Other branches of geopolitics were geo-medicine, geo-psychology, geo-jurisprudence and geo-economics. None of them was fully formed, as in fact would have been impossible, for the spatial emphasis was not sufficient to create new disciplines. Geo-medicine was concerned chiefly with diseases associated with different natural environments. Such study has long been a part of geography in all countries. Germany incorporated it into plans for conquering foreign areas and included it in the training of soldiers and other agents of the state who might be sent to remote parts of the earth. Geo-psychology appears to have been an attempt to bring mankind's habit of individual thought and action into line with the dominant environmental determinism of geopolitics. Geo-jurisprudence similarly essayed to harmonize law and environmental determinism. Geo-economics covered the fact-finding and planning of agencies set up to guide the government in ordering the destinies of German economic life.

Educational and Operational Centres.—To implement their program, the geopoliticians used established centres of higher education. At the University of Munich, Haushofer organized his Institute of Geopolitics (Institut fur Geopolitik), the best known, outside Germany, of all the geopoliticians' instruments. It came to be staffed by several score full-time specialists in geography and cognate fields who 'gathered, compiled and classified detailed information about all parts of the earth—its climate. surface features. natural resources, communication systems, economic production and social and political organization.

The work of the institute included both research and planning. Its activities were adopted officially in 1935 by Nazi government agencies which stressed planning. Two revealing names were given to institutions in this field set up under executive ministries: the National Bureau for Space Planning and Space Research (Reichstelle fiir Raumordnung und Raumforschung) and the House of National Planning (Haus der Reichsplanung).

The University of Heidelberg became the seat of the Association of Workers in Geopolitics (Arbeitsgemeinschaft fiir Geopolitik), an organization of all German university instructors concerned with geopolitics. Haushofer was for some time its president. This association directed the study of geopolitics at the university level. Its members monopolized German publication on their subject. The integration of Haushofer's projects, educational and operational. was signalized by creating under the *Reich* ministry of propaganda the National Socialist Teachers' association (Nationalsozialistischer Lehrer-Bund). It included two study groups. one to prepare teachers in the middle schools to present the homeland in geopolitician's terms, the other to prepare teachers in the upper schools to instruct on foreign countries.

In the Advanced School of Politics (Hochschule fur Politik) in Berlin. Haushofer's son Xlbrecht was made professor of geopolitics. From 1941 to 1943 he wrote the first volume of a text in political geography and geopolitics (published posthumously in 1951). Albrecht Haushofer, an active member of the German underground opposition. was executed by the Gestapo in April 1945. With Karl Haushofer's suicide in 1946, the human tragedy of the Haushoier dynasty came to an end.

Consequences for Germany.—One measure of the influence of geopolitics on Germany is the evidence of official support it received. There was none in the Weimar republic to speak of, inasmuch as the nationalistic philosophy and aims of geopolitics were alien to the liberal principles for which the short-lived German democracy stood. When the Nazi party took over in 1933, it gave geopolitics official sanction. Almost immediately German geography succumbed to the pressure and lost itself in geopolitics. Members of the profession who would not follow the new leader either withdrew to physical geography, a safe corner removed from political controversy, or were silenced by being refused permission to publish or lecture. Most of those who took their places bore names hitherto unknown to students of geography.

Only geopoliticians remained free to publish on aspects of geography that treat of mankind, and they took their cue from Haushofer. Through them, and the political connections he exploited and the organizations he sponsored. Haushofer completely dominated this new and exclusive brand of German geography. Taking colour from its authors. what was left of the onetime science of geography became propagandist in tone, intemperate in manner and unreliable as to facts.

The downfall of Nazi Germany erased German geopolitics from the ideological map of the new Germany; the extinction of the monstrous philosophy of Naziism included that of its byproduct. In spite of the feeble revival. in 1951, of the *Zeitschrift für Geopolitik,* geopolitics remained buried in the new Germany. Neither geographers nor political scientists attempted to let a new phoenix of a geopolitics cleansed of National Socialist ideas arise from the ashes. In fact. the bankruptcy of German geopolitics discredited legitimate studies in political geography in Germany following World War II. Far from attempting to revise geopolitics, a disillusioned science of geography in Germany failed to match the progress made especially in the Cnited States and Britain in the development of political geography.

Sound geography could have placed in correct perspective the relative strength of the nations as to strategic position, natural resources and productive capacity, and it would have warned that the natural environment neither fully measures human capacity nor determines the course of collective human action. The geopoliticians falsely assumed political power to rest wholly on material wealth, statistically computed. They added up the total natural resources of a country and multiplied by the intensity of utilization. Similarly they were content merely to count populations. From these facts they estimated the political and military strength of the nations. So engrossed, they failed to take account of the intangible forces generated in any people by living together as a nation. Besides, the myth of German racial superiority blinded them to the latent strength of non-Germans, both as peoples and as individuals.

The martial aims of the geopoliticians became increasingly apparent. They planned to have the revived German nation stride to world supremacy in a single war of conquest. In the slogan *"Blut und Boden"* (race and the land) Germans were taught by the Nazi leaders to vaunt their faith in their racial superiority to all other peoples, and their expectation of territorial supremacy—to be won by one more attack in a centuries-old succession of wars of conquest. While Hitler exploited chiefly the racial aspect of the shibboleth. Haushofer, who was, and remained. married to a woman of Jewish extraction. stressed its territorial aspect. He subscribed to racism only perfunctorily, although he permitted publication of "geographic" articles that embodied the racial "philosophy" of the third Reich.

Within its legitimate field geopolitics made itself little more than a formula for justifying Germany in wars of territorial conquest. From Kjellén it borrowed "autarky," the concept of national self-sufficiency. In the contemporary interdependent world, only the very largest and best-endowed nations could hope to approach permanent self-sufficiency. Others might build up stockpiles for or against an anticipated war of aggression. From Ratzel, geopolitics borrowed concepts about space, focusing them in the term *Lebensraum.* This they defined as the *right* of the German state "organism" to expand to the limit of its desires. More important than these loans: it borrowed from a truly outstanding student of political geography, Britain's Sir Halford Mackinder, the concept of "the heartland," a view of the earth as potentially arrayed in two camps—the land power of inner Eurasia and the sea power of the maritime lands peripheral to the heartland, including all the other continents. Germany, the geopoliticians reasoned, by attaching the heartland could make itself the master of the world.

From the Pan-German movement (*q.v.*) of the turn of the 19th century, geopolitics borrowed pan-regions, beginning with a German-dominated "Middle Europe" and "Eurafrica" as successive steps toward world conquest. From German political history and Ratzel, Haushofer himself worked out the doctrine that a political boundary marks merely the temporary halt of the nation-in-arms in its march toward unlimited territorial expansion.

The contributions of geopolitics to the war that broke out in 1939 were direct and large. The geopoliticians advanced a program for world domination, but it was incomplete because they paid no attention to the problem of assimilating the peoples they might conquer. Their preoccupation with war led them to assume that conquest itself would solve the whole problem.

The propaganda of geopolitics is generally admitted to have carried most weight with the very classes of German society that were least taken in by Hitler's demagogy. Thereby they were conditioned to fight a war of aggression, and their influence upon less-informed folk reinforced the exhortations of the Nazi leaders.

Instruction in geopolitics permeated the school system, and formed part of the training in national fanaticism given to the generation that was destined to bear the brunt of the fighting. The propaganda justified military aggression as "natural," and by implication scientific and inevitable. 'Geopolitics helped to delude all ages and classes of Germans into accepting an overvaluation of their power as a nation. By the same means it persuaded sympathetic or terrified cliques of collaborators in several neighbouring countries to pave the way for the conquests scheduled by the army general staff.

The information collected by the agencies of geopolitics directly aided German war plans. The military successes which stupefied the world in 1940 consummated projects published by geopoliticians well beforehand. The program of conquest was so audacious that it appeared to most non-Germans the dream of crackpots. Hence it was disregarded in the countries that had the power to block German military aggression, until steps taken to bring it to pass plunged the world into conflict. Actually the geopoliticians' estimates of relative military preparedness of the nations and the material resources on which each could rely proved accurate in two years of conquest.

Germany's first crucial military reverse was also forecast by geopolitics. The failure to conquer the Soviet Union was a demonstration of theories of space stressed by all the geo-strategists. Haushofer feared Russia A persistent disciple of Mackinder's teachings as far as the relationship of Russia and Germany was concerned. he emphasized time and again the necessity for Germany to join forces with its huge neighbour, and he rejoiced in the treaty of Aug. 1939 as the achievement of a lifelong ambition. Germany's attack on the Soviet Union in 1941 silenced him. Its unsuccessful outcome confirmed his contentions.

Influence Outside Germany. — Beyond the German-speaking world. the dogma of geopolitics was adopted with equal intensity by only one nation — Japan. Japan, like Germany, grew up on a long history of military conquests. Its militaristic tradition was reset in a frame of continental or world conquest by the Japanese program of "westernization" after 1868.

The objectives of geopolitics were therefore congenial to the Japanese mind. even though Japan and Germany were bound to clash if both persisted successfully in their separate and overlapping plans for conquest.

In addition, Haushofer's early enthusiasm for Japan gave his work a very favourable hearing there. He repeatedly stated his conviction that the Japanese nation was the most complete exemplification of the doctrines of geopolitics, although he pointed out weaknesses in Japan's environment and errors in its governmental policy. Between 1913 and 1938 he wrote six books on Japan alone, besides works covering the orient more broadly and lengthy commentaries in every issue of the *Zeitschrift*. Some of his work was translated into Japanese, and geopolitics was acclaimed and practised by a vigorous group of disciples drawn from Japanese geographers and political scientists.

Fascist Italy identified its territorial program with geopolitics as far as possible, notably in its claim to the Mediterranean sea as exclusively Italian — "mare nostro" ("our sea"). But the German geopoliticians did not hesitate to point out serious inherent weaknesses of Italy as a great power, and also the fact that it lay in the immediate path of German expansion. Presumably geopolitics never seized the imagination of any large section of the Italian people.

In France, the uritings of Ratzel exerted considerable influence on such outstanding students of human geography as P. Vidal de la Blache, J. Brunhes and C. Valloux. who incorporated many of Ratzel's ideas in their system of social geography (*géographie* sociale) but refused to follow German geopolitics along the dangerous road of environmental determinism. Repudiation of the pseudo science of geopolitics was convincingly expressed by A. Demangeon and J. Ancel.

Marxist and Leninist theory is bitterly opposed to the recognition of any influence on the life of states and societies by their natural environment, and geographical determinism has no place in its system. It is not surprising to note that Soviet geographers such as J. W. Semjonow in their contemptuous attacks against "Fascist Geopolitics" went far beyond the realm of German geopolitics and included. as alleged representatives of U.S. and British imperialism and colonialism, practically every writer of reputation in these countries who had written on the subject of political geography, from Ellen Churchill Semple and Alfred T. Mahan to Ellsnorth Huntington, Isaiah Bowman and Nicholas J. Spykman; in Britain from Mackinder to William G. East.

British and U.S. scholars at first dismissed geopolitics without analysis as unscientific and unworthy of study. German geopoliticians had been labouring 20 years when war brought both geopolitics and Haushofer first into full view of the English-speaking public. Beginning in 1940, numerous articles and uncounted comments and editorials made their appearance. In 1942 no fewer than five books traced the origin or analyzed the character of German geopolitics. Under the brilliant, if not always entirely objective, leadership of Nicholas J. Spykman (America's Strategy in *World* Politics, 1942) a new brand of American geopolitics became fashionable.

Once geopolitics had been appraised and applied, the spate of commentaries in English abated. But the subject remained very much alive, as was evinced by the continued and frequent appearance of the term in print without explanation or apology. The sudden rise to prominence of the term and its immediate acceptance by all sections of the English-reading public marked it as useful for expressing a concept more universal than the German movement that publicized the name.

Enduring Effects of Geopolitics. — No aspect of geopolitics is wholly acceptable to the world at large, but several of its ideas have been taken over, generally in modified form.

Useful devices embodied in the geopoliticians' maps have been adopted wherever maps are published. They may be seen in newspapers and pictorial and news magazines. Textbooks and atlases published in the United States and Great Britain after 1943 used a number of map devices that the geopoliticians publicized: among them simplicity. emphasis by means of broad lines or heavy shading, the projection of direction or movement by arrows, and pictorial representation.

The map became a powerful political weapon. Maps, intended to show the interrelations of the entire earth or its larger parts, were frequently drawn on unfamiliar grids. They stood as expressions of "global thinking." which Haushofer stressed from the beginning as a necessary preliminary to successful world domination by Germany. Twentieth-century events made global thinking, as a basis for understanding the world, essential to everybody. That use of the term is, however, very unlike the meaning in geopolitics that gave it currency.

Geopolitics implies a systematic and detailed knowledge of the earth prepared for use by governments. This was the contribution of Haushofer's Institute of Geopolitics at Munich. Similar agencies were set up as a wartime expedient by nations plunged into conflict with Germany, only to find themselves at a dangerous disadvantage through the lack of information that a geographic survey provides.

In peace. no less than in war, nations, drawing their wealth from all parts of the earth, can profit from knowing how the sources of wealth are distributed. Governments are exerting increasing control over natural resources found within their borders. Continued growth of population and speedier transportation promise to intensify the enduring need for accurate and up-to-date knowledge about the earth. The geographic survey. carried on by an agency of government, has permanent and universal utility.

Geopolitics was devised as an adjunct to warfare. It extended the horizon of military procedure in two ways: by adding political strategy to military strategy; by preconditioning the fighting man for each separate natural environment likely to become a theatre of war

Few people think of geopolitics in connection with any of the outgrowths thus far noted. When the word appears in English it is likely to refer loosely to the mutual power position (the power pattern) of the world's political units. Obviously the share of the earth controlled by each nation is a matter involving geography as well as government. Kjellén recognized this in describing the power position of the eight strongest states on the threshold of war in 1914 *(Die Grossmachte der Gegenwart,* 1914). Haushofer underlined it in the three volumes of his postwar revision and supplement. (See *Bibliography.)* If the apportionment of the earth's territory and resources among the nations can be measured in advance of war, each will have a true picture of the material foundation of its own power and that of its potential antagonists. So long as the analysis is objective, reliable as to facts, and unbiased by dogma. it can be argued that the study is as likely to lead a nation to shy away from war as to leap into it. Such an assessment of power promises to be of value only in a world of power politics. Those who use "geopolitics" in this sense contend that the seeds of power politics are so n broadcast by every war, and that until the entire earth is politically unified, sovereign nations may find themselves mustered on the battlefield. Geopolitics is calculated to aid governments in planning their foreign policy.

Planning was conspicuous in German geopolitics. Both Germany and Japan based decisions to launch wars of conquest on geopolitical estimates of the relative power potential of the Axis nations and their adversaries. These decisions were made possible by the choice that the natural environment affords to any state as to how it will use its area, strategical situation, population and natural endowment. Bent on war, the Axis powers prepared themselves to outfight selected opponents who were using equal or richer resources for ends only in small part military. The geopoliticians of both Germany and Japan overlooked the element of choice within the broad frame of natural environment. They assumed that the militaristic way of life followed by both nations was mystically determined by the natural environment, instead of having grown up as a result of frequent decisions to fight, spread over a period of several centuries, in an environment that gave ample scope to military prowess.

Their planning was based on a prejudiced estimate of power—overvaluation of their own and undervaluation of their rivals'. Their success in arms lasted only until latent opposition forces could be marshaled.

Planning is a leading objective of those who advocate geopolitics for the world at large. They use the word to mean that a nation should formulate its national policy only after duly appraising the natural environment as an inescapable condition of its power position. They differ from the German geopoliticians in avoiding ambiguous phrasing and in rejecting deliberate falsification.

In these stands they take safe ground. Some of them, particularly those who have not been trained in geography, drop into the pitfall of metaphysical philosophy; a still larger number believe the natural environment to be deterministic. Imbued with these ideas, they jeopardize the soundness of their planning and expose their program to risks that proved disastrous to the German and Japanese geopoliticians.

Much of the lumber of geopolitics bids fair to be forgotten. It was used as scaffolding to construct a faulty intellectual edifice. The befuddling phrase-making was no more than a device for hoodwinking people into accepting as "science" much that is unsound. Its exclusive orientation toward wars of conquest had values only to nations hoping to start such wars. The untenable hypotheses, such as the assumptions that the state is an organism and has a natural right to *Lebensraum,* helped bring on war, but did not show how to win it.

The name "geopolitics" has acquired such odium that many believe it to be unfitted to associate with respectable scientific terms. It is the only name available to designate the German pseudo science, and it has been urged that *"Geopolitik"* be reserved for that movement. It fits, more exactly than any other title, most of the writing that attempts to apply political geography to the problems of this or that nation. The term "applied political geography" is more aptly reserved for studies of the broad values and applications of geography to political life in general, viewed without national bias. Whatever the settled usage turns out to be, the entire world has been made aware of geography's value to government, through the popular interest in geopolitics. *(See* also GEOGRAPHY.)

BIBLIOGRAPHY.—Principal German works on geopolitics: *Zeitschrift fur Geopolitik,* monthly (1924–44; 1951–); Karl Haushofer, *Geopolitik des pazifischen Ozeans* (1924, 1938), *Grenzen in ihrer geographischen und politischen Bedeutung* (1927, 1939), *Wehrgeopolitik* (1932), *Der nationalsozialistische Gedanke in der Welt* (1933, published at the inauguration of the third *Reich), Weltpolitik von Heute* (1934); Erich Obst, *England, Europa, und die Welt* (1927); Karl Haushofer *et al., Bausteine zur Geopolitik* (1928); *Max Georg Schmidt, Schmidt-Haack Geopolitischer Typen-Atlas* (1929); the following three titles constitute a geopolitics of the contemporary world under the editorship of Karl Haushofer: Rudolf Kjellkn *et al., Die Grossmachte vor und nach dem Weltkriege* (1930), Karl Haushofer *et al., Jenseits der Grossmachte* (1932) and *Raumziberwindende Machte* (1934); Adolf Grabowski, "Das Problem der Geopolitik," *Zeitschrift fir Politik,* 22 (1933); Franz Braun and A. Hillen Ziegfeld, *Geopolitischer Geschichtsatlas* (1934); Walther Vogel, "Politische Geographie und Geopolitik," *Geographisches Jahrbuch,* 49 (1934); Otto Maull, *Das Wesen der Geopolitik* (1936).

Weigert *et al., Principles of Political Geography* (1957). (D. WH.; H. W. WT.)

GEOPONICI, or *Scriptores rei rusticae,* the Greek and Roman writers on agriculture. The Greeks paid less attention than the Romans to the scientific study of this subject, which in classical times they regarded as a branch of economics. Thus Xenophon's *Oeconomicus* contains a eulogy on agriculture and its beneficial ethical effects. The writings of Aristotle and his pupil Theophrastus also contain much agricuttural information.

About the 2nd century B.C., Bolus ("Democritus") of Mendes, Egypt, wrote a treatise *Peri Georgias,* frequently quoted by later compilers of *Geoponica* (agricultural treatises). To judge from the numerous writers cited by Varro and Columella, the Alexandrian period gave more attention to the subject. About 88 B.C. Cassius Dionysius of Utica translated into Greek and abridged the great work of the Carthaginian Mago, which was still further condensed by Diophanes of Nicaea in Bithynia for King Deiotarus. Vindonius Anatolius of Beirut and Didymus of Alexandria compiled agricultural treatises that were the bases for the *Geoponica* of Cassianus Bassus. His work in turn was the main source for the Byzantine *Peri georgias eclogai* or *Geoponica* (c. 950) once wrongly ascribed to Constantine VII.

The Romans, aware of the necessity of maintaining a numerous and thriving order of agriculturists, from very early times endeavoured to instill into their countrymen both a theoretical and a practical knowledge of the subject. The occupation of the farmer was regarded as next in importance to that of the soldier, and distinguished Romans did not disdain to practise it. In furtherance of this object, Mago's work was translated into Latin by order of the senate and the elder Cato wrote his *De agri cultura* (extant in a very corrupt state), a simple record in homely language of the rules observed by the old Roman landed proprietors rather than a theoretical treatise. He was followed by the two Sasernae (father and son) and Gnaeus Tremellius Scrofa, whose works are lost. The learned Varro (*q.v.*), when 80 years of age, composed his *Res rusticae,* dealing with agriculture, the rearing of cattle and the breeding of fishes. He was the first to systematize what had been written on the subject, and supplemented the labours of others by experience gained during his travels. In the Augustan age (to make no mention of Virgil's *Georgics)* Julius Hyginus wrote on farming and beekeeping, Sabinus Tiro on horticulture, and during the early empire Julius Graecinus and Julius Atticus on the culture of vines, and Cornelius Celsus (best known for his *De medicina)* on farming. The chief work of the kind, however, is the *De re rustica* of Columella (*q.v.*), which covers all aspects of farming. About the middle of the second century the two Quintilii, natives of Troia, wrote on the subject in Greek. It is remarkable that Columella's work exercised less influence in Rome and Italy than in southern Gaul and Spain, where agriculture became one of the principal subjects of instruction in the superior educational establishments that were springing up in those countries. One result of this was the preparation of manuals of a popular kind for use in the schools. In the third century Gargilius Martialis of Mauretania compiled a *Geoponica* in which medical botany and the veterinary art were included.

The *De re rustica* of Palladius (4th century), in 14 books, which is almost entirely borroued from Columella. is inferior in style and knowledge of the subject. It is a kind of farmer's calendar. in which the different rural occupations are arranged in order of the months. The 14th book (on iorestry) is written in elegiacs. The whole of Palladius and considerable fragments of Martialis are extant.

GEOPOTENTIAL. The geopotential is the potential energy of a unit mass aith reference to sea level. Surfaces of constant geopotential or level surfaces are fixed in space and may therefore be used as a scale to measure height. Height measured with reference to the geopotential surfaces is called geodynamic height and the common unit is the dynamic metre. For an average value of the gravitational constant the dynamic metre is equal to about 1.02 metric metres.

See ATMOSPHERE; METEOROLOGY; THERMODYNAMICS; UPPER AIR SOUNDINGS. (H. G. HN.)

GEORGE, SAINT, patron saint of England, was an early martyr in the east, perhaps at Lydda in Palestine where his alleged tomb is still shown. Nothing is known of his life. There is no reason to suppose that he is referred to, unnamed, in Eusebius' ecclesiastical history (viii, 5), and Gibbon's identification of him with George of Cappadocia. Athanasius' opponent, has been discredited. From the 6th century, legends about him as a warrior saint became very popular and increasingly extravagant. The story of his rescuing a maiden from a dragon. which first appears in the late 12th century and was popularized by the 13th-century *Golden Legend,* may owe something to the fact that the classical legend of Perseus and Andromeda was localized at Jaffa or Arsuf, not far from Lydda. This story is often represented in art, and St. George is frequently depicted as a youth wearing knight's armour aith a scarlet cross.

St. George has been known in England at least since the 8th century, but how he came to be looked on as its patron saint is not clear. No doubt returning crusaders popularized his cult (he uas said to have been seen in vision helping the crusaders at the siege of Antioch in 1098); but it is probable that he was not recognized as England's patron saint until King Edward III put the newly founded order of the Garter under his protection. He is one of the 14 auxiliary saints, and his feast day in both the eastern and western churches is April 23.

See H. Delehaye, *Les ltgendes grecques des saints militaires,* pp. 45–76 (1909). (D. AR.)

GEORGE I. (George Louis) (1660–1727), king of Great Britain and Ireland, born in 1660, was heir through his father, Ernest Augustus, to the hereditary lay bishopric of Osnabriick, and to the duchy of Calenberg, which formed one portion of the Hanoverian possessions of the house of Brunswick, while he secured the reversion of the other portion, the duchy of Celle or Zell, by his marriage (1682) with the heiress, his cousin Sophia Dorothea. The marriage was not a happy one. George Louis was a bad husband. Count Konigsmark—a handsome adventurer—seized the opportunity of paying court to the deserted wife. Conjugal infidelity was held at Hanover to be a privilege of the male sex. Count Konigsmark was assassinated. Sophia Dorothea was divorced in 1694, and remained in seclusion till her death in 1726. The prince's mother was Sophia, the youngest daughter of Elizabeth (*q.v.*) the daughter of James I. of England. Sophia found herself, upon the death of the duke of Gloucester, the next Protestant heir after Anne. The Act of Settlement in 1701 secured the inheritance to herself and her descendants. Being old and unambitious she rather permitted herself to be burdened with the honour than thrust herself forward to meet it. Her son George took a deeper interest in the matter. In his youth he had fought with determined courage in the wars of William III. Succeeding to the electorate on his father's death in 1698, he had sent a welcome reinforcement of Hanoverians to fight under Marlborough at Blenheim. With prudent persistence he attached himself closely to the Whigs and to Marlborough, refusing Tory offers of an independent command, and receiving in return for his fidelity a guarantee by the Dutch of his succession to England in the Barrier treaty of 1709.

In 1714 when Anne was growing old, and Bolingbroke and the more reckless Tories were coquetting with the son of James II., the Whigs invited George's only son, who was duke of Cambridge, to visit England in order to be on the spot in case of need. Neither the elector nor his mother approved of a step which was likely to alienate the queen, and which was specially distasteful to himself, as he was on very bad terms with his son. Yet they did not set themselves against the strong wish of the party to which they looked for support, and it is possible that troubles would have arisen from any attempt to carry out the plan, if the deaths, first of the electress (June 8) and then of the queen (Aug. 1, 1714), had not laid open George's way to the succession without further effort of his own.

George I. arrived in England when a great military struggle had come to an end. He had therefore no reason to call upon the nation to make great sacrifices. All that he wanted was to secure for himself and his family a high position which he hardly knew how to occupy, to fill the pockets of his German attendants and his German mistresses, to get away as often as possible from the uncongenial islanders whose language he could not speak, and to use the strength of England to obtain petty advantages for his German principality. He attached himself entirely to the Whig party, though he refused to place himself at the disposal of its leaders. He gave his confidence, not to Somers and Wharton and Marlborough, but to Stanhope and Townshend, the statesmen of the second rank. At first he seemed to be playing a dangerous game. The Tories, whom he rejected, were numerically superior to their adversaries, and were strong in the support of the country gentlemen and the country clergy. The strength of the Whigs lay in the towns and in the higher aristocracy. In 1715 a Jacobite insurrection in the north, supported by the appearance of the Pretender, the son of James II., in Scotland, was suppressed, and its suppression not only gave to the Government a character of stability, but displayed its adversaries in an unfavourable light as the disturbers of the peace.

The policy of George I.'s reign is the policy of his ministers. Stanhope and Townshend from 1714 to 1717 were mainly occupied with the defence of the Hanoverian settlement. After the dismissal of the latter in 1717, Stanhope in conjunction with Sunderland took up a more decided Whig policy. The Occasional Conformity Act and the Schism Act were repealed in 1719. But the wish of the liberal Whigs to modify if not to repeal the Test Act remained unsatisfied. In the following year the bursting of the South Sea bubble, and the subsequent deaths of Stanhope in 1721 and of Sunderland in 1722, cleared the way for the accession to power of Sir Robert Walpole, to whom and not to the king was due the conciliatory policy which quieted Tory opposition by abstaining from pushing Whig principles to their legitimate consequences.

Nevertheless something of the honour due to Walpole must be reckoned to the king's credit. It is evident that at his accession his decisions were by no means unimportant. The royal authority was still able within certain limits to make its own terms. This support was so necessary to the Whigs that they made no resistance when he threw aside their leaders on his arrival in England. When by his personal intervention he dismissed Townshend and appointed Sunderland, he had no such social and parliamentary combination to fear as that which almost mastered his great-grandson in his struggle for power. If such a combination arose before the end of his reign it was owing more to his omitting to fulfil the duties of his station than from the necessity of the case. As he could talk no English, and his ministers could talk no German, he absented himself from the meetings of the cabinet, and his frequent absences from England and his want of interest in English politics strengthened the cabinet in its tendency to assert an independent position.

Walpole at last by his skill in the management of parliament rose as a subject into the almost royal position denoted by the name of prime minister. In connexion with Walpole the force of wealth and station established the Whig aristocracy in a point of vantage from which it was afterwards difficult to dislodge them. Yet, though George had allowed the power which had been exercised by William and Anne to slip through his hands, it was understood to the last that if he chose to exert himself he might cease to be a mere cipher in the conduct of affairs. As late as 1727 Bolingbroke gained over one of the king's mistresses, the duchess of Kendal; and though her support of the fallen Jacobite took no effect, Walpole was not without fear that her reiterated entreaties would lead to his dismissal. The king's death in a carriage on his way to Hanover, in the night of June 10–11 in the same year, put an end to these apprehensions.

His only children were his successor George II. and Sophia Dorothea (1687–1757), who married in 1706 Frederick William, crown prince (afterwards king) of Prussia. She was the mother of Frederick the Great. (S. R. G.; X.)

GEORGE II. (George Augustus) (1683–1760), king of Great Britain and Ireland, the only son of George I., was born in 1683. In 1705 he married Wilhelmina Caroline of Anspach. In 1706 he was created earl of Cambridge. In 1708 he fought at Oudenarde. It was most unwillingly that, on his first journey to Hanover in 1716, George I., who was on bad terms with his son, appointed the prince of Wales guardian of the realm during his absence. In 1717 the existing ill-feeling ripened into an open breach. At the baptism of one of his children, the prince selected one godfather whilst the king persisted in selecting another. The young man spoke angrily, was ordered into arrest, and was subsequently commanded to leave St. James's and to be excluded from all court ceremonies. The prince took up his residence at Leicester House, and did everything in his power to support the opposition against his father's ministers.

When therefore George I. died in 1727, it was generally supposed that Walpole would be at once dismissed. The first direction of the new king was that Sir Spencer Compton would draw up the speech in which he was to announce to the privy council his accession. Compton, not knowing how to set about his task, applied to Walpole for aid. Queen Caroline took advantage of this evidence of incapacity, advocated Walpole's cause with her husband and procured his continuance in office. This curious scene was indicative of the course likely to be taken by the new sovereign. His own mind was incapable of rising above the merest details of business. He made war in the spirit of a drill-sergeant, and he economized his income with the minute regularity of a clerk. A blunder of a master of the ceremonies in marshalling the attendants on a levee put him out of temper. He took the greatest pleasure in counting his money piece by piece, and he never forgot a date. He was above all things methodical and regular. "He seems," said one who knew him well. "to think his having done a thing to-day an unanswerable reason for his doing it to-morrow."

Most men so utterly immersed in details would be very impracticable to deal with. George II. was exempt from this failing. He seemed to have an instinctive understanding that such and such persons were either wiser or even stronger than himself; and when he had once discovered that, he gave way with scarcely a struggle. Though in his domestic relations he was as loose a liver as his father, he was guided by the wise, unobtrusive counsels of his wife until her death in 1737, and when once he had recognized Walpole's superiority he was guided by the political sagacity of the great minister. It is difficult to exaggerate the importance of such a temper upon the development of the constitution. The apathy of the nation in all but the most exciting political questions, fostered by the calculated conservatism of Walpole, had thrown power into the hands of the great landowners. They maintained their authority by supporting a minister who was ready to make use of corruption, wherever corruption was likely to be useful, and who could veil over the baseness of the means which he employed by his talents in debate and in finance. To shake off a combination so strong would not have been easy. George II. submitted to it without a struggle.

So strong indeed had the Whig aristocracy grown that it began to lose its cohesion. Walpole dismissed all who opposed him. An opposition formidable in talents was gradually formed. In its composite ranks were Tories and discontented Whigs, discarded official hacks hungry for the emoluments of office, and youthful purists who fancied that if Walpole were removed corruption would cease. Behind them was Bolingbroke, excluded from parliament but suggesting every party move. In 1737 the opposition acquired the support of Frederick, prince of Wales. His marriage in 1736 to Augusta of Saxony brought on a quarrel with his father. In 1737, just as the princess of Wales was about to give birth to her first child, she was hurried away by her husband from Hampton court to St. James's palace at the imminent risk of her life, simply in order that the prince might show his spite to his father who had provided all necessary attendance at the former place. George ordered his son to quit St. James's, and to absent himself from court. Frederick in disgrace gave the support of his name, and he had nothing else to give, to the opposition. Later in the year 1737, on Nov. 20, Queen Caroline died. In 1742 Walpole, weighed down by the unpopularity both of his reluctance to engage in a war with Spain and of his supposed remissness in conducting the operations of that war, was driven from office. His successors formed a composite ministry in which Walpole's old colleagues and opponents were alike to be found.

War of the Austrian Succession.—The years which followed settled conclusively, at least for this reign, the constitutional question of the power of appointing ministers. The war between Spain and England had broken out in 1739. In 1741 the death of the emperor Charles VI. brought on the War of the Austrian Succession. The position of George II. as a Hanoverian prince drew him to the side of Maria Theresa through jealousy of the rising Prussian monarchy. Jealousy of France led England in the same direction, and in 1741 a subsidy of £300,000 was voted to Maria Theresa. The king himself went to Germany, and attempted to carry on the war according to his own notions. Those notions led him to regard the safety of Hanover as of far more importance than the wishes of England. Finding that a French army was about to march upon his German States, he concluded with France a treaty of neutrality for a year without consulting a single English minister. In England the news was received with feelings of disgust. The expenditure of English money and troops was to be thrown uselessly away as soon as it appeared that Hanover was in the slightest danger. In 1742 Walpole was no longer in office. Lord Wilmington, the nominal head of the ministry, was a mere cipher. The ablest and most energetic of his colleagues, Lord Carteret (afterwards Granville), attached himself specially to the king, and sought to maintain himself in power by his special favour and by brilliant achievements in diplomacy.

In part at least by Carteret's mediation the peace of Breslau was signed, by which Maria Theresa ceded Silesia to Frederick (July 28, 1742). Thus relieved on her northern frontier, she struck out towards the west. Bavaria was overrun by her troops. In the beginning of 1743 one French army was driven across the Rhine. On June 27th another French army was defeated by George II. at Dettingen. Victory brought elation to Maria Theresa. Her war of defence was turned into a war of vengeance. Bavaria was to be annexed. The French frontier was to be driven back. George II. and Carteret after some hesitation placed themselves on her side. Of the public opinion of the political classes in England they took no thought. Hanoverian troops were indeed to be employed in the war, but they were to be taken into British pay. Collisions between British and Hanoverian officers were frequent. A storm arose against the preference shown to Hanoverian interests. After a brief struggle Carteret, now Lord Granville, was driven from office in 1744.

Henry Pelham, who had become prime minister the year before, thus saw himself established in power. By the acceptance of this ministry, the king acknowledged that the function of choosing a ministry and directing a policy had passed from his hands. In 1745 indeed he recalled Granville, but a few days were sufficient to convince him of the futility of his attempt, and the effort to exclude Pitt at a later time proved equally fruitless.

Opposition to **Pitt.**—Important as were the events of the remainder of the reign, therefore, they can hardly be grouped round the name of George II. The resistance to the invasion of the Young Pretender in 1745, the peace of Aix-la-Chapelle in 1748, the great war ministry of Pitt at the close of the reign, did not receive their impulse from him. He had indeed done his best to exclude Pitt from office. He disliked him on account of his opposition in former years to the sacrifices demanded by the Hanoverian connection. When in 1756 Pitt became secretary of State in the Devonshire administration, the king bore the yoke with difficulty. Early in the next year he complained of Pitt's long speeches as being above his comprehension, and on April 5, 1757, he dismissed him, only to take him back shortly after, when Pitt, coalescing with Newcastle, became master of the situation.

Before Pitt's dismissal George II. had for once an opportunity of placing himself on the popular side, though, as was the case of his grandson during the American war, it was when the popular side happened to be in the wrong. In the true spirit of a martinet, he wished to see Admiral Byng executed. Pitt urged the wish of the House of Commons to have him pardoned. "Sir," replied the king, "you have taught me to look for the sense of my subjects in another place than in the House of Commons." When George II. died in 1760, he left behind him a settled understanding that the monarchy was one of the least of the forces by which the policy of the country was directed. To this end he had contributed much by his disregard of English opinion in 1743; but it may fairly be added that, but for his readiness to give way to irresistible adversaries, the struggle might have been far more bitter and severe than it was.

Of the connection between Hanover and England in this reign two memorials remain more pleasant to contemplate than the records of parliamentary and ministerial intrigues. With the support of George II., amidst the derision of the English fashionable world, the Hanoverian Handel produced in England those masterpieces which have given delight to millions, whilst the foundation of the University of Göttingen by the same king opened a door through which English political ideas afterwards penetrated into Germany.

George II. had three sons, Frederick Louis (1707–51); George William (1717–18); and William Augustus, duke of Cumberland (1721–65); and five daughters, Anne (1709–59), married to William, prince of Orange, 1734; Amelia Sophia Eleonora (1711–1786); Elizabeth Caroline (1713–1757); Mary (1723–72), married to Frederick, landgrave of Hesse-Cassel, 1740; Louisa (1724–1751), married to Frederick V., king of Denmark, *1743*.

GEORGE III. (George William Frederick), king of Great Britain and Ireland, was born June 4 (New Style), 1738, the son of George II.'s eldest son Frederick, Prince of Wales, and of Augusta, a princess of Saxe-Gotha. Almost from birth he was introduced to the ungainly squabbles that divided his father and grandfather; and Dr. Ayscough, the tutor assigned to him at the age of six, was chiefly remarkable as an adherent of the opposition. When George was thirteen his absurd father died; Ayscough was dismissed, and the unfortunate boy's education became a matter of acute political controversy, with the result that he had barely time to become accustomed to one set of instructors before they were changtd for another. In later life the old king's recollection of his two successive governors was that Harcourt, though well-intentioned, was wholly unfit for his job, while Waldegrave was a "depraved, worthless man"; and though he had a kindly remembrance of his second episcopal preceptor, Thomas of Peterborough, and of his sub-preceptor, Scott, he called Thomas's predecessor, Hayter of Norwich, an "intriguing, unworthy man, more fitted to be a Jesuit than an English bishop." Though his mother was devoted to him, she was a foolish, ignorant woman, who once remarked that logic was "an odd study" for children of her son's condition. Unfortunately, too, she kept him almost isolated from the world except for the remnants of the little Leicester House clique, such as Egmont and Bubb Dodington and the Earl of Bute, who used to encourage Frederick in his futile intrigues against George II. and his ministers. George is described in his youth as lethargic, an epithet which certainly cannot be applied to him when he became king; but a certain "vanity and obstinacy" and a tendency to let "his anger be turned into sulkiness" and to "behave like a child," which Lady Sarah Lennox noted as traits in his character, remained and are confirmed by his own admission to George Rose in *1804* that "his memory being a good one . . . what he did not *forget* he could not *forgive*," a point he illustrated by his grim declaration that he would not admit Fox to his councils, "even at the hazard of civil war." This reserved and authoritative disposition was much encouraged by the training he received at his mother's court, where Bolingbroke's "Patriot King" was laid down as the guide for his conception of royal duties; while the constantly whispered injunction of his mother, "George, be a king," in contrast to his grandfather's dependence on a Whig oligarchy, was allowed to sink into his mind.

His first actions on being called to the throne on the death of George II. (Oct. 25, 1760) showed his determination to "be a king." Dismissing Pitt, who had come to announce his accession, to await his pleasure, he consulted none of his ministers on the speech he addressed to the Council, but only Bute. Pitt had then been gloriously conducting the Seven Years' War since 1756, but there was as yet no prospect of peace. George III., however, had realized that, as long as Pitt, supported by the Whig oligarchy, was directing a successful war, it would be impossible for the king to obtain control over the machinery of government; accordingly from the outset he proclaimed his intention to bring to an end what he termed a "bloody and expensive war." On Pitt's vehement expostulations this phrase was toned down in the printed version to "expensive, but just and necessary war," and a promise made to consider the interests of the allies, notably Frederick the Great; but the king's resolution was not thereby shaken. Bute was very soon substituted for Holderness, Pitt's docile fellow-secretary, and encouraged those members of the cabinet who were outraged by Pitt's supercilious method of treating them as nonentities but who till then had been too timid to combine against him. Thus the great minister's resignation was brought about when he failed to persuade his colleagues to declare war on Spain in *1761*.

But the king's greatest stroke was in forcing Newcastle to resign a few months later; for Newcastle was the arch-schemer of Whig majorities, powerful from his control over elections and over all the patronage necessary to keep electors and members of parliament contented. With the fall of Newcastle the king took into his own hands all the Treasury patronage, and showed that he meant to be master by turning out some of the greatest Whig lords from their offices in the household or from their lord-lieutenancies in the counties. Negotiations for peace were energetically pushed on by Bute, who succeeded Newcastle at the Treasury, and when the Preliminaries of Paris were ready for submission to parliament, a favourable majority was ensured by the ruthless determination of the king's agent, Henry Fox, who not only bribed existing members profusely, but secured future majorities in the constituencies by a further holocaust of great Whig office holders and by turning out the humblest official voters, such as tide-waiters and other Treasury satellites. At the end of December 1762 the king's victory was made patent to all by a majority of 319 for the Preliminaries, and the Princess of Wales was able to exclaim, "Now my son is king of England!" For the next twenty years of his reign he could summon or dismiss his ministries almost at pleasure.

But though George III. had thus early in his reign obtained control over the government, he had by no means succeeded in obtaining the affection of his people. In his first speech to parliament he had made a bid for this affection by his boast, "Born and bred in this country, I glory in the name of Briton," in pointed allusion to the German upbringing of his two predecessors; but unfortunately the appeal fell flat, largely owing to the use of the word *Briton* instead of *English,* at the presumed suggestion of Bute, whose unpopularity was enhanced by his Scottish nationality. Nor was his marriage in 1761 of a nature to awaken any romantic enthusiasm. In the early days of his reign he had been much attracted by the beauty and unconventional charm of Fox's niece, Lady Sarah Lennox, and had even made a clumsy attempt at a proposal of marriage to her; but the influence of his surroundings, aghast at the prospect of his marriage with a subject, allied too to a powerful Whig clique, overcame his incipient passion, and he chose as his wife Charlotte of Mecklenburg, consoling Lady Sarah by assigning to her the post of bridesmaid. Queen Charlotte, though a lady of no special beauty or charm, made an excellent wife for the king, for both shared a taste for homely domesticity, which, though a subject of derision in court circles, eventually proved one of the chief sources of their people's affections. But for the time being any natural inclination to rejoice at the marriage was overshadowed by the king's partiality to the unpopular Scotsman, Bute, and by the dismissal of the national hero, Pitt, who, it was noted, was shortly afterwards greeted with frenzied enthusiasm in the City, while the king was received with marked coldness. This unpopularity was expressed with cold, almost malignant insolence by Wilkes in his famous No. 45 of the ***North Briton*** (April 23, 1763). The king felt himself insulted by comments on his speech to parliament, which, Wilkes maintained as we should now, were constitutionally applicable only to ministers; and for the next seven years devoted himself with remarkable pertinacity to securing Wilkes's exclusion from parliament, browbeating ministers and influencing private members to carry out the vendetta against him.

By 1763 King George III. had recovered for the throne a good deal of the power and influence which had nominally been left to it by the Revolution, but which had largely lapsed during the reigns of the first two Georges. Constitutionally the king could choose and direct his own ministers, subject of course to the power left to parliament to force their dismissal if they failed to obtain the support of the majority to the king's policy. But now that the king had wrested from the Whigs the means of influencing electors and members of the unrepresentative House of Commons, he was comparatively untrammelled by parliament. It is true that the old parliamentary groups, from which he had to make his choice of ministers, remained: but by his power of patronage he was able in every group to secure a section of personal adherents, always ready to vote for the king's measures even against their own party and hence soon known collectively as "king's friends." But even so there was always a danger that a minister of determination and pronounced views might run counter to the king's wishes; so George III. took the additional precaution of having always a familiar, changed from time to time, either in the cabinet or on its outer fringes, who should report confidentially on the attitude of his colleagues and generally act as the king's spy. Egmont is perhaps the first who emerged in this character; and for short periods Hertford and Rochford seem to have played a similar part. But Northington was the most efficient of these adjuncts, especially in breaking up the first Rockingham administration; until finally the king found the ideal man in North, the prime minister himself. Such, in short, was the system by which the king tried to establish his personal rule as the Patriot King, on whom, as Bolingbroke lyrically exclaimed, "the eyes of a whole people are fixed, filled with admiration and glowing with affection." He was to decide on all measures, his ministers were to be chosen, not from one party, but each according to his fitness for the post he occupied, in the duties of which he was to be responsible to the king alone: in fact, when the system was at its zenith during North's ministry, the cabinet met as a body only when the king summoned it to consider some report of one of his ministers on which he desired further advice.

But the system was not perfected in a day. In spite of all precautions the right ministers to carry it out were not easy to find. Bute, whom the king afterwards described as "deficient in political firmness," resigned immediately after the Treaty of Paris (1763), and George Grenville was tried. But he and his allies, the Bedfords, had not learned the lesson and still attempted to lecture and browbeat the king, as if they were the masters, as in the old days of the Whig supremacy. So Grenville had to go (1765)—not, however, before he had passed the Stamp Act with the king's full approbation—and was succeeded by Rockingham and his party of remnants from the glorious days of Newcastle. Such a ministry was obviously not what the king wanted, was only tolerable for the moment as a means of escape from Grenville, and was intrigued against by the king almost from the start.

When the Rockingham ministry had been sufficiently sapped by Northington, George was able to turn to the one man whom he expected to share his views about a non-party ministry. Pitt indeed had always declared for "measures, not men," and was supremely indifferent to the claims of party when it was a question of national policy, so that superficially there appeared to be the elements of agreement between the two, especially when Pitt formed his ministry (1766) from men of all parties without distinction. No doubt had Chatham, as he had become, retained his faculties and been able to guide the ministry, he, not the king, would have settled its policy, for he was not apt to take his orders from anyone. But, after his virtual retirement within a few months, the ministry he had formed to carry out his own policy proved to be exactly the one best suited to carry out the king's system of government. When by 1770 Chatham, Shelburne, Grafton and Camden had all resigned and Lord North was promoted to the Treasury, the king at last had a ministry in which all the members, and above all their chief North, took their orders directly from him. Not only the general policy but the minutest details of administration were conveyed in the king's daily letters to North and other ministers. For the succeeding twelve years, therefore, the policy of the country was essentially that of the king.

Not only was the king the director of the national policy during the war with America (1776–83), but there is little doubt that he had the country on his side in that policy. George III. stood for the principle that Parliament, under his guidance, had the right to legislate for the colonies, and though Chatham might quite fairly insist on the distinction between general legislation applicable to the whole empire as within the purview of the imperial parliament and legislation affecting only the colonies, on which they had a clear right to decide through their own representatives, and Burke point to the calamitous consequences of alienating America, such distinctions or appeals left cold the bulk of the population of England, who felt that the colonies were ungrateful children, ready to profit from the security our arms had gained for them, but unwilling to pay the price. It was not indeed the merits of the war in which the king was the prime mover that finally disgusted the country, but the series of calamities which marked its progress. For these the king's system of government was chiefly responsible. He himself did all that such a man could do. He supervised the general policy and even more meticulously the details of administration. As is made abundantly clear in his published correspondence[1], the king delighted in taking responsibility upon his own shoulders. He practically assumes the duty of leader of the House by his constant and detailed directions to North as to the conduct of business, he thinks no labour too great in inspecting troops or dockyards, in settling how regiments are to be raised, foreign mercenaries to be hired or naval expeditions to be equipped and, incidentally, devotes quite as much care to deciding how, on a journey to Portsmouth, his equerries and other attendants are to travel and what horses and carriages are to be taken from the royal stables. He certainly did not want courage, either physical or moral, as he showed throughout his life. "Let not this check dismay You," he wrote to Grafton, "in this World these things will happen, therefore rest assured that it will if possible stimulate me to act with greater vigour": as is well known, during the Gordon riots he and his old enemy Wilkes seem to have been the only people who did not lose their heads: when poor North moaned to him about the expense of the war he rebukes him for "weighing such events in the Scale of a Tradesman behind his Counter": he tells Sandwich that "the English Lion when roused has not only his wonted resolution but has added the swiftness of the Race Horse": and when there is some difficulty about Howe accepting the American command he writes to poor North, "Before I get to dinner I just take up my pen to acquaint You that things are very far from desperate, that if no one will interfere I do not despair of bringing things to rights . . . therefore rest satisfied till You hear more from Me."

But the trouble was that, though in some respects a shrewd judge of men when he was not crossed, George III. had not the eagle eye of a Chatham in planning and supervising a campaign, and still less the ability to make lesser men carry out his bidding. And owing to his calculated aversion to really able men who would undertake responsibility, he had to rely on ministers like Lord George Germain, incompetent and quarrelsome, odious too for his behaviour at Minden, North, a timorous soul, Sandwich, an evil liver, as the king himself admitted. Scandals in his own family, which led to the Royal Marriages Act of 1770, and his patent inability to control the excesses of his graceless heir did not add to the king's popularity, and cast doubts on his competence. Above all, his extravagant methods of securing a complacent parliament by the distribution of sinecures and even direct money bribes were at last beginning to awaken alarm Debts amounting to over £1,000,000 on his ample civil List, which had to be paid by the nation while engaged in this "bloody and expensive" war, and the wasteful extravagance of the royal household under a king notoriously parsimonious were rightly attributed to the unavowed exercise of "influence," and tended to unite opposition in the country and even in the House, in a way that Wilkes, the American war and Junius's gross attack on the king had all failed to do. Finally in 1780 the hitherto docile House of Commons accepted Dunning's motion that "the power of the Crown has increased, is increasing and ought to be diminished": a resolution that George III. attributed merely to a few "factious Leaders and ruined men," who wished to overturn "this excellent Constitution . . . the most beautiful Combination that ever was framed."

But two years later, when England, with almost all Europe against her, was forced, after Yorktown, to give up the struggle in America, George at last realized that his attempt to govern on the lines of the "Patriot King" had finally failed. So fully was he aware of this that on two separate occasions he seriously contemplated abdication; and on both occasions drew up messages to announce his decision to Parliament. The first occasion was in 1782, when he was forced to take a Rockingham ministry after North's fall, the second when, on the defeat of Shelburne (1783), he saw no alternative to the hated Fox-North coalition. These draft messages are drawn up with a dignity of language all the more striking as they are a complete admission of failure. He emphasizes his scrupulous respect for the "Rights of Parliament," a perfectly true claim, since in normal times its composition gave him complete control over it. His more detailed reasons set forth in the drafts of 1783 give the best exposition of his principles of government and incidentally suggest the reasons for their ultimate failure. His "pleasing hope," he declares to have been that, "He might have proved the happy Instrument of conciliating all Parties, and thus collecting to the Service of the State, the most able Persons this Nation produced. . . . This Patriotic Endeavour has proved unsuccessful, by the Obstinacy of a Powerful Combination that has long manifested a resolution of not entering into Public Service, unless the whole Executive management of affairs is thrown entirely into their hands." In other words George III. was beaten by the demand for full responsibility of the people's representatives for the executive as well as the legislative functions of government.

The year 1783, therefore, marks a clear epoch, not only in the reign of George III., but also in our constitutional history. It is perfectly true that the king did not in a day give up his ingrained ambition "to be a king," and that there are many instances after the date of his draft abdication in 1783 of successful attempts by him to influence the government. He took an active part in securing the rejection of Fox's India Bill in 1783 and in dismissing the Coalition; and the *Parliamentary Papers* of *John Robinson* (Camden Series, 1922) afford conclusive evidence that Pitt's victory at the polls in 1784 was largely due to the active interference of the king in the elections. Pitt's resignation in March 1801 was entirely due to the king's refusal to agree to his minister's policy of conciliation to the Catholics; his refusal to admit Fox into Pitt's reconstituted ministry of 1804 was decisive. Although he admitted Fox into the ministry of All the Talents in 1806 and even went so far as to tell him that "I have no desire to look back upon old grievances, and you may rest assured that I never shall remind you of them," yet when, after Fox's death, the ministry wished to allow Roman Catholics to join the army, he not only flatly refused, but forced their resignation by demanding a written assurance that they would never again bring up the Catholic question in any form. All this is true, just as it is true that George IV. and William IV. and even Victoria and Edward VII. still could exercise a certain amount of personal influence in the composition of a ministry or on the execution of its measures. But largely owing to the long ministry of Pitt, who, no more than his father, was one to take directions from a king or anyone else as to the policy he thought good, the growth of the cabinet's and still more of a strong prime minister's independence became an established understanding of the constitution. It is to be remembered too that the unwillingness of Pitt and other ministers to oppose a strong prejudice of the king, such as that against the Catholic claims or against Fox, was almost entirely due to the fear of inducing another bout of insanity in their master and not to any concession to the king's view of his own powers.

As early as 1765 there appeared symptoms of insanity in the king during a comparatively trivial illness, but they soon passed off. In October 1788, however, his madness was unmistakable. He became violent and a danger even to those who loved him best, and had to be put under restraint. Unfortunately he was at first put under the care of ignorant doctors, whose only idea of treating madness was by means of a strait waistcoat and even more brutal measures. At last he came under the charge of Dr. Willis, who had introduced a new method of soothing and persuasive treatment. Even more pathetic were the political squabbles that ensued over the Regency Bill. The obvious regent was the Prince of Wales, but, as he was a bitter opponent of the king and consequently an ally of Fox and all the disappointed Whigs, Pitt naturally thought that his powers during the king's temporary illness should be limited. Feeling grew very bitter on the subject, the doctors were dragged into the dispute, and the Prince's ribaldry about his unfortunate father became a public scandal. Fortunately under Willis's treatment the king recovered by March 1789, and the contentious Regency Bill was dropped. Again in the first half of 1801 he had bouts of madness under the excitement of the Catholic question and again in 1804 and 1810; in 1811 after the

[1] *Correspondence of George III. from 1760 to 1783* edited by Hon. Sir John Fortescue, 6 vols., 1927–28.

death of his favourite daughter, Amelia, his insanity became permanent, a Regency Bill was passed, and the old king remained in seclusion, blind as well as mad, till his death on Jan. 29, 1820.

During the first twenty-three years of his reign, when he was attempting to revive personal government, George III. enjoyed little of his people's affection. The dynasty had never yet achieved popularity, and George III., in spite of the bright hopes with which he ascended the throne, had done very little to win it for himself. At first he was overshadowed by the popular hero, Pitt, and his predilection for the Scotsman Bute did not help him. Few stories likely to endear him with the people radiated from the court, for he hardly saw any even of his ministers except on business or at formal levees, and for choice lived frugally in the dull seclusion of his domestic circle. His devotion to public business took no romantic turn, for he rarely captivated his people by such appeals as Pitt's in the Seven Years' War, and his industry was rather that of a clerk than of a great statesman. So immersed was he in the routine duties of his office that until 1788, when he went to drink the waters at Cheltenham, he had never, according to Wraxall, stirred further from London than the Nore, Coxe Heath, Oxford and Portsmouth. But, paradoxically, when he was no longer the real master in the state his popularity increased enormously. The first strong demonstration of this new popularity was on his recovery from his illness in 1789, partly no doubt from sympathy with his affliction, partly in indignation at his son's and his friends' hardly concealed hope that he would not recover. After that his popularity never waned. His sturdy conservatism—"I will have no innovations in my time," as he said to Eldon—and even his narrow obstinacy in the American War and in resisting Catholic claims; still more his determination to fight on against the French regardless of defeats and desertions by allies, struck a sympathetic chord in the hearts of his subjects. And as he became better known, with his little trick of repetition and his "What? What?" at the end of every sentence, especially during his visits to Weymouth, where he talked unceasingly and shrewdly, if not always cleverly, with all and sundry about their homely concerns, their apple-dumplings and so on, he won the love of his countrymen as "farmer George," one of themselves, with the same tastes, though a king, as the country folk with whom he loved to gossip; in fact, as Wraxall observed, by the end of his reign "his virtues had obtained for him a higher place in our esteem than any prince has occupied since the conquest."

Viewing him from a greater distance of time, we can say of him that few kings have shown greater courage, both moral and physical, in accepting responsibility or affronting actual danger—"he could not bear," he once said, "that any of his family should want courage." With little appreciation of beauty he preferred West to Reynolds, thought little of Shakespeare's "sad stuff," and had "no taste for what was called the fine, wild, beauties of nature; he did not like mountains and other romantic scenes, of which he sometimes heard much"; still he had a good taste in music and was a generous and interested patron of science and learning—for is it not to him that we owe the nucleus of the British Museum Library? Though almost malignant in his vendettas against greater men such as Chatham who had crossed his purposes, yet when he had accepted defeat he could be a generous loser, as in his remark to Fox already quoted and in his speech to Adams, the first envoy to St. James's from the United States:—"I will be very frank with you. I was the last to consent to the separation: but the separation having been made and having become inevitable, I have always said, as I say now, that I would be the first to meet the friendship of the United States as an independent power." Lastly, not the least service he rendered the country was the homely domesticity, even the dullness of his life. Thereby he set a standard of faithful troth in the relations of private life, which was new at any rate in the court circles of England and which has survived even the Regency to become almost a commonplace of modern English life. *(See* genealogical table in article ENGLISH HISTORY.)

BIBLIOGRAPHY.—Correspondence of George III. from 1760 to 1783 (ed. Fortescue) 6 vols., 1927–28; this contains, *inter alia,* the king's letters in *Corr. of Geo. III. with Lord North* (ed. Donne) 2 vols. 1867, but the latter book has useful notes. Geo. Rose, *Diaries & Corr.* 2 vols. 1860, has some illuminating talks with the king. Most of the Memoirs and Correspondence of the latter half of the 18th century have information about Geo. III. The *Histories* of England by J. Adolphus (1803, etc.) & W. N. Massey (4 vols., 1855–63) have first hand stories. J. H. Jesse, *Memoirs of Life & Reign of Geo. III.,* 3 vols., 1867, may also be consulted. L. Melville, *Farmer George,* 2 vols., 1907, and B. Willson, *Geo. III. as man, monarch and statbsman,* 1907, are more recent compilations about him. (B. Wi.)

GEORGE IV. [George Augustus Frederick] (1762–1830), king of Great Britain and Ireland, eldest son of George III., was born at St. James's Palace, London, on Aug. 12, 1762. He was naturally gifted, was well taught in the classics, learnt to speak French, Italian and German fluently, and had considerable taste for music and the arts; and in person he was remarkably handsome. His tutor, Bishop Richard Hurd, said of him when 15 years old that he would be "either the most polished gentleman or the most accomplished blackguard in Europe—possibly both." Reaction from the strict and parsimonious style of his parents' domestic life had its natural effect in plunging the young prince of Wales, flattered and courted as he was, into a whirl of pleasure-seeking. At the outset his disposition was brilliant and generous, but it was essentially unstable, and he started even before he came of age on a career of dissipation which in later years became wholly profligate. He had an early amour with the actress Mary ("Perdita") Robinson, and in the selection of his friends he opposed and annoyed the king, with whom he soon became (and always remained) on the worst of terms, by associating himself with Fox and Sheridan and the Whig party, When in 1783 he came of age, a compromise between the coalition ministry and the king secured him an income of £50,000 from the Civil List, and £60,000 was voted by parliament to pay his debts and start his separate establishment at Carlton House. There, under the auspices of Fox and Georgiana, auchess of Devonshire, he posed as a patron of Whig politics and a leader in all the licence and luxury of gay society—the "First gentleman of Europe," as his flatterers described him as years went on. And at this early age he fell seriously in love with Mrs. Fitzherbert.

His connection with this lady was for some time the one redeeming and restraining factor in his life. Mary Anne (or as she always called herself, Maria) Fitzherbert (1756–1837) was the granddaughter of Sir John Smythe, Bart., of Acton Burnell Park, Shropshire, and came of an old Roman Catholic family. Her second husband, Thomas Fitzherbert, died in 1781, leaving his widow with a comfortable fortune. She became a prominent figure in London society, and the young prince wooed her with all the ardour of a violent passion. The Act of Settlement (1689) entailed his forfeiture of the succession if he married a Roman Catholic, apart from the fact that the Royal Marriage Act of 1772 made any marriage illegal without the king's consent. which was out of the question. They were secretly married by the Rev. R. Burt, a clergyman of the Church of England, on Dec. 15, 1785. There is no doubt as to Mrs. Fitzherbert's belief, supported by ecclesiastical considerations, in her correct and binding, though admittedly illegal, relationship to the prince as his canonical wife; and their relationship was treated by their intimates on the footing of a morganatic marriage. The position nevertheless was inevitably a false one; Mrs. Fitzherbert had promised not to publish the evidence of the marriage (which, according to a strict interpretation of the Act of Settlement might have barred succession to the crown), and the rumours which soon got about led the prince to allow it to be disavowed by his political friends. He became heavily involved in debt, and as the king would not assist him, shut up Carlton House, and went to live with Mrs. Fitzherbert at Brighton. In 1787 a proposal was brought before the House of Commons by Alderman Newnham for a grant in relief of his embarrassments. It was on this occasion that Fox publicly declared in the House of Commons, as on the prince's own authority, in answer to allusions to the marriage. that the story was a malicious falsehood. A little later Sheridan, in deference to Mrs. Fitzherbert's pressure and to the prince's own compunction, made a speech guardedly modifying Fox's statement; but though in private the denial was understood, it effected its object, the House voting a grant of £221,000 to the prince and the king adding £10,000 to his income; and Mrs. Fitzherbert. who at first thought of severing her connection with the prince, forgave him. Their union—there was no child of the marriage—was brutally broken off in June 1794 by the prince, when further pressure of debts (and the influence of a new Egeria in Lady Jersey) made him contemplate his official marriage with princess Caroline; in 1800, however, it was renewed, after urgent pleading on the prince's part, and after Mrs. Fitzherbert had obtained a formal decision from the pope pronouncing her to be his wife, and sanctioning her taking him back; her influence over him continued till shortly before the prince became regent, when his relations with Lady Hertford brought about a final separation. For the best years of his life he had at least had in Mrs. Fitzherbert the nearest approach to a real wife, and this was fully recognized by the royal family[1]. But his dissolute nature was entirely selfish, and his various liaisons ended in the dominance of Lady Conyngham, the "Lady Steward" of his household, from 1821 till his death.

In 1788 his father's first attack of insanity made the prince's position in the State one of peculiar importance. Fox maintained and Pitt denied that the prince of Wales, as the heir-apparent, had a right to assume the regency independently of any parliamentary vote. Pitt, with the support of both Houses, proposed to confer upon him the regency with certain restrictions. The recovery of the king in Feb. 1789 put an end, however, to the prince's hopes. In 1794 the prince consented to a marriage with a German Protestant princess, because his father would not pay his debts on any other terms, and his cousin, Princess Caroline of Brunswick, was brought over from Germany and married to him in 1795. Her behaviour was light and flippant, and he was brutal and unloving. The ill-assorted pair soon parted, and soon after the birth of their only child, the princess Charlotte, they were formally separated. With great unwillingness the House of Commons voted fresh sums of money to pay the prince's debts.

In 1811 he at last became prince regent in consequence of his father's definite insanity. He had always lived in close connection with the Whig opposition, and he now empowered Lord Grenville to form a ministry. There soon arose differences of opinion betaeen them on the answer to be returned to the address of the Houses, and the prince regent then informed the prime minister, Mr Perceval, that he should continue the existing ministry in office. The ground alleged by him for this desertion of his friends was the fear lest his father's recovery might be rendered impossible if he should come to hear of the advent of the opposition to power. Lord Wellesley's resignation in Feb. 1812 made the reconstruction of the ministry inevitable. As there was no longer any hope of the king's recovery, the former objection to a Whig administration no longer existed. Instead of taking the course of inviting the Whigs to take office, he asked them to join the existing administration. The Whig leaders, however, refused to join, on the ground that the question of the Catholic disabilities was too important to be shelved, and that their difference of opinion with Mr. Perceval was too glaring to be ignored. The prince regent was excessively angry, and continued Perceval in office till that minister's assassination on May 11, when he was succeeded by Lord Liverpool, after a negotiation in which the proposition of entering the cabinet was again made to the Whigs and rejected by them. In the military glories of the following years the prince regent had no share. When the allied sovereigns visited England in 1814, he played the part of host to perfection. So great was his unpopularity at home that hisses were heard in the streets as he accompanied his guests into the city. In 1817 the windows of the prince regent's carriage were broken as he was on his way to open parliament.

The death of George III. on Jan. 29, 1820, gave to his son the title of king without altering the position which he had now held for nine years. The relations between the new king and his wife unavoidably became the subject of public discussion. In 1806 a charge against the princess of having given birth to an illegitimate child had been conclusively disproved, and the old king had consequently refused to withdraw her daughter, the princess Charlotte, from her custody. In the regency the prince was able to interfere, and prohibited his wife from seeing her daughter more than once a fortnight. On this, in 1813, the princess addressed to her husband a letter setting forth her complaints, and receiving no answer published it in the *Morning Chronicle*. The prince regent then referred the letter, together with all papers relating to the inquiry of 1806, to a body of 23 privy councillors for an opinion whether it was fit that the restrictions on the intercourse between the princess Charlotte and her mother should continue in force. All except two answered as the regent wished them to answer. But the general public leaned towards the wife of a notorious profligate. Addresses of sympathy were sent up to the princess from the city of London and other public bodies.

The discord again broke out in 1814 in consequence of the exclusion of the princess from court during the visit of the allied sovereigns. In August in that year she left England, and after a little time took up her abode in Italy. The accession of George IV. brought matters to a crisis. He ordered that no prayer for his wife as queen should be admitted into the Prayer Book. On June 7 she arrived in London. Before she left the continent she had been informed that proceedings would be taken against her for adultery if she landed in England. Two years before, in 1818, commissioners had been sent to Milan to investigate charges against her, and their report, laid before the cabinet, in 1819, was made the basis of the prosecution. On the day on which she arrived in London a message was laid before both Houses recommending the criminating evidence to parliament. A secret committee in the House of Lords after considering this evidence brought in a report on which the prime minister founded a Bill of Pains and Penalties to divorce the queen and to deprive her of her royal title. The bill passed the three readings with diminished majorities, and when on the third reading it obtained only a majority of nine, it was abandoned by the Government. The king's unpopularity, great as it had been before, was now greater than ever. In the following year (1821) Caroline attempted to force her way into Westminster Abbey to take her place at the coronation. On this occasion popular support failed her; and her death in August relieved the king from further annoyance.

Immediately after the death of the queen, the king set out for Ireland. His good reception in Dublin encouraged him to attempt a visit to Edinburgh in the following year (Aug. 1822). Since Charles II. had come to play the sorry part of a covenanting king in 1650 no sovereign of the country had set foot on Scottish soil. Sir Walter Scott took the leading part in organizing his reception, which was enthusiastic. He returned from Edinburgh to face the question of the appointment of a secretary of state which had been raised by the death of Lord Londonderry (Castlereagh). It was upon the question of the appointment of ministers that the battle between the Whigs and the king had been fought in the reign of George III. George IV. had neither the firmness nor the moral weight to hold the reins which his father had grasped. He disliked Canning for having taken his wife's side very much as his father had disliked Fox for taking his own. But, Lord Liverpool insisted on Canning's admission to office, and the king gave way. Tacitly and without a struggle the constitutional victory of the last reign was surrendered. But it was not surrendered to the same foe as that from which it had been won. The coalition ministry in 1784 rested on the great landowners and the proprietors of rotten boroughs. Lord Liverpool's ministry had hitherto not been very enlightened, and it supported itself to a great extent upon a narrow constituency. But it did appeal to public

[1]Mrs. Fitzherbert herself, after her final separation from the prince, with an annuity of £6,000 a year, lived an honoured and more or less retired life mainly at Brighton. There she died in 1837. William IV. on his accession offered to create her a duchess, but she declined; she accepted, however, his permission to put her servants in royal livery. The actual existence of a marriage tie and the documentary evidence of her rights were not definitely established for many years; but in 1905 a sealed packet, deposited at Coutts's bank in 1833, was at length opened by royal permission and the marriage certificate and other conclusive proofs therein contained were published in W. H. Wilkins's *Mrs. Fitzherbert* and *George IV*. In 1796 the prince had made a remarkable will in Mrs. Fitzherbert's favour, which he gave her in 1799, and it is included among these documents (now in the private archives at Windsor). In this he speaks of her emphatically throughout as "my wife." It also contained directions that at his death a locket with her miniature, which he always wore, should be interred with him; and Mrs. Fitzherbert was privately assured, on the duke of Wellington's authority, that when the king was buried at Windsor the miniature was on his breast.

opinion in a way that the coalition did not, and what it wanted itself in popular support would be supplied by its successors. What one king had gained from a clique another gave up to the nation.

Once more, on Lord Liverpool's death in 1827, the same question was tried with the same result. The king not only disliked Canning personally, but he was opposed to Canning's policy. Yet after some hesitation he accepted Canning as prime minister; and when, after Canning's death and the short ministry of Lord Goderich, the king in 1828 authorized the duke of Wellington to form a ministry, he was content to lay down the principle that the members of it were not expected to be unanimous on the Catholic question. When in 1829 the Wellington ministry unexpectedly proposed to introduce a Bill to remove the disabilities of the Catholics, he feebly strove against the proposal and quickly withdrew his opposition. The worn-out debauchee had neither the merit of acquiescing in the change nor the courage to resist it.

George IV. died on June 26, 1830, and was succeeded by his brother, the duke of Clarence, as William IV. His only child by Queen Caroline, the princess Charlotte Augusta, was married in 1816 to Leopold of Saxe-Coburg, afterwards king of the Belgians, and died in childbirth on Nov. 6, 1817.

George IV. was a bad king, and his reign did much to disgust the country with the Georgian type of monarchy; but libertine and profligate as he became, the abuse which has been lavished on his personal character has hardly taken into sufficient consideration the loose morals of contemporary society, the political position of the Whig party, and his own ebullient temperament. Thackeray, in his *Four Georges*, is frequently unfair in this respect. The just condemnation of the moralist and satirist requires some qualification in the light of the picture of the period handed down in the memoirs and diaries of the time, such as Greville's, Croker's, Creevey's, Lord Holland's, Lord Malmesbury's, etc.

(S. R. G.; H. C.)

GEORGE V. (1865–1936) King of Great Britain and Emperor of India was born at Marlborough House, London on June 3, 1865. He was a grandson of Queen Victoria and the second son of Albert Edward, the Prince of Wales, afterwards Edward VII. and of Alexandra, a Princess of Denmark and sister of the Empress Marie of Russia. King George was thus first cousin of the illfated Czar Nicholas II. whom he resembled in face and form especially in early life. Also he was first cousin of the Emperor William II. of Germany, Queen Victoria of Spain, Queen Marie of Rumania, King Constantine and Queen Sophie of Greece.

When 6½ years old, he and his elder brother, Prince Albert Victor, two years his senior, were placed under the tutorship of John Neale Dalton, then curate of Sandringham. In 1877 the two princes became naval cadets on the "Britannia" at Spithead, where they passed through the ordinary curriculum, and in 1879 they joined H.M.S. "Bacchante" under the command of Captain Lord Charles Scott, making a voyage to the West Indies, in the course of which they were rated midshipmen. After a month at home in 1880 they visited South America, South Africa, Australia, the Fiji Islands, Japan, Ceylon, Egypt, Palestine and Greece. A narrative of this voyage, *The Cruise* of *H.M.S. "Bacchante,"* compiled from the letters, diaries and notebooks of the princes, was published in 1886. At the close of this tour in 1882 the brothers separated. Prince George, who remained in the naval service, was appointed to H.M.S. "Canada," on the North American and West Indian station, and was promoted sub-lieutenant. He passed through the Royal Naval college at Greenwich and the gunnery and torpedo schools, being promoted lieutenant in 1885. He served successively in H.M.S. "Thunderer," "Dreadnought" and "Alexandra" of the Mediterranean squadron and H.M.S. "Northumberland" of the Channel Squadron. In 1890 he commanded the gunboat "Thrush" on the North American and West Indian Station, and in 1891, promoted commander, he commissioned the "Melampus." He was promoted captain in 1893, rear-admiral in 1901 and vice-admiral in 1903 nor was there any doubt as to his aptitude for seamanship. Throughout his life, he was a familiar figure at Cowes where his yacht, the "Britannia'—,a winner, it is stated, of 360 prizes in all—was frequently sailed by him in person. Among his friends was John Masefield, the seaman who became poet laureate. George's punctuality, sense of order, vigorous vocabulary—even his famous parrot—suggested the sailor. His collection of stamps is the most complete in existence and, in later years, he was devoted to the radio and motion picture.

In January 1892, his elder brother the duke of Clarence died and as heir to the throne, George had to relinquish his active career in the navy. He was created duke of York, earl of Inverness and Baron Killarney in 1892, and on July 6, 1893 he married Princess Victoria Mary (1867–1953), daughter of Francis, duke of Teck, and Princess Mary Adelaide, duchess of Teck, daughter of Adolphus Frederick, duke of Cambridge. Popularly she was beloved as the Princess Mary. Their eldest son, Prince Edward Albert, was born at White Lodge, Richmond, on June 23, 1894; Prince Albert Frederick George, duke of York, was born at Sandringham on December 14, 1895; Princess Victoria Alexandra Alice Mary on April 25, 1897; Prince Henry William Frederick Albert, duke of Gloucester, on March 31, 1900; Prince George Edward Alexander Edmund, duke of Kent, on December 20, 1902; and Prince John Charles Francis on July 12, 1905 (died January 18, 1919). For eighteen years, George and Mary, spending much of their time at York Cottage, near Sandringham, were overshadowed by the prestige of Queen Victoria and by the magnificent urbanity of King Edward VII. They visited Ireland in 1899 and it had been arranged before the death of Queen Victoria that they should make a tour in the colonies. On the accession of King Edward VII. (1901) this plan was confirmed. They sailed in the "Ophir" on March 16, 1901, travelling by the ordinary route, and landed at Melbourne in May, when they opened the first parliament of the Commonwealth. They then proceeded to New Zealand, returning by way of South Africa and Canada. In November 1901 the duke was created prince of Wales.

On May 6, 1910, King Edward VII. died. Since the new Prince of Wales was under 16, Queen Mary was nominated regent in the event of the demise of the Crown while the heir to the throne was under age. Parliament granted a civil list of £470,000 a year.

The domestic tastes of the King were a contrast to the social brilliance of his father and from the first, he appealed to the quiet solidities of the nation. The bitter quarrel between Edward and the Kaiser had no place in George's conception of duty. His only policy was conciliation and he began with the accession declaration which had contained words that were needlessly offensive to Roman Catholics. Acting under George's insistence, Parliament substituted the formula:

> I do solemnly and sincerely in the presence of God, profess, testify and declare, that I am a faithful Protestant, and that I will according to the true intent of the enactments which secure the Protestant succession to the Throne of my Realm, uphold and maintain the said enactments to the best of my power according to law.

A constitutional crisis was raging. The House of Lords rejected a budget passed by the House of Commons and the Commons replied by carrying a Parliament Bill that limited the powers of the Lords. After two elections had been won by the Liberal government in power, George—following the precedent of the Reform Bill of 1832—agreed to create peers in order to secure the passage of the measure which indication of the prerogative was sufficient for the purpose. Over Home Rule for Ireland, the crisis continued and the arming of Ulster, with a mutiny of British troops at the Curragh near Dublin, led the King to invite leaders of all parties—in 1914—to a conference at Buckingham Palace where, however, no settlement was reached.

It was soon apparent that King George—however simple his private life—intended to continue and even to outshine the ceremonial splendors of the Edwardian era. The coronation at Westminster Abbey, on June 22, 1911, was attended by representatives from all parts of the Empire and other countries and, in order to complete the public assumption of royal authority throughout the United Kingdom, the King and Queen, with the prince of Wales and Princess Mary, made State visits to Ireland, Wales and Scotland during July. At the opening of Parliament, the King wore his crown and, amid some misgivings on the part of his advisers, he proceeded with Queen Mary to India, where a coronation durbar was held at Delhi (December 12, 1911). The constitutional functions of the King in Great Britain were entrusted to a Council of State.

King George exerted little influence over events in Europe that led up to World War I. During that prolonged ordeal, he appeared in uniform when opening Parliament and on other public occasions. The Court, like the nation, was mobilized for active service. Royal visits were paid to important factories and workshops at the munition centres throughout Great Britain, as well as to shipbuilding yards, hospitals and other institutions engaged in war-work. Periodical visits were made by him to the Grand Fleet. In 1917 Queen Mary accompanied the King to France. The King made frequent visits to the French and Belgian fronts. Finally, after the Armistice, the King made another visit to Paris and to the battle-fields, Nov. 27–Dec. 10, 1918, and had an enthusiastic reception in the French capital (Nov. 28-30).

The long record of royal attendances at notable ceremonies included the funeral services at St. Paul's for Lord Roberts (Nov. 19, 1914) and Lord Kitchener (June 13, 1916); the commemoration service there on the entry of the United States into the war (April 20, 1917); the Albert Hall commemoration of the first Seven Divisions (Dec. 15, 1917); the thanksgiving at St. Paul's on Their Majesties' silver wedding (July 6, 1918); the presentation to the King at Buckingham Palace by the special Japanese mission of the sword and badge of a Japanese field-marshal (Oct. 29, 1918); and other events. On the occasion of Their Majesties' silver wedding, the King and Queen were received at the Guildhall (July 6, 1918) and were presented with a cheque for £53,000, subscribed by the citizens of London, to be devoted to charities according to Their Majesties' wish, together with a silver tankard once owned by Charles II.

On July 17, 1917 it was announced that King George had abandoned all German titles for himself and his family. At the same time a proclamation was issued to the effectthat henceforth the royal house of Great Britain and Ireland would be known, not as the house of Saxe-Coburg-Gotha, or popularly as the house of Hanover or Brunswick, but as the house of Windsor. It had previously been announced (June 20, 1917) that the King had decided that those princes of his family who were British subjects but bore German titles should relinquish those titles in favour of British names.

After the war, the world was faced by a dramatic paradox. The great autocracies of Russia, Germany and Austria-Hungary had collapsed in revolution. The British throne was unshaken. Immediately after the Armistice in 1918, the King and Queen on successive days made popular progresses through London and received general ovations. There were carriage drives through the city (Nov. 11) to a special thanksgiving at St. Paul's (Nov. 12), through the East End (Nov. 13), the south (Nov. 14), the north (Nov. 1j), the north-west (Nov. 18) and the south-west (Nov. 22). On Dec. 27 a banquet was given in honour of President Wilson at Buckingham Palace, where he and Mrs. Wilson were staying with the King and Queen.

On June 21–22, 1921, the King and Queen visited Belfast, where His Majesty inaugurated the new parliament of Northern Ireland. The King made an appeal to all Irishmen to pause and stretch out the hand of forbearance, to forgive and forget and to make for the land they loved a new era of peace, contentment and good-will. When, in the following December, an agreement was at last reached with the Irish Free State, the King in his telegram of congratulation to Mr. Lloyd George, ventured to hope thar his own speech at Belfast might have contributed to bring it about.

The policy of cultivating pageantry was developed further when, on February 28, 1922, the King's only daughter, Princess Mary, was married to Viscount Lascelles not in the comparative seclusion of a royal chapel but in Westminster Abbey. An astonishing response by the people encouraged the King to arrange that the Abbey should be the scene of other weddings in his family—the duke of York to Lady Elizabeth Bowes-Lyon on April 26, 1923, and the duke of Kent to Princess Marina of Greece and Denmark on November 29. 1934, which was broadcast throughout the world. Because of the death of the bride's father, the duke of Ruccleuch, the duke of Gloucester was married quietly on Nov. 6, 1935, to Lady Alice Montagu Douglas Scott.

In 1922, the King and Queen paid a state visit to Belgium and in 1923 they visited Italy. They were guests of King Vittoria Emanuele III. but it was arranged that, on May 9, they should be received by the Pope. The appearance of the King and Queen at great functions—the British Empire Exhibition at Wembley in 1924, the dedication of Liverpool Cathedral and the opening of the Mersey Tunnel are typical of these occasions—demonstrated the evergrowing affection which surrounded them on every side. Occasionally, a Socialist would raise his voice in not very convincing dissent. But the failure of the General Strike of 1926 proved that Great Britain, however hard hit, wanted no Communism. In 1928, the grave illness of the King aroused sympathy throughout the world and during the concluding years of an amazing reign, his prestige could hardly have been greater. His Christmas broadcasts, relayed from continent to continent, were irresistible in their dignified and intimate goodwill.

In May 1935, 25 years after accession, King George celebrated a Silver Jubilee which was marked by unforgettably enthusiastic expressions of affectionate loyalty of his subjects. Despite medical advice, King George insisted on wintering in England and on January 20, 1936, he succumbed at Sandringham to a chill. He was buried with his parents in St. George's Chapel, Windsor, and six kings attended the obsequies—Great Britain, Rumania, Denmark, Norway, Bulgaria and Belgium. His coffin was made by the village carpenter at Sandringham. At his funeral, the crowds were greater than any that ever gathered in the streets of London.

GEORGE VI (1895–1952), king of Great Britain, Ireland and the British Dominions beyond the Seas, second son of King George V and Queen Mary, was born at York Cottage, Sandringham, Dec. 14, 1895. He passed through Osborne and the Royal Naval college, Dartmouth, and in World War I served as a sub-lieutenant at Jutland. He was then attached to the naval branch of the R.A.F. and in Oct. 1918 was on the western front. After the war he spent several terms at Trinity college, Cambridge.

In June 1920, he was created duke of York and on April 26, 1923, he married Lady Elizabeth Bowes-Lyon. Princess Elizabeth, who succeeded her father as Elizabeth II in 1952, was born on April 21, 1926, and Princess Margaret on Aug. 21, 1930.

In Dec. 1924 the duke and duchess paid an unofficial visit to East Africa, during which the duke gained knowledge of conditions in East Africa. Less widely travelled than were his father and elder brother, he had seen something of the empire during his naval service and with the duchess carried out an important visit to Australia to open parliament at Canberra in 1927.

On the accession of his brother, Edward VIII (*q.v.*), the duke became heir presumptive, and on Edward VIII's abdication on Dec. 11, 1936, he succeeded as George VI. Their majesties were crowned on May 12, 1937.

In July 1937 they visited Ulster and the following July paid a state visit to France. In May and June 1939 they toured Canada and also visited the U S.

World War II imposed heavy burdens on the king and queen, who were indefatigable in their encouragement to their people. The king paid frequent visits to units of all the fighting services, both British and dominion, stationed in Britain, and to munitions factories, dockyards and other areas engaged in the war effort. He also visited the land fronts in North Africa (1943) and Italy (1944). The king and queen made many tours of the badly bombed areas of London and the provinces. On the first and successive wartime Christmas days, the king revived his father's practice of broadcasting a message to the empire.

His career and reign had close parallels with his father's. Each was educated without expectation of succeeding to the throne, and each entered the navy, so far as might be. "professionally." Again, each succeeded to the throne little known to the public men of his day and in times of abnormal difficulty. In each case, too, there was the same impartiality in dealing with their governments. He died at Sandringham Feb. 6, 1952. (C. M. CL.; X.)

GEORGE I. (1845–1913), king of the Hellenes, was the second son of Christian IX. of Denmark, and brother of Queen Alexandra of England. He was nominated for the Greek, throne by the British Government, at the request of the Greek national assembly. on the expulsion of King Otto I. in 1862, his election being recognized by the Powers on June 5, 1863. He was assassinated at Salonica on March 18, 1913, by a Greek named Schinas. For the events of his reign, *see* GREECE: *Modern History*.

GEORGE II (1890–1947), King of the Hellenes, eldest son of King Constantine, was born on July 20, 1890, at Tatoi, the royal villa near Athens. On account of his supposed Germanophile tendencies during World War I, he was excluded from the succession by the Allies in favour of his younger brother, Alexander, upon the deposition of his father by the ultimatum of June 11, 1917. After his father's restoration to the throne in 1920, he married on Feb. 27, 1921, Princess Elizabeth, elder daughter of King Ferdinand and Queen Marie of Rumania. Upon the second deposition of his father by the revolution of General Plasteras, his younger brother Alexander I having died in 1920 he succeeded to the throne on Sept. 27, 1922. After the unsuccessful counter-revolution of Oct. 1923, his position became more difficult. although there was no proof that he had been a party to that rising. Republican feeling grew under the leadership of Papanastasiou and others, and a number of military and naval officers demanded the deposition of the Gliicksburg dynasty. On Dec. 19, 1923, the king and queen left Greece. Next day. Admiral Condouriotes, for the second time: became regent. On March 25, 1924, the assembly deposed the dynasty and forbade its members to reside in Greece; and the plebiscite of April 13 confirmed the vote of the assembly.

On Oct. 10, 193j. the assembly declared for the restoration of the monarchy, and after a plebiscite in November showed this was the popular desire, George II returned as king. The nazi invasion of 1941 again caused him to leave the country. A plebiscite brought him back on Sept. 27, 1946, for a brief period before his death on April 1, 1947, in Athens. *(See* GREECE.)

GEORGE OF LAODICEA in Syria, often called "the Cappadocian," from 3j6 to 361 Arian archbishop of Alexandria, was born probably at Epiphania, in Cilicia. After many wanderings, in which he amassed a fortune: first as an army contractor and then as a receiver of taxes, he reached Alexandria, where in 356 he was promoted by the prevalent Arian faction to the vacant see. A semi-Arian or Homsiousian, George instigated the second Sirmian formula (promulgated by the third council of Sirmium 357). which was conciliatory toward strict Arianism, was opposed at the council of Ancyra in 358. His persecutions of the orthodox raised a rebellion which compelled him to flee for his life; but his authority was restored by a military demonstration. On the accession of Julian, he was killed by the people on Dec. 24, 361.

Though brutal in character, George possessed a cultivated literary taste and collected a splendid library, which Julian ordered to be conveyed to Antioch for his own use. An anonymous work against the Manicheans discovered by Lagarde in 1859 in a manuscript of Titus of Bostra has been attributed to him.

The sources for the life of George of Laodicea are Ammianus, Gregory Nazianzen, Epiphanius and Athanasius. Gibbon's theory of his identification with the patron saint of England is now rejected *(see* GEORGE, SAINT).

See J. H. Newman, *The Arians of the 4th Century* (1871); C. S. Hulst, *St. George of Cappadocia in Legend and History* (1910).

GEORGE THE **MONK** (also called HAMARTOLOS, "sinner") (fl. 9th century), Byzantine chronicler, lived during the reign of Michael III (842–867), but nothing seems to be known of his life. His *Chronicon Syntomon* ("Chronicle") in four books covers the period from the Creation to the death (in 842) of the emperor Theophilus, whose widow Theodora restored the use of icons (843). His main attention is focused on religious matters; the iconoclasts are fiercely attacked, and the work is full of theological discussions. It is an important contemporary authority for the years 813 to 842; but the early parts are a compilation based mainly on Malalas, Theophanes and various ecclesiastical works. In the introduction the author declares that his only object is to relate with strict truth such things as are "useful and necessary."

A continuation of this chronicle up to 948 is known as GEORGIUS CONTINUATUS. As the continuator is called "a Logothete" in some manuscripts he may have been Simeon Magister. In this continuation more attention is devoted to political history, and the author is clearly biased against Constantine VII and the Macedonian dynasty. This work was frequently used by other historians and the fact that it was subsequently reissued with alterations and interpolations makes it very difficult to arrive at the original text.

GEORGE, HENRY (1839–1897), U.S. economist and land reformer, popularizer of the "single tax" idea, was born in Philadelphia, Pa.. Sept. 2, 1839, of a religious, middle-class family. When not quite 14 years of age he left school. After two years as a clerk in the importing house of Asbury and Company, he became a seaman on the "Hindoo" for a voyage to Australia and India. On his return to Philadelphia in 1856 he learned typesetting, and in the following year signed up as steward on the United States lighthouse tender "Shubruck," bound for the Pacific coast service. He quit the ship in San Francisco and joined the gold rush to the Frazier river in Canada, but arrived too late. George spent the next two decades (1858–80) in California in newspaper work and Democratic party politics, developing in the process his gifts for writing and oratory but achieving little worldly success. After eight years of intermittent employment as a typesetter and five years as an editor for several newspapers, including the *San Francisco Chronicle,* he, along with two partners, started in 1871 the *San Francisco Daily Evening Post;* four years later, however, a policy of expansion strained the firm's credit and ended the enterprise.

George had failed at several attempts to gain elective office, but in 1876 a Democratic governor appointed him state inspector of gas meters. a job that ended with Republican victory in 1879. It had enabled him, however, to prepare his most important work, *Progress and Poverty* (1879). This book caught the spirit of discontent that continued to sweep a world just emerging from the great depression of 1873–78. He took as a basis the intricate orthodox. or "Ricardian." doctrine of rent, and in clarifying it for the ordinary reader gave it new meaning. Extending the law of diminishing returns and of a "margin of productivity," but still applying it to land alone, he held that since economic progress entailed a growing scarcity of land, the idle landowner reaps ever greater returns at the expense of the productive factors of labour and capital. The proposal, for which George became famous, was that the state tax away all economic rent and abolish all other taxes.

He optimistically envisaged that the government's annual income from this "single tax" would be so large that there would be a surplus for expansion of public works, from roads to universities. The economic argument was re-enforced and dominated by a humanitarian and religious appeal. The book had an enormous sale and was translated into many languages. Its vogue was enhanced by his pamphlets, voluminous contributions to the leading popular magazines and his lecture tours both in the United States and the British Isles. George moved to New York in 1880. Such was his reputation that in 1885 he became the mayoralty candidate of the reform forces in a spectacular contest, which he barely lost to the Democratic candidate, Abram Hewitt, running substantially ahead of the Republican candidate, Theodore Roosevelt. He died in New York on Oct. 29, 1897.

George's specific remedy had no significant practical result, and economists of reputation who supported it were rare. His economic analysis, though more sophisticated than that of most of his contemporaries, is crude by modern standards. His forceful emphasis, however, on "privilege" and the demand for equality of opportunity, coupled with a systematic economic analysis, proved a stimulus to orderly reform.

GEORGE, STEFAN (1863–1933), German lyric poet who was chiefly responsible for the revival of German poetry at the turn of the 19th century, was born at Biidesheim, near Bingen, July 12, 1868. He studied philosophy and the history of art in Paris, Munich and Berlin, and traveled widely, becoming associated with Mallarmé and the Symbolists in Paris and with the Pre-Raphaelites in London. Returning to Germany, where he divided his time between Berlin, Munich and Heidelberg, he founded a literary school of his own, the *George-Kreis,* held together by the force of his authoritarian personality. Many famous writers—including Hofmannsthal, briefly, Karl Wolfskehl, Friedrich Gundolf and Norbert von Hellingrath—belonged to it, or contributed to its journal, *Blätter* fur *die Kunst,* founded in 1892.

George aimed to impose a new classicism on German poetry, avoiding impure rhymes and metrical irregularities. Vowels and consonants were arranged with precision to achieve harmony. The resulting symbolic poem was intended to evoke a sense of intoxication. These poetic ideals were a protest not only against the debasement of the language but also against materialism and naturalism, to which George opposed an austerity of life and a standard of poetic excellence, preaching a humanism inspired by Greece, which he hoped would be realized in a new society. His ideas, and the affectations into which they led some of his disciples, his claim of superiority and his obsession with power, were ridiculed, attacked and misused by those who misunderstood them; it is necessary to remember that George himself was strongly opposed to the political developments which his ideas are sometimes thought to reflect. Indeed, one of his disciples, Count Claus von Stauffenberg, attempted to assassinate Hitler on July 20, 1944.

George died at Minusio, near Locarno, Dec. 4, 1933.

George's collected works fill 18 volumes *(Gesamtausgabe,* 1927–34), including five of translations and one of prose slretches. His collections of poetry, of which *Hymnen* (1890), *Pilgerfahrten* (1891), *Algabal* (1892), *Das Jahr der Seele* (1897), *Der Teppich des Lebens und die Lieder von Traum und Tod* (1899), *Der siebente Ring* (1907), *Der Stern des Bundes* (1914) and *Das neue Reich* (1928) are the most important, show his poetic and spiritual development from early doubts and searching self-examination to complete assurance of his role as a seer and as leader of the coming new society. Personally, and spiritually, he found the fulfillment of his striving for significance in "Maximin" (Maximilian Kronberger; 1888–1904) a beautiful and gifted youth whom he met in Munich in 1902. After his death George claimed that he had been a god, glorifying him in his later poetry and explaining his attitude to him in *Maximin, ein Gedenkbuch* (privately published, 1906).

Selections of George's poetry have been translated into English by C. M. Scott (1910) and C. N. Valhope and E. Morwitz (1943).

GEORGE, LAKE, a long, narrow lake in the eastern part of New York state in the foothills of the Adirondack mountains, which rise more than 2,000 ft. above the lake. Prospect mountain, rising 1,705 ft. above sea level, and Black mountain, 2,732 ft. in height, are the most prominent. Lake George has a maximum depth of about 400 ft., is 317 ft. above sea level and 224 ft. above Lake Champlain, into which it has an outlet to the north through a narrow channel containing many rapids and falls. The lake is about 33 mi. long and varies in width from $\frac{3}{4}$ mi. to 3 mi.

It has clear water, coming from mountain brooks and submerged springs, a clean, sandy bottom and beautiful tints of green and blue. It is noted for its beautiful mountain scenery, and its islands and is a favourite summer resort. Geologists are of the opinion that Lake George is of glacial origin.

Before the advent of the white man the lake was a part of the natural trail over which the Iroquois Indians frequently made their way northward to attack the Algonkins and the Hurons. During the struggle between the English and the French for supremacy in North America, and during the American Revolution, this natural pathway was still the best route of communication between New York and Canada and was of great strategic importance. Samuel de Champlain explored Lake Champlain in 1609, and at that time heard from the Indians of the beautiful lake, called by them *Andiatarocte* ("place where the lake contracts"); but no records show that Champlain ever visited Lake George. The first white man to see the lake (Aug. 18, 1642) appears to have been Father Isaac Jogues, a Jesuit missionary, who in company with René Goupil and Guillaume Conture was being taken by his Mohawk Indian captors from the St. Lawrence to the town of the Mohawks. In the spring of 1646 Father Jogues, while on a half-religious, half-political mission to the Mohawks, again visited the lake on the eve of the feast of Corpus Christi. He gave it the name "Lac du St. Sacrement." In 1755, Gen. Sir William Johnson renamed it Lake George in honour of George II of England. James Fenimore Cooper refers to it in his novels as Lake Horicon.

Lake George was the scene of many engagements during the French and Indian War and during the Revolution. On Sept. 8, 1755, at the head of the lake, Gen. William Johnson defeated a force of about 1,400 French, Canadians and Indians under Baron Ludwig August Dieskau, who left Canada with the intention of attacking Ft. Lyman (later Ft. Edward). The engagement is known as the battle of Lake George; a monument commemorating the battle was-erected in 1903. Following the battle, Gen. Johnson built a fort of logs and earth on the shores of Lake George near the battlefield which he called Ft. William Henry in honour of William Henry, duke of Gloucester. In the meantime the French entrenched themselves at Ticonderoga. Two years later, in March 1757, the governor of Canada sent an expedition of about 1,600 men to capture the fort, but the expedition failed. In August of the same year the garrison, in desperate straits because of loss of ammunition and supplies, surrendered to the marquis de Montcalm. While under escort to Ft. Edward, the Indian allies of Gen. Montcalm massacred or took prisoner a large part of the force. Ft. William Henry was destroyed. Gen. James Abercrombie's large army marched from the lake to its defeat at Ticonderoga in July 1758. Lord Amherst advanced along the lake en route to Ft. Ticonderoga, which he captured in July 1759. Near the site of Ft. William Henry, Gen. Amherst later built a new fort known as Ft. George. Its ruins remain.

GEORGE THE PISIDIAN (GEORGIUS PISIDA or GEORGIOS PISIDES) (fl. 7th century A.D), Byzantine poet, was a valuable chronicler of contemporary events. Born in Pisidia, he became a deacon and keeper of the records of the church of St. Sophia in Constantinople. His works include a poem of 1,088 iambic lines on the campaign of the emperor Heraclius (610–641) against the Persians, apparently the work of an eyewitness; the *Avarica*, an account of the abortive attack on Constantinople by the Avars (626) ; the Heraclias, a survey of the exploits of Heraclius down to the overthrow of the Persian King Khosrau II (628); a didactic poem *Hexaemeron* or Cosmourgia, on the creation; a treatise on the vanity of life after the manner of Ecclesiastes; a controversial composition against Severus. bishop of Antioch; and a poem on the resurrection of Christ. In his hands the Byzantine 12-syllable iambic verse begins to take shape. This became the principal verse in subsequent learned medieval Greek poetry. Pisides, while adhering faithfully to the rules of ancient metre (which from *c.* A.D. zoo was no longer distinguishable by ear) normally accentuates the 11th syllable of his iambic verse, and rigorously observes the caesura after the fifth or the seventh syllable. He also avoids an accent on the seventh syllable if a caesura follows, and is careful to avoid enjambment. By this means he combined the laws of ancient metre (based on quantity) with the new Byzantine metrical system (based on numbers of syllables and place of accents in a line), a real tour de force. Subsequent Byzantine poets as late as the 14th century followed him, and even developed this system further when writing iambic trimeters. Although later Byzantines admired his work, and although it has undoubted historical value, modern criticism rightly pronounces it dull.

GEORGE THE SYNCELLUS (GEORGIOS SYNKELLOS), of Constantinople. Byzantine chronicler and ecclesiastic, lived at the end of the 8th and the beginning of the 9th century A.D. He was the *syncellus* (cell mate, the confidential companion assigned to the patriarchs. in reality sometimes little more than a spy) of Tara(u)sius, patriarch of Constantinople (784–806), after whose death he retired to a convent and wrote his *Chronicle* of events from Adam to Diocletian (285). At his request, the work was continued after his death by his friend Theophanes Confessor. The Chronicle, which is rather a chronological table (with notes) than a history, is valuable. in spite of its religious bias and dry and uninteresting character, for the fragments of ancient writers and apocryphal books preserved in it (*e.g.,* considerable portions of the *Chronicle* of Eusebius).

GEORGETOWN, the capital of British Guiana, the only British possession in South America (see GUIANA), and seat of the colonial government, is situated on the right bank of the Demerara river at its mouth. Pop. (1946) 73.509; (1956 est.) 92.808. Area 2.5 sq.mi. Known during the Dutch occupation as Stabroek ("standing pool"). it was established as the seat of government of the combined colonies of Essequibo and Demerara (now with Berbice forming the three counties of British Guiana) in 1784, its name being changed to Georgetown in 1812. The streets are wide and straight, intersecting each other at right angles, several having double roadways. The city has about 30 mi. of macadamized roads. In Main street, the finest street in Georgetown, the canal which formerly existed in the middle of its dual carriageway has been filled in to form a broad walk with seats beneath its large. overhanging trees, and with gay, tropical flowers in sunken concrete troughs on its parapets. The principal residences, standing in their own gardens, are scattered over the town. Most of the houses and public buildings are constructed of wood. the former generally raised on brick pillars 4–10 ft. from the ground, the bright colouring of the wooden walls. jalousies and roofs adding to the beauty of the streets. As a consequence of two major conflagrations in 1945 and 1951, the majority of buildings in the business section have been rebuilt in ferroconcrete.

The public buildings in the centre of the city containing the offices of the government and the hall of the legislature, formerly called the court of policy, were erected between 1829 and 1834. They form a handsome E-shaped, brick-plastered bldck with deep porticoes and marble-paved galleries carried on castiron columns. The law courts, built in the 1880s, have a ground floor of concrete and iron. the upper story being of hardwood. Among other public buildings are the town hall, which was designed by a Jesuit priest and built between 1887 and 1889. and the Anglican (a great wooden building) and Roman Catholic (rebuilt in ferroconcrete after a fire in 1913) cathedrals. One of the two hospitals is government owned and the other is run by the Roman Catholic community. There are two government-owned secondary schools—the Queen's college for boys with accommodation for about 750 pupils. and the Bishops' high school for girls with accommodation for about 600 students. There is also a government technical institute which provides basic technical education. The Royal Agricultural and Commercial society has a large reading room and lending library. Its museum is chiefly devoted to the fauna of British Guiana but also contains collections of local economic, mineral and botanical exhibits, foreign birds and mammals.

The extensive botanical gardens to the east of the city are admirably laid out, and there is a small zoo containing local birds, animals and reptiles. The nurseries are devoted chiefly to the raising of plants of economic importance and the collections of ferns and orchids are very fine. In the gardens are the fields of the board of agriculture, where experimental work in the growth of sugar cane, rice, cotton. etc., is carried on. Other popular resorts are the sea wall and the promenade gardens in the centre of the city. There are facilities for outdoor sport and recreation including cricket. football and horse racing and there is also a privately owned rowing club. The city. once malarial, has been free from the disease since 1945. Water for public and domestic use is taken from the Lamaha conservancy (reservoir) on the east coast of Demerara.

Water street, the main business centre. runs parallel to the river for about $2\frac{1}{2}$ mi. and contains the stores of the wholesale and retail merchants, their wharves running out into the river to allow steamers to come alongside. British Guiana is in direct communication with the United Kingdom. France, the Cnited States. Canada and other countries, and steamships of various companies call frequently at Port Georgetown. There are public and private tidal berthage facilities with warehouse accommodation. The nine principal wharves, all privately owned, are situated along the river frontage and vary in length from 210 ft. to 575 ft. (E. A. As.)

GEORGETOWN, formerly a city of the District of Columbia. U.S.. now part of the city of Washington, D.C., is at the confluence of the Potomac river and Rock creek, about $2\frac{1}{2}$ mi. W.N.W. of the national Capitol. The streets are old-fashioned, narrow and well shaded. On the "Heights" are many fine residences with beautiful gardens: the Georgetown Visitation Junior college, a Roman Catholic college for women. founded in 1799; and the college and the astronomical observatory (1842) of Georgetown university.

Georgetown was settled late in the 17th century. It was laid out as a town in 1751, chartered as a city in 1789. merged in the District of Columbia in 1871, and annexed to the city of Washington in 1878. In the early days of Washington it was a social centre of some importance. The studio. for two years, of Gilbert Stuart. and "Kalorama." the residence of Joel Barlom were there. Legislation was passed by the 81st congress in 1950 to preserve the character of this section, to be known as Old Georgetown, by regulating the height. exterior design and construction of private and semipublic buildings in the area. See also WASHINGTON, D.C.

GEORGIA (Georgian *Sakartvelo*, Russian *Gruzia*, Turkish *Gürcistan,* Arabic *Jorzan,* Armenian *Vrastan*). a soviet republic of Transcaucasia, bounded on the north by the Russian Soviet Federated Socialist republic. on the east by Azerbaijan, on the south by Armenia and Turkey and on the west by the Black sea.

The surface of Georgia is characterized by a great variety of land forms. To the north lies the Caucasus with its lofty peaks (Elbrus. 18.481 ft.; Dykhtau. 17.054 ft.: Shkhara. 17.063 ft.; and Kazbek or Mkinvari. 16.558 ft.), the highest in Europe. The

Caucasus is a natural frontier: but there are three main passes through it, connecting Georgia with the great steppe to the north: Krestovy pass (7.835 ft.) south of the Darial gorge, Mamison pass (9,281 ft.) and Klukhor pass (9,239 ft.). To the south lies the Armenian plateau or lesser Caucasus. The Surami or Likhi range. a spur from the Caucasus to the Armenian plateau forms a watershed between the Black and the Caspian seas. The coastal lowlands along the Black sea and the Rion valley enjoy a Mediterranean and even subtropical climate. In eastern Georgia. between the Alazan and the Kura (Mtkvari) rivers, is bare steppe. cultivable only if irrigated. Round the Alazan, however. with its numerous left-bank mountain tributaries, is the fertile vine-growing Kakhetia. (For flora and fauna see CAUCASUS.)

The Georgians seem to be the result of the fusion of many tribes. the majority of which originated in Asia Minor and began to migrate thence to the western part of Transcaucasia in the 12th century B.C. They can therefore be described as an ancient Mediterranean race: their skin is white and sometimes slightly olive: their eyes are brown to black; their stature is medium to tall; and the head is oval. with a long face, pronounced cheek bones and an aquiline nose.

Their language stands apart from any other known speech. The peculiar Georgian alphabet is very ancient and adequate for expressing the wealth of varied sounds of the language. (See GEORGIAN LITERATURE.)

History. — According to Georgian annals, the peoples of the Caucasus derive from Targamos. a descendant of Japhet, who came from Babylon. Kartlos, one of the sons of Targamos, is the ancestor of the Kartlians (the eastern branch of the Georgians). and his brother Egros of the Mingrelians (the western branch). The Kartlians inhabited the upper Mtkvari valley and the Egrissi colonized the Rion valley west of the Likhi watershed. In the 4th century B.C., when Alexander of Macedon destroyed the Achaemenid Persian empire. the figure of a half-legendary Georgian dynast. the mepe or king Farnavazi of Parnabazus of Iberia (the country of the Kartlians), emerges with his capital at Mtskhet. He liberated the Iberians from the rule of a Macedonian governor and was suzerain over Kudzhi, the ruler of Egrissi or Colchis. He appointed eight provincial governors (*eristavni*), who represented the power of central authority over the local family heads (*mamasakhlisni*). Colchis was subjugated by Mithradates VI of Pontus. in the first decade of the last century B.C.; Roman "friendship" was imposed in 6j B.C. after Pompey's victory over Mithradates.

Mediaeval Georgia. — In the 4th century A.D., during the reign of the Iberian king Miriani (300–362), the Georgians embraced Christianity: their illuminatrix was Saint Nino (crucified in 330). During the next three centuries Georgia was involved in the conflict between the Byzantine and Persian empires. Colchis. now called Lazica. became more closely bound to Byzantium. Iberia passed under Persian control, then regained its independence under Vakhtang I Gurgaslani ("the Lion of Georgia;" 450–503) became a Persian province again in 533 and was finally restored by the Byzantines in 562 as a kingdom for Guaram. a descendant of Vakhtang through his mother, who made his capital at Tiflis (or Tbilisi, from tbili, "warm").

In the 7th century the caliphate succeeded the Sassanids in the suzerainty of Georgia and in the 8th century an Arab emirate was established in Tiflis. Meanwhile the house of Bagrationi was gaining in influence both in Armenia (*q.v.*) and in Georgia. For a few generations there were obscure princely rivalries and local wars until Bagrat III (1008–14) succeeded in uniting Georgia. During the reign of Bagrat IV (1027–72) the Seljuk Turks invaded Georgia for the first time. The country was saved by the crusades which forced the Turks to turn their attention to the Levant.

Ring David II Aghmashenebeli (*i.e.*, the Restorer; 1089–1125) reconquered Tiflis in 1122; thenceforth it was the capital of the united kingdom. When David died. Georgia extended from the Black sea to the Caspian. His successors failed to maintain political predominance and lost some territory, but Queen Tamara (1184–1212), extended the royal dominions into Armenia and to the Caspian sea again. The appearance of Jenghiz Khan's armies in 1220 rang the knell of Georgia's golden age.

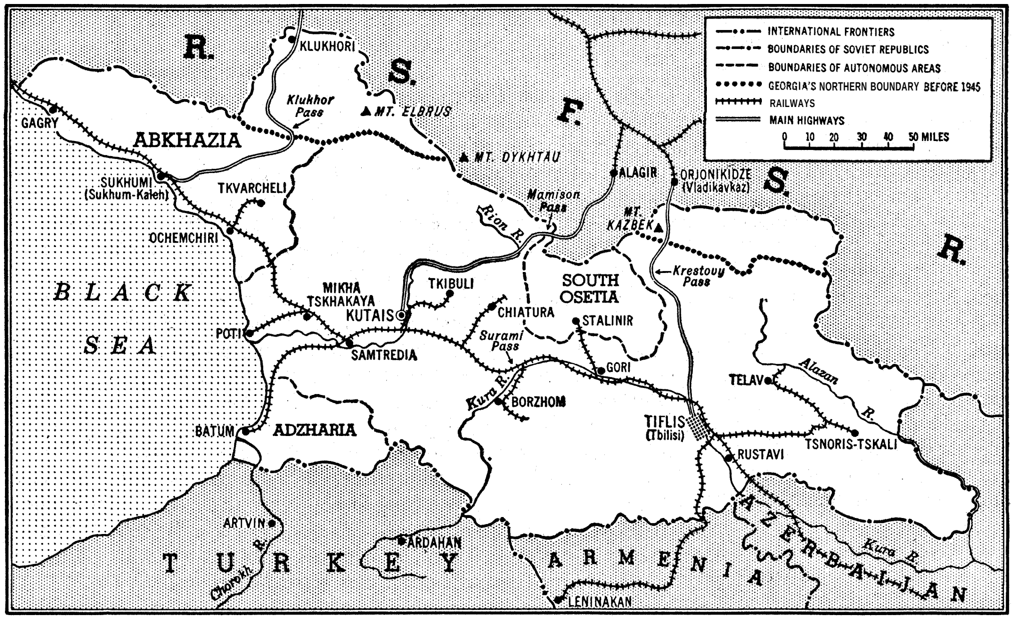
By 1236 the country east of the Likhi mountains was brought under Mongol overlordship, while its western part, which had become known as Imeretia, retained its independence. The collapse of Mongol rule in Persia during the first quarter of the 14th century favoured a temporary restoration of Georgian unity under Giorgi V Brtskinvale (*i.e.*, the Brilliant; 1314–1346) and his two successors, but in 1386 a more serious blow was dealt the country by Timur who took Tiflis and made prisoner King Bagrat V (1360–93). The devastations of Timur continued until 1404. but under Alexander (1413–43) another era of rebirth mas reached. Alexander, however. was the last member of the house of Bagrationi to be a king of all Georgia. Under his successors the various branches of the royal houses divided the country among themselves.

Turkish and Persian Rivalries. — While Georgia was weak and divided, Persia emerged again as a dangerous neighbour. Turkey, having conquered Constantinople, became a great power. Nevertheless. Christian Georgia survived because the two Moslem powers were never both strong at the same time and because their policies were always opposed. The 16th and 17th centuries witnessed a cultural renaissance in Georgia, but the country's political history during that period was one of civil strife. From 1636 Kartlia and Kakhetia were Persian dependencies. while the kingdom of Imeretia and the principalities of Samtskhe. Guria. Mingrelia, Abkhazia and Svanetia were within the Turkish sphere of influence. At the beginning of the 18th century Persia again slipped into anarchy, Turkish power was declining, and Russian imperialism appeared in Transcaucasia in 1722.

Annexation by Russia. — Taymurazi II. of the Kakhian line of the Bagratids, used this situation with skill and in 1744 was crowned in Tiflis as king of Kartlia. while his son Irakli became king of Kakhetia. When Taymurazi died in 1762. Irakli II pursued his father's policy of erecting a Caucasian multinational state based on Georgia. He partly succeeded, for his kingdom stretched from the Darial gorge to Nakhichevan and from Likhi range to Gandzha (Kirovabad); but all western Georgia remained in Turkish hands. He concluded with Russia a treaty of alliance (Georgiyevsk. July 24, 1783). whereby Russia guaranteed Georgia's independence while Irakli acknowledged Russian suzerainty. Russia, however, was unable to come to the aid of its ally when in 179j Agha Mohammed of Persia invaded Georgia and left Tiflis in ruins. Irakli died on Jan. 11, 1798. and his weak successor. Giorgi XII. offered little resistance to the increasing Russian control over Georgia. He died on Dec. 28, 1800. and on Feb. 16, 1801. the kingdoms of Kartlia and Kakhetia were incorporated in the Russian empire. The kingdom of Imeretia was annexed in 1810, while Guria. Mingrelia. Svanetia and Abkhazia were definitively annexed to Russia in 1830. 1857, 1864 and 1867 respectively; Samtskhe. under Turkish domination from 1625. was annexed by Russia in 1878.

Nationalism and the Independent *Republic*.—Under Russian domination no legal political activities were tolerated until the Russian Revolution of 1905. But from the second half of the 19th century there existed two so-called literary groups. one led by Ilia Chavchavadze (1837–1907), one of the greatest Georgian writers, the other by Giorgi Tsereteli (1842–1900), which were actually national political movements; and in 1893 the Third Group was born, an illegal Social Democratic party led by Noah Zhordania (1868–1953), Karlo Chkheidze and others. After 1905 a National Democratic party was established. There was also a small Bolshevik wing in the Georgian Social Democratic party, of which Ioseb Dzhugashvili (Stalin) was a member.

After the Russian Revolution of March 1917 the three Transcaucasian nationalities. Georgians, Armenians and Azerbaijanis, formed on Sept. 20. 1917, a Transcaucasian federal republic, which, however, broke down on May 26. 1918. Georgia then became independent, but the Turks had occupied Batum on April 15, and. the new Soviet Russian regime's professions of amity were not trusted. In this situation Akaki Chkhenkeli. the Social Democratic premier, signed with Gen. Otto von Lossow a Germano-Georgian treaty of friendship at Poti, on May 28, 1918.



GEORGIA AND SURROUNDING AREAS, INCLUDING PRINCIPAL RAIL AND HIGHWAY SYSTEMS

and a small German force of 3,000 was landed there. On June 4, a Turko-Georgian peace treaty was signed at Batum, ceding this port. Artvin and Ardahan (the old Samtskhej to Turkey.

The collapse of the Central Powers created a new situation. Germans and Turks left Georgia and a British force landed at Batum on Dec. 27, 1918 (they withdrew on June 4, 1920). A constituent assembly, chosen by a tree election in Feb. 1919. formed a new government headed by Zhordania. A delegation headed by Evgheni Gheghechkori, the Social Democratic foreign minister, was sent to Paris to seek recognition of Georgia's independence. Only on Jan. 1j, 1920, was a *de facto* recognition granted by the Allied Powers.

Georgia in the U.S.S.R.—On May 7, 1920, Soviet Russia concluded a peace treaty with Georgia, recognizing its independence: but this was a manoeuvre to gain time so as to undermine the new state from within. Such was the task of S. M. Kirov, who was sent to Tiflis as Soviet envoy. Georgia was recognized by the Allies *de jure* on Jan. 27, 1921, but on Feb. 11 Russian armies invaded the country. On Feb. 22 Turkey presented an ultimatum demanding the cession of Artvin and Ardahan. On Feb. 25 a Soviet republic was proclaimed in Tiflis. The Georgian government left the country on March 18 and established itself in Paris. while on March 16, 1921. a Russo-Turkish treaty was signed in Moscow. Turkey agreed to cede Batum to the Soviet republic of Georgia, but retained Artvin and Ardahan.

Stalin, who had an insignificant following in independent Georgia, was now its master as a member of the Kremlin Politburo and people's commissar for nationalities in the Soviet government. Fearing that even the Georgian Communists would be inclined to favour separatist feelings, on March 12, 1922, he included Georgia in a Transcaucasian Soviet Federated Socialist republic. A rising organized by Kaikhosro Cholokashvili broke out in Georgia on Aug. 27, 1924, but was put down by the Red army. On Dec. 5, 1936. the T.S.F.S.R. was dissolved and Georgia became a direct member of the U.S.S.R.

Population.— According to the census of 1939 the total population of Georgia was 3,542,289; in 1959 it was 4,049,000. Between 1939 and 1959 the urban population of the republic increased by about 63%, the rural population decreased by 9%. Tiflis, the capital, had 693,000 inhabitants in 1959; Kutaisi 128,000 and Batumi 82.000.

Before World War II the total area of the Georgian republic was 26.834 sq.mi., including the Abkhazian autonomous republic (3,320 sq.mi., with a population of 201,016 in 1926. about half of them Moslem), the Adzharian autonomous republic (1,080 sq.mi., with a population of 131,957 in 1926, mainly Moslem Georgians). and the South Ossetian autonomous province (1,430 sq.mi., with a population of 87,375 in 1926. mainly Moslems of Iranian origin). After World War II, when the Karachaev autonomous province and the Chechen-Ingush autonomous republic were suppressed and their populations deported to Siberia, the southern parts of both territories were given to Georgia. By this process Georgia increased its area to 26,911 sq.mi.

Economy. — Land under crops increased beween 1913 and 1950 from 741,200 ha. to 913.600 ha. The latter figure included 760,100 ha. under grain, 42,700 ha. under technical crops, 43,300 ha. of orchards (of which 22,500 ha. were of citrus fruit) and tea plantations covering 52,000 ha. and yielding about 31,000 metric tons of tea. In 1931 there were 2,114 collective farms, 82 state farms and 84 machine and tractor stations. Livestock in 1946 amounted to 1,490,000 head of cattle: 460,000 pigs and 2,069,000 sheep and goats.

Between 1913 and 1946 the number of workers employed in heavy industry increased from 10,900 to 80.600. The manganese ore deposits at Chiatura are among the richest in the world; their metal content is 57%, and the extraction amounted to 1,650,400 tons in 1937. Coal output at Tkibuli and Tkvarcheli increased between 1913 and 19jo from 70,000 tons to 1,323,000 tons. By 1946 the installed generating capacity amounted to 222,000 kw. as compared with 26,300 kw. in 1928. Production of electric power had amounted in 1946 to 816,000,000 kw.hr.; but as new hydroelectric power stations were built subsequently. it was estimated that twice as much was being generated by 1954. After World War II an iron and steel plant started production at Rustavi.

By 1946 there were in the republic 473 mi. of railways as compared with 276 mi. in 1913. The Poti-Tiflis line, built in 1867, was extended to Baku in 1883. The line linking Georgia along the Black sea coast with Rostov via Tuapse was opened in 1946.

GEORGIA is a southern state of the U.S. and youngest of the original 13 states, having been chartered as a colony in 1732 by George II of Great Britain. from whom it derived its name. With a total area of 58.876 sq.mi., it is the largest state east of the Mississippi river and 21st in size of all the states. Until early in the 19th century it comprised nearly all the present area of Alabama and Mississippi. Its size and its agricultural and industrial prominence earned for it before 1860 the popular title of "empire state of the south." The capital has been Atlanta since 1878. The official flower is the Cherokee rose. The state bird is the brown thrasher. Georgia is bounded on the north by Tennessee and North Carolina at the 35° parallel (north latitude) and on the south by Florida at the 30° 42' 42" parallel. It is bounded on the east by South Carolina and the Atlantic ocean and on the west by Alabama. It lies between the meridians 80° 53' 15″ and 85° 36' west longitude.

PHYSICAL GEOGRAPHY

Physical Features. — The surface of Georgia is divided into five physical zones. The most prominent of these is the coastal plain of 35,000 sq.mi. It extends from the Atlantic seacoast. which is skirted by numerous fertile semitropical islands of the Sea Islands group. northward to the fall line. which extends from Augusta through Milledgeville and Macon to Columbus. North of this line is the Piedmont plateau of rolling foothills that rise gradually in height from 500 ft.. until they reach the mountains about 50 mi. N. of Atlanta, to somewhat less than 2,000 ft. Above this plateau lie three small regions, the largest of which is the Blue Ridge in the northeast (part of the Appalachian mountain system), extending south and west into Georgia to a distance of 48 and 92 mi., respectively. In the extreme northwestern corner of the state is the Cumberland plateau (part of the Allegheny system), represented by Lookout and Sand mountains, having an elevation of about 2.000 feet. Between the two regions mentioned lies the Great valley, extending southward to Cedartown. The Georgia mountains are part of a mountain system running from Canada to central Alabama, appearing from Virginia to Georgia in the two separate prongs mentioned above, nith a wide valley between. The highest point in the state is Brasstown Bald (4.784 ft.), in the Blue Ridge region. The approximate mean elevation of the state is 600 ft. Near Atlanta, in the upper Piedmont plateau, is Stone mountain, probably the largest piece of exposed granite in the world.

On the Blue Ridge mountains in the northeast corner of the state begins a water parting line, the fall line, extending southwest to Atlanta, southeast of which the waters flow into the Atlantic ocean and above which they find their way to the Gulf of Mexico. The Great valley region and most of the western portion of the Blue Ridge mountains are drained by the Etowah and the Oostanaula rivers and their tributaries, forming at Rome the Coosa, mhich empties into Mobile bay. The Cumberland plateau and the northwestern part of the Blue Ridge mountains constitute a part of the Tennessee basin. The principal rivers of the state are the Savannah, forming the boundary with South Carolina; the Oconee and the Ocmulgee, nhich unite in the south-central part of the state to form the Xltamaha; the Satilla in the southeast; and the Flint and the Chattahoochee, which unite in the southwest corner to form the Apalachicola in Florida. All except the Satilla rise in the upper Piedmont and are navigable only south of the fall line. In the southeastern part of the state is the Okefenokee swamp, covering an area of 660 sq.mi., a national wildlife sanctuary, most of which lies in Georgia. Much of the area in this region of the state is unsuitable for cultivation because of numerous marshes and swamps.

Climate.--The climate of Georgia is mild. Mean annual temperatures range from about 57° to 68° F. January averages are about 40° in the mountains and 54° on the south coast; July averages range from about 74° to 82°. Mean annual rainfall is almost 50 in. a year. Snowfall averages seven to ten inches a year in the mountains, about three in Atlanta and becomes negligible on the coastal plain.

Soil.—Georgia is notable for the variety of its soils, by far the greatest number being found in the upper coastal plain. The dominant pattern is in northern Georgia, loam and clay rich in decomposed limestone and calcareous shales; in the Piedmont. clays and loams. mostly of dark red colour, derived from decomposed hornblende; and in the coastal plain. gray sands and sandy loams.

Vegetation.- here are 250 species of trees native to the state, more than 90% of which are of commercial importance. The mountains are covered with oak and hickory varieties, with shortleaf pine as a secondary type. Other hardwoods are hemlock, maple and chestnut. Loblolly pine grows abundantly in the Piedmont, while longleaf pine is found in the western and southern portions of the state. White and red oak, yellow poplar, cherry and ash' are important hardwoods throughout most of the state. The coastal area is noted for live oaks, cypresses and palmettos. Important flowering trees are magnolia, mimosa, dogwood, redbud, tulip and crepe myrtle, the last being nonindigenous. There are more species of shrubs than of trees. The most common flowering shrubs are yellow jasmine, flowering quince and arbutus, with rhododendron and laurel predominating in the mountains. The Cherokee rose bears a small white blossom with yellow centre. Spanish moss is abundant on the coast and around the streams and swamps of the entire coastal plain.

Animal Life.—There are 79 species of reptiles. Of these 40 are snakes, 23 are turtles, 13 are lizards and 3 are crocodilians. Poisonous snakes are the rattlesnake. of which the eastern diamondback is the most noted, copperhead and cottonmouth moccasin, the last being aquatic and found largely in the coastal plain. The coral snake is rare. Of the 63 species of amphibians 35 are salamanders and 28 are frogs and toads.

There are 160 species of birds that breed in Georgia and a greater number of migratory fowl. The largest family is the sparrow, of which 67 varieties have been identified. The bobwhite, or Virginia quail, is widely distributed and is the most popular game bird. Second in popularity and distribution is the dove. Marsh hens are abundant on the coast, and wild turkeys are found in the mountains and on the coast. Migrating geese and ducks are found on inland lakes, as well as on the coast The Okefenokee swamp has many interesting and rare waterfowl. including the water turkey. Virginia deer are found in 50 counties, but the coastal counties have the largest number. The black bear is found in 13 counties being most abundant in Ware and Charlton. Other prominent wildlife include the rabbit. squirrel, opossum, fox, raccoon, muskrat, mink, otter and weasel. Less prominent are the beaver, badger, wildcat. civet cat, mole, panther and skunk. The most popular fresh-water game fish are trout. bass. bream shad and catfish; all except the last are produced in state hatcheries for restocking. Off the coast are dolphins, porpoises, edible shrimps, blue crabs and tidewater oysters.

Parks and Monuments.—The 27 state parks range in area from the Jefferson Davis Memorial park (less than 5 ac.. near Irwinville) to Jekyll Island (an 11.000-ac. sea island, near Brunswick). The total acreage is in excess of 36,000. The parks are distributed throughout the state but are more numerous in the mountain area, where Vogel State park ranks high in tourist popularity. Nearly all state parks contain lakes or are adjacent to large bodies of impounded water. The Georgia Veterans Memorial park in Crisp county borders on the 13.000-ac. Lake Blackshear. The federal government administers six areas in Georgia. the largest being the Chattahooche National forest in north Georgia (nith headquarters at Gainesville), comprising 668,271 ac. Others of unusual interest are the Kennesaw Mountain National Battlefield park near Marietta, the Chickamauga and Chattanooga National Military park in Walker and Catoosa counties, and the Ocmulgee National monument (Indian) at Macon. The most important cemetery park is at Andersonville in Sumter county, where about 13,000 Union prisoners died in 1864.

HISTORY

Colonial.—Georgia's formation was the result of a desire of the British government to protect South Carolina from invasion by the Spaniards from Florida, and by the French from Louisiana. as well as of the desire of James Edward Oglethorpe (*q.v.*) to found a refuge for the persecuted Protestant sects and for the unfortunate but worthy indigent classes of England. The charter was granted to "the trustees for establishing the colony of Georgia in America," giving the colony a unique type of control. yet someuhat like the proprietary form. Parliament gave F10.000 to the enterprise, and the trustees encouraged the settlers to grow silk, grapes, hemp, olives and medicinal plants, for which England was dependent upon foreign countries. The sale of rum and the introduction of Negro slaves were forbidden. and severe limitations were placed on land tenure. Oglethorpe, as resident trustee, accompanied the first colonists, uho settled at Savannah in 1733. The early settlers were English, German Lutherans (Salzburgers), Scottish Highlanders, Portuguese Jews, Piedmontese, Swiss and others; but the main tide of immigration came from Virginia and the Carolinas after 1750.

As a bulwark against the Spanish and French the colony was successful, but as an economic and philanthropic experiment it was a failure. The industries planned for the colony did not thrive, and because sufficient labour could not be obtained, the importation of slaves was permitted, under certain conditions, in 1749. About the same time, parliament directed the trustees to end the prohibition on the sale of rum, and the restrictions on landholding were gradually removed. In 1753 the charter of the trustees expired and Georgia became a royal province, its character rapidly changing to resemble that of other southern colonies.

Under the new regime the colony was so prosperous that Sir James Wright (1716–85), the last of the royal governors, declared Georgia to be "the most flourishing colony on the continent." The people mere led to revolt against the mother country through sympathy with the other colonies rather than through any grievance of their own. The centre of revolutionary ideas was St. John's parish on the coast (settled by New Englanders, chiefly from Dorchester, Mass.) and the area north of Augusta (settled by Carolinians and Virginians). Loyalist sentiment was so strong that only 5 of the 12 parishes sent representatives to the first provincial congress, which met on Jan. 18, 1775, and its delegates to the Continental Congress therefore did not claim seats in that assembly. Six months later all the parishes sent representatives to another provincial congress that met on July 4, 1775.

The war that followed was a severe civil conflict, with the Loyalist and Revolutionary parties being almost equal in numbers; a large number of moderates preferred a neutral course. In 1778 the British seized Savannah, which they held until 1782, meanwhile reviving the British civil administration. and in 1779 they captured Augusta and Sunbury; but after 1780 the revolutionary forces were generally successful against Tories in the upcountry in bloody guerrilla fighting. Civil affairs also fell into confusion, partly because of a schism among the revolutionists. While a state constitution was adopted in 1777, harmony did not prevail until 1781.

Early Statehood.—In the Constitutional Convention of 1787 Georgia's delegates almost invariably gave their support to measures designed to strengthen the central government. Georgia became the fourth state to ratify the federal constitution (Jan. 2, 1788), and one of the three that ratified unanimously. Afterward a series of conflicts between federal and state authority caused the growth of states' rights theories. Because of these conflicts a majority of Georgians adopted the principles of the Democratic-Republican party, and early in the 19th century the people were virtually unanimous in their support of Jeffersonian ideas. The position of congress and of the supreme court with regard to Georgia's policy in the Yazoo frauds aroused distrust of the federal government. In 1795 the legislature granted, for $500,000, the territory extending from the Alabama and Coosa rivers to the Mississippi river, and between 35° and 31° N. lat. (almost all the present state of Mississippi and more than half of the present state of Alabama), to four land companies, but in the following year a new legislature rescinded the contracts, on the ground that they had been fraudulently and corruptly made. In the meantime the U.S. senate had appointed a committee to inquire into Georgia's claim to the land in question, and as this committee pronounced that claim invalid, congress. in 1800, established a territorial government over the region. The legislature of Georgia remonstrated but expressed a willingness to cede the land to the United States. In 1802 the cession was ratified, it being stipulated, among other things, that the United States should pay to the state $1,250,000, and should extinguish "at their own expense, for the use of Georgia, as soon as the same can be peaceably obtained on reasonable terms," the Indian title to all lands within the revised limits of Georgia. In 1824 the state remonstrated in vigorous terms against the dilatory manner in which the national government was discharging its obligation, with the result that in 1825 a treaty was negotiated at Indian Springs by which a small and unrepresentative group of friendly (Lower) Creeks agreed to exchange their remaining lands in Georgia for $5,000,000 and equal territory beyond the Mississippi. But Pres. John Quincy Adams, convinced that this treaty was accompanied by bribery and learning that it was not confirmed by the entire Creek nation, authorized a new one, signed at Washington in 1826, by which the Creeks kept a small tract within the recognized limits of Georgia. Gov. George M. Troup (1780–1856) proceeded to execute the first treaty, and the Georgia legislature declared the second treaty illegal and unconstitutional. In reply to a communication of President hdams, early in 1827, that the United States would take strong measures to enforce its policy, Governor Troup asked his legislature to prepare to resist to the utmost any military attack that the U.S. government should think proper to make. A final treaty, in 1827, ended the Creek controversy.

The controversy with federal authorities over Indian removal then focused on the Cherokees. In 1828 the legislature extended the jurisdiction of Georgia law to the Cherokee lands lying in the northern part of the chartered limits of Georgia. Andrew Jackson, then president, sided with Georgia, informing the Cherokees that their only alternative to submission to Georgia was emigration. Thereupon the chiefs resorted to the U.S. supreme court, which in 1832 declared that the Cherokees formed a distinct community "in which the laws of Georgia have no force" and annulled the decision of a Georgia court that had extended its jurisdiction into the Cherokee country (Worcester v. Georgia). But the governor of Georgia declared that the decision was an attempt at usurpation that would meet with determined resistance. and President Jackson refused to enforce the decree. He did, however, work for the removal of the Indians, which was effected in 1838.

Politics and Slavery.—Despite early national political unity, local partisanship had been represented by two factions. One, led successively by William H. Crawford and George M. Troup, represented the interests of the coastal element and the upcountry slaveholding communities; the other, formed by John Clark (1766–1832) and his father Elijah, found principal support among the nonslaveholders and the frontiersmen. At the same time there was a sectional cleavage between the older communities along the coast and the newer upcountry communities, in which the latter early gained a dominant position, as a result of which the capital was removed to the upcountry, where it became fixed at Milledgeville in 1807, and in the creation of numerous counties throughout the rapidly expanding cotton belt of middle Georgia. (Up to 1924 a total of 161 counties had been created; in 1932 the number was reduced to 159.)

The Troup faction. under the name of the States' Rights party, after 1832 endorsed the nullification policy of South Carolina against federal tariff laws. The Clark faction, calling itself the Union party, opposed South Carolina's conduct, but on the grounds of expediency rather than of principle. Because of its opposition to President Jackson's stand on nullification, the Troup party affiliated with the new Whig party, while the Clark party was merged into the Democratic party led by Jackson. The antislavery and nationalistic views of the Whig party during the 1850s caused its members in Georgia to shift to the Democratic party.

The activity of Georgia in the slavery controversy was important. Popular opinion at first opposed the Compromise of 1850 (see COMPROMISE MEASURES OF 1850), and some politicians demanded immediate secession from the Union. Others contended that the compromise was a great victory for the South and in a campaign on this issue secured the election of such delegates to the state convention (at Milledgeville) of 1850 that that body adopted, on Dec. 10, by a vote of 237 to 19, a series of conciliatory resolutions, since known as the Georgia platform. The approval in other states of the Georgia platform in preference to the Alabama platform (see ALABAMA) caused a reaction in the South against secession, which was followed for a short period by a return to approximately the former party alignment. But in 1854 the rank and file of the Whigs joined the American or Know-Nothing party (*q.v.*), which evaded the slavery issue, while most of the Whig leaders went over to the Democrats. The Know-Nothing party was nearly destroyed by its crushing defeat in 1856, and in the next year the Democrats, by a large majority, elected as governor Joseph Emerson Brown (1821–94), who, by three successive re-elections, was continued in that office until the close of the American Civil War.

Secession and the Civil War.—The Kansas question and the attitude of the North toward the decision in the Dred Scott case were arousing the South when Brown was inaugurated the first time. In his inaugural address he clearly indicated that he would favour secession in the event of any further encroachment on the part of the North. On Nov. 7, following the election of Pres. Abraham Lincoln, the governor, in a special message to the legislature, recommended the calling of a convention to decide the

SCENES IN GEORGIA

Top left: Fort Pulaski National monument on Cockspur Island at the entrance to the Savannah river. Its capture by Federal troops in 1862 successfully demonstrated for the first time the effectiveness of cannon fire on masonry walls

Top right: Oglethorpe hotel, Brunswick, designed by Stanford White (1853–1906)

Centre left: Glade shoals near Gainesville in the foothills of the Blue Ridge range, northeastern Georgia

Bottom left: Pirates' house near the Savannah waterfront. In the 18th century seamen were shanghaied from there for sailing ships through an underground tunnel connecting the house with the waterfront

Bottom right: Old harbour light (1852) at the foot of Emmett park in Savannah, near the Savannah river question of secession. Alexander H. Stepliens and Herschel V. Johnson contended that Lincoln's election was insufficient ground for such action. On Nov. 17 the legislature passed an act directing the governor to order an election of delegates on Jan. 2, 1861, and their meeting in a convention on Jan. 16. On Jan. 19 this body passed an ordinance of secession by a vote of 208 to 89. Already the 1st regiment of Georgia volunteers! under Col. Alexander Lawton (1818–96), had seized Ft. Pulaski at the mouth of the Savannah river, and Governor Brown proceeded to Augusta and seized the Federal arsenal there. Toward the close of 1861, however, Federal warships blockaded Georgia's ports, and early in 1862 Federal forces captured Tybee Island, Ft. Pulaski, St. Marys, Brunswick and St. Simons Island. Georgians responded freely to the call for volunteers: but when the Confederate congress. in April 1862, passed the conscript law, Governor Brown, in a correspondence with Pres. Jefferson Davis, offered serious objections. Brown also quarreled with Davis on other Confederate policies that he considered as infringements on the rights of a sovereign state.

In 1863 northwest Georgia was involved in the Chattanooga campaign. In the following spring Georgia was invaded from Tennessee by a Federal army under Gen. William T. Sherman. The resistance of Gen. Joseph E. Johnston and Gen. J. B. Hood proved ineffectual, and on Sept. 2 Atlanta was taken. On Nov. 15 Sherman burned Atlanta and began his famous March to the Sea, taking Savannah late in December. In the spring of 1865, Gen. J. H. Wilson, with a body of cavalry, entered the state from Alabama, seized Columbus and West Point on April 16, and on May 10 captured Jefferson Davis, president of the Confederacy, near Irwinville.

Reconstruction. — In accord with Pres. Andrew Johnson's plan for reorganizing the southern states! a provisional governor, James Johnson, was appointed on June 17, 1865, and a state convention reformed the constitution to meet the new conditions, rescinding the ordinance of secession, abolishing slavery and formally repudiating the state debt incurred in the prosecution of the war. A legislature and other officials were elected in Nov. 1865. The legislature ratified the 13th amendment on Dec. 9, and five days later Charles J. Jenkins was inaugurated governor. But both the convention and legislature incurred the suspicion and ill will of congress. Georgia was placed under military government, as part of the 3rd military district, by the Reconstruction act of March 2, 1867.

Under the auspices of the military authorities, registration of electors for a new state convention was begun, and 95,168 Negroes and 96,333 whites were registered. The acceptance of the proposition to call the convention and the election of many conscientious and intelligent delegates were largely the result of the influence of former Governor Brown, who was strongly convinced that the wisest course was to accept quickly what congress had offered. The convention met in Atlanta on Dec. 9, 1867, and by hfarch 1868 had revised the constitution to meet the requirements of the Reconstruction acts. The constitution was duly adopted by popular vote; and elections were held for the choice of a governor and legislature. Rufus Brown Bullock, Republican, was chosen governor; the senate had a majority of Republicans; and in the house of representatives, by the close vote of 76 to 74, a Republican was elected speaker. On July 21, the 14th amendment was ratified, and, as evidence of the restoration of Georgia to the Union, its congressmen were seated on July 25, 1868.

In Sept. 1868 the Democrats in the state legislature, being assisted by some of the white Republicans, expelled the 27 Negro members and seated their defeated a-hite contestants. In retaliation congress excluded the state's representatives on the technicality that their credentials did not state to which congress they were accredited, and, on the theory that the government of Georgia was a provisional organization, passed an act requiring ratification of the 15th amendment before Georgia's senators and representatives would be seated. The department of war then concluded that the state was still subject to military authority and placed Gen. A. H. Terry in command. With his aid and that of congressional requirements that all members of the legislature must take the test oath of nonsupport to any pretended government, *i.e.*, the Confederacy, and that none be excluded on account of colour, a Republican majority nas secured for both houses, and the 15th amendment was ratified. On July 15, 1870, Georgia was finally readmitted to the Union.

Reconstruction in Georgia was comparatively moderate, largely because a number of conservatives under the leadership of former Governor Brown supported the Reconstruction policy of congress. The election of 1870 gave the Democrats a majority in the legislature; Gov. Rufus B. Bullock, fearing impeachment, resigned, and at a special election James M. Smith was chosen to fill the unexpired term. After that the control of the Democrats was complete. Georgia, however, did not frame her home-rule constitution until 1877, when the threat of further military intervention had ended.

Post-Reconstruction. — The history of Georgia since Reconstruction has been one of nominal social and economic progress, nith the state standing firmly Democratic in politics. The 18-year inter\-a1 following 1872 was dominated by the Bourbon triumvirate of Joseph E. Brown, Alfred H. Colquitt and John B. Gordon, nho stood for low taxes and limited public services and who maintained a close liaison between business and political interests. The leasing of convicts to private concerns was the most criticized of their policies. The Independent movement, later backed by the Farmers alliance, challenged Bourbon control throughout most of the period, but by 1892 the Populist threat, with its greater appeal to rural voters, became more serious. All factions sought the Negro vote, and political corruption was widespread. The waning of Populism at the beginning of the 20th century was accompanied by the adoption of several new measures. Virtual disfranchisement of the Negro was effected by registration requirements in 1908 ("grandfather" laws, which placed restrictions on Negroes by requiring that a registrant be "a veteran of any war" or "the descendant of a veteran"), and the convict-lease system was abolished. A state-nide prohibition law of 1907 proved unpopular, and this issue remained prominent until adoption of the 19th amendment to the U.S. constitution in 1919 brought national prohibition. Laws seeking to protect labour in the state's growing industries and reforms in educational policy, with additional appropriations for public schools, were other notable measures adopted in the first quarter of the 20th century.

The Neill act of 1917 placed primary elections under legal control, establishing the county unit system for determining winners in such elections. In 1920 a constitutional amendment fixed the number of first-class counties at 8 and the number in the second classification at 30, while those remaining were in the third class. First-class counties were the most populous, and each had three representatives in the legislature and cast six unit votes. The second group of 30 counties had two representatives each and was entitled to four unit votes. The remaining 122 counties were the least populous. and each had one representative and cast two unit votes. Thus first-class counties had a total of 48 votes; second class. 120 votes; and third class. 244 votes, the total of all votes being 412 Subsequently the number of counties was reduced to 159 and the total of county unit votes to 410. Since nomination in the Democratic primary in Georgia was tantamount to election, county unit voting, together with the three-class system of representation, placed political control in the hands of the smaller counties dominated by rural voters.

In 1930 Richard B. Russell was elected governor on a platform of revamping governmental machinery to effect economy and efficiency. The Reorganization act of 1931 reduced 102 administrative units to 18 and established a board of regents to administer the public colleges and the university. Russell was succeeded in 1933 by Eugene Talmadge, who for four years opposed most aspects of the national administration. The Roosevelt administration nas popular in Georgia, honever, and Eurith D. Rivers after 1937 brought the state into the orbit of the New Deal, although his failure to finance expanded state services brought Talmadge hack to poner four years later on a platform of economy. He now attacked the more subtle effects of the New Deal, and the promotion of social equality for all races, and launched a white supremacy offensive. He caused the dismissal of several university-system officials thought to be advocating mixing of the races in public colleges and schools, the dismissals in turn causing the colleges to lose accreditation. Ellis Gibbs Arnall defeated him in 1942 and introduced a program of reform, restored college accreditation, lowered the voting age to 18, abolished the poll tax and promoted the adoption of a new constitution in 1945, embracing approximately 50 changes.

In the Democratic primary of July 1946, Eugene Talmadge, backed by rural voters and supported by some industrialists, again received the nomination for governor under the county unit system, although losing the popular vote to James V. Carmichael. In the following November he was formally elected governor without opposition, but he died before his inauguration. The general assembly convened in January and according to lam canvassed the election returns to find that about 700 write-in votes had been cast for the governor-elect's son, Herman E. Talmadge, whom they then declared governor. Because the constitution of 1945 was not clear on the question of succession in such a case, confusion followed. Arnall and the lieutenant governor-elect, Melvin E. Thompson, each claimed the succession on different legal grounds. Arnall was forcibly ejected from the governor's mansion by Talmadge partisans, who held the capitol for 67 days. On March 16 the state supreme court ruled in favour of Thompson, but in the special primary of 1948 young Talmadge won over Thompson in a county unit vote of 312 to 98, the popular vote being Talmadge, 357,865; Thompson, 312.035.

A federal court decision in 1945 ordered the Democratic (white) primary in Georgia open to Negro voters, causing the registration of Negroes to increase more than 700% by the end of the following year and providing new impetus to the white supremacy issue. A reregistration act in 1949, containing literacy, character and citizenship tests, and aimed at minimizing the Negro vote, proved unsatisfactory and was repealed after one year. In 1950 (and again in 1952) a proposed amendment extending the county unit system to general elections was defeated by the people. In the meantime a sweeping 3% sales tax levy enacted by the Herman Talmadge administration, most of which went largely for educational purposes, resulted in a rapid upgrading of Negro schools. What promised to prove the most serious issue since Reconstruction was provided in May 1954, when the U.S. supreme court announced its decision that segregation in public schools was unconstitutional. In November an amendment was ratified enabling the state to abolish public education but granting subsidies to private schools. Marvin Griffin in the meantime campaigned for governor on the Talmadge position of continued segregation and was elected. Accordingly, in 1955, the legislature passed a standby private-school law to go into effect if the court ordered a specific school to desegregate.

GOVERNMENT

Constitutions.— Georgia has had a total of eight constitutions, that of 1877 having the longest continuous history although amended 301 times. In 1945 a new constitution was adopted, about 90% of which was taken from the preceding document. Revision mas largely confined to form and organization although important changes were made. The amendment of 1941 increasing the governor's term from two to four years was continued in the new constitution, as was the teen-age qualification for voting (1943). The governor was made ineligible to succeed himself until four years from the date of leaving office. The membership of the state senate was increased from 52 to 54, bringing the total membership of the legislature to 259. The office of lieutenant governor was added along with several new boards, all being constitutional offices. The number of justices of the supreme court was increased from six to seven. Salaries of state officials in general were raised, the per diem pay of legislators being fixed at $15.

During his administration Gov. Eugene Talmadge had obtained legislative endorsement of his plans to give the governor, functioning along with the state auditor as the budget committee, power to transfer funds from one purpose to another. This executive subsequently exercised such power over the purse as to give him unusual control over every aspect of state government and to open the way for administrative abuses, which in turn crystallized a movement led by Governor Arnall to weaken the powers of the governor and to improve administrative efficiency. Arnall's proposals to make the board of regents, board of education, board of pardons and paroles, game and fish commission, and public service commission constitutional agencies mere ratified by the people in 1943. The constitution of 1945 continued this trend toward cutting down the powers of the governor and effecting decentralization in administration.

The 1877 constitution placed severe limitations on finance, taxation and debt, although amended many times to meet requirements of changing circumstances. In June 1937, 26 constitutional amendments were ratified, liberalizing the powers of the legislature, particularly with respect to the state's co-operating in the social program of the New Deal. A clause limiting the debt of a minor civil division to 7% of the assessed valuation of its property was amended 135 times before 1945. The new constitution raised the limit to 10%, but the additional debt had to be approved by a majority vote, as against a two-thirds vote in the old constitution, and had to be paid in five years. A significant new provision required that all tax moneys for state purposes be paid into the state treasury and that appropriations be made by the legislature to departments and agencies in specific sums. The new provision removed the old principle of allocating certain revenue to specific objectives, a practice which at one time removed as much as 60% of all state funds from legislative control. A determined effort by highway interests to amend the nen constitution so that most of the gasoline taxes and license-tag fees would be earmarked for construction and maintenance of roads succeeded in 1952.

Finances.— In the second half of the 20th century, Georgia's total annual income exceeded $300,000,000, more than 80% of it being derived from taxes that were nonexistent at the beginning of the century. The 3% general sales tax, begun in 1951, accounted for nearly 40% of the total. Motor-vehicle license taxes and gasoline taxes, begun in 1910 and 1921, respectively, provided 28%; while the income tax, introduced in 1929, accounted for slightly more than 15%. State taxes on land and real estate, once an important source of state revenue, mere reduced to one-fourth of a mill in 1951 and thereafter contributed only a negligible part of the state's income but remained the most important source of revenue for local government. Of the state's total income more than one-half was being spent for education; about one-quarter for highways; less than one-tenth for public health and public welfare; and less than one-tenth for all other departments. By 1950 Georgia's fixed debt had been paid off. and the state's financial position was better than at any time since 1860.

POPULATION

In 1760 Georgia's population was less than 10,000, with Negro slaves forming one-third of the total. By the end of the colonial period the number of settlers had grown to 33,000, of whom 18,000 were slaves. The state continued to grow throughout the American Revolution and by the first census in 1790 had reached 82,548, concentrated in the L-shaped corridor along the Savannah river and thence down the coast to the Altamaha. By 1800 the population had almost doubled, having increased to 162,686, 90% of the increase occurring in the upcountry, where land grants had become available. The population reached 691,392 by 1840, resulting from the freeing of land by removal of Indians, free grants of the state's western lands and rapid expansion of cotton planting. The 1860 population of 1,057,286 was 44% Negro and mas concentrated in the newer middle Georgia counties. In 1900 the population nas 2,216,331, with 46.7% Negro and 15.6% urban. Throughout the 20th century there was a steady decline in the proportion of Negroes and a sharp rise in the percentage of urban inhabitants.

In 1960 the total population was 3,943,116 (an increase of 498.538 over 1950), or 67.0 persons per square mile. The entire urban population, including the urban fringe adjacent to the five larger cities (and six unincorporated places of 2.500 or more elsewhere). was 2,182,117, or 55.3% of the state total. There are five standard metropolitan areas—Atlanta, Augusta, Columbus, Flacon and Savannah. With the exception of the nonwhites (practically all Negro), who comprised about 30% of the total population, Georgia's people were largely of Anglo-Saxon origin. The foreign-born comprised only a small fraction of 1%. South Georgia was heavily populated with Negroes, while a few north Georgia counties had none. All groups were predominantly Protestant in religion. In both the native white and the Negro population, males were outnumbered. the ratios being 98.8 (per 100 females) and 90.6. respectively. in 1950. In the second half oi the 20th century the rura! population was declining more rapidly than in the past because of crop-reduction programs and other changes in the agricultural pattern. Farm tenancy was also declining. 40% of the farmers belonging to that category, as opposed to 55% in 1940. Many Negroes were moving from farms to urban communities outside the state.

Note: Dash indicates place did not exist during the reported census, or data were not available.

EDUCATION

State School **System.**—As early as 1742 the Georgia trustees provided free tuition for children of poor families to attend a school at Savannah, and various forms of educational subsidy have continued throughout the state's history. After the American Revolution. academies were established in several counties with funds from confiscated Loyalist estates and by gifts of public land. By 1860 over 500 academies had been chartered, many by private, civic and religious groups. The acadetny system, essentially aristocratic. remained the general pattern of education throughout the pre-American Civil War period. Tuition was not free until 1817 and then only for children of indigent parents.

The constitution of 1868 authorized free public education on the elementary level for all children, and a school law was enacted in 1870. Appropriations reached S1.000.000 in 1893. Supplementary local tases for elementary schools were permitted by a constitutional amendment in 1904, but counties were not required to levy such a tax until 1919. In 1911 the state board of education became a professional one, and uniform schoolbooks were adopted; in the following year high schools became a part of the public-school system. In 1937 a seven-months elementary-school term was guaranteed by the legislature. The compulsory school law as amended in 1919 required attendance between the ages of 8 and 14 at least through the seventh grade.

School consolidation on a local experimental basis was begun in 1903. but not until 1919 did the legislature appropriate funds to encourage this movement. Simultaneously an adult illiteracy commission was established, followed by local taxation for adult schools, resulting in noteworthy progress in the eradication of illiteracy, the percentage dropping from 18.4% in 1920 to 9.4% in 1930.

In 19\33 the budget for elementary and secondary education was approximately $16.000.000 and by the second half of the 20th century had increased to more than $140.000.000. Free textbooks, a minimum teacher salary schedule of $3.000. a retirement system and a twelfth grade had been added. Vocational education was expanded and library services added. including one of the largest film libraries in the U.S. Enrollment in the public schools in 1933 was 750.054. as compared with more than Y60.000 in the second half of the 20th century. The number of public-school teachers increased from less than 20.000 to more than 30.000. The average salary of teachers rose from $655.15 to nearly $3.500.

Colleges and Universities.—The University of Georgia. at Athens. the oldest institution of higher learning in the state, was chartered in 1785 but did not open until 1801. In 1828 a medicai college was established at Augusta. During the latter half of the 19th century the state established many other colleges. including the Georgia Military institute st Marietta (destroyed by federal military forces in 1864), the Georgia Institute of Technology at Atlanta, a college for women at Milledgeville, a teacher's college and a college of agriculture at Athens. an agricultural college at Dahlonega and a number of small branch colleges in southern Georgia. In the first half of the 20th century five senior colleges and eight junior colleges (including a technical school) were established, all for white students only. In addition three public Negro colleges were provided. all located in the southern part of the state. at Albany, Fort Valley and Savannah.

Before 1931 the public colleges each had its own board of trustees and operated independentiy under separate fiscal systems. The creation of the university system of Georgia brought them and three agricultural experiment stations under one board of regents. the chief administrative officer being the chancellor. with his office in Atlanta. Seven of the existing institutions were immediate!~discontinued. and one new college was established in western Georgia. a populous area where four institutions were abolished. The regents controlled all the institutions as one fiscal unit, apportioning funds received from the legislature according to the needs of the individual institutions, The regents set up a councii of the university system. comprising the presidents. deans, other administrative officers arid some members of the teaching staffs of the schools, and some pi-ogress was made in defining the function of various units and integrating them into a more logical system of higher education. The regents, however. did not halt the trend early manifested in Georgia of developing area or regional colleges. In the second half of the 20th century a commuter's college, the Georgia State College of Business Administration. was created for the Atlanta area; and a day junior coilege was each authorized for Savannah. Augusta and Columbus. The university also established off-campus centres in various cities, some of which had local private colleges.

In 1933 the university system received an appropriation of approximately $1,500,000; in the second half of the 20th century the figure had increased nearly 15-fold. Enrollments increased during the same period from 9,000 to 25,000 students. Outside the university system are Agnes Scott college (Decatur, 1889; for women), Berry college (nonsectarian; Mount Berry, 1926), Tift college (Baptist; Forsyth, 1849; for women), Emory university (Methodist; near Atlanta, 1836), La Grange college (Methodist; La Grange, 1831). Mercer university (Baptist; Macon, 1833), Oglethorpe university (nonsectarian; near Atlanta, 1835). Piedmont college (Congregational; Demorest, 1897), Shorter college (Baptist; Rome, 1873), Wesleyan college (Methodist; Macon, 1836; for women), and Brenau college (nonsectarian; Gainesville, 1878; for women), all for white students. Atlanta is the largest centre in the south for the higher education of Negroes, having five undergraduate private colleges: Spelman (Baptist; 1881; for women), Morris Brown (Methodist; 1881), Clark (Methodist; 1877). Morehouse (Baptist; 1867: for men) and Gammon Theological seminary (Methodist; 1883); Atlanta university (nonsectarian; 1867) for undergraduates and graduates; and the Atlanta School of Social Work, affiliated nith Atlanta university in 1938, for graduates. Paine college (Methodist; 1883) in Augusta, is the only other private college for Negroes in Georgia.

Corrections and Welfare. — In 1811 Georgia began construction at Milledgeville of a state penitentiary that had a number of workshops and by 1820 had inaugurated a program of penal and criminal reform unusually progressive for the times. The rapid increase of the prison population following the emancipation of the Negro in 1865, there being no Negro prisoners before emancipation, brought a reversal of the earlier policy, resulting in the bulk of prisoners being leased to private businesses or assigned to county-operated chain gangs. The former practice ended in 1908. The constitution of 1945 established a board of corrections that assumed operation of a large new central penitentiary at Reidsville, and the custom of using convicts on county roads practically disappeared.

The Reorganization act of 1931 brought under a single board of control all state eleemosynary institutions, but in 1940 this board was abolished and the institutions placed under the public welfare department, though subsequently four were transferred to other departments. In 1943 the Georgia Academy for the Blind (Macon) and the Georgia School for the Deaf (Cave Spring) were transferred to the department of education, and later the tuberculosis sanitarium at Alto (later at Rome) was placed under the supervision of the board of health. In 1959 the Milledgeville State hospital, previously operated largely for the custodial care of 10,000 to 12,000 patients, was transferred to the board of health. The six institutions remaining under the department of public welfare were a training school for mental defectives (near Augusta), a training school for white boys (Milledgeville), a training school for Negro boys (Augusta), a training school for white girls (Atlanta), a training school for Negro girls (Macon), and a factory for the blind (Bainbridge).

THE ECONOMY

Agriculture. — Agriculture was the principal occupation of the people of Georgia until after World War II, when acceleration of mechanized farming reduced the farm population and the state underwent rapid industrialization. The most significant trend in Georgia agriculture in the second half of the 20th century was away from cotton, the principal money crop for 150 years, to a wide diversification. The largest cotton crop was in 1911, when 2,768,000 bales were produced on approximately 5,000,000 ac. A marked decline in cotton was noted in the early 1920s as a result of boll weevil infestation, the 1923 crop dropping to 588,000 bales. Diversification began at this point, and, after 1933, federal crop-control programs accelerated the movement. In the second half of the 20th century the soil-bank program had removed 380,000 ac. from production, of which only 10% was cotton; and the value of the state's corn crop in 1957 exceeded that of cotton for the first time since the American Civil War.

Loss of income from cotton was more than replaced by income from such new crops as tobacco, peanuts, poultry, livestock and forestry products. Tobacco, grown in Georgia since colonial times, underwent adaptability for commercial cigarettes during World War I, and by mid-century about 100,000 ac. annually were planted in southern Georgia. The state ranked first in the nation in peanut and in pimiento production, more than 500,000 ac. of peanuts being planted annually and harvested for nuts in addition to 150,000 ac. for hog grazing and other purposes. The pimiento industry began in 1912, when a superior plant was imported from Spain and was found to be adaptable to the cotton belt. The peppers came to be grown under contract to commercial packers.

The most spectacular development in Georgia agriculture was the rapid rise of the poultry industry. While the initial emphasis in the 1920s had been on egg production, the most outstanding results were later achieved in growing broilers, production increasing 126-fold. Tributaries to the broiler industry were processing plants, hatcheries, feed mills and supply houses. Livestock mas in the second half of the 20th century responsible for almost 40% of the state's gross farm income and 333% of its cash income. While ranking lowest among the southern states in the number of animals, Georgia played a leading role in developing herds of improved breeds, the greatest expansion being in the former cotton belt. Free range grazing in southern Georgia did not completely disappear until the second half of the 20th century. Other income from diversified agriculture was in valuable peach and watermelon crops in middle and southern Georgia, respectively; apples in northeast Georgia; and pecans, produced in nearly every county in the state, with large commercial orchards in its middle and southern portions.

Woodlands covered 24,000,000 ac., comprising two-thirds of the state's total area; under fire-protection measures, they were one of the state's greatest natural resources. After 1933 over 360,000 ac. of Georgia land were replanted with more than 1,000,000,000 trees, and the total annual value of ram timber and pulpwood after harvesting rose to $200,000,000. its processed value being $800,000.000. In lumber products Georgia ranked high in the nation and produced over 70% of the nation's naval stores.

Industry. — The total annual value of Georgia's manufactured goods in the second half of the 20th century was more than twice that of agricultural products. More than half of the state's rural population commuted daily to urban jobs; one plant at Marietta drew its workers from 39 counties. The mill village, once common everywhere, had almost disappeared. The largest single product manufactured was textiles. Lumber products ranked second. Wood processing and wood products plants increased more than sixfold after 1935, employees in this industry quadrupling in number. The newest manufacturing enterprise was pulpwood, which began in 1936, much of this going into the production of paper bags. About 40% of Georgia's new manufacturing plants were located in towns of fewer than 5,000 persons and utilized local labour and ram materials, but many large national concerns also located in Georgia near urban centres and were engaged in the manufacture of a wide range of products.

Minerals. — The most important mineral, sedimentary kaolin, found largely in the coastal plain just south of the fall line, is used in making whiteware and as filling and coating for paper. Other products of the region are limestone, fuller's earth, portland cement and bauxite. The crystalline rocks of the Piedmont and mountain region provide granite, marble, talc, feldspar, asbestos, ochre and barite, of which granite is the most important, being used principally for monuments. The granite industry is mainly around Elberton in northeast Georgia. Marble from the Tate quarries is widely noted for its quality and beauty and is second in importance in this region. In the Paleozoic area of northwest Georgia the principal products are portland cement, crushed limestone and ochre. Metal mining is confined to Bartom, with barite, ochre and brown iron ore being the leading products. Small quantities of coal are mined on Lookout and Sand mountains. The Dahlonega district, once famous as a gold-mining region, produces only negligible quantities of this metal.

Transportation. — Atlanta, long an important rail centre for the southeastern U.S., became a major air and motor transportation hub in the second quarter of the 20th century. Georgia in 1954 had 14.394 mi. of surfaced highways, 111 airports. and a motor vehicle registration of 1,239,000. Rail mileage exceeded 6.000. Other means of transportation were navigable rivers below the fall line. and ocean vessels having piers at St. Rlarys, Brunswick, Darien and Savannah.

GEORGIA, STRAIT OF. The Strait of Georgia lies between the central east coast of Vancouver Island and the southwestern mainland of the province of British Columbia, Canada. Its length is about 140 mi., and its greatest width about 20 mi. The northern part of the strait is almost closed off by a group of islands lying northeast of the town of Campbell River. The southern end of the strait is blocked by the San Juan Islands of Washington state. Depth of water in mid-channel is about 150 to zoo fathoms, but there are deeper, submerged valleys, and also numerous shoals which indicate the tops of submerged islands. There is a general counterclockwise movement of surface water in Georgia strait, aided by the large outflow of fresh water from the Fraser river. Tidal streams are complicated because tidal currents from Juan de Fuca strait to the southwest, and from Queen Charlotte strait to the northwest, both penetrate into Georgia strait. (J. L. R.)

GEORGIAN ARCHITECTURE, in architecture was the style of the 18th century in England and in the English colonies in America. There are slight differences in usages of the term in the two countries. In England, Georgian refers to the mode in architecture and the allied arts of the reigns of George I, II and III, extending from 1714 to 1820. The last decade of this era is often distinguished as Regency. The English Georgian style was strongly influenced by the work of the Italian Andrea Palladio (1518–1580). Introduced to England during the reign of James I in the 1620s, the Palladian style became even more admired in the 1720s under George I. Classical, formal and elegant, it esteemed "correctness" more than comfort.

In America, Georgian refers to the architectural style of the English colonies from about 1700 to the Revolution. Also formal and aristocratic in spirit, it was at first based on the baroque work of Sir Christopher Wren and his English followers in the late Stuart period, but after 1750 it became more severely Palladian. Typically, houses were of red brick with white-painted wood trim and sliding-sash windows. Interiors had central halls, elaborately turned stair balustrades, paneled walls painted in warm colours, and white plaster ceilings. All of these features were new to the colonies in 1700. Some of the earliest Georgian buildings were at Williamsburg, capital of Virginia from 1699 to 1780; other notable examples are Independence hall, Philadelphia (1745), and King's chapel, Boston (1754). The style was followed after the Revolution by the Federal style. 1780–1820. *See* also BAROQUE AND POST-BAROQUE ARCHITECTURE; GEORGIAN STYLES.

(HH. M.)

GEORGIAN BAY, the northeast section of Lake Huron, lies entirely within the Canadian province of Ontario. The bay is separated from the lake by Manitoulin Island and the Saugeen (or Bruce) peninsula. It is 120 mi. long and 51 mi. wide. Depth of water in the bay is generally between 100 and 300 ft.; the maximum depth is 540 ft. at a point near the main channel leading to Lake Huron. The bay also is connected with the north channel of Lake Huron, which lies north and west of Manitoulin Island. The principal tributary rivers are the French, draining Lake Nipissing on the northeast; the Maganatawan; the Muskoka draining the Muskoka chain of lakes; the Severn draining Lake Simco; and the Nottawasaga, which enters from the south. Small boats may pass from Georgian bay to the Bay of Quinte, on Lake Ontario, by traveling through the Trent valley waterway which includes the Trent canal. built in 1918.

The Georgian Bay national park, at the southeastern corner of the bay, was established in 1930 and it includes 30 of the more than 20,000 small islands of the bay. The region is forested and thousands of tourists visit the shore resorts in summer. The bay was the first part of the Great Lakes seen by white men, who reached it by way of the Ottawa and French rivers in 1615.

For a discussion of origin, geologic setting, history and commerce *see* GREAT LAKES, THE; and HURON, LAKE. (J. L. HH.)

GEORGIAN LANGUAGE. The Georgian language forms, together with Svanian, Mingrelian and Lazian, the southern or Kartvelian group of the Caucasian languages (*q.v.*). For the speakers of Svanian and Mingrelian it serves as the language of literature and of instruction. Among the Caucasian languages, only Georgian has an ancient literary tradition. The oldest inscriptions date from the 5th century, at which time also parts of the Bible were translated from Armenian into Georgian. The language of this period differs in some points from classical Old Georgian of the 10th and 11th centuries still in use in religious services. Old Georgian is somewhat difficult to understand but by no means incomprehensible to the Georgians of today; it was used in liturgy and for theological writings until the end of the 18th century. Old Georgian abounds in loan words from Armenian and especially from Greek; with the help of Greek the foundations were laid for a philosophical terminology. The language of medieval poetry, largely influenced by Persian, stands nearer to the contemporary language. But only in the middle of the 19th century did the literary language become definitively adapted to the living language of the people. The vocabulary of New Georgian is very extensive as compared with that of Old Georgian, every author drawing from his vernacular and even coining new expressive words. The dialects of modern Georgian show but slight differences, the most aberrant being those of the northeastern mountain tribes (Khevsurs, P'shavs).

The phonemic system of Georgian comprises the five cardinal vowels and 28 (Old Georgian, 2 more) consonant phonemes. This system is notably simpler than that of the North Caucasian languages; it shares with them some characteristic traits, *e.g.*, the division of the stops and affricates into three modes of articulation: voiced b, d, *g, dz, j*, voiceless with aspiration *p‘, t‘, k‘, ts, ch* and voiceless glottalized *p, t, k* or q, *ds, tch*. Diphthongs were current in Old Georgian, but have been reduced to single vowels. There is no phonemic vowel length. The first syllable of the word, or in longer words frequently the antepenultimate, is marked by very slight stress.

Georgian has roughly the same parts of speech as the Indo-European languages. The opposition between noun and verb is distinctly marked. The noun has seven cases: nominative, vocative, genitive, dative, ablative-instrumental, terminative-adverbial and a special case called ergative which in some constructions denotes the agent with a transitive verb. Because of fusion with postpositions there arose in New Georgian some secondary local cases. In Old Georgian the plural was formed in the nominative by *-ni,* vocative *-no,* oblique cases *-t'a;* this plural is seldom used in New Georgian, the regular plural being formed with a suffix *-eb-* to which are added the case endings used in the singular. There are no articles and no gender, even in pronouns. The attributive adjective, standing in New Georgian habitually before the noun, agrees with the noun in case but not in number.

It is the verb which shows fundamental differences from Indo-European languages. The Georgian verb is multipersonal: (1) The person of the agent is denoted in the third person by endings, in the first and second persons by prefixes most of which are not connected etymologically with the independent personal pronouns: *me v-dser* "I write," *shen dser* (in oldest Georgian *kh-dser)* "thou writest," *igi dser-s* "he writes." (2) Another set of personal prefixes refers to an object: *m-dser* "thou writest to me," *g-dser-s* "he writes to thee." (3) Relations between agent and objects called "versions" by Georgian grammarians are denoted by vowels inserted between the personal prefixes and the verbal root: *a-dser* (in oldest Georgian *kha-dser)* "thou writest on it," *vi-dser* "I write for me," *vu-dser* "I write for him," *e-dser-ebis* "it is written on it/for him." (4) The tenses of the verb are distributed according to three systems: present, aorist and perfect. In verbs corresponding to those called transitive in the Indo-European languages there is a different construction in each system. In the present the agent is put into the nominative, both direct and indirect objects into the dative: *kats-i dser-s dseril-s* "the/a man is writing the/a letter." In the aorist the object is put into the nominative, the agent into the ergative: *kats-man da-dser-a dseril-i* "the/a man wrote the/a letter." This construction which resembles the passive construction of other languages is characteristic of all Caucasian languages. In the perfect which denotes an action in the past not witnessed by the speaker, the object is put into the nominative, the agent into the dative: *kats-s da-u-dser-ia dseril-i* "it appears (it is said) that the man wrote the letter."

The Georgian alphabet was probably composed by Christian missionaries during the 5th century under the influence of and with some loans from the Greek alphabet. The bulk of the signs might have been derived from a form of the Aramaic script used in inscriptions dating from the 2nd century which have been discovered at Armazi, an ancient capital of Georgia. From the oldest form of the Georgian script arose in the 10th century an angular book script; from this developed the round form called *mkhedruli* on which are based the modern printed characters.

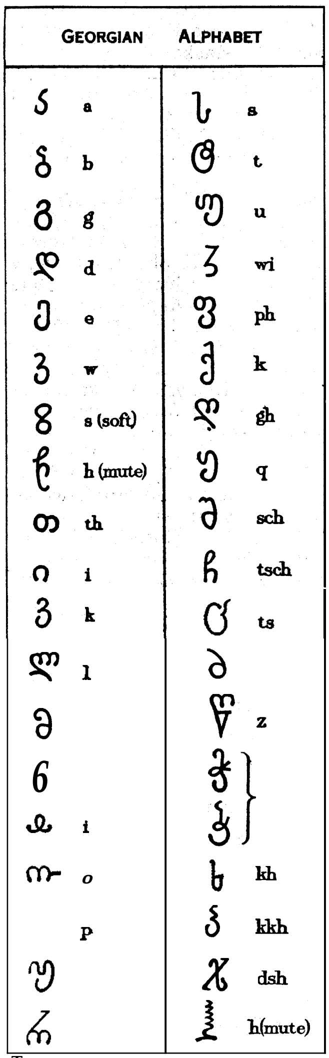
GEORGIAN LITERATURE. The earliest extant Georgian literature dates from soon after the conversion of Georgia by St. Nino, early in the 4th century, and the oldest manuscripts known are biblical. liturgical and hagiological—all of great value. They show a stage of linguistic development, a wealth of words and grammatical forms which prove that the language must already have had an ancient literary history. There were early translators of the Greek classical authors, and one of these says, in a preface, that he has endeavoured to give so exact a rendering of the text that he has converted philosophical terms syllable by syllable, a method which has endowed Georgia, from the 12th century. with a metaphysical terminology of great exactitude.

The folklore *(cf.* vol. i of the Grimm library, London, 1894) is of deep interest for comparative purposes, and its viens of the underworld may thro light on the religions of Egypt and Assyria.

One folk tale. *Et'heriani,* in prose and verse, the theme of which has been used for a successful opera in the 20th century. evidently assumed a literary form before the Christian era, and there is reason to believe that this may also be the case with the cycle of poems about Tariel, the hero of the greatest masterpiece of Georgian literature, attributed to Shot'ha Rust'haveli, an epic of more than 1,500 rhyming quatrains written in the reign of Queen T'hamar (1184–1212). This has been rendered into English prose *(The Man in the Panther's Skin, a Romantic Epic,* Roy. Asiat. Soc., 1911), and it gives Georgia a high place in the literature of the world.



THE GEORGIAN NATIVE ALPHABET
The Georgian, together with the majority of other Caucasian languages, composes a group fundamentally distinct from the Indo-European linguistic family

The T'hamarian age has also left us a large number of odes of great rhythmic variety, full of allusions to Greek and oriental writers. and translations or adaptations of foreign works, such as the *Story of the Loves of Vis and Ramin (Visramiani,* Eng. trans. published by Roy. Asiat. Soc., 1914), a romance of ancient Persia. Persian influence in Georgian literature was strong in the 17th century, and among the poets may be mentioned King T'heimuraz I (lyrics and translations). In the 18th century a revival of nationalism was aided by the founding of a printing press at Tiflis. where, in 1712, King Vakhtang VI published, with an elaborate commentary, the work of Rust'haveli; he also compiled a code of laws in which the ancient customary laws are of special interest.

Of this period also are compilations on the history and geography of Georgia (by Prince Vakhusht), both texts with a vast amount of other matter, published and translated by M. F. Brosset, by far the greatest. as he was the first, of western students of the literature. A great name is that of Prince Sulkhan Orbeliani (1655?–1725?), who in 1714 was Georgian envoy at Versailles. He kept a diary of his travels in Europe (partial French and Latin trans. in *Journ. Asiat.*, Paris, 1832 and 1834). and among his published works are a valuable dictionary of the language (Tiflis, 1884), and a rhymed translation of parts of the Persian Anvar-i-Suhaili. His Book *of Wisdom and Lies* (Eng. trans., 1894) is, after Rust'haveli. the most popular of Georgian books; in the form of interwoven apologues it highly recommends a sporting and Spartan education. In the early part of the 19th century the influence of Europe gre , and in the lyrics of A. Chavchavadze (1786–1846) and N. Barat'hashvili (1816–46) there is a Byronic strain, but G. Erist'havi, the first dramatist and founder of the national theatre. who translated poems of Petrarch. Johann Schiller, Adam Mickiewicz and others, had a steadying effect. The oppression of an alien rule (Russia, after 1801) inspired the patriotic verse of G. Orbeliani (1801–23) and Ilia Chavchavadze (1837–1907), who was the greatest Georgian of his generation in all branches of literature and public life. Acaci Tseret'heli (1840–191j) was the popular lyric poet of the century. I. Machabeli and D. Qiphiani translated Shakespeare into Georgian.

BIBLIOGRAPHY.—A general history of Georgian literature was published in 1895–1901 by A. Khakhanov (in Russian). M. F. Brosset's translation of the Georgian chronicles was published in St. Petersburg

(1849–58).

There is a good Georgian library at the Bodleian in Oxford and another at Harvard. At Oxford there is a fund for the encouragement of the study of Georgian literature.

GEORGIAN STYLES, in architecture and the decorative arts, developed during the 18th century in Great Britain and her colonies. During the reign of the Georges (1740–1830), urbgn aristocrats and merchants preferred the sober models of Andrea Palladio and Inigo Jones to the grandeur of continental baroque, and they built entire city squares of uniform, symmetrical town-houses, the façades of which were characterized by classical pilasters, pedimented doors and windows and graceful moldings. Their interiors—with paneled walls, quiet colours, Roman stucco ornamentation and Chippendale, Hepplewhite or Sheraton furniture—made elegant settings for the works of Reynolds and Gainsborough. Cnder the influence of the Adam brothers, the later style veered toward more authentic neoclassicism.

See also BAROQUE ART; GEORGIAN ARCHITECTURE; NEOCLASSICAL ART.

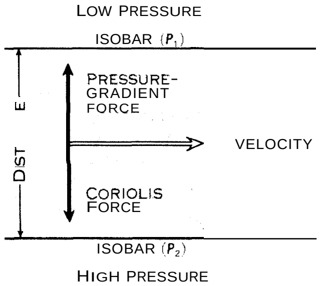
GEORGIUS CONTINUATUS: see GEORGE THE MONK.

GEOSTROPHIC WIND. When air moves horizontally without friction or acceleration, there is a balance between the deflecting force of the earth's rotation—Coriolis force (see MOTION, LAWS OF)—and the force arising from the horizontal variations of pressure. The wind blowing under this balance of forces is called "geostrophic wind."

The magnitude and direction of geostrophic winds are given by the direction and spacing of isobars (lines of constant pressure) on a horizontal surface. In the figure, two such isobars are drawn. The pressure p_1 along one isobar is less than the pressure p_2 along the other. The pressure gradient force acts at right angles to the isobars and toward lower pressure. The Coriolis force acts at right angles to the wind, to the right in northern hemisphere. In order that these two forces balance, the wind, indicated in the figure by the white arrow, must be parallel to the isobars, with lower pressure to its left. The smaller the distance between isobars, the faster the wind. Geostrophic wind is also proportional to the slope of isobaric surfaces and directed along contours of such surfaces. with high elevations to the right of the geostrophic wind (in the northern hemisphere).



THE BALANCE OF FORCES FOR GEOSTROPHIC AIR FLOW IN THE NORTHERN HEMISPHERE

In the southern hemisphere, the Coriolis force acts to the left of the wind, and therefore the relations between direction of the geostrophic wind and pressure field are opposite to those in the northern hemisphere.

In general, the geostrophic wind represents the actual wind with an error of about 10%, provided the actual winds are averaged over areas of 100 miles or more. But the geostrophic wind is generally a poor approximation close to the surface (see EKMAN SPIRAL), in regions of fast winds and large trajectory curvature and near the equator.

The geostrophic wind relation is useful in the analysis of weather maps because it aids in the constrcction of stream lines in regions of scant wind observations, and in the construction of isobars where pressure data are poor, particularly in the stratosphere (*q.v.*). (H. A. A. P.)

GEPHYREA, an obsolete phylum of small-to-microscopic wormlike animals, which has been broken down into the following groups: Echiurida, Sipunculida, Priapulida and Phoronida (*qq.v.*).

GERA, a town of Germany in the district of the same name, on the banks of the White Elster, 45 mi. S.S.W. of Leipzig. Pop. (1950) 98,576.

Gera (in ancient chronicles Geraha) became a town in the 11th century, and in the 12th century it came into the possession of the lords of Reuss.

The town was sacked by the Bohemians in 1450, was burned down by the Swedes in 1639 and suffered from fires in 1686 and 1780, after which it was mostly rebuilt.

Its educational establishments include a weaving school. Osterstein, the former residence of the princes of Reuss, stands on the site of a 9th-century castle. Gera is noted for its industrial activity. Its industries include wool weaving and spinning, dyeing, iron founding, the manufacture of textiles, machinery. musical instruments, leather and tobacco, and printing (books and maps) and flower gardening.

GERALDTON, a town and seaport in the district of Victoria in Western Australia, 306 mi. by road north-northwest of Perth. Pop. (1954) 8,309. Geraldton is the seat of a Roman Catholic bishop, the centre of extensive crayfishing and market gardening industries and a seaside resort. The town serves a wide agricultural area. The chief exports are wheat, wool, tomatoes, processed crayfish tails and flour.

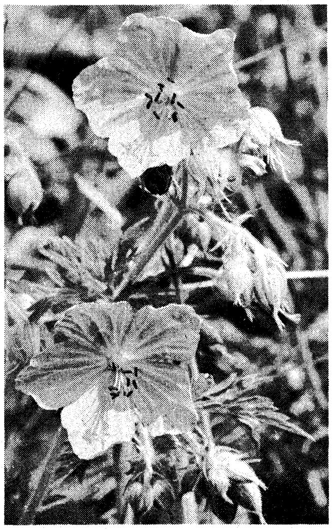
GERANIACEAE, a small but widely distributed family of Dicotyledons belonging to the Archichlamydeae, containing about 700 species in 11 genera. The family is represented in Britain by two genera, Geranium (cranes-bill) and *Erodium* (storks-bill), to which belong nearly two-thirds of the total number of species. The same two genera are the only representatives of the family in North America. The plants are mostly herbs, rarely shrubs, with generally simple glandular hairs on the stem and leaves. The opposite or alternate leaves have a pair of small stipules at the base of the stalk and a palminerved blade. The flowers, generally in a cymose inflorescence, are hermaphrodite, hypogynous and, except in Pelargonium, regular. The parts are arranged in fives. There are five free sepals, overlapping in the bud, and, alternating with these, five free petals. In Pelargonium the flower is zygomorphic with a spurred posterior sepal and the petals differing in size or shape. In Geranium the stamens are obdiplostemonous, *i.e.*, an outer whorl of five opposite the petals alternates with an inner whorl of five opposite the sepals; at the base of each of the antisepalous stamens is a honey gland. In Erodium the members of the outer whorl are reduced to scalelike structures (staminodes), and in Pelargonium from two to seven only are fertile. There is no satisfactory explanation of this break in the regular alternation of successive whorls. There are five, or fewer, carpels, which unite to form an ovary with as many chambers, in each of which are one or two, rarely more, pendulous anatropous ovules, attached to the central column in such a way that the micropyle points outward and the raphe is turned toward the placenta. The long beaklike style divides at the top into a corresponding number of slender stigmas.

The larger-flowered species of Geranium are markedly protandrous, the outer 'stamens, inner stamens and stigmas becoming functional in succession. For instance, in the meadow cranes-bill, G. *pratense,* each whorl of stamens ripens in turn, becoming erect and shedding their pollen; as the anthers wither the filaments bend outward, and when all the anthers have diverged the stigmas become mature and ready for pollination. By this arrangement self-pollination is prevented and cross-pollination ensured by the visits of bees which come for the honey secreted by the glands at the base of the inner stamens.

In species with smaller and less conspicuous flowers, such as *G. molle,* self-pollination is possible, since the divisions of the stigma begin to separate before the outer stamens have shed all their pollen; the nearness of the stigmas to the dehiscing anthers favours self-pollination.

In the ripe fruit the carpels separate into five one-seeded portions (cocci), which break away from the central column, either rolling elastically outward and upward or becoming spirally twisted. In most species of Geranium the cocci split open on the inside and the seeds are shot out by the elastic uptwisting; in Erodium and *Pelargonium* each coccus remains closed, and the long twisted upper portion separates from the central column, forming an awn, the distribution of which is favoured by the presence of bristles or hairs. The embryo generally fills the seed; the cotyledons are rolled or folded.

Geranium is the most widely distributed genus; it has 300 species and is spread over all temperate regions with a few species in the tropics. Three British species — G. *sylvaticum,* G. *pratense* and *G. robertianum* (herb Robert) reach the arctic, while G. *patagonicum* and G. *magellanicum* are found in the antarctic. *Erodium* contains 65 species (two British), most of which are confined to the Mediterranean region and west Asia, though others occur in America, in South Africa and west Australia. *Geranium* is represented in eastern U.S. by 11 species, 7 of which are introduced. In this region *Erodium* is represented only by two species introduced from Europe. In the western U.S. there are five species of *Geranium,* and *Erodium* is represented by one native species which extends throughout the whole region west of the Rocky mountains, where it is known as pin clover and pin grass. *Pelargonium,* with 250 species, has its centre in South Africa; the \\-ell-known garden and greenhouse "geraniums" are species of *Pelargonium* (see GERANIUM).



JOHN MARKHAM

MEADOW CRANES-BILL (GERANIUM PRATENSE)

For a monographic treatment of the family see R. Knuth, Geraniaceae. Pflanzenreich *53* (iv, 129): 1–640, fig. **1-80** (1912).

GERANIUM, the name of a genus of plants, the type of the family Geraniaceae, commonly called cranes bill; but also the common name of the garden geraniums, all of which belong to the South African genus *Pelargonium.* Formerly the genus Geranium comprised most of the family Geraniaceae.

The species of Geranium consist mostly of annual or perennial herbs, dispersed throughout the temperate regions of the world. They number about 250 and bear a considerable family resemblance. The leaves are for the most part palmately lobed, and the flowers are regular, consisting of five sepals, five imbricating petals, alternating with five glandules at their base, ten stamens and a beaked ovary. Fourteen species are natives of the British Isles. G. robertianum is herb Robert, a common plant in hedge banks. *G. sanguineum*, with flowers a deep rose colour, is often grown in borders, as are also the double flowered varieties of G. *pratense*. Many others of exotic origin form handsome border plants in our gardens of hardy perennials.

In North America about 25 species of Geranium are found, inclusive of several naturalized from the old world. Of the native species well-known representatives are the spotted cranes-bill or wild geranium (G. *maculatum*), common in woods from Newfoundland to Manitoba and southward to Georgia and Nebraska, with handsome rose-purple flowers, one to one and one-half inches broad; the Carolina cranes-bill (G. carolinianum), found in barren soil across the continent from Nova Scotia to British Columbia and southward to Florida and Mexico, with pale pink or white flowers about one-half inch broad; and the herb Robert mentioned above, which is native to rocky woods from Nova Scotia to Manitoba and southward to New Jersey and Missouri.

Pelargonium, though agreeing with Geranium in certain points of structure, differs in that the flowers are irregular, the two petals which stand uppermost being different — larger, smaller or differently marked — from the other three, which latter are occasionally wanting. This irregularity the modern florist has done much to annul, for the increased size given to the flowers by high breeding has usually been accompanied by the enlargement of the smaller petals, so that a near approach to regularity has been in some cases attained. Another well-marked difference, however, remains: the back or dorsal sepal in *Pelargonium* has a hollow spur, which is adnate; *i.e.,* joined for its whole length with the flower-stalk; while in Geranium there is no spur. This peculiarity is best seen by cutting through the flower stalk just behind the flower, when in Pelargonium there will be seen the hollow tube of the spur.

The various races of pelargoniums have sprung from the intermixture of some of the species obtained from the Cape of Good Hope. The older show-flowered varieties have been gradually acquired through a long series of years. The fancy varieties, as well as the French spotted varieties and the market type, have been evolved from them. The zonal or bedding race. on the other hand. has been more recently perfected; they are supposed to have arisen from hybrids between Pelargonium inquinans and *P. zonale;* perhaps better considered as belonging to P. *hortorum,* for the hybrid origin of many garden geraniums is obscure.

In all the sections the varieties are of a highly ornamental character, but for general cultivation the market type is preferable for indoor purposes, while the zonals are effective either in the greenhouse or flower garden. Some of the Cape species are still in cultivation — the leaves of many being beautifully subdivided, almost fernlike in character, and some of them are deliciously scented; P. quercifolium is the oak-leaf geranium. The ivy-leaf geranium, derived from P. *peltatum,* has given rise to an important class of both double- and single-flowered forms adapted especially for pot culture, hanging baskets, window boxes and the greenhouse. The common household geranium can be wintered over by hanging, roots up, in a cool, frost-free place.

The best soil for pelargoniums is a mellow fibrous loam with good well-rotted stable manure or leaf mould in about the proportion of one-fifth; when used it should not be sifted, but pulled to pieces by the hand, and as much sand should be added as will allow the water to pass freely through it. All are readily increased by cuttings made from the shoots when the plants are headed down after flowering, or in the spring, when they will root freely in a temperature of 65° to 70° F. They must not be kept too close, and must be very moderately watered.

GERARD (d. 1108), archbishop of York under Henry I, began his career as a chancery clerk in the service of William Rufus. He was one of the two royal envoys who, in 1095, persuaded Urban II to send a legate and Anselm's pallium to England. Gerard was rewarded for his services with the see of Hereford (1096). On the death of Rufus he at once declared for Henry I, by whom he was nominated to the see of York. He made difficulties when required to give Anselm the usual profession of obedience, and took the king's side on the question of investitures. He pleaded Henry's cause at Rome with great ability, and claimed that he had obtained a promise, on the pope's part, to condone the existing practice of lay investiture. But this statement was contradicted by Paschal, and Gerard incurred the suspicion of perjury. About 1103 he wrote or inspired a series of tracts which defended the king's prerogative and freely attacked the ecumenical pretensions of the papacy. In 1105, he became a stanch friend and supporter of Anselm. Gerard was a man of considerable learning and ability; but the chroniclers accuse him of being lax in his morals, an astrologer and a devil worshipper.

(H. W. C. D.)

GERARD (c. 1040–1120), variously surnamed TUM, TUNC, TENQUE or THOM, founder of the order of the Knights of St. John of Jerusalem (*q.v.*), found his way in some capacity to Jerusalem, where a hospice existed for visitors to the holy places. Of this institution Gerard became guardian about 1100, and he organized that religious order of St. John which received papal recognition from Paschal II in 1113, by a bull which was confirmed by Calixtus II shortly before the death of Gerard in 1120.

GERARD OF CREMONA (*c.* 1114–1187), medieval translator of Arabic into Latin, was born at Cremona in Lombardy. Little is known of his life. He went to Toledo to learn Arabic in order to read the Almagest of Ptolemy (not then translated into Latin) and remained there for the rest of his life. About 80 translations from the Arabic have been attributed to him. but it has been suggested that he was in charge of a school of translators which nas responsible for some. Many early printed editions of them omit the name of the translator. His translation of the *Almagest* (printed in 151j) was finished in 1175, it became more popular than that made from the Greek text about 15 years earlier in Sicily. Among other Greek authors translated from Arabic versions traditionally by Gerard are Aristotle, Euclid and Galen.

Translations of original Arabic texts attributed to him include works on medicine (*e.g.,* Avicenna's "Canon"), mathematics, astronomy, astrology and alchemy.

See B. Boncompagni, *Gherardo Cremonese e Gherardo da Sabbionetta* (1851); G. Sarton, *Introduction to the History of Science,* vol. 2, pp. 338–344 (1931).

GÉRARD, FRANÇOIS, BARON (1770–1837), French painter, who executed portraits of the most celebrated men and women of Europe, was born on May 4, 1770, at Rome, where his father occupied a post in the house of the French ambassador. At the age of 12 he obtained admission into the Pension du Roi at Paris, and from there passed to the studio of the sculptor Augustin Pajou; he subsequently studied with the painter Brenet and with David. In 1791, on his return to Paris after a stay in Rome, David availed himself of Gérard's help, and one of that master's most celebrated pictures—"Le Pelletier de St. Fargeau"—may owe much to the hand of Gérard. In 1793, at David's request, he was named a member of the revolutionary tribunal, from the fatal decisions of which, however, he invariably absented himself. In 1794 he obtained the first prize in a competition, the subject of which was "The Tenth of August," and in 1795 produced his famous "Bélisaire." A portrait of his generous friend Isabey the miniaturist (in the Louvre) obtained undisputed success in 1796, and the following year he executed his "Psyché et l'Amour" (also in the Louvre). A portrait of Madame Bonaparte in 1799 established his position as a portrait painter. All the leading figures of the empire and of the restoration sat for Gérard. This extraordinary vogue was due partly to the charm of his manner and conversation; Madame de Staël, Canning, Talleyrand and the duke of Wellington all bore witness to this.

Gérard died on Jan. 11, 1837.

GERARD, JAMES WATSON (1867–1951), U.S. lawyer and diplomat, was born at Geneseo, K.Y., on Aug. 25, 1867. Educated at Columbia university and at the New York law school, he was admitted to the bar in 1852 and began to practise in New York city. In 1908 he became associate justice of the supreme court of New York, resigning in 1913 on being appointed ambassador to Germany. At the outbreak of World War I, he assumed the care of British, Japanese, Rumanian and Serbian interests in Germany. On Feb. 3, 1917, diplomatic relations were broken off by the U.S. and he was recalled. On his return he resumed the practice of law in New York city.

Gerard wrote My *Four Years in Germany* (1917); *Face to Face with Kaiserism* (1518); and My *First Eighty-three Years in America* (1951).

He died in Southampton, N.Y., Sept. 6, 1951.

GÉRARD, JEAN IGNACE ISIDORE: *see* GRANDVILLE.

GERARD, JOHN (1545–1612), English herbalist and surgeon best known for his *Herball,* was born at Nantwich, Cheshire. He was educated at Willaston and, setting up in London, acted as superintendent of the gardens of Lord Burghley, chief secretary of state under Elizabeth I. Gerard's *Herball* (1597) was really an adaptation of the *Stirpium historiae pemptades* (1583) of Rembert Dodoens. Its style makes it the most famous of English herbals, though not the best. Its illustrations are mostly impressions from the wood blocks employed by Johann Teodor Tabernaemontanus in his *Icones plantarum,* published at Frankfurt in 1590. One of the woodcuts in the *Herball* represents the potato, and is thought to be the first figure of the plant published. There is also a figure of the "goose tree."

Gerard died in London in Feb. 1612.

See A. Arber, *Herbals,* 2nd ed. *(1938).*

GERARD, JOHN (1564–1637), English Jesuit missionary in England under Elizabeth I, was born at Etwall hall. Derbyshire, Oct. 4, 1564. After studying at the English college in Rome, where he was ordained priest, he entered the Society of Jesus in 1588, and returned secretly to England. Starting in Norfolk and then working south into Suffolk and Essex, Gerard established several centres with resident Catholic priests in the houses of the gentry. Dressed as a country gentleman he traveled unmolested and made many converts. He was a born leader, a man of commanding stature, great vigour of constitution, fluent in several languages, with a natural courtliness of manner. In July 1594 he was captured and spent three years in prison. He escaped from the Tower of London in 1597, and subsequently worked in Northamptonshire, Oxfordshire and Buckinghamshire. After the Gunpowder plot he managed to leave England in dis uise in 1606. The rest of his life was spent in English colleges on the continent. In 1607 he wrote a history of the Gunpowder plot and his autobiography, a vivid and accurate account (in Latin) of his experiences in England. He was spiritual director of the English college in Rome (1627–37), where he died, July 27, 1637.

See *The Condition of Catholics Under James I (Father Gerard's Narrative of the Gunpowder Plot),* ed. with his life by J. Morris *(1871)* and P. Caraman's trans. of the Autobiography, 2nd ed. *(1956).* (P. CN.)

GERASA, an ancient city of Palestine in the highlands of Gilead, 20 mi. N. of 'Ammān (Philadelphia) and 20 mi. E. of the Jordan (mod. Jerash). The city, now ruined, is pleasantly situated in a valley through which runs a perennial stream, the Chrysorrhoas of the Greeks, to fall into the Zerka (Jabbok) 6 mi. to the south. The site is undulating and strewn with knolls offering excellent positions for public buildings, a circumstance of which the Roman architects took full advantage, as their structures, magnificent even in ruin, testify. After 1878 a colony of Circassians occupied the site, or rather a small portion of it. The building materials for their village on the east bank of the stream have been extracted from the ruins, the bulk of which lie on the west bank.

The delightful orchard gardens of Jerash make it one of the pleasantest towns in all Palestine.

History.—Nothing up to the present, is known of the history of the city in Old Testament times or earlier, although the site was probably occupied. unless it represents Ramoth Gilead as has been suggested. Iamblichus asserts that it was originally colonized by veterans of Alexander the Great. Josephus tells us that it was captured by Alexander Jannaeus (c. 83 B.C.), rebuilt by the Romans (c. A.D. 65), burned by the Jews, and subsequently desolated and burned by Vespasian's captain Annius. From the time of Trajan it belonged to the Roman province of Syria, but about A.D. 160 it was allotted to the province of Arabia and during the peaceful reign of the Antonines (130–180), was adorned with magnificent buildings and rose rapidly in importance and prosperity.

If was the second city of the Decapolis and early in Christian times became the see of a bishop. To the Talmud and Jerome, Gerdsa and Gilead were synonymous, and similarly Mukkadsi calls Jebel 'Ajlūn, Jebel Jerash, Tughtakin. The atabeg of Damascus, had there a castle which was taken and destroyed by Baldwin II (1121). The Arabic geographer Yākūt, on the evidence of an eyewitness, reports it in ruins at the beginning of the 13th century. The "Gerasenes" of Matthew viii, 28 were not natives of Gerasa, as might be thought, but must be sought elsewhere (Khersa?).

Archaeology.—Of the many beautiful architectural monuments beyond Jordan, the fruit of Roman administration, the ruined grandeur of Gerasa supplies the finest. Laid out on a definite scheme with colonnaded main and cross streets, it is an early example of enlightened town planning. The city was surrounded by walls, 8 ft. thick, with a total circuit of 3,000 yd., and had six gates, the principal ones being north and south. The stream, near to which and roughly parallel to it ran the main street, divided the city in two, but the main public buildings were on the west bank and on the west side of the road. The approach to Jerash from the south passes a triumphal arch 300 yd. from the south gate. Between this and the gate on the left hand side are the ruins of a *naumachia* or tank for naval displays (170 × 60 yd.) and contiguous to it a stadium (100 × 60 yd.). Within the walls are found the main objects of interest: a fine peripteral temple; a theatre (south) in a good state of preservation; a colonnaded loop in the road generally, but doubtfully, regarded as the forum; a basilica or senate house; the great sun temple; a tetrapylon at the crossroads; and a theatre (north).

The outstanding feature of the site is undoubtedly the profusion of columns, of which over 200 still stand. "A catalogue of the visible monuments alone can convey little impression of their supreme beauty from the point of view of classical art, and not only are the buildings in themselves triumphs of architecture, but they are strikingly placed so that each one meets the eye as a distinct feature, while from the distance they compose themselves readily into a single harmonious picture." The decay of the city resulted partly from a decrease in water supply and from seismic disturbances, as well as from political vicissitudes.

The Trans-Jordan government in 1926 cleared the main street and retrieved and consolidated dangerous parts of the ruins. Excavation was begun on the temple area, and tourists were given facilities to visit Jerash by the government. (E. Ro.)

GERBIL, a small, jumping rodent (*q.v.*) of the deserts of Asia and Africa. The typical genus *Gerbillus*, along with *Meriones, Tatera* and others, form a special subfamily of the Cricetidae. Gerbils have unusually large eyes and ears, elongated hind limbs and long hairy tails; they progress by leaps, in the same manner as jerboas (*q.v.*).

These sandy-coloured herbivores live in burrows furnished with numerous exits and containing large grass-lined chambers. Most of them are active only during the day.

GERENUK, a gazellelike antelope, commonly known as Waller's gazelle (*Litocranius walleri*), having exceptionally long limbs and a long. slender neck. It ranges in east Africa from Somaliland to Kilimanjaro. being found in family groups. The gerenuk is noted ior its ability to stand on its hind limbs while browsing on branches and leaves of trees and shrubs. The horns of the buck are heavy and have a peculiar forward curvature at the tips; the coat is reddish-brown mith a broad darker band down the back.

See ANTELOPE.

GERGOVIA (modern Gergovie), in ancient geography, the chief settlement of the Arverni. situated in the Auvergne, 8 mi. from the Puy de Dôme. France. Julius Caesar attacked it in 52 B.C., hut was beaten off. Some walls and earthworks, probably of this period, survive.

Later, when Gaul had been subdued, the place was dismantled and its Gaulish inhabitants resettled 4 mi. away in the plain at the new Roman city of Augustonemětum (modern Clermont-Ferrand).

GERHARD, JOWANN (1582–1637), German Lutheran theologian, chairman of every major Lutheran theological assemhly of the period, biblical and patristic scholar of the first rank and a formidable polemicist, was born of a prominent Quedlinhurg family on Oct. 17, 1582. Profoundly influenced in his youth by the great Lutheran theologian-mystic Johann Arndt (*q.v.*), Gerhard studied philosophy, medicine and theology at the universities of Wittenberg, Marburg and Jena (D.Th., 1605). He became superintendent of the churches of Heldburg in the duchy of Coburg (160j); in 1615 he was appointed general superintendent of all churches in the duchy. The next year he rejoined the Jena theological faculty, where he remained until his death, Aug. 17, 1637.

Gerhard's theological system—most fully set forth in his monumental nine-volume *Loci theologici* (1610–22), the most important dogmatic work of the era of Lutheran orthodoxy—is deliberately designed to be both catholic and evangelical. Though constructed, after the fashion of the times, on a neo-Aristotelian framework, it recognizes the Sacred Scriptures as its only "principle" and breathes a profoundly practical and ethical concern throughout.

His other major works are the four-volume *Confessio catholica* (1634–37), a defense of the catholicity of the Lutheran position; *Meditationes sacrae* (1606), a small devotional manual that has been translated into almost every European language; *Harmonia evangelistarum* (1626–27), a harmonization of and commentary on the Gospels which completed the earlier work of Martin Chemnitz (*q.v.*) and Polycarp Leyser; and his posthumously published *Patrologia* (1653).

See E. R. Fischer, *Vita Ioannis Gerhardi* (1723); B. Hägglund, *Die Heilige Schrift und ihre Deutung in der Theologie Johann Gerhards* (1951), with detailed bibliography. (A. C. PN.)

GERHARDT, CHARLES FRÉDÉRIC (1816–1856), French chemist and theorist on organic compounds, was born at Strasbourg on Aug. 21, 1816. After attending the gymnasium at Strasbourg and the polytechnic at Karlsruhe. he mas sent to the school of commerce at Leipzig, where he studied chemistry under Otto Erdmann. Later he worked for some time with Liebig at Giessen. At Liebig's recommendation he was appointed demonstration assistant to Dumas in Paris. In 1841 he received the doctorate at the University of Paris. He became professor of chemistry at Montpellier in 1844, and in 1855 at Strasbourg, where he died on Aug. 19. 1856.

Although Gerhardt did some noteworthy experimental work—for instance, his preparation of acid anhydrides in 1852—his contributions to chemistry consist not so much in the discovery of new facts as in the introduction of new ideas that vitalized and organized an inert accumulation of old facts.

In 1839 he revived the old radicle theory of organic compounds under the title of the "theory of residues." In 1845 he invented the theory of homologues, which proved very useful in determining what members were still missing in the various series of compounds. Gerhardt first suggested that many organic substances were "conjugated" or "copulated" compounds formed by the union of two residues. In 1842 he attempted the first definite classification of organic compounds, but owing to the obscurity of some of his concepts, little progress was made until he cooperated with Auguste Laurent (*q.v.*).

Eventually Gerhardt introduced the idea that all substances were based on four main types; viz., hydrogen, hydrochloric acid, water and ammonia. Although these ideas were later abandoned they play an important part in the development of structural organic chemistry.

His chief works were *Précis de chimie organique* (1844–4j), and *Traite de chimie organique* (1853–56).

GERHARDT, ELENA (1883–1961), Germanmezzo-soprano singer. was born at Leipzig on Nov. 11, 1553. She studied at the Leipzig conservatory under Marie Hedmondt. and afterward received help in interpretation from Arthur Nikisch. who frequently accompanied her at concerts. As a lieder singer. and especially as an interpreter of Schubert. she set a high standard of purity and simplicity. She died in London on Jan. 11, 1961.

GERHARDT, PAUL (1607–1676), German hymn writer, was born at Grafenhainichen on March 12, 1607. After tutoring in Berlin. in 1657 he became "diaconus" to the Nicolaikirche there. Because of his uncompromising Lutheranism he refused to accept the elector Frederick William's "syncretistic" edict of 1664, and was deprived of his office in 1666. In spite of a public petition in 1667, he refused to resume an office which, he thought, implied at least a tacit repudiation of the Formula Concordiae. In 1668 he was appointed archdeacon of Lubben, Saxe-Mersburg, where he died on June 7, 1676.

Gerhardt is the greatest German hymn writer of the 17th century. Many of his best-known hymns first appeared in church hymnbooks, as for example in the Brandenburg hymnal in 1658; others in Johann Criiger's *Geistliche Kirchenmelodien* (1649), and *Praxis pietatis melica* (1656). The first complete set is the *Ceistliche Andachten* (1666–67), edited by Ebeling, music director in Berlin.

The life of Gerhardt has been written by Roth (1829), by Langbecker (1841), by Schultz (1842), by Wildenhahn (1845), by Bachmann (1863) and by H. Petrich (1914); also by Kraft in Ersch u. Gruber's *Allg. Encycl.* (1855).

The best modern edition of the hymns, published by Wackernagel in 1843, has often been reprinted (Eng. trans. by Kelly, *Paul Gerhardt's Spiritual Songs,* 1867).

See also T. B. Hewitt, *Paul Gerhardt as a Hymn-writer and His Influence on English Hymnody* (1918).

GERIATRICS: *see* GERONTOLOGY AND GERIATRICS.

GÉRICAULT, JEAN LOUIS ANDRÉ THÉODORE (1791–1824), French painter who influenced the romantic and realist movements, was born at Rouen on Sept. 26, 1791. He studied under Carle Vernet, who introduced him to the traditions of English sporting art, and then under Pierre Guérin, absorbing the methods of classicist figure construction and composition. At the Salon of 1812, he attracted notice with his "Charging Chasseur" (Louvre, Paris), executed in an impetuously dynamic, colourist style inspired by Gros and Rubens. Already he had begun to develop along two divergent lines shown in the visual realism of his many small studies of horses and soldiers, as against the grander, more severe style of his mythological compositions and landscapes (*cf.* the two "Heroic Landscapes," Chrysler collection). At the Salon of 1814, his "Wounded Cuirassier" (Louvre) shocked critics with its ponderous forms and sombre colours. Géricault spent 1816–17 in Florence and Rome, where his chief project was the unfinished "Race of the Riderless Horses," a huge, heroic frieze composition, surviving in a series of studies (Baltimore, Md.; Lille; Louvre; Rouen).

BY COURTESY OF MUSÉE DE LYONS

"A MAD WOMAN WITH A MANIA OF ENVY," ONE OF A SERIES OF FIVE PORTRAITS OF THE INSANE BY GÉRICAULT. IN LYONS MUSEUM

Returning to France in 1817. Géricault drew a group of military lithographs reckoned among the early masterworks in this medium. His sensational "Raft of the Medusa" (Louvre) was suggested by a contemporary shipwreck. In this enormous canvas he tried to raise a contemporary event beyond the triviality of reportage to the dignity of monumental art. The two aspects of his style here became united: starting with a close inquiry into its visual aspects (*cf.* the portraits of cadavers). he developed his theme into a carefully constructed dramatic composition. This controversial work marked the beginning of the struggle between the classicist and romantic movements. Disappointed by its hostile reception, Géricault left for England (1820) where, again influenced by British genre art, he produced lithographs, watercolours and oils ("Epsom Downs Derby," Louvre) of superb colour and grandly simple forms. The most significant of his last works are the portraits of the insane (Louvre; Lyons; Ghent; Winterthur and Springfield, Mass.). He died from the consequences of a fall from his horse on Jan. 26, 1824. in Paris.

See C Clement, Th *Géricault,* 2nd ed (1879) ; G. Oprescu, *Géricault* (1927); K. Berger, *Th. Géricault* (1952), Eng. trans. by Winslow Ames (1955); D. Aime-Azam, *Maeeppa* (1956). (L. E. A. E.)

GÉRIN-LAJOIE, ANTOINE (1824–1882), Canadian writer, librarian and leader in the early literary movement of French Canada, was born at Yamachiche, Aug. 4. 1824. He was educated at the Collège de Nicolet, where he wrote the first French-Canadian play, *Le jeune Latour.* In 1844 he joined the staff of the Montreal newspaper *La Minerve,* of which he soon became editor. At the same time he studied law and he was called to the Quebec bar in 1848. but he never practised law. In 1852, he was appointed translator to the legislative assembly of Canada; four years later he was made assistant librarian of parliament, a post which he held until 1880.

Gérin-Lajoie was one of the founders of the Montreal club, Institut Canadien and of the literary magazines *Les Soirées canadiennes* (1861–65) and *Le Foyer canadien* (1863–66). He was the author of *Catéchisme politique* (1851); *Dix Ans au Canada, de 1840–1850* (1888), the history of the advent of responsible government in the colony; and of a novel in two parts, *Jean Rivard, le de'fricheur* (1862) and *Jean Rivard, l'économiste* (1864), a portrayal of rural life in French Canada in mid-19th century. He died at Ottawa on Aug. 4, 1882. (G. J. SE.)

GERIZIM, a mountain in Jordan (mod. Jabal at Ṭūr), 2,890 ft. above sea level. With its companion mountain, Ebal, it flanks the valley in which lies Nāblus (Neapolis), the ancient Shechem.

History.— It was on Ebal and Gerizim that the tribes assembled under Joshua to hear the curses and the blessings connected with the violation and observance of the law (Deut. xi). The distance from Ai and the position of Ebal and Gerizim in the midst of a hostile country have constituted difficulties which Eusebius, Epiphanius and others met by associating Ebal and Gerizim with hillocks in the lower Jordan valley—a solution that has never found favour. From Gerizim—a prominent rock is still pointed out as his pulpit—Jotham addressed his parable to the treacherous elders of Shechem (Judges ix). This mountain is the holy place of the Samaritan community. About 432 B.C., following on the refusal of the Jews returned from the Exile to recognize the Samaritans, the latter erected on the mount a temple as rival to that at Jerusalem. This was probably destroyed by John Hyrcanus (c. 110 B.C.). The Samaritans were expelled from Gerizim by the emperor Zeno, who built a church (484). In the course of his struggle with the Samaritans, Justinian surrounded this church with a fortress.

Archaeology.— A small level plateau near the summit marks the site of the schismatic temple and an important link with the past was the celebration near this spot of the Passover by the Samaritans, comprising a small body in modern times. "As the sun sets on Passover eve the seven lambs are slain, ceremonially examined and roasted in the oven pit. At midnight the covering is removed and the flesh is eaten by the standing elders with their families in the improvised tents. Anything left over is scrupulously collected and consumed, so that the letter of the commandment may be kept." Excavations carried out by the German Archaeological institute uncovered Zeno's basilica. This building (121 ft. by 98 ft.), which was built over the ruins of the Samaritan temple, exhibits a well-preserved octagonal ground plan. Two side chapels with handsome mosaics were also disclosed. The abundance of fragments suggested that it would be possible to determine accurately the details of architectural design. (E. Ro.)

GERLACH, HELLMUT VON (1866–1935), German pacifist. radical journalist and political leader, a courageous opponent of German nationalism under William II, the Weimar republic and the Hitler regime, was born on Feb. 2, 1866. at Mönchmotschelnitz in Silesia. The descendant of a family of Prussian administrators, Gerlach held the conservative views of his class; but during his studies at Geneva. Strasbourg, Leipzig and Berlin he was influenced by Christian Socialism and Lord Randolph Churchill's "Tory democracy" won his admiration. In 1887 he entered the Prussian civil service but left it for journalism. working for Adolf Stocker (who combined Christian Socialism with anti-Semitism) on the newspaper *Das Volk.* Gerlach's political ideas were too radical for the paper, however, and Stocker dismissed him in 1896. In the same year Gerlach nas a co-founder. with Friedrich Naumann, of the National Social association (Nationalsozialer Verein) and, after visiting England and the Balkans. joined the staff of Naumann's new paper *Die Zeit.* In 1901 he became editor of the Berlin democratic newspaper *Die Welt am Montag,* and from 1903 to 1906 he represented the National Social party in the *Reichstag.* After losing his seat he visited Africa, where he became an admirer of British colonial methods.

During World War I Gerlach openly championed pacifist views. After the revolution he was undersecretary of state in the Prussian ministry of the interior (Nov. 1918–March 1919). where his conciliatory and liberal policy toward Poland earned him the hatred of the German nationalists. He remained, however, an active supporter of pacifist and radical-democratic organizations. In 1933 he emigrated, becoming the recognized head of German exiles in Paris. where he died on Aug. 2, 1935. His books include *Der Zusammenbruch der deutschen Polenpolitik* (1919); *Meine Erlebnisse in der preussischen Verwaltung* (1920); *Erinnerungen eines Junkers* (1924); *Von Rechts nach Links,* ed. by Emil Ludwig (1937).

GERLACH, LEOPOLD (1790–1861) and **ERNST LUDWIG VON** (1795–1877), brothers, mere leading figures in the movement of romanticism and reaction that determined Prussian politics from the Napoleonic Wars to the end of Frederick William IV's reign, after which Ernst Ludwig lived on to represent conservative opposition to Bismarck's power politics. Leopold was born in Berlin on Sept. 17, 1790, Ernst Ludwig on March 7. 1795. Leopold served as an officer in the war of 1806 and again in that of 1813–15. in which his brother also served as a volunteer. The romantic and conservative spirit of the Wars of Liberation against the French inspired both brothers with a lifelong belief in a greater Germany: with revolutionary France as its hereditary enemy; and therefore also with a readiness to side with Austria. In 1811, together with the poets Achim von Arnim and Heinrich von Kleist, Leopold joined the Christlich-Deutsche Tischgesellschaft (Christian-German Dining club); and from 1816 to 1819 both brothers were members of the Christlich-Germanische Tischgesellschaft favoured by the crown prince, the iuture Frederick William IV. Both identified themselves with the strict pietism of the postwar years, taking their political principles from Albrecht von Haller and, above all, from Friedrich Julius Stahl. After Frederick William had come to the throne (1840), Leopold, who had formed a close friendship with him, rose to be his adjutant general (1849) and became the most influential man of his entourage. In the fight against the revolution of 1848 he was the moving spirit of the "Camarilla" at court which, though it had to put up with the constitution of Nov. 1850, did its utmost to revise it in a conservative direction.

Meanwhile Ludwig, who in 1844 had been appointed president of the Magdeburg appeal court; founded the conservative newspaper *Kreuzzeitung* in 1848, in which his monthly commentaries appeared until 1857. Even more dogmatic than Leopold, he was second only to Stahl as a leader of conservative thought. In 1849 the brothers. uncompromisingly opposed to the liberal idea of a German nation, persuaded Frederick William IV to refuse the imperial dignity offered to him by the Frankfurt assembly. Both vigorously fought the German politics of J. M. von Radowitz, welcomed the Olmutz agreement (1850) and vainly sought to persuade the king to join Russia during the Crimean War. Leopold's correspondence with Bismarck. in its discussion of Napoleon III as a potential ally, shows that he early opposed his young friend's *Realpolitik,* though he had himself recommended Bismarck as Prussia's representative at the federal diet in Frankfurt. However, the brothers' narrow dogmatism, which regarded the movement toward German unity only as a "nationalist swindle," represented a lost cause even before Frederick William IV was dead.

Leopold died at Pocsdam on Jan. 10, 1861. eight days after Frederick William IV. His memoirs, in two volumes. were published in 1891–92 and his correspondence with Bismarck, ed. by H. Kohl. in 1896.

During the decade after 1862 Ludwig lived to see Bismarck completely abandon the ideas of traditional conservatism. His protest against the Prussian annexations of 1866 completed the breach between the former friends. Ludwig joined the Centre party as guest member, since throughout his life he had combined a firm Protestant conviction with respect for the ordered authority of the Roman Catholic Church. He died in Berlin on Feb. 18. 1877. There are *Aufzeichnungen aus seinem Lehen und Wirken,* ed. by his son, 2 vol. (1903).

GERLACHE, ÉTIENNE CONSTANTIN, BARON DE (1785–1871), Belgian Catholic statesman and historian. was born at Biourge. Luxembourg, on Dec. 26, 178.5. He studied law in Paris and practised there for some time, but he settled in Liege after the establishment oi the kingdom of the Netherlands. As a member of the states-general, he was an energetic leader of the opposition. He supported the alliance of the Belgian Catholics with the Liberal party, which paved the way for the revolution of 1830. On the outbreak of the insurrection in Aug. 1830 he still. however, thought the Orange-Nassau dynasty and the union with the Dutch provinces essential; but his views changed, and after holding various offices in the provisional government. he became president of the national congress and brought forward the motion inviting Leopold of Saxe-Coburg to become (on July 21 1831) king of the Belgians. In 1832 he was president of the chamber of representatives, but on Oct. 4, when Pope Gregory XVI, in the encyclical *Mirari vos,* condemned H. F. R. de Lamennais's conception of liberty, he resigned. accepting the Holy See's ultramontane ideas. On Oct. 13. 1832, the king appointed him president of the *cour de cassation* (supreme court of appeal), and he kept that office for 35 years. He was created a baron on Jan. 16, 1844. He also presided over the Catholic congresses held at Malines between 1863 and 1867. That his early liberal views underwent some modification was plain from the conservative principles enunciated in his *Essai sur le mouvement des partis en Belgique* (1852). As a historian his work was strongly coloured by his anti-Dutch feelings and his Catholic predilections. His *Histoire du royaume des Pays-Bas de 1814 jusqu'en 1830* (1839), published in two volumes, was a piece of special pleading against the Dutch domination. A complete edition of his works. 6 vol. (1874–75), includes a biography by J. J. Thoniisen. He died in Brussels on Feb. 10, 1871.

See Pierre de Gerlache, *Gerlache et la fondation de la Belgique (1931).* (C. VE.)

GERLACHE DE GQMERY, ADRIEN VICTOR JOSEPH DE, BARON (1866–1934), Belgian naval officer and polar explorer who led the first truly scientific expedition to the antarctic, was born at Hasselt. Limburg, on Aug. 2, 1866. He made his antarctic voyage in the "Belgica" (1897–99). After making new discoveries north of Graham Land, De Gerlache navigated into the pack ice. The vessel was beset there for 13 months, and thus became the first ship to winter in the antarctic. Despite extreme hardships the expedition completed valuable scientific work.

In 1901 De Gerlache led an expedition in the "Sélika" to the Persian gulf to collect zoological specimens. In 1905, again in the "Belgica." he carried out important oceanographical work off the east coast of Greenland. He led similar expeditions to the Barents and Kara seas in 1907 and to the Barents and Greenland seas in 1909, traversing the latter from west to east along latitude 78°. In 1913–14 he assisted Sir Ernest Shackleton in the organization of the Imperial Transantarctic expedition (1914–17), selling to the latter his yacht "Polaris," which was rechristened "Endurance." De Gerlache was granted the title of baron by a royal decree of Nov. 9, 1924.

He died in Brussels on Dec. 4, 1934. (H. G. Kc.)

GERLE, CHRISTOPHE ANTOINE (1736–*c.* 1801), French revolutionist and mystic, was born at Riom in Auvergne. He entered the Carthusian order and became prior of Laval-Dieu in Perche and afterward of Pont-Sainte-Marie at Moulins. He was elected deputy to the states-general in 1789 and in 1792 was chosen elector of Paris. During the revolutionary turmoil he developed a strong vein of mysticism. mingled with ideas of reform. He served as co-president with Catherine Théot (*q.v.*) at her meetings. She: Gerle and others were arrested, but he was later released by the Directory. Gerle. who renounced his monastic vows in Paris, became one of the editors of the *Messager du soir* and later was in the office of Pierre Bénézech. minister of the interior.

GERMAIN, SOPHIE (1776–1831), French mathematician, made notable contributions to the study of acoustics. elasticity and the theory of numbers. Born in Paris, April 1. 1776. she took correspondence courses from the École Polytechnique which did not accept women in the school itself. Her most fruitful contribution was the demonstration of the impossibility of solving Fermat's Last Theorem if x, y, z are not divisible by an odd prime, n.

After Ernst Chladni had demonstrated his vibrating plates. she presented three memoirs on ihe theoretical explanation of the phenomenon. in 1811, 1813 and 1816. This last memoir was awarded a prize offered by the Institut de France on the suhjecc, even though the equation was not yet rigorously demonstrated. She later succeeded in establishing the equation for the normal vibrations of a plate.

She was a friend of the mathematicians J. L. Lagrange and Carl Gauss. with whom she corresponded under her pseudonym M. Le Blanc before revealing her identity. Sophie Germain was highly esteemed by the great Gauss. who recommended her for an honorary degree from the University of Gfttingen. She died in Paris, June 26, 1831, before the degree could be awarded.

GERMAN, SIR EDWARD (1862–1936), English composer of light operas who was a follower of Sir Arthur Sullivan. His real name was Edward German Jones. Born at Whitchurch, Shropshire, on Feb. 17, 1862, he studied at the Royal Academy of Music, London. where his operetta The Rival Poets was performed in 1886. Beginning his career as an orchestral violinist and conductor at the Globe theatre, London, he became known as a composer of graceful incidental music for plays, including Richard *III* (1889). Henry *VIII* (1892) and *Nell* Gwynn (1900). Sets of dances from his music for the tno last-named plays won wide popularity. In 1901 German completed the score of The Emerald Isle, left unfinished by Sullivan, and during the next few years he composed four light operas,: *Merrie* England (1902), *A* Princess of *Kensington* (1903), *Tom* Jones (1907) and Fallen Fairies, on a libretto by W. S Gilbert (1909). Among German's orchestral works are two symphonies, three suites. *Welsh Rhapsody, Theme and Six* Diversions and a symphonic poem, *Hamlet;* he also wrote a number of successful songs. His music has melodic charm and distinction, a high standard of craftsmanship and. in the light style that he cultivated, a marked national character. He was knighted in 1928. He died in London on Nov. 11, 1936.

See W. H. Scott, *Edward German, an Intimate Biography* (1932). (H. Ru.)

GERMAN BAPTIST BRETHREN: see BRETHREN, CHURCH OF THE.

GERMANDER, the name given to plants of the genus Teu*crium,* mint family (Labiatae). comprising about 100 species distributed all over the world, a few of which are grown for ornament or fragrance. The common North American forms (T. *canadense* and T. occidentale) and the common British species (T. scorodonia) are frequently known as wood sage. The plants are small, uith small flowers remarkable for the slight development of the upper lip. T. chamaedrys, wall germander, forms low tufts; T. *fruticans,* brush or tree germander, is an evergreen shrub.

The so-called germander speedwell, Veronica chamaedrys, belongs to the figwort family (Scrophulariaceae).

GERMANIC LANGUAGES are a group of related languages comprising the modern and earlier forms of English, Frisian, Netherlandish (Dutch, Flemish), German (High and Low), Icelandic, Norwegian, Danish, Swedish, and a number of extinct languages, notably Gothic. The earliest recorded Germanic consists of mere fragments: from the 3rd to the 1st century B.C., a single inscription in North-Etruscan letters on a helmet unearthed near Negau, southern Austria: harigasti teiwa "Harigasti (owner of the helmet?) Teiwa (name of a god)"; and, beginning in the 1st century B.C., isolated Germanic words and names recorded by classical authors (Caesar, Tacitus, Pliny and others). The earliest extensive Germanic text is the (fragmentary) Gothic Bible translated by the Visigothic bishop Ulfilas (c. A.D. 350), written in a 27-letter alphabet of his own invention. From c. 200 to 800 there are scattered early Norse inscriptions, written in the 24-letter runic alphabet, *e.g.,* the inscription on a golden horn found in Gallehus (now Møgeltønder), Denmark, dating from c. 400: ek *hlewagastiʀ holtijaʀ horna tawido* "I, Hlewagast of Holt [Holstein], made [this] horn." Derivatives of this runic alphabet were used sparingly in England, Germany and particularly in Scandinavia. All extensive later texts use adaptations of the Latin alphabet. Old English (Anglo-Saxon) texts date from the early 7th century; Old High German from the middle 8th; Old Low German (usually called Old Saxon) from the early 9th; Old Norse (Old Icelandic and Old Norwegian) from the middle 12th (though many poems preserve an older form of the language); Old Netherlandish (Old Dutch) from the late 12th; Old Frisian from the early 13th; Old Swedish and Old Danish from the end of the 13th. (The following abbreviations will be used: Gmc., Germanic; Got., Gothic; ON, Old Norse; OE, Old English; OF, Old Frisian; OS, Old Saxon: OHG. Old High German.) See GOTHS; RUNE.

Proto-Germanic. — The statement that the languages named are related is based on the technical linguistic usage: related languages are variant historical developments of a single earlier language. Thus the Romance languages (French, Spanish, Italian, etc.) are said to be related because they can be shown to be variant developments of a single earlier language, Latin, of which there are extensive written records. In the case of Germanic, no written records of the parent language exist; but much of its structure can be deduced by the comparative method of reconstruction. (A reconstructed language is called a proto-language; reconstructed forms are marked with an asterisk.) For example, a comparison of Runic *-gastiʀ*, Got. *gasts,* ON gestr, OE *giest,* OF *iest,* OS and OHG *gast* "guest" leads to the reconstruction of the Proto-Germanic (PGmc.) form **ḡástiz.* Similarly, a comparison of Runic horna, Got. *haurn,* ON, OE, OF, OS and OHG horn "horn" leads to the reconstruction of PGmc. **hórnan.*

Such reconstructions are in part merely formulas of relationships: the *ḡ* of **ḡástiz* is the particular phoneme of PGmc. which by regular phonetic change gave Got., ON, OS and OHG g-, but (before an a which had changed to e) OE gi- and OF i-. Likewise, the *o* of **hórnan* is the particular phoneme of PGmc. which, in this environment, gave au in Gothic, o in the other languages. In other environments, *e.g.,* when followed by nasal plus consonant, the same phoneme gave *u* in all the languages: PGmc. **dumbaz,* Got. dumbs, ON dumbr, OE, OF and OS dumb, OHG tumb "dumb." What may be deduced is that in some environments the phoneme sounded more like o, in others more like *u.* It may be written *u∼o,* indicating that it varied between these two pronunciations.

The example of PGmc. *u∼o* shows that the reconstructions are more than mere formulas: they also give some indication of how PGmc. actually sounded. Sometimes the correctness of these deductions is independently confirmed. For example, OE cyning and OS and OHG kuning "king" are the basis for the reconstruction of PGmc. **kúningaz;* this is confirmed by Finnish kuningas, which must have been borrowed from Gmc. at a very early date.

As reconstructed, PGmc. had the following system of vowels and consonants:

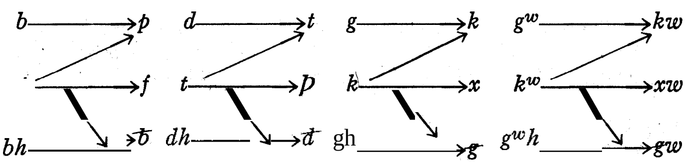
		ī			*p*		*b∼ƀ*				
i∼e	*u∼o*	ē		*ō*	*iu∼eu*	*t*	f	*d∼đ*	*s*	*z*	*m*	*n*
					ai au		*þ*					
	a		*ǣ*			k	*h∼x*	*g∼ḡ*	*w*	*j*	*l*	*r*

The *þ* represents the *th* of *thin, x* the *ch* of German *ach, j* the y of *yes.* To the above should perhaps be added long nasalized *į̄ ą̄ ų̄,* which resulted when inx anx unx changed to *į̄x ą̄x ų̄x.* The phonemes noted as *b∼ƀ, d∼đ, g∼ḡ* were the stops b d *g* in some environments, the spirants *ƀ đ ḡ* in others. (This type of alternation is not unusual; it occurs, for example, in modern Spanish.) The distribution seems to have been: all were stops'after nasal (mb nd ng) and when doubled (bb dd gg); *d∼đ* was also a stop initially and after l (d- ld); *b∼ƀ* was also a stop initially (b-); in other environments all three were spirants. The phoneme noted as h—x seems to have been h initially (h-), but *x* elsewhere.

Development. — By pushing the comparative method still farther back, relationships can be established between Germanic and other language groups, notably Celtic, Italic, Greek, Baltic, Slavonic, Iranian and Indic. All of these can be derived from a still earlier parent language, Proto-Indo-European (PIE).

A comparison of PGmc. with the PIE from which it developed reveals the many changes that occurred.

Consonants. — PIE had the spirant *s,* a few obscure consonants called "laryngeal," and at least the following stops (perhaps more): *p* t k k^w, b d g g^w, bh dh gh g^wh. By a change known as the Gmc. consonant shift (Grimm's law), the stops developed as follows:



Examples of b d g are: Lithuanian bald and Latin decem and genus but p t k in English pool, ten and kin. Examples of bh dh gh are: Sanskrit *bhū-*, dhd-, hd- (from **ghē-*) but b d g in English be, do, go. As for *p* t k, in the clusters *sp* st sk *pt* kt they gave PGmc. *sp* st sk f t xt: Greek *spáthē, stásis, skiá, skāpton* and *oktṓ* and also English spade, stead, shine (OE *scīnan*), shaft (OE *sceaft*) and eight (OE eahta). (By a special development, tt gave ss: Sanskrit sattci-, OE sess "seat".) Elsewhere, *p* t and k seem to have first become the voiceless spirants f *þ* and x. They remained so initially and after an accented vowel: Latin *piscis, tenuis* and *centum* but *f* th h in English fish, thin, and *hund(red)*; but, by a change known as Verner's law, after an unaccented syllable all voiceless spirants became voiced. Thereby f *þ* x coalesced with the new *ƀ đ ǥ* and *s* became *z:* Sanskrit *upári, mātár-, švašrū́-* (from **suekrū́-*) and *šašá-* (from **kasó-*) but OE *ofer* (from **oƀar,* cf. OHG *obar*) "over," *mōdor* "mother," *sweger* "mother-in-law" and *hara* (from **haza-*) "hare." PIE g^w k^w g^wh developed parallel to g *k gh;* but whereas they were separate phonemes in PIE (contrasting with the clusters *gu̯ ku̯ ghu̯*), in Gmc. they coalesced with these clusters and gave *kw xw gw*.

These changes gave the 11 stop and spirant phonemes assumed for PGmc. Reconstructions from the individual Gmc. languages then indicate that some of these began to undergo further changes: *ƀ đ ǥ* changed from spirants to stops in certain positions; and *x* changed to h initially.

Vowels.—Besides the above obstruents (stops and spirants), PIE had two other classes of phonemes: vowels and resonants. The vowel of any given root was not necessarily fixed, but varied in an alternation termed ablaut. Thus the root "sit" was alternately **sed-, *sod-, *sd-, *sēd-,* or **sōd-* (Eng. "sit" is from **sed-,* "sat" from **sod-,* "seat" from **sēd-*); and the root "do" was **dhē-, *dhō-,* or **dhə-* (Eng. "deed" is from **dhē-,* "do" from **dhō-*). Other vowels were a, *ā, ī, ū*. The PIE resonants were *i∼i̯, u∼u̯, m̥∼m, n̥∼n, l̥∼l, r̥∼r*. They were syllabic in some environments, nonsyllabic in others. Thus **bhr̥tó-* (Sanskrit *bhr̥tá-* "borne") had syllabic *r̥*, but **bhéreti* (Sanskrit *bhárati* "he bears") had nonsyllabic r. (Eng. "bear" is from **bher-,* "barrow" from **bhor-,* "burden" from **bhr̥-,* "bier" from **bhēr-.*)

This PIE system of vowels vs. resonants was reshaped by a number of changes. Syllabic *i u m̥ n̥* l *r̥* gave the vowels i u and the sequences *um un ul* ur; nonsyllabic *m* n *l* r gave the consonants m *n l r;* nonsyllabic *i̯ u̯* before vowels gave the consonants j w, though after vowels they continued to form diphthongs (*ei ai oi, eu au ou*). The resulting vowels and diphthongs then developed as follows:

i e a a o *u* e ē ō *ū* *ai oi* *eu* au *ou*

i∼e *a* *o∼u* *ī* *ē* *ǣ* *ō* *ū* *ai* *iu∼eo* *au*

These changes gave the PGmc. system of three short vowels (counting *i∼e, u∼o* as one each), five long vowels, and three diphthongs (counting *iu∼eo* as one). The variants *e, o, eo* occurred before a low vowel in the following syllable; the variants *i, u,* iu occurred before a high vowel (or j, *w*) in the following syllable, or before nasal plus consonant. Compare the following: PGmc. **béranan,* OE *beran* "to bear," but **biriþi,* OE *bir(e)þ,* "beareth"; PGmc. **gólþan,* OE *gold* "gold," but **gúlþjanan,* OE gyldan "to gild"; PGmc. **leoxtan,* OE *lēoht* "light," but **liuxtjanan,* OE liehtan "to give light."

Accent.—The PIE pitch accent which could fall on any syllable of a word was replaced in PGmc. by a stress accent on the first syllable. This seems to have led to a progressive reduction of unstressed syllables, *e.g.,* PIE **sodéi̯onom,* PGmc. **sátjanan,* OE *settan,* Middle Eng. *sette(n)*, modern "set." Strong initial stress is also reflected in the basic unit of old Gmc. poetry: two half lines, each with one of a small number of stress patterns, linked by the alliteration of stressed initial consonants or vowels (*e.g.,* Beowulf, li. 18: *Bḗo-wùlf* was *brḗme / blǽd wíde* spring "Beowulf was famous, his renown went far").

Declensions.—PGmc. kept the PIE system of three genders (masc., neut., fem.) and three numbers (sing., dual, plur.), though the dual was obsolescent. It reduced the PIE system of eight cases to six: nominative, accusative, dative, genitive, instrumental, vocative (though the last two were obsolescent). In the adjective declensions it made two innovations: (1) To the PIE vocalic types (*o-,* ō-, *i-,* u-stems) it added some pronominal endings to give the Gmc. "strong" adjective declension. (2) The PIE n-stem endings were extended to all adjectives to give the Gmc. "weak" adjective declension (*e.g.,* mod. German, strong: gutes Bier "good beer," but weak: das gute Bier "the good beer").

Conjugations.—The PIE verb seems to have had five moods (indicative, imperative, subjunctive, injunctive and optative), two voices (active, mediopassive), three persons (first, second, third), three numbers (sing., dual, plur.) and several infinitives and participles. In Gmc. these were reduced to: indicative, imperative, subjunctive-optative (usually called subjunctive, but containing the functions of both and actually derived from the PIE optative); a full active voice, plus an obsolescent passive (found only in Gothic); three persons: full singular and plural forms, plus an obsolescent dual (found only in Gothic); and one infinitive (present) and two participles (present and past). The PIE tense-aspect system (present, imperfect, aorist, perfect) was reshaped to a single tense contrast: present *v.* past. The past showed two innovations. On the one hand, in the "strong" verb, PGmc. transformed the ablaut of PIE into a specific tense marker, *e.g.,* PIE *bher-, bhor-, bhēr-, bhr-* in OE *beran* "bear," past singular *bær,* past plural *bǣron,* past participle boren. On the other hand, in the "weak" verb, it formed a completely new past and past participle, *e.g.,* OE *fyllan* "fill," past *fylde,* participle *gefylled.* Weak verbs fell into three classes depending on the syllable preceding the endings, *e.g.,* OHG full-e-n (from *full-*ja-n*) "fill," mahh-ō-n "make," sag-ē-n "say." Gothic also had a fourth type: *full-nō-da* "it became full."

Many PGmc. strong verbs showed a consonant alternation ("grammatical change") between *f/ƀ, þ/đ, x/ǥ, s/z*. This was the result, through Verner's law, of the alternating position of the PIE accent:

PIE **prḗu̯sonom*	PGmc. **fréosanan*	OE *frēosan* "to freeze"
**próu̯re*	**fráus*	*frēas* "(it) froze"
**prusń̥t*	**frúzunþ*	*fruron* "(they) froze"
**prusénos*	**frózenaz*	*froren* "frozen"?

In this particular word, English has generalized the *s* (now *z*): *freeze, froze, frozen;* German has generalized the z (now *r*) *frieren,* fror, gefroren; Dutch still shows the alternation: vriezen, vroor, *gevroren*. English has preserved grammatical change only in was, were and in a few isolated forms such as sodden, *(for)lorn,* the old past participles of seethe, lose.

Germanic Dialects.—Archaeological evidence suggests a relatively uniform Germanic people c. 750 B.C., located in southern Scandinavia and along the North sea and Baltic coasts from Holland to the Vistula. By c. 250 B.C., they had spread farther south and five general groups were distinguishable: (1) along the North sea coast and in Jutland; (2) along the middle Rhine and Weser; (3) along the middle Elbe; (4) along the Oder and Vistula; and (5) in Scandinavia (excluding Jutland).

Another 500 years later (A.D. 250) the division was much the same, though the Elbe group had spread southward to the Danube and the Oder-Vistula group southeast into the Carpathians and beyond.

Then came the great tribal migrations: part of the Korth sea group (Bede identifies them as Angles, Saxons and Jutes) conquered much of England; the Rhine-Weser group (Franks) conquered northern France; the Elbe group (Alemannians, Bavarians, Lombards) vacated the north and spread south; the Oder-Vistula group (Goths, Burgundians, Vandals) left to begin their many wanderings.

This five-way division of the Germanic peoples is based on nonlinguistic evidence; but it agrees well with the linguistic picture derived by the comparative method from earliest texts. Five groups were indeed distinguishable, though they were linked in sets of two, three or four through common linguistic innovations. Thus the East Gmc. group (Oder-Vistula) shared innovations with the North Gmc. group (Scandinavian): there PGmc. jj, *ww* (e g., **twajj-, *treww-,* cf. OHG zweiio "of two," *triuwi* "faithful") developed to long stop plus semivowel (cf. ON tueggia, tryggr, Got. *twaddjē, triggws*). On the other hand, North Gmc. and the three West Gmc. groups (North sea, Rhine-Weser, Elbe) shared certain later innovations: coalescence of *z* with *r* (Got. *maiza* "more," but OK *meire,* OE. OF *mára,* OS *mêro,* OHG *mēro*) and the loss of the reduplicative past of certain strong verbs (Got. *lailōt* "let," but ON, OE, OF, OS *lēt,* OHG *liaz*). The West Gmc. groups also showed innovations of their own: replacement of the *d*~*đ* alternation by simple *d* (PGmc. **blṓđan* "blood," Got., ON *blōþ,* but OE. OF. OS *blōd,* OHG *bluot*); the loss of final *-z* after unstressed vowels (PGmc. **dágaz* "day," Got. *dags,* ON *dagr,* but OE *dæg,* OF *dei,* OS *dag,* OHG *tag);* and the doubling of consonants in certain positions. especially before j (Got. *satjan* "set:" ON *setia,* but OE *settan,* OF *setta,* OS *settian,* OHG *setzen;* though ON also showed the doubling of *g* and k: Got. *lagjan* "lay," but ON *leggia,* OE *lecgan,* OF *ledza,* OS *leggian,* OHG *leggen).* Within West Gmc.. the North sea group showed innovations of its own: a single ending in the plural of verbs (where the others have one for each of the three persons); loss of the reflexive pronoun; loss of *-z* in certain pronoun forms (PGmc. **wīz* "we," Got. *weis,* ON *vēr,* OHG *wir,* but OE *wē,* OF, OS wi). The North sea group also shared some innovations with Korth Gmc.: loss of nasals before spirants (Got. *fimf, munþs, uns,* OHG *fimf, mund, uns* "five!" "mouth," "us.!' but OE. OF. OS *fif,mūþ* or *mūth, ūs;* in ON. only before *f* and *s: fifl* from **fimfill* "giant," *6s* "us") and i-umlaut, *i.e.,* the raising or fronting of stressed vowels before unstressed *j, i,* i (*cf.* the words "sit" and "lay" above; umlaut was just spreading into OHG at the time of the earliest texts). Within the North sea group, OE and OF showed still further innovations of their own: raising of *a* to *æ* and *e* (*dæg, dei* above) and palatalization of gg before *j* (*lecgan, ledza* above). Finally, to complete the circle, the Elbe group (from which came southern OHG) shared a few innovations with North and East Gmc.: the spread of the nominative and accusative singular neuter pronoun ending **-at(a)* to strong adjectives (OE. OF *hāl* "whole," OS *hêl,* but Got. *hailata,* ON *heilt,* OHG *heilaz*); and it shared certain forms with East Gmc. (PGmc. **iz* "he" in Got. *is,* OHG *ir, er,* but **h-* forms in ON *hann,* OE, OF, OS *he).* *See* also under the names of individual languages.

GERMANIC LAWS, EARLY. After the foundation of the greatest kingdoms of the Teutonic tribes on the soil of Roman civilization. the necessity for a written codification of the inherited tribal laws arose. This necessity evidently arose out of permanent intercourse with a native population which had been living under different laws. Thus the Visigoths: Burgundians and Salic Franks had already. at the turn of the jth and 6th centuries, codified their law. One and a half centuries later the Lombards did the same. The Teutonic tribes. living in the interior. owe their codification to the influence of the Frankish suzerainty; the Ripuarians, Alemans and Bavarians to the Merovingians; the Chamavic Franks. Saxonians. Thuringians and Frisians to Charlemagne. For the edict of Theodoric I *see* Roman Law.

The leges germanorum are codifications of the valid criminal law and the law of procedure, hut do not offer an exhaustive regulation of these and are not, on the other hand. solely confined to them. In substance they consist partly of already existing customary law and also partly of new statutory laws. Whether it is possible to distinguish among such varied forms: contained within a lex. the different strata of text is a question not definitely settled. It was thought. but has not as yet been proved. from the tradition of the Salic law that it was originally composed of primitive tariffs of composition. to which. later. constitutions were added with the intention of creating a new law. Moreover such constitutions (capitularia) are preserved to us partly as amendments (novellae) to older leges and partly as special laws. The capitularies of Charlemagne and of his son Louis were of particular importance in the development of the law. All *leges* and *capitularia* are in Latin, but in most cases there is also an admixture of Germanic legal terminology. We possess fragments of the Lex Salica and of the Carolingian capitulary in an old High-German translation.

For the whole body of the Germanic laws *see* P. Canciani, *Barbarorum leges antiquae* (Venice, 1781–1789); F. Walter, *Corpus juris germanici antiqui* (Berlin. 1824); *Monumenta Germaniae historica, Leges.* For further information on the codes in general *see* J. E. O. Stobbe. *Geschichte der deutschen Rechtsquellen* (Brunswick, 1860–1864); Paul Viollet. *Histoire du droit civil français,* 2nd ed. (Paris. 1893); H. Brunner, *Deutsche Rechtsgeschichte,* 2nd ed. (Leipzig, 1906); Brunner-Heymann, *Grundzüge der deutschen Rechtsgeschichte,* 7th ed. (Leipzig, 1925).

Leges **Visigothorum.**—It is now certain that the earliest written code of the Visigoths dates back to King Euric (466–485). Of this code. fragments of chapters cclxxvi to cccxxxvi have been discovered in a palimpsest manuscript in the Bibliotheque Nationale at Paris (Latin coll., no. 12161). The *lacunae* in these fragments have been filled in by aid of the law of the Bavarians, where the chief provisions are reproduced. Euric's code was used for all cases between Goths. and between them and Romans; in cases between Romans. Roman law was used.

Euric's code remained in force among the Visigoths of Spain until the reign of Leovigild (568–586), who made a new one, improving upon that of his predecessor. This work is lost, and we have no direct knowledge of any fragment of it. In the 3rd codification: however. many provisions have been taken from the 2nd. and these are designated by the word "antiqua"; by means of these "antiqua" we can reconstruct the work of Leovigild.

After the reign of Leovigild the legislation of the Visigoths underwent a transformation. The new laws made by the kings were declared to be applicable to all the subjects in the kingdom, of whatever race—in other words, they became territorial, and this principle of territoriality was gradually extended to the ancient code. Moreover. the conversion of Reccared I (586–601) to orthodoxy effaced the religious differences among his subjects, and all subjects, *qua* Christians. had to submit to the canons of the councils. which were made obligatory by the kings. After this change had been accepted. Recessvind (649–672) made a new code. which was applicable to Visigoths and Romans alike. This code. known as the *Liber judiciorum,* comprises 324 constitutions taken from Leovigild's collection. a few of the laws of Reccared and Sisebut, 99 laws of Chindasvind (642–653), and 87 of Recessvind. A recension of this code of Recessvind was made in 681 by King Ervig (680–687) and is known as the *Lex Visigothorum renovata;* and finally some additamenta were made by Egica (687–702). The texts of the *Leges Visigothorum* have been published by K. Zeumer in the 40 series of the *Mon. Germ. hist.* *Cf.* Zeumer's articles in the *Neues Archiv.,* vol. xxiii, xxiv and xxvi; H. Brunner. *Deutsche Rechtsgeschichte,* 2nd ed. (Leipzig, 1906); Ureña y Smenjaud. *La Legislacion Gotico-hispana* (Madrid, 1905); E. de Hinojosa, *Das germanische Element im spanischen Rechte* vol. 31 (*Zeitschrift der Savigny-Stiftung*).

Lex **Burgundionum.**—This code was compiled by King Gundobad (474–516). very probably after his defeat by Clovis in 500. Some additamenta were subsequently introduced either by Gundobad himself or by his son Sigismund. This law bears the title of *Liber Constitutionum,* which shows that it emanated from the king: it is also known as the *Lex Gundobada* or *Lex Gonzbata.* It was used for cases between Burgundians. but was also applicable to cases between Burgundians and Romans. The law of the Burgundians shows strong traces of Roman influence. It recognizes the will and attaches great importance to written deeds. but, on the other hand. sanctions the judicial duel and the *cojuratores* (sworn witnesses]. The vehement protest made in the 9th century by Agobard. bishop of Lyons, against the *Lex Gundobada* shows that it was still in use at that period. As late as the 10th and even the 11th centuries we find the law of the Burgundians invoked as personal law in Cluny charters, but doubtless these passages refer to accretions of local customs rather than to actual paragraphs of the ancient code.

The text of the *Lex Burgundionum* was published by F. Bluhme in the *Mon. Germ. hist., Leges,* iii, 525; by Karl Binding in the *Fontes rerum Bernensium,* vol. i (1880); by J. E. Valentin Smith (Paris, 1889 *seq.)*; and by von Salis (1892) in the quarto series of the *Mon. Germ. hist.,* cf. R. Dareste. "La Loi Gombette." in the *Journal des Savants* (July 1891); K. Zeumer in the *Neues Archiv.,* vol. xxv; Petot, "Un nouveau manuscr. de la loi Gombette." *Nouv. Rev. hist. de Droit* (1913).

Leges **Langobardorum.**—We possess a fair amount of information on the origin of the laws of the Lombards. The first part, consisting of 388 chapters, is known as the *Edictus Langobardorum,* and was promulgated by King Rothari at a diet held at Pavia on the 22nd of November, 643. This work, composed at one time and arranged on a systematic plan, is very remarkable. The compilers knew Roman law, but drew upon it only for their method of presentation and for their terminology; and the document presents Germanic law in its purity. Rothari's edict was augmented by his successors; Grimoald (668) added nine chapters; Liutprand (713–735), 15 vol., containing a great number of ecclesiastical enactments; Ratchis (746), eight chapters; and Aistulf (755), 13 ch. After the union of the Lombards to the Frankish kingdom, the capitularies made for the entire kingdom were applied to Italy. There were also special capitularies for Italy, called *Capitula Italica,* some of which were appended to the edict of Rothari.

At an early date compilations were formed in Italy for the use of legal practitioners and jurists. Eberhard, duke and margrave of Rhaetia and Friuli, arranged the contents of the edict with its successive additamenta into a *Concordia de singulis causis* (829–832). In the 10th century a collection was made of the capitularies in use in Italy, and this was known as the *Capitulare Langobardorum.* Then appeared, under the influence of the school of law at Pavia, the *Liber legis Langobardorum* also called *Liber Papiensis* (beginning of 11th century) and the *Lombarda* (end of 11th century) in two forms—that given in a Monte Cassino ms. and known as the *Lombarda Casinensis,* and the *Lombarda Vulgata.*

There are editions of the *Edictus,* the *Concordia,* and the *Liber Papiensis* by F. Bluhme and A. Boritius in the *Mon. Germ, hist., Leges,* iv. Bluhme also gives the rubrics of the *Lonzbarda,* which were published by F. Lindenberg in his *Codex. legum antiquarum* in 1613. For further information on the laws of the Lombards *see* J. Merkel, *Geschichte des Langobardenrechts* (1850); A. Boritius, *Die Kapitularien im Langobardenreich* (1864); Schupfer, *Manuale di storia del diritto italiano,* 2nd ed. (1895); Solmi. *Diritto longobardo e diritto nordico* (1898); C. Kjer, *Edictus Rotari* (Copenhagen, 1898), C. Kjer, *Dansk og langbardisk Arveret* (1901); J. Ficker, *Das langobardische und die skandinavischen Rechte* (Mitteilungen des Instituts fiir oesterreichische Geschichtsforschung, vol. xxii); Cf. R. Dareste, in the *Nouvelle Revue historique de droit français et étranger,* p. 143 (1900).

Pactus Alamannorum and Lex **Alamannorum.**—Of the laws of the Xlamanni we possess two different texts. 'The earlier text, of which five short fragments have come down to us, is known as the *Pactus Alamannorum,* and from the persistent recurrence of the expression "et sic convenit" was most probably drawn up by an official commission. The reference to affranchisement *in ecclesia* shows that it was composed at a period subsequent to the conversion of the Xlamanni to Christianity. There is no doubt that the text dates back to the 7th century. The later text, known as the *Lex Alamannorum,* dates from a period when Alamannia recognized the theoretical suzerainty of the Frankish kings but was ruled by national dukes and may be placed between the years 717 and 719.

The two texts have been published by J. Merkel in the *Mon. Germ. hist.,* Leges, iii, and by Karl Lehmann in the quarto series of the same collection. Cf. Heinrich Brunner. "Über das Alter der Lex Alamannorum" *(Berliner Sitzungsberichte,* 188j); Karl Lehmann. in the *Neues Archiv.,* vol. x; Bruno Krusch. *Die Lex Bajuvariorum,* mit zwei Anhangen: *Lex Alamannorum* und *Lex Ribuaria* (1924); Franz Beyerle, in the *Savigny-Zeitschrift fiir Rechtsgeschichte,* vol. xxxv; Bruno Krusch. Neue Forschungen uber die drei oberdeutschen Leges: *Bajuvariorum, Alamannorum* und *Ribuariorum* (1927).

Lex **Baiuvariorum.**—The law of the Bavarians has, in some parts, been taken directly from the Visigothic law of Euric and from the *Lex Alamannorum* and the *Lex Salica.* The Bavarian law. therefore. is later than that of the Alamanni. It dates. probably. from a period when the Frankish authority was very strong in Bavaria when the dukes were vassals of the Frankish kings. The date of compilation may be placed between 740 and 748.

The text of the *Lex Baiuvariorum* has been published by J. Merkel in the *Mon. Germ. hist., Leges,* iii, 183; by E. von Schwind (1927) in the quarto series of the same collection, and by Konrad Beyerle (München, 1926). Cf. von Schwind's articles in the *Neues Archiv.,* vol. xxxi, xxxiii and xxxvii; H. Brunner, Über ein verschollenes merowingisches Konigsgesetz des 7 Jahrhunderts, *Berliner Sitzungsberichte* (1901); V. Kralik, "Die deutschen Bestandteile der *Lex Baiuwariorum," Neues Archiv.,* vol. xxxvii; Bruno Krusch. *Die* Lex Bajuvariorum, *Textgcschichte, Handschriftenkritik und Entstehung* (1924); Franz Beyerle, in the *Savigny-Zeitschrift fiir Rechtsgeschichte,* vol. xlv. Ernst Heymann. "Zur Textkritik der *Lex Bajuwariorum," Kehr-Festschrift* (1925); Bruno Krusch, *Neue Forschungen uber die drei oberdeutschen Leges* (1927); Karl August Eckhardt, *Die* Lex Baiuvariorum, *eine textkritische Studie* (1927).

Lex Saxonurn. — The *Lex Saxonum* has survived in two manuscripts and two old editions (those of B. J. Herold and du Tillet). The law contains ancient customary enactments of Saxony, and, in the form in which it has reached us. .is later than the conquest of Saxony by Charlemagne. It is preceded by two capitularies of Charlemagne for Saxony—the *Capitulatio de partibus Saxoniae,* which dates undoubtedly from 782, and is characterized by great severity, death being the penalty for every offense against the Christian religion; and the *Capitulare Saxonicum,* of the 28th of October. 797, in which Charlemagne shows less brutality and pronounces simple compositions for misdeeds which formerly entailed death. The *Lex Saxonicum* apparently dates from 802, since it contains provisions which are in the *Capitulare legi Ribuariae additum* of that year. The law established the ancient customs, at the same time eliminating anything that was contrary to the spirit of Christianity; it proclaimed the peace of the churches. whose possessions it guaranteed and whose right of asylum it recognized. There is an edition of the *leges Saxonum* by Karl von Richthofen in the *Mon. Germ. hist., Leges,* and another by Cl. von Schwerin in the octavo series of the same collection (1918). Cf. von Schwerin, in the *Savigny-Zeitschrift fur Rechtsgeschichte,* vol. xxxiii; Martin Lintzel, in the *Sacigny-Zeitschrift fiir Rechtsgeschichte,* vol. xlvii.

Lex **Thuringorum.**—A collection of laws has come down to us, in one ms. and one old edition, bearing, in the ms., the name *Lex Thuringorum* and in the edition the name *Lex Angliorum et Werinorum, hoc est Thuringorum.* In early times there dwelt, south of the river Unstrut, the Angli, who gave their name to the *pagus Engilin* or *Englide,* and to the east, between the Saale and the Elster. the *Warni* (*Werini* or *Varini*) whose name is seen in *Werinofeld.* Cf. Hoops, *Reallexikon,* 1, 86, iv. 483. This text is a collection of local customs arranged in the same order as the law of the Ripuarians. Parts of it are based on the *Capitulare legi Ribuariae additum* of 803, and it seems to have been drawn up in the same conditions and circumstances as the law of the Saxons.

There is an edition of this code by Karl von Richthofen in the *Mon. Germ. hist., Leges,* v. 103, and another by Cl. von Schwerin in the octavo series of the same collection (1918).

Lex **Frisionum.**—This consists of a medley of documents of the most heterogeneous character. Some of its enactments are apparently pagan. Thus one paragraph allows the mother to kill her newborn child, and another prescribes the immolation to the gods of the defiler of their temple; others are purely Christian such as those which prohibit incestuous marriages and working on Sunday. The law abounds in contradictions and repetitions and the compositions are calculated in different moneys. From this it would appear that the documents were merely materials collected from various sources and possibly with a view to the compilation of a homogeneous law. These materials were apparently brought together at the beginning of the 9th century, at a time of intense legislative activity at the court of Charlemagne.

There are no manuscripts of the document extant; knowledge of it is based upon B. J. Herold's edition (*Originum ac Germanicarum antiquitaturn libri,* Basel, 1557), which has been reproduced by Karl von Richthofen in the *Mon. Germ. hist., Leges,* iii, 631 and by De Geer (1866). Cf. Patteta, *La Lex Frisionum* (1592); Hugo Jaekel, in the *Neues Archiv.,* vol. xxxii; Siegfried Rietschel, *Das Volksrecht der Friesen* (1911); Philipp Heck, *Die Entstehung der Lex Frisionum* (1927). (C. Pf.; K. A. Eck.)

GERMANICUS CAESAR (15 B.C.–A.D. 19) inherited his name Germanicus from his father Nero Claudius Drusus, brother of Tiberius and favourite stepson of Augustus. He was also great-nephew to Augustus, for his mother was the younger Antonia, daughter of Octavia and Marcus Antonius. When, therefore, Augustus adopted Tiberius in A.D. 4 he required him to adopt Germanicus, although Tiberius had a son of his own; and about the same time Germanicus married Augustus' granddaughter, Agrippina. Quaestor at the age of 20, he then served under Tiberius in Illyricum and won triumphal insignia. In A.D. 11 he accompanied Tiberius in his campaign on the Rhine. In 12 he was consul and was appointed to command Gaul and the two German armies. After Augustus' death (14), when Germanicus was superintending a Gallic census at Lugdunum (Lyons), a mutiny broke out among his legions on the lower Rhine. Germanicus quelled this with difficulty, partly by concessions, for which the authority of Tiberius was forged, but chiefly because of his personal popularity. He was apparently pressed to claim the empire for himself, and on one view this was the main purpose of the rising. In order to calm the excitement he determined at once on an active campaign. Crossing the Rhine, he attacked and routed the Marsi and ravaged the valley of the Ems. Next year he marched against Arminius, the conqueror of Varus, and performed the last rites over the remains of the Roman soldiers who lay unburied in the Teutoburg forest; but Arminius, favoured by marshy ground, was able to hold his own, and two Roman columns narrowly escaped disaster in their retreat. In 16 Germanicus tried again. A combined movement by land and water enabled him to concentrate his forces against the main body of the Germans encamped on the Weser, but his tactical victory still brought no end to the war. He was now recalled by Tiberius, who claimed that the Germans could be better managed by diplomacy than by arms, and who had work for his adoptive son in the east.

On May 26, 17, Germanicus celebrated a triumph, and became consul for the second time the following year. But before the office began he received supreme command over all eastern provinces and proceeded by easy stages to his duties, visiting Actium, Athens, Ilium and other places of historic interest. Meanwhile Tiberius had appointed Gnaeus Calpurnius Piso, a senior consular and a violent member of the old nobility, to govern Syria, and throughout Germanicus' tour Piso criticized, frustrated and even reversed his decisions. Nevertheless Germanicus settled the Armenian succession, organized Cappadocia and Commagene as provinces and negotiated successfully with Parthia and other eastern states.

Early the next year (19) he paid a somewhat theatrical visit to Egypt and incurred strong censure from Tiberius; for Augustus had forbidden Romans of rank to enter Egypt without permission. On his return to Syria the differences with Piso became intolerable and Piso now left the province, perhaps under his superior's orders. But shortly afterward Germanicus died at Antioch, convinced that Piso, through his wife Plancina, had poisoned him. He was hurriedly cremated, his ashes being deposited in Augustus' mausoleum. His death plunged Rome and the empire in gloom. and lavish honours were paid to his memory. The poisoning was not substantiated. Piso's suicide during his trial was caused by his fear of Tiberius on other charges. But Tiberius never emerged from suspicion. if not of instigating Germanicus' murder. at least of prompting the enmity which seemed to have issued in tragedy.

Germanicus and Agrippina had nine children, six of whom, three sons and three daughters, survived him, among them the emperor Gaius (Caligula) and Agrippina, mother of Nero.

The character and achievements of Germanicus are a notable enigma, mainly because Tacitus cast him as the hero to play against his villain Tiberius. It is not known whether there were serious differences between him and his uncle on German policy, on the treatment of the Greek-speaking provinces and cities or on the fundamental issues of the Roman constitution; whether Tiberius actually feared him as a rival to his power; and whether his visit to Egypt was prompted by thoughtlessness or by sinister motives. He is credited with a desire to restore the republic and has also been compared with Alexander, a combination hardly likely in a man of full political maturity. Yet, although his handling of the German mutiny lacked firmness, his other actions, even his German campaigns, were not marked by any proved incompetence; and it is hard to doubt his contemporary popularity. He had literary and oratorical abilities, and probably great personal charm.

(G. E. F. C.)

GERMANIUM. This chemical element notable for its remarkable electrical properties, is a silvery gray, metallic-appearing solid but is generally regarded as a metalloid with properties somewhere between a true metal and a nonmetal. It is in the fourth group of the periodic table (see Periodic Law) between silicon and tin. Its symbol is Ge, atomic number 32, atomic weight 72.60. It has nine isotopes with masses from 69 to 77.

In 1871, D. I. Mendeléyev predicted the existence and properties of an hypothetical element between silicon and tin which he called eka-silicon. In 1886, C. Winkler, in analyzing the sulfide mineral argyrodite, found a previously unknown constituent which he succeeded in isolating and to which he gave the name germanium after his native country. Further investigation definitely fixed the position of germanium in the periodic table between silicon and tin, confirming Medeléyev's predictions.

Even though germanium had been known for many years?it attained importance only after 1945 when it may be said to have initiated a revolution in electronics. This application is based upon the fact that being a metalloid it belongs to a class of materials known as semiconductors, *i.e.,* with electrical conductivity midway between a metal and a nonmetal. This permits the use of germanium devices as replacements for many applications of vacuum tubes, rectifiers, etc. See *Uses* below.

Source and Preparation.— Germanium is a rare element, its occurrence in the earth's crust being estimated at about 0.0004% to 0.0007%. This exceeds the content of such elements as beryllium, boron, arsenic, silver, gold, platinum and uranium but is considerably lower than that of elements such as lead, zinc and tin. The problem of recovery is complicated by the fact that there is very little natural concentration such as occurs with the other elements mentioned.

Germanium is never found in the free state. It is a constituent of the following uncommon minerals: argyrodite (Ag_8GeS_6—6% to 7% germanium); germanite (7 CuS.FeS.GeS_2—8.7% germanium); and renierite. The last two minerals have been found in southwest Africa and the Belgian Congo. The two chief sources are the zinc sulfide concentrates of the zinc–lead mining district of Missouri. Kansas and Oklahoma. which contain about 60% zinc and 0.010% to 0.015% germanium, and copper-zinc concentrates derived from certain African mining operations. A low-grade germanium concentrate results as a by-product of metallurgical steps directed toward the production of zinc metal. This is treated with strong hydrochloric acid and the resulting germanium tetrachloride is distilled off. This crude chloride is purified by successive distillations. The highly pure product is hydrolyzed in water to form germanium dioxide, which is then reduced to powdered metal by hydrogen at a temperature of about 650° C. The powdered metal is melted into ingots or billets in an inert atmosphere at about 1,100° C.

Germanium also occurs in minute amounts in bituminous coals from many parts of the world, including the United States. Under proper conditions of combustion germanium will concentrate in flue dusts, from which it can be extracted. However, so far as is known, only in England and Japan has this source of germanium been exploited. The process is rather complicated, but eventually a step is reached wherein a crude germanium tetrachloride is distilled off and purified much the same as described above.

The germanium ingots or billets produced as above require further purification for electronic purposes. The usual method for accomplishing this is "zone refining" and consists of passing the billet of germanium through successive heat zones. Only a very small segment of the germanium billet is melted at any one time and as it recrystallizes the impurities are swept to one end of the billet. The final step is to melt the germanium and draw a single crystal of the metal by using a seed crystal as a nucleus and carefully controlling the temperature.

Properties. — Germanium has valences of both two and four but compounds of the latter valency are more stable and more numerous. The metal is quite stable at atmospheric temperature. At 600° to 700° C. oxidation in air or oxygen proceeds. Germanium reacts readily with the halogens to form corresponding tetrahalides. Of the common acids, only nitric acid and aqua regia will attack germanium appreciably. Caustic solutions have little or no effect on germanium, but it will quickly dissolve in molten sodium or potassium hydroxide, forming the germanates.

Some Physical Properties of Germanium

Crystal structure	Octahedral
Ductility	Frangible
Hardness, Mohs' scale	6.25
Index of refraction	4,068–4.143
Density at 25° C. (g. per c.c.)	5.35
Melting point ° C.	958.5
Specific heat at 25° C. (cal. per g.)	0.086
Volume resistivity at 25° C. (microhmcentimetre)	60×10^6

Compounds. — The two most important compounds are the dioxide and the tetrachloride, both intermediate products in the processing of raw materials to metal. The dioxide is a white crystalline material while the tetrachloride is a volatile colourless liquid boiling at 84° C. Tests indicate that neither germanium nor germanium dioxide are toxic, though the tetrachloride causes irritation when inhaled, undoubtedly because of hydrolysis which frees hydrochloric acid.

Germanium may be determined analytically by first distilling off as the tetrachloride, precipitating as the sulfide in acid solution, followed by conversion to the dioxide and weighing. Spectrographic methods are usually employed for the analyses of most raw materials because of their low germanium content.

Uses. — The availability of germanium of an extraordinarily high degree of purity has been responsible for the revolution in electronics which began toward the close of World War II. This application is by far the major use of germanium. A succession of devices such as diodes, transistors and rectifiers have been developed which perform most of the functions of vacuum tubes plus others that a tube will not handle. These devices are characterized by simplicity and ruggedness, low power consumption and little heat emission. They begin to function immediately since there is no filament to heat.

The germanium diode consists of a fine wire of a proper conductive metal pressing against a thin waferlike disk of properly prepared germanium. Wire and germanium disk are soldered to separate electrical conductors and the unit is embedded in plastic or enclosed in glass. The complete assembly is smaller than a grain of corn. An interesting property of germanium diodes is their photoelectric effect, commercially utilized in the photodiode, said to have definite advantages over the "electric eye."

In 1948 the germanium triode or transistor (point-contact type) was announced (see TRANSISTOR). Since then further developments, particularly the junction transistor, have taken place. Transistors have proved of immense value in many applications; one example is in hearing aids, where their use has resulted in smaller and more dependable units. Their use has also simplified the construction of computers, the so-called "electronic brains." Still later, germanium junction rectifiers, both air and water cooled, with much higher capacity than selenium and copper oxide devices, were developed, with larger units in prospect.

Germanium is transparent to infrared light—in fact, thickness of several centimetres will give appreciable transmission over broad regions of the spectrum. Because of this property, germanium lenses are used in industrial and scientific infrared work.

The silica content of glasses may be replaced wholly or in part by germanium dioxide. Optical glasses so constituted will show an extension in range of properties, particularly in index of refraction and dispersion. Glasses of high refractive index have been mentioned for use in wide-angle lenses, in microscope objectives and for military purposes. Germanates, particularly of magnesium and zinc, are used in phosphors in fluorescent lamps.

Germanium forms alloys with many elements but commercial uses are limited. Perhaps the most promising alloys are those with silicon, a continuous series of solid solutions being formed which may have electronic applications. Germanium, like bismuth (and water), has the peculiar property of expanding upon freezing; even when alloyed with as much as 92% gold this property persists, suggesting the use of this alloy for precision castings such as dental inlays, the colour being that of 18 k. gold. An alloy with magnesium (Mg_2Ge) reacts with dilute acids to give a mixture of volatile hydrides (germanes) similar to the methane series of hydrocarbons.

GERMAN LANGUAGE. German is the national language of Germany and of Austria, and one of the four national languages of Switzerland. It is spoken throughout these areas and in adjacent parts of several neighbouring countries. Until the end of World War II the German-speaking area extended considerably farther to the east and there were many isolated German-speaking communities in Estonia, Latvia, Lithuania, Poland, Czechoslovakia, Hungary, Yugoslavia, Rumania and Russia. The language has been carried to other parts of the world as well: there are German-speaking communities in North and South America, South Africa and Australia. German is widely studied as a foreign language and is one of the main cultural languages of the western world.

As a written language (Schriftsprache) German is quite uniform; it differs in Germany, Austria and Switzerland no more than written English does in the United States and the British empire. As a spoken language, however, German exists in far more varieties than English. At one extreme is Standard German (Hochsprache), which is used in radio, television, public lectures, the theatre, schools and universities. This is based on the written form of the language and is relatively uniform except that speakers often show by their accents the general areas from which they come. At the other extreme are the local dialects (Dialekte, *Mundarten*), which differ from village to village—more in some areas, less in others. A local dialect is largely or even completely unintelligible to a German-speaker from another area. Between the extremes is a continuous scale of speech forms, which in the cities are close to the standard and are called Colloquial German (*Umgangs*sprache). Only in Switzerland is there anythihg resembling a second spoken standard. Besides the regular standard and the dialects (in great variety), there are two semistandards based on the speech of Bern and Ziirich, respectively, but they hardly exist in written form.

The foreign visitor who has learned Standard German will have little difficulty in most parts of the German-speaking area, since he will find everywhere persons who speak and understand the standard language. In the more remote areas, however, he may find unintelligible dialects.

STANDARD GERMAN

Sounds and Spelling

Vowels and Diphthongs. — In phonemic notation, the vowels and diphthongs are:

Checked:	i	u	u	Free: i:	u:	u:	*Diphthongs:*	ai	oi au
	e	o	o	e:	o:	o:	Unstressed:		a
		a			a:				

Checked Vowels.—These are short and occur only before consonants. Vowels /i e a o u/ are much like the vowels of English mit, bet, hot, gonna, puss: mit "with," Bett "bed," hat "has," Gott "god," mu8 "must." (Note that nouns are capitalized.) The tongue position of /ü ö/ is that of /i e/ but the lips are rounded as with /u o/: *Stücke* "pieces," Stocke "sticks." German spelling often shows that stressed vowels are checked and short by following them with double consonants.

Free Vowels.—The free vowels are long and occur in all positions. The vowels of English see, say, so, shoe are relatively lax and glide upward; German /i: e: o: u:/ are tense and steady, nith no glide: Sie "you," See "sea." so "so," Schulz "shoe." The /a:/ is much like the vowel of English spa: sah "saw." The /ü: ö:/ have the tongue position of /i: e:/ but the strong lip rounding of /u: o:/ as fruh "early," *schön* "beautiful." In spelling a stressed vowel is often shown to be free and long either by the absence of anything after it (as so); by an unpronounced h after it (sah); by the doubling of the vowel letter (See); or by the spelling of /i:/ as *ie* (Sie).

Diphthongs.—These are also free; much like the diphthongs of light, lout, Hoyt: leite "(I) lead," Laute "sounds," Leute "people." Also /ai/ is sometimes spelled ai: Kaiser "kaiser."

Unstressed.—This /ə/ is also free, but never stressed; it is like the e of begin, pocket: beredete /bə-ré:dətə/ "persuaded."

Umlaut Vowels.—The regular spellings for /ü ü:/ and /ö ö:/ are *ü* and *ö*. They often alternate with /u u:/ and /o o:/ as in the following forms with plain singular and umlauted plural: Mutter, Mutter "mother(s)," Bruder, *Brüder* "brother(s)," Tochter, *Töchter* "daughter(s)," Sohn, Sohne "son(s)." Sometimes /e e: oi/ are spelled a, a, *äu,* regularly so when they alternate with /a a: au/ as in *Mann, Männer* "man," "men," Vater, Vater "father(s)," Braut, Braute "bride(s)." Where a stands for a long vowel, it is often pronounced in formal speech with a vowel like that of fair: *Väter* / fɛ́:tər/, instead of everyday /fé:tər/.

hᵀasalized Vowels.—Such vowels are often used in loan words from French—for example, Teint /téⁿ/ "complexion," Chance /šáⁿsə/ "chance," Pardon /pardóⁿ/ "pardon," Verdun /verdöⁿ/ "Verdun." Less elegantly these are simply pronounced as a vowel plus /ŋ/: /téŋ, šáŋsə, pardóŋ, verdöŋ/.

Consonants. — The consonants, in phonemic notation, are as follows:

Obstruents, fortis:	p	t	k	f	s	š	x	Nasals:	m	n	ŋ
lenis:	b	d	g	v	z	ž	h	*Other:*	j	1	r

The fortis consonants are pronounced with strong muscular tension and are voiceless; the lenis consonants are pronounced with weak muscular tension and are usually voiced.

Fortis *Obstruents.*—The German /p t k f s/ are much like the corresponding English sounds. Initial /f/ is spelled f or *v: fiel* "fell," *viel* "much," both /fí:l/. The /s/ is spelled *ss* intervocalically after a checked vowel, otherwise ß : Masse /másə/ "mass," but *Maße* /má:sə/ "measures" and also *miß* /mís/ "measure!" er mißt /mist/ "he measures." The /s/ is spelled *s* before /p t k/ and finally: Wespe "wasp," Liste "list," Maske "mask," das "that." The /š/ is like English sh, but with lip rounding—it is usually spelled sch as in *Schiff* "ship." After open juncture, /šp št/ are spelled *sp,* st as in spat /špé:t/ "late," *verstehen* /fer-šté:ən/ "understand." The /x/ is a voiceless velar spirant [x] after /a a: o o: u u: au/, but a voiceless palatal spirant [ç] elsewhere; it is spelled ch as in *Bach, Bäche* [bbx, béçə] "brook(s)," *Buch, Bücher* [bu :x. bii:çər] "book(s)."

Lenis Obstruents.—The obstruents /b d g v z/ are much like the corresponding English sounds. The /v/ is usually spelled *w* in native words: Winter "winter," but v in loan words: Vase "vase"; /z/ is spelled *s* as in sie /zí:/ "she," lesen /lé:zən/ "to read." Both *z* and *tz* stand for /ts/: *zu* /tsú:/ "to," sitzen /zítsən/ "sit." The rare /ž/ of loan words is like the *z* of azure: Garage /gará:žə/ "garage." German /h/ is like English *h;* it occurs only after open juncture: hier "here," *geheim* (ga-hbim) "secret."

Lenis-Fortis Alternations.—Lenis obstruents cannot occur before other obstruents or before open juncture; hence they are often replaced in pronunciation (though not in spelling) by the corresponding fortis obstruents: leben "live," but er lebt /lé:pt/ "he lives," *lebhaft* /lé:p-hàft/ "lively"; *Räder* "wheels," but das Rad /rá:t/ "the wheel," des Rads /rá:ts/ "of the wheel"; Tage "days," but der Tag /tá:k/ "the day," *täglich* /té:k-lix/ "daily"; Motive "motifs," but das Motiv /mo:tí:f/ "the motif," des Motivs /mo:tí:fs/ "of the motif"; lesen "to read," but lesbar /lé:s-bà:r/ "legible," er las /lá:s/ "he read."

Nasals.—The nasals /m n/ are like English *m, n;* /ŋ/ is like the ng of singer, and it is spelled n before k, otherwise ng: *trinken* /tríŋkən/ "drink," Finger /fíŋər/ "finger."

Other.—German /j/ is like English y: *ja* "yes." The /1/ is never velarized ("dark") as in English full, but always the "bright" *l* which many English speakers use in million. The /r/ has two sounds: when it is followed by a vowel, most German speakers pronounce it as the voiced velar or uvular spirant [R] ; but when it is not followed by a vowel, they pronounce it as the vowel [ʌ], much like a in sofa. These two sounds thus alternate: [R] in lehren [lé:Rən] "teach," *bessere* [bésəRə] "better ones," but [a] in lehrt [lé:ʌt] "teaches," leer [le:ʌ] "empty," besser [bésʌ] "better." Instead of velar or uvular [R], some speakers use an apical flap or trill.

Stress.—German has four distinctive degrees of stress. The loudest (marked /°/) is the main stress of any stress group. Thus *Hans wohnt hier* may be /°háns vó:nt hí:r/ "Hans lives here" or /háns °vó:nt hi.r/ "Hans lives here" or /háns vó:nt °hí:r/ "Hans lives here." Other syllables in a stress group may have loud stress (marked /ʼ/): die Frau (di: °fráu/ "that woman"; medial stress (marked /ˋ/): die Frau /dì °fráu/ "the woman"; or weak stress (unmarked), like the syllable /zə/ in diese Frau /dí:zə °fráu/ "this woman." Most native German words are stressed on the first syllable: arbeitete /árbaitətə/ "worked," unless they begin with an unstressed prefix: bearbeitete /bə-árbaitətə/ "worked upon."

Intonation.—German has three distinctive degrees of pitch: low /^{1}/, middle /^{2}/ and high /^{3}/: Wo wohnt er? /^{2}vó: ^{3}°vó:nt e:r^1/ "Where does he live?" It also has three terminal contours. Two are used at the ends of sentences: (1) rising, used typically in questions without a question word: *Wohnt er* hier? /^{2}vó:nt è:r ^{3}°hí:r^3↑/ "Does he live here?"; and (2) falling, used typically in questions with a question word: Wo wohnt er? /^{2}vó: ^{3}°vó:nt è:r^1↓/ "Where does he live?" and in statements: Er wohnt hier /^{2}è:r vó:nt ^{3}°hí:r^1↓/ "He lives here." The third type, level, occurs typically at breaks within sentences: Er wohnt hier, ich *wohne* dort /^{2}é:r vó:nt ^{3}°hí:r^3|^{2}íx vó:nə^3°dórt^1↓/ "He lives here, I live there."

Open Juncture.—The open juncture between words (indicated by a space) and between certain parts of words (indicated by a hyphen) is usually sharply marked in three ways. (1) It often falls at the places where onset of pitch and of loud and middle stress occur. (2) It is reflected in the privileges of occurrence of certain phonemes—checked vowels, lenis obstruents and /j/ never occur before open juncture; /ŋ/ never occurs after open juncture; /h/ occurs only after open juncture. (3) It is reflected in the pronunciation of certain phonemes: a vowel following open juncture is usually pronounced with a glottal stop (marked [ʔ]): *eine* alte Erinnerung [ʔàinəʔáltəʔer-°ʔinəruŋ] "an old memory"; /p t k/ follotving open juncture are strongly aspirated: contrast the [tʰ] of *Fleischtopf* [fláiš-tʰòpf] "flesh pot" with the [t] of Bleistift [blái-štìft] "pencil."

MORPHOLOGY

German has two classes of inflected words, verbs and substantives.

Conjugation.—Verbs are inflected for the following categories (illustrated here by the strong verb *sprechen* "speak" and the weak verb *sagen* "say"):

Finite forms:	indicative present	indicative past	subjunctive general	subjunctive special	Imperative
(we, they)	*spreclzen* *sagen*	*sprachen* *sagten*	*sprächen* *sagten*	*sprechen* *sagen*	
(I)	*spreche* *sage*	*sprach*	*spräche* *sagte*	*spreche* *sage*	
(he, she, it)	*spricht* *sagt*				
(you, sing.)	*sprichst* *sagst*	*sprachst* *sagtest*	*sprächest* *sagtest*	*sprechest* *sagest*	*sprich* *sag(e)*
(you, pl.)	*sprecht* *sagt*	*spracht* *sagtet*	*sprächet* *sagtet*	*sprechet* *saget*	*sprecht* *sagt*

Nonfinite forms: infinitive, *sprechen; sagen* participle, *gesprochen gesagt*

(The above second person forms are familiar; in normal polite address, third plural forms are used: *Sie sprechen* "you speak," etc.)

Declension. — Substantives are inflected for case (nominative, accusative, dative, genitive) and number (singular, plural); and, in the singular, some are inflected for gender (masculine, neuter, feminine). Pronouns show highly irregular inflection. Only the third person pronoun (masc. *er*, neut. *es*, fem. *sie)* and the demonstrative–relative pronoun (masc. *der*, neut. *das*, fem. *die)* are inflected for gender. Nouns are inflected for case and number and are classifiable (though not inflected) for gender.

Adjectives agree in gender, number and case with a following modified noun. All adjectives take strong endings. In addition, descriptive adjectives take weak endings when they are preceded by certain inflected limiting adjectives. Thus, nom.-acc. pl. *frische grune Bohnen* "fresh green beans," with the strong ending *-e;* but *diese frischen grünen Bohnen* "these fresh green beans." with the weak ending *-en,* because of the preceding limiting adjective *diese.*

Syntax. — Clause structures are of two major types. In the subject–predicate (S–P). the subject is usually a nominative substantive expression; the predicate is always a finite verb expression which agrees with the subject in person and number. Either part may be a word: *Vater* ↔ *kommt* "father is coming"; or a modifier–centre phrase: (*mein* → *Vater*) ↔ (*kommt* ← *zurück*) "my father is coming back"; or a centre–centre phrase: (*Vater* ← *und* → *Mutter*) ↔ (*kommen* ← *und* → *gehen*) "father and mother come and go"; or a comhination of these. Less often the subject is an adverb: *heute* ↔ *(ist Montag)* "today is &Ion-day"; or a centreless phrase: *(was er sagt)* ⊚ *stimmt* "what he says is right."

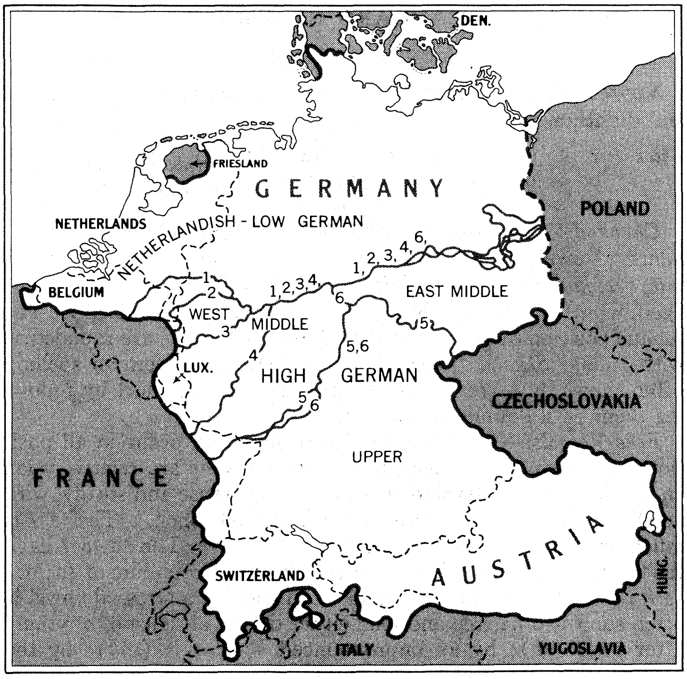
The other major clause structure is the plain predicate (PP), in which the predicate is again always a finite verb expression, either a word: *komm* "come!"; or a modifier–centre phrase: *mich* → *friert* "I'm cold" ("me freezes"); or a centre–centre phrase: *komm* ← *und* → *sieh* "come and see."

Major clause arrangements are: (1) Statement, with finite verb always second. S–P: *jetzt kommt er* "now he's coming"; PP: *mir ist kalt* "I'm cold" ("to-me is cold"). (2) Word question, with question word usually first, finite verb always second. S–P: *wann kommt er* "when is he coming"; PP: *wann wird gegessen* "when do we eat" ("when gets eaten"). (3) Order question, with finite verb always first. S–P: *kommt er jetzt* "is he coming now"; PP: *friert dich* "are you cold" ("freezes you"). (4) Command, with finite verb in the imperative or special subjunctive. S–P: *bleib du hier* "you stay here!," *seien Sie ruhig* "be quiet!," *Gott bewahre* "God forbid!"; PP: *komm* "come!"

The favourite sentence type consists of a major clause (or two or more in co-ordinate structure) with a rising or falling terminal contour: *Kommt er?* /$^{3°}$kómt è:r^{3}↑/ "Is he coming?"; *Er kommt* /^{2}è:r $^{3°}$kómt^{1}↓/ "He's coming"; *Komm!* /$^{3°}$kóm^{1}↓/ "Come!"

DIALECTS

Netherlandish-German Dialect Area. — Within the area outlined on the accompanying map, two standard languages have arisen out of the local dialects: Netherlandish in the Netherlands (Holland, where it is called Dutch) and Belgium (where it is called Flemish), and German elsewhere. From the point of view of local dialects, houever, all of this is a single speech area. One can start at the North sea coast of the Netherlands or Belgium, travel eaat into Germany and then south into Switzerland or Austria and never encounter a village where the local speech is suddenly different. The only sharp breaks occur when one enters the Frisian-speaking part of the northern Netherlands (the province of Friesland) or of Germany (the North Frisian islands and the adjacent coast of Schleswig), the French-speaking parts of Belgium and France.



MAP OF NETHERLANDISH-GERMAN DIALECT DIVISIONS
Numbers indicate isoglosses described in the text

Although within this area the differences from village to village are slight, their cumulative effect can be very great. This is particularly true in the west and centre of the area. where the rural population has been settled for 1,500years or more. Inhabitants often find it difficult to understand the dialect of a village 50 mi. away and at twice this distance the dialect may be practically unintelligible. This extreme variation results from the stability of the population and the fact that the area was for so long split into a multitude of small political units. Where these conditions have not obtained. the results are different. Thus Bavaria, though long settled, is relatively uniform linguistically because it has been unified politically for 1,000 years. In the northeast and southeast, which was not colonized by German speakers until the 10th century or later, the dialects show less variation—though even there it far exceeds anything known in the English of North America. (Until the end of World War II, the German speech border extended farther to the east—particularly in the northeast. where it went as far as East Prussia. The inhabitants of these areas were expelled immediately after the end of the war.)

In the south of this German-speaking area, nearly everyone grows up speaking the local dialect (though he is taught Standard German in school) and continues to use it with family, friends and neighbours. In northern Germany, on the other hand, many city dwellers grow up speaking only the local variety of Standard German and never learn the local dialect. Everywhere dialects have been affected by the great increase in communication and social mobility that developed during the late 19th and 20th centuries. Dialects are not dying out, but they are more and more being leveled and influenced by the standard language.

Low and **High** German. — The most striking dialect differences uithin the Netherlandish–German area are those which divide it into Netherlandish–Low German in the lowlands of the north and High German in the highlands of the south. When the Germanic tribes migrated into southern Germany during the early centuries of the Christian era, their speech had the voiceless stops *p* t k in much the same distribution as modern English. Then, probably during the 6th century, in what is called the "High German consonant shift," these stops when initial (*p*- t- k-) or long (*pp* tt kk) came gradually to be pronounced as affricates, and when following a vowel (*Vp* Vt Vk) to be pronounced as long spirants. The modern results, compared with related English words, are:

p-	pound	pfund	*pp*	apple	apfel	Vp	sheep	schā*f*
t-	ten	zehn	*tt*	sitting	sitzen	*Vt*	bite	beissen
k-	can	khann*	kk	lick	lekchen	Vk	make	machen

**khann* and lekchen, with affricates, are dialect forms; standard German has stops: *kann*, *lecken*

It is not known just where these changes originated, though it was most probably in southern Bavaria and adjacent Austria. Once the new pronunciations had arisen, they spread rapidly, though not uniformly. The situation at the end of the 19th century was that indicated on the map. Line 2, *maken/machen* (*i.e.*, unshifted k north of this line, shifted ch south of it), is generally chosen as the Low German/High German boundary, since it is typical for the shift of *Vp* Vt Vk (*schāp/schāf* "sheep," *bīten/beissen* "bite," *maken/machen* "make") and of t- (*tēn/zehn* "ten") and tt (*sitten/sitzen* "sit"). Where exceptions occur, they are usually at the western or eastern ends of the line. Thus, line 1, *ik/ich* "I," shows that shifted k spread unusually far to the northwest in this word; line 3, *dorp/dorf* "village" (cf. archaic English thorp) shows that shifted *p* after r and 1 spread less far than usual; and line 4, *dat/das* "that," shows that shifted t spread still less far in this word (and a few others: *dit/dies* "this." *it/es* "it." *wat/was* "what"). The striking way in which these lines radiate in the west has led to their being called the "Rhenish fan."

Shifted *p*- and *pp* spread still less far than other sounds. Line 5, *appel/apfel* "apple," lies wholly within the High German area, and is customarily used to subdivide it into Middle German (appel) and Upper German (apfel). Line 6, *pund/pfund* "pound," largely coincides with this in the west, but then runs north to join the *maken/machen* line; it is customarily used to distinguish Rest Middle German (*appel*, *pund*) from East Middle German (appel, fund—the latter being commoner than Upper German *pfund*). The shift of k- and kk presents special problems. Initial k- appears as kh- in much of the High German area (though as ch- in most of Switzerland); exact limits are unknown. Double kk appears as kch in most of Switzerland and as kch or kh along the southern border of Austria; elsewhere it changed to k.

HISTORY

Preliterary Period (to c. **A.D. 750**).—Netherlandish–Low German and High German belong to the Germanic languages (*q.v.*), specifically to the subgroup West Germanic (which also includes Frisian and English). Although the earliest written records are from *c.* 750, some of the developments of the immediately preceding centuries can be reconstructed.

Consonants.—West Germanic showed contrasts bet-ween (1) voiceless stops: short *p* t k, long *pp* tt kk; (2) voiceless spirants, short *f þ s* h, long *ff þþ ss hh;* and (3) voiced sounds, of which d was a stop in all positions (d dd); b was a stop initially, after nasal and when long (b- mb bb), but a spirant elsewhere (ƀ); and g was a stop after nasal and when long (ng gg), but a spirant elsewhere (*ǥ*). In the north, all voiceless stops, long voiceless spirants and voiced stops were kept as such; but f þ s h became voiced medially (f coalescing with 8), and 8 *ǥ* became voiceless finally (coalescing with f h). In the south, a totally different system evolved. First, *ƀ g* seem to have become stops, giving the system: *p* t k; *pp* tt kk; b d g; bb dd gg; f *þ s* h; *ff þþ ss hh.* Then the consonant shift took place, producing the following contrasts: long or fortis affricates, *pf tz* kh (from *p*- t- k-, *pp* tt kk); long or fortis stops. written either bb dd gg or *pp* tt kk (from bb dd gg); short lenis stops, written either b d g or *p* t k (from b d g); long or fortis spirants, *ff* (from *Vp* and *ff*), tth (from *þþ*), ʒʒ (from Vt), *ss* (from ss), hh (from Vk and hh); and short lenis spirants, f th *s* h (from f *þ s* h). Both north and south kept the nasals *m n,* liquids *l r* and semivowels w j.

Vowels.—West Germanic showed contrasts between (1) five short vowels, *i e a o u;* (2) five long vowels i *ē ā ō ū;* (3) three nasalized vowels *į ą ų;* and (4) four diphthongs, *ai* au eo *iu*. Probably quite early in this period, *į ą ų* lost their nasalization and coalesced in the Netherlandish–German area with *ī ā ū*. Kext, by a change which began in the north and spread south, *ai* au became partially monophthongized. In the north (where ai became ɛ̄ except before j, and au became ɔ̄ except before *w*), this gave a system of seven long vowels: *ī ē ɛ̄ ā ɔ̄ ō ū*. In the south (where ai became *ē* only before old h, r or *w* and au became *ō* only before old h and dentals), the change was accompanied by the diphthongization of old *ē* to ie, old *ō* to uo, giving *ī ē ā ō ū* plus ie uo. Where old ai au were kept as diphthongs, they seem to have changed to ei *ou;* and old eo seems to have changed to io. Finally, another vowel change must have started in the north and have spread south: i-umlaut, uhereby stressed back (or low) vowels were gradually fronted (or raised) if a following syllable contained an unstressed j, *i* or i. By the end of this period, the only phonemic umlaut was that of a to e, coalescing with old e, as *gast* "guest," pl, gesti. This change was just reaching the south as the earliest extant documents were written.

Old Period (**c. 750–1050**).—In the south (Old High German), the first German writings begin to appear during the second half of the 8th century. Their language is best described as a collection of monastery dialects: there is a certain uniformity in the writings of any given monastery, but none for the area as a whole. The documents show the monks struggling to express new concepts in German, first through translations of Latin word lists, then in prose translations—some highly skillful (Isidor, c. 800), others less so (Tatian, *c.* 830)—and in a new verse form (Otfrid, c. 870); they culminate in the able translations and interpretations of Notker Labeo (d. 1022). From the north (Old Low German, but usually called Old Saxon), almost the only writings preserved are a life of Christ in alliterative verse (Heliand, *c.* 830) and a fragment of a similar Genesis translation.

Consonants.—In the south. a new lenis stop arose through the change of th to d: thiob "thief" became diob, contrasting with *tiof* "deep." This change seems to have started in the southeast as early as the 8th century and to have spread during the next three centuries throughout the entire area. In the north, the new and old d coalesced: Middle Low German dbf "thief" like *dēp* "deep." Long tth in the course of this period changed so that it eventually coalesced with tt.

Vowels.—By the end of this period, *iu* had coalesced with a new (umlaut) vowel *ǖ* (see below); *io* had coalesced in the north with *ē,* in the south with ie; and unstressed vowels had begun to coalesce as a.

Middle Period (**c.** 1050–1350).—The number of written documents increased greatly in both north and south, and writing became independent of the monasteries. In the south especially, a highly sophisticated literature developed (courtly epic, Minnesang). There is clear evidence of a trend along with it toward a standard Middle High German literary language, though it seems to have had no influence on ordinary speech.

Consonants.—In the south and spreading into much of the north, a new phoneme arose through the change of sk to fortis S, spelled sch: OHG waskan, MHG *waschen* "wash." Fortis *s* then began to merge either with the new S (cf., with unchanged spelling. modern *spinnen* /špinən/ "spin," *stellen* /štelən/ "put") or nith fortis ʒʒ (cf. MHG *messe* "religious mass," *meʒʒen* "to measure," modern *Messe, messen*). In both north and south, final lenis stops became fortis: OHG gab "gave," RIHG gap.

Vowels.—In both north and south, most unstressed vowels (long and short) coalesced in a single vowel a. usually written e. Largely because of this, the various umlaut sounds became phonemic. The resulting vonel system for Middle Low German was: short. i e a o *u* plus the o *u;* long, *ī ē ɛ̄ ā ɔ̄ ō ū* plus the new a ɔ o *u;* and diphthongs, ei ou plus the-new *öü*. The resulting vowel system for Middle High German was: short, *i e* a o *u* plus the new e a o *ü;*

long, *ī ē ā ō ū* plus the new *ǟ ȫ ǖ;* and diphthongs, *ie uo ei ou* plus the new *iie öü.*

Early Modern Period (*c.* 1350–16501.—Four events—the growth of trade, the rise of a middle class, the invention of printing and the Reformation—were of great influence on the development of the language. In the north, resulting from the prosperity of the Hanseatic league, a standard Low German written language began to develop, though it never reached full growth and probably had little influence on everyday speech. In the south, the dialects which had developed in the recently settled East Middle German area were relatively uniform and contained elements from both West Middle and Upper German. Gradually they came to be used as the official languages of the chancelleries of the area, including that of Saxony; on this latter Martin Luther based the language of his widely read Bible translation (1j22–34). This type of German then grew gradually into modern Standard German. Its growth was aided by the fact that printers preferred it as a means of making their books appeal to the widest possible audience.

Consonants.—In nearly the entire area, intervocalic h was lost with lengthening of the preceding vowel, *e.g.,* [zéhən] "see" became [zé:an]. In a smaller area, medial [ŋg] changed to [ŋŋ], *i.e.,* [zíŋgən] "sing" became [zíŋŋən]; and then this and all other long consonants were shortened, *e.g.,* [zíŋŋən, zinnan] "sing." "think" became [zíŋən, zinan]. In a still smaller area, [w] changed to [v]. *e.g.,* [wás] "what" became [vás]. In each case, the old spelling nas kept. *sehen, singen, sinnen, was.*

Vowels.—In the southeast, as early as the 12th century, i *ǖ ū* began to be diphthongized to *ei öü ou;* by the 1jth century these had spread to East Middle German. where they coalesced nith the old *ei öü ou.* (They give modern standard /ai oi au/.) Spreading from the north, as early as the 13th century, short vowels in open syllables were lengthened (*e.g., geben* "give" became *gēben*) and coalesced with the corresponding long vowels. In a contrary development. many long vowels in closed syllables were shortened (*e.g., brāchte* "brought" became *brachte)* and coalesced with the corresponding short vowels. By a specifically Middle German development, *ie üe uo* were monophthongized to i *ǖ ū.* Finally, short e *e* a coalesced as *e,* long *ē ǟ* as *6.* These changes give the modern standard vowel system.

Modern Period (*c.* 1650 to the Present).— The outstanding developments of the modern period have been the increasing standardization of Standard German and its increasing acceptance as *the* supradialectal form of the language. In writing, it is almost the only form used; in speech, it is the first or second language of nearly the entire population.

Though Standard German is clearly based on the East Middle German dialects, it is not identical with any of them. It has accepted and standardized many forms from other areas. notably Upper German *pf* (*Pfund, Apfel)* and also large numbers of individual words in the form of other dialect areas. Since it is the only form of German taught in schools, its spoken form is based to a large extent on its written form; and the spoken form that carries the greatest prestige (that of stage, screen, radio, etc.) uses largely a Low German pronunciation of this written form. As a result, Standard German has been called—and not only facetiously—"High German with Low German sounds."

GERMAN LAW. German law[1] belongs to the systems of law which even today remain under the influence of "the Reception" of the *Corpus Iuris (see* COMMON *LAW).* It was only on the basis provided by the Reception of Roman law that from the 15th century onward a legal profession became established in Germany: with the appearance of a legal profession came a system of common law developed by lawyers (*Juristenrecht*). Although in Germany some important legal works by private authors had appeared at an early date (*e.g.,* the *Sachsenspiegel, c.* 1220. by the Saxon knight Eike von Repkow and the *Schwabenspiegel, c. 1260*). nevertheless the law which they contained was not developed in any systematic way. Roman law enabled German law to make the transition to activity inspired by theoretical thinking. Thus it was the Pandectists (the commentators on the *Pandectae,* for which *see* ROMAN LAW) who. under the influence of Kant's teaching. developed from the autonomy of the moral person the basic concepts of a subjectively conceived system of law. The development of these concepts into a system has ever since been regarded as a special strength of German law. To the influence of the *Corpus Iuris* may also be partly attributed the fact that German law is not a case-law system but has been codified on the model of Justinian's Digest in the law of the Pandectists. In Germany, therefore. the making of law is a process of applying the legal principle to the individual case. and the courts have never played the same dominating role as they are able to play in England under the case-law system.

Another factor which has had a lasting influence on German law is also connected with the Reception of Roman law in Germany in the form which had been given to that law by the Italian glossators. This factor is the conception of state sovereignty and the connected idea of the monopoly by the state of the legislative function. In Germany Roman law assisted in the growth of the national state. With the comparatively late transition to systematic legal study went an almost revolutionary change in the nature of individual responsibility for the development of the law. Unpaid leading men of the old Estates without legal training were replaced by the legally trained bureaucracy of the princes and the towns. The authority of these bureaucrats was based not on their independent decisions in legal cases but on the authority of the ruler of their state. His authority was limited by the then prevailing Christian and customary conceptions of political ethics, but he was nevertheless sovereign. This monopoly of judicial authority by the sovereign against which not even the vigorous resistance of peasants and citizens could prevail. has, until the present day. influenced German law in a number of different ways.

The union of the sovereign state with Roman law encouraged in Germany the early introduction of codified laws which, breaking with tradition. could be used as a means to establish the supremacy of the will of the ruler over the life of the community. This union also accelerated the development of bureaucracy. This is the reason for the characteristic of German life that social justice is generally introduced by state authority, that is to say by the bureaucracy; also why the German judge is a university-trained official who has taken up a judicial career and gives his opinion as an expert under the authority and anonymity of the court.

Modern German law is a mixture of various elements; a desire to rationalize and humanize the legal system is blended with democratic, liberal and social ideals: its aim is to achieve a social state based on the rule of law. It is aware that the coming era will be one of rationalized social integration and of co-operation under administrative control; in this era German law will seek to strengthen the individual's obligation to behave in a social, responsible way and to play his part in the common tasks of the community. The law, therefore, has not merely to prohibit what is antisocial but also to impose a positive duty to do what is social. German law takes the view that in the future society must be conceived as a democracy, involving social obligations rather than merely conferring individual rights; the modern mass state cannot evade its responsibility for social welfare.

These ideas have been developed in German legal theory from the basis provided by a close fusion of various elements from Roman law, Christian morality. the philosophy of the Enlightenment and the experience of the French Revolution. They are closely connected with the idea of a "natural legal order" based

[1]This surrey does not concern itself with law as practised in the German Demacratic Republic.

on a law of reason; the postulates of this theory are to be found by the exercise of reason and experience in a spirit of critical rationalism. This is the way in which planned codifications supersede tradition.

German law tended in the past to prefer constructions based on abstract concepts which assume the autonomy of the legal system and seek timeless solutions of problems. Today. with the aid of legal sociology:?;.supporters of the "jurisprudence of interests" and of "causal legal thinking" attempt, by an exact analysis of reality. to treat legal phenomena as a means to an end. Modern German legal theory goes beyond the mere investigation of external reality to consider the elements of man's community life. It assesses the principal factors in this community life in order that it may ensure that the judge applies to the different interests involved the scale of values laid down by the legislator.

It is true that this way of regarding the law cannot of itself create binding value-concepts. In German law under the Federal Republic. therefore. an attempt was made again to work out a practical system of legal ethics to replace the positive legal order which broke down under national socialism. It is generally recognized that the crisis of the law can only be overcome through a better understanding of the forms of human co-operation. To this end modern Catholic natural lam seeks to renew scholastic philosophy. while the philosophy of justice of the Neo-Kantians endeavours to reconstruct the law on the principle of a humanistic ethic of reason. Phenomenology similarly relies on an objectively conceived ethic of value.

CIVIL LAW

The German "Legal Family."—The expression German "legal family" usually signifies those legal systems which have developed from the basis provided by the German civil code. The central point of this group is not constitutional law or criminal law but civil law and as with the French legal family it is codified civil law. The importance of German law. therefore. for the world as a whole depends primarily on the civil code and on the laws of procedure associated with it. The Japanese civil code of 1898 appeared before the German civil code but was based on the first draft of the latter. The civil code of Siam of Jan. 1, 192j, and the Chinese civil code of 1929–31 also followed the German civil code. In Europe the Swiss civil code of 1907–12, in spite of some original ideas. owes much to the same source. The Swiss civil code is the most significant and finest product in a legislative framework of German-speaking legal learning in the 19th century. It inspired to an even greater extent than the German civil code the movement toward codification and the reception of foreign law which has given the German legal family an honourable position beside the Anglo-Saxon and French legal families. This influence is shown in its most striking form in the adoption of the Swiss civil code by Turkey as part of Mustafa Kemal Atatürk's scheme for secularizing and Europeanizing that country. It also had an influence together with the German civil code on the legislation supplementing the Austrian civil code. on the Soviet civil code of Oct. 31. 1922. on the Polish Law of Obligations of Oct. 27, 1933, on the Czechoslovakian civil code of Oct. 25, 1950, and on the legislation of Hungary, Yugoslavia. the Scandinavian countries. Peru and other states. In spite of the events of World War II, the makers of the Greek civil code of 1946 turned to the German civil code, a remarkable tribute to that system of law.

The Codification of Civil Law.—Before the foundation of the German-speaking legal family by the codification of German and Swiss civil law, there had already been some German examples of codification by the individual states. This legislation of the individual German states took the place of the so-called common law (*Gemeines Recht*), which was a combination of Roman, canon and German law and as *usus modernus pandectarum* had prevailed since the reception. Hopes of legal unity under the leadership of a revived Roman law faded when the imperial power collapsed. The desire for legislation in the German language and for the abrogation of obsolete lams and the modernization of outdated ones could only be effected, in view of'the distribution of strength in the Holy Roman empire, by the sovereign power within the different states. This tended to perpetuate differences between the lags of the states. From the middle of the 18th century, therefore, a movement came into being to codify the law in a form which would exclude other sources and provide one easily accessible and unified system. This movement was inspired mainly by ideas of the law of nature and by the Enlightenment.

The movement toward codification began with the Bavarian *Codex Maximilianeus Bavaricus Civilis* (*Kurbayerisches Landrecht*) of 1756. In its purest manifestation, however, the spirit of the time. which was characterized by the union between the law of reason and the state planning of the Enlightenment. is to be found in the Prussian code of 1794, the *Preussische Allgemeine Landrecht*. This "Prussian Natural Law," as Wilhelm Dilthey called it. contains a comprehensive plan for the organization of the state. The code in its 17,000 paragraphs aims at settling every conceivable legal situation once and for all. In an attempt to cover the entire Prussian law, the code became lost in a mass of exaggerated casuistical reasoning to which it resorted out of fear of problems of interpretation and in order to avoid the arbitrary decisions of judges in cases of uncertainty in the text of the code. For this reason it forbade any legal development by precedent. commentaries or "learned hair-splitting."

In contrast. the Austrian civil code of 1811. the *Allgemeine Bürgerliche Gesetzbuch,* which was also based on the law of reason. set out the private law in a compressed form (only 1.502 sections). It mas nevertheless the only permissible source of private law; although amendments have been made. it has continued in force until the present day and has proved its practical value.

The civil code of Saxony of 1863 was the first of a number of German civil codes based on the Pandects. It was a late-comer in the process of codification by the individual states. but in its scheme of concepts it was a forerunner of, and a kind of rehearsal for. the later German code. It is true. however. that in being limited to the state of Saxony it did not meet the growing desire for a unified civil law in the whole of Germany. This desire for legal unity had already been the occasion for the famous dispute between the law professors A. F. J. Thibaut and F. K. von Savigny. Thibaut, under the influence of the War of Liberation, had in 1814 demanded in his article "Concerning the Need for a General Civil Code for Germany" a unified civil code for the whole of Germany. In the same year Savigny (1779–1861), the most outstanding German jurist in the 19th century, replied with his article "The T'ocation of Our Time for Legislation and Legal Study." Savigny rejected codification because in his view law was the product of history; *i.e.,* it grows according to the inner convictions of the people. He believed codification at that time would have been either superfluous or harmful and that only few periods have the capacity and vocation for codifying activities of a significant kind.

At first this dispute was settled in practice by the course of political events. when the setting up of the German confederation as a union of sovereign states failed to provide a basis for a unified codification of civil law. However. commercial law called for legislative settlement in a way not confined to the individual states. because trade does not stop at the frontiers of the smaller countries. This commercial pressure led to the acceptance of the law concerning bills of exchange (*Allgemeine Deutsche Wechselordnung*) of 1848 which was brought into effect by the individual states of the confederation. In the same way with the help of the German confederation the General German commercial code (*Das Allgemeine Deutsche Handelsgesetzbuch*) of 1861 came into force. When in 1871 the German empire was established the idea of a comprehensive codification of a unified civil law was again mooted. It was first put into effect in the imperial laws on judicial administration but the first commission for the drafting of a unified civil law was set up as early as 1874; on Xug. 18, 1896, the civil code was promulgated and came into effect on Jan. 1, 1900.

CIVIL CODE

Character of the Civil Code.—The Civil Code is divided into four parts: law of obligations; property law; family law; and succession. A "general part!' precedes these four parts; in this general part elements common to the four separate parts are summarized. The general part does not, however. gather together the political and ethical principles of social life and set them out at the head of the code as guiding maxims for the practice and application of law. The creators of the code had rather in mind Gaius' threefold division into "persons. things and actions" and sought similarly to arrange the fundamental elements of civil law theory, that is the subjects, objects and transactions of the law. They hoped in this way, in the interests of brevity and logical completeness, to avoid constant repetitions. The third section of the general part deals with legal transactions and discusses the common elements in every possible kind of legal transaction in the law of obligations, the law of property, family law and in the law of succession; it was a notable innovation in the history of legislation.

This technique of constructing a general part consisting of rules drawn from other parts of the code is to be seen also within the law of obligations. Here, too, there is a general part *(Bürgerliches Gesetzbuch* ss. 242–432) and a special part *(BGB* ss. 433–835). The general part of the law of obligations contains rules which are common to all obligations whether arising by contract. delict, unjust enrichment or in any other way. The special part of the law of obligations, on the other hand, deals with individual obligations such as sale, tenancy, gift. mandate and suretyship. In this scheme of the civil code may already be seen an extraordinary mastery over the subject matter, clearness of arrangement and skilful handling of concepts. These qualities, however. expressed in a precise and often abstract way, have deprived the code of any wide measure of popularity. The civil code is written by jurists for jurists. In its highly developed use of concepts, generalizations and references, which are necessary in order to avoid casuistical reasoning. it lacks the intuition, close contact with life and comprehensibility of the Swiss civil code. These characteristics are the result of the way in which it was made, that is, by a committee of competent legal technicians. It is not the work of a single outstanding man in the same way as the Swiss civil code is the work of Eugen Huber. nor was the spirit of the time when it was made under the influence of a revolutionary mood as when the French civil code was made: on the contrary. the spirit which governed its creation was without passion. matter of fact and neutral. The German civil code did not attempt to exercise a broad educational influence or to emphasize ethical imperatives. though it contains an express prohibition against breaches of customary morals (*guten Sitten*), against abuse of right and against underhanded legal transactions (*Schikane*).

It should further be noted that the civil code did not give expression to a new pattern of society. Legal practice and theory, however, to a greater extent than was expected, adapted the code to the changes and upheavals of the 20th century and in particular to the problems created by an economic and cultural life deprived of its traditional standards. The main method nhereby this was effected was by resort to the so-called "general clauses." They provided a general directive which, in leaving the creation of more specific norms to the judge, may be said both to free him from and subject him to legislative restrictions. Thus the German legislator. through clauses more or less wide according to the circumstances. was able to take into account a new legal and economic ethical system and this has given to the German civil code a lasting character which is extremely important. These general clauses made use of such words as "good faith" (*Treu und Glauben*), "commercial custom" (*Verkehrssitte*), "customary morals" (*guten Sitten*). "important reason" (*wichtiger Grund*), "lack of proportion" (*Unverhältnismässigkeit*), "exploitation of necessity" (*Ausnutzung von Sotlagen)* and "inexperience" (*Unerfahrenheit*).

The General Part of the Civil Code.—The German civil code takes human personality as its starting point. It states in its first section that every natural person acquires on birth the capacity to hold rights and duties. This *Rechtsfähigkeit* means that every human being by virtue of his or her dignity as such is a subject in a legal sense and that the law does not recognize slavery and civil death. From this principle should be distinguished the capacity of the infant in law to enter into legal transactions at six years of age provided they are profitable to that infant (ss. 106 ff.). At 21 years every person acquires full capacity to act in a legal sense (*Geschäftsfahigkeit*). Until that age is reached a legal representative has to look after the interests of the minor. German law does not know the concept or doctrine of the trust; it makes use of the institution of legal representation nhereby an adult acts for the minor. It differs, therefore, from English law in that the rights and duties belong to the child alone. that they are exercised only in the name of the child and that there is always one and the same person to represent the child.

German law recognizes a general personal right (*allgemeines Persönlichkeitsrecht*) to which every individual is entitled. This conception of a general personal right covers many aspects of human personality such as the right not to be physically injured, to be protected against attacks on one's dignity as an individual, to possess a recognized name and to develop one's abilities in any desired direction The fact that some of these rights have been given specific recognition by the civil code does not now prevent the courts from protecting other unspecified expressions of human personality If this general personal right is violated the aggrieved party is entitled not only to the protection of the criminal law but also to ask for damages at civil law and if the defendant has been negligent or acted intentionally, for an injunction (*allgemeine Unterlassungsklage*).

General rules about legal personality are next considered *(BGB* ss. 21–54) The civil code mentions in this connection only associations (*Vereine,* ss. 55–79) and foundations (*Stiftungen,* ss. 80–88). Other kinds of legal persons are defined in the commercial code or in special laws. The civil code requires associations to have a statute. German law. unlike English law. makes no distinction between a memorandum and the articles of association. It requires every legal person to have a board (*Vorstand*) and a general assembly of the members (*Mitgliederversammlung*) as its "organs." This is a characteristically German conception unknown to English law and emphasizing the "personal" character of legal persons. The general assembly elects the board which acts as agent for the *Verein* without being limited by a doctrine of *ultra vires,* which is unknown to German law. A *Verein* may be incorporated by registration in the register of *Vereine* at the district court (*Amtsgericht*), provided it satisfies a number of conditions imposed in the interests partly of the community, partly of the members.

Concerning voluntary legal transactions (*Rechtsgeschäfte*), the code requires for a contractual agreement only two corresponding declarations of intention (*Willenserklärungen*). It demands neither consideration, as in English law. nor a justifying interest, as in modern Italian law. All declarations of intention become effective (s. 130), when they reach their addressee; it is not necessary that the addressee has actual knowledge of them. It is sufficient if he has been put into a position where. in accordance with ordinary business usage, he can be expected to have knowledge of them.

According to German law normally a voluntary legal transaction does not require any special form. The exceptions are expressly prescribed and involve writing (*Schriftform*) or public certification of the signature by a court or notary (*öffentliche Beglaubigung*) or public authentication.

A legal transaction is void if it is contrary to a statutory provision; *e.g.,* immoral, fictitious or not seriously intended. But mistake does not render a legal transaction void as it does in English law. It may, however, render it voidable. according to s. 119. In German law a party is less strictly bound by the letter of the transaction than he is in English law. He is in certain circumstances entitled to be released from his obligation because he acted under a mistake. On the other hand the party who avoids his own declaration is liable to the other party to the extent to which the latter has suffered damage by relying on the validity of the declaration. A declaration induced by fraud or threat is also voidable and a duty to disclose facts which are economically relevant to a transaction is much more readily assumed in German than in English law.

S. 133 deals with interpretation. It requires the true intention of the parties to be ascertained. "Interpretation must not cling to the literal meaning of words" and s. 158 adds that agreements are to be interpreted in accordance with the requirements of good faith, ordinary usage being taken into consideration.

S. 164 ti. contain general rules about agency. The civil code strictly separates, according to the ideas of R. von Jhering and P. Laband. the unilateral act, the "grant of authority." from the underlying contract which normally is effected when the power is granted. In contrast to the grant of authority dealt with in the general part the contract of agency is to be found in the law of obligations under such headings as mandate, contract of service and partnership. Agency denotes the external aspect, and mandate and the contract of employment are among the various possible internal aspects of the same situation. According to German law there is in principle no undisclosed agency by which both principle and agent are liable. The civil code distinguishes between contracts in the name of another person which bind that person alone and contracts in the name of the agent by which he only is bound.

The concluding section of the general part concern limitation (*Verjährung*) and exercise of rights (*Rechtsausübung*). German law regards limitation as an institution of substantive law, not of the lam of procedure, so that it does not treat this question as relating nearly to the limitation of actions. The regular period of limitation lasts 30 years, but there are so many far-reaching exceptions to this rule that frequently under German law much shorter periods of limitation apply than in similar cases under English lam-. Restrictions on the exercise of a right cannot be imposed for longer than 30 years; the entail (*fideicommissum*) was abolished after World War I.

Law of Obligations. — The general part of the law of obligations opens with the important rule of s. 242: "the debtor is bound to effect performance according to the requirements of good faith, ordinary usage being duly taken into consideration." This rule embodies the idea that a judge has not only to interpret legal concepts in accordance with the facts of life, to *subsumieren,* but also to fill. up the gaps by norm-creating decisions. The famous s. 1 of the Swiss civil code expresses this principle in specifying that a judge has to fill a gap in the code according to the rule which he would himself enact were he a legislator. German law regards this judge-made law as *Rechtsfindung* under BGB s. 242. This section gives the judge on the one hand power to dismiss a claim, although founded on an express rule of law, if the enforcement of the claim in the particular case would be contrary to good faith. On the other hand, it empowers him to grant a right to a person although there is no special rule to support it on the basis alone that good faith requires this result. S. 242 has thus considerably increased the freedom of the courts in interpreting contracts, a feature which has no exact parallel in modern English law. It has frequently enabled the courts to avoid giving a decision which public opinion would have considered inequitable. Although German law has no dual legal system — as had both English and Roman law — many of the functions performed in English law by the development of equity have been performed in German law by a wide application of the principle of s. 242. This was especially necessary in a period such as the first half of the 20th century when rapidly changing conditions required the adaptation of codified law to unprecedented situations. In this respect s. 242 gives to the German court even greater possibilities of creating new solutions than is possible in English law by appeal to the principle of equity.

The ensuing sections contain some general provisions relating to obligations, such as the rule that in Germany specific performance is to be regarded as the general. and damages as the exceptional, remedy. Justice Holmes's theory regarding Anglo-American law that contract involves merely liability to pay damages if the promise is not fulfilled is not applicable to German law. The debtor who has promised to do something is primarily liable to fulfil his promise and this liability will be enforced by the German courts. In the same way compensation according to German law (BGB s. 249) has in principle to be effected in kind and not by payment of money. A negligent failure to mitigate damage is specifically dealt with in s 254.

The civil code then deals with time and place of performance, forms, content and types of contract and with the various kinds and consequences of breach of contract: delaykd performance (*Verzug*); and subsequent impossibility of performance (*Unmöglichkeit*). They are followed by sections which set out the various nays of discharging an obligation (ss. 362–397) and the ways in nhich obligations may be transferred from one creditor to another (ss. 398–413).

The special part of the lam of obligations first deals with the law of sale; the rules contained in ss. 433–51j cover in principle not only the sale of goods and other chattel-interests but also the sale of immovable property In the same way the civil code attempts in the rules concerning tenancy which follow to make no distinction between the letting of movables and the letting of immovables. Nevertheless, the legislator has been forced in view of the special position of tenancies of immovables to make a number of rules which apply exclusively to such tenancies This tendency has become more pronounced in emergency legislation protecting tenants against termination of contract, giving them authority to sublet and to exchange their dwellings and determining rents and controlling housing. The ensuing sections of the special part deal with other customary parts of contract such as mandate, gaming and betting suretyship and liability of innkeepers.

The last 40 sections of the special part of the law of obligations deal with tno very important topics in German law: unjust enrichment (ss 812–822) and delicts (ss. 823–853). The civil code distinguishes between the general rule of unjustifiable enrichment stated in s. 812 and the special situations which are discussed in the ensuing sections. S. 812. which is very widely phrased, reads as follows: "Anyone who through an act performed by another or in any other way acquires something at the expense of that other without legal justification is bound to return it to him." The section has. however. been given a restricted interpretation by the courts and by legal writers.

The 30 sections that deal with delicts differ from the English law of torts in their extreme brevity. They are. however. supplemented by a number of important special statutory enactments such as the *Reichshaftpflichtgesetz* of June 7. 1871. the *Strassenverkehrsgesetz* of Dec. 19, 1952, and the *Luftverkehrsgesetz* of Aug. 1, 1922. Ss. 823 I and II and 826 are in the nature of general clauses. They are followed by a small number of special delicts. According to s. 823 I any person who intentionally or negligently injures unlawfully the life, body, health, freedom. property or any other absolute right of another person is bound to compensate him for any damage arising therefrom. S. 823 II gives a civil remedy for violation of a statutory duty. The third general clause (s. 826) reads "a person who intentionally causes damage to another in a manner contra bonos mores is bound to compensate him for such damage."

Apart from these delicts based on the culpability of the defendant German law in certain cases admits liability without fault. Such liability arises where a person has set objects into motion or put things to use which by their very nature endanger others and of which he enjoys the profits. In these circumstances it appears equitable that he should also bear the risk so created. Motor cars, railways and aeroplanes are outstanding examples of such objects Strict liability in the case of motorcar accidents is limited to a maximum of 5,000 DM for damage to property and 25,000 DM. for personal injury. but a higher sum may be claimed on the grounds of negligence under the civil code.

Strict liability for motorcars and aeroplanes is supplemented by a system of compulsory insurance in favour of third parties.

Law of Property. — In the third book of the civil code real and personal property are separately treated, but a number of rules are peculiar either to real or to personal property. A clear distinction is made between the treatment of property in the third book and the law of obligation. Acts of the parties under the rules of the law of property are "abstract" while acts of the parties under the law of obligations are "causal." The transfer, therefore: of a movable or immovable is valid) even though the contract of sale relating to it is invalid on the grounds of error or immorality. Property and obligations are kept distinct in order that a third party need not be concerned about the contractual background of the transfer of property. The necessary adjustment can be made by the rules relating to unjust enrichment.

The German law of property begins first with the regulation of possession (BGB ss. 854–872) and ownership (ss. 903–1007). The idea that ownership means a right to do anything that the owner pleases was replaced in the constitution of 1919 by the principle that '(ownership entails obligations. Its use should be service to the common meal." This statement is approved in all German constitutions since 1945. It implies that in the exercise of his right the owner must pay due regard to the interests of the community. This is especially true in regard to land. Every landowner has a duty to cultivate his land, an obligation which is also enforced in various mays by control council law no. 45. In an extreme case his land may be put under a trustee or may even be expropriated. This leads to the important question of agricultural reform, the details of which have not yet been worked out in legislation.

The general principles of the law of immovable property (BGB ss. 873–902) contain the rule that a disposition is valid only if it is entered in the land register (*Grundbuch*). This is a register of titles kept by the district court (*Amtsgericht*) which shows the legal position of the immovable property to which it relates. There is a land register for all real estate in Germany, so that every creation, transfer, encumbrance and cancellation of a right in respect of immovable property requires registration in addition to the agreement of the parties (s. 873).

The requirement of publicity which in the case of immovables is satisfied by registration is achieved as Ear as movables are concerned by possession. BGB s. 929 lays down in principle that transfer of movable property requires delivery of possession by the owner to the transferee plus agreement between the owner and the transferee that property should pass. Corresponding rules apply to the creation of a pledge (ss. 1205 ff.).

Possession of movables and registration of immovables is the basis of the wide protection afforded to good faith in German lam. Thus a person acquires ownership from a nonowner when he relies in good faith on the assumption that the man in possession of a thing—or registered in the land register—is its owner. This protection of the bona fide transferee does not apply if the transferor has acquired possession against the will of the true owner. as would be true of a finder or thief. This far-reaching acquisition of full and unencumbered property by transfer from a nonowner is among the most remarkable provisions of German law, although the courts generally apply the rule with caution.

The third book concludes with numerous provisions concerning restricted rights in respect of another man's property. German law recognizes hypothecs, land charges and annuity charges (BGB ss. 1113 ff.). The lack of a dual legal system comparable to common law and equity gives the creditor in a German hypothec or land charge only a restricted legal right. The creditor is empowered to take various steps to obtain, with the assistance of the court, satisfaction of his claim from the property of the mortgagor by way of foreclosure or sequestration. Other sections deal with ownership of a flat as distinct from the ownership of the house or of other flats (*Gesetz über Wohnungseigentum*, March 1;, 1951), with servitudes over land (BGB ss. 1018 ff.), with limited personal servitudes (ss. 1090 ff.), with rights or preemption over land (ss. 1094 ff.), with perpetual charges on immovables (ss. 1095 ff.), with heritable building rights (*Verordnung über* das *Erbbaurecht*, 1919) and with homesteads (*Reichsheimstättengesetz*, 1920).

Law of Domestic Relations.—The law of domestic relations is codified in the fourth book of the civil code and in the *Ehegesetz* of Feb. 20, 1946 (Control Council law no. 16). The latter contains the rules concerning celebration and nullity of marriage and the rules with regard to divorce. The civil code regulates all other questions relating to husband and wife. affinity and guardianship, including guardianship and curatorship over persons other than minors. Since April 1, 1953, however. in accordance with articles 3 II and 117 of the Basic law all ruies are annulled which contradict the principle of equality (*Gleichberechtigung*) between husband and wife. But no legal ordinance carrying out the principles of the articles had by the beginning of 1955 been issued. Faced by this legal vacuum the courts were forced to decide which parts of the old law were no longer compatible with the Basic law and which parts were in accordance with the principle of equality between the sexes. This duty fell on the courts as the constitutional rule was not a vague declaration of a future political program but an immediate binding injunction. The question has to be decided in each individual case as German law does not in general recognize the binding force of precedent. It has further to be decided. if a rule is rejected as contrary to the Basic law, with what principle it shall be replaced. Article 117 of the Basic law is only negative. It abolishes all legal provisions which discriminate between husband and wife, but creates no new rules. The legal situation is, therefore, as follows: Compensation for breach of promise to marry (BGB ss. 1298 ff.) may be demanded by both parties on the same grounds. There is no longer a special claim on the part of the woman. The sections concerning celebration of marriage (*Ehegesetz* ss. 11 ff.) are unaffected. Since the time of Bismarck (1875) they have required a secular celebration. Only a registrar can celebrate a marriage and a priest cannot, be a registrar. The religious celebration of marriage in church has to take place after the couple have been married in the registry office. A marriage may be voided on several grounds (Ehegesetz ss. 16 ff.) such as adultery and affinity: but this does not necessarily mean that the children are illegitimate. There are various ways in German law of treating marriage which are intermediate between complete nullity and full validity; the tendency is to treat the defective marriages in the same way as those which have been terminated by divorce.

The right to determine all questions relating to the matrimonial life has now to be decided by both spouses. Nevertheless. in case of disagreement the majority view is that the husband should decide doubtful issues, in the well-understood interest of both parties. A minority would prefer the decision of the court. Not only the wife but also the husband has the right to pledge the credit of the other spouse as an agent of necessity (BGB s. 1357). Each spouse is liable to maintain the other. The wife has in principle the same duties as the husband.

The doctrine of the equality of the sexes has also deeply influenced the law relating to the matrimonial regime (*Güterstand*); *i.e.*, the pecuniary relationship between the spouses (BGB ss. 1363 ff.). The hitherto existing legal "ordinary statutory regime" with the right of the husband to administer the estate of his wife and to use it as if he had a usufruct in it has been replaced by the regime of the separation of goods (BGB ss. 1426 ff.j. Reforms projected in 1955, however, would impose on both spouses some limitation with regard to their power of disposal over household property and would require in case of dissolution of the marriage participation of the other spouse in any profit earned by one spouse during the marriage.

The rules as to divorce. which have been relaxed in a liberal spirit. demand that the spouse be guilty of a matrimonial offense; alternatively. it is sufficient to prove as an objective fact a deep-rooted incurable disruption of marital relations which must be evidenced by the parties not having lived together for three years. The last-mentioned provision (Ehegesetz s. 48) has been by far the most important rule in the entire German law of divorce. Such a divorce. however, can be opposed by the partner who did not cause the disruption and must not be granted if. in the real interest of one or more minor children of the marriage, the continuance of the marriage is desirable. After the divorce has been granted the welfare of the children is the principle consideration in determining which party is to be granted custody. Questions relating to furniture and living accommodations have to be decided by the lower courts which have final and exclusive jurisdiction: On this question they have a very wide discretion. Joint property is presumed in earnings during the marriage.

The law relating to parent and child is based on the parental power (BGB s. 1626) which now belongs, according to the principle of equality between the sexes, to both spouses. Parental power has three aspects: care for the person; care for the property; and power to act as legal representative of the child According to s. 1666 the court for the protection of wards may take steps to prevent dangers threatening the child by reason of neglect on the part of the parents.

The position of the illegitimate child is determined by article 6 of the Basic law which lays down that legitimate and illegitimate children shall be put on equal footing. The relationship of the illegitimate child to the mother is given in every respect the same legal significance which the law attaches to any other mother and child relationship. The German civil code, however does not recognize a family relationship between the father and his illegitimate child; but the child is entitled to be maintained by the father according to the station in life of the mother.

Law of Succession.—The German law of succession, regulated in the fifth book of the civil code, is no longer based on the idea of family and community. It is merely a distribution of goods mortis causa. According to s. 1922 all rights and liabilities of a person pass immediately and automatically to his heirs on his death. The heir may be appointed by will or may take under the rules governing intestate succession.

There are private and public wills. Private wills, which require only handwriting and signature, are very informal documents. Moreover, the German courts interpret the rules governing private wills in a very liberal way. The will is opened at a special hearing of the lower court which issues on application a certificate of inheritance (Erbschein, ss. 2353 ff.). Public wills have to be made in the form of an oral declaration before a notary, who records them, or the testator may hand over to the notary a document and declare that it is his last will. If a near relative has not been appointed as heir he is entitled to receive from the heirs a sum equal to one-half of his share on intestacy (ss. 2303 ff.).

For the purposes of intestate succession in German law (ss. 1924 ff.) the relatives of the deceased are divided into groups called *Parentelen*. The first *Parentel* consists of the descendants of the testator, the second of his parents and their descendants, the third of his grandparents and their descendants and so on. There is no limitation of succession to the near relatives of the deceased. As long as one relative of a nearer *Parentel* is living at the death of the testator he excludes all other relatives of the next group. Apart from the succession of blood relatives. the testator's spouse has a right to a share in the capital of the estate (s. 1931). The share of the surviving spouse varies with the degree of nearness of those blood relations with whom the estate has to be shared.

Every heir has the right to disclaim the estate (ss. 1942 ff.), but this right must be exercised within a limited period; otherwise he is as a rule personally liable for the debts of the estate.

A testator may appoint an executor (*Testamentsvollstrecker*—ss. 2197 ff.). His legal position differs from that of an executor in English law in that neither rights nor liabilities pass to him. The latter remain vested in the heirs. He is merely a person entitled to act for and on behalf of the heirs. to dispose of the estate within the limits set by the law and the will by which he has been appointed, and to exercise such other powers as may have been granted to him by the will.

Special laws deal with succession to farmers. Their basic aim is to prevent the splitting up of farms, but they do not in general interfere with the capacity of the testator to dispose of his farm by will. They merely apply to cases of intestacy.

COMMERCIAL CODE; OTHER COMMERCIAL LAWS

Principles of the Commercial Code.—German law still maintains separate civil and commercial codes in contrast to the more modern Swiss law which deals with civil and commercial matters in one codification. The present commercial code. which has been in force side by side with the civil code since Jan. 1, 1900, dates in its main features from the General German commercial code of 1861 and paved the way for later codification in other spheres. It has been supplemented by many special laws dealing with commercial matters. In commercial questions the commercial code and its supplementary laws are primarily applicable; only where there is no special commercial rule has the court to apply the appropriate section of the BGB (introductory law to the commercial code s. 2).

The central feature of German commercial law is the subjective conception of "merchant"; French commercial lam, in contrast, is based on the objective concept of an "act of commerce." A merchant is a person who "exercises a commercial profession" (*Handelsgesetzbuch* s. 1). Some undertakings are commercial by reason of their nature and some are commercial by registration in the *Handelsregister*. There are, moreover, merchants by virtue of their organization, such as the company limited by shares, the private limited company and the co-operative society. A single merchant, a partnership and a company all possess a *Firma;* this means a commercial name under which the business is carried on. The civil name and the commercial name as well as the seat of the enterprise have to be registered in a special commercial register. This *Handelsregister*, which is kept by the district courts, is designed to show the legal position of merchants in regard to such matters as bankruptcy and the appointment of general agents called *Prokuristen*.

The special rules governing commercial acts which are prescribed in the third book of the commercial code are of great practical importance It is their function to reconcile freedom of trade nith the public interest. They have been mostly developed by mercantile custom.

The second book of the commercial code (ss. 105 ff.) deals with commercial associations in the form of ordinary commercial partnership (*offene* Handelsgesellsclzaf t), limited partnership (*Kom*mandztgesellschaft), and an association with a sleeping partner (stzlle Gesellschaft). In contrast with French and Italian law. the German commercial partnership is not a legal person but an association nhich belongs to all the partners in common (*Gesamthand*). All the partners are liable to an unlimited extent to creditors of the partnership. not only in respect to the property of the firm but also in regard to their own private property. The *offene* Handelsgesellschaft differs in this respect from the *Kommanditgesellschaft* in which one or more members have limited and the others unlimited liability. It also differs from a society with a sleeping partner where the sleeping partner is not liable to the creditors directly but only, within limits, to the other partners.

In the commercial code there is a fourth book which contains the maritime law. Its most important provisions deal with associations of part owners of seagoing ships (Reederezen or *Parten*reedereien) and with marine insurance.

Company Law.—The law referring to joint stock companies regulates the Aktiengesellschaft, a legal person corresponding to the English company limited by shares This is a corporation aggregate based on a capital (*Grundkapital*) divided into shares (Aktzen). The minimum capital is fixed at 500,000 DM.; thus the Aktiengesellschaft is confined to major business undertakings; smaller enterprises are intended to become private companies (Gesellschaften *mit beschränkter* Haftung). These shares are taken up by shareholders who have to contribute at least the nominal amount of the shares. Both bearer shares and shares registered in the name of a specific individual are known to German law, but whereas in England the latter are common and the former rare, in Germany the reverse is true. Bearer shares are transferred to a purchaser by an informal agreement by delivery of the certificate.

A joint stock company has three organs; the general assembly of shareholders (*Hauptversammlung*), the supervisory board (*Aufsichtsrat*) and the administrative board (*Vorstand*). Under German law a company is run by the administrative board. which is closest in function to the English board of directors. The administrative board is the representative and administrator of the company. The general assembly of the shareholders can only decide about the distribution of profits and not about the bnlance sheet, profit and loss account or amount of profits to be held in reserve; these matters are decided by the supervisory board and the administrative board. The supervisory board appoints the members of the administrative board. supervises them and receives their report. The supervision is done with the aid of auditors.

Two important new laws are the federal Law on Workers' Participation in the Coal and Steel Industries of May 21, 1951, and the Law Relating to the Organization of Undertakings of Oct. 11, 1952. The latter law lays down that representatives of the employees, electec! by secret ballot. shall occupy one-third of the seats on the supervisory board. Two of the seats must come from actual employees of the company; the others may be filled by "outsiders"; *i.e.*, representatives of the German Trades Union federation. The law for the coal and steel industries goes further and gives the workers the same number (five seats) on the supervisory board as the shareholder. It permits the trades union to fill three-fifths of thr workers' seats and to control the nominations made by the works council. The 11th neutral member is chosen by a complicated system xvhich may ultimately involve appeal to the court. The law for the coal and steel industries further compels the supervisory board to appoint to the administrative board a labour manager. who has equal rights with the other members of the hoard and is responsible for the social and personnel problems of the undertaking.

The law relating to private companies with limited liability (*Gesellschaften mit beschränkter Haftung*) of 1892 is more the product of theory than of practice and tradition. The intention was to create a form of enterprise in which liability is limited but which does not require the large minimum capital of 500,000 DM. prescribed for the foundation of a joint stock company. But it remains very doubtful if this form of private company can be reconciled n-ith principles of free competition, as it makes it possible to restrict the risk in a way which is not available to the individual merchant or the partnership. This is especially striking in the case of a "one-man company," where all the shares are vested in one person.

The *Gesellschaft mit beschränkter Haftung* is a legal person, with a minimum capital of 20.000 DM. dix-ided into share; called *Stammeinlagen* and with the rights of the members to participate. this right being called the *Geschäftsanteil*. The transfer of the share is rather complicated, and requires an agreement before a notary, the shares being not negotiable on the stock exchange. A member is liable to the amount of his share. The GmbH must have one or more managers (*Geschäftsführer*) corresponding to the administrative hoard of the *Aktiengesellschaft*. A supervisory board can. but need not, be appointed.

'Ihe co-operative society (*Erwerbs- und Wirtschaftsgenossenschaft*) was first organized in Germany in 1849 by F. H .Schulze-Delitzsch on the English model. The existing law treats a co-operative society as a legal person x~ithno fixed capital and no predetermined numher of members or shares. The voting rights of the members are equal. without respect to their different financial interests. There are societies n-ith unlimited and some with limited liability. In both cases ihe liability of the member is to the society and only arises when the society goes bankrupt. Co-operative societies have been very successfully de\-eloped.

Negotiable Instruments, Patents, Copyright.— A law of 1933 governs negotiable instruments such as bills of exchange, cheques and promissory notes. Here. however. German law has no great peculiarities. It has accepted the international convention of Geneva of 1930–31. International agreements are also the basis of the legal protection oi parents. copyright and designs in Germany. The various laws on this subject date from the conventions of Paris (1833) and Berne (1886).

PUBLIC LAW: CONSTITUTIONAL

The existence of "families of law" may he seen not only in civil but also in constitutional law. at least since the 13th century. Thus. the French constitution of 1814 and the Belgian constitution of 1831 were the model for similar legitimist constitutions in other parts of Europe; and in the same way German constitutions inspired other countries. The German monarchical constitution of 1871 had an effect even in China (1908) and in Japan (from 1889 onward). The Weimar constitution of 1919 influenced such constitutions as that of Finland. Lithuania and Latvia and was, in its last stages, the model for the Spanish constitution of 1931.

Nevertheless. it would be very misleading to draw too many conclusions from this phenomenon. Written constitutions are often of transient significance. They may remain on paper as a façade without being formally repealed. It is a characteristic of modern dictatorship to cloak the coup d'état with constitutional legality. Constitutions are. moreover, subject to fashion and conditioned by their times and above all by external political forces.

The. Weimar constitution was deeply influenced by French, Swiss. British and U.S. precedents. It is obvious that a constitutional convention after a lost war will look toward those political systems which have shown themselves most capable of carrying a nation to victory or of enabling it speedily to reintegrate itself into the international community. The Basic law of the German Federal Republic of 1949 must be seen. moreover: in the light of the defects of the past, against which they reacted.

The Frankfurt Constitution.— The first German constitution in which western ideas on the separation of powers, parliamentary institutions and guarantees of personal freedom came to prevail over the traditional autocratic system of most of the states was the Frankfurt constitution of March 28. 1849. It was the result of a new revolutionary movement in Germany which sympathized with the French r-evolution of 1848 and attempted to achieve the twofold purpose of establishing liberal constitutional government and of bringing about national unity. It aimed at a governmental structure consisting of a federally organized constitutional empire with a parliament of two houses. manhood suffrage and a responsible ministry. But these efforts failed. The constitution never became effective; the revolution lost its force and the princes succeeded in rejecting the whole plan.

The 1871 Constitution.— Incontrast to the paper constitution of Frankfurt the Bismarck constitution of 1871was a concise. clear and practical instrument based on agreement between the rulers of the states and fitted into the autocratic empire of that time. It contained no bill of rights. but this did not mean that no human rights were recognized. The sphere of liberties of the individual was regulated apart from provisions in the constitutions of the states by special laws; *e.g.*, with regard to arbitrary arrest, freedom of movement. freedom of the press. and freedom of trade arid of assembly. Such laws. however. could be changed at will, since there existed no definition of human rights which was binding on the legislature. Most of the rules of the Bismarck constitution were concerned with the relations between the states and the empire and were designed to ensure that the real power rested with the latter. The powers of the imperial government were enumerated and delegated while those of the states were enumerated and residual. Legislative power was vested in the federal council (*Bundesrat*) and the federal assembly (*Reichstag*).

The outstanding feature of this federal system was the hegemony of Prussia which rested on the traditional authority of a constitutional monarchy, the civil service and the army.

The **Weimar** Constitution.— The Weimar constitution of 1919was strongly influenced by the movement in favour of democratic self-determination which s\%-eptover Europe after World War I. The constitution provided for the separation of powers and for a court to decide in cases of conflict between the authorities. Under the constitution there were a president, chancellor and cabinet, a *Reichsrat* to represent the states and a *Reichstag* to represent the people. The chancellor was responsible to the *Reichstag*, which became a legislative body with real powers. The president was directly elected by the people. He appointed the chancellor and could dissolve the house and order new elections. In times of crisis, under the famous article 48, he was empowered together with the chancellor to legislate by decree. In contrast to the United States constitution the constitution of Weimar could be changed by the legislature. Thus, although human rights were recognized by the constitution, they were largely subject to legislative discretion. Whenever a question of human rights arose it was necessary to ascertain whether the rights in question were subjective and binding even on the legislature. or instructions to the executive or to the courts, or only mere declarations of future policy. The Weimar constitution was in many of its social provisions ahead of its era. But it proved an ineffective barrier against an authoritarian exploitation of governmental powers.

Lander Constitutions after **World War** 11.—The first German constitutions after World War II were those of the *Lander* of the *U.S.* and French zones. They were drafted in 1946 by Germans and approved by the occupying powers. The *Lander* of the British zone followed in 1950. For lack of new ideas these constitutions bear a fairly close resemblance to the Weimar constitution and to the constitutions of the *Lander* of 1919–23. In the constitutions of Bavaria and of the *Lander* of the French zone a religious influence is apparent. There are also some constitutional innovations, especially in economic and social matters.

The Basic **Law.**—New ideas combined with resemblances to the Weimar constitution are to be found in the German constitution on the national level, the Basic lam (*Grundgesetz*) of Bonn of 1949. The German people had not full autonomy in the drafting of their constitution. Numerous objections, mostly in favour of a federal solution; were raised by the military governors. Moreover, the Occupation statute remained in force besides the Basic law. The term "Basic law" was used because the idea of a dismembered Germany was abhorrent and the word constitution implies permanency. "The Basic law," according to its last article, "loses its validity on the day when a new constitution approved by the German people in a free vote comes into force."

With regard to fundamental rights of a political, economic, family, religious and social nature, a complete change has taken place since the Weimar constitution. The fundamental rights of the Basic law are no more mere declarations of a future political program. They are immediately binding on the legislature, the executive and the judiciary. for, according to article 19, "in no circumstances may the substance of any fundamental right be interfered with." These natural rights. which are conceived as existing before the coming into being of the state, are not subject to political control and are intended to prevent a despotic use of power by the legislature.

Other articles deal with the relations between the federation and the *Lander,* with the central government, legislation. and execution and administration of the law. The Bonn Basic law is more federal than the Weimar constitution. In the Basic law all state authority emanates from the people (article 20). There is a federal council *(Bundesrat)* and a federal assembly (*Bundestag)*. Through the *Bundesrat* the *Lander* participate in the legislation and administration of the federation. The president, as in France, is elected by the *Bundesversammlung* (the *Bundestag* and members of the parliaments of the *Lander);* his powers are not extensive. The chancellor dominates the cabinet and without his countersignature the president cannot act. The president appoints the chancellor, but the parliament elects him. The problem of governmental stability has been settled in a new way: to guard against reckless votes of censure the Basic lam (article 67) makes the overthrow of the government dependent on the election of the next chancellor; a vote of no confidence does not of itself bring about the fall of the government.

The dominant organ of the Basic law is the federal constitutional court (*Bundesverfassungsgericht*), which controls the legislature. the executive and the ordinary courts. Due process of law and the independence of the judiciary are guaranteed (article 97). The scope of judicial review has been much extended by the Basic law. Even an individual whose human rights have been violated has a constitutional complaint (*Verfassungsbeschwerde*). The control exercised by the court. however, is in the form of a legal decision, and it is difficult to define the border-line between a legal and a political decision.

Local Government. — Local government legislation has preserved a more characteristically German tradition. Germany has had two notable periods of local self-government, of which traces are still to be seen. The first, which reached its climax between the 13th and 15th centuries, was associated with the rise of mediaeval towns and with the Hanseatic and other leagues of cities. The second period dates from the Stein-Hardenberg reforms in Prussia (1807 onward) and lasted until the National Socialist regime. The Stein-Hardenberg reforms were the cornerstone of municipal self-government in all parts of Germany. They were based on the principle that the participation of the people in public affairs must begin at a level at which the individual citizen can himself co-operate in a practical way and where he is able to take a broad view of the situation. At this level the function of the state is to act as a kind of umpire. maintaining a balance and effecting compromises. The idea that the state's role is to solve internal tensions by assuming a judicially impartial attitude is one which is deeply rooted in Germany and may be equally adopted in economic and social conflicts.

The local governments codes (*Gemeindeordnungen*) issued after World War II took these ideas into account. The communes (*Gemeinden*) have full powers of local self-government and the task of executing the work for which the federal and *Lander* governments are responsible. except where the law expressly provides otherwise. Provision is made for the active participation of as many persons as possible in local affairs. Most of the larger units of local government have the so-called *Magistratsverfassung* whereby the legislative power is vested in a popularly elected council (*Gemeindevertretung*), the *Magistrat* being the *Kollegium* of officials entrusted with municipal administration. The *Magisfrat* consists of the *Bürgermeister* and two groups of officials, one professional and the other nonprofessional. All members of the *Magistrat* are elected by the *Gemeindevertretung.*

PUBLIC LAW: ADMINISTRATIVE

Administrative lam in Germany serves many purposes. It includes the activities of the communes, municipalities and other public corporations in such spheres as social insurance, public health, welfare, housing and reconstruction. Moreover, the organization of road traffic, posts and railways, electricity, water supply, taxes, public education, cultural activities, customs and excise and poor relief are within its scope. Although there is a tendency toward wider codification, only parts of German administrative law (*e.g.,* tax law by federal legislation and police lam by the *Länder*) have been as yet codified. In particular, the general rules of administrative law (*e.g.,* those governing the validity or revocability of administrative acts) are for the greater part uncodified. They have been developed by the courts and jurists under the stimulus of comparative studies, especially of French law (O. Mayer). This has led to a peculiar doctrine of the administrative act, which contrasts with the doctrine of the juristic act of private law. An administrative act is, as a matter of principle, and without prejudice to its possible illegality, deemed to be binding until it has been withdrawn by the public authority issuing it or has bren quashed either by some higher authority or by an administrative court. The principle applied is that the activities of administrative authorities are not subject to the same rules as those which govern relations between citizens, although general rules developed in civil law are sometimes applied *mutatis mutandis* to administrative lam.

The question whether a particular act or regulation of an administrative authority is or is not *ultra vires* is now more strictly construed than before 1933, after which the administrative courts played a role of decreasing importance. The excesses and abuse of power under Hitler's regime have provoked a reaction in favour of restricting administrative discretion.

If a civil servant exceeds his official duty, whether by intention or negligence, while acting within the scope of his official activities, only the state or other public corporation concerned may be sued for damages (Basic law, article 34). These provisions are widely interpreted by the courts, especially where a public authority has undertaken a dangerous activity. In the case of gross negligence or intention on the part of the civil servant the state may claim an indemnity from the official.

PUBLIC LAW: LABOUR

In contrast to England, the intervention of the state by means of legal regulations has played and continues to play a significant part in German labour relations. The central purpose of these regulations was from the outset more to protect the workers than to develop independent collective bargaining, which grew up more slowly than in England. Thus the German laws sought to protect workers against accidents while at mork by introducing precautions or by insisting on less dangerous methods of mork and by providing inspectors and controliers. They also prohibited child labour and Sunday work and ensured adequate social insurance. These laws were relatively early in date and have since been much developed.

German legislation has further given attention to the economic protection of the worker who is dependent on his place of work and wages. Laws requiring the payment of wages in cash (Truck acts) and prohibiting escessir-e deductions from wages were developed at an early date; the protection of the worker against unjustified termination of his contract of employment (*Kündigungsschutz*) came somewhat later. The *Kündigungsschutzgesetz* of Xug. 10, 1951, gave general protection against socially unjustified dismissals and provided special measures in case of mass discharge irom employment. The laws concerning unemployment insurance. the conducting of employment agencies and exchanges also tend to favour dismissed workers.

German law has also dealt with the question of collective bargaining, but although the system of labour regulations is as complete as possible the contractual function of collective agreements will always tend to remain in the sphere of social facts rather than in that oi the law. In Germany the revolution of 1918 and the Weimar constitution resulted in the recognition of trade unions and stimulated co ‹ective bargaining. After World War II the freedom to organize in trade unions—Germany has now only one unified Trades Union federation—and the right to strike was constitutionally guaranteed. A new law on wage scale contracts (*Tarifvertragsgesetz*) was passed in 1949; this defined the contractual function of the collective agreement, giving it an "extended" or compulsory normative effect (*Allgemeinverbindlichkeit*). Furthermore, the terms of the German wage-scale contract automatically became the terms of all individual contracts of employment (*Unabdingbarkeit*). An elaborate statutory machinery was set up by law for the settlement of minimum wages and with regard to holidays. The ministers of labour have also certain powers of intervention either by way oi conciliation or by bringing about voluntary or compulsory arbitration. The most important labour law has been the Lam Governing Industrial Relations Between Employers and Employees in Private Economy (*Betriebsverfassungsgesetz*) of Oct. 11, 1952, which is not remedial but a general comprehensive and systematic treatment of a part of labour law. It deals with the compulsory works councils (*Betriebsräte*) which have now acquired a far-reaching right of co-management especially in social and personnel questions. The agreements between the employer and the works council in the individual enterprise are, apart from the wage-scale contracts, an important source of German labour law. (See also under *Company* Law above.)

PUBLIC LAW: CRIMINAL

Early Criminal Codes.—Since the 6th century, beginning with the Lex *Salica,* there have been written collections of criminal lam in German territory. Rut it was not before the 15th and 16th centuries, at the time oi the reception of Roman law, that the first comprehensive codifications of criminal law were inade (the so-called *Halsgerichtsordnungen*) in some of the individual German states. The first authoritative code ior the whole of Germany was the Constitutio *Criminalis* Carolina of 1532, the *peinliche Gerichtsordnung* of Charles V, which remained in iorce for three centuries. It mas a reasonable compilation based in part on the union of German and Italian ideas and it was written in excellent German. The centuries following the enactment of the Carolina were notable for the juristic writings of such advocates of reform as Benedikt Carpzov (1595–1666), J. S. F. Bohmer (1704–72) and Paul Anselm von Feuerbach (1775–1833), the able author oi the Bavarian criminal code of 1813. During this period criminal law, influenced by the Enlightenment, became more humane, and the same influence led to the abolition of the inquisitorial procedure at the time oi the French Revolution.

The Federal Criminal Code.—After the unification of Germany the federal criminal code was issued in 1871. It is still in force, although several general schemes for the reform of criminal law have meanwhile appeared. They have had a considerable influence on the reform of criminal law in foreign countries; *e.g.,* in Switzerland (1942 onward) and in Scandinavia (criminal codes in the 20th century). But in Germany the reform movement succeeded only in replacing a few sections of the criminal code by means of supplementary laws. The criminal code is therefore still based on the ideals of liberal individualism. It would be more exact to say that it is again in force, ior Hitler eliminated the rule of law and the principle of *nullum crimen sine lege,* mhich at the time of the Enlightenment and the French Revolution had been introduced as a safeguard of individual liberty. In accord with the spirit of the times, however, some new social ideas have found expression. Thus, the obligation to go to the help of another person is now recognized by the German criminal code. Under *Strafgesetzbuch* s. 330a it is a punishable offense for anyone, in case of accident, public danger or emergency, not to give the assistance which may normally be expected of him, in particular when requested by the police to render such help.

The general part of the criminal code first deals with the nature of offenses in general and of the punishments which mav be inflicted. It explains the various forms a d degrees of crime, the objective and subjective elements of an offense (carefully distinguished in German criminal theory), the reasons for exemption irom punishment and the circumstances excludihg guilt; these are precisely defined, particular attention being paid to the question of mistake. The general part also sets out the various stages in the commission of an offense, explaining what constitutes an attempt and defining the different ways of participating in a crime; *e.g.,* aiding and abetting. Conspiracy, however, is unknown to German law.

German jurists have been particularly interested in the subjective constituents of a crime. There are various distinctions in German law such as direct and indirect intent or unconscious and aggravated negligence (*i.e.,* recklessness), but there are scarcely any presumptions of guilt. In this field the modern "doctrine of final action" (*Finale Handlungslehre*) of H. Welzel has made some interesting suggestions. It distinguishes between causality and finality. This starting point leads to new solutions, for example, to the problems of error, especially in cases of punishable negligence. StGB ss. 13–42 deal mith kinds of punishment and have been altered on a number of occasions, as national and authoritarian political ideas and liberal economic ideas have given way to the conception of the welfare state. The most important alteration, made in 1953, introduced "conditional suspension of sentence on probation" (*Strafaussetzung auf Bewährung*) which resembles the French sursis and the English probation. This idea had been worked out 70 years before by the German jurist, Franz von Liszt, professor of criminal law at Marburg, who in 1882, under the influence of Darwinism, produced his famous "sociologial" scheme *Der Zweckgedanke im* Strafrecht.

German lam no longer permits capital punishment; it was abolished by article 102 of the Basic law. Three forms of confinement are recognized: the severest form is penal servitude (*Zuchthaus*), which is considered more dishonourable than imprisonment (*Gefängnis*) but in practical effect differs little from it; detention (*Haft*), the mildest form of confinement, is imposed mostly ior petty offenses in breach of police regulations. There are, moreover, special preventative measures of security and reform, such as confinement in an asylum for mental cases, or in an institution for alcoholics or for drug addicts, or in a workhouse. These measures may be additional to punishment, as German law in this respect follows the so-called "double-track" system.

The *Jugendgerichtsgesetz* of 1953 provides special punishments for juveniles. The law distinguishes between an educational. disciplinary and punitive sanction. Any one of these three sanctions may be imposed on young persons between 14 and 18, and also on persons between 18 and 21 if the court decides in the circumstances to apply the law appropriate to the younger age group. Juveniles under punishment must not have contact mith adults undergoing punishment. The educational sanction mav take the form of a reprimand or of an order to the young person to adopt a certain way of life: *e.g.,* to live in a particular house, to do some special kind of work, not to smoke, etc. The court may also order a period of probation under supervision or send the offender to a reformatory school (*Schutzaufsicht* or *Fürsorgeerziehung*). The disciplinary sanction may involve seeking pardon of the injured person or attending for one or more weekends at a juvenile detention centre. In serious cases the juvenile may be sent to a juvenile prison for a specified or for an indeterminate period.

The special part of the criminal code (StGB ss. 80–3jo) deals with particular offenses. The difficulties of codification are very evident, as every special part of a criminal code must necessarily have a fragmentary and incomplete character. Because of social changes many offenses cannot be included in the criminal code; there are, for example, a number of special laws relating to taxation, economic matters and police regulations which impose punishment on the offender.

LAW OF PROCEDURE: CIVIL

Development.— The German civil lawyer thinks in terms of rights and duties, in contrast to the common lawyer who has, at all events until recent times, tended to think in terms of remedies; but the development of the German law of procedure since the ioundation of the empire in 1871 has tended to narrow the gulf between the two ways of legal thinking. This development is associated with such men as Adolf Wach, Konrad Hellwig, James Goldschmidt and Leo Rosenberg.

The present German law of procedure is based upon Romanized canon and Germanic law. From these two systems a form of procedure was developed mhich was taken from northern Italy to Germany at the time of the Reception. The laws of the various states and the decisions of the courts transformed it into the so-called Get*meine* Prozess. During the 18th century this system of procedure was influenced by the ideas of the Enlightenment and later by the French Code de *Procédure* Civile (1806). The desire for a uniform law of procedure, which is always stronger than the demand ior a uniiorm private law, grew more insistent during the 19th century. In 1877 the four great Judicature acts (*Reichsjustizgesetze*) were published: the law on the constitution of the courts (*Gerichtsverfassungsgesetz*), the code of civil procedure (*Zivilprozessordnung*), the code of criminal procedure (*Strafprozessordnung*) and the bankruptcy act (*Konkursordnung*). Supplementary laws later reformed these basic laws. These more recent lams show the influence of the Austrian code of civil procedure, which was published at the end of the 19th century and reveals a new awareness of social problems under the influence of the teaching of Franz Klein. Two years aiter the promulgation of the German Judicature acts a supreme court (*Reichsgericht*) mas established at Leipzig. Its predecessor, the ***Reichskammergericht,*** founded in 1495, had come to an end mith the Holy Roman empire in 1806.

Organization of the Courts.— The organization of the German civil courts is based on the proiessional judge, a civil servant, who must have studied at a university and who is appointed by the government aiter having passed two state examinations. His appointment as a judge is in Germany the beginning oi his career. The German judge is not subject to the decisions of a higher court (no binding force of precedents). The ordinary courts, which are at the local level *Amtsgerichte,* at the county level *Landgerichte,* and in respect of larger areas *Oberlandesgerichte,* are all part of the judicial system of the *Land.* In the *Amtsgericht* a single judge presides but in the *Landgericht* there are in civil cases a number of courts (*Zivilkammern*) each with a *Kollegium* of three judges. Where the amount in issue exceeds 1,000 DM. the case has to be brought beiore the *Landgericht* as the court of first instance. The *Oberlandesgerichte* function as courts of appeal ior a number oi *Landgerichte* and sit in senates of up to five members. Above them is the highest German civil court (*Bundesgerichtshof*) which sits at Karlsruhe. Practising lawyers, called *Rechtsanwälte,* combine the functions of solicitor and barrister. They prepare the cases and appear in court on behalf of their clients.

Principles of Procedure. — The German lam oi civil procedure is governed by the idea that the court is in principle restricted to a consideration of those facts which the parties have placed before it. The opposite inquisitorial system where the judge must ex officio investigate the circumstances is employed only in cases relating to status; *e.g.,* in divorce. German procedure requires as a rule an oral hearing in public. But preparations ior the trial involve the exchange of written pleadings) and the oral hearing often consists in little more than a formal reference to the pleading. The German law of procedure permits the free assessmrnt of evidence (ZPO s. *286).* According to this *Prinzip der freien Beweiswürdigung* the courts are not fettered by any formal rules of evidence; they can evaluate the ex-idence in their own iree and reasonable discretion. Any kind of evidence is admissable and the court has to decide how much weight to give to it.

The ordinary civil courts are replaced in certain matters by special courts which are subject not only to the *Zivilprozessordnung* but also to special laws of procedure. Of these courts the most important are the labour courts. They are regulated by the *Arbeitsgerichtsgesetz* of Sept. *3.* 1953. There are three instances, *Arbeitsgerichte, Landesarbeitsgerichte* and the final court of appeal, the *Bundesarbeitsgericht* at Kassel. They deal with disputes arising out of individual or collective agreements between employers and employees, and with wrongful acts connected with industrial disputes.

LAW OF PROCEDURE: ADMINISTRATIVE

In Germany administrative law is as a rule a concern of administrative courts. They are either general administrative courts (*Verwaltungsgerichte, Landesverwaltungsgerichte, Bundesverwaltungsgericht*) or special administrative courts such as fiscal courts *(Finansgerichte, Landesfinanzgerichte, Bundesfinanzgericht*) for taxation questions, courts for disputes about social insurance *(Sozialgerichte)* and the tribunal for patent questions *(Patentanrt).*

The separation of ordinary and administrative courts is generally deiended on the grounds that the administrative courts are more specialized and therefore better able to deal with such technical matters as administration and taxation. There are, however, signs of a movement in favour oi assimilating the different types of jurisdiction or rather of developing general conceptions common to all of them. Under the influence of this movement the scope of administrative law has been extended since the war. The Prussian system of enumerative clauses has been given up for the so-called general clause. Any administrative act and not only cases specifically mentioned in the statute may now come before an administrative court.

At present the main laws of administrative procedure are laws of the *Lander.* The cases which come before an administrative court relate to a challenge to an administrative act (*Anfechtungsverfahren*) or to some other kind of public law dispute (*Parteistreitverfahren*) or to an inquiry into the validity of subordinate legislation *(abstraktes Normprüfungsverfahren)* in order to test its conformity with the parent statute. If all remedies of the administrative courts have been exhausted, every private individual has the possibility of bringing a constitutional complaint before the federal constitutional court. This complaint, in which protection is sought in accordance with the fundamental rights of the Basic law against both administrative acts and against statutes and ordinances, subordinates the state in its executive iunctions to the rule of law.

LAW OF PROCEDURE: CRIMINAL

The German law of criminal procedure is characterized by a division between the function of the court and that of the public prosecutor *(Staatsanwalt).* The courts are the same as those sitting under civil procedure, but the *Amtsgerichte* may sit with lay assessors (*Schöffengerichte*) and the *Lnizdgerichte* may sit with three professional judges and six laymen who decide together on guilt and punishment (*Schwurgerichte).*

In contrast with the judges the public prosecutors are subject to the orders and directives of their superiors. The principle was borrowed from the French *Code d'instruction criminelle* of *1806.* The *Staatsanwaltschaft* has as its head the minister of justice and has offices attached to every lan- court. The judges and the public prosecutors have a duty to find out the "material truth." Their methods, however, differ. The prosecutor is the adversary of the accused. He has the duty to investigate where there is sufficient reason to assume that an offense has been committed (StPo s. *160).* If he is not convinced of the guilt of the accused person. he has to close the proceedings. Otherwise he applies to the court to hold the trial. At the trial he has an equal right with the accused to be heard, to produce evidence and to lodge an appeal. He has. however, special powers—he may order the police to assist him and he may arrest suspected persons whenever delay in obtaining a warrant is likely to hinder the prosecution. In the latter case the conditions which would have justified the issue of a warrant must have been fulfilled. The arrested person must be brought within *24* hours before a judge who must either issue a warrant or release the accused.

Although in Germany, as in England, the accusatory and not the inquisitorial system prevails, the position of the judge in a German criminal case is very different irom that oi an English judge in criminal proceedings. In Germany the presiding judge takes the evidence, interrogates the witnesses and experts and in general conducts the trial. The prosecutor and the defendant or his counsel can only interrogate witnesses by permission of the judge which must. however, be given. It should finally be added that the benefit of the doubt has always to be given to the accused.

GERMAN LITERATURE. The literary history of the German-speaking peoples of the continent of Europe may conveniently be divided into seven sections: (1) Old High German period. from the earliest records to the middle of the 11th century: *(2)* Middle High German period, from the middle of the 11th to the end of the 14th century; (3) transition period. covering the 1jth and 16th centuries; (4) Renaissance and Baroque periods, covering the 17th century; (j) age of Enlightenment; (6) age of Goethe; and (7) period following Goethe's death.

OLD HIGH GERMAN PERIOD

There are no records to suggest that the continental Germanic tribes possessed a written literature before the age of Charlemagne. When the vernacular literature began to emerge in the 9th century, it was merely a faint reflection of the activity of the monasteries; and this, with very few exceptions, Old High German literature remained. Translations of the liturgy, of Tatian's *Gospel Harmony (c.* 835) and of fragments of sermons form a large proportion of it. Rarely, as in the so-called *Monsee Fragments* and at the end of the period in the prose of Notker Labeo (d. 1022), does this ecclesiastical prose attain any kind of literary style. Without vitality of its own, it virtually sprang into existence at the command of Charlemagne, whose policy with regard to the use of the vernacular in place of Latin was liberal and farseeing; it docilely obeyed the tastes of the rulers that followed, becoming severely orthodox under Louis the Pious and consenting to extinction when the Saxon emperors withdrew their favour from it. Of the poetic fragments the most interesting are the *Meseburger Zaubersprüche* (*Merseburg Charms*), the *Wessobrunner Gebet* (*Wessobrunn Prayer) (c.* 789), the *Muspilli,* an imaginative description of the Day of Judgment, and the *Ludwigslied* (881), the first German historical ballad. The *Evangelienbuch, Liber evangeliorum* or *Gospel Book* of Otfrid of Weissenburg (c. 868) was the earliest attempt to supersede alliteration in German poetry by rhyme. The only genuine poetry of this epoch arose among the Low German races. To Saxon tradition we owe the earliest extant fragment of heroic legend, the *Hildebrandslied (Lay of Hildebrand*) (*c.* 800), and a Saxon poet was the author of a vigorous alliterative version of the Gospel story, the *Heliand* (c. 830). Of the existenct of a lyric poetry we only know by hearsay; and the drama had nowhere in Europe at that time advanced beyond an ecclesiastical function. Literature in the 10th and 11th centuries again reverted to Latin. The *Waltharilied (Lay of Walter) (c.* 930), *by* Ekkehard of St. Gall; the moralizing dramas of the nun Hrosvitha of Gandersheim; the *Ecbasis captivi* (*c.* 940), earliest of all the beast epics; and the romantic adventures of

Ruodlieb (*c.* 1030), although not in German, foreshadow the future developments of German poetry.

MIDDLE HIGH GERMAN PERIOD

At the middle of the 11th century, when the linguistic change from Old to Middle High German was taking place, a religious asceticism, originating in the Burgundian monastery of Cluny, cast a blight over secular poetry. Lugubrious in their asceticism are poems like *Memento mori* (*c.* 1070), *Vom Glauben,* a verse commentary on the creed by a monk Hartmann (*c.* 1140), and verses on "the remembrance of death" (*Von des tôdes gehugede*) by Heinrich von Melk (c. 1160). But in the *Ezzolied* (1063), a spirited lay by a monk of Bamberg on the life, miracles and death of Christ, and in the *Annolied* (*c.* 1080), a poem in praise of the archbishop Anno of Cologne, the tone is simpler and more popular.

A freer spirit is to be seen, too, in the lyric poetry inspired by the Virgin and in the *Kaiserchronik* (*c.* 1150), a long. confused chronicle of world history. The national legends begin to emerge in the popular literature. To the wandering *Spielleute* we owe the romance of *Konig Rother* (*c.* 1160), and the kindred stories of *Orendel, Oswald* and *Salomon und Morolf.* These poems bear witness to the influence of the crusades, as do also the *Alexanderlied* (*c.* 1130), and *Herzog Ernst* (*c.* 1180), which point the way to the court epic. The *Chanson de Roland* was, about 1135, reproduced in German by Konrad of Regensburg as the *Rolandslied.*

The court epic begins in Germany with the *Tristrant* (*c.* 1180) of Eilhart von Oberge, and a knightly romance of *Floris und Blancheflur* (*c.* 1170). In these years, too, the beast epic was reintroduced into Germany by an Alsatian monk, Heinrich der Glîchezâre, who based his *Reinhart Fuchs* (*c.* 1180) on the French *Roman de Renart.* Lastly, the *Minnesang,* or lyric, burst out with extraordinary vigour in the last decades of the 12th century. It is debatable how much in it is indigenous and national, how much the result of French and Provencal influence; but the freshness and originality of the earliest German singers, such as Kiirenberg, Friedrich von Hausen and Dietmar von Aist, are not to be questioned. Heinrich von Morungen's poetry displays marked Romance elements. The satirical *Spruchdichtung* is represented by two poets who call themselves Herger and "Der Spervogel" and was less dependent on foreign models.

Such was the preparation for the extraordinarily briiliant although brief epoch of German mediaeval poetry which was contemporary with the reigns of the Hohenstaufen emperors Frederick I (Barbarossa), Henry VI and Frederick II. National epic, court epic and *Minnesang,* to which may be added as a smaller group didactic poetry, comprise virtually all that survived in Middle High German. A Middle High German prose hardly existed and the drama, such as it was, was still essentially Latin.

The first place among the national epics belongs to the *Nibelungenlied,* which received its modern form in Austria about the end of the 12th century. It combines elements from various heroic cycles—the lower Rhenish legend of Siegfried, the Burgundian legend of Gunther and Hagen, the Gothic legend of Dietrich and Etzel—and its dramatic intensity and singleness of purpose reveal that its author possessed a lofty imagination and high epic gifts (*see* NIBELUNGENLIED). Less imposing is the second of the German national epics, *Gudrun:* as it survived it is the work of an Austrian, but the home of the story is on the shores of the North sea. Dietrich von Bern (*i.e.,* of Verona), or Theodoric the Great, who was looked upon for hundreds of years by the German people as their national hero, has been celebrated in no epic comparable to the *Nibelungenlied* but he appears in the background of a number of romances—Die *Rabenschlacht, Dietrichs Flucht, Alpharts Tod, Biterolf und Dietlieb, Laurin,* etc.—which make up what is usually called the *Heldenbuch.*

The court epic, or romance of chivalry, the influence of which is also apparent on all these popular epics, forms the greatest group of German mediaeval poetry. The poet who established the court epic in Germany was Heinrich von Veldeke, a native of the lower Rhineland; his *Eneit* (*c.* 1175–1186) is based on a French original. Other poets of the time, such as Herbort von Fritzlar, the author of a *Liet von Troye,* followed Heinrich's example. With the three masters of the court epic, Hartmann von Aue, Wolfram von Eschenbach and Gottfried von Strassburg—all of them contemporaries—the Arthurian cycle became the established theme of this type of romance and the embodiment of the ideals of the knightly classes. Hartmann was a Swabian, Wolfram a Bavarian, Gottfried presumably a native of Strasbourg. Hartmann, in his *Erec* and *Iwein,* provided the court epic of the age with its best models; his *Gregorius* and *Der arme Heinrich* are stories of religious contrition. Of all the mediaeval court poets he had the most delicate sense of style. Wolfram and Gottfried, on the other hand, represent two extremes of poetic temperament. Wolfram's *Parzival* is filled with mysticism and obscure spiritual significance, while Gottfried's *Tristan* is as lucid as Hartmann's *Iwein.*

Pareival and *Tristan* are the greatest of the German court epics, and the subsequent development of that literary form stands under the influence of the three poets Hartmann, Wolfram and Gottfried. To the followers and imitators of Hartmann belong Ulrich von Zatzikhoven (*Lanzelet, c.* 1195); Wirnt von Gravenberg, a Bavarian (*Wigalois, c.* 1205); the versatile Spielmann known as "Der Stricker"; and Heinrich von dem Tiirlin, author of an unwieldy epic, *Die Krone* ("the crown of all adventures," *c.* 1220). Wolfram's mysticism is to be seen in *Der jüngere Titurel* of a Bavarian poet, Albrecht von Scharfenberg (*c.* 1270), and in the later *Lohengrin* of an unknown poet; whereas Gottfried von Strassburg dominates the *Flore und Blanscheflur* of Konrad Fleck (*c.* 1220) and the work of two important poets of the later 13th century, Rudolf von Ems, who died in 1254, and Konrad von Würzburg, who lived until 1287. Of these Konrad alone carried on worthily the traditions of the great age; he excels in short romances such as *Die Herzemaere* and *Engelhard,* though he becomes diffuse and wearisome in his enormously long *Trojanerkrieg* and *Partonopier und Meliur.*

The most conspicuous changes which came over the narrative poetry of the 13th century were, on the one hand, a steady encroachment of realism and, on the other, a tendency to didacticism. The "fact" of the chronicle takes the place of the freer imaginings of the earlier poets in the work of Rudolf von Ems; while the growth of realism appears in the *Pfaffe Amis,* a collection of comic anecdotes, in the admirable peasant romance *Meier Helmbrecht,* written about 1250 in Bavaria, and in the adventures of Ulrich von Lichtenstein (*Frauendienst,* 1255; *Frauenbuch,* 1257).

One of Germany's greatest lyricists, Walther von der Vogelweide, summed up in himself all that was best in the *Minnesang;* in love song high and low, in religious poetry, in patriotic and political *Spruche*—*in* all he was a master. The originality and purity of his inspiration place him in the highest rank. He was born about 1170 and died about 1228; his art he learned in Austria—he calls the elegiac poet Reinmar von Hagenau his master—whereupon he wandered through Germany, where his championship of what he regarded as the national cause in the political struggles of the day won him foes as well as friends (*see* WALTHER VON DER VOGELWEIDE). Among Walther's immediate contemporaries, the highborn poets, whose lives were passed at courts, naturally cultivated the conventional lyric; but others availed themselves of the freedom of his poetry of uncourtly love. This was Walther's most valuable legacy to his successors, the greatest of whom was Neidhart von Reuental (*c.* 1180—*c.* 1250), who found the themes of his *Höfische Dorfpoesie* in the village and depicted the peasant with humorous banter or biting satire. The *Spruchdichter* came best out of the ordeal of the changing fashions of the later 13th century, favoured by the increasing interest in the moral and didactic applications of literature. The *Spruchdichtung* was in fact the connecting link between the *Minnesang* of the 13th and the lyric and satiric poetry of the 15th and 16th centuries.

A critical and didactic spirit was gradually taking the place of the idealism of chivalry. In the early decades of the 13th century, *Der Winsbeke,* by a Bavarian, and *Der welsche Gast* (1216), by Thomasin von Zirclaere, a native of Friuli, still inculcate the duties and virtues of the knightly life. But in the *Bescheidenheit* (*c.* 1230) of a wandering singer who called himself Freidank is found for the first time an antagonism to the unworldly code of chivalry and a sign of the changing social order, brought about by the rise of the middle class. In Der Renner by Hugo von Trimberg, written at the very end of the century, the terseness and wit of Freidank have given place to diffuse moralizing and allegory.

TRANSITION PERIOD

To End of the 15th Century. — By the middle of the 14th century knighthood was rapidly declining and the conditions under which mediaeval poetry had flourished were passing. But the stories of chivalry were still popular although the feeling for beauty of form and expression was lost. As time went on, prose versions of the old stories became more general, and out of these developed the *Volksbücher,* which were the favourite reading of the German people for centuries. The Buch der Abenteuer of Ulrich Fuetrer, written at the end of the 1 jth century, and Der Weisskonig and *Teuerdank* by the emperor Maximilian I (1459–1519), printed in the early years of the 16th. may be regarded as the last monuments of the decadent narrative literature of the middle ages. At the beginning of the new epoch the *Minnesang* could still point to two poets of distinction, Hugo von Montfort (1357–1423) and Oswald von Wolkenstein (1367–1445); but as the lyric passed into the hands of the middle-class poets of the German towns, its emotional sensitiveness gave place to moral and religious dogmatism; and the simple forms of the older lyric were superseded by ingenious metrical distortions. Under the influence of writers like Heinrich von Meissen ("Frauenlob," *c.* 1250–1318), Heinrich von Miigeln and Michael Beheim (1416–*c.* 1480), the *Minnesang* passed over into the Meistergesang. In the later 15th and in the 16th centuries all the south German towns possessed flourishing hfeistersinger schools in which the art of writing verse was taught and practised according to complicated rules.

The great lyric poetry of these transition centuries was not the *Meistergesang,* but the Volkslied. Never before or after did Germany have so rich a harvest of popular poetry—songs of love and war, hymns and drinking-songs, songs of spring and winter and historical ballads. In prose the most popular form was the Schwank or comic anecdote. Collections of such Schwanke range from the practical jokes of Till *Eulenspiegel* (1515), and the coarse witticisms of the *Pfaffe vom* Kalenberg (end of 14th century) and Peter *Leu* (1550), to the religious and didactic anecdotes of J. Pauli's *Schimpf und Ernst* (1522) and the more literary *Rollwagenbüchlein* (1555) of Jörg Wickram and the *Wendunmut* (1563 et seq.) of H. W. Kirchhoff. Of the first importance is the *Narrenschiff* (1494) of Sebastian Brant, a landmark on the way to the Reformation. The beast fable and beast epic appealed with peculiar force to the new generation. At the very close of the hfiddle High German period, Ulrich Boner revived the Aesopic fable in his *Edelstein* (1349), and in the century of the Reformation the fable became, in the hands of Burkard Waldis (*Esopus,* 1548) and Erasmus Alberus (*Buch* von der *Tugend* und *Weisheit,* 1550), a favourite vehicle of satire and polemic. A still more popular form of the beast fable was the epic of Reinke de Vos, which has come down to us in a Low Saxon translation, published at Liibeck in 1498.

The drama, as in all European literatures, emerged slowly and with difficulty from the church liturgy. As time went on the vernacular was substituted for the original Latin and, with increasing demands for pageantry, the scene of the play was removed to the churchyard or the market place; finally the drama was completely separated from ecclesiastical ceremony. The mimic representations, originally allegorical in character, with which the people amused themselves at the great festivals of the year, were interspersed with dialogue, and performed on an improvised stage. This was the beginning of the Fastnachtsspiel or Shrovetide-play which came to be a widespread dramatic feature. Among the earliest cultivators of this type of play were Hans Rosenplut (fl. c. 1460) and Hans Folz (fl. *c.* 1510), both of Nuremberg.

The Reformation. — The coming of the Protestant Reformation was prepared by mysticism and humanism, With Meister Eckhart (c. 1260–1327), Heinrich Seuse or Suso (c. 1300–66) and Johannes Tauler (*c.* 1300–61), mysticism was an essentially personal interpretation of Christianity and as such naturally conducive to the individual freedom of Protestantism. To the mystics we owe the early translations of the Bible into German; one was printed at Strasbourg in 1466. Johann Geiler von Kaisersberg (1445–1510), a pupil of the humanists and a friend of Sebastian Brant, linked mysticism with humanism. Humanism was transplanted to German soil with the foundation of the University of Prague in 1348 but its immediate influence was restricted by the fact that the pre-Reformation humanists despised the vernacular and wrote only in Latin. Thus, although neither Johann Reuchlin of Pforzheim (1455–1522) nor the patriotic Alsatian Jakob Wimpfeling (or Wimpheling) (1450–1528) nor the great Dutch humanist Erasmus of Rotterdam (1466–1536) has, strictly speaking, a place in the history of German literature, the battle of the humanists for liberalism in thought and scholarship cleared the way for a healthy national literature. The *Ackermann* aus Bohmen (c. 1401) by Johann von Saaz (Johann von Tepl), a prose dialogue between Death and a bereaved Plowman, in which Wycliffite affinities are noteworthy, should be mentioned for its style, individualism and religious discontent. Moreover, to humanistic stimulus we also owe many translations from the Latin and Italian, prominent among the translators being Niklas von Wyl (d. c. 1478), chancellor of Wiirttemberg, and Albrecht von Eyb (1420–75).

Martin Luther (1483–1546) demands a large share of attention in a survey of its literature; for his translation of the Bible (1522–34) is, like the English Bible, a great literary monument. Well aware that this Bible must be the keystone to his work, he gave himself endless pains to produce a work German both in language and in spirit. He chose his language, in respect of vocabulary and forms, so that it might be read without difficulty in wide circles of the population; and thus the Lutheran Bible became a factor of the first importance in unifying the speech of the nation. As a hymn writer (Geistliche Lieder, 1524–45) Luther was equally mindful of the importance of adapting himself to popular needs and his hymns form the starting point for a vast development of German religious poetry which was to culminate in the following century; English renderings were made by Miles Coverdale.

The most virile literature of this age was inspired by religious strife. Amongst Luther's henchmen, Philipp Melanchthon (1497–1560), the "praeceptor Germaniae," and Ulrich von Hutten (1488–1523) were powerful allies in his cause, although they had intellectual sympathies with the humanists. The satirical dramas of Niklas Manuel (1484–1530), a Swiss Protestant, and the polemical fables of Erasmus Alberus (c. 1500–53) were, however, insignificant compared with the fierce assault on Protestantism by the Alsatian monk Thomas Murner (1475–1537), the most ruthless of all German satirists. It was not until the following generation that the Protestant party could point to a writer who in genius and power was at all comparable to Murner, namely, Johann Fischart (c. 1550–*c.* 1591). His chief work, the *Affentheuerliche Naupengeheurliche Geschichtklitterung* (157j), a Germanization of the first book of Rabelais's satire, is a witty and ingenious monstrosity, a satirical comment on the life of the 16th century.

On the whole the form of literature which succeeded best in extricating itself from religious polemics in the 16th century was the drama. Protestantism proved favourable to its development, and the humanists, who had always prided themselves on their imitations of Latin comedy, introduced into it form and proportion. The Latin school comedy in Germany was founded by Wimpfeling and J. Reuchlin, and in the 16th century the chief writers of Latin dramas were Thomas Kirchmair or Naogeorgus (1511–63), Caspar Briihlom (1j85–1627), and Nikodemus Frischlin (1547–90). The Jesuits cultivated the Latin religious drama for propaganda purposes; at a somewhat later date, Jacob Bidermann (1578–1639) was the most important figure in this genre. In Basle Pamphilus Gengenbach produced moralizing *Fastnachtsspiele* in 1515–16; and in Berne Niklas Manuel employed the same type of play for anti-Catholic propaganda. Burkard Waldis (c. 1490–1556), Sixt Birck (1501–54) and Paul Rebhun (c.

1500–46) wrote dramas treating biblical themes on humanistic lines. In another important literary centre of the 16th century, Nuremberg, the drama developed on more indigenous lines. Hans Sachs (1494–1576), the Nuremberg cobbler and Meistersinger, left behind him a vast literary legacy embracing every form of popular literature from *Spruch* and *Schwank* to complicated *Meistergesang* and lengthy drama. But in the progress of the German drama he played an even smaller role than his Swiss and Saxon contemporaries; for his tragedies and comedies are little more than stories in dialogue. In the *Fastnachtsspiele,* where dramatic form is less essential than anecdotal point and brevity, he is at his best. After 1586 troupes of English actors began to tour the principal German cities; they at first played in English and their attraction was in their miming, music and acrobatics, especially in the antics of the clown; the more melodramatic products of the Elizabethan stage were prominent in their varied repertoire. They introduced the dramatic and theatrical element which had hitherto been lacking in the German drama. This is to be seen in the work of Jakob Ayrer (d. 1605) and Heinrich Julius, duke of Brunswick (1564–1613). But unfortunately these beginnings had hardly made themselves felt when the full current of the Renaissance swept across Germany, bringing with it the Senecan tragedy. Then came the devastation of the Thirty Years' War, which made the creation of a popular and national theatre impossible.

The novel was less successful than the drama in emancipating itself from satire and religious controversy; Fischart was too dependent on foreign models and too erratic to create a national form of German fiction. The most important novelist was a much less talented writer, the Alsatian Meistersinger and dramatist Jorg Wickram (d. *c.* 1560), who has been already mentioned as the author of a popular collection of anecdotes, the *Rollwagenbüchlein.* His *Der Knabenspiegel* and *Der Goldfaden,* are in form, and especially in the importance they attach to psychological developments, the forerunners of the modern German novel. But Wickram stands alone. The old *Volksbucher* were the real novels of the Reformation age; of these the most famous is *Doctor Johann Faust,* published at Frankfurt in 1587.

THE RENAISSANCE AND THE BAROQUE

The 17th century in Germany presents a complete contrast to its predecessor; the fact that it was the century of the Thirty Years' War, which crippled prosperity and frustrated social development, explains much, but it can hardly be held entirely responsible for the intellectual apathy and slavery to foreign ideas.

There were, however, some branches of German poetry which escaped this foreign influence. The hymn, continuing the great Lutheran traditions, shows extraordinary richness both in quality and quantity. Paul Gerhardt (1607–76), the greatest German hymn writer, was only one of many Lutheran pastors who in this age contributed to the German hymnal. On the Catholic side, the theosophic aphorisms of Angelus Silesius (Johann Scheffler) (1624–77) showed what a wealth of poetry lay in the mystic speculations of Jakob Boehme, the gifted shoemaker of Gorlitz (1575–1624), while Friedrich von Spee (1591–1635), another leading Catholic poet of the century, cultivated the pastoral allegory of the Renaissance. The revival of mysticism associated with Boehme gradually spread through the whole religious life of the 17th century. But all else was profoundly affected by foreign literary influences, French. Spanish, English, Dutch and Italian.

The first focus of the Renaissance literature was Heidelberg, where, under the leadership of J. W. Zincgref (1591–1635), a number of scholars further pursued that interest in the vernacular which had been shown a little earlier by the German translator of Clément Marot, Paul Schede or Melissus (1539–1602). G. R. Weckherlin (1584–1653), a native of Wiirttemberg who had spent the best part of his life in England, wrote *Oden und Gesänge* (1618–19), occasional verse and sonnets in alexandrines of great promise. But the greatest, or at least the most influential, writer of this group was Martin Opitz (1597–1639), a native of Silesia. Strongly influenced by the Renaissance breeding of Pierre Ronsard, Joseph Scaliger and Daniel Heinsius, he deplored the low state of German literature, experimented with every kind of poetry and translated a great deal, including John Barclay's novel *Argenis* (1626) and Ottavio Rinuccini's opera *Dafne* (1627). His *Buch von der deutschen Poeterey* (1624) gave the German Renaissance its theoretical textbook. This tract surveyed the categories of literature, asserted that accent and not syllable-counting was fundamental to German verse, turned poetry into an expression of learning and refinement, and regulated German literature for the next hundred years or so.

The work of Opitz as a reformer was furthered by another institution of foreign origin, namely. literary societies modelled on the *Accademia della Crusca* in Florence. These societies, of which the chief were the *Fruchtbringende Gesellschaft* or *Palmenorden* (founded 1617), the *Elbschwanenorden* in Hamburg and the *Gekronter Blumenorden an der Pegnitz* or *Gesellschaft der Pegnitzschäfer* in Nuremberg, although they produced much that was trivial, did German letters an invaluable service by their attention to the language, one of their chief objects being to purify it from foreign and un-German ingredients. J. G. Schottelius (1612–76) wrote his important grammatical works to further the objects of the *Fruchtbringende Gesellschaft.* Meanwhile the poetic centre of gravity had shifted from Heidelberg to Königsberg, where a group of academic poets gave practical expression to the Opitzian theory, chief among them being Simon Dach (1605–59), a gentle, elegiac writer. In Hamburg in the hands of Johann Rist (1607–67) and Philipp von Zesen (1619–89), in Silesia and Middle Germany in those of Paul Fleming (1609–40) and Andreas Gryphius (1616–64) and, rather later, Christian Hofmann von Hofmannswaldau (1617–79) and Daniel Caspar von Lohenstein (1635–83), the lyric moved steadily from earnestness of expression and feeling towards greater rhetorical affectation and extravagance, the last two poets especially cultivating the bombastic and euphuistic style of the Italians G. B. Guarini and G. B. Marini and the Spaniard Luis de Góngora.

Satire was cultivated by two Low German poets, J. Lauremberg (1590–1658) and J. Rachel (1618–69); but there is satire, too, in the powerful and scathing sermons of J. B. Schupp (1610–61), an outspoken Hamburg preacher, and in the scurrilous tracts and sermons of the Viennese monk Abraham a Sancta Clara (1644–1709), who had inherited something of his predecessor Murner's gift. In an adjacent sphere is Friedrich von Logau (1604–55), Germany's greatest epigrammatist; his 3,000 epigrams *(Deutsche Sinngedichte,* 1654) reflect admirably the intellectual temper of their age.

In the drama, while the influence of the English players was still effective, the models of Andreas Gryphius, the chief dramatist of the century, were mainly Dutch. Like Opitz he was a Silesian and a lyric poet of no mean ability, especially in the field of the sonnet, but his tragedies, modelled on the stiff Senecan pattern, suffered from his ignorance of the more highly developed drama of France, not to speak of England. In comedy he was less hampered, and his *Horribilicribrifax* and *Herr Peter Squentz*—the latter an adaptation, probably through a Dutch intermediary, of the comic scenes of *A Midsummer Night's Dream*—are the best German plays of the 17th century. Molière's influence is to be seen in the didactic and satirical works of Gryphius' successors, Christian Reuter (b. 1665) and Christian Weise (1642–1708).

The German novel of the 17th century was largely a product of foreign influence, Spanish and French. *Don Quixote* had been partly translated early in the century and the picaresque romance had found its way to Germany still earlier; while J. M. Moscherosch (1601–69) in his *Gesichte Philanders von Sittewald* (1642–43) made the *Sueños* of Quevedo the basis for vivid pictures of the life of the time, interspersed with satire. The best German novel of the 17th century, *Der abenteuerliche Simplicissimus* (1669) by H. J. Christoffel von Grimmelshausen *(c.* 1625–76), is picaresque, but it owed little more than its form to the Spaniards. It is in great measure the autobiography of its author and describes with uncompromising realism the social disintegration and the horrors of the Thirty Years' War. Christian Weise wrote a few satirical novels, but his realism and satire are too obviously didactic. He is seen to better advantage in his numerous dramas. The real successor of *Simplicissimus* in Germany was the English *Robinson Crusoe,* a novel which on its appearance was immediately translated into German (1721); it called forth hundreds of imitations *(Robinsonaden),* the vogue of which was to be kept alive by *Der schweizerische Robinson* of J. R. Wyss (1812 *et seq.).* With the exception of J. G. Schnabel's *Insel Felsenburg* (1731–43), the literary value of these imitations is slight, but they represented a healthier development than the "gallant" novels of French provenance, written by authors like Philipp von Zesen (1619–89), Duke Anton Ulrich of Brunswick (1633–1714), A. H. Buchholtz (1607–71), H. A. von Zeigler (1653–97)— author of the famous *Asiatische Banise* (1685)— and D. C. von Lohenstein; Grimmelshausen himself contributed specimens in the "gallant" vein.

AGE OF ENLIGHTENMENT

The Baroque exaggerations were of short duration. Although socially the recovery of the German people from the desolation of the war was slow and laborious, the intellectual life of Germany recuperated rapidly. Samuel Pufendorf (1632–94), Christian Thomasius (1655–1728), Christian von Wolff (1679–1754) and, above all, Gottfried Wilhelm Leibnitz (1646–1716), first of the great German philosophers, laid the foundations of rationalism. The next half century or so was dominated by the philosophical outlook of the Enlightenment *(Aufklarung).* German religious life was strengthened and enriched by a revival of pietism under mystic thinkers like Philipp Jakob Spener (1635–1705), a revival which left its traces on religious poetry. Christian Weise's sober lyrical work led the reaction against bombast. Mediocre though they were, the so-called "court poets," Rudolph von Canitz (1654–99), Johann von Besser (1654–1729) and Benjamin Neukirch (1665–1729), substituted the "good taste" of Nicolas Boileau for the extravagance of Marini; and from their midst sprang one lyric poet, Johann Christian Giinther (1695–1723), of high gifts. In Hamburg Barthold Heinrich Brockes (1680–1747), who was deeply impressed both by Wolffian rationalism and by English nature-poetry, gave the artificiality of poetic expression its death-blow. Ubiquitous translations and imitations of the English *Spectator, Tatler* and *Guardian*— the so-called *Moralische Wochenschriften*—helped to regenerate literary taste and strove to improve the morals of the German middle classes. Between 1724 and 1740 Johann Christoph Gottsched (1700–66) succeeded in establishing in Leipzig, then the metropolis of German taste, literary reforms in accord with French 17th-century classicism. He purified the stage by abolishing irrelevant buffoonery and provided it with a repertory largely of French origin; and in his *Kritische Dichtkunst* he laid down the principles according to which good literature was to be produced and judged.

Reform was necessary, but the Francophile limitations of Gottsched soon encountered resistance, and important opponents arose in the Swiss scholars, J. J. Bodmer (1698–1783) and J. J. Breitinger (1701–76). Basing their arguments on John Milton's *Paradise Lost,* which Bodmer had translated into prose, the Swiss demanded room for the play of genius and inspiration; they insisted that the imagination should not be dominated by the reason. The effects of the controversy appear in a group of Leipzig writers of Gottsched's own school, the *Bremer Beiträger,* as they usually are called after their literary organ. These men—C. F. Gellert (1715–69), author of graceful fables and tales in verse, hymns, moralizing comedies and a sentimental novel; G. W. Rabener (1714–71), mild satirist of Saxon provinciality; the dramatist J. Elias Schlegel (1719–49); and a number of minor writers—were in sympathy with many of the views which the Swiss had advocated. And in the *Bremer Beiträge* there appeared in 1748 the first instalment of an epic by F. G. Klopstock (1724–1803), *Der Messias,* which with Rlopstock's Odes inaugurated the great age of German literature in the 18th century. His rising interest in Germanic antiquity, accompanied by the enthusiasm that was awakened in Germany for James Macpherson's *Ossian,* aided the growth of the so-called bardic movement which was led by H. W. von Gerstenberg (1737–1823), K. F. Kretschmann (1738–1809) and Michael Denis (1729–1800). Signs of growth were also noticeable elsewhere. At Halle, before Klopstock's name was known at all, two young poets, J. I. Pyra (1715–44) and S. G. Lange (1711–81), wrote in rhymeless metres such as Klopstock advocated. The later Prussian poets, J. W. L. Gleim (1719–1803), J. P. Uz (1720–96) and J. N. Gotz (1721–81), who were associated with Halle, and K. W. Ramler (1725–98), in Berlin, cultivated mainly Anacreontic lyric and the Horatian ode; and Friedrich von Hagedom (1708–54) in Hamburg showed to what perfection the lighter *vers de société* could be brought. The Swiss physiologist Albrecht von Haller (1708–77) was the first German poet to give expression to the beauty and sublimity of Alpine scenery in *Die Alpen,* and a Prussian officer, Ewald Christian von Kleist (1715–59), author of *Der Frühling,* wrote admirable nature-poetry. Salomon Gessner (1730–88) became a European figure with his prose pastoral idylls.

As Klopstock had been the first of modern Germany's inspired poets, so Gotthold Ephraim Lessing (1729–81) was the first critic who brought credit to the German name throughout Europe. Like his predecessor Gottsched, whom he vanquished more effectually than Bodmer, he had unwavering faith in classicism, but classic meant for him, as for his contemporary, J. J. Winckelmann (1717–68), Greek art and literature, not French pseudo-classicism. He went, indeed, still further, and asserted in his *Literaturbriefe* (1759–65) and *Hamburgische Dramaturgie* (1767–68) that Shakespeare, with all his irregularities, was a more faithful observer of the spirit of Aristotle's laws than were the French dramatists. He looked to England and not to France for the regeneration of the German theatre and his own dramas were pioneer-work in this direction. *Miss Sara Sampson* is a *bürgerliches Trauerspiel* on the English model; *Minna von Barnhelm,* a comedy in the spirit of Farquhar; in *Emilia Galotti,* again, he remoulded the "tragedy of common life" in a form that came to be acceptable to the *Sturm und Drang;* and finally in *Nathan der Weise* he won acceptance for iambic blank verse as the medium of the higher drama. His two most promising disciples, J. F. von Cronegk (1731–58) and J. W. von Brawe (1738–58), unfortunately died young; but another of his friends, C. F. Weisse (1726–1804), was the most successful playwright of his day. Lessing's name is associated with Winckelmann's in *Laokoon* (1766), a treatise which defines the boundaries between plastic art and poetry, and with those of the Jewish philosopher Moses Mendelssohn (1729–86) and the Berlin bookseller C. F. Nicolai (1733–1811) in the famous *Literaturbriefe.* The last years of Lessing's life were embittered by conflict with Lutheran orthodoxy and intolerance.

To the widening of the German imagination C. M. Wieland (1733–1813) contributed by introducing the Germans to remote and exotic literary settings, largely under French inspiration. With the exception of his verse-romance *Oberon,* his work fell into neglect; he did, however, excellent service to the development of German prose fiction with his psychological novel *Agathon* and with his humorous satire *Die Abderiten.* He also translated 22 plays of Shakespeare. Wieland had a considerable following, including M. A. von Thummel (1738–1817), the Austrians Aloys Blumauer (1755–89) and J. B. von Alxinger (1755–97), who wrote travesties and epics under his influence, and K. A. Kortum (1745–1824), author of the most popular comic epic of the time, the *Jobsiade.* The German novel owed much to the example of *Agathon,* but the groundwork and form were borrowed from English models; Gellert had begun by imitating Samuel Richardson in his *Schwedische Gräfin* and he was followed by J. T. Hermes (1738–1821), Sophie Laroche (1730–1807), A. von Knigge (1752–96) and J. K. A. Musaus (1735–87), the last mentioned being, however, better known as the author of a collection of *Volksmärchen* (1782–86). Meanwhile rationalism was spreading rapidly. Men like Knigge, Mendelssohn, J. G. Zimmermann (1728–95), T. G. von Hippel (1741–96), Christian Garve (1742–98), J. J. Engel (1741–1802), as well as the educational theorists J. B. Basedow (1723–90) and J. H. Pestalozzi (1746–1827), wrote books and essays on popular philosophy which were as eagerly read as had been the *Moralische Wochenschriften.* In this context must also be mentioned the most brilliant of German

18th-century aphorists, G. C. Lichtenberg (1742–99).

THE AGE OF GOETHE

Sturm und Drang.—The periods of classicism and romanticism, together the greatest epoch in German literature, fell within the lifetime of Johann Wolfgang von Goethe (1749–1832). His youth and early manhood belonged to, and profoundly affected, the movement known as *Sturm und Drang* (Storm and Stress), which aimed at supplanting the Enlightenment, and all it stood for. Seeds of the new growth were to be found in Klopstock, in the spiritual force of pietism, and in the rising resistance to French classical taste, while the influence of Jean Jacques Rousseau, Edward Young and Macpherson, and of the recently translated Shakespeare was of prime importance. The critical writings of Gerstenberg (*Briefe uber Merkwürdigkeiten der Litteratur*, 1766–70) stressed personal feeling in matters of taste, but the chief impetus came from the oracular utterances of Johann Georg Hamann (1730–88), the "Magus im Norden," who observed that the basic verities of existence are to be apprehended through faith and the experience of the senses, emphasized the inspirational and symbolical function of language and pointed out the value of primitive poetry, such as that of the Bible. Poetry, he declared, was the mother tongue of the human race and not the product of learning and precept. His pupil was Johann Gottfried Herder (1744–1803). Herder grasped as no thinker before him the idea of historical evolution. Beginning with literary criticism, which engendered the main current of the *Sturm und Drang,* he ended as a philosopher of history and religion, writing on biblical interpretation, aesthetics, history of literature, and many other fields allied to his great objective, the history of mankind; his doctrine of *"Humanitat"* is fundamental to German classicism. He stressed the value of historical continuity in literature, finding therein the reason for the greatness of other literatures; he rejected imitation, discussed the essentials of a poetic language, explained original genius and pointed to the folksongs, ballads and romances of the middle ages as sources of inspiration, to which Percy's *Reliques* had recently drawn attention. Among his many works may be mentioned his *Fragmente uber die neuere deutsche Litteratur* (1767), *Kritische Wälder, Über den Ursprung der Sprache,* contributions to the collection *Von deutscher Art und Kunst, Volkslieder* (1778–9), *Zdeen zur Philosophie der Geschichte der Menschheit.* Percy's *Reliques* also affected the work of a group of poets who, adoring Klopstock and hating Wieland, founded in 1772 the Gottingen *Bund* or *Hain,* and published their poetry in the *Gottinger Musenalmanach.* With the exception of the two brothers, Christian zu Stolberg (1748–1821) and F. L. zu Stolberg (1750–1819), the members of this coterie belonged to the peasant class or the lower bourgeoisie; J. H. Voss (1751–1826), the leader of the *Bund*, and author of the famous idyll, *Luise* (1784), was a typical north German peasant. L. H. C. Holty (1748–76) and J. M. Miller (1750–1814), again, excelled in simple lyrics in the tone of the *Volkslied.* Closely associated with the Gottingen group were M. Claudius (1740–181j), an even more unassuming representative of the German peasant in literature than Voss, and G. A. Biirger (1747–94), author of the famous ballad of *Lenore.*

The *Sturm und Drang* was intimately associated with Goethe. As a student in Leipzig, Goethe had written lyrics in the Anacreontic vein and dramas in alexandrines; but in Strasbourg, where he continued his studies in 1770–71, he made the personal acquaintance of Herder, who interested him in Gothic architecture, the *Volkslied* and Shakespeare. The pamphlet *Von deutscher Art und Kunst,* to which, besides Goethe and Herder, the historian Justus Moser (1720–94) contributed, was a kind of manifesto of the *Sturm und Drang.* The new ideas seemed at once to set Goethe's genius free, and from 1772–75 he was extraordinarily fertile in poetic ideas. His *Gotz von Berlichingen* (1773), the first important drama of the *Sturm und Drang,* was followed within a year by the first novel of the movement, *Die Leiden des jungen Werther* (1774). He dashed off *Clavigo* and *Stella* in a few weeks in 1774 and 1775, and wrote a large number of *Singspiele,* dramatic satires and fragments—including *Faust* in its earliest form (the so-called *Urfaust*)—not to mention matchless lyrics. In all forms of literature he set the fashion for his time; tne Shakespearian restlessness of *Götz von Berlichingen* found imitators in J. M. R. Lenz (1751–92), F. M. von Klinger (1752–1831), J. A. Leisewitz (1752–1806), H. L. Wagner (1747–79) and Friedrich Miiller, better known as Maler Muller (1749–1825). The dramatic literature of the *Sturm und Drang* was its most characteristic product—indeed, the very name of the movement was borrowed from a play by Klinger; it was inspired by the desire to present upon the stage figures of Shakespearian grandeur impelled by gigantic passions, all considerations of plot, construction and form being subordinated to character and all accepted authority, literary, social, political or moral, rejected. The fiction of the *Sturm und Drang,* again, was in its earlier stages dominated by *Werthers Leiden,* as may be seen in the novels of F. H. Jacobi (1743–1819) and J. M. Miller, already mentioned above. Later, it was developed in a broader and less turbulent spirit by J. J. W. Heinse (1749–1803), author of *Ardinghello,* Klinger and K. P. Moritz (1757–93), whose *Anton Reiser* foreshadows *Wilhelm Meister.*

With the production of *Die Räuber* (1781) by Johann Friedrich Schiller (1759–1805), the drama of the *Sturm und Drang* entered upon a new phase. Schiller's tragedy was more skilfully adapted than those of his predecessors to the exigencies of the theatre; it and the succeeding dramas, *Fiesco* and *Kabale und Liebe—all* three in prose—were masterpieces of high promise. In his fourth drama, *Don Carlos,* he abandoned prose for iambic blank verse. In Swabia, however, the *Sturm und Drang* had also been displayed in the irritable C. F. D. Schubart (1739–91). Other eminent dramatists of this time were O. von Gemmingen (1755–1836), an imitator of Denis Diderot, F. L. Schroder (1744–1816) and A. W. Iffland (1759–1814), the two latter the greatest actors of their time. Germany owed to the *Sturm und Drang* its national theatre; permanent theatres were established in these years at Hamburg, Mannheim and Gotha, and the Hofburgtheater was founded at Vienna in 1776.

Classicism.—The *Sturm und Drang* soon exhausted itself. For Goethe this phase in his development came to an end with his departure for Weimar in 1775, while after *Don Carlos* Schiller turned aside from poetry to study history and philosophy; not until the very close of the century did he, under the stimulus of Goethe's friendship, return to the drama. The first ten years of Goethe's life in Weimar were marked by his renewed friendship with Herder, whose ideal of *"Humanität"* was now maturing, by an interest (which was to be lifelong) in scientific research, by his public service as a minister of state, and by his emotional attachment to Frau von Stein. He did not arrive at clearness in his ideas until after his sojourn in Italy (1786–88). Italy was, in the first instance, a revelation to Goethe of the antique; here he conceived that ideal of a classic literature which for the next 20 years dominated German literature. In Italy he gave *Iphigenie auf Tauris* its final form, he completed *Egmont*—like the exactly contemporary *Don Carlos* of Schiller, a kind of bridge from *Sturm und Drang* to classicism—and *Torquato Tasso. Wilhelm Meisters Lehrjahre* (1795–96), Goethe's most important novel, which had been originally concerned only with the theatre, became now a book on the conduct of life.

Before *Wilhelm Meister* appeared, however, German thought and literature had arrived at that stability in form and ideas essential to a great literary period. In the year of Lessing's death, 1781, Immanuel Kant (1724–1804), the great philosopher, had published his *Kritik der reinen Vernunft* and this, together with the two later treatises, *Kritik der praktischen Vernunft* and *Kritik der Urteilskraft,* placed the Germans in the front rank of philosophy. Under the influence of Kant, Schiller turned to the study of aesthetics, the first fruits of which were his wonderful philosophic lyrics, and his treatises *Anmut und Würde, Ästhetische Erziehung des Menschen* and *Über naive und sentirnentalische Dichtung.* Schiller's histories *(Geschichte des Abfalls der vereinigten Niederlande* and *Geschichte des dreissigjährigen Krieges)* show much literary quality but scarcely entitle him to rank alongside Johannes von Miiller (1752–1809), the greatest historian of the time in Germany.

The years 1794–1805, when in Jena and Weimar Goethe and Schiller wore united by a close friendship, mark the culmination of literary classicism. Schiller's treatises provided a theoretical basis; his new journal *Die Horen* and his *Musenalmanaclz*—in which the two poets published their magnificent ballad poetry—were its literary organs. Goethe, as director of the ducal theatre, influenced the whole dramatic production of Germany. Under his encouragement Schiller turned from philosophy to poetry and wrote the splendid series of classic dramas, the trilogy of *Wallenstein, Maria Stuart, Die Jungfrau von Orleans, Die Braut von Messina, Wilhelm Tell,* closing with the fragment of *Demetrius;* while to Goethe we owe the idyllic epic of *Hermann und Dorothea;* his severely classical plays *Die natürliche Tochter* and *Pandora* are less important; but it was chiefly owing to Schiller's stimulus that in those years Goethe brought the first part of *Faust* (1808) to a conclusion.

Although acknowledged leaders of German letters, Goethe and Schiller met with considerable opposition, especially from representatives of the once dominant rationalistic movement. But, apart from the two great poets, literature was in no very healthy condition; the stage was dominated by the extraordinarily popular plays of A. von Kotzebue (1761–1819); and there is a wide gap between Moritz's *Anton Reiser* or the philosophic novels which Klinger wrote in his later years, and Goethe's *Meister.* In lyric and epic poetry, it is impossible to regard poets like the gentle F. von Matthisson (1761–1831), or the less inspired G. L. Kosegarten (1758–1818) and C. A. Tiedge (1752–1841), as worthy of an age that produced Goethe and Schiller. Georg Forster (1754–94), however, who accompanied Captain James Cook round the world, provided a model of lucid descriptive writing.

The supreme work of Goethe's latter years is *Faust,* Germany's greatest contribution to the literature of the world. Although Part I was published in 1808, Part II was not completed until shortly before Goethe died and was published in 1832. In Part I is set out Faust's despair, his pact with Mephistopheles and his love for Gretchen; Part II covers the magician's life at court, the winning of Helen of Troy and Faust's purification and salvation. The doctrine of the fulfilment of life by striving and selfless activity, with the problems contained within it, is fundamental to Goethe's mature wisdom. *Wilhelm Meisters Wanderjahre,* with its social utopianism and teaching of restraint, offered a criticism of the rise of industrialism. The tragic novel *Die Wahlverwandtschaften* had similarly insisted upon the theme of renunciation. The autobiographical *Dichtung und Wahrheit* affirmed the causality existing within individual development. Dramatic pieces, a periodical *Über Kunst und Altertum,* scientific writings, the *Italienische Reise* and *Kampagne in Frankreich,* lyrics (especially *Der Westostlicher Divan)* of an intensely personal and philosophical kind indicate the many-sidedness of Goethe's achievement. Letters, diaries and conversations afford a very complete picture of his old age. His house at Weimar became a place of pilgrimage; his visitors and correspondents belonged to all countries, and his influence was extremely widespread.

The Romantic Movement.—The romantic movement began not so much as a protest against the classicism of Weimar, with which many romanticists were in sympathy, as a radical extension of some of its beliefs and interests. Friedrich Holderlin (1770–1843), one of Germany's greatest lyrical poets and author of the novel *Hyperion,* grew up as an admirer of Schiller; he sank into despair on realizing the impossibility of his longing for an age of heroic idealism and beauty such as that of ancient Greece; the Hellenic interests of the age were linked by him with an intense patriotism. Jean Paul Friedrich Richter (1763–1825), known as Jean Paul, was a disciple of Herder. His sentiment, ingenuity, whimsical style and lavish detail gained for his shapeless novels a vast degree of popularity; his sustained attention to contemporary life, rather than antiquity or the middle ages, and particularly to the smaller problems of life. was a new feature and his work foreshadowed the *Dorfgeschichte* of later decades. His principal novels were *Hesperus, Quintus Fixlein, Siebenkäs, Titan* and *Flegeljahre;* his *Vorschule der Ästhetik* reveals a historical grasp of literary growth and *Levana* is a treatise on education. The first romantic school proper was founded at Jena in 1798, appropriately near to Weimar. Ludwig Tieck (1773–1853), a leading member of the school, early developed a lifelong enthusiasm for Shakespeare and the Elizabethan and Spanish drama. Gruesome plays and fairy tales, novels and fantastic comedies full of wit and mockery were his earliest works. The short stories of his later period were more valuable. The theoretic basis of romanticism was laid down by the two brothers August Wilhelm and Friedrich Schlegel (1767–1845 and 1772–1829), who, accepting in great measure Schiller's aesthetic conclusions, adapted them to their own needs. These romantic critics maintained that the first duty of criticism was to understand and appreciate; the right of genius to follow its natural bent was sacred. The *Herzensergiessungen eines kunstliebenden Klosterbruders* by Tieck's school friend W. H. Wackenroder (1773–98) contained the romantic theory of art. The greatest imaginative achievement is to be found in the lyrics and fragmentary novels of Novalis (Friedrich von Hardenberg) (1772–1801), in which Christian mysticism, romantic mediaevalism and symbolism transfer the reader into the realm of the *Märchen;* this is particularly so in Novalis' *Heinrich von Ofterdingen* (1802). The novel was the romantic art-form *par excellence* and was attempted by almost every one of the romanticists. The universal sympathies of the movement were exemplified by the many admirable translations, produced under its auspices, of which the greatest was A. W. Schlegel's *Shakespeare,* and by A. W. Schlegel's courses of lectures at Berlin and Vienna. The critical essays and aphorisms of F. Schlegel are among the most important features of the movement; they argued that modern (or romantic) literature, as distinct from ancient (or classical), should deal with modern life in all its manifestations without any restriction, and put forward *Wilhelm Meister* as the model to be followed. The literary organ of the school was the *Athenaum* (1798–1800). J. G. Fichte (1762–1814) and to a much greater extent, F. W. J. von Schelling (1775–1854) were the exponents of the romantic doctrine in philosophy, while the theologian F. D. E. Schleiermacher (1768–1834) demonstrated how vital its individualism was for religious thought.

The first romantic school had dispersed by 1804. Two years later, however, another phase of romanticism was initiated in the town of Heidelberg. The leaders of this second romantic school were Klemens Brentano (1778–1842), L. A. von Arnim (1781–1831) and J. J. von Gorres (1776–1848); their organ was the *Zeitung für Einsiedler,* or *Tröst-Einsamkeit,* and their most characteristic production the collection of *Volkslieder* published under the title *Des Knaben Wunderhorn* in 1805–08. Compared with the earlier school, the Heidelberg writers were practical; they, too, were interested in the German past, but they put aside the idealizing glasses of their predecessors: they wrote historical works, not stories of an imaginary mediaeval world as Novalis had done, and they collected *Volkslieder* and *Volksbücher.* Their immediate influence on German intellectual life was consequently greater; they stimulated the interest of the German people in their history and we owe to them the foundations of the study of German philology and mediaeval literature, the brothers Jakob and Wilhelm Grimm (1785–1863 and 1786–1859) having been in touch with the circle in their early days. Again, the Heidelberg poets strengthened the national and patriotic spirit of their people; they prepared the way for the rising against Napoleon in 1813, which produced an outburst of patriotic song, the chief voices being those of E. M. Arndt (1769–1860), K. Th. Korner (1791–1813) and M. von Schenkendorf (1783–1817). When, about 1809, the Heidelberg school broke up and Arnim and Brentano settled in Berlin, the romantic movement followed two clearly marked lines of development, one north German, the other associated with Wiirttemberg. In the north Heinrich von Kleist (1777–1811), Prussia's greatest dramatic poet, created a romantic drama and short story of high poetic achievement; he was a leading writer in the patriotic movement against Napoleon. His plays, such as *Amphitryon, Der zerbrochene Krug, Das Käthchen von Heilbronn, Die Hermannsschlacht* and *Der Prinz von Homburg,* express the belief that the only security in life is to be found in the unconscious voice of feeling and instinct. Zacharias Werner (1768–1823), an undisciplined and unbalanced dramatic genius, sounded depths of mysticism and fatalism. There were at the same time some elements of decadence;

Friedrich de la Motte Fouqué (1777–1843), for instance, shows how easy it was for the mediaeval tastes of the romanticists to be satisfied with mediocre novels and plays. E. T. A. Hoffmann (1776–1822), a novelist of indubitable genius, cultivated for preference in his stories a morbid supernaturalism and gave European currency to German romanticism. The north German romantic circle could point to one lyric poet of the very first rank, the Silesian J. von Eichendorff (1788–1857); while A. von Chamisso (1781–1838), a French *émigré,* developed into a German poet of the purest water. Others, like Friedrich Ruckert (1788–1866), sought new inspiration in the poetry of the east; and Wilhelm Müller (1794–1827) following Lord Byron's example, stirred German sympathy for the oppressed Greeks and Poles.

The last phase of romanticism is represented by the Swabian school. Its chief representative Ludwig Uhland (1787–1862), himself a disciple of the Heidelberg school, as a ballad-poet is second only to Schiller in popular esteem. One might say that the mission of the Swabian circle, the chief members of which were J. Kerner (1786–1862), G. Schwab (1792–1850), W. Waiblinger (1804–30), W. Hauff (1802–27) and, most gifted of all, E. Morike (1804–75), was to preserve in both poetry and prose the romantic traditions from the disintegrating influences to which their north German contemporaries were exposed in the next generation.

GERMAN LITERATURE AFTER GOETHE'S DEATH

The Biedermeier Age and After.—With Goethe's death a great age in German poetry came to a close. In philosophy Schelling had given place to G. W. F. Hegel (1770–1831) and the Hegelian metaphysics proved a less fruitful influence on literature than did that of Fichte and Schelling. The transference of romantic ideas to religion and politics had led to reaction; and romantic politics, as enunciated by men like F. von Gentz (1764–1832) and Adam Müller (1779–1829) was an apology for the Metternich regime in Austria. Only at the universities—in Gottingen, Heidelberg and Berlin—did the movement continue, in the best sense, to be productive; German philology, historical science and jurisprudence benefited by romantic ideas, long after romantic poetry had been superseded. The day of romanticism was over; but a return to the classic and humanitarian spirit of the 18th century was impossible. The social condition of Europe had been profoundly altered by the French Revolution; the rise of industrialism had created new economic problems: the march of science had overturned old prejudices. The age of Goethe had, however, seen the growth of a unified German cultural life, conveniently described as German idealism, long before political unification became practicable. The frustration of political hopes after the fall of Napoleon thrust the middle classes, which had been the chief bearers of this culture, back into intellectual pursuits, while only the younger generation at the universities sought to prolong the struggle for liberalism and unity.

A number of important writers aimed at continuing the work of the previous age in the new conditions, expressing a restricted, private and passive spirit of compromise between frustrated idealism and possible achievement. The mood of the *Biedermeier* epoch is one of resignation. For the first time since the middle ages, Austrian literature steps into the forefront, combining the heritage of the Baroque and the Enlightenment of Joseph II's time with the impact of idealism. Franz Grillparzer (1791–1872), Austria's greatest dramatist, aimed at reconciling, as Kleist had attempted to do, the classicism of Goethe and Schiller with the romantic and modern spirit. The drama of idealism becomes, in his hands, the drama of renunciation. His plays—*Sappho, Das goldene Vliess, Konig Ottokars Gliick und Ende, Der Traum, ein Leben, Weh' dem, der liigt!* and others, stress the value of the inward life and the acceptance of tragedy as inherent in life itself. The popular farces of F. Raimund (1790–1836) and J. Nestroy (1801–62) continued, in a satirical vein, the Baroque and Italian comedy. E. von Bauernfeld (1802–90) wrote society comedy; Friedrich Halm (the pseudonym of E. F. J. von Munch-Bellinghausen, 1806–71), once extremely popular, later was no longer read. Much of the temper of the Austrian *Biedermeier* in the realm of regional fiction appears in the work of Adalbert Stifter (1805–68); he eschewed passion and glorified scenery rather than men. His novel *Der Nachsommer* (1857) which has a didactic flavour, extols the virtues of resignation and simplicity in family life, in a reposeful and pictorial style; short stories *(Studien, Bunte Steine)* and a historical novel *Witiko* (1865–67) should also be mentioned. Karl Immermann (1796–1840), in northwestern Germany, more vigorously reveals the perplexities of his transitional age; his novels *Die Epigonen,* which gave its name to the whole group of postclassical and postromantic writers, and *Miinchhausen* satirized the mediocrity of the time and discovered strength in peasant life; his dramas were unsuccessful.

The melancholy frustration of the age was reflected in the work of poets whose temperaments were more extreme than those of the *Biedermeier* writers. Nikolaus Lenau (1802–50), a Hungarian by birth, plumbed depths of poetic melancholy not before touched; lyrical epics in the Byronic mode (*e.g., Faust, Savonarola, Die Albigenser, Don Juan)* expressed Byron's discontent without his defiance. Morike embodied the idyllic modesty of the *Biedermeier* and probed deeply in his novel *Maler Nolten* into the artist's problems. Annette von Droste-Hulshoff (1797–1848), Germany's greatest poetess, found solace in a firm religious faith which she combined with a realistic attention to landscape. These lyrical poets stood much nearer to the romantic school than their contemporaries in the drama. C. D. Grabbe (1801–36), an extravagantly rebellious genius, scorned the accepted middle-class values and depicted the struggles between heroism and mediocrity in historical plays such as *Kaiser Friedrich Barbarossa, Napoleon, oder die hundert Tage* and *Don Juan und Faust.* Rebellious pessimism occurs also in the work of Georg Büchner (1813–37), whose social radicalism attracted political persecution; *Dantons Tod* deals with the impossibility of greatness in human life; a fragment *Woyzek* depicts proletarian misery. The greatest dramatic figure, however, was that of Friedrich Hebbel (1813–63), who evolved a profound theory of the tragedy that is inherent in historical progress, the sacrifice of the individual being necessary for the life of society; tragic guilt being independent of moral guilt. The spirit of Hegel's dialectic is in Hebbel's dramas, as well as Buchner's belief in the inevitable suffering of greatness. Hebbel's greatest works are *Judith, Maria Magdalene, Agnes Bernauer, Herodes und Mariamne, Gyges und sein Ring* and *Die Nibelungen.* His contemporary Otto Ludwig (1813–65), an expert dramatic theorist, displayed realism and psychological skill in his tragedies *Der Erbförster* and *Die Makkabaer* and his novel *Zwischen Himmel und Erde.*

In lyrical poetry the attack upon romanticism was conducted by A. von Platen-Hallermunde (1796–1835). The least subjective of all German lyricists, despising the political cares of his fellows, he became a supreme master of artistic form, especially in the field of the sonnet as he shows in his *Sonette aus Venedig;* he cultivated oriental modes in the lyric and aristophanic satire in his plays. His classicism stood alone, until much later when, between 1852 and 1860, Maximilian II of Bavaria gathered round him at Munich some of the representative poets of the day. A leading spirit of this group was E. Geibel (1815–84); F. von Bodenstedt (1819–92) revived the oriental interest in his *Mirza Schaffy;* other lyricists were H. Lingg (1820–1905), M. Greiff (1838–1911) and the Swiss, H. Leuthold (1827–79), all of them concerned with formal elegance. The chief prose writer of the group was Paul Heyse (1830–1914), notable for his short stories and his novels *Kinder der Welt* and *Im Paradiese.* Not far remote from these writers was J. V. von Scheffel (1826–86), who won popularity with his historical novel *Ekkehard* and his verse romance *Der Trompeter von Sackingen.*

Young Germany.—Political resistance to the romantic reaction was expressed in the 1830s in the work of a number of writers who came to be known as Young Germany. They did not form a school in the accepted sense; the group was called into being in 1835 by a decree suppressing the writings of Heinrich Heine, Karl Gutzkow, Ludolf Wienbarg, Theodor Mundt and Heinrich Laube. Of these men, Heine (1797–1856) is by far the most famous. He had made his reputation in 1826 and 1827 with *Die Harzreise* and his *Buch der Lieder,* both of which show how deeply he was immersed in the romantic traditions. The *Buch der Lieder* is, in fact, one of the most famous German songbooks. But Heine felt more acutely than any other man of his time how the ground was slipping away from beneath his feet; he hailed the July revolutions as the first stage in the "liberation of humanity" and sought in France the freedom and intellectual stimulus which Germany withheld from him. These sympathies were always counteracted, however, by doubts whether, after all, life had not been better in that old romantic Germany of his childhood for which, to the last, he retained so warm an affection. To these doubts were added bitter disappointments and the sufferings caused by spinal disease, and the gifted poet-satirist was often overshadowed by the cynic.

Heine's contemporary, Ludwig Borne (1786–1837), was a more wholehearted representative of the Young German point of view; and his brilliant *Briefe aus Paris* form a landmark in the development of German prose style. Karl Gutzkow (1811–78) had become a man of letters under the influence of the July revolution, and in an early novel, *Wally, die Zweiflerin,* then regarded as atheistic and immoral, he fought for the new ideas. His best literary work was the comedies with which he enriched the German stage of the 1840s, and the long novels *Die Ritter vom Geiste* and *Der Zauberer von Rom.* Heinrich Laube (1806–84), critic and author of social novels, was another of the leaders of the new movement, but he is best remembered as Germany's greatest theatre manager, being director of the Vienna Burgtheater from 1850 to 1867. The scholarship and learning of this period were strongly infused with Hegelianism, the leading spirits being D. F. Strauss (1808–74), author of the *Leben Jesu,* the historians G. G. Gervinus (1805–71) and W. Menzel (1798–1873), and the philosopher L. A. Feuerbach (1804–72).

The political ideas of the Young German movement gained ground in the unsettled conditions prevailing between the revolutions of 1830 and 1848. The early 1840s were marked by an outburst of political poetry, which may be compared with the national and patriotic lyric of 1813. Initiated by mediocre talents like N. Becker (1809–45) and R. E. Prutz (1816–72), the movement found a vigorous champion in Georg Herwegh (1817–75), who in turn succeeded in winning Ferdinand Freiligrath (1810–76) for the revolutionary cause. Others joined in the revolutionary cry—F. Dingelstedt (1814–81), A. H. Hoffmann von Fallersleben (1798–1874) and a number of Austrians. But the best Austrian political poetry, the *Spaziergänge eines Wiener Poeten* (1831), by "Anastasius Grün" (Graf A. A. von Auersperg, 1806–76), belonged to a decade earlier. E. Geibel was only temporarily interested in the political movement. The promising talent of M. von Strachwitz (1822–47) did not feel at home in the political atmosphere and he won greater fame as a ballad-writer.

Realism.—The growth of natural science combined with the decline of religious faith gave rise to a regard for the processes of nature as the only reality. On the one hand was the belief in man's power to harness nature to his needs, on the other an increased consciousness of man's dependence upon nature. Materialism and determinism followed in the wake of Feuerbach's agnosticism. After the revolution of 1848 a spirit of passivity came over literature; it was not wanting in achievement, but it lacked conviction and enthusiasm. Hegel's influence gave place to that of the chief exponent of philosophic pessimism, Arthur Schopenhauer (1788–1860). Schopenhauer's chief work, *Die Welt als Wille und Vorstellung,* had appeared, it is true, as far back as 1819; but the century was more than half over before pessimism became a dominant force in German intellectual life.

The function of literature in this context was not to proclaim idealized regions beyond the sphere of actuality; the poet, being dependent upon and conditioned by his world, did not set out to be its master. The caprices of romanticism were no more. It was natural that prose narrative should be the most suitable form in which realism expressed itself. In historical fiction realism showed itself in the descriptions of scenes and customs rather than in characterization. The influence of Sir Walter Scott and the heritage of the historical novels of Arnim and Hauff were taken further in the work of Willibald Alexis (the pseudonym of Wilhelm Häring, 1798–1871); after frankly imitating Scott in *Walladmor,* he turned to his own province of Brandenburg, and a series of novels between 1840 and 1856, from *Der Roland von Berlin* to *Dorothe,* reveal an increasing independence of his master. But Alexis had no successor and the historical novel later made way for the "antiquarian" novels by Georg Ebers (1837–98) and Felix Dahn (1834–1912). The greatest master of realistic historical fiction was Conrad Ferdinand Meyer (1825–98), a Swiss writer of short stories, lyrics, ballads and a poetic narrative *Huttens letzte Tage;* his work is dominated by a nostalgic admiration of great personalities and is marked by a magnificent smoothness of style and power of compression. *Jiirg Jenatsch* and *Der Heilige* began a series of finely polished stories. Ernst von Wildenbruch (1845–1909) may be mentioned here as a once popular writer of patriotic historical plays about the Hohenzollerns and mediaeval emperors; *e.g., Die Quitzows.* Under James Fenimore Cooper's influence American life and adventure came into vogue. The chief German writers who made these their theme were K. A. Postl, who wrote under the pseudonym of Charles Sealsfield (1793–1864), Friedrich Gerstacker (1816–72) and Karl May (1842–1912).

Of much importance was the novel of peasant and provincial life, of which Immermann had given an excellent example in *Der Oberhof,* a short story embedded in his *Miinchhausen.* A Swiss pastor, A. Bitzius, better known by his pseudonym Jeremias Gotthelf (1797–1854), was, however, the real founder of the peasant romance; and his simple, unvarnished stories of Swiss life were followed not long afterwards by the more famous *Schwarzwalder Dorfgeschichten* (1843–54) of Berthold Auerbach (1812–82). These village stories now seem lacking in naïveté, but they enjoyed a wide popularity in their day. The Low German peoples benefited by the revival of interest in dialect and peasant life; Fritz Reuter (1810–74) brought honour to the *Plattdeutsch* of the north, with his Mecklenburg novels, especially *Ut de Franzosentid, Ut mine Festungstid* and *Ut mine Stromtid,* books which have a place beside the best High German fiction of the period; what Reuter did for *Plattdeutsch* prose, his contemporary, Klaus Groth (1819–99), the author of *Quickborn,* did for its verse. Another north German, Theodor Storm (1817–88), is the author of short stories of delicate, lyric inspiration, steeped in that elegiac romanticism which harmonized so well with mid-century pessimism. In Switzerland Gottfried Keller (1819–go), a native of Ziirich, was a modern romanticist of a more robust type; his magnificent autobiographical novel, *Der griine Heinrich,* might be described as the last in the great line of romantic fiction that had begun with *Wilhelm Meister,* and his volumes of short stories, *Die Leute von Seldwyla* and *Züricher Novellen,* contain masterpieces of the first rank.

In Austria the story of peasant life was continued by Peter Rosegger (1843–1918), Marie von Ebner-Eschenbach (1830–1916) and Ferdinand von Saar (1833–1906), while in the field of regional drama Ludwig Anzengruber (1839–89) moved in the direction of naturalism. The humourists Wilhelm Busch (1832–1908) and Heinrich Seidel (1842–1906) may be mentioned in this general association.

Several important novelists stand aside from these trends. Gustav Freytag (1816–95) glorified the sturdy qualities of the middle class in commerce (*Soll und Haben*) and scholarship (*Die verlorene Handschrift*) and presented popular pictures of the German past in *Bilder aus der deutschen Vergangenheit* and *Die Ahnen.* Friedrich Spielhagen (1829–1911) followed in the wake of Gutzkow, holding up the mirror to social problems in a series of novels from *Problematische Naturen* to *Sturmflut.* Wilhelm Raabe (1831–1910) mingled pessimism with humour, and his works. such as *Die Chronik der Sperlingsgasse, Der Hungerpastor* and *Stopfkuchen,* are marked by nostalgic reminiscence, resignation and sentiment; his historical novels—Nach *dem grossen Kriege* and others—emphasize his doubts about his own time. Theodor Fontane (1819–98), a ballad-writer (under English influence) and author of social and historical novels, was concerned with caste problems, which he depicted with masterly realistic detail and psychological insight in *Vor dem Sturm, Irrungen, Wirrungen, Stine, Effi Briest* and others; like so many he perceived the crisis that faced German middle-class values and was as eager as Raabe for genuineness of feeling.

The Franco-German War had little or no immediate effect on literary development. Political and economic problems engrossed public attention. The dominant force in literature continued to be the philosophy of Schopenhauer. The novel was the most popular genre of the day. The drama showed little promise, except for the stage improvements following the artistic reforms introduced by the duke of Meiningen in his court theatre and the ideals of a national theatre realized at Bayreuth by Richard Wagner (1813–83), whose tetralogy *Der Ring des Nibelungen* was first performed there in 1876. The shortcomings of the contemporary outlook were sharply brought out in the works of Friedrich Nietzsche (1844–1900). Beginning as a disciple of Schopenhauer and friend of Wagner, he became militantly individualistic and strengthened the current of arrogant "titanism" that was developing. The individual, not the herd, the *Herrenmensch*, not the slave, self-assertion, not renunciation, are the ideas on which his ethics pivot. He looked forward to the emergence of the human race from the effete culture of tradition and its re-establishment upon a basis in harmony with man's primitive instincts. Nietzsche was a stylist of the first rank and his literary masterpiece *Also sprach Zarathustra* (1883–91) is one of the most important books of its time.

The Naturalist Movement.—Nietzschean individualism was only one of many factors which profoundly affected literature. The realistic movement as it had developed in France, Russia and Scandinavia became a dominant force in Germany towards the end of the century and, with the impact of Darwinism and the rising force of social democracy, the last step was taken in the abjuration of romanticism in the form of naturalism. The centre of this new movement was Berlin, which was rapidly becoming the literary metropolis. Literature became markedly tendentious: slum scenery, unadorned, even vulgar language, sex, alcoholism, poverty and the effects of heredity were exploited as its main features. The movement was founded by the review *Kritische Waffengänge* (1882–84), run by the brothers Heinrich and Julius Hart, and by M. G. Conrad's magazine *Die Gesellschaft* (1885–1902). The realistic novels of Conrad (1846–1927), K. Bleibtreu (1859–1928), M. Kretzer (1854–1941) and H. Conradi (1862–90), the tragedy *Jugend* by Max Halbe (1865–1944) and the satirical comedies of O. E. Hartleben (1864–1905) were less important than the sketches *Papa Hamlet* by Arno Holz (1863–1929) and Johannes Schlaf (1862–1941), their drama *Die Familie Selicke*, and the early works of Hermann Sudermann (1857–1928) and Gerhart Hauptmann (1862–1946). Sudermann, beginning as a novelist with *Frau Sorge*, won rapid fame in the drama with *Die Ehre* and *Heimat*, but later works (*e.g.*, *Es war* and *Das hohe Lied*) suffered from crass sensationalism. Hauptmann came to be one of the outstanding figures of 20th-century German literature. His drama *Vor Sonnenaujgang* (1887) made him head of the new movement; it was the first of a series of naturalistic plays of which *Die Weber* was the most powerful. Poetic mysticism joined forces with realism in *Hanneles Himmeljahrt*, historical realism came in *Florian Geyer*, and allegory in *Die versunkene Glocke*. Hauptmann's development was exceedingly varied and belonged to many fields, tragedy, fantasy, legend, lyric, comedy with *Der Biberpelz*, epic with *Till Eulenspiegel* and *Der grosse Traum*, novel and short story. His principal novels were *Der Narr in Christo Emanuel Quint*, the tragedy of a would-be religious leader, *Atlantis*, a study of the weakness of contemporary culture, *Der Ketzer von Soana*, a pagan glorification of sex, *Die Insel der grossen Mutter*, a utopian story of a matriarchy, and *Im Wirbel der Berufung*, a "Hamlet" story. *Das Buch der Leidenschajt* and *Das Abenteuer meiner Jugend* are autobiographical. During World War II, Hauptmann worked on a cycle of dramas on the Atrides, stressing the timeless values of humane classicism. His vast range and creative power, with his strong sense of compassion, made him a national figure.

The incompatibility of naturalism and artistic achievement was quickly apparent, as Hermann Bahr (1863–1934) explained in *Die Uberwindung des Naturalismus*. The range of literature had, however, been immensely widened, and in the many cross-currents that followed, the problems first adumbrated by the naturalists, especially those of sex and proletarian misery, recurred. Once the philanthropic zeal of naturalism was withdrawn, there remained, in the movement known as impressionism, merely a positivistic attention to reality. often only the sordid and obscene. At the same time other trends emerged—symbolism, an off-shoot of romanticism; expressionism, an incoherent and eccentric reaction against materialism for its neglect of ethical considerations; and neoclassicism, which looked back to the values of Lessing and Schiller.

20th-Century Verse.—Verse showed the most significant progress of all branches of literature in 20th-century Germany. The first poet to break with tradition was Detlev von Liliencron (1844–1909) in his *Adjutantenritte;* a soldier and sportsman, he resisted false sentiment and romanticism and wrote fluent ballads, realistic lyrics, an epic, dramas and novels. In the ballad he was followed by F. Avenarius (1856–1923), B. von Miinchhausen (1874–1945), Agnes Miegel (1879–) and Lulu von Strauss und Torney (1873–). O. J. Bierbaum (1865–1910) wrote in a cabaret-like vein, which was sustained in his plays and novels of bohemianism. Arno Holz in *Das Buch der Zeit* and *Phantasus* introduced novel theories of poetical form and his phrase-rhythms gave new flexibility to German poetry. G. Falke (1853–1916), J. H. Mackay (1864–1933) and Karl Henckell (1864–1929) belonged to the school of the naturalist lyric. Epic form was chosen by Heinrich Hart (1855–1906) in *Das Lied der Menschheit*, by the Viennese Marie delle Grazie (1864–1931) and by the Swiss Nobel laureate Karl Spitteler (1845–1924). Spitteler's *Prometheus und Epimetheus* and *Olympischer Frühling*, evincing Nietzsche's hatred of banality, foreshadowed other myth-making cosmic poems, such as *Dm Nordlicht* by T. Daubler (1876–1934) and the works of O. zur Linde (1873–1938) and A. Mombert (1872–1942). Richard Dehmel (1863–1920), whose verse (*e.g.*, *Erlosungen*, *Aber die Liebe*, *Zwei Menschen*) defended country life and depicted social, especially sexual, problems, was more reflective and tortuous than his friend Liliencron. Stefan George (1868–1933) cultivated the supremacy of aesthetic values, translated with distinction, and founded an esoteric circle of disciples around his journal *Blatter für die Kunst*. His sense of dignity and hatred of decadence were to be seen not only in the content of his verse, but in the typographical devices adopted to keep it from the vulgar herd (see *Die Biicher der Hirten und Preisgedichte*, *Der siebente Ring*, *Der Stern des Bundes*, *Das neue Reich*). In Vienna, Hugo von Hofmannsthal (1874–1929) realized the shortcomings of his initial impressionism and demanded a recasting of modern culture in a conservative sense; a perfect stylist, he was primarily a lyricist, but also achieved fame with his lyrical dramas (*Der Tor und der Tod*, *Elektra*, *etc.*), librettos, such as *Der Rosenkavalier*, narratives, and with his revival of the mediaeval mystery play with *Jedermann* and *Das Salzburger Grosse Welttheater*. The greatest and most influential of modern German lyricists is Rainer Maria Rilke (1875–1926), who extended the spiritual profundity and stylistic wealth of German poetry to an unparalleled degree. With his mystical humility and indifference to social reality and remote aestheticism alike. he stood aside from contemporary trends in *Das Stundenbuch* (1905), *Neue Gedichte* (1907–8). Translations, prose narratives, and an autobiographical novel *Die dufzeichnungen des Malte Laurids Brigge* were produced alongside lyric poetry; his *Duineser Elegien* (1923j and more exuberant *Sonette an Orpheus* (1923) form the most considerable poetic sequence in modern European poetry. Maximilian Dauthendey (1867–1918) juxtaposed effectively impressions of sound and colour, while Christian Morgenstern (1871–1914) combined a bizarre humour with melancholy yearning.

Among more traditionalist poets may be mentioned R. von Schaukal (1874–1942), R. Borchardt (1877–1945), R. A. Schroder (1878–) and A. Schaeffer (1885–1950). The expressionists G. Heym (1887–1912), G. Trakl (1887–1914) and E. Stadler (1883–1914) were filled with horror at the chaos they thought they perceived around them; their followers were such men as P. Zech (1881–1946), Franz Werfel (1890–194j), who is much better known as a novelist, K. Broger (1886–1944), H. Lersch (1889–1936), M. Barthel (1893–), R. Schickele (1883–1940), K. Heynicke (1891–), E. Lasker-Schiiler (1876–1945), W. Flex (1887–1917), and J. Becher (1891–1958). G. Benn

GERMAN AUTHORS

1. Walther von der Vogelweide (c. 1170–c. 1230). 2. Martin Luther (1483–1546). 3. Friedrich Gottlieb Klopstock (1724–1803). 4. Gotthold Ephraim Lessing (1729–81). 5. Johann Gottfried von Herder (1744–1803). 6. Johann Wolfgang von Goethe (1749–1832). 7. Johann Christoph Friedrich von Schiller (1759–1805). 8. Johann Christian Friedrich Holderlin (1770–1843). 9. Bernd Heinrich von Kleist (1777–1811). 10. Heinrich Heine (1797–1856). 11. Eduard Friedrich Mörike (1804–75). 12. Christian Friedrich Hebbel (1813–63). 13. Gottfried Keller (1819–90). 14. Gerhart Hauptmann (1862–1946). 15. Hugo von Hofmannsthal (1874–1929). 16. Rainer Maria Rilke (1875–1926). 17. Thomas Mann (1875–1955). 18. Franz Kafka (1883–1924)

(1886–1956), a surgeon who wrote poems about his profession, came to occupy a leading place in the German lyric after World War II.

J. Weinheber (1892–1945) came to the fore in the prewar years, and R. Hagelstange (1912–) and H. E. Holthusen (1913–) during the war; with them may be mentioned A. Goes (1908–), E. Langgasser (1899–1950), W. Borchert (1921–1947), Horst Lange (1904–) and J. Gunert (1903–). After World War II a religious flavour was strongly represented, as may be seen in the *Dies irae* of W. Bergengruen (1892–) and in the works of R. Schneider (1903–), while nature poetry was provided by W. Lehmann (1882–), Oda Schafer (1900–), G. Eich (1907–) and K. Krolow (1915–).

20th-Century Drama.—The drama saw many experiments after the days of naturalism, but less work of merit is to be recorded than in the spheres of the lyric and the novel. The verse dramas of Hofmannsthal had parallels in those of R. Beer-Hofmann (1866–1945). A. Schnitzler (1862–1931), a physician, drew marionettelike characters in impressionistic plays and dramatic dialogues (*Anatol, Liebelei, Der grüne Kakadu, Reigen, Der Sckleier der Beatrice, Der junge Medardus*) in which the libidinous element was monotonously present, though his *Professor Bernhardi*, like his novel *Der Weg ins Freie*, bad a polemical purpose. The miracle play of Max Mell (1882–), the grim dramas about the Austrian peasantry written by Karl Schonherr (1868–1942), and the psychopathically morbid works of K. Vollmöller (1878–1948) soon lost popularity. Neoclassical tendencies were to be seen in Paul Ernst (1886–1933), whose austere style and heroic ethics were displayed in historical plays, short stories and criticism.

W. von Scholz (1874–), more mystically minded than Ernst, S. Lublinski (1868–1910), Hans Franck (1879–), W. Schmidtbonn (1876–1952) and H. Eulenberg (1876–1949) belong to the same austere current, with W. Schafer (1868–1952) and R. Binding (1867–1938) representing kindred attitudes in the narrative field. The expressionist drama, with its symbolical figures and frenzied concentration of language, aided by remarkable advances in stage technique. owed much to Maurice Maeterlinck and August Strindberg, and to Frank Wedekind's (1864–1918) grotesquely naturalistic dramas on sexual obsessions. R. Sorge (1892–1916), G. Kaiser (1878–1945) and W. Hasenclever (1890–1940) inaugurated the new movement. It was markedly tendentious, its ethical purpose being stated with restless extravagance. Its representatives were P. Kornfeld (1889–died in imprisonment during World War II), C. Sternheim (1878–1943), E. Toller (1893–1939), R. Goering (1887–1936), F. von Unruh (1885–), B. Brecht (1898–1956) (who adapted *The Beggar's Opera* in *Die Dreigroschenoper* and whose *Mutter Courage und ihre Kinder* was very successful), E. Barlach (1870–1938), J. Becher (1891–1958), A. Wildgans (1881–1932), O. Kokoschka (1886–) and Hans Henny Jahnn (1894–1959). After the first two decades of the 20th century, other trends were visible. Carl Zuckmayer (1896–) moved from unintelligible plays to realistic comedies (*Der Hauptmann von Köpenick*) and scored successes after World War II with *Des Teufels General, Gesang im Feuerofen* and *Das Kalte Licht*. W. Goetz (1885–) revived the historical drama. There followed H. Rehberg's (1901–) Hohenzollern plays and the propagandist works of Hanns Johst (1890–). After World War II the excesses of the past were avoided, and G. Hermann Mostar (1901–), Hermann Rossmann (1902–), who wrote successful plays with topical significance: joined Brecht. Jahnn and Zuckmayer in the leadership in the field of dramatic composition. Of Austrian writers, Alexander Sacher-Masoch (1901–) and F. T. Csokor (1885–) may be mentioned, as well as the brilliant satirist Karl Kraus (1874–1936), whose plays, lyrics and essays earned wide approval.

20th-Century Novels.—Narrative prose produced important figures, though the new literary theories directed undue attention to psychological interests and the sordid topics already noted in connection with other genres, and accentuated that tendency toward formlessness which always had been a weakness of the German novel. The once popular works of W. von Polenz (1861–1903), G. von Ompteda (1863–1931) and Rudolf Herzog (1869–1943) gave way to productions of a less traditional kind. Otto Ernst (1862–1926) wrote delightful books for children and revived the *Bildungsroman* with *Asmus Sempers Jugendland* and others. Satanism and sex occur in the works of Stanislaus Przybyszewski (1868–1927) and H. H. Ewers (1871–1943). More important writers came to the fore under the influence of impressionism. Hermann Hesse (1877–), a Swabian who lived mainly in Switzerland, penetrated into the problems of the artist in *Peter Camenzind* and *Der Steppenwolf* and of adolescence in *Demian*, and treated with deep symbolism the duality of human existence in *Narziss und Goldmund*. Heinrich Mann (1871–1950) became famous for his bitter political and social satire and the riotous Italianate passion of his stories, such as *Im Schlaraffenland, Professor Unrat, Das Kaiserreich*. Heinrich's brother Thomas Mann (1875–1955) became the best known of modern German novelists; his constant theme is the contrast between the normal man and the artist. *Buddenbrooks* (1900) expounds the thesis that artistic refinement and physical decay go hand in hand. *Tonio Kroger* and *Der Tod in Venedig* (1912) develop the same problem, until in *Der Zauberberg* (1924) the pathological stress on decline and disintegration becomes oppressive. as all pre-1914 culture is analyzed. Four novels on the biblical theme of Joseph (*Joseph rrnd seine Briider*, 1933–44) again express the enmity of spirit and flesh. *Lotte in Weimar* (1939) deals with the sacrifices involved in being near the great. The postwar *Dr. Faustus* (1947) combines in a modernized version of the story the problem of the disintegration of artistic genius with a study of the degeneration of German culture into nazidom. *Der Erwahlte* revives the legend of St. Gregory. His final works, the brutally cynical *Die Betrogene* (1953) and buoyantly parodistic *Bekenntnisse des Hochstaplers Felix Krull* (1954) (of which the beginnings date back to 1911), each deal with the importance of discipline and responsibility as against the frivolous and tainted balance of the misfit. Essays, stories, political and literary criticism complete Mann's work. J. Wassermann (1873–1934) taught the doctrine of compassion and spiritual redemption in a series of valuable novels, such as *Caspar Hauser, Christian Wahnschaffe, Der Fall Maurizius* and *Etzel Andergast*.

In addition to less well-known men, such as Emil Strauss (1866–), author of *Freund Hein*, and W. Bonsels (1881–1952), who wrote *Die Biene Maja und ihre Abenteuer*, a number of women writers must be mentioned. Radical feminism occurs in the work of Gabriele Reuter (1859–1941) and Helene Bohlau (1859–1940), naturalism in Clara Viebig (1860–1952), romanticism in Isolde Kurz (1853–1944), history and religious tolerance in Enrica von Handel-Mazzetti (1871–1955) and regionalism in Helene Voigt-Diederichs (1875–), Agnes Miegel and Lulu von Strauss und Torney. The most significant, however, both in range and artistry is Ricarda Huch (1864–1947); her *Erinnerungen von Lzrdolf Ursleu dem Jüngeren* (1893) anticipated Mann's studies of decadence; *Vita Somnium Breve* traced the decline of a business firm; her main eminence. however, is in historical narrative, where she combines rich imagination and real scholarship in her tales of Garibaldi and the Risorgimento and *Der grosse Krieg in Deutschland*. Two excellent volumes on German romanticism, studies of Luther, Keller and German history, lyrics and *Novellen* indicate her wide scope. Ina Seidel (1885–) evoked the atmosphere of the French Revolution and German reactions to it in *Das Labyrinth* and *Das Wunschkind*.

The historical novel acquired a symbolical and allegorical value as a mirror for modern problems. *Tycho Brakes Weg zu Gott* (1916) by Max Brod (1884–) and *Amor Dei* and the Paracelsus novels (1917–25) of E. G. Kolbenheyer (1878–1962) shifted the interest from the historical scene to the state of mind of past thinkers. The native heroism of the Germans was stressed in *Der Sclziller-Roman* and other books by W. von Molo (1880–). Lion Feuchtwanger (1884–1958) showed much less profundity, but Stefan Zweig (1881–1942) composed a series of analytical historical narratives and portraits, and A. Neumann (1895–1952) combined history with the macabre. In Bruno Frank (1887–1945) a critical approach was united with an enlightened sensitivity. The regionalist trend, revived as a counterblast to the naturalist stress on urban life, grew into a powerful aid to nationalism and racialism; it was marked by the impressionist attention to environment as the ruling influence on character. The *Heimatkünstler* include F. Lienhard (1865–1929) of Alsace, A. Bartels (1862–1945) of Dithmarschen, R. H. Bartsch (1873–1952) of Styria, L. Ganghofer (1855–1922) of Bavaria, H. Hansjakob (1837–1916) of the Black Forest. G. Frenssen (1863–1945) of Holstein, H. F. Blunck (1888–1961) of Hamburg (who combines regionalism with an affection for Teutonic antiquity), H. Lons (1866–1914) of the Liineburg heath (likewise with an interest in history) and J. Ponten (1883–1940) of the Rhineland. *Volk ohne Raum* by Hans Grimm (1875–1959) united *Heimatkunst* with the study of colonial life, which was also the subject of numerous short stories. F. Griese (1890–), W. Vesper (1882–) and other; mostly younger men took regionalism to more extreme limits, but E. Wiechert (1887–1950) used regionalism to deal with the problem of man's rehabilitation in *Die Jerominkinder* and *Missa sine Nomine*. H. Stehr (1864–1940), though deeply attached to Silesia, mas really concerned with the quest for religious certainty (*Der Heiligenhof*).

Of the expressionist authors Kasimir Edschmid (1890–) became a leading representative of postwar writing with *Dns gute Recht* (1946) and other works. Klabund (Alfred Henschke) (1891–1926) excelled in exotic tales. Franz Kafka (1883–1924), in *Der Prozess* and *Dns Schloss*, studied with mystical symbolism and allegory man's forlorn efforts to integrate himself in the world. A. Doblin (1878–1957), whose style is influenced by James Joyce, reviews the former state of Germany in *November 1918*. F. Werfel moved from expressionist extravagance to religious yearning in *Barbara oder die Frömmigkeit* (1929) and *Das Lied der Bernadette* (1941). The children's novels of E. Kästner (1899–) and Hans Fallada's (1893–1947) books on the nothingness of "little men" have become well-known. Closely allied to expressionism was the vogue for books about World War I, usually on the pacifist side. with E. M. Remarque (1898–) and L. Renn (1889–) scoring popular success; A. Zweig (1887–), W. Flex (1887–191j), E. E. Dwinger (1898–) and E. Jiinger (1895–) are somewhat more considerable.

Hans Carossa (1878–1956) wrote a series of autobiographical stories dealing with the question of responsibility and the ripening and saddening effect of experience (*Rumänisches Tagebuch, Eine Kindheit, Verwandlungen einer Jugend, Das Jahr der schönen Täuschungen* and other works). Questions of guilt and reconstruction dominate the field and are mirrored in various ways in the novel of the vears following World War II. Hermann Broch (1886–1951; *Der Tod* des *Vergil*), Stefan Xndres (1906– ; *Die Sintflut*), T. Plievier (1892–1955; *Stalingrad, Mosknu* and *Berlin*). E. Langgasser (*Das unauslöschliche Siegel, Das Labyrinth*), W. Bergengruen (*Der Sternenstand, Pelegeja, Das Feuerzeichen*), G. von Le Fort (1876– ; *Der Kranz der Engel*), H. Kasack (1896– ; *Die Stadt hinter dem Strom*), E. Jiinger (1895– ; *Heliopolis*) and E. von Salomon (1902– ; *Der Fragebogen*) may be mentioned. R. Musil's (1880–1942) exposure of artificiality in *Der Mann ohne Eigenschaften* (1930–43) became more widely known later.

In Austria. the works of A. Lernet-Holenia (1897–), Alexander Sacher-Masoch and R. Brunngraber (1901–) gained much attention.

Literary Criticism.—At all times in German literary history, greater importance is attached to the transmission of ideas than to form. This point has been equally illustrated by developments in criticism, which has tended to relegate aesthetic appreciation to a secondary position. After the positivistic source study which was in vogue at the end of the 19th century receded. various currents and schools emphasized such things as sociological. ethnological and political factors in literary production. and literature was studied in terms of the history of problems and ideas. Generally speaking, criticism in Germany has rarely disengaged itself from the historical approach to literature, and. while surveys of whole epochs are numerous, critical biographies of importance are by comparison less frequent. Mediaeval studies have been consistently maintained; great attention is given to Goethe and to early romanticism, while the Baroque period was the subject of a considerable degree of interest, especially after World War I. Following World War II there was a marked tendency to relate literary criticism to contemporary problems.

Besides work published in German-speaking countries, much research of the highest scholarly value has come from England, France and the United States, where German studies have reached a high standard and are frequently combined with the study of comparative literature.

GERMANOS (Loukas Strenopoulos) (1872–1951), Greek archbishop of Thyateira and a leader of the ecumenical movement (*q.v.*), was born at Delliones in eastern Thrace on Sept. 15, 1872. He was educated in Constantinople and at the theological college at Halki. and in 1900 went to Germany for further study. He returned to be a professor at Halki (1904) and was ordained priest, later becoming also the director of the college (1907). In 1912 he was made metropolitan of Seleucia. but retained his position at Halki until 1922. when he became metropolitan of Thyateira and exarch of western and central Europe with his headquarters in London. In 1924 he was also named special representative of the patriarch of Constantinople to the archbishop of Canterbury, and in 1912 was awarded the Lambeth cross for his services to Anglican-Orthodox understanding. He played an important part in the formative years of 20th-century Christian co-operation. becoming a first president of the World Council of Churches on its establishment in 1948. His guidance helped bring the Orthodox churches into fuller association with the western churches. He died in London. Jan. 23. 1951. (H. M. W.)

GERMAN SILVER: see Nickel Silver.

GERMANTOWN, a section of Philadelphia. Pa.. which before 1851 was a separate borough, is one of the most historic communities in the state. It lies 6 mi. N.W. of the centre of Philadelphia and extends for more than a mile along Germantown avenue. formerly High street. Its first settlers were part of the vanguard of the great Germanic invasion of colonial Pennsylvania. William Penn's promise that his colony would offer an asylum where men might worship God as they chose early attracted Pietists from the Rhineland. and in 1683 a group of such people. chiefly from Frankfurt and Crefeld, founded Germantown. The principal figure among them was Francis Daniel Pastorius (*q.v.*).

Germantown quickly became a prosperous settlement. developing various handicraft industries. Weaving, tanning and wagon building were especially noteworthy. On the Wissahickon creek William Rittenhouse in 1690 built the first paper mill in the British colonies. In 1738 Christopher Sauer and his son established in Germantown a printing press which became perhaps the largest in colonial America. Sauer's German Bible was the first to be printed in a European language in America. One of his employees. Jacob Bey. was the first manufacturer of printing types in the British colonies.

Germantown soon ceased to be a wholly German community. and especially after the middle of the 18th century the English influx was great. Most of the fine buildings for which Germantown avenue is famous, symmetrical stone houses characterized often by the Germantown pent-roof and by inviting benches flanking the doorway, date from the middle and late 18th century. Outstanding among them is Cliveden (1763), planned by Chief Justice Benjamin Chew, an especially good example in stone of the monumental late Georgian style of the Philadelphia area. Grumblethorpe (1744) is lighter in style and a more typical Germantown home. The Morris house (1772) served as the presidential mansion of the United States when the yellow fever epidemic of 1793 drove George Washington from Philadelphia and is a graceful Pennsylvania Georgian town house. The original building of the Germantown academy (1760) still stands. From an earlier period (1690 and later) Wyck survives. and from a later period (1798) there, is Upsala, an example of the delicate federal style in Pennsylvania. Various organized groups are dedicated to the preservation of these buildings and of whole neighbourhoods of the colonial village.

On Oct. 4. 1777, several of the Germantown houses figured in military history, when Washington's continental army fought the battle of Germantown among them in an effort to break the defenses of British-occupied Philadelphia. After entering Philadelphia late in September. British Gen. Sir William Howe had divided his army in order to attack the forts down the Delaware river and to maintain his communications. Thus his main force at Germantown numbered less than 9,000, and Washington decided to attack with a reinforced army of 11,000. He planned a complicated double envelopment, but because his flank columns consisted of militiamen the plan did not work out and the brunt of the battle had to be borne by two columns of continental troops. making virtually a head-on assault on the British centre. The attack came close to success and might have prevailed but for an unnecessary loss of time spent trying to drive a British garrison from Cliveden and a confused collision in a fog between two American columns. As it was. Washington had to retreat.

GERMAN VOLGA REPUBLIC (Nemtsev Povolzhya A.S.S.R.) was from 1921 to 1911 one of the ten autonomous Soviet Socialist republics of the Russian federation. It was surrounded on west. north and east by the Saratov region (*oblast*) and bounded south and southwest by the Stalingrad region. Its area was 10,888 sq.mi., one-fourth lying on the right and three-fourths on the left bank of the Volga river. The country on the left bank is a plain. with chestnut-coloured soil passing into salt steppe in the southeast where it nears the Caspian depression. The right bank area is a plateau, cut by rivers into ravines which give it a hilly appearance. and it has some forest. Except for the Volga river the streams are shallow. liable to dry up. and not suitable for navigation. The climate is distinctly continental.

The chief crops are wheat, barley, rye. millet, maize and sunflower seed; in pre-1914 times wheat was largely produced for export. but the subsequent poverty and famine altered the balance of crops in favour of barley, rye, millet and sunflower seed; maize is also more widely grown thanformerly.

The industries include flour milling, tobacco making from local makhorka, begun in 1922, a leather factory built at the town of Golom-Karamysh in the right bank district, bacon factories and a factory built in 1926 at Marxstadt (formerly Katherinenstadt) on the left bank of the Volga for the manufacture of oil tractors. There are small sawmills in the forest area and a large one at Engels (formerly Pokrovsk), the administrative centre on the left bank of the Volga opposite to Saratov. Engels had in 1926 a population of 34.345 which by 1939 was increased to 73,279.

History.—About 27.000 German colonists were settled on the Volga river in 1760 and 1761 at the invitation of Catherine II by special manifesto. The climatic difficulties of their new environment. lack of capital, oppression by officials and attacks by Kirghiz and Kalmucks diminished their numbers by 50% in the first ten years. They were at first given special privileges, including exemption from army service, but in the mid-19th century these privileges were annulled. About 1870 the small measure of autonomy remaining to them was cancelled and the colonies broken up.

When World War I broke out, the German colonists were persecuted, and in Feb. 1915 an Imperial ukase ordered the destruction of their settlements in frontier areas. In Feb. 1917 another ukase prescribed the transportation of the Volga Germans to Siberia. Before this was carried out, the 1917 revolution took place. In early 1918, a commission was organized at Saratov to organize Soviet rule among the Volga Germans. and at that town in June 1918 the first Soviet congress of the Volga Germans expressed a wish for autonomous government.

On Oct. 19, 1918, the Autonomous German Volga district was created by decree. and it became a republic on Feb. 20, 1924. Of its 12 cantons, 5 had purely German inhabitants, 4 mixed German-Russian or German-Ukrainian inhabitants and 3 were predominantly Russian or Ukrainian. By 1939 the republic's population was 605.542 of which 67% was German. 20% Russian and 12% Ukrainian. The republic was abolished on Sept. 24, 1941. three months after the German aggression; its territory was divided between the Saratov and Stalingrad *oblasts* and its German inhabitants transported to Siberia.

GERMANY (*Deutschland*), a country of central Europe bordering on the Netherlands. Belgium, Luxembourg, France. Switzerland, Austria, Czechoslovakia and Poland. The area of Germany is 137,535 sq.mi. The German republic. which was founded in 1918, mas known after 1933 as the Third Reich. After a series of annexations beginning with that of Austria in March 1938. followed by the so-called Sudeten districts of Czechoslovakia in September and the larger part of the rest of Czechoslovakia in March 1939. Hitler's troops invaded Poland on Sept. 1. 1939. and in the course of World War II conquered further substantial areas. which were placed under German domination. At the end of the war. in 1945. the governments of the United Kingdom, the United States, the U.S.S.R. and France assumed supreme authority in Germany without however annexing it, and the country within its 1937 frontiers was divided into four zones of occupation, as was also Berlin itself. By the Potsdam agreement of Aug. 2, 1945. it was decided to transfer the city of Konigsberg (renamed Kaliningrad) and the adjacent area of East Prussia to the U.S.S.R., while, pending the final determination of Poland's western frontier at the peace treaty, the area of 1937 Germany east of the Oder-Neisse line, together with the city of Danzig (Gdanskj and the remainder of East Prussia. was placed under Polish administration. Simultaneously it was agreed that all Germans remaining in Poland, Czechoslovakia and Hungary should be transferred to Germany. In Nov. 1947 the Saar was placed under a special regime, being economically united with France and politically separated from Germany. It was reunited politically with the German Federal Republic on Jan. 1, 1957, and economically in July 1959.

The year 1949 saw the emergence of two separate republics in Germany: the German Federal Republic for the area of the three western zones of occupation and the German Democratic Republic for the eastern zone. Berlin was similarly divided into a western and an eastern municipality, eastern Berlin acting as capital of the German Democratic Republic. The capital of the German Federal Republic was Bonn. Although, because of its isolation, western Berlin could not become a constituent part of the Federal Republic, close ties were maintained between the two areas.

PHYSICAL FEATURES

Geology.—Germany consists of a floor of Palaeozoic rocks upon which rest unconformably the comparatively little disturbed beds of the Mesozoic system, while in the north German plain a covering of modem deposits conceals the whole of the older strata from view, excepting some scattered and isolated outcrops of Cretaceous and Tertiary beds. The rocks which compose the ancient floor are thrown into folds which in the western half of Germany run approximately from west-southwest to east-northeast. They are exposed on the one hand in the neighbourhood of the Rhine and on the other hand in the Bohemian massif. With the latter must be included the Frankenwald, the Thuringenvald and even the Harz. The oldest rocks, belonging to the Archaean system, occur in the south, forming the Vosges and the Black Forest in the west, and the greater part of the Bohemian massif, including the Erzgebirge, in the east. They consist chiefly of gneiss and schist, with granite and other eruptive rocks. Farther north, in the Hunsruck, the Taunus, the Eifel and Westenvald, the Harz and the Frankenwald, the ancient floor is composed mainly of Devonian beds. Other Palaeozoic systems are, however, included in the folds. The Cambrian, for example, is exposed at Leimitz near Hof on the eastern side of the Frankenwald, and the important coal field of the Saar lies on the southern side of the Hunsrück, while Ordovician and Silurian beds have been found in several localities. Along the northern border of the folded belt lies the coal basin of the Ruhr in Westphalia, which is the continuation of the Belgian coal field, and bears much the same relation to the Rhenish Devonian area that the coal basin of Liège bears to the Ardennes. The Permian, as in England, is not involved in the folds which have affected the older beds, and in general lies unconformably upon them. It occurs chiefly around the masses of ancient rock, and one of the largest areas is that of the Saar.

Between the old rocks of the Rhine on the west and the ancient massif of Bohemia on the east a vast area of Triassic beds extends from Hanover to Basle and from Metz to Bayreuth. Over the greater part of this region the Triassic beds are free from folding and are nearly horizontal, but faulting is by no means absent, especially along the margins of the Bohemian and Rhenish hills. The Triassic beds must indeed have covered a large part of these old rock masses, but they have been preserved only where they were faulted down to a lower level. Along the southern margin of the Triassic area there is a long band of Jurassic beds dipping toward the Danube; and at its eastern extremity this band is continuous with a synclinal of Jurassic beds, running parallel to the western border of the Bohemian massif, but separated from it by a narrow strip of Triassic beds. Toward the north, in Lower Saxony and North Rhine-Westphalia, the Triassic beds are followed by Jurassic and Cretaceous deposits, the latter being here the more important. As in the south of England, the lower beds of the Cretaceous are of estuarine origin and the Upper Cretaceous overlaps the Lower, lying in the valley of the Ruhr directly upon the Palaeozoic rocks. In Saxony also the Upper Cretaceous beds rest directly upon the Palaeozoic or Archaean rocks. The Eocene system is unknown in Germany except in the foothills of the Alps; but the Oligocene and Miocene are widely spread, especially in the great plain and in the depression of the Danube. The Oligocene is generally marine. Marine Miocene occurs in northwest Germany and the Miocene of the Danube valley is also in part marine, but in central Germany it is of fluviatile or lacustrine origin. The lignites of Hesse, the Cassel area, etc., are interstratified with basaltic lava flows which form the greater part of the Vogelsberg and other hills. The trachytes of the Siebengebirge are probably of slightly earlier date. The precise age of the volcanoes of the Eifel, many of which are in a perfect state of preservation, is not clear, but they are certainly Tertiary or post-Tertiary. Leucite and nepheline lavas are here abundant. In the Siebengebirge the little crater of Roderberg, with its lavas and scoriae of leucite basalt, is posterior to some of the Pleistocene river deposits.

A glance at a geological map will show that the greater part of north and central Germany is covered by Quaternary deposits. These are in part of glacial origin, and contain Scandinavian boulders; hut fluviatile and aeolian deposits also occur. Quaternary beds also cover the floor of the broad depression through which the Rhine meanders from Basle to Mainz, and occupy a large part of the plain of the Danube. The depression of the Rhine is a trough lying between two faults or systems of faults. The broader depression of the Danube is associated with the formation of the Alps, and was flooded by the sea during a part of the Miocene period. (P. LA.; I. L. G.)

Physical Geography. — Germany may be described broadly as the country from the Alps to the North and the Baltic seas, and it includes a number of very diverse zones and physical units; less than many other countries does it approach any real unity of structure or physical geographical character. The country may be divided into four areas: (1) the north German plain lying between the North and Baltic seas and the north edge of the mid-German hills; (2) the mid-German hills consisting of broken highlands running from the Ardennes to the northern side of the Bohemian block; (3) southern Germany including the Main and Neckar basins, the Swabian and Franconian Jura, the Danube basin and the Bavarian Alps; and (4) the Rhine valley.

The North German Plain. — This area is flat to the west of the Berlin area but to the east it consists of morainic hills more or less parallel to the Baltic coast and usually less than 600 ft. high.

In the western section the land lies low, with reclaimed coastal marshes providing rich pasture land behind which lie moors and sandy heaths. Of the two morainic belts in this area one contains many lakes; the other is practically a continuation of the Fläming and is called the Altmark toward its eastern end, and the Lüneburg heath in the centre, from which it dies down toward the North sea coast south of Cuxhaven.

A great difference is to be remarked between the coast of the North sea and that of the Baltic. On the former, where the sea has broken up the ranges of dunes formed in bygone times and divided them into separate islands, the mainland has to be protected by massive dykes, while the Frisian Islands are being gradually washed away by the waters. There are now only seven of the East Frisian Islands, of which Norderney is the best known; of the North Frisian Islands, on the western coast of Schleswig, Sylt is the most considerable. Besides the ordinary waste of the shores, there have been extensive inundations by the sea within the historic period, the Gulf of the Dollart having been so created in the year 1276. Sands surround the whole coast of the North sea to such an extent that the entrance to the ports is not practicable without the aid of pilots. Heligoland is a rocky island, but it also has been considerably reduced by the sea. The tide rises to the height of 12 or 13 ft. in the Jade bay and at Bremerhaven, and 6 or 7 ft. at Hamburg.

The coast of the Baltic, on the other hand, possesses few islands, the chief being Alsen and Fehmarn off the coast of Schleswig-Holstein, and Rügen off Pomerania. It has no extensive sands, though on the whole it is very flat; it has no perceptible tides; and a great part of its coastline is covered with ice in winter which also blocks up the harbours so that navigation is interrupted several months every year. Its *Haffs* (lagoons), fronting the mouths of the large rivers, are extensions of the rivers rather than sea bays cut off, though coastal subsidence has contributed to their evolution. Parallel to the Baltic shore is a fertile plain behind which are lines of wooded and heath-covered uplands, scattered with small lakes. Wide, marshy plains alternate with cultivated land in the valleys.

The rivers of the great lowland, the Ems, Weser, Elbe and Oder, are naturally navigable and need very few locks. Post-Pleistocene land sinking has brought the sea up the river mouths so that most of Germany's ports are river ports and have developed outports below themselves, as Bremerhaven below Bremen on the Weser, Cuxhaven below Hamburg on the Elbe and Warnemünde below Rostock on the Warnow. The east-west sections of two rivers in different parts of the same low area between morainic hills have been linked together in many cases by canals, so that a system of river and canal communication crosses Germany from its eastern to its western border. This system converges upon Berlin and helps to account for the phenomenal growth of the city from its insignificant position in the middle of the 17th century. The Oder from Raciborz in Poland and large sections of the Havel, Spree and Saale are navigable; the Elbe itself can be navigated right up into Bohemia, and its tributary, the Moldau (Vltava), as far as Prague. The development of this system of communications and of its focus at Berlin may be said to have changed the face of Germany.

The Mid-German Hills. — Where these hills merge into the northern plain is an area of rolling country called the Borde. The subsoil is largely loessic, making it very fertile. From prehistoric times this area has been inhabited. Running into the hills from the plain are great bays of lowland, the two biggest being the Cologne and Leipzig bays. In the western half of the central plateau the hills trend almost southwest to northeast, the main lines being sharply cut at right angles by the Rhine gorge from Bingen to Bonn. Beyond the eastern rim of the Rhine basin are large volcanic masses, the chief of which are the Vogelsberg (2,539 ft.) and the Rhon (3,045 ft.). This is an area of much faulting, drained mainly by the Weser and its tributaries which start close to the northern tributaries of the Main. There is thus a way through the mid-German hills from Frankfurt-on-Main in the south via Cassel to Hanover in the north, an important factor of the greatness of these cities. East of the Weser the hill lines of the Harz mountains (highest point the Brocken 3,747 ft.) and the Thuringian uplands are outlined and cut by faults with the result that both, and especially the Harz, have long been famed for the mining of metals.

The southeastern end of the Thuringian uplands and the northeastern end of the Franconian Jura approach one another and the mountains further east (the Erzgebirge and the Bohemian plateau) in the Fichtelgebirge (3,448 ft.). These mountains seem to be a centre of radiation of hills and rivers; from them the Naab goes south between the Franconian Jura and the Bohemian plateau to the Danube, the Main goes west to the Rhine between the Thuringian uplands and the Jura, the Saale and its tributaries flow north between the Thuringian uplands and the Erzgebirge, while from Bohemia the Eger flows east between the Erzgebirge and the Bohemian plateau. Eastward beyond the Thuringian uplands the hills trend northeastward in the Erzgebirge (4,082 ft.), which is the northern edge of the Bohemian block, as far as the sharp break by which the Elbe passes from Czechoslovakia to Germany. Beyond the Elbe the hills trend southeastward as the Riesengebirge (5,259 ft.) and the Sudetes, forming the northeast side of the Bohemian block.

Southern Germany. — The Main and Neckar are right-bank tributaries of the Rhine. Their basins are framed by the Swabian and Franconian Jura on the south and east, the Black Forest on the west and the mid-German hills on the north. The climate in these lowlands is warm and dry and they are among the most fertile lands in Germany. growing mainly vines and grain. The Neckar escapes to the Rhine south of, and the Main north of, the Odenwald. In the Neckar basin Stuttgart is the chief focus. In the valley of the Main Nürnberg, Bamberg, Würzburg and Frankfurt are the great centres; the river joins the Rhine just above Mainz.

The Swabian and Franconian Jura are built mainly of porous, Mesozoic rock dipping southward and the drainage is in many parts in deep-cut valleys. The ridge exceeds 3,000 ft. in only a few places in Germany, but the southeast border reaches nearly 4,900 ft. in the Bohemian plateau, which has the lower Bavarian forest in front of it. The Swabian Jura is higher and less broken than the Franconian, and from the rawness of winter on it a large part is known as the Rauhe Alb. The dip slopes of the Jura rise from the left bank of the Danube; the scarp slopes face north or northwest and are steep where they face the Neckar.

The main part of the Danube rises in the Black Forest and the basin is framed by Lake Constance and the Bavarian Alps on the south, and by the Alpine foreland (Jura) and the southwest border of the Bohemian block on the north. The river flows near the northern side of its basin, following the line of the Jura down to Regensburg, beyond which it flows beneath and parallel to the granite edge of the Bohemian block, and then onward past Passau. The large tributaries of the right bank are the Iller, Lech, Isar and Inn; on the left bank the Womitz, which joins the Danube at Donauworth, flows through the Jura zone between the Swabian and Franconian Jura, and the Altmiihl and its feeders' make use of a number of minor breaks in the sharp curve of the Franconian Jura. Linking the Danube and the Main and using parts of the Altmuhl a canal has been built from Regensburg through Nuremberg to Bamberg. Much land on the south of the Danube basin is poor, but some areas toward the centre, where the subsoil is loess, are fertile.

It is only the northern fringe of the Alps, from Lake Constance to about Hallein, that is in Germany and the frontier here lies along the northernmost of the east-west ridges of the Alps; the highest point in Germany, the Zugspitze (9,720 ft.), stands on the border of Tirol. The Bavarian Alps are of great beauty, with some exquisite mountain lakes, and farther down the northward valleys long lakes behind morainic dams, one of which, the Würmer See, has given its name to a moraine held by Albrecht Penck to mark one of the ice maxima of the Pleistocene glaciation. The slopes toward the Danube have much boulder clay and there are large swampy areas called Moose, but the better-drained valleys are relatively rich.

The Rhine Valley.—From Basle to Mainz the Rhine flows through a remarkable rift valley. On the east the upstanding edge is the sharp western slope of the Black Forest (the Feldberg is 4,898 ft. high) as far north as the latitude of Karlsruhe; recognizable again farther north is the Odenwald (c. 1,700 ft.). West of the Rhine the upstanding edge is the Vosges (in France), becoming lower and smoother north of Saverne but rising again in the Hardt (highest point, Donnersberg 2,254 ft.). The continuous block that once included the Vosges and the Black Forest was a Hercynian massif, and the rift has given a section of the Rhine with a broad valley floor and parallel sides. The course of the river is rough in places, and a volcanic mass, the Kaiserstuhl, stands out in the middle; the banks of the rapid river are rough land with few towns in the south, but many from Speyer northward. From Mainz to Bingen the Rhine flows from east to west, from the rift valley to the gorge cutting through the mid-German hills. From Worms through Mainz to Bingen the land is relatively low and has loess subsoil making it one of the best agricultural parts of the country. It is an area of ancient settlement where rich finds of prehistoric objects of several periods have been made.

Climate.—The climate of Germany is intermediate between the oceanic and continental climates of western and eastern Europe respectively. The differences in the range of temperature and the amount of rainfall throughout Germany are not so great as they would be were it not that the elevated plateaus and mountain chains are in the south, while the north is occupied by low-lying plains. In the northwest no chain of hills intercepts the warmer and moister winds which flow from the Atlantic, and these accordingly influence at times even the eastern regions of Germany. The mean annual temperature of southwestern Germany, or the Rhine and Danube basins, is about 52° to 54° F., that of central Germany 48" to 50° and that of the northern plain 46° to 48°. The difference in the mean annual temperature between the southwest and northwest of Germany amounts to about 3°.

The valley of the Rhine above Mainz has the greatest mean heat, the mildest winter and the highest summer temperature. The Baltic has the lowest spring temperature, and the autumn there is not much warmer. In central Germany the high plateaus of the Erz- and Fichtelgebirge are the coldest regions. In south Germany the upper Bavarian plain experiences a harsh winter and a cold summer. The warmest districts are the Rhine valley from Karlsruhe downward, less than 300 ft. above sea level, and protected by mountains. The same holds true of the valleys of the Neckar, Main and Moselle. Hence the vine is everywhere cultivated in these districts. The mean summer temperature there is 66" and upward, while the average temperature of January is above 32° F. The climate of northwestern Germany is oceanic, the summers not being too hot (mean summer temperature 60° to 62°), and snow in winter remains but a short time on the ground. West of the Weser the average temperature of January exceeds 32° (it is 34° at Cologne); to the east it sinks to 30°, and the Elbe is generally covered with ice for several months of the year, as are also its tributaries. The farther one proceeds to the east the greater are the contrasts of summer and winter.

Rain falls at all seasons, but chiefly in summer. The rainfall is greatest in the Bavarian tableland and the hilly regions of western Germany. For the Eifel, Sauerland, Harz, Thuringian forest, Rhon, Vogelsberg, Spessart, the Black Forest, the Vosges, etc., the annual average may be stated at 34 in. or more, while in the lower terraces of southwestern Germany, as in the Erzgebirge, it is estimated at 30 to 32 in. only. The same average obtains also on the humid northwest coast of Germany as far as Bremen and Hamburg. In the remaining parts of western Germany, it amounts to upward of 24 in. In the best wine districts, *i.e.*, in the valley of the Rhine below Mannheim and also in the valley of the Main, no more than from 16 to 20 in. fall. Eastern Germany as far south as the Thuringian forest has an annual rainfall of only 16 to 20 in. Thunderstorms are most frequent in July. The soil of Germany, in correlation with these facts of climate, is generally of the brown group (see EUROPE), moderately leached except near the sea where the leaching has generally been more intense and where the glacial subsoil often includes much sand. The soils on the Jurassic rocks of the south are specially rich in humus.

Vegetation.—Approximately 27% of the whole area of Germany is still covered with forest. About 45% of this forest is pine, about 40% beech and about 8% oak. Though plantations are extensive, there is still a certain amount of natural forest.

Beech (*Fagus* sylvatica) forest is found on all well-drained soils in the temperate regions, from sea level up to 2,000 ft. in the Harz mountains and 4,500 ft. in the Bavarian Alps. Associated with beech are silver fir, spruce, pine and oak. Where there is enough light and good soil the ground flora consists of dog's mercury, sweet woodruff, violets, etc.; higher up in wet places it includes balsam, willow herb and monkshood; on acid soils bilberry, wavy hair-grass and mosses are found.

On poorer, lighter soils, especially in the northeast, the forests are of Scots pine (*Pinus sylvestris*). They ascend to 4,000 ft. in the Black Forest mountains and 5,000 ft. in the Bavarian Alps. Most of these forests are planted, and there are also many plantations on inland sand dunes, for example along the Rhine valley floor above Mainz. The plantations have little or no ground flora, but the native forests often contain juniper, bilberry and heather, mosses and lichens. Many are mixed with oak, beech and hornbeam.

Extensive plantations of spruce (Picea abies), or spruce mixture, make up 20% of the productive forest of Germany. More tolerant of extreme cold than beech, it grows as a native tree on the upper slopes of the central and southern mountain areas where it is found up to the highest limit of trees. This limit is higher in the south than it is in the north. There are vast areas of spruce in the Black Forest. In the younger plantations the ground is covered with fungi, especially in autumn.

The oak forests on the light, sandy, acid soils of the northwest are generally mixed with birch. Beneath the trees grow broom, heather, bilberry, bracken, etc. The oak forests in the west are mixed with hornbeam with a well-developed shrub layer and ground flora. The northern and eastern oakwoods are mixed with pine. The two oaks found most in Germany are Quercus *robur*, which occurs everywhere, and Q. petraea, which occurs more in the east.

Alder (*Alnus* glutinosa) dominates the peaty fen woods and is the characteristic tree of river valleys, often with willow and poplar where it is very wet, or oak, ash, elm and hornbeam where it is drier. Willows, poplars, elms, chestnuts, walnut, maples and ash are locally common.

The silver fir (Abies alba) is a native of the central and southern mountains, being especially abundant on the western slopes of the Black Forest. In the Thuringian forests it grows up to 2,600 ft. and in the Bavarian Alps it reaches 5,000 ft. Above the silver fir is the larch (*Larix* decidua). which grows up to 6,500 ft., mixed with spruce and Arolla pine (*Pinus cembra*). Above the upper limit of forest the mountain pine (*Pinus mugo*) occurs as a prostrate shrub and beyond this rhododendrons and alpine plants.

Heathland is characteristic of the northwest with heather (*Calluna vulgaris*), whins, grasses, mosses and lichens where it is dry, and cross-leaved heath (Erica tetralix), club mosses, sundews and cotton grass in the wetter parts. Much land from the saltings and estuarine marshes of the North sea coast has been reclaimed and is now grassland. Reclamation of fens and marshes in areas where the soil contains lime has turned these into rich pasture. In places where the soil is acid, especially in the wide coastal belt, are many bogs containing Sphagnum, cotton grass, sundews, etc. In the north German plain sandy heaths, moors and bogs are being reclaimed.

Fauna. — The felling of trees in all the forested areas and the draining of the northern marshes for the reclamation of land brought about great changes in the fauna of Germany, which is characteristically mid-European. Hunting also helped to exterminate some animals, for instance the brown bear, lynx, ibex and bison, though it preserved others such as roe deer and red deer and wild boar. There are still chamois in the Bavarian Alps. Marmots, foxes, martens, weasels, badgers (becoming less common), beavers, otters and other small beasts are found in the mountains, forests and rivers. The elk has been reintroduced in certain places in northeast Germany and herds of bison are kept in some parks.

Many of the birds are migrants that cross the country in a northeast-southwesterly direction. Some, such as the red-backed shrike, and the white stork from north and east Germany, fly southeast, but the white stork from the west flies southwest. Geese, ducks and snipe are among the birds seen on the northern marshes and plains, and capercaillie among those found in the pine forests.

Germany is not rich in amphibians or reptiles. Carp are abundant in ponds and lakes and there are salmon, trout, eels and crayfish in the rivers. The salmon Salmo salar is not found in the Danube but there is another kind called huchen (Salmo hucho) in the river. Along the coast mussels and oysters are found, and the seas produce herring and cod. Insects are varied and numerous.

HISTORY

Classical writers from the time of Thales (c. 600 B.C.) were acquainted with the amber of the North German coasts, and the traveller Pytheas (c. 300 B.C.) certainly visited Germany and may have reached the Vistula. But there seem to have been few contacts between the classical and the Germanic world before the Cimbri and Teutoni, who probably came from Jutland, invaded the Mediterranean regions and Italy itself (113–101 B.C.). Ancient writers were uncertain of the distinction between Germans and Celts which mas not clearly recognized until the Gallic campaigns (58–51 B.C.) of Julius Caesar brought more exact knowledge. (See TEUTONIC PEOPLES for an ethnological and anthropological account of the prehistoric Germans.)

ANCIENT HISTORY

Caesar's conquest of Gaul halted the German pressure on the Celts, which had virtually driven them from the eastern bank of the Rhine and had led to Ariovistus' settlements on the upper Rhine in 71 B.C. and to extensive infiltration (attested by archaeology and by Caesar himself) on the middle and lower Rhine by the Treveri, Nervii and others. An invasion of Usipetes and Tencteri, repressed in 55 B.C., led Caesar to undertake two punitive expeditions across the Rhine in 55 and 53 B.C., neither intended to penetrate far. The province of Gaul as created by him in 51 B.C. extended to the Rhine, which he regarded as an ethnic frontier.

Augustus (31 B.C.–A.D. 14) seems at first to have held Caesar's view of the Rhine frontier, but in 12 B.C. his stepson Nero Claudius Drusus undertook what was evidently understood as a combined campaign of Gaul and Roman against the traditional enemies of both. It is not clear, however, how far Augustus intended annexation to go. Drusus himself died soon after reaching the Elbe (g B.c.), but his work was resumed by his brother,' the future emperor Tiberius from 9 to 7 B.C. Meanwhile the growth of a German empire under Maroboduus in Bohemia was engaging Roman attention; between 7 B.C. and A.D. 4 a series of expeditions penetrated into Germany across the Danube; and in A.D. 5 Tiberius subdued the Cimbri in Jutland by amphibious operations. A grand campaign in A.D. 6 was forestalled, however, by a revolt in Pannonia, and in A.D. 9 overenthusiastic efforts at provincialization led to a revolt in the west under Arminius and to the death of the governor P. Quinctilius Varus, with the loss of three legions, in the *saltus* Teutoburgiensis (probably near Paderborn). Augustus, who now appreciated the insuperable difficulties of conquering a wild country with a backward political organization, bequeathed to his successors the doctrine that the Rhine and the Danube were the frontiers of the empire. Only along the North sea coast (Frisii) and in the Wetterau and Taunus, where the Chatti. the most civilized German tribe, commanded the trade route. did Rome have interests beyond the Rhine; and the campaigns of Germanicus (A.D. 14–16), floridly described by Tacitus. are to be regarded as determined by this fact and by the need of re-establishing prestige. All garrisons across the Rhine were withdrawn under Claudius (41–54), and the Romans confined themselves to diplomatic intrigue, a method that had proved successful against Arminius (slain by his own kin in 19).

A new approach to the German problem was seen under the Flavian dynasty (Vespasian, Titus and Domitian, 69–96). Roman control of Friesland was reasserted, and the Chatti were subdued in two campaigns of Domitian (83 and 88). To shorten the line of the Rhine-Danube re-entrant, the defenses enclosing the area conquered from the Chatti up to the crest of the Taunus were extended southward and eastward to join the Danube near Regensburg, and the frontier works were improved and extended by Hadrian (117–138) and Antoninus Pius (138–161), bringing Roman dominion and even the outward signs of Roman civilization up to the Central German or Hercynian forest. An accompaniment of the policy was the creation by Domitian of the two provinces of lower and upper Germany, the former (carved out from Gallia Belgica) consisting of the more or less germanized tribes along the western stretches of the lower and middle Rhine, the latter comprising in the main the new conquests. Meanwhile a changed attitude to the nature of German dangers was seen in the disposition of the legionary garrisons. Whereas under Tiberius (14–37) there had been eight legions on the Rhine and five on or near the Danube, a century later the proportion was four to nine.

Western and Eastern Germans. — Tacitus' study of the Germans, published in A.D. 98, divides them into three groups, the Ingaevones of the northwest, the Hermiones of the interior and the Istaevones of the Rhine. These names are not fitted by Tacitus into his description of individual tribes and clearly derive from an earlier period during which Germans had hardly penetrated across the Elbe; they prepare for the distinction, only slightly blurred by tribal migrations, between western and eastern Germans, a distinction of great importance in their subsequent relations with Rome.

In Tacitus' time the most important tribes along the Rhine were the Frisii and the Batavi at its mouth, the Tencteri between the Ruhr and the Lahn and the Mattiaci opposite Coblenz. Behind them were the Chauci on the coast between the Ems and the Elbe, the Cherusci (Arminius' tribe) round Minden, the Chatti in Hesse-Cassel and the Hermunduri of Franconia, who were taken into the empire, as were the Mattiaci and some of the Chatti, in course of the new conquests. East of the Chauci along the Elbe were the Langobardi and on the middle Elbe the Suebi

Most of these names disappeared, to be replaced by greater political units. the Saxons, the Franks and the Alamanni. This development Hans Delbriick supposed to have been the result of deforestation, as the uninhabited wastes with which the tribes in Caesar's time had surrounded themselves for security and prestige (cf. De Bello Gallico, vi, 23, 1) were won for agriculture. These confederacies were becoming a menace to Rome in the 3rd century: in 276, Franks and Alamanni overran the whole of Gaul; and about this time the limes was finally abandoned. Attacks on Britain by the Saxons then began in earnest and the *Litus Saxonicum* may even commemorate their settlements as well as the defense against them. Diocletian (284–305) and his successors Constantine (306–337), Julian (who was in Gaul from 355 to 360) and Valentinian (364–375) encouraged campaigns and fortification, and a frontier along the Rhine was maintained, though Julian had to agree to a treaty allowing the Franks to settle in much of modem Flanders.

The Bastarnae in the Carpathians, known to Polybius in the 3rd century B.C., were the advance guard of a migration of Germans to the lands between the Elbe and the Vistula that took place about the beginning of the Christian era. By the time of Tacitus the lands immediately across the middle Danube were occupied by the Marcomanni and the Quadi, both scattered fragments of western Germans from the empire of Maroboduus. Tacitus' knowledge of the tribes behind these is dim, but the Burgundians and Gotones (the later Goths) can already be distinguished along the Warte and Vistula.

The Marcomanni and the Quadi gave trouble to Rome under Domitian (89 and 92) and Nerva (97). In 166 they took advantage of a plague and a Persian war to burst the frontier, penetrated into Italy itself and were only pacified by Marcus Aurelius after a series of exhausting campaigns lasting until his death (180). Commodus (180–192) entered into treaty with them and fortified the Danube yet more intensively.

These tribes continued to be dangerous neighbours to the empire, but their place as its principal assailants was taken in this sector by the Goths, who reached the Black sea early in the 3rd century and attacked the Danube frontier in 238. A succession of emperors (one of whom, Decius, met his death at their hands in 251) failed to check their forays, which extended over Greece and Asia Minor until Claudius II, surnamed Gothicus, defeated them in 269. His successor Aurelian (270–275), however, abandoned Dacia to them, and about this time the distinction between Visigoths and Ostrogoths begins to appear, the former in Dacia, the latter still in southern Russia. Warfare and fortification along the Danube frontier are attested notably in the reigns of Constantine and his sons and of Valentinian I.

The *Volkerwanderung* or Great Migrations. — Germans had for two centuries been infiltrating into the empire as soldiers and as captives settled in groups for agriculture; but their permanent entry in mass was part of the Volkerwanderung precipitated in Europe by the western movement of the Huns. About 370 the Ostrogothic kingdom was destroyed and soon after both branches of the Gothic nation requested asylum within the empire. Dissension with their hosts soon broke out, and the Romans were decisively defeated at Adrianople (378), after which the Goths were never expelled. Under their king Alaric (c. 365–410) and his successors, the Visigoths wandered over the empire seeking lands and political privileges and sacking Rome on the way (410). They finished in occupation of a kingdom embracing southwestern Gaul and most of Spain with its capital at Toulouse. During this period the principal general of the western Roman empire, Stilicho, himself of Vandal origin, was compelled to remove the garrisons of the Rhine for the defense of Italy, and the frontier was crossed at the end of 406 by a mixed host of Germans, mainly Vandals—actually migrants from eastern Germany—who penetrated first into Spain and then into Africa, where their leader, Gaiseric, founded a kingdom at Carthage in 439.

The first half of the 5th century is marked by complicated military and diplomatic manoeuvring between the rulers and generals of the eastern and western empires, the German tribes and the Huns, whose empire under Attila (433–453) embraced virtually all Germany. It was probably not least in order to escape this rule that the Saxons and kindred tribes from the seaboard in the next generation invaded Britain, which had been denuded of its Roman troops in 410. But Attila himself was defeated by Romans and Visigoths at Châlons (451), and the whole Hunnish empire broke up after the defeat of his successors by eastern German tribes in the battle of the Nedao river (454). During this period the situation of German tribes in the west begins to crystallize. Franks, Alamanni and Burgundians appear in Gaul, their areas of extensive settlement (as opposed to conquest) being still on the whole discernible from the linguistic frontier between German and French. In the eastern empire, Goths had overrun Asia (399) and attempted to act as emperor makers in Constantinople. But the eastern emperors succeeded in eliminating them; the most important incident was the emperor Zeno's transference from the Balkans to Italy of the Ostrogothic bands under Theodoric, who was to gain the mastery (489–493) over the mixed body of mercenary Germans that had already ejected the last western Roman emperor in 476. This process left a vacuum in the Danube basin, subsequently filled by Slavs and Ugrians, so that only enclaves—remnants for instance of the Gepidae—survived there of the eastern Germans.

The ancient period of German history may be said to close with the gradual extension of Frankish rule under Clovis (481–511) and his sons. Of the great confederacies only the Saxons and Alamanni remained in Germany, to be absorbed eventually in the new Germanic empire of Charlemagne. In Italy, Theodoric's successors failed to hold their ground against the generals of Justinian (518–565), under whom Africa too was regained for the eastern empire. A last chapter of the Volkerwanderung was the entry of the Langobardi (Lombards) into Italy in 568. The stage was then set for the Germany of the middle ages.

These tribal movements did not usually involve large numbers (the total of Vandals invading Africa is given as 80,000) and the Germans came more as conquerors than as settlers. They accepted the late Roman social structure of landlord and serf, the varying relationships being regulated by individual codes of law. For this reason there is virtually no archaeology of the migrations, the vestiges even of such settling migrants as the Rhineland Franks following late Roman typological developments. The long contacts with Rome had had their effects, not least in the conversion of the principal tribes to Christianity, which followed rapidly on the mission of Ulfilas to the Goths (c. 360). That Ulfilas happened to be an Arian caused the majority of German tribes (the Franks, led to conversion by Clovis, being the notable exception) to accept Arianism; and this created a religious cleavage between conquerors and conquered that had important political consequences as it worked against the social tendencies to fusion to which the archaeological evidence bears witness. Only the Anglo-Saxons in England, pagans and removed from contacts with the empire, preserved that model of a prehistoric German migration which had been familiar to Rome in the distant days of the Cimbri and Ariovistus. (C. E. S.)

MEROVINGIANS AND CAROLINGIANS

When the original western empire came to an end, the German tribal lands lying east of the Rhine had no unity, geographical or political. Divided from each other by forest or water, the German tribes were further subdivided by the varying degrees of romanization that they had experienced. Archaeology suggests that their social habits followed the same general pattern, and philology confirms that, despite dialectal differences, they spoke the same language. Nevertheless, "Germania" meant nothing to them, and their drawing together to form a mediaeval state was not an inevitable process but the outcome of a series of unpredictable accidents.

Merovingian Germany. — The Franks (*q.v.*), settled for the most part in, romanized Gaul, were nevertheless drawn toward the Rhineland and thus into the feuds and rapidly shifting alliances of the Germans on the eastern bank. Of these interventions we have intermittent literary evidence from the 6th century onward. They may be said to start with the wars of Clovis, during which the Merovingian dynasty of the Salian Franks established its authority over the Ripuarian or Rhineland Franks in part of what was later to be called Austrasia. With much less success, Clovis and his successors attempted to dominate the Thuringians of central Germany and the Alamanni and Bavarians of southern Germany. The latter in particular could often look for help from the masters of Italy; and thus the Catholic Franks found that their raiding and counterraiding across the Rhine helped to embroil them with the Arian Goths. However, it would be folly to elevate these clashes to the rank of wars of religion; no serious attempt seems to have been made to convert the Germans; rather, the intention was to exact tribute from them (in the case of the Saxons this usually took the form of cattle), to use them as mercenaries and to trade with them when possible. Certainly the spirit of tribal or national independence was unaffected, and the threat to the Rhineland remained. Meanwhile, the eastern borders of Germania became the prey of the land-seeking Slavonic peoples; and occasionally, as in the reign of Dagobert I, the Germans were glad enough of Merovingian help against their supplanters in the east. In the course of the 8th century, Frankish occasions of intervention tended to increase, and chieftains were deposed or, as occasion offered, imposed on recalcitrant tribes. But this relationship was too spasmodic to justify thinking that the Germans were subjected to any effective Frankish high kingship.

The Rise of the Carolingians and Boniface.—The Carolingian dynasty, which with papal backing supplanted the Merovingians in 751, was Austrasian and drew its strength from extensive estates in the lands between the Meuse and the Rhine. It had grown up in the atmosphere of Rhenish prosperity and likewise of Rhenish insecurity and was directly interested, in a way in which the Merovingians had never been, in the fate of the Rhineland and the behaviour of the German peoples beyond. It also saw clearly that effective control over them would necessitate their conversion to Christianity, and hence from the earliest days of their power the Carolingian mayors of the palace supported missionary work, both Irish and Roman. The pattern of Frankish penetration was always the same; small communities or churches were settled upon land newly won from forest or marsh, granted them by their Carolingian protectors. Thus, from Frisia in the north to Bavaria in the south, religious and economic penetration went hand in hand. A distinguished part was played by Anglo-Saxon missionaries, who linked the Frankish world not only with the high culture of the churches (notably York) from which they set out but also with Rome, the ultimate source of their inspiration. Chief among them were Willibrord (658–739), who worked among the Frisians and later the Thuringians, and St. Boniface (c. 673–754), the real founder of the German church. Supported by Charles Martel against the aristocratic Frankish clergy, who perhaps feared the growing influence of Rome, Boniface led missions into Franconia, Thuringia and Bavaria, where he founded or restored a primitive diocesan organization. In 742 he played a large part at the first council of the new German church. However, all this work was a mere beginning; the surface of paganism had scarcely been scratched, and the north, where the Saxon tribes lived. was untouched and hostile. But when Boniface finally left his beloved monastery of Fulda to seek martyrdom, with a few companions, among the northern Frisians, he had made a vital and doubtless unintentional contribution to the political unification of the German peoples. All except the Saxons had now begun to pass under the yoke of Rome.

Charlemagne.—What St. Boniface began, Charlemagne took one stage further. Contemporary writers were vastly impressed by the great warrior's almost ceaseless German campaigning. Both the East Frisians and the Saxons (whom archaeologists find difficulty in distinguishing) now came within the orbit of his missionary enterprise, and both resented it. In the wake of the missionaries, Frankish counts and other officials moved into northeastern Frisia. raising contingents for the royal host and doing the other business of secular government. One unforeseen effect of this subjugation of Frisia was the crippling of the only independent seapower that could protect the Frankish and English coasts from the marauding Norsemen. As for the Rhineland, the richer it grew the more necessary it became to protect its hinterland, Hesse (or Franconia) and Thuringia, from Saxon raids. But this was a hard task, since east of the Rhine there was no natural barrier to hold. Thus, each of Charlemagne's punitive expeditions hit deeper than its predecessor into the heart of Germany, leaving behind it bitter memories of forced conversion, deportations and massacre. It should not, however, be thought that Charlemagne's treatment of the Saxons sprang only from political considerations. He was as sincerely resolved to fulfil with fire and sword his missionary duty as a Christian ruler as were the Saxons to resist conversion and to uphold the bloodthirsty pagan rites of their antestors. Whenever Charlemagne's attention was distracted to some other part of his dominions, the Saxons could be counted on to revolt, to slaughter the Frankish officials and priests in their midst and to raid as far westward as they could manage. Charlemagne, in his turn, would punish the offending tribes and garrison the defense points abandoned by the Saxons. (These defense points, *werls*, or burgs, must have been centres for trade as well as defense, for coin hoards have often been found in their vicinity.) The most famous leader of Saxon resistance was a certain Widukind, who is to be distinguished from the Saxon historian of the same name. Widukind, for longer than any other Saxon, succeeded in keeping together a majority of the chieftains in armed resistance to the Franks. His difficulty was not that they tolerated the Franks but that their own feuds were too deep and complex to permit of serious political coherence. Resistance gave the Saxons a certain sense of racial unity that never deserted them; but they were not yet politically united among themselves, let alone with other Germans. They continued to live, much as in the days of Tacitus, upon their estates among the forest clearings—edhelingi (nobles), *frilingi* (freeman), *lazzi* (half-free) and unfree—a hierarchized society bound to the soil and little interested in common means of action. Widukind finally surrendered and was baptized; the Rhineland and the East Frankish church were saved, but at the cost of most savage repression in Saxony, which is reflected in the *Capitulatio* de *partibus Saxoniae*. The extreme north, looking to the Baltic and enjoying Danish support, was impossible to control; but finally, in 797, Charlemagne negotiated a form of peace with the remaining Saxons, the terms of which were embodied in the *Capitulare Saxonicum,* a statesmanlike measure. The battle for the north continued. but Saxony as a whole was slowly becoming integrated with the other national areas of Germany under Frankish control and had become part of the great march protecting the Frankish world from Danes, Slavs and Avars.

In the Bavarians Charlemagne found a people as independent as the Saxons but more civilized. They had commercial and dynastic contacts with Lombardy that made them (and to some extent the Alamanni of Swabia also) a southward-looking people. Italian preoccupations were, as much as anything, responsible for Charlemagne's decision to end the spasmodic control exercised by the Franks over the powerful Bavarian ducal dynasty of the Agilolfings and to establish a direct supervision. This was achieved. Bavaria was not francified, but Carolingian rule replaced Agilolfing, and Frankish churchmen and officials (such as the counts and *missi dominici*) moved as freely about Bavaria, seeing to the enforcement of the royal will, as they did in Saxony. But, as northern Frisia became the Frankish march against the Danes and Saxony that against the Slavs, so did Bavaria, together with Lombardy, become the march against the Avars. Only Christianity did as much to draw the regions of Germany together as did the powerful administrative'measures taken by the Franks to weld them into a protective march against the central European threat. But it was Francia, not Germany, that was protected.

The Kingdom of Louis the German.—Charlemagne's successor as emperor, Louis I the Pious, was not unpopular with his German subjects; on two occasions he owed his restoration to power largely to their support. In 825 his son, Louis the German, was entrusted with the government of Bavaria, whence he was gradually to extend his power over all Carolingian Germany. This was the first time that the German nations had had a ruler whose authority was confined to their own lands and whose time was largely taken up with defending them from Slavonic penetration;

but this was by no means the sum of ambition for Louis the German, who tended, like all his house, to regard the whole of Francia as a partible family inheritance of which each member, in each generation, should take for himself and his followers what he could get. Louis was thus satisfied neither with the partition treaty of Verdun (843), by which he obtained the bulk of the lands east of the Rhine together with the districts round Mainz, Worms and Speyer on the left bank, nor with that of Mersen (870), by which he settled a dispute with Charles the Bald of France over the middle kingdom of their nephew Lothair *(see* LORRAINE). Under the latter treaty Louis's dominions reached almost the proportions of mediaeval Germany. On the east they were bounded by the Elbe and the Bohemian mountains; on the west, beyond the Rhine, they included the districts afterward known as Alsace and Lorraine. Ecclesiastically they included the provinces of Mainz, Trier, Cologne, Salzburg and Bremen. But Charlemagne's capital at Aachen and the rich family estates in Lotharingia were never finally abandoned by either branch of the Carolingian dynasty, although the bulk of the lands that they controlled increasingly assumed the separate outlooks of France and of Germany. An example of this increasing separation is provided by the oaths sworn at Strasbourg in 842 by Louis and Charles, the former swearing in his brother's language, Romance, the latter, conversely, in German; but this drifting apart is in some ways less significant than the things that still held France and Germany together.

The ceaseless external blows from Danes, Saracens and Magyars that fell upon the Carolingian world in the 9th century did not have the effect of uniting it in resistance. Not only the Carolingians themselves but their followers also were prepared to take advantage of each other, to compromise with the enemy and to carve out ever more estates from each other's lands. They did not see great issues quite as clearly as historians now may. Nor are the motives that led them to behave thus quite as simple as at first they may look. So, in 887, Arnulf, an illegitimate son of Louis the German's son Carloman, led an army of Bavarians against Charles the Fat, in part because Charles was not defending the Rhineland from the ravages of the Danes, in part because his aim was the full Carolingian inheritance. But Arnulf was not equally successful in defending his eastern possessions. After his death in 899 the German kingdom came under the nominal rule of his young son, Louis the Child, and in the absence of strong military leadership became the prey of the Magyar horsemen and other invaders from the east.

Rise of the Duchies.—The rise of the German duchies was a direct outcome of the Carolingian decision, avoidable or not, to leave defense in the hands of those who were attacked; in other words, to decentralize military command and with it, inevitably, something else of the royal authority. The new *duces* were not, as was once thought, appointed by the peoples concerned, nor were they the descendants of the tribal chieftains of the post-migration period. It seems more likely that they were Carolingian counts who took the initiative in organizing defense on a local basis, without thereby seeking to shake men's loyalty to the house of Charlemagne, of which the German church was a natural champion. All the same, their initial success (the East Frankish kings eventually resumed leadership in the person of Henry the Fowler) established them in the hearts of those whom they protected. This was particularly the case with the Saxons, whose dukes, the Liudolfings, were descended from the military commanders first sent by Louis the German to defend east Saxony. Similarly, the Swabian dukes began with a military title *(duces Raetianorum)*; so did the Bavarian ducal family of Liutpold. The origins of the short-lived duchy of Thuringia are less easy to determine. Franconia naturally remained the German duchy most intimately associated with the East Frankish kingship. How, in practice, the lives of the German land-owning or land-renting freemen were affected by these changes is a matter largely of guesswork. Perhaps it is true that political insecurity and its economic consequences tightened the lord-man relationship, as in France and elsewhere. However, nothing is more striking than the variety, between region and region, of German social organization. Perhaps much more of tribal ways of local government survived the Carolingians and the Magyars than was once thought possible.

(J. M. W.–H.)

THE TENTH AND ELEVENTH CENTURIES, TO 1056

Conrad I (911–918).—When in 911 Louis the Child, last of the East Frankish Carolingians, died without leaving a male heir, it seemed quite possible that his kingdom would break into pieces. In at least three of the four stem lands, Bavaria, Saxony and Franconia, the ducal families were established in the leadership of their tribes. In Swabia (Alamannia) it is true, two houses were still fighting for hegemony; but only the church, fearing for its endowments, had an obvious interest in the future of the monarchy, its ancient protector. Against the growing authority of the dukes and the deep differences in dialect, in customs and in social structure between the tribes there stood only the Carolingian tradition of kingship; but, with Charles the Simple as holder of the West Frankish kingdom, its future was uncertain and not very hopeful. Only the Lotharingians put their faith in the ancient line and did homage to Charles, its sole reigning representative. The other component parts of the East Frankish kingdom did not follow suit.

We can only guess at the motives of the Saxon and Frankish tribal hosts who on Nov. 10, 911, elected Conrad, duke of the Franks, as their king at Forchheim in Franconia. At the opening of the 10th century the Germanic peoples settled in the lands east of the Rhine and west of the Elbe, the Saale and the Bohemian forest, rude and thinly spread though their settlements were, had to face even more savage and pagan races pressing in from further east, especially the Magyars. The Saxons, headed by their duke Otto, of the great race of the Liudolfings, were threatened by more enemies on their frontiers than any other tribe; Danes, Slavs and Magyars simultaneously harassed their homeland. A king who commanded resources further west in Franconia might therefore prove to be of help. The Rhenish Franks on the other hand, having hitherto given their royal house, the Carolingians, to the other tribes, did not wish to abdicate from their position as the leading and kingmaking people, which gave them many material advantages.

Conrad, elected by Franks and Saxons, was soon recognized also by Arnulf, duke of Bavaria, and by the Swabian clans. In descent, honours and wealth, however, he was no more than the equal of the dukes who had accepted him as king. To gain a lead over them, to found a new royal house and to acquire those wonder-working attributes which the Germans venerated in their rulers long after they had been converted to Christianity he had yet to prove himself able, lucky and successful. The reason why the relations between the German kings and a few score families of magnates seemed eventually to make up the sum of political events was that, at the very foundation of the German kingdom, circumstances had long favoured those men whom birth, wealth and military success raised well above the ranks of the ordinary free members of their tribe. Their estates were cultivated in the main by half-free peasants. slaves who had risen or freemen who had sunk. The holdings of these dependents fell under the power of the lord to whom they owed service and obedience. Already they were tied to the lands on which they laboured and already they received justice for many offenses at the hands of their protectors. For many reasons ordinary freemen tended generally to lose their independence and had to commend themselves to more fortunate and powerful neighbours and thus lost their standing in the assemblies of their tribe. Everywhere except in Friesland and parts of Saxony the nobles wedged themselves between king or duke and the rank and file. They alone could become prelates of the church, and they alone could compete for the possession and enjoyment of governmental rights. Besides the dukes of the stem lands who owed nothing in their position to the crown the bulk of administrative authority, jurisdiction and command in war lay with the margraves and counts whose hold on their charges hardened by and large into hereditary right. The commended men and the half-free disappeared from the important functions of public life. In the assemblies of the county they could no longer be dooms-men but came only to pay dues and to receive orders, justice and penalties. Their political role was passive. Those lords whose protection was most worth having also had the largest throng of dependents and thus became more formidable to their enemies and to the remaining freemen. Lordship and submission to it were hereditary, and thus the horizon of the dependent classes narrowed until eventually the lord and his officials filled the place of all secular authority and power in their lives. Military strength, the possession of arms and horses, and the habit of using them were decisive. Most dependent men were disarmed; that became part of their degradation.

Henry I (919–936).—Conrad I was quite unequal to the situation in Germany. According to the feeling of contemporaries his failure meant that his house was luckless and without the prosperity-bringing virtues which belonged to true kingship. On his deathbed in 918 he had therefore to propose that the crown, which in 911 had remained with the Franks, should now pass to the leading man in Saxony, the Liudolfing Henry (called the Fowler). Henry was elected by the Saxons and Franks at Fritzlar, their ancient meeting place, in 919. With a monarch of their own race the Saxons now took over the burden and the rewards of being the kingmaking people. The centre of gravity shifted to the east, where the Liudolfing lands and their power lay.

The transition of the crown from the Franks to the Saxons for a time enhanced the self-sufficiency of the south German tribes. The Swabians had kept away from the Fritzlar election. The Bavarians believed that they had a better right to the Carolingian inheritance than the Saxons (who had been remote outsiders in the 9th century) and in 919 elected their own duke Amulf king. They too wanted to be the royal and kingmaking people. Henry I's regime rested in the main on his own position and family demesne in Saxony and on certain ancient royal seats in Franconia. His kingship was purely military. He hoped to gather authority by waging successful frontier wars and to gain recognition in the first place by concessions rather than to insist on the sacred and priestlike status of the royal office which the church had built up in the 9th century. At his election he refused to be anointed and consecrated by the archbishop of Mainz. In settling with the Bavarians he abandoned the policy of supporting the internal opposition that the clergy offered to Duke Arnulf, a plank to which Conrad had clung. To end Arnulf's rival kingship he formally surrendered to him the most characteristic privilege and honour of the crown: the right to dispose of the region's bishoprics and abbeys. Arnulf's homage and friendship entailed no positive obligations toward Henry. and the Bavarian duke pursued his own tribal interests—peace with the Hungarians and expansion across the Alps—as long as he lived.

Policy of the Saxon Dynasty (919–1024).—From these unpromising beginnings the Saxon dynasty not only found its way back to Carolingian traditions of government but soon got far better terms in its relations with the autonomous powers of the duchies, which had gained such a start on it. However, the constitution that it bequeathed to its Salian successors was self-contradictory; while seeking to overcome the princely aristocracies of the stem lands by leaving them to themselves, the Saxon kings came to rely more and more both for the inspiration and for the practice of government, on the prelates of the church, who were themselves recruited from the ranks of the same great families. They loaded bishoprics and abbeys with endowments and privileges and thus gradualiy turned the bishops and abbots into princes with interests not unlike those of their lay kinsmen. These weaknesses, however, lay concealed behind the personal ascendancy of an exceptionally tough and commanding set of rulers up to the middle of the 11th century. Thereafter the ambiguous system could not take the strain of the changes fermenting within German society and even less the attack on its values that came from without: from the reformed papacy.

The Liudolfing kings won military success, and with it they gained that respect for their personal authority which counted for so much at a time when the great followed only those whose star they trusted and who could reward services with the spoils of victory. In 925 Henry I brought Lotharingia back to the East Frankish connection (see **LORRAINE**). Whoever had authority in this half French-speaking, half German-speaking region could treat the neighbouring kingdom of the West Franks as a dependent. The young Saxon dynasty thus won for itself and its successors a hegemony over the west and the southwest which lasted at least up to the middle of the 11th century. The Carolingian kings of France and the great feudatories who sought to dominate if not to ruin them became in turn petitioners and even vassals of the German court during the reign of the Ottos. The kings of Burgundy, whose suzerainty lay over the valleys of the Saône and the Rhône and over Provence, likewise fell under the tutelage of the masters of Lotharingia. Rich in ancient towns this region, once the homeland of the Carolingians, was more thickly populated and wealthier than the stem lands east of the Rhine. What little international trade came their way entered the Rhine valley through Lotharingia.

The Eastern Frontier.— Greater prestige still and a claim to imperial hegemony fell to the Saxon rulers when they broke the back of the Hungarian invasions against which the military resources and methods of western European society had almost wholly failed for several decades. In 933, after long preparations, Henry routed a Hungarian attack on Saxony and Thuringia. In 955 Otto I (936–973), at the head of a force to which all the tribes had sent mounted contingents, annihilated a great Hungarian army on the river Lech near Augsburg. The battle again vindicated the efficiency of the heavily armed man skilled in fighting on horseback.

With a Saxon dynasty on the throne, Saxon nobles gained office and power with opportunities for conquest along the eastern river frontiers and marches of their homeland. Otto I indeed had an eastern policy which aimed at getting more than slaves, loot and tribute. Between 955 and 972 he founded and richly endowed an archbishopric at Magdeburg which he intended to be the metropolis of a large missionary province beyond the Elbe, among the heathen Slavs. This would have brought their tribes under German control and exploitation in the long run; but the ruthless methods of the Saxon lay lords clashed with the church's efforts at peaceful penetration. In the 10th century there was little or no German agricultural settlement beyond the Elbe. Far too much forest clearing remained to be done in all the regions of western and southern Germany. The Saxon conquests up to the Oder were secured by military strongholds, called burgwards, and lasted only as long as their garrisons had the upper hand. Behind the Slav peoples of Brandenburg and Lusatia, moreover, new powers rose: the Poles under Mieszko and, to the south, the Czechs under the Premyslides received missionaries from Passau and Magdeburg without falling permanently under the political and ecclesiastical domination of Bavarians and Saxons. The heathen Elbe-Slavs, kept under by the Saxon margraves, rose in 983 when the military occupation collapsed and with it the missionary bishoprics which had been founded at Oldenburg, Brandenburg and Havelberg. Farther south the defenses of the Thuringian marches between the Saale and the middle Elbe remained in German hands, but only after a long and fierce struggle against Polish invaders early in the 11th century. The northern part of the frontier reverted to what it had been before Otto's trustees. Hermann Billung and Gero, opened their wars. Missionary enterprises directed from Bremen and Magdeburg achieved little before the 12th century. The Saxon ruling* class, bishops and margraves, must bear the responsibility for the fiasco of eastward expansion in the 10th century. The prelates too saw their missions as means to found ecclesiastical empires with subject dioceses and tithes on Slav soil. The tribes across the Elbe therefore remained unconverted and implacable foes, a standing menace to the nearby churches. The wars also left a legacy of savagery on both sides so that from *c.* 1140 onward the substitution of German settlers for the native Slavs became the common policy of both the church and the princes.

Government and the Nobility.—Conrad I's and Henry I's kingship rested on the will of the tribes or rather on that of their leaders and of the higher aristocracy. It was in the first place an arrangement between the Franks and the Saxons which the Bavarian and Swabian dukes recognized at a price by acts of personal homage. But the German kings, of whatever dynasty, had to live under Frankish law. After the death of Conrad I's brother Eberhard in 939 Otto I kept the Franconian dukedom vacant and the Franconian counts henceforth stood under the immediate authority of the crown. In Saxony too nobody succeeded to the dukedom of Otto's ancestors. The march-duchy of the Billungs, a bulwark raised against the Danes and the northern Slav tribes, did not give that family authority over all the other Saxon princes. In the south the Ottonians sought to turn the dukedoms of the stem lands into offices held of the crown as fiefs and to supplant native dynasties by aliens and members of their own clan. When even that did not stop rebellions under the banner of tribal self-interest, they began to break up the ancient Bavarian stem land by creating a duchy in Carinthia to cut off the spearhead of Bavarian expansion southward. The first two Salians, Conrad II (1024–39) and Henry III (1039–56) also bestowed vacant duchies quite freely on their own kin and on men from outside the stem boundaries. They competed against ducal power but could neither abolish nor replace it. In the 11th century as before, the dukes held assemblies of their folk, led the tribal host in war and enforced peace. The counts, who were the ordinary officers of justice in serious, criminal cases, obeyed the ducal summons, but for the most part they received their "ban," the power to do blood justice, from the king himself. The fiefs and the customary rights attached to their office, and indeed the office itself not only became hereditary but also came to be treated more and more as a patrimony to which they had an inherent right against all men, king and duke included. Even so, however, a good many comital families died out and their counties fell back into the king's hands. From Otto III's reign (983–1002) onward it became not at all unusual to bestow these on bishoprics and certain great abbeys rather than to grant them out again to other lay magnates. The bishops however could not perform all the functions of the counts; in particular their holy orders forbade them to pass judgments of blood. They needed officials called advocates to take charge of the higher jurisdiction in the counties and franchises that their churches possessed by royal grant. In the 10th and 11th centuries these advocates had to be recruited from the aristocracy, the very class whose greed for hereditary office was to be checked, because ordinary freemen could not enforce severe sentences or defend the privileges of the church against armed intrusion. Dangerous neighbours of bishoprics and abbeys in any case, the nobles as advocates and protectors of ecclesiastical possessions were anything but reliable servants of their ecclesiastical overlords. Thus there arose in nearly all German lands, whether the ducal office survived or not, powerful lines of margraves, counts and hereditary advocates who enriched themselves at the expense of the church (which meant also the crown) and in competition with one another. From the abler, more fortunate and longlived races among these dynasts sprang the territorial princes of the later 12th and 13th centuries, absorbing and finally inheriting most of the rights of government from the Reich itself.

The king was the personal overlord of all the great. His court was the seat of government and it went with him on his ceaseless journeys. The German kings, even more than other mediaeval rulers could only make their authority respected in the far-flung regions of their kingdom by travelling ceaselessly from duchy to duchy, from frontier to frontier. Wherever they stayed their jurisdiction superseded the standing powers of dukes, counts and advocates and for a brief while they could collect the profits of local justice and wield some control over it. As they came into each region they summoned its leaders to attend their solemn crown wearings, deliberated with them on the affairs of the Reich and the locality, presided over pleas, granted privileges and made war against peace breakers at home and on enemies abroad.

The royal revenues came from the king's demesne lands and from his share of the tributes that Poles, Czechs, heathen Slavs and Danes had to pay whenever he could enforce his claims of overlordship. The king's demesne was his working capital. He and his household lived on its produce during their wanderings through the Reich, and it also served to provide for his family, to found churches and to reward faithful services done to him, especially in war. To swell the hosts vassals had to be enfeoffed, and alienations were inevitable. The Salians, though they inherited the remains of Ottonian wealth as imperial demesne, brought little of their own to make up for its diminution. Already the last Saxon, Henry II (1002–24) and after him Conrad II therefore took to enfeoffing vassals with lands commandeered from the monasteries. But the beneficiaries often enough were already powerful and wealthy men in their own right, so that no class of freeborn mounted warriors, linked permanently with the crown, sprang from the loyalties and rewards of one or two reigns. In any case the lion's share of grants went to the German church.

The German Church.—From the Carolingians the German kings inherited their one and only institution of central government: the royal chapel, with the chancery that does not seem to have been distinct from it. Service there became a recognized avenue of promotion to the episcopate for high-born clerks. In the 11th century bishops and abbots conducted the affairs of the Reich much more than the lay lords, even in war. They were its habitual diplomats and ambassadors. Unlike Henry I, Otto I and his successors sought to free the prelates from all forms of subjection to the dukes. The king appointed them, and to him alone, as to one sent by God, they owed obedience. Thus there arose besides the loose association of stems in the German kingdom a more compact and uniform body with a far greater vested interest in the Reich: the German church. By ancient Germanic custom, moreover, the founder of a church did not lose his estate in the endowment that he had made; he remained its proprietor and protecting lord. The bishoprics, it is true, and certain ancient abbeys such as St. Gallen, Reichenau, Fulda and Hersfeld did not belong to the king; they were members of the kingdom but under his guardianship. The greater churches therefore had to serve the rulers with mounted men, money and free quarters. Gifts of royal demesne to found or to enrich bishoprics and convents were not really alienations but pious reinvestments, as long as the crown controlled the appointments of bishops and abbots. But the church did not merely receive grants of land, often waste, to settle, develop and make profitable. It was also given, as has been shown, powers of jurisdiction over its dependents. Nor did the kings stint the prelates in other regalian rights, such as mints, markets and tolls. These grants broke up counties and to some extent even duchies, and that was their purpose: to disrupt the secular lord's jurisdictions which escaped royal control.

This policy of fastening the church, a universal institution, into the Reich with its well-defined frontiers is usually associated with the name of Otto I. But it gathered momentum only in the reigns of his successors. It reached a climax under Henry II (1002–24), the founder of the see of Bamberg in the upper Main valley; but Conrad II (1024–39), though less generous with his grants, and his son Henry III continued it. Bishops and abbots became the competitors of lay princes in the formation of territories, a rivalry which more than any other was the fuel and substance of the ceaseless feuds, the smouldering internal wars in all the regions of Germany for centuries. The welter and the confused mosaic of the political map of Germany until 1803 is the not so remote outcome of these 10th- and 11th-century grants and of the incompatible ambitions that they aroused.

Conquest of Italy and the Imperial Crown.—Otto I's marriage with Adelaide (Adelheid), daughter of Rudolph II of Burgundy, and the Italian rivalries between his brother Henry, duke of Bavaria, and his (Otto's) son Liudolf, duke of Swabia, drew him southward. After 951, expeditions into Italy were a matter for the whole Reich under the leadership of its ruler and not just an outlet for the ambitions of the south German tribes. For the Saxon military class too the south was more tempting than the primaeval forests and swamps beyond the Elbe. With superior forces at their back the German kings gained possession of the Lombard kingdom in Italy. There too their overlordship in the 10th and the 11th centuries came to rest on the bishoprics and a handful of great abbeys.

After his victory over the Magyars in 955, Otto I's hegemony in the west was indisputable. By the standards of one chronicler, the Saxon Widukind, he had become emperor already because he had subjected other peoples and enjoyed authority in more than one kingdom. But the right to confer the imperial crown, to raise a king to the higher rank of emperor, had fallen to the papacy, which had crowned Charlemagne and most of his successors. The Carolingian order in the west was still the model and something like a political ideal for all its ruling families in the 10th century. Otto had measured himself against the political tasks which had faced his East Frankish predecessors and more or less mastered them. To be like Charlemagne, therefore, and to clothe his newly won position in a traditional and time-honoured dignity he accepted the imperial crown and anointment from Pope John XII in Rome in 962. The substance of his empire was military power and success in war; but Christian and Roman ideas were woven round the Saxon's throne by the writers of his own and the next generation. Although the German kings as emperors did not give the law to the Roman church in matters of doctrine and ritual, they became its political masters for nearly a century. The imperial crown enhanced their standing even among the nobles and knights who followed them to Italy and can hardly have understood or wanted all its outlandish associations. Not only the king but also the German bishops and lay lords thus entered into a permanent connection with an empire won on the way to Rome and bestowed by the papacy.

Otto II (973–983) and above all Otto III (983–1002) were strongly drawn toward their new Mediterranean sphere of action but Henry II returned to a sober regime centred on Germany and contented himself with two brief Italian expeditions. Under Conrad II (1024–39), the first member of the Rhine Frankish house known as the Salians, the kingdom of Burgundy fell finally under the overlordship of the German crown and this tough and formidable emperor also renewed German authority in Italy. His son and successor Henry III (1039–56) treated the empire as a mission which imposed on him the tasks of reforming the papacy and of preaching peace to his lay vassals. Without possessing any very significant new resources of power he gave to his authority an exalted and strained theocratic complexion. Yet under him, the last German ruler to maintain his hegemony in western Europe, the popes themselves seemed to become mere imperial bishops. He deposed three of them, and four Germans held the Holy See at his command; but lay opposition to the emperor in Germany and criticism of his regime over the church were on the increase during the last years of his reign.

THE CONFLICT BETWEEN EMPIRE AND PAPACY, 1056–1125

More than any other feudal society in early mediaeval Europe, Germany was divided and torn by the revolutionary ideas and measures of the reformed papacy. From the pontificate of Leo IX onward—he was one of Henry III's nominees—the most determined and inspired spokesmen of ecclesiastical reform placed themselves at the service of the Holy See. Only a few years after Henry III's death (1056) they agitated against lay authority in the church, founded on proprietary rights. They regarded the laity as passive partakers of the sacraments and denied the supernatural status of kingship. Priests, including bishops and abbots, who accepted their dignities from lay lords and emperors at a price committed a sin, for these earthly powers could not rightly confer churches at all, nor could they own them. They believed moreover that thorough reforms could only be brought about by the exaltation of the papacy so that it commanded the obedience of all provincial metropolitans and was out of the emperor's and the local aristocracy's reach. The endless repetition of these teachings in brilliant pamphlets and at clerical synods spread agitation in Italy, Burgundy and Lotharingia, all parts of the empire. Their new program committed the leaders of the movement to a struggle for power, because it struck at the very roots of the regime to which the German church had grown accustomed and on which the German kings relied. The vast wealth that Henry IV's predecessors had showered on the bishoprics and abbeys would, if the new teaching prevailed, escape his control and remain at the free disposal of prelates whom he no longer appointed. Under Roman authority the churches were to be freed from most of the burdens of royal protection without losing any of its benefits. The most fiery spirits in Rome did not flinch from the consequences of their convictions. Their leader Hildebrand, later Pope Gregory VII (1073–85) was ready to risk a collision with the empire.

The Minority of Henry IV.—Henry IV (1056–1106) was six years old when his father died. The full impact of the Gregorian demands, coming shortly after a royal minority, a Saxon rising and a conspiracy of the south German princes has often been regarded as the most disastrous moment in Germany's history during the middle ages. In fact the German church proved thoroughly unreliable as an inner bastion of the empire even before Rome struck. Its leaders, Anno and Adalbert (*qq.v.*), archbishops of Cologne and of Hamburg-Bremen respectively, shamelessly exploited their hold over the young king by hunting for spoils out of the imperial demesne. When Gregory VII launched his decrees against simony and clerical marriage, humiliated the aristocratic episcopate by summonses to Rome and sentences of suspension and, in 1075, forbade rulers to invest bishops and abbots with their churches, the German hierarchy was demoralized and shaken. The prelates' return to their customary support of the crown was neither disinterested, nor wholehearted, nor unanimous.

Henry IV's minority also gave elbow room to the ambitions and hatreds of the lay magnates. His mother Agnes of Poitou's feeble regency faltered before the throng of princes who respected only authority and forces greater than their own. The ruling influence of the higher clergy at the court of Henry III and the renewed flow of grants to the church had estranged them from the empire. It is likely also that these eternally belligerent men were lagging behind the prelates in the development of their agrarian resources. The latter had a vested interest in peace and under royal protection improved and enlarged their estates by asserting enterprise and also by offering better terms to freemen in search of a lord. The bishops' market and toll privileges brought them revenues in money, which many of the lay princes lacked. So far, however, the princes' military power, their chief asset, had remained unchallenged. Now for the first time they had also to face rivals within their own sphere of action. Henry III and the young Henry IV began to rely on advisers and fighting men drawn from a lower tier of the social order, the poorer freeborn nobility of Swabia and above all the class of unfree knights, known as *ministeriales*. The latter had first become important as administrators and soldiers on the estates of the church early in the 11th century. Their status and that of their fiefs was fixed by seignorial ordinances, and they could be relied on and ordered about, unlike the free vassals of bishops and abbots. The Salian kings, beginning with Conrad II used ministeriales to administer their demesne, as household officers at court and as garrisons for their castles. They formed a small army which the crown could mobilize without having to appeal to the lay princes whose ill will and antipathy toward the government of the Reich grew apace with their exclusion from it.

The Saxon Rising.—Having come of age, the king used petty south German nobles and his ministeriales to recover some of the crownlands and rights which the lay princes and certain prelates had acquired during his minority, particularly in Saxony. Here, however, his recuperations went further and a great belt of lands from the northern slopes of the Harz mountains to the Thuringian forest was secured and fortified under the supervision of his knights to form a compact royal territory, where the king and his court could reside almost continuously. The south German magnates were thus kept at a distance when Henry and his advisers struck at the neighbouring Saxon princes, especially Otto of Nordheim and the Billung family.

The storm broke in 1073. A group of Saxon nobles and prelates and the free peasantry of Eastphalia who had to bear the brunt of labour and carrying services in the building of the royal strongholds revolted against the regime of Henry's Frankish and Swabian servants. To overcome this startling combination and to save his fortresses, the king needed the military strength of the south German princes Rudolph of Rheinfelden, duke of Swabia, Welf IV, duke (as Welf I) of Bavaria, and Berchtold of Zähringen, duke of Carinthia. Suspicious and hostile at heart, they took the field for him only when the Eastphalian peasantry committed outrages which shocked even their leaders. Their forces enabled Henry to defeat the Saxon tribal rebellion near Langensalza in June 1075. But when the life and death struggle with Rome opened only half a year later, the south German malcontents deserted Henry and, together with the Saxons and a handful of bishops, entered into an alliance with Gregory VII. Few of them at this time were converted to papal reform doctrines, but Gregory's daring measures against the king gave them a chance to come to terms with one another and to justify a general revolt. For on Feb. 22, 1076, the pope had absolved all men from their oaths to Henry and solemnly excommunicated him. In October his legates met the German lords at Tribur to decide on the future of the king, whom his last adherents now abandoned. Although Henry had to be absolved by Gregory at Canossa in Jan. 1077, the princes two months later nonetheless elected Rudolph of Rheinfelden to rule in his place.

The Civil War.—The war which now broke out lasted for almost 20 years. A majority of the bishops, most of Rhenish Franconia (the Salian homeland) and some important Bavarian and Swabian vassals sided with Henry. He thus held a central position dividing his south German from his Saxon enemies, who could not unite long enough to destroy him. With the death of Rudolph of Rheinfelden (1080) and the retreat in 1089 of another antiking, Hermann of Salm, the war in Germany degenerated into a number of local conflicts for the possession of bishoprics and abbeys. It almost died down in 1098, when the south German adherents of the papacy came to terms with Henry for the time being, but without recognizing his antipope Clement III. Throughout these years the crown, the churches and the lay lords had to enfeoff more and more *ministeriales* in order to raise mounted warriors for their forces. Though this and frequent devastations strained the fortunes of many nobles, they knew how to recoup themselves by extorting more fiefs out of neighbouring bishoprics and abbeys. The divided German church thus bore the brunt of the costs of civil war and needed peace almost at any price. Henry, since 1080 once again a vulnerable excommunicate, could not protect it.

Henry V and the Concordat.—The Salian dynasty and the rights it fought for were saved because Henry IV's son and heir himself seized the leadership of a last and pitiless rising against his father (1105). This cold-blooded manoeuvre enabled Henry V (1106–25) to continue the struggle for the crown's prerogative over the empire's churches against the inexorable demands of the papacy. The conflict now shrank into a legalistic dispute over the right to invest bishops and abbots with their dignities and the secular possessions attached to them (see INVESTITURE). In the course of it the princes became the arbiters and held the balance between their overlord and the pope. In 1122, acting as intermediaries and on behalf of the Reich, they forced the temporary concessions known as the Concordat of Worms out of the Holy See and its German spokesman, Archbishop Adalbert of Mainz (1109–37), the bitter personal enemy of Henry V and the territorial rival of the Hohenstaufen sons of Henry's sister Agnes. But by then they had for the most part defeated efforts to restore royal rights in Saxony and to stem the swollen jurisdictions and territorial powers of the aristocracy elsewhere.

Germany after the Conflict.—When Henry V, the last Salian, died childless in 1125, Germany was no longer and had for some time ceased to be the most effective political force in Europe. The brilliant conquest states of the Normans in England and in Sicily and the patient, step-by-step labours of the French monarchy were achieving forms of government and concentrations of military and economic strength which the older and larger empire lacked. The papacy had dimmed its prestige, and Rome now became the true home of universalistic interests. When Pope Urban II preached the first crusade in 1095, Henry IV, cut off and surrounded by enemies, lived obscurely in a comer of northern Italy. The Holy See by its great appeal to the militant lay nobility of western Europe thus won the initiative over the empire. At this critical moment the Reich also lost control in the Italian bishoprics and towns just when their trade was finding dazzling new openings through the Latin conquests on the Levantine seaboard. Germany thus did not even benefit indirectly from the crusaders' triumphs although some of their leaders, *e.g.*, Godfrey of Bouillon and Robert II of Flanders, were vassals of the emperor. The civil wars renewed for a time the relative isolation of the southern and central German regions.

Internally the crown had saved something of the indispensable means of government in the control over the church, but it was a bare minimum and its future was problematic. The ecclesiastical princes henceforth held only their temporalities as imperial fiefs, for which they owed personal and material services. As feudatories of the empire they came to represent the same interests toward it as did the lay princes; at least their sense of a special obligation tended to weaken. The king's jurisdiction continued to exist side by side and in competition with that of the local powers. The great tribal duchies survived as areas of separate customary law. Each developed differently, and the crown could not impose its rights on all alike or change the existing social order. The most tenacious defenders of this legal autonomy had been the Saxons; but in Swabia, where distinct territorial lordships grew fast, it prevailed also. The Gregorian reform movement therefore aggravated the age-old contradictions in Germany's early mediaeval constitution. But its monastic culture and its intellectual interests were anything but barren. Both sides fought with new literary weapons to work on public opinion in cathedrals and cloisters and —who knows?—perhaps also in the castles of the lay aristocracy. In their hard-hitting polemical writings they attempted to expound the fundamental theological, historical and canonistic truths of their cause. The agitation did something to disturb the cultural self-sufficiency of the German laity. It drove many of the south German nobles to maintain direct connections with the Holy See and, whether they wanted it or not, they had to fall in with the aspirations of the religious leaders. The reform movement of the 11th and 12th centuries, one might almost say, very nearly completed the conversion of Germany which had begun five centuries before.

GERMANY AND THE HOHENSTAUFEN, 1125–1250

Dynastic Competition, 1125–52.—The nearest kinsmen of Henry V were his Hohenstaufen nephews, Frederick, duke of Swabia (1105–47), and his younger brother Conrad, the sons of Henry V's sister Agnes and Frederick, the first Hohenstaufen duke of Swabia. Some form of election had always been necessary to succeed to the crown but before the great civil war nearness to the royal blood had been honoured whenever a dynasty failed in the direct line. By 1125, however, the princes, guided by Archbishop Adalbert of Mainz, no longer respected blood right. Affinity with Henry V was no recommendation to them, and hereditary succession seemed to lower their authority in the government of the Reich. Instead of Frederick they chose Lothair of Supplinburg (1125–37), duke of Saxony, who, like the Hohenstaufen, had risen by a lucky marriage and a successful career of continuous fighting into the first rank of dynasts but, unlike them, had served the cause of the Saxon opposition to the Salians. With the enormous Nordheim and Brunonian inheritance and half that of the Billungs behind him, he could humble the Hohenstaufen brothers (1134) after marrying his only daughter and heiress to a Welf, Henry the Proud (*q.v.*). The Welfs, already dukes of Bavaria and possessors of vast demesnes, countships and ecclesiastical advocacies were even without this dazzling alliance somewhat better off than their Hohenstaufen rivals. In 1137, however, the fears of the church and a few princes turned against them. Instead of Henry the Proud, who now held the duchies of Saxony and Bavaria and the Mathildine lands in Italy, they chose Conrad (1138–52), Lothair's unsuccessful Hohenstaufen opponent.

The battle against the Welfs, which Conrad III put foremost on his political program, was abandoned with his death in 1152 when an election once again decided the succession and the political situation in Germany for the next 30 years. The princes then chose Frederick I Barbarossa (1152–90), the son of Conrad's elder brother Frederick and the Welf princess Judith, who agreed to share power in Germany with his Welf cousin, Henry the Lion. The price of his election was dualism. In 1156 the duchy of Bavaria, which Conrad had tried to wrest from the Welfs, was restored to Henry, already undisputed duke of Saxony. The Babenberg margrave of Austria, his rival, had to be compensated with a charter which raised his margraviate into a duchy and gave him judicial suzerainty over an even wider area. Taken out of the Lion's duchy, it was to be held as an imperial fief which might descend both to sons and daughters. A perpetual principality, it served as a model for the aspirations of many other lay princes.

Colonization of the East.—The history of Germany in the 12th and 13th centuries is one of ceaseless expansion. A conquering and colonizing movement burst across the river frontiers into the swamps and forests from Holsatia to Silesia and suffocated the Slav tribes between the Elbe and the Oder. Every force in German society took part: the princes, the prelates, new religious orders, knights, townsmen and peasant settlers. Agrarian conditions in the older lands of Germanic occupation seem to have favoured large-scale emigration. With a rising population, there was much experience in drainage and wood-clearing but a diminishing fund of spare land to be attacked in the west. Excessive subdivision of holdings impoverished tenants and did not suit the interests of their lords. Sometimes also seignorial oppression is said to have driven peasants to desert their masters' estates. They certainly found a better return for their labour in the colonial area: personal freedom, secure and hereditary leasehold tenures at moderate rents and in many places quittance from services and the jurisdiction of the seignorial advocate. The colonists brought with them a disciplined routine of husbandry, an efficient plow and orderly methods in siting and laying out their villages. Very soon even the Slav rulers of Bohemia and Silesia competed for immigrants. First and foremost, however, the Saxon and Thuringian marcher princes sought to attract settlers for the lands that they had conquered and the towns that they founded to open up communications and trade routes. The older regions of the Reich moreover had not only peasants but also men of the knightly class to spare—soldiers who needed fiefs and lordships to uphold their rank. Both could be gained beyond the Elbe under the leadership of successful princes. The Germanized east thus became the home of fair-sized principalities in the 13th century, while all along the Rhine valley the rights of government were scattered over smaller and less compact territories. The Ascanian dynasty for instance, which under Albert the Bear (*q.v.;* 1134–70) began to advance into Brandenburg, by 1250 not only ruled over a broad belt of land up to the Oder river but had already established itself on the eastern banks ready for further advances. Further south the Wettin (*q.v.*) margraves of Meissen busied themselves with settlements and town foundations in Lusatia.

For a time Henry the Lion, as duke of Saxony (1142–80), overshadowed all these rising powers, and the Welf profited as much by the ruthless use of his resources against weaker competitors as by his own efforts in Mecklenburg. As his protection was alone worth having in northeastern Germany, the newly established Baltic bishoprics were at his mercy and he alone could attract the traders of Gotland to frequent the young port town of Lübeck, which he extorted from one of his vassals in 1158.

The Reich too possessed demesnes in the east, notably the Egerland, Vogtland and the land of Pleissen in the Thuringian march. The Hohenstaufen kings therefore took some part in opening up these regions. They too founded towns and monasteries on their thickly wooded lands and established their *ministeriales* as burgraves and advocates over them. But in this as in many other things they only competed with the princes. They did not and could not control the eastward movement as a whole.

Hohenstaufen Policy in Italy.—It was different with the other great field of German expansion in the 12th century, Lombardy and central Italy. Here the emperors and their military following alone counted, and the rural population of Germany had no direct interest in the wars waged to recover and exploit ancient regalian rights over the growing Lombard city communes. The connection between the German crown, the empire and dominion over Italy has indeed been regarded as a disaster for Germany and the ever increasing concern of the Hohenstaufen dynasty with the south as its most tragic phase. But although Frederick Barbarossa's policy was opportunistic he had really very little choice. Having bought off the Welfs and reconciled other great families with yet more concessions and lastly endowed his own nephew, Conrad III's son Frederick, with Hohenstaufen demesnes in Swabia, he had to try to mobilize their good will for the empire while it lasted. He now aimed at setting up a regime of imperial officials and captains who were to exact dues and to control jurisdiction which the communes had usurped from the failing grasp of their bishops. The Germans in Italy did not bring valuable accomplishments to poor and savage tribesmen, but they attacked economically advanced and better developed communities to which they had nothing to offer in return for the rights and taxes they demanded. Military power was their chief asset in Lombardy and they used it ruthlessly.

For the Hohenstaufen *ministeriales* the rule of their masters in northern and central Italy was a career. They could be deployed continuously and became therefore the backbone of the imperial occupation. A handful of minor dynasts also served Barbarossa for many years in the powerful and profitable commands that he established. The German bishops and certain abbots still had to supply men and money and some of them, for instance Rainald of Dassel (1159–67) and Philip of Heinsberg (1167–91), archbishops of Cologne who as arch-chancellors for Italy had a vested interest, threw themselves wholeheartedly into the war. But the support of the lay princes was fitful and sporadic. Even at critical moments they could not be counted on unless they individually agreed to serve or to send their much-needed contingents for a season. The refusal of the greatest of them, Henry the Lion, in 1176 brought defeat at the battle of Legnano and in the long run spoiled many years' efforts in Lombardy.

Fall of Henry the Lion and the Estate of Princes.—Forced to retreat before the Lombard league in 1177 Barbarossa cooled toward his Welf cousin, whom he could justly blame for some of his setbacks. Dualism in Germany had outlived its purpose. Hitherto the enemies of Henry, the princes, bishops and magnates of Saxony, had been unable to gain a hearing against him at the emperor's court days. By 1178, however, the emperor was ready to help them. Outlawed (1180), beaten in the field and deserted by his vassals, the Welf had to surrender and go into exile in 1182. His duchies and fiefs, all but his houselands, were forfeited to the Reich.

His fall left a throng of middling princes face to face with an emperor whose prestige, despite reverses, stood high and whose resources had greatly increased since he began to reign. They were nonetheless the chief and ultimate gainers by the events of 1180. The final judgment by which Henry the Lion then lost his honours was not founded on folklaw but on feudal custom. The princes who condemned him regarded themselves as the first feudatories of the empire, and they also decided on the redistribution of his possessions among themselves. During the 12th century the stem duchies of the Ottonian period finally disintegrated. Within their ancient boundaries not only bishops but also lay lords succeeded in eluding the authority of the dukes. In their large immunities they themselves wielded stem-ducal powers. To enforce the imperial peace laws became both their ambition and their justification. Everywhere the greater lay dynasties and even some bishops tried to acquire a ducal or an equivalent title which would enable them to consolidate their scattered jurisdictions and if possible force lesser free lords to attend their pleas. These highest dynasts had interests in common, and they closed their ranks not only against threats from above but also against fellow nobles who had been less successful in amassing wealth, counties and advocacies and who did not possess the superior jurisdiction of a duke, a margrave, a count palatine or a landgrave. They and they alone were now called princes of the empire. To lend a certain cohesion to their varied rights they were willing to surrender their houselands to the Reich and receive them back again as a princely fief. For the emperor it was theoretically an advantage that men so powerful in their own right should owe their chief dignity and most valued privileges to his grant. It opened the possibility of escheats, for in feudal custom the rules of inheritance were stricter than in stem law. But in Germany the political misfortunes of rulers brought it about that by and large ancient caste feeling and notions of inalienable right conquered the principles of feudal law. By 1216 it was established that the emperor could not abolish principalities, nor could he create princes at random.

The "heirs" of Henry the Lion had to fight a ceaseless battle to establish and maintain themselves. In Bavaria the Wittelsbachs (*q.v.*) had received the vacant duchy but they were not recognized as superiors by the dukes of Styria or by the dukes of Andechs-Meran. In Saxony the archbishop of Cologne was enfeoffed with Henry the Lion's ducal office and all his rights in Westphalia, while an Ascanian prince, Bernard of Weimar, received the eastern half of his duchy. Neither he nor the archbishop, however, could make much out of their dukedoms, except in those regions where they already had lands and local jurisdictions. All over the Reich these and regalian rights, such as mints, fairs, tolls and the right of granting safe-conducts, were the substance of princely power, and to possess them as widely as possible became the first goal of the abler bishops and lay lords.

New Conflict with the Papacy, **1159–1215.**—The attempt to establish a direct imperial regime in Italy antagonized the papacy once again and led to a new struggle with Rome, the ally of the Lombard Communes. Political and territorial rather than ecclesiastical interests were at stake in this quarrel; but the popes could only fight it as heads of the universal church defending its liberty against a race of persecutors and had to employ their characteristic weapons, excommunication, propaganda and intrigue. Nonetheless the German bishops stood by Barbarossa and for the most part followed him in maintaining a prolonged schism against Pope Alexander III (1159–81). Unsuccessful in Lombardy, the centre of Hohenstaufen ambitions after 1177 shifted to Tuscany, Spoleto and the Romagna. This redoubled the fears and the resentment of the popes. particularly when Frederick's son and chosen successor, Henry VI (1190–97), became after 1189 the legitimate claimant to the Sicilian kingdom through his wife Constance, the sole surviving heiress. With their backs to the wall the popes had to make what use they could out of any opposition to the Hohenstaufen. Their chance came in 1197 when Henry VI died prematurely, leaving a three-year-old son, Frederick, to succeed him. To escape the chaos of a minority regime, the bulk of the German princes and bishops elected the boy's uncle, Philip of Swabia (1198–1208); but an opposition faction in the lower Rhenish region, led by the archbishop of Cologne and financed by Richard I of England. raised an antiking in Otto IV (1198–1215), a son of Henry the Lion. Pope Innocent III (1198–1216) had to enlarge on his rights over imperial coronations and become a partisan in the German electoral feud if he wished to defend his recuperations in Italy against Hohenstaufen claims. Territorial interests in the Romagna tempted the papacy to exploit the weaknesses of the empire's constitution, the uncertainties of electoral custom and the lack of strict legal norms in Germany. In the course of the war for the crown much hard-won demesne and many useful rights over the church had to be sacrificed by the rivals to bribe their supporters.

Territorial Rivalries and the Empire, **1215–50.**—Frederick II (1215–50) entered Germany to regain his own against Otto IV in 1211. Despite promises to divide his inheritance, he kept the kingdom of Sicily and the empire together and thus he also shouldered the inevitable life and death struggle with the papacy. The Hohenstaufen demesne in Swabia, Franconia and Alsace and on the middle Rhine was still very considerable, and Frederick even recovered certain fiefs and advocacies which had been lost during the recent civil wars. Their administration was improved, and they provided valuable forces for his Italian wars. The great peace legislation of 1235 moreover showed that the emperor had not become a mere competitor in the race for territorial gain. But, except for brief intervals the princes and bishops were left free to fight for the future of their lands against one another and against the intractable lesser dynasts who refused to accept their domination. The great charters which Frederick II had to grant, first to the ecclesiastical princes (1220) and later to all territorial lords (1232) gave them written guarantees against the activities of royal demesne officials and limited the development of imperial towns at the expense of episcopal territories. But they were not always observed, and until 1250 the crown remained formidable in southern Germany, despite the antikings Henry Raspe (1246–47), landgrave of Thuringia, and William, count of Holland (1247), whom the papacy caused to be elected by the Rhenish archbishops in Germany.

The Reich after the Hohenstaufen Catastrophe.—Frederick II died in 1250 in the midst of his struggle against Pope Innocent IV (1243–54). His son Conrad IV (1250–54) left the north in 1251 to fight for his father's Italian possessions. The antiking William of Holland (1247–1256) was thus without a rival in an indifferent Germany which had lost interest in its rulers. But the princes were not ready to become the sole residuary legatees of imperial authority. The bishops' cities and the towns, many of them founded on royal demesne could not be absorbed. Their economic power challenged the age-old aristocratic order in German society. Deprived of royal protection they banded together to defend their autonomy. Within the nobility moreover each rank tended to acquire some of the personal rights of its betters. The princes could not mediatize the free lords and counts or turn their vassalage into effective subordination. The Hohenstaufen breakdown after 1250 left a gap in Swabia which no rising territorial power was able to fill. Countless petty lords and imperial *ministeriales* of the southwest succeeded in holding their seignories as immediate vassals of the Reich. Their independent territories often survived for centuries. The *ministeriales* elsewhere too ceased to be the dependable servants they once had been. Many free nobles voluntarily joined their ranks, and the knights thus assimilated the rights of the free aristocracy. They became the governing class of the territorial principalities, the standing councillors of their masters whose household offices and local justice they monopolized and held in fee for many generations. Without the consent of this territorial nobility the princes could neither tax nor legislate. Even the less important *ministeriales,* who only administered manors for their lords, entrenched themselves as hereditary bailiffs who kept surplus produce for themselves and usurped seignorial dues, so that it paid the owners to commute the labour services of their villeins into money rents and to lease out those portions of the demesne which the unfree peasants had cultivated ior them. Even then, however, the hereditary officials could not be easily dislodged. Lastly the ambitions of the princes themselves did not aim above the patrimonial policies of the past. They were acquisitive, it is true, and attempted to build up their territories as best they could by usurpation, inheritance, marriage treaties and escheats. They also tried where possible to administer their lands with officials whom they could depose at will. Yet they did this not to found sovereign states, but chiefly to provide for their families. Again and again they divided their dominions among sons who in turn founded cadet lines and set them up on a fraction of the principality.

By 1250 there was thus no really effective political authority left in Germany. The prince-bishoprics had become fiercely contested prizes between neighbouring dynasties, often enough vassals of the see. But constant feuds, disorder and insecurity did not by any means frustrate the immense energies of the Germans in the 13th century. Eastward expansion continued under the leadership of the princes and, above all, of the knights of the Teutonic order. Their advance into Prussia went hand in hand with the opening up of the Baltic by the merchants of Liibeck. It is possible that three centuries of complete security from foreign invasion made it unnecessary for the German aristocracy to learn the virtues of political self-discipline and subordination; but it would be a great mistake if Hohenstaufen Germany were to be judged solely by its failure to achieve political and administrative unity.

(K. J. L.)

RISE OF THE HABSBURGS

The period from the death of Conrad IV to the election of Rudolph of Habsburg in 1273 is generally called the Great Interregnum. It was used by the princes to increase their authority, although Richard, earl of Cornwall, who was crowned in 1257, enjoyed some authority in the Rhineland, thanks to his wealth, until his death in 1272. The interregnum established the electors, who from now on possessed vested interest in the maintenance of the imperial title.

Until this time the territories of a prince were rarely divided among his descendants, the reason being that, although the private fiefs of the nobles were hereditary, their offices—margraviate, countship and the like—were in theory at the disposal of the king. There was now a tendency to set this principle aside. Otto II, duke of Bavaria, a member of the Wittelsbach family, had in 1214 become by marriage ruler of the Rhenish Palatinate. For two years after his death these extensive lands were ruled in common by his two sons; but in 12jj a formal division took place and the territory of the Wittelsbachs was divided into the duchies of Upper Bavaria and Lower Bavaria (in the next generation the Palatinate was in turn detached from the Upper Bavarian branch of the family). About the same time the small duchy of Saxony was divided into two duchies, those of Wittenberg and Lauenburg.

The end of the interregnum was brought about by the pope, who realized the necessity for some power which could protect the church in Germany. In Sept. 1273, at the instigation of Pope Gregory X, the electors raised to the throne a Swabian noble, Rudolph, count of Habsburg. The situation on the eastern border was critical, because of the aggressive policy of Ottakar II, king of Bohemia (*q.v.*). The victory won by Rudolph I over Ottakar at Durnkrut (Aug. 1278) saved eastern Germany from disintegration. By the annexation of all Ottakar's possessions except Bohemia. Rudolph became one of the chief territorial princes in the empire. His policy of territorial aggrandizement was justified by the condition of the German kingdom, the ruler of which had little strength save that which he derived from his hereditary lands. Four years after the fall of Ottakar. Rudolph obtained from the princes a reluctant assent to the granting of Austria, Styria and Carniola to his own sons, Rudolph and Albert. In 1286 Carinthia was given to Meinhard, count of Tirol, on condition that when his male line became extinct it should pass to the Habsburgs. *(See* AUSTRIA, EMPIRE OF.)

On Rudolph's death the electors, fearing the new power which he had founded, passed over his son Albert and elected Adolph, count of Nassau (July 1291). Like his predecessor, Adolph wished to secure an extensive territory for his family. Meissen, which he claimed as a vacant fief of the empire, and Thuringia, which he bought from the landgrave Albert II, seemed to offer a favourable field for this undertaking, and he spent a large part of his short reign in a futile attempt to carry out his plan. Naturally he sought to isolate Albert of Habsburg, who was treating with Philip IV of France, and this led to an alliance with Edward I of England. But many of the princes were disgusted with him, and at Frankfurt in June 1298 he was declared deposed. He resisted the sentence, but Albert of Habsburg, who had been chosen his successor, marched against him, and in July 1298, at Gollheim near Worms, Adolph was defeated and killed.

After Adolph's death Albert was crowned at Aachen in Aug. 1298. As his father had done, the new king Albert I made it the principal object of his reign to increase the power of his house, but he failed in his attempt to add Bohemia and Thuringia to the hereditary lands of the Habsburgs, and he was equally unsuccessful in his endeavour to seize the countries of Holland and Zealand as vacant fiefs of the empire. He recovered some of the lost crown-lands, however, and sought to abolish unauthorized tolls on the Rhine; he encouraged the towns and took measures to repress private war; he befriended the serfs and protected the persecuted Jews. His greatest danger came from a league which was formed against him in 1300 by the four Rhenish electors, who disliked his pro-French policy and resented his action with regard to the tolls. Albert, however, supported by the towns, was victorious; and the electors soon made their peace.

The Luxembourg Dynasty and the **Wittelsbachs.**—After Albert's murder in May 1308, Henry, count of Luxembourg, a brother of Baldwin, archbishop of Trier (1307–54), became king as Henry VII. Since 1273 the material conditions of Germany had improved because the Habsburg kings had confined their activities to north of the Alps; but in 1308 as in 1291 the electors preferred a weak ruler. Henry was an ideologue, who felt himself obliged to restore imperial rule in Italy; but he did not lack shrewdness. as witness his seizure of Bohemia for his son John in 1310. At the end of 1310 he crossed the Mont Cenis into Italy, but died there (Aug. 1313) when superficially success seemed within his grasp. Dante (cf. especially Paradiso, xxx, 137–139, 142–144) conferred on him a reputation in excess of his ability.

After a year's delay there was a double election to the empire when the larger party chose Louis of Wittelsbach, duke of Upper Bavaria, and the smaller chose Frederick, duke of Austria, the son of Albert I. After a war of eight years, Frederick was defeated at Miihldorf in Sept. 1322. The success of Louis IV was to some extent due to the imperial cities which supported him from the first; but he was perhaps still more indebted for his victory to the outbreak of war between the Swiss and the Habsburgs; the position of the Habsburg family had been sensibly weakened by the defeat of Frederick's brother Leopold of Austria at Morgarten in 1315. Northern Germany, where emperors were usually ignored, had been unconcerned in the struggle, which was an episode in the feud between the landed powers of Wittelsbach and Habsburg that lasted to the 17th century. Until the battle of Miihldorf Pope John XXII was ostensibly neutral, but the appointment by Louis of an imperial vicar in Lombardy in 1323 caused him to arraign and presently to excommunicate him. (The nature of the struggle is described in the article PAPACY.) Louis cleverly insisted that the vote of the electors sufficed to make a German king and that the approval of the papacy was not essential. Thus he retained the support of most electors until 1346. In a diet at Frankfurt (1338) the papacy was declared excluded from any share in the choice of an emperor. The higher clergy and princes were alarmed at papal aggression; but there was no national opposition to the pope. Foreign scholars, William of Occam, Marsilius of Padua, John of Jandun and the Spiritual Franciscans were more valuable to Louis than his own countrymen. He added Brandenburg, Tirol, Holland and Hainault to the lands of his family, which however soon proved incapable of keeping them. The death of Louis (Oct. 1347) forestalled civil war with Charles of Luxembourg, king of Bohemia, a papal candidate accepted by four electors in 1346.

Charles IV, who has an important place in the history of Bohemia (*q.v.*), was crowned in 1349 amid the visitation of the Black Death, which in Germany led to attacks on the Jews exceeding in violence similar attacks elsewhere. In the Golden Bull (*q.v.;* 13j5–56) Charles, now emperor, gave the empire an electoral college and a law of succession. For several generations the princes had regarded themselves as a caste rather than as territorial rulers, and their lands were subdivided to support all the sons of a family. By asserting the indivisibility of electoral lands Charles encouraged reconsolidation. The cities, despite the prohibition of the Golden Bull, formed new associations for mutual defense or strengthened those which already existed. The Hanseatic league carried on a successful war with Valdemar VI of Denmark, while it extended its commerce. In 1376 some Swabian towns formed a league which in spite of the imperial prohibition soon became powerful in southwestern Germany and defeated the forces of the count of Wiirttemberg at Reutlingen in May 1377 (see SWABIAN LEAGUE). Meanwhile the emperor who, unlike his predecessor, avoided conflict with either the papacy or the princes was steadily increasing the power of his house chiefly at the expense of the Wittelsbachs and Habsburgs. When he died in Nov. 1378, he wore the crowns of the empire, of Germany, of Bohemia, of Lombardy and of Burgundy; he had added lower Lusatia and parts of Silesia to Bohemia; he had secured the mark of Brandenburg for his son Wenceslaus in 1373; and he had bought part of the upper Palatinate. Learned and systematic, he was responsible for the foundation (1347–48) of Prague university, an international but also a German seat of learning. By his reform of the imperial chancery he created a court and a centre of scholastic jurisprudence, which for the next 150 years was to exert an influence over Germany out of proportion to the power of the crown.

Such was the ascendancy of Charles IV, that his son Wenceslaus succeeded him peacefully in 1378, although for 200 years no son had followed his father on the throne unchallenged. For several years Wenceslaus proved a successful king of Bohemia; but by 1385 anarchy aggravated by the schism in the church prevailed in Germany. The Swabian league allied itself with the Swiss cantons: and, though only the Swiss were victorious in the field, it became impossible to prevent the towns from receiving external burghers, *Pfahlbürger,* as a means of extending municipal interests in the countryside and of undermining the jurisdiction of neighbouring lords. The chief sufferers were the knights holding their fiefs of the empire; except in parts of southern Germany where their confederation, the Shield of St. George, successfully bargained with princes and towns, these knights became a distressed class prone to lawlessness. Intellectual development suffered little, and the foundation of universities was even promoted by the schism, which cut off Germany from France; *e.g.,* Vienna (1383, second foundation), Heidelberg (1385), Cologne (1388), Erfurt (1392, second foundation) and, after the expulsion of Germans from Prague by the Czech Hussites, Leipzig (1409). In 1400 the Rhenish electors set up the able Rupert of Wittelsbach, the elector Palatine, as a rival king. But Rupert had no large patrimony to sustain his dignity and, intervening in Italy (1401), was defeated by the Visconti and their mercenaries; he died in 1410 having failed to establish himself.

In defense of order Germany was compelled to rely on local organs of government. One of these, Fehmic court (*q.v.*) or Verne, which spread from Westphalia, had a brief period of general usefulness before its venality led to its repression (after 1450). Elsewhere the estates in a particular area, assembled in a Landtag, would by means of a *Landfrieden* restrain private wars when they became intolerable. Disintegration had reached its extreme, and although national unity was farther than ever from realization, the 15th century witnessed a slow consolidation of the territories ruled by princely dynasties. The estates, normally composed of nobility, towns and clergy, played their part in effecting unity on a local scale and preventing it on a national scale. At the same time as the Hohenzollern margrave and elector Albert Achilles was enacting the *Dispositio Achillea* (1473) to introduce primogeniture into Brandenburg, the estates of Württemberg were participating in the reunion of territories formerly partitioned among members of the reigning house. As feudal revenues declined, the princes were driven to depend on grants from the estates of their territories, and in 1438 those of Saxony gained an exclusive right to impose taxation. The local estates throughout Germany wrecked the national taxation on which all schemes for the reform of the empire hung; and those of Bavaria. Saxony and Austria removed foreigners (*e.g.,* Styrians in Austria) from the administration. The economy and civilization of Germany were sustained by the towns, and the stand of Nuremberg against Albert Achilles did much to save the independence of imperial cities; but the majority of towns were submitting to the government of princes, frequently, as in Brunswick and in Berlin, to the advantage of both sides. Meanwhile technical discoveries and improvements were transforming society. These included not only printing and the glazing of stoneware but also advances in metallurgy and mining, as well as the instrument manufacture of Nuremberg without which the Portuguese voyages of discovery could hardly have been made. A wave of piety swept Germany in the 15th century but ecclesiastical conditions were uneven and mainly unsatisfactory. A large number of monasteries were reformed. In the north the Augustinian congregation of Windesheim was the chief agency, in the south the Benedictines of Melk. Notwithstanding the efforts of the cardinals John Carvajal and Nicolaus Cusanus (legate 1451–52) the reform of the church, such as it was, owed most to the participation of the princes.

Sigismund, a brother of Wenceslaus, mas elected king in 1410. He gained standing for himself and for the empire by his part in the Council of Constance (1414–17); but he proved unable to defend Germany against the Hussites (*q.v.*) or to recoter Bohemia. He was mainly preoccupied in Hungary. Bohemia recognized him after negotiation with the Council of Basle in 1435. From 1434 to his death in Dec. 1437 he concerned himself with imperial reform; and his proposals for the division of the country into circumscriptions and for the regulation of currency and justice set the program for many schemes until Maximilian's time.

The Habsburgs Established.—In March 1438 the electors chose a Habsburg as king, in the hope that he would defend the eastern frontier. Albert II (*i.e.,* Albert V of Habsburg) was universally respected but died after a single campaign against the Turks in Oct. 1439.

Frederick, duke of Styria, the senior Habsburg prince, was elected as Frederick III in Feb. 1440. His reign was a series. of crises for Germany and particularly for the Habsburg lands. From 1438 to 1448 the electors preserved neutrality in the rivalry between the papacy and the Council of Basle. The Habsburg territories were jeopardized by the counts of Cilli until 1457 (when Ulrich of Cilli was murdered) and then by Frederick's brother Albert VI of Habsburg until 1463. Peasant revolts in the southeast and among the lesser nobility the feud of the Baumgartens were acute examples of social troubles besetting all Europe at this time. Frederick failed to acquire Milan in 1447 but secured for his family the succession to the Burgundian Netherlands in 1477. (C. A. J. A.)

Maximilian I.—Maximilian, Frederick's son, became king of the Romans, or German king, in 1486. He had exceptional advantages. He was heir to the extensive Austrian lands and as the widowed husband of Charles the Bold's daughter Mary he administered the Netherlands. Although he soon gave up these provinces to his son Philip, the fact that they were in the possession of his family added to his influence, and this was further increased when Philip married Joanna, the heiress of the Spanish kingdoms. When Maximilian ascended the imperial throne in 1493, the empire exercised in the affairs of Europe an authority which had not belonged to it for centuries.

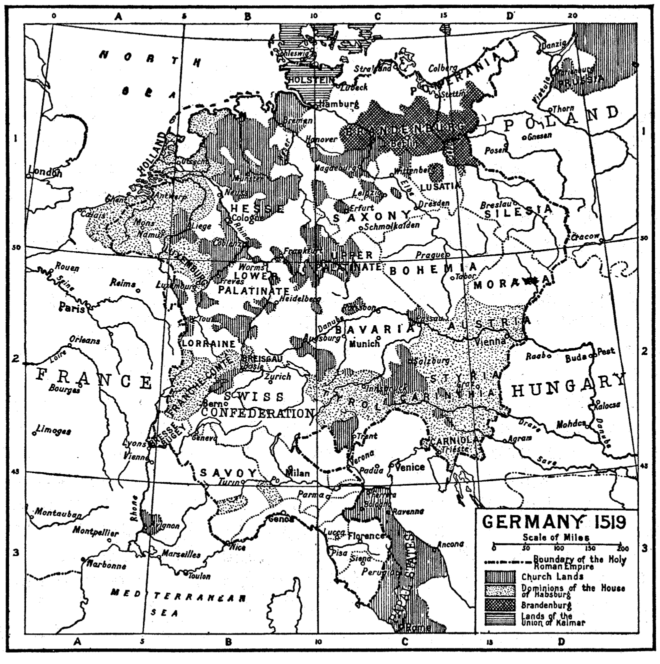
The reign of Maximilian I is important in many mays. The emperor himself is an interesting figure, erratic, ambitious, intelligent and fully aware of the contrast between his imperial position and his actual resources. His reign coincided with a strong movement among the princes for constitutional reform, led from within the electoral college by Bertold, archbishop of Mainz. Maximilian, in fact, was the first emperor to be confronted with a constitutional program. Naturally he had no sympathy with the limitation of imperial authority implied by the plan proposed by Bertold and his adherents. Nevertheless the changes which were made in his time had great influence on the later imperial constitution (see EMPIRE; DIET; IMPERIAL CHAMBER), and in a sense the modern history of the empire begins with him. In the history of Germany his importance lies in his resistance to the French claim to the provinces which had formed part of the Burgundian dominion. In this he was only carrying out his father's dynastic policy, and he had little support from other German princes. Few at the time realized that the integrity of Germany was at stake in the struggle which Maximilian maintained with very slender resources.

In many respects the reign of Maximilian must be regarded as the end of the middle ages. The feudal relation between the king and the princes and between the princes and their vassals had become purely nominal. No real control was exerted by the crown over the heads of the various states, and, now that war was carried on mainly by mercenary troops, the nobles did not hold their lands on condition of military service. The princes were now sovereigns, not merely feudal lords. By the growth of the cities in social, if not in political, importance the products of labour were more and more widely diffused; and it was easier than at any previous time for the nation to be moved by common ideas and impulses. Many causes contributed to effect a radical change in the point of view from which the world was regarded; and the strongest of all mediaeval relations, that of the nation to the church, was about to pass through the fiery trial of the Reformation. This vast movement in the later years of lllaximilian severed the mediaeval from the modern world.

The seeds of the Reformation were sown during the time of the great conflict between the papacy and the empire. During the struggle of the emperor Louis IV with the popes of his day the feeling revived with fresh intensity. At the same time the spiritual teaching of the mystics awakened in many minds an aspiration nhich the church, in its corrupt state, could not satisfy, and which was in any case unfavourable to an external aurhority. The Hussite movement further weakened the spell of the church. Still more powerful, because affecting a more important class, was the influence of the Renaissance, which toward the end of the 15th century passed from Italy to the universities of Germany. The men of the new learning did not sever themselves from Christianity, but they became indifferent to it; its conceptions seemed to them dim and faded, while there was a constantly increasing charm in literature, in philosophy and in art. No kind of effort was made by the church to prepare for the storm. The popular feeling for the first time found expression when Martin Luther, on All Saints' day 1517, nailed to a church door in Wittenberg the theses in which he contested the doctrine which lay at the root of the scandalous traffic in indulgences carried on in the Pope's name by Johann Tetzel and his like. This episode, derided at first at Rome as the act of an obscure Augustinian friar intent on scoring a point in a scholastic disputation, was in reality an event of vast significance, for it brought to the front as the exponent of the national sentiment one of the mightiest spirits whom Germany has produced. Under the influence of Luther's strong personality the most active and progressive elements of the nation were soon in more or less open antagonism to the papacy. (X.)

CHARLES V AND THE REFORMATION

The Accession of Charles V.—Maximilian died in Jan. 1519. After a long contest for the succession between his grandson, Charles I of Spain, and Francis I of France, Charles was elected in June 1520 and in the following October was crowned at Aachen as the emperor Charles V. The religious conflict had reached a critical stage. the bull of excommunication against Luther having just been published in Germany. Some of the reformers cherished a hope that the new emperor's policy might be to act as a mediator for peace, not unfavourable to their leader. But though Charles showed later that he would not hesitate to oppose the Pope in the sphere of politics, he held that he owed him entire allegiance in that of faith, and the protection of the church had always been regarded as a chief function of the emperors. Moreover the peoples under his direct sway were adherents of the old faith. He was king of Spain, Naples, Sicily and Sardinia, lord of the Netherlands, the county of Burgundy and the Austrian arch-



duchies and of the new lands beyond the Atlantic—by far the most important ruler of his time. He hoped to add north Italy to his dominions, and this was another motive for standing well with the Holy See. It was not surprising therefore that at the diet of Worms, in Jan. 1521, he issued the edict drawn up by Cardinal Aleandro denouncing the reformer. This was accepted by the diet and Luther was placed under the ban of the empire.

At his election Charles had been required to accept a *Wahlkapitulation* (electoral agreement) embodying the conditions on which he was to receive the crown—a precedent followed at subsequent elections. This was confirmed by the diet. Charles, regarded as a foreigner by the princes, undertook to respect the freedom of Germany, use the German language and convene the diets on German soil. He was not to bring foreign troops into Germany or place German troops under foreign command. An administrative council, the *Reichsregiment* (state board of control), was to be set up, and after some debate between Charles and the princes it was settled that it should consist of 22 members with a president nominated by the sovereign. It was to govern Germany in his absence; at other times its functions would be only advisory. There was an undertaking to aid the emperor by raising and paying an army. In April 1521 Charles invested his brother Ferdinand (afterward emperor) with the Austrian archduchies and then left Germany to deal with disturbances in Spain and renew his struggle with Francis I.

The Civil Wars.—Serious trouble arose in his absence. The *Ritterschaft*, the knighthood of the empire, was a discontented class which had suffered by the substitution of Roman law for the old feudal law under which they were tenants in chief of the crown. They had now no share in government, and the suppression of private wars had deprived them of active employment. Two of their leaders, Ulrich von Hutten and Franz von Sickingen, had become supporters of Luther, hoping the coming changes in Germany would improve their position. Hutten held that there could be no reform in church and state while the country was divided into a number of small princedoms, and he planned a revolution to be effected with the help of Sickingen, who had got together a small army, with which in Aug. 1522, he besieged Trier, the city of a prince archbishop and elector of the empire. The place made a good defense, and on the approach of an army levied by the princes the siege was abandoned. The revolt ended with the defeat and death of Sickingen at Landstuhl in May 1523. Hutten, broken in health, took refuge in Switzerland, where he died a few weeks later. Luther and his friends had stood apart from the movement though the knights had proclaimed the freedom of Germany from papal influence as one of their aims.

A more serious revolt was the rising in south and central Germany known as the Peasants' War (*Bauernkrieg*). The small farmers and peasants had real grievances, partly the outcome of changing economic conditions but largely of the grasping policy of the princes and great landowners. Like the knights, they had lost many of their traditional feudal privileges by the introduction of the new system of Roman law. In many districts there were obstacles to migration and resettlement which led to their small holdings being subdivided till, with an increasing population, they became too small to support a peasant family. Since 1461 there had been a recurrence of minor local outbreaks. The first movements of a rising on a wide scale took place in 1522 while the revolt of the knights was still in progress. As in former movements the standard of revolt was the *Bundschuh*, a peasant's clog upon a pole. As the rising spread, many knights and adventurers joined the peasants, and they also found friends among the poorer workers of the towns. A new feature of the revolt was that the rebels put forward a religious as well as a social program, one of their claims being that each village should elect its pastor. There were appeals also to scriptural prophecies interpreted to predict the coming of a new era of freedom and prosperity. Some of the lords granted the more moderate claims of the peasants, among these peace makers being the elector Palatine, the bishops of Bamberg and Speyer and the abbots of Fulda and Hersfeld. Luther wrote a pamphlet warning the princes that their oppression had caused the rising and that the reasonable claims of the peasants should be granted, but telling the peasants that their grievances did not justify their violence and that they should negotiate for peace. Meanwhile the rising spread along the Rhine and across the Main into Thuringia. It was not till the summer of 1525 that the war ended and ended in disaster for the rebels. After their first successes they had indulged in reckless outrages on life and property, and the princes, when their forces got the upper hand, wreaked a ferocious vengeance on them. Luther encouraged these reprisals in a pamphlet "On the Murderous Peasant Hordes," urging that the rebels deserved no mercy.

Rival Forces in the Diets.—During the civil wars the *Reichsregiment* had proved an inefficient organ of government, and it was soon to disappear. Meeting at Nuremberg in 1522, it had voted supplies for defense against the Turks, but many of the cities resisted its levy of taxes, and on an appeal to Charles its scheme was vetoed. It had left to a group of princes the suppression of the revolts. It had declined to enforce the edict of Worms, and a new meeting of the diet only ventured to direct that it should be enforced "if possible." The party of the reformers was gaining ground and had the support of several of the princes. Much church property was secularized, monasteries were suppressed and the Lutheran service was introduced into many churches. A notable event of 1525 was the action of Albert of Hohenzollern, grand master of the Teutonic order, who, supported by most of its knights, declared for Luther, secularized the property of the order and made himself the personal ruler of its territory between Poland and the Baltic—a first step toward the building up of the future Prussian kingdom. All over Germany men mere falling into line on one side or the other of the religious conflict. Charles vetoed a proposal for a national assembly to decide the questions at issue. The Catholics under the archduke Ferdinand and Cardinal Campeggio met at Regensburg to concert measures against Lutheranism, while on the other side assemblies at Speyer and Ulm declared their intention of forwarding the teaching of the new doctrines. In 1525 the Catholic princes formed a defensive league at Dessau, and the reformer princes took a similar step next year at Gotha.

In the diet that met at Speyer in June 1526 the reformers were the stronger party. A message from Charles in Spain, calling on the diet to forbid innovations and enforce the edict of Worms, was rejected on the ground that when the emperor wrote it three months earlier, he and the Pope were at peace but were now at war. The diet decreed that pending a national council each prince should regulate the religious affairs of his own dominions. After this wherever the reformers were in power—notably in Saxony, Brandenburg, Hesse and the Palatinate, in Strasbourg, Nuremberg, Ulm and Augsburg—the religious changes nent forward. But when the diet met again three years later at Speyer under the presidency of the archduke Ferdinand, the Catholic party was stronger, and a message from Charles required the repeal of the decree of 1526. But the Catholics were anxious for a truce, and with the approval of the reformer and theologian Philipp Melanchthon (*q.v.*), who was also striving for peace, secured the adoption of a decree that until a council met, the reformers should abstain from further changes, but that in their states the Catholic minority should have freedom to practise their religion. Philip of Hesse with four other princes and the delegates of several cities protested against any limitation of their powers and declared their resolve to disobey the decree. Melanchthon wrote of this rejection of the *modus vivendi* as "a terrible affair." The protest was the origin of the new name of "Protestant," soon applied to and accepted by the reformers.

Charles's Intervention.—Charles V, having this year made peace with the Pope and Francis I, was crowned by Clement VII at Bologna in Feb. 1530, and then went to Germany to make a personal effort to settle its troubles. The Protestant forces were now divided by the conflict between the Lutherans and the followers of the Swiss reformer Zwingli, whose influence extended to the south German cities. In June 1530 the diet was convoked at Augsburg. By the emperor's invitation, as a basis for discussing a religious peace the Lutherans presented a statement of their position, drawn up by Melanchthon, its articles accentuating points of agreement with the Catholics and dealing cautiously, and even vaguely, with points of controversy. It is known as the Confession of Augsburg and forms still the confession of faith of the Lutheran Evangelical Church. It led to long debates which ended, as was to be expected, in failure to effect an agreement. Four of the Zwinglian cities at once protested against it. Numbers of the Lutherans themselves denounced its guarded statements. A conference bet een Catholic and Lutheran theologians only accentuated points of vital difference. Several of the Lutheran princes and their friends left Augsburg. In November the diet ended with a decree issued by Charles giving the Lutherans till the following April to reconsider their position, calling for submission to a settlement, leaving it to the imperial courts to insist on the restoration of confiscated church property and referring to the hope of a final peace being effected by a general council.

In Jan. 1531 at Cologne Charles secured the election of his brother, the archduke Ferdinand, to the dignity of king of the Romans, which implied succession to the empire. Meanwhile Ferdinand would act as his representative in Germany instead of the discredited *Reichsregiment*. In April the Lutheran leaders formed at Schmalkalden in Hesse the defensive alliance known as the League of Smalkald, which was joined by 9 princes and 11 cities. It entered into relations with Denmark, the Zwinglians of Switzerland and the emperor's rival Francis I. Tension with France and the Turkish peril made the emperor hesitate to go to extremes. The Turkish danger was serious. The Turks had conquered Serbia and overrun Hungary, and only an outbreak of pestilence in their army had saved Vienna. Early in 1532 the emperor convoked a diet at Regensburg. The Lutherans absented themselves, and though the Catholics voted supplies for the Turkish war, they opposed the emperor's policy of concessions to their opponents. Charles then entered into direct negotiations with the Protestant princes, which resulted in July in the peace of Nuremberg, granting temporary toleration to the Lutherans, which was renewed in the following years. His reward was immediate and substantial. His subjects vied with each other in hurrying soldiers to his standard and the Turkish army was soon in full retreat.

Protestant Progress and Divisions.—Protestantism now made considerable progress especially in Anhalt and Pomerania, and, thanks chiefly to the energy of Philip of Hesse and the support of Francis I, the Lutheran claimant to Wiirttemberg, Ulrich, was forcibly restored to his duchy. (*See* WÜRTTEMBERG.) Ferdinand found himself obliged to recognize the restoration and to promise that he would stop all proceedings of the imperial courts against the members of the Smalkald league. Other events were less favourable to the supporters of the new religion. The mad outbreak of the fanatical Anabaptists at Münster, though suppressed, caused widespread alarm, and there was an abortive attempt at a revolution by the extremists at Liibeck. A renewal of the war between the empire and France in 1536 was followed by an enlargement of the League of Smalkald and its prolongation for ten years. Among its new members was Christian III of Denmark. About the same time Martin Bucer arranged the friendly agreement between the Lutherans and Zwinglians, known as the concord of Wittenberg (May 1536). Thus strengthened the Protestant princes declared against the proposed general council at Mantua. In June 1538 the Catholic princes formed a new defensive alliance, the League of Nuremberg, but though he had made a truce with France in this same month Charles was more conciliatory toward the Protestant princes than some of his supporters, and in April 1539 he came to terms with them, without however granting all their demands. This year the Lutheran Henry succeeded his Catholic brother George as duke of Saxony. Ducal and electoral Saxony were thus won to the Protestant party and, with its gains under the elector Joachim II in Brandenburg, it was now practically dominant throughout north Germany.

In 1542 Charles was again involved in war with both France and Turkey, and the League of Smalkald took advantage of his troubles to expel its opponent Henry of Brunswick-Wolfenbiittel from his duchy and establish Protestantism there. The citizens of Regensburg declared for Lutheranism, and Hermann von Wied, prince archbishop of Cologne, and William, duke of Gelderland, announced their secession from Rome. The Protestants were now at the height of their power, but their ascendancy was soon to be destroyed more by their own division and the folly and imprudence of their leaders than by the skill and valour of their foes. The unity and power of the League of Smalkald was undermined by dissensions between John Frederick, the ruler of electoral Saxony, and Maurice, who had succeeded Henry in ducal Saxony; and the bigamy of Philip of Hesse, carried through under a dispensation signed by Luther and several of his colleagues, made Philip many enemies and endangered his legal status, so that in June 1541 he saved himself by coming to terms with the emperor. Thus the league lost its most important leader. In 1543 it looked on helplessly while Charles crushed William of Gelderland and added his duchies to the lands of the Habsburgs. Charles, however, hesitated to make a general attack on the Protestants and, in accordance with the promises made in 1539 at Frankfurt, arranged conferences between the two religious parties which, however, gave no result. The diets held at Regensburg and Nuremberg failed to give any solution of the religious question, and made grudging votes for the war; but at the diet of Speyer in 1544 lavish promises to the Protestants obtained supplies with which a new army was placed in the field. In September of that year Charles concluded the treaty of Crépy with Francis I and had his hands free to deal with the affairs of Germany.

Charles was influenced by political even more than religious considerations. He regarded Protestantism as a movement that had divided and disorganized Germany, and endangered both the system of the empire and the supremacy of the Habsburgs. He now meant to break up the league and at the same time to use his influence for the convocation of a general council, which would deal with the abuses of discipline that had weakened the Catholic Church. Pope Paul III, not without hesitation, summoned the council which met at Trent in Dec. 1545, and Charles prepared for war. He made peace with Turkey and secured the neutrality of Bavaria and the support of Maurice of Saxony. He detached from the league those who were too timid or too lacking in zeal to face a conflict. Meanwhile its members were divided in policy, and neglected war preparations in the hope that another religious truce would be patched up. Luther, lamenting in his last days the Protestant divisions, died at Eisleben on Feb. 18, 1546. It was not until the diet met at Regensburg in June that a group of the Protestant princes, headed by Philip of Hesse and John Frederick, the ruler of electoral Saxony, realized the peril and at last began preparations for defense. In July they were placed under the ban of the empire and war began in the south. Charles had brought reinforcements from Italy and the Netherlands. Several cities, with Ulrich of Württemberg and the elector Palatine, submitted to him. The army of the league was forced northward from Saxony along the Elbe valley. At Mdhlberg on April 24, 1547, Charles forced the crossing of the Elbe with hardly a show of resistance, and scattered his opponents. John Frederick was taken prisoner and Philip of Hesse soon after surrendered. The Saxon electorate was added to Maurice's duchy as a reward; more than one of the Lutheran princes hastened to court the conqueror's good will; and Charles met the diet at Augsburg in Sept. 1547 confident in his power to remodel German affairs.

But his overconfidence led to mistakes of policy. The princes evaded his chief demands by prolonged debate, and were soon encouraged by news that he was quarrelling with the Pope over the proposed removal of the council from Trent (in the empire) to Bologna (in the papal states). Charles imagined he could settle the religious question himself. He proposed the acceptance of a compromise set forth in a decree known as the Interim, as it was to be in force till the decisions of the council were known. His critics, both Protestant and Catholic, spoke of it as "the Interim religion." Only a minority of both parties were ready to accept it. He did not satisfy either earnest Lutherans or orthodox Catholics by slurring over points of difference in vague formulas.

Maurice of Saxony prepared to change sides once more. He built up a secret alliance with several of the Lutheran princes and obtained promises of help from Henry II of France, with whom a secret treaty was signed in Jan. 1552. Charles was off his guard when the storm suddenly burst in March. Henry II invaded western Germany, declaring he came as the defender of German freedom. Maurice seized Augsburg and with his friends marched on Innsbruck, where the emperor was residing. Charles fled across the Brenner, and in May negotiations were opened, and by July the peace of Passau was arranged. Charles set at liberty John Frederick and Philip of Hesse and agreed that the Lutherans should have full religious liberty.

Maurice then went to help Ferdinand against the Turks, but his ally, Henry II of France, continued the war against Germany. He had seized Metz, and Charles failed in an attempt to recover it. Another of Maurice's allies, Albert of Brandenburg, after living on the country in Franconia, was for a while with the emperor's army fighting against France and then resumed his bandit raids, which became such a terror that a league of the princes, formed by Maurice, united to drive him out of Germany. Maurice lost his life in this campaign.

The Peace of Augsburg.—In Feb. 1555 the diet met at Augsburg to settle a final peace on the general basis of the treaty of Passau. Ferdinand presided for his brother. It was agreed that Catholics and Lutherans should be placed on an equal footing in the empire and that the Lutherans were to retain all the church property they had held at the date of the peace of Passau. But the Calvinists were excluded by both parties from the settlement, and the peace of Augsburg did not really establish either religious freedom or individual toleration. The principle of state supremacy —*cuius* regio eius religio—was accepted.

The treaty was published in Sept. 1555. Charles had left the settlement entirely to his brother. His health was failing, he was tired of the troubled affairs of Germany, and anxious chiefly to consolidate his Spanish dominions in the hands of his son Philip (then the husband of Mary Tudor). He abdicated, in Jan. 1556, entrusting Spain, the Netherlands and his overseas empire to Philip, while Ferdinand took over the conduct of German affairs though it was not until after the death of Charles (1558) that he was formally installed as emperor.

The Counter Reformation.— During his short reign Ferdinand I devoted himself to enforcing the peace of Augsburg. War with the Turks went on till 1562, and he had to deal with local troubles in Hungary, Bohemia and north Germany. Efforts were made, with no result, to compose the growing differences among the Protestants. In his Catholic dominions he supported the reforms decreed at Trent in matters of ecclesiastical discipline. The Catholics were now gaining ground thanks largely to the reforms in clerical training ordered by the council, and the missionary and educational work of the Jesuits. Before Ferdinand died in July 1564 the Counter Reformation had begun. Some changes had been introduced in the empire. Lutherans now sat among the judges in the imperial courts; and the Aulic council or *Hofrat* established by Maximilian I for the Austrian lands extended its authority over the empire and was known as the Reichshofrat.

Ferdinand's son and successor, Maxirnilian II (1564–76), was a man of tolerant views and had even been at one time suspected of an inclination to Lutheranism. He secured his election by a declaration of fidelity to the old faith, but for a while cherished optimistic but misleading dreams of effecting a peaceful religious reunion in Germany. His first diet at Augsburg in 1566 gave no encouragement to these hopes. The Catholics stood firmly for the decrees of Trent, and the Protestants gave new proof of their divisions by an attempt to exclude the Calvinist elector Palatine, Frederick III, from the advantages of the peace of Augsburg. This led Frederick and the Calvinists into closer relations with France and the Dutch Netherlands, while the Lutherans, now led by Augustus of Saxony, courted the friendship of the emperor. But even they were divided, while the Catholics were still gaining ground. Albert III of Bavaria boasted that without force or strife most of his people had been won to the Catholic cause. The emperor now abandoned his reunion projects and was for a while occupied with a Turkish campaign. The new diet held at Speyer in 1570 was chiefly engaged in debates on the abuses resulting from the enlistment of Germans by foreign agents as mercenaries, but nothing practical was done. It is to Maximilian's credit that he tried to mediate between his cousin Philip II and the rebellious Netherlands. He was engaged in negotiations with a Polish party, which wished to elect him king of Poland, when he died in Oct. 1576.

He was succeeded by his son Rudolph II (1576–1612). The drift of events during his long reign can be explained by noting as the chief factors the growing strength of the Catholics, not only in the Habsburg territories but also in south Germany and wide tracts of the Rhineland and Westphalia; the efforts of the Protestant leaders, now no longer prominent divines but politicians and princes, to obviate the divisions that weakened them by sinking sectarian differences in a common alliance against the house of Habsburg, which they regarded as the chief protector of the Counter Reformation; and, finally, the formation of opposing Catholic and Protestant leagues—the prelude to the Thirty Years' War. The first effort at a Protestant union was made in the very month of Rudolph's accession (Oct. 1576), when Augustus of Saxony drew up a moderately worded Lutheran profession of faith, the *Formula Concordiae*, which was accepted by a large number of princes and cities; but an influential minority refused it, and it only accentuated existing divisions. In the pears that followed the Catholics secured not a few successes. An immigration of refugees from the Netherlands into northwest Germany led to troubles, and the local Catholic government was driven from Aachen in 1581. The *Reichshofrat* declared the movement a rebellion, but it was not till 1598 that Protestant worship was abolished at Aachen and the Catholic government restored. At Cologne in 1582 the prince archbishop, Gebhard Truchsess von Waldburg, became a Lutheran, married and declared his intention of keeping both his see and its territory. He was placed under the ban of the empire and numbers of his subjects took up arms against him, aided by troops from Bavaria. This local conflict. the War of Cologne, lasted for nearly five years. The Protestant princes stood neutral except John Casimir, a zealous Calvinist with some military experience, who was acting as regent of the Palatinate in the minority of his nephew Frederick IV. He gave some help to Gebhard, who was finally driven from his see and took refuge at Strasbourg, where he instigated an unsuccessful rebellion. Meanwhile the Catholics succeeded in establishing their faith in several of the dioceses they had lost.

The Strengthening of the Parties.——After the death of Augustus of Saxony there was another brief alliance of the Protestant princes, under the leadership of his successor Christian I and of John Casimir. An opposition party was organized in the diet, but with little practical result, and the deaths of the two leaders in 1591–92 put an end to the alliance between Lutherans and Calvinists for a time. But in the diets held at Regensburg in 1593 the Protestant princes drew together. Under the leadership of Christian I of Anhalt they put forward demands for new concessions and tried to hinder or delay the payment of subsidies for a new war with Turkey. In 1598 they advanced a theory that in the diet the decisions of a majority did not bind the minority, and in the diet of 1603 they asserted the same position, protested against various decisions of the *Reichshofrat* and finally withdrew from the diet in a body. The war with Turkey lasted from 1593 to 1606, when peace was negotiated not by the emperor but by his brother Matthias, who, because Rudolph was intermittently mad, had been declared head of the house of Habsburg. Rudolph resented this indignity and his relations with his brother were strained till his death in Jan. 1612.

During the last years of his reign the leader of the Catholic party in Germany was Maximilian, the duke of Bavaria. In 1607 he was given an imperial mandate to deal with a religious riot in the free city of Donauworth and, after suppressing it, retained the city under his government. Alarmed by this arbitrary act, the Protestant princes formed in 1608 the Evangelical union, and in response the Catholics, led by Maximilian, united in a similar confederation, afterward known as the Catholic league. As the union was headed by the Calvinist elector Palatine, Frederick IV, many of the Lutherans were slack in supporting it, but it became very important by an alliance with Henry IV of France, who was ready to profit by German quarrels and was interfering in a disputed succession to the duchies of Cleve and Jülich. War between the two confederations on this question seemed imminent, but after the murder of Henry IV in May 1610 the union did not venture to fight.

Rudolph II was succeeded by his brother Matthias (1612–19). He had no children, and the Habsburgs selected as his heir tne Habsburg archduke Ferdinand of Styria. During the brief reign of Matthias the union and the league jealously watched each other. It was a time of dangerous tension. Matthias died in March 1619, and in the following August Ferdinand of Styria obtained the imperial crown as Ferdinand II (1619–37). He had already practically eradicated Protestantism in his archduchy, and was determined to secure the triumph of his church in the empire.

The Thirty Years' War **(1618–48).**—On his accession Ferdinand found himself faced with troubles in his hereditary dominions and a serious crisis in Bohemia, the conflict which was the first phase of the Thirty Years' War. Its beginning is usually dated from the revolt of the Protestant nobles in Bohemia in 1618. Since the days of Huss there had been a strong party in the kingdom opposed both to Rome and Vienna. When Ferdinand's accession was announced, the Bohemian diet refused to acknowledge him and elected as their king the elector Palatine, Frederick V, a son-in-law of James I of England. Ferdinand, on both dynastic and religious grounds, was determined to subdue the Bohemians. At first troubles in his other hereditary states made it difficult to take decisive action. But Spain promised help by invading the Palatinate and early in 1620 it was arranged that Maximilian of Bavaria should send the army of the league under Johann Tzerclaes, Count of Tilly, to assist the emperor. Frederick received little help from the Protestant princes, most of the Lutherans disliking the alliance with a Calvinist leader. He had hoped for English support, but James I went no further than allowing volunteers under Sir Horace Vere to take part in defending the Palatinate. Tilly marched into Bohemia and on Nov. 8, 1620, routed Frederick's army in the decisive battle of the Weissenberg (the White Mountain) near Prague. Frederick fled only to find Ambrose Spinola's Spanish veterans and a Bavarian force overrunning the Palatinate, so that he was obliged to leave Germany. His hereditary lands were declared forfeit and handed over to Maximilian. The war died down into mere desultory fighting against Frederick's only remaining adherents, Christian of Brunswick and Count Ernst von Mansfeld.

The war blazed up again on a larger scale in 1625. The emperor's successes and the rising power of Maximilian of Bavaria alarmed the Lutheran princes, and a new Protestant combination was formed, of which the leading member was Christian IV of Denmark, who as duke of Holstein was a prince of the empire. Two confederate armies were soon in the field, the princes accepting the leadership of King Christian and Mansfeld. Unwilling to depend entirely on Maximilian and the league and unable to raise a large force of his own. Ferdinand accepted the offer of the celebrated Albrecht von Wallenstein to raise, equip and maintain in the field at his own cost an army of 20,000 men, mostly veteran troops, on condition that he should command them and have a free hand. He was a wealthy Czech noble, who had seen service in the Turkish wars and had a real military genius with the mentality of a soldier of fortune. A Catholic, at least by profession, and serving the Catholic emperor, his levies were made up of a mixture of Catholics, Protestants and all kinds of. adventurers ready to fight under any successful leader. He meant to pay and supply his army by levying contributions on the country in which it operated. As the war went on, many of the armies in the field were not unlike Wallenstein's. In April 1626 with his hard-fighting mercenaries he defeated Mansfeld at Dessau, and in August Tilly with the army of the league defeated Christian of Denmark at Lutter. The victors united their armies and invaded Denmark. Wallenstein now formed in union with the Spaniards an ambitious scheme for cutting off the supplies of the Netherlands and controlling those of north Germany by seizing the North sea and Baltic ports. He was only partly successful, and after five months' siege had to abandon the attempt to seize Stralsund. But Denmark was at the mercy of the imperialists and in May 1629 had to conclude the peace of Liibeck.

Intoxicated by success, Ferdinand had only two months before issued the ill-advised "edict of restitution," ordering the restoration of all ecclesiastical lands taken over by the Protestants since the peace of Passau in 1552. This stirred up widespread opposition. While it was still being debated, Maximilian and the other members of the Catholic league united in demanding the dismissal of Wallenstein, now duke of Friedland, governor of the conquered territories of Mecklenburg and Pomerania, and rightly suspected of dangerous personal ambitions. Ferdinand had to yield just when new dangers were arising. In the summer of 1630 Gustavus Adolphus of Sweden declared himself the champion of the Protestant cause in Germany, and established himself with a strong force in Pomerania. How political rather than religious motives were now influencing events is shown by the fact that Cardinal Richelieu promised him subsidies from France for the support of the war.

Gustavus, probably the ablest soldier of his day, had already extended the Swedish power to several of the Baltic lands, and at first the Protestant princes were slow in uniting with him, suspecting that his real object was further Swedish conquests on the Baltic shores. But they soon welcomed his aid. He pushed forward to the Elbe gathering strength with success. He captured Frankfurt-on-Oder, added the Saxon army to his own and defeated Tilly and the main army of the league at Breitenfeld near Leipzig in Sept. 1631. Then, a hile the Saxons conquered Silesia and invaded Bohemia, Gustavus marched triumphantly through central Germany and established his headquarters at Mainz. In April 1632 Tilly met Gustavus on the Lech in an attempt to stop him from penetrating into Bavaria. The army of the league was defeated, however, Tilly was fatally wounded, and Gustavus occupied Augsburg and Munich. Ferdinand now appealed to Wallenstein to take command again. Wallenstein only consented on condition that he was given control of all the imperial forces and the right of making treaties and granting pardons. He then drove the Saxons out of Bohemia and repulsed an attack made by Gustavus on the entrenched camp near Nuremberg, but was defeated by the Swedes at Lutzen (Nov. 16, 1632). It was a costly victory, for Gustavus was killed leading a cavalry charge. The crown passed to his daughter Christina and under the government of the chancellor Axel Oxenstjerna the Swedes continued the war.

In April 1633 at Heilbronn the Swedes and their German allies agreed that the military command should be divided betaeen Bernhard of Saxe-Weimar and the Swedish general Gustaf Horn. France was still supplying money to the allies. The war went on in the Rhine and Danube valleys, the Swedes entering Alsace and Bernhard capturing Regensburg. Wallenstein showed no longer his former vigorous leadership. There was enough reason for dissatisfaction to evoke a movement for his dismissal. Ferdinand yielded and in Jan. 1634 declared Wallenstein deposed from command. Wallenstein tried to retain control of his army, but next month, as a result of a conspiracy among his officers, he was assassinated.

Commanded now by the archduke Ferdinand, king of Hungary (later the emperor Ferdinand 111), the imperialists began a successful campaign by recapturing Regensburg and Donauworth and then, aided by Spanish troops, won a complete victory over the Swedes and their allies at Nordlingen (Sept. 1634). The fortunes of the confederates were at a low ebb, but France presently came to their aid. Richelieu signed an alliance with Sweden at Compiègne in April 1635, and the following month France declared war and put its armies in motion. But by this time there was a movement for peace in Germany. Men of all classes were tired of the long conflict, in which they saw their country wasted and ruined by contending armies which levied contributions on city, town and countryside and, whether they were friends or foes, left a trail of misery in their track. John George I, the Lutheran elector of Saxony, took the lead in the movement and despite Swedish opposition signed in May 1635 the treaty of Prague aith the emperor. The vexed question of the ecclesiastical lands was settled by the agreement that land should remain for 40 years in the possession of those who held it on Nov. 12, 1627; during this period amicable arrangements might be made. The elector agreed to help the emperor to recover territories occupied by the Swedes and to place the Saxon army at his disposal, receiving in return a small increase of his own dominions. The elector of Brandenburg, George William, Eberhard III of Wurttemberg and several of the cities soon adhered to the treaty.

In this last phase the war became a struggle between the Bourbon and the Habsburg interests. The Swedes won some successes in north Germany but after France had come in, the important field of operations was in the west and south. The French armies on one side drove the Spaniards back in Flanders and on the other crossed the Rhine and, under the prince of Condé and the vicomte de Turenne with some help from Bernhard and the Swedish general Karl Wrangel, penetrated far into south Germany. (On Bernhard's death in 1639 his army was taken over and paid by the French.)

The Treaty of **Westphalia.**—While these operations were in progress, preliminary negotiations for a general peace had already begun at Hamburg and Cologne before the death of the emperor Ferdinand II in 1637. But it was not till Dec. 1641 that under his successor, Ferdinand III, a treaty was signed at Hamburg, by which it was agreed that peace conferences should meet at Munster and Osnabruck in March 1642; the emperor treated with France at the former and with Sweden at the latter. The Catholic princes of the empire were to be represented at Munster and the Protestants at Osnabrück. The conferences did not actually begin till 1645, when George William, the elector of Brandenburg, had made and John George, the elector of Saxony, was about to make, a truce with Sweden. In three years many controversial questions were settled, with much diplomatic playing for advantages, but at last in Oct. 1648 the peace of Westphalia (*q.v.*) was signed, ending the Thirty Years' War.

France gained possession of the three bishoprics — Metz, Verdun and Toul, with the Austrian territory in Alsace. Sweden was granted western Pomerania, Stettin, Verden and Bremen, and in virtue of this cession became a member of the empire. Hanover, Brandenburg and Saxony received some increase of territory, and the Rhenish Palatinate was divided between the electoral house and Bavaria. Switzerland and Holland, long actually independent, were formally recognized as independent nations. The German states of the empire were accorded a measure of independence by the recognition of the right to make alliances even with foreign powers, with the nominal proviso that these should not be injurious to the emperor or the empire. The princes were to regulate the religious affairs of their territories, and though there was a stipulation for individual religious freedom, in practice for long after in many states those who did not belong to the officially established religion were under some disabilities. To the imperial diet was left the settlement of treaties and laws affecting all Germany. By a compromise 1624 was fixed as the date for settling the question of the ecclesiastical lands; all lands secularized before that date were to remain secular. This left to the Catholics recent gains in the Habsburg territories. The general effect of the treaty was to relax the connection between the Habsburg and the other German lands. The empire survived, but there was a foreshadowing of the future change when the Habsburg emperor at Vienna would be no longer emperor of a Holy Roman empire, but emperor of Austria. But for another century and a half he was to represent the dignified tradition of some of the greatest memories of European history. **(A. H. A.)**

DECAY OF THE EMPIRE

Social and Economic Conditions after **1648.—The** condition of Germany after the conclusion of the peace of Westphalia was indeed tragic. The population had decreased in the course of the Thirty Years' War from about 30,000,000 to 20,000,000; the greatest decrease was shown in the rural population on whom the hardships of the war fell the most heavily, causing country people to migrate in large numbers to the cities. Many villages were totally degerted, and the old conditions were not completely restored until the middle of the 18th century.

Agriculture was almost at a standstill; large numbers of the land workers had been killed, or enrolled as mercenaries in the armies; stock had been destroyed and houses burned to the ground. Without capital or credit the peasants were reduced to utter dependence upon the great nobles and landowners who only furnished them with the money to rebuild their houses and replenish their stock on extremely hard terms. Everywhere their dues were increased and their rights of tenure diminished. A peasant without capital could not hope to improve the state of his holding. In consequence of the depopulation of the land the demand for agricultural produce had decreased, prices of livestock and grain had fallen and the area of land under cultivation had steadily diminished.

These conditions also affected the great landowners. In order to maintain their estates they were forced to raise mortgages on their properties at a high rate of interest. If, in spite of this, the nobility succeeded for the most part in maintaining their properties, it was chiefly due to the administrations of the different states, who came to their help by declaring moratoriums or by remitting interest. By the establishment of a *Fidei-kommiss* the aristocracy sought to keep their landed property; the same object prompted the prohibition of the sale of noble estates to townsmen which survived in many cases until the beginning of the 19th century. The great landlords were seldom in a position to carry out any agricultural development, and it was only gradually that a certain number of them, at the instigation of the ruling princes, began to cultivate the potato, which had been newly imported from America, and other foodcrops and to plant fruit trees and tobacco.

Industry and commerce had been equally ruined by the wars. The disorganization of industry had favoured the import of foreign goods, and the lack of purchasing power and skilled labour made recovery difficult. The country was flooded with French and English goods through the agency of the Dutch merchants. The once flourishing German trade had almost entirely ceased; the south German linen and cloth industry decreased, and the quality too deteriorated. Official regulations were of little avail, and it was only the immigration of the French Huguenots in the second half of the 17th century that gave new life to German industry. The ancient organizations of the handicraft workers, the guilds, had become rigidly occupational associations, and bad trading conditions and want of capital hindered the introduction of the factory system which was already developing widely throughout western Europe. German trade suffered especially from the fact that the mouths of the great German rivers were in foreign hands; the Dutch held the mouth of the Rhine; the Swedes and Danes the Weser, Elbe and Oder. This meant that German participation in world commerce was very restricted; German merchants were confined to internal trade and were often only agents for foreign investors.

Germany had been a wealthy country in the second half of the 16th century, but now money was scarce and furniture, art treasures and other valuables had been looted in large quantities by foreign armies: The crushing levies which the towns had to pay to preserve themselves from the hand of the invader had brought them to the verge of ruin. The mineral wealth, which had formerly been an important source of German prosperity, especially the silver mines, was partly exhausted and had partly diminished in value through the growing imports of precious metal from America. This loss of national wealth could only be replaced in the course of centuries. Intellectual life had also suffered severely, for hard conditions had made material interests and the struggle for daily bread predominant.

Political Organization in the 17th Century.—The political life of Germany was in a no less deplorable state. The imperial authority had become utterly powerless, lacked an administrative system and was possessed of only a very limited revenue. When the peace of Westphalia gave to the individual states the right to form associations among themselves or with foreign powers in so far as such alliances were not directed against the emperor and the empire, the emperor was reduced in fact to the position of president of an aristocratic republic. He was unable to make laws or levy taxes without the consent of the *Reichstag,* which from 1663 was to be permanently established at Regensburg. It was composed of representatives of all the immediate estates and was divided into the three chambers—electoral princes, princes and cities. The first chamber consisted of representatives of the eight electors of the empire—the archbishops of Mainz, Cologne and Trier, the king of Bohemia, the dukes of Saxony and Bavaria, the margrave of Brandenburg and the count Palatine of the Rhine; in 1693 a ninth was added, the elector of Hanover. The second chamber was composed of representatives of all the greater princes while the lesser counts and lords were combined in separate bodies each possessing a single vote. The third chamber consisted of the representatives of the immediate cities; their right to a casting vote when the other two houses disagreed was however disputed, and they were virtually condemned to insignificance. The working of this assembly was made very difficult by the fact that the representatives of the different estates had to obtain the consent of their principals on every vote. As communications were difficult and slow, the proceedings were often dragged out interminably, and it became excessively difficult to obtain consistent decisions.

Besides the *Reichstag* there existed a further general imperial organization, the *Reichskammergericht,* the supreme judicial body of the empire. It met first at Speyer and later at Wetzlar and was financed by the estates. Its effectiveness was seriously impaired, however, because the greater principalities were exempt by special imperial privileges from its jurisdiction. In addition the emperor maintained a separate *Reickshofgericht* at Vienna which was in perpetual conflict over questions of competence with the *Reichskammergericht.* Moreover, as the procedure was very complicated, the hearing of processes was almost incredibly prolix. and at times a decision was never reached. An inquiry held in 1772 revealed that no less than 61,233 suits were still awaiting judgment by the *Reichskammergericht.*

The empire possessed no army or police force and was unable to take precautions to safeguard its territory, to preserve law and order among its citizens or to protect the interests and lives of its subjects abroad. When the empire went to war each estate had to furnish a stated quantity of troops and ordnance. The amount was recorded in a register. When the numerous small contingents did assemble at the appointed date and place, which rarely happened, the troops were variously armed and for the most part were made up of raw levies. The organization of larger forces was difficult because no estate would permit its soldiers to be placed under foreign command. When it is also remembered that the troops were never trained together, it is easy to understand that an imperial army composed in such a manner rarely possessed any real military effectiveness. There existed no regular taxation, and the necessary duties were collected on the basis of a register in which each constituent estate of the empire was assessed at a definite rate. These amounts, however, were regularly diminished because the different estates protested that their ability to pay was rated too highly; and payment into the imperial treasury was very irregular. It can therefore be said with truth that after the peace of Westphalia the empire was a conception that ceased to have real meaning in Germany, for administrative measures were carried out not by the empire but by the individual territories that had grown up within it and had practically attained to the status of independent states. The number of these states was extraordinarily large, and has been estimated at about 1,800 including some amazing examples. The smallest territories were the dominions of the knights of the empire, numbering some 1,475. These were nearly all situated in southwest Germany, and their joint population amounted to about 500,000. Each individual territory averaged about 300 inhabitants. These territories, therefore, were no more thdn properties which, since their owners were free knights of the empire, were not under the dominion of a prince, but directly dependent on the emperor and the empire. In this instance the capacities of landowner and sovereign lord were united in the same person, who administered the law and exercised police rights over his little territory. These knights of the empire were unrepresented in the *Reichstag.*

Then there were 51 free imperial cities with a total population estimated at about 750,000. Included in their number were certain of the more important ancient commercial towns such as Hamburg, Bremen, Nuremberg, Augsburg, Ulm, Strasbourg and Frankfurt-on-Main but the vast majority were small and insignificant country towns of 2,000 to 3,000 inhabitants in southwest Germany which had had the good fortune, like the knights, to be protected by their ancient privileges from coming under the rule of a prince. For the most part these towns and cities were governed by a small number of patrician families who monopolized all positions of influence and profit and often gained a reputation for devoting the revenue of the tonn more to their own special interests than to those of the citizens at large. With certain exceptions, these towns were little animated by civic spirit and the desire for economic progress. Moreover they were overshadowed by the capitals rising round the residences of the princes although these had not the advantages enjoyed by the free cities.

The 63 ecclesiastical principalities (archbishoprics. bishoprics, abbacies) with their population of about 3,000,000 had special characteristics. Here the supreme lord was a bishop or abbot elected by the cathedral chapter with whom he shared the administration of the district. The chapter was almost entirely composed of the nobility of the neighbourhood, since these religious foundations and orders afforded the nobles a convenient opportunity of providing for their younger sons in a manner befitting their rank. For the most part the administration was bad, and it was not until the 18th century that a few of the ecclesiastical princes were sufficiently enlightened to introduce important reforms. Many bishops used their high position to further the interests of their families by making over to them ecclesiastical estates and by filling the chapters mith their relatives.

The temporal principalities and countships numbered between 170 and 200; the number varied because the estates were often divided among different lines of the same family, and many principalities united by inheritance under one prince. A patriarchal form of government characterized the smaller principalities, in nhich the prince was personally acquainted with most of his subjects, concerned himself in their family affairs and expected them to take a similar lively interest in the joys and sorrows of his own family. Nearly all these lesser princes maintained a magnificent court and employed a number of officials out of all proportion to the size of their principalities; they were especially inventive in introducing fresh methods of taxation by which they sought to obtain the money for the upkeep of their courts. A true political life was naturally impossible in all these miniature states and was only to be found in the few larger principalities. Of these, the greatest was in the possession of the house of Habsburg which ruled over a vast territory in southeast Germany composed of the kingdom of Bohemia, Austria, Styria, Carinthia, Carniola and Tirol and in addition a number of scattered possessions in southern Swabia stretching to the banks of the Rhine. These territories could not be regarded as constituting a single state, for from time to time they were divided among various branches of the ruling house, and it was only in 166j after the failure of the Tirolese line that Leopold I finally united all the possessions of the Habsburgs. The individual states, however, kept their own administration and diets, and the central authority for the whole territory, which Maximilian I had begun to establish, was still very unwieldy and exercised little control.

Next in importance came the territories of the house of Hohenzollern. The margrave of Brandenburg had inherited in the 18th century the district of East Prussia which had hitherto owed allegiance to Poland. At the same time he inherited from the last duke of Julich the district of Cleve in western Germany together with the countship of Mark and Ravensberg in Westphalia. After the death of the last Pomeranian duke, the treaty of Westphalia gave to the Hohenzollerns eastern Pomerania and, as compensation for western Pomerania. ceded to Sweden. the former bishoprics of Magdeburg, Halberstadt and Minden. The centre of their territory extended from the Elbe and the Harz mountains almost to the bank of the Vistula, while East Prussia (which was cut off from the central territory by Polish West Prussia) and their territories on the Rhine and in Westphalia formed districts loosely joined to the main body. The individual districts maintained substantial independence and did not look upon themselves as forming part of a single united territory, but rather as districts that had by chance come into the hands of the same ruler. After the Habsburgs and Hohenzollerns came the house of Wettin, which was divided into so many branches that the head of the house, the elector of Saxony, only ruled personally over a portion of its territories. The same was true of the house of Wittelsbach, of which the most powerful member was the elector of Bavaria, ruling over the largest and most compact territory, whereas the widely scattered lands in the Palatine were divided among numerous cadet branches of the family. In northwestern Germany the leading role fell to the house of Welf, whose lands in Hanover and Brunswick were shared among innumerable members of the family, The other important territories were the duchy of Württemberg and the margraviate of Baden in the south and the lands of the house of Hesse in central Germany. In these greater states there existed estates in which the landowning aristocracy exerted the predominant influence, but in which the civil population of the towns was also represented. These diets claimed that no new legislation could be enacted, no fresh taxation introduced, and no burden of loans laid upon the state without their consent. While the princes endeavoured to reduce the old-established power of the estates, they did not dare to suppress it outright. With the assistance of their paid officials and the support of the standing armies which had been maintained in all the greater states since the Thirty Years' War, the princes succeeded in the course of the 17th and 18th centuries in increasing their power until in fact they became absolute rulers; while the rights of the estates dwindled away more and more.

Administration and justice were far better in these greater states than in the smaller territories, and by developing the police system the princes ensured peace and order within their states. Political life in Germany was confined to these larger states. The only question was whether they would not gradually become wholly independent, and thus destroy the last traces of that national alliance of all the Germanic peoples that still existed in the old imperial state union (*Reichsverband*). In that event, Germany would have been divided into a number of independent states, each of which would have pursued its own special interest, and one could then have spoken of a German nation only in so far as the inhabitants of the different states possessed in common a similar language and certain common elements of intellectual culture. Such a collapse of the empire could only be avoided either by strengthening the power of the empire to such a degree that the central authority could bring the individual territories into submission, or by one of these territories becoming so strong that the remainder would be forced to submit to its leadership.

Ferdinand 111.—The sovereign princes of the German states were not sufficiently gifted to construct a real government in the midst of the difficulties then prevailing in Germany. Ferdinand III (1637–57) had been brought up in a strictly religious atmosphere and was dominated by his confessors. He had never given evidence of any special qualities. His eldest son, Ferdinand, who during his father's lifetime had been chosen as his successor by the imperial electors, died before him in 1654 and notwithstanding all his endeavours, the emperor was unable before his own death to bring about the election of his younger son, Leopold, as king of the Romans. Hence, when the emperor died in 1657 an interregnum followed that lasted for almost a year. until finally the electoral princes united to elect Leopold (Aug. 18, 1658) ; he was, however, compelled to sign a capitulation by which the imperial rights were still further reduced.

Leopold I and the French **Wars.**—Leopold, who until 1705 was to be the head of the German peoples, was 18 years old at the time of his election. He had originally been destined for the church; he was a thorough theologian, and a pious and bigoted churchman. Very reluctantly he abandoned his religious life in order to assume the duties of a temporal ruler. He invariably regarded the promotion of the interests of the Catholic Church as his first duty, while those of the house of Habsburg and of his Austrian territories had for him a quite secondary importance. He had little sympathy for the empire and its needs. Under the influence of his Spanish mother, Maria Anna, his education had been entirely Spanish, and in his immediate circle Spanish alone was spoken. Though kindly. well-intentioned. benevolent, and even weak by nature, Leopold was pitiless and unyielding in all matters involving either interest of the church or his own sovereign rights. His firm conviction that he was an instrument and agent for the execution of the divine will endowed him with an almost unshakable spiritual equanimity. Although he was not a man of action, Eeopold was exceedingly tenacious in maintaining his own point of view and in guarding his own interests.

In the first decade after the peace of Westphalia, the primary concern of all the estates was the maintenance of peace. As the war between France and Spain lasted until 1659, and as grave issues were arising in north and east, Germany could easily have been involved again in a general war. As no one believed in the ability of the emperor to safeguard the empire from this danger, there grew up a network of alliances between the different estates for mutual defense. The elector John Philip of Mainz succeeded in uniting the most important Catholic and Protestant princes in a great defensive alliance. The Confederation of the Rhine was signed on Aug. 16, 1658, for three years and had for its object the full execution of the peace of Westphalia, the prevention of foreign wars and the defense of its own territories. But in fact this alliance, which the emperor regarded as directed against his authority, very soon became largely dependent on France. It was frequently renewed and lasted until 1667.

During the first Northern War (1656–60), the emperor, in the Catholic interests, supported the Catholic king of Poland, John Casimir, and the elector of Brandenburg, Frederick William, who at the outset supported Sweden, later entered into an understanding with Poland and the emperor. These wars, however, were waged for the most part outside the territory of the empire, and Germany was far more deeply disturbed by the course of events on its western frontier.

Since 1661 Louis XIV had personally governed France, and in accordance with the traditional French policy which had been built up under Richelieu and Mazarin, he sought to advance the French frontier to the Rhine and to include Belgium within the French kingdom. Belgium and the Franche-Comte still belonged to Spain, and hence Louis's policy led in 1668 to a renewal of war between France and Spain. The intervention of England, Holland and Sweden brought the war to a conclusion after a few months by a peace which Spain purchased at the cost of the surrender of certain fortresses in southern Belgium. As Louis XIV was unable to dissolve this triple alliance, he endeavoured by means of a sudden invasion to crush Holland and succeeded in getting the archbishop of Cologne, the elector Palatine and the bishop of Miinster to allow the passage of his armies through their territories. The neighbouring states, which feared that they would be involved in the war, witnessed these intrigues with great disfavour and invoked the assistance of the emperor and the empire. As, moreover, Louis XIV had, without any legal grounds, driven the duke of Lorraine, Charles IV, who was a prince of the empire, out of his duchy, the empire had good cause to intervene.

But Leopold still hesitated to take any action against Louis XIV. In view of the anticipated extinction of the Spanish branch of the Habsburgs, his main policy mas to unite the Spanish monarchy with his own territories. This policy depended for its success upon the acquiescence of the French king, and since Louis was clever enough to dangle before the emperor the hope that France would help him to fulfil his desires, Leopold did not feel himself at liberty to oppose Louis in his schemes. Hence the Dutch found their sole support in the elector of Brandenburg, Frederick William, who had grown up in Holland and whose first wife had been a princess of Orange. By cutting the dykes and flooding the country the Dutch were able with great difficulty to avert the French attack in 1672. At the urgent request of the estates, Leopold determined to send an army under Raimondo, count of Montecucculi, for the defense of the imperial frontier on the Rhine, but with instructions to maintain the defensive. The empire declared war on France at the same time as Spain. The war mas chiefly waged in Belgium and on the Rhine. Louis XIV allied himself with Sweden, which at his request invaded Brandenburg from Pomerania in order to restrain the elector Frederick William, who was participating in person in the war against France. At the same time Louis XIV entered into relations with Poland and Turkey, and with Hungary which was discontented with the Habsburg rule. The emperor then found himself threatened in the rear. By his victory at Fehrbellin on June 28. 1675, Frederick William of Brandenburg drove the Swedes out of his territory and occupied nearly the whole of Swedish Pomerania. The French on the other hand were for the most part victorious in Belgium and on the Rhine. As the war dragged on without any definite decision being reached, Louis was able to induce first Holland and then Spain to conclude a separate peace. When the emperor saw that he could no longer hope to obtain any success by carrying on the war, he concluded the peace of Nijmegen with France in Feb. 1679. The greater part of Alsace and Lorraine, as well as the former Austrian territory of Breisgau, remained in French possession. The elector of Brandenburg. who was required by the peace to give up all his acquisitions in Pomerania, was unwilling to subscribe to such terms and for a short time carried on alone a forlorn fight. In the following year, however, he too was compelled to conclude peace.

In consequence of these events, Louis XIV became convinced that the weakness of the empire was such that he could encroach upon its territory with impunity. He established in the French law courts in Metz, Breisach and Besançon so-called chambers of reunion (*Reunionskammern*) for the purpose of determining what lands had at any former time belonged to the districts which had now been ceded to him. As the result of these investigations he declared that the countship of Mömpelgard, the whole of Alsace and certain districts in the Palatine and Trier belonged by right to France; and he sent his armies to occupy these districts. The imperial city of Strasbourg, which was included in these districts, was on Sept. 28, 1681, forcibly seized and at once erected into a powerful French fortress. The emperor and the *Reichstag* contented themselves with ineffectual protests against these acts of violence.

That the emperor did nothing to safeguard the integrity of the empire at this crisis is partly accounted for by the fact that his own immediate territories were menaced by many grave dangers. The Turks in Hungary were planning a desperate attack on Austria, and in the spring of 1683 appeared with a powerful army before the walls of Vienna. But Riidiger, count of Starhemberg, managed to defend the city until the arrival of an army under John Sobieski of Poland and the electors Maximilian Emmanuel of Bavaria and John George III of Saxony, which defeated the Turks and freed Vienna.

When Louis XIV, on grounds that had no legal justification whatever, sought to bring the Palatinate within his grasp, claiming it as the inheritance of Elizabeth Charlotte, the wife of his younger brother, Philip, duke of Orléans, war once more broke out in the west. The French armies invaded the Palatinate, and the emperor resumed the war in alliance with Holland and England. This new war lasted for nine years, inflicted severe losses on the French, but did not result in any decisive victory. Once more Louis was able to sow dissension among his enemies and to isolate Germany, and the emperor was forced to conclude the peace of Ryswick in 1697, with but small gain to himseif. Louis abandoned his claim to the Palatinate and the districts outside Alsace that had been declared to have once formed part of it. Further he had to restore his duchy to the duke of Lorraine, but he retained the whole of Alsace and also Strasbourg.

The **Conquest** of Hungary.—Meanwhile the war between the emperor and the Turks continued in the east; two-thirds of Hungary remained in Turkish hands. Prince Eugene of Savoy, one of the greatest generals of the age, was appointed to command the Austrian army and defeated the Turks in a decisive victory at Zenta (Aug. 29, 1697). Prince Eugene invaded Serbia and Bosnia and forced the Turks to conclude the peace of Carlowitz on Jan. 26, 1699, by which the entire kingdom of Hungary, with the exception of the Banat of Temesvar, was restored to the emperor. It was the conquest of Hungary that paced the way to the later Habsburg monarchy and its position as a great power.

The Spanish Partition Treaties.—Shortly after this the last Habsburg to occupy the Spanish throne, Charles II of Spain, died (Nov. 1, 1700). The question of succession, which had already occupied the European diplomats for decades, had now to be settled. The emperor Leopold's mother and his first wife had been Spanish princesses, and at the time of his marriage it had been expressly agreed that, in event of the failure of a male heir to the Spanish house, his children should be regarded as the heirs. But Louis XIV was also the son and husband of Spanish princesses. On marrying into the house of France. indeed, it had been stipulated that they should renounce all their rights to the Spanish inheritance. Louis. however, declared that this renunciation was invalid because the promised dowries of the princesses had never been paid in full. Louis had endeavoured to come to an agreement with Leopold about the partition of the Spanish dominions, but without definite result. These projects for a partition had aroused great uneasiness in Spain, and Charles II determined to make a will. By his first marriage with the princess Margaret Theresa, Leopold had only one daughter, who was married to the elector Maximilian Emmanuel of Bavaria; the only child of this marriage, the crown prince Joseph Ferdinand, then six years of age, was designated in 1698 by Charles II heir to all his possessions, but the young prince died in the following year. Then Charles II under pressure from the French party at the Spanish court was persuaded shortly before his death to draw up a second will in which he named as his sole heir Philip. duke of Anjou, a grandson of Louis XIV and Maria Theresa of Spain, who was then 17. Acting on this last will, Louis XIV despatched his armies into Spain as soon as he learned of Charles's death and sent his grandson to Madrid where, under the title of Philip V, he assumed the reins of government. (See also SPAIN.)

The War of the Spanish Succession (**1701–14**).—It remained to be seen, however, whether the success of this sudden and violent measure would be lasting. First there was the danger that the emperor would refuse to recognize the Validity of Charles's wiil and attempt, if necessary, to support his own claim by force of arms. Further, the interests of the other European states were deeply involved in this question. England and Holland, old enemies of Louis XIV. had as little desire as the emperor to see the great Spanish kingdom, with Belgium, Naples, Sicily, Milan and the rich Spanish possessions overseas, pass into the hands of the French king, whose power was already a sufficient menace to them. William 111 of Orange, stadholder of the Netherlands and since 1689 also king of England, believed that this must be prevented in the interests of both the countries over which he ruled. He was the first to stress the theory of a European balance of power and was the soul of the Grand Alliance concluded in the fall of 1701, between the emperor, England and Holland. Among his supporters Louis XIV reckoned-Hungary. which was anxious to throw off Austrian domination, the English supporters of James II, who had been dethroned in 1688, and a number of German princes, chief of whom was the elector of Bavaria. Louis possessed a seasoned army led by skilled generals and already held the greater part of the lands in dispute. It is true that his finances were in a bad state because the frequent wars of these latter pears and the extravagance of his court had involved him in heavy debt. Among the allies there existed points of disagreement especially after the death of William III (1702) when the close relationship maintained between England and Holland was dissolved and opposition to the war gained strength in England. But they had at the head of their armies two generals of outstanding military ability, Prince Eugene and the duke of Marlborough, whose harmonious co-operation was rarely broken by differences of opinion. In the first years of the war the advantage lay with France. Its position was such that it was able to strike a deadly blow at Austria by a concerted attack from the Rhine and Italy. This danger was averted by the union of Prince Eugene and Marlborough and the allied armies won a decisive victory at Blenheim on Aug. 13, 1704. The French general Camille Tallard was taken prisoner and the French army forced to retreat across the Rhine. Bavaria, whose elector was allied with Louis XIV, was occupied by the imperial troops and the elector Maximilian Emmanuel was forced to fly to Brussels. On May 5, 1705, the emperor Leopold died and was succeeded by his eldest son, Joseph I, then 27 years old. His arrogant bearing aroused great resentment in Germany and impeded the prosecution of the war.

Meanwhile a fleet of the maritime powers attacked Spain. The younger brother of the emperor Joseph, the archduke Charles, who was the imperial claimant to the Spanish throne, accompanied this fleet, which seized Gibraltar, sailed along the east coast of Spain and effected a landing at Barcelona. Catalonia rose in support of the archduke and by the summer of 1706 Charles was able to enter Madrid. In that year Marlborough gained a great victory over the French at the battle of Ramillies (May 23), and occupied almost the whole of Belgium. Eugene took command of the allied forces in Italy, and by his victory at 'Turin (Sept. 7) relieved the army, which had been surrounded, of the duke of Savoy and drove the French out of Italy. A year later Eugene occupied the kingdom of Naples.

The French, after failing in a renewed attempt to cross the Rhine into Swabia, concentrated their main military strength in the Netherlands. Eugene hastened thither with the imperial troops and again joined forces with Marlborough. After their victory at Oudenarde (June 11, 1708) the allies captured Lille. Louis XIV expressed his readiness to renounce on behalf of his grandson all claims to the Spanish throne and to agree to a restoration of the Franco-German frontier on the line laid down in the peace of Westphalia in 1648. This meant restoring Strasbourg. The allies, however, thought that he was only playing for time and demanded that he should place his troops at their disposal to help in the expulsion of his grandson from Spain. When he refused to do this, they broke off negotiations.

Once more the allies were victorious at Malplaquet (Sept. 11, 1709) and captured the fortress of Mons. Louis again sued for peace and now declared his willingness to concede to Germany his acquisitions in Alsace and the three bishoprics, Metz, Toul and Verdun. He further offered to pay a sum of money to be used in driving his grandson out of Spain. Intoxicated by victory the allies stood firmly by their former demands, and negotiations once more broke down.

A change now occurred in the general political situation which threatened to rob the allies of all the fruits of their victories. In England the Tories, who were opposed to the war, came into power and entered into negotiations with France for a separate peace. The other allies, too, were disturbed by the death of the emperor Joseph I (April 11, 1711), for as he left no son, his younger brother Charles was elected emperor. If Spain, Austria and the empire were all to be united under one ruler there was danger that such a disproportionate concentration of power under the house of Habsburg would threaten the European balance of power more seriously than the establishment of a second French dynasty in Spain. Neither England nor Holland nor Savoy felt disposed to prosecute the war for such an object; a peace congress assembled at Gtrecht in 1712 and the chief treaties were signed on April 11, 1713. The emperor was awarded only a portion of Lombardy and the Neapolitan mainland; no mention was made of a restoration of the old Franco-German frontier. Meanwhile the emperor and the Reichstag were still fighting, but when Landau and Freiburg-im-Breisgau had been captured by the French, they were forced in the treaties of Rastatt and Baden (March 7 and September 7, 1714) to assent to the terms of the peace of Utrecht. The frontiers of the German empire remained as laid down in the treaty of Ryswick (1697). The prospect of winning back the old German territories in the southwest, which a few years before had seemed so near realization, now completely disappeared. Moreover the emperor was forced to agree that the elector of Bavaria should recover his territories. Thus the War of the Spanish Succession had overthrown the supremacy enjoyed by France in Europe in the early years of Louis XIV's reign without yielding any profit to Germany. (See also SPANISH SUCCESSION, WAR OF THE; UTRECHT, TREATY OF.)

The Northern War.—At the same time another long-standing quarrel came to a head in the north and the east. The accession to the Swedish throne of the young king Charles XII (1697) gave Sweden's enemies a chance to unite in an attempt to oust it from the position of power in which it had been placed during the Thirty Years' War by Gustavus Adolphus. In 1697 the elector Frederick Augustus I of Saxony, after conversion to Catholicism, was elected king of Poland. In alliance with Denmark and the Russian tsar Peter the Great, he began a war in the summer of 1700 which was to last more than 20 years. By the spring of 1706, Charles was in possession of the greater part of Poland and the capital, Warsaw, and in agreement with a section of the Polish nobility had set up Stanislaus Leszczynski as king in opposition to Frederick Augustus. But Charles conceived the plan of overthrowing his chief enemy by seizing his German lands, and so rendering it impossible for him to receive money and reinforcements from Germany. To effect his purpose, he marched through Silesia toward Saxony, occupied a great part of the elector's domains and established his headquarters during the winter of 1706–07 in Altranstadt near Leipzig. But the peace which he compelled Augustus to sign and in which the latter renounced his claim to the Polish throne did not long remain in force. In the meanwhile Peter the Great had organized an efficient army with which he threatened to occupy Poland. Charles marched to oppose him and was completely defeated at Poltava (1709) and forced to take refuge in Turkish territory. The Swedes were driven from Poland, and their allied enemies invaded Swedish territory on all sides. The elector of Brandenburg who, with the emperor's consent, had assumed the title of king in Prussia in 1701, also took part in this attack upon his old enemy. The Swedish possessions in Germany, Pomerania, Bremen and Verden were seized, and when Charles returned from Turkey, he found himself powerless to give a more favourable turn to the war.

After Charles had been shot at Halden on the Norwegian frontier, the conclusion of peace was possible. Sweden was forced to surrender Bremen and Verden to Hanover and western Pomerania south of the Peene to Prussia. Of greater importance for future relations of Germany and Russia was that Estonia, Livonia and Ingermanland fell into the hands of the tsar, giving Russia a firm foothold on the shores of the Baltic and thereby a position that became more and more threatening to Germany. The Northern War made an end to Sweden as a great power although it retained the German districts of New Pomerania and Riigen until they were joined to Prussia in 1815.

Charles VI and the Pragmatic Sanction. — From his earliest youth the emperor Charles VI (1711–40) had been regarded by the emperor Leopold as the future king of Spain and he had been brought up in the spirit of Spanish Jesuitism. Throughout his life his dearest wish was to secure as large a share as possible of the Spanish possessions for the house of Habsburg, and Austrian policy became more and more obviously inspired by the desire to govern Italy and extend the Habsburg rule to the lower reaches of the Danube. The emperor had little sympathy with the interests of the rest of Germany which lay, above all, in safeguarding its western and northeastern frontiers. He exercised but limited influence in the empire and the individual states were practically independent. There was no common political history in Germany at this period though Germany's destiny as a whole was deeply influenced in the following decades by international affairs.

The lack of a male heir was the source of much anxiety to the emperor. He devoted his energies to assuring the succession to his eldest daughter, Maria Theresa, and as his action was contrary to the provisions of earlier compacts between the members of the house of Habsburg, which gave the precedence to the daughters of his eldest brother, he spared no trouble to ensure that after his death his wishes respecting the succession would be carried out. These wishes he embodied in a special law, the Pragmatic Sanction, for which he secured the approval of the diets in all the territories of his empire. (*See* AUSTRIA, EMPIRE OF.)

Charles did not consider this sufficient security in itself against the probable attempts on the part of the other heirs to secure the throne; he sought to have it recognized by the great powers and approved by the *Reichstag.* The approval of the *Reichstag* was especially difficult to obtain because two of the most important princes in Germany, the future electors Frederick Augustus II of Saxony and Charles Albert of Bavaria, had, in 1719 and 1722 respectively, married his brother's daughters and so had an immediate personal interest in frustrating the execution of the emperor's wishes. In these circumstances, the emperor was particularly anxious to secure the consent of the king of Prussia to his plan. Frederick William I of Prussia was quite willing to fall in with the emperor's wishes but demanded in return his assistance in prosecuting his claim to a part of the inheritance of the duties of Jiilich and Berg in the lower Rhine. The emperor appeared to assent to his wish and so secured the consent of Prussia to the Pragmatic Sanction by the treaty of Berlin (Dec. 23, 1728). But since it soon appeared that the emperor had made contrary promises to the rival claimants, the courts of Vienna and Berlin became estranged and Frederick William allied himself with the emperor's enemies.

War of the Polish Succession **(1733–35).**—In 1733 Augustus II of Poland (that is, Frederick Augustus I of Saxony) died. While Austria and Russia declared themselves in favour of the succession of his son Augustus III (who also followed his father as elector of Saxony), a number of Polish nobles, who were in relations with France, chose Augustus II's former opponent, Stanislaus Leszczynski, whose daughter was married to the young French king, Louis XV. Out of this quarrel arose the War of the Polish Succession (*q.v.*) which was chiefly fought in Italy and the upper Rhineland and which ended unfavourably for Austria; the emperor was forced in the peace of Vienna (1738) definitely to abandon Sicily and Naples which were placed under the rule of one of the Spanish princes, Don Carlos, though the duchy of Parma was ceded to Austria. Of special significance to Germany was the consent of the emperor to the cession of Lorraine. This duchy which had long been in the possession of France was made over to Stanislaus Leszczynski, as compensation for his abandonment of all claim to the Polish crown. After his death Lorraine was to be restored to France. The reigning duke of Lorraine, Francis Stephen, who was married to Maria Theresa, was compensated for the loss of his ancestral inheritance by the grand duchy of Tuscany. France, in return, recognized the Pragmatic Sanction with the important reservation that it only did so in so far as it did not conflict with established third party rights.

In the evening of his days the emperor found himself once more called upon to engage in war with Turkey — a war that ended disastrously for him. By the peace of Belgrade (1739), he was forced to restore a great part of the conquests made for him by Prince Eugene in the war of 1715–18, and a frontier was laid down for Serbia and Walachia that was to remain essentially the same until the outbreak of World War I.

Maria Theresa's Accession. — When the emperor Charles VI died on Oct. 24, 1740, his daughter Maria Theresa at once assumed the reins of government in the countries belonging to the house of Habsburg. The electors Frederick Augustus II of Saxony (Augustus III of Poland) and Charles Albert of Bavaria protested against her accession and were supported by France, which desired to see a partition of the Austrian territories; a still more pressing danger threatened Maria Theresa when the new Prussian king joined her opponents. Frederick William I of Prussia had died a few months before the emperor and his son Frederick II the Great thought that by virtue of certain old family compacts he could lay claim to a part of Silesia, namely the duchies of Liegnitz, Brieg, Wohlau and Jagemdorf. These claims had never been recognized by Austria, nor had they ever been completely settled. At one time, indeed, compensation had been offered but no final agreement was reached on the matter. Frederick now claimed the cession of a portion of Silesia and in return promised Maria Theresa his aid against her enemies. When she rejected his proposal, Frederick determined to occupy the disputed lands by force.

War of the Austrian Succession **(1740–48).**—In Dec. 1740 Frederick crossed the Silesian frontier, advanced as far as Breslau and defeated an advancing Austrian army near Mollwitz on April 10, 1741. As at the same time the Bavarians, supported by a French army, invaded Austria, advanced as far as Linz and even seized Prague with the help of the Saxons, Maria Theresa found herself in an extremely critical situation. Finally the German electors, under French and Prussian influence, did not elect as emperor her husband, Francis Stephen, but the elector Charles Albert of Bavaria (Jan. 24, 1742). He assumed the name of Charles VII, but throughout his three years' reign (1742–45) he never received full recognition in Germany nor succeeded in setting up a working government. When Frederick invaded Moravia in 1742, after he had secured possession of all Silesia and defeated an Austrian army at Chotusitz, Maria Theresa thought it prudent to open negotiations. Her troops had regained Linz and even invaded Bavaria, but she thought a complete victory over her other enemies impossible so long as the Prussian army threatened her flank. Frederick expressed his readiness to conclude a separate peace. England, also at war with France over colonial questions, acted as intermediary and thus the peace of Breslau (June 11, 1742) was concluded. Austria ceded the greater part of Silesia along with the countship of Glatz to Prussia and retained only the principalities of Troppau and Teschen. In return Frederick promised his neutrality. The first Silesian War, which ended with this peace, established the military reputation of Frederick the Great. It was the first armed contest between the two greatest German states that had developed out of the old empire, states which had long regarded each other with distrust and jealousy.

After the withdrawal of Prussia the struggle for the inheritance of Charles VI continued until the Austrian army captured Prague, freed Bohemia from the invaders and even captured Munich, the capital of the Bavarian pretender, Charles VII. England had also despatched an army to the continent, led by George II in person, which, after a victory at Dettingen in the summer of 1743, advanced from Hanover as far as the Rhine. The Austrians, under the leadership of Prince Charles of Lorraine, were advancing from southern Germany with the intention of crossing the Rhine, when Frederick decided to intervene again in the war. He feared that Maria Theresa, after a complete victory over her other enemies (as now seemed possible), would attempt to wrest Silesia back from him. Having signed a new alliance with France, Frederick invaded Bohemia and advanced by forced marches by way of Prague to Budweis. But as the expected simultaneous advance of the French army did not take place, he found himself forced to retire to Silesia before the oncoming Austrians. During the winter Charles VII died (Jan. 20, 1745), and his son, the elector Maximilian Joseph, at once made peace with Maria Theresa. He received back his ancestral domains in return for the renunciation of all his claims to the Austrian throne as grandson of the emperor Joseph I. As the elector Frederick Augustus II of Saxony had already abandoned his claims and made peace with Austria, and as the French were fully occupied with the campaign in Belgium, Frederick found himself alone opposed to the main force of Austria. Strengthened by Saxon troops, the Austrians attacked Silesia in the s- mmer of 1745, but were defeated near Hohenfriedberg on June 4. Once more Frederick was able to invade Bohemia, and by the end of the year a great part of Saxony was in his possession. On Dec. 1j his chief general, Leopold of Anhalt-Dessau, won a fresh victory over the Austrians and Saxons at Kesselsdorf, near Dresden.

The majority of the electors had in the meantime at Frankfurt-on-Main elected Francis Stephen of Lorraine as emperor. As Francis I he was nominal head of the German empire from 1745 to 176j. Maria Theresa, who perceived from the events of the last few years that it would not be so easy to retake Silesia and who laid great stress on the recognition of her husband as emperor by Frederick, signified her willingness to reopen negotiations. On Dec. 25, 1745, the second Silesian War was brought to a close by the peace of Dresden, by which Frederick retained Silesia and recognized Francis I as emperor.

The War of the Austrian Succession lasted for yet another three years and was chiefly fought in Belgium. Because the French victories on land were more than offset by the English victories at sea, each of the contestants began to doubt the possibility of a decisive victory, and the dispute was finally settled by the peace of Aix-la-Chapelle (1748) which recognized Maria Theresa as sole heiress of her father and gave certain frontier districts in Lombardy to Savoy and the duchy of Parma to prince Philip of Spain.

The Seven Years' War, 1756–63.—Although peace was thus outwardly restored, the tension between Austria and Prussia remained, since Maria Theresa had never abandoned her hopes of regaining Silesia at the first favourable opportunity. Her hopes were shared by her chief minister, the prince von Kaunitz-Rietburg, who looked upon Prussia as the natural enemy of Austria. Neither party, however, wished to resume the contest without the help of powerful allies. Kaunitz had already established relations with Russia, and his special concern was to induce France to lend support to his schemes. This was an especially difficult task because for a century and a half France had been accustomed to regard Austria as its particular foe. At the same time the French viewed the growing power of Prussia with dislike and feared that French influence in western Germany would be prejudiced. Frederick, for his part, was convinced that he would again be called upon to defend Silesia from an Austrian attack. Since he was himself allied with France, whereas in earlier wars England had supported Austria, he was anxious to separate England from Austria without imperilling his good relations with France. At this time English policy was governed by growing colonial rivalry with France, especially in America. In the autumn of 1755 French and British settlers in North America had already come to blows. It was obvious that the mother countries would also become involved in the conflict. As it was feared in England that in such an event France would attack Hanover, and since Austria showed itself unwilling to undertake the protection of Hanover against a French attack, the English government sought a promise of help in such a situation from Prussia. Since it was to be a purely defensive agreement, Frederick considered that he could enter into it without breaking faith with France. On Jan. 16, 1756, Frederick concluded with England the Convention of Westminster the main stipulations of which were that Prussia should help England in the event of an attack on Hanover and that England should support Frederick in the event of an attack on Silesia. When the news of this treaty reached Paris, it was regarded as a defection on the part of Frederick; and on May 1, 1756, at Versailles, the French concluded the defensive alliance with Austria for which Kaunitz had so long laboured but which might never have materialized without the Anglo-Prussian agreement.

While Kaunitz with the zealous support of Russia set to work in Paris to turn this defensive alliance into an offensive one, *i.e.,* to secure the consent of France to the complete destruction and partition of Prussia, Frederick the Great learned of the conclusion of the Versailles treaty. As at the same moment he received intelligence that Russia was arming on his eastern frontier, and from intercepted letters perceived that an attack on Prussia by Austria, Russia and France was being planned for the following spring, Frederick determined to anticipate the plans of his enemies before their negotiations had been completed. Austria having collected a great military force in Bohemia, Frederick inquired of Maria Theresa whether her military preparations were directed against Prussia and whether she would be ready to give him her assurance that in this and the following year no attack would be made upon him. On receiving an evasive answer he gave the order to his troops to cross the Saxon frontier.

Thus began the Seven Years' War (*q.v.*), in which Frederick the Great fought against Austria, France, Russia, Saxony and Sweden. His sole ally was England-Hanover, whose support consisted mainly in a subsidy of 4,000,000 talers a year. It was only his pre-eminent generalship and his resolute determination, even in the most difficult circumstances, to lose everything rather than to consent to any diminution of his state that made it possible for him to survive these perilous years.

During the autumn of 1756 Frederick occupied Saxony and after he had first defeated a relieving Austrian army at Lobositz compelled the Saxon army to surrender at Pirna. In the following year he invdded Bohemia, defeated the Austrians near Prague and invested the Bohemian capital. When, however, he sought to turn back the advancing Austrian army under Leopold, count von Daun, he was himself heavily defeated at Kolin on June 18, 1757, and forced to withdraw from Bohemia. At the same time Russian troops invaded East Prussia, the French attacked Hanover, and the English army that was stationed there to protect the country was put out of action. Hanover was occupied by the French. A second French army, in conjunction with an imperial army, advanced from Thuringia upon Berlin. Frederick immediately attacked this army and won a brilliant victory at Rossbach on Nov. 5. As the Austrians had in the meantime invaded Silesia and seized Breslau, Frederick hastened thither and by his victory at Leuthen (Dec. 5) recaptured the capital of Silesia.

The following year saw a dangerous attack by the Russians, who occupied Konigsberg. The Austrians advanced in the southnest to join them and besieged Kustrin. Frederick, who had again attempted an attack on Moravia, was forced by this to return in order to avert this pressing danger and to prevent a junction of the enemy armies. He defeated the Russians at Zorndorf on Aug. 25, although himself sustaining very heavy losses. The Russian forces now retreated into Pomerania and besieged Kolberg. The Austrians, however, had entered Lusatia and in an attempt to expel them Frederick was defeated by Daun at Hochkirch, near Bautzen, on Oct. 14. Notwithstanding this defeat Frederick was able, on the whole, to maintain himself in Silesia and Saxony, while in the west Ferdinand of Brunswick, who commanded the English and Prussian forces, held the line of the Rhine.

The year 1759 brought Frederick to the verge of irretrievable disaster. While the French advanced in the west as far as the Weser, Frederick, who this time had been unable to prevent a junction of the Austrian and Russian armies, was heavily defeated by them at Kunersdorf on Aug. 12. His army seemed to be well-nigh exterminated. Frederick himself almost despaired, and it was only his opponents' failure to use their victory that gave him time to collect his troops again. He was, indeed, unable to prevent the imperial army from entering Dresden and occupying a part of Saxony. But having failed to overpower Frederick completely his enemies began to weaken in their attack. The illness of the empress Elizabeth hindered the operations of the Russians since it was a matter of common knowledge that the sympathies of the heir-apparent were with Frederick. Although a Russian advance guard did on one occasion (Oct. 1760) reach Berlin, Frederick was able more or less to retain possession of his kingdom. But in 1761 the Austrians captured Schweidnitz and the Russians Kolberg, and it became daily more difficult for Frederick to obtain reinforcements and money with which to pursue the war. After the fall of Pitt's ministry, the English government began to negotiate for peace with France and English financial support was no longer forthcoming. No decisive change in the situation took place until the death of Elizabeth of Russia on Jan. 5, 1762. The new tsar, Peter III, immediately made peace with Frederick and entered into an alliance with him. Although he was murdered a few months later, his successor Catherine II the Great was also of the opinion that neither a strengthening of Austria nor the destruction of Prussia would serve the true interests of Russia. She withdrew her military support from Frederick but she did not renew the alliance with Austria. Since the conclusion of peace with England, France had lost all interest in the war with Prussia and had withdrawn French troops across the Rhine. Hence Maria Theresa found herself deprived of all hope of a decisive victory and was compelled to enter into negotiations for peace. Peace was signed at Hubertusburg on Feb. 15, 1763. Frederick evacuated Saxony but retained Silesia. Both parties renounced all claims to a war indemnity.

The importance of the Seven Years' War in the history of Germany lies in the failure of Austria's attempt to destroy Prussia before Prussian power was consolidated. But the hostility between the two greatest German states continued to exist and to influence powerfully the whole future political development of Germany.

Joseph II.—The emperor Francis I died (1765) soon after the conclusion of peace, and was succeeded by his son Joseph II (1765–90) who was appointed co-regent in the Austrian possessions by Maria Theresa. As long as his mother was alive, however, he exercised a very limited influence upon internal Austrian policy. His ambition therefore led him to invest the imperial position with new significance, to reform the *Reichshofrat* and the *Reichskammergericht,* and to restore many imperial rights that had fallen into disuse. He was steeped in the ideas of the *Aufklärung* and endeavoured to introduce them into public life. But although he was a man of quick perception, Joseph was a doctrinaire rather than a man of action, and he was too ready to seek to enforce his ideas without regard to circumstances. Frederick the Great said of him that he invariably took the second step before he had taken the first; and from the beginning his projects aroused the deep distrust of the German princes. Another principal concern of the emperor Joseph was the wish to secure some compensation for the loss of Silesia and indeed to extend the frontiers of his realm on all sides. This was first evident when Polish affairs called for interference on the part of the neighbouring powers.

First Partition of Poland.—When Augustus III died in 1763 he was succeeded on the throne of Poland by a king of Polish birth, Stanislaus Poniatowski. He had many enemies in Poland, however, and the Russian empress, Catherine II, sought to use these internal disputes to make herself mistress of the whole of Poland. This policy closely affected the interests of the neighbouring German states, and especially Austria and Prussia. Although Frederick the Great believed it impossible to check the expansion of Russian influence in Poland, he hoped that at least Austria and Prussia might obtain a share in the spoil. When the emperor Joseph in the course of a personal visit to Frederick at Neisse in 1769 expressed his desire for an understanding with his former enemy, a concerted action on the part of Austria and Prussia in the Polish question seemed to be possible. Joseph II devoted all his energy to the task of bringing this about, despite the disapproval of Maria Theresa, and even took the initiative of occupying Szepes.

His action was followed by the first partition of Poland by the treaty of Aug. 5, 1772. Russia received all the land lying to the east of the Dvina and Dnieper; Austria received Galicia and Lodomeria; while Prussia was given the Polish province of West Prussia, with the exception of Danzig and Thorn, the bishopric of Ermland and the district of the Netze. Though Prussia's share was the smallest, it was of very great importance in that it established the territorial unity between East Prussia and the main body of the kingdom. The knights of the Teutonic Order had indeed held West Prussia as well as East Prussia from 1308 to 1466, but under the Treaty of Thorn it had been reunited with the Polish kingdom as the province of Pomorze.

War of the Bavarian Succession.—Joseph II had designs on Germany also. In 1777 the elector Maximilian Joseph of Bavaria died, and with him the Bavarian branch of the Wittelsbachs came to an end. According to the principles of the German law of inheritance. Bavaria fell to the head of the younger branch of the Wittelsbach house, Charles Theodore, the elector Palatine. The emperor, who maintained that he himself had claims on Bavaria, succeeded in persuading the elector Palatine to make a treaty by which Charles Theodore, in return for the emperor's recognition of his rights to the remainder of Bavaria, ceded to the emperor the district of Lower Bavaria. The remaining German princes, especially Frederick the Great, saw a menace to themselves in this extension of the Habsburg power. The emperor's action seemed especially questionable because his claim was entirely unfounded; moreover, the childless Charles Theodore's heir, Charles of Zweibriicken, had protested to the Reichstag against the injury done to his rights. When the emperor sought to extend his claim to include Upper Bavaria and proposed to compensate the elector Palatine with the scattered Austrian possessions in Swabia and the Upper Rhineland, Charles of Zweibriicken again protested to the *Reichstag.* Frederick the Great promised his protection to Charles of Zweibriicken and, after he had assured himself of the co-operation of the elector of Saxony, Frederick Augustus III, invaded Bohemia in June 1778. The War of the Bavarian Succession came to an end without a decisive battle. The empress Maria Theresa, who from the beginning had disapproved of her son's actions, at once initiated negotiations with Frederick that led to the peace of Teschen (May 13, 1779). Austria received only a small district in Bavaria, the so-called Innviertel, and renounced all claims to the Bavarian inheritance.

The *League* of Princes.—Empress Maria Theresa died on Nov. 29, 1780. Joseph II now became sole ruler in Austria, Bohemia and Hungary. While he sought by far-reaching laws to transform these states into a more centralized state under German rule, to free the peasants and to reduce the influence of the church, he pursued his old schemes in foreign policy. He purchased the support of the empress of Russia by promising to help her to realize her eastern policy, and he resumed afresh his negotiations with the elector Palatine, Charles Theodore, for the cession of the whole of Bavaria to Austria. This time he offered him in compensation Belgium and the title of king of Burgundy. Charles Theodore was not unwilling to accept the offer; but once again Charles of Zweibrucken raised objections and called upon Frederick the Great for aid. Frederick seized the opportunity to put into execution a long-cherished plan. He had had sufficient experience of the unreliability of foreign alliances, and he now thought to raise the status of Prussia by an alliance with the more powerful German princes. As these all felt themselves thieatened by the emperor's action, Frederick found them more sympathetic to his idea than previously. On July 23, 1785 the League of German Princes was concluded among Prussia, Saxony and Hanover, to which were later added Saxe-Weimar, Saxe-Gotha, Palatinate-Zweibriicken, Brunswick. Baden, Hesse-Cassel, Anhalt, Ansbach, Mecklenburg, the electorate of Mainz and some other smaller states. The preservation of the integrity of the imperial constitution was the aim and object of this league. When the emperor saw that the majority of the German princes had united to oppose his projects, he was obliged to abandon them.

The League of German Princes was an important forerunner of later events since this was the first occasion on which the majority of the German states allied themselves under the leadership of Prussia and in opposition to Austria; yet it was not regarded by Frederick the Great and most of its members as a permanent institution. It mas called into being by Joseph II's projects for adding to his possessions and lost its significance with the complete abandonment of those projects by Joseph's successors. Of all its members only Charles Augustus of Saxe-Weimar sought to give it a more far-reaching character. He thought to endow the league with a permanent constitution and to establish a common legal, financial and customs administration, supported by a joint army. The league would then have taken the place in German political life of the old empire now crumbling into ruins. His plans, however, awakened no response in the other members.

The establishment of the League of Princes was the last political act of Frederick the Great. He died at Sans Souci on Aug. 17, 1786, lonely as he had lived, feared and admired by his contemporaries but not loved. The emperor Joseph II in the last years of his reign threw himself into vast undertakings in the east. The war against Turkey, into which he entered in alliance with Russia, ended disastrously for Austria and was threatening to involve the empire in a European war when Joseph died, on Feb. 20, 1790. As his successor the electors chose his younger brother, Leopold II grand duke of Tuscany, who ruled for only two years. A peaceable, prudent and farsighted man, Leopold at once sought to restore peace in the east, to bring about friendly relations with Prussia, to overcome the mistrust aroused in the German princes by the adventurous schemes of his brother and to quiet the disorder that had arisen within his dominions in consequence of the hasty reforms introduced by Joseph II.

THE FRENCH REVOLUTIONARY AND NAPOLEONIC PERIOD

The French Revolution. — After the outbreak of the French Revolution, the ideas of liberty, equality and fraternity became popular among the educated classes in Germany. The proceedings of the first French National Assembly were regarded as an attempt to put into practice in political life the great principles of reason; but public opinion was sobered and disillusioned when the Reign of Terror followed, which seemed to suggest that complete anarchy and insecurity of life and property were the immediate and the inevitable consequences of revolution. As yet the lower classes were not sufficiently independent to take a lively interest in these questions. Only in the Rhineland, which was soon afterward invaded by the French, was there any real agitation.

There was at first friction between the new rulers in France and the neighbouring German princes when the National Assembly wished to put the decree abolishing feudal rights into practice in Alsace, where many German princes had extensive estates. The princes called on the emperor and the empire for help against the execution of the French law. But the far-seeing, prudent emperor Leopold had little desire to be involved for such a cause in a war with France. Day by day the bands of French émigrés seeking refuge in Germany grew in number. They found asylum at the courts of the Rhineland princes, who permitted them to enlist and arm volunteers. The French saw in this a threat to their territory and demanded the disbandment of these troops. But even this dispute would not have led to an outbreak of war if it had not been that the course taken by the revolution and the attempted flight of Louis XVI in 1791 placed the lives of the French royal house in danger. Queen Marie Antoinette was the sister of the emperor, and she had long entreated him to support her and her husband; but Leopold considered that this would only be possible if concerted action were taken by all the great European powers. He invited the sovereigns of Europe in a circular note of July 6, 1791, to make common cause with him on behalf of the French king and queen. His proposal was energetically supported by Frederick William II of Prussia, who met Leopold at Pillnitz (Aug. 25–27), to discuss what further measures should be taken. The representatives of the French émigrés and especially the count of Artois, the youngest brother of Louis XVI, came to Pillnitz to solicit help. They were informed that only if the non-German powers also promised their support could the German states contemplate taking measures which would give the king complete freedom to decide whether to accept the new constitution. When, however, the National Assembly, after it had completed the drafting of the constitution, gave the king more liberty and when he accepted the constitution without any outward signs of intimidation, Leopold declared in a circular note of Nov. 12, addressed to all the great powers, that he considered the king's acceptance to have been a voluntary act and that the necessity for intervention by the great powers no longer existed.

Meanwhile the earlier Declaration of Pillnitz had become known in France through émigrés and had there aroused fierce resentment. In consequence of the threatening speeches delivered in the Legislative Assembly and the growing influence of extreme elements, the emperor found it necessary again to contemplate the assembling of a European congress. After he had concluded a defensive alliance with the king of Prussia for the maintenance of the integrity of their respective dominions, Leopold despatched a sharply worded note to the French government in which he announced that the growing disorder in France and the steadily increasing influence of the war party compelled him to take defensive precautions on the frontiers of the empire. The Girondists who had now taken complete control of the government demanded that he should cease all military preparations immediately and abandon explicitly the European congress. But when this reply reached Vienna, Leopold had just died (March 1, 1792). His son, Francis II, at once returned the answer that he could not grant either request until the complaints of the Alsatian princes had been settled and a government had been set up in France able and willing to carry out treaty obligations. On receipt of this reply the French government declared war on April 20.

War with France. — It is therefore not true to say that Prussia and Austria united to make war for the purpose of crushing revolutionary ideas; on the contrary, they desired to avoid war, while the Girondists in Paris were loudly demanding it. Obviously, when such a war once broke out, it would of necessity be a war for the principles of government and the enforcement of the ideas prevailing in the age of absolutism against the new ideas born of the revolution.

The Austro-Prussian campaign against France did not begin until the autumn of 1792. From the very outset its progress was' crippled by the fear that Catherine II of Russia would seize the opportunity presented by the preoccupation of the allies in France to annex the whole of Poland. The chief command was entrusted to the duke of Brunswick, who increased the resentment of the French by issuing a menacing manifesto to his armies. Since the French troops were ill equipped and badly led, the German armies succeeded in capturing Verdun and advancing as far as the passes of the Argonne. But here the duke of Brunswick delayed his attack so long that the French were able to bring up reinforcements for the defense of the passes. The bombardment of the Heights of Valmy (Sept. 20) had no decisive result. Brunswick did not dare to attempt a general assault or to advance any further since his line of retreat might be threatened. Since moreover differences of opinion had meanwhile arisen between the Austrian and Prussian commanders and news had arrived that a Russian army had, in fact, marched into Poland, Frederick William II, who was present with the army, decided to order a retreat. The allies' attack on France was thus frustrated. As Goethe rightly observed on the day of the battle, Valmy marked the beginning of a new epoch.

While it was yet winter the French took the offensive and occupied Speyer, Worms and Mainz, but failed to obtain more than a temporary grip upon Frankfurt-on-Main. Wherever the French troops came, they set up Jacobin clubs and sought to win over the population to revolutionary ideas. In this they were at first partially successful; but it was soon clear that the Paris government was more concerned with plundering the financial resources of the occupied districts than with their liberation. As soon as the inhabitants realized this, public opinion turned against the French. The threatening advance of the French on the Rhine again forced the two German powers to take vigorous steps. During 1793 the French were again driven out of Belgium, the greater part of which they had occupied. Mainz was recaptured and the German troops entered Alsace. It was not until the following year that the French were able by their victory at Fleurus to reconquer Belgium, to regain possession of Alsace and to advance on the lower Rhine as far as Aachen and Cologne. They were able to do this chiefly because Prussia had virtually retired from the war because Polish affairs demanded its whole attention. (See also FRENCH REVOLUTIONARY WARS.)

Second and Third Partitions of Poland.—In the autumn of 1792 negotiations mere initiated between Russia and Prussia for a new partition of Poland. On Jan. 23, 1793, a treaty mas signed by which Prussia obtained Danzig, Thorn, Posen and nearly all Great Poland, while Russia received Minsk, Pinsk and the frontier on the Zbrucz. Austria was merely promised assistance in reconquering Belgium. The emperor felt that he had been cheated, and his distrust of Prussia steadily increased from that time. Of the former Polish kingdom only a small and unimportant part remained in existence. The opposition displayed by the Poles to the occupation of the partitioned districts was forcibly crushed by Russia and Prussia. Both these states henceforth believed that the only security against a repetition of such occurrences lay in a complete partition of Poland. But this time Austria had to be given a share of the plunder, and after lengthy negotiations the third partition treaty was signed in Aug. 1795. Prussia got the Polish capital Warsaw with the district up to the Bug and Memel; Austria got Cracow, Siedlce and Chelm, and Russia got all eastern Poland together with Courland. The treaty was immediately put into force, and the old Polish kingdom was erased from the map of Europe without any attempt to consult the wishes of the inhabitants. The partition was a simple act of violence characteristic of the *Kabinettspolitik* of the 18th century.

Basle, Campo Formio and *Lunéville.*—Shortly before this Frederick William of Prussia had signed at Basle (April 5, 1795) a separate peace with France in order to leave himself free to deal with affairs in the east. By this treaty the left bank of the Rhine was given over to France, while Frederick William reserved the right to demand in compensation for Prussia's possessions that Germany north of a line drawn from the Rhine to Silesia should be declared neutral; French troops were not to enter this area, and in return I'russia promised to use its influence to prevent the north German princes from supporting the emperor against France. Thus Prussia once more resumed the anti-Austrian policy which it had for some years abandoned to make common cause with Austria against France.

Austria continued to carry on the war with the financial support of England for a further two years until it was compelled, as a result of Napoleon's masterly Italian campaign, to conclude the' peace of Campo Formio (Oct. 1797). The emperor was forced to surrender Lombardy and Belgium to France and received in return Venetia, Istria and Dalmatia. He was also forced to agree to the cession of the left bank of the Rhine to France. The German princes who suffered a loss of territory in consequence of this cession were to be compensated on the German right bank of the Rhine, and their claims were to be dealt with individually by a congress which was to meet at Rastatt.

This congress met but before it had completed its labours war had broken out anew. On the death of Catherine II (1796) her son Paul I had succeeded to the Russian throne; he was a bitter enemy of the revolution. Since Austria, too, was eager to throw off the hard terms of the treaty of Campo Formio, the English minister, William Pitt, was able to build up a new alliance against France. Napoleon had embarked on his expedition to Egypt, and the moment therefore seemed specially favourable for a renewal of the war. Under the leadership of the Russian general Alexander Suvorov the allied army drove the French out of Italy in 1799, but an attempt to expel them from Switzerland miscarried. Before Suvorov had arrived with Russian reinforcements the Austrian army had been defeated near Zurich. The French were also victorious over the English troops in the Netherlands, and when Napoleon returned from Egypt in the autumn of 1799 and took over the supreme command, the French armies again resumed the offensive. By their victory at Marengo (June 14, 1800) they won back Italy. They also advanced victoriously into southern Germany. Under these circumstances the allies decided to treat for peace with Napoleon, who had in the meantime become head of the French republic as first consul. By the peace of Lunéville (Feb. 9, 1801) the cession of the left bank of the Rhine to France was confirmed. Peace between France and England was signed in the following year at Amiens.

Napoleon and the Confederation of the **Rhine.**—Negotiations now began in Germany for the compensation of the German princes uho had incurred losses on the left bank of the Rhine. The *Reichstag* appointed a special commission for this purpose, but the settlement really lay in the hands of the great powers, especially France. Napoleon came to an understanding with Russia and Prussia to divide up the ecclesiastical states and the majority of the imperial cities among the injured princes. Bavaria, Württemberg, Baden and Hesse were won over by promises of especially large compensation; finally Austria was drawn in since, although it was reluctant to assent to such a great diminution in the Catholic elements in the Reichsfag, it gave up its opposition as unavailing. On Feb. 25, 1803, the results of the negotiations were embodied in the final decision of the commission: 112 states were apportioned, out of which in the first place certain foreign princes who had sustained losses elsewhere had to be compensated. Thus the hereditary stadholder of the Netherlands, who had been driven from his dominions, was given the abbacy of Fulda and certain adjoining districts; the duke of Modena the Breisgau; and the grand duke of Tuscany the archbishopric of Salzburg. Prussia was indemnified by the bishoprics of Miinster, Paderborn and Hildesheim in addition to Erfurt and a number of imperial cities in central Germany; Bavaria received the bishoprics of R'iirzburg, Bamberg, Augsburg and Freising with a number of south German imperial cities; Wurttemberg, Baden, Hanover and Oldenburg were similarly greatly increased in area. The map of Germany was entirely altered by these political changes which marked only the beginning of a transformation that was to be carried still further three years later.

Meanwhile war had again broken out between France and England. Russia and Austria made common cause with England; Prussia remained neutral. Napoleon's great victory at Austerlitz on Dec. 2, 1805, decided the war in his favour. The tsar withdrew to Russia, and Prussia, which in consequence of a violation of its territory by French troops was on the point of declaring mar on France, again entered into an understanding with Napoleon. Austria, however, was forced to sign the unfavourable peace of Pressburg on Dec. 26, 1805, to surrender Venetia to the kingdom of Italy recently founded by Napoleon, Tirol to Bavaria, and its remaining Swabian lands to Württemberg and Baden. As compensation, it received only the archbishopric of Salzburg, its former possessor, the grand duke of Tuscany, being compensated by

Wiirzburg. The emperor was also forced to recognize the elevation of Bavaria and Wurttemberg to the status of kingdoms. Napoleon set up in the Rhineland a new grand duchy of Berg for his brother-in-law Marshal Joachim Murat.

Kapoleon now resolved to unite the states that he had created or enlarged in a permanent confederation. and on July 12, 1806, he founded the Confederation of the Rhine which included Bavaria, Wurttemberg, Baden, Hesse-Darmstadt, Nassau and Berg as well as some small states. The territories of the counts and knights of the empire (*Reichsgrafen* and Reichsritter) which lay between these states were divided up among them and the rulers of the different states therefore feared that Napoleon's defeat would involve them in the loss of all that they had gained. The states of the Confederation of the Rhine remained independent in internal administration, but could not pursue an independent foreign policy and were required to place their troops at any time at the disposal of Napoleon, who had been nominated the official protector of the confederation. The members of the confederation informed the emperor and the Reichstag that they regarded themselves as having ceased to be members of the empire, and that this had ceased to exist (Aug. 1, 1806). The emperor therefore laid aside the German imperial crown on Aug. 6, having already assumed the title of emperor of Austria in 1804. The old German empire, in existence for almost 1,000 years, wholly disappeared, and the complete independence of the individual states that had grown up on its territory was legally recognized. Germany became a geographical expression, and lacked any political unity.

Prussia's Collapse and Resurgence, –Napoleon now thought that his day of reckoning with Prussia had tome. Thanks to his too cautious and wavering policy, Frederick William III found himself without support before the might of the French emperor. Frederick William was able to conclude a defensive alliance with Russia, when Napoleon's threatening speeches left no doubt as to his intentions, but, except for Russia, Prussia had as supporters only electoral Saxony and certain small north German states. When Kapoleon occupied certain Prussian districts on the Rhine in order to hand them over to the grand duchy of Berg and when he demanded that Prussia should recognize as valid this act of violence and completely disarm, Frederick William replied with an ultimatum in which he required Kapoleon to evacuate southern Germany. As Napoleon naturally refused to comply with this demand, war broke out between France and Prussia in Oct. 1806.

The defeat sustained by the Prussian armies at Jena and Auerstadt on Oct. 14 decided the fate of the Prussian kingdom. Napoleon entered Berlin in triumph and Frederick William was compelled to flee to Konigsberg. The whole of northern Germany was occupied by the French, and only a few Prussian fortresses put up a successful resistance. (See NAPOLEONIC CAMPAIGNS.) The elector of Saxony made peace with Napoleon and entered the Confederation of the Rhine in return for the conferment of the royal title. If the tsar had not at this moment come to its aid, Prussia would have been wholly destroyed. The bloody contests on the battlefields of West and East Prussia during the early months of 1807 failed to bring about a decisive victory, and Napoleon therefore entered into the peace negotiations with the tsar that resulted in the peace of Tilsit (July 7, 1807). Although Prussia continued to exist as a kingdom, it was forced to cede its entire possessions west of the Elbe in addition to the greater part of its acquisitions in the last partition of Poland. A vast war indemnity was demanded, and until it had been paid in full Prussia was required to consent to the occupation of its most important fortresses by French troops and had to undertake not to maintain an army of more than 42,000 men. Out of the territory between the Elbe and the Weser ceded by Prussia Napoleon created the kingdom of Westphalia, with which he incorporated the territory of the elector of Hesse-Cassel who had been dispossessed. He made his own brother Jerome king.

French rule in Germany brought about, directly or indirectly, important changes. In the states belonging to the Confederation of the Rhine a French administrative system and code of laws was directly imposed. In Prussia the changes came from within, though there too they were conceived and carried through by a few men with power and were not the outcome of a popular movement.

Stein and *Hardenberg*.—The chief force behind the Prussian reforms was Heinrich, baron vom und zum Stein (*q.v.*). Stein had pressed for alterations in the government before 1806 but without success. After the disastrous defeat at Jena, however, Frederick William perceived that desperate measures were needed and he appointed Stein as his leading minister, partly at the suggestion of Napoleon, ironically enough, though Stein was strongly anti-French and aimed at creating a strong Prussia which should repel the French invader and become the nucleus of a free and united Germany.

Stein came to power on Oct. 4, 1807; in Dec. 1808 he was forced to flee the country. In his single year of office, however, he produced domestic reforms which might have given Prussia a new life if they had not been allowed to disappear later under Junker pressure. The system whereby power was divided between the ministers of state and the cabinet, a body of the king's private advisers, was abolished; instead the chief ministers were themselves to offer advice and were to be the administrative heads of the various departments of state. Towns were freed from the jurisdiction of men appointed by the crown and were made instead self-governing. a reform which was to have been extended later to country districts, where government was in the hands of the Junker manorial courts. As well as making these administrative changes Stein struck at the caste system which ran through and through Prussian society. He placed himself behind the land reforms already recommended by the Immediate commission, which had been appointed by the king, and on Oct. 9, 1807, five days after he took office, he declared the Edict of Emancipation abolishing serfdom in Prussia. The laws whereby land could not pass from one class of owner to another were annulled; the Junkers were now permitted to sell their land, and the middle classes, which had the money to cultivate it, could buy it. Further, by the same edict, all the regulations confining particular occupations to particular classes were abolished. Meanwhile Gerhard von Scharnhorst (*q.v.*) was making changes in the army, trying to create a national rather than a purely professional force, and Stein supported these reforms also. Unfortunately an intercepted letter showed Napoleon where Stein's policy was designed to lead: an imperial decree was issued against him on Dec. 6, 1808, and he fled to Bohemia. His place was taken by Karl, prince von Hardenberg (*q.v.*). Hardenberg had been associated with Stein and pursued a similar policy of reform but with less force.

The War **of** Liberation — While the attention of Napoleon was fully engaged in Spain, Austria made another attempt in 1809 to regain its old position. As Russia refused its aid and Prussia after its defeat was unable to help, the war once more ended in the total defeat of Austria (Wagram, July 6, 1809). The peace of Vienna (Oct. 14) deprived Austria of Salzburg, Galicia and Istria. Napoleon erected a grand duchy of Warsaw out of the Polish lands formerly taken by Austria and Prussia and made the king of Saxony grand duke, while Dalmatia (already ceded by the treaty of Pressburg) and Istria were united to France under the name of the Illyrian provinces.

Although he was victor in this war, Kapoleon saw with anxiety the excitement these events aroused in the whole of Germany. Bodies of volunteers were formed in various districts to offer their assistance to Austria — such as those organized by Ferdinand von Schill and Frederick William of Brunsmick. Despite the fact that these movements met with no success, Napoleon deemed it necessary to unite the north of Germany still more closely with France, and in 1810, with the exception of Holland, he annexed all the German districts lying northwest of a line drawn from Cologne to Lubeck and formed them into *départements* after the French model. He had now attained the zenith of his power, and his marriage with the daughter of the emperor Francis had brought his dynasty within the circle of the ancient ruling houses of Europe. But a change came over the scene with his Russian campaign in 1812, in which the French army was almost entirely destroyed, a miserable remnant alone surviving to reach Germany in the winter.

It was only natural that Germany should seek to make use of

Napoleon's heavy defeat to shake off his rule; but there was wanting a single directing will in a country that was governed in part by princes who were vassals of France and in part occupied by French garrisons. The population of north Germany, where the rule of the foreigner had been felt most oppressively, was filled with a wild hatred against the French; in the south, where native princes still ruled and no foreign troops or officials had penetrated, emotions were less violent. For the first time the educated classes in Germany learned to understand the importance of a national state in the common life of a people. The rulers of the greater states, however, still hesitated to come to a definite decision. The emperor Francis did not wish to fight against his son-in-law, and Frederick William III of Prussia feared that he might lose the rest of his kingdom if the new war should prove unsuccessful. Only when the Russians seemed determined to pursue their fight with Napoleon on German soil were the German princes forced to decide on which side they would fight. At Napoleon's bidding, Austria and Prussia had been forced to send reinforcements to help him against Russia. The commander of the Prussian contingent, Count Yorck von Wartenburg, acting on his own responsibility, concluded a treaty of neutrality with the commander of the Russian forces opposing him. But it was only under pressure from the emperor Alexander of Russia that Frederick William finally decided to address from Breslau the "Appeal to my People" (*Aufruf an mein Volk*) in which he declared war against France. This proclamation gave the signal for a general rising in northern Germany against Napoleon. Volunteers enthusiastically rushed to arms and the Russian and Prussian troops advanced to the Saxon frontier. Austria remained neutral.

Napoleon hastened to the defense of his German allies, defeated the Russians and Prussians at Lutzen and Bautzen and forced them to retreat to Silesia. Feeling himself unable to prosecute the campaign to a final victory Napoleon concluded an armistice during which peace negotiations were opened at Prague through the intermediary of Austria. Napoleon, however, was unwilling to surrender any of his conquests and after much hesitation the emperor Francis finally made common cause with the allies and declared war on France on Aug. 12, 1813. Since England was giving financial support to the allies, and the Spaniards in conjunction with an English army were advancing from the south against France, Napoleon found himself opposed by almost the whole of Europe. After many changes of fortune, the campaign in Germany finally ended in the defeat of Napoleon at the Battle of Leipzig (Oct. 16–19, 1813). The French army had to retreat over the Rhine, the allied forces following them slowly; on New Year's Eve 1814 they crossed the Rhine and advanced into northern France. By the end of March 1814 the allies were in possession of Paris. Napoleon was compelled to abdicate his throne and appeal to the mercy of his enemies. He was banished to the island of Elba. The house of Bourbon was restored to power and, by the first treaty of Paris, France was forced to abandon all the conquests it had made since 1792. (See also NAPOLEONIC CAMPAIGNS.)

Reconstruction: the Congress of Vienna.—With the removal of French rule the difficult question of Germany's future organization arose. Austrian policy, now inspired by Prince Metternich, aimed at preventing Prussia from becoming too powerful and tried to draw to itself the German princes who had been allied with Napoleon. The emperor Francis signed the treaty of Ried with the king of Bavaria by which Maximilian was assured of full sovereign rights in his former dominions, and similar treaties were concluded with Wiirttemberg, Baden and the other states in the former Confederation of the Rhine. Thus it was no longer possible to regard these states as captured districts to be divided up among the victors. In northern Germany Hanover, whose ruler was the king of England, also remained intact. Moreover it seemed unjust to exclude from their territories the princes whom Napoleon had exiled while preserving the vassal states which he had created. Under these circumstances it became excessively difficult to find a means of giving expression to the political unity of Germany.

At the Congress of Vienna, which sat from Sept. 1814 to June 1815, the German question was one of the most difficult problems considered. Finally it was agreed that Austria should recover Tirol, Vorarlberg, Salzburg and the district of the Inn from Bavaria, Venetia and Lombardy in the south and also Dalmatia and the rest of France's Illyrian provinces. Austria kept most of Galicia. Belgium and the remaining scattered Austrian possessions in Swabia were given up. Thus Austria withdrew from western Germany, and the task of safeguarding the western frontier was passed on to Prussia, which was given a large area in the Rhineland and Westphalia, lands that on the east of the Rhine had belonged to members of the Confederation of the Rhine and on the west had formed part of Napoleonic France. These lands were entirely separate from Prussia's other possessions and a corridor joining them was refused. But the other powers, and especially England, hoped that Prussia would now provide a bulwark against possible French aggression and would be a safeguard to the new kingdom of the Netherlands. Prussia also received the Swedish province of Pomerania and about two-fifths—less than it had hoped—of Saxony; the Saxon king, Frederick Augustus I, had now to pay the penalty for having remained loyal to Napoleon to the last. Of its Polish lands Prussia kept only Posen, Danzig and what it had gained in 1772. The rest of Poland, apart from Galicia and from Cracow, which was made a free city, went to Russia, though it was promised a constitution. In compensation for the territory now handed back to Austria, Bavaria was given Wurzburg and the Palatinate lands on the left bank of the Rhine, together with the south German districts of Ansbach and Bayreuth, which were renounced by Prussia. Hanover gave up Lauenburg to Prussia, but was enlarged by East Friesland, Hildesheim, Goslar and some smaller lands.

After the settlement there remained in Germany 39 different states, of which four were the free cities of Hamburg, Bremen, Lubeck and Frankfurt; the rest had monarchical constitutions. The idea of restoring the empire was abandoned and the 39 states formed a union whose constitution was laid down in the Federal act of June 8, 1815. (E. BRA.; X.)

THE GERMAN CONFEDERATION, 1815–1866

The 1815 Settlement.—The Napoleonic Wars had broken the old political structure of Germany. At the same time the administrative changes brought about by the French and the patriotic emotions of the war of 1813 had led many Germans to demand a measure of German unity, and also constitutional reforms in the individual states. The history of the next 50 years in Germany showed the difficulty of reconciling these two demands and determined the form that German unification was to take.

The establishment of the German confederation at the Congress of Vienna satisfied neither the demand for German unity nor the demand for constitutional reform. The sovereign independence of the middle states—Bavaria, Hanover, Wiirttemberg, Baden and Saxony—was confirmed, and their rulers were reluctant to give up their new power to any central body. In the circumstances, the German confederation set up in June 1815 left few powers to the federal diet established at Frankfurt-on-Main. The federal diet was a meeting of plenipotentiaries and not a legislative assembly able to make decisions directly binding on individual citizens. It consisted of representatives of 39 sovereigns, some of whom ruled over territory not included in the confederation; for much of Austria and the Polish provinces of Prussia were excluded; the king of Hanover was also king of England; the duke of Holstein and Lauenburg was king of Denmark; and the duke of Luxembourg was king of the Netherlands. The Austrian representative acted as president of the diet. The individual states retained full sovereignty over their internal affairs. Even the establishment of a supreme court of justice for the confederation proved impossible. As any change in the confederation's basic principles could only be effected by a unanimous vote, an extension of its competence was practically impossible. The avowed purpose of the confederation was "to uphold the external and internal security of Germany and the independence and integrity of the individual German states." During the following years it was to demonstrate its inability to do either.

The establishment of the confederation in this form was largely the work of Metternich, the Austrian chancellor, and it was his influence that predominated in Germany until 1848. The working of the confederation depended on agreement between the two German great powers, Prussia and Austria. During the reign of Frederick William III of Prussia this peaceful dualism worked successfully. Frederick William was a timid, sceptical, unimaginative man with an unremitting dislike of liberalism, and he was quite ready to follow Metternich's lead both within the German confederation and by opposing domestic reforms in Prussia. Under his influence the changes introduced by Stein and Hardenberg in the stress of defeat before 1813 were never completed, although Hardenberg remained chancellor until his death in 1822. The promises that Frederick William had made in May 1815 of a representative assembly remained unfulfilled until 1847, and a long struggle was carried on in the new Prussian provinces of west Germany in an attempt to remove the French influence on the administrative and judicial systems.

Metternich hoped to use both the German confederation and the Holy alliance (*q.v.*) of Prussia, Austria and Russia (1815) as a means of fighting revolution wherever it might threaten. In a series of congresses between 1818 and 1823 (Aix-la-Chapelle, Troppau, Laibach, Verona) he tried to establish the principle that the great powers had the right to intervene to suppress revolution elsewhere; *e.g.*, in Spain and Italy. This policy was only partially successful since England refused to associate itself with it. Inside Germany. however, Metternich with Prussian support was able to use the federal diet to pursue the same ends. Some of the middle and smaller states, notably Baden and Wiirttemberg, had adopted constitutions based on representative assemblies and liberals in the other states were demanding similar measures. In the universities the student associations (Burschenschaften) were agitating for German unity, while papers like Joseph von Görres' Rheinische *Merkur* expressed liberal discontent with the settlement of 1815. In Oct. 1817 these sentiments found expression in a great gathering at the Wartburg in commemoration both of Luther's tercentenary and of the fourth anniversary of the battle of Leipzig. Within two years, however, Metternich found the excuse he needed for attacking the whole of this liberal and national movement. On March 23, 1819, August von Kotzebue, a writer of no great importance and a propagandist in Russian pay, was murdered by a student named Karl Sand. who had been associated with one of the most radical of the student organizations, the Unbedingten, led by Karl Follen. Metternich at once summoned a conference, which met at Carlsbad in August and was attended by representatives of most of the German princes. A series of decrees (the Carlsbad decrees) was drawn up and passed by the federal diet in September. The governments of the German states undertook to introduce press censorship, to remove university teachers suspected of subversive doctrines, to forbid the Burschenschaften and to establish a central commission to investigate the revolutionary movement.

The Carlsbad decrees began a decade of reaction when it seemed that Metternich had succeeded in halting the demand for national unity and constitutional change. The decrees were executed with various degrees of severity in the different states, for some, such as Baden, had a genuine constitutional life, others, such as the two Mecklenburg duchies, had preserved an almost mediaeval feudal system, while in Brunswick, Hesse-Cassel and others the most capricious and unenlightened despotism prevailed. In Prussia the most prominent of the leaders of the national and liberal movement were arrested or driven into exile.

The Zollverein. — Yet the political inactivity of the 1820s was accompanied by economic developments of the greatest importance. The end of the war had brought serious economic difficulties in most of the countries of Europe, and not least in Germany. Other countries were imposing tariffs that excluded German corn; British manufactured goods were flooding the German market. All over Germany there was an agitation for some measure that would remove the differences of tariffs, currencies, weights and measures and general economic policy between the individual German states. The economist Friedrich List led the movement in southern and western Germany, but efforts at action through the federal diet were unsuccessful. Similarly, negotiations between the governments of the southern states broke down because of particularist feeling and jealousy. By 1825 the initiative in forming a customs union lay with the one state prepared to take it — Prussia.

In June 1816 all internal customs barriers inside Prussia had been abolished and in 1818 the tariff was revised and a moderate protectionist system was introduced. Both these measures aimed at restoring order in the state's finances and at the integration of the newly won provinces into the Prussian state. From 1819 onward the independent enclaves of Schwarzburg, Anhalt and Saxe-Weimar, which were surrounded by Prussian territory, interrupting communications and serving as centres for smuggling, were absorbed into the Prussian economic sphere, so that by 1829 a large part of north Germany was included within a single customs system. In 1825 a new Prussian finance minister, Friedrich von Motz, began to extend this area. On Jan. 11, 1828, Hesse-Darmstadt adhered to the Prussian system, and by May 1829 agreement had been reached with Bavaria, whose new king, Louis I, was anxious for a customs union, and whose government had already succeeded in coming to an agreement with the neighbouring states of south Germany. The remaining states were rapidly forced in their own interests to join, and neither the attempt made in Sept. 1828 to form a mid-German commercial union (Mitteldeutscher *Handel*sverein), nor the effort to secure economic co-operation between Hanover, Oldenburg, Brunswick and Hesse-Cassel (treaty of Einbeck, March 1830) was long successful. By Jan. 1, 1834, a customs union (Zollverein) was in being including all the states of Germany except Austria and the states of the northeast, Hanover, Brunswick, Oldenburg and the Hansa cities. An attempt by the latter to form a rival union, the Steuerverein, did not long survive in the face of the changing economic situation and the attractions of membership of the Zollverein; Brunswick agreed to join in 1844, Hanover in 1851 and Oldenburg in 1852; only the great ports of Hamburg and Bremen remained outside until after the foundation of the empire. The Zollverein was a triumph for the Prussian officials who planned it. The inadequacy of the machinery of the federal diet had been demonstrated, and a step had been taken in the substitution of Prussian for Austrian leadership in Germany, since Austria was excluded from the Zollverein and the economic developments that resulted from it. Above all, a fresh impetus was given to trade and industry all over Germany, preparing the way for the great developments of the German economic system after 1850.

The Liberal Movement. — The prevailing political conditions in Germany prevented many attempts to follow the example of the French Revolution of July 1830. The particularly arbitrary rulers of Hesse-Cassel and Brunswick were deposed, and there were minor revolutionary outbreaks elsewhere. On May 27, 1832, a demonstration (similar to the 1817 Wartburg demonstration) was held at Hambach in favour of the liberal and national cause. Its sole effect was to enable Metternich to persuade the members of the confederation again to declare their support for conservative principles and to agree on further measures of repression. (The Six Articles, June 1832.)

Nevertheless, the death of the emperor Francis I in 1835 and the accession of his feeble-minded son Ferdinand began to weaken Metternich's influence inside the Austrian government. At the same time new movements in Germany began to make themselves felt. In spite of the ban imposed in 1835 on the writings of Heinrich Heine and the other writers of the Young Germany movement, in spite of the suspension of seven Göttingen professors in 1837 by the new king of Hanover, Ernest Augustus (the former duke of Cumberland, who succeeded to the throne when the crowns of England and Hanover became separated on the death of William IV), the movement for national unity and constitutional government continued to gather strength. An opportunity for demonstrating this national feeling occurred in 1841, when an international crisis gave rise to rumours of a possible French attack on Germany; it was at this time that "The Watch on the Rhine" (the title of a song written in 1840 by Max Schneckenburger) first became a national slogan.

Moreover the accession in June 1840 of a new king of Prussia, Frederick William IV, aroused hopes that Prussia might take the lead both in constitutional reform and in national unification.

These hopes were to be disappointed. The new king had, it is true, a romantic feeling for a common German past, its traditions and monuments, but this included a respect for the house of Habsburg as the traditional imperial dynasty in Germany so that he was unwilling to break the peaceful dualism that had been established in 1815. He had been brought up on the ideas of the conservative political philosophers of the romantic age, and he looked back to an idealized mediaeval state very unlike the system of government at which the liberals were aiming. Nevertheless his imagination, eloquence and enthusiasm, coupled with such measures as a relaxation of the censorship and the rehabilitation of some of those teachers and writers who had suffered for their liberal views, meant that in Prussia political activity of all kinds began to revive. New leaders of the liberal movement were emerging from the new industrial and commercial middle class of the Rhineland, men such as Ludolf Camphausen, David Hansemann, or Gustav von Mevissen, and they joined with the liberals in other parts of the kingdom in pressing for the fulfilment of Frederick William III's promise of a representative assembly, given in 1815 and not kept in his lifetime. After long hesitations and delays the king eventually summoned in Feb. 1847 an assembly composed of representatives of the diets of the various Prussian provinces, and this united diet met April 11, 1847. It soon became clear, however, that Frederick William's conception of a mediaeval system of estates (Stiindesstaat) grouped together under a king whose position derived from divine right was incompatible with the beliefs of even the mildest of liberals, and in June 1847 the diet was prorogued.

In most of the other states of Germany there were similar movements although their nature depended on the prevailing political conditions, which differed widely between the various states. In the towns artisans and apprentices were anxious to be rid of the last mediaeval restrictions on their professional freedom; in the country the peasants in south and west Germany and the German provinces of Austria wanted to be freed from their remaining feudal obligations. The intellectual classes — lawyers, professors, students — wanted freedom of speech, trial by jury and a representative system of government as well as the satisfaction of their desires for a German national state. In Austria the non-German nationalities were stirring, while the diets of the German provinces, especially that of Lower Austria, were voicing liberal demands. Liberal leaders in the individual states of Germany were beginning to meet one another and to draw up common programs expressing their liberal and national aims.

The Year of Revolution. — It only needed the example of the Paris revolution of Feb. 1848 to bring these discontents in Germany to a head. Within a few weeks the governments in most of the middle and small states had yielded to popular agitation, promised a constitution and appointed liberal ministers. In Bavaria, where dislike of the king's favourite, Lola Montez, had confused the political situation, Louis I was forced to abdicate in favour of his son Maximilian on March 20. The revolution scored equally easy and surprising successes in Vienna and Berlin. On March 13 Metternich was forced to resign and then went into exile; the emperor promised a constitution, and a national guard was formed. At the same time the non-German nationalities in the empire were demanding autonomy and constitutional government. On March 18, encouraged by the events in Vienna, the inhabitants of Berlin, not content with the promises the king had already made of summoning the united diet again, started riots in the streets. The king, with characteristic impetuosity, issued a long-winded sentimental proclamation "to my dear Berliners" and later even consented to salute the corpses of those killed in the street fighting. On March 19 on his orders the troops were withdrawn from the city although they could easily have suppressed the disturbances. A constituent assembly was summoned, and a ministry headed by the Rhenish liberals Camphausen and Hansemann was appointed.

These easy revolutionary successes in the individual states were accompanied by plans for establishing a measure of national unity. On March 5 a meeting of the leading academic liberals at Heidelberg had declared in favour of a national representative assembly, while the Hessian statesman Heinrich, Freiherr von Gagern sent his brother Maximilian on a mission to the courts of Germany to try and secure common action. These efforts were overtaken by the revolutions in Berlin and Vienna. The initiative now lay with the liberals rather than with the princes. The Austrian government was distracted by the national revolt in Hungary and by the revolution in Milan and the war with the kingdom of Sardinia for the possession of Lombardy. In Prussia Frederick William appeared to be prepared to co-operate in the work of German unification and declared on March 21 that henceforth Prussia would merge itself in Germany.

The Frankfurt Parliament. — A preliminary parliament met in Frankfurt at the instigation of the liberal leaders who had assembled at Heidelberg early in the month, and it established a committee of 50 to prepare for the election of a national assembly. The elections were duly held though the electoral laws and methods varied considerably from state to state, and on May 18 the national assembly met in the Paulskirche in Frankfurt. The success of the moderate liberals in the elections to the diets of the individual states and in the electrons to the Frankfurt parliament, together with the defeat of a radical rising in southwest Germany in April, led liberals all over Germany to hope that a constitution for a united Germany might emerge without difficulty.

The Frankfurt national assembly devoted a great deal of its time to the discussion of general principles and of the basic human rights it was necessary to guarantee in the new united Germany. But it also had to decide on immediate practical problems, such as the nature of the executive power and Germany's territorial extent. As a temporary answer to the first problem the archduke John, an uncle of the emperor Ferdinand and the most liberal-minded member of the Habsburg family, was appointed regent on June 29, and a government was formed under Charles, prince of Leiningen, the halt-brother of Queen Victoria. Yet it soon became clear that the executive appointed by the Frankfurt parliament had no power except such as was granted to it by the governments of the individual states. The Frankfurt parliament took over the conduct of a war with Denmark about the duchies of Schleswig and Holstein. Frederick VII of Denmark wished to separate Holstein from the German confederation and treat both duchies like the other provinces of the Danish kingdom. (See SCHLESWIG-HOLSTEIN QUESTION.) The war had broken out in April and was being waged by Prussian troops under a Prussian commander in chief, Friedrich, count von Wrangel. The Prussian government alone decided when the war should end and signed the peace of Malmo on Aug. 26. The war had been the object of great national enthusiasm, and Prussia's decision to end it (because the king was losing interest in liberal causes and feared international complications) became a source of such dissatisfaction at Frankfurt that Leiningen was forced to resign on Sept. 5, 1848. He was succeeded by Anton von Schmerling, a moderate liberal from Austria, who held office until December when he was succeeded by Heinrich von Gagern.

The Counterrevolution. — In September and October, during the political crisis caused by the end of the war with Denmark, revolutionary outbreaks by radical republicans in Frankfurt itself and in the southwest of Germany had to be suppressed. These risings were defeated only with the help of Prussian and Austrian troops. In October a similar revolt in Vienna was also suppressed and the city was bombarded by Alfred, prince von Windischgratz. By the end of the year the counterrevolution had triumphed in both Austria and Prussia. The emperor Ferdinand abdicated in favour of his 18-year-old nephew, Francis Joseph, on Dec. 2, and the new Austrian minister, Felix, prince zu Schwarzenberg, was prepared to reassert the authority of the central imperial government both inside the empire and in the rest of Germany. In Prussia, too, Frederick William IV had lost all the sympathy with the liberals he had shown in the spring and was relying increasingly on extreme conservative advisers. On Dec. 5 the Prussian national assembly was dissolved and a new constitution issued by royal proclamation. A new ministry with conservative sympathies had already been formed in October under Friedrich Wilhelm, count of Brandenburg. Although it contained certain concessions to the liberals, these were largely undone in the subsequent months when the old restricted franchise was restored.

The re-establishment of conservative governments in the two great states of Germany was inevitably reflected in the discussions of the Frankfurt parliament about the nature of the sovereign power in Germany and its territorial extent. By the end of 1848 the national assembly had completed its discussions about the basic rights to be included in the constitution, and in Jan. 1849 the proposed constitution was circulated to the individual states for their comments without any decision having been taken about the person or nature of the central executive. The second reading was concluded and the constitution adopted on March 27. The final decision was that the executive power should be in the hands of a hereditary emperor, although to obtain this the radicals had to be soothed with the promise of universal suffrage. The next stage was to elect an emperor.

Meanwhile, the territorial extent of the new Germany had been partially decided by the proclamation of a new Austrian constitution on March 4. By this, the Austrian empire was treated as a single whole, and it was made clear that either the whole empire or none of it would have to enter the new Germany. This was a blow to all those south German and Austrian liberals who had hoped for a "great German" settlement that would include at least the German provinces of Austria and meant that the initiative passed to those who believed in a "little German" settlement under Prussian leadership. Accordingly, when the election of an emperor took place in the national assembly on March 28, 290 votes were cast for Frederick William against 248 abstentions. On April 3 the king received a deputation headed by Eduard Simson, the president of the assembly, which came to offer him the crown. The offer was refused. Frederick William was too deeply conservative to receive a German imperial crown from any hands except those of the other German princes. On April 21, in spite of last-minute efforts by Camphausen and the governments of some of the smaller states, the king formally declared that Prussia could not accept the proposed constitution.

Without the support of either Prussia or Austria the Frankfurt parliament could not now survive. By May Gagern's ministry had broken up and the majority of the deputies were ordered home by the governments of their respective states. The rump that remained was forced to move to Stuttgart and was finally dispersed on June 18 by William I of Württemberg. In May and June final risings by the left in Baden and Saxony were suppressed with the help of Prussian troops. The revolutions were over.

The Prussian Union Project. — With the failure of the Frankfurt assembly to achieve German unification the opportunity for action passed back to the two great powers, Prussia and Austria. In the spring of 1849 Frederick William IV was listening to the advice of Gen. Joseph Maria von Radowitz. Radowitz was a Catholic conservative who believed that if Germany was to be saved from revolution, some concessions must be made to the social and national demands of the liberals. He devised a plan for setting Prussia at the head of a union of the states of north and central Germany that should be linked with the existing German confederation. On May 26, 1849, an "Alliance of the Three Kings" was concluded between Prussia, Hanover and Saxony to further the project, and in June a congress was held at Gotha attended by some of the former members of the Frankfurt assembly — moderate liberals willing to accept Prussian leadership in a little Germany — who gave Radowitz' plan somewhat reluctant support. In spite of opposition from many of the Prussian nobility, who suspected what they held to be Radowitz' leanings toward liberalism, it was agreed that a conference should meet at Erfurt in March 1850 to discuss a new constitution for Germany.

Meanwhile, Austria too had embarked on a positive policy. The king of Sardinia, Charles Albert, had been finally and decisively defeated at the battle of Novara in March 1849. The Hungarian revolt had been crushed with Russian assistance, and the Hungarian forces had capitulated at Világos on Aug. 13, 1849. The national movement in Bohemia had already been put down in June 1848. The danger of the disintegration of the Habsburg empire had gone, and Schwarzenberg was determined to follow up his attempt to consolidate and centralize the monarchy by a reassertion of Austria's predominance in Germany. He was aided in this task by Karl Ludwig, Freiherr von Bruck, his minister of commerce, who had a grand design of uniting the whole of central Europe into a single economic sphere of 70,000,000 inhabitants, a scheme which some of the liberals in south Germany were prepared to support. By the end of 1849 Austrian diplomacy had succeeded in drawing many of the small and middle states away from Prussia; Saxony and Hanover withdrew from the union project before the Erfurt congress assembled. Meanwhile Austria had announced its support for an alternative plan of constitutional amendment put forward by Brunswick, Hanover and Wurttemberg and, as the presiding power, had summoned a meeting of the federal diet for May 1850 to re-establish and revise the old federal constitution.

In spite of the relative failure of the Erfurt meeting, inevitable under these circumstances, Radowitz continued to work for the formation of the Prussian union. In the autumn of 1850 an internal conflict in Hesse-Cassel brought Prussian and Austrian troops face to face. The elector, Frederick William I, had appealed to the federal diet for support in his struggle with the liberals and on Oct. 31, 1850, Austrian and Bavarian troops entered Hessian territory in response to the elector's appeal; shortly afterward Prussian troops marched in to assert Prussia's right to defend the military roads that linked the parts of the Prussian kingdom lying on either side of Hessian territory. Radowitz urged the reluctant king to mobilize and prepare for war against Austria, and Brandenburg had been to Warsaw to try and gain the support of the tsar. But Nicholas I's sympathies were with Austria, and indeed most Prussian conservatives (Otto von Bismarck among them) were opposed to a breach between the two traditionally conservative powers in Germany. The influence of the conservatives prevailed, for Frederick William IV was reluctant to embark on a war between Germans and in any case was never capable of pursuing a consistent policy for long. Radowitz was obliged to resign on Nov. 3 and Brandenburg died suddenly on Nov. 6. A new ministry was formed under Otto, Freiherr von Manteuffel. The new government decided to negotiate with Austria, and with the encouragement of the tsar an agreement between the two governments was signed by Manteuffel and Schwarzenberg at Olmütz on Nov. 29. By this convention (long remembered by many of the Prussian supporters of Radowitz' policy as the "humiliation of Olmutz") Prussian troops were withdrawn from Hesse, and the question of the future constitution of Germany was referred to a conference which met at Dresden in Dec. 1850.

The Restoration of the Confederation. — At this conference which lasted until March 1851, Schwarzenberg was unable to secure for Austria the position in Germany for which he had hoped. Prussia, moreover, was able to win some support from the smaller states against the idea of a strong executive in Austrian hands. As a result, the only solution was a compromise that restored the old federal constitution of 1815 unchanged. It was as if the revolutions of 1848 had never been. Nor was Austria any more successful in using its political success at Olmutz to force its way into the *Zollverein;* the most it secured was a commercial treaty with Prussia in 1853. Schwarzenberg's plans for the establishment of Austrian political power in Germany, and Bruck's plans for an "empire of 70,000,000" in central Europe had both been disappointed. Thus the restoration of the position as it had been before 1848 pleased nobody and opened a period of political reaction and dull discontent. Many liberals went into exile (one, Carl Schurz, even became secretary of the interior in the United States), while those who remained behind began to realize that the unification of Germany could only come about by the action of those actually in possession of political power.

In Prussia, Austria and nearly all the smaller states every attempt was made to return to the constitutional position of the years before 1848. The Prussian constitution promulgated in Dec. 1848 was given its final form on Jan. 31, 1850; though it still made concessions to some liberal ideas, it was based on a restricted franchise by which two-thirds of the votes were held by those citizens whose taxes were rated in the two highest groups, while only one-third of the votes were held by the poorer people who made up the majority of the population. The Austrian constitution of 1849 was replaced by a patent of Dec. 1851 which imposed a centralized bureaucratic system of government on the whole empire. In 1855 this was followed by a doncordat with the pope, which restored the Roman Catholic Church to a position such as it had not enjoyed since before the reign of the emperor Joseph II. Yet the unimaginative bureaucracy that ruled in the largest states of the confederation and the general political stagnation were accompanied by considerable economic developments. Capital was being more widely invested; the railway network was being extended and the main railway system completed; coal production was rising, so that by 1860 Germany produced more coal than France and Belgium combined. At the same time the urban population, especially in Prussia, was increasing, so that a new industrial working class was coming into being, creating new problems with which economists such as Franz Hermann Schulze-Delitzsch, the founder of the co-operative movement in Germany, and agitators such as Ferdinand Lassalle were becoming concerned. (Lassalle began his agitation in 1861 and founded the Allgemeiner Deutscher Arbeiterverein in 1862.)

Moreover, events outside Germany made it increasingly clear that the restored machinery of the confederation was inadequate. The rise of Napoleon III and the re-emergence of France as a great military power, the Crimean War and the growth of the movement for Italian national unity all influenced developments inside Germany. In the Crimean War no common policy was followed by Austria and Prussia. Austria had hesitated between Russia and the west, but had by mobilization forced Russia to evacuate the principalities of Moldavia and Walachia. Prussia remained strictly neutral, although the opinion of the governing class was deeply divided and the king himself, as so often, unable to make *up* his mind. The situation of the confederation was even more serious in 1859 when Austria was involved in a war with France and Sardinia in defense of its possessions in north Italy. Francis Joseph appealed in vain to the Prussian government for support. The most that Prussia was prepared to do was to order a partial mobilization so as to enforce an armed mediation if necessary. After the Austrian defeat and the armistice of Villafranca (July 8, 1859), Francis Joseph publicly complained that he had been deserted by his natural allies. The period of peaceful dualism in the German confederation was clearly drawing to an end.

Plans for Reform.—The many projects for the reform of the confederation that were put forward after 1859—the attempts to overhaul the federal machinery or to restore co-operation between the two German great powers—were based on a deep division in the beliefs of Germans about the kind of united Germany they wished to see. The war of 1859 had given an opportunity for the expression of these different views. There were some who regarded Austria as taking the lead in a common German cause against the traditional enemy, France. Others regarded the Italian movement for national unity with sympathy and as an example which Germany must soon follow; to them Austria was a reactionary power hampering the free national development of Germany. The latter section of opinion began to find expression in a new political organization, the Nationalverein, founded in Sept. 1859. This body soon had branches in most of the states in north and central Germany and conducted a vigorous agitation for a united and liberal Germany from which Austria should be excluded. Its leaders, such as Rudolph von Bennigsen and Johann von Miquel, were to play important parts in the foundation and consolidation of the North German confederation and the empire after 1866. It was inevitable that such a project should look to the unification of Germany under the leadership of Prussia, yet the political situation in Prussia was such as to make it difficult for liberals to accept its leadership.

The "New Era" in *Prussia.*—In Sept. 1858 Frederick William IV, whose mind had been growing increasingly deranged, finally became incapable of carrying on the government and a regency was formed under his brother William, prince of Prussia (the future emperor William I). The regent had a personal dislike for his brother's ministers, and the Manteuffel government was replaced by one headed by Karl Anton, prince of Hohenzollern-Sigmaringen. Because the new government included one or two moderate liberals such as Rudolph von Auerswald, who had been a member of the liberal ministry of 1848, and because most of its members belonged to the group that had criticized Manteuffel in their journal, the Wochenblatt, the rival of the extreme conservative Kreuzzeitung, the new administration was hailed as inaugyrating a new era of liberal rule.

In fact, the regent had no intention of making concessions to the liberals. He was a simple, practical man whose main interest was in the army in which he had served since his early youth, and it was over the question of military reforms that he was to come into conflict with the liberal elements in the Prussian diet. The mobilization in the summer of 1859 had shown that the Prussian army needed overhauling and in Dec. 1859 the regent appointed the general Albrecht, count von Roon, war minister. Early in 1860 Roon brought his proposals for reform before the Prussian diet and asked for funds to put them into practice. The two points that aroused the most political discussion were a proposal to increase the active strength of the army by making every recruit serve a full three years, and a proposal to link the Landwehr, the reserve army, more closely with the regular army. It was the latter suggestion that especially aroused the anger of the liberals, for the Landwehr had been a preserve of the middle class and was connected with the ideals of a "people in arms" dating from the war of 1813. The liberal opposition to the military budget put an end to the idea of a new era in Prussia and involved the regent in increasing hostility to the liberals. For the year 1860 a compromise solution was found, and a military budget was voted so that Roon's reforms could be started; but the conflict was repeated the following year when the military budget was only passed by a small majority. In the autumn of 1861 a new party, the Deutsche Fortschrittspartei (the Progressive party) was formed by those liberals who saw the importance of retaining parliamentary control of finance and who wanted to unite Germany under the leadership of a liberal Prussia. In the elections of Dec. 1861 the new party had a considerable success, and in March 1862 the diet rejected the military budget. The diet was dissolved but in spite of attempts to influence the elections a new parliament was returned with a majority opposed to the military budget.

The king (the regent had succeeded to the throne on the death of Frederick William IV on Jan. 2, 1861) was unable to find a government that could resolve the conflict and win parliamentary support. The generals were talking of a coup d'état. Finally, on Sept. 18, 1862, Otto, count von Bismarck, was summoned from Paris, where he had recently become ambassador, and on Sept. 22, he agreed to become minister president of Prussia.

The Establishment of Bismarck.—It was only with reluctance that William had agreed to approach Bismarck. Bismarck had been closely associated with the extreme conservatives of the *Kreuzzeitung* group, with whom the king had broken in 1858, and his violent temperament and his ruthless methods made him a figure of alarm. He had served as Prussian representative with the federal diet from May 1851 to Jan. 1859, and then as ambassador in St. Petersburg until May 1862, when he was appointed to Paris. In his diplomatic career he had learned the necessity of making Prussian policy independent of that of Austria, and he was a firm believer in the necessity of friendship with Russia. He had used his influence in favour of neutrality during the Crimean War, and in Feb. 1863 he sent Gen. Gustav von Alvensleben to Russia to sign an agreement by which the Prussian government promised to help the Russians to suppress the revolt that had broken out in Russian Poland.

When Bismarck assumed office he not only had to solve the Prussian constitutional deadlock; he had also to decide on the policy Prussia should follow in the face of the various plans for reform of the confederation and the growing popular demand for national unity. For four years he solved the constitutional problem by governing without a budget. (Under article 109 of the constitution taxes continued to be levied until they were repealed, and the crown had considerable resources of its own—estates, forests, mines, etc.)

revealed by the war of 1859 caused several plans of reform to be put forward. The minister president of Saxony, Friedrich Ferdinand, count von Beust, and the Bavarian minister, Ludwig von der Pfordten, tried to revive the idea of a triple division of power in Germany, in which the middle and small states would play a role equal to that of Austria and Prussia. The suspicions felt by the middle states for each other prevented these plans from coming to anything. At the same time the Austrian government was taking the initiative both in constitutional change inside the empire and by attempting to reform the German confederation. The failure of the war of 1859 had obliged Francis Joseph to reform his methods of government. The first attempt in the October diploma (Oct. 20, 1860) was an attempt to establish a quasi-federal system based on the conservative landlords in the historic provinces. It soon failed and the patent of Feb. 26, 1861, restored a centralized form of government with a central parliament whose members were elected indirectly by the provincial diets. (See AUSTRIA. EMPIRE OF.) To Germans; if not to the other peoples of the empire, the February patent could be represented as a step in a liberal direction. Many liberals in south Germany still had the hope that Germany might be united under Austrian leadership and be a greater Germany that included the Germans inside the Austrian empire. In Oct. 1862 the Reformverein was founded in Munich to promote these aims. Its most important member was Julius Fröbel, a former member of the left in the Frankfurt assembly, who had taken part in the rising in Vienna in Oct. 1848. Now, however, he was reconciled with the Austrian government and even exercised an influence on some members of it; for while Johann, Count Rechberg-Rothenloven, the foreign minister, was a disciple of Metternich and believed in a peaceful dual control of Germany by Prussia and Austria, Anton von Schmerling, the minister of the interior, believed in the formation of a greater Germany under Austrian leadership.

In the summer of 1863 the emperor Francis Joseph took the initiative and summoned a congress of the German princes to meet at Frankfurt-on-Main on Aug. 18. Early in August the emperor met the king of Prussia at Gastein and invited him to attend, but without success. When the princes met, amid considerable enthusiasm in south and west Germany. another attempt was made to persuade the king of Prussia to come and the king of Saxony was sent to make a personal appeal. However, Bismarck with some difficulty succeeded in persuading William to stay away. This absence prevented the congress of princes from having any serious significance and made its discussions on reform of the confederation purely academic. The Austrian plan, by which the confederation was to be headed by a directory of five advised by an assembly of delegates from the individual states, was only to come into effect if Prussia agreed. But Bismarck put forward, on Sept. 15, an alternative plan including the alternation of the presidency between Austria and Prussia, a Prussian right of veto against any declaration of mar if federal territory was not attacked (*i.e.,* Prussia would not defend Austria's Italian dominions) and the creation of "a true national representation based on the direct participation of the whole nation." Although the liberals were still too suspicious of Prussia's conservative internal policy to give Bismarck's proposals a warm welcome, the Austrians had lost their initiative and the next move lay with Prussia.

Schleswig-Holstein. — It was the revival of the Schleswig-Holstein question (*q.v.*) that presented the confederation with its next crisis. After the Prusso-Danish war of 1848 the constitutional position of those two duchies had become a matter of international concern. The London protocol of May 8, 1852, had ruled that if Frederick VII of Denmark died without male heirs and the throne of Denmark passed to the line of Holstein-Glucksburg, the new king should also inherit the duchies of Schleswig, Holstein and Lauenburg. It was provided, however, that the duchies should be governed autonomously and not fully incorporated in Denmark. Holstein remained as before within the German confederation. At the same time Christian, duke of Augustenburg, the other claimant for the succession in the duchies, renounced his claims. The federal diet had, however, become increasingly anxious because the king of Denmark was not fulfilling his obligations and was asserting that the Danish constitution was valid in Holstein. In March 1863 the king of Denmark had issued a royal patent that applied the Danish constitution to Schleswig and left the position of Holstein unsettled. This move aroused great popular disapproval in Germany because it appeared to separate Schleswig from Holstein definitively, dividing territory that all German liberals regarded as German. On Oct. 1, 1863, the federal diet decided on action against Denmark.

The situation was complicated still further on Nov. 15 by the death of King Frederick VII, so that the question of succession to the duchies was added to that of their constitutional position. Christian of Glücksburg ascended the throne of Denmark as Christian IX and at once declared himself duke of Schleswig, Holstein and Lauenburg. At the same time Frederick of Augustenburg announced that he did not recognize his father's renunciation of his claims to the duchies and declared himself duke. His claim was widely supported inside Germany, for he was believed to have liberal leanings, and it was hoped that he would enable the duchies to be incorporated in the confederation. While the federal diet was supporting Frederick of Augustenburg's claims and sending federal troops into Holstein (Dec. 1863), Bismarck was acting with Austria independently of the confederation. He was anxious about international complications, and he was still in conflict with the Prussian diet; he was therefore careful to associate Austria with every step he took, a course which Rechberg, the Austrian foreign minister, was very ready to support. An Austro-Prussian alliance was signed on Jan. 16, 1864. An ultimatum presented to the Danes on Jan. 16 was rejected, and on Feb. 1 Austrian and Prussian troops invaded Schleswig under the command of Friedrich von Wrangel.

The German forces stormed the fortifications of Dueppel on April 18 as a preparation for crossing to the islands of Als and Fyn. Meanwhile the great powers were asked by the Danish government to mediate, and a conference was held in London from April 25 to June 25, accompanied by an armistice. The conference failed to reach an agreed solution since the Danes refused to accept either the Austrian suggestion that the. duchies should be linked to the Danish crown purely by a personal union or the suggestion that they should form a separate state under Frederick of Augustenburg. Hostilities were resumed and the Prussians were successful in landing on Als on June 29. The Danes, all hopes of British assistance having vanished, sued for peace, and an armistice was signed, which took effect on July 20. Preliminaries of peace were signed in August and the peace treaty was formally signed in Vienna on Oct. 30, 1864. Denmark gave up all rights to the duchies and they were handed over to Austrian and Prussian occupation.

The question at once arose of how the duchies should now be administered. The bulk of German opinion still supported the claims of Frederick of Augustenburg. Austria had little direct interest in the territories but hoped to be able to use them as a bargaining point that would make Prussia agree to support Austria if its Italian possessions were again threatened and might possibly even make Prussia cede some territory in Silesia. Bismarck, on the other hand, had already determined that the duchies should come under Prussian control. His position in Prussia had been strengthened by the successful war. The conservatives were given fresh confidence in him by the triumphs of the Prussian army and he had demonstrated his independence of the diet by fighting a war for which it had not voted any credits. King William and the emperor Francis Joseph met at Schonbrunn in Aug. 1864, and their ministers worked out a scheme for a joint occupation and administration of the duchies. The other members of the German confederation were still hoping for the establishment of Frederick of Augustenburg, but these hopes were rendered vain by Bismarck's hostility to him and the refusal of Prussia to allow the other states to participate in the occupation of the duchies. (The Saxon troops, the last to leave, departed from Holstein in Dec. 1864.) At the same time the Prussians were beginning to make use of their position in the duchies, and in March 1865 the Prussian naval base was moved from Danzig to Kiel.

The Convention of **Gastein.**—By May 1865, differences of policy between Austria and Prussia were becoming acute. Bismarck had stated in Feb. 1865 that he was only prepared to recognize Frederick of Augustenburg as duke if Frederick mere prepared to give Prussia control of the economic and military life of the duchies. These conditions were unacceptable both to Austria and to the federal diet, which continued to recognize Frederick's claims. On May 29, 1865, a Prussian crown council discussed the means by which the duchies might be annexed, but no firm decision was taken. Bismarck does not seem to have been ready for war, and in Aug. 1865 the king of Prussia and the emperor of Austria met at Gastein where a convention about the duchies was signed on Aug. 14. The Convention of Gastein laid down that Austria should administer Holstein and Prussia Schleswig. The port of Kiel and the fortress of Rendsburg came under Prussian control, nominally in the name of the confederation. In fact the other members of the confederation were not consulted, and the convention not only put an end to Frederick of Augustenburg's chances, but also made it harder afterward for Austria to claim to be the champion of the federal constitution against Prussia, Bisma ck himself regarded the convention as a "papering over of the cracks" and not as a lasting settlement. However, before a final breach with Austria he needed to ensure that Prussia would not be faced with a hostile coalition of foreign powers; he also needed a measure of popular support both in Prussia and in the other states of the confederation. A conversation with Napoleon III at Biarritz on Oct. 11, 1865, did not make France's intentions any clearer. Then, on Feb. 28, 1866, a Prussian crown council decided to strengthen Prussia's position decisively by offering an alliance to Italy, which was signed on April 8. Italy undertook to support Prussia against Austria on the understanding that the treaty would lapse if there were no war within three months.

Austro-Prussian Diplomatic Struggle.— Bismarck also surprised everyone on April 9, 1866, by proposing at a special meeting of the federal diet that a German parliament should be elected by universal suffrage and should meet to discuss constitutional reform of the confederation. This offer of universal suffrage, which was an attempt to gain popular support, was only partly successful in winning the liberals, but it showed that reform of the federal constitution was Prussia's aim and not just the annexation of Schleswig and Holstein. During the next two months, too, Bismarck was in touch with the leaders of the Nationalverein in the other states of north Germany, among them Bennigsen and Miquel in Hanover, in the hope of winning their support. They at least were prepared to support a policy of neutrality in an Austro-Prussian war and declared their belief in this policy at a liberal meeting at Frankfurt on May 20. Bismarck was not successful in eliminating the constitutional crisis in Prussia at this stage. Although after the success of the war with Denmark some of the Prussian liberals were prepared to vote Bismarck an indemnity for the period during which he had governed without a budget, the king was opposed to any such compromise and a suggestion made by Karl Twesten at the end of May 1866 for a solution of the conflict had to be refused.

The Austrians saw the Prussian preparations with alarm and began to strengthen their military forces in Bohemia. Alexander, Count Mensdorff-Pouilly, Rechberg's successor as foreign minister, was anxious for a peaceful solution, but other members of the Austrian administration were anxious to assert Austria's rights against Prussia by war if necessary, notably Ludwig, Freiherr von Biegeleben, the head of the German department in the Austrian foreign office. Austria's finances were in a bad state. The cost of the mobilization during the Crimean War in 1854–55 and of the war with Italy in 1859 had left its credit weak and it had been persistently excluded from the *Zollverein.* In 1862 a commercial treaty between Prussia and France gave France the most-favoured-nation treatment hitherto accorded to Austria under the treaty of 1853, and the *Zollverein* had been renewed in 1863 without Austria on the basis of the acceptance of the French treaty by the other members.

Nor did Austria succeed in welding the middle and small states of Germany into a solid anti-Prussian bloc. The two most important, Bavaria and Saxony, had ministers who still believed that the middle states could play a role of their own independently of Prussia and Austria. Moreover, Louis II of Bavaria was a neurotic young man who gave little of his time to the affairs of state. Many of the small states of central and north Germany had been forced by their geographical position to sign military agreements with Prussia and the most that they could hope for in an Austro-Prussian struggle was neutrality. Hanover and Hesse-Cassel had rulers ready to support Austria but the liberals in both states wanted at least neutrality even when they did not actively desire a Prussian victory.

On April 21, 1866, the emperor Francis Joseph ordered the mobilization of Austria's southern army under the archduke Albert, and the army of the north under Ludwig von Benedek was mobilized between April 27 and May 5. Prussian mobilization was complete by May 8. Last minute attempts at mediation mere unsuccessful. Napoleon III proposed a European congress (May 24) but, although Bismarck was ready to accept, the Austrians were prepared to do so only if the congress did not discuss any territorial increases for any of the participating states, and the proposal was dropped. Inside Germany an attempt was made by Anton von Gablenz, brother of the Austrian governor of Holstein, to mediate, but equally without success. By May 28 his proposals had been put aside. At the last minute Napoleon concluded a secret treaty with Austria by which in return for French neutrality Napoleon was, if Austria won, to receive Venetia, which was then to be handed over to Italy, while Austria was to receive compensation in Germany.

Austro-Prussian War.—Early in June Austria summoned the diet of Holstein to meet on the eleventh of the month and this step was immediately denounced by Prussia as a breach of the Gastein and other earlier agreements. Prussian troops entered Holstein on June 7. The last meeting of the federal diet took place on June 14, and at it Austria moved that troops of the confederation should be mobilized against Prussia. Bismarck denounced this step as unconstitutional and said that he would regard any states that voted for the Austrian proposal as being in a state of war with Prussia. Bavaria introduced a motion calling for the mobilization of contingents other than those of Austria and Prussia. This was carried by nine votes to six, Luxembourg, the Mecklenburg duchies and three groups of the smallest states of the north and centre voting against. The Prussian representative then left.

Prussian troops crossed the frontiers of Hanover, Saxony and Hesse-Cassel on the night of June 1j–16. One army marched through Hanover toward the Main river; on June 29 the Hanoverian army was forced to capitulate after the battle of Langensalza. The Prussian army captured the king of Hanover and the elector of Hesse, crossed the Main and entered Bavaria.

In the south the Italians had engaged the Austrians but were defeated on land at Custozza (June 24) and at sea in a battle off Lissa (July 25). The main theatre of war, however, was Bohemia, where a Prussian force advanced from Saxony and Silesia in accordance with the plan of Helmuth von Moltke. On July 3 Benedek's position at Sadowa (Koniggratz) was attacked by two Prussian armies, and they were joined by the third under the crown prince of Prussia at a critical moment. The Austrian army was utterly defeated.

King William and the generals would have liked to march on Vienna, but they were restrained by Bismarck supported by the crown prince. Rejecting an offer of mediation by Napoleon III, Bismarck began negotiations with the Austrians, and a preliminary peace was signed at Nikolsburg (Mikulov) on July 26 and embodied in the final peace of Prague on Aug. 23. The Austro-Italian peace treaty was signed on Oct. 3. Treaties with the southern states were negotiated during the same period. The terms were extremely mild. Austria paid an indemnity and surrendered Venetia to Italy but lost no other territory. Bavaria, Saxony, Wiirttemberg, Baden and Hesse-Darmstadt paid indemnities but remained intact. Prussia annexed Schleswig-Holstein, Hanover, Hesse-Cassel and Frankfurt-on-Main. The southern states agreed that their armies should come under Prussian command in the event of war. The states north of the Main, together with the kingdom of Saxony, joined a new North German confederation under Prussian leadership. The old confederation was at an end; Austria had been finally excluded from Germany.

(J. B. Jl.)

THE GERMAN EMPIRE

The Compromise of the Prussian Liberals.—The peace of Prague cleared the way for a settlement both in Prussia and in the wider affairs of Germany. The Prussian parliament had been dissolved at the beginning of the war, and new elections were held on the day of the battle of Sadowa. The liberals had a reduced majority and they were now split in their attitude to Bismarck; his success had shaken their liberal principles. The moderates broke away from the Progressives to form the National Liberal party, a party in which liberalism was subordinated to nationalism. Bismarck. on his side, made a conciliatory gesture by asking for an act of indemnity for the unconstitutional collection of taxes since the beginning of the parliamentary struggle in 1862. This act mas passed on Sept. 3, 1866, by 230 votes to 75. It was a decisive step in German history. The Prussian liberals, hitherto genuine opponents of Bismarck, dropped their insistence on parliamentary so ereignty in exchange for the prospect of German unity and for an assurance that united Germany would be administered in a "liberal" spirit. Instead of a struggle for power there was henceforth compromise. The capitalist middle classes ceased to demand control of the state; the crown and the Junker governing class conducted the state in a way which suited middle-class needs and outlook. Since the middle classes ceased to be liberals. the Prussian Junkers had to become "Germans." Neither side kept its bargain fully, and there were renewed alarms of cqnstitutional struggle throughout the period of the empire. But the decision of Sept. 3, 1866, was not undone; Germany did not become a constitutional monarchy of the western type.

The North German Confederation.—With the defeat of Austria Prussia was now the sole power in Germany. Bismarck was limited only by the promise given to Napoleon III that the states south of the Main should have "an internationally independent existence." All Germany north of the Main had been virtually conquered by Prussia, but Bismarck was anxious to conciliate south German opinion. Besides he dreaded the radical nature of a unitary German state. Therefore he tried to change as little as possible. and the North German federation which he created in 1867 had curious echoes of the despised German confederation which had vanished in 1866. Indeed Bismarck still thought of German unification as primarily an affair of foreign policy, *i.e.,* to represent a united power abroad. For him the only difference with 'the period before the war of 1866 was that, instead of being balanced by Austria, Prussia now dominated, hut since this domination was exercised in the interests of conservatism he expected little change. The federal constitution which he hastily drafted early in 1867 was not a sham. It contained genuine federal guarantees for the individual states. Nevertheless it was a pretense in that the reality on which it rested was not federal. A federation must be an association of states more or less equal in power; in the North German federation Prussia eclipsed the others so decisively that Prussian will was always sure to prevail.

The federal constitution was adopted by the North German *Reichstag* on April 17, 1867. Four years later it became almost mithout change the constitution of the German empire. Two principles were balanced against each other—the sovereignty of the German states and the national unity of the German people. In constitutional theory the first carried the day. The *Bundesrat* (federal council), its members nominated by the state governments, initiated laws. conducted the federal government and could alter the constitution by a two-thirds majority. (Prussia, which had 17 members out of 43, could thus veto any constitutional change.) The king of Prussia, as president of the confederation, nominated the chancellor who was to carry out federal affairs under the direction of the *Bundesvat.* The *Reichstag,* on the other hand, elected by direct universal suffrage, was strictly limited to legislative activities; there was no provision by which it could interfere with the activities of the federal government. Even its control of finance was limited to an approval of expenditure, other than that permanently authorized by the constitution (court expenses, chancellor's salary, etc.); and since the member states were to supplement the regular federal revenue by "matricular" contributions, the *Reichstag* did not possess the usual parliamentary sanction of being able to cut off the government's income. Yet despite these provisions the *Bundesrat* soon lost all importance and the German government became in as much need of a parliamentary majority as though Germany were a thoroughly liberal state. For, despite Bismarck's efforts to conceal the reality, the German states were without significance and the German people were conscious of their national unity. The federal element counted for more in the sphere of administration where there was a real division of duties. The federal authority controlled foreign affairs, the army and economic affairs, and there was to be a single judicial system and a single legal code. The states conducted ordinary administration and remained in control of educational and religious matters.

The war of 1866 had destroyed the *Zollverein.* In July 1867 Bismarck offered to all German states a new customs union on condition that they accepted a customs parliament. As this parliament was to consist of the members of the North German *Reichstag* with members from southern Germany added, this was a way of smuggling in German unity by a side door. Thus the line of the Main was weakened, though not removed, within a year of its establishment as an international boundary. The North German federation was regarded by many, including Bismarck, as a halfway house to German unification which would stand for a long time; Bismarck even thought that his life's work was accomplished. Indeed between 1867 and 1870 the movement for German unity lost ground in southern Germany. Early in 1870 the pro-Prussian government of Chlodwig, prince of Hohenlohe-Schillingsfürst in Bavaria was replaced by a clericalist government under Otto Camillus Hugo, count von Bray-Steinburg, and this government pushed ahead with plans for a separate South German confederation, predominantly Roman Catholic and under the protection of France and Austria. This underlined the precariousness of the existing situation, and the deciding question between 1867 and 1870 was not German opinion, but whether France and Austria would come together in order to oppose Bismarck's policy or even to undo his mork.

Tension with France.—The first alarm came in 1867 when Napoleon III raised the question of Luxembourg. This had been a member of the old confederation and a Prussian garrison still remained there. Napoleon III proposed to buy the grand duchy from its ruler, the king of Holland. There was an outcry in Germany and questions in the *Reichstag.* Bismarck held that no essentially German issue was at stake and probably held too that Prussia was not ready for a new war. But Napoleon had bungled the affair; other European powers protested. After a conference in London, Luxembourg became an independent neutral state with its fortifications dismantled. Thereafter Napoleon sought more actively for an alliance with Austria but without effect. The Austrian government would not risk a new defeat and its real interest in the French alliance was to resist Russia in the near east —a concern far removed from Napoleon's preoccupation with Germany and the Rhine.

Early in 1870 Bismarck made a move against France which has been variously interpreted; he hinted unofficially to the provisional rulers of Spain that they should offer the throne to Leopold, prince von Hohenzollern-Sigmaringen, a member of the Roman Catholic branch of the Hohenzollern family. It has often been argued that Bismarck gave this advice in order to provoke France into war, and that he was driven to provoke war by the trend of opinion hostile to Prussia in southern Germany. It seems more likely that he was concerned with establishing a friendly ruler in Spain and thus weakening still further Napoleon's project of an anti-Prussian coalition. At all events he could never have foreseen the folly of the French government which deliberately forced a crisis when it had already received satisfaction. Bismarck's intention had been to present the French with a *fait accompli.* They were to know nothing until Prince Leopold was actually elected. But by a confusion typically Spanish the *Cortes* had adjourned before Leopold s answer of acceptance arrived and the French government had to be told on July 3 why the *Cortes* was being recalled. There were wild protests in Paris and an immediate demand that Leopold be ordered to withdraw. On July 12 Prince Karl Anton renounced the Spanish candidature on behalf of his son. This was not enough for the French government; it insisted that King William. as head of the Hohenzollern family, should promise that the candidature be never renewed. This demand was presented to the king at Ems by Vincent Benedetti, the French ambassador, on July 13. Though the king refused to give a promise, he dismissed Benedetti in a friendly enough way. But when the account, given in the "Ems telegram" reached Bismarck, he shortened it in such a way as to imply that the French ambassador had been insulted. This version provoked a French declaration of war on July 1;. But though the Ems telegram gave the occasion for war, the cause of it was to be found in the French determination to check Prussia's greatness and to restore the fading glory of the empire by a renewal of prestige in foreign policy.

The **Franco-German** War. — Though the war was perhaps not planned by Bismarck, it was certainly not unwelcome to him. It solved at a stroke the problem of south Germany, since all the south German states at once acknowledged their treaty of alliance with Prussia and placed their troops under William's command. Austria dared not join France, Russia was won to benevolent neutrality by Bismarck's support of Russian designs in the Black sea, and Great Britain cared only for the neutrality of Belgium. The French had supposed that they would take the offensive. Instead, after a trivial victory at Saarbriicken, the French armies under Patrice de MacMahon were defeated on the frontiers at Wörth and Wissembourg (Aug. 4 and 6). One French army under Achille François Bazaine was driven into Metz and failed to break out in the two fierce battles of Mars-la-Tour and Gravelotte (Aug. 16 and 18). The main French army under MacMahon at first retreated and then attempted to pass the flank of the German forces in order to relieve Metz. This army was surrounded at Sedan and on Sept. 2 forced to surrender. That brought the overthrow of Napoleon and the establishment of a provisional government in Paris. The new government was resolved not to surrender any French territory, and the war was therefore continued. Metz surrendered in September. Strasbourg in October. The German armies were then free to press the siege of Paris throughout the winter. Though the French, under the inspiration of Léon Gambetta, made an amazing recovery, they were unable to relieve Paris which was compelled to capitulate on Jan. 28, 1871. An armistice was then concluded and a French national assembly elected which had to authorize the conclusion of peace. Preliminary terms were agreed to by Jules Favre on Feb. 26, and the final peace treaty was signed at Frankfurt-on-Main on May 10. France had to cede Alsace and most of Lorraine including Metz, its capital. Bismarck had not intended to make such extensive demands and was overborne by the German generals. On their prompting he also demanded Belfort, but abandoned this demand in exchange for a victory march by the German army through the streets of Paris. France had also to pay an indemnity of 5,000,000,000 fr., and the Germans remained in occupation of part of France until the indemnity was paid. *(See* also FRANCO-GERMAN WAR.)

The Making of **the** Empire. — During the war, negotiations were pushed on for the uniting of all Germany outside Austria. In September a conference of Prussia, Bavaria and Wurttemberg met at hfunich to discuss the terms of unification. Bray, the Bavarian prime minister, held out against any real union and demanded special treatment for Bavaria. Bismarck turned his flank by securing the incorporation of Baden in the North German confederation. Bavaria and Württemberg then negotiated separate treaties of union, which were concluded at the end of November. Some Bavarian wishes were fulfilled. Bavaria and Württemberg kept their own postal and telegraph services and were able to levy taxes on beer and brandy; Bavaria further kept its own army in peacetime. As a particularly meaningless concession, a committee of the ***Bundesrat*** under Bavarian chairmanship was to advise the chancellor on questions of foreign policy; the advice was seldom sought and never taken.

There remained the question of a name for the new state. Bismarck wished to revive the title of German emperor, a proposal most unwelcome to William. It was equally unwelcome to Louis II of Bavaria, the one important German sovereign. With great adroitness Bismarck manoeuvred one against the other and actually induced Louis to press the imperial title on William. The proposal mas seconded by the other German princes and supported by the North German *Reichstag;* the leader of the *Reichstag* deputation was Eduard Simson, who had offered the imperial throne to Frederick William IV in 1849 on behalf of the Frankfurt assembly. William could hold out no longer; he was proclaimed German emperor at Versailles on Jan. 18, 1871.

The remaining formalities were few. A *Reiclzstag* was elected from all Germany, and this *Reichstag* accepted the constitution of 1867, with the concessions to Bavaria, as the imperial constitution on April 14, 1871. The new Reich consisted of 4 kingdoms, 5 grand duchies, 13 duchies and principalities and 3 free cities (Hamburg, Lubeck and Bremen). Alsace-Lorraine was treated as a conquered province. It was made a *Reichsland* and ruled by an imperial governor or *Statthalter*. In theory this was a temporary settlement, but Alsace-Lorraine never developed the German loyalty which would have qualified it for autonomy. The constitution left open the great question of the powers of the *Reiclzstag* over the executive, a question never settled in the 40 years of the empire. The question was symbolized in two forms: the position of the imperial chancellor and the method of authorizing expenditure on the army. The chancellor was defined as "responsible" but it was not stated to whom; Bismarck contended that he was responsible to the emperor, while the politicians tried to insist that he was responsible to the *Reiclzstag.* As to military credits, Bismarck tried to include the sums necessary for an army of 400,000 men as a permanent grant in the constitution, and thus exempt from parliamentary criticism or control. He failed to carry this and had to agree to a compromise, the *Septennat,* by which military credits mere voted for seven years — hence the political crises which occurred every seven years (1879, 1886, 1893) when artificial alarm had to be created in order to renew the army grant.

Bismarck's Liberal Period and the **Kulturkampf.**—Bismarck had been on bad terms with the Prussian Junkers or conservatives ever since 1866, and the estrangement was completed by the creation of the empire. Only a small group, the Reichspartei, composed mainly of officials, remained loyal to him. On the other hand, the National Liberals were more enthusiastic for Bismarck than ever before, and from 1871 to 1879 they formed almost a government party. Bismarck discussed proposals for legislation with their leader, Rudolph von Bennigsen, and the National Liberals supported his general conduct of policy. Moreover, in the first years, the National Liberals managed to win more votes than any other single party despite universal suffrage; only in 1879 did it become clear that a purely middle-class party could not keep its hold on peasant and working-class voters. Thus the first period of the empire was the great age of liberal reform. Germany was given at a stroke uniform legal procedure, uniform coinage and uniform administration. An imperial bank was created, all restrictions on freedom of enterprise and freedom of movement were removed, and limited companies and trade combinations were allowed. Freedom of the press was secured in 1874. Work was begun on an imperial civil code, which finally extended to all Germany in 1900. Particularly important was the establishment of municipal autonomy in 1873; this freed the towns from the control of the *Landrat* (usually a large landowner) and thus cleared the way for the development. of local government in which Germany led the world.

Bismarck's alliance with the National Liberals naturally led him into conflict with the Roman Catholics, who made up more than a third of the population of the new empire. The conflict began after the Vatican council of 1870 had declared the infallibility of the pope. Some leading German Roman Catholics, known as Old Catholics, opposed these decrees; and the church demanded that the German states should dismiss all Old Catholic teachers. Thus a struggle began over the clerical control of education and soon turned into a general attack on the independence of the Roman Catholic Church. The conflict was also political. The German Roman Catholics were anti-Prussian both by tradition and by geography; they were at once particularist and greater German, in that they favoured both the small states and the German Austrians. As the struggle developed, the Roman Catholics organized their own political party, the Centre, and this party cut across class and state lines. The Centre was, in fact, the first mass party of imperial Germany, though, because of its confessional nature, it could never win a majority. But it was strong enough to menace the stability of Bismarck's political system.

The conflict with the Roman Church, the so-called *Kulturkampf,* was fought by Bismarck with all his usual exaggeration and violence. He abolished the special section in the Prussian ministry which dealt with Roman Catholic affairs, made marriage an exclusively civil proceeding and insisted on a state degree before a priest was appointed to a benefice. When the church excommunicated all Old Catholic teachers, Bismarck answered by expelling the Jesuits from Germany. The church only increased its resistance. The clergy refused to appear before the state courts or to pay the fines which were imposed. The archbishops of Posen and Cologne were imprisoned and the former deposed. These penal measures were expressed in the "May laws" which the Prussian *Landtag* passed in 1873, and were by further measures promoted by Adalbert Falk, the Prussian minister of cults, in 1874 and 1875. By then it was clear that Bismarck would not achieve victory. The Old Catholics carried no weight and even many Protestants, particularly among the Junkers, disliked this attack on religious teaching. Though Bismarck still allowed the struggle to continue, he put increasing responsibility on Falk and thus made it easy for himself to repudiate responsibility when the time came for a change of course. The conflict also served a purpose in foreign policy. It was a move against the Roman Catholic powers, France and Austria-Hungary, and a gesture in favour of Protestant England and Orthodox Russia. By 1877 the needs of Bismarck's foreign policy were changing. The danger of an ultramontane bloc had disappeared, if it had ever existed; and here too the way was open for a change of course.

The Breach with the National Liberals.—The first Bismarckian system broke down between 1877 and 1879. In 1877 Bismarck, still at odds with the Centre, offered to make Bennigsen, the leader of the National Liberals in the *Reichstag*, a Prussian minister. Bennigsen thought that this was the preliminary to a fully parliamentary ministry and insisted on bringing in two Liberal colleagues with him. Bismarck refused, and from that moment was determined on a reconciliation with the Conservatives and the Centre in order to escape from National Liberal control. He had also pressing financial motives for this breach. The revenues allotted to the empire by the constitution were from the first inadequate, and Bismarck disliked the dependence on contributions from the separate states which this involved. The National Liberals wished to create direct imperial taxation, in order to increase the power of the *Reichstag;* for the opposite reason Bismarck was set on indirect taxes. In 1873 he attempted to introduce a tobacco monopoly and was defeated by National Liberal opposition. A year or two later he had still more urgent reasons for action. Toward the end of the decade German agriculture faced the challenge of American wheat for the first time, and Bismarck was determined to protect German agriculture for reasons of social conservatism and also because he regarded the agricultural workers as the best element for the army in time of war. But it was not only agriculture that needed protection. German industry, too, was hard hit by the great economic crisis of 1873 and here, also, Bismarck was determined to protect a great iron and steel industry so as to ensure German strength in wartime. Thus every motive combined to thrust him over into a policy of protection—agricultural protection to satisfy the Junkers; industrial protection to satisfy the capitalists; and an escape from the interference of the *Reichstag* by the increase in customs dues.

The last of the old duties, inherited from the *Zollverein*, were repealed in 1877 and a new protective tariff was introduced in 1879. This tariff was opposed by the National Liberal party, which broke into two. One group, which retained the party name, hoped to renew the alliance with Bismarck; the other united with the Progressives or Radicals under Eugen Richter to form the German Independent party. In return Bismarck struck a bargain with the Centre. He agreed that the conflict with the Roman Church should be called off and that any increase in the customs yield beyond 130,000,000 Marks a year should be divided among the individual states—a striking illustration of the Centre's particularism. The new tariff was then passed on June 12, 1879, and Germany became a protectionist country.

Bismarck kept his bargain with the Centre. Falk resigned after being repudiated by Bismarck in the *Reichstag*. In 1880 Bismarck got power to suspend the May laws in individual cases and the secular examination for candidates to the priesthood was abolished. Pope Leo XIII, more conciliatory than his predecessor Pius IX, made Bismarck's task easy; he induced the two recalcitrant archbishops to resign. Peace was finally concluded in 1887. The peace was a compromise, not a defeat for Bismarck as sometimes suggested. The Roman Church preserved intact the education of priests for which it had been contending. In exchange the Roman Catholic party of the Centre accepted Bismarck's Reich and tacitly agreed to support his policy when confessional issues were not at stake. In fact the Centre became purely a party of tactics, once its religious concerns were secured.

The Social Democrats.—Bismarck always believed that every political system needed an enemy or whipping boy. The Centre had been the whipping boy of the liberal era; the Socialists were now chosen to take their place. Bismarck genuinely believed that the Social Democrats, as the followers of Karl Marx called themselves, represented a grave social peril; he took them as seriously as Metternich had taken the threat from "the revolution." In 1877 the Social Democrats won 12 seats at the general election. Bismarck then introduced exceptional legislation against them, but was thwarted by the National Liberal majority. An attempted assassination of the emperor on June 2, 1878, gave Bismarck the opportunity to dissolve the *Reichstag* and to win the election on the cry of "the social peril." The Liberals lost 42 seats, the Conservatives gained 37. The exceptional laws were then carried, on Oct. 19, 1878. The Social Democratic party was declared illegal and its press and its meetings were forbidden. In practice these laws amounted to little. Social Democrats were still candidates at elections and still sat in the *Reichstag;* their journals were easily smuggled in from Switzerland; and in all, between 1878 and 1890, only 1,500 persons were imprisoned. But as a political manoeuvre the attack on the Socialists served its turn. Bismarck secured a sound Conservative majority and in the anti-Socialist uproar no one noticed that the *Septennat* had slipped through almost without opposition early in 1879.

Bismarck's other weapon against the Social Democrats was his social policy. Bismarck had never shared the laissez-faire views of the Liberals and his breach with them freed his hands for measures of social security. The workers, too, were to be made to feel that they had a stake in the greatness of the German Reich. In 1881 he proposed a system of compulsory accident insurance, to be supported in part by subsidies from the Reich. This met with strong opposition from the Liberals, who in 1881 recovered in part from their defeat of 1878. It was not until March 1884 that Bismarck got his way. Later he instituted sickness insurance and a system of old age pensions, also subsidized by the Reich. Though the Social Democrats remained theoretically revolutionary, Bismarck's aim was, in the long run, achieved; the workers came to believe that they were benefiting, not from their own efforts, but from the paternal state.

Foreign and Colonial Policy.—The year 1879 also marked an epoch in Bismarck's foreign policy. Once the empire was founded, Bismarck's sole aim was peace and security. This aim never varied, though methods changed. In the first years of the Reich Bismarck had aimed at peace by avoiding foreign commitments and he stood resolutely aside during the great eastern crisis of 1875–78. Thereafter Bismarck came to see that he must take a more active line if Europe was to be kept at peace. On Oct. 7, 1879, he concluded a defensive alliance with Austria-Hungary against Russia; though this guaranteed Austria-Hungary's survival as a great power, it did not provide German support for its Balkan ambitions. Indeed Bismarck always advocated a partition of the Balkans between Austria-Hungary and Russia. The Austro-German alliance, far from estranging Russia, won it back to the side of peace and conservatism and the League of the Three Emperors (June 1881) was a revival, in more modern terms, of Metternich's Holy Alliance. But its precondition was that neither Russia nor Austria-Hungary should have Balkan ambitions, a condition almost impossible of fulfilment. To give Austria-Hungary greater security, Bismarck also concluded the triple alliance between Germany, Austria and Italy (May 20, 1882), by which Germany guaranteed Italy against France in exchange for Italian neutrality in the event of a war between Austria-Hungary and Russia. The triple alliance was not a vital part of Bismarck's diplomatic system; it seemed to become essential to Germany only when his successors failed to keep on good terms with Russia.

Bismarck's diplomacy became increasingly elaborate in method when a new eastern crisis arose over Bulgaria in 1885. His aim remained the same—to avoid being drawn into a war between Russia and Austria-Hungary and if possible therefore to prevent such a war. Since Russia and Austria-Hungary would not agree, each side had to be strengthened so as to maintain the balance between them. On the Russian side Bismarck concluded the Reinsurance treaty (June 18, 1887), promising Russia diplomatic support in Bulgaria and at the Straits and agreeing to stay neutral unless Russia attacked Austria-Hungary. On the other side Bismarck promoted the two Mediterranean agreements between Austria-Hungary, Great Britain and Italy (Feb. and Dec. 1887), which virtually created a triple entente opposed to Russia in the near east. These complicated arrangements subsequently led men of lesser understanding to accuse Bismarck of duplicity, but they served their purpose of averting a new Balkan war. Since Germany occupied the centre of Europe, its policy was bound to be two-faced.

Bismarck was long sternly opposed to German expansion overseas; he believed that Germany ran enough risks in Europe without also challenging the imperial interests of Great Britain and France. But when he had to choose between satisfying German national feeling by supporting German expansion in southeastern Europe and thus identifying himself with Austro-Hungarian ambitions or by launching colonies overseas, he chose the less provocative course. He had also a subsidiary motive in considerations of foreign policy. Between 1883 and 1885 he strove actively for a reconciliation with France, and he believed that this reconciliation would be easier if Germany were in conflict with Great Britain, France's colonial rival. Bismarck deliberately chose areas which were on the fringe of British colonial interests in the hope of provoking a violent British reaction; thus South-West Africa trampled on the toes of Cape colony, and New Guinea on the toes of Australia. His two tropical colonies, the Cameroons and East Africa, cut across the British plans that were just developing for a new empire in central Africa. The French, however, remained suspicious, and the colonial conflict with Great Britain failed to mature, for the British were too conciliatory. In 1885 Bismarck called off the conflict, especially as he needed British support for Austria-Hungary, and he would have been glad to get rid of the German colonies except for the pressure of imperialist feeling inside Germany. The German colonial empire was never a serious factor in German economic life; the colonies were an embarrassment, not a source of strength, and important only as an emotional outlet for the growing sense of German power. Though Bismarck had made the German empire in 1871 by evoking national feeling, he was anxious thereafter to arrest German expansion. His social and political conservatism made him dread a Germany that would dominate all Europe. Hence he sought to divert German nationalism into harmless channels. With this purpose, he took up the struggle with the Poles in eastern Germany. This struggle began in the days of the conflict with the Roman Church and was continued in 1886 by an economic war which sought to eliminate Polish landowners and to establish German colonists in the eastern marches. The conflict had the great advantage of being directed against a Slav people and yet being welcomed by Russia, itself in conflict with the Poles. For similar reasons, Bismarck exacerbated the conflict in the Reichsland, Alsace-Lorraine. This estranged even German liberals from France and made them tolerate Bismarck's policy of friendship with tsarist Russia. In essence, Bismarck wished to keep up hostility with France as being less risky for conservative Germany than a struggle for existence in eastern Europe.

This was well shown in the so-called war crisis of 1887. Bismarck had tried to win the general election of 1884 solely on the issue of colonies, but this cry had strengthened the left-wing parties, instead of the conservatives, who were opposed to colonial expansion. By 1887 the time for a new army grant was approaching; and Bismarck knew that he could not carry it through the existing Reichstag. Bismarck therefore deliberately raised the alarm of a French "revanche," and his manoeuvre was successful. The Reichstag threw out the army bill and was dissolved in Jan. 1887. Bismarck fought the election on the cry, "the fatherland in danger," and won a majority for his coalition of agrarian and industrial supporters. The reconstituted National Liberals, the party of capitalist interest, became the largest single party in the Reichstag for the last time (122 members). The Bismarckian coalition carried the army bill on March 11, 1887. It was Bismarck's last triumph.

The Fall of Bismarck.—Bismarck's impregnable position had a weak spot; he must be regarded by the emperor as indispensable. The old emperor, William I, remained faithful until his death on March 9, 1888; he never forgot that Bismarck had saved him from "liberalism" in 1862. Frederick III, his son and successor, was bound to Bismarck by memory of the triumphs of 1870. Liberal in phrase, he was at best National Liberal and, like the other National Liberals, would have made his peace with Bismarck in exchange for a few concessions. But he was already a dying man and his reign of 99 days ended on June 15, 1888. William II, third and last German emperor, had no memory of past dangers or past victories to bind him to Bismarck. He represented the new Germany which knew no moderation, the self-confident Germany which recognized no limits to German power. At the same time, he was impatient with Bismarck's social conservatism, which seemed to estrange the emperor from the mass of his subjects.

The dispute came to a head after the general election of 1890. Bismarck had failed to hit on a national cry and failed to carry the election. The Bismarckian coalition of Conservatives and National Liberals fell from 220 to 135; the Progressives, Centre and Social Democrats rose from 141 to 207. Bismarck wished to tear up the imperial constitution which he himself had made and to set up a naked military dictatorship. William II was determined to continue on the path of demagogy, appealing still more strongly to German national sentiment. There were, of course, also elements of personal conflict. Bismarck objected to the emperor's interference on questions of policy; William objected to Bismarck's attempts to manoeuvre with the party leaders, especially with Ludwig Windthorst, the leader of the Centre. But essentially it was a conflict between the old Junker Germany which tried to maintain moderation for reasons of conservatism and the new imperialist Germany which was without moderation. Once Bismarck had quarrelled with the emperor, he had no real support, for he had always fought the parties of the German masses. He tried without success to engineer a strike of Prussian ministers. Finally he was opposed even by the leaders of the army. On March 18, 1890, he was forced to resign.

Caprivi.—Bismarck's successor was Georg Leo von Caprivi, a military administrator who, despite his conservatism, accepted William II's policy of winning over the parties of the masses. Caprivi inaugurated the four years of the "new course," an attempt to follow a more democratic line without changing the social or economic foundations. Caprivi's first act was to refuse to renew the Reinsurance treaty with Russia, thus breaking the partnership between tsardom and the Junkers which had been the basis of Bismarck's policy. Caprivi promised German support for Austro-Hungarian plans in the Balkans, and he dreamed of bringing Great Britain as a fourth partner into the triple alliance. The symbol of this hope was the treaty of July 1, 1890, by which Germany received Heligoland in exchange for concessions to British interests in east Africa. In economic affairs Caprivi lowered the Bismarckian tariffs and looked forward to a free-trade era, in which German trade would expand overseas under the protection of the British navy.

Caprivi refused to renew the anti-Socialist laws and viewed without dismay the increase in the Socialist vote. He carried measures of social security and of factory inspection, which offended the great capitalists as much as his free-trade policy offended the agrarians. To please the Centre, Caprivi promoted an education bill, which gave the church control of religious instruction. This led to a revolt of Prussian ministers, headed by Miquel, now Prussian minister of finance and a former National Liberal. In the outcome the bill had to be withdrawn and the Centre party returned to opposition. At bottom Caprivi's problem was the same as Bismarck's, *i.e.,* how to carry the septennial army grant. But Caprivi meant to carry it with the support of the Centre and of the left-wing parties, the Progressives and the Socialists. It was symbolical of his demagogic policy that in 1892 he ceased to be Prussian prime minister; in theory the Prussian Junkers ceased to dominate the Reich. Caprivi introduced an increased army grant in the autumn of 1892; in view of his "liberal" foreign policy, he had to invoke the danger from Russia, not from France, and this led the conservative parties to oppose the bill. As the Centre also opposed it because of the education bill, it was rejected. Caprivi dissolved the *Reichstag* and tried the line of more social concession to please the Social Democrats and a reduction of the period of the army grant from seven to five years to please all the parties of the left. The Progressive party split, a majority supporting the army bill and being joined by some of the Centre party. The Cehtre members supported Caprivi purely as a matter of tactics; the Progressives supported him from the conviction that even radical Germans should favour war against Russia, a conviction shared by the Social Democrats. The split in the Progressive party was the end of German radicalism, an event as decisive as the split of the liberal ranks in 1866. Caprivi's anti-Russian line led even the Polish deputies to support the army bill, a unique event in the history of the Reich. With this miscellaneous support the army grant was renewed on July 13, 1893.

Caprivi, though a conservative, tried to behave as if Germany had passed through a liberal revolution. He played for the support of the parties of the left and, in political and economic matters alike, ignored the interests of the Junkers and of the great capitalists as though they no longer held the keys of power. He had claimed that this would lessen the appeal of the Social Democrats; instead they increased their representation to 44 in the general election of 1893. William II was now disillusioned with the policy of social concessions and began to advocate most of the violent measures that Bismarck had been dismissed for supporting in 1890. Moreover Botho, Graf zu Eulenburg, the Prussian prime minister, also advocated a revival of the anti-Socialist laws. Caprivi answered by proposing that the Prussian franchise should be revised in a democratic spirit. The struggle between Junker Prussia and democratic Germany, which Bismarck had avoided, seemed to be approaching; but democratic Germany was not fighting for itself. Its cause was merely being promoted by Caprivi, an enlightened general.

Caprivi's fall was hastened by the failure of his foreign policy. He had counted on winning Great Britain for the triple alliance but the British would not commit themselves. In June 1894 Caprivi's subordinates, Baron Adolf von Marschall von Bieberstein, the secretary of state, and Friedrich von Holstein, the real adviser on foreign policy, tried to blackmail Great Britain into friendship by joining with France to oppose British schemes in central Africa; this was the first open dispute with Great Britain since 1885. The British, far from being won over, were estranged and repudiated their earlier promises of support for Austria-Hungary. Germany had consequently to try to restore good relations with Russia. Thus foreign policy, too, dictated a return to conservatism. In Oct. 1894 William II "solved" the conflict between Caprivi and Eulenburg by abruptly dismissing both. There was neither anti-Socialist law nor revision of the Prussian franchise; merely a prolongation of the Bismarckian compromise or deadlock.

Hohenlohe.—Chlodwig, prince of Hohenlohe-Schillingsfürst, the new chancellor, had been prime minister of Bavaria before 1870 and subsequently Statthalter of Alsace-Lorraine. His greatest qualification was that he was 75; he was to revive the glories of the age of Bismarck without the personal difficulties of the great man's temper. Hohenlohe at first found it easy to get on good terms with the Conservatives. Moreover, his Bavarian experience had made him less hostile to the Centre than Bismarck had been, and he won the support of the Centre by agreeing to many of their confessional demands. In foreign policy Hohenlohe renewed German friendship with Russia, a task made easier by the shift of Russian interest to the far east. He refused to support Austria-Hungary in the Balkans and revived Bismarck's land legislation against the Poles. The Social Democrats were again treated as a subversive force but Hohenlohe made no serious effort to pass new anti-Socialist laws. In fact, his short period of effective rule, from 1894 to 1897, was an attempt to repeat the era of Bismarck without its troubles. Hohenlohe tried to behave like a good-tempered Bismarck, and William II modelled himself on his grandfather. The most striking event of this period was the flagrant dispute with Great Britain over the Boer republics which culminated in the Kruger telegram (Jan. 3, 1896) congratulating the president of the Transvaal on having defeated the Jameson raid. Like many of Bismarck's demonstrations in foreign policy, this was an attempt to satisfy German feeling by a display of power, proof that Germany now counted for something even in South Africa. The Kruger telegram did not affect British policy in South Africa, but it had a lasting effect on German feeling; it taught the Germans, for the first time, to regard the British as their principal rivals in imperial greatness.

Bülow and "World Policy".—Hohenlohe was too old to inaugurate a new policy or even to revive an old one; he could not even control the demagogic enthusiasms of William II. Philipp, Graf zu Eulenburg, the emperor's only personal friend, wished to bring his erratic behaviour under some control and in June 1897 persuaded him to appoint Bernhard von Bulow secretary of state. Bulow became at once the leading man, a position openly acknowledged on Oct. 17,1900, when he displaced Hohenlohe as chancellor. Bulow's task, in Eulenburg's words, was "to satisfy Germany without injuring the emperor"; in other words, to display imperial power without allowing William to make a fool of himself. In home affairs Bulow depended on Miquel, Prussian minister of finance since 1891 and vice-president of the Prussian ministry in 1898. Miquel was a former Radical, once a friend of Karl Marx, and now intent on reviving the partnership between Junker agrarianism and pan-German industrialism which had been broken in the days of Caprivi. All through the 1890s the Junkers had threatened to "bolt" as they did when they brought down Caprivi, thus displaying too openly the artificial Prussian control of the Reich which Bismarck had cloaked in national phrases. Miquel bought the Junkers anew for the Reich, not, as Bismarck had done, with arguments of high conservative principle, but literally by high tariffs on grain and by favouritism in fiscal policy. Tariffs on food were to make the Reich self-sufficient in time of war, and easy credits for the Junkers were to enable them to defend the "national" cause against Polish encroachments. Miquel's financial policy, culminating in the high and rigid tariff of 1902, made the Junkers economically dependent on the Reich. Though they' might still dislike the policy of limitless expansion, the mortgages which weighed on every estate east of the Elbe made them unwilling accomplices in pan-Germanism.

Bulow's own contribution was "world policy," the pursuit of grandeur abroad in order to stave off reform or conflict at home.

The new generation of Germans wished to experience anew the glories of the age of unification without its risks or dangers and such organizations as the Colonial society, the Navy league and the Pan-German league, existed more for the purpose of boasting than anything else. Nevertheless it was impossible to continue boasting without coming to believe that the boasts were true, and in time the demagogic organizations of imperialism took the government prisoner. There was some foundation for their boasts. Thanks to the iron and steel of the Ruhr, Germany had become the greatest industrial power of Europe, and there was nothing to stop its economic domination of the continent if it pursued a cautious foreign policy, relying on peaceful penetration, not on armed force. This was the justification for Bulow's policy of "the free hand," keeping Germany free from foreign alliances except its protectorate over Austria-Hungary. Even the Austro-German alliance seemed without risk, since Russia was now absorbed in the far east. Bulow's great object was to avoid being drawn into the far eastern conflict between Russia and Great Britain. He repeatedly rejected the British offers of an alliance, made most positively by Joseph Chamberlain in March 1898 and by Lord Lansdowne, British foreign secretary, in the spring of 1901. This British attempt is often treated as a turning point in the relations of the great powers, but this is to misunderstand its meaning. The British were concerned solely with China and were incapable of giving the Germans any support in Europe; the Germans were thus being asked to fight a war for existence against both Russia and France for the sake of British investments in the far east. Nor did the failure of the alliance negotiations lead to an estrangement between Great Britain and Germany. Bulow was as careful not to offend Great Britain in Africa as not to offend Russia in China. In Aug. 1898 he concluded an agreement with the British for a hypothetical partition of the Portuguese colonial empire and in exchange abandoned German patronage of the Boer republics. Moreover, during the South African War, official German policy remained strictly neutral, though public opinion in Germany (as elsewhere in Europe) was strongly on the side of the Boers.

Tirpitz **and** the **German** Navy.—Far more decisive in its effect on Anglo-German relations was the building of a great German navy, first sketched in the Navy law of 1898 and fully launched by the Navy law of 1900. The protagonist of this policy was Alfred von Tirpitz (*q.v.*), secretary of state for the navy since 1897. The essence of Tirpitz' naval policy was a great battle fleet, and he justified this by various strategical arguments. At times he spoke of a "risk theory," that Great Britain, on bad terms with Russia and France, would not risk a conflict with a German navy even smaller than its own; at others he envisaged a "decisive battle" with the British fleet. At bottom, Tirpitz, like the other supporters of the great navy, simply held that a great navy was essential to a great power; or, in the words of Theobald von Bethmann Hollweg, that it was necessary "for the general purposes of imperial greatness." Tirpitz insisted that the navy must be planned on a long-term basis, and the Navy law of 1900 laid down the lines on which the German navy should develop until 1917. This made it difficult or impossible to modify German building plans when the British later sought a naval agreement. Here again it would be a mistake to put too early a significance on the German navy. So long as the German plans were merely plans, they did not alarm British opinion much; the great naval scare only came after 1906 when the German navy seemed to be approaching British strength.

The naval projects played an essential part in German home policy, In 1897, when the plans were first drafted, German industry was going through a period of depression, and one object of the great navy was to provide a stable demand, at the taxpayer's expense, for German iron and steel. It was a concession to the German steel magnates which balanced Miquel's favouritism of the Junker landowners. But the navy had a wider appeal. Unlike the army, which retained its Prussian character, the navy was essentially German, an affair of the Reich. Even in 1848 the navy had been a proposal of the Radicals, and now Tirpitz' plans won the support of many liberals who would have opposed an anti-British policy on any other issue. Most striking of all, the Centre voted solidly for the second Navy law (1900) though it drew most of its support from peasants and artisans in areas far from the great ports. With this vote the Centre openly joined the government coalition. It tried to make one condition—that the navy should be paid for by direct taxation. This was the old demand that the Liberals had made in regard to the army. The Centre, too, was unsuccessful; the conservative agrarians had supported the navy only on condition that it should be financed by increases in the taxes on food or by an increase in the national debt. Direct imperial taxation was the vital issue on which the landed classes maintained a veto almost until the outbreak of World War I. In fact, the navy, like the army before it, was largely paid for by state borrowing. Thus inflationary finance, by which Germany conducted World War I, was the basis of the Reich's fiscal policy long before the outbreak of war. Implicit in it was the argument, based on the French indemnity of 1871, that the army and navy would in time pay for themselves by imposing terms of conquest on the other nations of Europe.

The First Moroccan Crisis, 1905–06.—The policy of "the free hand," which Bulow conducted on Holstein's advice, assumed that Great Britain, France and Russia would always remain on bad terms, because of their conflicts in Africa and the far east. So long as these conflicts continued, Germany could ignore such a triviality as Italy's reconciliation with France (1902), which Bulow dismissed as "a dance out of turn." German calculations were upset by the Anglo-Japanese alliance of 1902, which enabled the British to check the Russians in the far east without becoming involved themselves; this was shown in 1904 when the Russo-Japanese war broke out. The Germans would have welcomed a conflict between Russia and Great Britain, but they were far from being willing to join in the war on the Russian side. The most they were prepared to offer was an alliance with Russia which would become operative when the war in the far east was over. This offer was made in Nov. 1904 and repeated by William II in theatrical terms when he met Tsar Nicholas II at Bjorko in July 1905. The offer had no attractions for the Russians; once they had been defeated in the far east, their enemy would be Austria-Hungary not Great Britain. Bulow and Holstein, however, believed that the principal opposition to a "continental bloc" against Great Britain came from France. They therefore decided to use the opportunity of Russia's preoccupation in the far east to force France into dependence on Germany, the more so as the Anglo-French entente (April 8, 1904) had been concluded without enquiring into Germany's position. The result was the first Moroccan crisis.

On March 31, 1905, William II landed at Tangier and announced German support for Moorish independence. The French sought to negotiate. They were answered by a German demand for the resignation of Théophile Delcassé, French foreign minister, and faced, as they supposed, by a threat of war, gave way. Delcassé resigned and on the same day William II created Bulow a prince. This was the reward for success on a Bismarckian scale. But thereafter things went wrong for Germany. Holstein had launched the Moroccan crisis in the old style of cabinet diplomacy without making any attempt to prepare German opinion, which was indifferent to Moorish affairs. The French received strong diplomatic support from the British, including even military conversations against a possible German aggression, and recovered their nerve. At the conference of Algeciras (January–April 1906) the Germans were compelled to acquiesce in French predominance in Morocco and to content themselves with a shadow recognition of its independence. Holstein resigned in protest against this compromise and the German foreign ministry was left without any guiding intelligence until Alfred von Kiderlen-Wachter became secretary of state in 1909. The crisis had been the first for almost 20 years; and it had ended in failure for Germany. The Bismarckian system had been accepted by Germans because it had offered them success abroad; now this capital of success had been exhausted. The German government would either have to make political concessions at home or seek success abroad by more violent means.

The Bulow Bloc.—In 1906 it still seemed possible that Germany might follow the path of liberal reform. Until 1906 Bülow had controlled the *Reichstag* by a coalition of Conservatives and the Centre. This coalition was held together by concessions to the agrarian interest of the one and the confessional interest of the other. In 1906 the Centre put their price too high: they demanded a large share of government appointments for Roman Catholic officials and special privileges for Roman Catholic missionaries in the German colonies. When these terms were refused, they voted against the military grants for suppressing a native revolt in South-West Africa (Oct. 1906). Since the colonies were a popular, even a Radical cause, Bülow seized the opportunity to break with the Centre and organized instead a coalition between the Conservatives and the non-Socialist parties of the left; even the Progressives, who had held out against the go ernment until now, joined the Bülow bloc. Bulow believed that this coalition, in which the left predominated, would also enable him to solve the financial problem; he would be able to carry direct taxation over Conservative opposition. The bloc was successful at the general election of 1907, principally at the expense of the Social Democrats. Bulow now followed a progressive policy in colonial administration and revived the struggle against the Poles which had always been a popular cause. But he was still the prisoner of the Conservatives; he failed to reform the Prussian franchise, and he was unable to introduce direct taxation.

The logical consequence of the swing toward liberalism in home affairs should have been a *rapprochement* with England and an estrangement from Russia, as in the days of Caprivi. Bulow certainly attempted to improve relations with Great Britain, but his hands were tied by Tirpitz' naval plans, which after the development of the dreadnought or all-big-gun ship reached their most dangerous point. In fact Anglo-German relations took a sharp turn for the worse in 1908 and reached a crisis in March 1909, with the great naval scare in Great Britain. In order to get a yearly program of six dreadnoughts against Germany's four, Reginald McKenna, the first lord of the admiralty, had exaggerated Germany's building rate. This frightened the public into demanding more than McKenna himself wanted and "we want eight and we won't wait" became the slogan. On the other hand Bülow certainly accomplished the estrangement from Russia. In Oct. 1908 Russia and Austria-Hungary fell out over the Balkans, when Austria-Hungary annexed Bosnia and Hercegovina. Despite the criticism expressed by William II, the German government decided to support Austria-Hungary unreservedly and in March 1909 settled the crisis by a virtual ultimatum to Russia. The Bismarckian attitude of indifference in Balkan affairs was decisively abandoned, and later attempts to return to it proved ineffectual. Yet Bulow condemned his own policy when he said on his resignation, "No more Bosnias."

The high-water mark of Bülow's pose as a liberal statesman came in the autumn of 1908. In the "liberal" atmosphere of the Bulow bloc it became fashionable to blame William II for the erratic course of German policy and for all the failures of the preceding years. Criticism of the emperor became stronger in 1907 when Eulenburg, his only personal friend, was driven from public life by charges of immorality. In Oct. 1908 the English *Daily Telegraph* published an interview with William II on Anglo-German relations. This interview, in the usual rhapsodical style of imperial utterances, naïvely expressed the bewilderment which most Germans felt at the British resentment against German "world policy." Ordinarily it would have passed unnoticed; in the autumn of 1908, with isolation abroad and liberal stirrings at home, it became the locus of every German discontent. William II had in fact submitted the interview to the German foreign ministry before passing it for publication but Bülow made out that he had been too busy to read it. While ostensibly accepting responsibility, he encouraged the uproar in the *Reichstag* (Nov. 10–12) and public opinion was satisfied only when Bulow announced that in future William II would "respect his constitutional obligations." This seemed a great victory for liberal principles and for Bulow personally. He seemed to have broken the imperial authority which had been too much for Bismarck. But this was true only if Bülow remained in control of the *Reichstag* and that soon escaped him. The Conservatives resented Bülow's quarrel with Russia at the time of the Bosnian crisis (October 1908–March 1909); they resented still more his proposal to introduce succession duties on landed estates. They returned to their alliance with the Centre and defeated the succession duties by a narrow majority. Bülow wished to dissolve the *Reichstag;* but this made him again dependent on the emperor, and William II eagerly seized the chance to dismiss him on June 14, 1909. This ended the Indian summer of liberalism in Germany. Bülow was the last effective chancellor. After him Germany was administered, not governed, as Metternich's Austria had been in its days of decay.

Bethmann Hollweg.—Theobald von Bethmann Hollweg, the new chancellor, was a perfect symbol of the decline in the authority of the Reich. He had no experience either in politics or foreign affairs; he was content to administer. Cultured and honest, he ran over with good intentions, and his high character often put William II and even the *Reichstag* on their best behaviour. But he had no sense of power; he put forward sensible proposals and when these were defeated acquiesced in the wild policy of his opponents. This was early shown in his negotiations with Great Britain over the limitation of naval armaments. In March 1909, during the naval scare in Great Britain, the effect of an agreement would have been enormous on British opinion. Bethmann saw this clearly and tried to negotiate but he was resisted by Tirpitz, overruled by the emperor and gave way without protest. Again Bethmann was led by Kiderlen, his secretary of state, into a second conflict with France over Morocco (July–November 1911).

The Second Moroccan Crisis, 1911.—Kiderlen's object was to restore good relations with France but, with German heavy-handedness, he chose the way of threats and bullying. A German warship, the "Panther," was sent to the Moorish port of Agadir in order to stake out a claim against the French; and Kiderlen demanded the French Congo as compensation for surrendering German rights in Morocco which did not exist. Pan-German feeling was aroused and Kiderlen received more support in Germany than he had bargained for. Against his will he had to create a war crisis, and in this war crisis Germany was defeated by Anglo-French resolution. The Agadir affair ended with a settlement in which Germany received only a fragment of the French Congo. In the ensuing *Reichstag* debate Bethmann and Kiderlen were furiously attacked for their timidity, attacks openly patronized by the crown prince. Bethmann would not make a frank defense of his pacific policy, yet mas resolved against a policy of violence. Hence, as usual, he fell back on a policy of routine.

In the two and a half years between the Agadir crisis and the outbreak of World War I, Bethmann made sincere, though ineffectual, attempts to lessen the tension in international relations. He tried vainly to take advantage of Lord Haldane's visit to Berlin (Feb. 1912) to improve Anglo-German relations, an attempt once more wrecked by Tirpitz' refusal to restrict his naval plans. Again, Bethmann worked with Sir Edward Grey to limit the Balkan Wars and successfully prevented their turning into a conflict between Russia and Austria-Hungary. Finally he negotiated with the British agreements settling the Baghdad railway and devising a new hypothetical partition of the Portuguese empire. These seemed signs of a policy of appeasement. But Bethmann was the prisoner both of German opinion and of the great general staff. He was engaged in postponing a European war, not in preventing one, and even the improved relations with Great Britain aimed only at detaching the British from France and Russia so that Germany would have more chance of winning a continental war.

In home affairs also Bethmann was content to leave things at a standstill. He never found a government coalition to replace the Bülow bloc and therefore ran the *Reichstag* without a secure majority. His solution for every problem was to do nothing. Thus, in order not to annoy the Poles he did not enforce Bülow's anti-Polish laws; but in order not to annoy national feeling he did not repeal them. The general election of 1912 returned the Social Democrats as the largest single party. Bethmann did not attempt to renew Bismarck's battle against the Social Democrats. On the other hand he did not bring them over to the government side, As usual he made gestures without action. He consulted the Social Democratic leaders, but did not act on their advice.

He promised a reform of the Prussian franchise, but did nothing to redeem his promise. Bethmann's helpless position was clearly shown in Nov. 1913. The officers of the garrison at Saverne (Zabern) in Alsace provoked quarrels with the townspeople and arrested some of them in defiance of the law. Bethmann thought the military authorities in the wrong, but, as usual, thought it his duty to defend them. The *Reichstag* revolted, and Bethmann was censured by a vote of 293 to 54. It was a vote without a sequel. Bethmann did not resign; the military authorities were not punished; and the "progressive" *Reichstag,* which had condemned the military, voted an enormous capital levy for the further increase and equipment of the army. Thus, to the end, the German people tried to combine the rule of law at home and the rule of German military power abroad. It was certainly a great achievement that Germany remained a *Rechtsstaat* (a state of law) throughout the period of the empire; but it was an achievement that had to be paid for by the other peoples of Europe.

Outbreak of World War I.—The diplomatic crisis of July 1914 was not, like the two Moroccan crises, a manufacture of the German foreign office. There is little or no evidence that the Germans deliberately planned war in the summer of 1914; the strongest argument against this view is that there was probably no one in the government capable of planning anything. The crisis caught the German government unawares; but there could be no doubt of its response. The question which Bismarck had evaded had now to be answered. Was Germany to abandon or to extend the advance into southeastern Europe that had been proceeding for centuries? The survival of Austria-Hungary was at stake, and Germany had either to fight a war for the mastery of all Europe or to abandon even central and southeastern Europe to independent national states. Confronted as they were by such a crisis, the only dispute among Germans—between Bethmann and the general staff or between the German and Austro-Hungarian foreign offices—was tactical: whether Aug. 1914 was the best moment to fight the inevitable war for European hegemony. Bethmann, as usual. opposed but acquiesced and finished up even by defending the German march through Belgium which he knew to be indefensible and which brought Great Britain into the war.

The outbreak of war accomplished something which social concessions had failed to do; it brought the Social Democrats over to support of the imperial government. The German Socialists had always been the leading spokesmen in the Socialist International of the general strike against war. When it came to the point, they were won over by the argument that Germany mas being attacked by tsarist Russia (the old Radical cry of 1848). At the meeting of Socialist members. a minority opposed the war; but when the *Reichstag* met, the entire Socialist party voted for war credits, in the name of party unity. The Socialists went further. They joined the other parties in declaring *Burgfrieden,* a civil truce, by which they agreed to criticize neither each other nor the government. In other countries at war, the party politicians formed a coalition or otherwise established control over the government. In Germany the members of the *Reichstag* abdicated to the imperial government, though it remained unchanged and beyond its control. No wonder that William II declared, "There are no more parties; I see only Germans." This was, of course, an exaggeration. The Social Democrats had always some doubts about supporting the war without reserve, and they had to devise increasingly elaborate arguments in order to satisfy their consciences. In the autumn of 1914, after the battle of Tannenberg, it became obvious that Russia was not a menace to Germany. The Social Democrats then made out that Germany was becoming a Socialist country under the pressure of war and that they were fighting a war of defense against "entente capitalism."

For Germany, as for other belligerent countries, World War I fell into two distinct phases: the first, old-style conventional war which lasted until 1916; the second. a war of desperate expedients when both sides fought a struggle for existence. The German war plan was a plan for a short war. France was to be overrun within six weeks, Russia within six months; Great Britain mould be excluded from Europe. This plan met disaster at the battle of the Marne (Sept. 1914). The Germans missed the capture of Paris on which they had pinned their hopes; lines of trenches stretched to the French coast, and the Germans were left in occupation of Belgium and of northern France. Yet at the same moment the defeat of the Russians at Tannenberg gave Germany the security which was its ostensible war aim and at any time between Sept. 1914 and the summer of 1917 the Germans could have had peace on the basis of the *status* quo. Such a peace, horn-ever, was impossible for Germany. It mould have destroyed the prestige of the German armies; it would have arrested the expansion of German industry; above all, it would have led to a political revolution at home. The Bismarckian compromise between the demands of the middle classes and those of the Junkers had been created by him in order to restrain German ambitions and to make a moderate policy possible; now the Germans had to wage a mar of conquest and to abandon all moderation in order to preserve the Bismarckian compromise.

The defeat at the Marne brought a change in the high command. Helmuth von Moltke, nephew of the great commander of 1866 and 1870, disappeared and was succeeded by Erich von Falkenhayn, an organizer rather than a strategist. He determined to stand on the defensive in the west, while breaking Germany's enemies in the east. This plan was, in its limited aim, successful. Anglo-French offensives on the western front achieved nothing. Meanwhile the Russians were driven out of Galicia, and the way was prepared for the conquest of Poland. In the autumn of 1915 Serbia was overrun, and with the entry of Bulgaria into the war the Central Powers had a secure land route to Turkey and beyond it to the Persian gulf. Turkish efforts to threaten the Suez canal failed but this was more than offset by the Allied failure to break through the Dardanelles. The Allies had counted on great advantage from bringing Italy into the war (May 1915); but their hopes were disappointed. The Italian armies were no more than a match for the Austro-Hungarian army; and in any case they had to attack on a very narrow front where no decisive victory could be obtained.

In home affairs the second year of the war saw the first effort to mobilize German resources for a serious war. No preparations had been made for this, and the inspiration of the program came from Walther Rathenau, a businessman who convinced Bethmann and the high command of the need for an economic plan in the winter of 1914. It may be said without exaggeration that Rathenau alone made it possible for Germany to wage war for four years. Politically, too, the second year of the war saw the beginning of an effort to think in war terms. The conquest of Belgium shifted Germany's interests, as it were, west. Throughout the war Germans of every party, including the Social Democrats, made the annexation of Belgium, in whole or in part, or at least German control of Belgium, an essential condition of peace. This was sometimes justified by strategic arguments, disguised as the need for security, sometimes by arguments of economic union. The basic fact was that German plans of conquest had moved to the west and for a simple reason: Germany had become the greatest industrial power. The plans for extending German territory in the Baltic—the only plans with which the Prussian Junkers sympathized—were plans for the benefit of landowners; the plans for controlling southeastern Europe! also of long standing, were the plans of German traders; both were eclipsed by the ambition of the German magnates of the Ruhr to control the industrial resources of Belgium and of northeastern France. Against these plans, there was a stirring of German liberal sentiment, some of it roused merely by the hope that Germany might make peace with the entente if it demanded less territory in western Europe or was even content with territory in the east. But there was also a movement among a minority of the Social Democrats against a war of conquest, and soon against any war at all. In Dec. 1914 Karl Liebknecht, a left-wing Socialist, first voted against the war credits; in 191j some Social Democrats began to move against their party and to form an "independent" group, largely pacifist in tone.

In 1916 Falkenhayn, still without a constructive strategy, attempted to "bleed the French white" by the prolonged battle of Verdun (Feb. 21–June) which exhausted the Germans alinost as much as it did the French. At the same time an attempt to break British naval power by direct assault failed at the battle of Jutland

(May 31, 1916), the only serious engagement fought by the German High Seas fleet in the course of the war. It became clear that new men and new methods were necessary if Germany was to continue the war. The first decisive change came on Aug. 29,1916, when William II dismissed Falkenhayn and appointed Paul von Hindenburg chief of staff with Erich Ludendorff as his quartermaster general. Hindenburg, an elderly general who had achieved a spurious fame as the victor of Tannenberg, was merely a symbol of German resolve. Ludendorff, however, was a man who combined strategic daring with political ambition. He was determined to win the war and in order to do it intended to establish the authority of the high command over the civil government of the Reich.

The Political Crisis of 1916–17.—The appointment of Hindenburg and Ludendorff ushered in the political crisis of the German empire. Until then a semblance of Bismarck's constitution had been maintained. The high command had confined itself to military affairs, and Bethmann had still conducted policy. In Oct. 1916 the *Reichstag* gave the signal for ending this system when it passed a motion, proposed by the Centre, that it had confidence in Bethmann, so long as he possessed the confidence of the high command. Bethmann was at this time attempting to get tsarist Russia out of the war and to prevent the United States from entering it. The resolution of the *Reichstag* made it impossible for him to resist the policy of the high command. In Nov. 1916 Ludendorff cut across Bethmann's negotiations with Russia by insisting on the proclamation of an independent kingdom of Poland; this effectively estranged the Russians without bringing any serious Polish recruitment to the armies of the Central Powers. On Feb. 1, 1917, a crown council resolved, again against Bethmann's opinion, on unrestricted submarine warfare, in order to answer the British blockade by bringing Great Britain to its knees. Though this campaign had some success, it had the much graver failure that it brought the United States into the war.

The spring of 1917 saw an explosion of war weariness in Germany. Ludendorff had taken over a difficult strategic situation and he had to plan for a defensive war, with dispiriting results, for the whole of 1917. The first Russian revolution (March 1917) encouraged left-wing sentiment in Germany, and on April 7 Bethmann once more promised a democratic reform of the Prussian franchise, though as usual the promise was not carried out. In July there folloned mutinies in the German navy which was confined to its base at Kiel. Hitherto the attacks on the war had come from the Independent Social Democrats and from the Spartacists. as the revolutionary followers of Liebknecht were coming to be called. But in the spring of 1917 Matthias Erzberger, leader of the Centre, visited Gen. Max Hoffmann, who had succeeded Ludendorff on the eastern front, and learned from him that the war mas lost. Erzberger returned to Berlin, determined to secure for the Centre the position of leading anti-war party; after all it was the only party that could survive any change of regime. On July 6 he launched an attack on Bethmann accusing him of advocating a policy of conquest and demanding the enunciation of defensive peace terms. Ludendorff had long regarded Bethmann as weak and too pacific but he none the less welcomed this attack by Erzberger as a way of getting a chancellor more to his taste. Thus Erzberger and the high command worked hand-in-hand, though for exactly opposite ends. The politicians meant to get rid of Bethmann with Ludendorff's assistance, and then to control Ludendorff by calling in Bulow as chancellor. For Bulow, as a result of his clash with the conservatives in 1909, had an undeserved reputation as a liberal. His parting words to the conservatives had been: "We shall meet again at Philippi." Both Bulow and the *Reichstag* politicians thought that Philippi had now come. This grotesque scheme failed at the first hurdle. William II, with the humiliation of the *Daily Telegraph* affair still rankling, refused to hear Bulow's name mentioned, and Ludendorff then nominated out of hand Georg Michaelis, an unknown official who had acted competently as Prussian food controller. Thus ended the great crisis that was to give Germany parliamentary government with the backing of the high command.

The *Reichstag* had to be given some satisfaction. Having failed to make a chancellor, the politicians were allowed to make **a** policy. The "peace resolution" of July 19 was a string of innocuous phrases, expressing Germany's will to peace, but without a clear renunciation of indemnities or annexations. Most of the politicians who supported it, including Erzberger himself, were still in favour of annexing Belgium and part of northeastern France. The peace resolution was, at best, a gesture of good will in answer to Pres. Woodrow Wilson's advocacy of the Fourteen Points. Later in the year the *Reichstag* received a further acknowledgment from the high command. Ludendorff admitted that Michaelis had proved incompetent as chancellor and ordered him out of office (Nov. 2, 1917). Georg, count von Hertling, his successor, was 75 years of age and had been prime minister of Bavaria. Appointed principally to please the Centre, he was the only Roman Catholic to be chancellor of Bismarck's empire. As a further innocuous concession, Friedrich von Payer, leader of the Progressives, became vice-chancellor. Neither Hertling nor Payer had any influence on policy, which was determined by the high command. Only Richard von Kuhlmann, the secretary of state, tried to assert some civilian control but he too was ordered out of office by the high command when he ventured to suggest in the *Reichstag* that a peace based on complete victory was no longer possible.

Last Year of the Empire.—Bismarck's Reich was to have a last year of illusory success before defeat. In 1917 Ludendorff met and routed the Allied offensives on the western front. More important, the Russian forces on the eastern front fell to pieces, particularly after the failure of Alexander Kerensky's offensive (July 1917) and the Bolshevik revolution in Nov. 1917. The Bolsheviks believed that they could cause revolution also among the German workers by offering a peace "without indemnities or annexations." Hence they negotiated with the German high command at Brest-Litovsk. The Bolshevik calculation proved false. Though Germany was swept by a wave of strikes in Jan. 1918, these sprang simply from grievances against the hard domestic conditions, and in any case they collapsed without producing any political result. The German working class, through the mouths of the Social Democrats, had announced that they were fighting a war of defense against tsardom; but they continued to fight when tsardom had disappeared. On March 3, 1918, the Bolsheviks had to sign the peace treaty of Brest-Litovsk. by which Russia lost 56,000,000 inhabitants, 79% of its iron and 89% of its coal production. This annexionist treaty was not opposed by the parties that had voted for the "peace resolution." The Centre and the Progressives voted for the treaty, the bulk of the Social Democrats abstained and only the Independent minority of Social Democrats voted against. When it came to the treaty of Bucharest with Rumania (May 7, 1918), which made Germany the economic master of the country, the majority of the Social Democrats actually voted for the treaty. Thus, for a few brief months, Germany achieved the dream of *Mitteleuropa,* with all Europe east of the Rhine under its economic domination.

The decisive battle had, however, still to be fought in the west. On March 21, 1918, Ludendorff launched the "emperor's battle" (much against the emperor's wish). On April 9 he won a battle against the British and at the end of May against the French. Decision eluded him. On July 18 the French struck back, and on Aug. 8—the black day of the German army—the British broke through. Ludendorff remained confident that he could fight a defensive war. At the end of September Bulgaria collapsed and the collapse of Austria-Hungary was near. On Sept. 29 Ludendorff lost his nerve and declared that an immediate armistice was necessary. Further, to make the approach to the Allies easy, he ordered that Germany should become a constitutional monarchy overnight. Max, prince of Baden, who had long enjoyed a happy reputation as a liberal and an international conciliator, became chancellor (Oct. 3). The same day the political leaders were told by Ludendorff's representatives that the war had been lost. Ludendorff had never studied the Fourteen Points; and when he understood their impiications he wished to continue the war. He was overruled and resigned on Oct. 26. Hindenburg remained at the head of the general staff with Wilhelm Groener as quartermaster general.

The Revolution.— The change to constitutional monarchy had been carried through peacefully, at the order of the high command. At the end of October the *Reichstag* resolved that the chancellor must henceforth possess the confidence of the *Reichstag* and this resolution was approved by the emperor. But the German people were now growing impatient. On Nov. 3 mutiny broke out in the fleet at Kiel and revolt soon spread to Berlin. On Nov. 9 Liebknecht, the Spartacist leader, prepared to proclaim a Soviet republic. Prince Max's cabinet tried to counter this by proclaiming the abdication of the emperor. When this failed, Philipp Scheidemann, one of the two Social Democrats in the cabinet, proclaimed the republic in order to anticipate Liebknecht, much to the fury of Friedrich Ebert, his colleague. Prince Max handed over his office to Ebert, who thus became for 24 hours the last imperial chancellor. Meanwhile at Spa, the seat of the high command, where William II had taken refuge, the emperor tried to defend his position. He was told by Wilhelm Groener that the army would not support him and on Nov. 9 fled to Holland. Thus the Social Democrats and the high command, much against their will, combined to create the German republic. On Nov. 10 the workers' and soldiers' councils of Berlin, which had been set up in imitation of the Russian soviets, gave a revolutionary blessing to Ebert's regime; it was more important for him that the high command blessed it at the same time. *(See* also WORLD WAR I.) It remained to establish a government for the state.

Ebert, last imperial chancellor, became chairman of the Council of Peoples' Commissars, a body dominated by Majority Socialists who were opposed to revolution. His first act was to strike a bargain with the high command; Hindenburg would retain his command, and Ebert would resist the revolution. This had already lost its mass appeal with the signature of the armistice (Nov. 11). On Dec. 19 Ebert persuaded the Congress of Soldiers' and Workers' Councils to fix elections for the constituent assembly for Jan. 19, 1919. On Dec. 23 revolutionary sailors answered by occupying the chancellery and taking Ebert prisoner. He was rescued on Dec. 24 by troops from the Potsdam garrison. On Dec. 29 the three Independent Socialists resigned from the government in protest against Ebert's counterrevolutionary policy; this left him with a free hand. Gustav Noske, another Majority Socialist, organized a volunteer corps with which to defeat the revolution. He said: "Someone must play the bloodhound; I am not afraid of the responsibility."

On Jan. 4, 1919, Robert Emil Eichhorn, an Independent Socialist and police president of Berlin was dismissed. Mass demonstrations of protest followed, but the government was not overthrown. On Jan. 11 Noske's Volunteers entered Berlin. Heavy street fighting took place, which ended with Noske's victory on Jan. 15. The same evening the two Spartacist leaders Karl Liebknecht and Rosa Luxemburg were arrested and murdered by Volunteer officers. Elections for the national assembly were duly held on Jan. 19. The social revolution had been defeated and the way was clear for a democratic republic to preserve the economic order and the military values of imperial Germany. Ebert and Hindenburg, the two presidents of the Weimar republic, were also the partners who brought it into existence. (A. J. P. T.)

THE GERMAN REPUBLIC

The Weimar Constitution.— The national assembly met at Weimar on Feb. 6, 1919, and listened to an opening speech by Friedrich Ebert in which he underlined the breach with the past and urged the Allies not to cripple the young republic by the demands imposed on it. On Feb. 11 the assembly elected Ebert as president of the Reich, and on the following day Philipp Scheidemann formed a ministry which contained representatives of the Centre and of the Democrats, besides members of Scheidemann's own party, the Social Democrats. This was the so-called Weimar coalition.

The principal task of the assembly was to provide a new constitution for Germany. After several months' discussion, this was promulgated on Aug. 11, 1919. The government's draft mas drawn up by Hugo Preuss, one of the leaders of the Democratic party. Preuss, however, was not able to secure the unitary Reich he favoured, in which Prussia would have been broken up and the old states (*Länder*) abolished in favour of a new division of the country by provinces. The republic, like the empire it replaced, was to have a federal basis. The powers of the Reich, however, were considerably strengthened and it was now given overriding control of all taxation. National laws were to be superior to the laws of the states, and the Reich government was given the power to supervise their enforcement by the local authorities. Under the republic there were 17 *Lander* in all, ranging from Prussia with a population (in 1925) of 38,000,000 and Bavaria with 7,000,000 to Schaumburg-Lippe with 48,000. The only new *Land* was that of Thuringia. formed in 1919 from the amalgamation of seven small principalities.

The *Lander* continued to be represented in the *Reichsrat,* which replaced the imperial *Bundesrat,* but the new chamber's powers were much reduced and it took a subordinate place under the *Reichstag,* to which alone the government mas made responsible. All men and women over the age of 20 were to have the right to vote for the *Reichstag,* and the elections were to be conducted on the basis of proportional representation. Under this system no party ever succeeded in securing a clear majority and the governments of the republic from beginning to end were coalitions. Proportional representation had the further consequences of excluding independent members, encouraging the formation of numerous political parties and increasing the power of the party machines. In addition to the democratic franchise, provision was also made for popular initiative in legislation and for a referendum.

As a counterweight to the *Reichstag,* Preuss persuaded the assembly to endow the president as the chief executive with strong powers. He was to be elected independently of the *Reichstag* by the nation itself, was to hold office for seven years and was to be eligible for re-election. He mas given the power to make alliances and treaties; he was the supreme commander of the armed forces, with the right to appoint and remove all officers; he could dissolve the *Reichstag* and submit any law it had enacted to a referendum. Finally, under the famous article 48, he had the right to suspend the civil liberties guaranteed by the constitution in case of emergency and to take any measures required to restore public safety and order, if necessary with the help of the armed forces. These provisions reflect the insecurity, bordering on civil war, with which Germany was faced at the time; they were to prove of great importance in the final stages of the history of the Weimar republic. Under the president, political responsibility was to rest with the chancellor. The government was made dependent upon the confidence of a majority of the *Reichstag;* with the withdrawal of this confidence the government had to resign.

The Weimar constitution has been subjected to considerable criticism, notably for the system of proportional representation which it introduced and the large powers it conferred on the president. For the first time in German history, however, it provided a firm foundation for democratic development. The fact that within 14 years this ended in a dictatorship was due far more to the course of events and to the character of social forces in Germany than to constitutional defects.

The German Reich, as it was re-established in 1919, was a democratic but not a socialist republic. A number of measures for the socialization of certain parts of the national economy (*e.g.,* the coal, electrical and potash industries) were introduced but proved ineffectual. German industry continued to be marked by cartels and other combines of a monopolistic character, control of nhich was increasingly concentrated in the hands of a small number of men. The fact that, after the hopes aroused in 1918–19, no far-reaching plan for securing public control over industry or for breaking up the big landed estates was carried through had two consequences. Although the German working class undoubtedly improved its political and economic status under the republic, a considerable section was embittered by the failure to effect a drastic reform of the social and economic system. This was to provide the left-wing opposition (the Independent Socialists and the Communists) with strong working-class support which weakened both the Social Democratic party and the republic. Secondly, economic power was left in the hands of classes who were either irreconcilable opponents of the republic from the beginning, or equivocal supporters with a preference for authoritarian forms of government.

The position of the trade unions, the eight-hour day and the right of collective bargaining were safeguarded under the republic, but the attempt to extend democracy to the industrial sphere met with powerful opposition from the industrialists. A system of works councils set up early in 1920 enabled the workers in each factory to elect representatives to share in the control of management. This experiment, however, soon disappointed the hopes entertained of it, largely because of the stubborn resistance of the employers. The attempt to establish an economic parliament (Reichswirtschaftsrat), with equal representation for employers and workers proved equally disappointing.

The Treaty **of Versailles.**—Apart from drafting the constitution, the urgent task for the assembly and the new government was to conclude peace. The government's instructions to the German peace delegation which went to Versailles at the end of April 1919 show how wide was the gap between German and Allied opinion. In German eyes the break with the past was complete, and the Wilsonian program of self-determination and equality of rights as set out in the Fourteen Points was binding on both sides. The fact that the Allied powers refused to permit negotiations and the character of the terms presented on May 7 provoked bitter indignation throughout all classes in Germany.

Germany was called on to cede Alsace-Lorraine to France; Upper Silesia, most of Poznan and the so-called West Prussia to Poland; north Schleswig to Denmark, and three small frontier districts to Belgium. Danzig was to become a free city, independent of Germany; East Prussia was separated from the rest of the Reich by Polish Pomorze, and Memel was handed over to Lithuania. In Europe alone (without counting the German colonies, all of which had to be handed over to the Allies) Germany lost about 27,188 sq.mi. of territory, with a total population of over 7,000,000. The union of Austria with the Reich, which was desired by both countries, would have compensated for these losses, but was expressly forbidden by the treaty.

The left bank of the Rhine was to be occupied by Allied troops from 5 to 15 years to ensure the execution of the treaty's terms. The left bank, and the right bank to a depth of 50 km., were to be permanently demilitarized. In addition to the big industrial area of Upper Silesia which was to go to Poland, Germany was to lose the rich coal fields of the Saar for 15 years. At the end of this period a plebiscite was to be held. Until then the Saar was to be governed by the League of Nations and its coal mines by France.

The Allies could not agree on a figure for reparations. A decision was deferred until 1921, but the Germans were to make a provisional payment of 20,000,000,000 M. in gold as well as deliveries in kind. Prewar commercial agreements with foreign countries were cancelled; German foreign financial holdings were confiscated and the German merchant marine reduced to less than one-tenth of its prewar size. At the same time the Allies were to enjoy most-favoured-nation rights in the German market for five years.

Measures for the demilitarization of Germany accompanied the territorial and economic demands. The German army was to be limited to 100,000 officers and men; conscription was forbidden; the German general staff was to be dissolved; great quantities of war material were to be handed over, and the future manufacture of munitions rigidly curtailed. German naval forces were to be reduced to a similar scale, while the possession of military aircraft was forbidden. Inter-Allied control commissions were set up with wide rights of supervision to make sure that the disarmament clauses were carried out. A list of those accused of violating the laws and customs of war was to be prepared, and those named were to be handed over to the Allies for trial. Finally, as justification for their claims to reparations, the Allies inserted the famous war-guilt clause, article 231:

> The Allied governments affirm and Germany accepts the responsibility of Germany and her allies for causing all the loss and damage to which the Allied governments and their nationals have been subjected as a consequence of the war imposed upon them by the aggression of Germany and her allies.

All the German parties united in a solemn protest against these terms when the national assembly met in Berlin in the middle of May. The Allies were declared to have flagrantly violated the principles of a just peace proclaimed by Wilson, while the belief that Germany had been tricked into signing the armistice was widespread. The only concession of importance the German delegation was able to secure was the promise of a plebiscite in Upper Silesia. In June the Allies presented an ultimatum, and the German government had to face the alternatives of signing the peace treaty or submitting to an invasion of their country. A strong section of opinion in the army and in the parties of the right was in favour of rejection, whatever the consequences. The Centre and the Social Democrats, although sharing the indignation at the terms proposed, believed that rejection would mean economic ruin and the possible dismemberment of the Reich. Scheidemann, who was personally opposed to acceptance, resigned when his cabinet was unable to agree, and his place as chancellor was taken by Gustav Bauer who formed an administration supported by the Social Democrats and the Centre, but without the Democrats, most of whom joined the Nationalists (Deutschnationale Volkspartei) and the People's party (Deutsche Volkspartei) in opposition. On June 23 a majority of the assembly, persuaded that there was no alternative, voted in favour of acceptance, and the treaty was signed at Versailles on June 28.

The Allies' insistence that the republic should accept a peace settlement universally regarded in Germany as unjust and humiliating contributed powerfully to weaken the new regime. The republic never succeeded in breaking its association with the capitulation of 1918 and the signature of the peace treaty in 1919. For neither of these could the republic's leaders justly be held responsible, but the legend that the German army had never been defeated but was stabbed in the back by the Republicans, the Socialists and the Jews, "the November criminals," was assiduously repeated by the enemies of the republic and, in the mood of resentment created by the treaty, was readily accepted by many Germans. The Republican leaders, to whose sense of responsibility the nation owed the preservation of its unity and the avoidance of far worse disasters in the critical year which followed the request for an armistice, had to endure a campaign of vilification which represented them as traitors to the fatherland. From the ill-omened circumstances of its birth the republic was never able to set itself free.

The Years **of** Crisis, 1920–23.—The Weimar coalition of Social Democrats, Centre and Democrats, which had been the basis of Scheidemann's ministry (February–June 1919) was re-established by Bauer when the Democrats joined his government in Oct. 1919 and maintained by Hermann Miiller (also a Social Democrat) when he took Bauer's place as chancellor at the end of March 1920. The elections of June 6, 1920, however, showed a marked swing against the parties most closely identified with the republic. The Social Democrats' vote fell from 11,509,100 to 6,104,400 and the Democrats' from 5,641,800 to 2,333,700. The Roman Catholic parties, that is the Centre and the Bavarian People's party, had common lists at the election of Jan. 19, 1919, when they collected 5,980,200 votes; on June 6, going to the polls separately, the Centre obtained 3,845,000 votes and the Bavarian party 1,238,600. The opposition parties, the Nationalists and the People's party on the right, the Independent Socialists on the left, all showed heavy gains. This marked the end of the period during which the Social Democrats had been the dominant party in the republic. At the end of June 1920 the Weimar coalition was replaced by a new combination under Konstantin Fehrenbach (Centre), representing the Centre, the Democrats and for the first time the People's party. The inclusion of the People's party, which had raised its votes at the elections from 1,345,600 to 3,919,400, was due to the willingness of its left wing, led by Gustav Stresemann, to co-operate in the development of the republic on the pattern of a bourgeois and capitalist democracy.

Fehrenbach's ministry lasted until May 1921, when it resigned over the issue of reparations and was replaced by a restored Weimar coalition (Social Democrats, Centre and Democrats) under Joseph Wirth (Centre). This remained in office until Nov. 1922.

Throughout the period German politics continued to be dominated by the legacy of the lost war. Relations with France remained bad. Even before the occupation of the Ruhr in 1923, the French twice marched troops into German cities on the grounds that Germany was not carrying out its obligations under the treaty. French attempts to develop a separatist movement in the Rhineland failed but strengthened German impressions of an inflexible hostility and determination to break up the Reich on the part of France.

The plebiscite held in Upper Silesia on March 20, 1921 resulted in a majority for remaining with Germany. Disregarding the treaty provisions for the partition of the area according to the wishes of the inhabitants expressed by communes, Germany claimed that the whole territory should remain German. The Poles retaliated by organizing an armed revolt and attempting a seizure by force. A division of opinion among the Allies. with France supporting the Poles, led to the dispute's being referred to the League of Nations. The league's award, published on Oct. 20, 1921, divided the province, giving two-thirds of the territory to Germany, but leaving the coal mines, the principal industrial areas and a considerable German minority on the Polish side of the frontier. The decision was hotly resented in Germany.

Shortly after the Silesian plebiscite, on April 27, 1921, the Allied reparation commission fixed the total to be paid by Germany at 132,000,000,000 gold Marks. Regarding this as far in excess of the country's capacity to pay, the Fehrenbach government at once resigned (May 4). The Allies retorted with an ultimatum calling on Germany to announce its unconditional acceptance of the figure within six days, under threat of the occupation of the Ruhr. The German leaders were faced with the same dilemma as in June 1919. The Nationalists again took the easy way out by demanding the rejection of the Allies' demand. The Social Democrats and the Centre, impressed by the danger of seeing more of Germany occupied and possibly separated from the Reich, were joined by the Democrats in a renewal of the Weimar coalition, and Wirth, the new chancellor, secured a reluctant vote from the Reichstag in favour of accepting. Once again the Republican parties had been saddled mith the responsibility for carrying out decisions forced on a resentful country by the Allies.

The German government, however, found it impossible to pay the sums required on time. The bad economic and financial situation in the country led to frequent delays, culminating in July 1922 with the request for a moratorium on cash payments until the end of 1924. This request brought to light a sharp divergence between the Allies which led the French to proceed to the occupation of the Ruhr in Jan. 1923 on the pretext of a technical default by Germany in its deliveries of timber.

The Rapallo Treaty.—One may of breaking the hostile ring with which the Germans felt themselves encircled was to make common cause with the other outcast among the European nations, the Soviet Union. This idea was attractive not only to many on the left, but to some on the right, who believed that another war with France was inevitable and were looking for allies. Economic negotiations with Russia in 1921 proved successful and support for a *rapprochement* between the two countries came from Gen. Hans von Seeckt, the commander in chief of the army. Wirth and his foreign minister, Walther Rathenau, were both disillusioned by the difficulties of trying to co-operate with the western powers and were won over to the easterners' point of view. On April 16, 1922, a treaty of friendship was signed between Germany and Russia at Rapallo, establishing normal relations between the two countries, waiving reparations claims by both sides and promising the expansion of Russo-German trade. The treaty was widely acclaimed in Germany as a sign of national independence. The French and British were surprised and angry. No counteraction was taken, but Rapallo no doubt helped to harden French opinion for the trial of strength of 1923. The most important practical consequence was the conclusion of secret agreements between the German and Russian armies, which alloned German officers and units to acquire experience with the Red army and provided opportunities for experiments with the design of forbidden weapons such as tanks and aircraft.

Political Disturbances at Home.—At home, the successive governments had to deal with a situation in which public order nas still insecurely established and the republican regime challenged from both right and left. A workers' rising led by Communists took place in the Ruhr in the spring of 1920, and there was fierce fighting with the army and with the volunteer Freikorps before it was suppressed at the beginning of April. When miners in the Mansfeld district of central Germany took up arms against the police in March 1921, the Communists called for a general strike without success; the miners' resistance was rapidly overcome and order restored.

There was still widespread fear of a German revolution on the model of Russia's. Against this the powerful and moderate Social Democratic party and the trade union movement proved an effective barrier. After the left ning of the Independent Socialists joined the Communists (Dec. 1920), the majority of the Independents drew closer to the Social Democrats and a union of the two parties was achieved in Sept. 1922.

The greater danger to the republic came from the right. As early as March 1920, a coup d'état was attempted by Gen. Walther von Lüttwitz, who commanded the troops in the Berlin area, and Wolfgang Kapp, an East Prussian official who had helped Tirpitz to found the wartime Fatherland Front. With the help of the Ehrhardt brigade, one of the Freikorps formations, they assumed power in Berlin for a few days, while President Ebert and the government withdrew to Dresden. The Kapp *Putsch* honever failed to receive the support anticipated from the army or from the parties of the right (who regarded it as premature), and it was met by the solid resistance of the working class organizations, led by the trade unions, which called a highly successful general strike and forced Lüttwitz and Kapp to abandon their attempt.

Inside the *Reichstag*, the Nationalists kept up an unrestrained campaign against the republic and its leaders. But even the Nationalists were not sufficiently extreme for groups like the German Racial Freedom party in the north or Adolf Hitler's National Socialists in Munich, which combined anti-Semitism and antisocialism with open demands for the overthrow of the republic and an inflammatory nationalism. Closely linked with these groups were semimilitary organizations under a variety of names, drawing their membership largely from ex-servicemen (many of whom had served in the Freikorps after the war), and in close touch with officers in the regular army who provided them with arms and looked upon them as a reserve for the day when they would rise to destroy the republic and avenge the defeat of 1918. From this underworld of conspiracy, which was a breeding ground of the Nazi movement, were recruited gangs like the notorious Organization *Consul* (founded by Capt. Hermann Ehrhardt), which carried out a series of political murders. Among their victims mere Matthias Erzberger (Aug. 29, 1921), one of the leaders of the Centre party, who had signed the armistice, and Rathenau (June 24, 1922), the brilliant Jew who became foreign minister and was assassinated in broad daylight in the centre of Berlin. One of the most disturbing features mas the marked leniency shown by the courts toward political terrorism when practised by the right,

The stronghold of these counterrevolutionary forces was Bavaria. The most powerful party in south Germany, the Catholic Bavarian People's party, made no secret of its antirepublican and particularist views or its sympathy with proposals to restore the Wittelsbach monarchy in Bavaria. Relations between the state government in Munich and the Reich government in Berlin were continually strained by the refusal of the Bavarian authorities to proceed against the extremist organizations which found shelter in their territory, including Hitler's National Socialists who throughout the 1920s were predominantly a Bavarian movement.

The *Ruhr* and *Inflation*.—During these immediate postwar years the value of the Mark steadily deteriorated. This was due to a number of factors, among them reparation payments, the flight of German capital abroad, the obstacles to the revival of German foreign trade and a consequent adverse balance of payments. Faced with budgetary deficits, the German government followed a practice already begun during the war, that of issuing more money to meet its expenses. The result was a runaway inflation more severe than in any other part of postwar Europe. This process was well under way in 1922, during which the value of the Mark in terms of the dollar (pre-1914 relation: $1 = 4.20 M.) fell from 162 M. to over 7,000 M. The culmination of the inflation, however, came in 1923, the year which also saw the climax in the protracted crisis of internal disorder and disunity.

The occupation of the Ruhr by French troops in Jan. 1923 soon led to what was virtually a state of undeclared war between the French and the Germans in the Rhineland. The government formed by Wilhelm Cuno (Centre, People's party and Democrats) which succeeded that of Wirth in Nov. 1922, ordered passive resistance to French and Belgian attempts to get the mines and factories working and a ban on all reparation deliveries. The occupation forces retorted with mass arrests, deportations and an economic blockade which cut off not only the Ruhr but the greater part of the occupied Rhineland from the rest of Germany. This was a most serious blow to the German economy in view of the economic dependence of the rest of the country on the west, especially after the loss of Upper Silesia. On the German side there was resort to sabotage and guerrilla warfare, and for a time the army high command believed that the situation in the Ruhr might lead to open war, a view which led them to encourage the clandestine recruitment of irregular forces to form a Black Reichswehr.

The blockade enforced by the French dislocated the whole economic life of the country and gave the final touch to the depreciation of the currency. The Mark fell to 160,000 to the dollar on July 1; 242,000,000 to the dollar on Oct. 1; and 4,200,000.000 000 to the dollar on Nov. 20, 1923. The price of a single copy of a newspaper, to take one instance, rose to 200,000,000,000 M. Barter replaced other commercial dealings, food riots broke out, and despair seized hold of large sections of the population. The heaviest losers were the middle classes and pensioners, who saw their savings completely wiped out; the drop in real wages however hit the working classes hard. On the other hand, many businessmen and industrialists made large profits and bought up bankrupt enterprises; speculation was rife, and everyone with debts to pay off, such as farmers and landowners with mortgages on their land, gained immensely.

Threats of Disintegration and *Civil War*.—The extremist parties hastened to exploit a situation which undermined the authority of the state and destroyed social cohesion. A separatist movement in the Rhineland was supported by the French; in Saxony and Thuringia the Communists joined the local Social Democrats in the *Land* governments with the intention of carrying out a seizure of power in the Reich (Oct. 1923) and in Hamburg a Communist-led rising occurred on Oct. 23. At the same time the *Land* government in Bavaria openly defied the orders of the Reich government in Berlin. A coup aimed at the restoration of the Wittelsbach monarchy and even at the separation of Bavaria from the Reich appeared imminent, while Hitler and the small National Socialist movement were active in urging the Munich authorities to stage a march on Berlin, in imitation of Benito blussolini's march on Rome the previous year, and to carry out a national revolution against the republic.

In August the Cuno government had been forced to resign in face of a Social Democratic demand for a stronger policy to save the country from the threat of civil war and disintegration. A new ministry was formed by Gustav Stresemann with the support of the People's party, the Centre, the Democrats and (until November) of the Social Democrats. The problems confronting them were overwhelming, but Stresemann proved equal to them. On Sept. 26 he announced the courageous decision to call off the campaign of passive resistance in the Rhineland. This exposed him to violent attacks from the right, but he held to his course ordering the immediate resumption of work in the occupied areas and the lifting of the ban on reparation deliveries. A state of emergency was declared under article 48 of the constitution; the army was used to suppress the danger of a Communist coup in Saxony and Thuringia, the Hamburg rising was put down by the police, and the Reich government threatened drastic action if the Bavarian authorities did not fall into line. In a last effort to force the hand of the Bavarian government, Hitler attempted to stage a Putsch in Munich on Nov. 8–9 without success; the Munich authorities were glad enough to suppress the Nazis and make their peace with Berlin.

Toward Stabilization.— Having mastered the threat of civil war, Stresemann turned to face the problem of the Mark. A new currency, the Rentenmark, was introduced on Nov. 20, 1923, in strictly limited quantities and cover provided by a mortgage on the entire industrial and agricultural resources of the country. The process of stabilization was painful but was pushed through with determination by Hjalmar Schacht, who was appointed currency commissioner on Nov. 12, 1923, and president of the Reichsbank on Dec. 22, 1923.

The drastic action taken by Stresemann to end the crisis proved successful, but his critics on the left and right combined to defeat a vote of confidence on Nov. 23, and he promptly resigned. He was succeeded by Wilhelm Marx (Centre), Stresemann himself retaining the key post of foreign minister. In Feb. 1924 Marx felt secure enough to end the state of emergency, and Stresemann began the negotiations with the Allies which led to the Dawes plan.

The Dawes Plan.—The Ruhr was still occupied by the French. and the question of reparations remained unsettled. Thanks to the efforts of the British and U.S. governments, however, a committee of experts, presided over by a U.S. financier, Charles G. Dawes, was appointed in Jan. 1924 to survey the problem and make recommendations. On April 9 they produced their report, known as the Dawes plan (see REPARATIONS) which was accepted by the Allies and by Germany on Aug. 16, 1924. No attempt was made to determine the total amount to be paid by Germany, but definite proposals were made for the resumption of payments on a scale beginning at 1,000,000,000 gold Marks in the first year and rising to 2,500,000,000 in 1928 and subsequent years. Detailed arrangements were made for raising and transferring these sums, under foreign supervision, while a foreign loan of 800,000,000 RM. was secured to help the German government.

These proposals led to further bitter attacks on Stresemann's foreign policy of "fulfilment" from the German right. But, despite the success of the extremist parties at elections held in May 1924, Marx succeeded in finding a majority for the legislation embodying the Dawes proposals, and in return Stresemann secured the withdrawal of the French troops from the Ruhr.

On Aug. 30, 1924, the Reichsbank was made independent of the government and introduced the new Reichsmark currency with the exchange rate of 1 RM. = 1,000,000,000,000 M.

The year 1925 saw further progress toward stabilization. In Feb. 1925 President Ebert died, and Field Marshal Paul von Hindenburg was elected in his place. The election of Hindenburg, a monarchist and the candidate of the right, was opposed by the republican parties of the Weimar coalition and aroused considerable concern abroad. But, to the general surprise, Hindenburg, by his loyalty to the constitution during his first five years of office, in fact strengthened the republic and did something to reconcile the more moderate members of the monarchist right to the regime.

Locarno Pact.—In foreign policy, helped by the more conciliatory attitude of Edouard Herriot and Aristide Briand in France, Stresemann followed the Dawes agreement by the conclusion of the treaties of Locarno (*q.v.*) on Oct. 16, 1925. By this, Germany reaffirmed its renunciation of Alsace-Lorraine and undertook not to attempt any alteration of its frontiers with France and Belgium by force. The inviolability of these frontiers was guaranteed by the signatory powers, which included Great Britain and Italy. The treaties of Locarno were followed by the Allies' evacuation of the first (Cologne) zone of the occupied Rhineland, a withdrawal completed on Jan. 30, 1926, and by Germany's entry into the League of Nations with a permanent seat on the council in Sept. 1926.

The Locarno pact was regarded with grave suspicion by the Russians who feared that Germany might join the western powers in an anti-Soviet bloc. To reassure them, Stresemann signed a new Russo-German treaty in Berlin on April 24, 1926, confirming and extending the friendly relations established at Rapallo. Unlike Stresemann's agreements with the western powers, the treaty of Berlin received the unanimous approval of the German parties, including those of the right. A series of commercial treaties, completed in these years, began to restore German foreign trade. At the end of Jan. 1927, the Allied military control commission was withdrawn and, urged on by Stresemann, the League of Nations began to examine the problem of general disarmament. When the Kellogg-Briand pact to outlaw war was proposed, the German foreign minister accepted an invitation to go to Paris for the ceremony of signature, and was warmly received in the French capital (Aug. 27, 1928). In the five years since the crisis of 1923 Germany had thus made considerable progress toward regaining a position in Europe corresponding to its size and importance. This was almost entirely due to Stresemann.

Following the Dawes plan and the treaties of Locarno, large foreign investments were made in Germany, mostly in the form of short-term loans. As a result, the period from 1925 to the end of 1928 was one of remarkable prosperity in Germany. Private industry, the states, the municipalities and the churches, as well as the Reich, used these foreign loans to finance lavish expenditure. German industry was re-equipped, large public works undertaken; production boomed, unemployment was low and wages high; reparation payments were promptly met.

Party Politics and the Elections of *1924 and* 1928.—Throughout the years from 1924 to 1928 Germany was governed by a succession of coalition cabinets based on the three bourgeois parties, the Centre, the Democrats and the People's party. From the end of 1923 to the end of 1924 the office of chancellor was held by Marx (Centre); from Jan. 1925 to May 1926 by Hans Luther, a former minister of finance; and from May 1926 to May 1928 again by Marx. Elections were held twice in 1924, on May 4 and on Dec. 7. On the first occasion, the effects of the crisis and inflation were reflected in the marked gains of the extremist parties: Nationalists from 4,249,100 (in 1920) to 5,696,500; the combined list of Nazis and other racist parties, 1,918,300; the Communists from 589,500 to 3,693,300. Democrats and the People's party lost heavily, but the Social Democrats and the Centre, supporting the republic, held their ground. In December the Nationalists registered further gains, obtaining 6,205,800 votes, but the Nazis and their allies lost 1,011,000 votes, and the Communists fell back to 2,709,100. The republican parties regained many of the votes they had lost: Social Democrats 7,881,000 instead of 6,008,900 (May 1924); Democrats 1,919,800 instead of 1,655,100; People's party 3,049,100 instead of 2,694,400; Centre 4,118,900 instead of 3,914,400.

Opposition, apart from that of the Communists and the extreme right, came principally from the Social Democrats and Nationalists. The Social Democrats supported Stresemann's foreign policy and were loyal to the republic, but opposed the social and economic policies of governments which in their opinion were too much under the influence of industrial and business circles and too lenient toward the antirepublican forces on the right. The Nationalists, violently critical of Stresemann's foreign policy, were sharply divided in their attitude to the republic; representatives of the more moderate section were brought into their cabinets by both Luther and Marx, but were forced out again by the opposition of the party's irreconcilables led by Alfred Hugenberg.

In 1926 the question of compensation for the deposed princely houses excited prolonged controversy. A bill to provide generous compensation was challenged by the Social Democrats and Communists, who demanded a plebiscite. Over 14,000,000 people voted in favour of expropriation without compensation, but this fell short of the majority required by the constitution and the compensation bill was passed by the Reichstag. Social Democratic criticism of the army administration and clandestine rearmament roused another storm in the same year. General von Seeckt, the commander in chief of the army was obliged to resign, but the independent position of the army in the state which Seeckt had re-established was not impaired, and President Hindenburg made it plain that he would use all his influence to prevent civilian interference. The following year, Marx's government was responsible for two of the major achievements of the Weimar republic in social legislation, a comprehensive scheme of unemployment insurance covering 16,000,000 people and the extension of state arbitration in labour disputes.

On May eo, 1928, the German people again went to the polls. The most striking feature of the results was the gain made by the Social Democrats who received 9,151,100 votes. The Communists also gained support, receiving 3,263,400. This swing to the left was emphasized by the loss of votes by all the other big parties, including the Nationalists, whose vote fell to 4,380,000, and by the N.S.D.A.P. (Nationalsozialistische Deutsche Arbeiterpartei)—the Nazis—who got no more than 809,800 votes. On June 28, 1928, Hermann Muller, a Social Democrat. formed a cabinet in which the People's party, the Democrats and the Centre joined; Stresemann remained at the foreign ministry.

The Young Plan.—The first tasks of the new government were to secure a definitive settlement of the reparation question and the complete evacuation of the Rhineland. The question the nation most wanted to see answered was one on which the Dawes plan had nothing to say: the total amount Germany had to pay in reparations and the length of time over which payment was to be spread. On Feb. 11, 1929, a new committee of experts under the chairmanship of another American, Owen D. Young, set to work to produce a final plan. This time, the Germans themselves were represented in the discussions. After months of difficult negotiations, an agreed report was produced on June 7. The plan was negotiated and accepted with certain modifications at the two Hague conferences (Aug. 1929 and Jan. 1930) and came into force on Sept. 1, 1930. Total reparations were fixed at 121,000,000,000 RM., to be paid in 59 annuities, the present value of which was 39,000,000,000 RM. The foreign controls over German economic life established by the Dames plan were abolished, and the Bank of International Settlement was set up to handle the financial problems involved in transferring these amounts.

Before the Young report was published the Nationalists had launched an even more violent campaign than at the time of the Dawes plan against accepting it. Under the leadership of Alfred Hugenberg they joined forces with the Nazis in organizing a plebiscite in favour of a bill refusing all further obligations to pay reparations and declaring the chancellor and his ministers to be punishable for treason if they accepted new financial commitments. It mas during this campaign that the Nazis, financed by the Nationalists and their friends among the industrialists, made their first appearance on the national political scene. The plebiscite, however, failed completely, and a revolt against Hugenberg's leadership led to a break away from the Nationalist party under Gottfried Treviranus. Stresemann had secured from the Allies, at the same time that he accepted the Young plan, a promise to evacuate the whole of the Rhineland by June 1930. This was a decisive argument and the bills embodying the Young legislation were passed by the Reichstag in March 1930. By then Stresemann himself was dead (Oct. 3, 1929), worn out by the double strain of negotiating with the Allies and defending his policy against the attacks made on it by the right in Germany. Stresemann was the outstanding political figure of the Weimar republic and one to whom the German nation owed a great debt. His place was taken by Julius Curtius and his policy continued by the Müller government.

The End of the Republic.—On assuming office, Müller had spoken optimistically of the future and declared that the foundations of the republic were now firmly laid. The nation however was still divided. There was a sharp conflict of class interest between capital and labour, while the hostility of the Communists and of the Nationalists and Nazis to the republican regime was unconcealed. These weaknesses were clearly revealed in the second great economic crisis which the republic had now to face.

The basis of German prosperity in the later 1920s was precarious. Germany's economic recovery was too dependent on foreign credits. When these dried up and the loans already made were called in, Germany was plunged into a slump which was more severe than that experienced by any other country. Signs of this were already apparent at the beginning of 1929. With the crash on the New York stock exchange in Oct. 1929 and the beginning of the world depression, conditions in Germany rapidly went from bad to worse. Unemployment figures shot up; foreign trade was drastically curtailed; wages fell and the number of bankruptcies increased daily. The effects of the slump were felt by all sections of the community, by the farmers as much as by the urban population, by the shopkeeping, professional and white-collar classes as much as by the industrial workers. Nor were these effects limited to the economic field and to the hardship and insecurity suffered by millions who only a few years before had experienced the rigours of the inflation. The depression had immediate repercussions in the political field, undermining the foundations of the republic and producing a notable increase in the support for the extremist parties both on the left and on the right. Within two years the Nazis shot up to the first and the Communists to the third place among the German parties. In 1933 Hitler told a Munich audience: "We are the result of the distress for which the others are responsible." The depression was the indispensable condition for the Nazis' rise to power.

The immediate consequence of the slump was the breakup of the coalition government under Müller. Sharp differences of opinion divided the parties on the share of the burden to be borne by the different classes they represented. The particular issue in dispute was a proposal to cut unemployment benefit payments. To this the Social Democrats were strongly opposed, and on March 27, 1930, the Muller cabinet resigned.

Briining and *Schleicher*.—The man selected by Hindenburg to form the next government was Heinrich Briining, a 46-year-old member of the Centre party who had not previously held high office. His first concern was to pass the budget, but he was unable to secure a majority in the Reichstag for his proposals. The conflict of sectional interests was sharpened by the deterioration in the country's economic situation. Briining's appeal to the Reichstag to rise above party differences and look at the problem from a national point of view was met by the rejection of an essential part of his fiscal program (July 16, 1930), the Social Democrats combining with the Communists, Nationalists and Nazis to make up the hostile majority. Faced with a parliamentary deadlock, Briining resorted to the use of the president's emergency powers under article 48 to put his program into effect by decree (July 16, 1930). Such a possibility had been envisaged at the time of Briining's appointment to the chancellorship by the small group of men round the president, prominent among whom was Gen. Kurt von Schleicher, head of the ministerial office in the ministry of defense, a man who exercised great influence behind the scenes and who was convinced that the crisis could not be overcome by the compromise measures of coalition government. It was Schleicher who had suggested Bruning to Hindenburg as chancellor, and Briining, although sincerely attached to parliamentary institutions. accepted the view that the economic situation called for the use of emergency methods. His action, which overrode the principle of ministerial responsibility, was promptly challenged by the Social Democrats who succeeded in defeating the chancellor for the second time in the Reichstag. Briining at once took up the challenge and ordered the dissolution of the chamber, fixing the elections for Sept. 14, 1930. Both at the time and subsequently, in the light of later events, Bruning's decision to resort to the methods of presidential government and to go over the head of the Reichstag has been the subject of much controversy.

The results of the elections, held in an atmosphere of public disorder for which the Nazis and Communists were chiefly responsible, mere disconcerting. Bruning's appeal from the Reichstag to the nation failed. The impact of the depression on German society was reflected in the sensational rise of the Nazi vote from 809.800 (1928) to 6,406,379 (or 18.3% of the total) and that of the Communists from 3,263,400 to 4,590,160 (13.1%). The Social Democrats remained the strongest party in the Reichsfag, obtaining 8,575.244 (24.5%) votes. The Centre party won 4,126,900 (11.8%) votes. Hitler's party, campaigning on a platform of violent nationalism, antidemocratic and anti-Semitic radicalism, overnight moved from the position of ninth to that of second party in the state. Hitler insisted that he meant to come to power by legal means, a plan from which he never diverged, but the methods of demagogic propaganda and organized violence with which his campaign had been conduct??, as well as the character of the brown-shirted Nazi storm troopers, were patently incompatible with the continuation of parliamentary democracy. In the circumstances of the early 1930s, however, this acted as an attraction for all those who for the most varied reasons were in revolt against the system by which Germany had been governed since the war and which Hitler violently denounced.

Despite the result of the elections, Briining decided to remain in office. He had to face the noisy opposition of the Nazis and the Communists who attacked his government as unconstitutional and proceeded to reduce parliamentary procedure to a prolonged brawl. The Social Democrats, however, alarmed at the threat to the republic from the rising power of the two extremist parties, rallied to the chancellor's support, although they were critical of the deflationary policy he was pursuing. This provided Briining with sufficient votes to defeat the frequent motions of no confidence, while he put his program into effect by presidential decree.

The measures introduced by the government failed to check the slump. In an effort to break through the economic barriers separating the nations, Curtius, the foreign minister, proposed an Austro-German customs union (March 24, 1931) which would have had the additional advantage of placating the large body of opinion in both countries in favour of the combination of the two German states. France and Italy were strongly opposed to such a move and forced the German government to abandon it (Sept. 1931), a further blow to Bruning's prestige.

In July 1931 a severe financial crisis led the big Darmstadt and National bank to close its doors, and in September the figure for registered unemployment reached 4,300,000. On Oct. 3 (after the withdrawal of the customs union proposal) Bruning used the occasion of Curtius' resignation to reconstruct his cabinet, assuming the office of foreign minister himself. His dour struggle to master the economic situation continued, and he displayed unusual courage and integrity in the way he stood up to criticism and unscrupulous opposition, but success still eluded him. In the early months of 1932 unemployment passed the 6,000,000 mark.

In these circumstances the prospect of a presidential election in 1932, when Hindenburg's term of office expired, was alarming. Briining sought the agreement of the party leaders to a prolongation of the president's term until the crisis was over. Thanks to the opposition of Hitler and Hugenberg, this proposal was rejected and on March 13 elections for the presidency were held, with Hitler and three other candidates competing against Hindenburg. The result was a triumph for the old field marshal, now 84, who polled 18,661,736 votes to Hitler's 11,328,571. A second election, on April 11, made necessary by Hindenburg's failure to secure an absolute majority by 0.4%, raised the field marshal's vote to 19,359,642 and Hitler's to 13,417,460. The chief reason for Hindenburg's success was the decision of all the republican parties, including the powerful Social Democratic party, to vote for him as the defender of the constitution against the extremists. This trust was soon to be disillusioned.

The political struggle in Prussia, the largest of the German *Länder* or states, was scarcely less important than that in the Reich. Since 1920, Prussia had been governed by a stable coalition of the Social Democrats and Centre under the leadership of two Social Democrats, Otto Braun and Karl Severing. The Prussian government was regarded as the principal bulwark of German democracy and as such was a special object of the extremists' hatred; in particular, they wished to get control of the Prussian police force out of the hands of Severing. At the state elections on April 24, 1932, the Nazis scored another big success, becoming with 162 seats out of a total of 428 the largest party in the Prussian *Landtag;* they were unable to form an administration themselves, but the Social Democrat-Centre coalition had been defeated and only remained in office as a caretaker ministry until the political deadlock could be resolved.

Brüning hoped to offset the unsuccessful record of his government at home with successes abroad. He sought to secure the abandonment of reparation payments in view of Germany's desperate economic situation and the recognition of Germany's right to equality of armaments in view of the Allies' failure to disarm. There was considerable support for the cancellation of reparations on the Allied side, but Bruning's hopes were dashed by the postponement of the proposed conference until June 1932. Although the disarmament conference opened in February, French opposition rapidly brought it to a standstill, and here too Brüning failed to achieve any success.

Meanwhile intrigue among the president's camarilla, in which Schleicher played a leading part, led Hindenburg to withdraw his confidence from Brüning (May 30, 1932). Dependent upon the president's willingness to continue to sign emergency decrees, Brüning had no option but to resign, an event which may be regarded as decisive for the fate of German democracy. Brüning's program had raised powerful enemies among the industrialists and Junker landowners, and Schleicher turned against his former nominee when he failed to produce the government of national unity which was Schleicher's political objective. Once Brüning had secured the re-election of the president, his usefulness in Schleicher's eyes had been exhausted.

Papen and Schleicher.—One of the last acts of Brüning's government had been to impose in April a ban on the Nazi SA. *(Sturmabteilungen)*. Schleicher secured Nazi tolerance for his new nominee, Franz von Papen, on condition that the ban should be lifted and new elections held at once. Papen, although nominally a member of the Centre, was repudiated by that party, which remained loyal to Brüning, and on June 2 formed a nonparty cabinet, known as the cabinet of barons from its high percentage of members of the aristocracy with right-wing views. Schleicher became minister of defense.

Papen's government was highly unpopular in the country, but he relied upon the support of the president (and of the army), and he was fortunate enough to secure the success in foreign policy denied to Brüning. At the Lausanne conference on July 9, 1932, reparations were virtually abolished in return for a payment of 3,000,000,000 RM. into a general fund for European reconstruction. On July 20, 1932, Papen turned out the Braun-Severing government in Prussia on the pretext that it was unable to maintain public order and appointed himself Reich commissioner for Prussia. The Social Democrats, hamstrung by the attacks of the Communists on them as traitors to the working class, allowed Papen's action to pass without effective challenge and failed to call a general strike.

Immediately afterward elections to the *Reichstag* were held (July 31, 1932) and resulted in a Nazi triumph, 13,732,777 (37.4%) votes and 230 in place of 107 seats in the *Reichstag*. The old middle class parties, the People's party and the Democrats (now reorganized as the Deutsche Staatspartei) were practically wiped out but the Centre actually increased its vote to 4,586,501 (12.2%) ; the Communists also increased their votes to 5,278,094 (14.3%); and the Social Democrats got 7,951,245 (24.3%) votes. Papen agreed with Schleicher that it was necessary to bring the Nazis in and to make them share the responsibility for governing the country, but he hoped by holding out to force Hitler to accept office on his and not Hitler's terms. When the *Reichstag* met in Sept. 1932, the Nazis succeeded in massing an overwhelming vote against Papen, but he promptly dissolved the chamber and fixed new elections for Nov. 6, governing in the meantime by emergency decree.

At the November elections the Nazis got 11,737,391 (33.2%) votes, losing ground to the extent of 1,995,386 votes, but Schleicher, alarmed at the prospect of the deadlock continuing and at the further increase in the Communist vote, 5,980,540 or 17%, forced Papen's resignation on the grounds that the army could not deal with a double threat of civil war from both the Nazis and the Communists and that Papen's attempt to beat Hitler down was only increasing the danger of such a situation. Schleicher then took office himself as chancellor (Dec. 3, 1932). Hindenburg, however, had been alienated by Schleicher's intrigues against Papen and when Schleicher in turn failed to win the support of the other parties or to bring the Nazis into his government, Hindenburg declined to give him the power to dissolve the *Reichstag*. In the meantime, Papen had made contact behind the scenes with Hitler and the Nationalists, and was able to offer the president the prospect of a coalition which had a chance of securing a majority in the chamber. Hitler was driven by the declining fortunes of the Nazi party to accept considerably less than the demands he had made earlier in 1932, but he secured the chancellorship for himself. Papen, for his part, was convinced that he had tied Hitler's hands by forcing him into a coalition in which the Nazi ministers were heavily outnumbered, and in which he himself became vice-chancellor as well as Reich commissioner for Prussia. On Jan. 30, 1933, the coalition assumed office, and Adolf Hitler became chancellor of Germany, legally and not by revolution.

THE THIRD REICH

The Nazi Revolution. — In the coalition cabinet the Nazis held only 3 out of 11 seats. They had Hitler as chancellor, Wilhelm Frick as Reich minister of the interior and Hermann Goring (who became Prussian minister of the interior) as a Reich minister without portfolio. The Nazis were thus heavily outnumbered, and none of the key ministries were in their hands. The ministry of economy and that of food and agriculture, both in the Reich and Prussia, were held by Hugenberg, the leader of the Nationalists; the foreign ministry by Konstantin von Neurath, a career diplomat of conservative views; the ministry of defense by Gen. Werner von Blomberg. As vice-chancellor, Papen claimed the right to be present on all occasions when the chancellor saw the president and as Reich commissioner for Prussia he controlled the principal administrative machine in Germany. In this way Papen believed that he had tied Hitler's hands and effectively blocked any threat of extremist action by the Nazis. He was to be rapidly disillusioned.

Hitler's first step was to persuade his colleagues in the cabinet to agree to new elections in order to provide a majority in the *Reichstag;* he overcame their doubts by a categorical promise that, whatever the results, no change would be made in the composition of the coalition. The elections were fixed for March 5, 1933, and the Nazis made full use of the power they now possessed over the apparatus of the state, including the radio, to launch a whirlwind campaign. Although the other parties were still allowed to function, their meetings were broken up, their speakers assaulted and their newspapers continually suppressed. Goring, in control of the Prussian police force, displayed great energy in carrying out a purge of the police which placed the force under Nazi control; in addition, he called up 50,000 auxiliary police, the majority of them SA. and SS. (*Schutzstaffeln*). The police were forbidden to interfere with the many acts of intimidation carried out by the SA. who were thereby given the "freedom of the streets" for which they had long clamoured.

On the night of Feb. 27 the *Reichstag* building was destroyed by fire. It appears to have been secretly set alight by a Nazi gang under the direction of Karl Ernst, leader of the Berlin SA. group; the blame however was laid on the Communists, and on the pretext of a Communist plot to seize power the constitutional guarantees of individual liberty were suspended and the Reich government given emergency powers. It was in this atmosphere of fear and insecurity that the elections were held a week later. The Nazis increased their share of the votes cast to 17,265,823 (43.9%). They failed however to secure the outright majority for which they had hoped, and both the Centre party and the Social Democrats held firm, the former getting 4,423,161 (10.9%) and the latter 7,176,505 (18.3%). Even the Communists lost only 1,135,161 votes and polled 4,845,379 (12.1%). It was only with the help of his Nationalist partners (3,132,595 votes or 8%) that Hitler secured a bare majority of 288 plus 52 seats in a house of 647 deputies.

Hitler's next step was to secure the passage of an enabling act which would give the government the power to issue decrees independently of the *Reichstag* and of the president. For this he required a two-thirds majority in the Reichstag. The 81 Communist deputies were either arrested or excluded; the support of the Kationalists and of the Centre party (73 seats) was obtained by assurances and promises, and the Social Democrats who alone opposed the bill (March 23) were outvoted by 441 to 94. The Enabling act remained the constitutional basis of Hitler's dictatorship. No new constitution was ever introduced to replace that of the Weimar republic, which was simply suspended; fresh laws were promulgated as they were required.

Armed with these overriding powers, which he had been careful to obtain without formally infringing on the principle of legality, Hitler proceeded to carry out a revolution with the authority of the state on his side. The guarantees to which Papen and Hugenberg had trusted proved of no avail, and the Nazis took over and remodelled one after another of the country's institutions.

A series of decrees culminating in the Law for the Reconstruction of the Reich (Jan. 30, 1934) abolished the Land diets, transferred the sovereign powers of the Lander to the Reich and subordinated their administrations to the authority of the central government. In May 1933 the trade unions organization was suppressed and the unions merged into a German labour front under Robert Ley. This was followed in the course of the summer by the suppression or "voluntary" dissolution of the other political parties, including the Nationalists. Hitler's partners in the coalition. On July 14, 1933, the Nazi party was formally declared to be the only political party in Germany.

Opposition to these measures in the cabinet crumpled before the wave of revolutionary violence which swept over the country. Papen was shorn of his authority as Reich commissioner for Prussia. being replaced by Goring. and was quite unable to withstand the unscrupulous methods employed by Hitler and his lieutenants. Hugenberg was unable to prevent the dissolution of his own party and was forced to resign at the end of June 1933. The Nazi group in the cabinet was strengthened by the inclusion of Josef Goebbels as minister of public enlightenment and propaganda (March 14, 1933), but in fact the cabinet had ceased to count, and all decisions were taken by the Nazi leaders on their own authority.

There was, however, a point beyond which the process of Gleichschaltung (co-ordination), the current euphemism for Nazi seizure of control, could not be carried without seriously endangering the efficiency of the state and of the German economy. This was a threat to which Hitler, now the head of the government as well as the leader of a party, could not remain indifferent. During the summer of 1933 Hitler began to call a halt and declared openly that the revolution could not become a permanent state of affairs. The plans of the radical wing of the party to replace the capitalist economy by some form of corporate organization under state control were abruptly repudiated. Hitler could not afford to quarrel with the big industrialists and financiers, and from June 28 Hugenberg's successor at the ministry of economy was Kurt Schmitt, director general of the biggest insurance company in Germany, while Schacht, the new president of the Reichsbank (appointed on March 16), set his face firmly against radical anti-capitalist experiments.

The Roehm *Affair*.—There was considerable opposition to Hitler's new policy of stabilization, both from the more radical section of the Nazi movement and from those who had been left out in the scramble for positions and wanted no end to the revolution until they had been provided for. This opposition found its focus in the SA. and its leader in the SA. chief of staff, Ernst Roehm, who openly expressed his dislike of any compromise with the "reactionaries." From the summer of 1933 to the summer of 1934 this question of the so-called "second revolution" formed the dominant issue in German politics.

During the first half of 1934 the conservative forces in Germany came to look more and more to the army with its particular claim to the loyalty of the president, the aged Hindenburg, to withstand the demands of Roehm and the Nazi radicals for a renewal of the revolutionary process. The army leaders were inflexibly opposed to Roehm's plans for the incorporation of the SA. in the army as the basis for the expansion of Germany's armed forces. Hitler for his part was anxious to avoid an open quarrel. He needed the help of the generals in carrying out the rearmament of Germany; he recognized the importance of the army leaders' benevolent neutrality in agreeing to his assumption of power in 1933; and he was anxious to secure their support for his succession to the presidency (which included the supreme command of the armed forces) when Hindenburg, now in his 87th year, should die. For these reasons he could not afford an open clash with the army which still remained the most powerful independent institution in Germany.

The crisis came to a head in June 1934 and was touched off by Papen, who on June 17 delivered a speech at the University of Marburg in which he gave expression to the anxieties of the whole nation. Hitler now knew that Hindenburg had only a few weeks to live, and on June 21 when he flew to see the president at his country home he was met with an uncompromising demand, presented by the minister of defense, General von Blomberg: either the government must bring about a relaxation of the state of tension or the president would declare martial law and hand over power to the army.

Roehm had powerful enemies inside the party, notably Göring and Heinrich Himmler, the Reichsfiihrer of the SS., the party corps *d'élite*. When Hitler reluctantly made up his mind to take action against Roehm and the SA. leadership, it was Goring and Himmler who carried out the preparations for the purge. On the pretext of an SA. plot for a coup d'état, Roehm and his chief lieutenants were seized on the week end of June 30, 1934, and executed without trial. The opportunity was also taken to settle other accounts which had no connection with the SA. or the "second revolution": among those murdered were the former chancellor General von Schleicher and the former Nazi leader Gregor Strasser. A month later, on Aug. 2, President Hindenburg died, and with the agreement of the army leaders Hitler was proclaimed as his successor. The office of president and supreme commander was merged with that of chancellor, and Hitler assumed the title of Fuhrer und Reichskanzler. On Aug. 19 a plebiscite confirmed his new office by 88.2% of 43,529,710 votes cast.,

The crisis of June 1934 was the turning point of the regime. Although the army leaders congratulated themselves on the outcome, it was Hitler who after a period of hesitation had triumphantly reasserted his authority. Forced to choose, he had struck at the radicals and repudiated the "second revolution" but in doing so had used methods which only underlined the radical and revolutionary character of the regime he had established.

The Totalitarian Police State.—The years between 1934 and World War II saw the steady elaboration of the power of the totalitarian police state. The principal instrument of control was the unified police, security and SS. organizations under the direction of Himmler and his chief lieutenant, Reinhard Heydrich. Neither opposition nor dissent was tolerated. Schools. universities, the press, the theatre and the arts were forced to follow the pattern of Nazi regimentation, and the most determined efforts were made to indoctrinate the younger generation with the Nazi ideology through the schools and such organizations as the Hitler Youth. The concordat which the Vatican signed with the new German government on July 8, 1933, did not protect the Catholic community in Germany from constant interference and persecution by the Nazi authorities. The refusal of the German Protestants to accept the authority of the Nazi-sponsored German Christian movement led to an equally bitter conflict between the Protestant churches and the state, in the course of which many Protestant pastors, including Martin Niemoller (July 1937) were arrested and ill-treated.

Treatment of Jews.—The regime showed particular vehemence toward the Jews who were singled out for attack from the first day of Hitler's chancellorship. A law of April 7, 1933, decreed the dismissal of the Jews from government service and the universities; they were also debarred from entering the professions. Under the Nuremberg laws of Sept. 15, 1935, marriages between Jews and persons of "German blood" were forbidden, and the Jews were virtually deprived of all rights. Their persecution reached its climax in the pogrom of Nov. 9–10, 1938, carried out under the direction of the SS. On one pretext or another the greater part of all Jewish property was confiscated, and the surviving Jews were restricted to a ghettolike existence until the war when they were systematically put to death in different extermination camps. Altogether, in German-occupied Europe, out of a total of about 8,300,000 Jews, 6,000,000 were so killed or died of starvation or disease.

Rearmament.—By an extensive program of expenditure on public works—afforestation, land improvement, road building, etc.—the Nazi government succeeded in reducing the number of registered unemployed from over 6,000,000 in Jan. 1933 to 2,600,000 in Dec. 1934. From 1935 onward rearmament on a massive scale rapidly changed the problem from one of mass unemployment to one of an acute labour shortage. This remarkable recovery however did not lead to any comparable rise in the standard of living, which was deliberately held down by wage and price stabilization in order to permit the diversion of the greatest possible proportion of the national resources to the creation of a powerful military force.

All other considerations were sacrificed to Hitler's demand for the rearmament of Germany at double the rate which the military and economic experts thought possible. In Sept. 1936 Hitler proclaimed a four-year plan and appointed Goring with plenipotentiary powers to remove the obstacles which were holding up rearmament. Schacht, who became minister of economic affairs on Aug. 2, 1934, and to whom Hitler owed the expert planning of the finances of German rearmament as well as the elaborate network of controls over German foreign trade, became more and more critical of the reckless way in which the arms program was being pushed through and on Nov. 26, 1937, resigned from his post as minister of economics. Although Schacht remained minister without portfolio at Hitler's insistence and until Jan. 20, 1939, president of the Reichsbank as well, from the end of 1937 Goring was able to carry out Hitler's economic plans in preparation for war without hindrance. Germany's expenditure on armaments is estimated at over 51,000,000,000 RM. in the six years before 1939, rising from under 2,000,000,000 RM. in 1933–34 to 10,000,000,000 RM. in 1936–37 and 16,000,000,000 in 1938–39.

Shortly after Schacht's final resignation, Hitler successfully reorganized the two principal institutions which had so far escaped the process of Gleichschaltung—the army and the foreign service. He used the pretext of Field Marshal von Blomberg's *mésalliance* and a trumped-up charge of homosexuality against Gen. Werner von Fritsch to secure the removal of the first as minister of defense and of the second as commander in chief of the German army. Thereupon he assumed Blomberg's office of commander in chief of the armed forces himself and abolished the ministry of defense, replacing it by a separate high command of the armed forces (*Oberkommando* der Wehrmacht, O.K.W.) which in fact acted as his personal staff. Sixteen of the senior generals were retired, others were transferred to different posts.

At the same time Neurath was relieved of his post as foreign minister and replaced by the subservient Joachim von Ribbentrop, while the three ambassadors in the key posts of Vienna (Papen), Rome (Christoph Hassell) and Tokyo (Herbert von Dirksen) were all recalled. Finally, the insignificant Walther Funk assumed office at the ministry of economics after it had been stripped of the independent powers exercised by Schacht. By these measures, carried out in Feb. 1938, Hitler removed the few checks which still remained upon his freedom of action, and the last occasion on which the German cabinet met during the Third Reich was to hear the *Führer's* announcement of the changes he had proposed. Henceforth until the end of the war, Hitler's arbitrary power over Germany was complete.

Hitler's **Talk** of Peace—From the time that he first went into politics Hitler had been an uncompromising nationalist, and from the time that he came to power his unswerving aim was to overthrow the peace settlement of 1919 and reverse the verdict of 1918 by establishing a German hegemony in Europe. For the first few years, however, these aim: had lo be disguised until German rearmament had made progress, and Hitler showed great skill in soothing the anxieties of the other powers by his constant talk of peace.

On Oct. 14, 1933, Germany withdrew from the League of Nations and the disarmament conference. This was represented as a protest against the hypocrisy of the victor nations in refusing to keep their promise to follow Germany's example after they had forced it to disarm. The nonaggression pact with Poland, signed on Jan. 26, 1934, was used by Hitler as further evidence of his eagerness for peace, and when a Nazi rising in Austria on July 25, 1934, failed to secure power, he was quick to repudiate his followers and send Papen to Vienna on a mission of conciliation.

With the reunion of the Saar with Germany, following the plebiscite of Jan. 13, 1935, which had shown a 90.36% vote in favour of a return to the Reich, Hitler declared that all causes of dispute between Germany and France had been removed and that he renounced any claim to Alsace-Lorraine. He evaded British and French schemes for a general European settlement, however, and on March 16, 1935, announced that Germany was reintroducing conscription with the aim of creating a peacetime army of 35 divisions. This open repudiation of the treaty of Versailles involved a considerable risk, but the gamble came off; the other powers contented themselves with protests, and Hitler was encouraged to take bigger risks in future.

During the next few years Hitler played with remarkable success upon the divisions between the other European powers. He persuaded the British to sign an Anglo-German naval treaty (June 18, 1935) which was much resented in France, and he soon became the principal beneficiary of the quarrel between Italy and the western powers over Abyssinia. The outbreak of the civil war in Spain in 1936 enabled him to establish close working relations with Mussolini (Oct. 20–24, 1936) and perpetuated the conflict between Italy on the one hand and Great Britain and France on the other. Using the Spanish civil war as his text Hitler now redoubled his propaganda campaign against the dangers of communism with very considerable success in dividing and confusing public opinion in the western countries.

The ratification of the Franco-Soviet treaty of mutual assistance of May 2, 1935, provided him with a convenient pretext for the denunciation of the Locarno pact and the remilitarization of the Rhineland (March 7, 1936). The fact that this second open breach of the Versailles treaty was allowed to pass without effective challenge not only increased Hitler's confidence but had immediate repercussions in the alignment of the smaller powers. The alliance system which the French had built up in eastern Europe after 1919 began to show signs of strain.

On Nov. 25, 1936, Ribbentrop concluded the anti-Comintern pact with Japan, which gave a strong fillip to Hitler's anti-Bolshevik propaganda campaign, and a year later (Nov. 6, 1937) he secured the adhesion of Italy to the pact after Mussolini's state visit to Germany in Sept. 1937. By the end of 1937 Hitler was ready to take the offensive in foreign policy. German rearmament had already made considerable progress; he was convinced that France and Britain would never fight; he had driven a powerful wedge between the Soviet Union and the western powers; and he had won Italy away from the Anglo-French camp to close co-operation with himself.

Peaceful Annexations.—Hitler's first objective was the annexation of Austria, which had been forbidden by the peace settlement of 1919. After the unsuccessful Putsch of 1934, Hitler for a time had to go carefully in his relations with the Austrian republic. Then closer co-operation with Mussolini, who had hitherto been the most determined opponent of an Anschluss, opened up new possibilities. On July 11, 1936, a so-called gentlemen's agreement was concluded between Germany and Austria which ostensibly placed German-Austrian relations on a firmer footing but was used by the German government as a means of exercising pressure on Kurt von Schuschnigg's government in Vienna. Hitler explicitly forbade the Austrian Nazis to attempt another rising. He sought to preserve the façade of legality while applying political pressure under the threat, but without the overt use, of force. In accordance with this policy, on Feb. 12, 1938, Schuschnigg, the Austrian chancellor, was bullied into accepting far-reaching demands during an interview with Hitler at

Berchtesgaden. Schuschnigg's subsequent decision to hold a plebiscite, however, forced Hitler to act quickly and on March 12, 1938, German troops occupied Austria, 24 hours before the plebiscite was due to be held.

Once again the other powers failed to do more than utter solemn protests, and Hitler rapidly turned toward his second objective, the disruption of the Czechoslovak republic, The pretext in this case was supplied by the demands of the Sudeten German minority in Czechoslovakia for greater autonomy. These demands were skilfully used by Hitler to create a situation in which Czechoslovakia's ally, France, and Great Britain brought heavy pressure to bear on the Prague government to make far-reaching concessions in order to avoid war. This situation culminated in Neville Chamberlain's direct intervention in Sept. 1938 to secure Czech acceptance of Hitler's ultimatum for the cession of the Sudetenland to Germany (Munich conference, Sept. 29–30, 1938). Hitler in fact aimed at far more than this, at the breakup of the Czechoslovak state, and soon came to look upon the Munich settlement as a mistaken concession which had balked him of his entry into Prague. His hostility toward the Czechs was unappeased, and in March 1939 he used the smouldering quarrel between the Slovaks and the Czechs to create a further crisis which served as his pretext for the occupation of the whole of Bohemia and Moravia (March 15). Before the end of the month he followed this by the delivery of an ultimatum to Lithuania (March 20) and secured the return of Memel to the Reich from which it had been separated in 1919.

Poland's Refusal.—Shortly after the Munich settlement, Ribbentrop had opened yet another claim by suggesting to Jozef Lipski, the Polish ambassador to Germany (Oct. 24, 1938), that Poland should agree to the return of the free city of Danzig to the Reich and the construction of a German extraterritorial road and railway across Polish Pomerania to link East Prussia with the rest of Germany. These demands mere renewed in sharper terms after Prague. They met with an uncompromising refusal from the Polish government. and on March 31 the British government, which had abandoned its policy of appeasement after the occupation of Bohemia-Moravia, announced its guarantee to Poland in the event of any act of aggression.

Hitler's immediate retort was to denounce on April 28 the German-Polish nonaggression pact of 1934 and the Anglo-German naval treaty of 1935. Thereafter he relapsed into silence, while keeping up the tension in Danzig and watching to see how the situation would develop. In May, the understanding with Mussolini was converted into an open treaty of alliance by the signature of the "pact of steel," but Hitler's attention was directed above all to Moscow where the British and French were negotiating with the Russians in an attempt to build up a common front of resistance to German aggression in eastern Europe. The difficulties encountered in these talks encouraged Hitler to make a secret counterproposal for a Soviet pact with Germany. After a period of manoeuvring for position on the Russian side, Stalin agreed to a visit by Ribbentrop and the Nazi-Soviet pact was signed in Moscow on the night of Aug. 23-24. To the public pact of nonaggression was appended a secret treaty dividing the whole of eastern Europe into spheres of influence and partitioning Poland along the line of the rivers Narew, Vistula and San.

Hitler was convinced that the signature of the Moscow pact would lead the British and French to withdraw their guarantees to Poland. When the British government replied with the signature of the pact of mutual assistance between Great Britain and Poland (Aug. 2j), Hitler postponed the attack on Poland, originally fixed for dawn on Aug. 26, and attempted to avert British intervention by further diplomatic negotiations. The British, however, refused to bring pressure to bear on the Poles to accept what they regarded as unreasonable conditions, and on Sept. 1 the German army invaded Poland. Two days later Britain and France, after delivering an ultimatum demanding the immediate withdrawal of the. invading forces, declared war on Germany.

WORLD WAR II

The Years of Easy Conquests.—Hitler began the war with the intention of waging a localized war against Poland and following this with the quick offer of a peace settlement. The campaign, however, only lasted 35 days, and the ease of his conquest tempted Hitler to take the initiative in extending the war to the west, against the advice of his generals. Bad weather alone prevented him from launching an attack on the Low Countries and France before the end of 1939.

During the course of the winter 1939–40, Adm. Erich Raeder, commander in chief of the navy, won over Hitler to the idea of occupying Norway and Denmark, partly to safeguard the vital iron-ore supply route from northern Sweden through Narvik, partly to guarantee the inviolability of the Baltic and partly to prevent the dispatch of British and French troops to the aid of Finland (then at war with the U.S.S.R.) through Norwegian ports. The operation was launched on April 9 and, despite the risks involved in the sea-borne expedition to Norway, proved highly successful without disturbing the main concentration of German forces for the attack in the west.

The invasion of the Netherlands, Belgium and France mas begun on May 10, 1940. Following a plan suggested by Gen. Erich von Manstein, Hitler ordered the German armoured forces to concentrate on breaking through the hilly and lightly defended central sector of the front where the Ardennes covered the French frontier. The success of this advance through Sedan to the Channel coast, which cut off the French and British troops fighting in Belgium, proved the key to victory. The Dutch and Belgian armies surrendered before the end of May, the British were driven into the sea at Dunkirk, and by the middle of June the French had requested an armistice.

Hitler had no plans at all for the next stage of the war. With Poland eliminated and Britain's last continental allies out of the war, he hoped that the British would now be prepared to negotiate a settlement. In order to make this easier, he restrained the territorial appetite of Mussolini (who entered the war on June 10, 1940) and offered relatively moderate armistice terms to France.

When the British showed no disposition to consider a compromise peace, Hitler ordered preparations to be made for the invasion of Britain. How far he seriously intended to embark on so difficult an undertaking has been questioned, but in any case the failure of the German air force to win air supremacy over the Channel and their defeat in the Battle of Britain meant that the essential preliminary conditions were lacking, and in Oct. 1940 Operation "Sea Lion" was postponed indefinitely.

Admiral Raeder and the German naval staff were anxious to persuade Hitler to make the main German effort in the Mediterranean area, which they regarded as the most vulnerable part of the British position. Hitler, however, although he attempted to bring both Spain and Vichy France as well as Italy into the war, was never ready to spare more than limited forces for operations in North Africa, the Mediterranean and the middle east. In the summer of 1940 he ordered plans to be made for an attack on the U.S.S.R., and it was increasingly toward the east that his attention was directed.

Hitler had never regarded the Nazi-Soviet pact as more than a temporary expedient and throughout 1940 he became more suspicious of Russian aims in eastern Europe. A visit to Berlin by V. M. Molotov, the Soviet foreign minister, in Nov. 1940 failed to remove the causes of friction. Russian economic collaboration had been of great value to Germany in reducing the pressure of the British blockade, and in the first half of 1941 the Soviet government showed a marked disposition to avoid a breach with Germany, if at all possible. Hitler, however, had long seen the direction of German expansion as lying in the east and to cover his own aggressive designs now rapidly convinced himself that Germany was threatened by Russian ambitions. On Dec. 18, 1940, he signed the directive for Operation "Barbarossa," the object of which was described as the crushing of Soviet Russia in a quick campaign, and preparations to this end went on steadily throughout the winter and spring of 1941.

At this point, Hitler's plans were complicated by the action of Mussolini in attacking Greece (Oct. 28, 1940). The effect of this was to open up a Balkan front, of which the British might take advantage, at a time when Hitler was most anxious to keep the whole of eastern Europe quiet until his preparations against the U.S.S.R. were complete. The situation was made worse by the total failure of the invasion of Greece and by the rapid retreat of the Italians in North Africa before Sir Archibald Wavell's advance (Dec. 1940). Hitler was obliged to come to the aid of his axis partner. He sent German reinforcements to North Africa (where Erwin Rommel succeeded in driving the British back in the spring of 1941), and he took steps in readiness for a German invasion of Greece. Hungary and Rumania had already been reduced to the status of German satellites and made no difficulties about the movement of German troops toward the Greek frontiers; nor did Bulgaria, where, after a sharp diplomatic contest with the Russians the Germans proceeded to occupy key positions throughout the country in March. The remaining Balkan country, Yugoslavia, was induced under pressure to accede to the tripartite pact in March 1941, but the Yugoslav government was overthrown by a palace revolution in the name of the young king Peter. Thereupon Hitler ordered drastic measures to make an example of Yugoslavia. In the course of April 1941 German forces invaded both Yugoslavia and Greece, the former operation being accompanied by brutal air attacks on the defenseless city of Belgrade. By the end of the month both countries had been occupied, and in the last half of May German parachute troops completed the Balkan campaign by the capture of Crete.

Invasion of the Soviet Union.—With the occupation of Crete and Rommel's success in driving back the British to the Egyptian frontier, Raeder and others urged that the situation was ripe for a decisive blow against the whole British position in the middle east. But Hitler was set upon attacking the U.S.S.R. and insisted that all other operations must be postponed until it had been defeated, a task which he confidently expected to accomplish within six or eight weeks.

The invasion began on June 22, 1941, and in the opening stages of the campaign the German army drove deep into Soviet territory. Despite imposing successes. however, the Germans failed to achieve a decisive victory and by dispersing his forces Hitler left the frontal assault on the Soviet armies defending Moscow until late in the year. At the beginning of Dec. 1941, the onset of the dreaded Russian winter and the unexpected Soviet counteroffensive faced the German high command with a major military crisis. This brought to a head the strained relations between Hitler and the army leaders. Since the reluctance of the high command to undertake offensive operations in the west in the winter of 1939-40, Hitler had become increasingly critical of the generals, and was less and less prepared to listen to their advice. In Dec. 1941 he dismissed Gen. Walther von Brauchitsch, the commander in chief of the German army, and assumed the direct command of the armies in the field himself. The fact that by drastic measures he succeeded in holding the Soviet attacks during the winter greatly increased his confidence in his own military genius. Henceforward he refused to listen to any views, or even information, which ran counter to his own conception of how the war should be conducted.

Germany Declares War on the United States.—The Japanese attack on Pearl Harbor in Dec. 1941 now extended the war to the whole world. Hitler promptly declared war on the United States, whose resources he underestimated as grossly as those of the U.S.S.R. He failed however to grasp the unity of the war or the importance of seapower and in his growing preoccupation with the eastern front neglected until too late the importance of the Atlantic and Mediterranean theatres.

It was not until 1942 that Karl Donitz (who succeeded Raeder as commander in chief of the navy in Jan. 1943) was able to persuade Hitler of the importance of the U-boat war. Great efforts were made to build up Germany's submarine forces in 1942 and 1943, and the U-boat attacks taxed the Allies' shipping resources to the limit, but by the middle of 1943 the British and Americans were on the way to establishing a superiority in methods of defense (both by air and sea) against which the German navy was unable to prevail. By the end of 1943 the Germans had lost the battle of the Atlantic, largely through Hitler's neglect of its possibilities at an earlier stage.

Hitler had shown an equal blindness to the importance of the Mediterranean theatre of operations. At the close of 1942, the advance of the British 8th army from the east and the joint Anglo-U.S. landings in northwest Africa were driving the German and Italian forces under Rommel into a trap. Hitler now hurriedly made available the reinforcements he had earlier refused, but without being able to halt the Allies' advance; the only result was to increase the size of the forces captured in Tunisia, where more than 250,000 German and Italian troops surrendered in May 1943.

Meanwhile, in the east, ignoring the warnings of his professional advisers, Hitler had embarked on still more ambitious operations for the campaign of 1942, aiming at the occupation of the Caucasus oil fields in the south and a drive to the Volga in the southeast. The invasion of the Caucasus fell short of its objective, while the drive to the Volga turned into a desperate contest for the city of Stalingrad, where Hitler's obstinate refusal to withdraw in time led to the encirclement and capitulation of the German armies under Field Marshal Friedrich von Paulus at the end of Jan. 1943.

The double defeat of Stalingrad and Tunisia represented the turning point of the war. By mid-1943, Hitler had lost the initiative and from that time the German forces everywhere stood on the defensive.

The Nazi Empire — At the height of his success, Hitler was the master of the greater part of the European continent. German rule in the east was extended to wide areas of the Baltic states, Byelorussia, the Ukraine and European Russia; Poland (part of which was annexed, the rest organized as the government-general) and the protectorate of Bohemia-Moravia; Serbia and Greece (where the occupation was shared with the Italians); and the nominally independent, satellite states of Slovakia, Croatia, Hungary, Rumania and Bulgaria. In the west, Norway, Denmark, the Netherlands, Belgium and France were all under German occupation, part of France from the summer of 1940 and the whole country from Nov. 1942.

German economic exploitation of these territories was ruthless. The needs of the native population were subordinated to the demands of the German economy, often at the cost of widespread hunger and shortages, while German industrial and business firms as well as officials made the most of the advantages the situation offered. In eastern Europe German policy treated the population not only as conquered peoples, but in accordance with Nazi teaching, as inferior races without rights, fit only to serve as slaves. Those classes of the population which on account of their education or position might be expected to provide leadership, together with the Jews and any who showed signs of resistance, were put to death. At Mauthausen, one of the extermination camps in Austria, close to 2,000,000 people, mostly Jews, were exterminated between 1941 and 1945; at Oswiecim (Auschwitz) in Poland, 2,500,000 were executed in the gas chambers, while another 500,000 died from starvation and disease. Frequent man hunts were carried out to round up labour for deportation to Germany; at the end of 1944, 4,795,000 foreign workers had been recruited in this way, the three largest groups being Russians (1,900,000), Poles (851,000) and French (764,000). Those from the east were treated entirely as slave labour and the conditions under which they lived were often appalling. Hitler's and Himmler's plans for the new order they meant to build in eastern Europe were only partially carried out, but those who lived under German rule in Poland and the occupied parts of the U.S.S.R. suffered great hardship and cruelty.

In certain parts of the occupied territories (especially where the terrain was favourable) the Germans encountered partisan movements; *e.g.,* in Yugoslavia, Poland and the U.S.S.R. In almost all there was some form of resistance movement, in Norway, France and Holland as well as in the east. The German measures for stamping out this opposition, including the shooting of hostages, were frequently marked by brutality and left bitter memories behind.

In Germany itself the impact of war was not sharply felt until

1942. Casualties in the early campaigns were comparatively light and not until the winter of 1941–42 in Russia did they reach the scale of World War I. The effects of the blockade were reduced by the plundering of the occupied countries.

Following the crisis of 1941–42 on the eastern front Hitler demanded total mobilization. Fritz Sauckel, the *Gauleiter* of Thuringia, was made plenipotentiary general for manpower and took over the recruitment of foreign labour, while Albert Speer was appointed to succeed Fritz Todt at minister of armaments. It was thanks to Speer that Hitler was able to continue the war for another three years. By a remarkable feat of organization and improvisation he succeeded in maintaining and even raising German war production despite the heavy Allied bombing of industry and communications. By 1944 he had 14,000,000 workers under his direction and was virtually the economic dictator of the country.

In the early stages of the war, Goring was the second man in Germany and was named by Hitler as his successor. But by 1942 Goring's star was waning and suffered total eclipse with the failure of the air force to check the Allied raids or make effective retaliation. His place was taken by Himmler who had built up his power as head of the unified police and security services in a police state. During the war Himmler extended the functions of the SS. until it became virtually a state within the state. Not only was Himmler put in charge of the resettlement of the occupied territories in the east, but in the *Waffen* (armed) SS. divisions, 500,000 strong by 1944, he created a rival army to the *Wehrmacht* which in Hitler's eyes was far more reliable than the regular army.

Hitler's own position remained unchallenged until his death, apart from the attempt on his life in July 1944 (see below). The cabinet never met after the beginning of 1938. Ministers were confined to the discharge of their departmental duties, while Hitler reserved to himself alone the right to decide policy. This was true of military as well as of political decisions. He abolished the post of minister of defense in 1938 and, by dividing responsibility between his staff as commander in chief of the armed forces (the O.K.W.) and his staff as commander in chief of the army, after Dec. 1941 (the O.K.H.), he succeeded in preventing the growth of an organization with the independent authority of the great general staff during World War I. He retained his hold on the loyalty of Speer, Himmler, Goring and the other Nazi leaders until the last days of his life, and the contest for power between them was aimed at securing his favour not at replacing him. Adolf Hitler was in fact as well as in name the dictator of Germany.

The Beginning of Defeat.—Gen. Franz von Halder, chief of staff to the commander in chief of the army from 1938 to 1942, later expressed the view that by the end of 1943 at the latest Germany's defeat was certain. The fact that the war continued for another 18 months, at terrible cost to Germany, was due to the refusal of Hitler to admit defeat and his determination to drag down Germany and half Europe with him rather than repeat the capitulation of 1918.

During the course of 1943 Mussolini mas overthrown, Anglo-U.S. forces invaded Italy, and the Russians began the series of massive attacks which were to carry them deep into central Europe. In Italy energetic counteraction enabled the Germans to take advantage of the Allies' delays and establish a winter line south of Rome, thus forcing the U.S. and British forces to fight their may up the peninsula. In Sept. 1943 Mussolini was rescued by SS. troops and established as head of the Italian social republic set up under German protection in northern Italy. In the east Hitler insisted that the German troops must defend everything they held and obstinately refused to allow the strategic withdrawal which his generals considered the better course. This did not prevent the Red army from clearing most of Soviet territory and crossing the Polish frontier in Feb. 1944 and the Rumanian in March. In the summer of 1944 the German front in Poland broke and the Russians pressed forward toward the frontiers of the Reich; on June 4 Rome was liberated and on June 6 the British and Americans made their landings in Normandy.

Since the beginning of 1942 the Allied air forces had steadily increased the weight of their bombing attacks on Germany. The first 1,000-bomber raid, on Cologne, took place on the night of May 30–31, 1942. In July 1943 Hamburg was devastated in a series of such raids, while between mid-Nov. 1943 and mid-Feb. 1944, the R.A.F. dropped 22,000 tons of high explosive on Berlin (qv.). In March, the U.S. army air force carried out its first day raids on the German capital. These combined attacks continued without respite for three years and did enormous damage to the towns and communications of Germany.

Hitler, who had made his headquarters since the summer of 1941 in a remote part of East Prussia, was now completely cyt off from the life of the nation he led. He refused to visit the bombed towns, was scarcely ever seen in public and spoke or broadcast only on rare occasions.

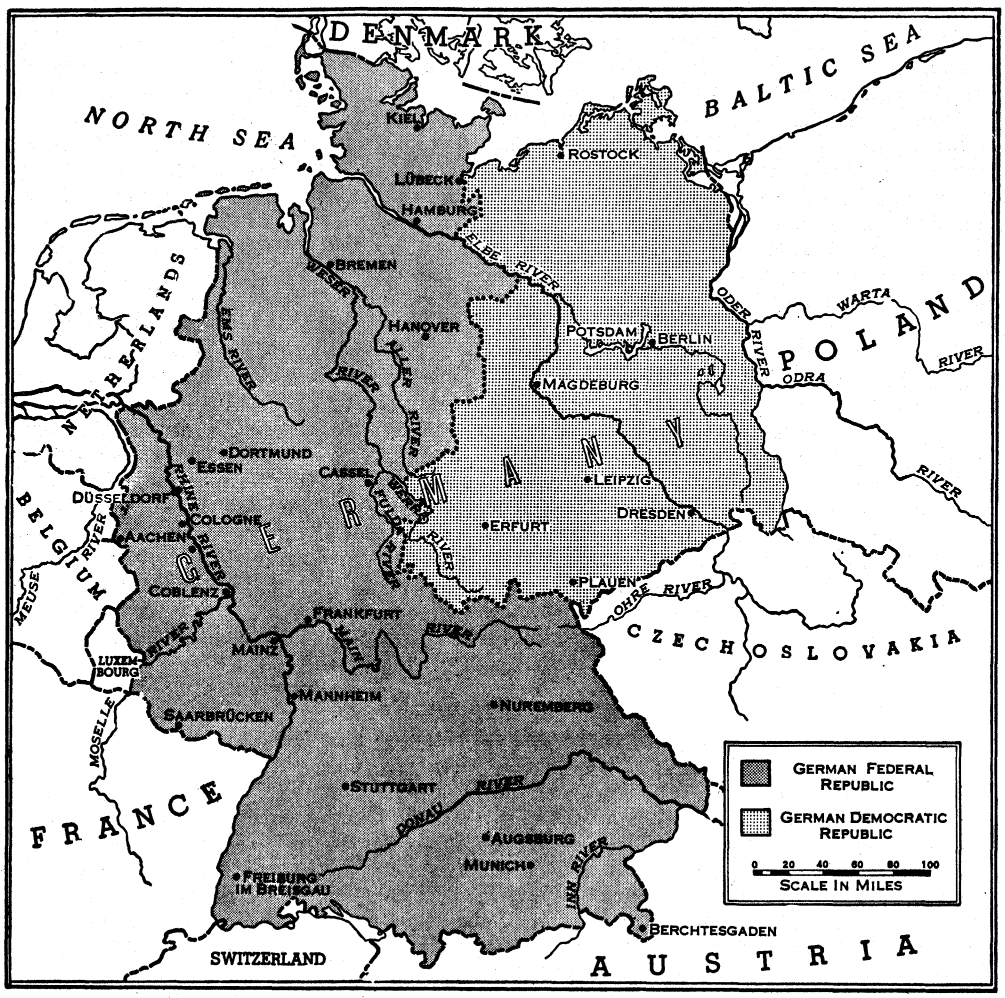
The **Plot** Against **Hitler.**—Realizing that Hitler's refusal to consider surrender would do irreparable harm to Germany, a group of German patriots had for some time been plotting to assassinate him. The German opposition was composed of a number of loosely connected groups, fluctuating in membership, with little common organization or common purpose other than their detestation of the Nazi regime. The two senior members, who had been engaged in conspiring to overthrow Hitler from before the war, were Gen. Ludwig Beck, chief of staff of the army until 1938, and Carl Goerdeler, a former *Oberbürgermeister* of Leipzig. The only institution in Germany able to stage a successful coup d'état was the army, and one of the principal centres of the plot was the *Abwehr* (the counterintelligence service of the armed forces). This was broken up by Himmler in the course of 1943 but was replaced by a small group in the command headquarters of the reserve army, whose outstanding personality was Col. Count Claus von Stauffenberg.

On July 20, 1944, Stauffenberg placed a bomb concealed in his' brief case under the table during a conference at Hitler's headquarters in East Prussia. By chance, however, Hitler, although injured, was not among those killed. The attempt of the conspirators to seize power in Berlin and bring the army over openly to their side failed, and both there and in Paris the coup was suppressed before the morning of July 21.

The End of the Third **Reich.**—From the summer of 1944 to the summer of 1945 the history of Germany is one of unrelieved disaster. By the end of 1944 the western Allies reached the Rhine, and six months' fighting in the west alone had cost the Germans 1,000,000 men killed, wounded and captured. The Russians swept through the Balkans and by Dec. 1944 were besieging Budapest and threatening East Pmssia. Nazi propaganda foretold a terrible fate for the German people if they failed to hold off the enemy, while extravagant hopes were placed in the secret weapons (guided missiles, jet planes and new U-boats) and in a split between the western powers and the U.S.S.R. By a last desperate effort a number of divisions and fresh supplies of equipment were gathered together in the closing months of 1944, but Hitler, ignoring the danger of a Soviet break-through in the east, persisted in gambling these resources on an attempt to disrupt the Allies' front in the west.

The Ardennes offensive of Dec. 1944, which fell far short of its objective, Antwerp, was the last offensive operation of which the German army proved capable. In Jan. 1945, the Russians launched an attack along the whole line from the Baltic to the Carpathians and broke into Germany from the east, while in March the British and Americans crossed the Rhine and poured in from the west. At Hitler's command Germany was turned into a battlefield in a senseless campaign which served no purpose except to delay the inevitable defeat by mortgaging the future of the nation.

Although there had been talk of a fight to the finish and the creation of a national redoubt in the mountainous country of Bavaria which was the birthplace of the Nazi party, Hitler finally refused to leave Berlin. In the last week of April he made preparations to commit suicide in the underground bunker of the Reich chancellery, while the Russians were fighting in the streets of Berlin. Among his last acts was to expel Goring and Himmler from the party and order their arrest on the suspicion that they were negotiating with the enemy. In the case of Himmler this was justified, although his efforts to reach a separate peace with the western powers through the representative of the Swedish Red



Cross, Count Folke Bernadotte, failed completely. In a political testament to the German nation, Hitler laid the blame for the disastrous war on others, principally on the Jews, and expressed neither regret nor remorse for what had happened. He appointed Admiral Donitz his successor as head of state and Goebbels as chancellor. In the early hours of April 29, he married his mistress, Eva Braun, and so far as is known shot himself on the afternoon of April 30. His body, together with that of his wife, is believed to have been burned in the chancellery garden. Goebbels committed suicide the following day and Himmler shortly afterward. Goring, Speer, Ribbentrop and most of the other Nazi leaders were captured and subsequently tried by the Allies as war criminals at Nuremberg. Only the fate of Martin Bormann, the head of the party chancery, who had acquired increasing influenre with Hitler in the last year of his life, remained uncertain.

The attempt of Admiral Dönitz to negotiate a surrender with the western powers proved unsuccessful. The Allies insisted upon an unconditional surrender and this was signed by Gen. Alfred Jodl and Adm. Hans von Friedeburg in the presence of representatives of the United States, Great Britain, the U.S.S.R. and France at Reims on May 7, 1945, to take effect midnight May 8–9.

GERMANY AFTER WORLD WAR II

With the unconditional surrender the German state ceased to exist and the responsibility for the government of the German people was assumed by the four occupying powers, the United States, Great Btitain, the U.S.S.R. and France. On June 5, the four powers announced that an Allied Control council, consisting of the four commanders in chief and their political advisers would be established in Berlin, and that the country west of the Oder-Neisse line would be divided into four zones of occupation (see *Population,* below). Berlin, although situated in the Soviet zone, was to be occupied by all four powers and to be governed by an inter-Allied authority or, in Russian, *Kommandatura.*

The Potsdam Agreement. — At the Potsdam conference (July 17–Aug. 2, 1945), attended by Joseph Stalin, Harry S. Truman, Winston Churchill and Clement Attlee (but not by a French representative), it was agreed, though a program of decentralization was to be carried out, not to partition Germany but to treat the country as a single economic unit with certain central administrative departments. Great Britain and the United States agreed to support at the peace settlement the Russian annexation of the northern half of East Prussia (including Konigsberg). The conference also agreed "pending the final delimitation of Poland's western frontier" to leave the territories east of the rivers Oder and Neisse (Pomerania, including Stettin and Swinemiinde; Silesia; and the southern part of East Prussia) under Polish administration, separating them from the Russian zone. The Poles proceeded to treat these territories as a permanent annexation. driving out the German population of several millions and bringing in Polish settlers. These changes in the east meant the loss of 23% of German territory as constituted by the treaty of Versailles.

The Allied plans for a common policy in Germany and for the treatment of the country as a single economic unit proved abortive. There were three principal reasons for this failure. The first was the opposition of the French, who had not been represented at Potsdam and who were determined, if possible, to prevent the reappearance of a unified German state by the partition of the Reich. The second was the growing divergence between the policies each of the powers followed in their own zones. The third and most important was the breakdown of the alliance between the United States and Great Britain on the one side and the U.S.S.R. on the other. Their differences covered the whole field of Allied policy, but so far as Germany was concerned, the most important issues were the functions and powers of the future German government, the economic unity of Germany, reparations, frontiers and the future of the Ruhr.

Prolonged negotiations between the four powers culminating in two meetings of the Council of Foreign Ministers during 1947 (Moscow, March–April; London, November–December) produced no agreement, and from 1948 the division of Germany by the "iron curtain" between the Soviet and western zones of occupation became the dominant fact in postwar development.

The Failure of Joint Allied Control. — The deadlock on the Allied Control council had already driven the British and U.S. authorities to act on their own initiative in dealing with the problems of their own zones of occupation. These were particularly severe in the British zone which contained the densely populated and heavily bombed industrial centres of the Rhineland, the Ruhr, Hanover and Hamburg.

The Allies undertook the occupation of Germany with the purpose of rooting out the Nazi regime and destroying once and for all the basis of German military power. Hence their original directives laid great stress on political and economic decentralization, disarmament, the arrest of war criminals, denazification, the dismantling of German war industries and reparations. They rapidly found themselves forced to deal with quite a different set of problems, the fundamental cause of which was not Germany's strength but its weakness. Characteristic of these problems were economic stagnation, the dislocation of communications, famine, a desperate shortage of housing. an unstable currency and rampant black market, the influx of millions of refugees expelled from Poland and the Czech Sudetenland, and the bewilderment and demoralization consequent to a lost war. Large-scale economic aid had to be given by the United States and Great Britain; in the first two and a half years even this did not prevent widespread hunger and suffering.

In 1946 the British accepted the offer of the U.S. government to merge their two zones for economic purposes and the bizone came into existence on Jan. 1, 1947. This development was bitterly attacked by the Russians and was disliked by the French who were still anxious to break up Germany and were occupied in detaching the Saar from the rest of their zone. The British and U.S. authorities had already handed over a great deal of administrative responsibility to the Germans and had set up state (Lander) governments. State parliaments (*Landtage*) were brought into being by elections in the U.S. zone at the end of June 1946, in the British in April 1947 and in the French in May 1947. The two largest parties to emerge in all three zones were the Christian Democratic Union (Christlich Demokratische Union, C.D.U.) and the Social Democratic party (Sozialdemokratische Partei Deutschlands, S.P.D.), the latter closely bound up with the revived trade union movement. In the bizone, on Jan. 1, 1947, a German economic council of 52 members elected by the Landtage assumed responsibility, under Allied supervision, for economic reconstruction.

Alongside this policy of rebuilding the German economy, and frequently (as in the case of dismantling) at variance with it, the Allies continued their measures to disarm Germany and reduce the industrial basis of its military power. This led to considerable confusion in Allied policy which already suffered from major differences between the western powers, *e.g.,* between the British Labour government and the United States over the socialization of the Ruhr industries; between the French and the other two western powers over the creation of centralized organs of administration and government. This confusion and the resulting sense of insecurity about the future added to German demoralization and apathy. Apart from the hardships of life in ruined and hungry towns, other factors weighed heavily upon the German population—the large numbers of prisoners of war still held abroad, especially in the U.S.S.R.; the difficulties of absorbing the refugees from the former eastern provinces; and the unbalanced division of the population between men and women (28,546,000 males to 35,952,000 females in the four zones, according to the census of Oct. 1946).

The turning point in the postwar history of Germany was the year 1948. The U.S. and British governments determined to press ahead with their plans for the reorganization of western Germany despite Soviet opposition and French reluctance. On Jan. 7, 1948, the powers and composition of the German Economic council for the bizone (meeting in Frankfurt) were changed to create the nucleus of a future German government. The Economic council was expanded from 52 to 104 members and a second chamber, a Landerrat consisting of two representatives from each state, was set up. To meet the objections of the French, a six-power conference was held in London, attended by representatives of the United States, Great Britain, France, Belgium, the Netheriands and Luxembourg. On June 7 this produced an agreed program for the future development of the three western zones. Its main features were: a constituent assembly and federal German government for all three zones (without the Saar, which at the end of 1947 became an autonomous territory economically attached to France); an Allied occupation statute governing relations between the Allies and the German authorities; an economic merger of the French with the British and U.S. zones; the establishment of an Allied Military Security board to enforce demilitarization; and an International Ruhr authority to control the coal and steel industries of the Ruhr basin.

The Russians, whose obstructive tactics had been responsible for the decision of the western powers to go ahead on their own initiative, reacted strongly to these developments. They attacked the new policy in western Germany, withdrew their representative from the Allied Control council (March 20) and began to place obstacles in the way of communications between western Germany and Berlin. Following the much-needed currency reform in the western zones (which the Russians had done everything possible to delay and which was put into operation on June 20) the Soviet authorities proceeded to enforce a blockade of the Allied garrisons in Berlin and of about 2,500,000 inhabitants of west Berlin, with the intention of driving out the western powers and securing control of the whole of the former capital. This blockade lasted from the summer of 1948 to the summer of 1949 and was accompanied by great hardship for the population of Berlin. The answer of the western powers was to institute a counterblockade of the Soviet zone and to organize the supply of Berlin by air. By Sept. 30, 1949, when the air lift ceased, 2,323,738 tons of food, fuel and raw materials had been brought into the beleaguered city in this way. Meanwhile the Allied governments refused to be diverted from the course on which they had embarked in western Germany and pressed ahead with the execution of the decisions made in the summer of 1948. On Sept. 1, a parliamentary council of 65 members, elected by the Landtage, met at Bonn under the chairmanship of Konrad Adenauer (C.D.U.) to draft a constitution. Pending a decision by a future German government on the question of public or private ownership, the coal, iron and steel industries of the Ruhr were placed in the hands of German trustees and an International Ruhr authority set up with powers to allocate supplies between internal and export needs, as well as to fix quotas, tariffs and prices. This plan, which made large concessions to the French point of view, was sharply criticized in Germany.

Following the Marshall offer of U.S. aid to Europe, further economic aid on a large scale (the European Recovery program) was made available to western Germany, and this, combined with the effects of the currency reform, led to a remarkable economic recovery. In the second half of 1948 industrial production rose from 45% to nearly 75% of the 1936 level, while steel production doubled during that year. The economic policy followed by the German authorities under the guidance of Ludwig Erhard was one of free competition and the removal of controls. This was criticized by the S.P.D. and the trade unions on the grounds that it led to a steep rise in prices and much hardship for the poorer classes of the community. The revival in German confidence, however, was marked.

In May 1949 the Russians, who had suffered a severe and unexpected setback with the success of the Allied air lift, finally agreed to lift the blockade of Berlin. The same month the western powers put into operation a new occupation statute for western Berlin which gave greater freedom and responsibility to the city administration under its lord mayor, Ernst Reuter (S.P.D.). After an uncertain period during which the Soviet authorities made further attempts to interfere with freedom of communication and the Allies continued the air lift, a tacit working agreement was reached which left Berlin divided into western and eastern sectors under separate administrations, but with the garrisons of the western powers still *in situ.*

A further meeting of the Council of Foreign Ministers held in Paris in May–June 1948 succeeded no more than earlier meetings in reaching agreement on a unified policy for the whole of Germany and the measures for the organization of separate west and east German states continued. On Jan. 17, 1949, an Allied Security board had been set up to supervise the demilitarization of Germany. Strong German protests continued to be made against the dismantling of German factories. A new program for demilitarization agreed on by the U.S., British and French foreign ministers in Washington in April made considerable concessions to the German attitude, but this did not stop the agitation, which led to a number of incidents with the British authorities in the course of the year. The three foreign ministers at their Washington meeting completed the arrangements for the merger of the French with the Anglo-American bizone and on April 10, 1949, published the promised occupation statute. This guaranteed full powers of self-government to the new west German state except for certain reserved subjects (see *Constitution,* below).

German Federal Republic. — With the occupation statute published, the parliamentary council at last concluded its discussions on the Basic law of the new state. It was passed by the council on May 8, 1949, by 53 votes to 12 and approved by the Allied military governors on May 12 with certain reservations, the most important of which was the exclusion of western Berlin as the proposed twelfth Land of the federation.

The constitution of the new German Federal Republic provided for a president and two chambers, the *Bundestag,* elected for four years, and the Bundesrat, representing the Lander governments. Considerably more freedom to manage their own affairs was left to the Lander than they had enjoyed under the Weimar constitution, but this did not satisfy the strongly particularist Bavarian *Landtag* which alone of the 11 Lander voted against ratification.

Elections for the *Bundestag* took place on Aug. 14. The two parties that stood for a rapid return to a free economy, the Christian Democrats and the Free Democrats (Freie Demokratische Partei, F.D.P.) secured 139 and 52 seats respectively, the S P.D., standing for a controlled economy and public ownership of heavy industry, 131 seats. When the parliament met at Bonn, the new capital, Theodor Heuss, the leader of the F.D.P., was elected federal president on Sept. 12 and Adenauer chancellor at the head of a right-wing coalition on Sept. 20. Kurt Schumacher became the leader of the large and critical S.P.D. opposition.

On Sept. 21 the occupation statute came into force, and the Allied military government disappeared in favour of the Allied high commission. On Oct. 11 the federal government was given permission to appoint its own delegate to the Organization for European Economic Cooperation in Paris, and on Nov. 24 the Allied high commission concluded a new agreement (the Petersberg agreement) with the chancellor. This covered further Allied concessions on dismantling and demilitarization; the right to build a German merchant marine; German membership in the Ruhr authority and in the Council of Europe; the right to re-establish consular and commercial relations abroad.

The new government faced severe internal problems, of which rising unemployment, the refugees from the eastern territories (between 16% and 18% of the total population of 47,612,200) and housing were the most pressing. Food and consumption goods were plentiful, but prices remained high and housing accommodation was desperately short. The S.P.D. attacked the economic policy of the government as responsible for the continuation of these conditions. Serious concern, with a widespread fear of war, was also felt throughout the country at the open hostility of the Soviet government and at the continued partition of Germany which, it was felt by many, was likely to be hardened by the policy of co-operation with the western powers on which Adenauer had embarked. On the other hand, the situation and prospects of the people of western Germany had changed out of all recognition since the immediate postwar years. and the new relationship with Germany's former enemies in the west which was beginning to take shape offered prospects for the future which would have appeared improbable on the morrow of unconditional surrender.

German Democratic Republic. — The Soviet zone of occupation, excluding Berlin, had a population of 17,313,734 in Oct. 1946. In April 1946 the Soviet military administration succeeded in bringing about a fusion of the Communists with the Social Democratic party in the Socialist Unity party (Sozialistische Einheitspartei Deutschlands or S.E.D.). The proposed alliance was rejected by the Social Democrats in the west under the leadership of Kurt Schumacher, but in eastern Germany Otto Grotewohl (joint chairman of the S.P.D. with Schumacher) agreed to join the veteran Communist Wilhelm Pieck in forming the new party, which rapidly became the main German agency used by the Soviet authorities to carry out their wishes. Other organizations used for the same purpose were the Free German Trade Union federation, the Farmers Co-operative organization and the Free German Youth.

In Oct. 1946 elections were held for the five Lander parliaments, and coalition governments between the S.E.D. and the two other principal parties, the Christian Democrats (C.D.U.) and the Liberal Democrats (Liberale Demokratische Partei, L.D.P.) were established. The eastern C.D.U. and the L.D.P. continued to be tolerated throughout the period, but only on conditions which made independent action impossible and subordinated them to the leadership of the privileged S.E.D. The Lander governments were balanced by a number of (German) central administrative departments which were directly responsible to the Soviet authorities. The Economic commission set up in 1947 and largely taking the place of the central administrative departments weighted the balance further in favour of central direction against the authority of the state governments and served, like the Economic council at Frankfurt, as the nucleus of a future central government.

Large-scale land reform affecting one-third of the total land area was carried out at the beginning of the occupation, close on 70% of the land being distributed for private ownership. No attempt however was made at that stage to introduce collectivization. A large number of industrial, commercial and financial undertakings were taken over by the state, and by 1948 it was estimated that 75% of the total industrial capacity of the zone was owned by the Economic commission and the Land governments.

Although much in eastern Germany recalled Soviet models, the Soviet zone in these years could not be accurately described as a Communist state. The first Soviet interest was to secure reparations, and everything else, including the interests of the German Communists, was subordinated to this purpose. Reparations were taken in three different ways: first, by dismantling and removing equipment; second, by taking from the current production of German undertakings on orders given by the powerful Soviet trading companies operating in the zone; third, by the direct transfer of German industrial property and land to Soviet corporations. The exact amount of reparations taken out of the zone has been much disputed; the order of magnitude is indicated by the fact that the Soviet corporations (representing only one category of reparation operations) accounted for one-quarter of the industrial production of the whole zone in 1947.

On Dec. 6–7, 1947, the S.E.D. convened in east Berlin a People's congress (Volkskongress) and a second one on March 17–18, 1948. The latter decided to set up a People's council (Volksrat) of 400 members to serve as a platform for the Soviet-directed agitation against the formation of a west German state. In the autumn of 1948 the People's council was set to work to draw up a constitution for a German Democratic Republic. A third People's congress of 1,525 members, "elected" on May 15–16, 1949, in the Soviet zone, adopted the constitution on May 30. The People's congress appointed a new People's council of 400 which was transformed on Oct. 7 into a provisional People's chamber (Volkskammer) for the new republic. A chamber of states (Landerkammer) was appointed three days later and on Oct. 11 the two chambers elected Wilhelm Pieck president of the republic. A government nominally a coalition but in fact dominated by the S.E.D. was established under the premiership of Otto Grotewohl. The Soviet military administration then formally handed over power to the new government, being replaced by a Soviet control commission, and the republic was recognized by the U.S.S.R. and other Soviet-dominated governments. In fact the firm hold of the Soviet authorities was not relaxed at all. The government and the S.E D. remained the instruments of Soviet policy. One of the first acts of the new government was dutifully to announce its acceptance of the loss of the eastern territories to the Poles. An agreement recognizing the Oder-Neisse line as the permanent frontier was signed on July 6, 1950. (A. Be.)

On May 16, 1950, Stalin announced a reduction in Soviet reparations demands. In a letter to Grotewohl he stated that by the end of 1950, eastern Germany would have paid about $3,658,000,000 toward the total Soviet demand of $10,000,000,000. In view of this, the Soviet government, in agreement with the Polish (entitled to 15% of the Soviet share), had decided to reduce the sum still due by 50%, that is, to $3,171,000,000 to be paid from current production over a period of 15 years.

At the same time the number of nationalized industries was extended. Of the 115 Soviet limited liability companies (*Sowjet*

Aktien Gesellschaften or S.A.G.) only 19 were handed back to the eastern German government.

During May 1952 the German Democratic Republic announced several measures which isolated it from the German Federal Republic. A police-guarded no man's land 3 mi. wide was created along the whole extent of the western frontier of the German Democratic Republic, Berlin remaining the only exception. The formation of a German people's army had been proceeding from June 1948, but an excuse to reveal its existence was found later, and on June 18, 1952, the *Volkskammer* approved a resolution for the establishment of a national army. A paramilitary labour service, under the title "Service for Germany," was approved on July 24 for young persons of both sexes who were 17 years old. A Soviet system of administration was introduced into the republic on July 23, when instead of the former five *Länder* there were created 14 new *Bezirke* (provinces, similar to Soviet *oblasfi*). each containing 15 to 16 *Kreise* (districts, similar to Soviet *rayony*). The "sovietization" of eastern Germany was continued by the collectivization of agriculture, which started on July 12, 1952, when the first east German *kolkhoz,* or *landwirtschaftliche* Produktionsgenossenschaft, was founded at the village of Brusewitz, near Schwerin. Revision of the whole system of justice, announced in Oct. 1952, brought the German Democratic Republic into line with the Soviet system.

This increasing sovietization, the raising of workers' production levels, increased persecution of the churches and serious food shortages led to the risings in east Berlin and strikes throughout the Democratic Republic which began on June 16–17, 1953. These were put down by the Soviet army, and some concessions were made.

From Jan. 1, 1954, the U.S.S.R. ended the collection of reparations from the German Democratic Republic and on that day transferred the remaining S.A.G. to the east German government. On March 25, 1954, the Soviet government announced that the German Democratic Republic was "sovereign."

Attachment to East and West Confirmed.—In spite of much propaganda and exchange of notes between the western powers and the U.S.S.R. and proposals and counterproposals from German Democratic and German Federal governments, the possibility of a reunification of the two republics became faint.

While the German Democratic Republic was being completely accommodated in the Russian orbit. between the three western great powers and the German Federal Republic considerable progress was made toward full association of the German Federal Republic with the Atlantic community. Although the general contract signed at Bonn on May 26, 1952, and the agreement on German participation in the European Defense Community signed the following day in Paris were refused ratification by the French national assembly (Aug. 30, 1954), a nine-power conference held in London from Sept. 28 to Oct. 3 of the same year agreed upon a new solution of the same problem. Proposed by the British government, the solution consisted of a series of documents which were signed in their final form in Paris on Oct. 23. First, there were agreements between France, the German Federal Republic, the United Kingdom and the United States on the termination of the occupation regime in Germany; second, there were documents relating to the revision of the Brussels alliance treaty (March 17, 1948) between Belgium, France, Luxembourg, the Netherlands and the United Kingdom and its extension to the German Federal Republic and Italy; finally, there were protocols concerning the entry of the German Federal Republic to the North Atlantic Treaty organization.

On March 21, 1955, President Heuss signed the instrument of ratification of the Paris agreements. As all other signatories also completed the ratification, on May 5 the German Federal Republic became a sovereign country. The Allied High commission at Bonn dissolved itself on the same day. In a proclamation Adenauer said that the goal of his government was "a free and united Germany in a free and united Europe." On May 7, in Paris, Adenauer took part in the establishment of the Western European union, and two days later the German Federal Republic became a full-fledged member of NATO. *(See* below, *Defense.)*

The Soviet reaction to the new situation was to invite (June 7) Adenauer to Moscow to establish diplomatic relations with the German Federal Republic. Adenauer arrived in Moscow on Sept. 9. After three days' hard bargaining he was promised that German prisoners of war would be repatriated in return for which he agreed to the establishment of diplomatic relations between the U.S.S.R. and the German Federal Republic. The number of German servicemen missing in the Soviet campaign was given at Bonn as 1,156,567 and the total of civilian deportees as about 750,000. Of these only about 140,000 were estimated still alive. But Marshal N. A. Bulganin, the Soviet premier, informed Adenauer that there were in the U.S.S.R. only 9,626 prisoners, all "war criminals."

Before leaving Moscow Adenauer sent to Bulganin a letter stating that his government represented the whole of Germany and that final determination of German frontiers must await a peace treaty. On Sept. 15 the Soviet government stated that there were two German governments and two German states, and that the question of German frontiers "was solved by the Potsdam agreement."

On Sept. 16 a government delegation of the German Democratic Republic arrived in Moscow, and four days later a treaty was signed. It stipulated that thenceforward the German Democratic Republic was fully responsible for its own internal and external affairs and that the Soviet had stationed armed forces in eastern Germany "temporarily." Ulbricht, one of the delegates, explained that, while the western powers would not withdraw their troops from western Germany and liquidate their bases there, the presence of Soviet troops on the territory of the G.D.R. would continue to be necessary.

On Sept. 29 the Soviet government announced that it was releasing 8,877 German "war criminals" and handing over 749 serious offenders to the German Federal or Democratic governments.

BIBLIOGRAPHY.—*The Classical Period:* References to Germany are scattered throughout classical literature, especially in the historians: Caesar, *De Bello Gallico,* published 51 B.C.; Tacitus, *Annales* and *Germania,* the latter edited with full commentary by J. G C. Anderson (Oxford, 1938); Ammianus Marcellinus (A. A.D. 390), ed. by C. U. Clark (Berlin, 1910–15); and Jordanes, *Getica,* ed. by T. Mommsen in *Monunzenta Gernzaniae historica* (Hanover, 1826–96). There are chapters on the Germans and their relations with the empire in vol. x–xii of the *Cambridge Ancient History* with full and excellent bibliographies; reference should also be made to ch. v, "Roman Germany and the Free Germans," in T. Mommsen, *The Provinces of the Roman Empire* (London, 1886), and vol. iv of C. Jullian's *Histoire de la Gaule,* 8 vol. (Paris, 1907–26). After A.D. 324, the terminal date of the *Cambridge Ancient History,* the *Cambridge Medieval History,* vol. i, has bibliographies of the migration period, not going, however, beyond 1911. Edward Gibbon's *The Decline and Fall of the Roman Empire*, vol. i–vi, with notes and appendices of J. B. Bury (London, 1909–14), is fundamental, with Bury's own *History of the Later Ronzan Empire From the Death of Theodosius I to the Death of Justinian,* vol. i (London, 1923), and his lectures collected as *The Invasion of Europe by the Barbarians* (London, 1928). The fundamental study of detailed tribes is that of L. Schmidt, *Geschichte der deutschen Stämme bis zum Ausgang der Völkerwanderung,* 2nd ed. (Munich, 1934). Laws of the Germans are edited in *Mon. Germ. Hist. Leges* (Hanover, 1835–89) For the archaeology of the migrations, *see* Nils Aberg, *Archaologie der Volkerwanderungen* (1922). For the Huns and their relations with the Germans and the empire, *see* E. A. Thompson, *History of Attila and the Huns* (Oxford, 1948). For the Anglo-Saxon invasions of Britain, *see* R. G. Collingaood and J. N. L. Myres, *In Roman Britain and the English Settlements,* 2nd ed. (London, 1937); R. H. Hodgkin, *A History of the Anglo-Saxons,* 2 vol, 2nd ed. (London, 1939).

The Early Middle Ages (500–900): Official material includes the diplomas, capitularies, canons of councils and formularies edited in *Monumenta Gernzaniae historica (see* above). Several of the modern studies already listed, especially Schmidt, are important for this period. *See* also W. Levison, *England and the Continent in the Eighth Century* (Oxford, 1946) and *Aus rheinischer und frankischer Frühzeit* (Dusseldorf, 1948); L. Halphen, *Charlemagne et l'empire carolingien* (Paris, 1947); J. Calmette, *L'Effondrement d'un empire et la naissance d'une Europe* (Paris, 1941). The great study of the German church is A. Hauck, *Kirchengesclzichte Deutschlands,* 5 vol, vol. i–iv in 3rd and 4th ed. (Leipzig, 1887–1920). Economic and social aspects: A. Dopsch, *The Econontic and Social Foundations of European Civilization* (London, 1937); *The Cambridge Econonzic History of Europe,* vol. i and ii (Cambridge, 1941–52); E Salin, *La Civilisation mérovingienne,* vol. i (Paris, 1950). A guide to the literature of the period and to the best editions of printed sources is W. Wattenbach, *Deutschlands Geschichtsquellen im Mittelalter,* revised by W. Levison, vol. i (Weimar, 1952).

The Later Middle Ages (900–1486): General works of reference are *The Cambridge Mediaeval History,* vol. iii, v and vi (Cambridge, 1922–29); *The Canzbridge Economic History of Europe,* vol. i and ii (Cambridge, 1941–52). Books on more limited subjects or periods are: G. Barraclough (ed.), *Mediaeval Germany 911–1250: Essays by German Historians* (Oxford, 1938) and *The Origins of Modern Germany,* 2nd ed. (Oxford, 1948); G. Tellenbach, *Die Entstehung des deutschen Reiches,* 3rd ed. (Munich, 1943); J. W. Thompson, *Feudal Germany* (1928); G. Tellenbach, *Church, State and Christian Society at the Time of the Investiture Contest,* trans. by R. F. Bennett (Oxford, 1940); A. Meister, *Deutsche Verfassungsgeschichte,* 3rd ed. (Berlin, 1922); F. Kern, *Kingship and Law in the Middle Ages,* trans. by S. B. Chrimes (Oxford, 1939); C. C. Bayley, *The Formation of the Germdn College of Electors in the Mid-Thirteenth Century* (Toronto, 1949); F. L. Carsten, *The Origins of Prussia* (Oxford, 1954).

The Reformation Period (1486–1648): J. Bryce, *The Holy Roman Enzpire,* 9th ed. (London, 1904); W. Andreas, *Deutschland am Vorabend der Reformation* (1932); L. von Ranke, *Deutschland im Zeitalter der Reformation,* 6 vol., rev. and enlarged ed. (Munich, 1925–26) and *German History in the Era of the Reformation,* trans. from the unrevised edition; J. Janssen, *History of the German People at the Close of the Middle Ages,* trans. by M. A. Mitchell and A. M. Christie, 17 vol. (London, 1896–1925); K. Brandi, *The Emperor Charles V,* trans. by C. V. Wedgwood (London, 1939); M. Ritter, *Deutsche Geschichte irn Zeitalter der Gegenreformation und des dreissigjahrigen Krieges,* 3 vol. (Stuttgart, 1889–1908); C. V. Wedgwood, *The Thirty Years' War* (London, 1938).

The Peace of Westphalia to the Congress of Vienna (1648–1815): B. Erdmannsdorffer, *Deutsche Geschichte, 1648–1740,* 2 vol. (Berlin, 1892–93); L. von Ranke, *Zwolf Bücher preussischer Geschichte,* a vol. (Leipzig, 1874); F. Schevill, *The Great Elector* (1947); J. G. Droysen, *Geschichte der preussischen Politik,* vol. i–x (Berlin, 1855–56); T. Carlyle, *History of . . . Frederick the Great,* 6 vol., 1st ed. (London, 1858–65); R. Koser, *Geschichte Friedrichs des Grossen,* 4 vol., 4th and 5th ed. (Stuttgart and Berlin, 1912–14); G. Ritter, *Friedrzch der Grosse,* 2nd ed. (Heidelberg, 1954); G. P. Gooch, *Frederick the Great* (London, 1947); J. F. Bright, *Maria Theresa* (London, New York, 1879); S. Padover, *The Revolutionary Emperor: Joseph the Second, 1741–90* (London, 1934); K. T. von Heigel, *Deutsche Geschichte, 1786–1806,* 2 vol. (Stuttgart and Berlin, 1899–1911); G. P. Gooch, *Germany and the French Revolution* (London, 1920); J. R. Seeley, *Life and Times of Stein,* 3 vol. (Cambridge, 1878); G. Ritter, *Stein,* 2 vol. (Berlin, 1931); H. vnn Srbik, *Metternich,* vol. i (Munich, 1925): H. von Treitschke. *German History in the 19th Century,* vol. i, trans. by E. and C. Paul (London, 1915); H. POPULATION, RELIGION, EDUCATION

Population. — The changes in area and population from 1871 are given in Table I.

About a quarter of the total population of Germany lived in towns of 100,000 inhabitants and over in 1950. The population of cities of over 250,000 inhabitants compared with the figure for

TABLE I.—*Germany: Area and Population*

From 1871 to 1945

Date	Territorial changes	Area sq.km.	Area sq.mi.	Population
May 10, 1871	Alsace-Lorraine annexed	540,857	208,825	41,059,000
July 1, 1914				67,800,000
June 28, 1919	Restitutions resulting from the treaty of Versailles*	468,620	180,934	59,800,000
Jan. 13, 1935	Saar returns to Germany	470,545	181,677	66,871,000
March 12, 1938	Incorporation of Austria	554,395	214,052	75,300,000
Sept. 21, 1938	Annexation of the Sudetenland	583,494	225,287	79,350,000
March 15, 1939	Annexation of Bohemia and Moravia	632,419	244,177	86,250,000
March 22, 1939	Annexation of Memel (Klaipeda)†	635,218	245,258	86,400,000
Aug. 2, 1945	Restitutions resulting from the Potsdam agreement‡	353,683	136,557	64,194,800

From 1946: the two republics and Berlin

Division	Area sq.km.	Area sq.mi.	Population 1946 census	Population 1950 census	Population 1955 est.
German Federal Republic!	245,820	94,911	45,706,500	49,842,624	52,190,000
West Berlin	481	186	2,012,500	2,146,952	2,195,000
German Democratic Republic	107,863	41,646	18,488,300	18,388,200	17,832,200
East Berlin	403	156	1,174,600	1,189,100	1,139,900
Total	353,683	136,557	64,194,800	68,230,824	70,022,000

*Alsace-Lorraine was returned to France; Saar was created as a territory administered by the League of Nations and incorporated within the French customs regime; Eupen-Malmédy was acquired by Belgium; northern Schleswig was returned to Denmark; Danzig was created as a free city; Memel (Klaipeda) was given to Lithuania, while Pomorze (Pomerania) and Poznania were incorporated with restored Poland, Upper Silesia was partitioned between Germany and Poland on Oct. 20, 1921.

†German wartime annexations to the detriment of Poland (western part of the country incorporated with the greater German Reich and the so-called Warsaw *General-Gouuernement* created); France (Alsace-Lorraine) Luxembourg (included into "Gau Mosel-land"), Belgium (Eupen-Malmédy) and Yugoslavia (northern Slovenia) are not included in the table.

‡Austria and Czechoslovakia regained independence, Memel returned to Lithuania. all the lands east of the Oder-Neisse line, together with the free city of Danzig, were included into Poland, the only exception being the northern half of East Prussia which was incorporated with the U.S.S.R.; Saar was again created as a separate territory united with France by a customs union.

§Excluding the Saar (area 991 sq.mi.; pop. [1955 est.] 992,000), politically re-united with Germany on Jan. 1, 1957.

*1955.

1939 is shown in Table II.

The population of the German empire at its establishment in 1871 was about 41,059,000. During the following 40 years it increased rapidly to 64,900,000, according to the census of 1910, and to 67,800,000 at the outbreak of World War I. The population was severely reduced by the war in three ways: the loss of men at the front and of other persons from war causes was estimated at 2,870,000; the birth rate during the war fell to the lowest point in history and remained low during the postwar years; and nearly 7,000,000 persons belonged to the territories which Germany had to surrender by the Versailles treaty.

Hitler's annexations of territory, however, much more than compensated for the war losses. Up to the summer of 1939 the annexations of the Saar, Austria, the Sudetenland, Bohemia-Moravia and Memel had resulted in an increase in population of 17,700,000, bringing the grand total of greater Germany to a figure of 86,400,000.

World War II reduced the population of Germany in much the same way as World War I: losses at the front and from other war causes were estimated at about 4,700,000; the birth rate fell from 20.6 per 1,000 in 1939 (in terms of Germany's 1937 frontiers) to 15 per 1,000 in 1942; and the loss of German territory to the east of the Oder-Neisse line brought about a further reduction of about 9,600,000. Nevertheless, if population figures are taken for the postwar area of Germany (which represents about three-quarters of the total area on Jan. 1, 1938), it will be seen that the population increased from 58,773,000 in 1939 to 68,230,824 in 1950 (excluding the Saar in both cases).

TABLE *111.—Germans in Eastern and Southeastern Europe*

Country	1937	1950	Country	1937	1950
Czechoslovakia	3,2[illegible]	200,000	Italy (Alto Adige)	290,000	214,000
Poland	741,000	100,000	Baltic states	195,000	—
Danzig	350,000	100,000	Memel territory	59,000	—
Rumania	720,000	380,000			
Yugoslavia	575,000	55,000			
Hungary	530,000	150,000	Total	6,600,000	1,099,000

This increase was largely accounted for by the influx of large numbers of German refugees expelled from Poland (in its new frontiers), Czechoslovakia and other countries of eastern and southeastern Europe. (See Table III.) The number of refugees in the German Democratic Republic was not known, but in 1950 the German Federal Republic included 4,500,000 Germans from the territory east of the Oder-Neisse line; 3,400,000 from Czechoslovakia, pre-1939 Poland and eastern European countries; and 1,548,000 from the German Democratic Republic. This last-named number was constantly increased by those Germans who were seeking asylum in the west. By the end of 1955 their number was estimated at 2,526,000.

Although war losses in the postwar German area were more than made good by the influx of German refugees, women outnumbered men to a greater degree. In 1950 there were 113.4 women per 100 men in the German Federal Republic and 124.2 women per 100 men in the German Democratic Republic. A survey of population by age groups is given in Table IV.

The birth rate in Germany between 1871 and 1914, a period of rapid industrial expansion, was, as it had been earlier in England in like conditions, unusually high. It had averaged about 35 living births per 1,000 of the population in the 1850s, rose to more than 39 in the decade after 1871 and then fell slowly but steadily to 27.5 in 1913. During World War I it fell sharply until it reached 14.3 in 1918. It rose again to 25.9 in 1920, but then fell steadily again to 14.7 in 1933. The percentage of marriages per year rose and fell in curves closely parallel to the birth rate.

In 1933 the National Socialist leaders were greatly alarmed by the low birth rate, which they regarded as an obstacle to the industrial and military expansion of the Reich. Several measures designed to increase the population were adopted between 1933 and 1939, the most publicized of which was the system of government marriage loans, a quarter of the loan being repaid for each child born alive. These measures brought about a moderate increase in the population figures, the birth rate having risen to 20 per 1,000 in 1939, whence it again declined in World War II to 15 in 1942 and 16 in 1943.

During 1946–50 the birth rate in the Federal Republic remained at about 16 per 1,000, while the death rate decreased from 12.4 to 10.4. In the Democratic Republic in 1948 the birth rate was 12.8 and the death rate 15.1. Table V illustrates the different development in the two parts of Germany between 1939 and 1952.

In the first years after World War II the eastern German authorities made no effort to check the drastic population developments in their territory, influenced partly, no doubt, by the overcrowded and chaotic conditions which prevailed. Then, however, there was a tendency to introduce population measures reminiscent of the Nazi era. Measures against abortions were tightened up, and in Sept. 1950 a law "for the protection of mother and child and the rights of women" was introduced, with the dual aim of increasing the employment of women in industry and encouraging the production of large families. Improvement along these lines, however, was largely offset by an increasing exodus to the Federal Republic of members of the most productive age groups during the ensuing years.

The density of population in Germany (including the Saar, but not the later annexations) increased steadily from 124.2 per square kilometre in 1910 to 134.3 in 1925, 140.3 in 1933 and 147.6 in 1939. It was this growing pressure of population that made the National Socialists proclaim so loudly and insistently that they must have more "living space"

(*Lebensraum*). The most rapid increase in density occurred in the cities, and the National Socialists tried, but with little success, to combat this flight from the country. After the war the density of population in the Federal Republic increased rapidly from 178 per square kilometre in 1946 to 194 in 1950 and 213 in 1955. Regional alterations brought about by the flight from bombed cities and the accumulation of expelled persons in the most easterly Lander grew less marked. But there were still great regional variations resulting from natural conditions, low population density being found in the barren northern area of Lower Saxony, the Swabian and Franconian highlands, the Upper Palatinate hill country, the Bavarian forest and the Alpine border region. In the German Democratic Republic the density of population increased only from 162 in 1946 to 164 in 1950, and then fell back to 158 by mid-1953, as the movement of refugees to the west gathered force. Comparative figures for population density are given in Table VI.

The *Refugees*.—One of the most acute social problems facing Germany at the end of World War II was that of the refugees; *i.e.*, those Germans expelled from former German territory east of the Oder-Neisse line and from Czechoslovakia, Hungary and Poland under the terms of the 1945 Potsdam agreement.

By the end of 1953 there were 8,451,000 expelled persons living in the German Federal Republic, and a further 2,153,000 political refugees from the German Democratic Republic and the Soviet sector of Berlin, who together formed about 22% of the population of the Federal Republic. In the Democratic Republic the refugee population in Aug. 1940 was 4,312,000, 24% of the population. By mid-1953, however, the number was reduced to 3,800,000, as these expelled persons joined in the flight to the west.

The distribution of the refugees in western Germany was from the first extremely uneven, and bore heavily on the rural and relatively poor regions of Schleswig-Holstein, Lower Saxony and Bavaria, lying on the eastern borders of the Federal Republic; the more industrial regions of the west had little accommodation available because of the widespread war damage. A scheme for a fairer redistribution of the refugees was drawn up by the federal government in Nov. 1949, and by the end of 1954 more than 750,000 expelled persons and refugees had been resettled in the industrial areas of North Rhine-Westphalia and Wiirttemberg-Baden. Nevertheless, 48.5% of all expelled persons were still living in Schleswig-Holstein, Lower Saxony and Bavaria.

By July 1955 only one-third of the expelled persons and refugees could be said to be fully integrated in the Federal Republic. A further 50% or so had jobs, but not in their own trades or professions. Just under a fifth were either unemployed, part-time employed, sick or invalid. Moreover, living conditions for many were still below the general standard, and many were still housed in camps.

Assimilation of the refugees in eastern Germany made greater progress, partly because of the Soviet insistence on the permanence of the Oder-Neisse frontier and partly because the nature of the land facilitated land reform on a much larger scale than was possible in the west, but mainly because it was prosecuted more vigorously. According to Soviet statistics 762,300 ha. were divided among the refugees, and it was possible to resettle about 348,000 on 90,600 farms. Attempts were also made to assimilate the refugees into industry, and groups of specialist craftsmen, such as those from the jewelry and glass industries in Czechoslovakia, mere encouraged to continue their trades and to build up new industries in what were formerly agricultural areas.

Religion.—As a result of the Reformation in the 16th century, northern, central and northeastern Germany became Protestant (Lutheran and Calvinist), while the west, south and southeast remained largely Roman Catholic. In both areas, however, enclaves of the other religious denomination remained. Until the large-scale movements of German refugees after World War II, the traditional territorial demarcation of Protestantism and Roman Catholicism in Germany remained basically unaltered, save for some changes brought about in industrial districts and large centres of population as a result of the Industrial Revolution.

The Hohenzollern empire established in 1871 was dominated by Prussia and was thus much more Protestant than Catholic. The antipathy came to the surface in the *Kulturkampf* (see History). As for the various Lutheran and Calvinist churches in Germany, they had always been so organized that the church in each Land' managed its own affairs; and this continued to be the practice after the foundation of the German empire in 1871.

When the empire ceased to exist after the German defeat in World War I, the traditional relationship between state and churches had to be revised. In the first place the various Protestant churches negotiated new treaties with the different Land governments which, in the Weimar republic, had succeeded the former ruling houses in Germany. The Land Protestant churches continued to be completely autonomous, but in 1922 they formed a loose association for purposes of mutual collaboration called the Deutscher Evangelischer Kirchenbund, or German Evangelical Church federation.

The organization of the Roman Catholic Church in Germany was elaborated during the 19th century, and this general organization was recognized in concordats which the church made, during the period of the Weimar republic, with Bavaria (1924), Prussia (1929) and Baden (1932). As a result the Roman Catholic Church in Germany was organized into a number of ecclesiastical provinces, each with an archbishop at its head and each consisting of a number of dioceses. The Roman Church, like the Protestant churches, retained the right to its own denominational schools and the right to levy a tax on its members, which, however, was collected for it by the state.

The old-established Jewish community in Germany was comparatively late in obtaining equality of rights with other citizens. Equality was granted to the Jews in Prussia in 1848, and during the next 20 years most of the other German Liinder followed suit. Like the Protestants, the Jews were organized on a Land basis, and below that on a congregational basis. It has been estimated that in 1933, when the Nazis assumed power, the membership of the Jewish congregations totalled about 500,000 persons. In the same year the religious composition of the country was as follows: Protestant, 62.7%; Roman Catholic, 32.5%; Jewish, 0.7%; other denominations and nonbelievers, 4.1%.

The Nazis made determined efforts to assimilate the Protestant churches in Germany to their organization. In July 1933 the constitution of the German Evangelical Church federation was revised, in conformity with the aims of the Nazi-inspired "German Christians," and as a result a National Synod of the Protestant Church was created and a Reich bishop appointed for the whole of the Protestant Church in Germany in accordance with the leadership principle. Ludwig Muller, the Reich bishop, was a wholehearted Nazi and in Dec. 1933 agreed without any hesitation to the incorporation of the German Protestant youth organization, numbering about 700,000 members, in the Hitler Youth. As a result of these measures opposition grew within the Protestant

*According to the 1950 census. †According to the 1946 census.

churches, and this crystallized, under the leadership of Martin Niemoller, into the Pastors' Emergency league. A protest meeting was held by the league at Barmen in May 1934, and there a declaration was issued which condemned the totalitarian claims of the Nazi state and maintained the church's right to independence in matters of faith. The Barmen declaration was, in effect, the beginning of the Bekenntnis Kirche, or Confessional Church, as the large group of dissident Protestant clergy led by Niemoller later came to be called.

In an attempt to resolve the difficulties which had arisen with the Protestant churches, the Nazis created in July 1935 a Reich ministry for ecclesiastical affairs, and Hanns Kerrl was appointed to the office. He instituted repressive measures against the Confessional Church, and Niemöller was imprisoned, other ministers were fiercely persecuted, and a strict supervision of church finances was introduced in an attempt to bring the clergy to heel. In 1936 the Confessional Church was declared illegal. However, despite all the oppressive measures and although it weakened itself by internal dissensions, the Confessional Church maintained its opposition to the Nazi regime, and the fine record of Niemoller and his followers greatly helped the restoration of friendly relations between German Protestantism and Protestantism in other parts of the world after the end of World War II.

Despite the incompatibility of the doctrines of National Socialism with those of the Roman Catholic Church, a concordat was signed in 1933 which confirmed most of the traditional rights of the Roman Church in Germany. Soon however the Nazi government began systematically to undermine the authority of the church and secured the suppression of various Roman Catholic lay associations and the virtual elimination of the Roman Catholic youth organization and church schools. In addition the Nazi regime disgraced itself by making extravagant attacks on the character of the Roman Catholic clergy. Leaders of the church defended their faith with great vigour, and throughout the Nazi period, even during the war, aspects of Nazi policy were fearlessly denounced from Roman Catholic pulpits and in pastoral letters.

Against the Jews the Nazis, in accordance with their bitterly anti-Semitic racial doctrines, adopted a policy of extreme persecution which ultimately became one of extermination. As a result, the 307,614 "believing Jews" registered in the census of 1939 had been reduced to a mere 30.000 by 1945.

From 1945 the relations between the state and the churches in the Federal Republic were governed by the relevant provisions of the Basic law or provisional constitution of the republic, which guaranteed to the churches their traditional rights. Though both Roman Catholic and Protestant churches followed a policy of political neutrality, from time to time church leaders in postwar Germany did not fear to voice their opinions on matters of public importance. Thus both Roman Catholic and Protestant leaders attacked the Allied dismantling policy after 1945; and Martin Niemoller in particular attracted much attention because of his opposition to proposals of German participation in a European defensive system, which would involve remilitarization of the country.

The organization of the Protestant Church in Germany was considerably modified after 1945. The former German Evangelical Church federation was dissolved in 1948, and in its place the Evangelische Kirche Deutschlands. or Evangelical Church of Germany, was set up. All the separate Lutheran and Calvinist churches of Germany, save the Church of Bremen, became members of the new body, which like its predecessor was by no means a central government of the German Protestant Church, but merely a loose federation, with members keeping their own identity and powers. Within the Evangelische Kirche Deutschlands a smaller association known as the Vereinigte Evangelisch-Lutherische Kirchen Deutschlands was also established in 1948—a union of all the separate Lutheran churches accounting for about 49% of the total membership of the bigger body.

According to a report made in March 1955 by the Church Office for Statistics in Hanover, over 41,000,000 Germans (roughly 60% of the total population) in the Federal Republic and in the Democratic Republic were Protestants. The largest group within the Protestant Church was the United Evangelical-Lutheran Church nith nearly 18,000,000 members, followed by the Evangelical Union Church with 14,700,000 members.

In the German Democratic Republic, out of a total population of 18,500,000, there were 15,000,000 Protestants; in the Federal Republic there were 26,000,000 Protestants and 22,000,000 Roman Catholics.

The signing of the Bonn conventions in May 1952 led to a campaign by the authorities to undermine the influence of the Protestant Church in the German Democratic Republic. Pressure was applied in particular to the Junge Gemeinde, the church fellowship in which the young people were organized. The campaign, however. was called off in June 1953, and a communiqué issued after a meeting of state and church representatives announced that the state would guarantee the independent existence of the church provided that the church would refrain from unconstitutional interference in economic and political life.

Despite this agreement, however, persecution continued, though less openly, and relations became strained again, in particular over the state policy of holding *Jugendweihe* or secular youth dedication ceremonies, a Marxist equivalent of the Christian confirmation service.

After 1945 the Roman Catholic Church returned to the organization and the state-church relationship embodied in the 1933 concordat, and the Holy See accordingly still recognized the prewar boundaries of the German Roman Catholic dioceses and provinces despite the territorial changes brought about by postwar cessions of German soil and the division of the country.

After World War II the few survivors of the Jewish community in Germany reorganized themselves anew on the traditional basis of the *Lend* and *Gemeinde* (state and local group). The different groups became represented as a whole by the Jiidische Kultus-Gemeinde (Community of Jewish Worship) and by the Zentralrat der Juden in Deutschland (Central Council of the Jews in Germany).

In Jan. 1955 there were about 22,000 Jews in the German Federal Republic and west Berlin, and about 4,600 in the German Democratic Republic.

Education. — The school system in Germany developed from three main types of school existing in the last quarter of the 19th century: the free elementary school for children between the ages of 6 and 14 (*Volksschule*); the intermediate school (*Mittelschule*), which for a small fee offered a six-year course following the first four years of the elementary school and concentrated largely on practical and commercial subjects, including one modern language; and the various types of secondary school, which prepared pupils for entry to the universities or technical colleges by means of the *Abitur* examination, taken at the age of 18 or 19. The oldest and best-known form of secondary school was the classical *Gymnasium*, which, modelled upon the ideas of Wilhelm von Humboldt in the early 19th century, gave a thorough grounding in Greek, Latin and the humanities; then the *Realgymnasium* was instituted in which classical and modern subjects were more evenly balanced: and finally the modern *Realschule*, teaching mathematics, science and modern languages, was established to meet the growing needs of trade and industry.

Certain liberal changes were introduced under the Weimar republic, although the main structure was not greatly altered. The first four years of the elementary school (known as the *Grzindschule)* were made compulsory for all, and for those children who did not enter an intermediate or secondary school two to three years' part-time vocational continuation school were prescribed. The Weimar constitution also intended to make free secondary schooling available to all children according to their ability, but this principle was never applied very widely in the various *Lander,* which were responsible for carrying out educational policy. Two additional types of secondary school were established during the Weimar period—the *Deutsche Oberschule,* which based its teaching more directly on German tradition, and the *Aujbauschule,* which in country districts offered a shorter course of six years to pupils leaving the elementary school at the age of 1z. There were, however. numerous local variations of these main types of schools, Denominational schools were the general rule throughout Germany, although mixed-denominational schools with some religious teaching gained ground under the republic, and there were also a few secular schools where no religious instruction was given.

The Nazi regime introduced certain further changes in the school system. The administration of education was centralized under the Reich and Prussian ministry of education in 1934, and attempts were made to bring about greater uniformity in secondary education. Only the *Deutsche Oberschule,* the *Aujbauschule* and the *Gymnasium* were retained, the first, because of its emphasis on Germanic tradition, reaching a dominant position, while the classical *Gymnasien* were considerably reduced in numbers. Another Nazi innovation was the plan to replace the six-year *Mittelschule* by a free four-year *Hauptschule* of a still more technical nature for selected pupils of physical and racial suitability. Teaching in all the schools became very largely coloured by Kazi theories, and there were in addition special schools for the training of the party Clite. notably the National Political Educational institutions and the Adolf Hitler schools. Although the denominational school was formally retained by the concordat of 1933, the Nazis systematically undermined its position and by 1940 it had finally disappeared from the scene.

Not counting the technical and other institutions of university standing, there were 23 universities in Germany in 1939, some of them mediaeval foundations, others having been founded in the 15th and 16th centuries. The modern period of university development may be said to have begun with the creation of the Prussian national University of Berlin in 1810, and it was inspired to a great extent by the humanistic thought of Humboldt, who insisted on a new independent position for the university, separated from the territorial power, as a "privileged corporation" with self-governing rights. To this important principle he added the two further principles of freedom of teaching and freedom of learning, the latter enabling students to attend whatever lectures they liked and to wander from one university to another, without any sort of tutorial system.

Despite various attempts during the Weimar period to broaden the social basis of the universities, they continued to remain the strongholds of the upper and the prosperous middle classes. In 1929 less than 5% of the students at universities and technical high schools were drawn from the lower class. Moreover, freedom of teaching all too frequently degenerated during the republic into freedom to disseminate nationalist propaganda against the state, and nationalist and antidemocratic ideas pervaded a number of the student associations. In the smaller provincial universities, in particular, Nazi-nationalist student organizations were already firmly established by 1931–32.

Immediately after coming to power Hitler appointed as minister of education (first in Prussia and from April 30, 1934, in the Reich) Bernard Rust, who was responsible solely to Hitler himself; new university rectors responsible only to the minister were appointed, and teaching staffs were severely purged not only of Jews but also of all who could be suspected of opposition to the new theory that the task of a German university was to create Aryan and Germanic man. Dismissals among professors and lecturers amounted to 1,687, while the number of students was reduced from about 150,000 in 1933 to about 60,000 in 1938. Curriculums were revised by the introduction of an ultranationalist approach in teaching history and of pseudoscientific geopolitics embodying the idea of German racial superiority and a German mission and duty to become a 200,000,000-strong leading nation of Europe.

After World War II.—The Potsdam agreement of Aug. 1945 provided for the control of German education by the occupying powers in order to eliminate Nazi and militarist doctrines and to make possible the successful development of democratic ideas. In spite of the immediate postwar chaos in education there was a strong desire, shared by Germans and occupying authorities alike, to introduce school reforms as early as possible, so that the German school might be transformed from a purely instructional institution into a more lively community where the child's independent and critical judgment was encouraged to develop. Varying degrees of school reform were therefore started in the four occupied zones even before general principles were formulated by the Control council in June 1947. This directive prescribed equal educational opportunities for all; the provision of free tuition and school equipment in all schools attended by children of compulsory school age which were supported by public funds, and financial assistance where required in other schools; compulsory full-time school attendance between the ages of 6 and 15, and part-time compulsory attendance until the age of 18 for pupils not taking higher education; the institution of a comprehensive school system in which elementary and secondary education formed two consecutive stages, and not two overlapping types or qualities of instruction; education for responsible citizenship and a democratic way of life; and teacher training in universities or training institutions of university rank.

Progress toward these ideals was far from uniform in the various zones of Germany. The comprehensive type of school was fully established only in the Soviet zope, where educational administration was centralized at a very early stage. This *Einheitssckule* provided for an eight-year elementary stage, followed by four years' secondary schooling either in an *Oberschule* or in a part-time or full-time vocational school. Private schools were abolished. No religious instruction was allowed in the schools, and the teaching was speedily converted to the inculcation of communism. Under pressure of the shortage of skilled labour, preference was later given to the 11-year elementary plus technical school, and this, shortened to a ten-year course by 1955, was threatening to replace many of the *Oberschulen.*

In the Federal Republic the school system reverted very much to the traditional Weimar structure, with considerable variations from *Land* to *Land.* Elementary education, for those 80% or so of children who did not go on to intermediate or secondary schools, consisted of from four to six years' *Grundschule,* followed by four or five years at elementary school, and part-time attendance at vocational schools for six to eight hours a week. In Feb. 1955 it was agreed to introduce greater uniformity in intermediate and secondary schooling. All intermediate-type schools were to be known as *Mittelschulen* and all secondary schools (leading to university matriculation) as *Gymnasien.* But there were longer and shorter courses at each type of school, and in the *Gymnasium* provision was made for classical, modern and mathematics or science classes. Secondary schooling was not everywhere free, but where fees were charged the number of scholarships had risen. In the southwest the denominational school was the general rule; in most other parts the mixed-denominational school with religious instruction nas fairly widely accepted.

The universities were faced with even greater problems at the end of the war; not only were the teaching staffs curtailed by denazification and many of the buildings destroyed, but the number of prospective entrants was abnormally high as a result of neglected studies during the war. Even after certain categories of Nazis and regular officers were excluded it was found necessary to impose a *numerus clausus* during the early postwar years. The great expansion in university attendance after the war may be illustrated by the fact that in 1935–36 there was 1 university student to 895 inhabitants, whereas in 1953 there was 1 to 423 inhabitants in the federal territory, and in west Berlin, where a second university, the Free University of Berlin, was founded in

1948, since the Humboldt university in the Soviet sector was being progressively converted to Communist principles.

A mixed commission of inquiry set up at the end of 1947 to consider the question of university reform in western Germany made various proposals. The most important of them concerned a greater degree of independence of the state, a closer relationship with the community as a whole, the employment of professors with special qualifications for teaching, and the introduction of a *studium generale* with the object of broadening the outlook and knowledge of the students. Apart from the founding of chairs of political or social science at a few of the universities, little had been done by 1954 to carry out the suggested reforms in western Germany. There was, hovever, greatly increased contact with the academic world abroad.

In eastern Germany great importance was attached to the broadening of the social basis of university attendance, and. in 1955, 53% of all students were said to come from workers' and farmers' families. Scholarship grants were available only for these and for students of lower middle-class origin. Political reliability, in the Communist sense, continued to determine academic advancement, and in every faculty students were required to pass a basic course in political science. Apart from the excessive and compulsory concentration on Communist political theory, the universities of the Democratic Republic were suffering from an overspecialization in technical subjects to meet the demands of the five-year plan.

TABLE VIII.—*Attendance at Universities and Technical Colleges*

Institution	Year of foundation	Total number of matriculated students (number of women in parentheses)			
		Winter 1911–12	Winter 1930–31	Winter 1936–37	Summer 1953
Universities					
Berlin	1810	9,829 (845)	14,687 (3,087)	6,717 (999)	8,473 (2,786)

CONSTITUTION AND GOVERNMENT

In 1933 the *Reichstag* ceased to have any real function in the state. An enabling act passed by a Sazi-Nationalist majority on March 23, 1933, set aside many of the clauses of the Weimar constitution, including the guarantees of personal liberty, and virtually gave Hitler dictatorial power. He and his cabinet were able to issue decrees having the force of law and, with all other parties except the National Socialist party dissolved, he speedily organized a totalitarian form of state in which the individual *Lander* were gradually shorn of their powers until they existed as little more than administrative divisions, while the state itself was dominated by the National Socialist party. This party established an intricate network of directing bureaus and mass organizations duplicating those of the state in order to secure its hold over every aspect of the life of the country, and its power was reinforced by the ubiquitous secret police or Geheime Staatspolizei (Gestapo).

At the end of World War II Germany was left without a government, and supreme authority was assumed by the U.S., British. French and Soviet commanders in chief, acting both individually in their own zones of occupation and also jointly, in matters affecting the whole of Germany, as the Allied Control council. Agreement on the political and economic principles that should govern Allied policy was reached at Potsdam on Aug. 2, 1945. The unwieldy state of Prussia was split up into a number of more moderate-sized *Länder* and certain other *Land* boundaries were redrawn to eliminate the very small units and to facilitate communications in the four areas of occupation. Gradually a fair measure of self-government was restored to the Germans, first at the level of the commune, and then at *Lund* level, until by the spring of 1947 elected diets and governments were functioning throughout the country. certain central powers being reserved to the occupying powers in each zone. In the meantime fundamental disagreement had developed between the occupying powers as a result of the Soviet refusal to co-operate in treating Germany as an economic whole in the manner prescribed by the Potsdam agreement. As a step toward this end, the U.S. and British zones tvere fused for purposes of economic organization at the beginning of 1947, and the French zone was associated with them in Oct. 1948.

German Federal Republic.—Efforts to establish a central German government by quadripartite agreement at successive conferences of the four foreign ministers having failed, the three western powers eventually decided that governmental development in western Germany could be held up no longer. At a series of talks in London in the spring of 1948, at which representatives from the Benelux countries were also present, principles were enumerated for the formation of a central government in western Germany, for the international control of the Ruhr and for the establishment of a military security board. The ministers-president of the 11 western German *Lander* were authorized to convene a constituent assembly for the drafting of a democratic and federal type of constitution which should combine adequate central authority with a proper degree of self-government for the participating *Lander.* The constitution was to be so formulated that it could be adapted when German unity was once more established. This constitution (known as the Basic law) was adopted by the parliamentary council at Bonn on May 8, 1949.

At first sight the Basic law closely resembled the Weimar constitution in being a federal, republican type of constitution weighted in favour of the central authority. But it granted the *Länder* much more legislative and administrative independence. Education and cultural and religious affairs were now the sole prerogative of the *Länder,* which also had wide legislative powers in the field of public health, press and films. Financial questions, moreover: were no longer the monopoly of the central government; powers of taxation were divided between the *Lander* and the centre, and it was a recognized principle that the two authorities should be self-supporting and independent of each other in their budget economy. Like the Weimar constitution the Basic law provided for a two-chamber legislature, consisting of a *Bundestag,* representing the nation as a whole, and a *Bundesrat,* formed from members of the *Land* governments. The *Bundesrat* was to act mainly in an advisory capacity, although it had powers of suspensory veto and of absolute veto over taxation legislation affecting *Land* interests. The position of the president was far less powerful than under the Weimar constitution. In particular, he had none of the former emergency powers, which now passed in severely curtailed form to the government. The government, however, was correspondingly strengthened, both by the provisions aiming at governmental stability and by the adoption of a system of collective responsibility.

The Basic law was approved by the U.S., British and French military governors with certain important reservations. The exercise of sovereign powers in the new Federal Republic was restricted by the Occupation statute, which was promulgated on the same date as the Basic law (May 12, 1949). By this document the three Allied powers reserved to themselves powers in the field of disarmament and demilitarization; controls in regard to the Ruhr, reparations, decartelization, trade discrimination, foreign interests and claims; foreign affairs; displaced persons; security of Allied forces and their immunities; occupation costs; respect for the Basic law and the *Land* constitutions; control over foreign trade and exchange; the minimum of control required to reduce the need for external economic assistance; and control over the treatment in German prisons of persons falling within the competence of the courts or tribunals of the occupying powers. An important reservation concerned the position of Berlin; it was decided that in view of the practical difficulties involved by the quadripartite occupation of the city, Berlin could not be included in the new Federal Republic, although it should be allowed to send observers to the federal parliament.

The federal government took office on Sept. 20, 1949, in the form of a coalition between the Christian Democratic union, the Free Democratic party and the German party, under the chancellorship of Konrad Adenauer. On the same date military government ceased to exist and Allied control was exercised instead through a civilian Allied High commission. During the following two years the controls enumerated in the occupation statute were gradually reduced, and on May 26, 1952, contractual agreements establishing a new relationship between the three western powers and the German Federal Republic were signed in Bonn. These extended to the Federal Republic full authority over its internal and external affairs except for special rights retained by the Allied powers over the stationing of armed forces in Germany, Berlin, and such matters as unification of Germany and a peace settlement. Because of delays in ratification and the breakdown of the plans for the European Defense Community, these agreements, in a somewhat amended form, came into force only on May 5, 1955, on which date the occupation regime came to an end and the Allied High commission was replaced by the embassies of the three western powers. *(See* above, *History.)*

German Democratic Republic.—On Oct. 7, 1949, a few days after the establishment of the federal government in Bonn, a government for the Soviet zone, thereafter to be known as the German Democratic Republic, was set up in Berlin. For some time past, administration in the Soviet zone had become highly centralized, all matters of importance having been controlled, under Soviet supervision, by a central economic commission and a number of main administrations. At the same time a shadow parliament known as the people's council had been elected on the single list system in May 1949, one of its main tasks being to draft a constitution for the Soviet zone. These two bodies were swiftly transformed into a government and a lower house. The diets of the five Soviet zone *Lander* elected their representatives to the upper house on the basis of 1 to every 500,000 inhabitants, and at a joint session of the two chambers on Oct. 11, 1949, the 73-year-old Communist leader Wilhelm Pieck was elected president of the new republic.

The provisional constitution of the German Democratic Republic also bore a superficial resemblance to the Weimar constitution, but whereas the Bonn constitution amended this in the direction of greater *Land* autonomy, the constitution for eastern Germany strengthened the powers of the centre. It granted the central authority virtually exclusive powers of legislation and a dominating position over finance and taxation. Moreover, although there was ostensibly a two-chamber legislature, the *Länderkammer* was elected entirely on a population basis and was little more than a reflection of the lower house. The *Volkskammer,* the lower house, was according to the constitution to be elected by proportional representation. In practice, however, the single-list system was used for the 1950 elections, the seats being allotted to the various parties in advance under an arrangement made by the Communists which ensured their predominance. The president was elected by the joint assembly of the two houses and had no powers other than purely representational. The minister-president was appointed by the strongest party in parliament, and his government reflected the strengths of the various parties represented in the *Volkskammer.*

East Berlin was rather more closely associated with the Democratic Republio than was west Berlin with the Federal Republic and, as befitted its geographical position in the centre of the Soviet zone, acted as capital for the area.

Revolutionary administrative reforms in the German Democratic Republic were initiated by the Communist Socialist Unity party on July 11, 1952, as part of a plan for intensifying the socialist structure of the country. These were embodied in a law of July 23 which abolished the *Land* governments and parliaments and substituted 14 regional councils and assemblies. The regions *(Bczirke)* into which the original five *Lander* were divided did not in all cases coincide with the *Land* boundaries. The reform aimed at reorganizing the country into units that would facilitate economic planning, and at tightening central control over all local and regional government.

Shortly after the establishment of the German Democratic Republic in 1949 the Soviet Military administration transformed itself into a Soviet Control commission with supervisory powers over the government. In May 1953 this was superseded by a civilian Soviet High commission, military control being vested solely in the Soviet commander in chief. In March 1954 the Soviet High commission relinquished its supervisory powers over the German Democratic Republic, except as regards security, and the nominal sovereignty of the country was more formally endorsed in a treaty between the Democratic Republic and the U.S.S.R. concluded in Sept. 19S j, when the Soviet High commission was finally dissolved. The U.S.S.R. retained its rights and obligations under four-power agreements relating to all-German affairs, and provision was made for Soviet troops to remain for the time being.

Legal System.—Judges and public prosecutors in Germany have always been civil servants. They are appointed for life, subject to the age limit, after university studies; a first examination; three years of basic practice in the courts, in public prosecutors' offices and in private legal practice; and a final examination. The English distinction between barristers and solicitors does not exist in Germany.

At the base of the structure of courts as established in 1879 is the local court *(Amtsgericht)* with jurisdiction over civil and criminal matters of a not very serious nature and such other matters as land registry, bankruptcy, etc. The local courts act as courts of first instance. Above the local court is the district court *(Landgericht),* a court of appeal from the local court and a court of first instance for more serious civil and criminal matters and divorce cases. Above the district courts are the courts of appeal *(Oberlandesgerichte),* of which there is normally one in each *Land;* there was previously also one in each Prussian province. The supreme court of the Reich *(Reichsgericht)* was established in 1879 at the apex of the system. It acted as the final court of appeal in matters of civil and criminal law, as the first and only instance in cases of treason, and also served the purpose of guaranteeing the uniform application of the law.

The courts of appeal and the supreme court were entirely composed of professional judges; certain cases before local courts were heard and tried by a single professional judge assisted by lay assessors and some cases before district courts by a jury under the chairmanship of a professional judge.

Under the Nazi regime, the *Lander* were deprived of their prerogatives in the administration of justice, which was made the exclusive concern of the Reich. The court system was changed in as far as a special supreme court, the people's court *(Volksgerichtshof),* mas established competent for political cases which were withdrawn from the old supreme court of the Reich. At local and district level special courts for those and similar cases were established.

After the collapse of the Nazi regime the occupation powers had supreme authority over the law and its application. It fell to them to cleanse the whole legal system—law, procedure and organization—of Nazi features. Special courts were abolished, from the local level to the people's court; some laws were annulled altogether and some in part. The division between western and eastern Germany resulted in the separate development of both after 1946.

In western Germany after 1946 authority over the legal system was gradually handed back to the administration of the *Lander*, and German jurisdiction over this field was finally restored in 1949. The Basic law of the Federal Republic re-established conditions very largely as they were in the Reich before 1933. The only substantial change mas the abolition of capital punishment. Competence over legal matters rests with the legislative authorities of the Federal Republic; the organization, the appointment of judges and the budgetary provisions of the administration of justice are the concern of the *Länder*. The structure of the system of courts was maintained. The supreme court of the Reich was replaced by the supreme federal court *(Bundesgerichtshof)*, which is supplemented by higher federal courts for taxation. administration and labour. The functions of the federal constitutional court (*Bundesverfassungsgericht*) extend beyond those of the constitutional court of the Weimar republic. The constitutional court decides on litigations between the federation and the *Lander*, on the interpretation of the Basic law and its compatibility with federal and *Land* law. It is called upon to decide whether a political party pursues any aims and methods conflicting with the spirit and letter of the Basic law. The federal president and federal judges can be impeached before the constitutional court. Judges of the constitutional court are elected half by the *Bzmdestag*, the federal parliament. and half by the *Bundesrat*, the legislative body representing the governments of the *Lander*.

In eastern Germany the legal system underwent considerable changes after the enforced introduction of the political and social system of the "people's democracies." Large parts of the civil and commercial code became obsolete by the abolition or restriction of private property in agriculture, industry and trade. The criminal code was extended by that type of offense falling under the heading of economic crimes and sabotage. A new criminal code began to be formulated, and the *Volkskamnzer*, the lower house of the legislature, in Oct. 1952 passed a new criminal procedure la\%-—replacingthe one of 1877—which was to create the procedure for the new code. In this new law, great importance was attached to making criminal procedure lead to respect for the socialist law, for socialist property, for labour discipline and for the protection of democracy.

The structure of courts was maintained until Aug. 1952, when the system mas reorganized to fit in with the new administrative pattern. The new Law on the Constitution of Courts provided for three kinds of courts only: district courts (*Kreisgerichte*, replacing the *Amtsgerichte*), area courts *(Bezirksgerichte*, replacing the *Landgerichte)* and the supreme court; the *Oberlandesgerichte* were eliminated. The underlying principle of the new legal system was the formation of a new class of "people's judges" who would ensure that the courts acted as guardians of the new social and economic order of the state. All criminal and civil matters dealt with by the new district and area courts in the first instance were to come before a senate consisting of one professional judge and two lay assessors (*Schöffen*), who would exercise full judicial functions. The supreme court (established in 1949) hears appeals only on behalf of the state. The *Volkskammer* is nominally the supreme authority in the administration of justice in eastern Germany and holds the functions of a constitutional court.

(See also GERMANIC LAWS, EARLY; GERMAN LAW.)

DEFENSE

Although strictly speaking the German army was founded in 1871, its origins and tradition may be traced back to a much earlier period. Before unification of the German empire several of the German states possessed independent armies, the best and the largest of which was the Prussian. As Prussia acquired hegemony in the Second Reich. Prussian methods and spirit dominated the creation of a new German army.

The Prussian Army.—The Prussian army was a standing mercenary body instituted toward the close of the Thirty Years' War by Frederick William, the Great Elector of Brandenburg. Having an efficient military force of 40.000 at his disposal, this clever and unscrupulous ruler was able to win a position for himself among the powers and to enlarge his dominions considerably. His grandson, Frederick William I, king in Prussia, known as the "sergeant-king," increased the standing army from 40,000 to 89,000 and was the first reigning prince to exchange court dress for military uniform. His army, essentially an infantry force, was drilled to perfection by Leopold I of Xnhalt-Dessau (*q.v.*), a stern disciplinarian. With this same army Frederick the Great was later to conquer Silesia. to resist Austria. Russia and France successfully in the Seven Years' War and to engineer the first partition of Poland. In 1788 it was aptly declared by Mirabeau that "Prussia was not a state possessing an army: rather was it an army which had taken over a nation." However, the inherent vice of a professional army was that, if thoroughly defeated, its only course left was to surrender, which was precisely the fate of the Prussian army at Jena in 1806 when it proved no match for the French with their new spirit, new organization and new battle tactics evolved by Napolean.

By the treaty of Tilsit the Prussian army was limited to 43,000, but Gerhard von Scharnhorst (*q.v.*), who in 1807 was appointed head of a military reorganization commission (Militär Reorganisationscommission), overcame the difficulty by introducing secret universal service on the so-called Krumper system, by which men were passed through the regimental establishments as hastily as possible and dismissed to the reserve. thus giving place to new recruits. The Prussian army of 135,000 commanded by Gebhard von Bldcher and his chief of staff August von Gneisenau which took part in the liberation campaign of 1813–14 was no longer mercenary but a national army. The "nation in arms" idea was born, and universal compulsory service was officially introduced on Sept. 3, 1814, by Hermann von Boyen, minister of war. The periods of service were 3 years in the army, 2 in the reserve and 14 in the *Landwelzr;* the annual contingent was fixed at 40,000.

This system, which survived almost half a century, was radically revised in 1860 when the annual contingent was fixed at 63,000, the period of reserve increased from two to four years and the *Landwelzr* divided into two levies, requiring five years in the first and seven in the second. This reform. planned by Albrecht von Roon, minister of war, and forced by Otto von Bismarck through a reluctant parliament, in fact suppressed the old *Landwehr*, which was considered politically too Liberal and militarily inefficient; it was now only a cadre for reservists from 27 years to 39 years of age. The reform increased the standing army's peacetime strength from 140,000 to 213,000 and transformed the force into an exclusive instrument of royal power. Under the masterly command of Helmuth von Moltke, the army defeated the Austrians in 1866 and the French in 1870; these victories and the position thereby won by Prussia finally reconciled the nation to the 1860 reform.

The Imperial Army and Navy.—After 1871 all the armies of the German states were united, though some retained their peculiarities of uniform and the three Bavarian army corps remained separately numbered. A *Landsturm*, or supplementary reserve, was introduced in 1888 for men of from 40 to 45 years. A great increase in population led to the virtual abandonment of the principle of universal service. More men came before the recruiting officer than it was possible to train, and in 1895 the period of service with the colours was reduced for infantry from three to two years. In 1907, for instance, there were 556,770 men of 20 years, but only 212.660 were assigned the active service, and the peacetime footing of the army was then about 615,000. In 1914 the army was organized in 25 army corps and 50 divisions. Each division consisted of four regiments or 12 infantry battalions, two regiments of field artillery comprising nine batteries of field guns and three of field howitzers (72 pieces in all), etc.

The German navy was begun later. It was only in 1896 that the first program of 17 battleships and eight heavy cruisers was approved by the *Reichstag*. William II and Adm. Alfred von Tirpitz, the navy minister, were the moving spirits behind this expansion, and their aim was to establish parity with the British navy. In Aug. 1914 Germany entered World War I with 35 battleships, 13 battle cruisers, 43 cruisers, eight old cruisers and 13 gunboats; together with destroyers, torpedo boats and submarines the German navy totalled 1,019,000 tons; its peacetime complement was 6,500 officers and 71,000 men.

In Aug. 1914 Germany was able to mobilize 123 divisions, and at the beginning of 1918 their number reached a peak of 246; but while the 1914 model comprised 12 battalions and total effectives of 16,650 men, by 1918 a German division comprised 9 battalions with an average of 9,550 men. The German army fought well in World War I. Among many good generals Erich Ludendorff, perhaps the only leader of genius in this war, was the sole commander who mas able to break through the tangle of the western front. Because of lack of transport and reserves, he lost the initiative and was forced to retreat. but the Allies never succeeded in breaking through the German front, never inflicted on the Germans a defeat in the Cannae style. In 1914, out of 9,750,000 men liable to be called up, 4,900,000 were trained reservists; during World War I, 13,250,000 served with the colours, of whom 1,834;524 were killed. At the time of the Armistice there were 183 German divisions comprising 3,403,000 men.

The **Reichswehr.**—By the treaty of Versailles (1919) Germany was required to reduce its army to seven infantry and three cavalry divisions; the total number of effectives was not to exceed 100,000, including a maximum of 4,000 officers. Universal compulsory military service was forbidden, and only voluntary enlistment was allowed. The treaty also restricted the navy, forbidding Germany to have any submarines and confining its naval strength to six heavy cruisers of not more than 10,000 tons, six light cruisers of not more than 6,000 tons, 12 destroyers and 12 torpedo boats. The personnel of the navy was restricted to 1.500 officers and 13,500 men. Finally, all fortified works, fortresses and field works between a line drawn 50 km. E. from the Rhine and the western frontier were to be demolished, and the whole zone was to be demilitarized. Germany was also forbidden to maintain any air forces.

When a German basic law on the new Reichswehr was promulgated on March 23, 1921, Germany appeared to be formally executing the Versailles disarmament clauses. Actually, however, the stipulations were never honoured. Well protected against the curiosity of the Allied Control commission and also that of a handful of German antimilitarists by Otto Gessler, minister of the *Reichswehr* from March 1920 to Jan. 1929, in nine successive cabinets, Gen. Hans von Seeckt, commander of the *Reichswehr,* successfully played the part of a modern Scharnhorst, his aim being, as he wrote in 1933, to build "not a mercenary army, but an army of leaders" which could be "the iron frame of the Reich." From the outset there was a secret general staff within the *Heeresleitung* officially named *Truppenamt,* and from the outset Seeckt was planning for an army of 35 divisions. Prototypes of new and forbidden weapons were built and tested in the Soviet Union, an outcome of the Rapallo agreement of 1922. The air force and experiments for chemical warfare were organized in the neighbourhood of Moscow, and the armoured centre was at Kama in the Urals. On Seeckt's resignation in Oct. 1926 work was continued by his successors, Gen. Wilhelm Heye (until Oct. 1930) and Gen. Kurt von Hammerstein-Equord (until Feb. 1934).

The **Wehrmacht.**—When Hitler came to power, everything was ready for a rapid expansion of the German army. The Reichswehr comprised only 21 infantry regiments, but by Jan. 1933 it had 46 generals, 120 colonels, 700 lieutenant colonels and majors, 2,000 captains, 5,000 first and second lieutenants and 21,000 noncommissioned officers. It was no wonder that every regiment easily became a division. Only the mass production of weapons and the reintroduction of conscription were lacking. The secret order to start the former was signed by Hitler on May 16, 1933, and the following day he made the first of his "peace" speeches. Conscription was reintroduced, first, on March 16, 1935, for one year, then, from Aug. 24, 1936, for two years.

According to the basic law of March 16, 1935, the Wehrmacht comprised the army (Heer), the air force (Luftwaffe) and the navy (Kriegsmarine). The army was composed of 12 army corps and 36 divisions, but in March 1939 a spokesman of the war ministry announced that the army comprised 18 army corps, 51 divisions (including 39 infantry, 4 light or motorized, 5 armoured and 3 mountain) and a cavalry brigade. The new infantry division comprised three infantry regiments and one artillery regiment. The infantry regiment comprised three battalions of. three companies and one company of 12 heavy machine guns and six heavy 80-mm. grenade throwers; each regiment had a 13th company of infantry guns (six 7j-mm., two 105-mm. and four light antiaircraft guns of 20 mm.), a 14th company of 12 antitank 37-mm. guns, one platoon of engineers and one signal platoon. The divisional artillery regiment had four battalions of three batteries of four pieces; *i.e.,* 36 gun howitzers of 105 mm., four guns of 105 mm. and eight howitzers of 150 mm. In addition the division comprised: a reconnaissance battalion composed of one mounted squadron, one cyclists' squadron and one heavy squadron (three armoured cars, two 75-mm. guns, two light machine guns, four heavy machine guns, three antitank guns and three heavy grenade throwers); an artillery observation battalion; a signal battalion; an engineer battalion; an antitank battalion of 36 guns, etc. The nominal strength of a division was 15,150 men.

Some idea of the expansion of the German army during World War II is given by the following figures: in Sept. 1939 Germany mobilized 77 divisions, 54 of which took part in the campaign against Poland; in May 1940 there were 148 mobilized divisions, of which 117 were launched against France, Belgium and the Netherlands; in June 1941 there were 4,980,000 men in the army alone (including 80,000 in the *Waffen-SS.*) organized in 186 divisions, of which 139, including 32 armoured and motorized, were concentrated against the Soviet Union.

The treaty of Versailles had forbidden Germany to maintain the air force, but had allowed it to have civil aviation. This proved useful for the training of pilots and mechanics and the maintenance of an aircraft industry. The first civil aviation company was formed in Jan. 1919, but the real preparatory work for a future air force began with the creation of the Deutsche *Lufthansa* on Jan. 6, 1926, which absorbed all existing companies. On April 28, 1933, Hitler created an air transport ministry with Hermann Goring as minister; on March 1, 1935, when the formation of an air force was officially admitted, this became an air ministry; Göring was appointed its chief with the rank of colonel general, later of field marshal and lastly of *Reichsmarschall.* In Jan. 1938 Germany was divided into seven air areas comprising 13 groups or Geschwader (9 bomber, 4 fighter), 68 wings or *Gruppen* and 203 squadrons or Staffeln, 2,424 first-line aircraft in all. As a rule, a group comprised three wings and a wing three squadrons of 12 aircraft each.

The air force expanded rapidly and on Sept. 1, 1939, comprised about 4,300 first-line aircraft including 1,180 fighters, 1,180 bombers, 336 dive bombers, 721 reconnaissance and 552 transport aircraft; the naval air force comprised 240 machines. The number of modern aircraft ready for war operations was, however, no more than 3,200; by Dec. 1940 this number was reduced to 1,956; in Dec. 1942 it was 2,074 and in Dec. 1944 it amounted to 3,888, of which 53% were fighters. This failure to enlarge the air force was in striking contrast with the development of anti-aircraft artillery: in Sept. 1939 there were about 2,600 heavy (88-mm. and 105-mm.) and 6,700 light (37-mm. and 20-mm.) anti-aircraft guns; in May 1944 the respective numbers were 14,489 and 41,937. In June 1941 1,480,000 men were enrolled in the air force.

Already by the end of 1934 Hitler had given orders for the secret construction of submarines, and six months later, by the Anglo-German naval agreement of June 18, 1935, Great Britain winked at the scrapping of the Versailles naval limitations. The agreement provided that Germany was not to build beyond 35% of the British tonnage in each category of ships, except that in the case of submarines it might build up to 45%—in which event proportionate tonnage reductions were to be made in other classes of vessels. Such an agreement suited Hitler at the time, but when, after the German annexation of Bohemia and Moravia, Great Britain concluded with Poland a mutual assistance agreement, he denounced the naval treaty on April 28, 1939. The treaty had, in any case, already been violated, and Germany entered World War II with a new navy of two battleships, three battle cruisers of the so-called 10,000-ton "Deutschland" type, two heavy cruisers, six light cruisers, 22 destroyers, 12 torpedo boats, 20 motor torpedo boats and 71 submarines. By June 1941 there were 298,000 men serving in the navy.

On March 7, 1936, Hitler ordered German forces to occupy the neutralized zone of the Rhineland, thus committing "a hostile act . . . calculated to disturb the peace of the world" (art. 44 of the treaty of Versailles) and "an unprovoked act of aggression" (art. 2 of the Locarno treaty of mutual guarantee). In order to intimidate France still further, so that operations could be safely undertaken in eastern Europe, Hitler secretly ordered, on May 28, 1938, the construction of a line of fortifications from the Belgian to the Swiss frontier.

There can be no doubt that this *Westwall* played a considerable part in stiffening the morale of the German people in the weeks preceding the outbreak of World War II.

Germany's expenditure on armaments from 1933 to 1939 was declared by Hitler, in his *Reichstag* speech of Sept. 1, 1939, to have amounted to more than 90,000,000,000 RM.

The Disarmament of 1945.—At the end of World War II, inter-Allied policy with regard to Germany was set down in the Potsdam agreement of Aug. 2, 1945. This stated that the purposes by uhich the Allied Control council should be guided in the occupation of Germany were the complete disarmament and demilitarization of Germany and the elimination or control of all German industry that could be used for military production. All German land, naval and air forces with their organizations, staffs and institutions were to be "completely and finally abolished." Till March 1948 this course was carried out by the quadripartite Allied Control council in Berlin; but the Soviet government then withdrew from the council as a result of disagreements on policy and, in the summer of 1948, began to build up a militarized police force in eastern Germany in violation of the Potsdam agreement.

German Democratic Republic: **"Volkspolizei."**—Communist German armed forces were organized by the department for internal affairs of the Soviet Military administration. The first *Bereifschaften* (alert units) were formed in Sept. 1948. At the end of 1950 the force officially known as the *Kasernierte Volkspolizei* (K.V.P.), or barracks people's police, comprised at least 39 *Bereitschaften,* or battalions, organized as military formations of a particular arm or service. In 1951, in the course of reorganization, 24 *Dienststellen* (regimental combat teams) were formed. On May 1, 1952, Wilhelm Pieck, president of the German Demociatic Republic, threatened the creation of a defense force if the Bonn and Paris agreements (*see* below) were signed; on June 18 the *Volkskammer* approved a resolution for the establishment of a "national army."

On Feb. 17, 1954, at the four-power conference in Berlin. John Foster Dulles, U.S. secretary of state, said that the military personnel of the Democratic Republic amounted to 140,200 men, including 100,000 in the army and the rest in the security troops, the air force and the navy. The army was composed of seven divisions (three mechanized). On May 14, 1955, a treaty of mutual defense was concluded by the U.S.S.R. and the seven European people's republics, including the German Democratic Republic. A unified command for the Communist armed forces was created.

On Sept. 26, 1955, the *Volkskammer* approved the addition of two amendments to the constitution declaring conscription a national duty and authorizing the necessary legislation. On Jan. 18, 1956, it adopted laws for the establishment of a national army and a defense ministry and for the introduction of new uniforms. Tno days later Willi Stoph, a 41-year-old member of the Politburo, was appointed minister of defense.

German Federal Republic in NATO.—Soviet policy in Germany, aiming at the formation of a Communist satellite state, and Communist aggression in Korea in June 1950 caused the western Allies to review the question of German disarmament and demilitarization. On Sept. 18, 1950, the U.S., British and French foreign ministers resolved to end the state of war with Germany and agreed that German participation in an integrated force for European defense was desirable. On Oct. 25 the French national assembly adopted a plan proposed by René Pleven, the premier, providing for a European Defense Community (E.D.C.), in which Germany would play an active part. On Dec. 19 the council of the North Atlantic Treaty organization (NATO) decided to ask the governments of France, Great Britain and the United States to discuss with the government of the German Federal Republic the possibility of a German contribution. The precondition of any useful German association with the defense of Europe was the willingness of the majority of the German people to bear arms again, and it was clear the German people felt no such willingness. However, the pace of international events caused German public opinion, that is, in the Federal Republic, to realize that to help in the defense of the nest was in Germany's own interest. On Feb. 8, 1952, by 209 votes to 1j6. the *Bundestag* rejected the policy of "neutrality" and declared its support for Adenauer's policy of assuming a fair share of the burden of defense. provided that it was on a basis of complete equality.

On May 26, 1952, the convention on relations between the three western powers and the Federal Republic was signed at Bonn; the next day a treaty instituting the E.D.C. was signed in Paris. The Bonn contract declared that the mission of the armed forces stationed by the three powers in the federal territory would be the defense of the free world. of which the G.F.R. and western Berlin formed part. The Paris treaty, concluded between France, the G.F.R., Italy, Belgium, the Netherlands and Luxembourg, defined the E.D.C. as an organization of supranational character, with common institutions and common forces composed of 43 divisions; viz., 14 French, 12 German, 12 Italian and j formed by Belgium, the Netherlands and Luxembourg. The E.D.C. was to be defensive, within the NATO framework. The foreign ministers of the six E.D.C. countries and the permanent representatives on the Atlantic council of the other countries of NATO signed two additional protocols concerning the assistance to be given by the signatories of the E.D.C. treaty to NATO countries and vice versa in the event of aggression. Therefore, while the Bonn contract restored German sovereignty, the Paris treaty kept the Federal Republic out of NATO.

Although by mid-1954 ratification of the E.D.C. treaty was completed in the Federal Republic, as well as in Belgium, the Netherlands and Luxembourg, the French national assembly, on Aug. 30, rejected it, and the whole project fell to the ground. The British government immediately proposed that the German Federal Republic enter NATO as an equal partner; that France accept German rearmament only in a framework where the size of the German contingent was fixed by international agreement and German troop movemepts controlled by the supreme Allied commander in Europe; and that the United Kingdom be committed to keeping its forces permanently on the continent.

A nine-power conference (the United Kingdom, the United States, Canada and the six E.D.C. powers) in London in September planned a new series of agreements which were signed at Paris in October. A protocol specified that German federal armed forces should not exceed the numbers fixed in the E.D.C. treaty of May 27,1952. The Paris agreements were approved by the French national assembly on Dec. 23,1954, and on May 5, 195j, the G.F.R. attained its sovereignty. Four days later the G.F.R. was formally inducted as the 1jth member of NATO.

On July 22, 1955, the first western German armament bill, the Volunteer act, was passed by the *Bundesrat;* the *Bundestag* had adopted it five days before. The act empowered the government to put a maximum of 6,000 officers and noncommissioned officers into uniform to prepare for the establishment of armed forces of 500,-000 men authorized by the Paris agreements. Theodor Blank was appointed head of the ministry of defense and Lieut. Gen. Adolf Heusiger became general inspector of the army.

SOCIAL CONDITIONS

Employment and Unemployment.—As a result of World War II losses, the economically active proportion of the German population had by 1946 decreased as compared with the prewar situation. In 1939, 51.2% of the population living in the postwar German area was either gainfully employed or registered unemployed, 9.3% was independent of trade or profession and 39.5% was living as dependents. In 1946 the proportions had altered to 45%, 13.2% and 41.8%, respectively.

A further analysis of the employed and unemployed persons for the two periods shows that, in 1939, 23.8% were engaged in agriculture and forestry, 43.9% in industry and crafts, 18% in trade and transport, 10.4% in public and private services and 3.9% in domestic service. The proportions in 1946 were: 27.7% in agriculture and forestry, 40% in industry and crafts, 15.7% in trade and transport, 13.0% in public and private services and 3.6% in domestic service. The position in 1946 was still abnormal in many respects; in particular, a large part of industrial life was still at a standstill, accommodation in the industrial areas was severely limited, and more than 7,000,000 refugees from the east were living in predominantly agricultural areas. By 1950 the occupational distribution of the German population was gradually reverting to its prewar structure, the drift away from agriculture into trade and industry being particularly noticeable. The number of gainfully employed persons in the Federal Republic on June 30, 1954, already exceeded the total in the same area for June 25, 1938, when the German economy was using its full resources, by 4,256,400. The greatest increases in employment were recorded in industry and handicrafts and trade and transport (see Table IX).

TABLE IX.—*Distribution of Gainfully Employed Persons in the Area of the Federal Republic, 1938–54*
(In thousands)

Type of employment	June 25, 1938		June 30, 1951		June 30, 1954	
	Total	Women	Total	Women	Total	Women
Agriculture and forestry	887.7	299.3	1,079.7	381.7	973.2	342.4
Industry and handicrafts	6,706.8	1,250.8	8,248.1	1,832.1	9,412.4	2,139.5
Trade and transport	2,242.6	690.9	2,714.1	894.7	3,255.9	1,236.9
Public services	1,598.7	406.1	2,073.7	787.0	2,168.9	846.7
Domestic service	8.0	802.0	605.0	603.7	689.7	688.3
Total	12,243.7	3,449.1	14,720.6	4,499.2	16,500.1	5,253.7

Although unemployment after the war never reached the dimensions witnessed in Germany during the world economic crisis (in Feb. 1932 more than 6,000,000 persons were unemployed), the problem in western Germany was serious enough in the first year or two after currency reform in June 1948. Up to that time, when money had little value, open unemployment was not great. Many unemployed did not bother to register, preferring to eke out a precarious existence on the black market, or performing casual labour for whatever food they could get.

The introduction of a currency reform in western Germany in June 1948 brought about a return to more efficient standards in business and industrial life; economies were introduced into the running of both public administration and private works and firms, and there was a gradual change-over to productive goods. The real extent of unemployment then became apparent, and by 1950 it had reached a monthly average of 10% (excluding west Berlin, which had an even higher rate because of its special problem of Russian interference with western trading outlets). This high level of unemployment was largely inherent in the postwar position of western Germany itself: the disruption of its economic structure; the extensive destruction of plants; the Allied prohibitions on industry and shipping; and the increase in population from about 35,000,000 in 1936 to about 47,700,000 at the end of 1949. There was, moreover, the special problem of the crowding together of the vast majority of the refugees in the three rural border regions of Schleswig-Holstein, Lower Saxony and Bavaria. These three Lander accounted for about 90% of the increase in unemployment in the U.S. and British zones in the first six months after the currency reform. The refugees were by no means merely an economic burden—in age and sex they were generally more employable than the average throughout western Germany; the problem was to organize their transfer to the industrial areas that required them.

TABLE X.—*Employment and Unemployment in the German Federal Republic, Period Ending June 30, 1949–55*
(In thousands)

	Gainfully employed		Unemployed		Percentage of the total labour force
	Total	Male	Total	Male	
1949	13,488.7	9,525.0	1,283.3	931.5	8.7
1950	13,845.6	9,693.7	1,538.1	1,081.9	10.0
1951	14,720.6	10,221.4	1,325.7	874.9	8.3
1952	15,170.7	10,493.6	1,240.0	783.9	7.6
1953	15,806.3	10,864.5	1,073.3	676.9	6.4
1954	16,500.1	11,246.4	1,007.7	611.8	5.8
1955	17,175	...	650.0	...	3.6

During 1950 the federal government embarked on a work-creation scheme involving the expenditure of 3,400,000,000 DM. on a variety of projects, including a housing program, credits to Lander with large refugee populations, and credits to industry. This scheme, together with general economic improvement as industrial conditions gradually became more normal, brought about a decided improvement in the unemployment situation. As a result of the notable economic recovery in the Federal Republic after the currency reform, and of the government's policy in moving unemployed persons from distressed areas, the unemployment figure had dropped to about 650,000, or 3.6%, by June 30, 1955.

Wages and Standard of Living.—During the two decades after World War I, wages and the standard of living fluctuated widely as Germany passed through first the inflation period and then, after a short-lived return toward economic prosperity, the economic depression following 1929. By 1933 wages had declined to a very low level. Although full employment was reached by 1938 and both wages and prices were in general pegged from that time onward, the standard of living on the whole deteriorated as the quality and quantity of consumer goods decreased and taxation and contributions to the National Socialist organizations increased.

Shortly after the occupation in 1945, the Allies directed that existing controls over wages be maintained, subject to the removal of certain inequities and discriminatory measures and to the variations of rates and allowances within the average wage levels. In western Germany there was a general removal of price and rationing control after the currency reform of June 1948, and an initial 15% wage increase was permitted. This was followed in Oct. 1948 by the complete abolition of the wage control legislation and by a return to the recognized measures of collective bargaining between the trade unions and the employers' associations which had been current during the Weimar republic. Table XI shows how the average gross weekly earnings of industrial workers (excluding miners) developed between 1946 and 1951.

TABLE XI.—*Average Gross Weekly Earnings in Manufacturing in the German Federal Republic, 1946–53**
(In RM./DM.)

Year	Yale	Female	All workers	Index 1938=100
1946	38.74	20.75	35.71	88.2
1947	40.10	21.89	36.78	90.8
1948	48.25	27.60	44.30	110.0
1949	61.58	36.26	55.57	140.6
1950	67.65	40.01	60.54	156.6
1951	76.96	44.85	68.52	177.4
1952	82.99	48.02	74.00	191.0
1953	87.19	51.34	77.87	201.3
1954	90.95	53.21	80.99	210.0

'Figures for 1946–49 refer to the bizone only (*i.e.*, the area of the Federal Republic excluding Rhineland-Palatinate, South Baden and Württemberg-Hohenzollern).

Wages continued to improve during 1954, and the government was able to claim that between the year of currency reform (1948) and 1954 average gross weekly earnings had practically doubled, whereas the cost of living index had moved up only one point, as follows (1938=100): cost of living index 168 (1948), 169 (1954); average gross weekly earnings in industry 110 (1948), 210 (1954).

As may be seen, however, at the beginning of the period of industrial recovery earnings were lagging far behind the rise in the cost of living. Moreover, during the period 1947 to 1953 the average weekly hours worked rose from 39.1 to 47.9. Nevertheless, by the end of 1954 the situation of wages in relation to the cost of living was generally satisfactory, and wage claims made during that year were in fact based on a demand by the workers for a larger share in the increased prosperity.

In the German Democratic Republic official wage regulation was introduced by an ordinance of Aug. 17. 1950, referring to wage increases in the state-owned undertakings. which were estimated to employ more than half the total number of industrial workers. This ordinance established a system of wage differentials corresponding to the relative importance of various industries in the national economy. It introduced a greater differentiation of wages for labour with different degrees of skill within the separate industries and laid down equal pay for men and women doing the same work. In general the new wage rates represented an increase of 8% to 30% over the previous rates. Maximum and minimum rates for some of the more important industries are given in Table XII.

TABLE XII.—*Minimum and Maximum Hourly Wages in the German Democratic Republic, as From Aug. 17, 1950*
(In DM.-Ost)

Sector	Minimum ate	Maximum rate	Sector	Minimum rate	Maximum rate
Underground coal and ore mining	1.10	1.95	Chemical raw materials . .	.76	1.54
Underground lignite, slate and potassium workers . .	.98	1.79	Construction .	.76	1.61
Metallurgy . .	.87	1.80	Textiles. . .	.68	1.32
Heavy industries.	.87	1.73	Railways	.83	1.60
Energy	.81	1.60	Forestry . .	.70	1.19
			Sugar . .	.81	1.30
			Retail trading .	.81	1.47

The differential wage system was carried a stage further on July 1, 1952, when the salaries of skilled workers. engineers and scientists working in certain key industries were raised, very considerably in some cases, in order to attract the "technical intelligentsia" into the service of the five-year plan. Further wage increases in 1953 and 1954 served to redress the balance somewhat between skilled and unskilled workers and between priority and nonpriority industries. In general, wages were rising faster than labour productivity in 1954, and great stress was laid on the need to increase "working norms."

Organized Labour. — In spite of a temporary interruption caused by inflation after World War I, trade unionism developed rapidly between 1913 and 1927, when the membership figure had risen to 8,200,000. More than half the members (4,600,000) were organized in the General German Trade Union association, which had Social Democratic leanings; more than 600,000 belonged to the rather conservative Christian trade unions; a further 150,000 belonged to the Liberal Hirsch-Dunckersche union. There were Communist unions, unions subsidized by the "masters" and unions for clerks, technical employees, foremen and so on.

In the spring of 1933, soon after the National Socialists came to power, all the trade unions were suppressed, many of their leaders imprisoned and their funds transferred to the National Socialist German Labour Front (D.A.F.), the only labour organization nhich was tolerated under the Nazi regime. Both workers and employers were forced into this organization on the principle that all alike belonged to a single community. which was to be guided by the slogan "The common good before the individual good." Hours of work, factory conditions and all similar matters were regulated by trustees of labour appointed by the Reich minister of economics. Strikes and lockouts were forbidden. Wages were in general fixed at the 1933 levels, and after 1937, when a labour shortage began to appear under the pressure of rearmament, restrictions were introduced on changes of employment.

Within the limits of its authoritarian structure the Labour Front engaged in numerous welfare activities for the benefit of the working-class family. The best known of these was the "Strength Through Joy" (Kraft *durch Freude)* scheme, under which scores of thousands were able to take holiday cruises, winter sports holidays and the like at a very low cost.

After World War II the trade union movement developed along different lines in western and eastern Germany. In the western zones the growth of a democratic trade union movement was encouraged, but, on the general principle of recreating democratic institutions from the lowest levels upward, the trade unions were at first authorized to form only locally. The result was a great variety of different types of union, organized in some places according to industries, in others by professions and in yet others in comprehensive associations. In no case were they subdivided into political groupings, however. In the course of time the general scheme emerged as a majority of industrial unions together with a smaller number of professional associations. These gradually federated, first at Land and later at zonal level, and at the beginning of 1950 a single federation, the Deutscher Gewerkschaftsbund, having a membership of more than 5,000,000, was established for the territory of the German Federal Republic. After the establishment of the federal government in Sept. 1949 the trade union movement managed to assert an appreciable influence over the government's industrial policy. It was consulted over the deconcentration of heavy industry, and managed to get accepted its schemes for copartnership between employers and workers (*Mitbestimmung*) in the management of the new coal. iron and steel concerns. Its demands for the nationalization of' various industries, however, were unsuccessful.

In the Soviet zone the trade union movement was reorganized from the top downward. As early as June 1945 an executive committee of the Freier Deutscher Gewerkschaftsbund (F.D.G.B.), or Free German Trade Union federation. was established, and 14 industrial unions and four professional associations were organized. This rigidly centralized apparatus, which was from the first dominated by Communists, gradually extended its network throughout Berlin and the Soviet zone.

Policy, however, was dictated from the centre, and there was also central financial control, so that the local branches had no opportunity of independent development or action. Membership was virtually compulsory; in Aug. 1950 it was given as 4,700,000 (excluding east Berlin). With the rapid reduction of private enterprise in the Soviet zone, the trade unions dropped their original function of representing the workers' interests as against the employers', becoming instead agents of the authorities for the administration of social insurance, for the organization of technical training and political indoctrination, and for ensuring execution of the various economic plans.

In June 1955 the F.D.G.B. statutes were amended and it thereby lost the last vestiges of independence and political impartiality. It was now under the open leadership of the Communist Socialist Unity party, its members lost the right to strike, and it was merely to serve as an instrument for increasing labour productivity and encouraging recruitment into the various semiofficial defense forces. F.D.G.B. membership was virtually compulsory, and by 1955 had reached a figure of just under 5,500,000.

Industrial Management. — When working-class leadership in the winter of 1918–19 threw its weight into the scales against bolshevism, it was clearly realized that the working class must in some way participate in the control of industry. Various schemes of nationalization were abandoned. A system of works councils was created, however, with the object of giving workers some control over industrial management. This move proved a complete failure, as was also the Economic council, a body with certain parliamentary powers on which workers and employees were equally represented. Real power continued to rest with the great associations of manufacturers (Reichsverband der Deutschen Industrie) and the trade unions, which exercised their influence directly on the government.

After World War II it was felt once again in western Germany that in view of the serious disruption of economic life and the large proportion of socially uprooted and impoverished people, some form of economic democracy had to be introduced. The principal political parties and the churches endorsed the demand that the workers have an equal share in industrial management. Many of the new Land constitutions embodied clauses of this nature. Laws were passed again setting up works councils, and some of the *Sander* also issued legislation reorganizing the chambers of trade and industry and allowing the workers and consumers an equal voice on them. On the federal level a law of May 1951 made provision for the workers to share in the management of the coal, iron and steel industries. This was followed in Oct. 1952 by a further law allowing the workers and employees a limited voice in the management of all firms employing more than five persons.

The government of the Federal Republic also put forward proposals for the creation of a new federal economic council, in which the workers could co-operate in economic planning at the highest level. The project broke down, however, over the trade unions' demand for 50% representation on the council.

In the fully planned economy of the Democratic Republic, the ordinary worker had little to say in the running of industry. For, although a fiction of collective agreements was maintained, the free trade unions had no more powers of representing the real interests of the workers than had the Labour Front under Hitler.

An act regulating conditions of labour was issued in Oct. 1949. Although covering such principles as the right to work, the retention of a normal 48-hour week, an annual paid holiday and various other measures of labour protection, its main concern was with the increasing of labour productivity in order to achieve the economic plan. Following an order of June 8, 1950, general collective agreements were to be drawn up by the trade unions and the competent ministries for the various branches of industry, and within these framework agreements the nationalized undertakings and private concerns employing more than 20 persons were to draw up works collective agreements.

These agreements were to contain reciprocal obligations for realization of the planned target, especially in labour productivity, the quality of products, the improvement and extension of the system of technical labour standards, the extension of the system of payment by results and the use of manpower in conformity with the government plan. Since the technical labour standards were continually raised, the average worker's hopes of obtaining better working conditions were still delayed.

Social Insurance. — An extensive system of compulsory, mainly contributory social insurance was built up in Germany during the second half of the 19th century, and in the 1930s unemployment insurance mas introduced.

At the time of the capitulation after World War II, in 1945, the day-to-day administration of the social insurance system was almost at a standstill, but under Allied supervision the system began to function again in a remarkably short time; in the British zone, for example, accident and sickness benefits, and pension payments to widows, the aged and infirm, were being paid again in normal fashion after a few weeks. The aftermath of the war resulted in an increasing burden of expenditure on the social services (*see* Table XIII).

TABLE XIII.—*Expenditure on Social Services in the German Federal Republic*
(In thousand million DM.)

Type	Income 1949	Income 1953	Expenditure 1949	Expenditure 1953
Social security	6,800	14,100	6,200	12,100
Civil servants' pensions	2,200	3,700	2,200	3,700
Welfare	1,900	2,700	1,900	2,700
Health service	—	100	—	TOO
Pensions for war-disabled and veterans' dependents	1,800	2,900	1,800	2,900
Total	12,700	23,500	12,100	21,500

Source: Statistics issued by the German Federal Republic ministry of labour (Nov. 1954).

The continuing importance attached to the social services was shown in the establishment, in Adenauer's second government in Oct. 1953, of a ministry for family affairs, and by the coming into force, on Jan. 1, 1955, of a law on family allowances, by which 25 DM. was payable each month for the third and further children in a family. The increasing complexity of the social services led to the appointment of an advisory council in 1953, whose task was to advise the minister of labour on the reorganization of the system. The council, however, had not made its report by Aug. 1955.

In eastern Germany the social insurance schemes were at first carried on by the separate *Lander*, there being in each of these a separate independent institute for social insurance. By a government decree of April 26, 1951, however, the responsibility for the control and administration of the system of social insurance was transferred to the Freier Deutscher Gewerkschaftsbund (F.D.G.B.), the Communist-run trade union federation. The decree came into force on May 1, 1951.

In the German Democratic Republic expenditure on social services in 1954 amounted to 5,100,000,000 DM.-Ost. Of this sum, 4,700,000,000 DM.-Ost. was provided by contributions, and the state contributed a subsidy of 388,000,000 DM.-Ost.

Housing. — The housing situation in Germany was already serious before World War II broke out. Before the war about 200,000 new dwellings (each for a new household) were built annually, while another 50,000 old dwellings were replaced by new ones; but all these were scarcely sufficient to accommodate the growing population. By 1926, it was estimated, about 950,000 German households were without proper dwellings. and after 1929 efforts were made to reduce this housing shortage by the construction of blocks of flats and small one-family or two-family houses. The number of these buildings constructed annually and the number of families thus housed are shown in Table XIV.

TABLE XIV.—*Housing, 1929-37*

Item	9 9	9.33	1934	935	1936	1937
Buildings constructed	170,783	91,909	128,574	143,185	155,112	168,090
Families accommodated	317,682	178,038	283,995	241,032	310,490	320,057

The destruction and damage caused by World War II were enormous, as Table XV shows.

TABLE XV.—*Houses Destroyed or Badly Damaged During World War II*

Territory	Total of separate dwellings in 1939	Destroyed or heavily damaged dwellings in 1946 (estimate)		Persons per dwelling	
		Number	Per cent of 1939 total	1939	1946*

An official survey held in 1950 revealed that in Sept. 1950 there were about 9,940,000 dwellings in the Federal Republic, of which about 9,404,000 were normal and 537,000 were emergency constructions. In 1950 the number of dwelling units in western Germany was therefore very nearly the same as in 1939. It must be remembered however that the population of western Germany increased greatly as a result of the influx from the former German territories in the east, and the housing shortage was thus acute.

In 1954 a record number of 541,000 new dwelling units was built in the Federal Republic, as compared with 518,000 in 1953, bringing the total of new dwelling units constructed since 1945 to 3,000,000. During 1954–57 the federal government aimed at constructing a further 2,200,000 units, representing a yearly average of 550,000.

In the German Democratic Republic the five-year plan provided for the construction of 10,100,000 sq.m. of dwelling space in 53 new towns. According to the state statistical bulletin, during 1950–53 (a period including one preplan year), 5,700,000 sq.m. were built. The target for 1954 was 2,000,000 sq.m.

ECONOMIC CONDITIONS

Natural Resources. — Germany, as compared with some other countries, is not rich in natural resources. A little less than one-fifth of pre-1938 Germany was unfit for cultivation, being covered by lakes, moors, river beds, hills and mountains, while the great northern plain, though fertile in some parts, consists in others of thin sandy soils fit to grow only potatoes, rye and fir.

As far as industrial resources are concerned, hard (or deep-mined) coal is the country's greatest natural asset. Coal is fairly widely distributed, but the Ruhr is the main centre of the industry. Many of the coal seams are comparatively thin. especially in the Ruhr; but on the other hand their situation, close to great natural waterways and to efficient canals, is favourable to distribution.

Apart from deep-mined coal, Germany is rich in deposits of lignite or soft coal, also called brown coal. These deposits are not mined, but rather scraped up by means of huge mechanical excavators, much as open-cast mining is carried on. Thus, though lignite has a low caloric content compared with coal. it has the advantage of not being dependent for its production on a supply of skilled miners, and from the beginning of the 20th century the exploitation of the huge deposits (estimated before World War II to be 57,000,000,000 tons) was vigorously carried on. Lignite is extensively used as a fuel in electric power plants, as a base for the production of synthetic nitrate and as cheap raw material for the production of synthetic oil.

Before the loss of Alsace-Lorraine after World War I, Germany was one of the chief steel-producing countries of the world. The loss of the rich iron-ore deposits of Lorraine reduced Germany's annual iron-ore production, for example, from 28,607,900 metric tons in 1913 to a mere 9,791,800 metric tons in 1937.

In addition to its coal and iron resources, Germany has deposits of zinc, copper, lead, silver, tin, bauxite, potash, rock salts and uranium ores. The potash and rock-salt deposits are large, the lead less so and the other mineral resources not considerable. The uranium deposits lie in Saxony, in the Democratic Republic, and it was no secret that from 1945 the Soviet authorities worked them intensively, though their output was unknown. Germany has petroleum deposits in the Hanover and Schleswig-Holstein areas of the Federal Republic and also in the Democratic Republic. Production of crude oil in western Germany in 1954 was 2,664,000 metric tons. The eastern German production of crude oil for 1950 was estimated at 893,000 metric tons.

Broadly speaking. it can be said that Germany is not conspicuously well endowed with natural resources. apart from coal. Invention, hard work and good systems of scientific and technological education rather than abundance of natural wealth contributed to Germany's rapid rise to the position of an economic power. The same factors played an important part in the revival of the country's economy after World War II.

Agriculture. — Up to the end of World War II two main systems of landholding formed the basis of German agriculture, each of them predominating in different parts of the country. The east, especially the country to the east of the Elbe, was a land of big properties, some tracts such as East Prussia and parts of Silesia being in the hands of comparatively few owners. Only about 12.4% of this area was farmed by tenants, the rest being run like home farms under the management of the owners or their administrators with hired agricultural labour.

In the west, in the south and in most parts of central Germany the land was mainly held by peasant proprietors. Some of them, especially in the northwest. owned fairly large farms and employed hired labour. Others, especially in the Rhine valley, were small holders, running their holdings with the help of their families and often engaging in some secondary industrial occupation in order to eke out their means of existence.

Table XVI.—*Distribution of Holdings, 1925*

Size of holdings	Number of holdings	Area covered
0.05–2 ha.	3,027,430	1,587,670 ha.
2–20 ha.	1,850,608	12,082,485 ha.
20–100 ha.	199,825	6,768,629 ha.
100 and more ha.	18,671	5,159,893 ha.

Agrarian Germany, outside certain districts, was thus a kind of peasant democracy, though dominated in some parts by large estate owners farming on a large scale and clinging tenaciously to traditional and somewhat feudal social conceptions. Even before World War II, however, this picture was gradually changing. Big estates were being broken up for various economic reasons, and new peasant agricultural holdings were created by reclaiming swamp and other unused lands. After 1945 a far more radical change took place. The eastern region of large estates, after the detachment of the area east of the Oder-Neisse line, coincided roughly with the Soviet occupation zone. There a drastic system of land reform was introduced in Sept. 1945, affecting all holdings over 100 ha. (247 ac.). Farms and estates numbering 11,465 with a total area of 2,917,826 ha. (7,207,030 ac.) were expropriated, and most of this land was parcelled out in peasant holdings of between 7 and 9 ha. (between 17.3 and 22.2 ac.), the recipients being in the main agricultural labourers and small peasants, together with many refugees from the east. As a result about half of all the farms in eastern Germany now consist of small properties of between j and 20 ha. (between 12.4 and 49.4 ac.), whereas in 1939 these holdings comprised only 21.2% of the total.

Measures of land reform were also carried out by the individual Lander in western Germany, but, since large estates, apart from forest lands, played no great role there, the area available for resettlement was relatively small. The distribution of holdings in this area in 1951 was as follows: 32.9% under 5 ac., 27.5% between j and 12.5 ac., 20.2% between 12.5 and 25 ac., 12.9% between 25 and 50 ac., 5.6% between 50 and 125 ac., and the remainder over 12 j ac.

Not only the pattern of ownership, but also the structure of agriculture altered considerably at the end of World War II. Until then, although mixed farming was to be found everywhere, Germany could be divided into the following distinctive agricultural regions: the clay plains in the east with their crops of rye and potatoes; the loess and black earth of central Germany and Silesia yielding wheat, potatoes and sugar beets; the dairying districts of the damp coastal lowlands and the Alpine forelands; and the fruit and vine-growing district of the west.

Table XVII.—*Land Devoted to Agriculture and Forestry, 1953*
(In thousands of hectares)

Territory	Total area	Agricultural area		Forested land	Built-on area, wasteland and other
		Arable land	Permanent meadows and pastures		
German Federal Republic .	24,427	8,651	5,546	6,912	3,318
German Democratic Republic	10,767	5,089	1,289	2,913	1,476
Berlin	88	27	3	20	38

In 1945 Germany lost about a quarter of its prewar agricultural area, consisting for the most part of arable land which had formerly produced about a quarter of its bread grain and a third of its potato crop. The agricultural balance suffered still further because of the political barrier that grew up between the Soviet zone and the three western zones. Western Germany was left at a distinct disadvantage in regard to arable land as compared with eastern Germany. Whereas in that area 75% of all agricultural land was under the plow, the percentages in the U.S., British and French zones were 59, 55 and 53, respectively. As a result, western Germany was even more dependent on the import of foodstuffs from abroad than was the German Reich before the war.

During the first few years after the war the shortage of fertilizers, seeds, equipment and machinery, as well as of skilled agricultural labour, badly affected the harvests. By 1949, however, both the harvests and the yields per acre were approaching, and in some cases outstripping, the prewar averages for the same areas. As may be seen from Table XVIII, the improvement in the German Federal Republic was considerable.

Livestock was maintained fairly well during World War II. In the final stages of the fighting, however. the number of animals was greatly reduced, particularly in the Soviet and French zones, and in the early postwar years the food shortage in western Germany was so intense that farmers were compelled to slaughter livestock and to convert their grassland to edible crops in order to meet the immediate emergency. This trend was gradually reversed

*Germany in pre-1938 frontier; other figures are for the Federal Republic only.

With the loss of the eastern territories in 1954, Germany's forests were reduced by about 23%. They still covered just over a quarter of the country (27%), consisting for the most part of fir, spruce, beech, oak and pine. The forests suffered considerably from overfelling after about 1935, and toward the end of World War II reafforestation was no longer keeping pace with the felling program.

Before World War II Germany was obliged to import about a third of its timber requirements; not only did these imports cease at the end of the war, but there were infinitely greater demands on timber for reconstruction purposes, with a consequent deterioration of supplies badly needed for paper, wood fibre, cellulose and numerous artificial substitute *(Ersatz)* products, as well as for pit props and railway sleepers (ties). With the restoration of normal trade conditions, however, timber felling in Federal Germany was gradually reduced from 29,500,000 cu.m. in 1950 to 24,900,000 cu.m. in 1953.

Viticulture is important on the sunny hillsides of the Rhine, the Main, the Neckar, the Moselle and the Saar, and hops are also grown in the south, particularly in Bavaria. Post-World War II wine harvests varied between 1,363,000 hl. in 1949 and 3,044,000 hl. in 1954, as compared with 1,722,000 hl. in 1932 and 4,525,000 hl. in 1934. Hop production rose very considerably from 9,722 tons (1935–38 annual average) to 15,576 tons in 1953, in which year the Federal Republic replaced Great Britain as the biggest hop producer in Europe.

Agricultural conditions in general passed through a number of different phases after World War I. German agriculture was financially in a bad way under the Weimar republic, with agricultural prices lagging far behind industrial prices and wages. and farms became heavily mortgaged. The National Socialist government aimed to make Germany self-sufficient in food, and this entailed great efforts, which were on the whole successful, to improve and stabilize agricultural conditions. Agricultural prices were fixed at remunerative levels, imports of food were controlled, there was a centrally controlled system of marketing, and the distribution of technical advice and information was greatly developed.

Although farming in the Federal Republic had by 1954 recovered from the immediate postwar crisis, thanks largely to the highly protectionist policy followed by the government, its progress was still slower than that of other branches of the economy. This was a result of disadvantages inherent in the small size and excessive fragmentation of farms, and the disinclination of the farmer to adopt new methods.

In 1953 the government drew up a program of land consolidation, cheap long-term credits, rural housing and technical advisory assistance, but no marked improvement could be expected for several years. In 1954 the Federal Republic produced between 60% and 70% of its food requirements, as compared with 85% for the whole of Germany in the heyday of the Third Reich.

In the early postwar years, farming in eastern Germany suffered from a shortage of both labour and technical equipment. Much labour was attracted into industry, and at the same time the progress of mechanization was slow. Agricultural costs were much higher than in the Federal Republic, and compulsory deliveries at low fixed prices were graded progressively steeply for the "larger" farmer, who was gradually squeezed out. Soon after the end of the war the Communist-dominated Peasants' Mutual Aid organization began to control every aspect of farm life. Then the state agricultural machinery pools (M.A.S.), which were set up in 1949, acquired a virtual monopoly of larger agricultural machinery. By Oct. 1953 there were 605 of these pools, owning 22,500 tractors.

The final phase in breaking the resistance of the independent landowners started in July 1952 with the promotion of collectivization. By the middle of 1953 almost one-third of the productive agricultural land was under some form of collective ownership, either state farms, other publicly owned farms or agricultural production co-operatives. There were 4,800 of the latter in Oct. 1953, covering 730,000 ha.

Between 1946 and 1950 there was a loss of about 400,000 agricultural workers who moved into industry, and from 1952 onward the collectivization policy caused a further flight from the land. Lack of reliable statistics prevented any estimate of the progress made in agriculture in the German Democratic Republic after 1945, but there were various indications that it was far from satisfactory.

Industry. — Germany's industrial progress, so marked during the half century before the outbreak of World War I, was checked for a time by the aftermath of that conflict. The treaty of Ver-

TABLE XXII.—*Distribution and Development of German Industry, 1925–33*

Industrial groups	Persons employed W			Horsepower employed					
				Wind, water, steam power			Electric motors		
	1925	1933	% change	1925	1933	% change	1925	1933	% change

sailles dislocated some of the leading industries, inflation upset the home market and the scarcity of capital following inflation hampered industrial reorganization. In 192j Germany was starting forward again, after the disrupting effects of the war and inflation, in a great industrial recovery. This continued upward during the next four years when the adoption of the Dawes plan for reparations re-established German credit and allowed Germany to borrow very heavily abroad. Part of the money borrowed was spent in prompt payment of reparations obligations under the Dawes plan; part was spent in public welfare improvements, such as public parks, libraries, baths and playing fields and buildings for the people; and a large part of the remaining money borrowed abroad was spent in the "rationalization of industry"; that is, in the modernization of old plants and the construction of new ones with up-to-date labour-saving machinery. Work previously done by hand was increasingly done by machines. The older forms of horsepower—wind, water and steam machines—were gradually replaced by electric motor power. so that bet een 1925 and 1933 the use of horsepower declined by 4.7%, and the use of electricity increased by 40.7%.

The excessive rationalization of industry, or replacement of hand labour by machines, affected Germany adversely in two ways. It saddled the nation with an intolerable foreign debt at high rates of interest which could not be met when the world depression began in 1929. It also tended to increase the terrible unemployment conditions in Germany which were at their worst in 1932. The number of persons employed in industry had fallen from 13,000,000 in 1925 to 9,000,000 in 1933, a drop of more than 30%.

The results of the industrial censuses of 1925 and 1933, which are shown in Table XXII, illustrate the developments which took place in German industry during this period.

In 1933 another great industrial recovery began. It was stimulated by the National Socialist policy of reducing unemployment by spreading out work at short hours and giving fixed low wages to as many persons as possible. The National Socialists also reduced unemployment by great government expenditure on rearmament and public works such as the *Autobahnen,* other roads, housing and barracks.

By 1939 the feverish effort at rearmament had completely wiped out unemployment and even created a severe labour shortage, in spite of the 22,000,000 then employed. As German exports were insufficient to pay for all the raw materials needed from abroad, Germany also began to suffer from a severe shortage of industrial raw materials. As it also wanted to be as far as possible self-sufficient in case of a future war and blockade, it developed a policy of autarchy. Instead of manufacturing goods from imported raw materials it began to manufacture them as far as possible from its own domestic resources. These substitute products—oil from coal; textiles from wood fibre, cellulose or casein; artificial rubber or buna; etc.—required much more labour, capital investment, horsepower and domestic materials, such as coal and timber, than goods formerly made from imported raw materials. As a result the severity of the labour shortage and raw materials shortage was further intensified.

Coal mining, Germany's basic industry, lost about 16% of the production capacity of 1913, the ceded part of Upper Silesia having an output of 32,000,000 tons of the total German output of 193,000,000 tons. Moreover, 13,000,000 tons a year from the Saar were not available from 1919 to 1935. These losses could not be completely overcome even by 1939. The world's coal situation had changed; lignite (brown coal) had become of great importance, and oil and electricity became serious competitors. Coal production increased to 163,000,000 tons in 1929, sank to 105,000,000 in 1932 and then rose again to 184,500,000 in 1937.

Lignite production increased rapidly after World War I and almost exactly equalled coal production in weight. It is largely used in the form of briquettes in private houses and flats, and also for generating energy in electric power plants and in industry generally.

Germany's total coal production in 1937 was mainly distributed in the following ways: about 10% was used in private houses; another 10% was used on the railways and in ships; 8% furnished energy in electric power plants; 28% was exported; and 34% was used for coking and distillation. The coking process produced coke for smelting iron ore, gas which was piped for hundreds of miles, oil, coal tar, dyes and thousands of other derivatives invaluable for the chemical industry and for the manufacture of many substitute products.

Iron and steel, another of Germany's basic industries, suffered an even greater dislocation as a result of World War I and the cession of Alsace-Lorraine to France. The production of iron ore had been 28,600,000 tons in 1913; of this output the districts remaining to Germany produced but 7,300,000 tons—a reduction of 74.5%. This production did not increase at first; in 1932 it even fell to 1,300,000 tons. The number of separate undertakings was reduced from 328 to 11j, and the number of persons employed from 43,000 to 13,802.

After 1933 Germany's iron and steel production recovered rapidly. Its great lack was iron ore to make up for the ores lost in Lorraine. To overcome this lack of domestic iron ore, Germany in 1937 imported 20,600,000 tons—9,100,000 from Sweden, 5,700,000 from France, 1,500,000 from Belgium and Luxembourg, 1,100,000 from Spain, 800,000 from Newfoundland, 700,000 from Algeria, 500,000 from Norway and a little from other countries. Its own domestic production of iron ore rose from 2,600,000 tons in 1933 to 9,700,000 tons in 1937.

The total of imported and domestic iron ore in 1937 (30,300,000 tons), however, was not enough for Germany's rearmament and other needs. Therefore there was formed, as part of the four-year plan, the Hermann Göring Reich Company for Ore Mining and Iron Smelting. By the use of a new acid smelting process discovered by Max Paschke and Eugen Peetz, this company was to exploit Germany's low-grade ores which lie in the Hanover-Brunswick regions and elsewhere. They have a low iron content of only 14%

to 30%, as compared with an average of 60% or more in Swedish ores, and 30% to 40% in other German ores.

Post-1945.—World War II brought grave damage to German industry, and the victorious powers had to frame a policy for a German industrial system that had collapsed. The policy was set down in the Potsdam agreement of Aug. 2, 1945, which was designed, in the economic sphere, to eliminate or control any branches of industry which could be used for military production; to ensure payment of reparations claims; but also to ensure that Germany, after all claims had been met, should be left with a self-supporting economy.

The Potsdam agreement therefore provided for the total prohibition of armaments and aircraft and sea-going ships, and industries that had potential war importance were to be strictly controlled in order to ensure that production was limited to Germany's legitimate peacetime needs. Surplus productive capacity was to be removed or destroyed. The Potsdam agreement also required that German industry be decentralized by the elimination of all excessive concentrations of enonomic power.

In March 1946 the Allied Control council published a provisional level of industry plan in implementation of the Potsdam agreement. This plan divided German industries into various categories, prohibited, restricted and unrestricted, and if carried out would have resulted in a restriction of Germany's industrial capacity to about 50% to 55% of the 1938 level. The plan was based, however, on various assumptions which were not fulfilled, such as the treatment of Germany as an economic unity, the pooling of resources between the four zones of occupation and the necessity of using the proceeds from current German production in the first place to pay for necessary German imports. Disagreements arose between the U.S.S.R. and the three western Allies on all these points and, though right up to 1947 the western Allies tried to ensure that Germany should be treated as an economic unity by the four occupying powers, circumstances forced them ultimately, in their own as well as Germany's interests, to organize industry in the western zones independently of what the Soviet occupation authorities were doing in their own zone. On Jan. 1, 1947, the British and U.S. zones were fused, for economic purposes, into a bizone, and later the French zone also joined the merger so that a uniform economic policy for the whole of western Germany became possible.

On Aug. 29, 1947, in default of a wider agreement, an Anglo-U.S. plan for a revised level of industry in the bizone was published. This provided for reparations claims and also for security considerations, but it allowed German industrial capacity, including a permitted level of steel production of 10,700,000 metric tons' (11,100,000 metric tons including the French zone), to be retained at roughly the 1936 level. As a corollary to this revised level of industry plan, a dismantling list was published on Oct. 17, 1947, which enumerated 682 plants that were to be removed as reparations or destroyed, as being surplus to the requirements of the new level of industry. In Feb. 1947 the U.S. and British military governments also promulgated laws for the bizone to implement those provisions of the Potsdam agreement forbidding excessive concentrations of economic power.

A new phase in the industrial development of western Germanv began in the early part of 1948 as a result of the Allied intentioh to associate the country in the economic revival to be fostered by the European Recovery program (E.R.P.). In Feb. 1948 the United States, Great Britain and France, in collaboration with the three Benelux countries, had begun discussions which resulted in an agreement to set up an international authority for the Ruhr to control Germany's heavy industries, and a military security board to watch over German industry in general to see that it did not infringe Allied controls. The association of western Germany in the E.R.P., however, made it essential to reconsider the level of industry plan and the dismantling list of 1947. Consequently, in April 1949 the United States, Great Britain and France agreed on a substantial reduction of the dismantling list, and many prohibitions and restrictions on German industry were removed. In Sept. 1950 the foreign ministers of the three powers agreed to a further revision of Allied controls over industry. The remaining restrictions on industry in the Federal Republic were abolished on May 5, 1955, when the Paris agreements restoring sovereignty to the Federal Republic came into force. On the same date the functions of the military security board came to an end.

On May 16, 1949, the occupying powers in western Germany promulgated law no. 27 to redefine Allied policy on the decartelization of German industry. During the inflation of the 1920s the concentration of industry in a few hands had been common in Germany. Vertical combines representing different stages of production and horizontal combines representing works concerned with a particular stage of production had been formed in order to control prices, etc. Some of these combines went no further than standardizing contracts, conditions of payment and so on; others divided markets at home and abroad by agreement; others again created central selling agencies which fixed a uniform price and regulated output with a view to obtaining maximum profits. Most of the basic industries—coal, lignite, pig iron, steel, potash and many others—adopted this highly centralized form of organization, thus securing a kind of co-operative monopoly for their members.

In a few cases the combination went beyond the cartel stage and a real trust was formed, representing the complete fusion of the enterprises concerned. This happened in the steel industry and in the chemical industry in particular. By 1928 there were about 3,000 cartels, some extremely weak, but others, like those in the steel and chemical industries, extremely strong.

Law no. 27, passed by the western Allies to deal with this state of affairs in western Germany, transferred the heavy industries (coal, iron and steel) to German trusteeship during the period of the decartelization that was to be carried out. The first

decartelization orders based on law 27 were issued on July 10, 1951, and transferred property from the former great steel combine known as Vereinigte Stahlwerke, and the firm of Otto Wolff, Cologne, to five specially created, smaller "unit companies."

The abortive Bonn convention of May 1952 on *Settlement of Matters Arising out of the War and the Occupation* (ch. 2) provided that Allied deconcentration and decartelization laws should remain in force until a German law against "restraints of competition" had entered into force. The Paris agreement of Oct. 23, 1954, on the ending of the occupation, cancelled the above provision, with the reservation, however, that Allied decartelization measures affecting the German iron and steel industries, and the former I. G. Farben chemical combine. should remain in force until effective decartelization measures had been carried out by the federal government. Moreover, in a letter to the Allied High commission on Oct. 23, 1954, Adenauer promised that the federal government would oppose all attempts to abrogate or alter existing decartelization measures before the entry into force of a German law.

The federal government produced the draft of a decartelization law on March 2, 1952, but this did not get beyond committee stage during the lifetime of the first federal parliament. On Feb. 17, 1954, Adenauer's new government resurrected the draft bill, with the amendments which had been suggested in committee, and in March 1955 it was given a first reading in the *Bundestag.* The draft bill, together with two alternative drafts, was referred to committee.

The question of the eventual ownership of the heavy industries and of continued Allied supervision of them through the International Ruhr authority and other bodies became prominent as a result of the French proposal (the Schuman plan) for a western European coal and steel authority of which western Germany should be a member. The federal government welcomed the scheme, and a bill providing for ratification of the Schuman plan was introduced into the federal parliament in June 1951. During the first reading of the bill by the *Bundestag* on July 12, 1951, Adenauer stated that removal of existing economic controls was a precondition of the ratification of the treaty by the Federal Republic. The Allied High commission gave the assurances required on Dec. 21, 1951, when it announced that as soon as the Schuman plan entered into force all Allied restrictions on German steel production and all direct Allied control of the German basic industries would be lifted; the only remaining interest of the Allies in those industries would be in the completion of the program of deconcentration. On Jan. 11, 1952, the *Bundestag* voted in favour of German ratification of the Schuman plan treaty.

The European Coal and Steel Community (Schuman plan) came into being on July 25, 1952, and in accordance with the Allied undertaking, all the postwar restrictions imposed by the western occupying powers on German steel production were formally abolished, and the progressive liquidation of the international authority for the Ruhr, set up-by the western powers in 1949, was announced.

The question of nationalization of the heavy industries ranks with *Mitbestimmungsrecht* (the right of workers to take part in management) as one of the main issues which arose over the organization of industry in western Germany after World War II. Insistence of the trade unions on some measure of *Mitbestimmungsrecht* led the government to pass, on April 10, 1951, a law granting *Mitbestimmungsrecht* to the workers in the basic industries (coal, iron and steel) only. The trade unions, however, accepted this law as only a first instalment, and demanded a general introduction of *Mitbestimmungsrecht* throughout German industry. This policy the employers strongly opposed. On July 19, 1952, however, the *Bundestag* passed a *Betriebsverfassungsgesetz* (Works Councils law), which came into force on Nov. 11, 1952. This law. which applied to industry other than coal, iron and steel, provided for a lesser degree of *Mitbestimmungsrecht* than had the previous law applicable to the heavy industries, and was therefore not favourably received by the trade unions or the Social Democratic party. The structure of *Mitbestimmungsrecht* was rounded off on June 9, 195j, when the *Bundestag* passed a *Personalvertretungsgesetz* (Personnel Councils law), which provided for staff collaboration about appointments, promotions, hours of work, etc.. in the federal civil service.

Industry in eastern Germany was severely hampered during the first two years after the end of World War II by the extensive dismantling of equipment and its removal as reparations to the U.S.S.R. Factories, mining equipment, railway lines and overhead electricity wires were among the items removed on a large scale, and in addition many thousands of skilled workers were deported to the U.S.S.R. In the industries left in their zone of occupation the Russians followed a policy of eliminating private ownership and enterprise as far as possible. The process of socialization of industry was formally ended on April 17, 1948, when the Soviet military administration issued order no. 64, which announced that as a result of the measures of expropriation the state had become responsible for about 40% of industrial production in the zone. This figure however was an understatement, since it did not take into account the 126 large industrial Soviet-owned enterprises known as Sowjet Aktiengesellschaften (S.A.G.). At the time of the official ending of the expropriation policy it would seem, in fact, that about 50% of eastern German industrial production capacity was under state or public ownership, 25% in the hands of the S.A.G. and about 25% left in private hands.

As soon as the initial policy of dismantling and removal of equipment and installations to the U.S.S.R. had ceased, the Soviet authorities embarked on a more positive economic policy in their zone, and one aspect of this was a consistent effort to raise the level of industrial production. An expedient to raise industrial production in eastern Germany was the adoption, as in the U.S.S.R., of concerted "plans." On June 30, 1948, a two-year plan was drawn up; and this was replaced, on Jan. 1, 1951, by the five-year plan, which was designed to increase industrial production in the Democratic Republic to 192% of the 1950 level by 1955.

The pressure on the population of the German Democratic Republic to achieve the objects of the five-year plan led to much hardship and discontent, which formed one cause of riots in Berlin and elsewhere in June 1953 (see *History,* above). A few days earlier the government had decided to slacken the tempo, and the disturbances caused this "new course" to be emphasized still further. It involved concessions to private industry, a policy of labour incentives and efforts to increase the quantity and reduce the prices of consumer goods. Also, the Soviet government in Aug. 1953 announced the end of reparations from the Democratic Republic as from Jan. 1, 1954, cancellation of the republic's debts to the Soviet Union, a reduction in the costs of the Soviet forces of occupation, an increase in deliveries of goods from the Soviet Union, large credits and finally the transfer of the 33 remaining S.A.G.'s to the republic. These corporations, representing, it was estimated, 32% of the total industrial production of the German

Democratic Republic, were in fact transferred on Jan. 1, 1954. In March 1954 it was announced that a second five-year plan was to be prepared, to follow the first at the end of 1955.

Transport and Communications.— Prussia nationalized its railways in 1876–79, and the other German *Länder* followed suit. In 1919 the Reich took over the various railways, but failed to run the unified system at a profit. Later, with the help of funds made available through the Dawes plan, the railways were reorganized, and thereafter their financial position improved. World War II, however, put an intense Strain on the Reichsbahn, and Allied bombing did enormous damage to both rolling stock and tracks. In addition to this the railway network in eastern Germany suffered severely as a result of wholesale removal of rolling stock and tracks by the U.S.S.R. as reparations.

In both eastern and western Germany, moreover, the railways suffered greatly after the end of World War II from the competition of road services, and were thus in a weak financial position. In the Democratic Republic the railways remained a state-owned enterprise; and the railways in western Germany, under a law passed by the *Bundestag* on July 6, 1951, were formally designated as a federal property.

TABLE XXVIII.—*Railway Freight and Passenger Traffic, 1952*

Territory	Track (km.)	Locomotives and rail cars	Passenger coaches	Freight cars	carried	Freight carried (tons)
German Federal Republic (federal railways)	30,674	12,212	22,673	283,222	1,219,009,000	262,371,000

In 1938 the total length of roads in Germany was estimated to be 213,394,523 km., and of these 3,051 km. represented the new *Autobahnen;* about 12,000 km. of *Autobahnen* were to have been built had not the war interrupted the program. In May 1955, after a ten-year pause, a six-year program for extending the *Autobahnen* in the Federal Republic was approved, part of the expense incurred to be financed from the Transport Finance bill passed in March 1955, increasing taxation on gasoline and diesel oil. In addition, 150,000,000 DM. of the increased revenue accruing under the bill was to be applied to help the federal railways.

German shipping was as greatly affected by World War II as it had been by World War I. Very little tonnage was left to Germany, most having been set aside for reparations. In addition, for security reasons the German shipbuilding industry was severely limited, and many dock and shipbuilding installations were destroyed or removed. Afterward, as stated above, Allied restrictions on the industry in western Germany were progressively removed, until by 1951 only the right to control shipbuilding capacity remained. In 1954 the Federal Republic had 2,227,000 gross registered tonnage of merchant shipping, as compared with about 4,400,000 tons owned by the Reich in 1939.

Before World War II about 20% of German inland traffic was water-borne; but the inland shipping system suffered great damage during the war, both from Allied bombing and from the demolition of bridges and locks on canals by the Germans themselves. Thus, for example, at the end of the war the important Dortmund-Ems canal was completely out of action. After 1945, however, rapid progress was made in both east and west Germany in repairing war damage and in extending the inland watenvays.

TABLE XXIX.—*Inland Shipping, 1952 and 1953*

In the Federal Republic important projects were being carried out in 1952 for the canalization of the middle Weser and of the Neckar, and in June 1955 the federal and French governments agreed to set up a committee to examine the possibilities of canalizing the Mosel river. In the Democratic Republic a new canal from Niederneuendorf to Paretz, in northwest Berlin, designed to enable inland shipping of the Soviet zone to avoid using the waterways of west Berlin, was opened to traffic on June 28, 1952.

The ban on German civil aviation imposed at the end of World War II was lifted in the Federal Republic on March 3, 1955, when the Allied High commission gave permission for the newly constituted air line Lufthansa to begin internal German services on April 1. In May Lufthansa was permitted to operate European services and in June transatlantic services.

Foreign Trade.— Germany has always suffered from a shortage of raw materials and an inadequate food supply, and the country's existence therefore has depended upon its ability to export manufactured goods to pay for the import of these necessities. Germany's exports really amount to a finishing goods industry on a huge scale. Between 1913 and the outbreak of World War II the relative importance of the principal groups of goods comprising Germany's imports and exports remained fairly constant, despite great changes in the total volume of goods imported and exported.

TABLE XXX.—*Imports and Exports, 1913–54; Relative Importance of Groups of Goods**

*Germany in pre-1914 frontiers. †Germany in pre-1938 frontiers.

Food steadily averaged about 40% of the total imports. but almost vanished from the list of exports. Correspondingly, the proportion of total exports represented by finished goods increased by about 15% between 1913 and 1937.

The direction of German trade, on the other hand, changed greatly after World War I. Before that war, nearly a quarter of Germany's total trade was with Great Britain and the United States. After World War I, partly because of the tariffs. currency changes and the strong bargaining position of these countries, and partly because of Germany's own restrictions of foreign exchange, tariffs and "clearing agreements." trade with both steadily declined. There was a fairly short-lived increase in trade with the U.S S.R. in the early 1930s until political antagonisms between the two countries became acute.

After World War II Germany found itself still poorer in raw materials and food supplies, with its economy unbalanced and suffering great losses from war damages, reparations and controls. At the same time the shipping resources had vanished and its capital reserves were heavily mortgaged by prewar and postwar debts. Nevertheless, after modest beginnings through the Joint Import-Export agency for the U.S. and British zones, and as the effect of the European Recovery program (E.R.P.). most-favoured-nation treatment from the United States and Great Britain, and the various measures taken by the Organization for European Economic Cooperation (O.E.E C.) to revive western trade in general, the foreign trade of western Germany revived to a remarkable degree.

From 1948 onward western Germany began to play a major role in the expansion of west European trade in general, and between that year and the first half of 1950 the trade with the German Federal Republic accounted for almost half the total increase in the exports of western European countries to each other. By 1953 the total monthly volume of imports and exports from the Federal Republic was already 50% greater than from the same area before World War II. For the first time since World War II, the Federal Republic achieved a surplus of exports over imports in 1952, and this increased considerably in 1953 and 1954.

The structure of the Federal Republic's foreign trade had by the end of 1953 reverted almost exactly to the prewar position of the Reich as a whole. About 37% of imports consisted of food and about 63% of industrial goods and raw materials; exports comprised 2.6% food and 97.4% industrial goods and raw materials. The direction of trade had. however, altered considerably in favour of western Europe and the western hemisphere. In 1953 over half of Federal Germany's imports were from the member states of O.E.E.C. and a further quarter from the United States, Canada and Latin America, while the proportion of its exports to these countries was two-thirds and one-sixth, respectively. The years 1950–53 saw an important expansion of trade with Latin America, in particular. Trade with the Soviet bloc continued to be almost nonexistent.

The foreign trade of eastern Germany after World War II also concentrated largely on the export of industrial goods of high quality, including textiles and chemicals, in return for food and raw materials. But this trade was diverted even more rigidly toward the U.S.S.R. and the satellite states than was western German trade toward the E.R.P. countries. The decisive change in the direction of eastern German trade took place after 1948, the first year of E.R.P. (See Table XXXII.)

During the two-year plan of 1949–50 and the five-year plan which followed in 1951, the tendency was to integrate the economy of the Democratic Republic more closely with the Soviet bloc and gradually to make the republic independent of trade with the west. A long-term trade agreement on the mutual deliveries of goods during the period from 1952 to 1955 was concluded between the U.S.S.R. and the German Democratic Republic in Sept. 1951. It was then claimed that the U.S.S.R. would supply all the wheat, cotton and fodder required by eastern Germany for this period, most of its meat, fat. wool, fish, tobacco, tea. manganese and chromium ores and pig iron, nearly half its requirements of rolling-mill products, and smaller quantities of coke. In return the Democratic Republic would supply the U.S.S.R. with heavy machinery, motors and industrial equipment on a large scale, together with chemical goods, ships, precision instruments, television sets, etc. Supplementary long-term trade agreements were similarly concluded between the Democratic Republic and the other Soviet satellite states.

After 1948 there was a rapid expansion in the trade of the Democratic Republic, which by 1953 had the largest total trade turnover of any of the east European countries and, next to China, was the most important trading partner of the Soviet Union. In that year 41% of east German imports consisted of food, 39% of raw materials and semifinished goods and 20% of manufactured goods. The corresponding figures for exports were 2%, 17% and 81%.

TABLE XXXII.—*Estimated Distribution of the Trade Turnover of the German Democratic Republic*

(Exports plus imports, in millions of U.S. dollars)

Finance.—Before World War I government functions were divided between three authorities: the Reich, the *Lander* or states and the local government bodies (districts and municipalities). In the bigger *Lander*, such as Prussia and Bavaria, provinces and government districts stood between the local government bodies and the central government. Administrative systems varied considerably in size, from that of Prussia which involved a population of nearly 40,000,000 to that of Mecklenburg-Strelitz which comprised about 100,000 persons. In Prussia itself there were considerable differences in the various provincial administrative systems.

After the revolution that followed World War I the Reich took over more administrative services than it had previously been responsible for, but police, education, justice, public health and supervision of industry continued to be within the competence of the different *Lander*. These, moreover, had tax-collecting services of their own, though some of the smaller *Lander* entrusted the Reich authorities with the collecting of *Land* taxes, and there was thus some overlapping in many cases between Reich authorities and *Lander* authorities. By 1939 the central government had become the chief taxing authority in Germany, having ousted the *Lander* from their former privileged position, as a result of the centralizing policy of the National Socialists. The central Reich government by that year controlled not only customs and excise but also income tax, corporation tax and the inheritance and property taxes as well. The various *Lander* were still allowed, however, to levy taxes on land, buildings, businesses and other sources of income. As the *Lander* found themselves unable to carry out the tasks incumbent upon them with the proceeds of the taxes left under their own control, they were allowed to share in the proceeds of the most important Reich taxes—the income tax, the corporation tax—and some minor taxes. In this way three-quarters of the income tax and of the corporation tax were handed over to the *Lander*, which in turn had to share with the municipalities the refunds which the Reich had made to the former. The post-World War II financial system in the Federal Republic was based on the principles laid down in its provisional constitution. By these the federal government acquired exclusive legislative rights over some taxes (*e.g.*, customs and financial monopolies) and concurrent legislative powers with the *Lander* in the case of certain other taxes (*e.g.*, the income and property taxes). The revenue from customs and excise (except 'beer) and from certain other taxes accrued to the federal government, while the revenue from beer and various other taxes accrued to the *Lander*. Similarly there was a division of competence with regard to the actual administration of the taxes, the federal finance authorities administering the customs, excise, financial monopolies and certain other taxes, and the *Lander* financial authorities administering the remainder. The Basic law also laid down (art. 109) that "the federation and the *Lander* shall be self-supporting and independent of each other in their budget economy." However, to enable *Lander* with low revenues to maintain an efficient administration, and to equalize as far as possible the burden of expenditure in the different *Lander*, the Basic law authorized the federal government, for these purposes, to draw upon an equalization fund provided from the proceeds of various *Lander* taxes, and to make grants to the poorer *Lander* in accordance with their needs. Table XXXIII shows the receipts and payments made in 1950 in implementation of this *Finanzausgleich* (equalization of financial burdens).

*Nine-month period beginning June 20, 1948 (currency reform). †Estimate

In eastern Germany the financial system after World War II was at first marked by extreme decentralization. The central zonal administrative organs which were the precursors of the ministries of the German Democratic Republic had indeed no tax revenues of their own and were financed from contributions from the railways and postal services and from contributions from the various *Lander* governments. By a law of Feb. 9, 1950, made retrospective to Jan. 1, 1950, the financial system of the Democratic Republic was centralized. By this law the authority to raise revenue and the right to receive the revenue were taken from the *Lander* authorities and given to the central ministry of finance, which made allocations to the *Lander*, *Kreise* (districts) and ***Gemeinden*** (parishes) to enable them to carry on their necessary work of local administration.

Expenditure . . .	8 . 8	33,352.9	34,753.4	9	38,138.1

*Estimate.

Before World War II Germany had an enormous external debt arising from the treaty of Versailles, by which Germany was made responsible for a reparations liability fixed at 132,000,000,000 RM. An agreement in London in 1924 rearranged Germany's financial obligations, however, in accordance with the main principles of the Dawes plan, and an external loan was issued by the Reich government in 1924 as a result. The financial burden of reparations on Germany was lessened once again in 1930 when the Dawes plan was replaced by the Young plan, but the new plan soon proved economically impossible and was suspended at Pres. Herbert Hoover's suggestion in 1931, and thereafter reparations obligations were virtually nullified. Germany still had a very heavy foreign debt, however, because of the large sums borrowed abroad during 1924–29 for the payment of reparations, the reconstruction of German industry and other purposes. Under National Socialism an internal debt was added to this external debt. The Nazi government borrowed vast sums from the German people, and the total public debt of the Reich, the states and the larger towns and cities rose accordingly from 24,000,000,000 RM. in 1932 to an estimated 64,000,000,000 RM. in 1939. After the war the western Allies had to pour financial help into the western zones of Germany to keep them viable, and in this way another debt gradually accumulated for which the Federal Republic in principle accepted liability.

An agreement on German prewar debts was signed in London on Feb. 27, 1952, between the United Kingdom, France, the United States and 1j other creditor countries, and the German Federal Republic, and this agreement, which laid down the terms and procedure for settlement of the debts, came into force on Sept. 16, 1953. Also on Feb. 27, 1952, the United Kingdom, France and the United States signed with the Federal Republic separate bilateral agreements for the settlement of the postwar debts owed to the three countries by the Federal Republic for economic assistance.

Banking and Currency.—The first commercial bank was established in Germany in 1619, but because of the political disorganization of the country it was not until the latter part of the 19th century that a modern co-ordinated banking system developed. A process of centralization set in, and by the 1930s German banking was dominated by the Reichsbank and five other big banks, two of which (the Reichskredit-Gesellschaft and the Berliner Handelsgesellschaft) were purely Berlin institutions, while the other three (the Deutsche Bank, Dresdner Bank and Commerz- und Privatbank) had many branches throughout the country. After the inflation of 1923 the Reichsbank was reorganized by the Dawes plan, and managed to preserve some semblance of independence till June 15, 1939, when a decree placed it directly under the control of Hitler, who exercised the control through Walther Funk, Reich minister of economics and president of the Reichsbank. Apart from the Reichsbank and the big private banks, there were in prewar Germany public banks maintained by the state governments, provinces and municipalities, and these were important as savings banks. Savings, however, suffered because of the 1923 inflation and fell from 19,000,000,000 RM. in 1914 to only 1,250,000,000 RM. in 1924. Later confidence was restored and savings grew from 4,600,000,000 RM. in 1927 to 15,700,000,000 RM. in 1937.

After Germany's collapse in World War II the banking system was developed along different lines in the Soviet zone and the zones occupied by the United States, Great Britain and France. In western Germany banks were allowed to maintain their existence, and accounts, other than those connected with Reich and Nazi property, were not blocked. In eastern Germany on the other hand all banks and stock exchanges were closed and bank balances blocked at the beginning of the occupation.

Though the western Allies did not act as drastically as the Russians, they considerably modified the banking system in western Germany, setting up a federal banking system in place of the former centralized structure. The head of this system was the Bank Deutscher Lander, and each of the 11 *Lander* had its own autonomous bank *(Landeszentralbank)* on which all the banking operations in the *Land* depended. The Bank Deutscher Lander derived its funds from the *Land* banks and acted as their banker. In addition it was the only bank allowed to issue notes, so to that extent centralizing influences were retained. The essentially federal character of the postwar west German banking system may be judged, however, from the fact that no German bank was allowed to maintain branches outside the *Land* in which it was registered.

The policy of the Bank Deutscher Lander was made by a board sitting in Frankfurt composed of the governor and chairman of its managing committee, together with the 11 heads of the *Lander* central banks. The federal character of the Bank Deutscher Lander was further emphasized by its inability to open branches or to do internal German business, generally speaking, except with the *Lander* central banks. In this respect it was quite different from the former Reichsbank, whose influence and ramifications were widespread.

On Nov. 7, 1951, however, the federal government approved a new banking law designed to modify considerably the decentralized system introduced by the occupying powers after the capitulation in 1945. The law proposed to substitute for the 30 or more small *Lander* banks functioning under the system of decentralization nine successor organizationsto the former "big three" (Dresdner Bank, Deutsche Bank, Commerz- und Privatbank), with power to operate in three big regions — covering north, south and west Germany — instead of being confined to *Lander* boundaries. The law came into force on April 1, 1952. By 1954 this reorganization was said to be completed.

The dominant economic requirement in Germany after World War II was a reform of the currency so that money could once more play its essential part in economic life instead of finding its place usurped, as a unit of value and means of exchange! by such commodities in short supply as cigarettes and coffee. After the western Allies had failed to reach an agreement with the U.S.S.R. on an all-German currency reform, they were forced to institute a separate reform in their own zones of occupation, and this reform was carried out in stages in 1948. The old Reichsmark was converted to the new Deutsche Mark at a rate of 10 RM. to 1 DM.; and half the amount resulting from conversion was placed in a blocked account. By a further currency law passed on Oct. 1, 1948, 70% of the blocked accounts were cancelled, 10% retained for compulsory investment and 20% freed for the individual holder to do with as he pleased. Thus in the end the Germans had the free use of 6% of their holdings (though a provision existed by which a later claim up to 10% of former Reichsmark holdings may be allowed).

The reform was severe, but necessary and beneficent in its ultimate effects. By July 1948 money in circulation had been reduced from about 65,000,000,000 RM. to about 10,000,000,000 DM., and this restoration of the purchasing power of the mark and of people's confidence in it was the indispensable foundation of the Federal Republic's subsequent economic recovery. By Dec. 1955 currency circulation amounted to 14,088,000,000 DM. and deposit money to 14,988,000,000 DM. From 1950 the exchange rate of 4.20 DM. = $1 remained unchanged. After Aug. 10, 1953, the rate was free to fluctuate between limits of 1% either side of par.

In the Soviet zone of Germany all existing banks were closed after the occupation had begun, and all bank deposits, totalling about 80,000,000,000 RM., were blocked. Later a decentralized system somewhat on the western model was introduced, and in Feb. 1947 five *Länder* central banks were set up. In 1948, after a separate currency reform was carried out in the Soviet zone, the Deutsche Emissions- und Girobank was set up as a central bank for controlling the new currency. On July 20, 1948, the title of the bank was changed to Deutsche Notenbank, and from that time the new institution began to exercise an ever-greater control over banking activities throughout the Soviet zone in fulfilment of the newly announced two-year plan. The system of centralized planning involved more and more of an encroachment on the functions of the five *Liinder* banks, and in March 1950 this process led to the complete amalgamation of the *Lander* banks with the Deutsche Notenbank. In Nov. 1951 the parliament of the Democratic Republic passed a law making' the Deutsche Notenbank the official state bank with functions enabling it to control the carrying out of the five-year plan in addition to the usual central bank functions such as control of note circulation and foreign exchange transactions.

The currency circulation of the German Democratic Republic was secret. Officially at par with the western Deutsche Mark, in 1955 the Deutsche Mark-Ost was being exchanged in west Berlin on the average at 4.50 DM.-Ost = 1 DM. On Oct. 30, 1953, the eastern Deutsche Mark was "revalued" at an exchange rate of 1 DM.-Ost = 1.80 roubles. (I. L. G.; P. G. Rs.)

GERMERSHEIM, town in the Rhineland-Palatinate. Federal Republic of Germany, at the confluence of the Queich and the Rhine, 8 mi. S.W. of Speyer. Pop. (1959 est.) 7,175. Germersheim existed as a Roman stronghold under the name of Vicus Julius. The citadel was rebuilt by the emperor Conrad II, hut the town itself was founded in 1276 by the emperor Rudolph I, who granted it the rights of a free imperial city. From 1330 to 1622, when it was conquered by Austria, the town formed part of the Palatinate of the Rhine.

From 1644 to 1650 it was in the possession of France; but on the conclusion of the peace of Westphalia it was again joined to the Palatinate. In 1674 it was captured and devastated by the French under Turenne, and after the death of the elector Charles (1685) it was claimed by the French as a dependency of Alsace. As a consequence there ensued the disastrous Germersheim war of succession, which lasted until the peace of Ryswick in 1697. Through the intervention of the pope in 1702 the French, on payment of a large sum, agreed to vacate the town. and in 1715 its fortifications were rebuilt. In July 1744 the French were defeated there by the imperial troops, and in July 1793 by the Austrians. In 1835 the new town was built.

Between 1834 and 1919 Germersheim was strongly established as a German frontier fortress town and remained so until after World War I. During World War II it once again came under attack and over one-third of the town was destroyed in air and ground bombardments. It was rebuilt after the war, however.

Germersheim is the site of the foreign and interpreters' institutes of the University of Mainz, and many other schools are in the town. Industries include enamel and chemical works, and there are dry docks for river shipping; the region is strongly agricultural.

Germersheim is the capital of the district of the same name.

GERMINAL, "the month of buds," the first spring month of the French Republican calendar, substituted for the Gregorian calendar on Oct. 5, 1793. *(See* FRENCH REPUBLICAN CALENDAR.)

GERMINATION, of seeds: *see* PLANT PROPAGATION.

GERMISTON, town in Transvaal, South Africa, 9 mi. E. of Johannesburg and 8 mi. from Jan Smuts International airport. Altitude 5,478 ft. Pop. (1960) 139,407; whites 55,605, coloured 3,350, natives 78,389, Asians 2,063.

The town is an important railway junction, where lines meet from Natal and Cape Province ports, Lourenço Marques, Pretoria and Johannesburg. It is situated in the heart of the Witwatersrand gold-mining area and has the largest gold refinery in the world.

GERO (c. 900–965), margrave of the Saxon east mark, was entrusted in 937 by the German king Otto, afterward the emperor Otto the Great. with the defense of the eastern frontier of Saxony against the Wends and other Slavonic tribes.

In a few years Gero extended the Saxon frontier almost to the Oder, and suppressed a rising of the conquered peoples in a great victory on Oct. 16, 955. In 963 he defeated the Lusatians and compelled the king of the Poles to recognize the supremacy of the German king.

GEROLSTEIN, a village and climatic health resort of Germany, in Rhineland-Palatinate. situated on the Kyll, in the Eifel range, 1,240 ft. above the sea, 28 mi. N. of Trier. Pop. (1950) 3,097. The castle of Gerolstein was built in 1115 and is now in ruins. Gerolstein is celebrated for its lithia waters, which are largely exported.

GÉRÔME, JEAN LÉON (1824–1904), French painter, sculptor and teacher, born at Vesoul, Haute-Saône, on May 11, 1824. was trained by P. Delaroche, whom he accompanied to Italy in 1844–45. His "Cockfight," exhibited at the Paris Salon of 1847, failed to win him the Rome prize but caused a popular sensation. After 1853 he traveled much in the middle east. His enormous "L'Apothéose du Siecle d'August" (exhibited at the Exposition Universelle, 185j) was bought by the state.

Gérôme was a good draftsman in the style of J. A. D. Ingres, an inventive illustrator in the manner of Delaroche. From about 187j he turned increasingly to sculpture.

Gérôme exerted an important influence on the development of U.S. painting through his teaching, as did many other prominent academic French painters of the late 19th century. His pupils included Thomas Eakins, J. Alden Weir, F. A. Bridgman and many others. He died in Paris in the night of Jan. 10–11, 1904.

GERONA, a maritime frontier province in the extreme northeast of Spain, formed in 1833 of districts taken from Catalonia and bounded on the north by France, east and southeast by the Mediterranean sea, southwest and west by Barcelona and northwest by Lerida. In the northwest a small section of the province, with the town of Llivía, is entirely isolated and surrounded by French territory; otherwise Gerona is separated from France by the Pyrenees. The population in 1950 was 322,371. The area is 2,264 sq.mi.

The region has numerous historical associations (see CATALONIA), and it acted as the guardian of the passes through the Pyrenees at the eastern end, performing the same service as Roncesvalles in the west. The three main rivers, the Ter, Muga and Fluvia, rise in the Pyrenees and flow in a southeasterly direction to the sea. Along their banks there is much good arable land, while the lower slopes of the Pyrenees are well wooded with oak, pine and chestnut. Cape Creus is a marked feature of the coast line arid is the most easterly point of the Iberian peninsula. It is formed by the dying down seaward of the Pyrenees. The climate varies locally. The Cerdaiia district and other mountainous tracts are cold during eight months while Gerona, La Bisbal and Santa Coloma have typical Mediterranean features. The coastal fisheries are important especially at Llansá, Rosas, Palamos and Blanes. The cork industry flourishes at San Felíu de Guixols (with fisheriesj, Palafrugell and Cassa. There is also a little metalliferous mining. Much use is made of water power, and the linen, cotton and general textile manufactures are important.

Gerona (*q.v.*) is the capital while Figueras was long a most important frontier fortress. Gerona was held by government troops during the civil war of 1936–39 until after the capture of Barcelona on Jan. 26, 1939.

GERONA, the capital of the province of Gerona in northeastern Spain, on the railway from Barcelona to Perpignan in France and on the right bank of the Ter river, at its confluence with the Oña, a small right-hand tributary. Pop. (1950) 26,163 (mun.).

Gerona is the ancient Gerunda, a city of the Auscetani. It claims to be the place in which St. Paul and St. James first rested when they came to Spain, and it became the see of a bishop about 247. It was for a long time in the hands of the Moors, whose amir, Suleiman, was in alliance with Pippin the Short, king of the Franks about 759. It was taken by Charlemagne in 785, but the Moors regained and sacked it in 795, and it was not until 1015 that they were finally expelled. It gave the title of count to the king of Aragon's eldest son. It has been besieged no fewer than 25 times in all, and only 4 of the sieges have resulted in its capture. Its noblest resistance was in 1809, when it was besieged in May by the French with 35,000 troops under Verdier, Augereau and Gonvion St. Cyr; 40 batteries were erected against it and a heavy bombardment maintained; but under the leadership of Mariano Alvarez de Castro it held out till famine and fever compelled a capitulation on Dec. 12. The French, it is said, had spent 20,000 bombs and 60,000 cannon balls, and their loss was estimated at 15,000 men.

The older part of the town occupies the steep slope of the Montjuich or Hill of the Capuchins; the newer portion stretches down into the plain and beyond the Oña There are still remains of the city walls, and the hill is crowned by what were at one time very strong fortifications, now put to other uses. The cathedral is a fine specimen of Gothic architecture; the nave measures 73 ft. from side to side. The old cathedral on the same site was used as a mosque by the Moors, and on their expulsion in 1015 it appears to have been greatly modified if not entirely rebuilt. New works were carried out during the 14th century, but it was not till the beginning of the 15th that the work on the present structure was really begun. The collegiate church of San Feliu (St. Felix) is mainly of the 14th century, but was modified in the 16th and its façade dates from the 18th. The spire is conspicuous. The Benedictine church of San Pedro de Galligans (or de lós Gallos) is an interesting Romanesque building of early date. It is named from the small Galligans river, an affluent of the Oña, which flows through the city. In the same neighbourhood is a small church with a rare Spanish example of a transverse triapsal plan. Gerona is still the seat of a bishop. There is a public library. Paper, cotton and woollen goods are extensively manufactured.

GERONIMO (c. 1829–1909) was a leader but not chief of a North American Apache Indian band called Chiricahuas. Geronimo gave June 1829 as the date of his birth; the place, No-doyohn canyon, Arizona. His mother taught him tribal legends. Geronimo said that when a boy he "would practise stealing" and "feats of war." He rose to leadership of a faction of braves by exhibiting extraordinary courage, determination and skill in successive raids of vengeance upon Mexicans by whom his mother, wife and children had been killed in 1858. Devastating Apache raids and massacres in Arizona and New Mexico brought action by the U.S. army under command of Gen. George F. Crook which placed offenders, including Geronimo, on reservations. In 1876 Geronimo fled to Mexico. During the following decade he led outlaw bands in intermittent raids against American settlers. In 1886 General Crook finally succeeded in bringing Geronimo to a meeting wherein he and his Apache warriors agreed to surrender if they would be taken to Florida where their families were being held. The terms were agreed to, but on the way the Indians escaped. General Crook was replaced by Gen. Nelson A. Miles, who after months of pursuit finally secured another conditional surrender of the elusive Geronimo and followers. During this final campaign. which lasted 18 months, no fewer than 5,000 troops and 500 Indian auxiliaries had been employed in the apprehension of a band of Apaches comprising only 35 men, 8 boys and 101 women, who operated in two countries without bases of supply. Army and civilian losses totalled 95; Mexican losses were heavy but unknown. Geronimo's losses were 13 killed, but none from direct U.S. army action.

By orders from Pres. Grover Cleveland, and contrary to terms agreed upon by Miles, Geronimo and 14 companions were placed under military confinement. finally! at Fort Sill, Oklahoma. There Geronimo was allowed to carry on stock raising and farming. Before his death on Feb. 17, 1909, this most cunning of Indian fighters dictated to S. M. Barrett Geronimo's Story of *His Life* (1906).

GERONTOCRACY, government by old men. The degree to which the old are accorded prestige and status varies greatly from society to society and from one social class to another. Yet in both primitive and technological societies and in many, particularly religious, organizations it frequently works out that major policy determination, executive and administrative responsibility, and judicial authority rest in the hands of older people.

In advanced societies outstanding creative works in the arts and sciences are most frequently produced by men in their 30s. The qualities and conditions that make for governmental leadership, however, seem to develop more slowly and to combine in such a way that outstanding leaders as a group are notably older than outstanding scientists are at the time they produce their greatest work.

Among primitive societies the vast majority have older men serving as chieftains, as counselors and in judicial roles. Among Australian tribes, especially, aged men have great authority, and it is here that the best examples of what approaches a "true" gerontocracy—rule by the old men as a class—exist. The Dieri, *e.g.*, are reported to have had, within a general assembly made up of all men fully initiated into adulthood, a great council made up of aged men. This council made the major decisions, administered justice, and regulated the ceremonies and movements of the group.

Relevant facts for more highly developed societies are often a matter of public record, thus permitting a clearer assessment of the role of the aged in governmental matters than is possible in the instance of primitive groups. But surveys in both primitive and advanced societies indicate that, strictly speaking, gerontocracy as a form of government seldom exists. Rather there is often a disproportionate representation of older individuals in governmental activities. Successful candidates for president of the United States, for instance, are most frequently nominated and most frequently serve between 55 and 59 years of age. Peak years of service of prime ministers of England and of presidents of republics other than the United States have also been between 55 and 59. Members of the U.S. president's cabinet have most often served between 50 and 54 years of age, members of the British cabinet between 55 and 59. Where electoral terms are long (as in France) or where appointment is for life, or continued tenure is contingent upon personal desire of the incumbent, a much greater age of service is recorded. Thus appointments to the U.S. supreme court are most frequently made at ages 55 to 59, but over 85% of the service rendered is by men beyond 6j. A variety of evidence suggests that new movements are more frequently started by young men, but as the organization becomes established and stable, older men dominate in the government. In the United States, the passage of time has brought an increased emphasis upon older leadership. For example, the mean ages of representatives and senators in 1799 were 43.50 and 45.2j years respectively. By the mid-1920s mean ages had increased to 53.46 years for representatives and 57.50 for senators. In addition to increased age of the groups as a whole, considerable weight is given to seniority in committee and other assignments through which power is wielded.

In addition to actual service, it is significant that at least in the United States older individuals evince strong interest in political and governmental matters and more frequently exercise the ballot than do the young. For example, a larger proportion of a sample of voters over jj voted in the 1948 presidential election than of those under 35, though both groups voted somewhat less than did those around 50 years of age. Among college graduates, the percentage voting in local and primary elections apparently increases until the 50s and remains at a high level until old age, slightly more than four-fifths of those in the mid-40s and in older age groups reporting such voting.

In general, there appears to be no uniform or even clearly defined pattern of gerontocracy in either primitive or modern societies though in both there is a strong tendency in this general direction. Rarely is advanced age in itself a sufficient qualification for an important post; usually old leaders had attained prominence in some way in their prime and have maintained their prominence into old age. Old men occupy influential positions in overwhelming numbers compared to old women. And, finally, the old are more likely to have governmental responsibility in the more stable societies with advanced economies and more complex organizations.

A number of reasons for the widespread political power of older people suggest themselves. It may be that the qualities required for leadership emerge more slowly than other capacities. that the reputation and broad personal contacts necessary for vote getting and the experience needed to function effectively require years to develop or that older individuals being more conservative and hence more interested in the maintenance of the *status quo* are more highly motivated to seek and retain office. On the other hand, the reasons may lie in the characteristics of the groups who appoint or elect leaders. It has been suggested that a basic conservatism of the mass of the party membership results in the repeated nomination and election of those who by virtue of previous officeholding have served a long "apprenticeship" to the party and represent familiar faces in whom the general population can have confidence. Moreover, the organization of the political group may be a factor in determining the ease with which younger men are introduced into positions of leadership. In groups autocratic in structure vigorous action by the central figures may force a certain mobility of younger talent, not so possible under the election systems of democratic parties. Of interest in this connection is the fact that in the French national assembly of 1946 about 33% of the deputies from the Communist party (a highly centralized party) were under 36 years of ages whereas only 8% of the deputies from the Socialist party were under 36. The latter party, although characterized by a strong organization, is highly decentralized and has a highly democratic system for the appointment of leaders. The rules, procedures and customs of political parties may thus play a significant role in determining the relative influence of the young and the old.

GERONTOLOGY AND GERIATRICS. Gerontology is the science or the study of aging. Aging affects all matter, animate and inanimate; metals, planets, radiation activity, rocks and colloidal gels change with age just as living organisms do. However, gerontology is chiefly concerned with aging as it affects the processes of life and particularly, of course, the aging of man. Aging is a part of living and, therefore, a factor in growth and development, but gerontology applies chiefly to aging after the peak of maturity.

Gerontology is divided into three major subdivisions: (1) the aging of the individual as a unit; (2) the biological processes of aging affecting the component parts of the individual; and (3) the sociological aspects of aging mankind. The first of these divisions is called geriatrics and pertains to the medical or clinical care of aging or aged persons. In this division, the individual man or woman is the unit. The second division, the biology of senescence, is concerned with the mechanisms of aging as they affect the cells, and chemical reactions of the tissues which make up the organism. The sociological problems of aging populations include economic, political and cultural facets.

These three areas of study are intimately related, both theoretically and pragmatically. The individual is the primary unit, be it man or other living entity. On the one hand, the individual is composed of myriads of tissue cells, each being an entity in itself. On the other hand, society is composed of many millions of individuals. From the purely practical viewpoint, the more we know about the biology of senescence, the more wisely can we guide and maintain the health of aging people; and the more we know of the capacities and limitations of people as they grow older, the more intelligently can we attack the serious social problems which arise from changes in the age composition of populations.

Though aging is as old as time and the aged have always been a medical and social problem, there was no significant interest in gerontology until about 1940. The former lack of interest can be attributed to a number of factors: It was only after 1900 that the numbers of older people in the population became significant. Science is in itself young and thus, naturally, concerned first with the problems of youth, growth and development. The aged were long considered as an unavoidable economic burden. With the tremendous increase in longevity during the 20th century (life expectancy at birth in 1900 was 47 years and in 1952 over 67 for males and over 71 for females) the social pressure of the more mature in our populations demands attention.

Geriatric Medicine.—Geriatric medicine is that part of the science and practice of medicine which deals particularly with the health and illnesses of the aging and the aged. It is perhaps best contrasted with pediatrics, which deals with the health and sicknesses in infants and children. Geriatrics is not a medical specialty in the generally accepted use of the term, since it crosses the lines of all the various specialties. For example, there are special geriatric problems in ophthalmology (diseases of the eye), in dermatology (diseases of the skin), in surgery and in internal medicine Therefore, the adjective "geriatric" is preferred to the noun "geriatrics." Geriatric medicine takes special cognizance of the biologic changes consequent to aging and those disorders which are more frequent in the latter half of life. Geriatric medicine is not limited to the problems of those already senile; it is much more concerned with the aging from full maturity onward. The two most critical decades are those from 40 to 60 years of age. Geriatrics is concerned with both abnormal and sick individuals and the maintenance of health of those apparently well. It is not limited to the purely physical aspects of medicine; the intellectual and emotional changes which occur with normal aging and the psychiatric disorders common in the involutional period and in the *senium* are equally parts of geriatric medicine. Preventive measures offer far more hope of accomplishment than attempts to deal with changes and depreciations already existent.

Medical problems of the mature person are profoundly affected by the changes of age on the one hand and by the characteristics of the commoner disorders in this age group on the other hand. It is extremely significant that aging brings about change; the older person is not the same individual as he was in youth and early maturity. Aging affects all the structures and functions of the living organism. Immunity, physiologic capacities, repair processes, memory, method of thought, nutritional requirements, endurance and the like are all altered by age. These changes occur so gradually and insidiously that they are often ignored, but they are, nevertheless. most significant.

The obvious changes of aging, such as wrinkles and graying hair, are the least important. Among the subtle and obscure changes are a slowing and weakening of the responses of the organism to external stimuli and injurious forces, slowing of the speed of repair following injury, a lessened requirement for food (but a narrowing margin of safety in regard to deficiencies in certain elements) and a very gradual involution of the functional capacities. In terms of everyday living these changes mean that the aging person, by reacting less violently to infection or other injuries, presents milder symptoms and signs of disease. As a result, illnesses are often well advanced in the older person before medical guidance is sought, and the physician is thus greatly handicapped. The lessening of response to adverse environmental conditions is illustrated by the fact that older persons tolerate extremes of heat and cold poorly; undereating or overeating, dehydration or too rapid fluid intake are prone to lead to much more serious consequences than in youth. Adaptability is lessened.

Aging is not all decline, however, since certain attributes improve with aging in the normal person. Though speed diminishes, endurance often actually improves. Judgment very definitely increases as we become more and more mature, assuming that there was intelligence in youth. Age alone does not guarantee good judgment or wisdom, but as judgment is based upon learning from experience and having experiences takes time, the element of age in the development of judgment is inevitable. The ability to learn declines far more slowly than most people assume; careful psychological tests indicate that the ability to learn at 80 is approximately the same as at 12, with the peak occurring at about 22 years of age. However, these studies were conducted with people who wanted to learn; without desire to motivate the effort of learning, ability depreciates more rapidly.

S o disease is limited solely to the later years of life. However, certain disorders occur much more frequently among people over 40 years of age. These same illnesses may occur in youth, although only exceptionally. The disorders common in senescence include particularly arteriosclerosis (so-called hardening of the arteries), hypertension (high blood pressure), diabetes, arthritis, gout and cancers. Of these, the disorders involving the circulation (arteriosclerosis and hypertension) and, therefore, the heart—both directly and indirectly—are by far the most important. Conservative estimates placed the annual deaths attributable to these two circulatory disorders at more than 200,000 in the United States in 1952; more than 250,000 persons were also becoming totally disabled each year because of circulatory disease. These various disorders have certain significant characteristics in common. (1) They begin insidiously and progress without symptoms for a long time. It is often a matter of from 2 to 20 years of insidious progression before evidences of subjective distress or objective physical findings call attention to the fact that something is wrong. Therefore, any effective preventive efforts must begin relatively early in life. (2) Their causation is largely from within rather than from obvious external sources, such as infection. They arise as a result of a summation of many superimposed insults, and in no two instances are the causative factors necessarily identical. This multiple and obscure origin of the causative factors is also a significant obstacle to effective curative or preventive treatment. (3) These disorders are frequently multiple in the same individual, and rather than conferring an immunity or protection they tend to increase the vulnerability to related diseases. (4) The degenerative diseases are characteristically progressive, usually leading to a long period of disability before they destroy.

Geriatric medicine, being concerned with the health as well as the diseases of aging and aged, is much interested in the changes which take place in normal aging people. Because of the insidious and subtle development of either normal or abnormal aging, changes in function must be searched for. The person who waits until they are obvious cannot expect much in the way of correction. The attitude of clinical geriatrics must be one of anticipation and prevention of difficulties rather than hope for dramatic cure. With wiser living, many of the disabling disorders can be so markedly retarded that not only is life extended, but the enjoyment of life is enhanced greatly. The objective of geriatrics is not merely to prolong life, but to permit continued vigour and usefulness. There can be no sharp line of distinction between health and disease, since health is always relative. But disease does not necessarily imply imminent disaster. It is possible to control and retard the progression of many of the depreciations and disorders of age if measures are instituted early enough. There is, unfortunately, an immense lag between medical knowledge and application.

Biology of Senescence.—The second major division of gerontology is concerned with the study of the biology of senescence. Knowledge of the phenomena of involution is meagre in contrast to what has been learned concerning the biologic processes of growth or evolution. Aging, and therefore senescence, is part of living. It is continuous from the moment of conception until death, although the rate of change is variable and not symmetrical. To study the changes of aging is to study the mechanisms of life, for aging is essentially the element of time in living.

As man is composed of millions of minute cells, it is natural to attempt study of the processes of aging in these individual units. This, however, is almost impossible because cells do not age in the generally accepted sense. Instead, once they are mature and fully differentiated, they divide and make two young daughter cells. With the exception of a few cells of the brain, none of man's tissues are as old as he is; the tissue cells are being replaced constantly. The fact that cells do not age has been demonstrated dramatically by tissue culture studies. The classical experiment of Alexis Carrel continued a culture of chicken embryo heart cells for 34 years (1912–46). At the end of this time, these cells were growing with the same vigour and showed no evidence of depreciation over a period several times longer than the normal life span of a chicken. Carrel concluded that in an optimum environment living cells can be immortal. It is notable, however, that in order to continue the survival of these cells, the nutrient media upon which they grew had to be replaced at least every 48 hr. or the tissue cultures deteriorated quickly.

Thus the focus of attention in studies of the biology of aging shifted from the cells to the nonliving, but essential, matrix or internal environment in which they live and function. It is in this portion of the body that the changes of aging are first manifest structurally and are biologically significant. The intercellular portion of the organism includes the blood, lymph, tissue juices, fibres of connective tissue and the matrix of bone and the like. Gradual thickening and increased density of the fibrous supporting matrix occur, impeding the transport of nutrients to the cells and of metabolic debris from the tissues. It is here that we must search for an understanding of the processes of aging and hope to find ways and means of retarding depreciation.

As the rate of aging varies between different species of animals and between different individuals of the same species as well as between different parts of the same individual, age in the biological sense is entirely different from chronological age. For example, a 300-day-old white rat is approximately the biologic equivalent in age of a 30-year-old man. Some men age more slowly than the average. Others are biologically older than their years would indicate. Assessment of biologic age is an extremely difficult problem by no means solved; no single criterion will suffice. The biologic age of an individual is the mean of the total ages of various structures and functions.

Sociologic Gerontology.—Within the first half of the 20th century the average duration of human life in the U.S. increased by about 20 years (*see* above). This prolongation was accomplished largely by reduction in deaths of infants and children, but even for those over 50 years of age there was some improvement in life expectancy. In 1950, women of 50 years of age had a further expectancy of 24 years and men of 50 an expectancy of 21 years more of life. The increasing longevity is world-wide, but not uniform among the various nations. In 1942, Australia and New Zealand led the list with an average life expectancy of 65 years. In the same year, the United States population had an average expectancy of 64.82 years, Great Britain 62, Italy 55, Japan 48, and India 27.

Even more significant from the sociologic viewpoint is the fact that the percentage of various age groups of the population was changing greatly. In the United States in 1900, 17.8% of the population were 45 years old or older. By 1950, this group constituted 28.4%. The median age of the people increased from 26.4 in 1930 to 30.1 in 1950, an increase of 3.7 years in two decades. The sociologic implications of such population changes are immense and complex; such shifts were without precedent in the known history of the world. Here it is possible only to enumerate briefly some of the more obvious and urgent problems.

The problem of employment and utilization of the increasing millions of the elderly involves many collateral questions, such as retirement pensions, housing, job analysis and evaluation of individual capacities. Either an economic system will have to find employment for these individuals suitable to their peculiar capacities or the younger age group must carry the burden of their support in addition to supporting and educating children. The care of relatively helpless senile individuals and those prematurely disabled by chronic diseases was in urgent need of study and attention by the early 1950s. Eighty per cent of deaths resulted from the chronic progressive disorders characteristic of later years. Millions were being partially or totally disabled for long periods. In the United States the rate of admission to hospitals for mental illness of patients suffering from arteriosclerotic dementia, a consequence of aging, increased 536% from 1910 to 1936. In 1949, 32% of first admissions into state hospitals for mental illness were of patients 60 years old or older. The cost of these chronic disorders was truly incalculable.

Other sociologic problems include the effect of an aging population upon the political picture. The aged affect the structure of the family. Culture is affected by these shifts, and the character and duration of education is in need of revision because of longevity; adult education is taking on entirely new significance.

The most hopeful aspect of gerontology was that with enhancing survival, the world populations would become more and more mature. Although long years of life do not guarantee emotional maturation, they are requisite for its development. When men live long enough to have time enough to think, hope for ultimate peace does not seem quite so remote and impossible of fulfilment.

GEROUSIA, the council of elders at Sparta, corresponding in some of its functions to the Athenian Boulē. In historical times it numbered 28 members, to whom were added *ex officio* the two kings and, later, the five ephors. Candidates must have passed their 60th year; *i.e.*, they must no longer be liable to military service. Vacancies were filled by the Apella; once elected, the *gerontes* held office for life and were irresponsible. The council prepared the business which was to be submitted to the Apella and was empowered to set aside, in conjunction with the kings, any "crooked" decision of the people.

Together with the kings and ephors it formed the supreme executive committee of the state, and it exercised also a considerable criminal and political jurisdiction, including the trial of kings; its competence extended to the infliction of a sentence of exile or even of death.

GEROW, LEONARD TOWNSEND (1888–), U.S. army officer, commander of the 5th corps and of the 15th army during World War II, was born in Petersburg, Va., July 13, 1888. He was graduated from Virginia Military institute, Lexington, and commissioned second lieutenant of infantry in 1911, serving in France during World War I. Gerow was chief of the war plans division, U.S. war department, 1940–42. In Feb. 1942 he was assigned to command the 29th division, which he took to the United Kingdom in October of that year. He was appointed to command the 5th corps in July 1943, and continued in command during operations in France, Belgium, Luxembourg and Germany from the landings on Omaha beach, Normandy, on June 6, 1944, to the successful conclusion of the battle of the Bulge in Jan. 1945. Gerow then assumed command of the 15th army for the remainder of the war. He was commandant of the Command and General Staff school, Ft. Leavenworth, 1945–47, and commanding general, 2nd army, 1948–50, when he retired as lieutenant general. He later was made a full general. (F. C. PE.)

GERRHA, ancient port on the Arabian coast of the Persian gulf inhabited by Chaldean exiles from Babylon (Strabo, Bk. xvi., and Pliny, *Hist. Nat.* vi. 32). Various identifications of the site have been suggested (Qatif, Kuwait, Salwa), but the ancient name is unquestionably preserved in that of modern 'Uqair (pronounced Ujair, Ojer) as suggested by Philby. Cheesman in 1923 discovered ruins here which tend to confirm this conjecture though the matter still requires further examination. The classical story that the houses here were built of rock-salt is difficult to understand. 'Uqair is now one of the chief ports of Hasa with a growing trade. It has an excellent deep-water harbour with a very difficult approach from Bahrein, where goods are trans-shipped from ocean steamers to sailing boats.

GERRY, ELBRIDGE (1744–1814), American statesman, was born in Marblehead (Mass.), July 17, 1744, the son of Thomas Gerry, a prosperous Marblehead merchant. He graduated at Harvard in 1762 and entered his father's business. In 1772 and 1773 he was a member of the Massachusetts general court, and in 1773 he served on the committee of correspondence which became one of the great instruments of intercolonial resistance. In 1774–75 he was a member of the Massachusetts Provincial Congress. The passage of a bill proposed by him to arm and equip ships to prey upon British commerce (Nov. 1775) was, according to his biographer, Austin, "the first actual avowal of offensive hostility against the mother country which is to be found in the annals of the Revolution." From 1776 to 1781 Gerry was a member of the Continental Congress, where he early advocated independence, and was one of those who signed the Declaration after its formal signing on Aug. 2, 1776, at which time he was absent.

Gerry was again a member of Congress in 1783–85 and in 1787 was a delegate to the Constitutional Convention. He served as an Anti-Federalist in the National House of Representatives in 1789–93. In 1797 he was sent by President John Adams, with John Marshall and Charles Cotesworth Pinckney, on a mission to France to obtain from the government of the Directory a treaty embodying a settlement of several long-standing disputes. The discourteous and underhand treatment of this embassy by Talleyrand and his agents resulted in the speedy retirement of Marshall and Pinckney. The episode is known in American history as the "X Y Z Affair." Gerry remained in Paris for some time in the vain hope that Talleyrand might offer to a known friend of France terms that had been refused to envoys whose anti-French views were more than suspected. This action of Gerry's brought down upon him from Federalist partisans a storm of abuse and censure, from which he never wholly cleared himself.

In 1810–12 he was governor of Massachusetts. His administration was especially notable for the enactment of a law by which the State was divided into new senatorial districts in such a manner as to consolidate the Federalist vote in a few districts, thus giving the Democratic-Republicans an undue advantage. The outline of one of these districts, which was thought to resemble a salamander, gave rise in 1812, through a popular application of the governor's name. to the term "Gerrymander" (*q.v.*). In 1812 Gerry, who was an ardent advocate of the war with Great Britain, was elected vice-president of the U.S., on the ticket with James Madison. He died in office at Washington, D.C., Nov. 23, 1814.

BIBLIOGRAPHY.—J T. Austin, *Life of Elbridge Gerry, with Contemporary Letters* (Boston, 1828–29): Edward Channing, *History* vol. iv; Yale, *Chronicles of America;* Henry Xdams, *History.*

GERRYMANDER, an American expression which has taken root in the English language, meaning to arrange election districts so as to give an unfair advantage to the party in power by means of a redistribution act, or to manipulate constituencies generally. The word is derived from the name of the U.S. politician Elbridge Gerry (*q.v.*), who was governor of Massachusetts in 1812 at the time his party in the legislature redistricted the state so as to concentrate its strength and dissipate the strength of its opponents. The appearance of one electoral district on the map resembled a salamander. It was represented in cartoons as a winged monstrosity with the label "Gerrymander." It was, however, only a new name for an old practice. In the American colonial period political advantage was often obtained by changing county lines.

See L. F. Schmeckebier, *Congressional Apportionment* (1941); E. C. Griffith, *The Rise and Development of the Gerrymander* (1907).

GERS, a *de'partement* of southwestern France, composed of the whole or parts of certain districts of Gascony; viz, Armagnac, Astarac, Fezensac, Pardiac, Pays de Gaure, Lomagne, Comminges, Condomois and of a small part of Agenais. It is bounded N. by the *de'partement* of Lot-et-Garonne, N.E. by Tarn-et-Garonne, E. and S.E. by Haute-Garonne, S. by Hautes-Pyrénées, S.W. by Basses-Pyrénées and W. by Landes. Pop. (1954) 185,111. Area, 2,429 sq.mi.

The *de'partement* consists of a plateau sloping from a height of 1,100 ft. at the base of the Pyrenees to the Garonne beyond the northern boundary. It is drained by the Save, Gimonne, Arrats, Gers and Baïse diverging fanwise to the Garonne, and by the Arros, Midouze and Douze feeding the Adour in the west. Gers is primarily agricultural. The valleys are fertile, especially in the southwest, and the grain produced is more than enough for local needs. Wheat, maize and oats are the chief cereals. Two-thirds of the wine produced is made into brandy, known by the name of Armagnac. The natural pastures are supplemented chiefly by crops of sainfoin and clover; horses, cattle, sheep and swine are reared in large numbers; turkeys, geese and other poultry are abundant. There are mineral springs at Aurenson, Barbotan and several other places in the department. There are flour mills and tanneries; faïence and cream of tartar are made, and feathers cleaned and prepared. Gers is divided into the *arrondissements* of Auch, Mirande, Condom.

GERSHOM BEN JUDAH (*c.* 950–*c.* 1028), known as RABBENU GERSHOM, and "the Light of the Exile," was the greatest rabbinical authority of the Jews of western Europe. As the brilliant teacher of the rabbinic academy at Mainz in Germany, he was one of the first to transplant the talmudic learning of Babylonia and Palestine to the schools of the west. A consummate scholar, he attracted students from all parts of Europe, and was the mentor, guide and appellate judge of the autonomous and democratically governed Jewish communities of Germany and France, helping to mold their political. social and co-operative institutions. At synods of community leaders he proposed and guided the adoption of legal enactments that shaped the organized life of European Jewry. These enactments prohibited polygamy and limited the husband's right of arbitrary divorce, strengthened the jurisdiction of courts of law and extended the use of the principle of majority rule in community legislation. He wrote many *responsa,* worked on a critical text of the Talmud and on the Masora, and transmitted to his students an extensive oral commentary on the entire Talmud. All rabbinic scholars of Germany and France of the subsequent generations considered themselves the students of his students, and followed faithfully his teachings, his customs and his legal enactments. (I. A. A.)

GERSHWIN, GEORGE (1898–1937), U.S. composer, prominently identified with music of the jazz type, was born in Brooklyn. N.Y., on Sept. 26, 1898. Originally named Jacob Gershvin, he studied piano with Charles Hambitzer and harmony with Edward Kilenyi. and from an early age worked for New York music publishing firms and also wrote popular songs.

Although he had already written the scores for a number of musical comedies. as well as various popular songs, including the highly successful *Swanee* (1919), it was his *Rhapsody in Blue,* an elaborate composition for piano and orchestra in jazz style, that first drew serious attention to the young composer. First performed by the Paul Whiteman orchestra in Aeolian hall, New York city, on Feb. 12, 1924, it became one of his best known works. In 1931 he wrote the score for a musical satire, *Of Thee I Sing* (first musical comedy to be awarded the Pulitzer prize in drama). His folk opera, *Porgy and Bess* (1935), was written in collaboration with his brother Ira Gershwin (1896–), who wrote the lyrics for many of his compositions. Based on the novel *Porgy* (1925) by DuBose Heyward, the opera depicts life on "Catfish Row," a Negro tenement district in a southern U.S. city during the early 20th century. By the second half of the 20th century it had been produced many times in the United States and other countries, including the U.S.S.R. and countries in Latin America and the near east.

Musical comedy scores by George Gershwin include *La, La Lucille* (1919); the *George White Scandals* (1920–24); *Lady Be Good!* (1924); *Song of the Flame* (1925); *Tell Me More* (1925); *Oh Kay* (1926); *Treasure Girl* (1928); *Show Girl* (1929); *Girl Crazy* (1930); and *Let 'Em Eat Cake* (1933).

Among his other compositions were a one-act opera, *Blue Monday* (later called *135th Street)* (1922); the symphonic tone poem, *An American in Paris* (1928); *Piano Concerto in F* (1925); a second *Rhapsody in Blue* (1931); *Cuban Overture* (1932); *Variations on I Got Rhythm* (1934); and a suite of jazz preludes for the piano in 1936. He died in Hollywood, Calif., on July 11, 1937, and was buried at Hastings-on-Hudson, N.Y.

GERSON, JEAN DE (1363–1429), French theologian, chancellor of the University of Paris and a leader of the conciliar movement for church reform, called *doctor christianissmus.* He was born at Gerson (from which his surname is derived) near Reims on Dec. 13. 1363; the family name was Charlier. He was educated at the College of Navarre in Paris, studying theology under Pierre d'Ailly (*q.v.*), who remained his life-long friend. At the university he was elected procurator for the French "nation" in 1383, and in 1387 was sent with the chancellor and others to Clement VII to procure the condemnation of Jean de Montson, a Dominican who had rejected the Immaculate Conception. When D'Ailly was made bishop of Puy in 1395, Gerson was elected chancellor of the university, then at the height of its fame and attracting students from all the lands of Christendom.

In theology Gerson was a follower of the nominalist William Ockham (*see* also NOMINALISM). Impatient with the merely verbal subtleties of decadent scholasticism, he turned away from the whole medieval tradition that had emphasized the value of reason in the discernment of divine truth. For Gerson the good or evil of an action depended solely on the will of God, which human reason could not fathom. He urged students to apply themselves to the study of the Bible and the church fathers instead of indulging in fine-spun arguments on points of speculative theology. It seemed an attractive program to many, but the rejection of human reason as a key to theological truth could as easily lead to religious skepticism as to the purer and simpler faith at which Gerson aimed. His own theological writing was influenced by the mystical tradition of the Victorines and of St. Bonaventura. He had a great reputation as a preacher and a moralist; one of his moral treatises u-as a work warning university students against the obscenity and skepticism of the then very popular *Roman de la rose.* Some scholars have credited Gerson with the authorship of the famous mystical treatise the *Imitation* of *Christ,* but it is most probably not his work.

Gerson is especially remembered for his part in healing the Great Schism which began in 1378 when two rival candidates, Urban VI and Clement VII, disputed the papal throne. *(See* also PAPACY: *The Great Schisnz, 1378–1417.*) At first his attitude was moderate. He deprecated the views of zealots on both sides who held that all members of the opposing party were in a state of excommunication and lacked valid sacraments; but as the schism grew more embittered Gerson came to propound really radical doctrines on church government as the only means of restoring unity. He taught that although the papacy was divinely established as the head of the church, nevertheless the authority of the whole universal church was greater than that of any individual pope. The practical consequence was that a general council could judge and depose a pope. Gerson supported the Council of Pisa (1409) which claimed to depose the two existing "popes" and elect a third. After it became apparent that this had merely produced three "popes" instead of two, the Council of Constance assembled in 1415.

Gerson attended this council and played a leading part in its deliberations (including those that led to the condemnation of John Huss). His views on conciliar authority were accepted, and the schism mas ended by the forced resignation of two "popes" and the deposition of the third. Gerson, however, had one major defeat at the council. In 1408 he had taken the lead in condemning a work of the theologian Jean Petit, who had defended the assassination of the duc d'Orléans by partisans of the duke of Burgundy as justifiable tyrannicide. The case of Jean Petit was reconsidered at Constance, but the council refused to condemn him explicitly. When Gerson left Constance in 1418 he was prevented from returning to France by the threats of the duke of Burgundy, and he went into exile in Germany.

In 1419, on the death of the duke, he returned to France and settled at Lyons. Gerson had always showed a tenderness toward small children, and he spent his last years teaching children and writing hymns and works of devotion. He died with a reputation for exemplary piety on July 12, 1429.

The best editions of his collected works, those of Paris (4 vol., 1606) and Antwerp (5 vol., 1706), are both very imperfect.

GERSONIDES (LEVI BEN GERSHON) (1288–*c.* 1344), known from his initials, with the title Rabbi, as RALBAG and also called LEO DE BAGNOLAS, LEO HEBRAEUS or MAESTRO LEON, Jewish mathematician, astronomer, philosopher and biblical commentator, was born at Bagnols in Languedoc, of a family distinguished for piety and learning. He lived at Avignon (where the rule of the Angevin counts of Provence and later of the popes was comparatively tolerant), at Orange and at Perpignan. His *De Numeris harmonicis* (written in Hebrew but extant only in the Latin version) was composed at the instance of Philip of Vitry, bishop of Meaux. Other mathematical works of his include a treatise called *De Sinibus, chordis et arcubus,* one of the first European writings on trigonometry. He invented (or improved) an astronomical instrument. which he called Jacob's staff *(baculus Jacob),* for measuring heights and used the camera obscura. These inventions enabled him to correct the astronomical tables of the time. His importance as an astronomer is undisputed but cannot easily be assessed, as the astronomical part of his philosophical work *Milhamot Adonai* ("The Wars of the Lord"; partial Ger. trans. by B. Kellermann, *Die Kämpfe Gottes,* 2 vol., 1914–16) was unfortunately omitted both from the *editio princeps* (1560) and from the second edition (1868), although it had been translated into Latin in 1342. As a philosopher Gersonides develops the synthesis of Aristotelianism and Judaism which Maimonides (*q.v.*) had effected. On account of his familiarity with Averroes' commentaries, he is more firmly grounded in Aristotle than his illustrious predecessor. He himself wrote supercommentaries on the six books of the Aristotelian *Organon* and on Porphyry's *Isagoge,* some of which were printed, with the commentaries of Averroes, in the Latin edition of Aristotle (1550). His pronounced rationalism is in evidence also in his commentaries on the Bible. His orthodox contemporaries mockingly called his main work "Wars *against* the Lord." *See* also JEWISH PHILOSOPHY. (A. AN.)

GERSOPPA, FALLS OF, a cataract on the Sharavati river in Kanara district, Bombay, India. 53 mi. N.W. of Shimoga. The river there crosses the main scarp of the Western Ghats, having cut its headwaters far back beyond the crest. It descends in four cascades one of which, the most striking in all India, has a vertical plunge of 830 ft. The Mahatma Gandhi power station (projected output, 120,000 kw.) utilizes the fall. The power is mainly consumed in the factories and mines of Mysore. Near the village are extensive ruins of Nargabestikere, the former capital of the Jain chiefs of Gersoppa. The area was formerly celebrated for its pepper. Some timber is extracted from its forests. (T. HER.)

GERSTÄCKER, FRIEDRICH (1816–1872), German novelist and writer of travels, was born at Hamburg on May 10, 1816, the son of Friedrich Gerstacker, a celebrated opera singer. In 1837 he went to America and traveled widely in the United States, supporting himself by whatever work came to hand. A diary describing his adventures in America had been published in Germany in the *Rosen,* and he returned to Germany in 1843 to find himself famous as an author. Gerstacker published these popular sketches in 1844 under the title *Streif- und Jagdziige durch die Vereinigten Staaten Nordamerikas.* In 1845 his first novel, *Die Regulatoren in Arkansas,* appeared, and thereafter his literary productions continued uninterruptedly. From 1849 to 1852 he traveled around the world, visiting numerous countries including South America, to which he returned in 1860 to report on the possibilities for German emigration to that country. He recorded his observations in *Achtzehn Monate in Sudamerika* (1862). He continued to travel in many countries and published a number of novels descriptive of the scenes he had visited. He died at Brunswick on May 31, 1872. His works, which dealt with the great world hitherto hidden from the narrow "parochialism" of German life, were immensely popular. Many of his books were translated into other languages, notably English, and became widely known on both sides of the Atlantic. His best works, from a literary point of view, are, besides the above-mentioned *Regulatoren,* his *Flusspiraten des Mississippi* (1848) ; *Tahiti* (1854) ; *Die beiden Sträflinge* (1857); *Aus dem Matrosenleben* (1857); and *Blau Wasser* (1858).

GERSTENBERG, HEINRICH WILHELM VON (1737–1823), German poet, critic and theorist of the *Sturm und Drang* movement. He was born at Tondern, Schleswig, Jan. 3, 1737. After studying law at Jena he entered the Danish military service and took part in the Russian campaign of 1762. He spent the next 12 years in Copenhagen, where he was a friend of the poet Klopstock. From 1775 to 1783 Gerstenberg was official Danish representative at Liibeck, and in 1786 received a judicial appointment at Altona, where he died, Nov. 1, 1823. The text of his cantata *Ariadne auf Naxos* (1767) was set to music by J. A. Scheibe and J. C. Bach (these scores were lost) and later adapted for a famous duodrama by Georg Benda. Gerstenberg also translated Beaumont and Fletcher's *Maid's Tragedy* (1765), and himself wrote a gruesome but powerful tragedy, *Ugolino* (1768). His chief service to the new literary movement was his *Briefe iiber Merkwürdigkeiten der Literatur* (3 vol., 1766–67), in which the critical principles of the *Sturm und* Drang—and especially its enthusiasm for Shakespeare—were first definitely formulated.

As a musician Gerstenberg, a pupil of Scheibe, formulated theories on instrumental and dramatic music opposed to those of Jean Jacques Rousseau.

BIBLIOGRAPHY.—Gerstenberg's *Vermischte Schriften* appeared in 3 vol. (1815–16). The *Briefe Lber Merkwurdigkeiten der Literatur* were republished by A. von Weilen (1888–89). *See* also *A. M*. Wagner, H. *W. von Gerstenberg und der Sturm und Drang*, 2 vol. (1920); J. W. Eaton, *Gerstenberg and Lessing* (1938). For Gerstenberg's musical influence *see* A. Schering, "C.P.E. Bach und das 'redende Prinzip' in der Musik," in *Jahrbuch der Musikbibliothek Peters* (1939).

GERVAIS, (FRANÇOIS LOUIS) PAUL (1816–1879), French paleontologist and zoologist most noted for his work on fossil vertebrates, was born on Sept. 26, 1816, in Paris, where he obtained doctorates in science and medicine. He studied paleontology as assistant to H. M. D. de Blainville, Cuvier's successor as professor of comparative anatomy in the Museum of Natural History. In 1845 Gervais was appointed to the chair of zoology and comparative anatomy in the faculty of sciences at Montpellier of which he was appointed dean in 1856. He returned to Paris in 1865 with professorships in anatomy, comparative physiology and geology at the Sorbonne. Three years later he achieved his ambition of succeeding to the chair of Cuvier and Blainville in the museum. Most important of Gervais' earlier works were his *Zoologie et pale'ontologie françaises* (1848–52), essentially a continuation of Cuvier's and Blainville's publications on the same subject. Among his major later works were *Zoologie et pale'ontologie générales* (1867–75) and uith Van Beneden, a series of important studies on whales—*Ostéographie des cétacés vivants et fossiles* (1868 *et seq.)*. He also published numerous papers on vertebrates brought back by French expeditions abroad, and was the author of such general zoological works as *Histoire naturelle des mammifères* (1855) and, with Van Beneden, *Zoologie médicale* (1859). Gervais died in Paris on Feb. 10, 1879. (A. S. RR.)

GERVASE OF CANTERBURY (d. c. 1210), English monk and chronicler, entered the house of Christchurch, Canterbury, at an early age. He made his profession and received holy orders in 1163, and seems to have resided almost continuously at Canterbury from the time of his admission. The only office which we know him to have held is that of sacrist, which he received after 1190 and laid down before 1197. About 1188 he began the compilation of his *Chronica*. Beginning with the accession of Stephen he continued his narrative to the death of Richard I. Up to 1188 he relies almost entirely upon extant sources; but from that date onward is usually an independent authority. A second history, the *Gesta Regum,* is planned on a smaller scale and traces the fortunes of Britain from the days of Brutus to the year 1209. The latter part of this work, covering the years 1199–1209, is the only part of the *Gesta* which deserves much attention.

See the introductions and notes in W. Stubbs's edition of the *Historical Works* of *Gervase of Canterbury* (Rolls Ser., No. 73, 2 vols., 1879–1880).

GERVASE OF TILBURY (*fl.* 1211), Anglo-Latin writer of the late 12th and early 13th centuries, was a kinsman and schoolfellow of Patrick, earl of Salisbury, but lived the life of a scholarly adventurer, wandering from land to land in search of patrons. Before 1177 he was a student and teacher of law at Bologna; his first employer of royal rank was Henry fitz Henry, the young king of England (d. 1183), for whom Gervase wrote a jestbook which is no longer extant. Subsequently Gervase was a clerk in the household of William of Champagne, cardinal archbishop of Reims (d. 1202), and before 1189 he entered the service of William II of Sicily, who had married Joanna, the sister of Henry fitz Henry. Some time after 1198, he found employment under the emperor Otto IV. Though a clerk in orders Gervase became marshal of the kingdom of Arles, and married an heiress of good family. For the delectation of the emperor he wrote, about 1211, his *Otia Imperialia* in three parts. It is a farrago of history, geography, folklore and political theory—one of those books of table talk in which the literature of the age abounded. The most interesting of his dissertations are contained in the second part of the *Otia,* where he discusses, among other topics, the geography and history of England.

See the *Otia Imperialia* in G. Leibnitz's *Scriptores rerum Brunsvicensium,* vols. i and ii (Hanover, 1707); extracts in J. Stevenson's edition of *Coggeshall* (Rolls series, No. 66, 1875). Of modern accounts the best are those by W. Stubhs in his edition of *Gervase of Canterbury,* vol. i introd. (Rolls series, 2 vols., No. 73, 1879), and by R. Pauli in *Nachrichten der Gesellschaft der Wissenschaften zu Gottingen* (1882). In the older biographies the *Dialogus de scaccario* of Richard Fitz Neal (*q.v.*) is wrongly attributed to Gervase.

GERVINUS, GEORG GOTTFRIED (1805–1871), German historian and Shakespearian commentator, was born on May 20, 1805, at Darmstadt, and died on March 18, 1871, at Heidelberg. In 1835 he became professor of history at Gottingen. His *Geschichte der poetischen Nationallitteratur der Deutschen,* 5 vol. (1835–42), subsequently entitled *Geschichte der deutschen Dichtung,* 5th ed. by K. Bartsch (1871–74), was the first comprehensive and scholarly history of German literature. In 1837 he was one of the seven Gottingen professors dismissed for their protest against the violation of the constitution by the king of Hanover. After some years in Heidelberg, Darmstadt and Rome, Gervinus settled in Heidelberg, where in 1844 he was appointed honorary professor. In the following year he espoused the cause of the German Catholics, hoping for a union of all the Christian confessions and the establishment of a national church. In 1846 he came forward as a champion of the Schleswig-Holsteiners. With other patriotic scholars he founded the *Deutsche Zeitung,* one of the best-written liberal journals published in Germany in the 19th century. Between 1849 and 1852 Gervinus published his important work. *Shakespeare,* in 4 vol. (4th ed., 2 vol. [1872]; Eng. trans, by F. E. Bunnett [1863] new ed. [1877]). During this period he also sketched his *Geschichte des neunzehnten Jahrhunderts,* 8 vol. (1854–60). His parallel study of Handel and Shakespeare appeared in 1868.

See M. Rychner, *G. G. Gervinus. Ein Kapitel über Literaturgeschichte* (1922) (A. Gs)

GESENIUS, HEINRICH FRIEDRICH WILHELM (1786–1842), German orientalist and biblical critic, was born at Nordhausen. Hanover, on Feb. 3, 1786, and was educated at Helmstadt and at Gottingen. In 1811 he became professor of theology at Halle, where he remained until his death on Oct. 23, 1842. To Gesenius, uho was an exceptionally popular teacher, belongs in a large measure the credit of having freed Semitic philology from theological and religious prepossession. and of inaugurating the strictly scientific (and comparative) method

His chief work, the *Hebräisches u. Chaldaisches Handwörterbuch* (1810–12), has passed through several editions (Eng. ed.: Francis Brown, S. R. Driver and Charles A. Briggs, *A Hebrew and English Lexicon of the Old Testament,* 1907).

GESNER, ABRAHAM (1797–1864), Canadian geologist and inventor, noted for his early processes for distilling kerosene, was born in Nova Scotia on May 2, 1797. He qualified as a doctor of medicine in London in 1827. Returning to the dominion, he published in 1836 *Remarks on the Geology and Mineralogy of Nova Scotia,* and in 1843 brought before the Geological society of London "A Geological Map of Nova Scotia, With an Accompanying Memoir." In 1849 he issued a volume on the industrial resources of the country. He dealt also with the geology and mineralogy of New Brunswick and Prince Edaard Island. In 1854 Gesner established a New York company at Newton Creek. L.I., to manufacture kerosene from petroleum Devoting himself later to the economic side of geology in various parts of North America he published in 1861 *A Practical Treatise on Coal, Petroleum and Other Distilled Oils,* which was translated into a number of languages. He died at Halifax, N.S., on April 29, 1864.

GESNER, JOHANN MATTHIAS (1691–1761), German classical scholar and schoolmaster, was born at Roth, near Ansbacb, and died at Gottingen, where he had become professor of rhetoric. His special merit lies in the attention he devoted to the explanation and illustration of the subject matter of the classical authors.

His principal works are editions of the *Scriptores rei rusticae,* of Quintilian, Claudian, Pliny the Younger, Horace, and the Orphic poems (published after his death); *Primae lineae isagoges in eruditionem universalem* (1756); an edition of B. Faber's *Thesaurus erudi-*

tionis scholasticae (1726), continued under title *Novus linquae et eruditionis Romanae thesaurus* (1749); *Opuscula minora varii argumenti* (1743–45); *Thesaurus epistolicus Gesnerianus,* ed. by Klotz (1768–70); *Index etymologicus latinitatis* (1749). *See* C. H. Pöhnert, *J. M. Gesner und sein Verhältnis zum Philanthropinismus und Neuhumanismus* (1898); and Sandys, *Hist. of Class. Schol.* iii, 5–9 (1908).

GESNER, KONRAD VON (1516–1565), German-Swiss writer and naturalist, called by Cuvier "the German Pliny," was born at Zurich. He took his M.D. at Basle in 1541, and then practised at Zurich, where he became lecturer in physics at the Carolinum. He died of plague on Dec. 13, 1565.

To his contemporaries he was best known as a botanist, though his botanical mss. were not published till long after his death (at Nuernberg, 1751–71), he himself issuing only the *Enchiridion historiae plantarum* (1541) and the *Catalogus plantarum* (1542) in four tongues. In 1545 he published his remarkable *Bibliotheca universalis* (ed. by J. Simler, 1574), a catalogue (in Latin, Greek and Hebrew) of all past writers with the titles of their works, etc. A second part, under the title of *Pandeclarium sive partitionum universalium Conradi Gesneri Ligurini libri xxi,* appeared in 1548; only 19 books being then concluded. The 21st book, a theological encyclopaedia, was published in 1549, but the 20th, intended to include his medical work. was never finished. His great zoological work, *Historia animalium,* appeared in 4 vol. (quadrupeds, birds, fishes) folio, 1551–58, at Zurich, a fifth (snakes) being issued in 1587 (there was a German translation entitled *Thierbuch,* of the first 4 vol., Zurich, 1563); this work was the starting point of modern zoology. Not content with such vast works, Gesner put forth in 1555 his book entitled *Mithridates de differentiislinguis,* an account of about 130 known languages, with the Lord's Prayer in 22 tongues, while in 1556 appeared his edition of the works of Aelian. To nonscientific readers, Gesner is probably best known for his love of mountains (below the snow line) and for his many excursions among them, undertaken partly as a botanist, but also for the sake of mere exercise and enjoyment of the beauties of nature. In 1541 he prefixed to a singular little work of his (*Libellus de lacte et operibus lactariis*) a letter addressed to his friend, J. Vogel, of Glarus, as to the wonders to be found among the mountains, declaring his love for them, and his firm resolve to climb at least one mountain every year, not only to collect flowers, but in order to exercise his body.

In 1555 Gesner issued his narrative (*Descriptio Montis Fracti sive Montis Pilati*) of his excursion to the Gnepfstein (6,299 ft.), the lowest point in the Pilatus chain, and therein explains at length how each of the senses of man is refreshed in the course of a mountain excursion.

See Lives by J. Hanhart (Winterthur, 1824) and J. Simler (Zürich, 1566); *see* also Lebert's *Gesner als Arzt* (Ziirich, 1854). A part of his unpublished writing, ed. by Schmiedel, was published at Nuernberg in 1753.

GESNERIACEAE, a family of dicotyledonous plants, consisting of herbs, vines and shrubs, chiefly tropical, a few found in temperate regions. About 100 genera are recognized, with in excess of 1,300 species, the tropical genera being sharply limited geographically as between the tropics of the two hemispheres. Large genera in the old world are *Cyrtandra, Didymocarpus* and *Aeschynanthes,* and in the new world *Columnea, Kohleria, Corytholoma* and *Gesneria.* Many species representing various genera are cultivated for ornamental purposes because of their very showy flowers, those common in the United States being representatives of *Sinningia,* popularly known as *Gloxinia.*

(E. D. ML.)

GESSLER, OTTO KARL (1875–1955), German statesman, was born at Ludwigsburg on Feb. 6. 1875, and entered the legal department in Bavaria in 1905. He was burgomaster of Regensburg in 1911, and of Nuremberg in 1914–19. He was a member of the German Democratic party and was minister of reconstruction in the reich from 1919 to 1920, and from 1920 to 1928 minister of defense. After the entry of German troops into the demilitarized zone in 1920. and the occupation by French troops of Frankfurt. Darmstadt and Hamburg, Gen. Gustav Noske resigned, and Gessler, following him, began his tenure of office as minister of war, faced with the necessity of allaying the suspicion of the Allies. He had as his colleague Gen. Hans von Seeckt and in spite of difficulties succeeded in reorganizing the *Reichswehr.* Gessler became increasingly unpopular with the parties of the left. and the Social Democrats asserted that relations were maintained between the patriotic unions and the *Reichswehr.* He resigned on Jan. 12, 1928. Gessler died March 24, 1955, in Lindenberg, Ger.

GESSNER, SALOMON (1730–1788), Swiss poet, painter and etcher, was born at Zürich on April 1, 1730, and died there on March 2, 1788. The first of his writings to attract attention was his *Lied eines Schweizers an sein bewaffnetes Madchen* (1751); but most of his other work consisted of "Pastoral Idylls" in a rhythmical prose. *Der Tod Abels* (1758) was translated into most European languages. including Welsh. The English version ran through about a score of editions, was appreciated by Sir Walter Scott, Lord Byron and William Wordsworth. and is mentioned by Thomas Hood in his "Dream of Eugene Aram."

This extraordinary popularity, not very intelligible now, was apparently due to the fact that he was one of the earliest poets to combine keen observation and love of nature, profound religious feeling and strong patriotism. He translated some of Pope's *Pastorals.*

Gessner's etchings are better than his somewhat conventional landscapes.

The final collected edition of his works was published at Zürich in 1841. Lives of him were written by J. J. Hottinger (1796) and H. Wolfflen (1884). *See* also his *Briefwechsel mit seinem Sohn* (1861) and Bertha Reed, *The Influence of Salomon Gessner on English Literature* (1905).

GESSO, an Italian word (Lat. *gypsum*) for plaster of Paris, especially when used as a ground for painting, or for modelling or sculpture. (*See* SCULPTURE TECHNIQUE.)

GESTALT PSYCHOLOGY: *see* PSYCHOLOGY, HISTORY OF.

GESTA ROMANORUM, a Latin collection of anecdotes and tales, probably compiled about the end of the 13th century or the beginning of the 14th; one of the most popular books of the time, and the source, directly or indirectly, of later literature, in Chaucer, Gower, Shakespeare and others. Of its authorship nothing certain is known; but it was evidently intended as a manual for preachers.

The name, *Deeds of the Romans,* is only partially appropriate to the collection, since it comprises fragments of very various origin, oriental and European. The style is barbarous, and the narrative ability of the compiler seems to vary with his source; but he has managed to bring together a considerable variety of excellent material. He gives us, for example, the germ of the romance of "Guy of Warwick"; the story of "Darius and His Three Sons," versified by Occleve; part of Chaucer's "Man of Lawe's Tale"; and a tale of the emperor Theodosius, the same in its main features as that of Shakespeare's *Lear.* Owing to the loose structure of the book, it was easy for a transcriber to insert any additional story into his own copy, and consequently the mss. of the *Gesta Romanorum* exhibit considerable variety. The earliest editions are supposed to be those of Ketelaer and de Lecompt at Utrecht, of Arnold Ter Hoenen at Cologne, and of Ulrich Zell at Cologne—all of uncertain date.

An English translation, probably based directly on the ms. Harl. 5,369, was published by Wynkyn de Worde about 1510–15, the only copy of which now known is preserved in the library of St. John's college. Cambridge. In 1577 Richard Robinson published a revised edition of Wynkyn de Worde. and the book proved highly popular. Between 1648 and 1703 at least eight impressions were issued. In 1703 appeared the first volume of a translation by B. P., probably Bartholomew Pratt, "from the latin edition of 1514." A translation by the Rev. C. Swan forms part of Bohn's antiquarian library and was re-edited by Wynnard Hooper in 1877. Critical editions of the Latin text have been produced by A. Keller (Stuttgart, 1842) and Oesterley (Berlin, 1872). *See* also Warton, "On the Gesta Romanorum." dissertation iii, prefixed to the *History of English Poetvy;* Douce, *Illustrations of Shakespeare,* vol. ii; F. Madden, Introduction to the Roxburghe Club edition of *The Old English Versions of the Gesta Romanorum* (1838);

Gesta Romanorum, trans. by C. Swan (1824); M. Komroff (ed.), *Tales of the Monks from the Gesta Romanorum* (1928).

GESTATION PERIOD. The period of gestation or pregnancy in mammals is usually defined as the time, between conception and birth, in which the embryo or fetus is developing in the uterus. This definition raises occasional difficulties since in some species (*e.g.*, in monkeys and man) with long periods during which intercourse may be performed, the exact time of conception may not be known. In these cases it is customary to date the beginning of the period from some well-defined point in the reproductive cycle, such as the beginning of the previous menstrual period. However, as knowledge of the time of ovulation becomes more precisely known correction is made for this factor.

The length of the gestation period varies from species to species, and each has its characteristic average duration. The shortest known gestation is that of the Virginian opossum, about 12 days, and the longest that of the Indian elephant, about 22 months. Very little is known of the causes of this species variation but in most mammals the time of birth is determined by the length of life of the *corpus luteum*, a glandular organ which replaces the ovum in the ovary. The *corpus luteum* secretes a hormone. progesterone, which is essential for the maintenance of pregnancy. When it degenerates and no longer secretes progesterone, birth follows. The length of life of the *corpus luteum* is, therefore, a determining factor in the length of the gestation period. Pregnancy may be extended by the injection of progesterone and the young continue to grow, but they do not live for more than a few days under this treatment. However, this is not the only mechanism, since in the mare and the East African bat *Nycteris luteola*, the *corpora lutea* (plural) degenerate early in pregnancy, yet pregnancy continues. Probably in these species some other organ takes over the secretion of progesterone. Removal of the *corpora lutea* during pregnancy produces variable results. In the monkey and in man they may be removed early, *i.e.*, soon after uterine implantation of the embryos, without interruption of gestation; in other species (*e.g.*, mice. cattle and goats) the *corpora lutea* appear to be essential throughout, since abortion or resorption of the embryos follows their excision.

Gestation Periods
(in days)

Animal	Average	Variation
Ape, Barbary	210	
Ass	365	
Baboon, sacred	183	
Bat, Common European	50	
Bear, American black	215	
Buffalo (Bison)	275	
Camel	406	370–440
Cat	63	60–70
Cattle	284	260–300
Chimpanzee	237	216–261
Chipmunk	31	
Coyote	60–65	
Deer, Virginia	215	
Dog	61	58–63
Dolphin	276	
Elephant, Indian	645	520–730
Ferret	42	
Fisher	338–358	
Fox	52	49–55
Giraffe	395–425	
Goat	151	145–157
Ground squirrel	28	
Guinea pig	68	
Hamster	16½	
Hedgehog, European	35–40	
Horse	337	320–355
Hyena	110	
Kangaroo, giant	38–40	
Lion	108	105–113
Man	267	250–290
Marten, pine	220–265	
Mink	50	39–76
Monkey, capuchin	185	
Monkey, grivet	215	
Monkey, rhesus	164	146–180
Mouse	19	18–20
Opossum, Virginian	12½	
Otter, Canada	62

Seal, northern fur	350	
Sheep	148	143–159
Skunk	62	
Squirrel, gray	44	
Tiger	105–109	
Whale	*c.* 365	
Woodchuck	28	

Evolutionary Factors.—In the course of evolution the duration of gestation appears to have become adapted to the needs of the species. The degree of ultimate growth is a factor, for smaller animals usually have shorter periods of gestation than do larger forms. Main exceptions to this rule are found in the guinea pig and related South American rodents, in which gestation is prolonged (65 days for the guinea pig and 111 days for the chinchilla), in comparison with 20–30 days which is the usual length for rodents. The young of these species are born in a state of greater maturity than are those of the rat with its period of 22 days Another factor is that, in many species with restricted breeding seasons, the gestation period is adjusted to cause birth at the season when food is most abundant. Thus the mare, a spring breeder with 11 months' gestation, has its young the following spring. while the sheep, a fall breeder with a 5 months' gestation, lambs also in the spring. Animals which live in the open tend to have longer gestations and the young are born in a state of greater maturity than those which can conceal their young in underground burrows or in caves. This applies to rodents generally, and to the bear whose young are born very immature, while the she-bear is in her period of winter sleep; these animals have short periods. The Virginian opossum and marsupials generally have short gestations; 40 days only for the largest kangaroos. The young are born in an extremely immature state and immediately transfer to the pouch in which gestation may be said to continue.

Delayed Implantation.—Embryos of some species experience an arrest in development at the blastocyst (hollow sphere of cells) stage, thus greatly prolonging the gestation period. This is especially true of the fur-bearing carnivores, the martens and weasels. Thus, the European badger and American marten breed in July and August; the embryo develops for a few days, then lies dormant in the uterus and is not implanted in the uterus until January. After implantation, however, development is normal and birth occurs in March. The total gestation period is thus about 250 days—only 50 actually taken up by growth. The dormant period can be reduced by at least three months if the pregnant females are exposed to artificial light during autumn and winter in order to increase daily amounts of light, a result which suggests that the pituitary gland, by its regulation of the *corpus luteum*, may be involved in prolongation. This type of gestation has also been observed in the armadillo and the roe deer; there is reason to suspect that it occurs in bears and seals.

Delayed implantation also occurs in rodents of the rat and mouse family which become pregnant while they are still suckling a litter. Gestation in these is usually 21 days, but under such circumstances it may be prolonged to 30 or 40 days. The prolongation results from the drain on the mother caused by lactation, since the degree of lengthening is directly related to the number of young which are being suckled. Delayed implantation is shown less in larger rodents. such as the common rat (gestation 22 days) and the cotton rat (27 days) than it is in mice.

Minor Variations in the Gestation Period.—If a large series of gestations of one species are plotted as a curve the distribution is found to be normal, *i.e.*, there are few of short length; then the daily frequency increases rapidly to a maximum; and the number of longer gestations falls off rapidly until there are very few greatly prolonged ones. This distribution suggests that either a single factor or a great number of minor factors, all culminating at or near one date determine the length of gestation. The latter is probably near the truth as several minor variations are known to occur—in man, the gestation period for males is three to four days longer than that for females; and in cattle, bulls are carried about one day longer than heifers. In both species the gestation period of twins is five to six days less than it is for singlets. In species such as the rabbit or pig, which bear many at a time, gestation is shorter for large litters than it is for small ones. Heredity, also, influences gestation since in cattle the mean gestation period ior Holstein-Friesians is 279 days, while for Brown Swiss it is 290 days, with other breeds between these extremes. The same tendency is noticeable in horses, where draft horses tend to have a shorter gestation than saddle horses, though Percherons fall into the longer group.

The season of year affects gestation in a few species. This effect is most marked in the horse. in mhich gestations terminating in winter average about 20 days shorter than those ending at any other time of year. The cause of this has not been explained. The age of either parent is without influence on the duration of gestation.

When hybrids are produced by crossing of two species with different gestation periods, the hybrid is carried for a period between those of the two parents. Thus a mare carrying a mule foal (fathered by a jackass) has a gestation period about 10 days longer than her normal period, while a jenny ass carrying a hinny (fathered by a stallion) has a period about 10 days less than the normal for the ass. which is about 365 days. In either case the gestation period of the hybrid is not exactly midway between those of the parents, but is a little toward the mother's species, suggesting that maternal physiology is an influence as well as that of the hybrid.

See also EMBRYOLOGY; EMBRYOLOGY, HUMAN; REPRODUCTION; REPRODUCTIVE SYSTEM; CHILDBIRTH; PREGNANCY.

For a more complete discussion *see* L. B. Flexner's *Gestation* (1955); the gestation periods of many species may be iound in J. H. Kenneth's *Gestation Periods* (1943). (S. A. A.)

GESUALDO, DON CARLOS, PRINCE OF VENOSA (*c.* 1560–1613), Italian composer, was born in Naples about 1560. He was a nephew of Alfonso Gesualdo, archbishop of Naples, and probably a pupil of Pomponio Nenna of Bari. His fame as a lutenist in his own day mas great and spread over all Italy; his madrigals have a peculiar interest today in view of their extreme modernness. A dramatic incident in his life was the murder, in 1590, of his wife with her lover by his orders. He afterward went to the court of Alfonso d'Este at Ferrara, and in 1594 married Donna Eleonore d'Este.

In the same year Gesualdo published his first two books of five-part madrigals. These mere followed by the third, fourth, fifth and sixth books, and in 1613, the complete edition: *Partitura delli sei libri de Madrigali a cinque Voci*. The first four books were masterly in style, but the fifth and sixth showed an extraordinary advance in the direction of modern harmony and close affinity between music and words. Gesualdo seems to have written down such progressions and modulations as pleased him. His instinct for harmonic effect was marvellous as was his grasp of the emotional possibilities in his texts. The union of words and music was complete. Short, exclamatory phrases and compressed harmony in the dramatic portions contrasted vividly with the smooth contrapuntal writing of quieter moments. One of his most characteristic madrigals. *Moro lasso al mio duolo,* is printed in Burney's *General History of Music*. *A* volume of *Sacrae Cantiones* for five. six and seven voices appeared in 1603,

See Hawkins, *Hist. of Music* (1776): Kroyer. *Anfange der Chronzatik im italienischen Madrigal des XVI Jahrhunderts* (1902); Gray and Hesseltine, *Carlo Gesualdo* (1926); and Grove's *Dictionary of Music and Musicians*, "Gesualdo," by Scott Goddard. Modern reprints of the madrigals will be found in *Raccolta nazionale,* vol. lix–lxii: Barclay Squire, *Ausgewählte Madrigale;* L. Torchi. *L'Arte musicale in Italia,* vol. iv; Pr. de la Moskova, *Recueil des morceaux de musique ancienne*.

GETA, PUBLIUS SEPTIMIUS (189–212), younger son of the Roman emperor Septimius Severus, was born at Mediolanum (Milan). In 198 he received the title of Caesar, and in 209 those of Imperator and Augustus. Between him and his brother Caracalla there existed from their eariy years a keen rivalry. On the death of their father in 211 they were proclaimed joint emperors; and after the failure of a proposed arrangement for the division of the empire, Caracalla pretended a desire for reconciliation. He arranged a meeting with his brother in his mother's apartments, and had him murdered in her arms by some centurions.

GETAE, an ancient people of Thracian origin, closely akin to the Daci (*see* DACIA). The original home of the Getae seems to have been the district on the right bank of the Danube between the rivers Oescus (Iskr) and Iatrus (Yantra). The view that the Getae were identical with the Goths is not generally accepted. Their name first occurs in connection with the expedition of Darius Hystaspes (515 B.C.) against the Scythians (*see* SCYTHIA), in the course of which they were brought under his sway, but they regained their freedom on his return to the east. During the 5th century, they appear as furnishing a contingent of cavalry to Sitalces, king of the Odrysae, in his attack on Perdiccas II. king of Macedon, but the decay of the Odrysian kingdom again left them independent. When Philip II of Macedon in 342 B.C. reduced the Odrysae to the condition of tributaries, the Getae made overtures to the conqueror. Their king Cothelas undertook to supply Philip with soldiers, and his daughter became the wife of the Macedonian. About this time, perhaps being hard pressed by the Triballi (*q.v.*) and other tribes, the Getae crossed the Danube. Alexander the Great, before transporting his forces into Asia, decided to make his power felt by the Macedonian dependencies. His operations against the Triballi not having met with complete success, he resolved to cross the Danube and attack the Getae. The latter. unable to withstand the phalanx, abandoned their chief town, and fled to the steppes. where Alexander was unwilling to follow them. About 326, an expedition conducted by Zopyrion, a Macedonian governor of Thrace, against the Getae. failed disastrously. In 292, Lysimachus declared war against them, alleging as an excuse that they had rendered assistance to certain barbarous Macedonian tribes. He penetrated to the plains of Bessarabia, where his retreat was cut off and he was forced to surrender. Although the people clamoured for his execution, Dromichaetes, king of the Getae, allowed him to depart unharmed, probably on payment of a ransom. When the Gauls made their way into eastern Europe, they came into collision with the Getae, whom they defeated and sold in large numbers to the Athenians as slaves. From this time the Getae seem to have been usually called Daci; for their further history *see* DACIA.

The Getae are described by Herodotus (iv, 93–96) as the most valiant and upright of the Thracian tribes; but what chiefly struck Greek inquirers was their belief in the immortality of the soul and their worship of Salmoxis whom the euhemerists of the colonies on the Euxine made a pupil of Pythagoras. They were experts in the use of the bow and arrow while on horseback.

GETHSEMANE (*i.e.,* "oil press"), the place to which Jesus withdrew with his disciples on the eve of the Crucifixion. The Greek terms used of it in the Gospels suggest that it was an enclosed piece of ground. There was probably a house on it and presumably an oil press. It lay east of Kidron and was a part of the Mount of Olives. The traditional site was secured by the Franciscans (1681), enclosed by them (1848), and laid out as an European flower garden. The "garden" of Christ's time was an orchard. The "Grotto of the Agony" was marked from the 4th century by a sanctuary which was later destroyed. Another church was erected on the site in the 12th century. In 1920 when the church was being rebuilt on the site of the 12th century building, the floor of the 4th century basilica was laid bare, disclosing a different orientation. Plans were altered and re-erection proceeded on the site and along the lines of the primitive church. The Greeks have a garden called Gethsemane distinct from the Latins.

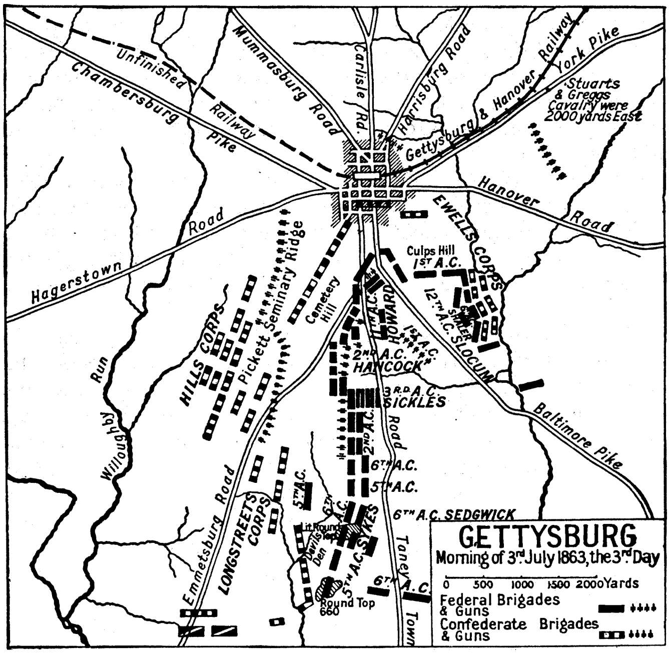
(E. Ro.)

GETTYSBURG, a borough of southern Pennsylvania, U.S.A., 35 mi. S.W. of Harrisburg; the county seat of Adams county. It is on federal highways 15, 30 and 140; and is served by the Reading and the Western Maryland railways. The population in 1950 was 7,046; in 1940, 5,916 by federal census. It lies in a valley $1\frac{1}{2}$ mi. wide, at an altitude of 520 ft., surrounded by beautiful rolling country and fertile farmlands. In the national cemetery, which was laid out soon after the battle of Gettysburg, are the graves of 3,814 U.S. soldiers; and the spot where Abraham Lincoln, at the dedication in Nov. 1863, delivered his memorable "Gettysburg address" is marked by a monument. The battlefield was made a national military park (2,448.17 ac.) in 1895 and transferred to the jurisdiction of the national park service in 1933. The lines of the battle have been laid out and details of the battle are commemorated by monuments, markers and tablets. Five steel observatories provide views of the entire area. Gettysburg was settled about 1780, became the county seat in 1800 and was incorporated as a borough in 1806.

Battle **of Gettysburg.**—The battle of July 1, 2 and 3, 1863, is often regarded by reliable historians as the turning point of the American Civil War (*q.v.*). It arose from a chance encounter. Lee, the commander of the Confederate army of Northern Virginia, had intended to concentrate his scattered forces at Cashtown while Meade, the Federal commander, although he had a cavalry division in Gettysburg, had no idea of holding the town prior to the battle on July 1. This cavalry division, supported by two weak army corps, was screening the concentration of his army of the Potomac in a selected position on Pipe creek to the southeastward. On June 30, however, one of A. P. Hill's Confederate brigades, sent to Gettysburg to obtain fresh stocks of shoes, had found it occupied by Federal cavalry. This led Hill, on his own initiative, to advance there on July 1 to explore the situation. At the same moment Ewell's corps was moving down toward Gettysburg from the north. Lee's remaining corps, commanded by Longstreet, was in the rear of Hill's corps. Hill's lead, ing brigades met strenuous resistance from the Federal cavalry division of Gen. John Buford, which was promptly supported by the infantry of the 1st Corps under Gen. J. F. Reynolds. The Federals so far held their own that Hill had to deploy two-thirds of his corps for action, and the western approaches of Gettysburg were still held when Ewell appeared to the northward. Reynolds had already fallen, and the command of the Federals, after being held for a time by Gen. Abner Doubleday, was taken over by Gen. O. O. Howard, the commander of the 11th Corps, which took post to bar the way to Ewell on the north side. But Ewell's attack, of which the decisive thrust. at 3.30 P.M. was led by the fiery Jubal Early, swiftly drove back the 11th Corps to Gettysburg; the 1st Corps, with its flank thus laid open, fell back also, and the remnants of both Federal corps retreated through Gettysburg to the Cemetery hill position. They had lost severely in the struggle against superior numbers, and there had been some disorder in the retreat. Still a formidable line of defense was taken up on Cemetery hill and both Ewell and Lee refrained from further attacks, for the Confederates had also lost heavily during the day and their concentration was not complete. In the meanwhile Meade had sent forward Gen. W. S. Hancock, the commander of the Federal 2nd Corps, to examine the state of affairs, and on Hancock's report he decided to fight on the Cemetery hill position. Two corps of his army were still distant, but the 12th arrived before night, the 3rd was near, and Hancock moved the 2nd Corps on his own initiative. Headquarters and the artillery reserve started for Gettysburg on the night of July 1. On the other side, the last divisions of Hill's and Ewell's corps formed up opposite the new Federal position, and Longstreet's corps prepared to attack its left.

Owing, however, to misunderstandings between Lee and Longstreet (qq *v.*), the Confederates did not attack early on the morning of the 2nd, so that Meade's army had plenty of time to make its dispositions. The Federal line at this time occupied the horseshoe ridge, the right of which was formed by Culp's hill, and the centre by Cemetery hill, from which point the left wing stretched southward, the 3rd Corps on the extreme left, however, being thrown forward considerably. The 12th held Culp's, the remnant of the 1st and 11th Cemetery hill. On the left was the 2nd, and in its advanced position—the famous "salient"—which was occu-



PLAN OF THE BATTLE OF GETTYSBURG MORNING OF THE THIRD DAY, JULY 3, 1863, SHOWING DISPOSITION OF UNION AND CONFEDERATE TROOPS

pied contrary to Meade's orders, the 3rd, soon to be supported by the 5th; the 6th, with the reserve artillery, formed the general reserve. It was late in the day when the Confederate attack was made, and valuable time had been lost, but Longstreet's troops advanced with great spirit. The 3rd Corps salient was the scene of desperate fighting; and the "Peach Orchard" and the "Devil's Den" became as famous as the "Bloody Angle" of Spottsylvania or the "Hornets' Nest" of Shiloh. While the Confederate attack was developing, the important positions of Round Top were unoccupied by the defenders—owing to the 3rd Corps having taken up its unduly advanced position. This omission was repaired only in the nick of time. The danger was perceived by the commanding engineer of the army, General Gouverneur K. Warren, who at once notified General George Sykes, commanding the 5th army corps. General Warren asked for troops with which to hold Little Round Top, and Vincent's and Weed's brigades were sent there. The attack on Little Round Top was, after a hard struggle, repulsed. The 3rd corps, in the meantime attacked by troops of Hill's and Longstreet's corps, was pressed back, and the Confederates actually penetrated the main line of the defenders, though for uant of support Wright's brigade (Hill's corps) which achieved this was quickly driven out. Ewell on the Confederate left waited for the sound of Longstreet's guns, and thus no attack was made by him until late in the day. Here Culp's hill was carried with ease by one of Ewell's divisions, most of the Federal 12th Corps having been withdrawn to aid in the fight on the other wing; but Early's division was repulsed in its efforts to storm Cemetery hill. Two of Hill's divisions, Pender and Heth, and Rode's division of Ewell's corps, remained inactive.

That no decisive success had been obtained by Lee was clear to all, but Ewell's men on Culp's hill, and Longstreet's corps below Round Top, threatened to turn both flanks of the Federal position, which was no longer a compact horseshoe but had been considerably prolonged, to the left; and many of the units in the Federal army had been severely handled in the fighting. General Meade did not discuss a plan of retreat on July 2, but during a council of war that night did discuss plans of battle for

July 3. General Lee decided to alter his tactics. The broken ground near Round Top offered so many obstacles that he decided not to press Longstreet's attack further. Ewell was to resume his attack on Meade's extreme right, while the decisive blow was to be given in the centre (between Cemetery hill and Trostle's) by an assault delivered in a pseudo-Napoleonic manner —Napoleon would scarcely have launched his characteristic decisive thrust with one fresh division against an "unstretched" line and strong front — by the fresh troops of Pickett's division, which belonged to the corps of Longstreet, who was put in charge of the central attack. Meade, however, was not disposed to resign Culp's hill, and with it the command of the Federal line of retreat to Ewell, and at early dawn on the 3rd a division of the 12th Corps, well supported by artillery, opened the Federal counterattack; the Confederates made a strenuous resistance, but after four hours' hard fighting the other division of the 12th Corps and a brigade of the 6th, intervened with decisive effect, and the Confederates were driven off the hill. The defeat of Ewell did not, however, cause Lee to alter his plans. Pickett's division was to lead in the great assault, supported by the part of Hill's corps that had not already been engaged. Col. E. P. Alexander, Longstreet's chief of artillery, formed up one long line of 75 guns, and 65 guns of Hill's corps came into action on his left. To the converging fire of these 140 guns the Federals, cramped for space, could oppose only seventy-seven. The attacking troops formed up before 9 A.M., yet it was long before Longstreet could bring himself to order the advance, upon which so much depended, and it was not till about 1 P.M. that the guns at last opened fire to prepare the grand attack. The Federal artillery replied, but after nearly two hours' cannonade its commander, Gen. H. J. Hunt, ordered his batteries to cease fire in order to reserve their ammunition to meet the infantry attack. Ten minutes later, in response to an appeal from Alexander, Pickett asked and received permission to advance, and the infantry moved forward to cross the 1,200–1,400 yds. which separated them from the Federal line. Their own artillery was short of ammunition — therefore Alexander's appeal; the projectiles of that day were not sufficiently effective to cover the advance at long ranges, and thus the Confederates, as they came closer to the enemy, met a tremendous fire of unshaken infantry and artillery.

The charge of Pickett's division is one of the most famous episodes of military history. In the teeth of an appalling fire from the rifles of the defending infantry, who were well sheltered, and from the guns which Hunt had reserved for the crisis, the Virginian regiments pressed on and finally broke bleade's first line. But the strain was too great for the supporting brigades, Heth's division and parts of Pender's and Anderson's divisions. Hancock made a counterstroke, and the remnant of the Confederates retreated. Of Pickett's own division over three-quarters, 3,393 officers and men out of 4.800. were left on the field, two of his three brigadiers were killed and the third wounded, and of 1j regimenta! commanders ten were killed and five wounded. One regiment lost 90% of its numbers. The failure of this assault practically ended the battle; but Lee's line was so formidable that Meade did not in his turn send forward the army of the Potomac —a reluctance for which he has been severely criticized. By the morning of July 5, Lee's army was in full retreat for Virginia. He had lost about 30.000 men in killed, wounded and missing out of a total force oi perhaps 75,000. Meade's losses were over 23,000 out of about 82,000 on the field. The main body of the cavalry on both sides was absent from the field, but a determined cavalry action was fought on July 3 between the Confederate cavalry under J. E. B. Stuart and that oi the Federals under D. McM. Greg:: some miles east of the battlefield, and other Federal cavalry made a dashing charge in the broken ground southwest of Round Top on the third day, inflicting thereby, though at great loss to themselves, a temporary check on the right wing of Longstreet's infantry.

GEULINCX, ARNOLD (1624–1669), Flemish philosopher and devoted admirer of Descartes, was born at Antwerp in Jan. 1624. Having studied and lectured at Louvain till 1658, when he was deprived of his post, he became a Protestant and, from 1663, lectured at the university of Leyden. He died at Leyden in Nov. 1669.

As Descartes elaborated his theory of knowledge by starting from the *cogito*, so Geulincx developed from it a theory of moral conduct. He goes halfway toward occasionalism, for, unlike N. Malebranche, he allows the self's efficacy to produce changes of state in itself, denying only its power to produce them in bodies—its own or another. (*See* CARTESIANS.)

GEUM, a genus of hardy perennial herbs (family Rosaceae, *q.v.*), containing about 60 species, widely distributed in temperate and arctic regions; commonly called avens. The erect flowering stalks spring from a cluster of radical leaves. which are deeply cut or lobed, the largest division being at the top of the leaf. The flowers are borne singly or in clusters on long stalks at the end of the stem or its branches. They are white, yellow or red in colour, and shallowly cup shaped. The fruit consists of a number of dry achenes, each bearing a hook formed from the persistent lower portion of the style, and admirably adapted for ensuring distribution. About 20 species are natives of North America, of which ten are common in moist woods in the eastern United States. Several are easy to cultivate and well adapted for borders or rock gardens. There is not much interest in them for gardening purposes: the exception being the showy *G. chiloense*, which is known in several horticultural forms with bright scarlet flowers. This was introduced into England from Chile in 1826. It is now in most British and American gardens, especially the form called Mrs. Bradshaw. Two species occur in Great Britain; *G. urbanum* is a common hedge plant with small yellow flowers and *G. rivale* (water avens) is a rarer plant found throughout the north temperate zone. Both species were once widely used as a corrective of dysentery, as their roots contain an astringent tannin.
(N. TR.)

GEVELSBERG, a town of Germany, in the *Land* of North Rhine-Westphalia, 6 mi. S.W. from Hagen, on the railway to Düsseldorf. It has hardware factories. Pop. (1950) 27,918.

GEWANDHAUS CONCERTS, famous concerts given at Leipzig, probably those of the oldest standing in existence, since they date back to the time when Bach was cantor of the Thomasschule. They acquired special fame under Mendelssohn (1835–43), while other conductors have included Niels Gade (1844–48), K. Reinecke (1860–95), Arthur Nikisch (1895–1922) and W. Furtwängler (1922–28).

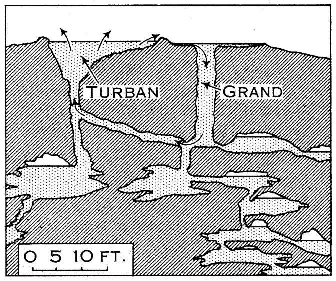
GEX, a town of eastern France, chief town of the *arrondissement* of Gex, in the *département* of Ain; formerly it was the chief town of the canton of Gex when it was included in the *arrondissement* of Nantua; 10 mi. N.N.W. of Geneva and 3 mi. from the Swiss frontier. Pop. (1954) 1,237.

It gives its name to the old Pays de Gex, between Alps and Jura, at various times under Swiss, Genevese and counts of Savoy, until in 1601 it came into the possession of France, retaining, however, until the Revolution its old independent jurisdiction, with Gex as its chief town. The Pays de Gex is isolated by the Jura from the rest of French territory, and until 1926 came within the circumscription of the Swiss customs, certain restrictions being imposed on its products by the French customs. The town is situated 2,000 ft. above sea level at the base of the most easterly chain of the Jura.

GEYSER, an intermittent hot spring which, at more or less regular intervals, spouts its contents of water and steam into the air to heights varying from mere inches to, in exceptionally vigorous geysers, hundreds of feet.

The word stems from "Geysir," the Icelandic proper name, meaning gusher or spouter, which has been applied since 1647 to a particular geyser in southwestern Iceland. In 1847 the German chemist Robert Wilhelm von Bunsen used the word as a technical term for all hot springs similar to "Geysir" in action; the English spelling is geyser.

Geysers are a rare natural phenomenon that occurs mostly in regions of relatively recent volcanic activity. The three areas of highest development are at Yellowstone National park in the United States, and in Iceland and New Zealand. Geysers have also been reported from Alaska, Tibet, Japan, the Malay archipelago, South and Central America. and Nevada. Coldwater springs exhibiting geyser action occur at Kane. Pa.. and Soda Springs, Ida.



FROM BLOSS AND BARTH. BULLETIN OF THE GEOLOGICAL SOCIETY OF AMERICA

HYPOTHETICAL CROSS SECTION THROUGH GRAND AND TURBAN GEYSERS OF YELLOWSTONE PARK

Yellowstone National park in northwest Wyoming possesses the world's greatest concentration of geysers. Whereas all of Iceland contains only 30 known active geysers. Yellowstone's boundaries include some 200 active geysers. almost 10% of the hot springs being geysers. The hot springs and geysers tend to be concentrated along the drainage basins of streams, such areas then being called "geyser basins." This local usage conflicts with the earlier and preferred use of geyser basin to denote the box-1-like depression or crater (see illustration) containing the geyser's pool during quiescence.

The two major geyser basins of Yellowstone National park, the upper basin and the lower basin, are located along the rather level valley floor bordering the Firehole river. The Upper basin, the most spectacular of its type on the globe, possesses a myriad of hot springs and geysers, some with pools containing water above the boiling temperature of 93° C. for that elevation yet. for unknown reasons, not boiling. Old Faithful. the most renowned of the upper basin's jo-odd geysers. erupts to heights of 100 to 150 ft. at intervals of about an hour and for durations of about five minutes. Grand geyser. which erupts irregularly at intervals varying from once to twice a day. majestically expels its water to heights approaching 160 ft.; the eruption, punctuated by short periods of quiescence. may last from 18 to 50 min. and result in the discharge of over 9,000 cu.ft. of water. Castle geyser. whose eruptions may be accompanied by earth tremors. sometimes steams for two hours after the eruption. Beehive geyser, an infrequent performer. was observed to erupt to a height of 219 ft.. the highest measured in the park.

The great geyser district of New Zealand. located near the upper basin of the Waikato river in the south of the province of Auckland. presents a striking profusion of boiling springs. steam jets and mud volcanoes. The geysers were inactive in 1880 but revived after the Tarawera volcanic eruption of 1886: seven gigantic geysers then came into existence, discharging water. steam, mud and stones to heights up to 800 ft. for four hours before quieter conditions prevailed. Waimangu, the greatest of all geysers, was active from 1900 to 1904, occasionally spouting jets to 1,500 ft.; draining nearby Tarawera lake in 1904 caused Waimangu's water level to drop about 3j ft., whereupon geyser action ceased.

Iceland's geysers are mostly concentrated within two areas. one 30 mi. north of Reykjavik. the second extending eastward from Reykjavik toward the active volcano, Hekla. Geysir itself is 30 mi. northwest of Hekla in a broad valley at the foot of a range of hills. During its calm periods Geysir appears as a sea-green pool 60 ft. in diameter and 4 ft. in depth. filling and gently overflowing a bowl-like depression or basin on the summit of a mound of siliceous mineral deposits. or sinter (*q.v.*). Extending downward from the basin's centre is a 10 ft. diameter. 70 ft. deep. well-like shaft whose water temperatures. at various depths. were first measured by V. Lottin in 1836. Ten years later Bunsen and A. L. O. Descloizeaux observed that: (1) Gepsir's temperature increased steadily from its surface downward to the mid-point of its well whereupon, for greater depths. it increased at a lesser rate; and that (2) Geysir's temperature at all depths, except for minor fluctuations. steadily increased as the time for 'the next eruption drew near. Conclusions drawn in Bunsen's classic (1847) paper were: (1 j the steady temperature increase for all depths would, Geysir's temperature-depth relationships being as observed, cause boiling conditions to be most closely approached at mid-depths; (2) an upward movement of the water column in the tube sufficient to cause overflow from the basin would trigger the eruption by elevating the deeper, high-temperature waters to shallower levels of reduced pressure such that the water at mid-level would, during one of these upward surges. exceed the boiling temperature of its new site; (3) the volumes of steam consequently formed at mid-depths would increase the upward surge of the water column to accelerate overflow: and (4) in turn, this accelerated overflow would cause more levels within the geyser column to boil, the chain reaction ultimately producing a full scale eruption.

Bunsen's theory. conceived to fit only Geysir. was widely accepted and extended. perhaps unduly, to cover all geysers. Subsequent work revealed features of geyser action unaccounted for by the theory. For example, H. O. Lang in 1880 noted the necessity of an influx of relatively cooler water to terminate an eruption, otherwise all geysers would simply become steam vents. T. Thorkelsson in 1940 cited convincing evidence in support of his theory that bubbles formed by the dissolved gases in the water. principally nitrogen, carbon dioxide, oxygen and argon, could cause eruptions without the necessity of boiling conditions being attained at depth.

See E. T. Allen and Arthur L. Day, *Hot Springs of the Yellowstone National Park,* Carnegie Institution of Washington, D.C. (1935); T. F. W. Barth. *Volcanic Geology, Hot Springs and Geysers of Iceland,* includes a bibliography of literature on geyser action published between 1780 and 1949, Carnegie Institution of Washington, D.C. (1950).

(F. D. B.)

GEZELLE, GUIDO (1830–1899). Flemish poet. was born at Bruges on May 1. 1830, and died at Bruges on Nov. 27, 1899. He was one of the earliest and greatest leaders for the revival of Flemish as a literary language. He wrote in the dialect of west Flanders patriotic and religious poems inspired by deep feeling and a philosophic spirit. His first volumes of poetry appeared in 1862.

GEZER, a royal Canaanite city described in the Old Testament as on the boundary of Ephraim. in the maritime plain, and near the Philistine border. According to Jerome. Gezer was four Roman miles north of Nicopolio ('Amwas). At this point, near the village of Xbu Shusheh, stands Tell Jezar. whose identification with Gezer was suggested by Clermont Ganneau in 1871 and later confirmed by the discovery of boundary inscriptions with the name Gezer inscribed on rock outcroppings around the site.

History. — In the time of Papi I (c. 2500 B.C.) Gezer marked the high tide of Egyptian invasion of Palestine, and was an objective in the time of Sesostris I (1980–193j B.C.). It is the Kazir of Thutmose III's lists (*c.* 1500 B.C.) and three of the Tel el Xmarna tablets come from Gezer (Gazri). Merneptah, in quelling the revolt of the Palestinian cities, evidently looked upon Gezer as formidable, for he proclaims himself "Binder of Gezer." and "Seized upon is Gezer" is a triumphal cry in his hymn of victory. Throughout the Maccabean wars Gazera. as it was known. was an important frontier post.

Archaeology. — The site was excavated systematically and thoroughly by Macalister for the Palestine Exploration fund from 1902–05 and 1907–09. The excavations revealed a whole series of strata covering all periods from the Neolithic Age to the time of the Maccabees, together with a long series of structures and objects illustrative of a corresponding variety of cultures and cults. Among the discoveries of special interest are two cuneiform tablets of the 7th century B.C., an alignment of monoliths (mazzeboth). many instances of presumed infant sacrifice. a water tunnel cut to a vertical depth of 94 ft.. an agricultural calendar for the year written on a limestone plaque, and a variety of cult objects. Part of the site. including the acropolis. was not available for excavation. Fresh excavations were begun on the site in 1923–24, at the instigation of a private individual. Tombs and diverse epochs with furniture intact have been disclosed.

GEZIRA (*i.e.* the island) a triangular-shaped territory, comprising the districts of Iiorthern and Old Southern Gezira. Blue Nile province. Sudan. It lies between the Blue and White Niles and extends from their confluence at Khartoum as far south as 13° 30' N. Pop. (1956) 853.782, area 8,465 sq.mi. This vast plain lying about 2,000 ft, above sea level is the site of irrigation works known as the Gezira scheme which depends for its water supply on the dam 'at Sennar (*q.v.*).

The canalization system of the Gezira scheme covers an area of approximately 1.000.000 acres and produces valuable crops of millet, fodder and long-staple cotton. The scheme is run under an agreement between the Sudan government. the Sudan Plantations syndicate and the local Sudanese cultivator. The Sudan government, which bore the cost of constructing the Sennar dam and major canalization and maintains them, receives 40% of the proceeds of the cotton crop; the Sudan Plantations syndicate. which is responsible for the supervision of the growing of the crop, its transport. ginning and marketing. receives 20%: while the Sudanese tenant who provides the labour for the cultivation and picking of the cotton receives 40%. These tenants. about 25,000 in number and each farming an area of 40 acres under rotation, are drawn largely from those formerly cultivating in the area under an uncertain and sporadic rainfall. They continue to draw rent for their lands while they are under irrigation.

In a normal year the scheme produces an average of 4 cwt. of long staple cotton to the acre with a total export value of about £3,000,000 besides about 80,000 tons of millet which forms an essential part of the food supplies of the northern Sudan.

The chief town of the area is Wad Medani (pop. 47.677. 108 mi. S. of Khartoum by rail). in which is situated the administrative headquarters of the Blue Nile province. (G. R. F. B.)

GHADAMES (GADAMES or RHADAMES) (Lat. Cidamus or Cydamus), a town in an oasis of the same name. in that part of the Sahara which forms part of Libya. It is about 300 mi. S.W. of the city of Tripoli and some 10 mi. E. of the Algerian frontier, which closely follows the caravan route from Ghadames to Ghat. The oasis. which stands on the cretaceous Tinghert plateau 1.200 ft. above the sea, is enclosed by a circular rampart more than 3 mi. in circumference, the town being at the S.W. corner. The mean temperature is 73°, the rainfall about 8 in., and the number of rainy days six.

The streets of the town are narrow and vaulted and have been likened to the bewildering galleries of a coalpit. The roofs are laid out as gardens and preserved for the exclusive use of the women. The Ghadamsi merchants have been known for centuries as keen and adventurous traders. Ghadames itself is the centre of a large number of caravan routes, and in the early part of the 19th century about 30.000 laden camels entered its markets every year. Its prosperity was affected by the competition of the Tripolitan merchants about 1873 and by the invasion of Bornu by Rabah in 1893. The chief articles brought by the caravans are ostrich feathers, skins and ivory and one of the principal imports is tea.

In 1845 the population was estimated at 3,000, of whom about 500 were slaves and strangers. and more than 1.200 children; in 1954 it n-as 2.271.

The inhabitants are chiefly Berbers and Arabs: while many Tuaregs (*q.v.*) live outside.

Before the Christian era Ghadames was a stronghold of the Garamantes, who took their name from Garama (see FEZZAN). Remains of the old settlement of the Garamantes exist on the plateau near the town. In the 7th century Ghadames was conquered by the Arabs. Afterward it fell under the power of the rulers of Tunisia, then to a native dynasty which reigned at Tripoli, and in the 16th century it became part of the Turkish vilayet of Tripoli, the political fortunes of which it shared. Italian forces effectively occupied the town and oasis in 1924.

GHALCHA, GHARCHA, a name applied by the Turki-speaking population to the group of tribes about the sources of the Oxus and the mountainous regions near them. These fall into three parts: (1) Yüdghah, held by the Yidakh tribes, south of the Dorah pass over the Hindu Kush, in the British sphere of influence, (2) Wakhan, the Wakhi tribe's seat on the upper Panj, Sanglich and Minjan, on the valleys of the Waroj, in Afghanistan. and (3) Shignan, Roshan, about the confluence oi the Panj and Oxus, Sarikol on the eastern slope of the Pamir, and Yaghnob, on an upper affluent of the Zar-afshan — all in the Russian sphere.

Doubtless Iranian by origin. the Ghalchas are classed as an outlier of the shortheaded Alpine race. and the iorm Gharcha suggests that they may be akin to the Gharjis of Gharjistan. They differ from the Tajiks of Badakhshan in type. They are tall, with hair black, chestnut or red, eyes brown to bluish gray. oval faces and nose slightly aquiline. Converted at an early date to the Shi'a creed of Islam they still profess it. which fact separates them from their orthodox neighbours. Wakhan used to export musk. gold, silver and slaves. and Minjan, lapis lazuli. from mines still worked. but little else is known of them, excepting their dialects which differ in each of the regions mentioned. Of the languages four distinct forms are known: Wakhi. spoken in Wakhan, Shigni or Khigni in Shignan and Roshan. Ish Kashmi and Muriani or Murgi. These tongues possess some forms in common with the Dardic languages (*q.v.*), to the south, thus linking the latter with the Iranian tongues. Persian is the second language.

GHANA, formerly the Gold Coast and Togoland, an independent state within the British Commonwealth lying on the west coast of Africa and bounded on the west, north and east by the republics of Ivory Coast. Upper Volta and Togo. As a British colony the Gold Coast comprised the Gold Coast colony. Ashanti (*q.v.*) and the Northern Territories until 1956, when Togoland. which had been administered with the Gold Coast, became integrated with it. On March 6, 1957. the Gold Coast became an independent state and changed its name to Ghana. It became a republic on July 1, 1960. See GOLD COAST.

GHARIAL: see GAVIAL.

GHAT (formerly, Anglo-Indian GHAUT), a Hindi word originally having some such meaning as "staircase" but now signifying a terraced bank. It is sometimes extended to mean a defile giving access through such a bank or through a hill to a plateau, or even to any steep road or rail incline. The word is specifically applied to the artificial terracing of river banks! as in the bathing and crematory ghats at Benares and other Indian cities, and to ferry landings, Topographically it has come to mean a range oi hills. and in this sense is given to the EASTERN AND WESTERN GHATS, the highlands bordering the eastern and western shores of the Indian peninsula.

The term Eastern Ghats is applied to several discontinuous and dissimilar hill areas (there is a loo-mi. gap across the lower Godavari river and the Kistna river). In the north they are dissected blocks of ancient Peninsular rocks. in the centre (the Cuddapah ranges) worn-down stumps of loftier ancient mountains, and in the south mainly rounded masses of gneiss. In Orissa they sometimes exceed 3.000 ft., but they are lower elsewhere.

The Western Ghats are the crest of the great fault scarp of the western edge of the plateau. Their seaward slopes are very steep and dissected by canyonlike valleys: but on the landward side slopes are gentle and valleys wide and mature. 'The scarp begins south of the Tapti estuary and for its first 300 mi. rises to 3,000–5,000 ft. In this section the plateau is capped by the Deccan lavas, which give it a wall-like face and tabular upper surface. From near Goa southward the ancient gneisses and granites of the plateau form the escarpment. For over 200 mi. summit levels are below 3,000 ft. Hill forms are more rounded; and several of the coastal streams have cut their valleys inland beyond the crestline and captured headwaters of plateau rivers. Beyond the 13th parallel summit levels rise again until the Ghats culminate in the Nilgiri hills (*q.v.*). This great dome of gneiss reaches a height of 8,640 ft. in Mt. Doda Betta. It overlooks the wide Palghat gap which is usually regarded as the southern limit of the Ghats. The streams of the Western Ghats are important sources of power, notably at Gersoppa (*q.v.*) and in the Nilgiris. (T. HER.)

GHAZALI (MOHAMMED IBN MOHAMMED ABU HAMID AL-GHAZALI, in mediaeval Europe known as ALGAZEL) (1058–1111), Islamic theologian and philosopher, was born at Tus of Persian stock. In theology he belonged to the school of Al-Ash'ari, which in his time supported the Seljuk regime, and in 1091 he was appointed professor in Baghdad by the vizier Nizam al-Mulk. After a physical and psychological crisis, he left his professorship in 1095 and spent ten years in seclusion cultivating the mystical life, first for two years in Damascus and then, after a pilgrimage to Mecca, probably again in Baghdad. He was prevailed upon by the sultan to accept a professorship at Nishapur in 1105 but soon left it and lived in retirement at Tus with a few disciples.

Most of Ghazali's numerous works have survived, but not all have been published. Several works appear to have been falsely ascribed to him (see the *Journal* of the *Royal* Asiatic *Society*, pp. 24–45, 1952). His chief book, The Revival *of the Religious* Sciences (*Ihya' Ulum* ad-Din): contains the insight he gained from the crisis of 1095 and subsequent meditations, combining theological orthodoxy with mystical experience. Though few followed him exactly, his work partially reconciled theologians and mystics (Sufis), who had often been violently opposed to one another.

If he is sometimes called the greatest Moslem after Mohammed and entitled "the proof of Islam" (Hujjat *al-Islam*), this is less for that reconciliation than for his defense of orthodoxy against the propaganda of the revolutionary Isma'ili movement and against the Arabic Neoplatonic philosophy of Farabi and Avicenna. Ghazali, by his own reading, mastered the logical technique of these philosophers and then, in his Incoherence *of* the Philosophers (*Tahafut al-Falasifah*), used it against their metaphysical positions where these were opposed to Islamic orthodoxy. Since his time most Islamic theology has had a Greek philosophical basis.

Obermann, *Der philosophische und religiose Subjektivismus Ghazalis* (Vienna, 1921); A. J. Wensinck, *La Pensée de Ghazzali* (Paris, 1940); M. Smith, *Al-Ghazali: the mystic* (London, 1945). Much of Ghazali's *Ihya* is reproduced by M. Asin Palacios, *La Espiritualidad de Algazel y su sentido cristiano* (Madrid, 1934–41); and there is an analysis and index edited by G. H. Bousquet (Paris, 1955). W. Montgomery Watt, *The Faith and Practice of al-Ghazali* (New York, London, 1953), includes a translation of his spiritual autobiography. The *Tahafut* is mostly translated in *Averroes' Tahafut al-Tahafut* by S. van den Bergh (London, 1954). (W. M. WT.)

GHAZIABAD, a municipality, with tehsil (subdivision), in Meerut district, Uttar Pradesh, India, 12 mi. E. of Delhi. Pop. (1951) 43,745. The town was founded in 1740 by Ghazi ud-Din, son of Azaf Jah, first nizam of the Deccan. It is an important railway junction and does some trade in grain and hides. One of the colleges of Agra university is in the town.

GHAZIPUR, a municipality, tehsil (subdivision), and district in the Benares division of Uttar Pradesh, India. The town stands on the left bank of the Ganges, 44 mi. E. of Benares. It is the headquarters of the dwindling opium department, where all the opium grown under government licence used to be collected and manufactured. There are also scent distilleries, using the produce of the rose gardens in the vicinity. Pop. (1951) 33,498; tehsil (358 sq.mi.) 488,237.

GHAZIPUR DISTRICT has an area of 1,308 sq.mi. It forms part of the great alluvial plain of the Ganges, which divides it into two unequal portions. The northern tract lies between the Gumti and the Gogra, whose confluences with the main stream mark its eastern and western limits, respectively. The southern tract is much smaller, enclosed between the Karamnasa and the great river itself. Sugar refining is the chief industry. Pop. (1951) 1,141,278.

GHAZNI, a famous city in Afghanistan, the seat of an extensive empire under two mediaeval dynasties, and interesting in the modern history of India. Ghazni stands on the high tableland of central Afghanistan, in 68° 18′ E., 33° 44′ N., at a height of 7,283 ft., and on the direct road between Kandahar and Kabul, 221 mi. by road N.E. from the former and 92 mi. S.W. from the latter. A very considerable trade in fruit, wool, skins, etc., is carried on between Ghazni and India by the *povindah* merchants. Ghazni, long in decay, is reviving since the opening of the Kabul road for motors. It stands at the base of the terminal spur of a ridge of hills, an offshoot from the Gul-Koh, which forms the watershed between the Arghandab, and Tarnak rivers. The castle stands at the northern angle of the town next the hills, and is about 150 ft. above the plain. The town walls are on an elevation, partly artificial, and form an irregular square, partly of stone or brick laid in mud, and partly of clay built in courses, flanked by numerous towers with three gates. The plain in the direction of Kandahar is bare except near the river, where villages and gardens are tolerably numerous. Abundant crops of wheat and barley are grown, as well as of madder, besides minor products. Snow lies 2 or 3 ft. deep for about three months, and tradition speaks of the city as having been more than once overwhelmed by snowdrift. Fuel consists chiefly of prickly shrubs. In summer the heat is not like that of Kandahar or Kabul, but the radiation from the bare heights renders the nights oppressive, and constant dust-storms occur. Probably the existing site formed the citadel only of the city of Mahmud. The remarks of Ibn Batuta (*c.* 1332) already suggest the present state of things, viz., a small town occupied, a large space of ruin; for a considerable area to the northeast is covered with ruins, or rather with a vast extent of mounds, spoken of as Old Ghazni. The only remains retaining architectural character are two remarkable towers rising to the height of about 140 ft., and some 400 yd. apart belonging, on a smaller scale, to the same class as the Kutb Minar at Delhi (*q.v.*). Arabic inscriptions in Cufic characters show the most northerly to have been the work of Mahmud himself, the other that of his son Masa'ud. On the Kabul road, a mile beyond the Minaret of Mahmud, is a village called Rauzah. Here, in a poor garden, stands the tomb of the famous conqueror. The village stands among luxuriant gardens and orchards, watered by a copious aqueduct.

History.—The city is not positively mentioned by any ancient author but it is possibly the *Gazaca* which Ptolemy places among the *Paropamisadae,* and this may not be inconsistent with Sir H. Rawlinson's identification of it with *Gazos,* an Indian city spoken of by two obscure Greek poets as an impregnable place of war. We seem to have definite evidence of the existence of the city before Mohammedan times (644) in the travels of the Chinese pilgrim, Hsüan Tsang, who speaks of *Ho-si-na* (*i.e.,* probably *Ghazni*) as one of the capitals of *Tsaukuta* or Arachosia, a place of great strength. In early Mohammedan times the country adjoining Ghazni was called *Zābul.* When the Mohammedans first invaded that region Ghazni was a wealthy entrepôt of the Indian trade. Of the extent of this trade some idea is given by Ibn Haukal, who states that at Kabul, then a mart of the same trade, there was sold yearly indigo to the value of two million dinars (£1,000,000). The provinces on the Helmund and about Ghazni were invaded as early as the caliphate of Moawiya (662–680). The arms of Yaqub b. Laith swept over Kabul and Arachosia (Al-Rukhaj) about 871, and the people of the latter country were forcibly converted. Though the Hindu dynasty of Kabul held a part of the valley of Kabul river till the time of Mahmud, it is probably to the period just mentioned that we must refer the permanent Mohammedan occupation of Ghazni. In the latter part of the 9th century the family of the Samanid, sprung from Samarkand, reigned in splendour at Bokhara. Alptagin, originally a Turkish slave, and high in the service of the dynasty, about the middle of the 10th century, losing the favour of the court, wrested Ghazni from its chief (who is styled Abu Bakr Lawik, wali of Ghazni), and established himself there. His government was recognized from Bokhara and held till his death. In 977 another Turk slave, Sabuktagin, who had married the daughter of his master Alptagin, obtained rule in Ghazni. He made himself lord of nearly all the present territory of Afghanistan and of the Punjab. In 997 Mahmud, son of Sabuktagin, succeeded to the government, and with his name Ghazni and the Ghaznevid dynasty have become perpetually associated. Issuing forth year after year from that capital, Mahmud (*q.v.*) carried fully 17 expeditions of devastation through northern India and Gujarat, as well as others to the north and west. The wealth brought back to Ghazni was enormous, and contemporary historians give glowing descriptions of the magnificence of the capital as well as of the conqueror's munificent support of literature. Mahmud died in 1030, and some 14 kings of his house came after him; but though there was some revival of importance under Ibrahim (1059–99), the empire never reached anything like the same splendour and power. It was overshadowed by the Seljuks of Persia and by the rising rivalry of Ghor (*q.v.*), the hostility of which it had repeatedly provoked. Bahram Shah (1118–52) put to death Kutbuddin, one of the princes of Ghor, called king of the Jibal or hill country, who had withdrawn to Ghazni. This prince's brother, Saifuddin Suri, came to take vengeance and drove out Bahram. But the latter, recapturing the place (1149), paraded Saifuddin and his vizier ignominiously about the city and then hanged them on the bridge. Ala-uddin of Ghor, younger brother of the two slain princes, then gathered a great host and came against Bahram, who met him on the Helmund. The Ghori prince, after repeated victories, stormed Ghazni and gave it over to fire and sword. The dead kings of the house of Mahmud, except the conqueror himself and two others, were torn from their graves and burnt, whilst the bodies of the princes of Ghor were solemnly disinterred and carried to the distant tombs of their ancestors. It seems certain that Ghazni never recovered the splendour that perished then (1152). Ala-uddin, who from this deed became known in history as *Jahānsoz* (Burn-all), returned to Ghor, and Bahram reoccupied Ghazni; he died in 1157. In the time of his son Khusru Shah, Ghazni was taken by the Turkish tribes called Ghuzz (generally believed to have been what are now called Turkomans). The king fled to Lahore, and the dynasty ended with his son. In 1173 the Ghuzz were expelled by Ghiyasuddin, sultan of Ghor (nephew of Ala-uddin Jahansoz), who made Ghazni over to his brother Muizuddin. This famous prince, whom the later historians call Mohammed Ghori, shortly afterwards (1174–75) invaded India, taking Multan and Uchh. This was the first of many successive inroads on western and northern India, in one of which Lahore was wrested from Khusru Malik, the last of Mahmud's house, who died a captive in the hills of Ghor. In 1192, the king of Ajmere being defeated and slain near Thanewar, the whole country from the Himalayas to Ajmere became subject to the Ghori king of Ghazni. On the death of his brother Ghiyasuddin, with whose power he had been constantly associated and of whose conquests he had been the chief instrument, Muizuddin became sole sovereign over Ghor and Ghazni, and the latter place was then again for a brief period the seat of an empire nearly as extensive as that of Mahmud the son of Sabuktagin. Muizuddin crossed the Indus once more to put down a rebellion of the Khokhars in the Punjab, and on his way back was murdered by a band of them, or, as some say, by one of the *Mulāhidah* or Assassins. The slave lieutenants of Muizuddin carried on the conquest of India, and as the rapidly succeeding events relieved their dependence on any master they established at Delhi that monarchy of which the shadow was still surviving in 1857. The death of Muizuddin was followed by struggle and anarchy, ending for a time in the annexation of Ghazni to the empire of Khwarizm by Mohammed Shah, who conferred it on his famous son, Jelaluddin, and Ghazni became the headquarters of the latter. After Jenghiz Khan had extinguished the power of his family in Turkestan, Jelaluddin defeated the army sent against him by the Mongol at Parwan, north of Kabul. Jenghiz then advanced and drove Jelalhddin across the Indus, after which he sent Ogdai, his son, to besiege Ghazni. Henceforward Ghazni is much less prominent in Asiatic history. It continued subject to the Mongols, sometimes to the house of Hulagu in Persia, and sometimes to that of Jagatai in Turkestan.

Ibn Batuta (*c.* 1332) says the greater part of the city was in ruins, and only a small part continued to be a town. Timur seems never to have visited Ghazni, but we find him in 1401 bestowing the government of Kabul, Kandahar, and Ghazni on Pir Mohammed, the son of his son Jahangir. At the end of the century it was still in the hands of a descendant of Timur, Ulugh Beg Mirza, who was king of Kabul and Ghazni. The illustrious nephew of this prince, Baber, got peaceful possession of both cities in 1504, and has left notes on both in his own inimitable Memoirs. "It is," he says, "but a poor mean place, and I have always wondered how its princes, who possessed also Hindustan and Khorasan, could have chosen such a wretched country for the seat of their government, in preference to Khorasan." He commends the fruit of its gardens, which still contribute largely to the markets of Kabul. Ghazni remained in the hands of Baber's descendants, reigning at Delhi and Agra, till the invasion of Nadir Shah (1738), and became after Nadir's death a part of the new kingdom of the Afghans under Ahmad Shah Durani. The historical name of Ghazni was brought back from the dead, as it were, by the news of its capture by the British army under Sir John Keane, July 23, 1839, at the cost of 182 killed and wounded. Two years and a half later the Afghan outbreak against the British occupation found Ghazni garrisoned by a Bengal regiment of sepoys, but neither repaired nor provisioned. They held out under great hardships from Dec. 16, 1841, to Mar. 6, 1842, when they surrendered. In the autumn of the same year General Nott, advancing from Kandahar upon Kabul, reoccupied Ghazni, destroyed the defences of the castle and part of the town, and carried away the famous gates of Somnath (*q.v.*).

GHEE, clarified butter used in India (Hindu, *ghi*). The best is prepared from butter of the milk of cows, the less esteemed from that of buffaloes. The butter is melted over a slow fire and set aside to cool; the thick, opaque, whitish, and more fluid portion, or ghee, representing the greater bulk of the butter, is then removed. The less liquid residue, mixed with ground-nut oil, is sold as an inferior kind of ghee. It may be obtained also by boiling butter over a clear fire, skimming it the while, and, when all the water has evaporated, straining it through a cloth. Ghee which is rancid or tainted, as is often that of the Indian bazaars, is said to be rendered sweet by boiling with leaves of the *Moringa pterygosperma* or horse-radish tree.

In India, ghee is one of the commonest articles of diet, and indeed enters into the composition of everything eaten by the Brahmans. It is also extensively used in Indian religious ceremonies, being offered as a sacrifice to idols, which are at times bathed in it. Sanskrit treatises on therapeutics describe ghee as cooling, emollient, and stomachic, as capable of increasing the mental powers, and of improving the voice and personal appearance, and as useful in eye-diseases, tympanitis, painful dyspepsia, wounds, ulcers, and other affections. Old ghee is in special repute among the Hindus as a medicinal agent, and its efficacy as an external application is believed by them to increase with its age. Ghee more than ten years old, the *purāna ghrita* of Sanskrit *materia medicas,* has a strong odour and the colour of lac. Some specimens which have been much longer preserved—and "clarified butter 100 years old is often heard of"—have an earthy look, and are quite dry and hard, and nearly inodorous. Medicated ghee is made by warming ordinary ghee to remove contained water, melting, after the addition of a little turmeric juice, in a metal pan at a gentle heat, boiling with the prepared drugs till all moisture is expelled and straining through a cloth.

GHEEL or GEEL, a town of Belgium, about 30 mi. E. of Antwerp and in the same province.

The population in 1955 was estimated to be 24,829. The legend reads that in the year 600 Dymphna, an Irish princess, was executed there by her father; in consequence of certain miracles she was canonized and made patron saint of the insane.

The old Gothic church was dedicated to her, and in the choir was placed her shrine. with fine panel paintings by, probably, a contemporary of Hans Memlinc. A colony of the insane was established in farms and houses round the little place within a circumference of 30 mi. and is said to have existed since the 13th century.

This area was divided into four sections, each having a doctor and a superintendent attached to it.

GHENT (GENT, Fr Gand), the capital of East Flanders, Belg., stands at the junction of the Lys and the Scheldt. The estimated population of the city proper was 162,997 in 1955; its area is 14.6 sq.mi. Including the three chief suburbs of Ledeberg, Gentbrugge and St. Amandsberg. the population was 218.210 and the total area 20 sq.mi. Ghent has retained more traces of its past than any other Belgian town, Among the old buildings grouped together at its centre is the Gothic cathedral of St. Bavon. begun in the 12th century and finished in 1531, when the tower (262 it.) was com-

pleted. It contains. among many famous works of art, the great polyptich altarpiece "The Adoration of the Lamb" by Hubert and Jan van Eyck. The original 12 panels, which had been dispersed since 1816. were eventually brought together again under the treaty of Versailles in 1920. The picture was removed by the Germans in World War II but restored in 1945. Other old churches include St. Nicholas (13th century). St. Jacques (12th–14th centuries). St. Michel (15th–17th centuries), and St. Pierre, at one time the oratory of the abbey of the same name. which is also an imposing building. Among other notable abbeys are the abbey of St. Bavon, founded in the 7th century, and the abbey of the Byloke. with its splendid 14th-century gable. Ghent is famous for its Béguines, the name given to members of lay sisterhoods founded in the 1ath century (*see* BÉGUINES) who live in enclosed districts known as *béguinages*. One of the most attractive of these is the Béguinage of Ter Hoyen, which has entirely preserved its original appearance.

In the centre of the city stands the Belfry (14th century), a massive. rectangular construction some 300 ft. high. Its bell tower, frequently altered in the course of centuries and entirely rebuilt 1912–13, is surmounted by a gilded copper dragon. forged in Ghent in 1377. The carillon (mid-17th century'). one of the most important in the country, is composed of 52 bells. The town hall comprises tn-o buildings of different styles, the diversity of which ii a reflection of the diversity which once reigned in the administrarive and judiciary organization of the city: the Schepenhuis van de Keure (an alderman's house). which faces north, was built between 1518 and 1j3j and is a magnificent example of Flamboyant Gothic; the Schepenhuis van Ghedeele (also an alderman's house), which faces east. was completed in 1620 in Renaissance style. The interior of the town hall is no less imposing, with its splendid Gothic staircase and its vast chapel. Not far away is the castle of the counts of Flanders. which was built in 1180 by Philip of Alsace, count of Flanders. in order to humble the troublesome townspeople. Restored at the beginning of the 20th century, this warlike structure with its great keep and circular walls stands in striking contrast to the buildings that surround it. Other historical buildings include the Cloth hall (14th century). the Vleeshuis (meat hall. 1jth century). and the castle of Gerard the Devil, built in the 13th century. which now houses state archives. Ghent is also well-known for its large public squares and market places, of which the principal one is the Vrÿdagmarkt (Friday market), the centre of the life of the medieval city. Of Ghent's many public parks the two chief ones are the Parc de la Citadelle (57 ac.) and the Parc Albert (22 ac.), both in the southern quarter of the town. By the Parc de la Citadelle stands one of the city's numerous museums, the Museum of Fine Arts. It contains two famous paintings by Jerom Bosch. "Christ Carrying the Cross" and "'The Penitence of St. Jerome." The Museum of Archaeology, housed in the abbey of the Byloke. and the Lapidary museum. in the ruins of the abbey of St. Bavon. both have important municipal collections. Ghent possesses a university. founded in 1816 by William I. and also an agricultural college. The university library. which has been contained in a new building since 1941, has a very big collection of buoks and manuscripts. The city of Ghent is also the seat of a bishop.

Ghent is a road and rail junction, and is connected to the mouth of the Scheldt by the Terneuzen canal (built in 1822–29), thus giving it direct access to the North sea. The seaport. which lies north of the city on the canal. is the basis of its industrial activity, and in the 1950s extensive alterations were being made to the canal and its lock, in order to make the port accessible to the largest vessels. Near the city, and particularly toward the east. there is a vast hurticultural region where azaleas, palms. orchids. begonias and many other plants are grown, and every five years a great flower show, the "Floralies." is held, attracting visitors from all over the world. Ghent's principle industries are textiles (cotton and linen), metallurgy. including the making of machines. and chemicals. The making of paper is the chief of the secondary industries. The city is also a centre of commerce and banking.

History.—Ghent was with Bruges and Ypres one of the chief towns of the county of Flanders. It owes its origin to the economic developments which took place in Flanders in the 10th century, and the city itself sprang up on the banks of the Lys, under the protection of the castle which the counts of Flanders had built nearby. The growth of Ghent in the 12th century was rapid, and by the 13th century it was one of the largest towns in northern Europe. Its astonishing prosperity was due largely to the cloth industry. Ghent cloths. which were luxury products made from English wool, were famous all over the known world up to the 1jth century. The city's wealth gave it great political power, which it defended fiercely. It also had considerable privileges and was autonomist and republican. which aroused the hostility of the counts of Flanders and often led to open conflict. At the beginning of the Hundred Years' War, Louis de Nevers, count of Flanders, remained a faithful vassal to the king of France. whereas the city, fearing that the wool trade would suffer unless it continued to be friendly to England, ranged itself on the side of Edward III under the energetic leadership of Jacob van Artevelde. In Jan. 1340, Edward III was given public acknowledgment as king of France in the Vrÿdagmarkt. In March, the same year. John of Gaunt, duke of Lancaster, was born in the abbey of St. Bavon.

The end of the 14th century saw a terrible insurrection against another count of Flanders. Louis de Male. In the following century the policy of the dukes of Burgundy provoked fresh uprisings. The army of Ghent was massacred by Philip the Good at Gavère in 1453, and the city was unsuccessfully besieged in 1488. In 1539

the people of Ghent rose in revolt against the emperor Charles V (who was born in the city in 1500) as a protest against the crippling taxes they were forced to pay. This rebellion was sternly repressed. Ghent was stripped of its privileges. and the emperor imposed a new constitution which practically ended its communal autonomy, together with its social and economic structure, which had been largely democratic. In the 16th century, too. the cloth industry disappeared. unable to compete with the English cloth trade. During the second half of the century Ghent came into prominence again at the time of the religious troubles and the uprisings against Philip II of Spain. Within its walls was signed the famous Pacification of Ghent in Nov. 1576 (*see* NETHERLANDS). From 1577 to 1584 the city was under Calvinist domination. Ghent continued to decline in importance despite the linen trade which began in the 17th century. However, at the beginning of the 19th century cotton spinning was begun there and in 1827 a port was constructed. Since then Ghent has become the centre of the Belgian textiles industry. During World War I. Ghent was under German occupation from Oct. 9, 1914, until Armistice day. Nov. 11, 1918. The western part was damaged in the final operations. During World War II, German troops again occupied Ghent from May 1940 until its liberation by Allied forces in 1945.

Famous men born in Ghent include Lambert Quetelet (*q.v.*), the astronomer, meteorologist and statistician, and Maurice Maeterlinck (*q.v.*), the dramatist and poet.

GHERARDESCA, UGOLINO DELLA (c. 1220–1289), count of Donoratico. was the head of the powerful family of Gherardesca, the chief Ghibelline house of Pisa. He allied himself by marriage with the Visconti, leaders of the Guelph faction in the city. For his share in the defeat of the Pisans by the Genoese at the battle of Meloria (1284) *see* MELORIA and PISA: *History*. .He was accused of treachery: and increased his own unpopularity by ceding castles to Florence and Lucca, and by his hesitation to make peace with Genoa, lest the return of the Pisan prisoners, including the leading Ghibellines, should diminish his power. Civil war broke out in Pisa in 1288, stirred up by Gherardesca's rival the archbishop Ruggieri, who captured the count, his two sons, Gaddo and Uguccione, and his grandsons, and starved them to death in the Muda, a tower belonging to the Gualandi family. Dante. in a terrible but magnificent passage. placed Ugolino and Ruggieri in the second ring of the lowest circle of the *Inferno*.

GHETTO, formerly the street or quarter of a city in which the Jews were compelled to live. The term is now used loosely of any locality where they congregate.

The mediaeval *Jewry (Juiverie, Juderia,* etc.) was the inevitable social expression of Jewish solidarity and Gentile aversion, and did not necessarily have any legal implication. The third Lateran Council (1179), which prohibited true believers even from lodging amongst the infidels. laid the foundations of a stricter control, which was sporadically enforced. It was not, however, reduced to a system until the counter-Reformation, when the bull *cum nimis absurdum* of Paul IV. (1555) enjoined for the first time the consistent enforcement of the mediaeval principles of segregation, the Ghetto of Rome being established in the following year. The Papal example ultimately prevailed in almost every city of Italy; and the name *Ghetto,* originally found in Venice, was generally applied to the new quarter thus created. In Germany, where a similar system obtained, the names *Judengasse,* etc., were used instead. In the Papal territories in France the term *Carrière (des Juifs)* was employed. In the rest of Europe the formal institution never generally prevailed. Among the most important examples of it in the north were Frankfort and Prague; in the south, Avignon, Rome and Venice, where the old buildings may still be seen.

Within their Ghettos the Jews enjoyed a considerable degree of autonomy under their own authorities, who were responsible for the collection of the oppressive communal taxation. The Jewish quarter thus formed to some extent an independent corporation, with its own officials, purveyors, guilds, amusements, and courts. Economic activity was however restricted by law to money-lending and a few more of the meanest occupations. The houses tended to be of unusual height, being compelled to extend vertically since there was no room for them to do so laterally. In order to prevent exploitation by Gentile landlords (the Jew was forbidden to hold real estate), security of tenure was guarded by an extension of the old Jewish principle of *Hazakah,* or prescriptive right. In Italy this ultimately acquired full legal status as the jus *gazaga.* The Ghettos were enclosed with walls and gates, which were kept locked at night and on certain church festivals; *e.g.,* from Thursday to Saturday in Holy Week. Outside, and sometimes inside as well, a badge or hat of distinctive colour had to be worn. The French Revolution temporarily swept away the infamous system, though it was widely restored in the reaction that followed. It was abolished however for good by the liberal movements of the 19th century, the last vestige disappearing with the capture of Rome in 1870.

Jewish Life in the Middle Ages (1896); S. Kahn, article "Ghetto" in the *Jewish Encyclopedia.*

GHIBERTI, LORENZO (1378–1455), Italian sculptor, who executed the second and third pairs of bronze doors of the baptistery in Florence, was born in Florence in 1378. Trained as a goldsmith under his stepfather, Bartolo di Michele, called Bartoluccio, he was active in 1400 as a fresco painter at Pesaro, whence he returned in the winter of 1400–01 to take part in the competition for the second bronze door of the Florentine baptistery. The seven competitors (who included Filippo Brunelleschi and Jacopo della Quercia) were required to prepare bronze trial reliefs of the sacrifice of Isaac. According to Ghiberti's own account, "the palm of victory" was unanimously awarded to him and in 1403 he received the contract for the bronze door. Work on the door occupied him for 21 years and it was set in place in April 1424.

Each wing of the door contains ten scenes from the New Testament and four reliefs of church fathers and evangelists. The scenes, like the trial relief, are set in quadrilobe frames imitated from those on the first bronze door by Andrea Pisano and the exposed surfaces are gilt. In the *Commentarii* Ghiberti expresses admiration for the work of a German goldsmith, Gusmin, and the style of the trial relief is influenced by French goldsmiths' work. The lyrical narrative technique and the fluent rhythms of the composition are, however, personal to Ghiberti and recur in the earlier reliefs on the bronze door. In the later reliefs, *e.g.,* the "Christ Before Pilate" and "Christ Carrying the Cross," use is made of more complex and ambitious schemes.

The success of the door led to the commissioning in 1425 of the third bronze door of the baptistery, generally known, from a comment of Michelangelo, as the "Gate of Paradise." The panels of this door were cast by 1437 and the door was completed in June 1452. Each wing of the Porta del Paradiso contains five rectangular reliefs of scenes from the Old Testament between figurated borders containing statuettes in niches and medallions with busts. The entire surface of the door is gilt. The change in the shape of the relief field between the earlier and later doors made it necessary to include in the latter a number of separate incidents in each relief, and this in turn involved compositional and spatial problems not present in the earlier door. Especially in the beautiful scene of the "Story of Isaac" these were solved by Ghiberti with remarkable success. The poetic rendering of landscape throughout the reliefs is also notable. Before executing the "Gate of Paradise" Ghiberti produced for the baptismal font at Siena two reliefs of the "Baptism of Christ" and "St. John the Baptist Before Herod" (commissioned 1417, completed 1427), which mark the transition from the style of the earlier to thnt of the later bronze door, and concurrently with the bronze door he designed the shrine of St. Zenobius for the duomo, or cathedral in Florence (commissioned 1432, completed 1442). Ghiberti revived the classical practice of bronze casting on a monumental scale, and for the guild hall of Or San Michele cast three bronze statues of St. John the Baptist (1412–16), St. Matthew (1419–22) and St. Stephen (1425–28). He also designed a number of staine -glass windows for the cathedral in Florence and has been credited with many terra cotta sculptures.

He died at Florence on Dec. 1, 1455.

Ghiberti's *Commentarii* are a document of major importance for the study of Italian art. The first of the three commentaries gives an account of ancient art (based in the main on Pliny); the second describes the course of Italian art from the late 13th century to Ghiberti's own time, and includes the sculptor's autobiography; and the third deals with optics and art theory.

GHICA (GHIKA or GHYKA) a family which played a great part in the modern development of Rumania, many of its members being princes of Moldavia and Walachia. According to Rumanian historians the Ghicas were of humble origin, and came from Kiupru in Albania.

1. GEORGE (*c.* 1600–1664), the founder of the family, is said to have been a playmate of Küpruli Aga, the famous vizier, who recognized George while he was selling melons in the streets of Constantinople, and helped him on to high positions. George became prince of Moldavia in 1658 and prince of Walachia in 1659–60. He moved the capital from Tîrgovishtea to Bucharest. From him are derived branches of the family which became so conspicuous in the history of Moldavia and Walachia.

2. The Walachian branch starts afresh from the great ban DEMETRIUS or DUMITRU GHICA (1718–1803), who was twice married and had 14 children. One of these, Gregory, prince of Walachia 1822–28, starts a new era of civilization, by breaking with the traditions of the Phanariot (Greek) period and assisting in the development of a truly national Rumanian literature. His brother, Prince Alexander Ghica, appointed jointly by Turkey and Russia (1834–42) as hospodar of Walachia, died in 1862. Under him the so-called *règlement organique* had been promulgated; an attempt was made to codify the laws in conformity with the institutions of the country and to secure better administration of justice. Prince Demetrius Ghica, who died as president of the Rumanian senate in 1897, was the son of the Walachian prince Gregory.

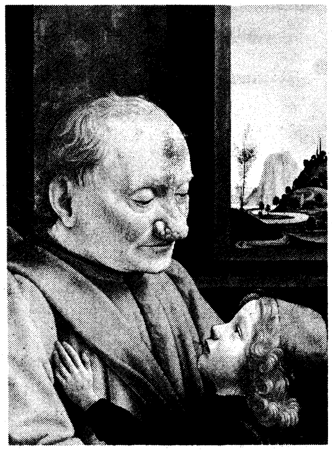
3. MICHAEL (1794–1850) was the father of ELENA (1827–1888), a well-known novelist, who wrote under the name of Dora d'Istria. She married a Russian prince, Koltsov Mazalskiy, in 1849, but the marriage was unhappy, and in 1855 she left St. Petersburg for Florence, where she died in 1888. There she published works characterized by lightness of touch and brilliance of description, such as *Pèlerinage au tombeau de Dante*, *La Vie monastique dans les églises orientales* (1844), *La Suisse allemande*, etc. One of her last works was devoted to the history of her own family, *Gli Albanesi* in *Roumenia: Storia dei Principi Ghika nei secoli XVII.–XIV.* (Florence, 1873).

4. SCARLAT GHICA (1750–1802) was twice prince of Walachia. His grandson JOHN (IOAN) GHICA (1817–1897), a lifelong friend of Turkey, was educated in Bucharest and in the West, and studied engineering and mathematics in Paris (1837–40); returning to Moldavia he was involved in the conspiracy of 1841, which was intended to bring about the union of Walachia and Moldavia under one native prince (Michael Sturdza). The conspiracy failed and John Ghica became a lecturer on mathematics at the university which was founded by Prince Sturdza in Jassy. In 1848 he joined the party of revolution and in the name of a provisional government then established in Bucharest went to Constantinople to approach the Turkish government. Whilst there he was appointed Bey of Samos (1853–59), where he extirpated piracy. In 1859 after the union of Moldavia and Walachia, Prince Cuza induced John Ghica to return. He was the first prime minister under Prince (afterwards King) Charles of Hohenzollern. He joined the anti-dynastic movement of 1870–71. In 1881 he was appointed Rumanian minister in London and retained office until 1889. He died on May 7, 1897 in Gherghani.

GHILZAI, a large and widespread Afghan tribe, who extend from Kalat-i-Ghilzai on the S. to the Kabul river on the N., and from the Gul Koh range on the W. to the Indian border on the E., in many places overflowing these boundaries. They are of the same stock as the Isa' Khel and Lodi Pathans. The Ghilzai clans now rank collectively as second to none in strength of military and commercial enterprise. They are a fine, manly race of people, and it is from some of their most influential clans (Suliman Khel, Nasir Khel, Kharotis, etc.) that the main body of *povindah* merchants is derived.

See *Tribes* and *Castes of the Punjab and North-west Frontier Province,* vol. ii. (1911).

GHIRLANDAJO (GHIRLANDAIO, GRILLANDAJO, originally DOMENICO DI TOMMASO BIGORDI) (1449–1494), one of the finest of the Florentine painters of frescoes, and master of Michelangelo, was born in Florence in 1449. He probably began his career as a goldsmith, but was certainly active as a fresco painter by the early 1470s, his earliest works being influenced both by Andrea del Castagno and by such ceremonial portrait cycles as the Medici chapel frescoes by Benozzo Gozzoli. Three saints at Cercina, near Florence, may be his earliest works, but the "Mater Misericordiae" and the "Pietà," with members of the Vespucci family introduced as mourners (Ognissanti. Florence), probably date. from about 1473. They already show his characteristic style in that they have likenesses of the donors introduced rather incongruously into the sacred scenes, which are themselves depicted with a minute realism influenced by Flemish art. This may be seen most clearly in the "St. Jerome," also in Ognissanti, dated 1480, which may even be copied from an original by Jan van Eyck; the contrast between it and the more sensitive realism of the companion "St. Augustine" by Botticelli is very marked and clearly reveals the fundamentally pedestrian character of Ghirlandajo's art. Before that date, he had already painted the scenes from the life of Sta. Fina (San Gimignano. Pieve; almost certainly 1475), and he had begun to use assistants, a practice he was to carry to great lengths. In 147j he was also working in the Vatican, but the first surviving fresco there is one of the two which formed part of the scenes from the lives of Christ and Moses, commissioned from several painters by Pope Sixtus IV for his Sistine chapel; there is a contract of Oct. 27. 1481. The important fresco is the "Calling of the First Apostles," which is chiefly noteworthy as being stylistically old-fashioned in its reminiscences of Masaccio and as having many portraits of members of the Florentine colony in Rome.



GIRAUDON

"OLD MAN WITH HIS GRANDSON" BY GHIRLANDAJO. IN THE LOUVRE, PARIS

On his return to Florence. Ghirlandajo began in 1482 to paint the "Roman Heroes" in the Sala dei Gigli of the Palazzo Vecchio. Many details from classical antiquity occur in his later works, and it is clear that he had spent much time in Rome in the study of the remains (a sketchbook in the Escurial, Madrid, is attributed to his workshop and contains numerous drawings of the antiquities). During the last years of his life he and his helpers produced two major fresco cycles and a large number of altarpieces, but for all his panel paintings he remained faithful to the old-fashioned tempera technique and never painted in oil himself.

The frescoes and altarpiece in the Sassetti chapel. SS. Trinità, were painted between about 1482 and 1485 for Francesco Sassetti. an agent of the Medici bank. The ceiling has representations of the four sibyls and the walls are devoted to scenes from the life of St. Francis. The "Pope Authorizing the Rule of the Franciscan Order" contains a large number of portraits of the Medici, the Sassetti and other dependents of the Medici, and there can be little doubt that these were intended to show Francesco Sassetti's close ties with the ruling family. The decoration was completed by the altarpiece of the "Adoration of the Shepherds." dated 148j, and showing a blend of interest in classical antiquity in the treatment of the subject, and in contemporary Flemish painting—such as the Portinari altar by Hugo van der Goes—in its handling and detail.

On Sept. 1, 1485, Ghirlandajo signed a contract with Giovanni Tornabuoni (also a Medici banker) to decorate the choir of Sta. Maria Novella with frescoes depicting the lives of the Virgin and the Baptist; the fresco of "Zaccharias and the Angel" bears the date 1490, but the altarpiece was still incomplete at Ghirlandajo's death in Florence on Jan. 11. 1494. This cycle was Ghirlandajo's major work and for it he employed many assistants, among whom was very probably the boy Michelangelo, who certainly served a short apprenticeship under him.

Ghirlandajo's main claim to fame may well lie in his having taught the technique of fresco painting to Michelangelo. The lack of imagination in his works has led to his being ranked well below Botticelli, in spite of the great appeal his realistic detail made to the 19th century. It may be observed that he never received a commission from the Medici themselves, but only from their supporters—wealthy but not perhaps highly sensitive.

(P. J. MY.)

GHIRLANDAJO, RIDOLFO (1483–1561), Florentine painter, was the son of Domenico Ghirlandajo. He was born in Florence on Jan. 4, 1483, and, since his father died in 1494, he was brought up by his uncle David and presumably received his first training from him in the family shop; but G. Vasari. who knew him, says he was a pupil of Fra Bartolommeo, and it is likely that he was also influenced by F. Granacci and others, in particular Raphael. The two were close friends when Raphael was in Florence between 1504 and 1508, and both were in close contact with Fra Bartolommeo, so that all three must have influenced each other. Ridolfo, however, did not really live up to his early promise and he settled down to enjoy his Florentine fame: producing much decorative work and going into local politics. He and his assistants arranged the decorations for such ceremonial occasions as the entry of Pope Leo X (1515) or of the Emperor Charles V (1536). He also painted many religious pictures and many excellent portraits, his earliest datable work being either the "Madonna and Saints!' (1jog; Accademia, Florence). which is reasonably attributed to him, or the "Coronation of the Virgin" (1504; Louvre museum, Paris). Other works by him are in London, New York, Philadelphia (Johnson collection) and several museums and churches in Florence. Ridolfo died in Florence on Jan. 6, 1561.

(P J. MY.)

GHOR or GHUR, a medieval kingdom lying to the southeast of Herat in the western part of modern Afghanistan.

Ghor is mentioned in the *Shahnama* of Firdousi (A.D. 1010) and in the Arab geographies of that time; but the people and princes of Ghor first became known to us in connection with the Ghaznevid dynasty, and the early medieval histories of Ghor and Ghazni are so intertwined that nothing need be added to what will be found under GHAZNI (*q.v.*).

About A.D. 1100 one of the princely families of Ghor, deriving the appellation of Shansabi, or Shansabaniah, from a certain ancestor Shansab. of local fame. acquired predominance in all the country; and Malik 'Izz ud-Din al-Husain of this family was known afterward as "the Father of Kings," from the honour to which several of his seven sons rose. Three of these mere: Amir Kutb ud-Din Mohammed, called the lord of the Jibal or mountains, and Sultan Saif ud-Din Suri, for a brief period master of Ghazni (both of whom were put to death by Bahram the Ghaznevid), and Sultan Ala ud-Din Jahansuz. who wreaked vengeance upon Ghazni and began the conquests which were afterward immensely extended both in India and in the west by his nephews Ghiyas ud-Din Mohammed ibn Sam and Mohammed Ghori. For a brief period during their rule it was boasted. with no great exaggeration, that the public prayer was read in the name of the Ghori from the extremity of India to the borders of Babylonia and from the Oxus to the Straits of Hormuz. After the death of Mohammed Ghori the Indian dominion became independent, and the whole kingdom fell to pieces before the power of Mohammed Shah of Khwarizm and his son Jalal ud-Din (c. 1214–1j), a power in its turn speedily shattered by the Mongol flood.

The princes of Ghor experienced, about the middle of the 13th century, a revival of power which endured for 140 years. This later dynasty bore the name of Kurt or Kărt. The first of historical prominence was Malik Shams ud-Din Kurt, who in 124j held the lordship of Ghor in some kind of alliance with; or subordination to, the Mongols and in 1238 received from the Great Khan Mangu an investiture of all the provinces from Merv to the Indus, including by name Seistan, Kabul. Tirah (adjoining the Khyber pass) and Afghanistan, which he ruled from Herat. He stood well with

Hulagu and for a long time with his son Abaka, but at last incurred the latter's jealousy and was poisoned when on a visit to the court at Tabriz (1276). His son Rukn ud-Din Kurt was, however, invested with the government of Khurasan (1278), but after some years, mistrusting his Tatar suzerains, he withdrew into Ghor and abode in his strong fortress of Khaisar till his death there in 1305. The family held on through a succession of eight kings in all, sometimes submissive to the Mongol, sometimes aiming at independence. But in 1380 Timur came against Herat and carried away the king and the treasures of his dynasty. A revolt and massacre of his garrison provoked Timur's vengeance: he put the captive king to death, came against the city a second time and showed it no mercy (1383). Ghor has since been obscure in history.

The valleys of the Taimani tribes though narrow are fertile and well cultivated, and there are many walled villages and forts about Parjuman and Zarni in the southeastern districts. The peak of "Chalap Dalan" is the Koh-i-Kaisar, which is somewhat more than 13,000 ft. in height. All the country now known as Ghor was mapped during the progress of the Russo-Afghan boundary delimitation.

Bibliography.—"Tabakát-i-Násiri," trans. by H. G. Raverty, in *Bibliotheca Indica,* vol. 78 (1848 ff.); *Cambridge History of India,* vol. 3 (1928); B. Spuler, *Die Mongolen in Iran* (1939).

GHOSE, LALMOHUN (1849–1909), lawyer, statesman, orator and scholar, was born at Krishnagur, Bengal, on Dec. 17, 1849. He was the second son of Rai Ram Lochun Ghose Bahadur, Principal Sadar Amin of the district. Ghose was called to the bar in England in 1873 and on his return to India began to practise in the Calcutta High Court. Ghose was honorary secretary and principal speaker of a deputation on Indian administration to the Marquess of Hartington. The result was repeal of the Vernacular Press Act and the establishment of a Statutory Indian Civil Service.

Early in 1880, he returned to India, but two months later the Indian Association again sent him to England to continue their opposition to Lord Lytton's policy. Returning in November the same year, he resumed practice at the Bar, and devoted the next two years to various political measures, such as the Vernacular Press Act, Criminal Procedure Code Amendment Bill, etc.

In 1883, he again proceeded to England in order to assist in an appeal of Surendranath Banerjea before the Privy Council. From August 1883 to August 1884, he addressed meetings in London and elsewhere in support of Ripon's policy in the Ilbert Bill and the representation of Indian interests in Parliament. He was the first Indian to seek election to Parliament; in 1885 and again in 1886 the Liberals of Deptford invited him to become their candidate, but on both occasions he was defeated—the second time owing to his support of the Irish Home Rule Bill. He returned to India in 1887.

In 1892, he was elected a member of the Bengal Legislative Council from which he retired in 1895. In 1903, he was elected president of the Indian National Congress at Madras and for some years took an important part in its deliberations. Ghose's last political speech was delivered as chairman of a public meeting called in 1906 at Calcutta to protest against Lord Curzon's partition of Bengal. Ill-health prevented him from taking any further active part in political work, and he died at Calcutta on Sept. 18, 1909.

Ghose was a thorough Constitutionalist and the whole spirit of his utterances was loyal to the British Government. He was the greatest orator of his time in India. As a member of the Bar he was rather an advocate than a lawyer, and commanded the fullest respect of Bench and Bar alike.

Bibliography.—*Speeches of Lalmohun Ghose,* Parts I.–II., edited by A. Banerjea, 1883–84. (H. Da.)

GHOST DANCE. In 1870 there started among the Paiute (Paviotso) of Western Nevada a new faith — the Ghost Dance religion—which in most cases spread rapidly because of the wide feeling, founded on solid fact, that the westward movement of white culture was destined to destroy the native culture. In some cases "the new cult was encouraged by the chiefs as a check to the rival powers of the Shamans" (Spier, see bibliography). The Modoc war of 1873 saw the immediate disappearance of the cult, but it may still survive, or more probably there may survive separate cult-elements which, if re-stimulated and recombined, would present a very close resemblance to the complex of ideas, beliefs and rites which constitute the Ghost Dance religion.

In 1890 changes in the administration with the appointment of inexperienced men in charge of the reserves, led to discontent, notably among the Sioux of Pine Ridge. Pledges had been broken. Messianic ideas of a deliverer who shall restore the world to the godly and punish the transgressors of his ordinances are found in Indian thought, and there is a continuity of idea, inspired by, and probably based on, political conditions, between the ideals of Pontiac; the Paiute dreamer of 1870 named Ta'vibo; Smohalla, the dreamer of the Columbia region whose oratory, activities and personality made him a man of wide influence; the Shaker teachers of Puget Sound; and the doctrines of Wovoka the Messiah, the Paiute who is known as Jack Wilson. The new teaching — in reality the old teaching — reached the Sioux in 1889 and took the form of a prophecy of a new world. Even progressive and intelligent Indians held the belief in the close advent of a liberator who should restore the Indian race, living and dead, to a regenerated earth where the pristine conditions of life should prevail. Administration of Indian reserves had been adequate; intelligent, sympathetic and satisfactory in many cases. The prophecy sometimes allowed the white man to share the predicted felicity. The movement took hostile expression among the discontented Sioux, whose leaders, Sitting Bull and Red Cloud, were irreconcilable enemies of the whites. Sitting Bull, a medicine man rather than a secular chief, was killed on Dec. 15, 1890. By Jan. 16, 1891, the outbreak ended, as a result of the military and political operations conducted by Gen. Miles, who put the agencies in charge of military officers known to and respected by the Indians.

The Ghost Dance begins in the middle of the afternoon or later. No musical instrument is used except by individual dancers. The Sioux wore a "ghost shirt," almost always made of white cloth, tailored in Indian fashion. No metal was allowed to be worn. The ghost stick carried by the leader was a staff about 6 ft. long, with red cloth and red feathers. Other articles used were arrows with bone heads, a bow, a gaming wheel and sticks. The ground was consecrated. The priests were ordained by the conferment of a consecrated feather, either of a crow, the sacred bird of the Ghost Dance, or of the eagle, sacred in Indian lore, given to the candidates by the apostle. The feathers were painted. The dancers were ceremonially painted on the face with elaborate designs, in red, yellow, green and blue, suggested in trances, and were thus strengthened in spiritual vision and physical health. All went to bathe—to wash away all evil, spiritual and material. Attendance was compulsory, as those who stayed away would be turned to stone or punished. Songs, adapted to the simple dance step, were carefully rehearsed. Participants fell into trances and on regaining consciousness narrated their visions. The general psychology of the dance as an element in religious and social life, and as it functions in the lives of primitive people, forms a topic of importance as, in general, sexual display takes place and selection is encouraged—a feature sternly and successfully repressed in the Ghost Dance, in which the whole attention of the performers, the whole community, was successfully concentrated upon the purpose of the dance and upon the message of salvation which it conveyed.

Kroeber, "A Ghost Dance in California" (*Journal of American Folklore,* 1904, 17, p. 32–35), and *Handbook of the Indians of California* (Bulletin 78, Bureau of American Ethnology, 1925); Leslie Spier, *The Ghost Dance of 1870 among the Klamath of Oregon* (University of Washington publications in Anthropology, vol. ii. No. 2, 1927).

GIAMBONO (Michele di Taddeo Bono), Italian painter and mosaicist, was active in Venice from 1420 to 1462. He was a representative of the old Gothic tradition in Venice, but was much influenced by Gentile da Fabriano and Pisanello and the new International Gothic introduced by them into Italy. Among the few signed works by him are a large polyptych in the Accademia, Venice, a "Madonna" in the Galleria Nazionale, Rome, and the mosaics of the Mascoli chapel in St. Mark's at Venice, begun in 1444. The mosaics at St. Mark's represent an attempt to introduce three-dimensional representation in a technique that was dominated by the two-dimensional Byzantine tradition, but it is not certain that the architectural settings are his. Other works include a copy, of 1447 (in the Accademia), of an altarpiece by Antonio Vivarini in S. Pantaleone, Venice, and an altarpiece of 1441 in San Daniele del Friuli, near Udine. The National gallery, London, and the Metropolitan museum, New York, are among those possessing works attributed to him.

See E. Sandberg-Vavala in *Journal of the Warburg and Courtauld Institutes,* 20 ff. (1947). (P. J. My.)

GIANNINI, AMADEO PETER (1870–1949), U.S. banker, was born May 6, 1870, at San Jose, Calif., the son of an Italian immigrant. He left school at the age of 13 to work in the fruit and vegetable business and later entered the banking business when he took his father-in-law's seat on the board of the Columbus Savings and Loan society in San Francisco. In 1904 he founded the Bank of Italy in that city, the bulk of his business stemming from small businessmen. After the San Francisco earthquake of 1906, he salvaged the gold and securities from his bank and began making loans for the rebuilding of the city. He began to buy small banks, making them branches of his Bank of Italy, and in 1919 he founded the Bancitaly corporation, which was succeeded in 1928 by the Transamerica corporation, a holding company for his financial interests. In 1930 the banks were consolidated into the Bank of America National Trust and Savings association, which by 1948 had become the largest bank in the U.S., with 517 branches and assets of more than $6,000,000,000. Giannini died June 3, 1949, at San Mateo, Calif.

GIANNONE, PIETRO (1676–1748), Italian historian, who opposed the papal interference in Naples, was born at Ischitella, Capitanata, May 7, 1676. He graduated in law (Naples, 1698), became interested in the New Learning and wrote the *Istoria civile del Regno di Napoli* (1723)—a polemical survey of Neapolitan history in which he espoused the side of the civil power in its conflicts with the Roman Catholic hierarchy. As a result of this the Istoria was placed on the Index and Giannone excommunicated. In Vienna, where until 1734 he received a pension from Charles VI, Giannone prepared his most important work, *Il* Triregno, ossia del *regno* del *cielo, della* terra, e del papa, (3 vol., ed. by A. Parente, 1940). On the transfer of the Neapolitan crown to Charles of Bourbon, Giannone left Vienna for Venice. Unhappily there arose a suspicion that his views on maritime law were not favourable to the pretensions of the Republic, and this, together with clerical intrigues, caused him finally to seek refuge in Geneva (1735). But while visiting a village in Piedmont, he was kidnapped by agents of the Sardinian government and taken to the castle of Miolans (1736). There he wrote his *Autobiografia* (ed. by F. Nicolini, 1905). Giannone was incarcerated for the last 12 years of his life in the fortresses of Ceva and of Turin, where he died March 17, 1748.

GIANT. In classic mythology the word meant beings more or less manlike, but monstrous in size and strength, like the Titans and the Giants sung by Hesiod in the Tlzeogony, who can heap up mountains to scale the sky and war beside or against the gods. (O.E. *geant* through Fr. *géant* by assimilation from gigantem, acc. of Lat. *gigas.*) But there also appear in the legends of giants some with historic significance. The idea that the giants were earthborn or indigenous races was familiar to the ancient Greeks (see Welcker, *Griechische* Gotterlehre, i, 787). The Bible records the traditions of the Israelites of fighting in Palestine with tall races of the land such as the Anakim (Numb. xiii, 33; Deut. ii, 10; iii; I Sam. xvii, 4). In Homer "the Cyclops and the wild tribes of the Giants" seem dim traditions of pre-Hellenic barbarians, godless, cannibal, skin-clad, hurling huge stones in their rude warfare. Giant legends of this class are common in Europe and Asia. In early times it was usual for cities to have their legends of giants. Thus London had Gog and Magog. whose effigies (14 ft. high) stand in the Guildhall (see GOG); Antwerp had Antigonus, 40 ft. high; Douai had Gayant, 22 ft. high; etc. It was a common opinion that the human race had itself degenerated, the men of primeval ages having been of far greater stature and strength. Yet so far as can be judged from actual remains, it does not appear that giants, in the proper sense, ever existed, or that the men of ancient time were on the whole taller than those now living. It is now usual to apply the word giant merely to unusually tall men and women. In every race of man the great mass of individuals do not depart far from a certain mean or average height, while the very tall or very short men become less and less numerous as they depart from the mean standard, till the utmost divergence is reached in a very few giants and a very few dwarfs. See also GIGANTICISM; REPHAIM.

See P. Lohmann, Archäologisches von en-nebi Samwil: *Zeitschr.* (1904); **E.J** *Wood, Giants and Dwarfs (1860).*

GIANT ORDER: see ORDER.

GIANT'S CAUSEWAY, a promontory of columnar basalt, on the northern coast of County Antrim, N. Ire., lying between Portrush and Ballycastle. Local folklore ascribes its formation to a race of giants who built it as a roadway to Staffa (*q.v.*), where a similar structure occurs. The prismatic forms were caused by the rapid cooling of the lava flows where they entered the sea. The pillars composing the Giant's causeway are mostly irregular hexagons. In diameter they vary from 1j to 20 in., and some are 20 ft. in height. The great causeway is in some places nearly 40 ft. wide and is highest at its narrowest part. It extends outward into a platform and for nearly 100 yd. is above water. Other cliffs to the east exhibit similar columns. The most remarkable of the cliffs is the Pleaskin, the upper pillars of nhich are 60 ft. high; beneath these is a mass of coarse black amygdaloidal rock, of the same thickness, underlain by a second range of basaltic pillars, from 40 to 50 ft. high

GIANT'S KETTLE (GIANT'S CAULDRON), a glacial pothole, *i* e., a deep cylindrical hole in solid rock drilled out by eddying currents of water of subglacial streams, bearing stones, gravel and other detrital matter. The size varies from a few inches to several feet in depth and diameter and upon the retreat of the ice, the hole frequently contains the sand. gravel or boulders which have assisted in its formation. Good examples occur in the Alps (Lucerne), Germany, Norway and U.S. These must not be confused with true potholes which occur in river beds and at the base of sea cliffs.

GIAOUR, a word used by the Turks to describe all who are not Moslems, especially Christians. The word, first employed as a term of contempt, has become so general that in most cases no insult is intended in its use. It is a Turkish adaptation of the Persian gaur.

GIARDINO, GAETANO (1864–193j), Italian soldier, was born at Montemagno, Italy, on Jan. 24, 1864. He joined the army in 1882 and saw service in Eritrea (1889–94) and in Tripoli (1911–12). On Italy's intervention in World War I he was appointed chief of staff to the and army and was promoted brigadier general in Aug. 1915. In June 1916, he was given command of the 48th brigade and played an Important part in the attack on Gorizia. In June 1917, he was promoted lieutenant general, but a few days later was chosen minister of war and made a senator. He held office until after Caporetto, when he was appointed assistant chief of staff to the new commander in chief, Gen. Diaz. In April, 1918, he was given the command of the 4th army in the Grappa sector. At the battle of Vittorio Veneto (Oct. 24–Nov. 3, 1918) he delivered a general attack on the Austrian lines and after a hard struggle forced the enemy to retreat. In 1919 he was promoted *general d'esercito.* In Sept. 1923, as the government of Fiume was unable to carry on, Giardino was sent to take charge of the town, where he remained until its annexation by Italy under the terms of the treaty between Italy and Yugoslavia in Jan. 1924. Giardino died in Turin, Nov. 21, 1935.

GIAUQUE, WILLIAM FRANCIS (1895–   ), U.S.

physical chemist, pioneered in applying the third law of thermodynamics (*q.v.*) to problems of chemical interest and in the investigation of the properties of matter at temperatures lower than any previously attained. Born May 12, 1895, in Niagara Falls, Ont., of U.S. parentage, thus acquiring U.S. citizenship, he was educated at the Niagara Falls Collegiate institute and the University of California (Berkeley). Upon receiving the Ph.D. degree in 1922 he was appointed to the faculty of the department of chemistry at Berkeley. By comparing entropies of gases obtained from experimental low temperature calorimetric measurements with those calculated theoretically from spectroscopic data, Giauque established a firm experimental basis for quantum statistics and the third law of thermodynamics, and led to an understanding of the apparent exceptions to this law. In 1929, with H. L. Johnston, he discovered the oxygen isotopes of mass 17 and 18 and thus disclosed the difference between the physical and chemical atomic weight scales. In 1926 he proposed the adiabatic demagnetization method for obtaining temperatures well below 1° K., and in 1953, with D. P. MacDougall, performed the first successful experiments making use of this method. Giauque's adiabatic demagnetization method is basic to numerous experiments which have since been made in the temperature range below 1° K. He has received the Chandler, Cresson, Nobel (chemistry, 1949), Gibbs and Lewis awards. (J. W. St.)

GIBBET, a primitive form of gallows. It was a custom at one time—though not part of the legal sentence—to hang the body in chains, this being known as gibbeting. *See* HANGING; CAPITAL PUNISHMENT.

GIBBON, EDWARD (1737–1794), English historian, was born at Putney on April 27 (O.S.), 1737. His father, who was also named Edward Gibbon, was M.P. for Petersfield and Southampton until 1747; he married Judith, daughter of James Porten, by whom he was the father of seven children. Edward was the only one to survive childhood, and he was so delicate as a child that his life was often despaired of. He first attended a day-school in Putney, and studied Latin with John Kirkby, author of *Authomates* (1745). He went in 1746 to a school at Kingston-on-Thames, where "at the expense of many tears and some blood, I purchased the knowledge of the Latin syntax." Meanwhile he was reading Pope's *Homer* and Dryden's *Virgil*. His mother died in 1747, and his father moved into Hampshire, but Gibbon lived under the care of his aunt, chiefly at his grandfather's house at Putney. Here he developed his great love of reading, and had the run of his grandfather's library. His 12th year, 1748, he records as "the most propitious to the growth of my intellectual stature." At the end of that year, his aunt, Catherine Porten, opened a boarding-house for Westminster school. Gibbon went with her, and entered the school in Jan. 1749. His health broke down again, and he was taken in 1750 to Bath and Winchester, without much effect. He made one more attempt at Westminster, but it was evident that his health would never stand it, and after this he studied under various tutors. Meanwhile his appetite for history was developing, and he read widely, ranging over every period. On a visit to his father he first discovered later Roman history.

Oxford and **Lausanne.**—About his 16th year his health rapidly improved, and on April 3, 1752, he went to Magdalen college, Oxford, as a gentleman commoner, "with a stock of erudition which might have puzzled a doctor, and a degree of ignorance of which a schoolboy might have been ashamed." He disliked the university and his tutors, and they disliked him. "I spent 14 months at Magdalen college," he says; "they proved the 14 months the most idle and unprofitable of my whole life." While at Oxford he was influenced by Middleton's *Free Inquiry* (1749) to join the church of Rome, and his conversion was completed by Bossuet's *Variations of Protestantism* and *Exposition of Catholic Doctrine*. Gibbon was received into the church on June 8, 1753. He announced his decision in a letter to his father, who became exceedingly annoyed and removed him from Oxford. Soon afterwards he was sent to live at Lausanne, with M. Pavilliard, a Calvinist minister. Here he learned French of necessity, and after five years "spontaneously thought" in that language, which influenced his style to the last. He studied the logic of Crousaz, and "the articles of the Romish creed disappeared like a dream." In less than two years he had returned to Protestantism. He studied widely, classics, philosophy and mathematics, which last he soon abandoned. In 1755 he travelled in Switzerland, studying the Swiss political institutions. In 1757 he met Voltaire. In the same year he fell in love with Susan Curchod, daughter of the pastor of Crassier, who afterwards became Madame Necker. On his return to England his father objected to the marriage, and Gibbon "sighed as a lover," but "obeyed as a son." He found that his father had married again. At this time he met Mallet, who introduced him to Lady Hervey's circle, where his French accomplishments made him welcome. Mallet advised him to counteract the influence of French on his style by reading Addison and Swift. In 1761 Gibbon published his *Essai sur l'étude de la littérature*, begun in Lausanne in 1758. His father urged its publication, hoping that it might introduce him to public notice, but it was more successful abroad than in England. It was translated into English in 1764.

His Later Life.—He was already contemplating a history, but had not chosen his period. In 1763 he left for a tour on the continent. He went first to Paris, where he found the circle of d'Alembert and Diderot congenial, and was tempted to stay there permanently; then to Switzerland, staying a year at Lausanne, and in April 1764 to Italy. Rome was the main object of his visit, and it was in Rome he records "on the fifteenth of October 1764, as I sat musing amidst the ruins of the Capitol . . . that the idea of writing the decline and fall of the city first started to my mind." He returned from the tour in June 1765, visiting Naples, Venice, and Verona on the return journey. The next five years were uneventful. Gibbon lived chiefly at Buriton. He projected and abandoned a history of the Swiss revolution, and in 1770 successfully exposed Warburton's Virgilian theories in *Critical Observations on the Sixth Book of the Aeneid.* But he had by now formed the plan of his history, and settled down to the vast researches it involved. His studies were interrupted in 1770 by his father's death, and his own consequent move to London, but by Oct. 1772 he was fairly started. At first he moved slowly and with hesitation; after the first few chapters, swiftly and without corrections or alterations. In Feb. 1776 the first volume was published, and met with an unprecedented success, passing rapidly through three editions. He was allowed by his publishers two-thirds of the profits on the first edition, which amounted to £490. Hume, in the midst of his congratulations, warned him that he was provoking a controversy in the chapters on the growth of Christianity, and the controversy was not slow in following. His only reply was the *Vindication* (1779), a complete and crushing reply to Davies and others who had attacked him (for a full account see *Bibliographers' Manual*, 1858, pp. 885–886).

In 1774 he became M.P. for Liskeard, which did not interrupt his work, except for an interval in 1779 when he was employed to write a *Mémoire justificatif* in answer to a French manifesto. For this service he was rewarded with a seat at the Board of Trade and plantations worth £800 a year. Gibbon lost his seat in Sept. 1780, but was returned for Lymington in a by-election in June 1781. In April 1781 the second and third volumes of his history appeared, which caused no excitement, but sold fast. Then followed a critical event in his life; Lord North's ministry fell, and Burke abolished the Board of Trade. Gibbon gave up his parliamentary career, which had been mute and inglorious indeed, but had acted as "a school of civil prudence, the first and most essential virtue of an historian," sold everything but his library, and moved to Lausanne in Sept. 1783, where he joined his friend Deyverdun. Here, in a house with a charming garden and a wonderful view, the history was quickly finished; the fourth volume was finished in 1784, the fifth two years later; and, he says, "it was on the day, or rather night, of the 27th of June 1787, between the hours of 11 and 12, that I wrote the last line of the last page in a summer-house in my garden. After laying down my pen, I took several turns in a *berceau*, or covered walk of acacias, which commands a prospect of the country, the lake and the mountains. The air was temperate, the sky was serene, the silver orb of the moon was reflected from the waters, and all nature was silent. I will not dissemble the first emotions of joy on the recovery of my freedom, and, perhaps, the establishment of my fame. But my pride was soon humbled, and a sober melancholy was spread over my mind by the idea that I had taken an everlasting leave of an old and agreeable companion, and that whatsoever might be the future fate of my history, the life of the historian must be short and precarious."

He took the manuscript to London in 1787, and in April 1788 the last three volumes were published, with as great success as before. He returned to Lausanne, where he suffered greatly from the loss of his friend Deyverdun, who died on July 4, 1789. The provisions of Deyverdun's will enabled Gibbon to remain in the same house, and there he wrote his *Memoirs of my Life and Writings* in 1789. In 1793 he came back to England and later in the year was obliged to undergo several operations. He never recovered his strength, and died on Jan. 16, 1794. He was buried at Flitching, Sussex. (J. S. B.; X.)

The **Value** of His Work.—Gibbon's literary art, the sustained excellence of his style, his piquant epigrams and his brilliant irony, would perhaps not secure for his work the immortality which it seems likely to enjoy, if it were not also marked by ecumenical grasp, extraordinary accuracy and striking acuteness of judgment. It is needless to say that in many points his statements and conclusions must now be corrected. He was never content with second hand accounts when the primary sources were accessible: "I have always endeavoured," he says, "to draw from the fountain-head; my curiosity, as well as a sense of duty, has always urged me to study the originals; and if they have sometimes eluded my search, I have carefully marked the secondary evidence on whose faith a passage or a fact were reduced to depend." Since he wrote, new authorities have been discovered or rendered accessible; works in Greek, Latin, Slavonic, Armenian. Syriac, Arabic and other languages, which he was unable to consult, have been published. Again, many of the authorities which he used have been edited in superior texts. The relative weights of the sources have been more nicely determined by critical investigation. Archaeology has become a science. In the immense region which Gibbon surveyed there is hardly a section which has not been submitted to the microscopic examination of specialists.

But apart from the inevitable advances made in the course of a century during which historical research entered upon a new phase, the reader of Gibbon must be warned against one capital defect. In judging the *Decline and Fall* it should carefully be observed that it falls into two parts which are heterogeneous in the method of treatment. The first part, a little more than five-eighths of the work, supplies a very *full* history of 460 years (A.D. 180–641); the second and smaller part is a summary history of about 800 years (A.D. 641–1453) in which certain episodes are selected for fuller treatment and so made prominent. To the first part unstinted praise must be accorded; it may be said that, with the materials at the author's disposal, it hardly admitted of improvement, except in trifling details. But the second, notwithstanding the brilliancy of the narrative and the masterly art in the grouping of events, suffers from a radical defect which renders it a misleading guide. The author designates the story of the later empire at Constantinople (after Heraclius) as "a uniform tale of weakness and misery," a judgment which is entirely false; and in accordance with this doctrine, he makes the empire, which is his proper subject, merely a string for connecting great movements which affected it, such as the Saracen conquests, the crusades, the Mongol invasions, the Turkish conquests. He failed to bring out the momentous fact that up to the 12th century the empire was the bulwark of Europe against the East, nor did he appreciate its importance in preserving the heritage of Greek civilization. He compressed into a single chapter the domestic history and policy of the emperors from the son of Heraclius to Isaac Angelus; and did no justice to the remarkable ability and the indefatigable industry shown in the service of the State by most of the sovereigns from Leo III. to Basil II. He did not penetrate into the deeper causes underlying the revolutions and palace intrigues. His eye rested only on superficial characteristics which have served to associate the name "Byzantine" with treachery, cruelty, bigotry and decadence. It was reserved for Finlay to depict, with greater knowledge and a juster perception, the lights and shades of Byzantine history. Thus the later part of the *Decline and Fall*, while the narrative of certain episodes will always be read with profit, does not convey a true idea of the history of the empire or of its significance in the history of Europe. It must be added that the pages on the Slavonic peoples and their relations to the empire are conspicuously insufficient; but it must be taken into account that it was not till many years after Gibbon's death that Slavonic history began to receive due attention, in consequence of the rise of competent scholars among the Slavs themselves

His Attack on Christianity.—The most famous chapters of the *Declzne and Fall* are the 1jth and 16th, in which the historian traces the early progress of Christianity and the policy of the Roman Government towards it. The flavour of these chapters is due to the irony which Gibbon has employed with consummate art and felicity. There was a practical motive for using this weapon. An attack on Christianity laid a writer open to prosecution and penalties under the statutes of the realm (9 and 10 William III. c. 22, still unrepealed). Gibbon's stylistic artifice both averted the peril of prosecution and rendered the attack more telling. In his *Autobiography* he alleges that he learned from the *Provincial Letters* of Pascal "to manage the weapon of grave and temperate irony, even on subjects of ecclesiastical solemnity." It is not easy, however, to perceive much resemblance between the method of Pascal and that of Gibbon, though in particular passages we may discover the influence which Gibbon acknowledges. For instance, the well-known description (in chap. xlvii) of the preposition "in" occurring in a theological dogma as a "momentous particle which the memory rather than the understanding must retain" is taken directly from the first Provincial Letter The main points in the general conclusions of these chapters have been borne out by subsequent research. The account of the causes of the expansion of Christianity is chiefly to be criticized for its omissions. There mere a number of important contributory conditions (enumerated in Harnack's *Mission und Ausbreitung des Christentums*) which Gibbon did not take into account. He rightly insisted on the facilities of communication created by the Roman empire, but did not emphasize the diffusion of Judaism. And he did not realize the importance of the kinship between Christian doctrine and Hellenistic syncretism, which helped to promote the reception of Christianity. He was ignorant of another fact of great importance (which has only in recent years been fully appreciated through the researches of F. Cumont), the wide diffusion of the Mithraic religion and the close analogies between its doctrines and those of Christianity. In regard to the attitude of the Roman Government towards the Christian religion, there are questions still *sub judice;* but Gibbon had the merit of reducing the number of martyrs within probable limits.

Gibbon's verdict on the history of the middle ages is contained in the famous sentence, "I have described the triumph of barbarism and religion." It is important to understand clearly the criterion which he applied; it is frequently misapprehended. He was a son of the 18th century; he had studied with sympathy Locke and Montesquieu; no one appreciated more keenly than he did political liberty and the freedom of an Englishman. This is illustrated by his love of Switzerland, his intense interest in the fortunes of that country, his design of writing "The History of the Liberty of the Swiss"—a theme, he says "from which the dullest stranger would catch fire." Such views and sentiments are incompatible with the idealization of a benevolent despotism. Yet in this matter Gibbon has been grossly misapprehended and misrepresented. For instance, Mirabeau wrote thus to Sir Samuel Romilly: "I have never been able to read the work of Mr. Gibbon without being astounded that it should ever have been written in English; or without being tempted to turn to the author and say, 'You an Englishman? No, indeed.' That admiration for an empire of more than two hundred millions of men, where not one had the right to call himself free; that effeminate philosophy which has more praise for luxury and pleasures than for all the virtues; that style always elegant and never energetic, reveal at the most the elector of Hanover's slave." This criticism is based on a perverse misreading of the historian's observations on the age of Trajan, Hadrian and the Antonines. He enlarges, as it was his business to do, on the tranquillity and prosperity of the empire in that period, but he does not fail to place his finger on the want of political liberty. as a fatal defect. He points out that under this benevolent despotism, though men might be happy, their happiness was unstable, because it depended on the character of a single man; and the highest praise he can give to those virtuous princes is that they "deserved the honour of restoring the republic, had the Romans of their days been capable of a rational freedom." The criterion by which Gibbon judged civilization and progress was the measure in which the happiness of men is secured, and of that happiness he considered political freedom an essential condition. He was essentially humane; and it is worthy of notice that he was in favour of the abolition of slavery, while humane men like his friend Lord Sheffield, Dr. Johnson and Boswell were opposed to the anti-slavery movement.

BIBLIOGRAPHY.—Of the original quarto edition of *The Decline and Fall,* vol. i. appeared, as has already been stated, in 1776, vols. ii. and iii. in 1781 and vols. iv.–vi. (inscribed to Lord North) in 1788. In later editions vol. i. was considerably altered by the author; the others hardly at all. The number of modern reprints has been very considerable. For many years the most important and valuable English edition was that of Milman (1839 and 1845), which was reissued with many critical additions by Dr. W. Smith (8 vols. 8vo, 1854 and 1872). This has now been superseded by the edition, with copious notes, by J. B. Bury (7 vols. 8vo, 1896–1900; new ed. 1909–13). The edition in Bohn's British Classics (7 vols., 1853) deserves mention. *See* also the essay on Gibbon in Sir Spencer Walpole's *Essays and Biographies* (1907). There are in addition, translations in nearly every European language. Gibbon's *Miscellaneous Works, with Memoirs of his Life and Writings, composed by himself; illustrated from his Letters, with ocrnsional Notes and Narrative,* published by Lord Sheffield in two vols. in 1796, has been often reprinted. The new edition in five vols. (1814) contained some previously unpublished matter, and in particular the fragment on the revolutions of Switzerland. (J. B. B.)

GIBBON, the collective title of the smaller manlike apes of the Indo-Malay countries, all belonging to the genus Hylobates (see PRIMATES), which constitutes the *family* Hylobatidae. One of the distinctive features of this family is the presence of small naked callosities on the buttocks. The extreme length of the limbs and the absence of a tail are other features of these small apes, which are arboreal in their habits. and make the woods resound with their unearthly cries; in agility they are unsurpassed. When they descend to the ground —which they do to obtain water —they walk in the upright posture, either with the hands crossed behind the neck, or held above the head. Their food consists of leaves and fruits. Gibbons may be divided into two groups, the one represented by the siamang. Hylobates (*Symphalangus*) syndactylus, of Sumatra and the Malay Peninsula, and the other by a number of closely allied species.

SILVERY GIBBON (HYLOBATES MOLOCH) MANLIKE SMALL APE OF THE EAST INDIES

The union of the index and middle fingers by means of a web extending as far as the terminal joints is the distinctive feature of the siamang, which is the largest of the group and black in colour with a white frontal band. Black or puce-gray is the prevailing colour in the second group, of which the hulock (H. hoolock) of Assam, H. *lar* of the Malay region and Tenasserim, and H. *agilis* of Sumatra are representatives. The range of the genus extends from the southern bank of the Brahmaputra in Assam to southern China, the Malay Peninsula, Java, Sumatra and Borneo.

GIBBONS, GRINLING (1648–1720), English wood carver, who helped to decorate St. Paul's cathedral. Windsor chapel and many great English houses, was born in 1648. Whether he was born Dutch or English, and when he arrived in London are uncertain. He died in London on Aug. 3. 1720. Gibbons early displayed great talent and was recommended by John Evelyn to Charles II, who employed him in the execution of statuary and ornamental carving He also worked for Sir Christopher Wren. One of his principal works is a life-size bronze statue representing James II in the dress of a Roman emperor.

He is, however, chiefly famous as a sculptor in wood. He executed the ornamental carving for the chapel at Windsor, the foliage and festoons in the choir of St Paul's, the baptismal fonts in St. James's. and an immense quantity of ornamental work at Burleigh, Chatsuorth and other great houses. The finest of all his productions is a ceiling at Petworth. His subjects are chiefly birds, flowers. foliage, fruit and lace, characterized by delicacy and elaboration of details, and truthfulness of imitation. In 1714 Gibbons nas appointed master carver in wood to George I. An example of his incredible realism is the lace cravat carved in limewood. now in the Victoria and Albert museum. London. once ouned by Horace Walpole, who is said to have worn it occasionally.

See A. E. Bullock, *Grinling Gibbons and his Compeers* (1914); *H.* A. Tipping, *Grinling Gibbons and the Woodwork of his Age* (1914). (*J. E.* LE.)

GIBBONS, JAMES (1834–1921), U.S. Roman Catholic cardinal and archbishop, called by Theodore Roosevelt in 1917 the most respected, venerated and useful citizen of the U.S., was born in Baltimore, Md., July 23, 1834. Educated at St. Charles college, Ellicott City, hfd., and St. Mary's seminary. Baltimore, Gibbons was ordained priest on June 30, 1861. After four years as a pastor and volunteer chaplain to the Civil War troops in the military hospitals of Baltimore. he became secretary to Archbishop Martin J. Spalding. In 1868 he was consecrated bishop and appointed to organize the new vicariate apostolic of North Carolina, in which capacity he attended the Vatican council in 1869–70. In 1872 Gibbons was promoted to be bishop of Richmond, and in 1877 he was named coadjutor to the archbishop of Baltimore. During his nine years in the south as a missionary bishop he had traveled widely and met all classes of people; the experience brought home to him the need for a simple and concise statement of the doctrines of the Roman Catholic Church, and as a consequence during his time in Richmond he wrote The Faith of *Our* Fathers (1876), which proved to be the most popular work on Catholic apologetics ever published in the United States; it is still widely sold. In Oct. 1877 Gibbons succeeded to the premier see of Baltimore, and in that office he presided as apostolic delegate over the Third Plenary council of the American hierarchy (1884). In 1886 Pope Leo XIII made him the second American cardinal.

Cardinal Gibbons was a fairly frequent contributor to periodicals' on questions of national interest, and beside The Faith *of Our Fathers* he wrote four other volumes dealing with religious subjects. Upon the opening of the Catholic University of America in Washington (1889) he became its first chancellor and was its powerful protector during the first difficult years.

The spirit in which the cardinal always viewed his native land and its institutions is illustrated by his remark that the constitution of the United States was the greatest instrument of government that ever issued from the hand of man. His sermon upon taking possession in Rome of his titular Church of Santa Maria in Trastevere (March 2j, 1887) was in high praise of the practical workings of the U.S. system of separation of church and state. The nation, in turn, felt a deep affection for him, and at the civic celebration of his golden jubilee as a priest and his silver jubilee as a cardinal (Baltimore, June 6, 1911) the United States witnessed the most distinguished gathering that it had ever seen in honour of a private citizen, led by President Taft. Cardinal Gibbons died on March 24, 1921, loved and esteemed by Americans of every walk of life and of every religious belief.

See John Tracy Ellis, *The Life of James Cardinal Gibbons, Archbishop of Baltimore, 1834–1921,* 2 vol. (1952). (J. T. E.)

GIBBONS, ORLANDO (1583–1625), English composer, was the most illustrious of a family of musicians all more or less able. His father, William Gibbons (d. 1595) was one of the "waits" of Cambridge, and his three sons, and, at least, one of his grandsons, were all good musicians. The eldest son. Edward (c. 1570–c 1650), was priest-vicar and succentor at Exeter cathedral, and some of his music is extant in various libraries. Ellis (1573–1603) contributed two madrigals to Morley's *Triumphs oj Oriana.* Orlando. the youngest and most famous of the brothers, was born at Cambridge. Dec. 25, 1583. At 12 years of age he became a chorister of King's college, Cambridge, and in due course a sizar of the college. taking his degree of Mus.D. in 1606. At the age of 21, he became organist of the Chapel Royal. Gibbons received many marks of royal favour, and in 1619 was appointed one of the king's musicians for the virginals. In 1622 he received the honorary degree of Mus.D. at Oxford, for which occasion he composed the anthem "O. clap your hands." Next year he nas appointed organist of Westminster Abbey, but only lived to hold the post for two years. In 1625 he went to Canterbury to produce a composition written in honour of the marriage of Charles to Henrietta Maria. and there died of apoplexy on June 5, 1625. He was buried in Canterbury cathedral.

The works published by Gibbons during his lifetime were Fantasies in Three Parts, composed for viols (c 1610). said to have been the first piece of music in England printed from engraved copper plates; six pieces for the virginals printed in the collection called Parthenza (1611); *Madrigals and Motets of 5 parts,* Apt for Viols and Voices (1612), which rank among the most exquisite of his works; and two anthems printed in Leighton's Teares or *Lamentaciones* (1614). His fame was kept alive as a composer of church music by the selections from his services and anthems printed by Barnard in his First Book of Selected *Church Music* (1641), and by Boyce in his Cathedral Music (1760–78). Some 40 anthems by Gibbons are in existence. Some'of these are in the polyphonic style of which he was a consummate master; others show him as a pioneer in the new form developed by Blow. Purcell and others of a later generation, for they have solos. often with instrumental accompaniment, and chorus.

Gibbons wrote church services in both the old and the new style, and left 17 hymn tunes marked with his own peculiar dignity of expression.

A collection of Gibbons's church music was edited by Sir F. Ouseley, in 1873; a complete edition is in the Carnegie edition of *Tudor Church Music,* vol iv (1925). His pieces for keyboard instruments nere edited by Margaret Glyn, j vol. (1925), and some of his music for strings by Fellowes (1924). See Margaret H. Glyn, About Elizabeth and Virginal Music and its *Composers* (1924), and E. H. Fellowes, Orlando *Gibbons* (1925).

GIBBS, JAMES (1682–1754), British architect, designer of St. Martin-in-the-Fields. London, was born in Aberdeen on Dec. 23, 1682. In 1700 or 1701 he went to the Netherlands, whence he traveled through France to Italy. In 1703 he entered the Pontifical Scots college in Rome to train for service as a Catholic missionary in his native land, but soon left it to study the arts, first painting and then architecture. In 1709 he went to England, where a sinecure granted by the earl of Mar enabled him to set up as an architect in London.

Gibbs was appointed one of the surveyors to the commissioners for building 50 new churches in London, and in 1714 designed St. Mary-le-Strand, his first public building. In 171j. he lost the surveyorship, but his private practice continued to prosper. Among his most famous buildings were St. Martin-in-the-Fields, London (1722–26),the Senate house at Cambridge (1722–30) and the Radcliffelibrary at Oxford (1737–49). He was an architect of great ability whose Roman training kept his style outside the Palladianism (*q.v.*) that dominated the English architectural scene. His books, especially A Book of Architecture (1728), were influential in Britain and America well into the 19th century. Gibbs died on Aug. 5, 1754, in London.

See Bryan Little, The Life and Work of James Gibbs 1682–1754 (1955), with a bibliography; and John Summerson, Architecture in Britain 1530–1830 (1954), for the best discussion of his architectural style. (Ms. W.)

GIBBS, JOSIAH WILLARD (1839–1903), the most distinguished American mathematical physicist of his day, was born at New Haven, Conn., on Feb. 11, 1839. Entering Yale in 1854 he graduated in 1858, and in 1863 went to Europe, studying in Paris in 1866–67, in Berlin in 1867 and in Heidelberg in 1868. Returning to New Haven in 1869, he mas appointed professor of mathematical physics at Yale in 1871 and held that position till his death on April 28. 1903. His first contributions to mathematical physics were two papers published in 1873 on "Graphical Methods in the Thermodynamics of Fluids," and "Method of Geometrical Representation of the Thermodynamic Properties of Substances by Means of Surfaces." His next and most important publication was his famous paper "On the Equilibrium of Heterogeneous Substances" (1876–78), which. it has been said, founded a new department of chemical science. This was translated into German by W. Ostwald (who styled its author the "founder of chemical energetics") in 1891 and into French by H. le Chatelier in 1899. In 1881 and 1884 he printed some notes on the elements of vector analysis for the use of his students; these were never formally published, but they formed the basis of a textbook on Vector Analysis which was published by his pupil, E. B. Wilson, in 1901. Between 1882 and 1889 a series of papers on certain points in the electromagnetic theory of light and its relation to the various elastic solid theories appeared in the American *Journal of* Science, and his last work. *Elementary* Principles in Statistical Mechanics, was issued in 1902. The name of Willard Gibbs is especially associated with the "Phase Rule." In 1901 the Copley medal of the Royal society of London was awarded him as being "the first to apply the second law of thermodynamics to the exhaustive discussion of the relation between chemical, electrical and thermal energy and capacity for external work."

Gibbs' original scientific papers were assembled in 1928, and published in two volumes by the Yale University Press as The Collected *Works* of J. Willard Gibbs. In 1936 there followed two companion volumes, A Commentary on the Scientific Writings of J. *Willard* Gibbs, written by a group of distinguished authors. The literature devoted to the exposition and applications of Gibbs' contributions is far too voluminous to be outlined here, but an extensive bibliography of books and articles about Gibbs can be found in Josiah Willard Gibbs, The History of a Great Mind (2nd ed., 1952), written by L. P. Wheeler, a former student of Gibbs. This book should be consulted for further biographical information, and for letters and short manuscripts not in The Collected *Works.* (B. B. On.)

GIBBSITE (Hydrargillite), aluminum hydroxide or trihydrate, is an important mineral of many bauxites. Commercial trihydrate bauxite, a major source of aluminum, may contain 60% or more aluminum oxide. or alumina (Al_2O_3), but rarely does this all represent gibbsite. Gibbsite is prominent in bauxites of Arkansas, Jamaica, the Guianas. Brazil, west Africa, India and many other locations. In bauxites. gibbsite is usually fine grained and may be cryptocrystalline, or occasionally relatively coarse in small cavities, or vugs, or veinlets.

Gibbsite in significant deposits is of secondary origin, but small-scale, hydrothermal sources are known. Under extreme weathering conditions. it may develop from any aluminous mineral, especially feldspars or feldspathoids. It may form directly from these or with the intermediate formation of clay mineral, or from boehmite.

Synthetic gibbsite is made from bauxite or high-alumina materials for production of aluminum metal and alumina chemicals. High temperature calcination yields corundum (*q.v.*) but partial calcination may yield a variety of near-anhydrous alumina types of difficultly analyzed structures.

The formula is α-$Al_2O_3.3H_2O$ or structure cell formula 8[Al-(OH),]. Bayerite, a dimorph of gibbsite, is not known in nature. Gibbsite. which is monoclinic prismatic, frequently occurs in tabular crystals of hexagonal aspect. Cleavage is perfect, hardness 2.5 to 3.5, specific gravity 2.4 or slightly less. Refringence is moderate (1.568–1.587). It is soluble in strong mineral acids and alkalies. The theoretically pure mineral contains 65.4% Al_2O_3 and 34.6% H_2O, but natural specimens are generally contaminated by ferric oxide, silica and other impurities. See also Alumina; Aluminum; Bauxite; Corundum, Artificial.

(W. K. Gr.)

GIBEON, an ancient city of Palestine, whose inhabitants successfully tricked Joshua into a truce (Josh. ix). David's select warriors fought with the chosen of Ishbosheth at the "Pool of Gibeon" (II Sam. ii), and there Joab treacherously slew Amasa (II Sam. xx).

But Gibeon was more renowned for its "high place" which the youthful King Solomon made it one of his first cares to visit, and where for a time the tabernacle was deposited. Gibeon is most probably represented today by El-Jib. where there seems to be an echo, if faint and uncertain, of the ancient name. El-Jib is a small village on an isolated hill, 5 mi. N.W. of Jerusalem, and is surrounded by olive groves. There are to be found springs and the remains of a reservoir.

Alt would identify Gibeon with Tell en-Nasbeh.

(E. Ro.)

GIBRALTAR, a rocky peninsula, projecting southward, about $2\frac{3}{4}$ mi. long with greatest breadth nearly 1 mi., connected with the Spanish mainland by a sandy flat less than 10 ft. above the sea; bounded to the east by the Mediterranean and to the west by the Bay of Algeciras. Since 1713 it has been a British fortress and crown colony controlling the Strait of Gibraltar. Area: 2.25 mi., including reclamations.

Physical Features.— The promontory of Gibraltar, known as "the Rock," shoots abruptly upward from the low ground at the north front in a fine mural precipice, the basal portion of which is partly concealed by a sloping curtain of debris and breccia. This precipitous wall culminates at the Rock Gun (1,330 ft.) from which point the dividing ridge or backbone of the promontory extends southward in a sharp jagged arch. the dominant points of which are Middle hill (1,211 ft.), Signal hill (1,260 ft.), a point above Monkey's Alameda (1,398 ft., the highest of the Rock) and O'Hara's tower (1,380 ft.). At the latter the ridge is sharply truncated, and succeeded to the south by the well-marked plateau of Windmill hill and Europa point. From the Rock Gun to O'Hara's tower the dividing ridge presents to the east a bold escarpment, which is for the most part inaccessible, and in places almost vertical, the cliffs where they are lowest having a drop of not less than 300 or 400 ft., and of more than 1,000 ft. where they approach the sea on the north.

From their base the ground falls rapidly away to the coast line at angles that vary from 30° to 40°. The opposite slopes of the dividing ridge are not so abrupt, the only really precipitous portion that faces the west being the line of cliff that overlooks Gardiner's road and Engineer's road between the Moorish wall and the Mount.

The top of Windmill hill slopes from 400 to 300 ft. above the sea and so is separated by a great cliff from O'Hara's tower on the north; it ends southward in a zoo-ft. cliff, below which are Europa flats that themselves end in a jo-ft. cliff plunging steeply into fairly deep water. Europa point is $11\frac{1}{2}$ nautical miles from the African coast, and its lighthouse is in 5° 21' W. and 36° *6 30"* N.

The Rock is limestone, covered on the west by shales, both of Lower Jurassic age. The limestone has many caves with accumulations of bone breccia, and there are several apparently Pleistocene or still more recent deposits. The cave at the north end overlooking the isthmus near the Devil's tower has yielded evidence of the former presence of 2 j species of mammals, including the elephant and rhinoceros. During tunnelling operations on the east side of the Rock in 1944 a cave (Gorham's) 40 ft. high was found; it was excavated in 1948 and revealed four levels of occupation from Neanderthal to Roman times.

The flora of the Rock is not overly rich, because of the isolation and of the character of much of its surface. The stone pine and the wild olive appear to be long established. The fauna, apart from the Barbary apes, is not of great interest. A Mousterian flint industry was described for Gibraltar— especially the Devil's tower site—by Dorothy Garrod, who also found in 1926 a second skull of Mousterian type (discovery of the first in 1848 antedated by eight years that at Neanderthal). (H. J. F.; X.)

Climate.— June, July and August are practically rainless and May and September nearly so. The rest of the year is delightful, with occasional storms. The thermometer in summer does not often reach go° F. in the shade; from 83° to 8j° may be taken to be the average maximum for July and August, and the mean annual temperature is 64.4°.

The average yearly rainfall is $35\frac{1}{3}$ in., and the highest recorded rainfall in Gibraltar occurred in the winter of 18 j5–56 when it was 77.14 in., the lowest recorded rainfall being in 1800–01 when it was 1 j.12 in. The water supply for drinking and cooking purposes is almost wholly derived from rain water, stored chiefly in underground tanks; there are only two fresh-water wells. Rain reservoirs with a capacity of 12,000,000 gal. are filled with water from specially prepared collecting areas, covering about 50 ac., high up the Rock. There are separate reservoirs for army, navy and civilians.

History.— Gibraltar was known to the Greek and Roman geographers as Calpe or Alybe, the two names being probably corruptions of the same local (perhaps Phoenician) word. The eminence on the African coast near Ceuta which bears the modern English name of Apes' hill was then designated Abyla; and Calpe and Abyla, at least according to an ancient and widely current interpretation, formed the renowned Pillars of Hercules (Herculis columnae), which for centuries were considered as the limits of enterprise to the seafaring peoples of the Mediterranean world. Gibraltar was named after Tarik ibn Zaid, its name being a corruption of Jebel el-Tarik (Mount Tarik).

Tarik invaded Andalusia in A.D. 711 with an army of 12,000 Arabs and Berbers and in the last days of July of that year destroyed the Gothic power in a three days' fight on the banks of the river Guadalete near where Jerez de la Frontera now stands. In order to secure his communications with Africa he ordered the

THE SIEGE OF GIBRALTAR. 1779–83, SHOWING ARRIVAL OF BRITISH RELIEVING SQUADRON UNDER ADMIRAL DARBY. APRIL 12, 1781

building of a castle on the Rock that the Romans had known as Mons Calpe. This work. begun in the year of the great battle, was completed in 742. It covered a wide area. reaching from the shores of the bay to a point halfway up the northwestern slope of the Rock; there the keep, a massive square tower, still stands and is known as the Moorish castle. Gibraltar was taken in 1309 by the Spaniards and retaken in 1333 by the Moors, from whom it passed in 1411 to the Moorish ruler of Granada. In 1462 it became Spanish once more, passing in 1469 into the family of the duke of Medina Sidonia. In 1502 Gibraltar was formally incorporated with the domains of the Spanish crow?. The Spaniards made great efforts to strengthen the place and succeeded so well that throughout Europe Gibraltar was regarded as impregnable, the engineer Daniel Speckle (1536–89) being chiefly responsible for the design of the fortifications.

Gibraltar was taken, however, by the allied British and Dutch forces after a three days' siege, on July 24, 1704. (See SPANISH SUCCESSION, WAR OF THE.) The capture was made, as the war was being fought, in the interests of Charles, archduke of Austria, but Sir George Rooke, the British admiral, on his own responsibility caused the British flag to be hoisted and took possession in the name of Queen Anne, whose government ratified the occupation. The Spaniards quickly assembled an army to recapture the place, and a new siege was begun in Oct. 1704 by troops of France and Spain under the marquess of Villadarias. The defense of the British admiral, Sir John Leake, and of the military governor, Prince George of Hesse-Darmstadt (who had commanded the land forces in July), caused it to be lifted after six months. By the treaty of Utrecht (1713) Spain formally recognized England's title to Gibraltar. Twice in the diplomatic exchanges of the next few years, England was prepared to consider restitution; but on both occasions the negotiations fell through, and by 1721 English public opinion was adamant against surrender. A Spanish attack in 1720 and another siege in 1727 alike proved abortive, and by the treaty of Seville of 1729 Spain ratified the eession.

Neither in the War of the Austrian Succession nor in that of 1762 did Spain again endeavour to besiege the Rock, but the siege of 1779–83, during the American Revolutionary War, is justly regarded as one of the most memorable sieges of history. Hostilities had begun on June 21, 1; 79, but were confined at first to a strict blockade from the land side, where the Spaniards set about constructing siege batteries under fire from the fortress. On Nov. 14, after a spirited naval action, the privateer "Buck" forced her way into the harbour with supplies; many such incidents followed. In Jan. 1780 Adm. Sir George Rodney won a great victory over Juan de Langara and entered with a convoy. Prince William Henry (afterward King William IV) served as a midshipman during this expedition. Supplies and reinforcements were thrown into the fortress by Rodney, and "the garrison," in spite of the scurvy, "might now be considered in a perfect state of defence," said John Drinkwater (see below). On June 7 an attack by Spanish fire ships was successfully dealt with by the naval force in the bay under Captain Lesley of the frigate "Enterprise." By autumn the supply question had again become acute. Though the enemy's batteries still did not open fire! the siege works steadily progressed, and there were frequent small engagements at sea in which the English were not always successful. Further, the expulsion, with great harshness, of the English residents of Barbary in Jan. 1781 put an end to a service of supply and information which had been of the greatest value. Three more months passed in forced inaction. Then, on April 12, 1781, on the arrival of a British relieving squadron under Adm. George Darby, the whole of the Spanish batteries opened fire. Stores were landed in the midst of a heavy bombardment, and much damage was done to fortifications and military buildings and to the town. The bombardment continued up to June 1, after which the rate of the enemy's fire decreased until by July 12 it had almost ceased. In September the firing again became intense and casualties increased. By October both sides were well covered, and in November the governor, Gen. Sir George Eliott, secretly prepared a great counterstroke. The sortie made on the night of Nov. 26–27 was brilliantly successful, and the Spanish siege works were mostly destroyed. At the close of the year the garrison was thus again in an excellent position.

Early in 1782 a gun-carriage wheel, allowing a large angle of depression, was invented by an officer of the royal artillery, one of many experiments made throughout the siege with guns, mountings, ammunition, methods of fire, etc., both in Gibraltar and in the Spanish camp. The new gun carriage enabled 93% of hits to be obtained at 1,400-yd. range. In April grates for heating shot were constructed by order of the governor; these were destined to be famous. At the same time it was reported that Louis de Berton, duc de Crillon and duc de Mahon, was to command the besiegers (French and Spanish) with J. C. E. LeMichaud d'Arçon as his chief engineer. The grand attack was imminent, and preparations were made to repel it. The chief feature of the attack was to be, as reported on July 26, ten ships "fortified 6 or 7 ft. thick . . . with green timber bolted with iron, cork and raw hides; which were to carry guns of heavy metal and be bomb-proof on the top with a descent for the shells to slide off; these vessels . . . were to be moored within half-gunshot of the walls." Many of the now existing rock galleries in the fortress were made about this time. The garrison made a preliminary trial of the red-hot shot on Sept. 8, and the success of the experiment not only elated the defenders but was partly instrumental in causing Crillon to hasten the main attack. After a preliminary bombardment the famous battering ships took up their positions in broad daylight on Sept. 13 and opened fire. The British solid shot failed to penetrate the massive wooden armour on their sides and roofs, and about noon the ships had settled down to their work and were shooting coolly and accurately. Then the British began to use red-hot shot. All day the artillery duel went on, the shore guns, though inferior in number, steadily gaining the upper hand, and by nightfall the battering ships were in great distress. The struggle continued in the dark, and one by one the ten ships were set on fire. Before noon on Sept. 14 the attack had come to an end, every ship having been blown up or burned to the water's edge. More than 8,300 rounds were expended by the garrison, though less than 100 pieces were in action. The enemy's bombardment was, however, resumed and partial engagements continued up to the third naval relief of the fortress on Oct. 11 by Lord Howe, his tactics completely defeating, without an engagement, the combined French and Spanish fleet. The long siege came to an end on Feb. 6, 1783, when Crillon informed Eliott that the preliminaries of peace had been signed.

The treaty of Versailles (1783) once more confirmed Britain's possession of the Rock, and its history thereafter was comparatively uneventful. Rumors in 1801 of a Spanish and French attack ended after Sir James Saumarez defeated the enemy ships off Algeciras in July. In 1830 the status of "fortress" was changed to that of "crown colony."

During World War I the Rock was of great value as a base for Allied navies, the most important being that of the United States. Thousands of Spanish refugees sought shelter in the fortress during the civil war of 1936–39. After Italy entered World War II in 1940 all women and children were removed from Gibraltar. as well as all male civilians except about 3,000 engaged in essential work. Additional defenses were constructed on the land side of the Rock to guard against attack through Spain, military engineers expanded the interior defenses fivefold. the length of tunnelling being increased from 2 mi. to 10 mi.. and a canal was cut across the isthmus. The repatriation of the 17,000 evacuees in the years following the war created the housing and other difficulties referred to below.

With the changing character of modem war the strategic role of Gibraltar was much altered. The withdrawal of the last royal marine in 1948 and of the last infantry battalion in 1950 severed a connection of almost 250 years; their place was taken by the 78th heavy anti-aircraft regiment, royal artillery. A permanent building scheme for the royal air force, whose association with the Rock began in 1937, was completed in 1956.

Successive Spanish governments. but especially that of Gen. Francisco Franco, stated from time to time that Gibraltar was Spanish territory to which the Spanish people did not renounce their claim—a claim that was never recognized by the United Kingdom government.

The Town. — The modem town of Gibraltar is of comparatively late date, nearly all the older buildings having been destroyed during the great siege (1779–83). The town lies, with most of its buildings crowded together, at the northwestern corner of the Rock and covers an area of only ¾ by ¼ mi. A good deal of land has been reclaimed from the sea. Much of the town, in fact the entire business quarter, is on level ground, and the narrow streets and ramps that go up the Rock only communicate with various private houses, barracks, etc. To the south of the town are the barracks for the military garrison and the majority of the larger official residences, together with sports grounds and other amenities. The Gibraltar museum, which was opened in 1930, contains casts of the Gibraltar skulls, a collection of the flora of the Rock and pictures, coins and stamps.

Population.—After the capture of the town by the British, the former Spanish population emigrated and founded, 6 mi. away, the little town of San Roque. Most of the native inhabitants are descendants of later Spanish and Italian settlers; there are also a number of Maltese and between 2,000 and 3,000 Jews. The Jews form a distinct society of their own. The language of the people is Spanish, not very correctly spoken. English is learned as a foreign language and is rarely spoken in their homes. Thousands of workers cross "the Lines" daily from the neighbouring Spanish town of La Linea de la Concepción, itself a mere suburb of Gibraltar whose population in 1950 was 55,105 (mun.). Though the gates are kept open. the frontier barrier closes at 10 P.M. save for those who have a pass. Aliens are not allowed to reside in Gibraltar without a special permit. which must be renewed at short intervals. After 1900 similar requirements were extended to British subjects not previously resident. In July 1951 the civilian population uas 22.848, an increase of 30% since the previous census of 1931. An official warning was given that if numbers continued to grow some would have to emigrate.

Government and Finance.—Power of legislation was vested until 1950 in the governor, who is also commander in chief, assisted by an executive council (established in 1922) of four official and three nominated unofficial members. By a new constitution there was then created in addition a legislative council, inaugurated on Nov. 23, 1950, of three ex-officio, five elected and two nominated members. Voting for the elected members was by proportional representation, the electorate being the same as for the city council. The governor, who presides over the legislative council, retains the right to enact any measure necessary in his judgment for public order or defense. The city council of four elected members succeeded in 1921 an earlier board of sanitary commissioners; it is responsible for buildings and streets, the civilian water supply and other matters of municipal administration not impinging on defense considerations. An appeal from its decisions, so far as these affect individuals, lies to the supreme court.

The grant of popular representation was allied to the need for direct taxation, a legacy of World War II. Hitherto the main sources of revenue had been: (1) duties on wine, spirits, malt liquors, tobacco and motor spirit (fuel); (2) port and harbour dues; (3) tavern and other licences; (4) posts and telegraphs; (5) rents of crown estate; and (6) stamps and miscellaneous. A rehousing scheme announced in 1945 to relieve the chronic problem of overcrowding in an inelastic space and estimated then to cost £750,000 for 1,000 flats, was revised soon after to a figure of £2,250,000 for 472 flats, a cost no longer within the colony's means. In 1947 a government lottery, calculated to produce, with fortnightly draws, £48,000 annually, was instituted to help with the problem, and a £1,000,000 loan was launched in 1948. In 1949 a trading-profits tax (the first direct taxation ever imposed in Gibraltar) and a new import tax on coffee was announced. Income tax was introduced in 1953. In 1955 import duties were imposed on a number of items.

Trade union legislation dates from 1947; nonresident aliens, who outnumber resident workers, especially in the admiralty dockyard, may not vote on strike issues.

Religion and Education.—Apart from the garrison and civil officials, there are comparatively few members of the Anglican Church. The great majority of the people belong to the Church of Rome, and in 1910 Gibraltar became a Roman Catholic bishopric, independent of the Spanish hierarchy and subject directly to the Vatican. There are, besides an Anglican and a Catholic cathedral, four Catholic churches. Nonconformist churches and four Jewish synagogues. The Anglican bishopric of Gibraltar, created in 1842, ministers to Anglican congregations throughout southern Europe from Madeira to the Caspian.

Education is compulsory for all children between the ages of 5 and 14. The 16 elementary schools (nearly all Roman Catholic) are subsidized by the government. as are also 4 secondary schools and a dockyard technical school; there are, in addition, several private schools. In the mid-1950s there was a total enrolment in government-aided schools of more than 3,500 students.

Commerce.—With few exceptions, Gibraltar has been a free port since 1705—a distinction arising, it is said, from the refusal of a sultan of Morocco to allow much-needed exports from Morocco to Gibraltar if full liberty of trade were not granted to his subjects.

During the great wars of the beginning of the 19th century trade was most active in Gibraltar, and some large fortunes were made. Thereafter the chief business was the coaling of passing steamers. This entered a period of decline after World War I, but with the installation of more modern coaling machinery in 1932 and exemption from the payment of port dues by vessels calling solely for bunkers, coaling enjoyed a modest revival. The increased use of oil fuel by ships, however, made unlikely any restoration of the earlier prosperity. Another source of trade is the export of goods landed for re-export to Morocco, but much of this business which formerly went to Gibraltar was transferred to lines of steamers operating directly between Morocco and British, German and French ports. Nearly all the fresh meat consumed in Gibraltar ordinarily comes from Morocco, and also large quantities of poultry and eggs. A large part of trading activity consists in importing from overseas for resale to the services and to Spaniards from the mainland. Of more than 2,000 tons of coffee imported each year, only 2% is consumed locally. About 3,500 vessels, totalling about 9,000,000 tons, enter and clear each year.

The money, weights and measures in legal use are British. Before 1898 only Spanish money was current, but the great depreciation of the Spanish currency during the war with the United States led to the reintroduction of British currency as the legal tender of Gibraltar. Notwithstanding this change Spanish money is still accepted.

After 1927 the currency included £5, £1 and 10*s*. notes issued by the government of Gibraltar. There are branches of Barclays bank (dominion, colonial and overseas) and the Crédit Foncier d'Algérie et de Tunisie and several private bankers. A government savings bank was founded in 1882 and had over £1,000,000 on deposit by the 1950s.

Harbour and Fortifications.—Early in the 20th century the defenses of Gibraltar were modernized. Old pieces of artillery at or near the sea level were replaced by new weapons placed high up, many of them on the crestline of the Rock, and new dockyard works were undertaken. Gibraltar became an important naval base where ships could lie at anchor secure against attack by surface vessels and be given extensive repair.

The land space available for the purposes of dockyard extension being very limited, a space of about 64 ac. was reclaimed from the sea in front of the Alameda and the road to Rosia; some of the land reclaimed was as much as 40 ft. under water. The large quantity of material required for this purpose was obtained by tunnelling the Rock from west to east and from quarries above Catalan Bay village, to which access was gained through the tunnel. The graving docks occupy the dugout site of the former new mole parade. There are three of these docks, 850, 550 and 450 ft. in length respectively, and a small dock which is available for merchant vessels of light draught. The largest dock is divisible by a central caisson so that four ships can be docked at one time. The docks are all 95 ft. wide at the entrance, with 354 ft. of water over the sills at low-water spring tides. The enclosed harbour covers 440 ac., 250 of which have a minimum depth of 30 ft. at low water. It is closed on the south and southwest by the south (or new) mole and the south mole extension, together 3,660 ft.; on the west by the detached mole, 2,717 ft.; and on the north by the north (or commercial) mole. The last runs westward from Devil's Tongue for about 2,900 ft. and then southward, giving a total length of more than a mile.

The south mole is said to have been begun by the Spaniards in 1620. It was successfully assaulted by landing parties from the British fleet under Sir George Rooke at the capture of Gibraltar by the British in 1704. It is formed of rubble stone floated into position in barges. The mole has a width at its top of 102 ft., and it has a continuous wharf wall on the harbour side, 3,500 ft. long, with water alongside 30–35 ft. deep.

The detached mole is a vertical wall formed of concrete blocks, each block weighing 28 tons. These blocks were built together on the sloping block system upon a rubble foundation of stone deposited by barges and levelled by divers for the reception of the concrete blocks.

The north mole is chiefly used by the navy as a convenient wharf for destroyers and other smaller craft. At the end nearest the town are large stores. Parallel with and inside the western arm of the mole, which is built of rubble, are five jetties faced with a concrete wharf wall and having 20 to 30 ft. of water alongside.

The Devil's Tongue was constructed during the great siege of 1779–83 in order to bring a flanking fire to bear upon part of the Spanish lines.

The old wharf at Waterport was extended and improved by the addition of a new mole, which was provided with sheds for transit cargo, electrical cranes and other equipment to facilitate the handling of cargo. In Jan. 1956 a port development scheme was approved. to cost £1,500,000, to include a deepwater quay and to be financed from Colonial Development and Welfare funds, irom a London market loan and from port revenues.

With the development of air warfare the defense of Gibraltar became a problem of particular difficulty because of the lack of space upon which to construct adequate airfields. At the beginning of World War II there was available only one small landing place with a length of merely 200 yd. A new runway on the narrow isthmus joining the Rock to the mainland mas built with rockspoil from the tunneling of new defenses; it was 190 yd. wide and projected out into the bay for nearly half its length of 1,800 yd.

GIBSON, CHARLES DANA (1867–1944), U.S. artist and illustrator, creator of the "Gibson girl." was born at Roxbury, Mass., on Sept. 14, 1867. After a year's study at the schools of the Art Students' league, he began with some little drawings for the humorous weekly *Life*.

These he followed up with more serious work, and soon made a place for himself as the delineator of the American girl. at various occupations, particularly those out-of-doors. The "Gibson girl" obtained an enormous vogue, being later published in book form. Some book illustrations followed, notably those for *The Prisoner of Zenda*.

Gibson was imitated by many of the younger draftsmen, copied by amateurs, and his popularity was shown in his engagement by *Collier's Weekly* to furnish weekly for a year a double page, receiving for the 52 drawings the sum of $50,000, said to have been the largest amount ever paid to an illustrator for such a commission. These drawings covered various local themes and were highly successful, being drawn with pen and ink with masterly facility and great directness and economy of line. So popular was one series. "The Adventures of Mr. Pipp." that a successful play was modeled on it. In 1905, although besieged with commissions. Gibson withdrew from illustrative work, determining to devote himself to portraiture in oil, in which direction he had already made some successful experiments; but in a few years he again returned to illustration. He published a number of books of sketches. In 1932 he became a member of the National Academy of Design. Gibson died in New Y'ork city on Dec. 23, 1944.

"GIBSON GIRL" BY CHARLES DANA GIBSON

See Fairiax Downey, *Portrait of An Era* (1936).

GIBSON, EDMUND (1669–1748), English theologian and jurist. was born at Bampton in Westmorland. In 1686 he entered Queen's college. Oxford. where in 1692 he published a valuable edition of the *Saxon Chronicle* with a Latin translation: indexes and notes.

This was followed in 1693 by an annotated edition of the *De institutione oratoria* of Quintilian, and in 1695 by a translation (2 vol.) of Camden's *Britannia,* "with additions and improvements." with the assistance of William Lloyd. John Smith and other English antiquaries. Gibson was appointed chaplain and librarian to the archbishop of Canterbury, when he began to catalogue the library, and in 1703 and 1710 respectively, he became rector of Lambeth and archdeacon of Surrey.

During the reigns of William and Anne the controversy over the rights and privileges of convocation suggested to him the researches which resulted in the famous *Codex iuris ecclesiastici Anglicani* (2 vol., 1713; and enlarged ed., 1761). This work is a learned and comprehensive discussion of the legal rights and duties of the English clergy, and the constitution, canons and articles of the English Church.

In 1716 Gibson was presented to the see of Lincoln, from where he was in 1720 transferred to that of London, where for 25 years he exercised great influence, being regularly consulted by Sir Robert Walpole on ecclesiastical affairs. He broke with Walpole on the Quakers' Relief bill of 1736. He died Sept. 6, 1748.

Gibson's other works include *Vita Thomae Bodleii* with the *Historia Bibliothecae Bodleianae* in the *Catalogi librorum manuscriptorum* (1697). and the *Reliquiae Spelmannianae* (1698).

GIBSON, JOHN (1790–1866), English neoclassical sculptor, whose attempt to revive polychromed sculpture caused much controversy. was born on June 19, 1790, at Gyffin, Conway, Caernarvonshire. In 1804 he was apprenticed to a monumental mason in Liverpool, in which city he remained until 1817, latterly enjoying the patronage of the writer William Roscoe.

One of his first Royal Academy submissions, "Psyche Borne on the Wings of Zephyrus" (1816), was praised by John Flaxman, under whose persuasion he went to Rome in 1817. There he was befriended by Antonio Canova, leader of the neoclassicists; he was also instructed after 1822 by Bertel Thorwaldsen. His commissions from Rome (he did not return to England. even for visits, until 1844) included "Mars and Cupid" (1819), "Hylas and the Water Nymphs" (1826) and "Hunter and Dog" (1844); he was elected an associate of the Royal Academy in 1833 and a full member in 1838.

In face of opposition, but invoking Greek precedent. he introduced colour into a statue of Queen Victoria done for Liverpool in 1847, tinting only diadem, sandals and robe hem. A repetition of the 1833 "Cupid Tormenting the Soul" was, however, completely coloured—Gibson said at the behest of the god in a vision—and the best-known example of this polychromy was the "Tinted Venus" of 1851–55.

His commemorative sculpture included the Queen Victoria group for the princes' chamber. houses of parliament, London (1850–55), statues of George Stephenson (1844) and Sir Robert Peel (1851) and portrait busts.

Gibson died in Rome on Jan. 27, 1866. The Gibson gallery, Burlington house, contains his bequest to the Royal Academy of casts and a few works in marble.

GIBSON, THOMAS MILNER (1806–1884), English statesman. was the leading associate of Richard Cobden and John Bright and became prominent as a persuasive exponent of their doctrines. He was born at Port of Spain. Trinidad, on Sept. 3, 1806. By birth and marriage an East Anglian landowner. he was elected Conservative member for Ipswich in 1837; converted to free trade. he turned Liberal two years later and lost his seat. He was member for Manchester from 1841 to 1857, when his opposition to the Crimean War led to his defeat, and for Ashton-under-Lyne from 1857 to 1868. Vice-president of the board of trade under Lord John Russell from 1846 to 1848, he became president in 1859 upon Cobden's refusal to enter Lord Palmerston's ministry, relinquishing the presidency of the poor law board. During his long tenure on the board of trade, which ended in 1866, Milner Gibson gave valuable support to W. E. Gladstone's fiscal and financial reforms at the exchequer, and was himself largely responsible for the repeal of "taxes on knowledge." He withdrew from politics in 1868 ard died at Algiers on Feb. 2j, 1884.

Milner Gibson was an effective propagandist for the Anti-Corn Law league, a respected and popular figure in parliament and an adequate administrator. His wife's *salon,* for long a noted meeting place of English and European intellectuals, added to his influence in Liberal society. Consistently loyal to Cobden and Bright, he lacked their reluctance to take office as well as their stature, and found a place in the variegated cabinets of Russell and Palmerston primarily as the best available representative of the "Manchester school." (A. F. T.)

GIBSON, WILLIAM HAMILTON (1850–1896), U.S. illustrator, author and naturalist, was born in Sandy Hook, Conn., on Oct. 5, 1850. He had sketched flowers and insects when he was only eight years old, had long been interested in botany and entomology and had acquired great skill in making wax flowers. His first drawings, of a technical character, were published in 1870. He rapidly became an expert illustrator and a remarkably able wood engraver, while he also drew on stone with great success. He drew for many periodicals, his most popular works being a long series of nature articles published in *Harper's, Scribner's* and *Century*. Gibson died July 16, 1896, at Washington, Conn.

Gibson was an expert photographer, and his drawings had a nearly photographic and almost microscopic accuracy of detail. He was perfectly at home in black and white, but rarely (and feebly) used colours.

GICHTEL, JOHANN GEORG (1638–1710), German mystic, was born at Ratisbon on March 14, 1638. He was admitted an advocate, first at Spires, and then at Ratisbon, but a meeting with the baron Justinianus von Weltz (1621–68), a Hungarian nobleman who cherished schemes for the reunion of Christendom and the conversion of the world, and a natural leaning toward mysticism changed his career. He promoted a society known as the *Christerbauliche Jesusgesellschaft.* The movement in its beginning provoked no active hostility; but when Gichtel began to attack the teachings of the Lutheran clergy and church, especially upon the fundamental doctrine of justification by faith, he was prosecuted and banished (1665). He settled at Zwolle, Holland, where he co-operated with Friedrich Breckling (1629–1711), who shared his views and aspirations. In 1668 he moved to Amsterdam, where he made the acquaintance of Antoinette Bourignon (1616–80), and became an ardent disciple of Jakob Boehme, whose works he published in 1682 (Amsterdam, 2 vol.). He had attracted to himself a small band of followers known as Gichtelians or Brethren of the Angels, who held views at which he had arrived independently of Boehme. But, unlike Boehme, who "desired to remain a faithful son of the Church," the Gichtelians became Separatists (*cf.* J. A. Dorner, *History of Protestant Theology,* ii, p. 185).

Gichtel's correspondence was published without his knowledge by Gottfried Arnold, a disciple, in 1701 (z vol.) and in 1708 (3 vol.). It has been frequently reprinted under the title *Theosophia practica*.

GIDDINGS, FRANKLIN HENRY (1855–1931), U.S. sociologist and one of the founders of systematic sociology in the U.S., was born in Sherman, Conn., on March 23, 1855. He studied engineering at Union college, Schenectady, N.Y., and after graduating in 1877 was a journalist in Springfield. Mass. He succeeded Woodrow Wilson as professor of politics at Bryn Mawr college in 1888 and was professor of sociology at Columbia university from 1894–1928. He died at Scarsdale, N.Y., on June 11, 1931.

Giddings' idea of sociology as the basic social science, formulated in his *Principles oj Sociology* (1896), was derived from A. Comte and L. F. Ward. In his psychological analysis of society he was influenced by Adam Smith, from whom he derived his doctrine of "the consciousness of kind," through which the integration of society is achieved. This was further developed in his conception of social behaviour as "differential responses to stimulation" in his *Studies in the Theory of Human Society* (1922). the best statement of his mature sociological theory. Giddings was stimulated by the theories of Herbert Spencer, Charles Darwin. Ludwig Gumplowicz, Gabriel Tarde, Émile Durkheim, Karl Pearson and others, welding their doctrines into a well-integrated system. In such later works as *The Scientific Study of Human Society* (1924), he emphasized the importance of a statistical approach to sociological problems. On public affairs he wrote *Democracy and Empire* (1900), *Western Hemisphere in the World of Tomorrow* (1915) and *The Responsible State* (1918). *The Mighty Medicine* (1930) and a posthumous volume, *Civilization and Society* (1932), summarized his theory and its applications.

Hankins, "Franklin Henry Giddings (1855–1931)," *American Journal of Sociology*, pp. 349–67 (Nov. 1931); C. H. Northcott, ch. 38, in *Introduction to the History of Sociology*, ed. by H. E Barnes (1947); R. G. Hoxie *et al.* (eds.), *A History of the Faculty of Politiral Science, Columbia University* (1955). (H. E. Bar.)

GIDDINGS, JOSHUA REED (1795–1864), U.S. statesman, prominent in the antislavery conflict, was born at Tioga Point, now Athens, Pa.. on Oct. 6, 1795. In 1806 his parents moved to Ashtabula county, O. For several years after 1814 he was a schoolteacher, but in Feb. 1821 he was admitted to the Ohio bar and soon obtained a large practice. He served in the lower house of the state legislature in 1826–28, and from 1838 until 1859 was a member of the national house of representatives, first as a Whig. then as a Free-soiler and finally as a Republican. Recognizing that slavery was a state institution, uith which the federal government had no authority to interfere, he contended that slavery could exist only by a specific state enactment. that therefore slavery in the District of Columbia and in the territories was unlawful and should be abolished. that the coastwise slave trade in vessels flying the national flag, like the international slave trade, should be rigidly suppressed, and that congress had no power to pass any act which in any way could be construed as a recognition of slavery as a national institution. His attitude in the so-called Creole case attracted particular attention. In 1841 some slaves who were being carried in the brig "Creole" from Hampton Roads, Va., to New Orleans, La., revolted, killed the captain, gained possession of the vessel and soon afterward entered the British port of Nassau, Bah. Thereupon, according to British law, they became free. The minority who had taken an active part in the revolt were arrested on a charge of murder, and the others were liberated. Efforts were made by the U.S. government to recover the slaves; Daniel Webster, then secretary of state. asserting that on a U.S. ship they were under the jurisdiction of the United States and that they were legally property. On March 21, 1842, before the case was settled, Giddings introduced in the house of representatives a series of resolutions, in which he asserted that "in resuming their natural rights of personal liberty" the slaves "violated no law of the United States." Giddings was formally censured by the house, and thereupon resigned, appealed to his constituents and was immediately re-elected by a large majority. From 1861 until his death, in Montreal, Que., on May 27, 1864, he was U.S. consul-general in Canada.

Giddings published a series of political essays signed "Pacificus" (1843); *Speeches in Congress* (1853); *The Exiles of Florida* (1858); and a *History of the Rebellion: Its Authors and Causes* (1864).

See *The Life of Joshua R. Giddings* (1892), by his son-in-law, George Washington Julian.

GIDE, ANDRÉ PAUL GUILLAUME (1869–1951), French novelist and essayist, was born in Paris on Nov. 21, 1869, and educated at the École Xlsacienne and the Lycée Henri IV. He made his debut in literature with a half-psychological, half-lyrical confession, *Les Cahiers d'André Walter* (1891). This was followed by the ironical *Le voyage d'Urien* (1893). *Paludes* (1895), depicting the mediocrity of man's life, and *Les Nourritures terrestres* (1897), a work in which his anti-intellectualism was carried to the extreme of advocating a pure voluptuousness for the enrichment of life. In 1902 Gide published his first novel, *L'Immoraliste,* a masterpiece, following the purest classical tradition with clear-cut psychological design and sureness of touch. *La Porte étroite* (1909, Eng. tr. 1924), *Isabelle* (1911), *La Symphonie pastorale* (1919) are comparatively short analytical novels. distinguished by the same merits. In the *Caves du Vatican* (1914) he attempted less successfully the fantastic and humorous novel. This *sotie* is interesting as illustrating the idea of the *acte gratuit;* that is, void of all ethical or social finality. Among Gide's later works were *Les Faux monnayeurs* (1925), an unequal work, encumbered with detail, but of acute analysis; and *Si le grain ne meurt* (1924), an autobiographical account in which sincerity sometimes gives way to cynicism. He wrote *Le Retour* de *l'U.R.S.S.* (1936) after a trip to the Soviet Union left him disillusioned of a former warmth for the soviet experiment. *Imaginary Interviews* (Eng. tr. 1944), a series of interior dialogues about literature. was written during World War II and became a vehicle for Gide's reactions to the German occupation. Gide also wrote several critical essays and translations. His works were collected in French (*Œuvres complètes,* 1j vol.. 1932–39), and his definitive *Journals* were published in English in three volumes (1947–49). Gide was awarded the 1947 Nobel prize for literature. He died Feb. 19, 1951.

GIDE, CHARLES (1847–1932), French economist and supporter of the co-operative movement, was born on June 29. 1847, at Uzès (Gard). Educated at the College d'Uzès, he entered the faculty of law of the University of Paris. He early became professor of political economy, first at Bordeaux, then at Montpellier and from 1898 to 1920 at the University of Paris. He was the author of one of the best introductory treatises on political economy, *Principes d'e'conomie politique* (first published in 1884 and later translated into English and other languages), and joint author with Charles Rist of a work on the history of economic theory, *Histoire des doctrines kconomiques* (3rd ed.. 1920). Gide devoted a great deal of time and energy to the encouragement and furtherance of the co-operative movement in France, and wrote largely on this question. He unremittingly endeavoured to maintain and promote harmonious international relations and especially to preserve co-operation among intellectual workers in different countries.

GIDEON, surnamed JERUBBAAL (in the Douai version of the Bible, GEDEON JEROBAAL), a liberator, reformer and "judge" of Israel who delivered Israel from hordes of desert raiders—Midianites and others (Jud, vi–viii). He is called Jerubbaal also in the narrative, and it'is possible that the exploits of two heroes have been combined in the passage. There are, as a matter of fact, at least two narratives combined in the relevant chapters of Judges. According to one account Gideon is visited by the angel of Yahweh as he is threshing corn in a wine press, to hide it from the Midianites. and is greeted as the future saviour of Israel. A portion of this narrative has been lost, but it must have told of a raid on Tabor by the Midianites, in the course of which Gideon's brothers were killed. Gathering 300 of his clansmen. Gideon first attacked the raiders by night and drove them away in flight, and then, pursuing them beyond Jordan, captured and slew their two chiefs, Zebah and Zalmunnah. He was then offered the throne, but refused it, and made an image from the Midianite spoil. thus leading Israel into idolatry. In the other narrative Gideon is summoned at night by Yahweh to overthrow the altar of Baal and to establish an altar to Yahweh in its place. This is discovered in the morning. and Gideon is saved from the anger of his fellows only by the pleading of his father, who argues that since Baal has been insulted. Baal must take vengeance—if he can. Gideon then gathers all Israel, his force is reduced to 300 in number. and with these. encouraged by a dream which he hears told in the camp of Midian, he assaults the enemy by night. They flee in panic, but find that the fords of Jordan are held against them by Ephraimites. who capture and kill the two chiefs Oreb and Zeeb. The Ephraimites then complain that Gideon, a Manassite, had not summoned them to follow him, and he appeases their anger by pointing to the honour they have won in killing Oreb and Zeeb.

The story is important as illustrating the danger of raids from the desert to which Palestine was subject, and it prepared the way for Abimelech (*q.v.*), Gideon's son, who made the first effort to establish an Israelite monarchy. *See* also JUDGES, THE BOOK OF.

(S. A. C.; T. H. R.)

GIDEONS, THE. The Gideons, the Christian Commercial Men's Association of America, International, was organized by three traveling men at Janesville, Wis., on July 1, 1899. In Nov. 1908, the organization began to place copies of the Bible in hotel guest rooms, a work which made it famous the world over.. On that date, Bibles were placed in the Superior hotel, Iron Mountain (later Superior), Mont. Later the work was extended to include hospitals and penal institutions and schools. During World War II the Gideons supplied the U.S. armed forces with service testaments.

The Bible work of the Gideons is supported through free-will offerings. The emblem of the Gideons is a two-handled pitcher and torch. in memory of the Bible account of Gideon's victory over the Midianites in Judges vii.

GIEDION, SIGFRIED (1893–), Swiss art historian and the first to apply scholarly methods of analysis successfully to 20th-century architecture. was born in Lengnau, Switz., on April 14, 1893. He was influenced by scholars such as Jakob Burckhardt, Alois Riegl. August Schmarsow and his teacher Heinrich Woelfflin. Giedion's initial training in engineering stood him in good stead when he set out to clarify origins and directions of modern architecture: which he was able to observe closely in his capacity. (from 1928) as secretary-general to the International Congresses for Modern Architecture (C.I.A.M.) and through his personal friendship with such leading architects as Walter Gropius and Le Corbusier.

Giedion taught at the Federal Institute of Technology, Ziirich, and at Harvard university and wrote a number of books. His *Space, Time and Architecture* (10th ed., 1954) is indispensable for an understanding of 20th-century architecture. *Mechanization Takes Command* (2nd ed., 1957) dealt with the consequences of industrialization and *Constancy and Change in Art and Architecture* (Mellon lectures for 1957) marked a new stage in Giedion's development by re-examining such basic problems as abstraction, symbol: symmetry and proportion.

Giedion's work was characterized by unorthodox approaches and great strength of perception; in his historical studies he tried to see the past in all its relevance for the present and future.

(E. F. SR.)

GIEN, a town of central France in the *arrondissement* of Montargis. within the *département* of Loiret on the Loire, 39 mi. E.S.E. of Orleans by rail. Pop. (1954) 6.798. Gien has many old houses.

A stone bridge was built there by Anne de Beaujeu, daughter of Louis XI, about the end of the 1jth century. It is the seat of a subprefect. The old castle. used as a law court. was built in 1494 by Anne de Beaujeu, of brick and stone arranged in geometrical patterns. Gien was damaged extensively during World War II.

GIERKE, OTTO VON (1841–1921) was a leader of the German school of historical jurisprudence second only to F. K. von Savigny (1j79–1861). Born at Stettin on Jan. 11, 1841. he studied at the universities of Berlin and Heidelberg and was professor of law at Breslau (1871–84), Heidelberg (1884–87) and Berlin (1887–1921). His first researches, on the history of associations in German law. culminated in *Das Deutsche Genossenschaftsrecht* (4 vol., 1868–1913). This major work was partly translated into English by F. W. Maitland under the title of *Political Theories of the Middle Age* (1900). Its "realist'! doctrine of corporations profoundly influenced legal theory. From about 1888 Gierke turned more to private law, commenting on the German civil code then newly drafted, and publishing *Deutsches Privatrecht* (2 vol., 1895–1905) and *Das Recht der Schuldverhältnisse* (1917). Gierke died at Berlin on Oct. 10, 1921. His son Julius (187j–), born at Breslau on March 5, 18; j, wrote several works on commercial, insurance and maritime law, and was professor at Gottingen from 192j.

See the introduction to F. W. Maitland, *Political Theories* of ***the Middle Age,*** (1900); S. Mogi, *Otto von Gierke* (1932).

GIERS, NICHOLAS KARLOVICH DE (1820–189j), Russian statesman of Swedish extraction, was born on May 21,

1820. He was educated at the lyceum of Tsarskoye Selo, near St. Petersburg (Leningrad). At 18 he entered the service of the eastern department of the ministry of foreign affairs. and spent more than 20 years in subordinate posts, chiefly in southeastern Europe, until he became minister plenipotentiary in Persia in 1863. He remained there for six years, and, after serving as a minister in Switzerland and Sweden. he was appointed in 1875 director of the eastern department and assistant minister for foreign affairs under Prince Gorchakov, whose niece he had married. The Herzegovinian insurrection had broken out, and he could perceive from secret official papers that the incident had far-reaching ramifications. While the Austrian officials in Dalmatia were almost openly assisting the insurgents, Russian volunteers were flocking to Serbia with the connivance of the Russian and Austrian governments, and General Ignatiev, as ambassador in Constantinople, was urging his government to take advantage of Turkey's weakness and bring about a radical solution of the eastern question. Gorchakov did not want a radical solution involving a great European war, but he did nothing to stem the current of popular excitement. Alexander II, personally averse to war. was not insensible to the patriotic enthusiasm, and remained undecided. Giers gauged the situation accurately. As an official and a man of non-Russian extraction he had to be reticent. but in private he condemned severely the ignorance and recklessness of those around him. The event justified his sombre previsions. The so-called patriots wished to defy Europe in order to maintain intact the treaty of San Stefano, and again Giers found himself in an unpopular minority. His influence mas thrown into the scale of peace. His views. supported by Count Shuvalov, finally prevailed, and the European congress assembled at Berlin. He was not present at the congress, and escaped the blame for the concessions which Russia made to Great Britain and Austria. From that time he was practically minister of foreign affairs, for Prince Gorchakov was in weak health. and lived mostly abroad.

On the death of Alexander II in 1881 it was generally expected that Giers would be dismissed, as deficient in Russian nationalist feeling, for Alexander III had strong anti-German Slavophil tendencies. In reality the young tsar was fully determined not to let his hand be forced by men less cautious than himself. He wanted a minister of foreign affairs who would allow him to control the main lines, and occasionally the details, of the national policy. Giers was, therefore, appointed minister of foreign affairs on the retirement of Prince Gorchakov in 1882; he held office until 1894. In accordance with Alexander III's wish, Giers followed systematically a pacific policy. Accepting the Triple Alliance as a *fait accompli,* he sought to establish more friendly relations with the cabinets of Berlin, Vienna and Rome. To the advances of the French government he at first turned a deaf ear, but when the *rapprochement* between the two countries was effected with little or no co-operation on his part, he utilized it for restraining France and promoting Russian interests. He died on Jan. 26, 1895, soon after the accession of h'icholas II.

GIESEBRECHT, (FRIEDRICH) WILHELM (BENJAMIN) VON (1814–1889), German historian. author of the first general history of the medieval empire based on modern critical methods, was born in Berlin, March 5, 1814, and studied under Leopold von Ranke. In 1857 he became professor at Konigsberg and in 1862 succeeded Heinrich von Sybel at Munich, where he died, Dec. 18, 1889. In *Geschichte der deutschen Kaiserzeit* (6 vol., 1855–95; completed by B. von Simson), Giesebrecht concerned himself with political and religious aspects, ignoring legal, social, economic and constitutional history. His romantic view of the emperors aroused controversy, notably with Sybel. Other works include *Jahrbücher des deutschen Reiches unter Otto II* (1840) and the restoration of the important monastery records *Annales Altahenses* (1841).

GIESSEN, a town of Germany, capital of the former province of Upper Hesse, in central Hesse. It is at the confluence of the Wieseck with the Lahn, 41 mi. N.N.W. of Frankfurt am Main on the railway to Cassel. Pop. (1950) 46,712. Giessen was formed in the 12th century out of the villages Selters, Aster and Kroppach, for whose protection Count William of Gleiberg built the castle of Giessen. The town came, in 1203, into the possession of the count palatine, who sold it in 1265 to the landgrave Henry of Hesse. It was fortified in 1530 but in 1805 the walls were demolished. In the old part of the town the streets are narrow and irregular. The principal buildings are the Stadtkirche, the provincial government offices, comprising a portion of the old castle dating from the 12th century, and the town hall (containing an historical collection). The university, founded in 1607 by the landgrave of Hesse, has a library, a botanic garden, an observatory, medical schools, a museum of natural history, a chemical laboratory and an agricultural college. The industries include metal founding and the manufacture of rubber articles, machines, leather, tobacco and beer.

GIFFARD, GODFREY (*c.* 1235–1302), chancellor of England and bishop of Worcester, brother of Walter Giffard (*q.v.*), succeeded his brother as chancellor in 1266, and held that office until 1270. He was bishop of Worcester from 1268 until his death on Jan. 26, 1302. He was a benefactor of his cathedral.

See W. Thomas, *Survey of Worcester Cathedral; Episcopal Registers; Register of Bishop Godfrey Giffard,* ed. by J. W. Willis-Bund (1898–99); and the Annals of Worcester in the *Annales monastici,* vol. iv., ed. by H. R. Luard (1869).

GIFFARD, WALTER (d. 1279), chancellor of England and archbishop of York, was a son of Hugh Giffard of Boyton, Wiltshire, and after serving as canon and archdeacon of Wells, mas chosen bishop of Bath and Wells in May 1264. In August 1265 Henry III appointed him chancellor of England, and he was one of the arbitrators who drew up the *dictum de Kenilworth* in 1266. Later in this year Pope Clement IV named him archbishop of York. He was the chief of the three regents of the kingdom from the death of Henry III in 1272 until the return of Edward I in Aug. 1274, and again in 1275. Giffard died in April 1279.

See *Fasti Eboracenses,* ed. by J. Raine (1863); Giffard's *Register* from 1266 to 1279, ed. by W. Brown.

GIFFARD, WILLIAM (d. 1129), bishop of Winchester; received his see from Henry I (1100). He was one of the bishops elect whom Anselm refused to consecrate (1101) as having been nominated and invested by the lay power. During the investitures dispute Giffard was on friendly terms with Anselm, and drew upon himself a sentence of banishment through declining to accept consecration from the archbishop of York (1103). He was, however, one of the bishops who pressed Anselm, in 1106, to give way to the king. (*See* also ANSELM, SAINT.) He was consecrated after the settlement of 1107. He founded at Waverley, Surrey, the first English Cistercian house (1128) and restored Winchester cathedral with great magnificence.

GIFFEN, SIR ROBERT (1837–1910), British statistician and economist, was born at Strathaven, Lanarkshire, on July 22, 1837. After working for the *Stirling Journal,* he joined the staff of the *Globe* in 1862. He also assisted John Morley on the *Fortnightly Review* and in 1868 he became assistant editor on the *Economist.* In 1873 he was named city editor of the *Daily News.* He later held the same position on *The Times.* In 1876 he was appointed head of the statistical department in the Board of Trade where he became assistant secretary (1882) and controller-general (1892). As chief statistical adviser to the government he was constantly employed in drawing up reports, giving evidence before commissions of inquiry and acting as a government auditor. He retired in 1897 and died in Scotland on April 12, 1910.

GIFFORD, RQBERT SWAIN (1840–1905), U.S. painter and etcher, best known for his coastal views and north African scenes, was born at Naushon, Mass., Dec. 23, 1840. He was a late product of the Hudson river tradition. He worked mainly in New York city, where he was long a teacher in the Woman's Art School of Cooper Union and its director from 1896 until his death, Jan. 15, 1905. He was also an etcher and water colourist of considerable reputation. (D. H. W.)

GIFFORD, WILLIAM (1756–1826), English man of letters who, as first editor of the *Quarterly Review,* attacked Leigh Hunt and what he called the Cockney school of poetry, was born in Ashburton, Devonshire, in April 1756. Orphaned at 12, he was harshly treated by his godfather who resented paying for his schooling and sent him first to a farm, then to sea and finally to a shoemaker as apprentice. Through the kindness of an Ashburton surgeon, William Cookesley, he was sent back to school and to Exeter college. Oxford. He took his degree and in 1782 became tutor to Lord Grosvenor's son and began to publish verse. *The Baviad* (1794) is a satire, after Persius. on the Della Cruscan coterie led by Hester Lynch Piozzi (*q.v.*), and *Tlze Maeviad* (1795) is an attack on the corruptions of the drama. In 1802 he published a translation of Juvenal's *Satires,* prefaced by a short autobiography. An admirer of the classics, he mas also interested in post-Shakespearean dramatists and edited the plays of Philip Massinger (1804–13), Ben Jonson (1816) and John Ford (published posthumously, 1827).

Meanwhile, with George Canning's support, Gifford had founded the *Anti-Jncobin* (1799), and in 1809 he became editor of the new *Quarterly Review* founded by Canning and his friends to counterbalance the Whig *Edinburgh Review.* For the next 15 years he made it the vehicle for his hatred of radicals and also of most rising authors, upon whom. according to Southey, he looked as Tzaak Walton did upon worms. Although ultimately responsible for it. he almost certainly did not write the famous attack on Keats's *Endymion* (1818): hut his habitually malevolent reviews provoked Hazlitt into writing *A Letter to William Gifford, Esq.* (1819) in which he called him "the Government Critic . . . the invisible link, that connects literature with the police." He resigned from the *Quarterly Review* in 1824, and died in London on Dec. 31, 1826.

See R. B. Clark, *William Gifford* (1930).

GIFT, in general English, a term for a present or thing bestowed. *i.e.,* an alienation of property otherwise than for a legal consideration. Formerly in English law property in land could be conveyed by one person to another by a verbal gift of the estate accompanied by delivery of possession. The statute of frauds required all such conveyances to be in writing. and a later statute (8 and 9 Vict. *c.* 106) requires them to be by deed (*q.v.*).

Chattels may be effectually transferred from one person to another by a simple verbal gift accompanied by delivery. But unless the actual thing is bodily handed over to the donee, the mere verbal expression of the donor's desire or intention has no legal effect whatever. The persons are in the position of parties to an agreement which is void as being without consideration. But a declaration of trust. while retaining possession, is good *(see* Williams. *Personal Property).* When the nature of the thing is such that it cannot be bodily handed over, it will be sufficient to put the donee in such a position as to enable him to deal with it as the owner. For example, when goods are in a warehouse, the delivery of the key will make a verbal gift of them effectual; but it seems that part delivery of goods which are capable of actual delivery will not validate a verbal gift of the part undelivered. The gift of such personal property as is not chattels or transferable to bearer requires a written transfer in proper form.

For gift taxes. *see* ESTATE AND INHERITANCE TAXES. *See* also REAL PROPERTY AND CONVEYANCING, LAWS OF.

GIFT EXCHANGE: *see* TRADE, PRIMITIVE.

GIFU, landlocked Japanese prefecture of central Honshū, is dominated by mountains except for a small southern portion, which is the inner part of the Nōbi plain. The plain section has most of the agriculture. the capital Gifu. other leading cities (Ōgaki, Seki, Mino) and most industry—textiles. pottery, paper, cutlery, automobiles, machinery, wood products and chemicals. Forestry is the main occupation in the mountain districts. Economic ties with Nagoya are strong and many industries are either branches or subsidiaries of Nagoya firms. Railways link Gifu with Pacific coast cities and Toyama on the Sea of Japan. Area 4,016 sq.mi. Pop. (1960) 1,638,399. (J. D. EE.)

GIFU, capital and largest city of Gifu prefecture, central interior Honshū, Japan, lies at the foot of Mt. Kinka along the Nagara river in the Nōbi plain. Once a feudal period castle town, it achieved prosperity as a textile making centre with strong Nagoya commercial ties. Many large, modern factories house silk. cotton and wool textile. metals and machinery manufacturing. At the same time. Gifu is well known for its paper umbrellas. lanterns, fans and other traditional handicraft products that are made in hundreds of small household workshops. It serves as the regional commercial centre for the inner Nōbi plain and has the prefectural offices and university, many fine parks, temples and libraries. A summer tourist attraction is nighttime cormorant fishing on the Nagara river, where tame cormorants, with rings around their necks to prevent swallowing, catch and disgorge small trout. Pop. (1960) 304.192. (J. D. EE.)

GIGANTISM: *see* DWARFISM AND GIGANTISM.

GIGLIO, an island of Italy (anc. Igilium), off the southwest coast of Italy, in the province of Grosseto, Tuscany region, 11 mi. W. of Monte Argentario. It measures about 5 mi. by 3 mi. and its highest point is 1,634 ft. above sea level. Pop. (1951) of Giglio Castello, the village at the highest point, 1,043; of Giglio Porto (at the harbour) 1.020. Granite was quarried there by the Romans and is still used. The island is fertile and produces wine and fruit. the cultivation of which has taken the place of the forests of which Rutilius spoke when it served as a place of refuge from the barbarian invaders. Charlemngne gave it to the abbey of Tre Fontane at Rome, with a considerable part of the Maremma. From 1264 to 1406 it belonged to Pisa. then to Florence; then. after being seized by the Spanish fleet, it was ceded to Antonio Piccolomini. nephew of Pius II. In 1558 it was sold to Eleonora, wife of Cosimo I of Florence.

GIGTHI, a Roman city of north Africa, near the west coast of the Little Syrtis (Gulf of Gabès). It lies about 20 mi. N.E. of the modern Medenine. The ruins are considerable, especially those of the forum, surrounded on three sides by Corinthian porticos; there were the capitolium. curia and basilica and various temples. The thermae and a market have also been cleared. To the northwest is the island of Djerba. identified with the land of the lotus eaters. In Roman times it was joined to the mainland by a causeway, the remains of which are still visible. Houmt Souk (Djerba). the chief village, on the north coast of the island is a centre of the sponge fishery. The Spaniards intervened in Djerba in 1510 and after 153j and made it their base of operations against Tripoli in 1560. They were defeated and the Spanish garrison on the island was exterminated.

GIGUE, the courtly version of the English jig from which it derived its name when entering the court circles of continental Europe during the 17th century. Whereas true Scotch and Irish jigs were quick and wild and of indefinite form and rhythm, *gigues* were danced by couples in formal, ballet style and generally in $\frac{6}{8}$ or $\frac{12}{8}$ time as the melodic lines were fashioned of rapidly moving groups of three eighth-notes. In musical literature the *gigue* attained importance as the final movement of the suite (*q.v.*). Invariably written in fugal style, the contrapuntal lines retained the rapid groups of three eighth-notes. *See* JIG. (L. HT.)

GIJÓN, a seaport of northern Spain, province of Oviedo, on the Bay of Biscay and the terminus of railways from Avilés, Oviedo and Langreo. Pop. (1950) 86,523 (mun. 108.546). The older parts of Gijbn occupy the slopes of a rocky peninsula, Santa Catalina point. while its more modern suburbs extend east and west along the shore. The town contains few buildings of architectural interest beyond the 15th-century parish church of San Pedro, with its triple rows of aisles, and the Jovellanos Nautical and Technical institute, which contains a fine collection of drawings. This institute mas founded in 1797 by Gaspar Melchor de Jovellanos (1744–1811), the poet and statesman. a native of Gijbn.

A stretch of sandy beach east of the peninsula has made this the bathing quarter of the town. Westward to Cape Torres extends the Bay of Gijón, the most important roadstead on the Spanish coast between Ferrol and Santander. The construction of a commercial port at Gijón was begun with a royal grant in 1480. An arsenal was added in the reign of Philip II (1556–98), and to this the remnant of the Invincible Armada returned for repairs in 1j88. In 1778 the port was equipped for trade with the West Indies. Its modern prosperity, however, dates from 1884, when railway communication was established with Langreo and other Asturian mining districts. In 1892 the harbour of Musel, at the western end of the bay, was constructed. At the eastern end, protected by Santa Catalina and two moles, lie the outer and two inner harbours of Gijon proper.

Gijón is usually identified with the Roman Gigia, captured by the Moors early in the 8th century; it was one of the first cities to be retaken by King Petayo (720–737). In 844 Gijón successfully resisted a Norman raid; in 1395 it was burned down, and in the 16th and 17th centuries it suffered many attacks by corsairs. In the civil war of 1936–39, the capture of Gijón by nationalist forces in Oct. 1937 marked the end of fighting in the region. Coasting, as well as foreign, trade is considerable. Gijón is also an important industrial centre.

GILA CLIFF DWELLINGS, a national monument (reservation) situated about 35 mi. N. of Silver City in the southeastern part of Catron county, N.M., U.S. The reservation (160 ac. in area) was established on Nov. 16, 1907, to protect a group of four cliff dwellings still in good preservation in the canyon of the west fork of the Gila river.

GILA MONSTER (*Heloderma* suspecturn), with its relative H. *horridum* of Mexico, the only lizards known to be poisonous. The Gila monster inhabits deserts in the southwestern United States, chiefly in Arizona, New Mexico and Utah. It is usually about two feet in length and has a thick body covered with small beadlike tubercles. In colour it is blackish or purplish, with large, somewhat transverse, pinkish or yellowish blotches. The poison fangs are in the lower jaw, but its bite is not proved to cause death in rnan. This lizard is usually sluggish but, especially in the wild state, is aggressive when molested, snapping its powerful jaws from side to side with an unexpected agility, all the while emitting sharp hisses. Its grip is tenacious and cannot be broken by man without some prying instrument. In movement the Gila monster is slow and clumsy, dragging rather than lifting its body over the ground. It is oviparous, depositing its soft-shelled eggs in the sand. (See LIZARD; REPTILES.)

GILAN, the westernmost of the three Caspian provinces of Iran, lying between 37° N. and 38° N. with a breadth varying from 15 mi. to 60 mi. Pop. (1956) 1,629,327. Separated on the north from the U.S.S.R. by the little Astara river, it is bounded on the nest by the province of Azerbaijan, on the south by Kazvin and on the east by Mazandaran. Like all the Caspian provinces of Iran, Gilan consists geographically of two zones: the coastal plain, backed by an almost impenetrable jungle; and the forestclad spurs running out northward from the massif of the Elburz range. These zones present an astonishing contrast in climate, landscape and race. Though the Safid Rud (called Kizil Uzun in its upper reaches) is the only river of any volume, the province is abundantly watered by a great number of smaller streams.

The climate of the plains in the neighbourhood of Resht, the capital is exceedingly damp and relaxing, with a high rainfall (56 in having been recorded), yet over a great part of the area the fall is not sufficiently sure and regular in summer to provide for cultivation without resort to irrigation. The mild and wet winter is broken by the *bad-i-garm* (warm wind). The soil is fertile, consisting mainly of a rich loam lying over sandstone and shingle. The vegetation resembles that of southern Europe, but because of the warm humidity which prevails, it is more tropically luxuriant, and in the lower valleys of the Elburz, up to 5,000 ft., there are forest tracts as dense as any Indian jungle.

The prevailing forest trees are box, oak, ash, beech, elm and hornbeam; the first named comes to rare perfection but unfortunately indiscriminate cutting for export has tended to make it scarce. Many kinds of fruit-bearing trees are to be met with but the quality of the fruit they yield is on the whole disappointing. Two varieties of wild grape occur but the cultivated vine does not thrive; medlar and fig flourish, as do wild pomegranate and watermelon, the latter attaining huge proportions. Oranges and lemons thrive in the gardens, and in the hilly district of Rudbar there is considerable cultivation of olives.

The specialities of Gilan in the direction of fruit are a peculiar variety of pear, in great demand for grafting, and the "Gilan plum" which is well known all over northern Iran.

The fauna is well represented, but tigers, once not uncommon, are now scarce; panther, hyena, jackal, wild boar are to be found as are two species of deer, the fine Maral stag (*Cervus elephus maral*) and the Ahu or roedeer (Capreolus pyargus). Among the birds, pheasant, woodcock, duck, teal, geese and various other waterfowl abound.

The fishing industry on the Caspian from this province became important, but during World War I and later the business was practically at a standstill because of the unacceptable claims advanced by the Soviet government in regard thereto. Early in 1928, however, the parties came to terms; thereafter the fisheries, which produce the finest caviar, worked satisfactorily. Of crops, rice held its own as the fundamental produce of Gilan.

Sericulture which was formerly a very important and practically the sole industry of Gilan was reduced almost to nothing about 1865 by a mysterious epidemic disease which broke out among silkworms alike in Persia and in France; but thanks to the researches of the famous bacteriologist, Louis Pasteur (who was deputed by Napoleon III to study the disease), it was gradually got under control; and from 1890 onward the trade regained some of its former prosperity. Another notable product of the Caspian provinces, though not specially of Gilan, is sugar cane, for the growth of which the climate seems eminently suited. Tea planting was introduced into the Lahijan district in 1901. The government actively participated, and the industry was put on a prosperous and progressive footing. The other crop of importance produced in the province is tobacco, to the cultivation of which considerable impetus was given by the increase in cigarette smoking throughout Iran.

The capital of the province and the most active commercial centre is Resht (*q.v.*), through which the Tehran-Kazvin-Pahlavi motor road runs. The latter place (formerly known as Enzeli) enjoys by far the most lively trade of all the Caspian ports of Iran.

After remaining long independent, Gilan was conquered by Hulagu Khan, who razed the fortifications of Shamiran to the ground in 1227 and formed it into two small principalities, separated by the river Safid Rud and with their capitals at Lahijan and Resht respectively. This remained the position until 1567 when the province was finally incorporated in Persia by the Safavid monarch, Shah Tahmasp.

Gilan was, however, occupied by a Russian force in the early part of 1723, and Tahmasp III, the tenth Safavid Shah, being then without a throne and his country occupied by the Afghans, ceded it, together with Mazandaran and Astarabad, to Peter the Great by treaty. Russian troops remained in occupation until 1734 when they were obliged to evacuate it.

The derivation of the name Gilan from the modern Iranian word *gil* meaning mud (hence "land of mud") is incorrect. It probably means "land of the Gil," an ancient tribe which classical writers mention as the Gelae.

See H. L. Rabino, *Les provinces caspiennes* ***de*** *la Perse. Le Guilan* (1917); J. B. L. Noel, "A reconnaissance in the Caspian provinces of Persia," *Geogr. J.* lvii (1921); L. S. Fortescue, "The Western Elburz and Persian Azerbaijan," *Geogr. J.* lxiii (1924) and "Les provinces caspiennes de la Perse," *La Geographie* xliii (1925).

GILA RIVER. The Gila river rises in southwest New Mexico in Grand and Catron counties near the Gila Cliff Dwellings National monument. The river, 650 mi. long, flows west–southwest over the hot, dry desert land of southwestern United States into the Colorado river at Yuma, Ariz., (elevation 141 ft.). Near Clifton, Ariz., the Gila receives its main charge of water from the San Francisco river. On the San Carlos Indian reservation, near Globe, Ariz., the Gila is dammed by the Coolidge dam completed in 1928. The dam's capacity is 1,250,000 ac.ft. of water, which is used for irrigation in the Casa Grande valley. From Coolidge dam the river flows west about 125 mi. to a point 20 mi. west of Phoenix, where it receives the Salt river, its major tributary from the north-east. Roosevelt dam on the Salt and Coolidge dam on the Gila store all available surface water and the Gila river bed is a dry, desolate, barren waste land to its confluence with the Colorado river near Yuma. Other major tributaries include the San Pedro and Santa Cruz rivers. Important towns on or near the river are Yuma, Florence, Safford, Hayden and Coolidge, all in Arizona.

(M. J. L.)

GILBERT, SIR ALFRED (1854–1934), British sculptor and goldsmith, whose best-known work is the "Eros" memorial fountain in Piccadilly Circus, London, was born in London on Aug. 12, 1854. His first training in art was at Heatherley's art school, London. and he also studied at the Royal Academy schools and under Sir Joseph Edgar Boehm. From 1875 to 1878 he attended the École des Beaux-Arts in Paris under P. J. Cavelier. He then nent to Italy, where he produced his first important works, including "The Kiss of Victory" and "Perseus Arming." In 1884 he returned to England and his "Icarus." commissioned by Lord Leighton, was exhibited at the Royal Academy that year.

In 1885 Gilbert began the memorial (known as "Eros") to the philanthropic earl of Shaftesbury, which was unveiled in 1893. In 1888 he produced the statue of Queen Victoria at Winchester and also made the first sketches for the silver gilt and enamel mayoral chain for Preston, a good example of his talent for delicate craftsmanship. In 1892 he was elected royal academician and began his memorial to the duke of Clarence (one of his most important works), which was placed in the Albert chapel. St. George's, Windsor. In 1904 he became bankrupt and settled in Bruges. Belg., where he remained until 1926 when, at the wish of King George V. he returned to England to finish the Clarence memorial. Gilbert's last important work was the Queen Alexandra memorial opposite St. James's palace, London, unveiled in 1932, in which year he was knighted.

Gilbert died in London on Nov. 4, 1934. (R. Gs.)

GILBERT, CASS (1859–1934), U.S. architect, designer of the Woolworth skyscraper and the U.S. supreme court building, was born at Zanesville. O., on Nov. 24. 1859. He studied at Massachusetts Institute of Technology and in 1883 began his career as an architect in St. Paul, Minn., but later moved to New York. He became most widely known as the architect of the Woolworth building in New York (1913), which, with its 60-story tower rising to a height of 792 ft., lacily ornamented in modified Gothic, is regarded as one of the best designed of early skyscrapers. He utilized the neoclassical style characteristic of the national capital for the treasury annex (1919) and the supreme court building (completed 193j) in Washington, D.C.

Gilbert's other buildings include the Minnesota state capitol at St. Paul; the Endicott building. the Dayton avenue church and St. Clement's Episcopal church in St. Paul; the U.S. customhouse and the Union club, New York; the Brazer building and the Suffolk Savings bank in Boston; Art building and Festival hall (for the Louisiana Purchase exposition) and the Central Public library. St. Louis; Ives Memorial library, New Haven (Conn.); and the Public library, Detroit, He drew the plans for the University of Minnesota and for the University of Texas. Gilbert died on May 17, 1934, at Brockenhurst, England.

GILBERT, GROVE KARL (1843–1918), U.S. geologist. was born at Rochester, K.Y., on May 6, 1843, and graduated at the University of Rochester in 1862. He began the study of geology and in 1869 went as a volunteer assistant on the second Ohio State survey. In 1871 he was assigned to the Wheeler survey and during his three years' service took a remarkable trip by boat up the lower canyons of the Colorado river. by pack train through central Arizona and down the valley of the Gila. and again by boat down the Colorado to the, Gulf of California. As a result of this trip he published two papers characterizing the basin range and plateau provinces and naming and describing ancient Lake Bonneville. He was transferred to the Powell survey in 187j which took him to Utah. and with the formation of the U.S. geological survey in 1879, he was made one of the six senior geologists. In 1884 he was placed in charge of the Appalachian division of geology, and in 1889, upon the creation of the division of geologic correlation, he was placed at its head. After 1892 he relinquished most of his administrative duties and his position as chief geologist in order to return to the fuller study of some of his earlier problems. During this period his studies included the geology of Colorado. Mexico and Alaska, and he visited the latter with the Harriman expedition. The *Bonneville Monograph,* which he himself regarded as his *magnum opus,* was published in 1890. His report on the *Geology of the Henry Mountains,* in which the volcanic structure known as laccolite was first described, and his *History of the Niagara River* (1890) were of particular importance. He had much to do mith planning the federal survey's bibliographic work and the adoption of principles of nomenclature and cartography, which form the basis of the survey's geologic map work.

He died at Jackson, Mich., on May 1, 1918.

See *Bulletin* of the Geological Society of America, vol. xxxi, pp. 26–64, which includes a complete bibliography of his publications; and N. M. Davis, *American Journal of Science,* 4th series, vol. xlvi, pp. 669–681.

GILBERT, SIR HUMPHREY (*c.* 1539–1583), English soldier, navigator and pioneer colonist in America, was the second son of Otho Gilbert, of Compton, near Dartmouth, Devon, and half-brother of Sir Walter Raleigh. He was educated at Eton and Oxford; intended for the law; appointed (July 1566) captain in the army of Ireland under Sir Henry Sidney. In April 1566 he had already joined with Antony Jenkinson in a petition to Elizabeth for the discovery of the Northeast passage; in Nov. 1j66 he presented an independent petition for the "discovering of a passage by the north to go to Cataia." In Oct. 1569 he became governor of Munster; on Jan. 1. 1570 he was knighted. In 1571 he was returned M.P. for Plymouth; in 1572 he campaigned in the Netherlands against Spain without much success; from 1573 to 1578 he lived in retirement at Limehousc, devoting himself especially to the advocacy of a northwest passage (his famous *Discourse* on this subject was published in 1576). Gilbert's arguments, widely circulated even before 1575, were apparently of weight in promoting the Frobisher enterprises of 1576–78. On June 11, 1578, Sir Humphrey obtained his long-coveted charter for northwestern discovery and colonization: authorizing him, his heirs and assigns. to discover, occupy and possess such remote "heathen lands not actually possessed of any Christian prince or people, as should seem good to him or them." Disposing not only of his patrimony but also of the estates in Kent which he had through his wife, daughter .of John Aucher of Ollerden. he fitted out an expedition which left Dartmouth on Sept. 23, 1578, and returned in May 1579, unsuccessful.

In 1579 Gilbert aided the government in Ireland; and in 1583, after many struggles—illustrated by his appeal to Walsingham on July 11, 1582, for the payment of an amount due to him from government, and by his agreement with the Southampton venturers—he succeeded in equipping another fleet for "Western Planting." On June 11, 1583, he sailed from Plymouth with five ships and the queen's blessing; on July 30 he was off the north coast of Newfoundland; on Aug. 3 he arrived off the present St. John's. and selected this site as the centre of his operations. On Aug. j he began the plantation of the first English colony in North America. Proceeding southward with three vessels, exploring and prospecting, he lost the largest near Cape Breton (Aug. 29). Immediately after (Aug. 31) he started to return to England with the "Golden Hind" and the "Squirrel." of 40 and 10 tons respectively. Obstinately refusing to leave the "frigate" and sail in his "great ship," he shared the "Squirrel's" fate in a tempest off the Azores. "Monday, Sept. 9," reports Hayes, the captain of the "Hind," "the frigate was near cast away . . . yet at that time recovered; and, giving forth signs of joy, the general. sitting abaft with a book in his hand, cried out unto us in the 'Hind.' 'We are as near to heaven by sea as by land.' . . . The same Monday night, about twelve, the frigate being ahead of us in the 'Golden Hind,' suddenly her lights were out. . . . in that moment the frigate was devoured and swallowed up of the sea."

B. Quinn, *The Voyages and Colonising Enterprises of Sir Humphrey Gilbert* (1940). Gilbert's interesting writings on the need of a university for London, anticipating in many ways not only the modern London university but also the British Museum library and its compulsory sustenance through the provisions of the Copyright act, have been printed by Furnivall *(Queene Elizabethe's Achademy)* in the Early English Text Society Publications, extra series, no. viii. *See* also the lives by W. G. Gosling (1911) and D. B. Chidsey (1932).

GILBERT, SIR JOHN (1817–1897), English painter and illustrator, was born at Blackheath, London, on July 21, 1817. He had had little formal instruction nhen he began to exhibit water colours on historical and romantic subjects at the Gallery of British Art. Gilbert began to exhibit at the Royal Academy in 1838, was elected an associate of the academy in 1872 and a full member on June 29. 1876. Many of his most ambitious works are at the academy. But it is not in these large works in oils that Gilbert was seen at his best. At the gallery of the Old Rater Colour society, to which from 1852. when he was elected an associate exhibitor, until he died (Oct. j. 1897), he contributed 270 drawings, most of them admirable because of the largeness of their style, massive colouration, broad chiaroscuro and vigorous design. "The Trumpeter," "The Standard-Bearer," "Richard II resigning his Crown" (at Liverpool), "The Drug Bazaar at Constantinople," "The Merchant of Venice" and "The Turkish Water-Carrier" are examples.

Gilbert was elected a full member of the Old Water Colour society in 1855, and president of the society in 1871, shortly after which he was knighted.

GILBERT, SIR JOHN THOMAS (1829–1898), Irish Celtic scholar and historian, mas born in Dublin on Jan. 23, 1829. As a young man he studied the records of his native city, and his first important work was a *History of the City of Dublin* (3 vol., 1854–59). He was secretary of the public record office (1867–75). Gilbert was, from 1855, secretary of the Irish Celtic and Archaeological society, and published many original documents relative to Irish history, notably those of the convents of St. Mary and St. Thomas in Dublin.

He died in Dublin on May 23, 1898.

See *Life of* Sir *John T. Gilbert, by* his wife, Lady Gilbert, 2 vol. (1905).

GILBERT, NICOLAS JOSEPH LAURENT (1751–1780), French poet, was born at Fontenay-le-Château in Lorraine. In 1774 he came to Paris. where he became known as an opponent of the Encyclopaedists and a panegyrist of Louis XV. The satiric force of one or two of his pieces, as *Mon Apologie* (1778) and *Le Dix-huitième Siècle* (1775), justify his reputation, which has been further increased by writers, who, like Alfred de Vigny in his *Stello* (ch. 7–13), considered him a victim to the spite of his philosophic opponents. His best-known verses are the *Ode imitée de plusieurs psaumes,* usually entitled *Adieux à la vie.*

GILBERT, RUFUS HENRY (1832–1885), U.S. surgeon and transit expert who played a major role in the development of rapid transit in New York city, was born in Guilford, N.Y.. Jan. 26, 1832. He attended the College of Physicians and Surgeons and then served as a surgeon in the Union army in the Civil War. He had become interested in the development of rapid transit in large cities as a means of allowing movement of population from crowded downtown tenements, with their high incidence of illness, and left the army to pursue that work. After gaining experience with the Central Railroad of New Jersey, he incorporated the Gilbert Electric Railway company in 1872 to build elevated lines in New York utilizing pneumatic tubes set on elevated structures, with cars propelled by air pressure in the tubes. Financing difficulties prevented construction until 1876, however, and forced adoption of the more conventional type of elevated railroad, with trains drawn by steam locomotives. The Sixth avenue line, from Trinity church to Central park, was completed and placed in operation in April 1878. But financiers forced Gilbert from the company and he died July 10, 1885, broken financially, physically and mentally. (J. F. D.)

GILBERT, SEYMOUR PARKER (1892–1938), U.S. lawyer and financial expert, was born in Bloomfield, N.J., on Oct. 13, 1892. He graduated from Rutgers college in 1912, and from Harvard law school in 1915. After admission to the New York bar, he practised with the firm of Cravath and Henderson in New York city from 191j to 1918. In the latter year, on the initiative of R. C. Leffingwood, a former associate secretary of the treasury, he joined the War Loan staff as counsel. In June 1920 he became assistant secretary (later undersecretary) of the treasury in charge of fiscal affairs. He resigned on Nov 17. 1923, and was appointed permanent agent general for reparation payments from Germany under the Dawes plan on Oct. 31. 1924, succeeding Owen D. Young. At the end of his first year. Nov. 30, 1925, Gilbert reported that the initial annuity of 1,000,000,000 gold marks due on reparation payments had been received in full. On Sept. 2. 1926. he turned over to the U.S. treasury the first cash payment. $5,900 000. received by the United States from Germany under the operation of the Dawes plan. At this time, by agreement with the German finance minister. Gilbert modified the amount of immediate cash payments and fixed the total annuities to be paid during the ensuing three years.

Gilbert relinquished his reparations post in 1930 and returned to the United States to become a partner in J. P. Morgan and Co. He died in New York city, Feb 23, 1938

GILBERT (or GYLBERDE), **WILLIAM** (1544–1603), the most distinguished man of science in England during the reign of Queen Elizabeth I, was a member of an ancient Suffolk family, long resident in Clare, and was born on May 24, 1544, at Colchester, where his father, Hierome Gilbert. became recorder. Educated at Colchester school, he entered St. John's college, Cambridge, in 1558, and after taking the degrees of B.A. and M.A. in due course. graduated M.D. in 1569, in which year he was elected a senior fellow of his college. He traveled in Europe, and in 1573 settled in London, where he practised as a physician. He was admitted to the College of Physicians probably about 1576, and he held several important offices. In 1589 he was one of the committee appointed to superintend the preparation of the *Pharmacopoeia Londinensis* which the college in that year decided to issue, but which did not actually appear until 1618. In 1601 Gilbert was appointed physician to Queen Elizabeth I, with the usual emolument of £100 a year. On the death of the queen in 1603 he was reappointed by her successor; but he did not long enjoy the honour, for he died on Nov. 30 (Dec. 10. N S.), 1603, either in London or in Colchester. He was buried in the latter town, in the chancel of Holy Trinity church. where a monument was erected to his memory. To the College of Physicians he left his books, globes, instruments and minerals, but they were destroyed in the great fire of London.

Gilbert's principal work is his treatise on magnetism (*q.v.*), entitled *De magnete, magneticisque corporibus, et de magno magnete tellure* (London, 1600; later editions — Stettin, 1628, 1633; Frankfort. 1629, 1638). This work. which embodied the results of many years' research, was distinguished by its strict adherence to the scientific method of investigation by experiment, and by the originality of its matter. It contains an account of the author's experiments on magnets and magnetic bodies and on electrical attractions, and also his great conception that the earth is nothing but a large magnet, and that it is this which explains, not only the direction of the magnetic needle north and south, but also the dipping or inclination of the needle. A posthumous work of Gilbert's was edited by his brother from two manuscripts; its title is *De mundo nostro sublunari philosophia nova* (1651). He was also the first advocate of Copernican views in England, and he concluded that the fixed stars are not all at the same distance from the earth.

GILBERT, SIR WILLIAM SCHWENK (1836–1911), English playwright and humorist, son of William Gilbert (a descendant of Sir Humphrey Gilbert), was born in London on Nov. 18. 1836. His father wrote novels. the best-known of which were *Shirley Hall Asylum* (1863) and *Dr Austin's Guests* (1866). Several of these novels were illustrated by his son, who developed a talent for whimsical draftsmanship. W. S. Gilbert was educated at Boulogne, at Ealing and at King's college. London. He became a clerk in the education department of the privy council office in 1857. Disliking the routine work, he left the civil service in 1861, entered the Inner Temple. was called to the bar in Nov. 1864. and joined the northern circuit. His practice was inconsiderable, and his military and legal ambitions were eventually satisfied by a captaincy in the volunteers and appointment as a magistrate for Middlesex (June 1891). In 1861 he began to contribute excellent comic verse to *Fun*, with humorous illustrations, the work of his own pen, over the signature of "Bab." These were collected in 1869 under the title of *Bab Ballads*, followed by *More Bab Ballads*. The two collections and *Songs of a Savoyard* were united in a volume issued in 1898, with many new illustrations. The best of the old cuts, such as those depicting the "Bishop of Rum-ti-Foo" and the "Discontented Sugar Broker," were preserved intact.

While remaining a staunch supporter of *Fun*, Gilbert became dramatic critic to the *Illustrated Times*. Early in Dec. 1866 T. W. Robertson was asked by Miss Herbert, lessee of the St. James's theatre, to find some one who could turn out a bright Christmas piece in a fortnight, and suggested Gilbert; the latter promptly produced *Dulcamara*, a burlesque of *L'Elisire d'amore*, written in ten days, rehearsed in a week, and duly performed at Christmas. He sold the piece outright for £30, a piece of rashness which he had cause to regret, for it turned out a commercial success. In 1870 he was commissioned by Buckstone to write a blank verse fairy comedy, based upon *Le Palazs de la vérité*, the novel by Madame de Genlis. The result was *The Palace of Truth*, a fairy drama, poor in structure but clever in workmanship, produced by Mr. and Mrs. Kendal in 1870 at the Haymarket. This was followed in 1871 by *Pygmalion and Galatea*, another three-act "mythological comedy"; *The Wicked World*, written for Buckstone and the Kendals; and in collaboration with Gilbert à Beckett, *The Happy Land* (1873). Gilbert's next dramatic ventures inclined more to the conventional pattern, combining sentiment and a cynical humour in a manner strongly reminiscent of his father's style. These were: *Sweethearts* (Prince of Wales's theatre, Nov. 7, 1874); *Tom Cobb* (St. James's, April 24, 1875); *Broken Hearts* (Court, Dec. 9, 1875); *Dan'l Druce* (Haymarket, Sept. 11, 1876); and *Engaged* (Haymarket, Oct. 3, 1877). The first and last of these proved decidedly popular. *Gretchen*, a verse drama in four acts, appeared in 1879. A one-act piece, called *Comedy and Tragedy*, was produced at the Lyceum on Jan. 26, 1884. Two dramatic trifles of later date were *Foggerty's Fairy* and *Rozenkrantz and Guildenstern*, a travesty of *Hamlet*, performed at the Vaudeville in June 1891. Several of these dramas were based upon short stories by Gilbert, a number of which had appeared from time to time in the Christmas numbers of various periodicals. The best of them have been collected in the volume entitled *Foggerty's Fairy, and other Stories*.

In the autumn of 1871 Gilbert commenced his memorable collaboration (which lasted over 20 years) with Sir Arthur Sullivan. The first two comic operas, *Thespis; or The Gods grown Old* (Dec. 26, 1871) and *Trial by Jury* (Royalty, March 25, 1875), were merely essays. Like one or two of their successors, they were, as regards plot, little more than extended "Bab Ballads." Later (especially in the *Yeomen of the Guard)*, much more elaboration was attempted. The next piece was produced at the Opera Comique (Nov. 17, 1877) as *The Sorcerer*. At the same theatre were successfully given H.M.S. *Pinafore* (May 25, 1878), *The Pirates of Penzance; or The Slave of Duty* (April 3, 1880), and *Patience; or Bunthorne's Bride* (April 23, 1881). In Oct. 1881 *Patience* was removed to a new theatre, the Savoy, specially built for the Gilbert and Sullivan operas by Richard D'Oyly Carte. *Patience* was followed on Nov. 25, 1882, by *Iolanthe; or The Peer and the Peri;* and then came, on Jan. 5, 1884, *Princess Ida; or Castle Adamant*, a re-cast of a charming and witty fantasia which Gilbert had written some years previously, and had then described as a "respectful perversion of Mr. Tennyson's exquisite poem." The impulse reached its fullest development in the operas that followed next in order—The *Mikado; or The Town of Titipu* (March 14, 1885); *Ruddigore* (Jan. 22, 1887); *The Yeomen of the Guard* (Oct. 3, 1888); and *The Gondoliers* (Dec. 7, 1889). After the appearance of *The Gondoliers* a coolness occurred between the composer and librettist; Gilbert thought that Sullivan had not supported him in a business disagreement with D'Oyly Carte. But the estrangement was only temporary. Gilbert wrote several more librettos, and of these *Utopia Limited* (1893) and the exceptionally witty *Grand Duke* (1896) were written in conjunction with Sullivan.

As a master of metre Gilbert had shown himself consummate, as a dealer in quips and paradoxes and ludicrous dilemmas, unrivalled. Even for the music of the operas he deserves some credit, for the rhythms were frequently his own (as in "I have a Song to Sing, O"), and the metres were in many cases invented by himself. One or two of his librettos, such as that of *Patience*, are virtually flawless. Enthusiasts are divided only as to the comparative merit of the operas. *Princess Ida* and *Patience* are in some respects the daintiest. There is a genuine vein of poetry in *The Yeomen of the Guard*. Some of the drollest songs are in *Pinafore* and *Ruddigore*. *The Gondoliers* shows the most charming lightness of touch, while with the general public *The Mikado* proved the favourite. The enduring popularity of the Gilbert and Sullivan operas was abundantly proved by later revivals. Among the birthday honours in June 1907 Gilbert was given a knighthood. In 1909 his *Fallen Fairies* (music by Edward German) was produced at the Savoy. Gilbert was drowned at Harrow Weald, Middlesex, on May 29, 1911. (T. S.)

GILBERT AND ELLICE ISLANDS, British colony consisting of 37 coral atolls and islands spanning the central Pacific ocean. While the total area is only 369 sq.mi. and the population (1956 est.) 37,385, the distances between islands and groups of islands are vast. From Ocean Island in the west it is about 2,200 mi. to Christmas Island in the east, and from Washington in the north at 4° 7 N. latitude it is about 1,000 mi. to Niulakita at 10° 4 ȷ' S. latitude.

The islands form four groups: there are 16 Gilbert islands, 9 Ellice islands, 8 Phoenix islands and 3 Line islands, with Ocean Island as an outlier from the Gilbert Islands.

Gilbert Islands (pop. 28,035). The principal islands in this group, much the most populous in the colony, are Butaritari, Little Makin, Tarawa, Abaiang, Marakei, Maiana, Abemama, Kuria, Aranuka, Nonouti, Tabiteuea, Beru, Nikunau, Onotoa, Tamana and Arorae. These islands lie north and south of the equator between 174° E. and 178° E.

Ellice (Lagoon) Islands (pop. 4,569) lie between 5° and 11° S. and at about 178° E. The group contains a large number of tiny coral islands or atolls, grouped in nine clusters, extending over a distance of about 400 mi. from northwest to southeast. The chief groups are Funafuti or Ellice, Nukulaelae or Mitchell, Niulakita or Sophia, Nukufetau, Nui or Egg, Nanumanga and Niutao or Lynx.

Phoenix Group (pop. 1,461). This group is scattered south of the equator between 171° and 175° W. Individual islands in this group are Gardner, McKean, Hull, Birnie. Sydney, Enderbury, Phoenix, and Canton which is under Anglo-American administration and is an international airport.

Line Islands (pop. 864). These are Fanning Island, which has a relay station on the transpacific cable, Washington Island, and Christmas Island, lying between 157° and 160° W.

Ocean Island (pop. 2,456) is the centre of administration for the colony. It is located at 0° 52' S., 169° 35' E. Ocean Island, an atoll pushed up by volcanic action, is rich in high-grade phosphate.

The islands are on the ethnological borderland between Polynesia and Melanesia and the natives show a mixture of these racial strains, with a larger Negroid element in the Ellice group. The inhabitants of the Nui atoll, in the Ellice group, speak the language of the Gilberts, while the others are Samoan in speech. Research supports the tradition that they came from Samoa originally. Many of the natives have been converted to Christianity.

The temperature varies between 80° and 90° F. by day and drops to a minimum of 70° at night. In an average year rainfall ranges from 40 in. near the equator to 100 in. in the extreme northern Gilberts and around 120 in. in the Ellice Islands.

Almost beyond doubt, this region is of comparatively recent subsidence.

Resources are so limited that copra production is the only commercial agriculture, and phosphate mining the only industry. The principal crops are pandanus fruits and coconuts. Phosphate, copra and shark fins are exported. (*See* also PACIFIC ISLANDS.)

Most of these islands were taken over as a British protectorate in 1892 and annexed as a colony at the request of the native governments in 1915. Ocean Island was annexed in 1916. The Phoenix group, which had been colonized by emigrants from the Gilbert Islands, was included in the colony by an order in council of March 18, 1937. Most of the islands were seized by the Japanese soon after the attack on Pearl Harbor.

They were driven from the Gilberts by U.S. forces in 1943.

GILBERT DE LA PORRÉE, in Latin, GILBERTUS PORRETANUS or PICTAVENSIS (1076–1154), French theologian and philosopher, was born in Poitiers. A pupil of Bernard of Chartres, he taught at Chartres and in Paris (*c.* 1140) and became chancellor of Chartres and bishop of Poitiers (1142–54). His philosophical treatment of God and of the Trinity provoked St. Bernard's opposition: his doctrine of *"divinitas"* as distinct from "God" was held to be dangerous, or heretical, by the council of Reims (1148). According to him, ideas are in God as models (*exemplaria*), of which the forms innate in individual things (*formae nativae*) are copies (*exempla*). Created things are composite: "what they are," or *subsistens,* depends on a multiple *subsistentia* (species and genus, *quo est*); what is substantial in them underlies (*substat*) the accidents characterizing the individuals. In the *De sex principiis* (by him or by a pupil; ed by A. Heysse, Münster, 1953) relation, together with quality and quantity, is considered to be inherent to substance, as against the other six Aristotelian categories. which Aristotle did not discuss in detail and which are there specially treated.

Gilbert wrote commentaries on four of Boethius' theological treatises, from which he derived many of his doctrines—edited with Boëthius' *Opera* (Basle, 1570) and by J. P. Migne, in *Patrologia Latina,* lxiv (Paris, 1847); commentary on "De hebdomadibus," also edited by N. M. Haring in *Traditio,* ix (New York, 1953)—on the *Psalms,* on the *Apocalypse* (Paris, 1512), on St. Paul's letters and, in the form of sermons, on the *Canticles* (Strasbourg, 1497).

(L. M.-Po.)

GILBERT FOLIOT (d. 1187), bishop of Hereford, and of London, is first mentioned as a monk of Cluny whence he nas called in 1136 to plead the cause of the empress Matilda against Stephen at the Roman court. Shortly afterward he became prior of Cluny; then prior of Abbéville, a house dependent upon Cluny. In 1139 he was elected abbot of Gloucester. The appointment was confirmed by Stephen, and from the ecclesiastical point of view was unexceptionable. But the new abbot proved himself a valuable ally of the empress, and her ablest controversialist. Gilbert's reputation grew rapidly. He was respected at Rome and in 1148 was nominated by the pope to the see of Hereford. He was an Angevin at heart, and after 1154 was treated by Henry II with every mark of consideration. He was Becket's rival for the primacy, and the only bishop who protested against the king's choice. Recket endeavoured to win his friendship by procuring for him the see of London (1163). But Gilbert evaded the profession of obedience to the primate, and apparently aspired to make his see independent of Canterbury.

On the questions raised by the constitutions of Clarendon he sided nith the king, whose confessor he had now become. He urged Becket to yield, and, when this advice was rejected. encouraged his fellow bishops to repudiate the authority of the archbishop. Gilbert was twice excommunicated by Becket. but both on these and on other occasions he showed great dexterity in detaching the pope from the cause of the exile. To him it was chiefly due that Henry avoided an open conflict with Rome of the kind which John afterward provoked.

Gilbert was one of the bishops whose excommunication in 1170 provoked the king's knights to murder Becket; but he cannot be reproached with any share in the crime. His later years were uneventful, though he enjoyed great influence with the king and among his fellow bishops.

See Gilbert's *Letters,* ed. by J. A. Giles (1845); *Materials jor the History of Thomas Becket,* ed. by J. C. Robertson, Rolls series (1875–1885); and Miss K. Norgate's *England under the Angevin Kings* (1887).

(H. W. C. D.)

GILBERT OF SEMPRINGHAM, ST., founder of the Gilbertines, the only religious order of English origin, was born at Sempringham in Lincolnshire, *c.* 1083–89. He was educated in France, and ordained in 1123, being presented by his father to the living of Sempringham. About 1135 he established there a convent for nuns; and to perform the heavy work and cultivate the fields he formed a number of labourers into a society of lay brothers attached to the convent.

Similar establishments were founded elsewhere, and in 1147 Gilbert tried to get them incorporated in the Cistercian order. Failing in this, he formed communities of priests and clerics to perform the spiritual ministrations needed by the nuns. The women lived according to the Benedictine rule as interpreted by the Cistercians; the men according to the rule of St. Augustine, and were canons regular. The special constitutions of the order were largely taken from those of the Premonstratensian canons and of the Cistercians. Like Fontevrault (*q.v.*) it was a double order, both communities living side by side; but, though the property belonged to the nuns, the superior of the canons was the head of the whole establishment, and the general superior was a canon, called "Master of Sempringham." The general chapter was a mixed assembly composed of two canons and two nuns from each of the houses.

The order received papal approbation in 1148. By Gilbert's death (1189) there were nine double monasteries and four of canons only, containing about 700 canons and 1,000 nuns in all. At the dissolution there were some 2j monasteries. The order never spread beyond England.

See Bollandists' *Acta Sanctorum* (Feb. 4); Dugdale, *Monasticon* (1846); Helyot, *Hist. des ordres religieux* (1714), ii. c. 29; R. Graham, *St. Gilbert of Sempringham, and the Gilbertines* (1901), and F. A. Gasquet, *English Monastic Life* (1904).

GILDAS (GILDUS) (516?–570), the earliest of British historians, surnamed by some Sapiens, and by others Badonicus. Two short treatises exist, purporting to be lives of Gildas. and ascribed respectively to the 11th and 12th centuries; but they seem to confuse two, if not more, persons who had borne the name. Gildas was almost certainly an ecclesiastic. He went abroad, probably to France, in his 34th year, where after 10 years of hesitation and preparation, he composed the work bearing his name.

His materials, Gildas tells us, were collected from foreign rather than native sources. The *Cambrian Annals* give 570 as the year of his death.

The writings of Gildas have come down to us under the title of *Gildae Sapientis de excidio et conquestu Britanniae.* The work is now usually divided into three .portions—a preface, the history proper, and an epistle—the last, largely made up of Scriptural passages brought together for the purpose of condemning the vices of his countrymen and their rulers, being the longest but least important. In the second portion, he passes in brief review the history of Britain from its invasion by the Romans until his own times.

Among other matters he refers to the persecution under Diocletian, the election of Maximus as emperor by the legions in Britain, final abandonment of the island by the Romans and the coming of the Saxons under Vortigern. Unfortunately his statements are vague and obscure. With one exception (the date of the battle of Mount Badon referred to in connection with the date of his own birth, *see* ARTHCR) no dates are given, and events, are not alnays taken up in the order of their occurrence. These faults become serious when, as is the case from nearly the beginning of the 5th century to the date of his death, Gildas's brief narrative is our only authority for most of what passes current as the history of England. Thus it is on his sole, though in this instance perhaps trustworthy, testimony that the famous letter rests. said to have been sent to Rome in 446 by the despairing Britons, commencing: "To Agitius (Aetius), consul for the third time, the groans of the Britons."

Gildas's treatise was first published in 1525 by Polydore Vergil, but with many avowed alterations and omissions. In 1568 John Josseline, secretary to Archbishop Parker, issued a more accurate edition; and in 1691 a still better edition appeared at Oxford by Thomas Gale. The next English edition described by Potthast as *editio pessima* was published by the English Historical society in 1838, and edited by the Rev. J. Stevenson. The text of Gildas founded on Gale's edition collated with two other manuscripts, with elaborate introductions, is included in the *Monumenta Historica Britannica,* edited by Petrie and Sharpe (1848). Another edition is in A. W. Haddan and W. Stubbs, *Councils and Eccles. Documents* relating to Great Britain (Oxford. 1869); *see* also Theodor Mommsen's edition in *Monum. Germ. hist. auct. antiq.* xiii, *Chronica minora saeculorum iv-vii,* vol. iii (1898).

For useful bibliographical notes *see* C. Gross, *Sources of English History* (1915) and *E.* K. Chambers, *Arthur of Britain* (1927).

GILDER, RICHARD WATSON (1844–1909), U.S. editor and poet, was born in Bordentown, N.J., on Feb. 8, 1844. Unable to attend college, he worked on the *Newark* (N.J.) *Daily Advertiser* and was cofounder of the *Newark Morning Register*, which soon failed. He held positions on *Hours at Home* (1869) and *Scribner's Monthly* (later the *Century Magazine*), becoming editor of the latter in 1881.

Throughout this time Gilder had been contributing verse and descriptive pieces to various magazines and newspapers, but the greatest development of his poetic talent came after he met his future wife. Helena de Kay, an art student at Cooper Union. Her knowledge of art and music broadened his interests. and after their marriage in 1874 their home became a social centre for some of the most distinguished persons of the day. The immediate fruit of this relationship was *The New Day* (1875). a series of love sonnets, and a sequel volume, *The Celestial Passion* (1887). In Gilder's later verse the lyric impulse is somewhat obscured by the numerous "causes" that occupied his energies. Perhaps most memorable of these were his efforts in behalf of international copyright law, civil service reform, and as chairman of the New York Tenement House commission.

After several collapses from overwork, Gilder died in New York city on Nov. 18, 1909.

A collected edition of Gilder's verse appeared in 1908. Autobiographical material may be found in *Grover Cleveland: a Record of Friendship* (1910) and his *Letters* (1916).

See also Brander Matthews, "Richard Watson Gilder," ***North American Review*** (Jan. 1910).

GILDERSLEEVE, BASIL LANNEAU (1831–1924), U.S. classical scholar, born in Charleston. S.C., on Oct. 23, 1831, graduated at Princeton in 1849, and studied at Berlin. Bonn and Gottingen. From 1856 to 1876 he was professor of Greek in the University of Virginia. holding the chair of Latin also in 1861–66, and in 1876 he became professor of Greek in the newly-founded Johns Hopkins university, a position from which he retired in 1915. In 1880 *The American Journal of Philology* was established under his editorial charge.

He published a *Latin Grammar* (1867; revised. with the co-operation of Gonzalez B. Lodge, 1894 and 1899) and a Latin series for use in secondary schools (1875). both marked by lucidity of order and mastery of grammatical theory and methods. His edition of *Persius* (1875) is of great value. But his bent was rather toward Greek than Latin. His special interest in Christian Greek was partly the cause of his editing in 1877 *The Apologies of Justin Martyr,* "which" — to use his own words — "I used unblushingly as a repository for my syntactical formulae." His *Syntax of Classical Greek* from Homer to Demosthenes with C. W. E. Miller (part i, 1900; part ii, 1911) collects these formulas. Gildersleeve edited in 1885 *The Olympian and Pythian Odes of Pindar,* with a brilliant and valuable introduction. His views on the function of grammar were summarized in a paper on *The Spiritual Rights of Minute Research* delivered at Bryn Mawr in 1895, and his collected contributions to literary periodicals appeared in 1890 under the title *Essays and Studies Educational and Literary.* He was also the author of *Hellas and Hesperia* (1909) and of *Creed of the Old South* (1915). He died in Baltimore on Jan. 9, 1924.

GILDING, the art of spreading gold, either by mechanical or chemical means, over the surface of a body for the purposes of protection or ornament. The art of gilding was known to the ancients. According to Herodotus, the Egyptians were accustomed to gild wood and metals; and gilding by means of gold plates is frequently mentioned in the Old Testament. Pliny informs us that the first gilding seen at Rome was after the destruction of Carthage, under the censorship of Lucius Mummius, when the Romans began to gild the ceilings of their temples and palaces, the capitol being the first place on which this enrichment was bestowed. Owing to the comparative thickness of the gold-leaf used in ancient gilding, the traces of it which yet remain are remarkably brilliant and solid. Gilding has in all times occupied an important place in the ornamental arts of Oriental countries; and the native processes pursued in India at the present day may be taken as typical of the arts as practised from the earliest periods.

Modern gilding is applied to numerous surfaces and by various processes, making the art an important part of widely different ornamental and useful arts. It forms an important and essential part of picture framemaking, is largely employed in connection with cabinet-work, decorative painting and house ornamentation, and is of great importance in bookbinding and ornamental leather work. Further. gilding is much employed in electro-gilt reproductions and in electro-plating, and is also a characteristic feature in the decoration of pottery, porcelain and glass. Any of these various processes may, however. fall under one of two heads — mechanical gilding and chemical gilding.

MECHANICAL GILDING

This embraces all the operations by which gold-leaf is prepared *(see* GOLDBEATING), and the several processes by which it is mechanically attached to the surfaces it is intended to cover. It thus embraces the burnish or water-gilding and the oil-gilding of the carver and gilder, and the gilding operations of the house decorator, the sign-painter, the bookbinder, the paper-stainer and several others. Polished iron, steel and other metals are gilded mechanically by applying gold-leaf to the metallic surface at a temperature just under red-heat, pressing the leaf on with a burnisher and reheating, when additional leaf may be laid on. The process is completed by cold burnishing. Copper and wood are perhaps the most widely used bodies for the application of gilding.

Copper Gilding. — For the gilding of copper, employed in the decoration of temple domes and other large works, the following is an outline of the process employed: The metal surface is thoroughly scraped, cleaned and polished, and then sufficiently heated in a fire to remove any traces of grease or other impurity which may remain from the operation of polishing. It is then dipped in an acid solution prepared from dried unripe apricots, and rubbed with pumice or brick powder. Next, the surface is rubbed over with mercury, which forms a superficial amalgam with the copper, after which it is left some hours in clean water, again washed with the acid solution and dried. It is now ready for receiving the gold, which is laid on in leaf, and, on adhering, assumes a grey appearance from combining with the mercury, but on the application of heat, the latter metal volatilizes, leaving the gold a dull, greyish hue. The colour is brought up by means of rubbing with agate burnishers. The weight of mercury used in this process is double that of the gold laid on, and the thickness of the gilding is regulated by the circumstances or necessities of the case. For the gilding of iron or steel, the surface is first scratched over with chequered lines, then washed in a hot solution of green apricots, dried and heated just short of red-heat. The gold-leaf is then laid on, and rubbed in with agate burnishers, when it adheres by catching into the prepared scratched surface.

Wood Gilding. — In applying gilding to wood, after the surface has been sand-papered in order to remove all sharp edges, followed by a very careful dusting, the glue priming size stage is of first importance.

Priming. — Glue size is made by mixing an ounce of glue to a gill and one-half of water, and allowing it to soak at least two hours, after which the mixture is placed in a double boiler and heated until it has become all liquid; then it is removed to set. The combination, which is of jelly-like appearance, can then be cut into blocks or squares, and is generally known as the stock glue size. It is the supply base for all following sizes where glue is used as an ingredient.

Sizing, a term used mostly by painters, is primarily applied to the act of glazing the surface oi the material to be gilded. For this preparation, the stock glue size is thinned by mixing a two-thirds proportion of water and dissolving the combination by heat in a double boiler, being careful not to place the vessel near an open fire.

It is necessary for this size to be painted on the raw wood when the combination is still warm. It is well also to have the surface moderately warm so that the size will not form a film on the surface of the wood, but will soak into the grain and act as a filler. It is also necessary to remove any superfluous liquid and blank spaces that may appear just after the glue size is applied. From two to five hours are required for the wood to dry. The glue priming size is followed by the whiting size. This size is made by adding another one-third portion of water to the stock glue size and then heating.

The First Coat of Whiting. — After this mixture has reached the proper temperature, which is somewhat under boiling, sprinkle in the best quality of bolted whiting until the mixture becomes a thick cream.

The first coat of whiting should be applied in a stipple-like fashion, which enables the second coat to have a gripping surface on which to take a better hold. This stippling should be given at least two hours to dry. After the first coat has been applied and allowed sufficient time to dry, the surface should be carefully examined for imperfections such as miscuts, openings at joints, or nail holes. These imperfections require considerable care in filling with putty, made in the following manner: —

Putty Filler. — Make a depression in the stock dry whiting, and pour in a small amount of stock size glue, which should be heated. Take a putty stick and work it around until it becomes a doughy mass of whiting and glue. When it has finally been kneaded sufficiently to allow handling, work it in the palm of the hand until it becomes as pliable as common painter's putty. In placing this prepared putty into the blemishes on the wood, moisten each particle immediately before putting it into place. It is also advisable to use a little moisture in smoothing over the surface and removing any superfluous putty.

The second coat of whiting or filling coat is also called the smooth coat. It is applied as evenly and smoothly as possible, with the exception of the parts that are desired to retain a stippled effect, in which case, the stipple is repeated and applied on the parts as in the previous coat. Do the stippling before finally smoothing the other surfaces with a brush

The third coat, if necessary, is next applied. This all depends on the surface to be gilded and the amount of ornamentation, and is mainly intended to produce a pleasing effect. When the desired body of whiting has been applied and has dried for at least two hours, the parts which are to remain smooth are rubbed down with a damp cloth. If necessary, especially in deep ornamentation, a brush will answer this purpose better. After the moist smoothing of the surface has been accomplished, it is gone over with a fine piece of sandpaper (o or oo) in order to remove the burr which is caused by the damp smoothing. After removing all dust after sand-papering, it is ready for its first coat of gold size.

Gold Size is applied in much the same manner as paint would be applied, which means working it out smoothly so as to prevent any surplus remaining in comers or causing puddles. Where ornamentation is deep, puddles or floods in hollows are causes of crackling and endless trouble, and one of the most common warnings to an apprentice is, "Don't let the depths fill up."

A Second Coat, and sometimes a third, is applied in like manner, being careful again to allow the surface to dry well after each application and sandpaper to remove any surface burrs. After this, the wood is again dusted off carefully and a coat of very weak size is applied, by heating a piece of stock glue until it is completely dissolved. This weak size must not be applied in a hot state and must be of an even, cool temperature before applying; in fact, less warm than luke-warm. The weak size must be applied by a long soft-haired brush, avoiding puddles in the depths and with such a gentle touch that you do not disturb the gold size. A weak size solution is made as follows: A piece of stock size glue the size of a lima bean dissolved in one gill of hot water, allowed to cool, add a few drops of denatured alcohol.

Burnished gold size is made as follows: Take a desired amount of the basic (red clay, blue clay or any one of many more colours as it comes in the jar) place it in the vessel and add cold water. Stir until it has reached such a consistency that the brush will stand upright in it, then place it in the heater to remain only long enough to take off the chill. The stock glue, having previously been placed in a heater to bring to a very high temperature, is poured, a little at a time, into the clay, stirring the mixture in a rapid, agitative manner, adding glue until it reaches the consistency of just wanting to drip from the brush in a heavy, creamy form; the jar containing the burnished gold size is covered and allowed to set over night to ascertain its strength, which should be of a jelly consistency.

A test of gold size for immediate use is made as follows: Apply very thinly, a coat of the size on the thumb nail or two other finger nails, so that it may dry through the heat of the finger and fanning in the air. When this has dried, take the opposite thumb nail and begin to burnish the nail that holds the gold size. If it comes off, it lacks glue; if it is dull and slaty looking, it lacks body clay; but if it burnishes by the finger nail action and has a mellow lustre, the test is successful and the size is ready for use.

Hints on Application. — Gold size must never be cold, nor can it be warm when it is applied. In laying gold-leaf with the hair tip, a solution of a few drops of alcohol in water should be added to the gold sizing before the leaf is flipped on. Also, if possible, keep the wood tilted so that the liquid will run down and not remain in puddles in any one spot. Burnishing must be done within 48 hours, the sooner the better, after the liquid and gold size have dried; but the minimum should be four hours for drying. After burnishing the surface, it may be necessary to apply small patches of gold in spots where it did not adhere in the first laying.

Faulting, or patching, is done in the same manner as gilding with the exception that the solution in this case should contain a greater percentage of alcohol, which quickens the drying. Small patches dry in about 30 minutes. After the patching has been completed, then, with a soft brush, preferably goat hair or badger, dust off all surplus particles of gold, so that they will not mix with the lacquer which follows. When the burnishing has been done, take some weak size and with a camel's hair brush, apply very lightly a coat all over, not with a heavy brush motion, but just laying it on. When dry, which takes about one hour, the wood is ready for lacquering.

Lacquering is the process in which pure white shellac, diluted with denatured alcohol until it flows in a watery state, is applied with a camel's hair brush in a light manner. The lacquer must dry for about ten hours, after which the wood is ready for toning.

Any desired effect may be obtained by dissolving a pigment with turpentine and adding a few drops of painters' dryer, which acts as a binder. It should have the consistency of thin, transparent white raw umber or zinc white. This medium is freely applied, allowing it to settle into the depths, removing the surplus from all high light with cheese cloth or soft, absorbent cloth. After a few moments, the final effect can be obtained by an additional light wiping with the cloth, although the best results are often obtained by using the fingers instead of a rag. It is advisable not to tone, at any one time, a greater surface than can be kept under control, because within ten minutes, this tone so strongly adheres to the lacquer that erasure is difficult. (A. E.)

CHEMICAL GILDING

This embraces those processes in which the gold used is at some stage in a state of chemical combination. Of these the following are the principal:—

Cold Gilding. — In this process the gold is obtained in a state of extremely fine division, and applied by mechanical means. Cold gilding on silver is performed by a solution of gold in aqua-regia applied by dipping a linen rag into the solution, burning it, and rubbing the black and heavy ashes on the silver with the finger or a piece of leather or cork.

Wet Gilding is effected by means of a dilute solution of chloride of gold with twice its quantity of ether. The liquids are agitated and allowed to rest, when the ether separates and floats on the surface of the acid. The whole mixture is then poured into a funnel with a small aperture, and allowed to rest for some time, when the acid is run off and the ether separated. The ether will be found to have taken up all the gold from the acid, and may be used for gilding iron or steel, for which purpose the metal is polished with the finest emery and spirits of wine. The ether is then applied with a small brush, and as it evaporates it deposits the gold, which can now be heated and polished. For small delicate figures a pen or a fine brush may be used for laying on the ether solution.

ire-gilding or **Wash-gilding** is a process by which an amalgam of gold is applied to metallic surfaces, the mercury being subsequently volatilized, leaving a film of gold or an amalgam containing from 13 to 16% of mercury. In the preparation of the amalgam the gold must first be reduced to thin plates or grains, which are heated red hot, and thrown into mercury, previously heated, till it begins to smoke. Upon stirring the mercury with an iron rod, the gold totally disappears. The proportion of mercury to gold is generally six or eight to one. When the amalgam is cold it is squeezed through chamois leather for the purpose of separating the superfluous mercury; the gold, with about twice its weight of mercury, remains behind, forming a yellowish, silvery mass of the consistency of butter. When the metal to be gilded is wrought or chased, it ought to be covered with mercury before the amalgam is applied, that this may be more easily spread; but when the surface of the metal is plain, the amalgam may be directly applied to it. When no such preparation is applied, the surface to be gilded is simply bitten and cleaned with nitric acid. A deposit of mercury is obtained on a metallic surface by means of "quick-silver water," a solution of nitrate of mercury, the nitric acid attacking the metal to which it is applied, and thus leaving a film of free metallic mercury. The amalgam being evenly spread over the prepared surface of the metal, the mercury is then sublimed by a heat just sufficient for that purpose; for, if it is too great, part of the gold may be driven off, or it may run together and leave some of the surface of the metal bare. When the mercury has evaporated, which is known by the surface having entirely become of a dull, yellow colour, the metal must undergo other operations, by which the fine gold colour is given to it.

First, the gilded surface is rubbed with a scratch brush of brass wire, until its surface is smooth; then it is covered with a preparation called "gilding wax" and again exposed to the fire until the wax is burnt off This wax is composed of bees-wax mixed with some of the following substanaes: viz., red ochre, verdigris, copper scales, alum, vitriol, borax. By this operation the colour of the gilding is heightened; and the effect seems to be produced by a perfect dissipation of some mercury remaining after the former operation. The dissipation is well effected by this equable application of heat. The gilt surface is then covered over with nitre, alum or other salts ground together, and mixed up into a paste with water or weak ammonia. The piece of metal thus covered is exposed to a certain degree of heat, and then quenched in water. By this method its colour is further improved and brought nearer to that of gold, probably by removing any particles of copper that may have been on the gilt surface. This process, when skilfully carried out, produces gilding of great solidity and beauty; but owing to the exposure of the workmen to mercurial fumes, it is very dangerous, and besides there is much loss of mercury.

Gilding of Pottery and Porcelain. — The quantity of gold consumed for these purposes is very large. The gold used is dissolved in aqua-regia, and the acid is driven off by heat, or the gold may be precipitated by means of sulphate of iron. In this pulverulent state the gold is mixed with one-twelfth of its weight of oxide of bismuth, together with a small quantity of borax and gum water. The mixture is applied to the article with a camel's-hair pencil, and after passing through the fire is of a dingy colour, but the lustre is brought out by burnishing with agate and bloodstone, and afterwards cleaning with vinegar or white lead (*see* POTTERY AND PORCELAIN).

GILDS: *see* GUILDS.

GILEAD, a name used to denote the whole of the territory occupied by the Israelites between the plateaus of Moab and the Hauran, and sometimes in a wider and more general sense to denote the region extending from the river Arnon, to the base of Hermon. It is a country of high forest ridges (average height, 2,500 ft.) lying between the Jordan and the desert plateau. The base slopes are of sandstone partly covered by white marls and the upper of limestone scored and riven by numerous *wadis.* Whilst the gentle declivities towards the eastern plateau have tended to be bare of trees, the western slopes, prior to the World War, were well clothed with oak, terebinth and pine. Gilead is in the main a fertile and beautiful land. "The pastures are everywhere luxuriant, and the wooded heights and winding glens, in which the tangled shrubbery is here and there broken up by open glades and flat meadows of green turf, exhibit a beauty of vegetation such as is hardly to be seen in any other district of Palestine."

History.—The name Gilead first appears in the narrative of the reconciliation of Jacob and Laban (Gen. xxxi.), where the comppsite nature of the narrative renders identification of locality difficult, and was in use in the time of Josephus, and even later, but with no precise geographical definition. In the Israelitic conquest of the territory east of the Jordan Sihon was crushed at Jahaz, south of Heshbon (Num. xxi., 23) and Og, king of Bashan, smitten at Edrei (Deut. i., 5). In the division of the land the southern half of Gilead fell to Reuben and Gad (according to one account) and the northern half to Manasseh. Gideon on the soil of Gilead swept back the routed hosts of Midian (Judges viii.); Jephthah the Gileadite smote the Ammonites from Xroer to Minnith (Judges xi.) and dealt faithfully with the treacherous men of Ephraim when their tongues betrayed them at the fords of Jordan (Judges xii.). Gilead was the scene of the fierce barrle between David and Absalom. Round Ramoth-Gilead many bitter struggles were waged and Ahab perished before its walls. The land, too, played a prominent part in the Maccabean revolt.

It was the fate of the Gileadites to meet the first shock of the Syrian onslaughts and the rolling tide of Assyrian invasion. The Gilead hill country appears to have bred a bold, independent people, but kindly and hospitable. Its intricate country formed a refuge for royalty expectant or in eclipse. Saul's son, Ishbosheth, was here made king by Abner. To its friendly shelter Absalom fled before the anger of his father and abode three years, and David, too, when Absalom's rebellion was at its height, found harbourage and a kindly welcome. It was men of Jabesh-Gilead who risked their lives to recover the bodies of Saul and his sons from the walls, or market-place of Beth-Shan (Beisān). From his home amongst the Gilead hills Elijah emerged to become one of the world's great spiritual leaders, and twice at least did Jesus visit the region — the land beyond Jordan. To Josephus it was Peraea, a land of small provinces whose names re-echoed the centres in which Greek colonists had established themselves during the reign of the Seleucidae. Gilead had as chief cities in Old Testament times, Mahanaim, Succoth, Penuel, Mizpeh, Jazer, Ramoth-Gilead, Jabesh-Gilead, and in later times Pella (Fihl), Gerasa (Jerāsh) and others. Ramoth and Mahanaim were stations of two out of three of Solomon's commissariat officers. The country was later extensively and intensively Romanized, and it is difficult to determine where the Old Testament cities of Gilead lie. Gilead is now part of Jordan.

The balm associated with Gilead is probably to be identified with mastic, the resin furnished by *Pistachia lentiscus*. (E. Ro.)

GILES, SAINT, patron of Saint-Gilles, a town in southern France (*département* of Gard) on the site of an ancient abbey claiming his relics and protected by Charlemagne. One of the 14 Holy Helpers. or auxiliary saints, Giles was venerated throughout Europe as patron of cripples, beggars and blacksmiths; and pilgrims to his tomb contributed much to the prosperity of the medieval town and abbey. The saint's symbols. the hind and arrow, refer to famous but conflicting legends based upon a 10th-century uncritical biography which claims that he, a young Athenian aristocrat, after visiting St. Caesarius of Arles (d. 543), lived as a hermit until wounded by Flavius, king of the Goths. who was pursuing a hind that had fled to Giles for safety. Later Flavius built an abbey, making Giles abbot. His feast day is Sept. 1.

See F. Brittain, *Saint Giles* (1928) ; *H* Thurston and D Attwater, *Butler's Lives of the Saints,* vol. iii, pp 457–458 (1956). (A. B WR.)

GILES OF ROME (Lat. AEGIDIUS ROMANUS) (*c.* 1245–1316), Italian theologian and philosopher. known honorifically as doctor *fundatissimus* ("the best-grounded teacher"). The intellectual leader of the Augustinian hermits, Giles nas probably a pupil of Thomas Aquinas in Paris, and for eight years refused to submit to the ecclesiastical condemnation of Aquinas' philosophical doctrines (1277). Giles mas general of his order from 1292 to 129S and archbishop of Bourges from 1295 to 1316. Developing in an original way Augustinian and Thomistic doctrines. he maintained that God's existence is both directly evident to the human mind and demonstrable from sense experience: that essence and existence are distinct (his polemic with Henry of Ghent became famous), both being "things" at the same level, that is. by participation in God's ideas and in God's existence respectively; and that the pope must have direct political poner over the whole of mankind. His vast literary production includes commentaries on Aristotle, on the De causis, on Peter Lombard's Sentences and on parts of the Bible; theological works (Quodlibeta and Theoremata, notably the *Theoremata* de esse et essentia, ed. by E. Hocedez [1930]); political treatises (*De ecclesiastica* potestate against Philip IV of France, ed, by R. Scholz [1929], and the very popular De *regimine principum*); and *Errores* philosophorum, edited by J. Koch with English translation by J. Riedl (1955). Numerous editions of collected and individual norks of Giles appeared in the 15th, 16th and 17th centuries; for a catalogue see G. Bruni. Le operc di Egidio *Romano* (1936).

GILES, PETER (1860–193j). Scottish comparative philologist. who was master of Emmanuel college, Cambridge, from 1911 until his death. nas born near Aberdeen on Oct. 20, 1860. He was educated at the local parish school, the University of Aberdeen, Freiburg im Breisgau, and Gonville and Caius college. Cambridge, where he took a first class in the classical tripos. won a large number of scholarships (including two for New Testament and international law) and was appointed reader in comparative philology in the university in 1891. He was the author of a Short *Manual* of Comparative *Philology* for Classical *Students* (1895) and of many articles in works of reference. A man of strict integrity Giles managed the affairs of Emmanuel college in a businesslike way and raised its status in Cambridge by securing only good appointments among its fellows. He died on Sept. 17. 1935, at Cambridge.

See an appreciation *by* J. Whatmough in *Word Study,* vol 30, no. 1, pp. 1–3 (1954). (J. WH)

GILGAL (*i.e.,* "circle" of sacred stones), the name of several places in western Palestine mentioned in the Old Testament. The most important is that situated near Jericho (Josh. iv, 19; xv, 7). Josephus recorded that it was ten stadia, and Jerome that it was two Roman miles from Jericho, but neither was explicit in its location. The latter speaks of it as a deserted place held in deep veneration by the natives. The sacredness of the spot may have been due to the erection there of the 12 memorial stones (Josh. iv. 20). Zschokke (1865), Conder (1874) and Dalman (1911) identified it with sites at or near Khirbet el-Ethilek, between Jericho and Jordan, and about $1\frac{1}{2}$ mi, from Jericho. Another Gilgal (mentioned in Josh. xii, 23) appears to have been situated in the maritime plain. This has been identified with Jiljuliyeh, 4 mi. N. of Antipatris. A third Gilgal (II Kings iv, 38) was in the mountains near Bethel. evidently the modern Jiljuliyeh, about 7 mi. N. of Bethel (Beitin). A fourth Gilgal (Deut. xi. 30) would seem to be suggested in the neighbourhood of Mt Gerizim. A place called Juleijil, 1 mi. E. of the foot of Mt. Gerizim, is a likely identification (E. Ro.)

GILGAMESH, EPIC OF, the title of one of the most important literary products of Babylonia, from the name of the chief personage in the tales of nhich it is composed.

Though the Gilgamesh epic is known to us chiefly from the fragments found in the royal collection of tablets made by Assur-bani-pal. king of Assyria (668–626 B.C.), for his palace at Nineveh, internal evidence points to the high antiquity of at least some portions of it; and the discovery of tablets II and III and of a fragment of the epic in the older form of the Babylonian script (c. 2000 B.C.) confirms this view. It is equally certain that the epic originating in Babylonia is a composite product: it consists of a number of independent stories or myths originating at different times and united to form a continuous narrative with Gilgamesh as the central figure. This raises the question whether the independent stories were all told of Gilgamesh or were transferred to Gilgamesh as a favourite popular hero. Internal evidence lends its neight to the latter theory.

Gilgamesh is said to have been a king in the first dynasty of Erech and to have reigned 126 years. The name is Sumerian, and fragments of an early Sumerian poem concerning him have been found at Nippur. Why and how he came to be a popular hero in Babylonia cannot be determined, but the epic indicates that he came as a conqueror and established himself at Erech. There are in the first part of the epic dim recollections of actual events, but solid fact is soon left, and the epic soars to the heights of genuine myth. Gilgamesh becomes a god and, in certain portions of the epic, clearly plays the part of the sun-god of the springtime. taking the place apparently of Tammuz or Adonis. though the story shows traits that differentiate it from the ordinary Tammuz myths.

A separate stratum in the Gilgamesh epic is formed by the story of Enkidu. introduced as the friend of Gilgamesh, who joins him in his adventures. No doubt Enkidu, who symbolizes primeval man, was a figure originally entirely independent of Gilgamesh, but his story was incorporated into the epic.

Another stratum is represented by the story of a favourite of the gods known as Ut-Napishtim (or in Sumerian Zi-u-sud-ra), the Xisuthros of Berossos. who is saved from a destructive storm and flood that destroys his fellow citizens of Shuruppak. Gilgamesh is artificially brought into contact with Ut-Napishtim, to whom he pays a visit for the purpose of learning the secret of immortal life and perpetual youth which he enjoys. During the visit Ut-Napishtim tells Gilgamesh the story of the flood and of his miraculous escape. Nature myths have been entwined with other episodes in the epic, and finally the theologians took up the combined stories and made them the medium for illustrating the truth and force of certain doctrines of the Babylonian religion.

In its final form, the Gilgamesh epic covered 12 tablets, each tablet devoted to one adventure in which the hero plays a direct or indirect part. Of all 12 tablets, portions have been found among the remains of Assur-bani-pal's library, but some of the tablets are so incomplete as to leave even their general contents in some doubt. The fragments do not all belong to one copy. Of some tablets, portions of two, and of other tablets, portions of as many as four copies have turned up, pointing to the great popularity of the production. The best preserved are tablets VI and XI. uhile of those partially preserved a considerable number can be restored. A brief summary of the contents of the 12 may be indicated as follows:

In the first tablet, after a general survey of the adventures of Gilgamesh, his rule at Erech is described, where he enlists the services of all the young able-bodied men in the building of the great wall of the city. The people sigh under the burden imposed, and call upon the goddess Aruru to create a being who might act as rival to Gilgamesh, curb his strength and dispute his tyrannous control. The goddess consents and creates Enkidu, who is described as a wild man. living with the gazelles and the beasts of the field. Enkidu, whose name points to the tradition which made Ea (*q.v.*) the creator of humanity, symbolizes primeval man. Through a hunter, Enkidu and Gilgamesh are brought together, but instead of becoming rivals, they are joined in friendship. Enkidu is induced by the snares of a maiden to abandon his life with the animals and to proceed to Erech, where Gilgamesh, who has been told in several dreams of the coming of Enkidu. awaits him. Together they proceed upon several adventures. which are related in the following four tablets. At first. indeed. Enkidu curses the fate which led him away from his former life. and Gilgamesh is represented as bewailing Enkidu's dissatisfaction. The sun-god Shamash calls upon Enkidu to remain with Gilgamesh, who pays him all honours in his palace at Erech. With the decision of the two friends to proceed to the forest of cedars in which the goddess Irnina—a form of Ishtar—dwells, and which is guarded by Khumbaba. the second tablet ends. In the third tablet, very imperfectly preserved. Gilgamesh appeals through the goddess Ninsun, mother of Gilgamesh, to the sun-god Shamash for his aid in the proposed undertaking. The fourth tablet contains a description of. the formidable Khumbaba, the guardian of the cedar forest. In the fifth tablet Gilgamesh and Enkidu reach the forest. Encouraged by dreams. they proceed against Khumbaba, and dispatch him near a specially high cedar over which he held guard. In the sixth tablet Cilgamesh is wooed by the goddess of love, Ishtar. Gilgamesh. recalling to the goddess the sad fate of those who fall victims to her charms, rejects the offer. In the course of his recital snatches of other myths are referred to, including the famous Tammuz-Adonis tale, in which Tammuz, the youthful bridegroom, is slain by his consort Ishtar. The goddess, enraged at the insult: asks her father Anu to avenge her. **A** divine bull is sent to wage a contest against Gilgamesh, who is assisted by his friend Enkidu. This scene of the fight with the bull is often depicted on seal cylinders. The two friends by their united force succeed in killing the bull, and then after performing certain votive and purification rites return to Erech, where they are hailed with joy. In the seventh tablet Enkidu is smitten with sore disease, but the fragmentary condition of this and the succeeding tablet is such as to envelop in doubt the accompanying circumstances, including the cause and nature of his disease. The eighth tablet records the death of Enkidu. The ninth and tenth tablets, exclusively devoted to Gilgamesh, describe his wanderings in quest of Ut-Napishtim, from whom he hopes to learn how he may escape the fate that has overtaken his friend. He goes through mountain passes and encounters lions. At the entrance to the mountain Mashu, scorpion men stand guard, from one of whom he receives advice as to how to pass through the Mashu district. He succeeds in doing so, and finds himself in a wonderful park, which lies along the seacoast. In the tenth tablet the goddess Sabitu, who, as guardian of the sea, first bolts her gate against Gilgamesh, after learning of his quest, helps him to pass in a ship across the sea to the "waters of death." The ferryman of Ut-Napishtim brings him safely through these waters, despite the difficulties and dangers of the voyage, and at last the hero finds himself face to face with Ut-Napishtim. In the 11th tablet, Ut-Kapishtim tells the famous story of the Babylonian flood. Ut-Napishtim and his wife are anxious to help Giigamesh to new life. He is sent to a place where he washes himself clean from impurity. He is told of a weed which restores youth to the one grown old. Scarcely has he obtained the weed when it is snatched away from him by a serpent, and the tablet closes somewhat obscurely with the prediction of the destruction of Erech. In the 12th tablet Gilgamesh succeeds in obtaining a view of Enkidu's shade, and learns through him of the sad fate endured by the dead. With this description, in which care of the dead is inculcated as the only means of making their existence in Aralu where the dead are gathered. bearable, the epic, so far as we have it, closes.

The reason why the flood episode and the interview with the dead Enkidu are introduced is quite clear. Both are intended as illustrations of doctrines taught in the schools of Babylonia; the former to explain that only the favourites of the gods can hope under exceptional circumstances to enjoy life everlasting; the latter to emphasize the impossibility for ordinary mortals to escape from the inactive shadowy existence led by the dead, and to inculcate the duty of proper care for the dead. That the astro-theological system is also introduced into the epic is clear from the division into 12 tablets. nhich correspond to the yearly course of the sun, while throughout there are indications that all the adventures of Gilgamesh and Enkidu, including those which have a historical background, have been submitted to the influence of this system and projected onto the heavens. This interpretation of the popular tales. according to which the career of the hero can be folloued in its entirety and in detail in the movements in the heavens. in time. with the growing predominance of the astral-mythological system, overshadowed the other factors involved, and it is in this form, as an astral myth. that it passes through the ancient world and leaves its traces in the folk tales and myths of Hebretvs. Phoenicians. Syrians, Greeks and Romans throughout Asia Minor and even in India.

Ebeling in Gressmann's ***Altorientalische Texte zum Alten Testament,*** 2nd ed (1926).

GILGIT, a territory in the northwest of Kashmir containing Gilgit hill station. It gives its name also to the Gilgit river, the Gilgit *wazarut* lying to the south and to the Gilgit political agency comprising a number of states and principalities whose territories extend toward Chitral. Afghanistan, the U.S S.R. and Sinkiang. The whole area, which has been administered by Pakistan since 1947 (see below), was previously under the jurisdiction of the maharaja of Rashmir, excepting the states in the political agency which were administered by a British officer directly responsible to the government of India. These states, which included Hunza, Nagar, Ashkuman, Yasin, Ghizar, the little republic of Chilas. etc., formerly acknowledged the suzerainty of Kashmir, paying an annual tribute in gold or grain, but they formed no part of its territory.

Within the wider limits of the former Gilgit agency are many mixed races, speaking different languages, which have all been usually classed together under the name Dard. The Dard, hoaever, are unknown beyond the limits of the Kohistan district of the Indus valley to the south of the Hindu Roh, the rest of the inhabitants of the Indus valley belonging to Shin republics, or Chilas. The great mass of the Chitral population are Kho (speaking Khouar), and they may be accepted as representing the aboriginal population of the Chitral valley (See HINDU KUSH.) Between Chitral and the Indus the "Dards" of Dardistan are chiefly Yeshkuns and Shins, and it would appear from the proportions in nhich these people occupy the country that they must have primarily moved up from the valley of the Indus in successive waves of conquest, first the Yeshkuns and then the Shins. The Shins are of Hindu origin and spread themselves northward and eastward as far as Baltistan, where they collided with the aboriginal Tatar of the Asian highlands. The *wazarat* of Gilgit contained a population (1941) of 76,526, all Mohammedans, mostly of the Shiah sect, but not fanatical. The dominant race is that of the Shins, whose language is universally spoken. This is one of the so-called Pisacha languages. an archaic Aryan group intermediate betueen the Iranian and the Sanskritic.

In general appearance and dress all the mountain-bred peoples extending through these northern districts are very similar. Thick felt coats reaching below the knee, loose "pyjamas" with cloth "putties" and boots (often of English make) are almost universal, the distinguishing feature in their costume being the felt cap worn close to the head and rolled up round the edges.

Routes in the Gilgit Agency.—One of the oldest recorded routes through this country is that which connects Mastuj in the Chitral valley with Gilgit, passing across the Shandur range (12,250 ft.). It now forms the highroad between Gilgit and Chitral, and has been engineered into a passable route. From the north three great glacier-bred affluents make their way to the river of Gilgit, joining it at almost equal intervals: and each of them affords opportunity for a rough passage northward. (1) The Yasin river, which follows a fairly straight course from north to south for about 40 mi. from the foot of the Darkot pass across the Shandur range (15,000 ft.) to its junction with the Gilgit river, close to the little fort of Gupis, on the Gilgit-Mastuj road. Much of this valley is cultivated and extremely picturesque. At the head of it is a grand group of glaciers, one of which leads up to the well-known pass of Darkot. (2) Twenty-five miles (by map measurement) below Gupis the Gilgit receives the Ashkuman affluent from the north. The little Lake of Karumbar is held to be its source, as it lies at the head of the river. The same lake is sometimes called the source of the Yarkhun or Chitral river, and it seems possible that a part of its waters may be deflected in each direction. The Karumbar, or Ashkuman, is nearly twice the length of the Yasin, and the upper half of the valley is encompassed by glaciers, rendering the route along it uncertain and difficult. (3) Forty miles or so below the Ashkuman junction, and nearly opposite the little station of Gilgit, the river receives certain further contributions from the north which are collected in the Hunza and Nagar basins. These basins include a system of glaciers of such gigantic proportions that they are probably unrivalled in any part of the world. The glacial head of the Hunza is not far from that of the Karumbar, and, like the Karumbar, the river commences with a wide sweep eastward, following a course roughly parallel to the crest of the Hindu Kush (under whose southern slopes it lies close) for about 40 mi. Then striking south for another 40 mi., it twists amid the barren feet of gigantic rock-bound spurs which reach upward to the Muztagh peaks on the east and to a mass of glaciers and snow fields on the west, hidden amid the upper folds of mountains towering to an average of 25,000 ft. The next great bend is again to the west for 30 mi., before a final change of direction to the south at the historical position of Chalt and a comparatively straight run of 25 mi. to a junction with the Gilgit. The valley of Hunza lies 10 mi. from the point of this westerly bend, and 20 (as the crow flies) from Chalt.

Glaciers and **Mountains.**—Conway and Godwin Austen have described the glaciers of Nagar, which, enclosed between the Muztagh spurs on the northeast and the frontier peaks of Kashmir (terminating with Rakapushi) on the southwest, and massing themselves in an almost uninterrupted series from the Hunza valley to the base of those gigantic peaks which stand about Mt. Godwin Austen, seem to be set like an ice sea to define the farthest bounds of the Himalayas. From its uttermost head to the foot of the Hispar, overhanging the valley above Nagar, the length of the glacial ice bed known under the name of Biafo is said to measure about 90 mi. Throughout the mountain region of Hunza and Nagar the valleys are deeply sunk between mountain ranges, which are nowhere less than 15,000 ft. in altitude and which must average above 20,000 ft. As a rule. these valleys are bare of vegetation. Where the summits of the loftier ranges are not buried beneath snow and ice they are bare, bleak and splintered, and the nakedness of the rock scenery extends down their rugged spurs to the very base. Sun-baked in summer and frost-riven in winter, the mountainsides are but immense ramps of loose rock debris, only awaiting the yearly melting of the upper snow fields, or the advent of a casual rainstorm, to be swept downward in an avalanche of mud and stones into the gorges below. Here it becomes piled and massed together, till the pressure of accumulation forces it out into the main valleys, where it spreads in alluvial fans and silts up the plains. This formation is especially marked throughout the high level valleys of the Gilgit basin.

Passes.—Each of these northern affluents of the main stream is headed by a pass, or a group of passes, leading either to the Pamir region directly or into the upper Yarkhun valley from which a Pamir route diverges. The Yasin valley is headed by the Darkot pass (15,000 ft.), which drops into the Yarkhun not far from the foot of the Baroghil group over the main Hindu Kush watershed. The Ashkuman is headed by the Gazar and Kora Bohrt passes, leading to the valley of the Ab-i-Punja; and the Hunza by the Kilik and Mintaka, the connecting links between the Taghdumbash Pamir and the Gilgit basin. They are all about the same height—15,000 ft. All are passable at certain times of the year to small parties, and all are uncertain. In no case do they present insuperable difficulties in themselves; but the gorges and precipices which distinguish the approaches to them from the south, the slippery sides of shelving spurs whose feet are washed by raging torrents, the perpetual weary monotony of ascent and descent over successive ridges multiplying the gradient indefinitely —these form the real obstacles blocking the way to these northern passes.

Gilgit Station.—The pretty little station of Gilgit (4,890 ft. above sea level) spreads itself in terraces above the right bank of the river nearly opposite the opening leading to Hunza, almost nestling under the cliffs of the Hindu Koh, which separates it on the south from the savage mountain wilderness of Darel and Kohistan. It includes a residency for a political officer, with about half a dozen homes for the accommodation of officials, barracks suitable for a battalion of troops, and a hospital. Evidences of Buddhist occupation are not wanting in Gilgit, though they are few and unimportant. Such as they are, they appear to prove that Gilgit was once a Buddhist centre! and that the old Buddhist route between Gilgit and the Peshawar plain passed through the gorges and clefts of the unexplored Darel valley to Thakot under the northern spurs of the Black mountain.

Connection With West Pakistan.—The Gilgit river joins the Indus a few miles above the little post of Bunji, where a suspension bridge spans the river. A little below Bunji the Astor river joins the Indus from the southeast, and this deep pine-clad valley indicates the continuation of the highroad from Gilgit to Kashmir via the Tragbal and Burzil passes. Another well-known route connecting Gilgit with West Pakistan lies across the Babusar pass (13,690 ft.), linking the lovely Hazara valley of Kaghan to Chilas; Chilas (4,150 ft.) being on the Indus. 50 mi. below Bunji. This is a more direct connection between Gilgit and the plains of West Pakistan than that afforded by the Kashmir route via Gurais and Astor, which latter route involves two considerable passes—the Tragbal (11.585 ft.) and the Burzil (13.776 ft.). Like the Kashmir route, it is no defined by a good military road.

History.—The Dards (Daradae) are located by Ptolemy with surprising accuracy on the west of the upper Indus, beyond the head aters of the Swat river (Soastus), and north of the Gandarae; *i.e.*, the Gandharis, who occupied Peshawar and the country north of it. This region was traversed by two of the Chinese pilgrims of the early centuries of the Christian era, who have left records of their journeys; viz., Fahien, coming from the north, *c*. 400, and Hsuan Tsang, ascending from Swat, *c*. 631. The latter says: "Perilous were the roads, and dark the gorges. Sometimes the pilgrim had to pass by loose cords, sometimes by light stretched iron chains. Here there were ledges hanging in mid-air; there flying bridges across abysses; elsewhere paths cut with the chisel, or footings to climb by." Yet even in these inaccessible regions were found great convents and miraculous images of Buddha. How old the name of Gilgit is we do not know, but it occurs in the writings of the great Mohammedan savant al-Biruni, in his notices of Indian geography. Speaking of Kashmir, he says: "Leaving the ravine by which you enter Kashmir and entering the plateau, then you have for a march of two more days on your left the mountains of Bolor and Shamilan, Turkish tribes who are called *Bhattavaryan*. Their king has the title Bhatta-Shah. Their towns are *Gilgit,* Aswira and Shiltash, and their language is the Turkish. Kashmir suffers much from their inroads" (tr. Sachau, i, 207). It is impossible to say what ground the writer had for calling the people Turks. But it is curious that the Shins say they are all of the same race as the Moguls of India. whatever they may mean by that. Gilgit, as far back as tradition goes, was ruled by rajas of a family called Trakane. When this family became extinct the valley was desolated by successive invasions of neighbouring rajas, and in the 20 or 30 years ending with 1832 there had been five dynastic revolutions. The most prominent character in the history was a certain Gaur Rahman or Gauhar Aman, chief of Yasin, a cruel savage and manseller, of whom many evil deeds are told. Being remonstrated with for selling a *mullah,* he said, "Why not? The Koran, the word of God, is sold; why not sell the expounder thereof?" The Sikhs entered Gilgit about 1842 and kept a garrison there. When Kashmir was made over to Maharajā Gulab Singh of Jammu, in 1846, by Lord Hardinge, the Gilgit claims were transferred with it. And when a commission was sent to lay down boundaries of the tracts made over, Vans Agnew (afterward murdered at Multan) and Lieut. Ralph Young of the engineers visited Gilgit, the first Englishmen who did so. The Dogras (Gulab Singh's people) had much ado to hold their ground, and in 1852 a catastrophe occurred, parallel on a smaller scale to that of the English troops at Kabul. Nearly 2,000 men of theirs were exterminated by Gaur Rahman and a combination of the Dards; only one person, a soldier's wife. escaped, and the Dogras were driven away for eight years. Gulab Singh would not again cross the Indus, but after his death (in 1857) Maharaja Ranbir Singh longed to recover lost prestige. In 1860 he sent a force into Gilgit. Gaur Rahman just then died, and there was little resistance. The Dogras took Yasin twice, but did not hold it. They also, in 1866, invaded Darel, one of the most secluded Dard states, to the south of the Gilgit basin, but withdrew again. In 1889, in order to guard against the advance of Russia, the British government, acting as the suzerain power of Kashmir, established the Gilgit agency. On the British withdrawal in 1947 the place of the political agent was taken by a Kashmiri governor. In Nov. 1947 the Gilgit scouts rose in revolt, imprisoned the governor and proclaimed Gilgit's accession to Pakistan. When the fighting between India and Pakistan ceased in Kashmir (*q.v.*) in 1949, a cease-fire line was established. The whole of Gilgit, including the agency and the *wazarat,* lay north of this line, within the area occupied by the forces of Pakistan, and from that date was administered by the government of Pakistan. The states and principalities of the former British agency were included in an agency established by Pakistan on the British model.

GILIA, a genus of about 100 species of mostly herbs of the Polemoniaceae family. It is a polymorphic genus, mostly native to western North America, a few to South America, and containing annual, biennial and perennial species that show much variation in growth habit, inflorescence and flower colour. The following are popular garden plants: G. *capitata,* an annual of about two feet with dense globose heads of light-blue flowers; G. *rubra,* commonly known as standing cypress, is a common, leafy-stemmed garden perennial, three to five inches high, with a narrow panicle of externally bright scarlet flowers that are yellowish and dotted with red on the inside; G. *aggregata,* known as scarlet or skyrocket gilia, a biennial, one to three feet high with showy scarlet to white flowers; and G. *tricolor,* known as bird's-eyes, an annual one to three feet, with loose clusters of fragrant flowers with yellowish tubes, purple throats and lilac or violet roundish corolla lobes. All are of easy culture in the flower garden, and even the biennials and perennials will often flower from seed within a single season.

(J. M. BL.)

GILKIN, IWAN (1858–1924), Belgian poet, was born at Brussels on Jan. 7, 1858. He was a member of the group of poets known as La jeune Belgique, and his earlier work shows strongly the influence of Baudelaire. He wrote *Damnation de l'artiste* (1890), *Ténèbres* (1892) and other poems collected under the title of *La Nuit* (189;). Other volumes of verse followed. His most individual work is to be found in his dramatic poem *Prométhée* (1899) and the blank verse drama *Le Roi Cophétua.* Gilkin died at Brussels on Sept. 30, 1924.

GILL, SIR DAVID (1843–1914), British astronomer, skillful observer of solar and stellar parallax and pioneer in the use of photography for mapping the stars, was born at Aberdeen, Scot., on June 12, 1843, and educated at Marischal college and at the University of Aberdeen. In 1872 he became director of Lord Lindsay's private observatory at Dunecht near Aberdeen, whence he undertook expeditions to observe the transit of Venus at Mauritius in 1874 and the close approach to the earth of Mars at Ascension Island in 1877.

In 1879 Gill was appointed H.M. astronomer at the Cape of Good Hope in succession to E. J. Stone. In 1888 and 1889 he carried out, with the co-operation of many astronomers, a program of intensive observation with the heliometer of selected minor planets. This led to the first determination (1901) of the solar parallax with modern accuracy ($8''.804 \pm 0''.0046$). While at the Cape observatory Gill completed the Cape Photographic Durchmusterung (1885–89), introduced observations of stellar parallax with the heliometer (*q.v.*), arid served as one of the original council for the International Astrographic Chart and Catalogue. He was made knight commander of the Order of the Bath in 1900.

Gill died in London on Jan. 24, 1914. (O.J. E.)

GILL, (ARTHUR) ERIC ROWTON PETER JOSEPH (1882–1940), English sculptor, engraver, typographical designer and essayist. He fiercely defended the principle that designer and workman should be one; and the popularity of his Perpetua (1925) and Gill sans-serif (1927) type faces is evidence of a successful application of this and of his purifying influence on type design. Gill was born on Feb. 22, 1882, at Brighton, Sussex, where his father was an Independent minister. From 1897 his family lived at Chichester, where the boy would have seen the unique Romanesque bas-reliefs at the cathedral. At his father's wish he was articled in 1899 to a London architect, R'. D. Caroe. but in 1903 he turned to letter carving and typography, following spare-time studies at the new Central School of Art with Edward Johnston, a pioneer of early 20th-century lettering styles. Until 1910 Gill worked mainly as a letter cutter and carver on tombstones, but in 1909 he turned to figure sculpture. A "Madonna and Child" of 1910 brought him into public notice, arid in 1911, befriended by Augustus John, Roger Fry and others, he held an exhibition at the Chenil gallery, London. This early group also includes a "Crucifixion" (1910; Tate gallery, London), in Hoptonwood stone, a material he was to make fashionable in the 1920s and 1930s; a "Cupid" (1910) in Portland stone; and a "Torso" (1912; Manchester City Art gallery) in the softer Bath stone. The "Crucifixion" is inspired by Saxon and Romano-British sculpture, but also in its limbs. hands and feet by Paul Gauguin's works, such as the "Christ Jaune"; the head resembles certain elongated ones of Picasso's "Negro" period. There is early evidence of other derivations as far apart as 6th-century Greece (in the "Contortionists") and certain Mexican (Aztec) crouching figures (in the "St. Simeon Stylites"). Gill was received into the Roman Catholic Church in 1913 (later becoming a Dominican tertiary), and carved the "Stations oi the Cross" ior the new Westminster cathedral (1913–18); these reliefs, though slightly perfunctory in conception, are the clearest evidence of his knowledge of the Chichester sculptures. In other works from about 1912 to 1927 Gill appears to lack the ingenuousness and force of earlier years; but monumentality and confidence return in two figures over life size: a caryatid in pine (1927) and "Mankind" (1928; Tate gallery), a colossal torso of majestic quality. Gill's other works include the Stations of the Cross at St. Cuthbert's church, Bradford, Yorkshire (1920–24), the reliefs on Broadcasting house, London (1933), and the splendid "Creation of Adam" for the council hall of the League of Nations, Geneva (1935–38). Gill was a prolific writer and set forth his ideals clearly in his writings; *Christianity and Art* (1927); *Sculpture, an Essay on Stone Cutting—With a*

Preface About God (1917); *Id quod visum placet, A Practical Test of the Beautiful* (1926); *Beauty Looks Ajter Herself* (1933); *Money and Morals* (1934); *Work and Leisure* (1935); *The Necessity of Belief* (1936); *Work and Property* (1937).

Gill died at Harefield, Uxbridge, Middlesex on Nov. 17, 1940.

GILL or BRANCHIA, the name given to any structure specially adapted for aquatic respiration. The essential features of gills are thinness and large surface of exposure to facilitate transit of respiratory gases; hence they are generally filamentous, feathery or plate-shaped body projections. Gills occur in some Annelida, most Mollusca, the larger Crustacea, aquatic Arachnida, aquatic larvae of insects, fishes, and most larval and a feu- adult Xmphibia. Gills often have accessory functions, as producing food-concentrating currents and brooding of young (as in bivalve mollusks). *(See* ANNELIDA; ARACHNIDA; CRUSTACEA; FISHES; MOLLUSCA.)

The word is also applied to structures resembling the branchiae of fishes, such as the wattles of a fowl or the radiating films on the underside of fungi.

In liquid measure a gill is one-fourth of a pint.

GILLES LI MUISIS or LE MUISET (*c.* 1272–1352), French chronicler, was born probably at Tournai, and in 1289 entered the Benedictine abbey of St. Martin in his native city, becoming prior of this house about 1329, and abbot two years later. Gilles wrote two Latin chronicles. *Chronicon majus* and *Chronicon minus,* dealing with the history of the world from the creation until 1352. This work, edited by J. J. de Smet, in *Corpus chronicorum Flandriae, tome* ii (Brussels, 1841), and by H. Lemaitre for the Société de l'Histoire de France (1906), is valuable for the history of northern France and Flanders during the first half of the 14th century.

Gilles also wrote some French poems, and these *Poésies de Gilles li Muisis* were published by Baron Kervyn de Lettenhove (1882).

GILLESPIE, GEORGE (1613–1648), Scottish clergyman, was born at Kirkcaldy on Jan. 21, 1613, where his father, John Gillespie, was parish minister, and was educated at the University of St. Andrews. He was acting as private chaplain to the earl of Cassillis when he wrote his first work, *A Dispute Against the English Popish Ceremonies Obtruded Upon the Church of Scotland* (1637), which was burned by order of the privy council. In April 1638 Gillespie was ordained minister of Wemyss (Fife), and in the same year was a member of the Glasgow assembly, before which he preached (Nov. 21) a sermon against royal interference in matters ecclesiastical. In 1642 Gillespie was translated to Edinburgh. In 1640 he had accompanied the commissioners of the peace to England as one of their chaplains; and in 1643 he was appointed one of the four Scottish commissioners to the Westminster assembly, where he displayed great power as a controversialist. In 164j he returned to Scotland and is said to have drawn the Act of Assembly sanctioning the directory of public worship. On his return to London he had a hand in drafting the Westminster confession of faith, especially chapter one. Gillespie was elected moderator of the assembly in 1648. He died at Kirkcaldy on Dec. 17, 1648.

Gillespie's principal publications were controversial and chiefly against Erastianism.

See *Works,* with memoir, published by Hetherington (1843–46).

GILLESPIE, THOMAS (1708–74), Scottish clergyman, was born at Clearburn, Duddingston, Midlothian, in 1708. He received ordination at Korthampton in Jan. 1741. In September of the same year he was admitted minister of the parish of Carnock, Fife, the presbytery of Dunfermline admitting as valid the ordination he had received in England, and allowing a qualification of his subscription to the church's doctrinal symbol, so far as it had reference to the sphere of the civil magistrate in matters of religion. Having absented himself from the meetings of presbytery held for the purpose of ordaining one Andrew Richardson, an unacceptable presentee, as minister of Inverkeithing, he was deposed by the assembly of 1752 for maintaining that the refusal of the local presbytery to act in this case was justified. He continued, however, to preach, first at Carnock, and afterward in Dunfermline, where a large congregation gathered round him. In 1761, in conjunction with Thomas Boston of Jedburgh and Collier of Colinsburgh, he formed a distinct communion under the name of the "Presbytery of Relief"—relief, that is to say, "from the yoke of patronage and the tyranny of the church courts." The Relief Church eventually became one of the communions combining to form the United Presbyterian Church (*q.v.*).

Gillespie died on Jan. 19, 1774.

GILLETTE, WILLIAM HOOKER (1853–1937), U.S. playwright and actor, most successful in portraying the cool, resourceful man of action and associated particularly with the character Sherlock Holmes, was born at Hartford, Conn., on July, 24, 1853. After graduation from Hartford high school, he studied at various times at New York university, Massachusetts Institute of Fine Arts and Boston university.

Gillette served with a number of stock companies and made his first appearance as an actor at the Globe theatre in Boston, Mass., in 1875 in *Faint Heart Ne'er Won Fair Lady*. His play *The Professor,* a light comedy in which he appeared in the title role, was produced at the Madison Square Garden theatre in New York city in 1881. *Esmeralda,* his second successful play, produced later in 1881, ran for a year and was later revived from time to time.

Held by the Enemy, a Civil War spy story (produced in Brooklyn, N.Y., in 1836) and *Secret Service* (Philadelphia, 1895) are considered among his best original works. His famous play *Sherlock Holmes,* first produced in New York in 1899 and later in England, was frequently revived in both countries with Gillette in the leading role. His only motion-picture appearance was as Sherlock Holmes in a production of 191j. He died at Hartford, Conn., on April 29, 1937.

GILLINGHAM, a municipal and parliamentary borough of Kent, Eng., on the Medway, next to Chatham with which it and Rochester form the three "Medway towns." Pop. (1951) 70,676. Area 13.0 sq.mi. Its population is largely industrial, employed in the Chatham dockyards, part of which are in the borough, and in local industries. A number of residents are attached to the services in the local establishments. The church of St. Mary Magdalene ranges in date from Early English to Perpendicular. There was formerly a palace of the archbishops of Canterbury in the town.

Gillingham was incorporated in 1903, and in 1929 the boundaries were extended to include Rainham parish.

GILLOT, CLAUDE (1673–1722), French painter and engraver, best known as the master of Watteau and Lancret, was born at Langres on April 27, 1673. His sportive mythological landscape pieces, with such titles as "Feast of Pan" and "Feast of Bacchus," opened the Academy of Painting at Paris to him in 1715; and he then adapted his art to the fashionable tastes of the day. He was connected with the opera and theatre as a designer of scenery and costumes. He died in Paris on May 4, 1722.

GILLOTT, JOSEPH (1799–1873), English pen maker, was born at Sheffield on Oct. 11, 1799. He set up in business in Birmingham, and about 1830 he turned his attention to the manufacture of steel pens by machinery; in 1831 he patented a process for placing elongated points on the nibs of pens. Subsequently he invented other improvements, getting rid of the hardness and lack of flexibility, which had been a serious defect in nibs, by cutting. in addition to the centre slit, side slits, and cross grinding the points.

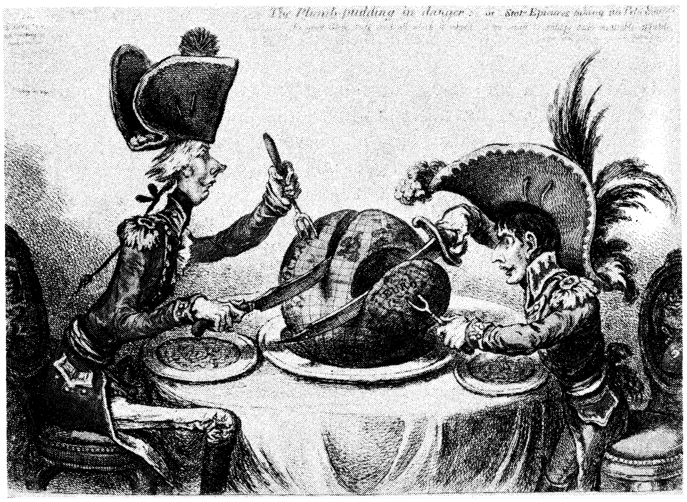
Gillott was a liberal art patron and one of the first to recognize the merits of J. M. W. Turner. He died at Birmingham Jan. 5, 1873.

GILLOW, ROBERT (d. 1773), the founder at Lancaster of a distinguished firm of English cabinetmakers and furniture designers whose books begin in 1731. He was succeeded by his eldest son Richard (1734–1811), who was taken into partnership about 1757, when the firm became Gillow and Barton, and his younger sons Robert and Thomas. The business was continued by his grandson Richard (1778–1866). The firm were architects as well as cabinetmakers, and the first Richard Gillow designed the classical custom house at Lancaster.

About 1761 premises were opened in Oxford street, London. For a long period the Gillows were the best-known makers of English furniture. Sheraton. Hepplewhite and Robert Adam designed for them. Between 1760 and 17jo they invented the original form of the billiard table. They were the patentees (about 1800) of the telescopic dining table. For a Captain Davenport they made, if they did not invent, the first writing table of that name.

GILLRAY, JAMES (17j7–1815). English caricaturist. who lampooned the political figures of his day. was born at Chelsea. Gillray began by learning letter-engraving and later was admitted as a student to the Royal Academy. supporting himself by engraving and perhaps by caricatures signed with fictitious names. William Hogarth's works were a source of study and delight for him in these years. Soon his own caricatures began to appear; the first that is certainly his is "Paddy on Horseback." published in 1779. The name of Gillray's publisher and print seller. Miss Humphrey~is inextricably associated with his. He lived in her house during all the years of his fame and his prints were shown in the windows of her shop.

A number of his most trenchant satires were directed against



"THE PLUM PUDDING IN DANGER" BY JAMES GILLRAY

"Farmer George"—King George 11—and his court. After the French Revolution. Gillray became a conservative and he issued caricatures ridiculing Napoleon and the French and glorifying John Bull. His last work. from a design by Bunbury, is entitled "Interior of a Barber Shop in Assize Time" and is dated 1811. While engaged on it he became mad, although he later had occasional intervals of sanity. He died on June 1. 1815.

Gillray's caricatures may be divided into two classes: the social and political. The political caricatures form a historical record of the latter part of the reign of George III. They were circulated not only over Britain but throughout Europe and exerted a powerful influence. In this series George III. the queen. the prince of Wales. Fox. Pitt. Burke and Napoleon are the most prominent figures. Among Gillray's best satires on the king are: "Farmer George and His Wife.'! companion plates, in one of which the king is toasting muffins for breakfast, and in the other the queen is frying sprats; "The Anti-Saccharites," where the royal pair propose to dispense with sugar to the great horror of the family; "A Connoisseur Examining a Cooper"; "Temperance Enjoying a Frugal Meal"; and "Royal Affability." "The First Kiss These Ten Years." a satire on the peace, is said to have greatly amused Napoleon.

Like most of the English caricatures of the time, Gillray's plates were executed in etching with stipple and coloured by hand. They were produced for popular consumption and perhaps this is one of the reasons for that hurried vitality and spontaneity which make them so lively and timely. The injustices and pretentions which they depict as ridiculous absurdities are always present in some form or other. and in the work of Gillray they are leveled to the ground of truth by combination of conviction. vitality, acute human observation, fantasy and artistic naïveté. Unlike Daumier, Gillray does not situate the caricature in the realm of great art, but he does bring it to the threshold.

See Thomas Wright and R H. Evans. *Historical and Descriptive Account of the Caricatures of James Gillray* (1851); Mary Dorothy George, *Catalogue of Political and Personal Satires . . . in The British Museum,* vol. v–ix (1935–1949). (H. Es.; X.)

GILLYFLOWER, a name applied to various flowers, but most commonly to the clove pink, *Dianthus caryophyllus,* of which the carnation is a cultivated variety, and to the stock. *Matthiola incana,* a well-known garden favourite. The word is sometimes written gilliflower or gilloflower, and is reputedly a corruption of July flower, "so called from the month they blow in." The name n-as originally given in Italy to plants of the pink tribe, especially the carnation, but has in England been transferred to several cruciferous plants.

The gillyflower of Chaucer and Spenser and Shakespeare was, as in Italy, *Dianthus caryophyllus;* that of later writers and of gardeners. *Matthiola.* The principal other plants which bear the name are the wallflower, *Cheiranthus cheiri,* called wall gillyflower in old books; the dame's violet: *Hesperis matronalis,* called variously the queen's, the rogue's and the winter gillyflower; the ragged robin. *Lychnis floscuculi,* called marsh gillyflower and cuckoo gillyflower; the water violet. *Hottonia palustris,* called water gillyflower; and the thrift. *Statice armeria,* called sea gillyflower. As a separate designation it is usually applied to the wallflower.

GILMAN, DANIEL COIT (1831–1908). U.S. educator, first president of Johns Hopkins university, was born in Norwich, Conn.. on July 6. 1831. After his graduation at Yale in 1852 he went to St. Petersburg, Russia, as attaché, then studied at Berlin (1854–55). For 17 years he worked at Pale as assistant librarian. professor of physical and political geography and secretary of the governing board. From 1872 to 1875 he was head of the University of California at Berkeley. In 187j he became first president of Johns Hopkins. This post he filled until 1901, after which, until 1904, he served as the first president of the Carnegie institution at Washington, D.C. He died at Norwich on Oct. 13, 1908.

Gilman's influence upon higher education in the United States was great, as was his contribution to the organization of the Johns Hopkins hospital, of which he was made director in 1889. Under him Johns Hopkins had an immense influence, especially in the promotion of original and productive research. Through his services on numerous foundations and boards devoted to education, and as president of the National Civil Service Reform league, he further aided in educational and social betterment in the United States.

See Fabian Franklin, *Life of Daniel Coit Gilnzan* (1910); John Thomas Faris, *Men Who Conquered* (1922).

GILMAN, LAWRENCE (1878–1939), U.S. music critic. who wrote on many aspects of modern music. was born at Flushing, N.Y., July 5, 1878. Educated in the New York public schools and the Collins Street Classical school (Hartford, Conn.). he studied art with William M. Chase and at the Art Students league in New York city. He was an illustrator for the *New York Herald* (1896–98). He became music critic for *Harper's Weekly* in 1901, also serving as assistant editor (1903–11) and managing editor (1911–13). He was an editor of *Harper's Magazine* (1913–15) and music; drama and literary critic of the *North American Review* (1915–23), leaving to become the *Yew York Herald Tribune* music critic, a position he held until his death in Franconia, N.H., Sept. 8. 1939. He wrote program notes for the New York Philharmonic society and for the Philadelphia orchestra (1921–39).

Gilman wrote *Phases of Modern Music* (1904), *Edward MacDowell* (1905; revised and enlarged. 1909), *The Music of Tomorrow* (1907), *Stories of Symphonic Music* (1907), *Aspects of Modern Opera* (1909), *Nature in Music* (1914), *Wagner's Operas* (1937) and *Toscanini and Great Music* (1938).

GILMORE, PATRICK SARSFIELD (1829–1892), U.S. bandmaster. was born in Ireland: and settled in America about

1850. He organized the best wood wind and brass players of Europe and America, playing in the remoter areas and introducing Wagner, Liszt and other great composers where they had been unknown. He was responsible also for many great orchestras, including one at the World's Peace Jubilee, Philadelphia, 1872, when the orchestra numbered 2,000 and the chorus 20,000. He died at St. Louis Sept. 24, 1892.

GILPIN, BERNARD (1517–1583), English clergyman. the "apostle of the north," was born at Kentmere in 1517 and educated at Queen's College, Oxford, where he was elected fellow in 1j42; in the same year he was ordained. Gilpin was one of the first scholars elected to Wolsey's new foundation at Christ Church. At Oxford he defended the doctrine of the church against Hooper. but his confidence in his own cause was somewhat shaken by a public disputation in which he supported Hooper against Peter Martyr. In 1552 he preached before Edward VI a sermon on sacrilege. in which he denounced the expropriation of church property. About this time he became vicar of Norton in the Durham diocese, and obtained a licence, through William Cecil, as a general preacher throughout the kingdom during the king's lifetime.

On Mary's accession he went abroad to study at Louvain. Antwerp and Paris, returning to England in 1556 as rector of Easington and archdeacon of Durham. His outspokenness excited hostility, and he was brought before Tunstall, bishop of Durham, on a charge of heresy. Tunstall dismissed the case. and presented Gilpin with the rich living of Houghton-le-Spring. and when the accusation was renewed, he again protected him. Gilpin's enemies, however, obtained a royal warrant for his apprehension from Bonner, bishop of London, but his arrival in London was fortunately delayed by an accident in which he broke his leg, and he was freed from danger by the news of Queen Mary's death. He died at Houghton on May 4, 1583.

Gilpin steadily refused promotion. He held a great position in the north, and displayed a magnificent hospitality at Houghton to all classes of his parishioners, and treated them with great generosity in critical times. He built and endowed a grammar school, maintained a large number of poor children at his own charge, and helped the more promising pupils to enter the universities.

See Christopher Wordsworth, *Ecclesiastical Biography*, vol. iii, 4th ed., w-hich contains a contemporary sketch by G. Carleton, originally, printed in Bates's *Vitae selectorum aliquot virorum*.

GIL POLO, GASPAR (?1530–1591), Spanish novelist and poet, was born at Valencia. He finds a place in the history of the novel as the author of La Diana enamorada, a continuation of Montemayor's Diana, and perhaps the most successful continuation ever written by another hand. One of the most agreeable of Spanish pastorals, it was imitated by Cervantes in the *Canto* de *Caliope,* and was translated into English, French. German and Latin. The English version of Bartholomew Young, published in 1598 but current in manuscript 1j years earlier, is said to have suggested the Felismena episode in the *Two Gentlemen* of *Verona;* the Latin version of Caspar Barth, entitled *Erotodidascalus* (Hanover, 1625), is a performance of uncommon merit as well as a bibliographical curiosity.

GILSONITE is a native bitumen (*q.v.*), an asphaltite, found near the Colorado–Utah border in the Uinta basin. It is named after S. H. Gilson, one of its discoverers; the alternarive names uintaite or uintahite are derived from its location. Gilsonite is a lustrous, jet-black solid bitumen exhibiting conchoidal fracture. It gives a brown streak, ranges in specific gravity from 1.03 to 1.10 and is soluble in carbon disulfide. The melting point varies from 110° to 260° C.. depending on chemical composition.

Gilsonite occurs as veins filling parallel, vertical fractures. The largest veins are several miles long, thousands of feet deep and about 20 ft. thick. Maximum annual production before 1950 was about 75,000 tons, when it was used largely in manufacturing paints and other coating materials. Gilsonite production increased after 1957, when it was mined hydraulically and transported as a water slurry by pipeline to refineries for conversion to coke and gasoline. (S. R. SN.)

GILYAKS, a Palaeo-Asiatic people originally widespread throughout the Lower Xmur and the north of Sakhalin. The clan forms a society based on common rights and marital duties. The men in one class: A. had to take wives from another class. B. The women in class A had to marry men—not from B but from a third class, C. Thus brother and sister mated into different clans. The classificatory system of relationship is developed on these lines: common fire, community in the bear rites, common enemies, community in blood money and common tabus bind the clans together. Shamanism and bear worship existed. Death was due to evil spirits and the corpse was cremated, except in certain special cases.

See M. Czplicka, *Aboriginal Siberia* (1914).

GIMA'A: see ARABS.

GIMBAL, a mechanical device for hanging an object in order that it may keep a horizontal and constant position. while the body from which it is suspended is in free motion, so that the motion of the supporting body is not communicated to it. It is thus used particularly for the suspension of compasses or chronometers and lamps at sea, and usually consists of a ring freely moving on an axis. within which the object swings on an axis at right angles to the ring.

The word is derived frorn the O. Fr. *gemel*, a term for a ring formed of two hoops linked together and capable of separation, used in the 16th and 17th centuries as betrothal and keepsake rings. They sometimes were made of three or more hoops linked together.

GIMLET, a tool used for boring small holes. It is made of steel, with a shaft having a hollow side. and a screw at the end for boring the wood; the handle of wood is fixed transversely to the shaft. A gimlet is always a small tool. A similar tool of large size is called an auger. See TOOL.

GIMP or GYMP. Probably a nasal form of the Fr. guipure, from *guiper,* to cover or "whip" a cord over with silk, a stiff trimming made of silk or cotton woven around a firm cord, often further ornamented by a metal cord running through it. It is also sometimes covered with bugles, beads or other glistening ornaments. The trimming employed by upholsterers to edge curtains. draperies, the seats of chairs, etc., is also called gimp; and in lace work it is the firmer or coarser thread which outlines the pattern and strengthens the material.

Gimp is also a shortened form of gimple (the O.E. wimple), the kerchief worn by a nun around her throat, sometimes also applied to a nun's stomacher.

GIN, a potable distilled spirit, deriving its principal flavour from the juniper berry (*juniperus communis*). The origin of gin was medicinal and is attributed to Franciscus de la Boe (1614–1672). professor of medicine at the University of Leyden. Holland, who distilled spirits in the presence of the juniper berry in order to prepare a specific with known diuretic properties. The juniper berry was known by its French name of *genièvre,* which the Dutch altered to *genever*, and the English to gin.

By 1792 Holland was producing 14,000,000 gallons, of which 10,000,000 were exported. British soldiers returning from the wars on the continent brought the taste for gin to England. However, it was Queen Anne who gave gin distilling its impetus during her reign (1702–14), when she raised the duties and taxes on imports and lowered the excise on home products.

There are two basic types of gin, those produced in the Netherlands and those produced elsewhere, principally in England and America. The difference derives from the fact that the Dutch utilize very rich, full-bodied spirits and distill their gin at a very low proof, usually below roo. while the English and American distillers use highly purified spirits, distilling their gins off at about 160 U.S. proof.

Dutch gins are known as Geneva. Genever, Schiedam or Hollands. Low proof spirits distilled from a mash of at least one-third barley malt are rectified. The resultant spirits, together with the flavouring agents. are redistilled, coining off at between 94 and 98 proof. Dutch gins are malty in flavour and have a very full body. Other "botanicals" are included with the juniper berries. but not in the variety employed in England and the United States.

English gin is produced by rectifying high proof grain whisky or spirits to assure complete purity and flavour-free spirits. These are then reduced with water to proof strength (114.2 U.S. proof), placed in a pot still together with the flavouring agents, and the whole redistilled. The resultant gin is reduced to 80, 86 or 94 U.S. proof; depending on the market for which it is intended, and allowed to rest for a very short period before bottling for the market.

The "botanicals" used to flavour gin in England and the United States are juniper berries, preferably from Germany and Italy; orris? angelica and licorice roots; bitter almonds: caraway, coriander, cardamon, anise and fennel seeds; calamus, cassia bark, lemon peel. sweet and bitter orange peels, etc. Each gin producer has developed his own secret formulas, using some or all of the foregoing.

American gin producers follow the English method. usually employing solely 190 proof grain spirits. Their gin stills often have a tray or gin head in which the botanicals rest and through which the alcoholic vapours swirl as they rise.

Usually. gin is not aged. Some U.S. producers do age their gin although under U.S. regulations no claim of age may be made for gin. Such aged gins have a pale golden colour.

English and American gins are dry gin. The term London Dry gin is used in the United States and has lost its geographical significance. Old Tom gin is a slightly sweetened gin. while fruit flavoured gins are produced by adding such flavors as orange. lemon, raspberry or pineapple to finished gin.

Sloe gin is a gin in name only. It is a sweet liqueur with the acid tang of the sloe berry.

Hollands gin is generally drunk neat or mixed with water, while dry gins are consumed in a variety of fashions — neat. in cocktails such as the dry martini and long drinks such as the Tom Collins. or mixed with tonic water. *See* also ALCOHOLIC BEVERAGES; DISTILLED. (H. J. GN.)

GINDELY, ANTON (1829–1892), Austrian historian. noted for his work on Bohemian history and on the period of the Thirty Years' War. was born in Prague. Sept. 3. 1829, the son of an Austrian father and a Czech mother. He studied at Prague and in 18jj made the first of his journeys investigating archives in Bohemia. Poland and Germany. There he gained access to the records of the Moravian Brethren. which led him to write several works. including *Geschichte der böhmischen Briider* (1857). In 1862 he became professor at Prague and in 1867 official Bohemian archivist. He was also the editor of *Monumenta historiae bohemica* (j vol., 1864–90).

Gindely's other important works include *Geschichte des 30 Jährigen Krieges* (1869–80), *Rudolf 11 und seine Zeit* (1863 and 1868) and a criticism of Wallenstein, *Waldstein während seines ersten Generalats* (2 vol. 1885–86), which caused controversy.

His *Geschichte der Gegenreformation in Böhmen* was edited by T. Tupetz (1894). Gindely died in Prague. Oct. 24, 1892.

GINER DE LOS RÍOS, FRANCISCO (1840–1915), Spanish philosopher and jurist, was born in Ronda (Andalusia) on Oct. 10, 1840 He graduated in Granada. and in 1867 went to the University of Madrid as a professor of jurisprudence and there came under the influence of Sanz del Río, Krause's famous disciple. In accordance with his belief that philosophy should have a concrete influence on practical life, he devoted himself to the educational question. Twice Giner resigned his chair, together with several of his colleagues, in a stand for liberty of thought in the university against a reactionary government, and was twice reinstated.

He helped found the Institución Libre de Enseñanza, an educational institute which did much to improve teaching methods in Spain. by the application of philosophical thought to the problems of education. His greatest influence was personal and direct, for he was a born teacher, a man of refined sensibility, pure in his life as in his ideals.

Giner published several volumes of essays — literary, educational. philosophical and religious — as well as *Leccioizes Sumarias de Psicologiu* (1871); *Psicologiu; Idea del Derecho,* with Alfredo Calderón, trans. from the German of Roder (188j); *Resumen de Filosofía del Derecho,* with Alfredo Calderón (1898); and other works.

A complete edition of his numerous works was undertaken a year after his death.

See S. de Madariaga, ***The Genius of* Spain** (1923).

GINGEE, a rock fortress of southern India, in the South Arcot district of Madras. It consists of three hills, connected by walls enclosing an area of 7 sq.mi. The origin of the fortress is shrouded in legend. When occupied by the Mahrattas at the end of the 17th century, it withstood a siege of eight years against the armies of Xurangzeb. In 1750 it was captured by the French, who held it with a strong force for 11 years. It surrendered to the English in 1761.

GINGER, the rhizome or underground stem of *Zingiber officinale* (family Zingiberaceae; *q.v.*), a perennial reedlike plant growing from 3 to 4 ft. high. The flowers and leaves are borne on separate stems, those of the former being shorter than those of the latter and averaging from 6 to 12 in. The flowers themselves are borne at the apex of the stems in dense ovate-oblong conelike spikes from 2 to 3 in. long, composed of obtuse strongly-imbricated bracts with membranous margins, each bract enclosing a single small sessile flower. The leaves are alternate and arranged in two rows, bright green. smooth. tapering at both ends. with very short stalks and long sheaths. which stand away from the stem and end in two small rounded auricles. The plant rarely flowers and the fruit is unknown.

GINGER. THE UNDERGROUND STEM OF THE PLANT ZINGIBER OFFICINALE, WHICH HAS BEEN USED AS A SPICE FROM EARLY TIMES

Though not found wild. it is considered with good reason to be a native of the warmer parts of Asia, where it has been cultivated from an early period and the rhizome imported into England. From Asia the plant spread into the West Indies, South America, western tropical Africa and Australia.

The use of ginger as a spice has been known from very early times; it was supposed by the Greeks and Romans to be a product of southern Arabia and was received by them by way of the Red sea; in India it has also been known from a very remote period.

Ginger is known in commerce in two distinct forms. coated and uncoated ginger, *i.e.*, having or lacking the epidermis. For the first. the pieces, called "races" or "hands," from their irregular palmate form: are washed and simply dried in the sun. In this form ginger presents a brown, more or less irregularly wrinkled or striated surface. and when broken shows a dark brownish fracture, hard, and sometimes horny and resinous. To produce uncoated ginger the rhizomes are washed, scraped and sun dried, and are often subjected to bleaching. either from the fumes of burning sulfur or by immersion for a short time in a solution of chlorinated lime. The whitewashed appearance that much of the ginger has. as seen in the shops. is due to the fact of its being washed in whiting and water. or even coated with sulfate of lime. Cncoated ginger, as seen in trade, varies from single joints an inch or less in length to flattish irregularly branched pieces of several joints, the "races" or "hands." and from 3 to 4 in. long; each branch has a depression at its summit showing the former attachment of a leafy stem. The colour. when not whitewashed, is a pale buff; it is somewhat rough or fibrous, breaking with a short mealy fracture, and presenting on the surfaces of the broken parts numerous short bristly fibres.

The principal constituents of ginger are starch, volatile oil (to which the characteristic odour of the spice is due) and resin (to which is attributed its pungency). Its chief use is as a condiment or spice, but in medicine to promote the digestive activity of the stomach it is also used internally. The rhizomes, collected in a young green state. washed, scraped and preserved in sirup, form a delicious preserve, which is largely exported both from the West Indies and from China.

Cut up and preserved in sugar, ginger forms an agreeable candy.

GINGER ALE, a sweetened, carbonated beverage, the predominating flavour and pleasant warmth of which are derived mainly from the underground stem, or rhizome, of *Zingiber officinale.* Though originally carbonated by fermentation, modern ginger ales are artificially saturated with carbon dioxide gas. The Jamaican and African varieties of ginger rhizome yield the finest-flavoured beverages. the flavour and pungency of the rhizome being dependent upon the essential oil and oleoresin, which are its principal active constituents.

Other flavouring materials are frequently added; for example, spices, citrus essences, fruit juices, foam producing substances, etc.. and occasionally peppery materials: such as capsicum, to increase the pungency of the beverage.

lhere are two general types: pale dry ginger ales tend to be less sweet, more acid, lighter, milder and highly carbonated; golden. or aromatic. ginger ales tend to be sweeter! less acid, darker and generally more pungent. The joint committee of definitions and standards of the U.S. department of agriculture in 1922 defined ginger ale as the carbonated beverage prepared from ginger ale flavour. sugar sirup. harmless organic acid. potable water and caramel colour. Ginger ale flavour, or ginger ale concentrate. was defined as the flavouring product in which ginger is the essential constituent. with or without the addition of other aromatic and pungent ingredients, citrus oils and fruit juices.

In preparing a carbonated ginger ale, a sirup is first made. this being compounded from water. sugar, ginger ale flavour or extract. citric or tartaric acid. caramel colour and possibly foam essence. Such a sirup is employed in making the carbonated beverage in the manner which is described under SOFT DRINKS.

(R. W. ME.)

GINGER BEER is the generic term for three classes of nonexcisable (less than 2% proof spirit) ginger-flavoured beverages: brewed fermented ginger beer, beverages made by the artificial carbonation of brewed ginger-flavoured concentrates, and nonbrewed ginger beers.

The principal differences between ginger beer and ginger ale lie in the rather higher gravity and greater proportion of extractive matter in ginger beer; in the appearance. ginger beer usually being cloudy while ginger ale is brilliantly clear; and also in the fact that ginger ales frequently contain certain capsicum extracts which increase the sharpness of the beverage.

Until about 1850, brewing and fermenting of mixtures of ginger. other spices and bitter vegetable substances constituted the only known method of making ginger beers, many of which had alcoholic contents in the region of 10%–12% proof spirit. The restrictions created in Great Britain by the Excise act of 1855 led to the manufacture of ginger beer by the dilution of brewed concentrates with carbonated water. Nonbrewed ginger beers later became popular, although many of these beverages have a pronounced lemon flavour; they frequently contain a foam-producing extract—usually an extract of quillai bark.

The production of ginger beer by fermentation is carried out by first making an aqueous infusion of a mixture of vegetable products among which ginger predominates. The following is a suitable mixture: bruised Jamaica ginger 6 parts. liquorice extract 2 parts, hops 3 parts, cloves 3 parts, gentian $\frac{1}{4}$ part. Five parts of such a mixture are boiled in 200 parts of water for 20 to 30 min.; the extract is strained and sweetened with 6 or 7 parts of sugar. Caramel colour is added as desired, the extract cooled to about 70° C. and; after adding 1 fl.oz. of brewer's yeast, allowed to ferment for 24 hours. Citric acid is then added to the liquor according to the taste of the manufacturer. and the beverage is bottled after standing for a few days to permit the mucilaginous matter to settle out. The bottled product is pasteurized by some manufacturers.

(W. P.-D.)

GINGHAM, a fabric usually made with a plain weave; it originally was made completely of cotton fibres but later much of it was made of manmade fibres. The name comes from the Malayan word *gingan,* meaning striped, and thence from the French *guingan,* a term used by the Bretons to signify cloth made from striped colouring.

Medium or fine yarns of varying quality are used to obtain the plain, check or stripe effects. The cloth is yarn-or skein-dyed or printed. and it runs to about six yards to the pound. Texture thread counts average 64 x 56 per square inch. The warp and the filling may be the same, even-sided and balanced.

Gingham is strong, rather stout, substantial and serviceable. It launders easily and well. but lower-textured fabric may shrink considerably unless preshrunk. Prices of gingham have a wide range; designs or patterns run from the conservative to gaudy, wild effects.

Uses include dress goods. trimming. kerchiefs. aprons, children's wear and beachwear. It is very popular in summer dress wear for women and children. Ginghams on the market in the early 1960s included chambray gingham, nurses' gingham, Scotch, tissue and zephyr.

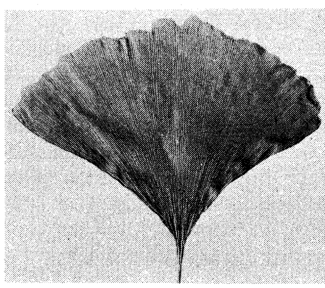
(G. E. L.)

GINGUENÉ, PIERRE LOUIS (1748–1815), French author, was born at Rennes, in Brittany. He was educated at a Jesuit college in his native town and went to Paris in 1772. He wrote criticisms for the *Mercure de France,* and composed a comic opera, *Pomponin* (1777). The *Satire des satires* (1778) and the *Confession de Zulmé* (1779) followed. His defense of Piccinni against the partisans of Gluck made him still more widely known. He welcomed the Revolution, and joined Giuseppe Cerutti, the author of the *Mémoire pour le peuple français* (1788), and others in producing the *Feuille villageoise,* a weekly paper addressed to the villages of France. Imprisoned during the Terror, he escaped death by the downfall of Robespierre. He assisted, as director-general of the "commission extcutive de l'instruction publique," in reorganizing the system of public instruction, and was an original member of the Institute of France. In 1797 he was for a few months minister plenipotentiary to the king of Sardinia. He was appointed a member of the tribunate, but Napoleon had him expelled at the first "purge.!' He was one of the commission charged to continue the *Histoire littéraire de la France.*

Ginguené's most important work is the *Histoire littéraire d'Italie* (14 vol., 1811–35), unfinished at the time of his death.

GINKGO or MAIDENHAIR TREE (Ginkgo *biloba),* a tree grown since ancient times about temples in China where it is considered a sacred plant. Although reported as native in western China, it is not positively known to occur in a truly wild state.

It is a smooth, sparingly branched tree, sometimes 120 ft. high, with deciduous fan-shaped leaves, 2–4 in. broad and nearly as long, which in form, veining and aspect resemble those of the maidenhair fern. Botanically, the closest allies of the ginkgo are the cycads. Like them, it is dioecious. *i.e.,* the pollen and seed cones are on different individuals.



JOHN H. GERARD

LEAF OF THE GINKGO TREE (G. BILOBA)

As the sole survivor of a numerous group of plants with a very long geological ancestry the ginkgo may be legitimately regarded as a "living fossil." It has existed essentially unchanged for millions of years, or probably for a longer period than any other living tree, tracing back directly to the fossil Cordaitales of the Palaeozoic. Fossil species occur in the Triassic. Jurassic and Tertiary formations in the British Isles, and forms with leaves very similar to those of the living ginkgo are abundant in Triassic and Jurassic rocks of the Pacific coast of North America, especially in Oregon and Alaska.

The ginkgo is cultivated as an ornamental tree in temperate countries. groning without protection in many parts of Europe and also in North America as far north as the Great Lakes

For its structural peculiarities *see* GYMNOSPERMS: *Ginkgoales,, Cycadales*

GINNING: *see* COTTON AND THE COTTON INDUSTRY.

GINSBURG, CHRISTIAN DAVID (1831–1914). Hebrew scholar, nas born on Dec. 25. 1831, at Warsaw. Shortly after conversion in 1846, he went to England. where he published a translation of the Song of Songs, with a commentary (1857), a translation of Ecclesiastes (1861) and treatises on the Karaites (1862), on the Essenes (1864) and on the Kabbala (1865) From the appearance in 1867 of Jacob ben Chajim's *Introduction to the Rabbinic Bible* (Hebren and English. with notices) and the *Massoreth Ha-Massoreth* of Elias Levita, in Hebrew. with translation and commentary. Ginsburg ranked as an eminent Hebrew scholar In 18'70 he was appointed to the committee for the revision of the English version of the Old Testament His lifework culminated in the publication of the *Massorah* (1880–86), and the Masoretico-critical edition of the Hebren Bible (1894) and the elaborate introduction (1897).

His later works include: *Facsimiles of Manuscripts of the Hebrew Bible* (1897–98) and *The Text of the Hebrew Bzble in Abbreviations* (1903), in addition to a critical treatise "on the relationship of the so-called Codex Babylonicus of A.D. 916 to the Eastern Recension of the Hebrew Text" (1899). Ginsburg died on March 7 1914.

GINSENG (SANG) is the plant and roots of two species of *Panax* (family Araliaceae) used as a drug in China. *Panax quinquefolius* is the American ginseng. which is native of rich cool woods from Quebec and Manitoba southward to Florida. Alabama. Louisiana and Arkansas Approximately 150 ac are cultivated in America Almost all of the carefully dried root of ginseng is exported to Hong Kong, from where it is distributed in southeast Asia The export from America amounts to about 100.000 lb annually *Panax ginseng,* Asian ginseng. native of Manchuria and Korea and cultivated in Korea and Japan is more appreciated in some markets than is the American ginseng.

The Chinese from time immemorial have considered ginseng to be a cure for most diseases and infirmities. In fact the generic name of the plant. *Panax,* is derived from Greek words translated as "panacea." a cure-all. The continued demand for ginseng roots. and especially those roots that may resemble a man in form. is probably due to a belief widely held among the Chinese that ginseng is an aphrodisiac. There is no evidence, however. to indicate that ginseng has any value. either as a drug or as an aphrodisiac.

The export of wild ginseng root from America to the orient began in the early 1700s. In 1773 the sloop "Hingham" sailed from Boston for China with 55 tons of ginseng aboard. Shipments have continued from that time until the present. The greatest amount shipped in any year was 622.761 lb. in 1862. The price of ginseng varied from 49 cents to $27 a pound during the century 1858–1958.

Ginseng has been in cultivation in America since about 1870. and in Korea since at least the early years of the century. In the years 1895 to 1903 or 1904 a ginseng "boom" took place in America. Extravagant and sometimes fraudulent representations were made concerning the fortune to be made from ginseng culture. Hundreds of gardens mere started and stock companies were formed to grow ginseng on a grander scale. A leaf disease of ginseng became prevalent in 1904, ruining many plantations and discouraging growers.

Most ginseng gardens are small. less than one acre. Intensive cultivation is practised and nearly all labour involved must be done by hand. Rich soil, woodlands with adequate natural shade or rich farm land with artificial shade, is necessary. Ginseng requires five to seven years to mature from seed. The value of the crop depends on the care with nhich the root mas prepared and the market when it is sold The grading of ginseng root is a highly subjective art. The value of cultivated ginseng root is about 60% of a comparable grade of wild root.

GINZBERG, LOUIS (1873–1953). Talmudic scholar and teacher, was born at Kovno. Lithuania on Nov. 28. 1873, and was educated in the Lithuanian rabbinical schools of Kovno and Telshe and at various German universities He mastered the Talmud in his youth. and his secular studies gave him command also over western methods of research. Moving to the United States in 1899, he became editor of rabbinical literature of the *Jewish Encyclopedia.*

In 1902 Ginzberg became professor of Talmud at The Jewish Theological Seminary of America, remaining there until his death on Nov 11. 1953.

Ginzberg's best-known works are *Legends of the Jews* and the *Commentary on the Talmud of Jerusalem* (in Hebrew). Into the first he gathered all the folklore in Jewish tradition bearing on Scripture. and in two volumes of notes, with enormous erudition and remarkable insight. he traced these legends to their sources. In the second work, of which only the commentary on the first treatise of the Talmud was completed, Ginzberg included discussions bearing on the whole rabbinic system and showing the scope and development of rabbinic theology and ritual. His massive studies in the development of Halakah (Jewish religious law) demonstrated that sociological and economic factors influenced the evolution of Jenish law in its creative periods. (L. F.)

GIOBERTI, VINCENZO (1801–1852), Italian philosopher and politician, was born at Turin where he mas educated. He was ordained priest in 1825. Partly under the influence of Mazzini, the freedom of Italy became his ruling motive in life—its emancipation. not only from foreign masters, but from modes of thought alien to its genius, being linked in his mind with papal supremacy, though in an intellectual rather than political way. On the accession of Charles Albert he received a court chaplaincy, but he resigned this office in 1833. and shortly afterward was arrested on suspicion of political intrigue. Imprisoned and banished without a trial, Gioberti went to Paris, and a year later. to Brussels, where he remained until 1845, teaching philosophy and writing philosophical uorks. An amnesty having been declared by Charles Albert in 1846. Gioberti returned to Italy in 1847 and uas enthusiastically received. He was soon elected president of the chamber of deputies. At the close of the same year a new ministry was formed headed by Gioberti; but with the accession of Victor Emmanuel in March 1849, his active life came to an end. For a short time he held a seat in the cabinet, though without a portfolio; but an irreconcilable disagreement soon followed, and he was sent on a mission to Paris where he remained until his death on Oct. 26, 1852.

Gioberti's writings are more important than his political career. Writing against the speculations of Rosmini-Serbati, he reconstructs. as he declares, ontology, and begins with the assertion that the *Ens* creates *ex nihilo* the existent, which is the universal idea in God become finite and individual. God is the only being *(Ens)*; all other things are merely existences. God is also the origin of all human knowledge, and we apprehend Him by intuition. A knowledge of both being and existences, and of their mutual relations. is necessary as the beginning of philosophy.

Gioberti is in some respects a Platonist. He identifies religion with civilization. and in his *Del primato morale e civile degli Italiani* (1843) concludes that the church is the axis on which the well being of human life revolves. In it he pictures the supremacy of Italy. brought about by the restoration of the papacy as a moral dominion. founded on religion and public opinion. In his later works, the *Rinnovamento* and the *Protologia,* he is thought by some to have shifted his ground under the influence of events. In his first publication La *Teorica del sovran-naturale* (1838) he supported the reality of revelation and the future life. In the *Introduzione allo studio della filosofia* (3 vol., 1839–40) he states his reasons for requiring a new method and new terminology. and brings out the doctrine that religion is the direct expression of the *zdea* in this life, and is one with true civilization in history. Civilization is a conditioned mediate tendency to perfection, to which religion is the final completion; it is the end of the second cycle expressed by the second formula, the *Ens* redeems existences, the many return to the one.

In 1846 appeared his essays on the more popular subjects, *Del bello* and *Del buono*. *Del primato morale e civile degli Italiani* and its *Prolegomeni* and his attack on the Jesuits, *Il Gesuita moderno* (1847). no doubt hastened the transfer of rule from clerical to civil hands. The hope that the loss of the papal temporal power would lead to a revival of religion expressed in the *Rinnovamento civile d'Italia* (1851), together with the pantheistic ontologism of his philosophy led to Gioberti's writings being placed on the *Index*. They were edited by G. Massari (1856–61).

GIOIOSA-IONICA, a town of Calabria, Italy, province of Reggio di Calabria. It is 65 mi. N.W. by rail from the town of Reggio and 38 mi. direct; 492 ft. above sea level. Pop. (1951) 5,002. Near the station, which is on the east coast of Calabria 3 mi. below the town to the southeast, are the remains of a small theatre belonging to the Roman period but the name of the city to which it belonged is unknown. Remains of baths and other buildings also have been found.

GIOJA, MELCHIORRE (1767–1829), Italian writer on philosophy and political economy, was born at Piacenza, on Sept. 20, 1767. Renouncing his orders in 1796, he went to Milan, and on the arrival of Napoleon in Italy, advocated a republic under the dominion of the French in a pamphlet *I Tedeschi, i Francesi, ed i Russi in Lombardia*. Under the Cisalpine Republic he became historiographer and director of statistics. He was several times imprisoned, in 1820 on a charge of being implicated in a conspiracy with the Carbonari. After the fall of Napoleon he retired into private life, and died at Milan on Jan. 2, 1829.

Besides the *Nuovo Prospetto delle scienze economiche* (1815–17), a summary of what had already been written on economics, administration and finance, Gioja's more important productions which reflect his passion for statistics and his inclination toward the English economists, are *Del merito e delle ricompense* (1818), *Filosofia della statistica* (2 vol., 1826) and contributions to the *Annali Universali di Statistica* founded by him in 1824. His complete works appeared at Lugano (1832–49).

GIOLITTI, GIOVANNI (1842–1928), Italian statesman, was born at Mondovi, province of Cuneo, on Oct. 27, 1842, and educated at the Lycée and at Turin university, where he graduated in law in 1861. After working in an advocate's office for some years, he was appointed king's procurator in Turin, and then held appointments in the ministry of justice and the ministry of finance. In 1882 he was appointed councilor of state and elected deputy for Cuneo. As deputy he took part in the attack on Magliani, minister of finance, which led to the fall of the Depretis cabinet. On March 9, 1889 Giolitti was appointed finance minister in the Crispi cabinet, but resigned at the end of 1890. On the fall of the Rudini cabinet in May 1892, Giolitti succeeded to the premiership, but his ministry fell after 18 months in disastrous circumstances. The building crisis and the commercial rupture with France had impaired the situation of the state banks and one, the Banca Romana, had been further undermined by maladministration. A bank law, passed by Giolitti failed to effect an improvement. The senate refused to confirm Giolitti's conferment of senatorial rank on Tanlongo, director general of the Banca Romana, and an interpellation in parliament on the position of the bank led to Tanlongo's arrest and prosecution. A parliamentary commission of enquiry, appointed to investigate the condition of the state banks acquitted Giolitti of personal dishonesty.

Giolitti left the country for a short time and kept in the background for several years. He gradually regained much of his former influence, however, since he outlined a series of reforms in the social and agrarian field. He became minister for the interior in the Zanardelli cabinet, succeeding Zanardelli, who resigned on account of ill-health, in Nov. 1903. During his tenure of office, he lost the support of the Socialists by the strong measures he was fdrced to take to quell serious disorders in various parts of the country. In March 1905, feeling himself no longer secure, he resigned, indicating Fortis as his successor.

When Sonnino became premier in Feb. 1906, Giolitti did not openly oppose him, but his followers did, and Sonnino was defeated in May, Giolitti becoming prime minister again. For three years he remained in Dower, and bv clever management of the elections. was returned by a strong majority in 1909. Opposition against him in parliament grew rapidly, however, led by Sonnino, and his cabinet fell in Dec. 1909, the chamber rejecting a bill of fiscal reforms which included a graduated income-tax. He played a leading part in opposition during the succeeding ministries of Sonnino and Luzzatti, and became premier for the fourth time in March 1911. During this period in office, he introduced a new franchise law (Oct. 26–Nov. 2, 1913) which practically amounted to universal suffrage, raising the electorate from 3,000,000 to 8,000,000.

The chief event of Giolitti's fourth cabinet was the Libyan war; adversary as he had always been of colonial adventures, he decided that the conquest of Libya was necessary in order to preserve Italy's prestige in a Europe where Austria-Hungary had annexed Bosnia-Herzegovina two years before and where France was slowly conquering Morocco. When the Turks, defeated, asked for peace, which was concluded at Ouchy, Switz., Giolitti extended the electorate, saying that Italians who die at war must have a right to vote. In 1913 the elections took place and gave him a great majority, but with an increase of Socialists. The opposition changed from the extreme right to the extreme left. Giolitti, discouraged by dissension among his supporters, and feeling opposition to his rule increasing not only in parliament, but in the country as a whole, seized the opportunity of a hostile vote by the Radical group to resign on March 10, 1914. He was succeeded by Salandra.

When World War I broke out his attitude was in favour of absolute neutrality, and on the eve of Italian intervention he attempted to upset the Salandra cabinet by his personal influence over the parliamentary majority. He was frustrated by formidable popular demonstrations in favour of participation on the side of the Entente; he expressed, however, his views in a famous letter to C. Peano. later on minister of the treasury with him in 1920–21, in which he declared that even without going to war Italy might gain considerably.

Giolitti believed that Italian resources were unequal to war and that her unpreparedness would have serious consequences. But in the dark hour after Caporetto he appeared again in the chamber and made an eloquent appeal to Italians to stand firm and united in face of disaster. After the war the disappointment over the peace settlement, the heavy burden of suffering and loss caused by the war, and the extreme socialistic policy of the Nitti cabinet brought about the return of Giolitti. On Oct. 12, 1919 he made the well-known election speech, the "Discorso di Dronero" outlining his future policy, and explaining his previous attitude, and on June 15, 1920 the fifth Giolitti cabinet was formed. He succeeded in forming a cabinet which comprised a number of non-Giolittians of all parties, but only a few of his own "old guard," so that he won the support of a considerable part of the chamber. although the Socialists and the Popolari (Catholics) rendered his hold somewhat precarious. His policy of inactivity during the occupation of the factories by the workmen organized by Socialist leaders in Sept. 1920 provoked the irritation not only of the manufacturers but among many of the middle classes. He appears greatly to have overestimated the strength of the Socialists, and therefore gave them a free hand with the object of avoiding bloodshed, and also perhaps to prove to the workmen that they could not run industry without the capitalists and the technical experts. When he realized the strength of the national reaction, he allowed the fascists free rein to re-establish order and exercise many of the functions pertaining to the government, while he assumed an attitude of Olympic calm and posed as being *au-dessus de* la *mêlée,* so as to avoid compromising himself with any party.

In foreign affairs Giolitti succeeded in achieving a solution of the Adriatic problem, and with Count Sforza carried through the Treaty of Rapallo (*q.v.*). He dissolved the chamber on April 7, 1921. and was confirmed in power by the elections on May 15. But he resigned with his cabinet at the end of June, being succeeded as premier by his war minister Bonomi whom he designated to the crown as his successor. Giolitti took no part in the subsequent events; on the eve of Mussolini's so-called "march on Rome" he thought that his duty was to go at once to the capital and oppose the adventure; but Prime Minister Facta persuaded him to remain in his lonely distant country place and went as far as to make him believe the falsehood that floods had destroyed the railways.

When Mussolini made his first "elections" in 1924, Giolitti presented a list of his own in Piedmont, independent from the government. which. in the language of the time. meant opposition; but Giolitti's opposition became extreme only after Matteotti's murder; although he was 82 he spoke in the chamber with great firmness against the fascist regime.

Giolitti's influence. in spite of his age, remained very strong in Piedmont until his last moments. He died in his country place in Piedmont on July 17, 1928.

Before his death Giolitti had published *Memorie della mia vita,* which have been translated in English under the title *Memoirs of My Life.*

For a synthetic judgment of Giolitti as a statesman, *see* Benedetto Croce, *History of Contemporary Italy;* and for Giolitti's action in his last cabinet, *see* the chapter on Giolitti in Count Carlo Sforza, *Makers of Modern Europe* (1930).

GIORDANO, LUCA (1632–170j), the most celebrated and prolific Neapolitan painter of the late 17th century, u-as born in Naples in 1632. His nickname *Luca fa presto* ("Luke, work quickly") is said to derive'from his father's admonitions. which were certainly heeded. He probably learned his technical virtuosity at a very early age, since he was the son of a painter-copyist, His other nickname, Proteus, was due to his skill in producing pastiches in the style of almost any other artist, including even Durer and Rembrandt, but it seems that he never made any copies in the strict sense of the word. Since he is said to have painted a complete high altarpiece in one day, it is no wonder that his output was huge: both in oil and in fresco. His range of subject matter was equally great. although most of his pictures naturally deal with religious or mythological themes.

Giordano's earliest dated work is of 1651. but he is not recorded in the painters' guild until 1665. He was very much influenced at the beginning of his career by the work of Jusepe de Ribera. the major Neapolitan artist of the first half of the century, and it is likely that he was actually Ribera's pupil. His style underwent a profound change as a result of journeys to Rome, Florence and Venice. The lightness and brightness of Veronese's decorative works in Venice and the recent work by Pietro da Cortona in Rome and Florence induced him to abandon the gloom and drama of Ribera in favour of a more decorative approach; and the influence of Pietro da Cortona's frescoes in the Pitti palace, Florence, is particularly evident in Luca's huge ceiling fresco in the ballroom of the Medici-Riccardi palace. Florence, begun in 1682 and completed in the following year. In 1682 he also painted the ceiling of the Corsini chapel in Sta. Maria del Carmine, Florence.

He went to Spain in 1692 as court painter to Charles II, returning via Genoa to Naples in 1702. The frescoes in the Escorial are often held to be his best works, but nearly 50 pictures in the Prado museum: Madrid, all painted in Spain: testify to his unflagging energy.

Much the greater part of his output nevertheless remained in Naples, particularly in the churches, but many of his frescoes were destroyed or damaged in World War II. The great St. Benedict cycle of 1677 in the abbey of Monte Cassino was entirely destroyed, but the "Christ Expelling the Traders from the Temple" (1684) in the Gerolomini (S. Filippo Neri) in Naples survived the damage to the church. His last great work in Naples was the ceiling of the Cappella del Tesoro in S. Martino, begun on his return in 1702 and completed in April 1704. Giordano died in Naples on Jan. 12, 1705. His usual signature was "Jordanus." and this has led to confusion with Jacob Jordaens, with whose work Luca's has very little in common.

(P. J. My.)

GIORGIO, FRANCESCO (1439–1502), Italian engineer, architect, painter and sculptor, was born on Nov. 14. 1439, at Siena. and died there in 1502. He was engaged on constructive and decorative work in his native town from 1463 to 1478 when he was employed by the duke of Urbino as architect and military engineer. In 1490 he constructed the model for the dome of Milan cathedral, and five years later invented the mines used at the siege of Naples. Some of his paintings, which show the influence of Fra Filippo Lippi, are in the Siena gallery.

His *Trattato di architcttura civile e militare* was edited *by* C. Saluzzo in 1841

GIORGIO, FRANCESCO DI: *see* FRANCESCO DI GIORGIO.

GIORGIONE (GIORGIONE DA CASTELFRANCO, originally GIORGIO BARBARELLI) (1477 or 1478–1510), Italian painter of the Venetian Renaissance, was born at Castelfranco. Contemporary documents call him Zorzo or Zorzi da Castelfranco. The form of Giorgione or Zorzon (meaning tall or great George) cropped up 40 years after his death. Because of an unfounded tradition, appearing about 1650, of his illegitimate descent from the local gentry family of Barbarelli, he is often referred to as Giorgione Barbarella or Barbarelli. Giorgio Vasari, writing before 1550, states that Giorgione was of very humble origin.

Giorgione presents a fascinating problem in the history of Renaissance art. The few documents available and the contemporary literary sources show that he aas held in high esteem at a relatively young age, and that his work was regarded as a sort of turning point in art between the 15th and the 16th centuries and as the beginning of a new, "modern." style based on the effects of colour and light; they also show that his fame was not limited to Venice. The number of his documented works is exceedingly small, even allowing for the short span of his active life, a mere 12 to 13 years. By the 17th century. a Giorgione myth based on anecdotes had come into existence, of which the writings of Ridolfi are a telling expression. Giorgione was erroneously claimed as ancestor of a romantic trend in Venetian painting after 1600 (*e.g.,* Pietro della Vecchia). which displayed dramatic accents and violent contrasts of light and shade.

The Giorgione literature since 1870 shows such a lack of consensus that a great Italian art historian (A. Venturi) could exclaim: "Everybody makes his own Giorgione." Two opposite tendencies, however, can be distinguished among the critics of that period: one "expansionist" (H. Cook, Monneret de Villard, L. Justi). attributing to Giorgione more and more pictures, especially those displaying a softly emotional, moody character; the other "restrictive" (Gronau. Lionello Venturi, Hourticq) trying, among this welter of mostly very subjective attributions, to go back to the facts securely established by the earliest sources. About 1870–80, G. B. Cavalcaselle and G. Morelli did great service in dispelling this fog. The Giorgione exhibition in Venice in 1955 provided an opportunity for putting some order into chaos.

Vasari says that Giorgione entered Giovanni Bellini's workshop, but his early work proves that his compositions were influenced more by Vittore Carpaccio (*q.v.*) and by the classicism of Francesco Francia and Lorenzo Costa. Also, the treatment of light on shining surfaces as introduced in Venice by Antonello da Messina in his altarpiece of S. Cassiano (1475) must have impressed the young artist.

The contemporary inscription on the back of a painting entitled "Laura" (Vienna) mentions its completion, on June 1, 1506, by Giorgione, who is described as a colleague of Vincenzo Catena. On Aug. 14, 1507, and Jan. 24, 1508, the Council of Ten ordered payment to Giorgione for a painting for the audience room of the Ducal palace; by May 23, 1508, this painting was certainly completed. On Aug. 1, 1508, the frescoes on the façade of the German Merchants' hall were underway. In Sept. or Oct. 1510, Giorgione died of the plague that raged in Venice. Shortly after his death, Isabella d'Este, marchioness of Mantua, wrote to her agent T. Albano, entreating him to secure a nativity scene by Giorgione, said to be in his estate; Albano replied that Giorgione had done this subject twice, but that neither of the owners wished to sell.

Count Baldassare Castiglione. writing in Rome not later than 1524, mentioned Giorgione among the "most excellent" painters, together with Leonardo, Mantegna. Rafael and Michelangelo. The most valuable source, however, consists of the notes written by the Venetian patrician Marcantonio Michiel between 1520 and 1543, each entry being carefully dated. He mentions 12 paintings and one drawing by Giorgione; also one painting of which he is not quite sure and tuo copies after Giorgione. Most of these works are lost. as is the picture of an armoured St. George mirrored in a pond and in two looking glasses, described by Paolo Pino in 1548. Two of the paintings mentioned by Michiel, however, can be identified: the "Three Philosophers" (or magi), in the Vienna gallery; and the landscape with the thunderstorm (*tempesta*), depicting a young man and a woman nursing her baby. in the academy in Venice. To these should be added the portrait "Laura," in the Vienna gallery; the altarpiece in the parish church of Castelfranco; and the fresco-fragment of a female nude in the academy in Venice—the only fragment that has survived, though in an appalling state of preservation, of Giorgione's decoration of the German Merchants' hall. These five pictures. and especially the four oil paintings, dated betneen 1505 and 1508, are the hard core on which the knowledge of Giorgione's art rests.

Giorgione's technique is the contrary of a "sweeping movement." His brush stroke consists of very fine disconnected lines and dots. The modeling is achieved by a sort of hatching that resembles the technique of water-colour miniatures and is related to what was later called pointillism. Its effects are to make the entire surface seem to vibrate. so that the atmosphere between individual objects, permeated by light. becomes the subject of artistic rendering.

This new feeling for nature is the source of the charm and the peculiar mood emanating from Giorgione's paintings. It has been aptly called pantheistic. This feeling, though not caused by, is intimately related to the philosophical "naturalism" informing the contemporary Venetian and Paduan humanists grouped around Barbaro and Pietro Pomponazzi.

On the criterion of this unmistakable "trembling" brush stroke, the following additional pictures can be confidently attributed to Giorgione: "The Testing of Moses" (Uffizi, Florence), but only the nine figures on the left and the distant part of the landscape (the rest, as also the companion piece, the "Judgment of Solomon," is clearly by an assistant, possibly G. Campagnola); the "Adoration of the Magi" (National gallery, London); the "Judith" (Leningrad); the three exquisite little mythological panels (two in Padua and one in the Philipps memorial, Washington, D.C.); the little "Madonna with Child" (Leningrad, the head is badly repainted); the "Madonna with SS. Catherine and John" (Academy, Venice); the ex-Benson "Nativity" (Kress collection, National gallery, Washington, D.C.) and the ex-Allendale "Adoration of the Shepherds" (same collection); the only extant drawing is a landscape with a seated man (ex-Koenig, Museum of Rotterdam). The "Boy With Arrow" (Vienna) is doubtful (possibly a studio picture with partial collaboration of the master). All these should be dated before 1505; likewise, the so-called "Vendramin" portrait (Berlin); the original parts of the portrait of a young woman (Duveen. N.Y., much restored); the "Old Woman" ("Col Tempo," Academy, Venice); and the heads and a few other parts of the two youths in the "Concert champêtre" (Louvre, Paris), the rest being completed by the young Titian (*q.v.*), who was an assistant in Giorgione's workshop about 1508 and possibly later (Titian's collaboration is proved by the statuary conception of the standing woman and the broad, sweeping, dramatic brushwork). To the end of Giorgione's short life belong the unfinished "Madonna with SS. Anthony and Roch" (Madrid) and the fragment of a self-portrait (Braunschweig); X-rays have revealed that it is painted over an earlier, unfinished Madonna by Giorgione. However, Giorgione's development after 1508 (the year of the frescoes) is very dim and not likely to become clearer, because of lack of material.

BY COURTESY OF KUNSTHISTORISCHES MUSEUM

"THREE PHILOSOPHERS" BY GIORGIONE. IN THE KUNSTHISTORISCHES MUSEUM, VIENNA, AUSTRIA

Among many, the following paintings that have been variously attributed to Giorgione should be rigidly excluded from his work: The Dresden Venus and the "Concert," both by Titian; the "Boy With Flute," possibly by Titian; the "Three Ages," possibly by G. Bellini; the "Concert," possibly by Lotto; the "Judgment of Solomon," by Sebastiano del Piombo; the "Adulteress," probably by D. Mancini; the double portrait (Venezia palace, Rome); the "Knight and Page" (Uffizi); the so-called "Broccardo" (Budapest); and the two pictures of singing men (Borghese, Rome). The last six paintings belong to a later development.

Giorgione did not form a school. properly speaking. But his influence was colossal and decisive—on Titian, Sebastiano Del Piombo and Bellini, and on the entire tradition of Venetian painting and its derivations, through Velazquez to Manet.

GIOTTINO (GIOTTO DI MAESTRO DI STEFANO), an early Florentine painter, whose name occurs in 1368 in the records of the guild. His father is sometimes identified with a pupil of Giotto, who attained some fame. In 1369 Giottino was called to Rome to assist in paintings in the Vatican. To his early period are ascribed the frescoes in the lower church of Assisi representing the "Coronation of the Virgin" and two scenes of the legend of St. Nicholas. They differ somewhat in style from his later work—the frescoes in the chapel of the Bardi family in Sta. Croce in Florence representing the miracles of Pope St. Silvester.

These works are animated and firm in drawing, luminous in colour, with naturalism carried further than by Giotto. They are among the most important paintings of Giotto's school. A "Descent From the Cross," in the Uffizi at Florence, also has been ascribed to Giottino.

Much confusion has arisen because Vasari identified Giottino with the painter Maso, who was active between 1320 and 1350, and to whom Ghiberti ascribed the frescoes of the St. Silvester legend.

GIOTTO (GIOTTO DI BONDONE) (1266/67?–1337), Italian painter, was born at Vespignano near Florence. For more than six centuries he has been revered as the father of modern art and the first of the great Italian masters. He certainly achieved great personal fame in his own lifetime, as Dante says in the *Dioine Comedy (Pur.* xi, 94–96) "Cimabue thought to hold the field in painting, but now Giotto has the cry, so that the fame of him is obscured." The mere fact that he was mentioned in Dante, even though not in a particularly flattering context, was sufficient to establish and maintain this fame in 14th- and 15th-century Italy and legends soon began to crystallize around his name. When, in 1550, Giorgio Vasari published the first modern history of art he naturally began with Giotto as the man who, even more than his master Cimabue, broke away from the dark ages and ushered in the "good modern manner."

As early as the middle of the 15th century the story was told of Giotto as a shepherd boy drawing his father's sheep on a piece of flat stone and being discovered by Cimabue, who took him to Florence. Still earlier, however, the Anonymous Dante Commentator (of *c.* 1400) had told an entirely different story. for, according to him, Giotto was apprenticed to the wool trade in Florence but spent all his time in Cimabue's shop, so that finally his father transferred his apprenticeship. Both stories agree in making Giotto Cimabue's pupil and this tradition is probably largely correct. Nevertheless, whatever he may have learned from Cimabue it is certain that, like Nicola Pisano about 30 years earlier, he was truly a reviver of classical ideals and a great innovator at the same time, bringing the new humanity, which St. Francis had brought to religion, into painting.

In Giotto's works the human beings who are his exclusive subject matter act with dedicated passion their parts in the great Christian drama of sacrifice and redemption. By comparison, all his predecessors and most of his immediate successors painted a puppet-show with lifeless manikins tricked out in the rags of the splendid, hieratic and impersonal art of Byzantium, which was to be entirely superseded by the urgent emotionalism of the Franciscan approach to Christianity.

The Date of Giotto's Birth.—The date of Giotto's birth can be taken as either 1266/67 or 1276, but the 10 years' difference is of fundamental importance in assessing his early development and is crucial to the Assisi problem *(see* below). It is known that Giotto died. Jan. 8, 1337 (new style; 1336, old style); this mas recorded at the time in the Villani *Chronicle.* About 1373 a rhymed version of the Villani *Chronicle* was produced by Antonio Pucci, town crier of Florence and amateur poet, and in this it is stated that Giotto was 70 when he died. He was thus born in 1266/67, and it is clear that there is 14th-century authority for the statement (possibly Giotto's original tombstone, now lost). Vasari, ho ever, gives 1276 as the year of Giotto's birth and it may be that he was copying one of the two known versions of the *Libro* di *Antonio Billi,* a collection of notes on Florentine artists. In this version, the *Codex Petrei* (Biblioteca Nazionale, Florence), the statement that Giotto was born in 1276 at Vespignano, the son of a peasant, occurs at the very end of the "Life" and may have been added much later, even, conceivably. from Vasari. In any case, whether Vasari or "Antonio Billi" first made the statement, it cannot have the same authority as attaches to Pucci, who was about 27 when Giotto died.

Certainty of the date of Giotto's birth, if settled by new documents, could help to solve the problem of his work at Assisi and the question of the origins of his style.

The **Assisi** Problem.—This, the central problem in Giotto studies, may be summed up as the question whether Giotto ever painted at Assisi and, if so. what? There can be no reasonable doubt that he did work at Assisi. for there is a long literary tradition which goes back to the *Chronicle* of Riccobaldo Ferrarese nho wrote in or before 1319; *i.e.,* when Giotto was alive and famous. Later writers down to Vasari expanded this and made it clear that Giotto's works were in the great double church of S. Francesco. By Vasari's time several frescoes in both upper and lower churches were attributed to Giotto. the most important being the cycle of 28 scenes from the life of St. Francis of Xssisi in the nave of the upper church and the "Franciscan Virtues" and some other frescoes in the lower church.

In the 19th century it was observed that all these could not be by the same hand and the new trend toward scepticism of Vasari's statements led to the position adopted by F. Rintelen in which he rejected all the Assisi frescoes and dated the St. Francis cycle to a period after Giotto's death. This extreme view has been generally abandoned, and indeed a dated picture of 1307 can be shown to derive from the St. Francis cycle. Nevertheless, many scholars prefer to accept the idea of an otherwise totally unknown "Master of the St. Francis legend" on the grounds that the style of the cycle is irreconcilable with that of the Padua frescoes, which are universally accepted as Giotto's. This involves the idea that the works referred to (in Giotto's lifetime) by Riccobaldo cannot be identified with anything now extant and must have perished centuries ago, so that Ghiberti. Vasari and others mistakenly transferred the existing St. Francis cycle to Giotto. Five hundred years of tradition are thus written off.

Still more difficult, the St. Francis frescoes. major works of art, must be attributed to a painter who cannot be shown to have created anything else. whose name has disappeared without trace although he was of the first rank and, odder still, one formed by the combined influences of Cimabue the Florentine and P. Cavallini the Roman, influences which coalesce at Assisi and may be taken as the influences which formed Giotto himself. Arising out of the fusion of Roman and Florentine influences at Assisi, there was later a tendency to see the hand of Giotto, as a very young man, in the works of the "Isaac Master," the painter of two scenes in the nave above the St. Francis cycle of "Isaac and Esau" and "Jacob and Isaac." If this theory is accepted it is easy to understand that Giotto, as a young man, made such a success of this commission that he was entrusted with the most important one, the official painted biography of St. Francis based on the new official biography written by St. Bonaventura. In fact, the whole of our mental picture of St. Francis stems largely from these frescoes. Clearly, a man born in 1276 mas less likely to have received such a commission than one ten years older, if, as mas always thought, the commission was given in 1296 or soon after by Fra Giovanni di Muro, general of the Franciscans. (For reasons why this date is not necessarily binding, *see* bibliography, P. Murray.) The works in the lower church are generally regarded as productions of Giotto's followers (there are, indeed, resemblances to his works at Padua) and there is real disagreement only over the "Legend of St. Francis." The main strength of the non-Giotto school lies in the admittedly sharp stylistic contrasts between the St. Francis cycle and the frescoes in the Arena chapel at Padua; especially if the Assisi frescoes were painted 1296–*c.* 1300 and those of the Arena, *c.* 1303–05; for the interval between the two cycles is too small to allow for major stylistic developments. This argument becomes less compelling when the validity of the dates proposed and the Roman period *c.* 1300 are taken into account. As already mentioned, the Assisi frescoes may have been painted before 1296 and not necessarily afterward, and the Arena frescoes are datable with certainty only in or before 1309, although probably painted c. 1305–06; clearly, a greater time lag between the two cycles can help to explain stylistic differences: as can the experiences which Giotto underwent in what was probably his second Roman period.

Roman Period c. 1300.—Three principal works are attributed to Giotto in Rome. They are the great mosaic of "Christ Walking on the Water" (the "Navicella") over the entrance to St. Peter's, the altarpiece painted for Cardinal Stefaneschi, in the Vatican gallery, and the fresco fragment of "Boniface VIII Proclaiming the Jubilee" in S. Giovanni Laterano. Giotto is also known to have painted some frescoes in the choir of Old St. Peter's but these are lost. It is known from the *Necrology* (1343) that Cardinal Stefaneschi was a great benefactor of St. Peter's and that he employed Giotto to make the "Navicella" but the date 1298 for this commission does not occur in the actual text, although it is often said to occur, on the authority of F. Baldinucci, who saw another version in the 17th century.

It is known, however, that the religious jubilee of 1300 was very largely unpremeditated and the "Navicella" is most probably a commemoration of its success, and therefore commissioned at almost any date after 1300. In any case, it was almost entirely remade in the 17th century except for two fragmentary heads of angels (in the museum of St. Peter's and in Boville Ernica), so that old copies must be used for all stylistic deductions.

The fresco fragment in S. Giovanni Laterano was cleaned in the 20th century and was tentatively reattributed to Giotto on the basis of its likeness to the Xssisi frescoes. The original attribution cannot be traced beyond the 17th century, but, on the other hand, the "Stefaneschi Altar" (Vatican), with its portrait of the cardinal himself, must be one of the works commissioned by him. It is, nevertheless, so poor in quality that it cannot be by Giotto's own hand. It may be observed that several works bearing Giotto's signature, notably the "St. Francis" (Paris. Louvre) and the altarpieces in Bologna and Florence (Sta. Croce). are generally regarded as school pieces bearing his trade-mark. whereas the "Ognissanti Madonna" (Uffizi, Florence), unsigned and virtually undocumented, is so superlative in quality that it is accepted as entirely by his hand.

The Crucifix in Sta. Maria Novella and the "Madonna" in S. Giorgio sulla Costa (both in Florence) may be possibly identifiable with works mentioned in very early sources and if so they throw light on Giotto's early style (before 1300). It is also possible that, about 1305, Giotto went to Avignon but the evidence for this is slender.

Paduan Period.—There is thus no very generally agreed picture of Giotto's early development and many of the surviving documents and pictures are capable of more than one interpretation. It is with some relief. therefore, to turn to the fresco cycle in the chapel in Padua known as the Arena or Scrovegni chapel. Its name derives from the fact that it was built on the site of a Roman amphitheatre by Enrico Scrovegni, the son of a notorious usurer mentioned by Dante. The founder is shown offering a model of the church in the huge "Last Judgment," which covers the whole west wall. The rest of the small bare church is covered with frescoes in three tiers representing scenes from the lives of SS. Joachim and Anna, the life of the Virgin, the Annunciation (on the chancel arch) and the Life and Passion of Christ, concluding with Pentecost. Below these three narrative bands is a fourth containing monochrome personifications of the Virtues and Vices. The chapel was apparently founded in 1303 and consecrated on March 25, 1305. It is known that the frescoes were completed in or before 1309 and they are generally dated *c.* 1305/6, but even with several assistants it must have taken at least two years to complete so large a cycle.

The frescoes are in relatively good condition, and all that has been said of Giotto's power to render the bare essentials of a setting with a few impressive and simple figures telling the story as dramatically and yet as economically as possible is usually based on the narrative power which is the fundamental characteristic of these frescoes. These dominating figures, simple and severe, are the quintessence of his style, and anatomy and perspective were used—or even invented—by him as adjuncts to his narrative gifts and he never attained to the skill which so often misled the men of the 15th and 16th centuries. In the Padua frescoes the details are always significant. whereas it is a characteristic of the Assisi cycle that there occurs from time to time a delighted dwelling on details that are not absolutely essential to the story.

ALINARI

DETAIL FROM "DESCENT FROM THE CROSS," A FRESCO BY GIOTTO. IN THE ARENA CHAPEL. PADUA

Sta. Croce Frescoes.—Documents show that Giotto was in Florence in 1311–14 and 1320 and it u-as probably during these years, before going to Naples (c. 1329?), that he painted frescoes in four chapels in Sta. Croce belonging to the Giugni, Tosinghi-Spinelli, Bardi and Peruzzi families. The Giugni chapel frescoes are lost as are all the Tosinghi-Spinelli ones, except for an "Assumption" over the entrance, not universally accepted as by Giotto. The Bardi and Peruzzi chapels contained cycles of St. Francis and the two SS. John, respectively, but the frescoes were whitewashed and were not recovered until 1852, when they were damaged in the process of removing the whitewash and then heavily restored. Much the same happened to a portrait of Dante in the Bargello, also in Florence, for which there is a traditional attribution to Giotto. The account taken of the restorations to the Bardi and Peruzzi chapel frescoes and of the similarities and dissimilarities between the Bardi St. Francis frescoes and those at Assisi tends to vary according to the writer's views on the Assisi problem, but most students would agree that it would be imprudent to ascribe much of the actual handling (as distinct from the design) to Giotto himself in either chapel. There is no evidence for the dating of the chapels, nor is it certain which came first, but they are probably approximately contemporary. The date 1317 is often advanced as a terminal point for the Bardi chapel, since it contains a representation of St. Louis of Toulouse, who was canonized in that year. This is inadmissible since his halo may well have been added, and in any case it is not unknown for holy personages to be represented as haloed before their formal canonization.

Naples and the Last Florentine Period.—On Jan. 20, 1330, King Robert of Naples promoted Giotto to the rank of "familiar" (member of the royal household), which implies that he had been in Naples for some while, possibly since 1328. and he remained there until 1332/33. All the works he executed there have been lost, but traces of his style may be distinguished in the local school. On April 12, 1334, he was appointed capomaestro, or surveyor, of the cathedral of Florence and architect to the city. This was a tribute to his great fame as a painter and not on account of any special architectural knowledge. On July 19 of the same year he began the campanile, or bell tower, of the cathedral. It was later altered but is known, in part at least, from a drawing in Siena. He may have designed some of the reliefs carved by Andrea Pisano on the campanile; certainly the bronze doors of the baptistery by Andrea show clear traces of Giotto's frescoes in Sta. Croce. Indeed the whole course of painting in Tuscany was dominated by his pupils and followers—by Taddeo Gaddi, Bernardo Daddi, Maso, Orcagna and the Lorenzetti in Siena—but none of these really understood all of his innovations and it was not until Masaccio (b. 1401) and Michelangelo (b. 1475) that his true successors arose.

GIOVANNI DI PAOLO (c. 1399–1482), the name commonly given to Giovanni di Paolo di Grazia, a long-lived, enormously productive Sienese painter of great individuality. He probably mas a pupil of Taddeo di Bartolo, whose style is reflected in his earliest dated work. the "Madonna" of 1426 at Castelnuovo Berardenga. In that year Giovanni fell under the influence of the art of Gentile da Fabriano, who was then active in Siena. The earliest example of Gentile's influence, dominant for a decade, is the "Madonna" of 1427 in the Robert von Hirsch collection. Basel, Switz. During the 1440s and early 1450s Giovanni produced his most important works. These include the monumental altarpiece of the "Presentation of Christ" of 1447–1449 in the Siena gallery, the somewhat later altarpiece of "St. John the Baptist," only ten scenes of which work are known. and 12 splendid miniatures in a antiphonary in the public library. Siena. The brooding "Madonna" altarpiece of 1463 in the Pienza cathedral marks the beginning of Giovanni's late period, of which the coarse "Assumption" polyptych of 1475 from Staggia is the last important example.

Giovanni's tormented spirituality and expressionist style were little appreciated before about 1920, but from that time Giovanni's tense, often highly dramatic art aroused constantly increasing interest. Not only the colouristically and formally attractive figures and landscapes of the painter's early and middle period, but also the harsh, ugly forms of the 1460s and especially the 1470s are of interest. as they illustrate the artist's changing vision of the world during the course of his development.

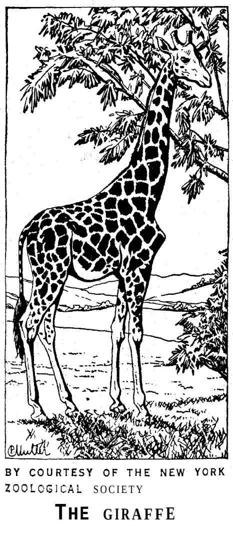
GIPPSLAND: *see* VICTORIA.

GIRAFFE, the tallest of all mammals, reaching 18 ft. 7 in. in height, the type of the family Giraffidae. The classic term "camelopard" has fallen into disuse.



BY COURTESY OF THE NEW YORK ZOOLOGICAL SOCIETY

THE GIRAFFE

Skin-covered horns are present in both sexes. and there is often an unpaired one in advance of the pair on the forehead. Among other characteristics may he noticed the length of the neck and limbs. the absence of lateral toes. and the long tufted tail. The tongue is remarkable for its length (up to 18 in.) and elasticity. It is covered with numerous large papillae, and forms an organ for the prehension of food. Giraties inhabit open country and browse on tall trees. To drink or graze they are obliged to straddle. the forelegs apart; but they are capable of going long without nater. They can gallop at over 30 mi. an hour. When standing among mimosas they are difficult of detection. They are almost entirely voiceless. One fawn is produced at a birth Formerly giraffes were found in large herds, but persecution led to their extermination in many districts. Formerly widespread over southern Europe and India, giraffes are now confined to Africa south of the Sahara. Apart from the Somali giraffe (*Giraffa reticulata*), characterized by its deep liver-red colour, there are numerous local subspecies of the ordinary giraffe (*G. camelopardalis*).

GIRALDI, GIAMBATTISTA (known also as CINZIO, the Italian form of his "academic" name, CYNTHIUS) (1504–1573), Italian novelist, poet and dramatist, a typical representative of mid-16th-century Italian literary ideals, was born in Ferrara He studied under Celio Calcagnini and succeeded him in the chair of rhetoric there (1541), later moving to the universities of Turin and Pavia. He died in Ferrara.

Giraldi was influenced both by the Paduan reintroduction of Aristotelian literary principles and by the Catholic reaction to it. In his *Discorso intorno al comporre de' romanzi* (1549) he defended the legitimacy of the romantic epic. and in his poem *Ercole* (1557) he tried to reconcile the Aristotelian rules nith modern taste. In his *Discorso sulle comedie e sulle tragedie* (1543) he reacted against the austerity of the classical tragedies and in his own tragedies—*Orbecche* (1541) ; *Didone* (1542) ; *Altile* (1543) ; *Cleopatra* (1543); *Selene; Eufimia; Arrenopia; Epitia,* from which Shakespeare's *Measure for Measure* derives; and *Antivalomeni* (1549)—he included new dramatic elements while conforming to the Aristotelian rules. His *Ecatomnziti* (1565). 112 stories collected according to the pattern of Boccaccio's *Decameron,* aims at stylistic distinction as well as showing a liking for direct narrative, in the manner of Matteo Bandello. They are moralistic in tone and were translated and imitated in France. Spain and England: Shakespeare's *Othello* derives from Giraldi's story of the Moor of Venice. He tried to renew the pastoral drama with his *Egle* (1545).

In spite of his ambition toward erudition, all Giraldi's literary attempts are amateurish: they remain interesting examples of the transition from Renaissance to Counter-Reformation ideals.

GIRALDUS CAMBRENSIS (GERALD DE BARRI) (*c.* 1146–1220), medieval historian, was born at Manorbier castle. Pembrokeshire, the son of William de Barri. He studied at Paris until 1172 when he nas appointed to collect tithe in Wales. In 117j he became archdeacòn of Brecon. and on the death of his uncle in the following year. an attempt was made to elect him bishop of St. David's, but Henry II was unwilling to see anyone with ponerful native connections a bishop in Wales. Giraldus in 1180 was made commissary to the bishop of St. David's, and in 1184 one of the king's chaplains. While accompanying Prince John to Ireland he wrote his interesting *Topographia Hibernica* and his *Expurgatio Hibernica,* a strongly prejudiced history of the conquest In 1188 he went with the primate, Baldwin to Wales to preach the third crusade and nhile there acquired material for his *Itinerarium Cambrense.* He then set out for the Holy Land, but in 1189 was sent back to Wales by the king to keep order. Having successively refused the sees of Bangor and Llandaff, he retired to Lincoln from 1192–98 and wrote his *Gemma ecclesiastica* and *Vita S Remigii.* In 1198 he nas elected bishop of St. David's. but Archbishop Hubert's objection necessitated three visits to Rome and a violent indication of the independence of St. David's from Canterbury. In the end, the pope ordered a new election. the prior of Llanthony being elected in 1202. Giraldus spent the rest of his life in retirement. and produced the *Descriptio Cambriae, De rebus a se gestis,* his autobiography. *De Instructione principis,* and the *Vita Galfridi Archiepiscopi Eborecensis.*

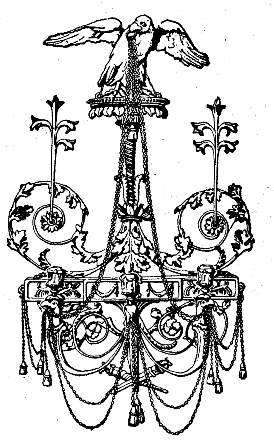
Giraldus was an excellent Latinist, well versed in the social and intellectual life of his day. His eloquence. his humour and naïve vanity, his keen, though impressionistic, observation of customs, traditions, scenery. etc., and his friendships with his great contemporaries, such as Innocent III. Richard Coeur-de-Lion, King John, Stephen Langton, St. Hugh of Lincoln and Grosseteste, all contribute to making him one of the most vivid and enterprising of writers.

As historical material, however, Giraldus' works must be estimated both in the light of his violent party spirit and of his intense patriotism.

His writings were edited by J. S. Brewer, *et al.*, in the "Rolls series," 8 vol. (1861–91). The *De Invectionibus* was edited by W. S. Davies in *Y Cymmrodor,* vol. xxx. (1920). The *Topographia,* the *Expugnatio,* the *Itinerarium* and the *Descriptio* were translated in Bohn's "Library series" (1863) and the last two again in "Everyman's Library" (1908).

GIRANDOLE [from the Ital. *girandola*], an ornamental and luxurious candleholder that came into use about the second half of the 17th century, and was commonly made and used in pairs. In the great 18th-century period of French house decoration the famous *ciseleurs* designed some exceedingly beautiful examples. Various metals have been used for the purpose and some have been made in hardwoods.

Gilded bronze has been a frequent medium, but for table purposes silver is still the favourite material.



BY COURTESY OF THE METROPOLITAN MUSEUM OF ART

AN 18TH CENTURY GIRANDOLE MADE BY ADAM AND HEPPLEWHITE

GIRARD, JEAN BAPTISTE (known as PÈRE GIRARD or PÈRE GREGOIRE) (1765–1850), French-Swiss educationalist, hailed in Switzerland as a second Pestalozzi, was born at Fribourg and educated for the priesthood at Lucerne. In 1804 he began his career as a public teacher, first in the elementary school at Fribourg (1805–23), then, on being driven away by Jesuit hostility, in the *Gymnasium* at Lucerne until 1834. In that year he retired to Fribourg and devoted himself to the production of his books on education, *De l'enseignement régulier de la langue maternelle* (1834; 9th ed., 1894; Eng. trans. by Lord Ebrington, *The Mother Tongue,* 1847) and *Cours éducatif* (1844–46). Father Girard's books influenced educational methods elsewhere. He abandoned the system of cramming children's minds with rules and facts, seeking instead to stimulate their intelligence.

GIRARD, STEPHEN (1750–1831), U.S. financier and philanthropist, founder of Girard college in Philadelphia, was born in a suburb of Bordeaux, Fr., on May 20, 1750. His father was a sea captain, and the son cruised to the West Indies and back, 1764–73. In May 1776 he settled in Philadelphia as a merchant. In June of the next year he married Mary (Polly) Lum, daughter of a shipbuilder, who, two years later, after Girard became a citizen of Pennsylvania (1778), built for him the "Water Witch," the first of a fleet trading with New Orleans and the West Indies. Most of Girard's ships were named after his favourite French authors, such as "Rousseau," "Voltaire," "Helvétius" and "Montesquieu." His beautiful young wife became insane, and spent the years from 1790 until her death in 1815 in the Pennsylvania hospital. In 1810 Girard used about $1,000,000 deposited by him with the Barings of London for the purchase of shares of the much depreciated stock of the Bank of the United States—a purchase of great assistance to the United States government. In May 1812 he established the Bank of Stephen Girard. He subscribed in 1814 for about 95% of the government's war loans of $5,000,000, of which only $20,000 besides had been taken. In 1793, during the plague of yellow fever in Philadelphia, he volunteered to act as manager of the hospital at Bush hill; again during the yellow fever epidemic of 1797–98 he took the lead in relieving the poor and caring for the sick. He died in Philadelphia on Dec. 26, 1831. His philanthropy was shown in his disposition by will of his estate, the bulk of which went to Philadelphia to be used in founding a school or college, in providing a better police system, and in making municipal improvements and lessening taxation. Girard's heirs-at-law contested the will in 1836. In 1844 Daniel Webster, appearing for the heirs, made a famous plea for the Christian religion, but Justice Joseph Story handed down an opinion adverse to the heirs (*Vidals* v. *Girard's Executors*). Work upon the buildings was begun in 1833, and the college was opened in Jan. 1848. The principal building, planned by Thomas Ustick Walter (1804–87), has been called "the most perfect Greek temple in existence." To a sarcophagus in this main building the remains of Stephen Girard were removed in 1851. The course of training is partly industrial—for a long time graduates were indentured until they came of age—but it is also preparatory to college entrance.

See H. A. Ingram, *The Life and Character of Stephen Girard* (1884); George P. Rupp, "Stephen Girard—Merchant and Mariner," in *1848–1849: Semi-Centennial of Girard College* (1898).

GIRARDIN, DELPHINE DE (1804–1855), French author, was born at Aix-la-Chapelle, the daughter of Sigismund Gay and the writer Sophie Gay. She published two volumes of miscellaneous pieces, *Essais poétiques* (1824) and *Nouveaux Essais poétiques* (1825). A visit to Italy in 1827, during which she was enthusiastically welcomed by the literati of Rome and even crowned in the capitol, was productive of various poems, of which the most ambitious was *Napoline* (1833). She was married in 1831 to Émile de Girardin (*q.v.*). The contemporary sketches which she contributed from 1836 to 1848 to the feuilleton of *La Presse,* under the *nom de plume* of Charles de Launay, were collected under the title of *Lettres parisiennes* (1843 and 1853), and obtained a brilliant success. *Les Contes d'une vieille fille à ses neveux* (1832), *La Canne de Monsieur de Balzac* (1836) and *Il ne faut pas jouer avec la douleur* (1853) are among the best known of her romances; and her dramatic pieces in prose and verse include one-act comedies, *C'est la faute du mari* (1851), *La Joie fait peur* (1854), *Le Chapeau d'un horloger* (1855) and *Une Femme qui déteste son mari,* which did not appear until after the author's death. Among the frequenters of her salon were Théophile Gautier and Honoré de Balzac, Alfred de Musset and Victor Hugo. She died on June 29, 1855. Her collected works were published in six volumes (1860–61).

See Sainte-Beuve, *Causeries du lundi,* t. iii; G. de Molènes, "Les Femmes poètes," in *Revue des deux mondes* (July 1842); Taxile Delord, *Les Matinées littéraires* (1860); G. d'Heilly, *Madame de Girardin, sa vie et ses oeuvres* (1868); Imbert de Saint Amand, *Mme. de Girardin* (1875); H. Malo, *Une Muse et sa mère, Delphine Gay* (1924) and *La Gloire du vicomte de Launay* (1925).

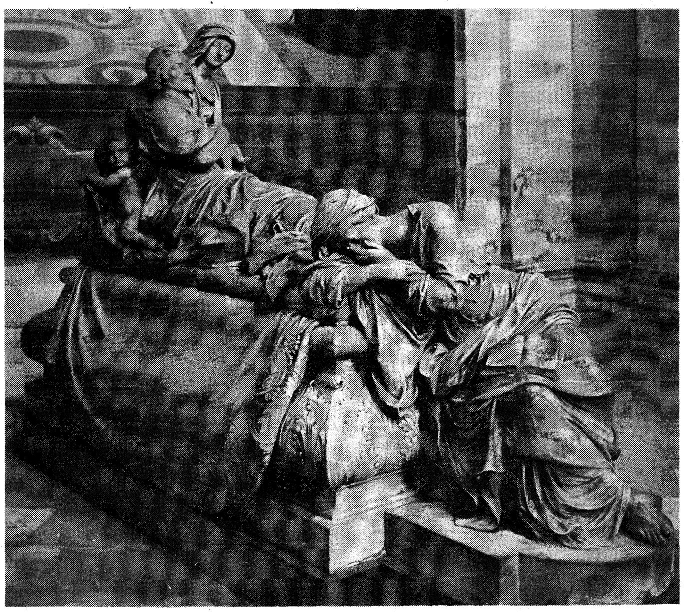
GIRARDIN, ÉMILE DE (1802–1881), French publicist, was born in Paris, the son of Gen. Alexandre de Girardin and of Madame Dupuy, wife of a Parisian advocate. He became inspector of fine arts under the Martignac ministry just before the revolution of 1830, and was an energetic and passionate journalist. In 1836 he inaugurated cheap journalism in a popular Conservative organ, *La Presse,* the subscription to which was only 40 francs a year. This undertaking involved him in a duel with Armand Carrel, the fatal result of which made him refuse satisfaction to later opponents. In 1839 he was excluded from the chamber of deputies, to which he had been four times elected, on the plea of his supposed foreign birth (he was wrongly alleged to have been born in Switzerland), but was admitted in 1842. He resigned early in Feb. 1847, and on Feb. 14, 1848, sent a note to Louis Philippe demanding his resignation and the regency of the duchess of Orleans. In the legislative assembly he voted with the Mountain. He pressed eagerly in his paper for the election of Prince Louis Napoleon, of whom he afterward became one of the most violent opponents. In 1856 he sold *La Presse,* only to resume it in 1862, but its vogue was over, and Girardin started a new journal, *La Liberté,* the sale of which was forbidden in the public streets. He supported Émile Ollivier and the Liberal empire, but plunged into vehement journalism again to advocate war against Prussia. His most successful *coup* was the purchase of *Le Petit Journal.*

Girardin married in 1831 Delphine Gay (*see* above), and after her death in 1855 Guillemette Joséphine Brunold, countess von Tieffenbach, widow of Prince Frederick of Nassau. He was divorced from his second wife in 1872.

His writings include: *De la presse périodique au XIX^e siècle* (1837); *De l'instruction publique* (1838); *Études politiques* (1838); *De la liberté de la presse et du journalisme* (1842); *Le Droit au travail au Luxembourg et a l'Assemblée Nationale,* 2 vol (1848); *Les Cinquante-deux* (1849, etc.), a series of articles on current parliamentary questions; *La Politique universelle, décrets de l'avenir* (1852); *Le Condamnt du 6 mars* (1867), an account of his own differences with the government in 1867 when he was fined 5,000 fr. for an article in *La Liberté; Le Dossier de la guerre* (1877), a collection of official documents; *Questions de mon temps, 1836 à 1856,* articles extracted from the daily and weekly press, 12 vol. (1858).

GIRARDON, FRANÇOIS (1628–171j), French sculptor, the most purely classical of the sculptors employed at Versailles, was born at Troyes. where he was baptized on March 17, 1628. He attracted the attention of Chancellor Pierre Séguier who brought him to Paris to study under François Anguier, and afterward sent him to Rome. He returned about 16jo and became a member of the academy in 1657. He worked for Sicolas Fouquet at Vaux-le-Vicomte and after the minister's fall was extensively employed in the decoration of the royal palaces. In 1663 he was working under Charles Le Brun on the Galerie d'Apollon at the Louvre, and in 1666 received the commission for'his most famous work, the "Apollo Tended by the Nymphs," for the Grotte de Thétis at Versailles. The inspiration for this elaborate work (later moved and its grouping altered), seems to derive partly from Hellenistic sculpture (particularly the Apollo Belvedere), and partly from Nicolas Poussin's paintings Of his other works for Versailles the most notable are the relief on the Bain des Nymphes (1668–70), perhaps inspired by Jean Goujon's Fontaine des Innocents, and "The Rape of Persephone" (pedestal completed 1699), in which he challenges comparison with Giovanni Bologna's "Rape of the Sabines." The effect of this group is marred by its present situation in the centre of the colonnade at Versailles where it can be seen from all sides instead of from a fixed viewpoint as originally intended.

Although superficially a baroque artist, Girardon's deep-seated classical tendencies emerge in the careful relating of sculpture to site. This is evident in his two principal works outside Versailles, the equestrian statue of Louis XIV in the Place Vendôme (1683–92), which was destroyed during the Revolution, and his tomb of Richelieu in the Sorbonne (1675–77). He undertook comparatively little portrait sculpture, but the classical bias of his mind and his abilities as a decorator made him the ideal collaborator with Le Brun (who designed many of Girardon's .numerous works for Versailles), just as Charles Antoine Coysevox (*q.v.*) was with Le Brun's successor, Jules Hardouin Mansart.



LEVY AND NEURDEIN

TOMB OF CARDINAL RICHELIEU BY FRANÇOIS GIRARDON IN THE CHURCH OF THE SORBONNE. PARIS. PIETY SUPPORTS THE FIGURE OF THE DYING CARDINAL. WHILE CHRISTIAN DOCTRINE WEEPS AT HIS FEET

As Coysevox's star rose, that of Girardon sank, and he received few royal commissions after 1700. He died in Paris on Sept. 1, 1715.

See P. Francastel, *Girardon* (1928) and *La Sculpture de Versailles* (1930); *M.* Oudinot, "François Girardon. Son rôle . . . à Versailles et aux Invalides," *Bulletin de la Societé de l'Histoire de l'Art Français,* pp. 204 ff. (1937). (F. J. B. W.)

GIRAUD, HENRI HONORÉ (1879–1949), French army officer, was born in Paris on Jan. 18, 1879. After graduating from St. Cyr in 1900, he served in French Morocco until World War I. Captured by the Germans in 1914, he successfully escaped —a feat he repeated in World War II. 28 years later. He returned to Morocco in 1922 and participated in the Rif war. In World War II, Giraud commanded the 7th army and. for a few days before his capture in May 1940, the 9th army. His second escape occurred in April 1942.

Seven months later, after secret negotiations with the Allies, he was whisked to north Africa in the wake of the Anglo-American landings. Appointed commander in chief of the French forces, he raised and equipped, largely with American matériel, 250,000 combat troops. From June to Oct. 1943 he was co-president (uith Charles de Gaulle) of the French Committee of Sational Liberation. Differences with de Gaulle resulted in his retirement in April 1944.

After the war, Giraud was elected to the constituent assembly. He also served as vice-president of the Conseil Supérieur de la Guerre.

He died in Dijon on March 11, 1949, and was buried at the Invalides, in Paris.

His publications include two memoirs: *Mes Évasions* (1946) and *Un seul but, la Victoire* (1949). (M. V.)

GIRAUDOUX, HIPPOLYTE JEAN (1882–1944), French author and diplomatist, was born on Oct. 29, 1882, at Bellac (Haute Vienne) and educated at the *École Normale* in Paris. He became head of the press service in the French foreign office, and later secured an appointment in the diplomatic service. He wrote a series of novels and plays which showed extraordinary originality and wit. Although the influence of André Gide is apparent, the style is unmistakably Giraudoux's own. and has undoubtedly influenced contemporary writers. René Lalou has described his method as being in literature what impressionism is in painting.

The most important of his novels are *Simon le pathétique* (1918), partly autobiographical in character; *L'Adorable Clio* (1920), one of the lightest and yet the most profound of war studies; *Suzanne et le Pacifique* (1921); *Siegfried et le Limousin* (1922). in which the hero, a French poet, becomes a prisoner of war in Germany, loses his memory, rises to a high political position, and then has to decide whether he shall return to France and learn to be a Frenchman once more; *Bella* (1926), in which the principal personages in Paris political life are described; *Juliette au pays des hommes* (1924) and *Pleins Pouvoirs* (1939). His collection of short stories. *Provinciales,* provides a good example of his impressionist methods.

As a dramatist Giraudoux won a prominent place. His greatest successes were *Amphitryon 38, Intermezzo* and *La guerre de Troie n'aura pas lieu.*

Giraudoux died in Paris, Jan. 31, 1944.

GIRDLE, a band of leather or other material worn round the aaist. either to confine the loose and flowing outer robes so as to allow freedom of movement, or to fasten and support the garments of the wearer. Among the Romans it was used to confine the *tunica,* and it formed part of the dress of the soldier; when a man quitted military service he was said *cingulum deponere,* to lay aside the girdle. Money being carried in the girdle. *zonam perdere* signified to lose one's purse, and, among the Greeks, to cut the girdle was to rob a man of his money. Girdles and girdle-buckles are not often found in Gallo-Roman graves. but in the graves of Franks and Burgundians they are constantly present, often ornamented with bosses of silver or bronze, chased or inlaid.

In the Anglo-Saxon dress the girdle makes an unimportant figure, and the Norman knights, as a rule, wore their belts under their hauberks. After the Conquest, however, the artificers gave more attention to a piece whose buckle and tongue invited the work of the goldsmith. That of Queen Berengaria lets the long pendant hang below the knee, following a fashion which frequently reappears.

In the latter part of the 13th century the knight's surcoat is girdled with a narrow cord at the waist, while the great belt, which had become the pride of the cavalier, loops across the hips carrying the heavy sword aslant over the thighs or somewhat to the left of the wearer.

But it is in the second half of the following century that the knightly belt takes its most splendid form. Under the year 1356 the continuator of the chronicle of Nangis notes that the increase of jewelled belts had mightily enhanced the price of pearls. The belt is then worn, as a rule, girdling the hips at some distance below the waist, being probably supported by hooks as is the belt of a modern infantry soldier. The end of the belt, after being drawn through the buckle, is knotted or caught up after the fashion of the tang of the Garter. The waist girdle either disappears or as a narrow strap is worn diagonally to help in the support of the belt. Ornament covers the whole belt, commonly seen as an unbroken line of bosses enriched with curiously worked roundels or lozenges which, when the loose strap-end is abandoned, meet in a splendid clasp. About 1420 this fashion tends to disappear, the loose tabards worn over armour in the jousting-yard hindering its display. The belt never regains its importance as an ornament, and, at the beginning of the 16th century, sword and dagger are sometimes seen hanging at the knight's sides without visible support.

In civil dress the belt of the 14th century is worn by men of rank over the hips of the tight short-skirted coat, and in that century and in the 15th and 16th there are sumptuary laws to check the extravagance of rich girdles worn by men and women a-hose station made them unseemly. Even priests must be rebuked for their silver girdles with baselards. Purses, daggers, keys. penners and inkhorns, beads and even books, dangled from girdles in the 15th and early 16th centuries. Afterwards the girdle goes on as a mere strap for holding up the clothing or as a sword-belt. At the Restoration men contrasted the fashion of the court, a light rapier hung from a broad shoulder-belt, with the fashion of the countryside, where a heavy weapon was supported by a narrow waistbelt. Soon afterwards both fashions disappeared. Sword-hangers were concealed by the skirt, and the belt, save in certain military and sporting costumes, has no more been in sight in England. Even as a support for breeches or trousers, the use of braces has supplanted the girdle.

In most of those parts of the Continent — Brittany, for example —where the peasantry maintains old fashions in clothing, the belt or girdle is still an important part of the clothing. Italian non-commissioned officers find that the Sicilian recruit's main objection to the first bath of his lifetime lies in the fact that he must lay down the cherished belt. With the Circassian the belt still buckles on an arsenal of pistols and knives.

Folklore and ancient custom are much concerned with the girdle. Bankrupts at one time put it off in open court; French law refused courtesans the right to wear it; St. Guthlac casts out devils by buckling his girdle round a possessed man; an earl is "a belted earl" since the days when the putting on of a girdle was part of the ceremony of his creation; and fairy tales of half the nations deal with girdles which give invisibility to the wearer. (O. B.)

GIRGA or GIRGEH, a town of Upper Egypt on the west bank of the Nile, 313 mi. S.S.E. of Cairo by rail and about 10 mi. S.S.E. of the ruins of Abydos. Pop. (1956 est.) 41,200. The town stands on a sharp bend of the Nile. Many of the houses are of brick decorated with glazed tiles. The town is noted for the excellence of its pottery. Girga is the seat of a Coptic bishop. It also possesses a Roman Catholic monastery, considered the most ancient in the country. As late as the middle of the 18th century the town stood a quarter of a mile from the river, but is now on the bank.

GIRGENTI, a town in Sicily *(see* AGRIGENTUM).

GIRISHK, a village and fort in Afghanistan, on the right bank of the Helmund 78 m. W. of Kandahar on the road to Herat; 3,641 ft. above the sea. The fort is the residence of the governor of the district (Pusht-i-Rud). It commands the fords of the Helmund and the road to Seistan, from which it is about 190 m. distant; and it is the centre of a rich agricultural district. Girishk was occupied by the British during the first Afghan War; and a small garrison under a native officer, successfully withstood a siege of nine months. The Dasht-i-Bakwa, a level plain of considerable width, stretches beyond Girishk towards Farah.

GIRL GUIDES. The aim of the Girl Guides association is to help its members, through character training, to become good citizens with a sense of service and responsibility not only to their own families and communities but also nationally and internationally.

The movement has no political or sectarian aims and is open to all girls of appropriate age who are prepared to make the twofold promise of the Brownie or the threefold Guide promise. A Brownie promises to do her best to do her duty to God and the queen and to help other people every day, especially those at home. The Guide promises duty to God and the queen, helpfulness to other people at all times and obedience to the Guide law. The law requires honesty, loyalty, helpfulness, friendliness, courtesy, concern for animals, obedience, cheerfulness, thrift and purity in thought. word and deed.

Guides are encouraged to be practising members of their own religious denominations.

Origin and Development. — The formation of the Girl Guides association was the result of a spontaneous demand from the girls themselves following the beginnings of the Scout movement (see BOY SCOUTS). In response. Sir Robert Baden-Powell with his sister, Agnes Baden-Powell? devised a scheme of training. and the movement began in 1910. Sir Robert married, in 1912, Olave Soames. who was appointed chief commissioner in 1916. In 1918 she was elected Chief Guide.

From small beginnings the movement grew to include Brownies, aged $7\frac{1}{2}$ to 11; Guides, 11 to 16; Rangers (land. sea and air sections), 14 to 21; and Cadets (Guiders; *i.e.,* officers in training); also through "extensions," "auxiliaries" and "lones" to make guiding possible for handicapped girls, for girls in approved schools or training homes and for those living too far from a company to attend its regular meetings. The Trefoil Guild links those who are no longer active members of the movement but who "are prepared to carry out the Guide ideals in their daily lives and in the community in which they live and work."

Queen Elizabeth II and Queen Elizabeth the queen mother are patrons. Princess Margaret is Chief Ranger of the British Commonwealth and empire. The princess royal is president. In 1923 the association was incorporated by royal charter.

Organization. — A council elects the executive committee and a chief commissioner. Decentralization, through countries' chief commissioners and county, division and district commissioners, enables the training policy to be carried out by the Guiders in companies and packs and also allows the needs of the girls to be represented to the executive committee. Local associations in districts or divisions are groups of interested persons, principally nonmembers, whose support enlists public interest.

Headquarters of the association for Great Britain and the commonwealth are at 17–19 Buckingham Palace Road, London, S.W.1.

Training. — There are headquarters training centres in England at Foxlease in the New forest, Hampshire; Waddow hall. Lancashire; and on M.T.B. (Motor Torpedo Boat, Ex. R.S.) 630 on the Dart river. Scotland, Wales and Ulster also have centres for the training of Guiders.

Citizenship training begins in the pack where the Brownie learns in the "pack pow-wow" to express her views; it continues through the Guide company where Guides in patrols under their girl leaders discuss the affairs of the company and the leaders meet as a company committee. The Kanger organization varies: but it is calculated always to help the girl to an understanding of democratic government and to the carrying of her Guiding into a wider world. A system of tests and badges at all stages encourages girls to widen their interests and develop skills. Special stress on homemaking badges helps to train future wives and mothers. Camping and outdoor activities develop initiative and resource while awareness and often experience of international contacts, together with the underlying motive of both promise and law, emphasize world sisterhood and service.

World Association.— The World Association of Girl Guides and Girl Scouts co-ordinates members in 35 countries. Associations applying for membership must have self-governing organizations representative of the country as a whole and must accept the principles of the promise and law, and also the principle that the movement is open to girls of all races, nations and creeds. Membership must be voluntary and the organization must be strictly nonpolitical. International conferences are held regularly in different countries, and at one of the earliest, in 1930, Lady Baden-Powell was appointed World Chief Guide. At the same time a design for the Guide world flag was agreed upon. The joint birthday of the founder and the Chief Guide, Feb. 22, is celebrated throughout the world as "Thinking day" when the movement's 4,250,000 members join in thought and expression of a common purpose. (B.-PL.)

GIRL SCOUTS is a voluntary organization "dedicated to helping girls develop as happy, resourceful individuals willing to share their abilities as citizens in their homes, their communities, their country and the world. This purpose is achieved through a program that is based on a voluntarily accepted code of living. The program is carried out in small groups under the guidance of adult leadership. It provides a wide range of activities developed around the interests of girls, and offers opportunities for fun, friendship, service and daily practice in living the Girl Scout Promise and Laws" (constitution of the Girl Scouts of the U.S.A.).

Girl Scouting is open to all girls 7 through 17 years old who are willing to subscribe to the promise and laws of scouting, pay annual membership dues and meet other simple requirements. Adult membership is open to both women and men. The Girl Scouts are part of the world-wide Scout movement founded by Sir Robert (later Lord) Baden-Powell in 1910: the organization is a member of the World Association of Girl Guides and Girl Scouts. Juliette Gordon Low of Savannah, Ga., formed the first Girl Scout troop in the U.S. in 1912, following the pattern set up for Girl Guides, sister organization of the Boy Scouts of Great Britain. Mrs. Low was a native of Georgia, but she had lived in Great Britain and had helped to organize Girl Guide troops. She became the first president of the U.S. organization; when she retired from office in 1920 she received the title of founder, and her birthday (Oct. 31) was set aside as a special day for the Girl Scouts. At the time of her death in 1927 the Girl Scouts had troops in every state of the Union and had more than 140,000 members.

The Girl Scout promise: "On my honour, I will try: to do my duty to God and my country, to help other people at all times, to obey the Girl Scout Laws." These laws are as follows:

1. A Girl Scout's honor is to be trusted.
2. A Girl Scout is loyal.
3. A Girl Scout's duty is to be useful and to help others.
4. A Girl Scout is a friend to all and a sister to every other Girl Scout.
5. A Girl Scout is courteous.
6. A Girl Scout is a friend to animals.
7. A Girl Scout obeys orders.
8. A Girl Scout is cheerful.
9. A Girl Scout is thrifty.
10. A Girl Scout is clean in thought, word and deed.

These laws are a simple code for growing girls and are substantially the same in all countries in which Scouting is organized; they have been recognized as a standard of conduct and an expression of friendship regardless of race, nationality or religion. The trefoil emblem of the Girl Scouts, which symbolizes the three parts of the promise, is used in various versions throughout the world-wide movement.

Girl Scouting in the United States is divided into three age groups: Brownie Scouts, 7 through 9 years old; Intermediate Girl Scouts, 10 through 13; Senior Girl Scouts, 14 through 17. Four major areas of interest which carry through the program for the three age levels centre on the home, the arts, citizenship and the out-of-doors. These four areas are subdivided respectively into 11 program fields: agriculture, health and safety, homemaking; arts and crafts, literature and dramatics, music and dancing; community life, international friendship; nature; out-of-doors, sports and games.

Girl Scouting is "girls and adults working together" in basic units called troops, which usually consist of 16 to 32 girls and an adult leader or leaders. Except for the Brownie Scouts, troop business is transacted and decisions arrived at through a representative system of government whereby smaller subunits known as patrols elect their representatives to a "court of honour" which also includes the elected troop officers and the adult leaders.

Activities of girls in Scouting are designed to foster good social attitudes, broadened interests, development of individual capacities, growth of a sense of responsibility. Girls undertake projects which are progressively challenging. Community service is basic to the program, and may range from making simple gifts for invalids or singing Christmas carols to beautifying the grounds of public buildings. Scouts learn to know and appreciate the out-of-doors through games, nature study and camping.

The Brownie Scout learns to get along with her peers and to develop simple skills. She may hem towels for her mother, raise a potted plant for Easter services, help prepare a picnic meal for a troop party for parents.

The Intermediate Girl Scout develops new skills or broadens her talents through a program of progression through ranks, and by work for proficiency badges. She selects her own areas of interest from more than 100 badges, such as Active Citizen, Campcraft, Child Care, Hospitality. Work for badges usually involves practical applications plus community service: *i.e.*, "*Weather*—Know the rules of safe conduct during a thunder storm, out-of-doors and indoors." or "Storyteller—Learn how to select good stories for younger children. Tell them to children in your family . . . at the public library."

The Senior Girl Scout devotes much of her time to community service and vocational exploration, often combining them by working as a volunteer hospital aide or ranger aide, or assisting at a public playground. Many Seniors take part in visits exchanged among girl members of the various associations in the world-wide Scout-Guide movement.

Adapting itself to the changing needs of girls, the organization grew from the first troop of 12 girls to a membership by the latter 1950s of more than 2,000,000 girls and 600,000 adult volunteers. Professional workers in Girl Scouting account for less than 0.5% of adult membership.

The Girl Scout council is the organization which makes Scouting available to girls in the community. It is established, developed, maintained and financed by local volunteers. Clubs, schools, church groups and other private organizations assist local councils by providing meeting places, leadership, financial help, volunteer support and other co-operation. The Girl Scout national organization is financed principally by membership dues of $1 per annum. Governing body is the National council, consisting of delegates elected by local Girl Scout councils and meeting at regular intervals. The national organization publishes *The Girl Scout Leader*, *The American Girl* and various handbooks. The headquarters are in New York city. (For the British equivalent of Girl Scouts, see GIRL GUIDES.) (E. W. CT.)

GIRLS' FRIENDLY SOCIETY, THE. An organization for all girls sponsored by the Protestant Episcopal Church. Founded in England in 1875, it spread to the United States with the establishment of the first branch at St. Anne's Church, Lowell, Massachusetts, in 1877.

Today it has an international membership with branches in forty-four countries. The program of the society, based on the present-day interests and needs of girls, includes worship, study, recreation, and service to the Church and the community. An understanding of the issues of the world today as they affect young people is emphasized. A junior department provides a program for girls under 12 years of age.

Branches may be organized in any parish, mission, or institution of the Episcopal Church, headed by leaders who are communicants of the Church; the membership of the society, however, is inter-denominational.

GIRNAR, a sacred hill in western India, in the peninsula of Kathiawar, 10 m. E. of Junagarh. Five peaks rise about 3,500 ft. above the sea; on them are numerous Jain temples, frequented by pilgrims. At the foot of the hill is a rock, with an inscription of Asoka (2nd century B.C.), and also two other inscriptions (dated A.D. 150 and 455).

GIRODET-TRIOSON (ANNE LOUIS GIRODET DE ROUCY) (1767–1824), French painter typical of the first phase of the romantic movement. known as Girodet-Trioson after his guardian, M. Trioson, was born at Montargis, Loiret, on Jan. 29. 1767. A pupil of J. L. David, his "Joseph reconnu par ses freres" (Joseph recognized by his brothers) won him the Prix de Rome at the age of 22. He submitted to the Salon of 1792 "Le Sommeil d'Endymion" (Endymion sleeping) (Louvre), a cold! sensual, crepuscular work. nearer in feeling to the troubled romanticism of Chateaubriand than to the Spartan ideal of David. Girodet was also a poet, and his interest in literature is given full reign in the curious "Ombres des guerriers français reçues par Ossian dans le palais d'Odin" (Ossian receiving the generals of Napoleon in the palace of Odin), done for Malmaison in 1801, "Fingal" (Leningrad), painted for Napoleon in 1802, and above all, the famous "Atala au Tombeau" (The burial of Atala) (Louvre) of 1808. This. together with his windswept portrait of Chateaubriand meditating in front of the Coliseum (1809. Versailles), is Girodet's most typical work. In "La Révolte du Caire" (The revolt in Cairo) (1810, Versailles), he made a determined etiort to copy the swirling compositions of Antoine Gros, for whom he had a deep affection. His landscape sketches and book illustrations, notably for Pierre Didot's Racine (1801–05), have a freshness that is missing from his more elaborate works. He died in Paris on Dec. g. 1824.

Girodet's poem *Le Peintre* and essays on *Le Génie* and *La Grâce* were published after his death with a biographical notice by his friend M. Coupin de la Couperie (1829); E. J. Delecluze, in his *Louis David, son école et son temps* (1855), gives a briei life. (ha. B.)

GIRONDE, a maritime de'partement of southwestern France, formed from parts of the old province of Guyenne, viz., Bordelais, Bazadais. and parts of Pkrigord and Agenais. Area. 4,141 sq.mi. Pop. (1954) 896.517. It is bounded north by the *département* of Charente-Maritime, east by those of Dordogne and Lot-et-Garonne, south by that of Landes, and west by the Bay of Biscay. The de'partement lies on the east and the west sides of the Gironde estuary formed by union of Garonne and Dordogne. On the west, the Landes consist chiefly of morass or sandy plain, divided from the sea by dunes planted with pines which bind the sand together and prevent it from drifting inland. On the east the dunes are fringed for some distance by large lakes, Hourtin, Carcans and Lacanau, communicating with each other. The Bay of Arcachon forms a vast shallow lagoon, a large part of which has been converted into arable land. The estuary of the Gironde, about 45 m. in length, widens northwards from 2 to 6 miles. Islands and mud banks divide it into east and west channels and make navigation difficult. It is, however, well buoyed and lighted, and has a mean depth of 21 feet. There are wide marshes on the right bank north of Blaye, and on the left low-lying polders protected by dikes and composed of fertile salt marshes. At the mouth of the Gironde stands one of the finest French lighthouses, the tower of Cordouan built 1585–1611, and extended in the late 18th century.

The climate is humid and mild and very hot in summer. Wheat, rye, maize, oats and tobacco are largely grown, but the culture of the vine is by far the most important industry carried on (see WINE), the six vine-growing districts occuping about one-seventh of the surface of the de'partement. The Mitdoc is a region 50 mi. long by about 6 mi. broad, along the left banks of the Garonne and Gironde. The Graves country is a zone 30 mi. long. on the left bank of the Garonne from near Bordeaux to Barsac. The Sauternes country lies south-east of the Graves. The Côtes lie on the right bank of Dordogne and Gironde between Dordogne and Garonne, and on the left bank of the Garonne. The produce of the Palus, the alluvial land of the valleys, and of the Entre-deux-Mers, on the left bank of the Dordogne, is inferior. Fruits and vegetables are largely grown, peaches and pears being especially fine. The Médoc breed of horses, the Bazadais breed of oxen and the Bordelais breed of milch cows are well known. Oyster-breeding is on a large scale in the Bay of Arcachon. Resin, pitch and turpentine are obtained from the pine woods, which also supply vine-props, and there are well-known quarries of limestone. Manufactures and trade are chiefly carried on at Bordeaux (*q.v.*), the chief town, and the third port of France. Pauillac, Blaye, Libourne and Arcachon are minor ports.

Gironde is divided into the arrondissements of Bordeaux, Blaye-et-Sainte Luce Langon. Lesparre-Médoc and Libourne, and has 50 cantons and 5jj communes. The de'partement is served chiefly by the Orlkans and Southern companies. It forms part of the circumscription of the archbishopric, the appeal-court and the *académie* (educational division) of Bordeaux, and of the region of the XVIII army corps (Bordeaux). Besides Bordeaux, Libourne, La Réole, Bazas, Blaye, Xrcachon, St. Emilion and St. Macaire are the most noteworthy towns. Among other places of interest the chief are Cadillac, on the right bank of the Garonne, where there is a 16th century castle, surrounded by fortifications of the 14th century; Labri.de, with a feudal chbteau in which Montesquieu was born and lived; Villandraut, where there is a ruined castle of the 11th century; Uzeste, which has a church begun in 1310 by Pope Clement \-; Mazères with an imposing 14th century castle; La Sauve, which has a church (13th cent.) and other remains of a Benedictine abbey; and Ste. Foy-la-Grande, a bastide created in 1255 and afterwards a centre of Protestantism, which is still strong there. La Teste. pop. (1946) 6,674, was the capital. in the middle ages, of the famous lords of Buch.

GIRONDISTS, the name given to a political party in the Legislative Assembly and National Convention during the French Revolution (1791–93) (Fr. Girondins). The name was first given them because the most brilliant exponents of their point of view—Vergniaud, Gensonné, Guadet—were deputies from the Gironde. In the Legislative Assembly these represented a compact body of opinion which, though not as yet definitely republican, was considerably more advanced than the moderate royalism of the majority of the Parisian deputies. Associated with these views was a group of deputies from other parts of France, of whom the most notable were Condorcet, Jacques Pierre Brissot, Roland and Pétion. On the policy of the Girondists Madame Roland, whose salon became their gathering-place, exercised a powerful influence (see ROLAND); but such party cohesion as they possessed they owed to the energy of Brissot (*q.v.*) who came to be regarded as their mouthpiece. Hence the name Brissotins, coined by Camille Desmoulins. As strictly party designations these first came into use after the assembling of the National Convention (Sept. 20, 1792), to which a large proportion of the deputies from the Gironde who had sat in the Legislative Assembly were returned. For the struggle of the Girondists with the Montagnards and their ultimate downfall, see FRANCE: *History*.

BIBLIOGRAPHY.—Of the special works on the Girondists, Lamartine's *Histoire des Girondins* (1847, new ed. 1902) is rhetoric rather than history, and is untrustworthy; the *Histoire des Girondins,* by A. Gramier de Cassignac (1860) led to the publication of a *Protestation* by J. Guadet, a nephew of the Girondist orator, which was iollowed by his *Les Girondins, leur vie privte, leur vie publique, leur proscription et leur mort* (1861, new ed. 1890); with which *cf.* Alary, *Les Girondins par Guadet* (Bordeaux, 1863); also Charles Vatel, *Charlotte de Corday et les Girondins; pièces classées et annottes* (1864–72); *Recherches historiques sur les Girondins* (1873); Ducos, *Les Trois Girondines* (Madame Roland, Charlotte Corday, Madame Bouquey) *et les Girondins* (1896); Edmond Biré, *La Ltgende des Girondins* (1881, new ed. 1896). Memoirs or fragments of memoirs by particular Girondists also exist; *e.g.,* Barbaroux, Pétion, Louvet, Madame Roland.

GIRTIN, THOMAS (1775–1802), English landscape painter in water colour. He was born in London on Feb. 18, 1775, the son of a brushmaker. He was apprenticed to Edward Dayes, the water-colourist, with whom he later quarreled. While still boys he and J. M. W. Turner were employed by the connoisseur Thomas Monro in copying works by J. R. Cozens. Girtin went on numerous sketching tours, chiefly in the north of England and founded a sketching club for young artists. During 1801–02 he visited Paris and produced a series of etchings of that city. His gigantic panorama of London, the "Eidometropolis," was exhibited just before his premature death, probably from consumption, on Nov. 9, 1802.

Girtin's earlier landscapes are in the 18th-century topographical manner, but in his last years he evolved a bold, spacious and romantic style, in spirit akin to the contemporary poetry of Wordsworth, which greatly influenced English landscape painting. The increasing power of his last works at least tempers the exaggeration of Turner's supposed remark: "If Tom Girtin had lived, I should have starved." The British museum and the Victoria and Albert museum, London, are rich in examples of his work.

See J. Mayne, *Thomas Girtin* (1949); T. Girtin and D. Loshak, *The Art of Thomas Girtin* (1954). (D. Lk.)

GIRVAN, a small burgh and fishing town of Ayrshire, Scot., at the mouth of the Girvan, $54\frac{1}{2}$ mi. S.S.W. of Glasgow and 22 mi. S.S.W. of Ayr by road. Pop. (1951) 5,990. The principal industries — besides catering to visitors — are fishing (mainly herring and whitefish), the manufacture of woolen goods, tweeds and knitwear, the building and repairing of fishing boats and the processing of seaweed. Girvan's mild and equable climate is favourable to early potato crops, and its sandy beaches are an attraction to holidaymakers. It is the port of communication with Ailsa Craig (*q.v.*).

GIRY, (JEAN MARIE JOSEPH) ARTHUR (1848–1899), French historian, who made a considerable contribution to the study of the origins and significance of the urban communities in France. He was born at Trevoux (Ain) on Feb. 28, 1848, and studied at the École de Droit, the École des Chartes and the École des Hautes Études. He held posts at the Bibliothèque Nationale and the Archives Nationales before being appointed lecturer at the École des Hautes Etudes in 1877. He became lecturer at the faculty of letters of the Sorbonne in 1881, and professor at the École des Chartes in 1885. He died at Paris on Nov. 13, 1899.

Giry's works include *Histoire de la ville de Saint-Omer et de ses institutions jusqu'au XIV^e^ siècle* (1877); *Les Établissements de Rouen* (2 vol., 1883–85); *Documents sur les relatzons de la royaute' avec les villes de France de 1180 à 1314* (1885); and *Étude sur les origines de la commune de Saint-Quentin* (1887). His *Manuel de dzplomatique* (1894) secured his election to the Académie des Inscriptions.

GISBORNE, a seaport of New Zealand, in Cook county, provincial district of Hawke's bay, on Poverty bay of the east coast of North Island. Pop. (1956) urban area 22,622; (1958 est.) 23.600 (town, 20,500). The port has rail connection with Wellington. Wool, frozen mutton and agricultural produce are exported from the surrounding district. Near the site of Gisborne, Captain Cook landed in 1769 and gave Poverty bay its name from his inability to obtain supplies because of the hostility of the natives.

GISORS, a town of France, in the *de'partement* of Eure, in the pleasant valley of the Epte, 44 mi. N.W. of Paris on the railway to Dieppe. Pop. (1954) 5,056. In the middle ages Gisors was capital of the Vexin. Its position on the frontier of Normandy caused its possession to be hotly contested by the kings of England and France during the 12th century, when with the fortresses of Neaufles and Dangu it was ceded by Richard Coeur de Lion to Philip Augustus. During the wars of religion of the 16th century it was occupied by the duke of Mayenne on behalf of the League, and in the 17th century, during the Fronde, by the duke of Longueville. Gisors was made a duchy in 1742 and afterwards came into the possession of the count of Eu and the duke of Penthièvre.

Gisors is dominated by an 11th- and 12th-century stronghold of the kings of England. The central tower, the choir and parts of the aisles of the church of St. Gervais date from the middle of the 13th century. and the rest from the Renaissance. Gothic and Renaissance styles mingle in the west façade, adorned with a profusion of sculptures; the fine carving on the wooden doors of the north and west portals is particularly noticeable. Among the industries of Gisors are felt manufacture, bleaching, dyeing and leather dressing.

GISSING, GEORGE ROBERT (1857–1903), English novelist, was born at Wakefield on Nov. 22, 1857. He was educated at the Quaker boarding school of Alderley Edge and at Owens college, Manchester. His life, especially its earlier period, was spent in great poverty, mainly in London, though he was for a time also in the United States. supporting himself chiefly by private teaching. He published his first novel, *U'0rkers in the Dawn,* in 1880. *The Unclassed* (1884) and *Isabel Clarendon* (1886) folloned. *Demos* (1886), a novel dealing with socialistic ideas, was, however, the first to attract attention. Gissing's own experiences had preoccupied him with poverty and its brutalizing effects on character. He made no attempt at popular writing, and for a long time the sincerity of his work was appreciated only by the few. But his unflinching realism, and the minute care of his descriptions of the sordid milieu of shabby London streets left their mark on the English novel. Among his more characteristic novels are: *Thyrza* (1887), *A Life's Morning* (1888), *The Nether World* (1889), *New Grub Street* (1891), *Born in Exile* (1892), *The Odd Women* (1893), *In the Year of Jubilee* (1894), *The U'hirlpool* (1897). Others; *e.g., The Town Traveller* (1901), indicate a humorous faculty, but his novels are mainly concerned with the life of the poorer middle classes, with lonely men and women engaged in a generally hopeless struggle with fate and with the conflict between education and circumstances. The quasi-autobiographical *Private Papers of Henry Ryecroft* (1903) reflects Gissing's studious and retiring tastes. He was a good classical scholar and had a minute acquaintance with the late Latin historians, and with Italian antiquities; his posthumous *Veranilda* (1904), a historical romance of Italy in the time of Theodoric the Goth, was the outcome of his favourite studies. He died at St. Jean de Luz in the Pyrenees on Dec. 28, 1903.

Cazamian, *Roman et idées en Angleterre* (1923); *Letters of George Gissing to Members of his Family,* collected and arr. by A. and E. Gissing (1927); *see* also introductory essay by T. Seccombe to *The House of Cobwebs* (1906), *a* posthumous volume of Gissing's short stories.

GIULIO ROMANO: *see* Romano, Giulio.

GIUNTA PISANO (d. 1255–1267), Italian painter, a native of Pisa and according to some critics a pioneer who, coming from Tuscany to Assisi, influenced the development of Umbrian art. It is said that he painted in the upper church of Assisi, notably a "Crucifixion" dated 1236, with a figure of Father Elias, the general of the Franciscans. embracing the cross. This painting no longer exists. Three large Crucifixions are ascribed to the same master, whose signature can be traced on them. One is in SS. Raineri e Leonardo in Pisa and was formerly in the convent of St. Anna; the other, in the Museo Civico at Pisa, is completely overpainted; the third is in Sta. Maria degli Angeli at Assisi. In these paintings Christ is represented with his head leaning on one side with an expression of pain, and his body bending forward in agony — a conception differing from "the triumphant Christ" of the preceding age.

GIURGIU, a town in the region of Bucharest, Rumania; situated amid mud flats and marshes on the left bank of the Danube. Pop. (1956) 32,613. Three small islands face the town, and a larger one shelters its port, Smarda, $2\frac{1}{2}$ mi. E. A railway runs north to Bucharest and northwest to Blejesci and steamers ply to Ruschuk, $2\frac{1}{2}$ mi. S.W. on the Bulgarian shore, whence railways run to Varna, Sofia and South Bulgaria. Thus Giurgiu, besides having a considerable trade with the home ports lower down the Danube, is the headquarters of commerce between Bulgaria and Rumania. It exports timber, grain, salt and petroleum; importing coal, iron and textiles. There are also large sawmills, and pipelines for oil run to Baicoi-Bucharest.

Giurgiu occupies the site of Theodorapolis, a city built by the Roman emperor Justinian (A.D. 483–565). It was founded in the

14th century by Genoese merchants who called the town, after the patron saint of Genoa. San Giorgio (St. George). As a fortified town, Giurgiu figured often in the wars for the conquest of the lower Danube; especially in the struggle of Michael the Brave (1593–1601) against the Turks, and in the later Russo-Turkish wars. It was burned in 1659. In 1829, its fortifications were finally razed, the only defense left being a castle on the island of Slobosia, united to the shore by a bridge.

GIUSTI, GIUSEPPE (1809–1850), Italian poet whose satires on Habsburg rule in Italy in the early years of the Risorgimento are still enjoyed for their literary merits, was born at Monsummano in Tuscany on May 13, 1809. After two periods as a law student at Pisa (1826–29 and 1832–34), he led an inconspicuous life until the revolution of 1848. He then sat as a deputy in the two Tuscan legislative assemblies and in the short-lived constituent assembly (till April 1849). He died in Florence on March 31. 1850.

Giusti's satirical poems were at first circulated only in manuscript; and the first collections of them, Poesie italiane (unauthorized, 1844) and Versi (1845; to be distinguished from the innocuous Leghorn edition, Versi di Giuseppe *Giusti,* 1844), had to be printed outside Italy, at Lugano and at Bastia. without the author's name. His first notable satire, La ghigliottina a *vapore,* dates from 1833. Other satires were Lo stivale ("The Boot," in allusion to the cartographical shape of the Italian peninsula); La terra dei morti, in protest against Lamartine's description of Italy as the land of the dead; *Il* brindisi di Girella; *Gingillino,* denouncing opportunist officials; *Il* dies *irae,* on the death of the Austrian emperor Francis I; and Per *l'incoronazione,* on the coronation of the succeeding emperor. His masterpiece, however, is *Sant' Ambrogio* (1847), a poem describing a company of Austrian soldiers at Mass, in which the poet begins by deriding them but gives way to sympathy and a sense of solidarity with them as they join in a chorus by Verdi. Popular in their day because of their liberal. anti-Austrian ideas, their satire against the Tuscan grand duke and his agents, and their patriotic expression of faith in Italy's resurgence, Giusti's satires can still be read with pleasure for their wit, their humorous turns of phrase and their power of ridicule in characterization.

His complete works, including some previously unpublished material, were edited by F. Martini (1924); selections were edited by P. Carli (1912).

GIUSTINIANI, the name of a prominent Italian family which originally belonged to Venice, but established itself subsequently in Genoa also; at various times it had representatives in Naples, Corsica and several of the islands of the Archipelago.

In the Venetian line the following are most worthy of mention:

1. LORENZO (1380–1456), the Laurentius Justinianus of the Roman calendar, entered the congregation of the canons of St. George in Alga, and in 1433 became general of that order. About the same time he was made bishop of Venice by Eugenius IV; and on the removal of the patriarchate from Grado to Venice by Nicholas V in 1451, he was promoted to that dignity, which he held for 14 years. He died on Jan. 8, 1456, and was canonized by Alexander VIII, his festival being kept on Sept. 5. The best edition of his works is that of the Benedictine P. N. A. Giustiniani (2 vol., 1751).

2. LEONARDO (1388–1446), brother of the preceding, was for years a senator of Venice, and in 1443 was chosen procurator of St. Mark. He translated into Italian Plutarch's Lives of *Cinna* and *Lucullus,* and mas the author of some poetical pieces, amatory and religious—strambotti and cunzonetti—as well as of rhetorical prose compositions. The popular songs set to music by him became known as Giustiniani. (See *Poésie inédite* di Leonardo Giustiniani, edited by Wiese [1883].)

3. BERNARDO (1408–1489), son of Leonardo, entered the Venetian senate and served on diplomatic missions to France and Rome; about 148j he became one of the Council of Ten. He wrote a history of Venice, De *origine* urbis Venetarum rebusque ab *ipsa* gestis *historia* (1492; Ital. trans. 1545). It is to be found in vol. i of the Thesaurus of Graevius.

4. PIETRO, also a senator, lived in the 16th century and wrote a *Historia rerum Venetarum* in continuation of Bernardo. He also wrote chronicles De gestis Petri Mocenigi and De *bello* Venetorum *cum Carolo* VIII (Script, rer. Ital. vol. xxi).

Of the Genoese branch of the family the most prominent members were the following:

5. AGOSTINO (1470–1536) was born at Genoa and, after joining the Dominicans in 1487, studied Greek, Hebrew, Chaldee and Arabic; and in 1514 began the preparation of a polyglot edition of the Bible. As bishop of Nebbio, Corsica, he took part in the earlier sittings of the Lateran council (1516–17) but, in consequence of party complications, withdrew to his diocese and ultimately to France, where he became a pensioner of Francis I, and was the first to occupy a chair of Hebrew and Arabic in the University of Paris. He became acquainted with Erasmus and More and returned to Nebbio, about 1522. He bequeathed his fine library to the republic of Genoa. Of his projected polyglot only the Psalter was published (Psalterium Hebraeurn, Graecum, Arabicum, *et Chaldaicum,* Genoa, 1616). Besides the Hebrew text, the LXX translation, the Chaldee paraphrase and an Arabic version, it contains the Vulgate translation, a new Latin translation by the editor, a Latin translation of the Chaldee and a collection of scholia. Giustiniani printed 2,000 copies at his own expense, including 50 in vellum for presentation to the sovereigns of Europe and Asia. Besides an edition of Job, containing the original text, the Vulgate and a new translation, he published a Latin version of the *Moreh Nevochim* of Maimonides (Director dubitantiunz *aut perplexorum,* 1520) and also edited in Latin the Aureus *libellus* of Aeneas Platonicus and the Timaeus of Chalcidius. His annals of Genoa (Castigatissimi *annali* di Genova) were published posthumously in 1537.

6. POMPEIO (1569–1616), a native of Corsica, who served under Alessandro Farnese and the marquis of Spinola in the Low Countries, where he lost an arm, and was known by the sobriquet Bras de Fer. He defended Crete against the Turks, and subsequently was killed at Friuli. He left in Italian a personal narrative of the war in Flanders, repeatedly published in Latin (*Bellum* Belgicum, Antnerp, 1609).

7. GIOVANNI (1513–1556), born in Candia, was the translator of Terehce's *Andria* and Eunuchus, of Cicero's In Verrem and of Virgil's Aeneid, viii.

8. ORSATTO (1538–1603), Venetian senator, translator of the Oedipus Tyvannus of Sophocles and author of a collection of Rime, in imitation of Petrarch, was one of the latest representatives of the classic Italian school.

9. GERONIMO, a Genoese (16th century), translated the *Alcestis* of Euripides and three of the plays of Sophocles; he wrote two original tragedies, Jephte and Chrzsto in Passione.

10. VINCENZO, who in the beginning of the 17th century built the Roman palace, made the art collection associated with his name. The collection was removed in 1807 to Paris, and in 1815 all that remained of it, about 170 pictures, was purchased by the king of Prussia and removed to the Berlin royal museum.

GJELLERUP, KARL ADOLPH (1857–1919), Danish poet and novelist who shared the Nobel prize for literature with Henrik Pontoppidan in 1917. Born at Roholte, Zealand, on June 2, 1857, he studied theology, although already an atheist; and, strongly influenced by Georg Brandes and Darwinism, wrote novels expressing optimistic radicalism—En Idealist (1878) and Germanernes Laerling (1882). Travel broadened his outlook and he reacted against naturalism, developing an idealistic philosophy incorporating elements derived from Schiller, Schopenhauer, Wagner and Buddhism. He settled in Germany in 1892 and wrote many of his later works in German, often using Germanic and classical or Indian themes and settings. His works include novels—Die *Opferfeuer* (1903), Pilgrimen *Kamanita* (1906; Eng. trans. by J. E. Logie, The Pilgrim Kamanita, 1911); plays—*Brynhild* (1884). *Wuthhorn* (1893); and verse in Danish. He died at Klotzsche near Dresden, Oct. 11, 1919.

GLACE BAY, a town and port, the chief coal-mining centre of Cape Breton county, Nova Scotia, on the Atlantic ocean. The town is 14 mi. E. of Sydney, with which it is connected by railway. Coal mining dates from 1720 and major operations from 1858. The rich bituminous seams dip seaward for four miles. Pop. (1956) 24,416. Large fishing fleets, particularly for swordfishing, are stationed there. Marconi sent a transatlantic wireless message from Glace Bay in 1902. (C. W. RD.)

GLACIAL EPOCH: see PLEISTOCENE EPOCH.

GLACIER, a body of ice originating on land by compaction and recrystallization of snow and showing evidence of present or past movement. Glaciers occur where snoafall in winter exceeds melting in summer, conditions which prevail only in high mountain areas and polar regions at present. Because they are restricted to cold, remote places, glaciers are less familiar to most persons than are rivers, lakes and other kinds of hydrologic phenomena. Nonetheless, glaciers are extremely important features because of the direct and indirect effects on the earth and its inhabitants resulting from the presence of extensive ice-covered areas.

Glaciers occupy a total of 5,800,000 sq.mi., or 10% of the earth's land surface. an area nearly as large as South America. Of the present area of glaciers 96% is concentrated in Antarctica and Greenland, and the remainder is widely scattered on all continents, except Australia, and on many islands in high latitudes. The exact volume of glaciers is not known, but conservative estimates suggest that there is enough ice to incase the entire earth in a mantle between 100 and 200 ft. thick. Variations in the existing amount of glacier ice are highly critical to man because appreciable changes, either increases or decreases, would adversely affect the distribution of people and their economic relationships. For example, if all existing glacier ice were to melt, the resulting rise in sea level of about 200 ft. would submerge every major coastal city in the world.

Types of **Glaciers.**—*Ice* Sheets.—The largest glaciers, which are called ice sheets or icecaps, cover huge areas and in many cases are thick enough to bury entire mountain ranges except for the highest peaks. Practically all of Antarctica, an area of more than 5,000,000 sq.mi. is covered by an ice sheet locally 8,000 ft or more in thickness. The Greenland ice sheet covers about 650,000 sq.mi. and has a maximum measured thickness of nearly 11,000 ft. Smaller ice sheets occur on Iceland. Spitzbergen and several other arctic islands, and still smaller ones in the highlands of Norway.

Valley Glaciers.—Ice streams which flow down mountain valleys are valley glaciers. The Alps, Rockies, Himalayas and other high ranges of the world contain many glaciers of this kind. The smallest valley glaciers are thin patches of ice covering only a fraction of a square mile. And at the other extreme is Beardmore glacier in the antarctic which is about 120 mi. long and 2j mi. wide. Hubbard glacier in Alaska is about 75 mi. long. Many large valley glaciers are 1,000 to 3,000 ft. thick.

Piedmont Glaciers.—A third and more rare type, intermediate between valley glaciers and ice sheets, are piedmont glaciers. They are valley glaciers which spread laterally over the lowland at the foot of a mountain range. The Malaspina and Bering glaciers in Alaska, each of which covers about 1,500 sq.mi., are splendid examples.

Differences in size between these three types of glaciers depend on climatic factors which determine the amount of snow that accumulates. Differences in form result from the fact that glacier ice flows and thus can mold its form according to the topography.

How Glaciers Form.—Glaciers originate in snow fields. The lower limit of perennial snow fields is called the snow line. The snow line is at sea level in polar regions and rises gradually toward the equator. The maximum altitude of the snow line (about 20,000 ft.) occurs not at the equator but in the dry horse latitudes between 20° and 30° north and south of the equator. Climatic conditions. which are determined by geographic position and altitude, affect both winter snowfall and summer melting, and thus are the major factors affecting locations of snow fields and glaciers. It is for this reason that some very cold but dry areas have no glaciers whereas other warmer areas with abundant snowfall support large glaciers.

As snow fields grow in thickness, solid ice is formed through gradual recrystallization of the accumulated snow. In the first step. which takes place near the surface, melting, evaporation and compaction transform fluffy flakes of new-fallen snow into a porous mass of small, rounded granules called firn. This stage in the change of snow to solid ice can be seen in any melting snowdrift. The weight of snow which accumulates year after year buries the firn of previous years to greater and greater depths. The increasing pressure causes melting and recrystallization at the edges of grains until all air space is gone, and solid crystalline ice is formed.

The thickness of snow, firn and ice can continue to increase only until the strength of ice is exceeded by the pressure exerted by the weight of the accumulation, at which point movement begins. As a result of the pressure from above, ice at the bottom moves in much the same way that cold molasses or tar will flow. Although ice in small pieces is a brittle substance incapable of flowing, ice under sufficient pressure behaves as a plastic material and flows readily though quite slowly. The thickness required to initiate movement varies somewhat depending on slope of the land surface, temperature of the ice and other factors, but some flow occurs in ice masses as little as 50 ft. thick.

Flowage causes a glacier to move downward or laterally into a zone where losses exceed annual accumulation of snow. If the glacier descends below the snow line, losses are due mostly to melting and evaporation, but where a glacier extends into the sea much of the wastage may result from breaking off of icebergs which float away. Thus, the size of a glacier and also variations in its size depend on the degree of balance between accumulation and wastage rates. A glacier which is in equilibrium (a rare condition) does not fluctuate in size because flowage from the zone of accumulation exactly compensates for losses sustained in the zone of wastage.

Glaciers move so slowly that the motion cannot be seen, but the speed of movement can be estimated in various ways. For example. there are many records of the bodies of mountaineers buried by avalanches in the Alps having been carried several miles to a glacier terminus in a few decades. Likewise. the movement of large rocks or other objects on a glacier surface can be determined by successive observations or measurements from some fixed point off the ice. Somewhat more precise ways of measuring glacier speeds include drilling deep holes in the ice and inserting pipes which are progressively deformed, or by setting up rows of stakes and measuring their movement by surveying techniques. Maximum velocities up to 150 ft. per day have been recorded, but a few inches or a few feet per day are more typical.

The various parts of a glacier move at different rates. Movement of a valley glacier is similar to the flow of a river in that velocities are greater in the centre than near the edges, as is shown by the fact that a straight row of stakes soon becomes curved. Ordinarily flow is more rapid in the middle part of a glacier than near its head or terminus. The upper 100 to zoo ft. of a glacier is composed of rigid, brittle ice which does not flow but is carried along by the mobile ice underneath. This brittle zone fractures easily and is characterized by long cracks called crevasses, which are caused by forces that result from different rates of flow in various parts of the underlying ice. Especially at places where the gradient of the bedrock floor changes abruptly, the upper surface of the glacier may be broken into a jumbled maze of ice pinnacles called *séracs*.

Effects of Glaciation.—Glaciers are the most powerful of all erosional agencies and their special effects on land features commonly are both distinctive and spectacular. Glaciated mountains are much more rugged than nonglaciated mountains. Sharp pointed peaks like the Matterhorn in Switzerland and deep, U-shaped valleys like Yosemite in the Sierra Nevada of California owe their form mainly to glaciation. The fiords of Norway, Patagonia and Alaska, are glaciated valleys now partially submerged by the sea.

A glacier abrades and polishes the bedrock floor over which it passes; rocks and sand pushed along by the ice have the effect of a giant rasp or piece of sandpaper. Frost action, landsliding and avalanching carry rock debris onto a glacier surface from the land protruding above it. The material carried by a glacier ranges from house-sized boulders to clay particles. When the glacier melts all of this material is laid down as an unsorted deposit called till or boulder clay. At the terminus of a glacier the melting ice drops its load in the form of mounds and ridges referred to as a terminal moraine. Valley glaciers also commonly have lateral moraines between the edge of the ice and the valley walls, and medial moraines formed by confluence of tributary glaciers which have lateral moraines.

Drumlins are clusters of elongate hills oriented parallel to the direction of ice movement; they are composed of till laid down near the margins of large ice sheets.

Much of the material laid down by glaciers is reworked by melt-water streams, which build outwash plains and outwash terraces composed of stratified sand and gravel. Kettles are depressions on outwash plains formed by melting of ice blocks buried in the outwash deposits. Eskers are winding ridges of stratified gravel and sand believed to have been deposited by subglacial streams.

Former Periods of Glaciation.— Present-day glaciers are in part remnants left over from the Ice Age or Pleistocene epoch (*q.v.*), when the ice-covered area of the earth was three times its present size (see also MAN, EVOLUTION OF: Estimation *of Geo*logical Antiquity). The antarctic and Greenland glaciers were not much larger then than now, but large areas in North America and Europe were covered by ice sheets. Exactly when Pleistocene glaciation began is not known, but probably less than 1,000,000 years ago. Available evidence indicates that there were at least four major glacial periods, separated by intervals when the climate was warmer than at present. So far as can be determined by use of the radiocarbon method for dating wood and other organic matter found in glacial deposits, the last major ice advance in North America and Europe culminated about 18,000 years ago. At this time the snow line was 1,200 to 1,400 ft. lower than at present and mean annual temperature may have been about 14° F. cooler. Final shrinkage of the North American and European ice sheets began about 11,000 years ago, and by 3000 B.C. glaciers were less extensive than at present. After 2000 B.C., glaciers again expanded slightly and in most parts of the world attained sizes slightly greater than during the 17th and 18th centuries. Warmer climate during the last half of the 19th century, and especially the first half of the 20th century, caused extensive shrinkage of glaciers throughout the world. Although recession has been the general rule during this period, a few glaciers have either advanced or remained essentially stable.

Not only are remnants of Pleistocene glaciers still present, but also the landscape over wide areas bears the direct or indirect imprint of glaciation. Areas that were covered by ice are strewn with till and characterized by typical glacial land forms, including moraines, drumlins and eskers. Drainage features reflect influences of glaciation, in that the courses of some rivers, as the Missouri, were determined by the position of the glacier margin; furthermore, the thousands of lakes and swamps in Canada and the northern United States and in northern Europe occupy basins formed by glacial erosion and deposition. Indirect effects of the Pleistocene glacial episode extend far from the areas actually covered by ice. Belts of sand dunes and blankets of wind-blown silt, called loess (*q.v.*) occupy large areas south of the boundaries of the former North American and European ice sheets.

Terraces caused by variations in stream load accompanying glaciation and deglaciation are prominent features in many valleys. Terraces were also formed along the coast as a result of sea level fluctuations during glaciations and interglacial periods. Large lakes developed in regions now arid, as a result of greater precipitation and less evaporation during glacial times; Great Salt lake (*q.v.*) is a remnant of a formerly much larger body referred to as glacial Lake Bonneville (see also UTAH).

Before the Pleistocene ice age, there were two earlier major glaciations. Both of these occupied large areas in belts which are now tropical. One glaciation occurred during late Pre-Cambrian time (about 600,000,000 years ago) and the other during the Permian period (roughly 235,000,000 years ago). Apparently, all three of the known major glacial episodes were rather brief, and during the long intervals between them glaciers were not present even in high mountain and polar regions. This means that we are living during an unusual period, because during most of geologic time climate was considerably warmer than at present, and trees of subtropical types grew even in polar areas that are now covered by ice.

Glaciological Research.— Although an impressive amount is known about glaciers, many important problems await solution. Much remains to be learned about the physical properties and behaviour of glaciers, especially the large ice sheets. Flow speeds of many glaciers have been determined, but there is no satisfactory explanation of the mechanism by which flow of ice occurs. Relations between glacier fluctuations and climatic variations are highly complicated and poorly understood. The ultimate cause of world-wide climatic changes which during geologic time have resulted in three major glaciations is still an unsolved mystery. Variations in astronomic, atmospheric, oceanic and continental tectonic factors have been considered, and recently migration of the poles was suggested. All of these and many other related problems are the subjects of intensive study by glaciologists all over the world. Apart from purely scientific interest, there is a practical aspect to such investigations because of potential effects 'on man that would accompany changes in the present amount of glacier ice. Studies of past behaviour of glaciers have been too limited in scope to be of significant value in forecasting future trends. See also GEOLOGY.

Hobbs, *Characteristics of Existing Glaciers* (1911). Later work includes: H. W. Ahlmann, *Glacier Variations and Climatic Fluctuations* (1953); A. E. Vial, *Alpine Glaciers* (1952); F. E. Matthes, "Glaciers" in *Physics of the Earth*, vol. ix (1942): R. F. Flint, *Glacial and Pleistocene Geology* (1957); R. P. Sharp, ('Glacier Flow: a Review," *Bull. Geol. Soc. Amer.*, 65:835–838 (Sept. 1954); the latter two references contain extensive bibliographies. The *Journal of Glaciology* and *Zeitschrift fur Gletscherkunde* are devoted almost entirely to results of glacier research; in addition, articles on glaciers appear in many other geological and geographical journals. (J. P. MR.)

GLACIER BAY NATIONAL MONUMENT is approximately 100 mi. N.W. of Juneau in southeastern Alaska. Its ice fields terminate in more than 20 glaciers. Muir glacier, the best known, has a face 2 mi. wide and more than 200 ft. high. Glacier bay lies in a basin whose high western boundary culminates in 15,320-ft.-high Mt. Fairweather. Many glaciers funneling into a single narrow channel produce dramatic ice movements.

The region has been known since about 1700. Around 1750 the ice filled practically the entire bay; it had begun to retreat by the time of Capt. George Vancouver's visit in 1794. Since then the ice front usually has been in retreat.

The G.S. naturalist John Muir visited and reported on Glacier bay in 1879 and 1880. Thereafter it was intensively studied by glaciologists, climatologists and plant ecologists.

Glacier bay was made a national monument in 1925; a unit in the U.S. national park system, it comprises about 2,300,000 ac. It may be reached by ship, small boat or air. (J. E. CL.)

GLACIER NATIONAL PARK, in northwestern Montana, C.S., was established in 1910 to protect a highly scenic part of the Rocky mountains. Traversed from north to south by the continental divide, the park is a wilderness of more than 1,000,000 ac.

The mountains constitute a fault-block range. Faulting of the earth's crust along the eastern slope has resulted in rock of ancient origin being forced eastward for 15 mi. on rock of a later geologic period, a formation referred to as the Lewis overthrust.

Mountains, lakes: cirques and U-shaped valleys all show the effect of glacial action that took place during a more recent period, when the region was covered by an ice sheet hundreds of feet thick. A few remnants of the glaciers still cling to the higher peaks.

West of the continental divide, rainfall is heaviest, so that forest growth is more luxuriant there. Characteristic trees are western red cedar, hemlock. larch. white birch. lowland white fir and est-ern white and ponderosa pine. East of the divide, lodgepole pine and Engelmann spruce predominate, while Douglas fir occurs

THE MER DE GLACE

The Mer de Glace, near Chamonix, in the French Alps, is a glacier $3\frac{1}{2}$ miles long, formed by the junction of three others, the Glacier du Géant, the Glacier de Talèfre and the Glacier de Leschaux

BY COURTESY OF (BOTTOM LEFT) W. S. BARCLAY, (BOTTOM CENTRE) THE NEW ZEALAND HIGH COMMISSIONER; PHOTOGRAPHS, (TOP LEFT) E. M. NEWMAN FROM PUBLISHERS PHOTO SERVICE, (TOP CENTRE) THE KEYSTONE VIEW CO., INC., (TOP RIGHT, CENTRE) BRADFORD WASHBURN, (BOTTOM RIGHT) EWING GALLOWAY

VARIOUS TYPES OF GLACIERS

Top left: Monte Rosa glacier seen from Gornergrat, Switzerland. The dark rock on the right is hundreds of feet in height

Top centre: Balmaceda glacier. Last Hope Sound, Chile. Huge blocks of ice stand above the glacier's surface

Top right: Mendenhall glacier near Juneau, Alaska. This glacier is a large, nearly stagnant ice sheet

Centre: Malaspina glacier in the Mt. St. Elias range, Alaska, an excellent example of the piedmont type of glacier

Bottom left: La Romanche glacier, Beagle Channel, Tierra del Fuego, falls directly into the sea

Bottom centre: Franz Josef glacier and Castle rock, Westland, South Island, N. Z., showing crevasses and jagged ice formations on the surface

Bottom right: Tschierva glacier from Alp Ota, near Pontresina, Switzerland. This glacier is an Alpine type showing valley formation and lateral moraines along the margins on both sides. At high elevations, groups of limber pine, whitebark pine and alpine fir grow in meadows that are bright with wild flowers in the summer.

The white mountain goat attracts the attention of visitors by its ability to traverse sheer cliffs. Other mammals of the sanctuary are black and grizzly bear, mountain lion, coyote, elk, moose and deer. Some of the park's birds are Rocky Mountain jay, water ouzel, Clark's nutcracker, white-tailed ptarmigan and grouse.

Adjoining the international border, Glacier is contiguous to Canada's Waterton Lakes National park. The two comprise the Waterton-Glacier International Peace park. (Dx. B.)

GLACKENS, WILLIAM JAMES (1870–1938), U.S. painter and leader of the group known as The Eight, was born in Philadelphia on March 13, 1870, studied at the Pennsylvania Academy of the Fine Arts and at the same time worked as an illustrator for the *Philadelphia Record*, the *Public Ledger* and the *Press*. In 1895 he spent a year in Paris and then settled in New York where he continued as an illustrator for the *New York Herald* and the *New York World*. *McClure's Magazine* sent him to Cuba in 1898 to cover the Spanish-American War. At about the turn of the century he took up painting seriously; "Hammerstein's Roof Garden" (1901) was his first important picture. As an illustrator he had dealt with all aspects of contemporary life; he was a sure draftsman and had a keen visual memory, which gave an authentic quality to his work.

He joined with a group of artists who were also interested in depicting contemporary life, and they united to oppose the stodgy, old-fashioned viewpoint of the National Academy. Robert Henri was the leader, and around him gathered John Sloan, George Luks, Everett Shinn as well as the more romantic painters Ernest Lawson, Maurice Prendergast and Arthur B. Davies. Known as The Eight (later, known as the "Ash Can school" because of their honest rendering of city scenes), they held one memorable exhibition in 1908 at the Macbeth gallery, but, due to diversity of viewpoints, the group did not hold together.

One of Glackens' major early works was "Chez Mouquin" (1905) showing a gay New York restaurant in a vivid and robust manner. Later he became interested in Impressionism and very consciously tried to imitate Renoir.

He died in Westport, Conn., on May 22, 1938.

GLADBACH, the name of two towns in Germany, distinguished as Bergisch Gladbach and Monchen-Gladbach.

1. BERGISCH GLADBACH is in North Rhine-Westphalia, 8 mi. N.E. of Cologne by rail. Pop. (1950) 32,681. It possesses four large paper mills, and among its other industries are percussion caps, nets, machinery, iron founding and fire clay. Ironstone. peat and lime are found in the vicinity. Near Gladbach is Xltenberg, with a remarkably fine church built for the Cistercian abbey.

2. MONCHEN-GLADBACH, also in North Rhine-Westphalia, 16 mi. W.S.W. of Dusseldorf on the main line of railway to Aachen. Pop. (1885) 44,230; (1950) 124,879. Its industries are the spinning and weaving of cotton, the manufacture of silks, velvet, ribbon and damasks, and dyeing and bleaching. There are also tanneries, machine works and foundries. The beautiful minster has a Gothic choir (1250), a nave (early 13th century) and a crypt of the 8th century. The town is the headquarters of important insurance societies. A Benedictine monastery was founded near Gladbach in 793; so it was called Monchen-Gladbach (Monks' Gladbach). The monastery was suppressed in 1802. Gladbach became a town in 1336 and came into the possession of Prussia in 1815. Its oil tanks, railway yards and airfield were frequent targets for British bombers in World War II.

GLADDEN, WASHINGTON (1836–1918), U.S. Congregational minister and religious journalist. the foremost early advocate of the social gospel (*see* CHRISTIAN SOCIALISM) in the U.S., was born at Pottsgrove, Pa., Feb. 11, 1836. He grew up on a farm and received early newspaper training in a small city newspaper office. He attended Williams college. Williamstown, Mass., and later held pastorates at North Adams and Springfield, Mass. He was religious editor of the *New York Independent* for four years from 1871. In 1882 he became pastor of the First Congregational church of Columbus, O., which he served until his death (becoming emeritus pastor in 1914).

Gladden was attracted to the ministry by "a religion that laid hold upon life with both hands, and proposed, first and foremost, to realize the Kingdom of God in this world" *(Recollections)*. As acting editor of the *Independent* he aided in the exposure of the Tweed ring. He opposed both socialism and classical economic theory and sought to apply the "Christian law" to social problems; he was probably the first U.S. clergyman of note to approve of unionization. A popular speaker, he appeared before universities and theological schools, twice giving the Beecher lectures at Yale.

The titles of his 40 books often conveyed their messages: *Applied Christianity* (1887), *Who Wrote the Bible?* (1891), *Ruling Ideas of the Present Age* (1895), *Social Salvation* (1901). His poem "O Master, Let Me Walk With Thee" became a familiar hymn.

Gladden advocated church union, stimulating the formation of many federations by his fictional account of *The Christian League of Connecticut* (1883). He was a charter member of the American Economic association and served two years on the Columbus city council. In 1904 he was elected moderator of the National Council of Congregational Churches and shortly afterward startled the country with a proposal to reject a $100,000 gift from John D. Rockefeller to the denomination's foreign missions board, on the ground that it was "tainted money." He died at his home in Columbus on July 2, 1918.

See his autobiography, *Recollections* (1909), which contains a bibliography of his works; C. H. Hopkins, *The Rise of the Social Gospel in American Protestantisnz, 1865–1915* (1940). (C. H. Hs.)

GLADIATORS (from Lat. *gladius*, "sword"), professional combatants who fought to the death in Roman public shows. That this form of spectacle, which is almost peculiar to Rome and the Roman provinces, was originally borrowed from Etruria is shown by various indications. The older Roman name for the fighters was *bustuarii*. The first gladiators are said to have been exhibited at Rome in the Forum Boarium in 264 B.C. by Marcus and Decimus Brutus at the funeral of their father. On this occasion only three pairs fought, but the taste for these games spread rapidly, and in 174 B.C. Titus Flaminius celebrated his father's obsequies by a three-day fight in which 74 gladiators took part.

Julius Caesar engaged such extravagant numbers for his aedileship that his political opponents took fright and carried a decree of the senate imposing a certain limit of numbers, but notwithstanding this restriction he was able to exhibit no less than 300 pairs. During the later days of the republic the gladiators were a constant element of danger to the public peace. The more turbulent spirits among the nobility each had his band of gladiators to act as a bodyguard. Under the empire the passion for the arena steadily increased. Augustus, indeed, limited the shows to two a year and forbade a praetor to exhibit more than 120 gladiators; yet 100 pairs were the fashionable number for private entertainments, and in the Marmor Ancyranum the emperor states that more than 10,000 men had fought during his reign. Even the emperor Titus ordered a show which lasted 100 days; and Trajan, in celebration of his triumph over Decebalus, exhibited 5,000 pairs of gladiators.

Domitian at the Saturnalia of A.D. 90 arranged a battle between dwarfs and women. Even women of high birth fought in the arena, and it was not till A.D. 200 that the practice was forbidden by edict.

Gladiators were commonly drawn either from prisoners of war, slaves, or criminals condemned to death. Down to the time of the empire, only greater malefactors, such as brigands and incendiaries, were condemned to the arena; but by Caligula. Claudius and Nero this punishment was extended to minor offenses. For the first century of the empire it was lawful for masters to sell their slaves as gladiators, but this mas forbidden by Hadrian and Marcus Aurelius. Besides these three regular classes, the ranks were recruited by a considerable number of freedmen and Roman citizens who had squandered their estates and voluntarily took the *auctoramentum gladiatorium*, by which for a stated time they bound themselves to the *lanista.* Even men of birth and fortune not seldom entered the lists, and one emperor, Commodus, actually appeared in person in the arena.

Gladiators were trained in schools (ludi) owned either by the state or by private citizens, and though the trade of a *lanista* was considered disgraceful, to own gladiators and let them out for hire was reckoned a legitimate branch of commerce. Men recruited mainly from slaves and criminals, whose lives hung on a thread, must have been more dangerous characters than modern galley slaves or convicts; and, though highly fed and carefully tended, they were of necessity subject to an iron discipline. In the school of gladiators discovered at Pompeii, of the 63 skeletons buried in the cells many were in irons. But hard as was the gladiators' lot (so hard that special precautions had to be taken to prevent suicide), it had its consolations.

A successful gladiator enjoyed far greater fame than any modern prize fighter or athlete. He was presented with broad pieces, chains and jeweled helmets, such as may be seen in the museum at Naples; poets like Martial sang his prowess; his portrait was multiplied on vases, lamps and gems; and highborn ladies contended for his favours.

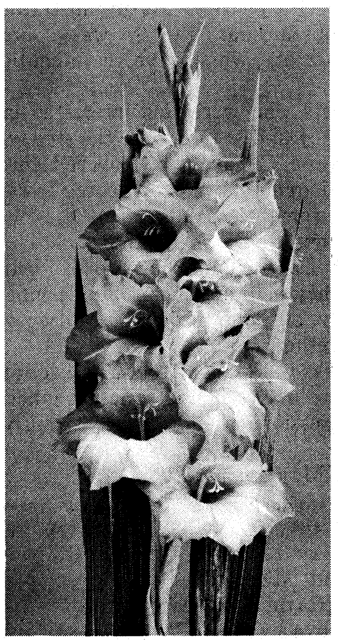
There were various classes of gladiators, distinguished by their arms or modes of fighting. The Samnites fought with the national weapons—a large oblong shield, a visor, a plumed helmet and a short sword. The Thraces had a small round buckler and a dagger curved like a scythe; they were generally pitted against the Mirmillones, who were armed in Gallic fashion with helmet, sword and shield, and were so called from the fish which served as the crest of their helmet. In like manner the Retiarius was matched with the Secutor; the former had nothing on but a short tunic or apron, and sought to entangle his pursuer, who was fully armed, with the cast net *(iaculum)* that he carried in his right hand; if successful, he despatched him with the trident (tridens, *fuscina*) that he carried in his left. There were also the Andabatae, who are believed to have fought on horseback and to have worn helmets with closed visors; the Dimachaeri of the later empire, who carried a short sword in each hand; the Essedarii, who fought from chariots like the ancient Britons; the Hoplomachi, who wore a complete suit of armour; and the Laquearii, who tried to lasso their antagonists.

The shows were announced some days before they took place by bills affixed to the walls of houses and public buildings; copies were also sold in the streets. These bills gave the names of the chief pairs of competitors, the date of the show, the name of the giver and the different kinds of combats. The spectacle began with a procession of the gladiators through the arena, after which their swords were examined by the giver of the show. The proceedings opened with a sham fight *(praelusio, prolusio)* with wooden swords and javelins. The signal for real fighting was given by the sound of the trumpet, those who showed fear being driven on to the arena with whips and red-hot irons. When a gladiator was wounded, the spectators shouted *"habet"* ("he is wounded"); if he was at the mercy of his adversary, he lifted up his forefinger to implore the clemency of the people, to whom (in the later times of the republic) the giver left the decision as to his life or death. If the spectators were in favour of mercy, they waved their handkerchiefs; if they desired the death of the conquered gladiator, they turned their thumbs downwards. (A different account is given by Mayor on Juvenal iii 36, who says: "Those who wished the death of the conquered gladiator turned their thumbs towards their breasts, as a signal to his opponents to stab him; those who wished him to be spared turned their thumbs downwards as a signal for dropping the sword.") The reward of victory consisted of branches of palm, sometimes of money.

Gladiators who had exercised their calling for a long time or who displayed special skill and bravery were presented with a wooden sword *(rudis)* and discharged from service. The first Christian emperor was persuaded to issue an edict abolishing gladiatorial games (325), yet in 404 we read of an exhibition of gladiators to celebrate the triumph of Honorius over the Goths, and it is said that they were not totally extinct in the west till the time of Theodoric.

The tesserae of gladiators were small oblong tablets of ivory or bone, with inscriptions giving the name of the gladiator; the name of the *patronus* or *dominus;* the letters SP (for *spectatus,* "approved"). showing that the gladiator had passed his preliminary trials; a day of a Roman month; and the names of the consuls of a particular year.

GLADIOLUS, (from *gladius,* a "sword," in allusion to the sword-shaped leaves) a numerous genus of showy herbs belonging to the iris family (Iridaceae). They grow from a solid fibrous-coated corm (a bulblike enlargement of the base of the stem) and have long narrow plaited leaves and a terminal one-sided spike of generally bright-coloured irregular flowers blooming from the bottom upward. The segments of the limb of the perianth are very unequal, the perianth tube is curved, funnel shaped and widening upward, the segments equaling or exceeding the tube in length. There are about 250 known species, a large number of which are South African, but the genus extends into tropical Africa, forming a characteristic feature of the mountain vegetation, and as far north as central Europe and western Asia. One species G. *illyricus,* though very rare, is found wild in England, in the New forest and the Isle of Wight. Some of the species have long been cultivated in flower gardens, where both the introduced species and the modern varieties bred from them are very ornamental and popular.



J. HORACE MCFARLAND CO.

A GARDEN GLADIOLUS

The modern varieties of gladioli have almost completely driven the natural species out of gardens, except in botanical collections. The most gorgeous groups are those of hybrid origin, most of which have been derived from G. *blandus,* G. *cardinalis,* G. *dracocephalus,* G. *psittacinus,* G. *gan*davensis, G. *oppositiflorus* and G. *primulinus.* The flowers of the best varieties are of great size and substance, often measuring seven to nine inches across, while the range of colour is marvelous, with shades of gray, purple, scarlet, salmon, crimson, rose, white, pink, yellow, etc., often beautifully mottled and blotched in the throat. The plants are vigorous in growth, often reaching a height of three to four feet.

The beginning of the modern cultivated gladioli was probably the introduction of G. gandavensis (itself a hybrid) in 1841.

A deep and rather stiff sandy loam enriched with well-decomposed manure is the best soil for gladioli. The corms should be planted in succession at intervals of two or three weeks, after warm weather arrives, about three to five inches deep and at least one foot apart.

The gladiolus is easily raised from seeds, which should be sown in March or April in pots of rich soil placed in slight heat, the pots being kept near the glass after they begin to grow, and the plants being gradually hardened to permit their being placed out of doors in a sheltered spot for the summer. The time occupied from the sowing of the seed until the plant attains its full strength is from three to four years. Because few of the seeds come true to type approved sorts are multiplied by secondary corms which form around the principal corm; but in this they vary greatly, some kinds furnishing abundant increase, while others fail to yield offsets.

The rich glowing colours of the modem gladioli render them exceedingly valuable as decorative plants during the summer months. They are, moreover, very desirable and useful flowers for room decoration, for while the blossoms themselves last fresh for several days if cut early in the morning or late in the evening, the undeveloped buds open in succession, so that a cut spike will go on blooming for some time. (N. TR.)

GLADSTONE, HERBERT JOHN GLADSTONE, 1ST VISCOUNT (1854–1930), English statesman, son of W. E. Gladstone (*q.v.*), was born in London on Jan. 7, 1854, and educated at Eton and at University college. Oxford. He lectured on history at Keble college for three years (1877–80) and then entered on a parliamentary career, representing Leeds from 1880 to 1910.

From 1880 to 1881 he acted as private secretary to his father, and in 1881 became a lord of the treasury. His other political offices were financial secretary to the war office (1886); under-secretary at the home office (1892–94); first commissioner of works (1894–95); chief whip to the Liberal party (1899–1906); and secretary of state for home affairs (1905–10). In 1910 he was created a viscount, was appointed the first governor general and high commissioner for South Africa, a post which he held until July 1914. He was created knight of the grand cross of the order of St. Michael and St. George in 1910 and made knight grand cross of the order of the Bath in 1914. He wrote *W. E. Gladstone* (1918) and *Affer Thirty Years* (1928). Lord Gladstone died at Dane End, near Ware. Hertfordshire, on March 6, 1930.

GLADSTONE, WILLIAM EWART (1809–1898), four times prime minister of Great Britain, was born in Liverpool on Dec. 29, 1809. His descent was purely Scottish. His mother, formerly Anne Robertson of Dingwall, came of good Highland family; and his father John (1764–1851) was descended from the Gledstanes of Lanarkshire, once bailies to the earls of Douglas. His father's father had been a corn dealer at Leith; John Gladstone made himself into a merchant prince by trading with the East and West Indies, and became a leading citizen of the great slaving port of Liverpool. He was a Canningite member of parliament from 1818 to 1827, was made a baronet in 1846, and died worth about £600,000. William Ewart Gladstone, named after a friend of his father's, was the fifth of six children. He was sent to Eton, where Arthur Hallam, the subject of Tennyson's *In Memoriam*, was his closest friend. Eton he ever afterward described as the queen of all schools; he did not particularly distinguish himself there. He first displayed his considerable powers of intellect at Christ Church. Oxford, nhere he secured two first classes in 1831, in Greats (classics) in November and in mathematics in December.

His father dissuaded him from his original intention to take orders in the Church of England; and he devoted his life, as he saw it, to serving the principles of the Gospel in politics. As a disciple of Edmund Burke and George Canning, he mistrusted parliamentary reform; his speech against it in May 1831 at the Oxford Union. of which he was president, made a strong impression, and was indeed regarded as the finest so far delivered there. One of his Christ Church friends, son of the duke of Newcastle, persuaded the duke to support Gladstone as candidate for Newark in the general election of Dec. 1832; and the "Grand Old Man" of Liberalism thus began a parliamentary career of more than 60 years as a Tory member for what was little better than a pocket borough.

His abilities were noticed early; his maiden speech on June 3, 1833, defending the treatment of slaves on a plantation his father owned in Demerara, made a decided mark. He held minor office in Sir Robert Peel's short government of 1834–35, first at the treasury under Peel himself. then as undersecretary for the colonies under Lord Aberdeen. After two other women had refused him, in July 1839 he married Catherine (1812-l goo), daughter of Sir Stephen Glynne of Hawarden near Chester. She was a woman of lively wit, complete discretion and exceptional charm, utterly devoted to her husband, to whom she bore eight children. This marriage gave him a secure base of personal happiness for the rest of his life. It also established him in the aristocratic governing class of the time; his wife's mother had been Pitt's first cousin. His first book. *The State* in *Its Relations With the Church*, had been published in 1838. He outgrew while he wrote it its strong and narrow doctrines, to the effect that the Church of England must act as the conscience of the state, which in its turn can distinguish religious truth and falsehood; doctrines already obsolescent when the book appeared.

The Influence of **Peel.**—Macaulay, in a too celebrated afterthought, referred to him in reviewing this work as the rising hope of stern and unbending Tories. His early parliamentary performances were indeed strongly Tory; but time after time actual contact with the effects of Tory policy forced him by the evident justice of each particular case to take a more liberal view. His conversion from the conservatism in which he was brought up to the liberalism which gave him lasting fame was prolonged by stages over a generation. He took his first steps in a liberal direction during Peel's second ministry (1841–46). By 1840 he was attending meetings of what would now be called the shadow cabinet, and had hoped to be included in the new cabinet from the start as secretary for Ireland; but Peel rightly judged that he was too strong an Anglican for immediate contact with a country part Roman Catholic and part Presbyterian. and that the son of so successful a merchant would be useful at the board of trade. Gladstone, made vice-president of the board under the ineffective Lord Ripon, complained privately that "the science of politics deals with the government of men, but I am set to govern packages"; yet the wisdom of Peel's choice was soon apparent. The vice-president's powers ofw application astonished even his hard-working colleagues; Sir James Graham said of him that he could do in four hours what would take any other man 16, and that he worked 16 hours a day.

Under Peel's supervision he embarked on a major simplification of the tariff; in 1842 the duties on no fewer than 750 articles were removed or reduced. While mastering the complexities of this subject Gladstone became indeed a more thoroughgoing free trader than Peel himself. The prime minister felt that Gladstone was outstanding among all the promising young men in the government; said that a more admirable combination of ability, knowledge, temper and discretion had never before been exhibited in parliament; and in May 1843 invited him into the cabinet as president of the board of trade.

Gladstone accepted, after characteristic hesitations about a proposal to amalgamate t o Welsh bishoprics; and continued the work of improving the commercial structure of the country. The Railway act of 1844, prepared under his direction, compelled all lines to carry passengers in covered coaches, once a day at least, at a charge of not more than 1*d.* a mile, and made provision for eventual state purchase of railway lines. Among other useful tasks, he much improved working conditions for coal heavers in the London docks. Early in 1845, when the cabinet proposed to increase the state grant to the Irish Roman Catholic college at Maynooth, Gladstone resigned—not because he did not approve of the increase, but because it went against the views he had published seven years before. Plain men found his reason for resigning pernickety. At the end of the year he rejoined the cabinet as secretary of state for the colonies. This legally involved the resignation of his seat at Newark. As he was by now a convinced free trader, and the duke of Newcastle was a protectionist, he could not win it again; and for various reasons he did not contest any of the half-dozen possible seats suggested to him by the Conservative whip. For six months, till Peel's government fell in June 1846, he was in office, but not in parliament—a position of doubtful constitutional propriety. Absence from the commons had an effect of importance to him; he was unable to make any personal reply to Disraeli's onslaughts on Peel. While he was at the colonial office he was led nearer to liberalism by being forced to consider the claims of English-speaking colonists to govern themselves; but he was there too short a time to make any useful mark on colonial policy.

Private Preoccupations.—The Glynne family estates were deeply involved in the financial panic of 1847. For several years Gladstone was concerned with extricating them, devoting his customary energy to the intricacies of industrial investment and land tenure; dull as this work must have been at the time, it gave him a still fuller insight into practical economics, which helped him later when he was chancellor of the exchequer. In the course of these operations he became the largest landlord in the county of Flint. At about the same time he began, with singular simplicity, a habit of charitable work which was open to a great deal of misconstruction; he often tried, in the streets of London, to persuade prostitutes to enter a home which he and his wife maintained, or in some other way to take up a different way of life. He spent much time and money on these efforts, till well past his 75th birthday. Another private matter that absorbed a great deal of his attention was the conversion of his youngest sister to the Roman Catholic church; this pained him even more acutely than any of the political separations that befell him.

Some of his closest Oxford friends were among the Anglicans who left the Church of England for the Church of Rome under the impact of the Oxford movement and the Gorham judgment (*see* ENGLAND, CHURCH OF. and MANNING. HENRY EDWARD). Gladstone had been brought up by an evangelical mother; he had moved over to. a high Anglican position when in Italy just after leaving Oxford. and once he had reached it he retained it. Neither affection nor argumentative skill could ever persuade him to become a Roman Catholic himself; but the suspicion that he was one dogged him, and was used against him from time to time by political and clerical adversaries. Of these he had many in the University of Oxford, for which he was elected M.P., to his great delight, in Aug. 1847. He scandalized many of his new constituents at once by voting for the admission of Jews to parliament, and many more by his tolerant opposition to Lord John Russell's Ecclesiastical Titles act of 1851.

In June 1850 he made his first weighty speech on foreign affairs, opposing Lord Palmerston in the Pacifico debate. That autumn he paid a private visit to Naples, and called on a learned friend. who turned out to be in prison. The conditions that he found in the Neapolitan prisons so appalled him that when he returned to London next February he could talk of little else. Brushing aside a request to join a protectionist government that was in contemplation, he appealed to Lord Aberdeen, the leader of his Peelite friends and a former foreign secretary, to use his influence to help the many thousands of starving political prisoners Gladstone had seen living chained to criminals in underground dungeons. Aberdeen took time in consulting powerful acquaintances in Vienna; nothing was actually done. So in July 1851 Gladstone published two trenchant *Letters to Lord Aberdeen* which described what he had seen and appealed to all Conservatives to set an iniquity right. The results were far from what he had desired. For the time. the Neapolitan prisoners were treated even worse than before, and most Conservatives, all over Europe, were deaf to his appeal. But Palmerston circulated the *Letters* to all the British missions on the continent, and they delighted every liberal who heard of them.

Financial Policy.—For nine years after Peel's death in 1850 Gladstone's political position was seldom comfortable and sometimes embarrassing. One of the most eminent of the duindling band of distinguished Peelites. he was mistrusted by the leaders of both the main parties, and distrusted some of them—particularly Palmerston and the protectionist Disraeli—in his turn. He refused to join Lord Derby's government in 1852. At the end of that year, by a brilliant attack on Disraeli's budget, he brought the government down; and he took a long stride forward in public estimation as a result, for he joined Aberdeen's coalition as chancellor of the exchequer. His first budget speech on April 18, 1853, gave the country in Greville's words "the assurance of a *man* equal to great political necessities, and fit to lead Parties and direct Governments." In his bold and comprehensive plan he made further large reductions in duties, propounded the eventual elimination of the income tax, and with considerable political courage revived and carried a scheme that Pitt had not been strong enough to carry in 1796, for the extension of the legacy duty to real property. Every other member of the cabinet at first opposed this proposal, and he converted them all. His budget provided the backbone of the coalition's success in 1853, a year in which he spent much time in arranging for competitive entry into the civil service. He was also busy preparing the Oxford University act passed in the following year; this local preoccupation kept him from taking any detailed interest in the events which led up to the Crimean War. He defended the war, then and thereafter, as necessary at its inception for the defense of the public law of Europe; but of course its outbreak deranged his financial plans. He determined to pay for it as far as possible by taxation. and doubled the income tax—from *7d.* to *1s. 2d.*—in 1854. When Aberdeen fell in Jan. 1855 Gladstone agreed to join Palmerston's cabinet, but resigned three weeks later with two other Peelites, Sir James Graham and Sidney Herbert, sooner than accept J. A. Roebuck's committee of inquiry (*see* ROEBUCK, JOHN ARTHUR). This action mas no more readily explicable to ordinary men than his resignation ten years earlier had been, and he was for a time unpopular in the country. He made himself more unpopular still by speeches in parliament in the summer of 1855 in which he held that the war mas no longer justified, as its proper objects had already been attained. Meanwhile his imagination was still haunted by the horrors of Naples. He helped finance a quixotic project, to which Palmerston added £500 from secret service funds. A steamer with an armed crew was dispatched to rescue some Neapolitan prisoners confined on a Mediterranean island. The good, and the harm. that might have come of this voyage were alike averted when the vessel sank on the way.

Gladstone always kept up his reading in classical studies, as well as in theology and Italian poetry; and used his leisure out of office to prepare a long book. *Homer and the Homeric Age* (3 vol.; Oxford, 1858), which suggested that ancient Greek life had been designed by providence to show men how they should behave to each other. He helped to defeat Palmerston in the commons by a speech on China in March 1857; and later that year opposed the Divorce bill on religious grounds with such persistency that he was accused long afterward of having invented parliamentary obstruction himself. He twice refused to join Derby's government in 1858, in spite of a generous letter from Disraeli; but accepted an offer to visit the Ionian Islands protectorate as lord high commissioner in the winter of 1858–59, a journey that produced no useful results.

In June 1859 he gave a silent, unavailing vote for Derby's Conservative government on a confidence motion, and caused surprise by joining Palmerston's Whig cabinet as chancellor of the exchequer a week later. His sole, but overwhelming, reason for joining a statesman he neither liked nor trusted was the critical state of the Italian question. The triumvirate of Palmerston, Russell and Gladstone did indeed help over the next 18 months to secure the unification of almost all Italy; but on other matters the cabinet was much divided.

Gladstone was constantly at issue with his prime minister over spending on defense. By prolonged efforts, he managed to get the service estimates down by 1866 to a lower figure than that for 1859. He took little other part in the government's foreign policy, except for an unfortunate and unauthorized reference to the seceding American states as "a nation" in Oct. 1862. The national economy responded well to his policies at the exchequer. which included the abolition of a further 370 duties by the celebrated budget of 1860. Two other financial measures of that year were important: the Anglo-French trade treaty, a project of Richard Cobden's which Gladstone warmly supported. and which shortly doubled the value of Anglo-French trade; and Gladstone's proposal to abolish the duties on paper, which to Palmerston's ill-concealed delight the house of lords rejected. Next year Gladstone repeated the proposal, this time including it with all the other budget arrangements in a single finance bill which the lords dared not amend, a procedure that has been followed ever since. Another particularly useful step was the creation of the post office savings bank. These measures brought him into increased contact, and increased popularity, with the leaders of working-class opinion; journeys round the main centres of industry did the same. A few words of his in the commons on May 11, 1864, were widely interpreted outside as a declaration of belief in practically universal suffrage; seen in their context, they are not quite so extreme. They are worth quoting, with their context, as an example of his characteristic tendency to qualification: "I venture to say that every man who is not presumably incapacitated by some consideration of personal unfitness or of political danger is morally entitled to come within the pale of the Constitution. Of course, in giving utterance to such a proposition, I do not recede from the protest I have previously made against sudden, or violent. or excessive, or intoxicating change." In the general election of July 1865 Gladstone was defeated at Oxford, but just secured a seat in south Lancashire; the sadness of the defeat was atoned for in some degree by a contact with a popular constituency which he found refreshing. When Palmerston died in October and Russell became prime minister, Gladstone took over the leadership of the house of commons, while remaining at the exchequer. It was not a post for which he was well suited; he was too busy to spend much time in making himself agreeable to backbenchers, and while Whigs distrusted him as a former Conservative, Conservatives distrusted him as a renegade, and radicals as a churchman.

By now quite convinced of the need for a further reform of parliament, he introduced a bill for the moderate extension of the franchise in March 1866. Violently attacked by Robert Lowe. it foundered in committee in June, and the whole government resigned. Next year Disraeli introduced another moderate Reform bill; and this passed, hut not until John Bright and Gladstone had transformed it in committee into a stronger one that gave a vote to most householders in boroughs. Early in 1868 Disraeli became prime minister; Gladstone, two months later, carried against him in the commons three resolutions calling for the disestablishment of the Protestant church in Ireland. and explained that autumn in *A Chapter of Autobiography* the reasons that had led him so far from the conclusions of his first book. Russell had by now resigned from active politics. and it was to Gladstone that the Liberal whips looked for instructions during the general election at the end of the year. Though Gladstone lost his Lancashire seat, he was returned for Greenwich; and the Liberal party won handsomely in the country as a whole. His abilities had made him its indispensable leader; and Queen Victoria called on him to form a government when Disraeli resigned.

First Administration.— Gladstone's first cabinet (1868–74) was one of the most capable of the century *(see* ENGLISH HISTORY: *The Age of Victoria* [1837–1901]). Its prime minister tried, like Peel and unlike Palmerston or Disraeli, to supervise the work of each department. while giving close attention to church appointments and devoting his main efforts to Irish and foreign policy. The Irish church was successfully disestablished in 1869, and a first attempt to grapple with Irish land was made in 1870; but the Land act of that year almost broke up the cabinet, and was emasculated by the lords. Abroad, an attempt to promote disarmament in 1869 failed, as Bismarck refused to consider it: the Franco-German War took the government completely by surprise; and the cabinet would not allow Gladstone to propose to Prussia the neutralization of Alsace and Lorraine. The principal achievements of 1871 and 1872, the London declaration by the great powers that they would not in future abrogate treaties without the consent of all the signatories and the settlement by arbitration of a long-standing claim for compensation by the United States, look well in retrospect, but were thought pusillanimous at the time. The most useful reforms at home mere administrative, except for the Education act of 1870 and the Ballot act of 1872; these measures supplemented the work of parliamentary reform. but antagonized opposite wings of the Liberal party. When an Irish University bill failed by three votes to pass the commons in March 1873, Gladstone resigned, but was forced back into office by Disraeli. In August he had to reshuffle his cabinet, and again took on the chancellorship of the exchequer himself. Fascinated by another plan to abolish income tax altogether, he dissolved parliament suddenly in Jan. 1874; but his party was heavily defeated, and his government resigned. As far back as 1855 he had written: "Public life is full of snares and dangers, and I think it a fearful thing for a Christian to look forward to closing his life in the midst of its (to me at least) essentially fevered activity." So he gave up the Liberal party leadership. though he remained M.P. for Greenwich; and retired to Hawarden. to write pamphlets attacking papal infallibility and articles on Homer.

Bulgarian Atrocities— The indifference of Disraeli's government to the brutality of Turkish reprisals against risings in the Balkans in 1875–76 brought him back to active politics. He had held for many years that the only just solution to Balkan problems was to hand the peninsula over to its indigenous inhabitants. Now, in Sept. 1876, he published a famous pamphlet on *Bulgarian Horrors and the Question of the East* which demanded that the Turkish irregulars should remove themselves, "one and all, bag and baggage, . . . from the province they have desolated and profaned." He took the lead in stirring popular indignation against the government's bellicose eastern policy; but it was uphill work. London society and the London mob were both against him; the queen, under the blandishments of her prime minister, strongly disapproved; the Whiggish elements in his own party were lukewarm or indifferent at first; and only some radicals, with whom he had little in common, supported him hotly. He paid too little attention to the embarrassment he was causing the Liberal party leader, Lord Granville. Yet in the end he triumphed.

He gave up his Greenwich seat, and stood for the Scottish county of Midlothian against a sitting Conservative who was heir to the greatest local magnate. In two tremendous outbursts of oratory, of volcanic force, in Nov. 1879 and March 1880, Gladstone secured his own return to parliament, but he did much more as well; he overthrew a government.

The general election of March and April 1880 had more, and on the whole more ardent, contests than any before; and it was this one man's eloquence that decided the result, and secured a large Liberal majority. The feat is unique. Gladstone was able, by manifest sincerity and skill of argument combined, to convince a majority of the electorate all over the kingdom that recent Conservative policy had been morally wrong, and the Conservative government had to resign.

Second Administration.— In his second administration (1880–85) Gladstone foolishly combined again for two years and a half the duties of prime minister with those of chancellor of the exchequer. Party lines had not yet set firm, and his large apparent majority in the commons was unruly; for example, he was dogged by the tiresome controversy over Charles Bradlaugh (*q.v.*); and it was not till 1884 that he could introduce the measure for which most Liberals had been pressing, a third Reform act that nearly doubled the electorate by giving votes to householders in country districts. This measure was only passed after a stiff quarrel with the house of lords. Gladstone had hoped to settle the eastern question quickly, and then retire. As it was. he and Granville, the foreign secretary, did manage by a brusque naval threat to compel Turkey to cede Thessaly to Greece; but Granville would not let him go on to give up Cyprus, as the government had already been weakened by other questions and had vital work still before it. There was, again, an appearance of weakness in what can now be recognized as Gladstone's magnanimous attitude to the Transvaal Boers after Majuba *(see* SOUTH AFRICA: *History)*; and there were still graver troubles in Ireland, in the throes of agricultural catastrophe. The exceedingly complicated Irish Land act of 1881, largely Gladstone's own work, did promote in the long run the prosperity of the Irish peasant; but violent crime continued, culminating in the murder on May 6, 1882. of Gladstone's close friend and nephew-in-law Lord Frederick Cavendish, who had just been sent to Dublin as chief secretary in the hope that a settlement could be reached. No alternatives were left to strong police powers in Ireland and measures to restrict the freedom of Irish members to obstruct the work of the commons; Gladstone hated both, but had to sanction them.

A third imperial inbroglio came to overshadow the other two, when a series of unavoidable decisions compelled the cabinet to authorize the occupation of Egypt in 1882. Gladstone's settlement of the Egyptian debt question (1885) was honourable to his belief in the concert of Europe, but had the unintended effect of tying British foreign policy to German. The worst mistakes he ever made were to allow Gen. C. G. Gordon (*q.v.*), whom he never met, to go to Khartoum, and then to fail to rescue him; Gordon was killed in Jan. 1885. This cost Gladstone much in popularity. Firm handling of a dispute with Russia over the northern borders of Afghanistan did something to restore his prestige; but when the government was defeated on the budget in June 1885 he was glad to resign. He refused a -gracefully worded offer of an earldom from the queen.

Irish Home Rule.—Though he had only spent three weeks in Ireland in his life (in 1877), Gladstone had historical insight and imaginative sympathy enough to appreciate the full force of Irish nationalism. For many years he had looked favourably on the case for Irish home rule, that is, for a subordinate parliament in Dublin. as his close colleagues knew. In the autumn of 1885 he believed the time for it was ripe; but as a combination of Irish with Conservative votes had defeated him in June, he waited silently to see what an Irish-Conservative combination would produce. Before the general election of Nov.–Dec. 1885 the radical leader Joseph Chamberlain (*q.v.*), whom Gladstone never much liked or understood at all, secured the allegiance of enough of the new voters in the countryside for his "unauthorized program" to produce a paradoxical result: in the new parliament the Liberal M.P.'s exactly equalled the total of Conservatives plus Irish. At this moment an indiscretion by Gladstone's youngest son revealed his father's conversion to home rule, and most Conservatives therefore turned against it. Lord Salisbury's government was defeated when parliament'met, and Gladstone formed his third cabinet in Feb. 1886. His Home Rule bill was rejected in parliament in June by a large secession of Whigs under Lord Frederick Cavendish's brother Lord Hartington (later duke of Devonshire, see DEVONSHIRE. SPENCER COMPTON CAVENDISH, 8TH DUKE OF), and in the country at a general election in July, and Gladstone resigned office.

He had kept his Midlothian seat, unopposed, and carried with him into the neu parliament a personal following 190 strong, supported by the National Liberal federation, the most powerful political machine in the country. He devoted the next six years to an effort to convince the British electorate that to grant home rule to the Irish nation would be an act of justice and wisdom. This policy was abhorrent to the English upper classes, and for the first time a marked class division between the parties opened. At the jubilee of 1887 Gladstone was cheered from the pavements, but hissed from the balconies. The act was symbolic of the position he had now reached, of the great popular hero of the age. His reputation stood higher with Scotsmen, Irishmen and Welshmen than with Englishmen, except for the English nonconformists, to whom his tendency to regard and describe great political questions as moral ones made a strong appeal; portraits of him were far commoner in poor men's cottages than those of any other political leader. He spoke at many great meetings, and co-operated with the Irish leader C. S. Parnell (*q.v.*). But his judgment did not improve as he got older; and in 1890, when he was over 80, momentary excitement led him into a dangerous quarrel with Parnell about the political consequences of the O'Shea divorce. (Gladstone had never believed the rumours about Parnell's liaison, holding that Parnell would never "imperil the future of Ireland for an adulterous intrigue.") He never sought to correct the errors about him which Parnell spread in Ireland. He sanctioned an extensive program of Liberal reforms drawn up at Newcastle in 1891, because it was headed by home rule; and on this platform the Liberals won in the general election of 1892 a majority of 40—if the Irish voted with them.

Gladstone, an "old, wild, and incomprehensible man of 82½," as the queen called him in a letter at the time, formed his fourth cabinet in Aug. 1892. Its members were only held together by awe of him. In 1893 he piloted another Home Rule bill through 85 sittings of the commons; the lords rejected it on Devonshire's motion by the largest majority ever recorded there, 419–41, but the full discussion in the commons brought Ireland eventual benefit. The cabinet rejected Gladstone's proposal to dissolve.

He could not agree with his colleagues that a large increase in the naval estimates mas necessary, and finally resigned—ostensibly because sight and hearing were failing—on March 3, 1894. He was much mortified by the coolness of his last official interview with the queen he had served loyally all her reign; by now she frankly detested him, and had to struggle to conceal the fact in his presence. He retired to Hawarden, and busied himself with a critical edition of the works of Bishop Joseph Butler (2 vol.; Oxford, 1896), whom he used to name with Homer, Aristotle and Dante as his "four great teachers" besides the Gospels. Humanitarian to the end, in his last great speech, at Liverpool in Sept. 1896, he denounced Turkish atrocities in Armenia. After a painful illness, he died of cancer of the palate at Hawarden on May 19, 1898. His body lay in state in Westminster hall for three days, and was buried in Westminster abbey.

Character.—As a young man Gladstone was handsome. As he grew older his face grew more formidable, with deep lines from beside the nostrils to the corners of the mouth, and was much wrinkled in old age. His spare and upright figure, well proportioned. was just below the middle height. His voice was clear, deep and sonorous. with a touch of Lancashire accent; and none who saw it soon forgot the flash of his dark eyes.

His truly extraordinary vigour far exceeded that of other men, and was coupled with no less extraordinary powers of self-control and an iron devotion to duty. Training and natural ability led him to qualify statements and subdivide arguments; his thoughts indeed were often complicated. but his character was fundamentally simple. It was a simple sense of duty that took him into politics, a career in which he never felt really at home and for which he was in some ways unfitted, not least by his tendency to believe that other men's motives were invariably as disinterested as his own, and by his excessive anxiety to maintain the consistency of his own conduct. Political courage and personal magnanimity he had in abundance; and he was the most efficient administrator of his age. His gift for concentration was remarkable; this helped people who did not know him well to think him hard or even hypocritical. But no one who knew him intimately doubted his entire sincerity, or failed to be captivated by his delightful manners, the warmth of his human sympathies and the range of his mind. He was combative by instinct, and combined a magical quickness of apprehension with an unusually retentive memory and an inexhaustible fund of phrase; these qualities made him a fearsome adversary in debate. In his prepared speeches he-was able to communicate to his hearers a full sense of the significance of the subject he was discussing, and of their responsibility for seeing that it was decided aright. Purely as an orator, he had two or three equals in his own day; as a statesman, only Peel came near him. A few British prime ministers—Walpole, Chatham, Pitt, Churchill—have been leaders as great; none has been more inspiring. Lord Acton, indeed, assessing for Gladstone's daughter in 1879 her father's standing among the world's statesmen of the past two centuries, concluded that "in the three elements of greatness combined—the man, the power, and the result—character, genius. and success—none reached his level."

BIBLIOGRAPHY.—Gladstone's official *Life* is by John, Viscount Morley, 3 vol. (London, 1903). It should be supplemented for personal details by *The Diary of Lady Frederick Cavendish,* ed. by J. Bailey, 2 vol. (London, 1927); Herbert, Viscount Gladstone, *After Thirty Years* (London, New York, 1928); *Reminiscences of Lord Kilbracken* (London, New York, 1931), and Sir P. Magnus, *Gladstone* (London, New York. 1954). R. W. Seton-Watson, *Disraeli, Gladstone and the Eastern Question* (London, New York, 1935) and J. L. Hammond, *Gladstone and the Irish Nation* (London, New York, 1938) are the only satisfactory full-length monographs on him.

Among the British Museum Additional Manuscripts are 750 volumes of Gladstone papers which await full research. A little of his correspondence has been published: selected *Correspondence on Church and Religion,* ed. by D. C. Lathbury, 2 vol. (London, 1910); *Gladstone and Palnzerston* (London, New York, 1928) and *The Queen and Mr. Gladstone,* 2 vol. (London, 1933; New York, 1934), both ed. by P. Guedalla; *Gladstone to His Wife, a* selection, ed. by A. Tilney Bassett (London, Toronto, 1936); *The Gladstone-Granville Political Correspondence, 1868–1876,* ed. by Agatha Ramm, 2 vol. (London, 1952). He made two selections himself from his numerous articles in magazines: *Gleaning of Past Years,* 7 vol. (London, 1879) and *Later Gleanings* (London, 1897). Of a projected edition of his *Speeches* by A. W. Hutton and H. J. Cohen only 2 vol. appeared (London, 1891, 1892). A. Tilney Bassett, *Gladstone's Speeches* (London, 1916) contains, besides the texts of 14 of his best speeches, complete lists of all of them and of all his publications. (M. R. D. F.)

GLAGOLITIC ALPHABET. According to tradition, when St. Cyril of Thessalonica undertook his mission to Moravia in the middle of the 9th century A.D., he invented an alphabet for his Slavonic translations of essential religious texts. This alphabet was, almost certainly, the Glagolitic, in which some of the earliest extant manuscripts of Old Church Slavonic are written. After the failure of the Moravian mission, it was quickly superseded among the Orthodox Slavs by the so-called Cyrillic alphabet, and it remained in use principally among those Catholic Croatians who persevered in their loyalty to the Slavonic liturgy. The name of the alphabet is. in fact. probably derived from the Old Church Slavonic *glagola* "(he) said," which would be frequently heard in the chanting of the liturgical Gospels. The origin of the individual letters cannot be said to be well established: despite several, often conflicting, attempts to derive them from contemporary Greek forms or from oriental sources that would have been familiar to such an accomplished linguist as St. Cyril. See ALPHABET.

GLAISHER, JAMES (1809–1903), English meteorologist and aeronaut. was born in London on April 7, 1809. After serving for a few years on the ordnance survey of Ireland, he acted as an assistant at the Cambridge and Greenwich observatories successively, and when the department of meteorology and magnetism was formed at the latter. he was entrusted with its superintendence. which he continued to exercise for 34 years. until his retirement from the public service. In 1845 he published his well-known dew point tables. which have gone through many editions. In 1850 he established the Meteorological society, acting as its secretary for many years. and in 1866 he assisted in the foundation of the Aeronautical Society of Great Britain. He made a series of balloon ascents between 1862 and 1866, mostly in company with Henry Tracey Coxwell. with the object of carrying out observations on the temperature, humidity, etc., of the atmosphere at high elevations. He died on Feb. 7, 1903, at Croydon.

GLAMIS, a village and civil parish in Angus (Forfarshire), Scotland, 5 mi. S.W. of Forfar. Pop. (1951) 876. The name (pronounced Glaams) is derived from the Gaelic, *glamhus*, "a wide gap," "a vale." In the village is a sculptured stone! supposed to be a memorial of Malcolm II, although Fordun's statement that the king was slain in the castle is now rejected.

Glamis castle. the seat of the earl of Strathmore and Kinghorne, is a fine example of the Scottish baronial style, enriched with certain features of the French chbteau. In its present form it dates mostly from the 17th century, but the original structure was as old as the 11th century, for Macbeth was thane of Glamis. Robert II bestowed the thanedom on John Lyon, who had married the king's second daughter by Elizabeth Mure and was thus the founder of the existing family. Patrick Lyon became hostage to England for James I in 1424. When, in 1537, Janet Douglas, widow of the 6th Lord Glamis, was burned at Edinburgh as a witch, for conspiring to procure James V's death. Glamis was forfeited to the crown, but it was restored to her son six years later when her innocence had been established. The 3rd earl of Strathmore entertained the Old Pretender in 171j and fell on the battlefield at Sheriffmuir. Sir Walter Scott spent a night in the "hoary old pile" when he was about twenty years old, and gives a striking relation of his experiences in his *Letters* on *Demonology and Witchcraft*. The castle was the early home of Lady Elizabeth Bowes-Lyon, who became consort to King George VI. In 1930 it was the birthplace of Princess Margaret Rose, the first royal babe to be born in Scotland for 300 years.

GLAMORGAN (Welsh *Morgannwg;* the name Glamorgan is a corruption of the Welsh Gwlad Morgan. meaning the terrain of Morgan, a 10th-century Welsh prince). A county of southern Wales bounded northwest by Carmarthenshire; north by Carmarthenshire and Breconshire, east by Monmouthshire and south and southwest by the Bristol channel and Carmarthen bay. Area 817.j sq.mi. Economically it is the most important of the Welsh counties containing Cardiff. the capital of Wales. and Swansea, the second biggest town. It is the most densely populated of the Welsh counties. Structurally and physically it may be considered in two sections: (1) the northern upland section of barren moorland, part of the south Wales coal field; (2) the rural southern section including the vale of Glamorgan and the Gower peninsula.

The body of the county forms a sort of quarter circle between the rivers Taff and Neath. Near the apex of the angle formed by these rivers is the loftiest peak in the county, the great Pennant scarp of Craig y Llyn or Cam Moesyn (1,969 ft.). To the south and southeast extends a great coal field. its surface forming an irregular plateau with an average elevation of 600 to 1,200 ft., but with numerous peaks about 1.500 ft. or more, Mynydd y Caerau being 1,823 ft. Out of this plateau have been carved, to the depth of 500 to 800 ft. below its general level, three distinct series of narrow valleys, those in each series being more or less parallel. The Cynon, the Great and Lesser Rhondda (tributaries of the Taff) and the Ely flow to the southeast, the Ogwr or Ogmore (with its tributaries the Garw and Llynfi) flow south through Bridgend, and the Avon brings the waters of the Corwg and Gwynfi to the southwest into Swansea bay at Aberavon. To the east of this high ground and divided from it by a spur of the Brecknock mountains culminating in Carn Bugail (1,570 ft.) is the Rhymney, which forms the county's eastern boundary. On the west other spurs of the Beacons divide the Neath from the Tawe and the Tawe from the Loughor. which, with its tributary the Amman, separates the county on the northwest from Carmarthenshire. The rivers are all comparatively short, the Taff, the chief river, being only 40 mi. long.

To the south of this central hill country. which is wet, cold and sterile, and whose slopes form the coal field's southern edge, there stretches out to the sea the undulating plain known as the vale of Glamorgan, rising in places to more than 400 ft. The floor of the vale is of New Red Sandstone and Lias. On the faces of the almost perpendicular coastal cliffs can be seen the beds of coloured rocks lying nearly horizontally—red and green marls, black shales and blue and yellow limestones. Stretching westward from Swansea is the Gower peninsula of folded Old Red Sandstone and Carboniferous rocks. Cefn-y-Bryn, an anticline of Old Red Sandstone, forms its prominent backbone. The peninsula is a low plateau with some hills rising to 600 ft. Most of the southern part is of Mountain Limestone covered inland by boulder clay. The limestone cliffs are of great beauty. The National Trust owned 171 ac. of the Gower peninsula in 1954.

After the coal measures forming the north of the county had been deposited the southern part was subjected to powerful folding; the resulting anticlines were worn down, and then submerged slowly beneath a Triassic lake in which accumulated the Keuper conglomerates and marls which spread over the district west of Cardiff and are traceable on the coast of Gower. The succeeding Rhaetic and Lias of the coastal plain (the fertile vale of Glamorgan) from Penarth to near Bridgend were laid down by the Jurassic sea. A well-marked raised beach is traceable in Gower. Sand dunes are present locally around Swansea bay, and between the rivers Ogmore and Neath where Kenfig town lies buried. Moraines, chiefly formed of gravel and clay, occupy many of the Glamorgan valleys. and are glacial in origin.

Between the vale and the coal field is a succession of ridges of Old Red Sandstone, Mountain Limestone and gray-green Pennant Sandstones. The uplands of the coal field are of Pennant Sandstone and are bleak, barren moorland. In each of the narrow valleys between run river, railway and road. On either side of the road is a continuous line of gray houses, works, etc., mostly erected in the 19th century. The churches belonging to the old villages are upon the moorland near the ancient trackways.

Early Settlement.—The earliest known traces of man within the county are the remains found in the caves of the south coast of Gower (*q.v.*). These are of Palaeolithic date. Many flint implements have been found on the south coast particularly at the mouth of the Ogmore river. There are many cairns and tumuli on the hills of the north such as those on Garth mountain near Cardiff, Crug-yr-avan and a number east of the Tawe. There is little evidence of a strong Megalithic culture, although there is a well-preserved stone circle at Carn Llecharth near Pontardawe, and fine dolmens at Cefn Bryn in Gomer and at St. Nicholas and St. Lythan's, near Cardiff. Several prehistoric beaker pots have been found in the vale of Glamorgan and the valley ways, especially that of the Taff, have yielded socketed axes of the late Bronze Age. Important sites on the coast and along the inland valleys are guarded by indigenous hilltop forts occupied probably in Romano-British times. In Roman times the country from the Neath to the Wye was occupied by the Silures. a mixture of peoples dominating the moorlands of south Wales. There are Ogham stones at Loughor and Kenfig. The conquest of the Silures by the Romans began about A.D. 50 by Ostorius Scapula and was continued by Sextus Iulius Frontinus. The important station of Gaer on the Usk near Becon was connected by two branch roads, one running from Cardiff through Gelligaer (where there was a strong hill fort) and Penydarren, and another from Neath through Coelbren. An important Roman road ran along the vale from Caerleon through Cardiff to Neath (Nidum).

Glamorgan was an important centre of Celtic Christianity. Llandaff is associated with St. Dubricius and St. Teilo (6th century). To this period also belongs the establishment of the great monastic settlements of Llancarfan, Llandough and Llantwit Major (Llanilltyd Fawr). After the withdrawal of the Romans, the coasts were raided by Saxons. The Scandinavians who came in the 9th and succeeding centuries left more abundant traces both in the place names of the coastal areas and in such camps as that on Sully Island, the Bulwarks at Porthkerry and Hardings Down in Gower. Mean hile the native tribes had been reorganized into a principality known as Glywyssing, till about the end of the 10th century when it acquired the name of Morgannwg (the territory oi Morgan, a prince who died in A.D. 980). Morgannwg was then the whole country from the Neath to the Wye.

The Norman conquest was effected at the end of the 11th century by Robert Fitz Hamon, lord of Gloucester who, in 1080, began the building of Cardiff castle. His followers settled in the vale, which became known as the "body" of the shire, while in the hill country the Welsh retained their customary laws and much of their independence. Glamorgan, whose bounds were contracted between the Neath and the Rhymney, then became a lordship marcher, its status and organization being that of a county palatine. Cardiff, the caput *baroniae,* was granted municipal privileges, and in time Cowbridge, Kenfig, Llantrisant, Aberavon and Neath also became chartered market towns. The manorial system was introduced throughout the vale, the manor often becoming the parish. The religious houses included the Cistercian abbeys of Neath and Margam founded in 1129 and 1147, respectively, the Benedictine priory of Ewenny (1141) and that of Cardiff (1147). Dominican and Franciscan houses were also iounded at Cardiff in the following century. Gower (with Kilvey) had a separate history (see GOWER).

For the first two centuries after Fitz Hamon's time the lordship of Glamorgan was held by the earls of Gloucester, the first earl being Fitz Hamon's son-in-law. The lordship passed by descent through the families of De Clare (who held it from 1217 to 1317), Despenser, Beauchamp and Neville to Richard III. on whose fall it escheated to the crown. Raids from the hills were frequent. Cardiff castle was seized by the Welsh about 1153 and Caerphilly castle was built to keep them in check, but this provoked an invasion in 1270 by Llywelyn ap Gruffydd, who besieged the castle. In 1294 Morgan led a rebellion against Edward I and in 1316 Llewelyn Bren (Llywelyn ap Rhys) again besieged Caerphilly castle and in 1317 was hung, drawn and quartered in Cardiff castle. In 1404 Owen Glendower (Owain Glyn Dwr) swept through the county, burning Cardiff and carrying all before him. By the Act of Union of 1536 the county of Glamorgan was incorporated as it now exists, by the addition to the old county oi the lordship of Gower and Kilvey, west of the Neath. The lordship of Glamorgan, shorn of its quasi-regal status. was granted by Edward VI to William Herbert, afterwards 1st earl of Pembroke, from whom it has descended to the present marquess of Bute. (See CARDIFF.)

The rule of the Tudors promoted the rapid assimilation of the inhabitants of the county, and by the reign of Elizabeth I even the descendants of the Norman knights had largely become Welsh both in speech and sentiment.

In common with the rest of Wales the county was mainly royalist in the Civil War, but later dissatisfaction made it declare for parliament. A subsequent royalist revolt in Glamorgan in 1648 was crushed by Colonel Horton at the battle of St. Fagan's.

Industrial Development. — Down to the middle of the 18th century the county had no industry of importance except agriculture. The coal which underlies practically the whole surface except the vale of Glamorgan and west Gower was little worked till about 1755, when it began to be used instead oi charcoal for the smelting of iron. The iron works were mostly on the northern outcrop of the coal field and by 1811 there were 25 blast furnaces in the county, among them those of Aberdare. Dowlais and Merthyr Tydfil. Down to about 1850 the chief collieries were owned by the ironmasters and were worked for their own requirements. When, in the district north of Cardiff. the suitability of the lower seams for steam purposes was realized, an export trade sprang up and soon assumed enormous proportions. The port of Cardiff (including Barry and Penarth). from which the bulk of the steam coal was shipped, became the first port in the world for the shipment of coal. This remarkable development coincided with the ever increasing demand for railway construction, steamships and navies, but resulted in an absence of by-product industries in the area. In the southwest of the county the triangle formed by Port Talbot, Ystalyfera and Loughor concentrated on the metallurgical industries which focused on Swansea. "the metallurgical capital of Wales." The manufacture of iron and steel was carried on at Dowlais. Ebbw Vale, Merthyr Tydfil and at Port Talbot, Briton Ferry, Pontardawe and other places. During the last quarter of the 19th century the use of the native ironstone was almost wholly given up and the necessary ore was imported. The tinplate industry centred in the Swansea-Llanelly area, though the oldest works in the county are at Melin Griffith near Cardiff. Copper smelting was carried on in the west of the county, at Port Talbot, Cwmavon, Neath and Swansea, and to a smaller extent at Cardiff, the earliest works having been established at Neath in 1584 and at Swansea (*q.v.*) in 1717. There are nickel works at Clydach near Swansea. Swansea has almost a monopoly of the manufacture of spelter or zinc, and lead, silver and other metals or their by-products are treated in or near the town. The development of the anthracite coal field lying to the north and west of Swansea (from which port it is mostly shipped) dates mainly from the closing years of the 19th century.

After World War I there was a big drop in the demand for south Wales steam coal both at home and abroad. (See WALES.) This was due to the increase in the number of modernized power plants using small'coal, and the loss of export markets and of the admiralty coal contract (because of the conversion of naval ships from coal to oil fuel). The result was the serious depression of the 1930s during which many collieries and steel works became derelict. A small area west of Port Talbot suffered considerably less, since it dealt mainly with anthracite coal, for which there was a consistent demand, and it also contained other industries. The coal region was, therefore, scheduled for attention under the Special Areas (Development and Improvement) act of Dec. 1934. The main object of the act was not to organize relief works. but to assist the economic recovery of the areas by attracting new industries to them. A survey of the natural resources and public services in south Wales was completed in 1937 and by the end of 1938 several new establishments had been brought to Glamorgan and other coal areas.

After World War II the industries of Wales were further diversified through the agency of the Distribution of Industries act. By 1954 there were 137,000 people in regular work in new iactories and extensions to factories established after 1937 and the bulk of these were in Glamorgan. Four leading Welsh firms pooled resources and plans to form the Steel Company of Wales which modernized the Welsh tin-plate industry by the establishment of a strip-mill plant at Port Talbot, with complementary cold reduction plants at Trostre near Llanelly and Velindre near Swansea. In Nov. 1953 the Port Talbot plant was in full production employing more than 8,000 men and turning out 3,500 tons of rails and 22,800 tons of steel strip and plate weekly. The National Coal board's long-term development plan in the south Wales coal field included schemes in several Glamorgan valleys.

Agriculture and Fisheries. — Regarded largely as an industrial county, Glamorgan still has an extensive agricultural character. In 1953 there were some 125,000 ac. under rough grazing and 205,000 ac. under crops and grass covering 63% of the total area. The county is roughly divided into two-thirds hill and mountain area and one-third lowland. The hill districts produce mutton, lamb, wool, store cattle and milk.

There were between 4,000 and 5,000 farms in 1953, of which 2,200 were milk producers. Even hill farms naturally suited only for sheep and store cattle produced milk for the densely populated mining valleys—a ready-made market on their doorsteps. The average size of farms is between 60 and 70 ac. with the largest more than 500 ac. In the main they are family concerns with one or two workers to help. In Oct. 1953 there were 3,300 regular and 1,500 casual workers on the land—600 more than in 1939.

The vale of Glamorgan, celebrated down the ages for its high natural fertility, now has a big milk yield as well as high wheat, cattle and sheep production. Since the beginning of World War II notable features of farming in the Gower peninsula have been the high proportion of early potatoes and vegetables and the cultivation of flowers. The progress of agriculture in Glamorgan after World War II is illustrated by these comparative figures (1953, 1939 in parenthesis): total tillage and grass, 40,000 ac. (18,500); total cattle, 78,000 (69,000); sheep, 296,000 (364,000); pigs, 27,000 (20,000); poultry, 350,000 (348,000); horses, 5,500 (12,000).

Forestry developments in the county are increasingly yielding pit props for the south Wales coal field.

Two of the three Welsh fishery centres are in Glamorgan—Cardiff and Swansea. In 1953 Swansea had 11 trawlers and Cardiff had 10. Hake is the main catch but other wet fish and shellfish are also important.

Communications.—The physical features of the county are well suited for communication purposes. The coal trains could run easily from the high ground of the coal field to the vale and thence to the coal exporting ports on the coast, the uphill return journey being done with empty cars. Thus a large number of small private lines ran down from the coal valleys focusing on Cardiff, Barry, Port Talbot and Swansea, which are well supplied with dock accommodation. Gradually the small railway lines became amalgamated and after 1923 they were all run by the Great Western railway. Since 1946 they have been absorbed into the Western Region of the nationalized British railways. The main line, between the highland and the sea, serves Cardiff, Bridgend, Port Talbot, Neath, Swansea and Loughor.

The number of passengers who travelled by air from Cardiff to the west of England in 1953 was 11,000. Between 1948 and 1954 regular services were established between Cardiff and the Channel Islands, Paris, Dublin and Liverpool.

Population and Administration.—The rapid rise of population with the development of its industries and coal mining was one of the most remarkable features in the social-economic life of Glamorgan during the 19th century. In the three decades between 1831 and 1861 the population increased 35.2%, 35.4% and 37.1% respectively, and from 1881–91, 34.4%. In 1901 the population stood at 859,931. In 1931 it was 1,229,065 and in 1951 it was 1,202,581, a decrease of 2.2%. The area of the administrative county with associated county boroughs is 817.6 sq.mi.; that of the administrative county alone is 732.5 sq.mi. The county is divided into seven parliamentary divisions, Aberavon, Barry, Caerphilly, Gower, Neath, Ogmore and Pontypridd, each returning one member. In addition there are three members for Cardiff, two each for Swansea and Rhondda, and one each for Aberdare and Merthyr Tydfil. There are three county boroughs: Cardiff (a city), Merthyr Tydfil and Swansea; five municipal boroughs: Barry, Cowbridge, Neath, Port Talbot and Rhondda; 12 urban districts and seven rural districts.

Glamorgan is in the Wales and Chester circuit, and assizes are held at Cardiff and Swansea alternately. All three county boroughs are quarter sessions boroughs and have their own commissions of the peace and police forces. Two of the municipal boroughs—Neath and Port Talbot—also have their own commissions of the peace. The county is in the dioceses of Llandaff and Swansea and Brecon.

Evans, *Glamorgan: Its History and Topography*, 3rd ed. (Cardiff, 1950); *The Official Guide to the County of Glamorgan, etc.* (London, 1953).

GLANDERS

GLANDERS or Farcy is primarily a specific infectious and contagious disease of solipeds (the horse, ass and mule). Secondarily, man may become infected through contact with diseased animals or by inoculation while handling diseased tissues and making laboratory cultures of the causal bacillus. As a disease of solipeds, glanders was recognized at an early period. In 425 B.C. it was mentioned by Hippocrates in his writings. In 1797 Erill Viborg, a Danish veterinarian, first published a systematic description of glanders and farcy. He rightly described them as one and the same disease, capable of being transmitted by contact. In 1882 Friedrich Loffler and Johann Schiitz in Germany isolated and identified the causal agent, which they named the *Bacillus mallei*, now designated technically as the *Pfeifferella mallei* or *Malleomyces mallei*. Ordinarily, it is spoken of as the glanders bacillus and described as a gram-negative bacterium, non-spore forming and nonmotile, growing readily in laboratory culture media. In the affected animal, the bacillus is present in the nasal discharges, secretions from pustules and ulcers on the skin and from diseased nodules in the lungs, bronchial and submaxillary lymph glands.

The infection can be disseminated through the medium of both clinical and nonclinical (latent) cases. Close contact between the affected and nonaffected always results in an increasing spread of the disease. Natural infection may take place through one of the following channels: by ingestion into the digestive tract through the consumption of infection—contaminated feed or water; by inoculation through slight abrasions of the skin or mucous membrane, or by inhalation into the respiratory tract. After infection, the disease usually follows a chronic course with a variable period of incubation extending from several weeks to several months. Horses which are kept closely stabled and worked hard or debilitated usually develop clinical symptoms in a shorter period than those kept outdoors on open range. The period of incubation appears to be relatively shorter in the mule and donkey.

Clinical cases are manifested either by a chronic nasal discharge from one or both nostrils, with or without visible ulceration of the nasal septum; chronic enlargement and induration of the submaxillary lymph glands without outward suppuration or the presence of pustules and ulcers (farcy buds) on the skin of the hindlegs or other parts of the body. Nonclinical or latent cases are essentially pulmonary in type and the lesions remain in a concealed state (occult) in the lungs as tubercle-like nodules and suppurating foci. In many latent cases, the affected animal shows slight signs of lung trouble (altered breathing). These occult cases frequently spread infection through the respiratory secretions for a variable period of weeks or months before showing clinical symptoms and can be detected only by the use of the mallein test. The agent used for this test is an extract or toxin produced from pure cultures of the bacillus, and its use as a diagnostic agent for glanders was first demonstrated in 1891 by O. Kalning and C. Helman in Russia and by Leonard Pearson in the U.S. There are three recognized types of mallein test: (1) the subcutaneous mallein test, a hypodermic injection of mallein under the skin on the side of the neck, which in from 10 to 12 hr. produces a definite rise in temperature (thermal reaction) and a distinct painful swelling at the site of injection; (2) the ophthalmic mallein test, in which the mallein is placed in the fornix of the eye and the reaction is manifested in from 6 to 12 hr. by the development of a purulent discharge from the eye; (3) the palpebral intradermic mallein test in which the mallein is injected into the loose fold of skin below the margin of the lower eyelid and the reaction is manifested in from 24 to 48 hr. by marked swelling of the eyelid and a muco-purulent discharge from the eye. In addition to these allergic mallein tests, several laboratory methods can be used, especially in the diagnosis of human glanders: the agglutination, precipitin and complement-fixation tests and laboratory culture examinations.

The post-mortem appearances of glanders comprise one or more of the following gross lesions: skin lesions, consisting of nodules, pustules and ulcers especially of the hindlegs; respiratory lesions, consisting of nodules and ulcers on the nasal septum, turbinated bones, larynx and trachea; pulmonary lesions consisting of tuberclelike nodules embedded in the lungs; lymphatic lesions, involving the submaxillary, bronchial and inguinal lymph glands. Lesions also may occasionally be found in some of the body glands such as the liver. spleen and kidney. The treatment of glanders in animals is not recognized as a cure for the disease.

The only effective policy for the control and suppression of the disease is compulsory notification of all cases, slaughter of all reactors to the mallein test and proper cleaning and disinfection of the affected premises. Under this policy, glanders was completely eradicated in the U.S., Great Britain and Canada. The disease is still known to prevail in some parts of Europe, Asia and Africa.

Glanders in Man.—While glanders as a disease of solipeds was recognized and referred to from an early period (by Hippocrates), no specific description of it as a disease of man was definitely recorded until the year 1830. Since then, many cases of glanders in man have been reported. In 1900 Otto von Bollinger in Germany published an account covering 120 cases. In 1906 George D. Robins in Canada published a report of 156 cases. In 1908 William Hunting in England reported 10 cases which he observed personally. Following World War I (1914–18), the incidence of human glanders in Russia was appallingly high for a time. because of lack of control over the disease in horses.

Glanders most frequently occurs in man through occupational contact with diseased horses, from making an autopsy on a diseased animal or from making laboratory cultures of the *Bacillus* mallei. In man, the period of incubation averages from one to five days. The onset and manifestations of the disease are fairly typical. Within a few days following infection. constitutional disturbances develop manifested by fever, malaise, fatigue. loss of appetite. jaundice, nausea, headache and rheumatic pains. More definite signs develop rapidly in the form of an erysipelaslike swelling of the face and the limbs or a painful nodular eruption which is soon followed by a general pustular eruption. There is also nasal involvement accompanied by a purulent nasal discharge and ulceration of the septum. The final stage of the disease is characterized by profuse suppurating pustules covering the body, intramuscular abscesses. pneumonia, diarrhoea, emaciation and fatal collapse.

The average duration of acute cases is from two to four weeks. In chronic cases, the symptoms are quite similar in character but are prolonged over a period of several months. The treatment of human glanders has included the use of many drugs, largely tonic and palliative. combined with surgical treatment. In selected 'cases, the use of sulfadiazine and other sulfapyrimidines might be indicated. Favourable results nere reported in several cases following the use of serum from hyperimmunized horses. The prevention of glanders in man depends essentially on the eradication of the disease in horses, asses and mules. (C. D. Mc.)

GLANDS. Glands are structures which secrete fluids They are classified according to their mode of secretion, the nature of the secretion, the behaviour of the secretory gland cell and the organization of the gland. The mode of secretion may be toward the outside of the body (exocrine) or toward the blood and lymph vessels (endocrine). The secretion may be characterized as cellular (as in the testis) or noncellular (prostate, thyroid or salivary glands).

During secretion, the gland cells produce their characteristic secretions either through cellular activity without any direct contribution of the protoplasm (merocrine type, as in salivary glands) or through cellular disintegration (holocrine type. as in sebaceous glands, or apocrine type, as in mammary glands). The gland may be composed of a single cell or of a simple or complex organization of cells.

Anatomy.—The unicellular glands in mammals are limited entirely to goblet cells. These secrete mucous, a Iubricating fluid widely distributed especially in the intestinal tract. The multicellular glands consist of four components: (1) secretory gland cells; (2) ducts which convey the secretory product from the gland cells to an external surface; (3) connective tissue elements which provide a framework to maintain the preceding two elements; and (4) blood vessels, lymphatics and nerves which supply the nutrients and raw materials of the secretion, carry away the waste products, and in some places control the activity of the gland cells and blood vessels. All four parts are intimately interwoven anatomically and integrated functionally.

The gland cells may be arranged as a folded sheet (as in the choroid plexuses of the brain). They may be arranged as punched out projections, generally toward the connective tissue framework. These projections may be simple (as in intestinal glands) or branched (as in gastric glands), and each is further subclassified according to whether the projection is tubular (as in the intestine), coiled (as in sweat glands). or acinar or grapelike in shape (as in the sebaceous glands of the skin). In the simple glands. each secretory projection pours out its secretion directly into an unbranched duct. In the compound glands, the ducts are branched and the secretion passes from the secretory portion to a series of progressively larger ducts which finally empty on to an outer surface (as in salivary glands, pancreas, liver).

All compound glands are enclosed in connective tissue capsules. The glands are partly broken up into grossly visible lobes (as the liver, which has five lobes) in relation to major branchings of the duct system. These are further partly separated into smaller units, the lobules, which are also visible with the naked eye. These are in turn further divided into inicrolobules which are visible only with the microscope. All four components of glands (secretory, ductular, connective, and vascular and neural) consist of cells and a cellular cement or binding substance. Embedded in the latter only in the connective tissue are microscopically visible fibres In the connective tissue the cement substance with its fibres is the most prominent feature, the cells being sparse. In the other three gland components, the cells are most conspicuous, the cement substance being small in amount.

Histology.—As stated above, there are four components of glands. secretory portion (whence the secretion originates), the duct system (which conducts the secretion to a surface), the connective tissue (which is the sustaining framework of the gland) and the blood vessels and nerves. The last two components are present in all glands and differ in their microscopic structure in no essential way from their counterparts in nonglandular organs. The ducts may be absent from certain glands in later embryos and foetuses and in adult life. Such organs are endocrine and secrete directly into the circulating blood. Some endocrine glands (the islands of Langerhans of the pancreas, producing insulin) frequently retain a relationship to ducts; the secretion is nevertheless passed directly into the blood just as in other endocrine glands.

There are certain glands which have no ducts which are not endocrine. Their secretion passes directly onto the surface of the organ (as for example. goblet cells. choroid plexus). The ducts are all of the nature of cylinders whose malls consist of cells. These may occur as a single layer of cells which may be flat (as in intercalary ductuli), cuboidal (as in the pancreas), columnar (as in the kidney); or they may be arranged in layers two or more cells thick (as in salivary glands).

It is possible that certain ducts not only conduct the secretion but also alter its composition. Gland cells, like others, consist of a cell membrane, the nucleus and the cytoplasm, including the ground substance, a basophilic substance (called chromophile), mitochondria and Golgi apparatus. In addition, the cytoplasm frequently contains specific granules, watery vacuoles and fat droplets.

The specific granules are believed to contain the specific protein in some form resembling that which is characteristic of the secretion.

Some gland cells show little or no detectable change in structure whether they are secreting or not. Others, both exocrine and endocrine, pass through cyclic morphological changes during strong secretion and then revert to the normal or relatively inactive state. These include: reduction in the number of specific granules. increase in the number of watery vacuoles, increased prominence of the chromophile substance, increased number and size of the mitochdndria, and hypertrophy of the Golgi apparatus. In addition, the nucleus increases in volume with an apparent decrease in stainability of the chromatin, an increase in size and stainability of the nucleolus and a displacement of the nucleus as a whole toward the secretory surface. The cell as a whole becomes smaller. All of these structures revert to normal in the absence of marked secretory activity.

Gland cells, like others, must be considered to be in a state of continual activity. Even "resting" cells are active, performing work in maintaining their integrity and internal organization, and in synthesizing and secreting their specific substances or secretions at minimum levels. *See* also ENDOCRINOLOGY; HORMONES.

(I. GH.)

GLANVILL (or GLANVIL), **JOSEPH** (1636–1680), English philosopher, was born at Plymouth and educated at Oxford. After the Restoration he was successively rector of Wimbush, Essex, vicar of Frome Selwood, Somersetshire, rector of Streat and Walton.

In 1666 he was appointed to the abbey church, Bath; in 1678 he became prebendary of Worcester cathedral, and acted as chaplain in ordinary to Charles II from 1672. He died at Bath on Nov. 4, 1680. Glanvill's first work (a passage in which suggested the theme of Matthew Arnold's *Scholar Gipsy), The Vanity of Dogmatizing,* etc. (1661), shows how philosophical scepticism might be employed as a bulwark for faith.

The endeavour to cognize the whole system of things by referring all events to their causes appears to him to be doomed to failure from the outset. We know isolated facts, but we cannot perceive any such connection between them as that the one should give rise to the other. In the words of Hume, "they seem conjoined but never connected." All causes then are merely the occasions on which the one first cause operates.

Glanvill rejected the scholasticism and Aristotelianism of his own university for the Platonism of Cambridge, writing in 1662 the *Lux Orientalis* which reproduced Henry More's theory of the pre-existence of the soul. In spite of his admission of the defects of our knowledge, Glanvill yielded to vulgar superstitions, and actually endeavoured to accredit them both in his revised edition of the *Vanity of Dogmatizing,* published as *Scepsis scientifica* (1665), and in his *Philosophical Considerations concerning the existence of Sorcerers and Sorcery* (1666). The latter work was based on the story of the drum alleged to have been heard every night in a house in Wiltshire (Tedworth, belonging to a Mr. Mompesson), a story which made much noise in the year 1663, and which is supposed to have furnished Addison with the idea of his comedy *The Drummer*. Glanvill's *Sadducismus Triumphatus,* printed posthumously in 1681, also defends witchcraft; but he supported a more honourable cause in his defense of the Royal society of London, as *Plus Ultra, or the Progress and Advancement of Science since the time of Aristotle* (1668), a work showing his empirical tendencies.

GLANVILLE (GLANVIL or GLANVILL), **RANULF DE** (d. 1190), chief justiciar of England and reputed author of the first classical text on the common law, was born at Stratford, Suffolk, date unknown. In 1180 Glanville, who had served as sheriff of Yorkshire and Lancashire, succeeded Richard de Lucy as chief justiciar. For the remainder of the reign of Henry II he was the king's principal adviser, and during the king's frequent absences was, in effect, viceroy of England. He was removed from office in 1189 by Richard I and imprisoned until, it is said, he paid a ransom of £15,000. He subsequently accompanied King Richard I on the third crusade, dying at Acre, in Palestine, in 1190.

Glanville, a man of great energy and versatile talent. was useful to Henry II in many ways, chiefly in the great legal changes that mark Henry's reign. The common law was greatly strengthened by the re-establishment of the *curia regis,* by the increased use of itinerant justices and ,by new remedies and improved methods of procedure, including the inquest, from which the right of trial by jury was ultimately developed.

Glanville is best known for the *Tractatus de legibus et consuetudinibus regni Angliae* ("Treatise on the Laws and Customs of the Kingdom of England"), the earliest of the classical texts on the common law. This treatise, attrlbuted to Glanville, but probably written by his nephew and secretary Hubert Walter (*q.v.*), was an accurate, lucid description of the procedure in the king's court. It was soon accepted as the authoritative statement of the law of the period and did much to establish and to extend the common law in competition with the canon and the feudal systems of law. Largely because of the *Tractatus* this period in the common law came to be known as the age of Glanville.

Written about 1188. the *Tractatus* was first printed in London in 1554. An annotated edition by George E. Woodbine was published in New Haven, Conn., in 1932. John Beames' English translation of 1812 was reprinted in Washington, D.C., in 1900, with an introduction by Joseph Henry Beale. *See* also ENGLISH *LAW;* COMMON LAW. (S. TT.)

GLAPTHORNE, HENRY (*c.* 1610–*c.* 1643), English poet and dramatist whose poetry resembles that of his "noble Friend and Gossip, Captaine Richard Lovelace," to whom he dedicated his poem, *Whitehall* (1643). He was presumably born in 1610 at Whittlesey, Cambridgeshire, where he was baptized on July 28 of that year. His plays included *Argalus and Parthenia* (1639), a pastoral tragedy, and *Albertus Wallenstein* (1639), his only attempt at historical tragedy. His plays, although undistinguished, contain isolated passages of merit. He also published *Poems* (1639), many in praise of an unidentified "Lucinda," and edited the *Poems Divine and Humane* of his friend Thomas Beedome (1641).

He was living in London in 1643 when he published an unofficial royalist pamphlet, but nothing further is known of him.

GLAREOLIDAE, a family (order Charadriiformes) of old world shore-inhabiting birds comprising the coursers and pratincoles (*q.v.*).

GLARUS, one of the Swiss cantons, the name being taken from that of its chief town. Its area is 264 sq.mi., of which 173.1 sq.mi. are classed as "productive" (forests covering 41 sq.mi.). It is composed of the upper valley of the Linth which rises in the glaciers of the Todi, 11,876 ft., and has carved out for itself a deep valley, with comparatively level floor, occupied by a number of villages.

Glacier passes lead from its head to the Grisons, also the rough footpath over the Kisten pass, but a carriage road over the Klausen pass gives access to the canton of Uri. The Sernf valley or Kleinthal, which joins the Linth at Schwanden, a little above Glarus itself, has a track leading to the Grisons over the Panixer pass and the Segnes pass. Just below Glarus town, another glen (coming from the southwest and leading by the Pragel pass to Schwyz) joins the main valley, and is watered by the Klön. It is separated from the main glen by Glarnisch (9,560 ft.), while the Sernf valley is similarly cut off from the Grossthal by the high ridge running northward from the Haus Stock (10,361 ft.) over the Karpfstock (9,167 ft.).

In the east the Riesetenpass leads to the valley of Weisstannen, and the Widersteinerfurkel leads to the Murgtal, both being valleys of the St. Galler Oberland. There is a sulfur spring at Stachelberg, near Linthal village, and an iron spring at Elm, while in the Sernf valley there are the Plattenberg slate quarries, and just south of Elm those of the Tschingelberg. A railway runs through the whole canton from north to south past Glarus to Linthal village, while from Schwanden there is an electric line (opened in 1905) up to Elm.

In 1950 the population of the canton was 37,663, five-sevenths of which were Protestants and two-sevenths Catholics, all German-speaking. The density per square mile was 142.7. After the capital, Glarus (*q.v.*), the largest villages are Nafels, Ennenda (opposite Glarus, of which it is practically a suburb), Netstal, Mollis and Linthal.

The slate industry existing since the beginning of the 17th century, the cotton spinning introduced in 1714, the cotton printing established in 1740 and the weaving are the most important manufactures. There is little agriculture, while the breeding of cattle is important, for it is a region of mountain pastures which can support thousands of cows. The canton produces green cheese made of skim milk, whether of goats or cows, mixed with buttermilk and coloured with powdered *Melilotus caerulea.* The curds are brought down from the huts on the pastures, and, after being mixed with the dried powder, are ground in a mill, then put into shapes and pressed. The canton forms a single administrative district and contains 28 communes. It sends representatives elected by the *landsgemeinde* to the federal *ständerat* and *nationalrat*. The canton still keeps its primitive democratic assembly or *landsgemeinde* (meeting annually in the open air at Glarus on the first Sunday in May), composed of all male citizens of 20 years of age or more. It acts as the sovereign body, so that no "referendum" is required, while any citizen can submit a proposal. It names the executive of 6 members, besides the *landammann* or president, all holding office for three years. The communes (forming 18 electoral circles) elect for three years the *landrat,* a standing committee of members in the proportion of 1 for every 500 inhabitants or fraction over 250. The constitution dates from 1887.

GLARUS (Fr. *Glaris),* the capital of the Swiss canton of the same name 42½ mi. S.E. by rail from Zürich, is on the left bank of the Linth at the northeastern foot of the Vorder Glarnisch (7,648 ft.); on the east rises the Schild (7,453 ft.). In May 1861 practically the whole town was destroyed by fire. Pop. (1960) 5,852, almost all German-speaking.

The DISTRICT OF GLARUS is said to have been converted to Christianity in the 6th century by the Irish monk, Fridolin, who was the founder of the Benedictine nunnery of Sackingen, on the Rhine between Constance and Basel, that about the 9th century became the owner of the district. The Habsburgs gradually drew to themselves the exercise of all the rights of the nuns, so that in 1352 Glarus joined the Swiss confederation, and gained complete freedom after the battle of Nafels (1388). Zwingli the Reformer was priest there 1506–16 and Glarus early adopted Protestantism, but there were many struggles between the two parties, and to secure peace it was arranged that, besides the common *landsgemeinde,* each party should have its separate *landsgemeinde* (1623) and tribunals (1683). The slate-quarrying industry appeared early in the 17th century, cotton spinning was introduced about 1714, and calico printing by 1750. In 1798; in consequence of the resistance of Glarus to the French invaders, the canton was united to other districts under the name of canton of the Linth. The old system of government was restored in 1814, but in 1836 by the new liberal constitution one *landsgemeinde* only was retained. Pop. (1960) 40,118.

GLAS, JOHN (1695–1773), Scottish minister, founder of the Glasite Church, was born at Auchtermuchty, Fife, where his father was parish minister, on Oct. 5, 1695. He became minister of Tealing, Dundee, and in 1725, in a letter to Francis Archibald, minister of Guthrie, Forfarshire, he repudiated the obligation of national covenants. In the same year his views found expression in the formation of a society "separate from the multitude" numbering nearly a hundred, and drawn from his own and neighbouring parishes. Its members pledged themselves to follow Glas's doctrine. From the scriptural doctrine of the essentially spiritual nature of the kingdom of Christ, Glas in his public teaching drew the conclusions: (1) that there is no warrant in the New Testament for a national church; (2) that the magistrate as such has no function in the church; (3) that national covenants are without scriptural grounds; (4) that the true Reformation cannot be carried out by political and secular weapons but by the word and spirit of Christ only. This argument is most fully exhibited in Glas's *The Testimony of the King of Martyrs* (1729).

Glas was summoned (1726) before his presbytery, and he was in 1728 suspended from the discharge of ministerial functions, and finally deposed in 1730. The members of his society for the most part continued to adhere to him, thus constituting the first "Glassite" or "Glasite" church. The seat of this congregation was shortly afterward transferred to Dundee (whence Glas subsequently removed to Edinburgh), where he officiated for some time as an "elder." He next laboured in Perth for a few years, where he was joined by Robert Sandeman (*see* GLASITES), who became his son-in-law, and eventually was recognized as the leader and principal exponent of Glas's views. Ultimately in 1730 Glas returned to Dundee, where the remainder of his life was spent.

In 1739 the general assembly removed the sentence of deposition which had been passed against Glas. He died in 1773.

A collected edition of his works was published at Edinburgh in 1761 (4 vol., 8vo), and again at Perth in 1782 (5 vol., 8vo). Glas's *True Discourse of Celsus* (1753), from Origen's reply to it, is a competent and learned piece of work. The *Testimony of the King of Martyrs concerning His Kingdom* (1729) is a classic repudiation of erastianism and defense of the spiritual autonomy of the church under Jesus Christ.

GLASER, DONALD ARTHUR (1926–), U.S. nuclear physicist who was awarded the 1960 Nobel prize in physics for his invention and subsequent development of a research instrument known as the bubble chamber (*q.v.*), was born in Cleveland, O., on Sept. 21, 1926. After graduating from Case Institute of Technology, Cleveland, in 1946. he attended California Institute of Technology, Pasadena, where he received his Ph.D. in physics in 1950, specializing in cosmic ray studies and nuclear physics. He conceived the idea for the bubble chamber while at the University of Michigan, where he taught from 1950 to 1959, when he joined the faculty of the University of California at Berkeley. Glaser, who at 34 was one of the youngest scientists ever to be awarded a Nobel prize, received a D.Sc. degree from Case institute in 1959.

GLASGOW, a city, county of a city, royal and parliamentary burgh and port, Lanarkshire, Scotland, situated on both banks of the Clyde 44 mi. W.S.W. of Edinburgh and 396½ mi. N.W. of London by road. Pop. (1961) 1,054,913. Area 60.4 sq.mi. The valley of the Clyde is closely confined by hills, and the city extends far over these. The commercial centre of Glasgow, with the majority of important public buildings, lies on the north bank of the river, which traverses the city from east-southeast to west-northwest, and is crossed by a number of bridges. The uppermost is Dalmarnock bridge, dating from 1891, and next below it is Rutherglen bridge, rebuilt in 1896, superseding a structure of 1775. Next comes King's bridge at Ballater street. St. Andrew's suspension bridge gives access to the Green to the inhabitants of Hutchesontown, a district which is approached also by Albert bridge, leading from the Saltmarket. Above this bridge is the tidal dam and weir. Victoria bridge (1856) took the place of a bridge erected by Bishop Rae in 1345, and demolished in 1847. Then follows the Portland street suspension bridge (1853) by which pedestrians from the south side obtain access to St. Enoch square and, finally, the bridge variously known as Glasgow, Jamaica street, or Broomielaw bridge (1835). Toward the close of the 19th century it was reconstructed and reopened in 1899, but because of its inadequacy to cope with the constantly increasing traffic, George V bridge, a short distance downstream, was opened in 1928. The Richmond park foot bridge was reconstructed in the 1950s. There are two railway bridges.

History. — Some historians hold that the name of Glasgow comes from Gaelic words meaning "dark glen," descriptive of the narrow ravine through which the hlolendinar flowed to the Clyde. But the more generally accepted version is that the word is the Celtic *Gleschu,* afterward written Glesco or Glasghu, meaning "dear green spot" *(glas,* green; *cu* or gku, dear), supposed to have been the name of the settlement that Kentigern found there when he came to convert the Britons of Strathclyde. Kentigern or Mungo ("dear one") became the patron saint of Glasgow. and the motto — "Let Glasgom Flourish by the Preaching of the Word." usually shortened to "Let Glasgow Flourish"—and arms of the city are identified with him. It is not till the 12th century, however, that the history of the city becomes clear. About 1178 William the Lion made the town by charter a burgh of barony, and gave it a market with freedom and customs. At the battle of the Bell o' the Brae, on the site of High street, Wallace routed the English under Percy in 1300; he was betrayed to the English in 1305 in Robroyston. Plague ravaged the burgh in 1350 and 30 years later; the regent Arran, in 1544. besieged the bishop's castle, and there was a subsequent fight at the Butts (now the Gallowgate). Most of the inhabitants were opposed to Queen Mary and many actively supported Murray in the battle of Lnngside — the site now occupied by the Queen's park — on May 13, 1568, in which she lost crown and kingdom. Under James VI the town became a royal burgh in 1636. with freedom of the river from the Broomielaw to the Cloch. The people made common cause with the Covenanters to the end of their long struggle.

Montrose mulcted the citizens heavily after the battle of Kilsyth in 1645, and three years later the provost and bailies were deposed for contumacy to their sovereign lord. Plague and famine devastated the town in 1649, and in 1652 a conflagration laid a third of the burgh in ashes. Even after the restoration its sufferings were acute. It was the headquarters of the Whiggamores of the west and its prisons were constantly filled with rebels for conscience' sake. The government scourged the townsfolk with an army of Highlanders, whose brutality only served to strengthen the resistance at the battles of Drumclog and Bothwell Brig. The union was hotly resented, but marked the dawn of almost unbroken prosperity. By the treaty of union Scottish ports were placed. in respect of trade, on the same footing as English ports, and the situation of Glasgosv enabled it to acquire a full share of the ever-increasing Atlantic trade.

The commerce of Glasgow was already considerable and in population it was now the second town in Scotland. It enjoyed a practical monopoly of the sale of raw and refined sugars, had the right to distil spirits from molasses free of duty, dealt largely in cured herring and salmon, sent hides to English tanners and manufactured soap and linen. It challenged the supremacy of Bristol in the tobacco trade—fetching cargoes from Virginia, Maryland and Carolina in its own fleet—so that by 1772 its importations of tobacco amounted to more than half of the whole quantity brought into the United Kingdom. The tobacco merchants built handsome mansions and the town rapidly extended westward. With the surplus profits new industries were created, which helped the city through the period of the American Revolutionary War. Most, though not all, of the manufactures in which Glasgow has always held a foremost place date from this period. It was in 1764 that James Watt succeeded in repairing a hitherto unworkable model of Thomas Newcomen's fire (steam) engine in his small workshop within the college precincts. Shipbuilding on a colossal scale and the enormous developments in the iron industries and engineering were practically the growth of the 19th century.

Glasgow was an important target for enemy air action in World War II and considerable damage was done, particularly to the large tenement blocks.

Buildings.—The municipal buildings (1888) occupy the eastern side of George square, the civic centre of the city, and many additional blocks have been built or purchased for the municipal staff. A sanitary department was opened in 1897, including a bacteriological and chemical laboratory. Added buildings, connected with the older ones by two bridges, were completed in 1923. Up till 1810 the town council met in a hall adjoining the old tolbooth. It then moved to the structure at the foot of the Saltmarket, now used as courthouses, and, after two further moves, the present quarters were occupied. On the south side of George square is the head post office.

On the west side stand the Bank of Scotland (1869) and the Merchants' house (1874–77), the head of which (the dean of guild) along the head of the Trades' house (the deacon convener of trades), has been ex officio member of the town council since 1711, an arrangement devised with a view to adjusting the frequent disputes between the two guilds. The Trades' hall (1794) is the oldest public building in the city. The Royal exchange, a fine Corinthian building, is used as a public library. Argyle street, the busiest thoroughfare, leads to Trongate, where a few remains of the old town are carefully preserved. On the south side of the street, spanning the pavement, stands the Tron steeple, a stunted spire dating from 1637, all that is left of St. Mary's church, burned down in 1793. On the opposite side, at the comer of High street, stood the ancient tolbooth, or prison, a turreted building, five stories high, with a Jacobean crown tower. The only remnant of the structure is the tower known as the Cross, or Tolbooth, steeple.

The old Royal infirmary, designed by Robert Adam and opened in 1794, adjoining the cathedral, occupied the site of the archiepiscopal palace, the last portion of which was removed toward the close of the 18th century. It was rebuilt in 1912, and later extensions demolished the block containing the ward in which Joseph Lister first applied his discovery of antisepsis. On the northern side are the buildings of the medical school attached to the institution.

Hutcheson's hospital, founded by George and Thomas Hutcheson in the 17th century for poor old men and orphan boys, and adorned with statues of the founders, is situated in Ingram street. By the increase in the value of its lands the hospital has become a very wealthy body and is able to subsidize schools apart from the charity.

St. *Mungo's* Cathedral.—The cathedral stands in the northeast quarter of the city 104 ft. above the Clyde. It is a beautiful example of Early English work, impressive in its simplicity. Its form is that of a Latin cross, with imperfect transepts. At the centre rises a fine tower, with a short octagonal spire. The choir, locally known as the High church, serves as one of the city churches, and the extreme east end of it forms the Lady chapel. The chapter house, which projects from the northeastern corner, was built in the 15th century and has a groined roof supported by a pillar. The crypt beneath the choir is borne on 65 pillars and lighted by 41 windows. The sculpture of the capitals of the columns and bosses of the groined vaulting is exquisite and the whole is in excellent preservation. Strictly speaking, it is not a crypt, but a lower church adapted to the sloping ground of the right bank of the Molendinar burn. St. Mungo's well in the southeastern corner was considered to possess therapeutic virtues, and in the crypt a recumbent effigy, headless and handless, is reputed to be the tomb of Kentigern.

In 1115 an investigation was ordered by David, prince of Cumbria, into the lands and churches belonging to the bishopric, and from the deed then drawn up it is clear that at that date a cathedral had already been endowed. When David ascended the throne in 1124 he gave to the see of Glasgow the lands of Partick besides restoring many possessions of which it had been deprived. Jocelin (d. 1199), made bishop in 1174, was the first great bishop, and is memorable for his efforts to replace the cathedral built in 1136 by Bishop John Achaius, which had been destroyed by fire. The crypt is his work, and he began the choir, Lady chapel, and central tower. The new structure was sufficiently advanced to be dedicated in 1197. James Beaton or Bethune (1517–1603), the last Roman Catholic archbishop, fled to France at the Reformation in 1560, and took with him the treasures and records of the see, including the Red Book of Glasgow dating from the reign of Robert III. The documents were deposited in the Scots college in Paris, were sent at the outbreak of the Revolution for safety to St. Omer, and were never recovered. This loss explains the paucity of the earlier annals of the city. The Reformers threatened to mutilate the cathedral, but the prompt defense of the craftsmen was the means of saving it.

Excepting the cathedral, no Glasgow church possesses historical interest. This is due largely to the long survival of the severe sentiment of the Covenanters. There are several fine modern churches.

Art Galleries, Libraries and **Museums.**—Glasgow merchants and manufacturers have been constant patrons of art, and their liberality may have had some influence on the younger painters who, toward the close of the 19th century, broke away from tradition and, stimulated by training in the studios of Paris, became known as the "Glasgow school."

In 1944, Sir William Burrell presented the magnificent collection of paintings, tapestries, *objets d'art,* etc. which bears his name, to be housed at the estate of Dougalston extending to 360 ac. just north of Glasgow. The art gallery and museum, the finest in Great Britain outside London, was opened in 1901 in Kelvingrove park. Opposite is the huge Kelvin hall burned down in 1926, but rebuilt in the following year. The Institute of Fine Arts, in Sauchiehall street, is mostly devoted to periodical exhibitions of modem art. There are also museums in the People's palace on Glasgow green and at Camphill.

The faculty of procurators possesses a valuable library which is housed in its hall in West George street. In Bath street there is the Philosophical Society's library and the Physicians' library is in St. Vincent street. The Mitchell library was moved to North street in 1911 and extended in 1953. It is the chief public library in the city. The Stirling library in Miller street has an extensive commercial reference library and is particularly rich in tracts of the 16th and 17th centuries. The Athenaeum in St. George's place is occupied by the Royal Scottish Academy of Music and the College of Dramatic Art.

University and Schools.—The university, founded in 1450 by Bishop Turnbull under a bull of Pope Nicholas V, survived in its old quarters till far into the 19th century. The *paedagogium,* or college of arts, was at first housed in Rottenrow, but was moved in 1460 to a site in High street, where Sir James Hamilton of Cadzow, first Lord Hamilton (d. 1479), gave it four acres of land and some buildings. Queen Mary bestowed upon it 13 ac. of contiguous ground, and her son granted it a new charter and enlarged the endowments. Before the Revolution its fortunes fluctuated, but in the 18th century it became very famous. By the middle of the 19th century, however, its surroundings had deteriorated, and in 1860 it was decided to rebuild it elsewhere. The ground had enormously increased in value and a railway company purchased it for £100,000. In 1864 the university bought the Gilmore hill estate and adjacent property and the new buildings (1870) were placed on the ridge of Gilmore hill—the finest situation in Glasgow. On the south the ground falls in a series of terraces toward Kelvingrove park and the Kelvin. On the west stand the houses of the principal and professors. The third marquess of Bute (1847–1900) gave £40,000 to provide the Bute or common hall, divided by a screen from the Randolph hall, named after another benefactor, Charles Randolph (1809–1878). The library includes the collection of Sir William Hamilton, and the Hunterian museum, bequeathed by William Hunter (*q.v.*) the anatomist, is particularly rich in coins, medals, black-letter books and anatomical preparations. Exhibitions were founded by John Snell (1629–79), a native of Colmonell in Ayrshire, for the purpose of enabling students of distinction to continue their careers at Balliol college, Oxford. The governing body includes the chancellor, elected for life by the general council, the principal, also elected for life, and the lord rector, elected triennially by the students voting in "nations" according to their birthplace (*Glottiana,* natives of Lanarkshire; Transforthana, of Scotland north of the Forth; Rothseiana, of the shires of Bute, Renfrew and Ayr; and Londoniana, all others). There were 67 professors and some 6,100 students in 1952. By an act of 1889, women were permitted to enrol as students and to graduate.

A faculty of engineering was instituted in 1923 and after World War I chairs were founded in languages and branches of chemistry, law, physics, engineering, medicine and theology, besides accountancy and music. During the period 1899–1903 the buildings were much extended and a further large extension was opened in 1907. In 1927 a new range of buildings in the west quadrangle provided additional accommodation for teaching and in 1930 a union for men students was opened. A memorial chapel was dedicated in 1929. Among other additions have been a new observatory, the Gardiner Institute of Medicine, a new reading room with accommodation for 565 readers (opened in 1939) and further buildings for chemistry and research into nuclear physics. Four halls of residence for men and one for women are under the control of the university.

The Royal Technical college in George street originated in the foundation (1796) by John Anderson (1726–96), professor of natural philosophy in the university, who opened a class in physics for working men, provided for the instruction of artisans and others unable to attend the university. It was the first technical college in the United Kingdom. In 1799 George Birkbeck (1776–1841) succeeded Thomas Garnett (1766–1802) and began in the following year those lectures on mechanics and applied science which, continued elsewhere, ultimately led to the foundation of mechanics' institutes in many towns. In 1886 the foundation was amalgamated with the college of science and arts (1823), the successor of the mechanics' institution; the "Young" chair of technical chemistry; the Atkinson institution (1861) and Allan Glen's school (1853) being named the Glasgow and West of Scotland Technical college. It received its present name in 1912 and was affiliated with the university in 1913. The Glasgow schools of architecture and art are in part maintained by the college. In 1912 Allan Glen's school was transferred to the Glasgow school board.
