The Anderson College of Medicine was instituted in 1799; it became one of the most important in the United Kingdom and in 1886, when it was separated from the original Anderson foundation, was placed under a separate governing body. St. Mungo's college, which developed from an extramural school in connection with the Royal infirmary, was incorporated in 1889, with faculties of medicine and law. Both colleges are with the veterinary college now under the control of the university. The school of art, the agricultural college and the schools for the training of teachers are institutions with distinctly specialized objects. The high school in Elmbank is the successor of the grammar school (long housed in John street) which was founded in the 14th century as an appanage of the cathedral. Other secondary schools include Glasgow academy, Kelvinside academy and the girls' and boys' schools endowed by the Hutcheson and other educational trusts.

Parks and **Open** Spaces.—Of the 52 parks and 770 minor open spaces and playgrounds, comprising 4,007 ac., the oldest is the Green (136 ac.), on the right bank of the river, adjoining a densely populated district. It once extended farther west, but a portion was built over at a time when public rights were not vigilantly guarded. It is a favourite area for popular demonstrations. The Kelvin flows through Kelvingrove park (87 ac.), in the west end, and the ground is naturally terraced, while the situation is beautified by the adjoining Gilmore hill with the university on its summit. The park contains the Stewart fountain erected to commemorate the labours of Lord Provost Stewart and his colleagues in the promotion of the Loch Katrine water scheme, statues of Lord Lister, Lord Roberts and Carlyle, and a war memorial. The other parks on the right bank are, in the north, Ruchill (53 ac.), acquired in 1891, and Springburn (77 ac.), acquired in 1892, and, in the east, Alexandra park ($98\frac{1}{2}$ ac.), in which is laid down a nine-hole golf course, and Tollcross ($83\frac{1}{2}$ ac.), acquired in 1897. Victoria park (654 ac.), at Whiteinch, contains a remarkable grove of fossilized trees.

On the left bank Queen's park (148 ac.), occupying a commanding site, was considerably enlarged in 1894 by the enclosure of the grounds of Camphill. The other southern parks are Richmond (44 ac.), acquired in 1898, Maxwell (21 ac.), which was taken over on the annexation of Pollokshields in 1891; Bellahouston (172 ac.), acquired in 1895; and Cathkin Braes ($72\frac{1}{2}$ ac.), presented to the city in 1886 by James Dick, a manufacturer, containing "Queen Mary's stone," a point which commands a view of the lower valley of the Clyde. In the northwestern district of the town 40 ac. between Great Western road and the Kelvin are devoted to the royal botanic gardens. Other acquisitions include 200 ac. of the Balloch castle estate (Loch Lomond park), the Rouken Glen (288 ac.), Linn (206 ac.), Newlands and Glenconner (14 ac. each), Dawsholm (79 ac.), Knightswood (148 ac.) and King's (68 ac.) parks. The corporation owns, besides, the Ardgoil estate of 14,740 ac.

Government.—By the Local Government (Scotland) act, 1889, the city was placed entirely in the county of Lanark, the districts then transferred having previously belonged to the shires of Dunbarton and Renfrew. In 1891 the boundaries were enlarged to include six suburban burghs and a number of suburban districts, the area being increased from 9.5 sq.mi. to 18.5 sq.mi. In 1912 Govan, Partick, Pollokshaws and several suburban districts were included in the city, making the total area 29.9 sq.mi. Further extensions were made in 1925, when parts of Renfrewshire, Dunbartonshire and Lanarkshire, including the Yoker district, were added, raising the area to 44.8 sq.mi. Extensions in 1931 and 1937 brought Glasgow to an area of 62.1 sq.mi. In 1893 the municipal burgh was constituted a county. Glasgow is governed by a corporation consisting of 113 members, including 20 bailies and the lord provost.

As a county Glasgow has a lieutenancy (successive lords provost holding the office) and a court of quarter sessions, which is the appeal court from the magistrates sitting as licensing authority. In 1859 water was conveyed by aqueducts and tunnels from Loch Katrine to the reservoir at Mugdock, a distance of 27 mi., whence after filtration it was distributed by pipes to Glasgow. In 1914 works were completed to raise Loch Katrine 5 ft. and to connect with it by tunnel Loch Arklet (455 ft. above the sea), with storage for 2,050,000,000 gal. The two lakes together possess a capacity of 12,000,000,000 gal. The entire works between the lake and the city mere duplicated over a distance of $32\frac{1}{2}$ mi., and an additional reservoir, holding 694,000,000 gal., was constructed and a dam built $1\frac{1}{4}$ mi. west of the lower end of Loch Arklet, designed to create a sheet of water $2\frac{1}{2}$ mi. long and to increase the water supply of the city by 10,000,000 gal. a day. In 1919 power was given to raise Loch Katrine a further 5 ft., making 17 ft. that could be drawn upon. This work was finished in 1926 and provides storage equivalent to six months' supply to the city at 70,000,000 gal. a day. The water committee supplies hydraulic power to manufacturers and merchants. Huge gas works opened at Govan in 1921 and a large electric generating station at Dalmarnock bridge in 1920, are now vested in national boards. A large refuse electric power works was opened at Govan in 1929.

By lapse of time and congestion of population, certain quarters of the city, in old Glasgow especially, were slums and rookeries of the worst description. The municipality obtained parliamentary powers in 1866 to condemn for purchase overcrowded districts, to borrow money and levy rates. The work was carried out, and when the act expired in 1881 whole localities had been recreated. Under the amending act of 1881 the corporation began in 1888 to build tenement houses and lodging houses. The powers of the improvement trustees were practically exhausted in 1896, when it appeared that the funds showed a deficiency of £423,050. Assessment of ratepayers for the purposes of the trust had yielded £593,000, and it was estimated that these operations had cost the citizens £24,000 a year. In 1897 an act was obtained for dealing in similar fashion with insanitary and congested areas in the centre of the city, and on the south side of the river. The drainage system was entirely remodelled, the area being divided into three sections, each distinct, with separate works for the disposal of its own sewage. Housing conditions and unemployment were again very bad after World War I, and led to a "rent strike." Under the various Housing (Scotland) acts, 89,571 houses were completed by March 1953, but overcrowding continued to be as great a problem as slum clearance. In May 1930 the corporation, under the Local Government (Scotland) act, 1929, became the local education authority.

Throughout the 19th century the population grew prodigiously. Only 77,385 in 1801, it was nearly doubled in 20 years, being 147,043 in 1821, already outstripping Edinburgh. In 1901 it stood at 761,709, in 1931 at 1,088,461 and in 1951 at 1,089,555. Since 1918 Glasgow has returned 1j members to parliament, one each for Bridgeton, Camlachie, Cathcart, Central, Gorbals, Govan, Hillhead, Kelvingrove, Maryhill, Pollok, Scotstoun, Shettleston, Springburn, Tradeston and Woodside.

Communications, — One railway terminus is situated in Queen street, and consists of a high-level station (main line) and a low-level station for Balloch, etc., used in connection with the city and district line, largely underground, serving the northern side of the town. The central station terminus for Carlisle, Edinburgh, etc., in Gordon street, comprises a high-level station for the Cathcart Circle railway and a low-level station for Balloch, and for the connection between Maryhill and Rutherglen, which is mostly underground. Both the underground lines communicate with certain branches of the main line, either directly or by change of carriage. The older terminus in Buchanan street now takes the northern and eastern traffic and the station in St. Enoch square serves the southwest of Scotland and Carlisle. The Glasgow subway—$6\frac{1}{2}$ mi. long, worked in two tunnels and passing below the Clyde twice—was opened in 1896 as a cable line. It was bought in 1923 by the corporation and was converted to electric traction, the new system being inaugurated in 1935.

There are at certain points free steam ferryboats or floating bridges for conveying vehicles across the harbour. The corporation has obtained powers to construct twin tunnels under the river at Whiteinch. Steamers, carrying both goods and passengers, constantly leave the Broomielaw quay for the piers and ports on the river and firth, and the islands and sea lochs of Argyllshire.

The Port. — The Clyde navigation trustees are responsible for 18 mi. of the River Clyde, from Port Glasgow to Glasgow. The harbour occupies 368 ac. of water space. For the most part it is lint l by quays and wharves, which have a total length of just over 12 mi., and from the harbour to the sea vessels drawing 26 ft. can go up or down on one tide. In the middle of the 18th century the river was fordable on foot at Dumbuck 12 mi. below Glasgow and $1\frac{1}{2}$ mi. S.E. of Dumbarton. The earliest shipping port of Glasgow was Irvine in Ayrshire, but lighterage was tedious and land carriage costly, and in 1658 the civic authorities endeavoured to purchase a site for a spacious harbour at Dumbarton. Being thwarted by the magistrates of that burgh, however, in 1662 they secured 13 ac. on the southern bank at a spot some 2 mi. above Greenock, which became known as Port Glasgow, where they built harbours and the first graving dock in Scotland. Sixteen years later the Broomielaw quay was built, but it was not until the tobacco merchants appreciated the necessity of bringing their wares into the heart of the city that serious consideration was paid to schemes for deepening the waterway.

In 1768 John Golborne advised the narrowing of the river and the increasing of the scour. By the building of numerous jetties, the constant use of steam dredgers and the blasting of rock, the channel was gradually deepened and much land reclaimed. By 1900 it had a minimum depth of 22 ft., and, as already indicated, the largest vessels make the open sea in one tide, whereas in 1840 it took ships drawing only 15 ft. two and even three tides to reach the sea. From 1812 to 1820 Henry Bell's "Comet," 30 tons, driven by an engine of 3 horsepower, plied between Glasgow and Greenock, until she was wrecked, being the first steamer to run regularly on any river in the old world. When the quays and wharves ceased to be able to accommodate the growing traffic, the construction of docks became imperative. In 1867 Kingston dock on the south side, of 43 ac., was opened but soon proved inadequate, and in 1877 Queen's dock (two basins) at Stobcross on the north side, of $33\frac{3}{4}$ ac., was opened. In 1897 Prince's dock (three basins) on the opposite side, of 35 ac., was opened, fully equipped with hydraulic and steam cranes and all the other latest appliances. The Rothesay dock ($20\frac{1}{2}$ ac.) at Clydebank, opened in 1907, and the wharf at Renfrew, are included in the harbour.

The railway has access to the harbour for goods and minerals at Terminus quay to the west of Kingston dock, and a mineral dock has been constructed by the trust at Clydebank, about $3\frac{1}{2}$ mi. below the harbour. The King George V dock at Shieldhall, which added another 20 ac. of water space and over a mile of quays to the harbour, was opened in 1931. It is connected by railway lines and a road joining the new trunk road of the Glasgow corporation scheme. There are also five graving docks, the Partick dry dock, and two patent slips. The shipping attains to colossal proportions. The imports consist chiefly of grain and flour, leather, tobacco, timber, oil, iron ore, bacon and other foodstuffs; and the exports principally of cotton, jute and linen goods, yarn, coal, machinery and spirits.

Industries. — Natural causes, such as proximity to the richest field of coal and ironstone in Scotland and the vicinity of hill streams of pure water, account for much of the great development of trade in Glasgow. It was in textiles that the city showed its earliest predominance, which, however, was not maintained, though several cotton mills are still worked. The leading feature in the trade has always been in the manufacture of light materials. Thread is made on a considerable scale. Carpets are woven and some factories are exclusively devoted to the making of lace curtains. The allied industries of bleaching, printing and dyeing have prospered. The use of chlorine in bleaching was first introduced in Great Britain at Glasgow in 1787, on the suggestion of James Watt, whose father-in-law was a bleacher; and it was a Glasgow bleacher, Charles Tennant, who first discovered and made bleaching powder (chloride of lime). Turkey red dyeing was begun at Glasgow by David Dale and George Macintosh, and the colour was long known locally as Dale's red. A large quantity of gray cloth continues to be sent from Lancashire and other mills to be bleached and printed in Scottish works. These industries gave a powerful impetus to the manufacture of chemicals, and the works at St. Rollox developed rapidly.

There are several breweries and distilleries and Glasgow is the centre of the whisky blending, bottling and casing industry. Many miscellaneous industries are carried on such as the making of glass, paper, clothing, confectionery, cabinets, biscuits, boots and shoes, pottery and rubber goods. Since the days of the brothers Robert Foulis (1705–76) and Andrew Foulis (1712–75), printing, both letterpress and colour, has been identified with Glasgow, though less than with Edinburgh. The discovery of the value of black-band ironstone, till then regarded as useless "wild coal," by David Mushet (1772–1847), and Neilson's invention of the hot-air blast threw the control of the Scottish iron trade into the hands of Glasgow ironmasters; the furnaces themselves were mostly erected in Lanarkshire and Ayrshire. The expansion of the industry was such that in 1859 one-third of the total output in the United Kingdom was Scottish. Mild steel is manufactured and some crucible cast steel is made. In addition to brass foundries there are works for extraction of copper and smelting of lead and zinc. Locomotive engines are built, all kinds of builder's ironwork is forged, and the sewing machine factories in the neighbourhood are important. Boilermaking and marine engine works, in many cases being directly connected with the shipbuilding yards, are numerous.

Shipbuilding, indeed, is the greatest of the industries of Glasgow. Excepting a trifling proportion of wooden ships, the Clyde-built vessels are made of steel, the trade having owed its immense expansion to prompt adoption of this material. Every variety of craft is turned out, from battleships and great liners to dredging plant and hopper barges. In the 20th century many new industries were established, among them the manufacture of motor trailers, welding machinery, electrodes, electric lamps and batteries, electric household appliances, silk and synthetic fibre garments, seamless containers, etc. The Great British Empire exhibition of 1938 was held from May to October in Bellahouston park.

GLASITES, a Christian sect, founded in Scotland by John Glas (*q.v.*). It spread into England and America, but is now practically extinct. The name Glasites or Glassites was generally used in Scotland; in England and America the name Sandemanians was more common. Glas dissented from the Westminster Confession only in his views as to the spiritual nature of the church and the functions of the civil magistrate. But his son-in-law Robert Sandeman added a distinctive doctrine as to the nature of faith which is thus stated on his tombstone: "That the bare death of Jesus Christ without a thought or deed on the part of man is sufficient to present the chief of sinners spotless before God." In their practice the Glasite churches aimed at a strict conformity with the primitive type of Christianity as understood by them. Each congregation had a plurality of elders, pastors or bishops, who were chosen according to what were believed to be the instructions of Paul, without regard to previous education or present occupation, and who enjoy a perfect equality in office. In all the action of the church unanimity was considered to be necessary; if any member differed in opinion from the rest, he must either surrender his judgment to that of the church, or be shut out from its communion. The Lord's Supper was observed weekly; and between forenoon and afternoon service every Sunday a love feast was held at which every member was required to be present. Mutual exhortation was practised at all the meetings for divine service, when any member who had the gift of speech (χάρισμα) was allowed to speak. The practice of washing one another's feet was at one time observed; and it was for a long time customary for each brother and sister to receive new members, on admission, with a holy kiss. The lot was regarded as sacred; the accumulation of wealth they held to be unscriptural and improper, and each member considered his property as liable to be called upon at any time to meet the wants of the poor and the necessities of the church. Churches of this order were founded in Paisley, Glasgow, Edinburgh, Leith, Arbroath, Montrose, Aberdeen, Dunkeld, Cupar, Galashiels, Liverpool and London, where Michael Faraday was long an elder. Their exclusiveness in practice, neglect of education for the ministry, and the antinomian tendency of their doctrine contributed to their dissolution. Many Glasites joined the general body of Scottish Congregationalists, and the sect may now be considered extinct. The last of the Sandemanian churches in America ceased to exist in 1890.

See James Ross, *History* of *Congregational Independency in Scotland* (Glasgow, 1900). (*D.* M.)

GLASS, CARTER (1858–1946), American politician, was born at Lynchburg, Va., on Jan. 4, 1858. He received his education in the Lynchburg schools and learned the printer's trade, which he followed for several years, eventually becoming proprietor of the Lynchburg *Daily News* and *Daily Advance*. He was elected to the Virginia State Senate for two terms (1899–1903) and was a member of the Constitutional Convention in 1901. He was elected in 1902 to the national House of Representatives, and thereafter was continuously re-elected until his resignation in 1918. As chairman of the House banking committee he was active in framing and passing the Federal Reserve Bank law. In 1918 he entered President Wilson's cabinet as secretary of the Treasury. Under his guidance the fifth Liberty Loan was floated in April, 1919. In Nov. 1919 he resigned after his appointment to the U.S. Senate, where he remained by election until his death, on May 29, 1946.

GLASS. The attributes of a glass are transparency, uniformity of properties at all points in its substance, hardness, brittleness and conchoidal or shell-like markings on fractured areas. Until the 20th century a glass was always regarded as a transparent product resulting from the fusion of mineral substances. In 1903 Gustav Tammann defined a glass as a supercooled liquid, thus including as glasses many organic substances, such as glycerol. betol and sugar, which after being melted could be cooled to yield clear, rigid products. Further, some of the high polymer organic substances, described in England as plastics (*e.g.*, pollopas, polystyrene, etc.), possess transparency and uniformity of properties and have been moulded into lenses and other transparent objects. They have been described, especially in continental Europe, as organic or polymeric glasses.

The definition accepted in the United States, however (American Society for Testing Materials), recognizes as glasses only those of inorganic origin. While for scientific classification it must be insisted that many organic substances can be converted into glasses, for purposes of description in this article it is convenient to accept the limitation in this American definition, of which the following is a slight variant:

> Glass is an inorganic product of fusion, which has cooled to a rigid condition without crystallizing. Masses or bodies of glass may be colourless or may be made coloured, translucent or opaque by the presence of dissolved material or of amorphous or crystalline substances in suspension.

The inorganic substances convertible into glasses by fusion and cooling include single elements, such as selenium, and the oxygen, sulphur. selenium and tellurium compounds of silicon, boron, phosphorus. germanium, arsenic, antimony and bismuth. Nitrates, sulphates and fluorides can also form glasses. These glass-forming substances, within certain limits of composition, also bestow glass-forming characteristics on their compounds with the oxides of sodium, potassium, lithium, calcium, magnesium, lead, barium, zinc, aluminum, iron, cobalt, nickel. copper, manganese, etc. The most frequently used glass-forming substances are the oxides of silicon, boron and phosphorus. that of silicon dominating all others. The production of fused silica glass (from rock crystal or quartz sand) has for many years been a large-scale industry.

In 1932 the terms "glass network former" and "glass network modifier" were introduced by W. H. Zachariasen, the first to designate those compounds (in particular the oxides of silicon, boron, etc.) which favour the production of a glass, the latter to define the function exercised by the oxide of the metallic elements.

According to his views, confirmed experimentally by B. E. Warren (1934), both crystals and glass have a three-dimensional network structure built from a certain group of atoms constituting a repeatable unit in the network. In crystalline silica and the silicates the unit is comprised of an atom of silicon linked to four oxygen atoms so spaced as to conform to the shape of a tetrahedron. It is assumed that in silica-containing glasses this same unit controls the formation of the network; but whereas in crystals the cells in the network produced from these units are repeatable and symmetrical, in glasses they are random. nonrepeating and nonsymmetrical. (See CRYSTALLOGRAPHY.) The elements from the basic oxides (sodium, potassium. calcium, barium. etc.) are regarded as occupying a position within the cell and to have a greater freedom of movement. (For a fuller exposition see, for example. J. E. Stanworth's Physical Properties of Glass, Oxford, 1950.)

Most commercial glasses contain at least three major constituents, some six or more, comprised of one or more of the glass-forming oxides (silica. boric oxide, etc.) together with one or more of the oxides of the metallic elements (sodium. potassium. calcium, etc., as above); and each constituent has its own specific function to discharge in modifying the ease of melting and the physical properties of the glasses. (For typical compositions used for different purposes see Properties, Manufacture and Uses, below.)

A large proportion of the known chemical elements have been embodied as constituents in glasses, bestowing on them the most diverse range of colour and physical properties—optical, electrical, heat and radiation transmitting, mechanical and chemical—so that commercial glasses can now be produced for the most diverse of purposes. The density can be varied between fourfold and fivefold; the thermal expansion thirtyfold; and the electrical resistance ten thousand millionfold. The variety and number of commercial glasses of different compositions and properties is very great. Of the highest-quality optical glasses alone some makers produce more than 100 varieties. But limitations on the range of commercial glasses are imposed by physicochemical and economic conditions. For example, although from the three most commonly used constituents alone, silica (sand), soda and lime, a very large number of glasses could be prepared by varying the proportions, certain of them cannot be cooled under manufacturing conditions without the deposition of crystals of one component or of compounds produced on fusion—SiO_2 as tridpmite, $CaSiO_3$ as wollastonite and $Na_2O.3CaO.6SiO_2$ as devitrite. This phenomenon of devitrification still has to be guarded against in the chambers from which sheet glass is drawn at about 1,000° C. Optical glass compositions are also limited by devitrification because of the slow rate of cooling given. The other physicochemical condition is that not all compositions yield glasses sufficiently resistant to weathering or chemical attack. On the economic side it is obvious that the more expensive lead oxide and potash, which increase refraction and brilliance, will be reserved for the special objects for which adequate prices can be expected. Sheet glass, plate glass, bottles and jars and much common domestic ware are made from sand, soda and lime because of their cheapness. The use of continuous automatic glassmaking machines also tends to a standardization of compositions employed.

The shaping of glass drawn from the furnace in the fluid condition at 1,000°–1,200° C. depends on its continuous increase of viscosity in cooling from the highest melting temperatures (1,300°–1,600° C.) down to the rigid state already reached at 450°–650° C., according to the glass. Glassmaking is therefore unique in that it consists not only in the production of the glass itself but also in its conversion directly from the furnace into the fully shaped articles, whereas metals, because they have a sharp freezing point, must first be poured and converted into ingots.

Except for the introduction at St. Gobain in France in the last decade of the 17th century of a new invention for rolling large plates of glass, the processes for shaping glass remained much the same in principle from the early Christian era (see History, below) until nearly the end of the 19th century, when the development of machines. at first semiautomatic, began in England and in the United States. In the 20th century epoch-making advances took place. especially in the U.S. but also in Belgium and England, in the invention of fully automatic machinery for shaping glassware required in great numbers or quantities. At least 95% of the total weight of glass manufactured in the U.S., Great Britain and several other countries is by automatic machinery. The Corning ribbon machine can make more than 1,000,000 electric light bulbs a day.

As just before the opening of the Christian era when the blowpipe came into use, so with the development of glassmaking machines, the output of glassware increased enormously and the uniformity and general quality of the articles greatly improved. Modern glassmaking has become largely a branch of engineering. In consequence, the glass industry, no longer dependent on skilled glass blowers for utilitarian glass. so spread after 1915 that by 1954 there were few countries outside the arctic and antarctic where it had not been established. Both the importance of the industry and its great expansion during the 20th century are illustrated by the data shown in Table I for the three largest producing countries (U.S.S.R. unknown).

TABLE I.—Glass Production, *1900* and *1950*

Country	1900		1950	
	Population	Production (tons)	Population	Production (tons)
United States . . .	76,000,000	1,000,000	152,000,000	5,460,000
Great Britain . . .	38,000,000	220,000	50,000,000	1,230,000
West Germany . . .	39,000,000	400,000	48,000,000	800,000

The great advances made were rendered possible by clever inventors backed up by systematic scientific research and control. The first university department for research and teaching in glass technology was established in 1915 at Sheffield, Eng , and the first Society of Glass Technology, in 1916, also in Sheffield. Similar institutions soon followed in the U.S., then in 1922–23 in Germany and later in several other countries. In glass as a decorative material. notable advances were made after 1920 in purity, range of colouring, form and decorative surface treatment. These advances were pioneered mainly by individual glassworks or by individual artists; but to the old established schools for training in glass craftsmanship at Zwiesel in Bavaria and at Steinschonau (Kamenicky Senov) and Haida (Novy Bor) in Czechoslovakia there were added another at Zelezny Brod in Czechoslovakia, one at Rheinbach in Germany and three in Great Britain (London, Edinburgh and Stourbridge). There is an International Commission on Glass which maintains contact with all institutions engaged in promoting the study of glass in all its aspects.

For a readable and accurate general account of glass and glassmaking the reader may be referred to Glass, The Miracle Maker, by C. J. Phillips, and ed. (New York, 1948). (W. E. S. T.)

PROPERTIES, MANUFACTURE AND USES

The simplest glass and one with excellent properties in most respects is fused silica (SiO_2). By fusing silica with alkali (soda) a glass is obtained at a much lower temperature and therefore more cheaply, but it is not resistant to the weather. Indeed, one range of such alkali-silica glasses constitutes the commercial water glass or sodium silicate. Additions of a suitable amount of one or more further constituents (*e.g.,* lead oxide or lime) gives much-improved chemical stability while maintaining the relatively low temperature of glass formation and so results in commercially usable glasses. The alkali-lead oxide-silica glasses are used for producing best-quality cut crystal ware, while the alkali-lime-silica type, modified often by the introduction also of a little magnesia and alumina, is used for the commoner glasses such as containers, flat glass and cheap domestic glassware. Where considerable resistance to thermal shock and great chemical resistance is needed, as in cooking ware and chemical apparatus, a borosilicate glass is used in which the alkali content is largely replaced by boric oxide. Of these glasses the Pyrex brand is most widely known (W. C. Taylor, United States patent 1,192,474).

For special optical purposes the silica may be wholly or largely

TABLE 11.—*Percentage Compositions of Typical Commercial Glasses*

replaced by boric oxide (borate glasses) or phosphoric oxide (phosphate glasses). Many of these are deficient in chemical stability and can be used only in protected positions. The range of these was extended after 1939 by the use of rare-earth oxides (*e.g.*, U.S. patent 2,150,694). One phosphate glass (British patent 585,257 of Feb. 3, 1947) has remarkable resistance to hydrofluoric acid solution, which rapidly attacks all ordinary glasses.

Table II sets out a number of typical glass compositions. To these may here be added that of glass fibres used for electrical insulating braids and the like. The great surface area per unit weight possessed by such fibres makes the chemical attack by moisture or acids proportionately far greater than that suffered by the same glass in lump or vessel form. For insulating fibre the very durable glass of percentage composition (approximately) SiO_2 54, B_2O_3 10, Al_2O_3 14, CaO 17, MgO 4 is used. (See Glass *Fibres*, below.)

PROPERTIES

Since chemical and physical properties are controlled largely by composition, it follows that these also can be varied over a wide range. Indeed it has been claimed that in the making of glass-to-metal seals, when the expansion characteristics of glass and metal must be matched quite closely, it is easier for the glass manufacturer to adjust his glass to match a given alloy than for the alloy maker to produce his alloy to match a given glass. In the case of such an ancient craft as glassmaking, trial and error has resulted over the centuries in the development of certain glass compositions which are particularly suited to certain processes (*e.g.*, lead crystal glass for lengthy hand forming operations), but the introduction of mechanical methods of forming and the need for glasses for electrical and other special purposes resulted in demands that could scarcely have been met without the systematic research on the effect of composition on glass properties that has been carried out in the 20th century.

Properties that are particularly important are the following:

Chemical durability, or resistance to attack by weather or by any solid, liquid or gaseous substances which the glass vessel may contain. In a very broad sense the alkali content of the glass controls this property, high alkali imparting poor durability. This is not, however, the only factor. Boric oxide, alumina, zinc oxide and zirconia all help to give increased durability in certain circumstances. Table III indicates the relative effects of some oxides on the attack of water on various simple three-component glasses of the same general type. The order of attack varies with the nature of the reagent and the temperature as well as the composition of the glass. Since the weathering and chemical corrosion of commercial glasses are usually extremely slight and noticeable only after a considerable time interval, the methods of testing durability exaggerate the severity of the conditions either by reducing the glass to the form of small grains of controlled size, thus greatly increasing the surface exposed to attack, or by raising the temperature; or both methods may be united in one test. Table IV shows the percentage losses sustained by various types of glass in the form of grains of 20–30 mesh when heated for one hour in boiling water or the reagents indicated.

In view of the effect on solutions for injections, etc., of small amounts of alkali dissolved out of the containers (ampoules), it is of paramount importance that such articles be made of really durable glass. The same applies to containers for blood storage.

Viscosity and, particularly, the rate at which viscosity changes with temperature, has an important effect on the forming of glass

while hot and plastic. Since such operations often proceed step by step, it is necessary that the glass remain soft enough to yield to formative pressure over a considerable range of temperature, ending at a viscosity high enough to retain the final shape. Alteration of the forming process thus means quite often alteration of composition in order to secure the required viscosity. The lead crystal glass used for hand working remains soft over much too wide a range of temperature to suit an automatic bottle-forming machine, and the glass suitable for the latter again would not be suitable for flat glass-drawing machines. Viscosities of 10^3 c.g.s. (centimetre-gram-second) units (poises) (furnace working temperature), 10^6 c.g.s. units (lower limit of working range) and 10^{13}–10^{14} c.g.s. units (T_g or transformation point) are important in glassworking.

Softening Point.—The softening of glass is a time-temperature phenomenon. Useful data, however, result from finding the temperature at which a rod of standard dimensions, heated in a standard apparatus at a standard rate, begins to elongate at a defined rate under its own weight. Such a temperature is the Littleton softening point. Values range from 500°–1,100° C. It corresponds with a viscosity of 4.5×10^7 poises.

Annealing Point.—This is defined as the temperature at which strain will be relieved in 15 minutes, corresponding with a viscosity of 2.5×10^{13} c.g.s. units.

Surface tension plays an important part in forming operations. It closes the ends of tubes when heated, draws in the skirt of an electric bulb envelope to seal to the flare of the stem and prevents glass from penetrating into minute crevices in moulds. Values for silicate glasses are around 300 dynes per centimetre.

Density.—Ordinary bottle and window glasses have densities in the region of 2.5. That of lead crystal glass is approximately 3.1, of "densest flint" optical glass 7.2 and of fused silica 2.2. Factors enabling density to be calculated from composition have been applied with partial success.

Thermal expansion is important as a factor in the resistance of glass to heat shock and in determining the stresses set up in windows under alternating heating (solar radiation) and coding (rain). A very powerful factor is alkali content, since both sodium and potassium oxides markedly increase the expansion. Values range from 56×10^{-7} to 140×10^{-7} cm. per centimetre per degree centigrade. (Silica glass 5.6×10^{-7}, Vycor glass 8×10^{-7}, Pyrex glass 32–36×10^{-7}, bottle glass 82–88×10^{-7}, lead crystal glass 88×10^{-7}.) In glass-to-metal seals the expansions of glass and metal must match closely over the range of temperature in which glass cannot yield to stress.

Thermal Endurance.—Thermal expansion, mechanical strength, the dimensions of the article and the rate at which heat is spread affect thermal endurance. Glass rods of Pyrex type in one test withstood, when dropped into cold water, a shock of 325° C., while soft lamp-working glass withstood only 112° C. and a commercial soda-lime glass 131° C. Tests of this property are routine practice in many glassworks to detect faulty ware as it is very sensitive to departures from normal technique.

Thermal Conductivity.—Values range from 0.0078 to 0.0028 cal. per centimetre per degree centigrade per second. High soda, potash and lead oxide contents decrease thermal conductivity, while high silica and boric oxide increase it.

Mechanical Properties.—Glass is very strong in compression. When it breaks it does so in tension. Compressive strength ranges from 90,000 to 180,000 lb. per square inch, tensile strength from 4,000 to 1,500,000 lb. per square inch (depending on cross-sectional area of specimen), Young's modulus 6,500,000 lb. per square inch, Poisson's ratio (σ) 0.14–0.271 (ordinary glass about 0.22). The true strength of glass is never realized in tests. Reduction in diameter of a test piece results in higher and higher values, thought to be a result of the reduction of the number of chance flaws in the glass surface from which fracture begins.

Considerably greater strength is obtained from simple shapes by a controlled sudden chilling instead of the normal annealing. Such "toughened" glass used as an automobile window will withstand an impact roughly eight times that needed to break ordinary glass of the same thickness.

Containers such as milk bottles make many trips between factory and consumer. The improvement in mechanical and thermal properties achieved is illustrated by the fact that whereas 20 trips was regarded as average in the 1920s, the figure in 1954 was nearer 60. Improved design of containers also helped.

Electrical Properties.—Conductivity of glass varies with composition and increases with temperature; therefore, though glass is a good insulator at room temperature, it is possible when it is raised to red heat to pass sufficient current through the mass to raise the temperature to 1,400° C. and continue melting by electrical energy. High alkali content gives (relatively) high conductivity or low resistivity. Resistivity ranges from 10^8 to 10^{18} ohms per cubic centimetre. Lead glasses of good working properties have high resistivity and so are used in electric lamps to support the filament.

Dielectric constant depends on composition and on the temperature and the frequency. It varies from 3.7 to 16.5. Pyrex-type

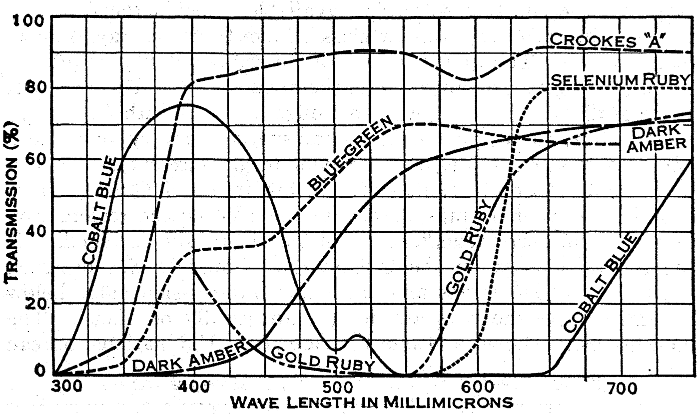

FIG. 1.—TRANSMISSION OF VARIOUS COLOURED GLASSES FOR LIGHT OF DIFFERENT WAVE LENGTHS

glass has the low value of 4.1–5.0. Dielectric loss varies with frequency. For Pyrex-type glass the value changes from 1.9×10^{-2} to 4×10^{-2} as frequency falls from 10^6 cycles to 10^3 cycles. Values for most glasses are around 1–2×10^{-2}.

Optical Properties.—Refractive index (for sodium D line) varies from 1.458 (fused silica) through 1.478 for Fluor Crown, 1.517 for Hard Crown, 1.613 for Dense Barium Crown, 1.613 for Dense Flint, 1.668 for Dense Barium Flint to 1.717 for Double Extra Dense Flint.

Dispersion (difference between refractive indexes for wave lengths in different parts of the spectrum) varies between (Fraunhofer lines C–F) 0.007 for fused silica and 0.024 for Double Extra Dense Flint glass.

Stress Optical *Coefficient.*—Under stress glass behaves as a uniaxial optically negative crystal (Brewster); that is, it rotates the plane of polarization of light passing through it. On this depends the working of the strain viewer used to test whether an article is properly annealed or not.

Absorption and Transmission.—Of the "white" light falling on a glass plate at right angles to the surface, some is reflected, some is absorbed and some emerges at the other surface. The absorption is not the same for all wave lengths, so the emerging light is relatively stronger in some wave lengths than others in comparison with the incident light. Instead of now being ordinary white light it is coloured. The extent of the absorption in the various wave lengths depends upon the glass composition, the thickness and the temperature. Fig. 1 shows the behaviour of a number of glasses. Specially interesting are (1) glasses very low in iron content, which transmit ultra-violet light (quartz glass is best); (2) glasses of high ferrous iron content, which cut off both ultra-violet and heat radiation, as spectacles for furnace workers; and (3) glasses containing nickel oxide, which transmit ultra-violet but no visible light.

Ultra-Violet Ray Transmitting Glass.—Glasses having the property of transmitting radiations of shorter wave length than occur in the visible spectrum (that is, shorter than 400 $m\mu$, the sign $m\mu$ representing 1 millimicron or $\frac{1}{10,000,000}$ cm.) have been known for many years. Fused silica or quartz provides a glass transmitting rays down to 190 $m\mu$. In 1907 E. Zschimmer prepared in small quantities a number of glasses having transmission limits varying from 186 $m\mu$ to 280 $m\mu$. As the most active rays which affect a photographic plate are those of short wave length, lenses which transmit well in the ultra-violet are advantageous in camera work. O. Schott, at Jena, introduced such a glass under the name of "Uviol." Good ultra-violet transmission is important especially for stellar photography.

The stimulus to the development of ultra-violet transmitting sheet glass was the study by Bernard at Samaden and Auguste Rollier at Leysin, Switz., of the beneficial effect of high alpine sunlight on tuberculosis patients, and the employment of electric arc lamps having a high output of ultra-violet rays for combating rickets. The rays of therapeutic value are confined to a small region from about 297 to 307 $m\mu$. Because of atmospheric absorption, the shortest solar rays available, even in the Alps, are 295 $m\mu$, but ordinary window glass seldom transmits rays shorter than 310 $m\mu$. The question arose as to the possibility of preparing window glass to transmit the therapeutic rays. This was first successfully done by F. E. Lamplough in 1925 with Vita-glass. Like quartz, fused boric oxide is transparent to very short rays, and Vita-glass resembles ordinary window glass except that it contains about 2% boric oxide and is of low iron and titanium oxide content. For high transparency in the ultra-violet region, iron oxide in the ferric condition must be rigorously excluded. Of the several glasses on the U.S. market, Corex D was designed primarily for sun lamps and has a low transmission value below 290 $m\mu$ where the rays are not therapeutically beneficial. The measurements shown in Table V, made at the U.S. national bureau

TABLE V.—*Ultra-Violet Ray Transmission, at 302 $m\mu$*

of standards on samples two millimetres thick, indicate the transmission in the region of therapeutic value of a number of specimens of glasses available. After short service the transmission of most such glasses diminishes considerably and then remains constant. The amount of the decrease is indicated in the third column, which shows transmission values after stabilization. (*See* also LIGHT; SPECTROSCOPY.)

MANUFACTURE AND USES

Raw Materials.—The oxides shown in the conventional expressions of glass compositions are not always present as such in the mixture, known as "batch," charged into the melting furnace. In many cases the material furnishing them to the glass is a carbonate; sometimes it is a nitrate or sulphate or possibly a hydroxide. In Table VI are set out a number of oxides which take part in glass formation, with the usual raw materials employed to introduce them into the batch.

Materials may be chosen for their cheapness or for some property in addition to their capacity to yield a desired constituent. Thus alkali nitrates, much more expensive than the carbonates per

TABLE VI.—*Chief Raw Materials Used in Making Glass*

*Approximate figures.

unit of oxide contributed to the glass, are sometimes employed because they assist melting and provide an oxidizing atmosphere which is desirable when melting lead glasses and certain coloured glasses. Sundry fluorides are used not for their alkali or calcium contents but because they contribute fluorides which opacify the glass if in sufficient amount or speed up melting and refining when used in small quantities. The colours produced by various materials are indicated in Table VII. Such colours are either "solution" colours or owe their action to finely divided particles dispersed through the main glass mass; *e.g.*, gold and other ruby glasses.

Sand is a most important material. It must possess a reasonably uniform grain size with no large grains and little dusty material and for colourless glass must contain very little iron oxide (0.04% maximum for good-quality containers, 0.02% for lead crystal tableware and not more than 0.006% for optical glass; window-glass sands may contain as much as 0.10% obtained by blending good sands with poorer ones); other colouring oxides should not be present in amount to give rise to detectable colour.

Batch Preparation.—The raw materials are stored in bins, "silos" or sacks and are weighed out, mixed and sent to the furnace. In large installations the weighing may be automatic, material being fed in predetermined sequence to a weighing machine so interlocked that further use is impossible until correct weight is shown. When weighed out, the batch is tipped into a mixer, frequently of the well-known concrete-mixer type. and is discharged to a hopper which holds one "mixing" or is elevated and conveyed to a storage bin. Very special batches (*e.g.*, for optical or coloured glass not made in quantity) are sometimes mixed by hand and shovel in wooden tubs. Conveying of batch is by bucket or belt conveyor, by "unit mix" hopper on a monorail or by compressed air along a tube. Segregation by vibration or

TABLE VII.—*Colouring Materials*

Glass constituent	Per cent present in glass	Batch material	Colour produced	Melting conditions
Copper	0.03–0.1	Cuprous oxide	Ruby	Reducing

Cobalt oxide	0.001–0.1	Cobalt oxide; Smalt	Blue with high red transmission	Sot markedly affected

"free fall" is of course a danger, and briquetting of mixed batch is claimed as a solution to such segregation troubles. It is customary and in general beneficial to include in the mixing a proportion of broken glass of the same composition as that to be made. This comes naturally from waste glass incidental to manufacture and is called cullet. It should be of small-sized pieces.

Batch Feeding.—To large furnaces this is generally automatic by screw or pusher feeding device or by discharging a thin stream across the furnace to form a "blanket" of batch. When melting is done in pots, hand filling with shovels is the rule except in some plate-glass works where power-operated ladles are used.

Glass Melting Furnaces.—Meltings in early times were carried out in clay pots heated by wood. The process, on more modern lines, still persists, but producer gas from coal or lignite, oil, coke-oven gas and natural gas are the common fuels. Electric heating is employed where power is cheap and other fuels expensive (Switzerland) or as a boost to other methods. Special glasses and those made in small quantity are generally melted in pot furnaces containing 1–20 pots (most often 8–12). The pots may be open or "closed"—*i.e.*, covered with a hooded side opening which abuts on a hole in the furnace wall so that the flame gases have no access and cannot affect the glass. Their capacity ranges from a few pounds to 30 cwt., and shapes vary. A common one has an egg-shaped horizontal section so that the maximum amount of floor space of a circular furnace may be used. The clay mixture contains raw clay with a percentage (30 or more) of carefully graded prefired clay ("grog"). Sometimes so-called sillimanite is used as grog. The making is either by hand from rolls of plastic mixture or by casting a fluid slip in plastic moulds as in the pottery industry. Drying must be slow and very carefully controlled and, before being placed in the melting furnace, pots are heated in a "pot arch" to a temperature in excess of 1,000° C. and are transferred hot. A ring of clay is placed in each to define a clean area from which molten glass will be gathered. The flames come from ports, generally in the floor of the furnace but sometimes in the end walls in the case of rectangular furnaces (pots in two parallel rows), and, circulating over the pots, pass out by flues in the pillars supporting the crown or by a port at the opposite end as the case may be. Larger amounts of glass are melted in tank furnaces, based on the invention of Friedrich and William Siemens, in which the walls define the glass-melting area and the flame passes over the surface of the glass.

Those of small size, 2–10 tons' capacity, may be "day tanks" in which glass is melted overnight and worked out during the day, or melted one day and night and then worked out. Bigger tanks are continuous, batch being charged at one end into a "doghouse" and removed as reasonably homogeneous glass at the other for feeding to forming machines. Such tanks (see fig. 2) are divided into melting and working ends by a bridge wall. Communication is either through a "doghole" in the bridge or by a submerged "throat" which connects holes in the floor of each compartment. The flames may pass from side to side (cross-firing) or, entering at the back wall, pass down to the bridge and return (horseshoe firing) or, in small tanks, pass down from the back walls and out through ports at either side of the bridge. In yet another form the furnace crown is hollow and the flame from the back wall returns from near the bridge between the false crown and the outer one to pass to a heat recovery system. Such systems may be (1) regenerative, in which the waste gases heat stacks of brickwork which then, by reversal of flame direction, are used to preheat the combustion air and fuel gas, or (2) recuperative, in which the gas flow through the system is constantly in one direction and the waste gases pass over tubes through which the combustion air is led for preheating. Large tanks of the window-glass type are 136 ft. long and 28 ft. uide and hold approximately 5-ft. depth of glass; *i.e.*, approximately 1,000 tons. Gas consumption for such a tank is about 50,000,000 cu.ft. per month.

During melting, carbonates, sulphates, nitrates. etc. in the batch decompose, with evolution of the corresponding acid gases (CO_2, SO_3, etc.). In addition, water is driven off from wet sand

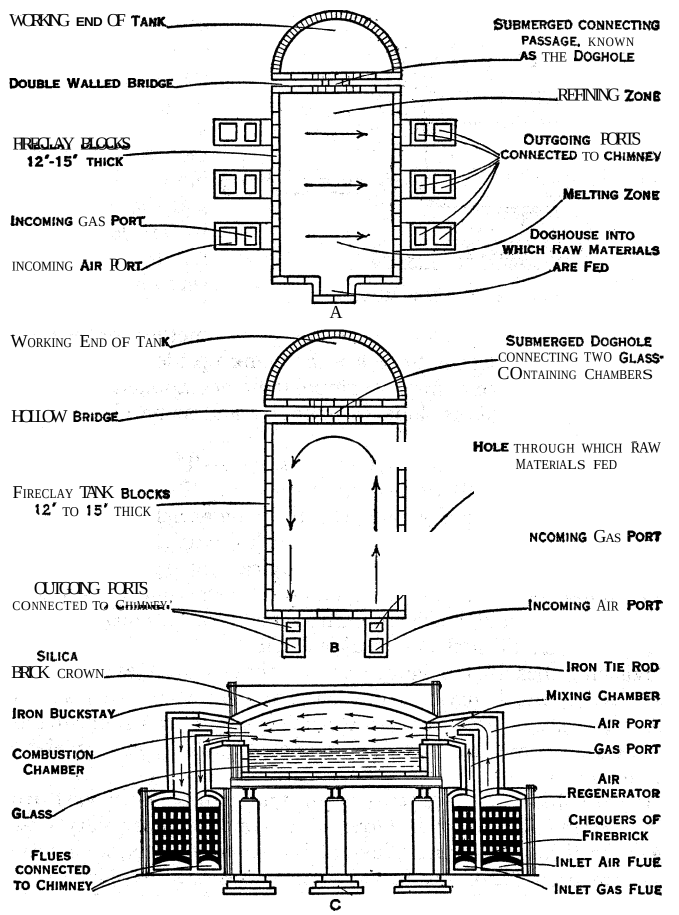

FIG. 2.—PLANS OF TWO TYPES OF TANK FURNACES FOR MELTING GLASS

A. Plan of cross-flame furnace. B. Plan of horseshoe-flame furnace. C. Cross section of oross-flame furnace and from some crystalline salts; *e.g.*, borax. The more easily fusible materials form a glaze. which speeds up reaction by increasing surface contact. and the proportion of molten matter increases at the expense of undissolved grains (mostly silica). Finally the last trace of batch disappears but the melt is full of bubbles ("seedy"). The temperature is now raised somewhat to reduce viscosity and to complete decomposition so that the bubbles disappear, after which the temperature is slowly reduced from the 1,400°–1,500° C. (1,600° for Pyrex-type glass) at which melting is carried out to the working temperature of around 1,250°–1,400° C., depending on the composition. This temperature gradient from end to end of the tank is achieved by proper location and size of burners and by screening the working end in some cases by a "shadow wall" built on the bridge.

Glass Forming Processes.—Hand Processes.—These are generally applied to pot-melted, good-quality glass, frequently lead crystal because its working properties suit the leisurely sequence of manipulations involved. After the glass within the ring in the pot has been skimmed clean, an amount of glass is gathered on the blowpipe and withdrawn, the tail of glass being dropped at the instant of separation outside the ring so that it does not contaminate the next gather. By blowing. rolling on a polished iron plate (marver). swinging, etc.. the glass is formed into a hollow, pear-shaped bulb. The blowpipe may be rolled up and down the long arms of the glassmaker's chair while he works on it with shearlike tools (pucellas or procellas) to constrict it, draw it out, flatten the base with a wooden "battledore" and so on. Extra glass may be cast on to form stems, bases, handles, etc. The glass is then attached at the base to a rod (punty) and is cracked off the pipe so that the other end of the article may be finished, using the rod as axis of rotation. Production can be speeded up by blowing the body of the article in a mould and then finishing at the chair. Large articles such as illuminating globes are mouth-blown in moulds, and the excess glass is cracked off by heating at a diamond scratch after annealing. An alternative method of removing the waste cap of glass is to rotate the blank upside down and melt off the waste by very intense pinpoint flames applied at the line of separation. This is done for tumbler and some electric lamp blanks.

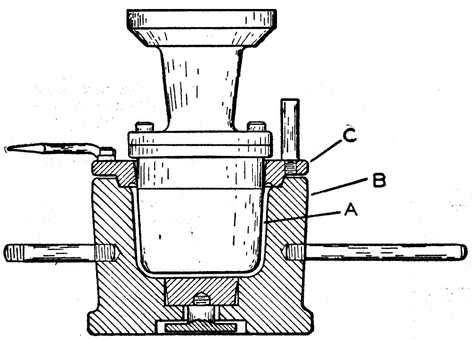

FIG. 3.—PRESS MOULD
A. Plunger. B. Mould body. C. Ring

Lamp Working (Bench Glass Blowing).—This is carried out using tubing and rods of various diameters. They are heated in the flame of a gas-air blowpipe, the air being enriched with oxygen when borosilicate glass is worked. The articles made include chemical and other scientific and surgical apparatus (*e.g.*, glass eyes, ampoules, syringes, thermometers), egg timers, decorative figures and animals, beads and Christmas tree ornaments.

The making of such items as electric lamps, radio valves and television tubes is a development of these processes, but it has been largely mechanized, while massive components of glass pipe lines and heavy chemical apparatus are handled by semimechanical processes. Some use has been made of high-frequency electric welding.

Moulds for glass are mostly of fine-grained gray cast iron. When extra-high polish is required or conditions are very exacting, special heat-resisting alloys of the stainless steel or nichrome type are used. Moulds for most purposes are used hot, sometimes at temperatures approaching 600° C.; but for thin-walled hollow ware they are used wet and are coated with a paste (comprising carbonizable material with a binder) to retain the water, which provides a cushion of steam between glass and mould when the former is rotated. Usually the moulds are of two or more sections in the body, together with a base and in some cases (for example, for pressing) a ring (fig. 3) to define the upper edge of glass and to locate the plunger in proper relation to the mould body.

Moulds used for automatic machines present problems in cooling. This factor largely controls the rate of working.

Mechanical Methods.—These involve pressing, blowing, drawing, casting, rolling. individually or in combinations of two or more processes. Thus bottles may be made by press and blow or blow and blow (or suck and blow) methods as described in BOTTLES.

Feeding Glass to Machines.—This is done by hand in the semi-automatic processes which are still operated to deal with special shapes. The glass is gathered on an iron rod with a ball-shaped end and is allowed to run off the latter into the mould The machine operator shears through the stream when sufficient glass has been supplied. Fully automatic container-forming machines either gather their own mould charges by suction from a pool of glass or receive separate charges extruded from a feeder channel running from the working end of a tank furnace and cut off by mechanically or pneumatically operated shears Very accurate control of glass level, glass homogeneity, temperature and feeder mechanism is needed to deliver charges of constant weight to make articles of constant capacity.

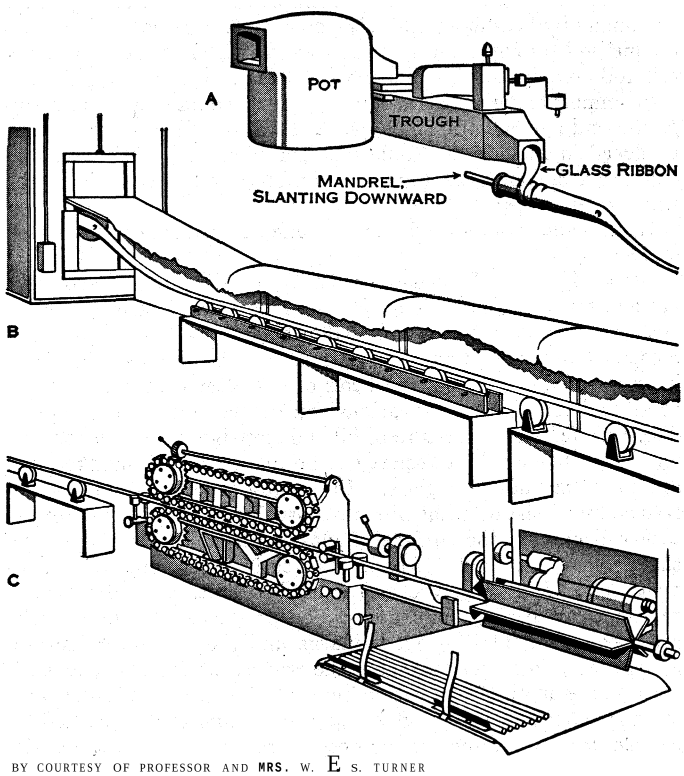
Pressed Glass.—The moulds may be "block" (*i.e.*, body in one piece), with a movable base to eject the pressed article, or, for heavily decorated pieces, the body may be in three, four or more sections hinged to swing open to clear projections. For ware of precise dimensions or when a number of articles are desired at one pressing, font moulds are used, with cavities fed from a central reservoir at which the pressure is applied by plunger and in which excess glass remains to form a means for removing the pressing from the mould. Automatic presses carry a number of moulds on a circular table, rotated step by step to bring each in turn below a charging device (feeder), then to a pressing station and, after a sufficient interval for cooling, to a take-out point. Pressure in automatic machines is generally exerted by compressed air through a cylinder and piston and a toggle linkage. Hand presses operate as a rule by lever and crank Glass blocks for light-transmitting walls are made by welding together at the edges two rectangular cup-shaped pressings. They have good thermal- and sound-insulating properties. and when prismatic ribs are formed on the inside surfaces considerable spreading of the transmitted light results.

Light-Blown Hollow Ware.—Blanks for making tumblers, electric lamp envelopes and the like are made on \Vestlake-type machines or on the Corning ribbon machine. The former machine follows to a considerable extent the motions of a hand worker but uses shorter pipes and gathers by suction. The Corning machine takes a continuously rolled ribbon of glass bearing thickened hot portions spaced by thinner cold ones and from the hot "blobs" blows the blank, using blowheads on one continuous belt above the ribbon and moulds on another belt below it. Speeds of up to 1,000 or more bulbs per minute are attainable.

Drawing Processes.—Tubing.—In drawing tubing by hand, a parison of suitable shape, generally thick-walled, is attached at the free end to a punty and is then drawn out. The drawn tube (or rod if not blown out) is rested on a ladderlike rack and is cut up into lengths. There is much waste glass attached to both pipe and punty.

In mechanical drawing, a stream of glass flows as a flat ribbon onto a revolving, hollow, downwardly inclined mandrel, blends thereon to a uniformly thick coating and is drawn off the lower end as a tube if air is blown into the upper end at relatively low pressure (up to 18 in. water gauge). The size of mandrel nose, temperature and rate of feed and removal of glass together with the pressure of air determine tubing dimensions. Drawing speeds range from about 20 to 850 ft. per minute. Removal is controlled by a drawing device, located 100–200 ft. away, consisting of two endless caterpillar belts whose asbestos-faced shoes engage the tubing or rod which is by that time almost cold. Various devices on the machine are used to cut the glass into lengths depending on its thickness and diameter. This is the Danner process (fig. 4), which is much used.

Precision-Bore Tubing.—Suitable tubing is caused to pass over



BY COURTESY OF PROFESSOR AND MRS. W. E. S. TURNER

FIG. 4—THE DANNER MACHINE FOR DRAWING GLASS TUBING

A. Molten glass is delivered at a controlled rate from pot (charged from a separate furnace) through trough onto rotating mandrel. B. Runway, furnace end; the glass tubing is drawn away from the mandrel end over heat-insulated pulleys. C. Runway, tractor end; the glass tubing is drawn rapidly by tractor mechanism at end of runway into a length-cutting machine

a sizing mandrel while hot and plastic, and is collapsed upon it to produce a very accurate bore by exhausting the air within the portion of tube adjacent to the mandrel. The tubing is then used to form, *e.g.,* barrels for hypodermic syringes, without need for internal grinding—a process which would much reduce its strength and increase its liability to attack by chemicals and sterilizers in use.

Glass *Fibres.*—*See* below.

Sheet Glass.—Early sheet glass was hand-made (1) by blowing a large parison, attaching to a punty, cracking off from the pipe, reheating and spinning the pipe so that centrifugal force caused the glass to spread out to form a disk attached at its thickened centre to the pipe; (2) by blowing and swinging the parison so that it elongated to form a long cylinder which was then, after cracking off the ends, split longitudinally and opened out while heated in a flattening kiln till it lay on a smooth refractory "stone" hearth. The first step in mechanization, attributable to J. H. Lubbers, was production of glass cylinders approximately 40 ft. long by 30 in. in diameter which were similarly treated. Present methods are in principle two. The first is upward drawing from a pool of glass, the line of draw being located either by a slot in the bottom of a long fire clay boat (Fourcault process) or by a cooling bar placed a little below the surface (Slingluff or Pittsburgh process). When the sheet is a few feet above glass level it is rigid enough to be engaged by the first of a series of pairs of asbestos-faced rollers which continue to draw it upward (fig. 5). The ribbon is cut into sheets which are removed as they emerge and are stored after washing in dilute acid to remove surface deposit. The second method is horizontal drawing (Colburn or Libbey-Owens process). Here, although the sheet is drawn vertically from the pool in the drawing chamber or trough, it is then bent over a nichrome roller (fig. 6) and passed between two endless belts which draw it forward to proceed into a 200-ft.-long roller annealing furnace (leer or lehr), at the cold end of which it is cut into sections. The speed depends on the thickness of the sheet and is of the order of 100 in. per minute for thin glass. The process may be applied to furnish glass for grinding and polishing as plate glass. Production per machine is much greater with the Colburn than with the Fourcault process.

Rolled Glass.—Originally the demarcation between sheet and plate glass was sharp. One was blown, the other cast, rolled and (generally) ground and polished to a flat surface on each side. The demarcation is not so clean-cut nowadays. The first cast and rolled plate is ascribed to Lucas de Nehou in 1688. A process of casting molten glass onto an inclined table feeding a pair of rolls was developed by Chance Brothers and E. F. Chance in 1890 to produce figured (*i.e.,* patterned surface) glass. The discontinuous processes reached peak development in the Bicheroux process (1918), in which the glass rolled from the teemed contents of a pot is received on a train of cars moved past the inclined rolling table, shears cutting between the cars to enable each in turn to be hauled away to the annealing leer. Continuous methods for making polished plate are typified by those of the Ford Motor company and Pilkington Brothers Limited. In the first the glass passes from the melting furnace through a channel under close control of temperature and quantity and flows in a widening stream down an inclined spout to feed a large-diameter bottom roll working with a small-diameter top roll. The 40-in.-wide rolled ribbon passes directly into a leer 440 ft. long, which it traverses in about $2\frac{1}{2}$ hours. The glass is then cut into lengths and ground and polished. In the Pilkington process, the width of ribbon may be much wider, and in one form it passes directly without cutting from the leer to the grinding and polishing section in which it is operated upon on both upper and lower surfaces at once (twin plate process).

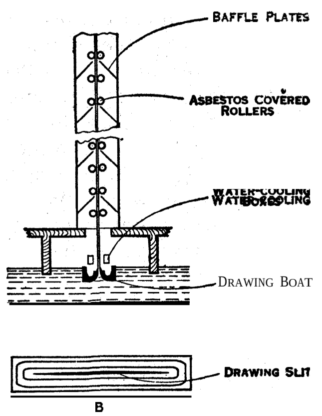


FIG. 5.—PRINCIPLE OF THE FOURCAULT SHEET-GLASS DRAWING PROCESS

Grinding and Polishing of Plate Glass.—The old discontinuous process involved setting sheets of glass in plaster on huge 30-ft.-diameter circular cast-iron tables. Spaces between sheets were filled with waste glass. The tables were then taken to the motor and rotated below a "spider" carrying a number of cast-iron "tools," which had on their under surfaces "nogs" to engage the glass, with spaces between through which sand or emery could be carried by water as a slurry to do the abrading. Starting with fairly coarse sand, the size of abrasive was reduced stage by stage until a very smooth gray surface was obtained. The tools were then changed for polisher disks faced with felt charged with rouge and water. This brought about the final polish (see LENS). It was the irregularity of surface of cast and rolled rough plate, which

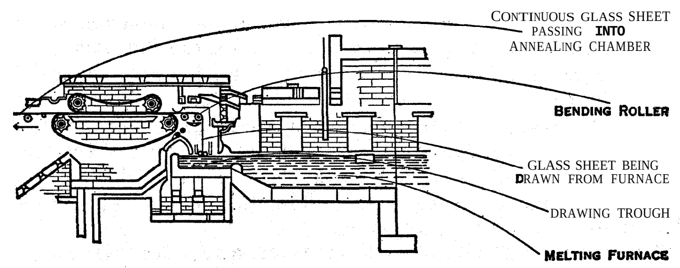

FIG. 6.—PRINCIPLE OF THE COLBURN (OR LIBBEY-OWENS) SHEET-GLASS DRAWING PROCESS

made necessary the removal of so much material, that encouraged the development of later methods using pairs of rollers instead of a casting table and "rolling pin." The continuous grinding and polishing methods of Ford and others involve bedding the glass on fabric on carefully levelled cars passing down a track to bring their contents in turn below a series of independent motor-driven heads operating tools supplied with successively finer abrasive and. after a space for cleaning and inspection, under similarly driven polishing heads supplied with rouge paste. Elaborate arrangements for collecting, regrading and returning abrasive to the system may be provided. The glass, polished on one face, is rebedded and the process repeated, on a second line, on the opposite face. The Pilkington twin plate process saves cars and double track.

Foam Glass.—The insulating value of glass fibre is well established. A sort of vitreous "sorbo" has been made which in addition to possessing good insulation properties will carry some load and can be dressed to dimensions without special tools. This is produced by packing into moulds crushed glass grains mixed with a substance (*e.g.,* carbonaceous material or limestone) which. at a temperature at which the grains become soft enough to sinter together, will produce bubbles of gas. The moulds are passed through a furnace and the product in large slabs is sawed into suitable blocks. It is used for partition walls in building and as thermal insulation. It is light enough to float in water, has a very low absorption of the latter (2%) and, being rotproof and verminproof, may be considered as a substitute for cork.

Annealing.— The free cooling of glass from the molten state results in solidification first on the outside. Such material, being rigid, resists the inward pull of the hotter glass inside, which. in cooling down to room temperature, needs to contract more than that on the surface. Such a piece of glass is left with the surface in compression if of simple shape (*e.g.,* a sphere). As such it is strong against mechanical shock. Surfaces with sudden changes of contour, on the contrary, are in similar circumstances very prone to disruption by the application of slight additional stress, mechanical or thermal. To make commercial glassware safe in use it must, after receiving its final shaping, be cooled very slowly from a temperature at which it is soft enough for stresses to be relieved in a few minutes to a lower temperature, below which it is not possible to introduce permanent stress by sudden cooling. From that point the limit to the rate of cooling is the ability of the article to withstand the temporary stresses set up by the thermal gradient at the moment. The process may be carried out (1) batchwise, in kilns uhich are charged, heated and cooled (optical glass and certain very thick-walled goods), or (2) most often, by passing the ware on a conveyor belt down a tunnel leer, 2 ft. 6 in. to 11 ft. wide and 30 ft. to 440 ft. long, in which a suitable temperature gradient is established. The atmosphere in the leer may be controlled to affect the surface of the glass and improve durability. Heating is by gas, oil or electricity. Modern leers. because of good insulation and rapid transfer of ware from machines, need little additional heat above that taken in by the hot glass itself. The time to anneal depends upon the wall thickness of the article. Very thin ware, such as electric lamp bulbs, needs only a few minutes; containers generally need one to two hours in leers 65–75 ft. long. Rolled plate glass needs very long leers because of the speed with which the ribbon is produced and fed forward. A slow speed in a roller conveyor or leer would allow the ribbon to sag between the rollers and destroy its flatness.

Processes Applied After Formation and Annealing.—Removing Waste Caps From Blanks.—This is done by (1) cracking off, either by making a crack in the plane of separation and then heating in this plane with needle-point flames, or by heating first and then scratching; or (2) melting off as described earlier.

Edge Grinding.—Dishes, globes, illuminating bowls, tumblers, etc. are held down on a horizontally rotating iron disk fed with abrasive and water. Alternatively, a fine grit sandstone wheel is used.

Fire Finishing.— The ground edges are heated first in a soft flame and then in a high-intensity flame till fusion rounds them and removes the grayness. Slow cooling follows. With tumblers less bead is produced this way than by melting off.

Decorative *Cutting* (Grinding).—The design is roughed out on the article in a water-resistant paint and is then cut on an abrasive wheel. Formerly this was an iron disk with mitred edge fed with sand and water. The process, repeated with emery and water, gave a smoother finish which was further improved by powdered pumice and finally by brushing with putty powder (tin oxide). The modern method employs first a silicon carbide wheel of, say, 80 to 100 grit followed by an alumina wheel of, say, 150 to 180 grit and then immersion in an acid polishing bath containing strong sulphuric and hydrofluoric acids, worked warm. Cheap ware, mass-produced in moulds to standard dimensions, may be cut in machines which index the ware step by step and present it to the wheel at each step.

Hand-made articles would not be sufficiently regular to suit such a process.

Other Abrasive Processes.—Intaglio is similar to decorative cutting, but the spindle is overhanging and the wheels are much smaller. The depressions are shallower and the process is intermediate between cutting and engraving. The last uses an overhanging spindle with copper wheels of diameter from pinhead size to around four inches, of various thicknesses and edge contours. These are fed with a mixture of oil and abrasive (emery generally) and in the hands of the expert can be made to turn out the most artistic "drawings" on glass. In sandblasting, sand grains entrained by a blast of air at pressures usually of 2–25 lb. per square inch will obscure the surface of glass with a pattern rather like that given by grinding. If paper backed by a resilient sticky substance (*e.g.,* glue and glycerine) is used to protect the portions to remain clear. designs may quickly be produced Metal stencils are used in sandblasting trade-marks and the like on glassware. Sandblasting in stages, changing the pattern of the resist at each stage as the depth of excavation increases. has produced some very striking relief effects. In glass *sculpture,* hand tools operated by flexible drive or a motor of the bosch type are used to execute designs in *situ* on large sheets of glass.

Ice-Flower Patterns.— A sandblasted glass surface is coated with strong glue and slowly dried. At the proper stage the glass is placed in a warm enclosure and the shrinkage of the glue drags glass from the surface to produce a system of shallow conchoidal fractures which is considered decorative.

Etching.—Hydrofluoric acid attacks most glasses readily. The effect varies according as the material removed remains in solution or is left in the surface, which depends in part on the acid strength and also on what other substances are present in the etching mixture. Clear etching is produced by either dilute hydrofluoric acid alone, or in some cases (*e.g.,* lead glasses and some low silicates) by strong acid used with strong sulphuric acid. In the case of lead glass there is a deposit but it brushes off in warm water. In other circumstances a rough mat or translucent surface is produced; *e.g.,* with potassium fluoride and a mineral acid a delicate satin finish, with ammonium bifluoride mixtures a "white" finish. The internal surface of a "pearl" electric light bulb is produced in two stages: first a coarse etch from an internal spray with a strong ammonium bifluoride mixture, then a spray rinse with a more dilute one which smoothes the too-sharp contours of the first etched surface and largely restores the original strength of the bulb. Ammonium bifluoride is the active constituent of inks for writing on glass and of pastes for badging glassware through a wax resist (see Enamelling, below).

Enamelling.—(I) A design cut in a brass or glass plate is charged with a mixture of enamel colour and medium; *e.g.,* lithographic varnish and a sheet of transfer tissue paper is gently applied and then peeled off from one corner to bring with it the design in enamel. This is applied to the clean glass surface and the paper is damped and peeled off. leaving enamel only on the glass, which is then heated carefully till the enamel fuses to it. The same transfer method is used for applying wax resists to glass to be etched. (2) A silk or other mesh screen carries light-sensitive material that has been exposed behind a negative and developed to produce a design in open apertures (the background is of closed ones). Enamel mixture is brushed over this by a squeegee to force it through the apertures and so print the design on the glassware held beneath. In the case of circular containers provision is made for rotating the ware as it is moved below the screen.

Silvering, *Coppering,* Gilding.—Mirrors, once made with tin amalgam, have since the discoveries of Michael Drayton and Justus von Liebig been made by chemical reduction of silver-ammonia compounds to metallic silver. Modern developments include processes in which the solutions meet in a spray above the cleaned glass, passing on a conveyor, and deposit the silver immediately the spray falls on the glass. Copper and gold may also be deposited by chemical reduction. Gold films of controlled thickness may be obtained by heating an organic gold compound. Dark-coloured mirrors are obtained by depositing films of lead sulphide. In addition to chemical deposition, films may be produced by "sputtering" (high-voltage discharge between electrodes) in *vacuo* or by evaporating in vacuo—the latter process yielding aluminum or rhodium mirrors, and. with certain fluorides, the "bloomed" lens which has a very high light transmission. Films which permit the passage of sufficient electric current to warm the glass are of two kinds: first, the rather thick sprayed aluminum grid which enables the glass plate to be used as a radiator, and, second, the film which can be heated to preserve clear vision through a glass screen in vehicles. Staining of glass by silver or copper compounds produces the yellow or red colours seen in windows. (See STAINED GLASS.) A somewhat similar treatment has been applied to glass coming hot from the forming process to give a surface which may be soldered to metal. "Lustres" are produced by painting with organic sulpho-compounds of gold, platinum or other precious metals, in an essential oil (*e.g.,* lavender). Gentle heating smokes off the medium and decomposes the sulpho-compound, leaving a bright metallic mirror surface on the glass.

Photosensitive Glass.—Certain glasses (U.S. patent 2,515,275 of July 18, 1950) containing small amounts of gold. silver or copper are sensitive to light. When exposed to ultra-violet radiation no obvious change occurs until the glass has subsequently been heated to a temperature a little below that at which it softens. The characteristic colour (yellow or ruby) then develops. Some of the glasses are so controlled in composition that the "nuclei" produced initiate devitrification and produce an opal effect. By exposure to the radiation behind a negative or stencil, very decorative effects may be produced. (M. PN.)

In addition to the many uses of glass referred to in the foregoing, attention may be directed to its employment as the basis of four substantial branches of industry: namely, optical instruments (see LENS), electric lamps and radio valves, safety glass and glass fibres. Of these two last-named industries the following special accounts are given.

Safety Glass.—This has been defined as glass so treated or combined with other materials as to reduce the likelihood of injury to persons by objects from exterior sources or by the glass itself when it is cracked or broken. Such glass is made in one of two ways. The first consists in laminating a sheet of plastic between two sheets of glass, and the second in heat-treating a single layer of glass.

Laminated Glass.—The invention of this type of glass, popularly and romantically ascribed to Edouard Benedictus of France, was actually anticipated by John Wood of England, who was granted a patent for making such glass in 1905. After the first commercially successful Triplex glass made under the Benedictus patents, several important developments took place. First. celluloid (a cellulose nitrate plastic) was replaced by cellulose acetate plastic, which is inherently more stable than celluloid. A contemporary development was the use of ultra-violet-absorbing glass to protect the celluloid plastic from the damaging light rays. In 1943 by far the major portion of the world's production of laminated glass was made with a polyvinyl acetal plastic, which replaced the older cellulose plastics because of its greater flexibility at low temperatures.

A description of the operations involved with the vinyl type of plastic will indicate the principles on which all these processes have been based. The panes of glass to be reinforced can be either flat or curved: and although drawn sheet glass is sometimes used, the best type is prepared from thin, polished plate. the panes normally employed varying in thickness from $\frac{1}{16}$ in. to $\frac{3}{4}$ in., depending upon the purpose for which the lamination is to be used. After cutting to the proper size, the panes of glass are thoroughly cleaned and dried and then sheets of vinyl plastic, also thoroughly cleaned and cut to the proper size, are placed between the panes of glass and the resulting sandwich is bonded together by the application of heat and pressure. The vinyl plastic is self-bonding and very resistant to water penetration. Hence, no additional adhesive and edge sealer are needed, as was the case in the older processes. The vinyl laminated glass is more resistant to impact than the celluloid lamination, and its strength is more uniform over the range of temperatures normally encountered out-of-doors.

When such a laminated glass is struck heavily, the cracks radiate from the centre of attack, but the splinters remain firmly adhering to the intermediate plastic layer. It is, therefore, used in the glazing of motorcars and aeroplanes to reduce injuries should the glass become broken. Bullet-resisting glass is a laminated glass generally $1\frac{1}{2}$ in. thick and made of several layers of glass interspersed with several layers of plastic.

Heat-Treated Glass.—The principle on which this glass is manufactured is the same as that on which Rupert's drops are made. A sheet of glass is heated to just below its softening point and then is uniformly and rapidly cooled with a blast of air. This rapid cooling puts the outside surfaces of glass under compressional strain and, since glass generally fails under tension, this product is much stronger than untreated glass to bending, twisting and tensional stresses but is susceptible to the impact of sharp objects capable of puncturing the surface. When it fails. cracks develop throughout the whole body of the glass and it breaks into a large number of comparatively small and harmless pieces. In America it is generally used for the back light glazing in motorcars; in Great Britain it is used for windshields, side windows and back lights to a very large extent. Also, it is extensively used in places where glass is subjected to pressures uniformly distributed over the surface. (G. B. WA.; A. C. WE.)

Glass Fibres.—Probably the first form of glass produced was a fibre drawn quite unintentionally when a mass of molten glass was manipulated. These fibres were coarse, but finer fibres that could be woven were produced by melting the end of a glass rod, attaching the droplet to a rotating wheel and thus drawing, or spinning, a fibre. René de Réaumur, in 1713, in a report to the Paris Academy of Science, submitted glass fabric woven by the Venetian Carlo Riva. In 1893 Edward Drummond Libbey set up a glass fibre producing unit at the Columbian exposition and, by weaving the fibres together with silk threads, made various curios including lamp shades, neckties and a gown for Georgia Cayvan, a celebrated actress. The infanta Eulalia of Spain was presented with a glass gown of similar design. These gowns. though dramatic, were impractical because the fibres were too coarse to permit the fabric to be folded. Efforts to industrialize glass fibre manufacture are reflected in numerous patents issued prior to 1914, mainly in Europe. Most of these concerned improvements to the rod-drawing process such as the Venetians' or Libbey's process. The spinning wheel was replaced by revolving drums and a multitude of fibres was drawn simultaneously. In 1908 W. Pacsinsky produced glass silk fibres by drum-winding threads dra n from the perforated bottom plate of a ceramic glass melting chamber. Before and during World War I Germany thus produced coarse glass fibres to replace imported asbestos and other high-temperature insulation materials.

In 1929 F. Rosengarth invented a process in which a stream of molten glass impinges on the centre of a fast-rotating ceramic disk with radial serrations. In these the glass divides into small streams and is whipped off the edge of the disk into fibres. Rosengarth, together with the Hager brothers, industrialized this process. It is still much used in Europe because of the low installation cost of the process when small to medium production is required. Centrifugal processes were also being developed in the U.S. by Harford and Stafford in the 1920s, and many variations and refinements of the early versions were later proposed and introduced. In the U.S. also, P. O. E. Friedrich and F. L. Dimmock began production of glass fibres by the drum-winding process about 1923 and before 1927 had established a market for their fibres for use in electric storage batteries, in ornamental applications and for various other purposes. The Owens-Illinois Glass company took up the search for industrial glass fibre processes in 1931 and was followed by the Corning Glass works in 1935. The two companies combined their efforts in 1938. forming the Owens-Corning Fiberglas corporation. In this period Games Slayter, John H. Thomas and several associates were successful in developing new processes suitable for large-scale industrial manufacture. The first was a process for the production of relatively short interfelted glass fibres, or "glass wool." The other two were textile fibre processes which came into production in 1935 and 1936.

Glass Wool.—In this process, fibres with diameters ranging from about 0.00035 in. to 0.00080 in. are produced and form a resilient, white, fleecelike mass which is known as glass wool. (The term "spun glass" is not appropriate to these products.)

Production begins with the accurate formulation of the batch of silica sand, limestone and other selected mineral ingredients as in standard glass manufacturing operations. The batches are melted in large gas-fired glass-melting tanks or furnaces. At the forehearth end of the tank the glass drains down through small orifices formed in bushings of temperature-resistant metal. As the streams of molten glass pour down, they are caught by jets of high-pressure air or steam. The action attenuates the glass into fibres that may be long or short, coarse or fine, according to the accurate control exercised over the glass temperature, the size of the orifices and the pressure of the jets. The fibres pass downward through a forming hood to a travelling conveyor, on which they gather in the desired thickness. Glass mineral wool thus formed has a density of 1½ lb. per cubic foot, compared with the density of about 14 lb. common to the "spun glass" wool produced by earlier European processes.

The fibres are customarily lubricated with a microscopic film of an inert mineral oil, or they may be treated with a thermosetting binder and carried through compression rolls and ovens to produce semirigid to rigid sheets or "boards." The basic wool may be processed and fabricated to form bats, blankets, boards, blocks, pipe insulation and cements for many uses as thermal insulation and for sound absorption purposes.

Glass Textiles.—The second and third of the three U.S. processes produce fibres or filaments suitable for textile uses. Both begin with the formation of virgin glass into small marbles (about ⅝ in. in diameter) that are inspected to eliminate impurities that might interfere with subsequent operations. The glass marbles are then remelted in small electric furnaces which have perforated metal bushings through which the molten glass flows in fine streams. From this point on, the two textile fibre processes differ.

The staple fibre process is substantially the same as the wool process, in that the streams of glass are attenuated into fibres by jets of steam or air. The fibres are gathered as a thin webbing on a revolving drum immediately below. The webbing is drawn off the drum, gathered as a loose strand of fibres known as sliver and immediately wound on a tube. The strand or sliver may then be further drafted, twisted and plied to form a yarn resembling a cotton or worsted yarn. The term "staple fibre" is given to this process and material because the individual fibres are of limited length (9 in. to 12 in.) as contrasted with the other textile fibre, known as "continuous filament," the length of which is limited only by packaging requirements and may be measured in miles.

Bonded Mat or Staple Tissue.—A modification of the staple fibre process is used to produce bonded mat or staple tissue. a thin sheet of fine glass fibres held together with a binding agent such as starch or resin. The fibres are gathered as a webbing on a continuous conveyor instead of a drum and are treated with the selected binding agent, calendered and dried The sheets are rolled and trimmed and are widely used, as a pipe-wrapping material holding a bituminous coating, round oil. water or gas pipes in position as a corrosion protective. The sheets form an inorganic base for roofing felts and, cut into small sizes, are used as retainer plates in batteries. Mat thicknesses range from 0.010 in. to 0.050 in. according to their intended use.

In the continuous filament process the bushings in the electric furnaces are provided with 100, zoo or more small orifices. As the molten glass flows downward in parallel streams, the operator gathers the strands and feeds them over a size applicator to a high-speed winder. The tension created by the minding unit mechanically draws each filament to a diameter considerably smaller than the orifice diameter.

Both textile fibres are exceedingly fine and correspondingly flexible. The normal fibre diameter is 0.00022 in. A strand of 100 filaments is still too fine for commercial weaving; customarily, two to four strands are twisted and plied to produce a fine yarn. Yarns and fabrics made from staple fibres resemble cotton or worsted; they have a rough texture produced by the free ends of the individual fibres Continuous filament textiles resemble natural silk or rayon; they have a high lustre and a sleek surface. Coloured glass yarns and fabrics were introduced in 1940 in a limited range of blue and tan shades by incorporating suitable mineral pigments in the glass itself. In 1954 it was preferred to dye the fibres by resin-carried pigments.

Properties of Glass Fibres.—Glass fibres are inorganic, incombustible, nonabsorbent, nonhygroscopic and chemically stable. The diameter of textile and "wool" fibres is so small in relation to their individual mass and length that they bend freely and do not break until bent to a radius several times the diameter of the fibre. Thus, in a yarn composed of fibres so fine that several hundred filaments are required to construct it, there is little likelihood that any individual filament will ever be bent to the breaking point, even when the fabric into which the yarn is woven is folded upon itself.

The tensile strength of fine glass fibres substantially exceeds that of any other commercial fibre. Individual fine glass fibres produced in the laboratory have shown breaking strengths of 350,000–500.000 lb. per square inch. In actual bulk production, figures of around 200.000 lb. per square inch are regularly obtained. The lower strength is explained through damage of fibres by abrasion during the manufacturing processes. The stretch of glass fibres is less than 2%.

Glass fibres have a vastly greater surface area than an equivalent weight of glass in solid form; hence, their chemical durability is related not only to the inherent resistance of the glass itself but also to the fibre diameter and the service conditions encountered. Accordingly, various glass compositions are used. Glass fibres for general thermal insulating and acoustical work are produced from highly durable, low-alkali glass compositions. For electrical applications, a glass containing no alkali metal oxides is used. Glass wool has a unique density-conductivity relationship. At its natural density of 1½ lb. per cubic foot. the conductivity "k" (British thermal units/hour/square foot/inch/°F.) at 70° F. mean temperature is 0.27. When the density is increased by compressing the wool to about 9 to 12 lb. per cubic foot, the conductivity is lowered to approximately 0.24. Further increases in density show a gradual rise in conductivity. There is a gradual increase in conductivity with rising mean temperatures and a fall with decreasing fibre diameters.

In textile yarns and fabrics, the intimate contact of fibre to fibre and the lack of entrapped air spaces increase the conductivity materially. Thus, in electrical applications, where the internal heat induced in motor windings must be rapidly dissipated, glass fibre insulation shows desirable heat-conduction properties. Both wool and textile forms of fibrous glass have high heat resistance and can be used in all temperature ranges to approximately 1.000° F. By adding refractory clays in the production of insulating blocks and cements, the temperature limit can be raised to 1,200° or 1,400° F.

Glass has long been recognized as an excellent electrical insulation material. When made flexible by conversion to fibres or fabrics, the inherent electrical properties are retained, but leakage and moisture penetration can occur through the interstices of the fabrics. Therefore, glass electrical insulation materials, like cotton or asbestos, must be used with suitable electrical varnishes and impregnants. The temperature resistance of glass considerably exceeds that of standard electrical varnishes and impregnants but permits the use of those capable of withstanding greater heat than organic fibres and thus has enabled engineers to design equipment tolerating higher operating temperatures than are practical for cotton and with less bulk than is practical for asbestos. The introduction of resins with temperature resistance substantially above previously available varnishes extended opportunities for utilizing the strength, space factor and heat resistance of glass insulation. The resistance of glass to all acids except hydrofluoric, its electrical insulation value and the high porosity of mats of glass fibres early suggested its use in electric storage batteries to help retain the active ingredient on the positive plates. Glass fibre mats were used in storage batteries for heavy industrial applications as early as 1925. The proper use of glass retainer mats made it possible to increase the service life of automotive batteries by more than 100%.

Uses *of* Glass Fibres.—The unique combination of properties possessed by glass fibres and the variety of sizes and forms made commercially practical by the development of the U.S. processes resulted in the development of many uses.

Glass wool and products made therefrom are used as building insulation, as thermal insulation in domestic equipment (ranges, refrigerators, water heaters, etc.), as industrial insulation (cold-storage and refrigerated equipment, boilers, retorts, ovens, process equipment, piping, duct work, etc.), as marine insulation in merchant and naval ships of all types and as thermal insulation in aircraft, railroad passenger, freight and tank cars, buses, trucks and military vehicles. It is also used for sound-absorption and acoustical purposes in buildings and equipment.

Glass fibre mats are used as a reinforcement for bitumen in pipe wraps and roofing felts, as storage battery retainer mats, as a strainer-type air-filtering medium and in some electrical, acoustical and light-diffusing applications. Coarse glass fibres are used to produce impingement-type replaceable air filters, eliminator mats in air washers and contact or diffusion mats in rectifying towers used in alcohol distillation and in other types of fractionating processes.

Glass electrical textiles are used as sliver or yarns in the insulation of wires and cables, as cords for binding coils in magnetic equipment, as braided sleeving for the insulation of lead wires and as plain or varnished cloth or tape for wrapping coils and other parts. The cloths are also used to form laminated sheet materials and glass-mica insulations.

Glass service fabrics are used in various military and naval applications, as pipe lagging cloths and tapes. as chemical filtration fabrics, in filters for blood plasma and oils and wherever an incombustible, nonshrinking and nonstretching fabric is needed.

After World War II a vast new field of application was found for glass fibres in plastics reinforcement, particularly with resins of the polyester type, which require little or no pressures during their cure. Very large articles, such as boats (up to 50 ft.), motor-car bodies, aircraft parts (radomes, ducts), corrugated translucent roofing sheets and fishing rods can be formed, all with a high strength for weight ratio, excellent impact strength and weathering resistance.

In the U.S., glass decorative fabrics were produced as drapery materials, shower curtains and marquisettes. Glass threads also found use in surgery as a suture material for certain types of work. Medical research established that glass fibres cannot be inhaled into the lungs and are innocuous both in the intestinal tract and in the blood stream. Workers handling glass fibre products. particularly in wool form, may experience a transitory skin irritation of purely mechanical character, which produces no allergic reaction and soon passes as they become accustomed to the material. No physiological reactions of the body to glass fibres have been demonstrated.

HISTORY

ANCIENT TIMES TO 19TH CENTURY

Early Glass.—Little is known of the earliest phases of glass-making. It is not even certain in which of the riverine civilizations of the ancient near east glass was first made. The earliest wholly glass objects (as opposed to objects of other materials covered with glaze) from Egypt are beads that date from some time after the 6th dynasty; that is, after about 2500 B.C. Possibly earlier than these are a green glass rod that may go back as early as 2600 B.C., found at Eshnunna in Babylonia, and a small piece of blue glass found at Eridu, dating from before 2200 B.C. Whether glass was actually made earlier in Mesopotamia or not, however, there can be little doubt that the first vessels of glass were manufactured in Egypt under the 18th dynasty (15th and 14th centuries B.C.), particularly from the reign of Amenhotep II (1448–20) onward. These vessels are distinguished by a peculiar technique. The shape of the vessel required was first formed of clay (probably mixed with sand) which was fixed to a metal rod. On this core the body of the vessel was built up, usually of opaque blue glass. On this, in turn, were coiled threads of glass of contrasting colour, which were pulled by a comblike instrument in an upward and downward direction to form feather, zigzag or arcade patterns. These pattern threads, usually yellow, white or green in colour, and sometimes sealing-wax red, were rolled in (marvered) flush with the surface of the vessel. Finally, if desired, handles—often of translucent glass and sometimes of patterned "canes"—were added. The vessels so made were nearly always of small size and were in most cases made for toilet use, to contain unguents and the like. Occasionally glass was decorated with designs cut on the lapidary's' wheel. Glass is known to have been made on the palace site of Tel el Amarna, the residence of Ikhnaton (c. 1375–54 B.C.), and the number of fragments found in and near the palace of Amenhotep III (*c.* 1408–1375 B.C.) at Thebes suggests that it was made there also. This great period of activity seems to have died down after the 14th century B.C., and after the 21st dynasty (about 1000 B.C.) appears to have ceased altogether.

Little is known of the glass made at this time in Mesopotamia, but the Nineveh tablets of the reign of Assur-bani-pal (668–c. 626 B.C.) and the remains of glass in various forms excavated by M. E. L. Mallowan at Nimrud (Kalakh) afford practically certain proof that glassmaking was carried on there during the 8th to the 6th centuries B.C. It is possible that certain vase-shaped vessels of palish green glass, cut from the solid mass as if the glass had been stone, may be Mesopotamian and date from as early as the 2nd millennium B.C., although none has been found in controlled excavations. A vase of this technical type, however, is known which bears the cartouche of the Assyrian king Sargon (722–705 B.C.), and it is possible that glass treated in this way, and thus contrasting completely with the core-wound glasses of Egypt, was manufactured over a long period in Mesopotamia.

Glass mas made in Greece in Mycenaean times, usually in the form of small moulded architectural details, but a few vessels of forms abnormal to Egypt suggest that perhaps some vessel glass also was made in the Egyptian technique. The glasses of this period found in the greater part of the Aegean area are probably imports from Egypt.

In general, glass which may be dated to the first half of the 1st millennium B.C. is scarce and displays little homogeneity. Some of it may have been made in Mesopotamia and exported through the Phoenician traders to countries farther west, while some of it may even have been manufactured at sites in the eastern Mediterranean or Aegean of which nothing is at present known. From the 6th century B.C., however; glass begins to appear in great quantities once again, particularly on the Greek-inhabited islands of the Aegean, in Greece itself, Italy, Sicily and even farther west. This profusion of specimens contrasts with the poverty of finds on Egyptian soil, and, although the technique of manufacture of these glasses is the same as that of the core-wound Egyptian glasses of the 18th–21st dynasties, it is probable that they were made elsewhere—possibly in Syria or some part of the Greek world. The vessels made were still small, serving mainly for toilet purposes, but the shapes are quite different from those of the earlier Egyptian dynastic glass. They were in the main decorated with the light-coloured threads on a dark (usually blue) ground familiar from the Egyptian 18th dynasty, but a notable variation is to be found in pieces decorated with dark-purple threads on a white ground. In the Hellenistic period (roughly from the 4th century B.C.) the shapes of these vessels tend to degenerate. The technique of decoration, however, remained the same throughout, although new colour combinations were used, and was indeed continued right into the era of blown glass.

The Roman Empire.—In Egypt in the course of the Ptolemaic period (323–30 B.C.) Alexandria seems to have come to the fore as a glassmaking centre, and in the crucial period about the 1st century B.C., which saw the beginnings of glass as it is known today, it had become pre-eminent in certain branches of glassworking. Most directly connected with the antecedent sand-core techniques was the manipulation of coloured glass rods to make composite canes which, when cut across, revealed a design, much as in the Brighton rock of modern times (mosaic glass). Slices cut from such canes could be arranged side by side to produce repetitive patterns. When, as often happens, the canes are of circular section and with starry or flowerlike designs, the resultant glass is called millefiori (thousand flowers). The technical advance most fraught with possibilities for the future, however, was that of mould pressing, by which glass could be pressed down into a mould by means of a plunger, thus producing vessels of open shapes, such as bowls, dishes, etc. (See Manufacture and Uses, above.) A combination of this technique with the millefiori technique enabled bowls to be produced with variegated designs in infinite variety. Sometimes glass of various colours was irregularly compounded. to give the effect of a natural veined stone, and occasionally enclosures of gold leaf in the glass simulated the glitter of natural pyrites (aventurine glass). Bowls were often finished round the rim with a cordon made of a clear glass thread twisted with one of opaque white; sometimes such cable threads were themselves coiled round and round from a centre to make a bowl of lacy appearance, with the opaque-white glass threads apparently set in a clear colourless matrix. All these pieces might be finished with a fire-polish by returning them to the furnace, but many mould-pressed glasses were, in fact, given a rotary polish, either by means of a spinning wheel fed with abrasives or by a process akin to lathe turning, where the object spins and the tool is stationary. Similar equipment probably was used for the numerous pieces which give every appearance of having been cut from a solid block of glass or at least from a thick blank prepared by the mould-pressing process. The pieces made in this way (usually flat dishes or two-handled cups) follow in shape the current forms of pottery and metalwork. Wheel engraving appears to have become an Alexandrian specialty in the 1st century B.C. and probdbly continued to be so throughout the two succeeding centuries. The Alexandrian engravers produced not only the cut-from-the-block effects already described but also wheel-cut designs both in intaglio and in raised relief, the latter being achieved by the laborious process of grinding back the whole surface of the glass to form the ground of the design. Simple motifs such as lotus buds or lotus flowers were produced in this way. but occasionally also more elaborate figural compositions. Other Alexandrian specialties appear to have been enamel painting (by which pigments mixed with a glassy flux were fused with the surface of the glass vessel in a separate firing in a muffle kiln) and a technique whereby a leaf of gold etched with a design was sandwiched between two layers of colourless transparent glass.

The mould-pressing process described above seems to have given the cue for the most important innovation in the whole history of glass manufacture—blowing. Perhaps by a pure stroke of inventive genius it was perceived that glass on the end of a hollow metal tube could be blown into a mould as easily as it had been hitherto pressed in. The next stage was to make mould-blown forms such as flasks, which could not be made by the pressing technique. Finally, it was realized that the glass bulb on the end of the blowpipe could be shaped freehand to any form desired, and handles, feet and decorative elements added at will. This crucial discovery, probably made during the 1st century B.C., lies behind the astonishing growth of the glass industry in Roman imperial times. It has been said with truth that never before the modern era was glass so widely used as under the Roman empire. Not only were luxury vessels of the types already described produced with an elaboration of skill which astonishes, and often baffles, the modern technician, but commercial containers for a variety of products were mass-produced in common greenish glass on a scale unmatched before the 19th century.

The discovery of glass blowing may well be credited to the Syrian glassworkers, since the first mould-blown glasses bear the signatures of Syrian masters, and since the readily ductile Syrian soda glass was especially apt for this purpose. The Syrian glassworkers. however, seem always to have been willing to migrate where demand promised a ready market, and some of the masters of mould blowing already mentioned appear to have moved to Italy already early in the 1st century A.D.; in the course of this century Italy probably became one of the chief glass-producing areas of the empire. In particular, the art of glass engraving seems to have been transplanted there, and one branch of that art—grinding through an opaque-white layer of glass to the darker ground on which it is superimposed (cameo glass)—appears to have flourished on Italian soil. The most famous example of this exacting technique is the Portland vase. in the British Museum, London. The capacity of the Italian cutter to surpass his masters in work of the most complex character is seen in the so-called cage-cups (diatreta), on which the design—usually a mesh of tangent circles with or without a convivial inscription—is so undercut that it stands completely free of the body of the vessel, except for an occasional supporting strut. These cups were perhaps made at Aquileia and date from the 3rd and 4th centuries A.D.

By an economic process paralleled in the pottery industry, glassmaking soon spread from Italy to the northern province of Gaul and in particular to the valleys of the Rhône and the Rhine. It seems certain that glass was manufactured in Britain, too, but little is known of the industry there and it was probably not of great importance. The Rhineland, however, became one of the great glassmaking areas of the Roman world, and although (in part no doubt because of successive migrations of near eastern workers) Rhenish glass is always recognizably Roman, several types of decorated glass were specialties of the district. Of these, glasses decorated by threads trailed on in serpentine patterns and then pressed flat and notched are perhaps the most important and characteristic (Schlangenfadenglaser). A considerable school of glass engraving also seems to have flourished, probably centred on Cologne. Although some of the engraving is in an impoverished

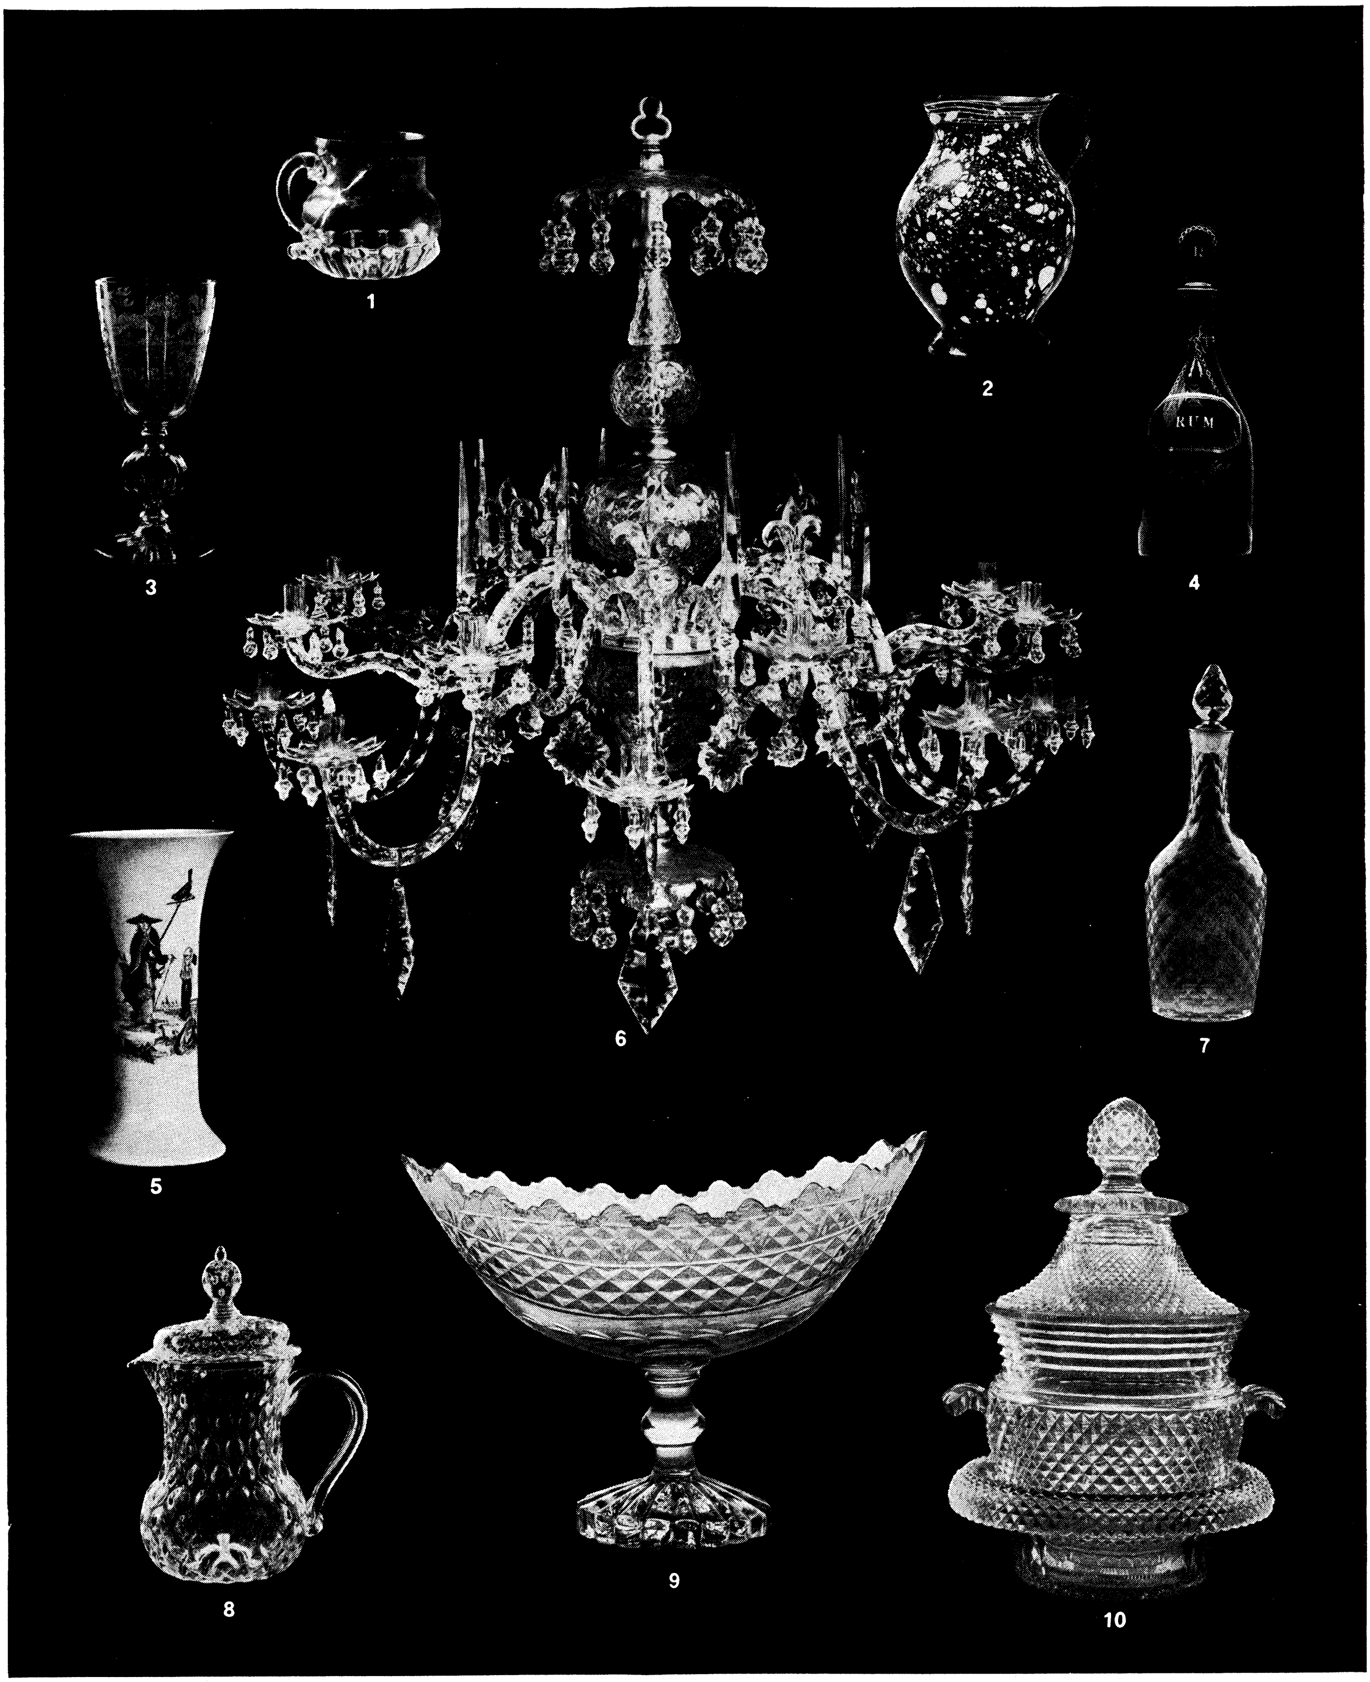
EUROPEAN GLASS OF THE 18TH AND EARLY 19TH CENTURIES

1. Goblet and cover, engraved on the wheel, Silesia: about 1740
2. Beaker with inset medallion in red and gold by J. J. Mildner, Gutenbrunn, Aus.: 1792
3. Beaker, wheel-engraved through a red "flashing," Bohemia; about 1840
4. Sweetmeat glass, San Ildefonso, Sp.: second half of 18th century
5. Double-walled beaker decorated with etched gold leaf (*Zwischengoldglas*), Bohemia: about 1730
6. Beaker enamelled by Anton Kothgasser, Vienna: about 1815
7. Goblet (English) stipple-engraved with diamond point by Frans Greenwood, Dordrecht, Neth.: 1728
8. Dish of opaque-white glass (*lattimo*) painted in enamel colours. Miotti glasshouse, Venice: about 1730
9. Sweetmeat glass and cover, engraved on the wheel. Bohemia; about 1750

BY COURTESY OF VICTORIA AND ALBERT MUSEUM

ENGLISH GLASS: LATE 17TH TO EARLY 19TH CENTURIES

1. Goblet containing in the stem a coin of 1684; about 1685
2. Goblet with baluster stem; early 18th century
3. Goblet containing in the stem a coin of 1690; late 17th century
4. Wineglass with shouldered stem and moulded inscription, "God Save King G"; about 1715
5. Wineglass with drawn stem and early type of engraving: about 1730
6. Wineglass with air-twist stem, engraved with Jacobite motives; about 1745–55
7. Wineglass with enamel-twist stem, engraved and inscribed "Success to the Eagle Frigate John Knill Commander," Bristol; 1756–60
8. Wineglass with faceted stem and bowl; about 1760
9. Sweetmeat glass with cut decoration; about 1750–60
10. Rummer with engraved decoration; 1821
11. Wineglass enamelled by a member of the Beilby family, Newcastle upon Tyne; about 1770



ENGLISH GLASS: 16TH TO EARLY 19TH CENTURIES

1. Tankard, bearing the raven's-head seal of George Ravenscroft; about 1675
2. Jug of bottle glass with incorporated white specks (Nailsea type); early 19th century
3. Goblet engraved with diamond point, probably made in the London glasshouse of Jacopo Verzelini: 1581
4. Rum decanter of blue glass with gilt decoration; about 1780
5. Beaker of opaque-white glass painted in enamel colours; about 1755–60
6. Chandelier, cut glass; about 1765
7. Decanter decorated with faceted cutting; about 1760
8. Jug of mould-blown glass, with air bubbles in the cover knob; first half of the 18th century
9. Fruit or salad bowl, English or Irish; late 18th century
10. Wine cooler; about 1825

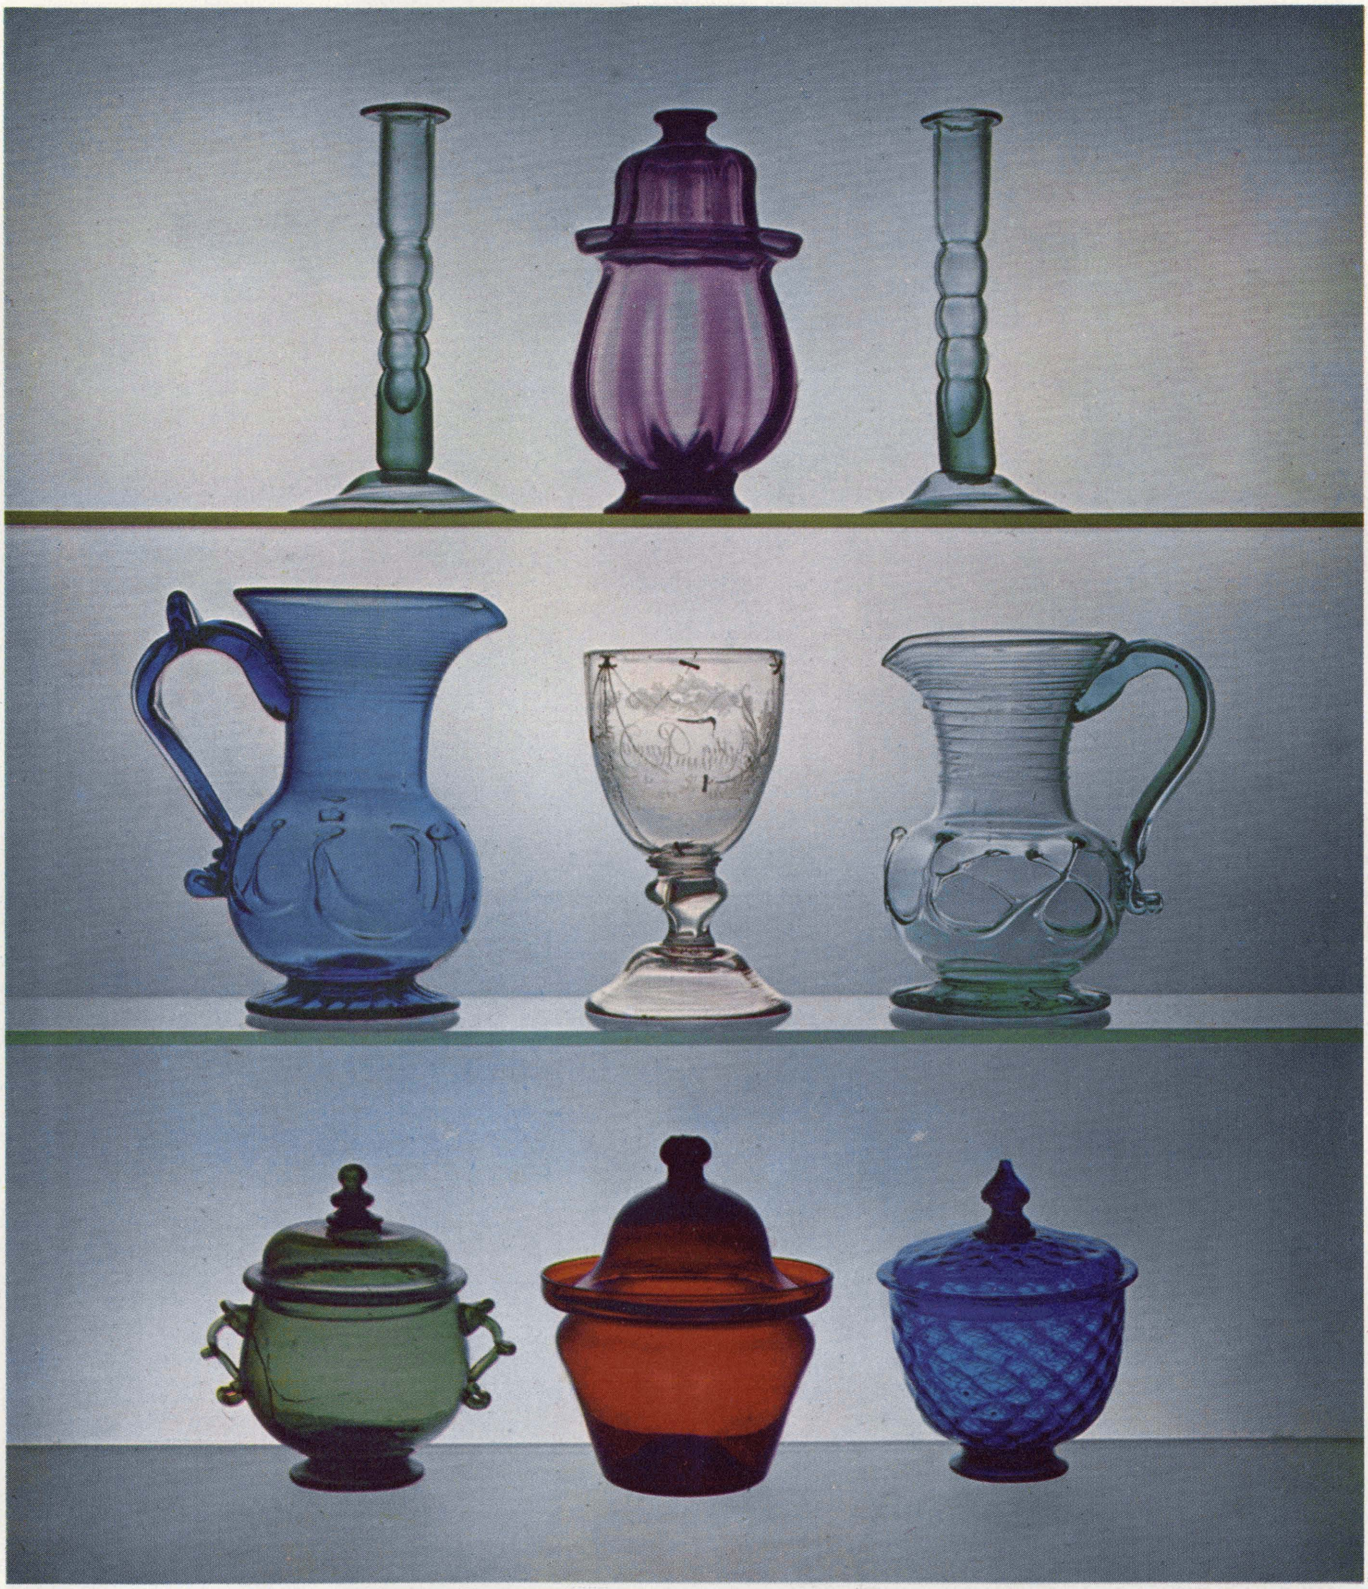
CENTRAL EUROPEAN AND SCANDINAVIAN GLASS AFTER 1850

1. Bowl designed by August Kühne and Josef von Storck and engraved by Carl Pietsch of Kamenicky Senov (Steinschonau), Bohemia, for J. and L. Lobmeyr, Vienna; 1875
2. Lustred glass vase made by the firm of J. Lotz' Witwe, Klastersky Mlyn (Klostermiihle). Bohemia, and shown at the Paris exhibition of 1900
3. Vase engraved with "Hamlet" motifs designed by Jaroslav Horejc and engraved by A. and K. Bischoff at the Lobmeyr studio, Kamenicky Senov. Czech.; 1955
4. Wineglass desianed by Wilhelm Wagenfeld for Peill und Putzler, Duren, Ger.; 1954
5. Engraved bowl designed by Edward Hald at Orrefors glassworks, Sweden; 1925
6. Vase with decoration of internal colour and bubbles designed by Edvin Ohrstrom at Orrefors glassworks, Sweden; 1939
7. Vase with semiopaque white decoration designed by Vicke Lindstrand at Kosta glassworks, Sweden; about 1954
8. Vase of partly bubbled glass designed by Gunnel Nyman for Nuutajarvi (Notsjo) glassworks, Finland; about 1947
9. Vase with engraved decoration, from a series originally designed about 1946 by Tapio Wirkkala for the firm of Karhula-Iittala, Finland

BY COURTESY OF (1) CONSERVATOIRE NATIONAL DES ARTS ET MÉTIERS, PARIS, (2, 6 7) VICTORIA AND ALBERT MUSEUM, (3) METROPOLITAN MUSEUM OF ART, (4) DAUM, NANCY, (5) VENINI VENICE (8) KONINKLIJKE NEDERLANDSCHE GLASFABRIEK, LEERDAM

FRENCH, ITALIAN AND DUTCH GLASS AFTER 1850

1. Cased vase made by Cristallerie de Baccarat, France; about 1851
2. Vase of coloured glass with relief decoration made by Émile Gallé, France; probably about 1895
3. Vase made by René Lalique, France; 1930
4. Bowl designed by Michel Daum, France; 1953
5. Stemmed bowl made by the firm of Venini, Venice, It.; 1920s
6. Vase with figured decoration designed by Ercole Barovier at the firm of Barovier e Toso, Venice; 1951
7. Covered goblet made by the firm of Salviati, Venice; 1869
8. Vase designed by Andries D. Copier at the Leerdam glassworks, Netherlands; mid-20th century



OBJECTS ASSEMBLED BY COURTESY OF THE CORNING MUSEUM OF GLASS, CORNING GLASS CENTER; PHOTO BY JOHN KALINICH

EARLY GLASS OF THE UNITED STATES

Top row: Left and right, pair of candlesticks, probably from glassworks of Caspar Wistar, Wistarberg, N.J., about 1740–80. Centre, sugar bowl, probably from Bakewell glasshouse, Pittsburgh, Pa., first half of the 19th century

Second row: Left and right South Jersey style pitchers with "lily pad" decoration, probably Lockport or Lancaster glassworks, New York, about 1840–60. Centre, engraved goblet from the New Bremen (Md.) glass manufactory of John F. Amelung, dated 1792

Bottom row: Left, sugar bowl, Wistarberg or Glassboro, N.J., probably last quarter of the 18th century; centre, sugar bowl, probably from Zanesville, O., glassworks, about 1815–30; right, sugar bowl possibly from Manheim, Pa., or Henry W. Stiegel glassworks, about 1765–74

BY COURTESY OF (1, 2, 4) THE METROPOLITAN MUSEUM OF ART, NEW YORK, (3) FREDERICK K. GASTON, (5, 8) J. HERBERT WEST, (6, 14) EARL J. KNITTLE, (7) THE TOLEDO MUSEUM OF ART, (9, 11) GEORGE S. MCKEARIN, (10) ARTHUR SUSSEL, (15) FRANCES M. NICHOLS, (16) MRS. E. E. STEINHART; FROM (12, 13) KNITTLE, "EARLY AMERICAN GLASS" (THE CENTURY CO.)

AMERICAN BLOWN, MOULDED AND PRESSED GLASS; 1765–1865

1--4. Attributed to Stiegel: prototypes Continental: 1. Engraved and panelled flint lip glass. 2. Vitreous enamelled flint canister. 3–4. Flint suoar bowl and oitcher showino Venetian diamond technique

5. Swirled, expanded, double-domed Ohio type sugar bowl, 1820–40

6. Swirled and fluted, expanded, reamed edged amber bowl, Pennsylvania-Maryland-Ohro type; 1784–1840

7. Paper-weight made by Wm. T. Gillinder, Philadelphia; 1850–60

8. Amber flower "off-hand" blown by Zanesville, Ohio, artisan; 1840–50

9–13. Insufflated or contact blown-mould technique, 1790–1864: 9. Four-mould pitcher. 10. Three-mould celery holder. 11. Three-mould baroque patterned decanter. 12. Three-mould vase. 13. Three-mould opalescent pitcher

14. Swirled and fluted expanded Ohio pitcher; 1816–26

15. Lacy pressed glass, New England Glass Co., Cambridge, Mass.; 1840–50

16. Crude early pressed glass, Boston and Sandwich Glass Co., Mass., and Providence, R.I.; 1828–38

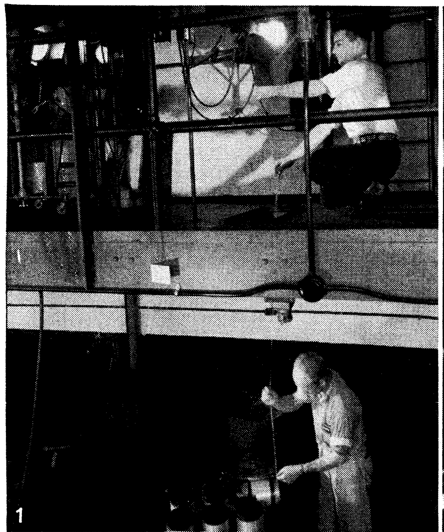
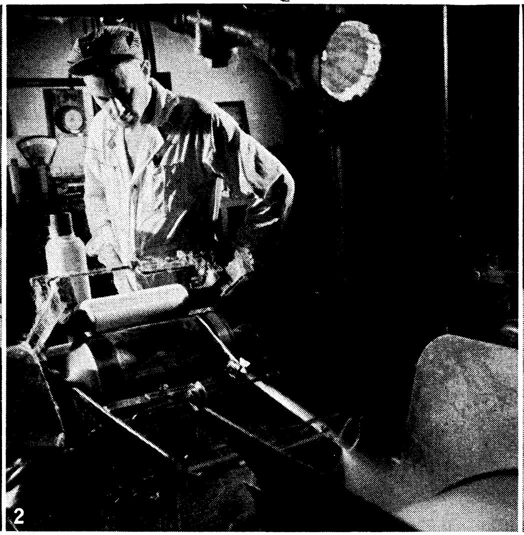
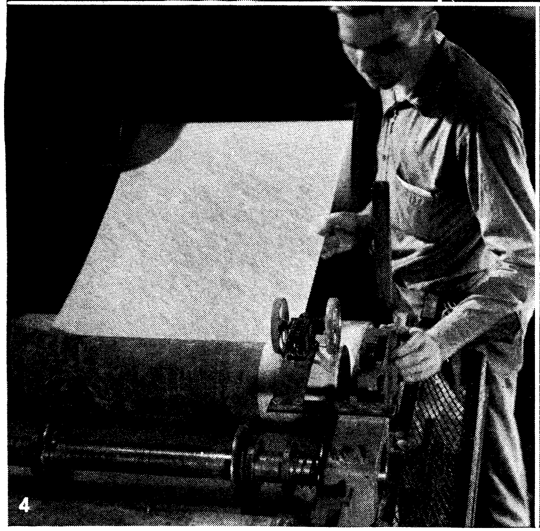
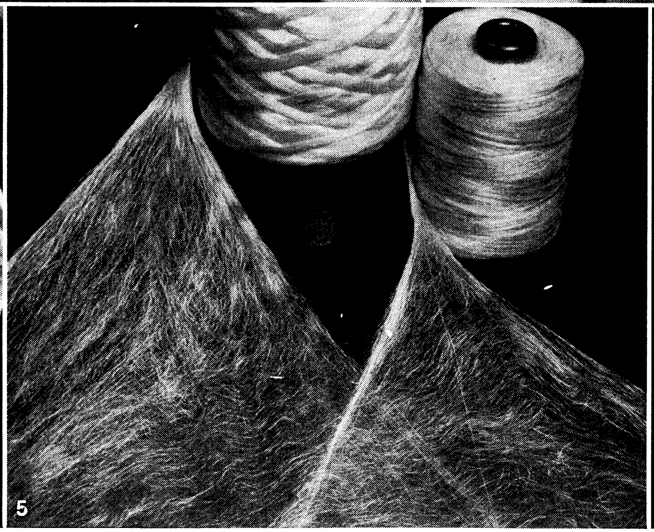
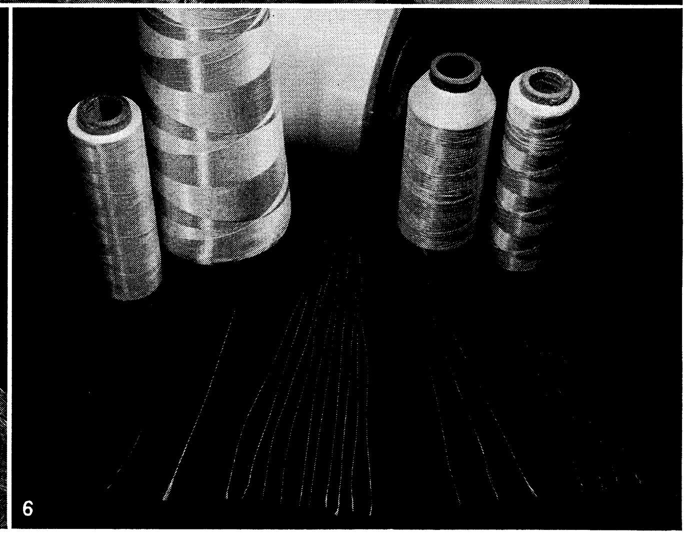
5. Foreman in a Finnish glass factory examining an engraved vase











BY COURTESY OF OWENS-CORNING FIBERGLAS CORPORATION

THE MANUFACTURE OF GLASS FIBRE

1. Manufacturing continuous filament glass fibres for textile use. Glass cullet in the form of marbles is melted in the electric furnace shown at the top of the picture. Bushings with multiple openings at the bottom of the furnace allow 100 to 400 individual filaments to be drawn simultaneously and gathered as a single strand. The man below is supervising the winding of filament. This process of manufacture is one of the four basic types; the other three are illustrated in figs. 2, 3 and 4
2. Production of glass in the form of staple fibre. Fibres are drawn by steam or air pressure from an electric furnace above the drum at the extreme right. They pass by a drying and tempering flame and gather as a web on a wide revolving drum. The web is drawn from the drum to form a sliver (pronounced *sly'-ver*) from which rovings or yarns may be subsequently formed
3. Production of glass mineral wool. Molten glass is drawn from large melting tanks or furnaces through small orifices and torn into shreds by steam or air pressure. The fibres gather on a conveyor as a white fluffy material having a natural density of 1½ lb. per cubic foot. This is the basic form of glass mineral wool and is used to fabricate many types of thermal and acoustical products
4. Forming glass fibre "bonded mat," a wafer-thin sheet of glass fibres. The fibres are produced by the staple fibre process except that the web is treated with a suitable binder and is gathered in sheet form. This product is used for storage battery retainer mats and air filters and to provide a paintable surface for glass mineral wool used in acoustical applications
5. Two forms of glass staple fibre. At the left is the plain form spread out to show the interlacing of many individual fibres. This form can be drafted and twisted for constructing moderately fine to heavy yarns. The type at the right contains a double strand of continuous filament in the centre of the staple fibres so that they may be handled without further drafting to form a high bulking material for electrical cable insulation and other purposes
6. Forms of glass yarn used for electrical insulation purposes. Left: a tube and cone of yarn suitable for weaving into fabrics. Centre background and right: various packagings of yarn, multiple wound to provide several strands in parallel arrangement. These forms are used for serving on magnet wires or cables to form an electrical insulation

linear style, often eked out by lines scratched with a hard-stone point, some of it is executed by means of wheels sufficiently thick to permit rounded cuts corresponding to the relief modelling of the human figure and simulating it when the piece is seen against the light. Both these types of decoration flourished in the 3rd and 4th centuries A.D.

In Egypt in the later (3rd–jth) centuries of the Roman epoch glass was in frequent use for tableware. but the artistic standards of manufacture did not stand very high. Plain dishes, cups. bowls and lamps are frequently met with, the glass metal of the tablewares ranging from an almost colourless material of good quality to a greenish-brownish substance full of bubbles and impurities. Decoration in this late period is mainly restricted to a few rough-cut lines. an occasional group of coloured glass blobs on. for instance) the lamps. or a zigzag trail of glass thread running between the lip and the shoulder of a vase. In Syria during the same period. however. this trailing technique. which was particularly suitable to the ductile Syrian material, was carried to extreme lengths, circuits of threads round the body or neck of a vessel, zigzags—either on the body or festooned between lip and shoulder—and fantastically worked handles being much favoured. Here too the quality of the material degenerated and .the finer types of glass ceased to he made.

With the breakdown of the Roman empire glassmaking fared differently in different parts of the world. In the east. urban life continued relatively undisturbed, and glassmaking evolved in an unbroken progress into Islamic times. In the northern provinces, however, from being a centralized industry, glassmaking became an affair of small glasshouses working in comparative isolation in the forests that supplied them with fuel. There relatively simple shapes were made in an impure greenish or yellowish material, their decoration being restricted to simple trails of thread. Considerable virtuosity. however, was displayed in the manufacture of the elaborate and fantastic "claw beakers" (*Rüsselbecher*) from about A.D. 500 onward. On these, two superimposed rows of hollow trunklike protrusions curve down to rejoin the wall of the vessel above a small button foot.

In the eastern parts of the empire, Syria appears to have continued with its predilection for trailed and applied ornamentation, which became in the 5th–7th centuries sometimes fantastically elaborate. In Egypt the art of glass seems to have suffered a catastrophic decline. only small rough vessels of impure green or blue material being manufactured, with no more decoration than a few coloured blobs of glass or circuits of trailed thread. In Byzantium itself the position of glassmaking is obscure. A distinction made between *vitriarii* (glassmakers) on the one hand and *diatretarii* (glass cutters) on the other; in edicts of Constantine the Great, Theodosius and Justinian. suggests that cutting played an important part in Byzantine glass decoration. This is borne out by the fact that the greater part of the glass brought back from the sack of Constantinople by the crusaders, and placed in the treasury of St. Mark's in Venice. is in fact cut. Apart from the few pieces of obviously Roman glass which had presumably been kept as heirlooms in Byzantium, these glasses are decorated either with tessellated patterns of overlapping round or oval facets or with round bosses cut in the relief technique. These same two broad divisions of cutting technique are observable in the glass of the 5th century excavated at Kish in Mesopotamia, and it is a fair assumption that here, as in some of the other arts. Byzantine taste was strongly influenced by the east. It is probable, however. that some enamelled and gilt glass also was made in the Byzantine provinces (*e.g.,* in Corinth). if not in Byzantium itself. The position of glassmaking in Italy during this period is obscure.

Islam.—In the course of the 7th century A.D. the whole near east was overrun by the Arabs. Although the original political unity of this invading force was soon split by faction, and a number of rival dynasties were established in different parts of the conquered territory, an Islamic cultural area was created which was comparable with the area of Graeco-Roman culture existing under the Roman empire. In these conditions there evolved a glass style which is as distinctively Islamic as that of the Roman empire was Roman. Although it often is not possible to say where a particular glass mas made, the different parts of the Islamic world seem to have shown a predilection for one or another type of glassmaking. In Syria the native bent for plastic work seems to have continued to find its outlet both in pieces more or less heavily decorated with trailed threads or applied blobs and in pieces blown is moulds patterned with ribs or with honeycomb or other all-over designs. In Mesopotamia glassmaking seems to have flourished especially under the Xbbasid caliphate (A.D. 750–1258), which, particularly in the 9th century. appears to have attracted to its service many of the best artists in the Islamic world. In particular, a great school of glass engraving appears to have been established in Mesopotamia. Not only were the earlier modes of facet and boss cutting continued. but (perhaps deriving from them) two splendid new styles were created. the one of linear engraving in intaglio. the other a method of relief cutting in which the outlines of the design were left standing in relief by the cutting back of the ground and were then enlivened by crosshatching. In this technique were produced bowls. bottles and ewers of remarkable sumptuousness, decorated with figures of running animals and with plant scrolls, the leaves of nhich were formed by semipalmettes. The number of fragments of this latter type of cut glass found in Persia after World War II suggests that such work may also have been done there, and the fine linear style referred to above was probably also practised in the more easterly provinces of the Xbbasid caliphate.

In Egypt there was both innovation and, after the decay of the post-Roman period, a notable revival of earlier techniques. Among the innovations mas the device of stamping a glass by means of tongs, one jaw of which was patterned; and many fragments of vertical-sided bowls decorated by this means have been found in Egypt. The technique, however. probably spread to other lands. and one extension of it. by which the upper and lower halves of bottles were made separately in contrasting colours, decorated by the tongs and then joined together, was probably a Syrian innovation. Of greater importance was the Egyptian invention of lustre painting. In its simplest forms it consists of no more than painting in a pigment containing silver, which, when fired in a reducing atmosphere. produced a thin metallic film on the glass varying in colour from pale yellow to brown. Intact bowls and a bottle decorated by this technique are known. but whole classes of far more elaborate lustre-painted wares are represented only by fragments. They present a very wide variety of polychrome surface effects, many of which are probably not produced by lustre pigments properly so-called and the technical secrets of which are not yet understood. The vessels decorated by these techniques must have been sumptuous in the extreme.

The Egyptian archaizing revivals of this period included the reintroduction of millefiori glass, mainly in plaques for wall decoration, and of white fern and feather patterns produced on dark glass vessels by combed and imbedded glass threads. Glass cutting was also practised in Egypt but probably was confined mainly to the production of deeply incised small perfume bottles of square section. the bases of which were often cut into four tapering feet—a conformation nhich has earned for them the name of molar-tooth bottles. Egypt probably also perfected the technique of gilding. which was decisive for the next phase in Islamic glassmaking. It seems possible that it was glassworkers with a knowledge of this technique, migrating from Egypt to Syria on the fall of the Egyptian Fatimite dynasty in 1171, who laid the foundation of the Syrian art of enamelled and gilt glass.

Although the earlier phases of this art are incompletely understood, the first group of enamelled and gilt glasses seems to be one in which thick enamels are used (particularly white and turquoise blue), often in series of beadlike drops. This class is associated with the town of Rakka in Syria. but the association is far from certain. X similar uncertainty surrounds the origins of the two broad families into which the mature Syrian glass of the 13th century is divided. One class. characterized by the use of thick, jewellike enamels, is connected with the town of Aleppo; the other, notable for its exquisitely painted small-scale figural decoration, is attributed to Damascus. Both these cities were famous for their glass at this epoch, but it is far from certain what each produced. Wherever made, the glass of this type represents one of the high lights in the history of the art. whether one considers the rich polychromy of the enamels—green, red, yellow, white and turquoise blue—of the "Aleppo" group, or the masterly drawing in red outline of the "Damascus" group. Toward 1300 Chinese influences, infiltrating to the near east by way of the Mongols and Tatars, makes itself felt in the decoration of these glasses and is apparent in the great series of mosque lamps which from about this time began to be made for the rulers and great officers of state in Egypt. From a peak point of excellence at the beginning of the 14th century, a decline set in which was greatly precipitated by Timur's sacking of the chief Syrian cities at the end of the century. Damascus fell finally in 1400, and it is recorded that the glass-workers of that city were carried into captivity in Samarkand. Nevertheless, some enamelled glass, of inferior quality. continued to be made in the 15th century, perhaps in Egypt. By the end of that century. however, there is evidence that mosque lamps were being made in Venice for the oriental market, and the great near eastern tradition of enamelled and gilt glass was clearly moribund.

Venice and the **Façon de Venise.**—A glass industry was already established in Venice in the 11th century, and it is evident that vessel glass was being made there by the third quarter of the 13th century. In 1291 the glass furnaces were removed to the neighbouring island of Murano in order to obviate the risk of fires. in the city. Although Venice had constant contact with the east, there is no evidence that it was indebted to that source for its skill in glassmaking, and when the first Venetian enamelled glasses appear in the second half of the 15th century, although their technique is essentially similar to that of the Syrian glasses just mentioned, it is clear that they are of independent development. Little is known of the vessels made before this period, but it is evident from representations in pictures that they were mainly footed flasks and low beakers. The Venetians themselves attributed the introduction of enamelling to a member of the glassmaking family of Barovier, and the earliest pieces known, commencing with a goblet referable to the year 1465, certainly show no signs of outside influence. These, like most Venetian glass of this and the immediately succeeding period, show that their makers were inspired with the ideals common to the artists of the Italian Renaissance. The subjects of the enamelled glasses are drawn probably from contemporary woodcuts and *nielli,* and represent triumphs, allegories of love, grotesques and so forth. with decorative borders formed of dots of enamel laid on a ground of gold etched in a scale pattern. Many of these pieces were of richly coloured glass, mainly blue, green and purple. The Venetians were keenly aware of the Roman achievement, in glassmaking as in the other arts, and not only did they reproduce the earlier mosaic, millefiori and aventurine glass, and the glass made of blended colours resembling those of natural layered stones (calcedonio, sometimes miscalled Schmelzglas), but they even copied the Roman form of bowl with vertical external ribs. All these types of coloured glass were Venetian specialties and had probably been evolved as a part of the extensive local bead industry. The greatest achievement of Venice, however, and that upon which its great export trade came to be based, was the manufacture of clear. colourless glass, the secret of which had probably been lost during the middle ages. From its resemblance to the natural crystal, this material was called *cristallo,* although in fact it often has a brownish or grayish cast which is not unpleasing. This glass, which was fluxed with soda. was very ductile and cooled quickly. It therefore demanded of the workman great speed and dexterity, and this in turn affected the nature of the glasses made. Although in the first half of the 16th century the Venetian glass blowers produced glasses of an austere simplicity of form, as the century drew on (and more markedly still in the 17th century) there was a tendency to produce elaborate and fantastic forms which in the end overreached itself. Enamelling went out of fashion in Venice (except on pieces for export) in the first half of the 16th century, its place being taken to some extent by the use of opaque-white glass threads for decorative purposes (*latticinio* or *latticino*). This form of decoration became progressively more complex, opaque threads being embedded in a matrix of clear glass and then twisted into cables which were themselves used to build up the wall of a vessel. The height of complexity was reached when a bulb of glass decorated with cables or threads running obliquely in one direction was blown inside a second bulb with threads writhen in the other direction, the composite globe thus formed being then worked into the desired form. This gave a vessel completely covered with a lacy white pattern (vetro di trina). Other methods of decoration at this time were mould blowing, and dipping a vessel while hot into water, or rolling it on a bed of glass fragments, to produce a crackled surface (ice glass). Cristallo was also found suitable for engraving with the diamond point, which produced spidery opaque lines especially suitable for. delicate linear designs. Most Venetian work of this type was devoted to scrolling leafy designs which run round the rims of dishes and plates. The technique seems to have come in about 1560.

The glassworkers of Murano were governed by stringent laws, which forbade them to leave Venice or to teach their secrets to outsiders, under dire penalties both to themselves and their families. Such was the demand for Venetian glass in the rest of Europe, however, and such the desire of kings and nobles to have the making of glass in their own hands, that many Venetian workmen in the course of the 16th century were tempted to abscond to other countries, where they helped to set up glassworks. Furthermore, there was at L'Altare, near Genoa, a second great centre of glassmaking, where glass was made so like the Venetian in style and material that it is nowadays impossible to distinguish the two. The glassworkers at L'Altare, moreover. were governed by no such laws as the Venetians and rather made it their policy to supply their men and teach their methods wherever there was a demand for them. By these two agencies, therefore, the Italian art of glass spread to the rest of Europe, and glasshouses were established in France, Spain, Portugal, Austria and Germany, while in the north Antwerp seems to have been a source of secondary diffusion. Italian glassworkers were to be found as far north as England, Denmark and Sweden. Their labour was necessarily diluted by that of native workmen, to whom they were often required to teach their methods; while changed sources of raw materials often modified the quality of the glass they made. But even allowing for this and for the adjustments imposed by local taste on form and ornament, it remains true to say that in the late 16th and the 17th centuries there was an international style in glass, wholly Italian in origin and inspiration. This is the so-called *façon* de Venise.

Although there was everywhere a family likeness among glasses of the *façon* de Venise, certain countries developed types peculiar to themselves which are worthy of mention. Thus, in Spain, not only were fantastic and even bizarre shapes evolved in a local green metal, both in the south and in Catalonia, but in Barcelona a characteristic kind of enamelled decoration was developed, the peculiarities of which include a light leaf-green colour and a singular and constantly recurring lily-of-the-valley motif (late 15th-16th century). At Hall, in the Tirol, a characteristic type of decoration with the diamond point, often supplemented by cold painting, was favoured. This consisted of usually alternating broad and narrow upright panels containing symmetrical scroll-work or coats of arms and other devices. Almost equally stiff and formal diamond-point work is to be seen on the glasses probably made at the London glasshouse of Jacopo Verzelini (examples dated between 1577 and 1590). A far more promising development of diamond-point engraving occurred in the Netherlands. There too the work of the 16th century was relatively formal and perhaps slightly stiff. Like the work done in other countries, however, it is marked by a linear character and a clarity achieved by the use of simple hatching, in one direction only, as a filling pattern. In the succeeding century, however, fresh developments occurred which, while having the initial result of making diamond-point engraving more supple and pleasing, contained in themselves the seeds of decay. At this epoch diamond-point engraving was practised not only by professional glass decorators but also, possibly to an even greater extent, by talented amateurs, among whom were numbered members of the humanistic intellectual elite of the time, such as Maria Tesselschade Roemers Visscher (1595–1649), her even more famous sister Anna Roemers Visscher

(1583–1651) and Anna Maria van Schurman (1607–78). The tuo last-named decorated their glasses with flowers and insects drawn with a gossamer touch and often accompanied by epigrams in Latin or Greek capitals scratched with severe precision or in the free scrolled style of the Italianate writing masters of the time. A similar calligraphy was practised on its onn at a later date by the amateur Willem Jacobsz van Heemskerk (1613–92), with notably beautiful results. The subject engraving of the Erst half of the 17th century shows a gradual abandonment of the clarity of the older linear handling. in favour of a system of close hatching and crosshatching to produce chiaroscuro effects, the high lights being formed by sometimes completely opaque spots. Of the many artists working in this manner, only two are worthy of special mention. One was an accomplished engraver signing C. F. M., whose earliest dated glass is of 1644. and the other Willem Mooleyser, of Rotterdam, who worked in the last two decades of the 17th century and whose work has a scribbled freedom and vigour which raise it above the average. By the end of the century this type of diamond-point work was superseded in popularity by wheel engraving.

Germany. — In Germany, toward the end of the 17th century, a reaction to Venetian glass styles seems to have set in. In that country there had been a continuous survival; probably from late Roman times, of a local type of green glass. made in forest glass-houses and fluxed with potash obtained by burning forest vegetation, and called therefore *Waldglas* (forest glass). In this material. often of great beauty of colour, were made shapes peculiar to Germany, notably a cylindrical beer glass studded with projecting bosses (*Krautstrunk* or "cabbage stalk") and a wineglass (*Römer*) with cup-shaped or ovoid bowl set on a similarly prunted hollow stem. This became the classic German shape of wineglass, survived into the 18th century and survives, with modifications, to the present day. Apart from these indigenous forms, made in a native metal, German glass made in Venetian-type *cristallo* developed, in the latter part of the 17th century, local characteristics of its own. This was especially true of Nuremberg, where the Italianate tall-stemmed goblet underwent a transformation into a severe glass with stem composed of no more than a baluster-shaped element and a bulb, joined together by a number of disk-shaped *mereses* and attached to foot and bowl by the same means. On these goblets is to be seen some of the most accomplished glass engraving ever practised. Leader and founder of the Nuremberg school of engravers was one Georg Schwanhardt (1601–67), a pupil of Caspar Lehmann. Lehmann had been gem cutter to the emperor Rudolph II in Prague and had there taken the decisive step of transferring the art of engraving from the decoration of precious stones to that of glass. His first dated work is a beaker of 160j. and in 1609 he obtained an exclusive privilege for engraving glass. It is nevertheless virtually certain that, although he is the first great personality in glass engraving. he was not the first to practise the art in the German area. On Lehmann's death in 1622, Schwanhardt inherited his patent and moved to his own native city. Nuremberg, where a whole school of glass engraving grew up around him and his family. Schwanhardt's own work is characterized by a delicate handling of tiny landscapes, often accompanied by contrasting bold formal scrollwork. His son Heinrich, too, excelled in rendering minute landscapes but also engraved inscriptions of fine calligraphic quality. Other notable Nuremberg engravers of the late 17th century were Paul Eder, Hermann Schwinger (1640–83), whose mastery of calligraphy is reminiscent of Heinrich Schwanhardt's, H. W. Schmidt and G. F. Killinger, both of whom are chiefly notable for the delicacy with which they rendered landscape. Work somewhat similar to that of the Nuremberg engravers was done at Frankfurt-on-Main by members of the family of Hess.

After Lehmann's death, little engraving of high quality was done in Bohemia for a while. Just before 1700, however, thanks to the perfection of a massive, crystal-clear, potash-lime glass which allowed cuts of considerable depth, the engravers of the Bohemian-Silesian area came into prominence. A powerful aid to economic working was the harnessing of water power in the mountainous districts of the Riesengebirge, and this enabled the engravers (those of the Hirschberger Tal in particular) to practise the art of relief engraving, which demands an immense output of energy in grinding down the ground on which the design stands. In this technique were produced massive covered goblets decorated with powerful acanthus scroll designs in the contemporary Baroque taste. Relief engraving (*Hochschnitt*) was only occasionally used by itself in the Bohemian-Silesian area in the 18th century, being more often employed in conjunction with intaglio engraving (Tiefsclznitt) on Silesian glasses. By the turn of the 18th century the engravers of this area—almost always anonymous workmen who were obviously regarded rather as artisans than as artists—had acquired immense technical skill, and this enabled them to adapt to glass decoration all the changing fashions of the 18th century in the decorative arts. Their work, however, although striking for its virtuosity, is seldom of great artistic value. Glass engraving, often of fine quality, was also practised in many parts of Germany—notably Thuringia, Saxony and Brunswick—but the most significant work of the late 17th and early 18th century was that done in Brandenburg. There, the glassworks at Potsdam (moved to Zechlin in 17.36) produced massive goblets and beakers which were engraved—usually to order for the court—in Berlin, where a water-powered engraving shop had been installed in 1687. Both Hochschnitt and *Tiefschnitt* were practised, the former being to some extent subordinated to the latter. This workshop, indeed. produced perhaps the greatest of the German intaglio engravers, Gottfried Spiller (d. after 1721), whose deep cutting on the thick Potsdam glass has seldom, if ever, been surpassed in the history of glass engraving. A notable engraver from the same shop, although overshadowed by Spiller, was Heinrich Jaeger (working from before 1694 until after 1701); and later! in the 1730s and 1740s, work of high quality was done by Elias Rosbach (d. 1765). Another workshop of great significance was that set up toward the end of the 17th century at Cassel, in Hesse. There worked perhaps the greatest of all the Hochschnitt engravers, Franz Gondelach (b. 1663, still working 1716), who handled his material with a truly sculptural feeling.

In the second half of the 18th century engraving as a means of decorating glass declined in favour! although the technical skill required for its production never died out in the Bohemian-Silesian area. It experienced a great revival in the second quarter of the 19th century, when the taste of the newly prosperous bourgeoisie favoured elaborate decoration. The engraving of this period is often skilful in the extreme! although marred by excessive naturalism. Striking innovations of the period were the use of a casing (normally ruby red or opaque white) through which the design was cut down to the colourless glass. A yellow coating (the silver stain of the stained-glass artist) was often used in the same way. Notable engravers of this epoch were Dominik Bimann (1800–57), August Bohm (1812–90), A. H. Pfeiffer (1801–66) and members of the Pelikan and Simm families.

Second in importance only to engraving as a method of decorating glass in Germany was enamelling. Germany had proved a profitable market for enamelled Venetian glass during the 16th century, and in the latter part of that century glass enamelling began to be practised in the Germanic lands themselves, the most notable centre being Bohemia. This enamelling, in bright opaque colours, was much favoured throughout the 17th century, chiefly on the cylindrical drinking glasses, often of great size. known as *Humpen*. The glass of which they were made was frequently impure and of a greenish or yellowish cast, while the painting itself was rather the simplified repetitive work of artisans than that of original artists. Nevertheless, the gaiety of colour of these glasses, and a certain naïveté in their painting, give them an authentic unsophisticated charm. The most-favoured types of decoration include a representation of the imperial double-headed eagle with the coats of arms of the imperial hierarchy displayed on its wings (Reichsadlerhumpen); representations of the emperor with his seven electors, either seated or mounted on horseback (Kurfurstenhumpen); subjects from the Old and New Testaments; and allegorical themes such as the Eight Virtues and the Ages of Man. These were painted between borders of multicoloured or white dots or intersecting ellipses, often on a gold ground. This general style continued into the 18th century, but in the course of that century the levels of artistic and technical competence sank, and the tumblers and spirit bottles which were the main types produced can be regarded only as objects of peasant art.

A far more sophisticated type of enamel painting was carried on during the third quarter of the 17th century at Nuremberg. Here, painting in black or sepia (*Schwarzlotmalerei*)—a technique borrowed from the stained-glass artist—was used to decorate the small cylindrical beakers (often resting on three hollow ball feet) which were a locally favoured shape. Other colours, notably red used in touches with the black, were also occasionally employed. The greatest and most original artist of this school was Johann Schaper (1621–70), who painted delicate architectural and landscape compositions in which use was made of a fine point to etch in details through the black enamel to the colourless glass. The best of Schaper's followers were J. L. Faber, Hermann Benkert (1652–81+), Johann Keyll and Abraham Helmhack, but none of them equalled him in artistic competence. Comparable work appears to have been done, although on a more restricted scale, in the Rhineland, notably by Johann Anton Carli (d. 1682) of Andernach. At the beginning of the 18th century Schwarzlot painting, often with touches of gold, was practised in Bohemia and Silesia and reflected the changing fashions in the decorative arts. Daniel Preissler (1636–1733) and his son Ignaz are known to have done this work, but it has not certainly been identified.

In the first half of the 19th century the decorators of vessel glass once again borrowed from the stained-glass artist. Samuel Mohn (1762–1815), his son Gottlob Samuel Mohn (1789–1825) and Anton Kothgasser (1769–1851) painted the straight-sided beakers typical of this "Biedermeier" period in transparent enamels and yellow stain.

A technique peculiar to Bohemia in the 18th century was that of the "gold sandwich glasses" (Zwischengoldglaser). These were beakers, or less often goblets, made of two layers of glass, exactly fitting one over the other, between which was sandwiched a gold leaf previously etched with a steel point to the desired design. The earliest work in this technique was anonymous, but at a later date J. J. Mildner (1763–1808) employed it with notable success, making gift tumblers decorated with medallions of etched gold or silver leaf (often backed with red pigment), and sometimes also engraved on the wheel or with the diamond point.

England.—Glass was certainly made in England during the later middle ages, but most of it was used for church windows. (See STAINED GLASS.) The vessel glass of the period has not been much studied and is only imperfectly understood. It is only when the 16th century is reached, and particularly the second half of it, that the picture becomes clearer. Two lines of development may be traced in this period. On the one hand is the glass of German *Waldglas* type, made in the woods which supplied the furnaces with fuel and a source of potash. These glasses were made by glassworkers whose traditions were those of Lorraine and of Flanders. Much of their production was of window glass, but they also made vessels in a modest variety of shapes and modes of decoration. Chief among the forms made was a tumblerlike drinking glass with a low doubled foot rim produced by pushing in the bottom of the bulb from which the glass was made; this might be decorated either by mould-blown diaper designs, or by swirled ribbing imparted by mould blowing and subsequent twisting, or by a zone of trailed threading beiow the neck. Applied notched ribbons or small circular motifs were also used. Small bottles of mould-blown hexagonal section or of flattened ovate form with diagonal ribbing were also made. The second line of development was that of the international Venetian style brought by immigrant Italians (see above); this, however, in time acquired an English idiom. This work was done mainly in London.

In the 17th century these two traditions were welded into one, the main factor in the process being the proclamation of 1615 forbidding the use of wood in glass furnaces. Thenceforth coal was the sole means of fusing glass, and glasshouses tended to fix themselves where coal measures (and the frequently concomitant fire clays for making glass pots) were abundant. These areas tend to be those where industrial development has been continuous ever since (*e.g.*, the Stourbridge area and Tyneside), and excavation on these sites has seldom been practicable. Little, therefore, is known of provincial glassmaking in England in the 17th century, but it may be taken as certain that *Waldglas* disappeared (even if some of its forms survived) and that an Anglicized form of the 17th-century *façon* de *Venise* became the national style. Some idea of this style may be gained from the fragments of glasses often excavated in London and other cities. It is frequently difficult to distinguish between an English glass and an imported continental one, although a certain coarseness may be taken as symptomatic of local make. During the first half of the 17th century, English glassmaking was dominated by a series of monopoly holders, the greatest of them being Sir Robert Mansell (1593–*c.* 1656), who effectively controlled the industry from 1623 until his death. After the Restoration, although some monopolies were granted for certain categories of glasswares, an increasingly important role in the English industry was played by the Worshipful Company of Glass Sellers (reincorporated in 1664), which was able to keep closely in touch with the needs of the English market. Its members seem to have laid stress on simplicity of shape and durability of material as appears from the correspondence of one of them, John Greene, with his suppliers in Venice (fig. 7, B). Dissatisfied with the quality of glass supplied to them, and no doubt anxious also to make England independent of foreign sources of both finished glass and raw materials, they commissioned George Ravenscroft (1618–81) to make experiments with native materials, in the hope of evolving a more solid metal than the Venetian and one which more closely resembled rock crystal. A similar change of taste was taking place in Germany about the same time (see above). Ravenscroft was completely successful, his crucial discovery being the use of lead oxide as a flux. His "glass of lead," evolved about 1675, was perfected toward the end of the century and set a standard for the rest of Europe. It was solid and heavy and more durable than the Venetian-type glass which it progressively displaced. It was also characterized by brilliance and dark shadow paradoxically combined. It was slower to work than the Venetian glass, and gradually the Venetian idioms were dropped from English glassmaking in favour of a genuine native style. This style is best seen in the drinking glasses which, at the end of the 17th century and beginning of the 18th, constitute the chief glory of the English industry. These often massive baluster glasses were composed of a usually funnel-shaped bowl and a stem compiled of any of a large variety of pear-shaped and bulbous knops. In their simplicity and the harmony of their proportions, they rank among the classics of the Queen Anne style.

Toward the middle of the 18th century, taste in the arts generally inclined to lighter forms, and in the case of glass this tendency was given additional impetus by the passing in 1745–46 of an excise levied on glass by weight. Drinking glasses became slighter, the bowls smaller and the stems taller and more slender. The loss in architectural values was often offset by extraneous decoration. At first this tended to be concentrated in the stem. Bubbles of air had sometimes previously been enclosed in a knop forming part of the stem of a wineglass! and these bubbles were now drawn out and twisted so that they formed a cable of air ribbons inside a cylindrical stem. Stems of this type were popular for about zo years before and 10 years after the middle of the century. Just before 1750 a stem came into favour which was decorated with threads of opaque-white glass instead of the air twists. These stems were made by much the same techniques as the Venetian latticinio glass (*see* above). They remained in fashion during the third quarter of the century, their lapse from favour being perhaps hastened by the second Glass Excise act in 1777, which imposed a tax on the opaque-white "enamel" glass, previously exempt.

These forms of ornament had been restricted to the stems of glasses, but other methods of decoration were simultaneously evolved which could be used to embellish the whole glass. First of these was engraving, which had been sporadically practised in England as early as the end of the 17th century. This work and the inscriptions. coats of arms and arabesque borders in German style which were engraved during the first 20 years or so of the 18th century were undoubtedly the work of immigrant (probably German) artisans. By 1735, however, at least one English engraver was capable of executing such commissions, and from about this time engraving on glass begins to take on a more English character. An artless use of floral motifs, *chinoisevies* and scenes from country life is typical of the engraving of the third quarter of the 18th century. and in this period also falls the frequent representation on glasses of Jacobite themes—portraits of the Old and Sew Pretenders. the rose with buds. the honeysuckle and the other flowers used in the symbology of the Stuart cause, together with the mottoes of such "loyal" societies as the Cycle club. Engraving never reached great heights in England. but English glasses were in demand by engravers on the continent, particularly in the Netherlands, where the work of at least one notable artist—Jacob Sang, of Amsterdam—was almost exclusively done on imported English drinking glasses. English lead glass seems also to have been particularly sympathetic to the Dutch diamond-point engravers, whose work in this period was executed almost exclusively in stipple. The chief masters of this delicate art, in which the design seems no more than a bloom on the surface of the glass, were Frans Greenwood (1680–1761) of Dordrecht, the originator of the style, and David Wolff (1732–98) of The Hague, whose work, if uninspired, is of high technical accomplishment.

The second decorative technique of foreign inspiration to be used on English glass in the 18th century was enamelling. It was used for embellishing opaque-white glass in ,imitation of china about the middle of the century—a type of work usually associated with the name of Michael Edkins (1734–1811), a Bristol artist, but in fact done in many parts of the country. Perhaps the most original work in this medium was done on clear glass by members of the Beilby family of Sewcastle upon Tyne, during the 1760s and 1; 70s. Their rendering in pink- or blue-toned white enamel of ruins, trophies of arms and rural pastimes, often framed in scrollwork of the utmost delicacy, is one of the best things in English rococo glass. Gilding mas also used at this time to decorate glasses, usually with simple designs of vine and grapes.

These ornamental techniques, however, were of ephemeral growth in England. Far more significant than any of them, because more firmly rooted in the very nature of English glass, was the art of cutting. Although literary references to cut glass occur before 1720, the earliest known pieces extant can hardly be dated much before 1730. On them the cutting is mainly confined to brims and feet, which are scalloped or notched; or, in the case of wineglasses, to the thicker parts of the glass, such as the stem. which might be fluted or cut in an all-over pattern of flat diamonds. Throughout the period from about 1745 to 1770, shallow cutting was the normal, diamonds, hexagons, flutes and scale pattern being combined with segmental lunate cuts (produced by holding the glass at an angle to the cutting wheel) and with triangular and diamond motifs in very low relief. These elements could be combined to produce designs of great complexity and richness, and this period is the golden age of English cutting. About 1770 a plainer style, employing mainly flutes, responded to the rising neoclassical fashion in the other arts. The flutes were sometimes combined with diamonds in relief, and when further taxes were imposed on glass in 1777 and 1781. and in 1780 trade between England and Ireland was freed, it was this relief-diamond style which was taken up in the latter country by the glasshouses founded under these favourable economic conditions. The Irish glassworkers could afford to be more lavish with their metal, and on this thicker glass increasingly deeply cut diamonds and other relief motifs could be produced. About the turn of the century the diamonds began to be reduced in size and to be used as a diaper design covering whole areas. often alternating with fields of larger truncated diamonds. the surfaces of which were themselves diversified with cut crosshatching. Such designs were often used in combination with deeply cut horizontal grooves. These styles. which were subsequently followed in England as well as in Ireland. finally led to a complete breaking up of the face of the glass into points and ridges, with increased prismatic effect but with a disastrous loss of that surface quality which is one of the peculiar beauties of glass. The prismatic brilliance was enhanced by the progressively greater purity and whiteness of the glass made during the second quarter of the 19th century, and the temptation to cut ever more deeply and with greater complexity finally seduced the glassmakers into producing the "prickly monstrosities" of the Great exhibition of 1851.

Throughout the 18th century there was great admiration on the continent for English lead "crystal," and in the second half of it some of the continental glasshouses. by the use of lead oxide, had contrived to produce a comparable material. English cut glass was admired and exported, and the styles of cutting of the late 18th and early 19th centuries were much imitated abroad.

The Far East.—Glass has never been truly at home in China. Records suggest that it was brought there from the west as early as the 3rd century A.D.. but finds of small glass objects of typical Chinese shapes dating from as early as the Han dynasty (206 B.C.–A.D. 220) suggest that, even if the material was brought from the west, it could be worked on the spot to conform to Chinese usage. It was no doubt regarded as a cheap substitute for jade. The Chinese themselves do not claim to have made glass before the 5th century A.D., and even then it is very doubtful if they knew more than how to make beads and other similar small objects. The vessels of glass occasionally found in burials of the T'ang (A.D. 618–906) and later dynasties may be assumed to have been imported. Of the extant glass vessels typically Chinese in form, none can be shown to be of a date earlier than the reign of the emperor K'ang Hsi (1662–1722), and there is every likelihood that glassmaking mas in fact introduced in this period, when, through the Jesuits. China became vividly aware of western culture. To this period probably belongs a series of bowls and vases of which the blown character is manifest. They are often of a decayed metal which appears to suffer from the same deficiencies as European glass of the same epoch. During the reigns of the emperors Yung Chêng (1723–35) and Ch'ien Lung (1736–96) the emphasis on blown forms is subordinated to the desire to make glass a surrogate for natural stones. Although the colours used are often not such as are found in nature, the glass is handled as though it were jade, the foot in particular being fashioned as though cut from stone. This lapidary treatment is further emphasized in the cased glass bottles cut on the wheel in such a way that the design stands in one or more colours on a ground of a contrasting tone.

(R. J. C.)

United States. — Glassmaking was apparently the first industry to be transplanted from Europe in the wake of the Spanish conquerors. As early as 1535 glass was being made at Puebla de los Angeles in Mexico, and in 1592 a glasshouse was located in the territory of the Rio de la Plata in the town of Córdoba del Tucumán, Arg. Broken glass, undoubtedly of European origin, was remelted at the latter and fashioned into various objects including thick. semitransparent flat glass.

The London company of Virginia set up a glasshouse in Jamestown in 1608 for the manufacture of "glasses" and beads. A "tryal of glasse" was sent off to England before the winter of 1609, the "starving time" during which 440 of the colony's 500 inhabitants died. In 1621 the company tried again, and although the second attempt was more carefully planned, it too failed. Excavation of the site has revealed that glass was melted in considerable quantities though no evidence of bead manufacture has been found.

For more than a century after Jamestown. there is little American glass to speak of. The earliest successful glasshouse was begun in 1739 by Caspar Wistar. The fact that his works produced only humble utilitarian vessels and windowpanes saved him from extermination by the "lords of trade." Wistar died in 1752, after which the factory was operated by his son Richard. It was offered for sale in 1780. Although few, if any, objects exist which can be assigned to the Wistar Glass works with certainty, it is important as the cradle of the American glass known today as South Jersey type. Glass so-called is the work of individual glass blowers using ordinary bottle or window glass to make objects of their own design. Applied glass and. occasionally, pattern moulding were the only feasible means of decoration. and the resultant loopings and threadings are typical of continental traditions. One decorative device, the lily pad, is of particular importance as no European prototype is known. A hot gather of glass applied to the base of the bowl is pulled up around the sides in a series of projections in which the bowl appears to rest.

The second great name in early American glass is Henry William Stiegel. In 1763, 13 years after his arrival in America and after several years in the iron business, he built his first glasshouse. Like Caspar Wistar, Stiegel was concerned with the manufacture of bottles and windowpanes, but, with the founding of his second house at Manheim, Pa., in 1765. he ventured into the table glass business. No longer beneath the notice of the "lords of trade," he reported to them in 1767 that the glass he made was both inconsiderable in quantity and ordinary in quality. This report is in sharp contrast to the many advertisements in which he favourably compares his wares with English imports. Encouraged by the patriotic adoption of the nonimportation agreement, Stiegel built a third glasshouse, the American Flint Glass works, also located at Manheim and completed in 1769. Adverse economic conditions. caused by approaching war and colonial preference for imported tablewares, brought final failure in 1774.

Few pieces can be attributed with confidence to the Stiegel factories and, like that of Wistar, his name survives as the founder of a tradition. Stiegel-type glass is characterized by the use of clear and artificially coloured glasses; by extrinsic decoration, such as engraving, enamelling and pattern moulding; and, in general, by two distinct styles, one involving English and tlie other German techniques and decorative devices. Certain mould-blown patterns, such as the diamond-daisy and daisy-in-hexagon, are believed to have been originated at the Stiegel houses, no European prototypes having been identified.

Before the turn of the century, several other glassworks were founded, but few survived the Revolution. These houses were devoted largely to the manufacture of bottles and window glasses and, with the notable exception of the New Bremen Glassmanufactory, most of the off-hand pieces which can be tentatively assigned to them are of the South Jersey tradition. Three of these enterprises are of particular importance: First, the New Bremen Glassmanufactory, founded by John Frederick Amelung and company, is of special interest as many of its presentation pieces are both signed and dated as well as being among the finest produced in the U.S. before 1800. Originally from Bremen, Ger., Amelung was persuaded to come to America, Maryland in particular, for the express purpose of founding what he believed to be a much-needed industry. By 1785 his works offered green and white hollow ware for sale; by 1795 the glassworks themselves were offered for sale. One of the most famous pieces in the history of American glass is the Bremen Pokal, blown and engraved in 1788 and sent back to Amelung's German financiers in Bremen. probably the only return they ever received on their investment.

The second factory of importance, later known as the Olive Glass works. was completed in 1781 by former employees of the Wistar Glass works, the Stanger brothers. In addition to the many fine South Jersey pieces attributed to this house, it is of interest because of its long history, eventually becoming part of the Owens Bottle company, a forerunner of the Libbey-Owens-Ford Glass company.

The third notable venture begun before 1800 is the well-known works associated with the name Pitkin. Erected near the Connecticut river in 1783, it was intended for the manufacture of crown window glass, but need and foresight converted it in 1788 to a manufactory of bottles and flasks. The factory thrived until 1830 and is best known for the half-post ribbed flasks in natural browns, ambers and greens. Today the word "Pitkin" denotes a type of flask and not a specific glassworks.

The few houses which survived the 1790s and the depression following the War of 1812 multiplied to more than 90 by 1830. This high rate of increase is partially explained by the false prosperity which preceded the War of 1812, and later by the employment of a special sales agent, extensive paid advertising and the adequate tariff regulations, finally achieved in 1824 For convenience, they are divided into three geographical groups: New England, the middle Atlantic states and the midwest.

Until about 1830 American glasshouses produced little more than simple imitations of European glasses, at best interesting and often very handsome combinations of various decorative devices and traditions. The big change occurred between 1830 and 1840 with the production of fine lead glass, the use of the full-size incised mould and. finally, the pressing machine.

The glasshouse known as Bakewell's was synonymous with the finest achievements of the revived industry. Originally established in 1808 in Pittsburgh, Pa., the first city to use coal for fuel in glassmaking, the company survived under several different firms until 1882. Glass cutting, introduced to Pittsburgh by William Peter Eichbaum, glass cutter to Louis XVI, was an important part of Bakewell's operation. In addition to being the first American company to supply the White House, serving Pres. James Monroe in 1817, Bakewell's produced such specialties as lead glass tumblers with sulphides in the bases portraying the marquis de La Fayette, Andrew Jackson, George Clinton, Benjamin Franklin and George Washington. This company also had the distinction of holding the first patent on mechanical pressing, granted in 182j for a device to make knobs.

Fine lead glass was first successfully made in the New England area in the south Boston works of the Boston Crown Glass company. Thomas Cains, first employed by this firm in 1812, was making flint glass there in 1813. He left the firm in 1824 to found the Phoenix Glass works, which survived until 1870. One particular device usually associated with the Boston manufactories of this period is the guilloche or chain, employed in the decoration of a large variety of tableware.

The New England Glass company, founded in 1818, maintained the same high standards as Bakewell's, even to the point of making glass for President Monroe. This factory held the second patent on a device for mechanical pressing, granted in 1826, and produced quantities of pressed glass of all types before it was moved to Toledo, O., in 1888. The New England Glass company was also famous for its very fine free-blown and engraved glass. In addition vessels were made there in the so-called blown-three-mould technique in which decorative designs adapted from cut glass patterns of the period were impressed in the glass by blowing in moulds hinged in two, three or more sections. More than

400 different moulds have been determined and grouped according to pattern under three primary headings: geometric, arch and baroque. By 1830 this type of production was being replaced by the much more efficient pressing machine.

Deming Jarves. one of the founders of the New England Glass company, founded the Boston and Sandwich Glass company in 1825. Because of his "Reminiscences," extensive advertisements and thorough excavations of the factory site, more is known about this particular factory than any other of the period. Consequently, "Sandwich" has become a generic term for pressed glass even though many other factories used identical machinery and, in cases. identical moulds. Jarves' first patent on a pressing device, the fifth to be granted. was received in 1828 after the Boston mould maker Hiram Dillaway entered his employ. Before the fires were drawn at Sandwich in 1888, Jarves had founded the Mount Washington Glass works in 1837 and the Cape Cod Glass works in 1857.

Among the outstanding makers of fine lead glass in the middle Atlantic states were the Brooklyn Flint Glass works of John L. Gilliland and company and the Dorflinger Glass works. Gilliland, a partner in the Bloomingdale Flint Glass works, sold out in 1823 and founded his own works in Brooklyn. In 1864 two members of the Houghton family acquired controlling interest, and in 1868 the works was moved by barge to Corning, N.Y., to form part of the now famous Corning Glass works.

Perhaps the most fascinating aspect of American glass is that series of pictorially moulded bottles known as historical flasks, produced between 1815 and 1870. Three hundred and ninety-eight different examples have been divided into the following groups: (1) Masonic, (2) emblems and designs related to economic life. (3) portraits of national heroes and designs associated with them and their deeds and (4) portraits of presidential candidates, emblems and slogans of political campaigns. In the second group are a number of interesting designs encouraging the American system of better internal transportation and high protective tariffs. Among the 16 celebrities portrayed in the third and fourth groups are Jenny Lind. the Swedish singer; Lajos Kossuth. the Hungarian patriot; the marquis de La Fayette; and the notorious Thomas W. Dyott, a patent-medicine vendor and bottle manufacturer. These containers were also used as propaganda during political campaigns. William Henry Harrison is pictured in this connection with other impedimenta relative to the log cabin and hard cider campaign of 1840.

The first 25 years of pressed glass, 1825 to 1850, are referred to by collectors as the "lacy period." A milestone within this brief span occurs in 1830 with the development of the cap ring, a device which ensured uniform thickness at the edge of each piece regardless of the amount of glass forced into the mould. Before this date most impressed designs are inspired by Anglo-Irish cut glass. often coupled with popular American devices such as the sheaf of wheat. Between 1830 and 1840 the objects are thinner and more lavishly decorated, often including elaborate motifs based on the classic and Gothic revivals. Because of the unpleasant surface left by the mould and in an effort to imitate the brilliance of cut glass. unstippled areas were filled in with over-all lacelike patterns; hence the term "lacy." About 1840 economic conditions forced glassmakers to revert to cheaper moulds and simpler geometric forms and to abandon the stippled patterns. During this period the mechanical press became firmly established. and by 18jo glassmaking was one of America's new mass-producing industries. (T. S. B.)

MODERN GLASS FROM 1850

The modern history of glass can be said to begin in the middle of the 19th century with the great exhibitions and with the new self-consciousness in the decorative arts which they expressed. Glassmare was being publicly discussed in art journals and collected in museums, and this new spirit of awareness led to a greatly increased borrowing of ideas among the leading glass centres and to the borrowing of ideas from the past.

Gnderlying these complexities of the modern period, however, are still distinguishable certain fundamental methods of using glass which are associated with particular centres. The English style of deeply cut crystal, which had established its supremacy in the early 19th century, has continued to represent a greai part of the production of most of the European and U.S. glass centres. The demand for it, however. has been mainly of a popular nature and until comparatively recent times it attracted little of conscious artistry. Engraved glass. and to a lesser extent coloured and painted glass. have been given the greatest attention in the central European glass-producing area. The Venetian glasshouses at Murano have continued to be the leading exponents of furnace-manipulated glass.

But alongside these traditional methods of using and decorating glassware can be discerned the development of a renewed interest in the beauty of the material itself which, expressed in various ways, in the use of thick masses and in internal figuring and patterning, has been the keynote of the most significant modern contributions to the art of glass.

Pressed glassware, which was first made in the United States with great promise in the first half of the 19th century, had already by the middle of the century assumed the role of a cheap imitation of cut crystal. As such it was of little aesthetic interest. Only in comparatively recent times did pressed glass begin to appear which had been designed expressly in relation to its process of manufacture and which made no attempt to imitate the effects of other processes.

Great Britain. — The Great exhibition of 1851 was the culmination of a period of intense activity in the British glasshouses. The excise duty on glass had been removed in 1845, and the British glassmakers were determined not only to excel in their traditional deeply cut crystal but also to rival the Bohemians in coloured, cased and enamel-painted wares. Probably the most enrerprising of the English glassmakers of the period was Benjamin Richardson, of Wordsley near Stourbridge. and surviving pieces which were shown by him in the exhibition include opal vases with admirable flower painting by Thomas Bott. a ruby-cased goblet with delicate engraving designed by W. J. Muckley, and crystal wares deeply cut in elaborate and sometimes curvilinear patterns.

Probably in reaction against the banality of pressed-glass imitations of cutting, the most sophisticated work in crystal during the later 1850s and 1860s was decorated by engraving. The London firm of Apsley Pellatt (which had been known earlier for its "cameo incrustations") mas prominent in this phase. Much of the engraved work for London dealers was carried out by emigrant Bohemian craftsmen, and in Edinburgh J. H B. Millar, a Bohemian, established in the late '50s an important engraving firm which was initially staffed largely by his fellow countrymen.

The Venetian style of furnace-manipulated glass was also exerting a strong influence. It can be seen, for instance, in the wares of George Bacchus of Birmingham in the early '50s and of Isaac Barnes of Birmingham around 1870. In some degree the Venetian style was a source of inspiration for many of the fancy wares that were made in Great Britain, as in the United States and elsewhere, during the '80s and '90s. These were mostly in coloured glass and were identified by such names as "Burmese" (apparently of American origin and made by Thomas Webb and Sons of Stourbridge), "chameleon" (Hodgetts, Richardson of Stourbridge) and "crushed strawberry" (John Walsh Walsh of Birmingham).

A striking form of mid-Victorian virtuosity was the cameo glass which was produced by Stourbridge glassworkers. This work, which was inspired by the Portland vase, consisted in a lengthy process of etching and carving. normally through a white glass casing, to leave a white carved design in relief on a dark-coloured glass body. The first important pieces were produced in the '70s by John Northwood. He was followed by other glassworkers, and in the '80s a considerable amount of semicommercial cameo glass was produced in the Stourbridge factories, particularly under George Woodall for Thomas Webb and Sons and under John Northwood for the firm of Stevens and Williams.

The influence of the arts and crafts movement was toward the use of plastic forms and furnace decoration, which John Ruskin had advocated in a strongly worded passage (*Stones of Venice*, vol. ii [1853]). In 1859 Philip Webb designed for William Morris some simply formed tableware which was made at the London glassworks of James Powell and Sons. From about 1880 this glassworks was under the control of Harry J. Powell, who, working until World War I, developed a simple, dignified style of handmade blown glass, both clear and coloured and sometimes delicately cut and engraved, which represents probably the finest achievement of modern British glasswork. The spirit of his work was subsequently continued by the firm in the designs by Barnaby Powell, James Hogan and others, with an increasing tendency to exploit the effect of thick glass with waving surfaces.

During the 1930s and after World War II other firms produced work in which a restrained and distinctively modem approach was made to the cutting of faultless crystal glass. Particularly outstanding in this respect were the designs which were produced shortly before World War II by Keith Murray for Stevens and Williams and by Clyne Farquharson for John Walsh Walsh. New and appropriate designs for pressed glass were used by firms such as Chance Brothers and United Glass Bottle Manufacturers, and at the opposite pole of glasswork an amount of interesting engraved work on glasses was carried out by independent artists such as Laurence Whistler.

United States.—By the middle of the 19th century American pressed glass was already a disturbing influence on the design of the finer wares. Its decoration was by that time mostly designed in imitation of cut glass, and the process of fire polishing was being used to give a surface almost as smooth as that of blown glass. During the succeeding decades pressed-glass designs became increasingly complicated, and this tendency was accentuated in the soda-lime glass which William Leighton began to use for pressed work at Wheeling, W.Va., in the 1860s and which was later widely used in the western glasshouses for the cheapest coloured wares.

In general the finer wares of the early part of the period were similar to those of the Biedermeier and later styles of Europe. The New England Glass company at Cambridge, Mass., was employing many European craftsmen and was producing a wide variety of richly decorated cased and engraved wares. At the Boston and Sandwich Glass company cased glass was extensively used for large kerosene lamps. The effect of the competition of pressed glass on cut-crystal work can be seen in the appearance of fine-line cuttings, and during the period up to the Philadelphia Centennial exhibition of 1876 the most significant crystal work was decorated by engraving. Louis Vaupel and Henry S. Fillebrown were two notable engravers employed by the New England company from 1856 and 1860, respectively.

At the time of the Centennial exhibition cut-crystal work began to revive and by 1880 a considerable boom in its production had developed—a boom which was to continue throughout the '80s and '90s. New industrial methods contributed to the production of crystal glass of flawless quality and to its deep cutting with mathematical accuracy in elaborate designs. Among many others, a noteworthy producer of this type of glass in the '90s and later was the Libbey Glass company, which was the successor to the New England Glass company in Cambridge and had moved in 1888 to Toledo, O. Later, about the early years of the 20th century, intaglio cutting in crystal became popular, and work in this expensive process was carried out in a number of cut-glass factories such as the T. G. Hawkes Glass company at Coming, N.Y.

As in Great Britain and elsewhere a great amount of glass was made in fancy forms and colours which although undisciplined and often tasteless nevertheless preserves perhaps more than any other glass the flavour of the period. In the '60s, and later, typically Victorian epergnes were often inspired by the furnace-decorated methods of Venetian glass; and in the '80s and '90s there was a spate of wares in fancy colours which were given specific names such as peachblow, amberina, pomona and Burmese and were made by such firms as the New England Glass company, the Mount Washington Glass company at New Bedford, Mass., and the Hobbs, Brockunier company at Wheeling.

Although belonging essentially to the category of the fancy glasses, the Favrile glass of Louis Comfort Tiffany represented an altogether higher level of achievement both in its shapes and in the colouring and figuring of the glass. It was first shown to the public in 1893, and in pieces which were produced a few years later Tiffany achieved an outstanding expression in glassware of the *art nouveau* style. Much of his work was in a heavily lustred glass which was considerably admired abroad, especially in central Europe where it created a new fashion.

During the 1930s and after World War II new forms of pressed glassware appeared in simple, satisfying designs appropriate to their purpose and the process of manufacture, such for instance as the Pyrex ovenware shapes of the Corning Glass works. In fine glassware the work of the Steuben company of Corning was outstanding. In 1933 this company was reorganized by Arthur Amory Houghton, Jr., and with the help of John Monteith Gates and the sculptor Sidney Waugh he deliberately aimed to produce original works in an impeccable material which would rank as fine art. The most typical work was in simple forms decorated with sculpturesque intaglio engraving by Sidney Waugh; and the interesting experiment was made, not without success, of commissioning designs for engraving from a number of internationally known painters and sculptors. Other noteworthy modern American work included simple designs in blown glass by the Blenko Glass company of Milton, W.Va., and enamel patterned bowls by the independent artist Maurice Heaton.

Czechoslovakia, Austria and Germany.—In the middle of the 19th century the glasshouses of central Europe were producing a great variety of the cased and coloured wares which had become particularly associated with Bohemia in the preceding Biedermeier period. They were also producing a great amount of cut crystal glass in the deeply cut English style, and indeed work of this nature continued with little change throughout the modern period.

A revival of the indigenous art of engraving was initiated by Ludwig Lobmeyr, who from 1864 was in control of the Viennese firm of J. and L. Lobmeyr. His first opportunity was at the Paris exhibition of 1867, and his reputation was firmly established at the Vienna exhibition of 1873. He commissioned designs for his glasses from the leading Viennese architects and painters of the time, and his work was carried out by the finest craftsmen in Bohemia and Austria. Lobmeyr's taste was based upon a deep study of the 18th-century Bohemian and Silesian engraved glass, and the work he commissioned was mostly in the style of a past period. His fame rests mainly on engraved glass, but he also produced glasses of other types such as the Old German enamelled glass which was made for him around 1878 by A. A. Egermann in Novy Bor (Haida).

The *art nouveau* style, which went under the name of *Jugendstil* in central Europe, made a deep impression on central European glassware. The work which was made around the turn of the century abounds in slender shapes and flowing organic motifs. Glasses designed by Karl Koepping in Berlin, with long, waving stems and tuliplike bowls, were perhaps the extreme instance of *art nouveau* style applied to glassware. In 1897 an exhibition of glass by the American Louis Comfort Tiffany was shown at several of the museums in the area. Not only the forms of the Tiffany glasses but also their figured and heavily lustred material attracted great interest. Several factories started making a similar heavily lustred glass, and the firm of J. Lötz' Witwe of Klostersky Mlyn (Klostermiihle) won a *grand prix* at the Paris exhibition of 1900 with glassware in this type of material.

From around 1900 onward a movement toward a modern purist approach to glass was largely fostered by the work of designers connected with the Vienna Kunstgewerbeschule. Men such as Kolo Moser and Josef Hoffmann, who were also closely associated with the Wiener Werkstatte, were designing glasses in simple rational forms, and much initiative in this movement was shown by the firms of E. Bakalowits Sohne of Vienna and J. Lotz' Witwe. This was the period in which the glass-teaching schools achieved a remarkable influence on glass design and came to work in close collaboration with the factories. The most important of these in the years before World War I were the schools at Kamenicky Senov (Steinschonau) and Kovy Bor (Haida) in Bohemia and at Zwiesel in Bavaria.

After World War I the outstanding figure in Czech glass art was Josef Drahonovsky. who was professor at the Prague School of Industrial Art. He was essentially a sculptor and most of his glass designs were for sumptuously engraved glass of a monumental quality. His colleague in Prague, Jaroslav Horejc, designed for engraved work of a broadly similar character, some of it for the Lobmeyr firm of Vienna. In 1920 a new glass school was founded at Zelezny Brod with the intention of encouraging a specifically Czech spirit in glassware. After World War II this school was one of the principal centres for much successful work in the design of thick-walled and figured glasses and of elegantly proportioned tablewares.

In Austria after World War I the Lobmeyr firm under the control of Stefan Rath produced many admirable engraved and relief-carved pieces designed by artists such as Ena Rottenberg, Lotte Fink and Vally Wieselthier. Lobmeyr also produced some of the best designs of Michael Powolny, who had his own workshop and had designed for the firm of J. Lötz' Witwe.

In Germany the outstanding engraver and glass carver of the period after World War I mas Wilhelm von Eiff, who was professor at the Stuttgart Kunstgewerbeschule. Bruno Mauder of the school at Zwiesel was a strong influence for the use of natural and appropriate glass forms; and some fine tablewares were made in bloun and pressed glass both before and after World War II—such as those designed by Wilhelm Wagenfeld for the Vereinigte Lausitzer Glaswerke and for Peill und Putzler of Düren, and by Richard Sussmuth for Glashiitte Immenhausen of Cassel.

France. — In France, as in central Europe and in England, the production of the factories in the middle of the 19th century was mainly divided between cut crystal and coloured wares. The "opalines," the opaque-white and coloured wares, often with elaborately painted and gilt decoration. were especially popular. The larger factories, particularly Baccarat and St. Louis, continued to participate in the international fashions of the rest of the century and beyond. But in France, perhaps because the tradition of industrial glassmaking was comparatively weak, inventive genius manifested itself mainly in the work of individual artists, and thereby a new spirit was introduced into the modern conception of glass.

In the late '60s and '70s three individual artists were experimenting in glasswork, and all of them were represented in the exhibition of 1878. The first was Joseph Brocard. who was studying the enamelling of glass and whose main ambition was to reproduce mediaeval Syrian glass. The second was Eugène Rousseau. a commissioning dealer in ceramics who had turned to glasswork at the end of the '60s, and mas at the height of his achievement in the '80s. Typically his glasses were thick-walled and translucid, often with interior crackling and shot with random streaks of colour. In 1885 he associated with himself E. Léveillé, who continued to work in a similar style after Rousseau's death in 1891. The third of the individual artists at the 1878 exhibition, and the most significant of them, was Emile Gallé of Nancy, who had been experimenting in glasswork since about 1867. His earliest work was in clear glass, lightly tinted and decorated with enamel and engraving; but he soon developed toward the use of deeply coloured, almost opaque glasses, which he used in heavy masses often cased in several thicknesses and carved or etched away to form plant motifs. His inspiration undoubtedly reflects the prevailing interest in Japanese art, and some of his methods must have been suggested by those of Chinese glass. His forms were frequently asymmetrical and of an organic inspiration, and as such his work contributed largely to the art nouveau style of the end of the century. In this period much of Gallé's manner was reflected in ranges of industrial glassware made by the firm of Daum Frères of Nancy.

In later times the leader of French glass art was René Lalique, who was producing his most typical work around the 1920s. Lalique's mork is characterized by his use of clear glass, by his return to symmetrical forms and by his relief decoration produced by blowing into moulds or by pressing. He was a leading advocate for the use of glass in architecture. and much of his work was in the form of lighting equipment and other details of interior decoration. The work of his contemporary Maurice Marinot was more in the tradition of Rousseau, with heavy. thick-walled vessels in strong forms often with boldly cut-away abstract decoration; and Henri Kavarre in the 1930s was producing work of a similar monumental nature.

A number of French artists also explored with success the use of *pâte de verre,* which is powdered glass fired in a mould. The pioneer in the use of this material was Henri Cros. who was working toward the end of the 19th century. In the 20th century important work in the material was carried out by Albert Dammouse and François Décorchement. The most significant work of Jean Luce and Marcel Goupy, designers of glass and pottery, was in the production of elegant tablewares. Aristide Colotte used glass as a sculptor in large, hewn pieces. Jean Sala worked mainly in coloured bubbled glass. André Thuret produced glasses in thick plastic forms and with colour effects. In the industrial field after World War II the firm of Daum was distinguished by its thick clear-glass vessels manipulated into random shapes.

The Scandinavian Countries. — Tip to the time of World War I the Swedish glass industry produced little original work. The sudden development of modern Swedish glass in the 1920s was attributable mainly to the initiative of the Swedish Arts and Crafts society which resulted in the employment of the painters Simon Gate and Edward Hald by Orrefors glassworks and Edvin Ollers by Kosta glassworks from the years 1916–17. The first results were exhibited in Stockholm in 1917 and consisted of hand-blown, undecorated tablewares, together with the luxury "Graal" glass with internal stained decoration which had been so rapidly developed under Gate's inspiration at Orrefors. It was. however, engraved glasswork, chiefly that designed by Gate and Hald at Orrefors, on which the reputation of Swedish glass was established in the 1920s and particularly at the Paris exhibition of 1925.

In the 1930s there came a change of direction whereby the Swedish factories took less interest in engraving and followed the initiative of the French artists in making thick-walled glasses, usually tinted or patterned with internal colour. In this mode they found their greatest success, and this can be attributed largely to their having achieved a system of intimate association between their artists and their glassmaker craftsmen.

At Orrefors additional artists were added to the establishment from 1929 onward. including Vicke Lindstrand, Sven Palmqvist, Nils Landberg, Edvin Ohrstrom and Ingrid Lundin. Each of them worked in an individual style, and in addition to decorative pieces many of them designed tablewares for the subsidiary Sandvik factory. At Kosta important mork was produced by Elis Bergh and later by Vicke Lindstrand. Gerda Stromberg designed for both Eda glassworks and for Strombergshyttan, while other outstanding work was produced by Hugo Gehlin for Gullaskruf and by Monica Bratt for Reijmyre.

In Denmark the Holmegaard glassworks and in Norway the Hadeland glassworks both followed in some respects the example of Swedish glass. At Holmegaard the movement began in the late 1920s with the appointment as art director of Jacob E. Bang, whose designs included an amount of striking engraved work. and was continued in the interestingly shaped wares of his successor, Per Lutken. At Hadeland some distinctively formed glass was designed by a number of artists including Sverre Pettersen, Herman Bongard and Willy Johansson.

In Finland a modern style of glasswork appeared which is of the greatest significance in the development of modern glass. The work is frequently asymmetrical, modelled in heavy masses and in graceful, tall shapes. These characteristics were defined particularly in the work of Gunnel Nyman (d. 1949), and later in the work of Tapio Wirkkala and Timo Sarpaneva for the firm of Karhula-Iittala and of Kaj Franck for the Nuutajarvi (Notsjo) glassworks.

Belgium and the Netherlands. — In Belgium, the Val St. Lambert factory was an important producer of heavily cut crystal throughout the period. It is also associated with cased work, and it was particularly prominent with original work of this nature around 1900. Later Charles Graffart designed for it wares made in a variety of techniques, some of them with engraved decoration.

The Dutch glassworks at Leerdam played an important part in the modern movement, and it followed a line of development distinct from that of the Scandinavian factories. In 1915 the decision was made to invite designs from artists, and by the early '20s excellent simple tablewares were being made to designs by the architects K. P. C. de Bazel and H. P. Berlage and by the decorative artist C. de Lorm. Also in the early '20s the making of special pieces called Unica was begun by C. Lebeau, and these were subsequently continued by the art director Andries D. Copier. Among the later decorative work of the factory the graceful designs by Floris Meydam are outstanding.

Italy.— The revival of Italian glassmaking dates from the early 1860s when the Museo Vetrario was founded at Murano (Venice) and Antonio Salviati began to make, in addition to mosaic tesserae, the glasses which subsequently attracted great attention at the Paris exhibition of 1867. These were in variations of the traditional Venetian style with elaborate furnace decoration, and the production of glasses of this nature continued at Murano throughout the remainder of the 19th century and beyond.

The early 1920s saw the beginning of a more conscious spirit of artistry in Italian glasswork. The decorative artist Vittorio Zecchin was influential in this movement. Paolo Venini began to produce glass in simple elegant forms, and G. Balsamo Stella was designing engraved work for the firm of Cappellin. In later times, and particularly after World War II, much research was made into new methods of colouring and figuring glass, and the results of this were seen especially in the glasses designed by Ercole Barovier for the firm of Barovier e Toso. Work of a similar nature mas designed by Giulio Radi for the firm Arte Vetraria Muranese; and from the Venini firm, presided over by Paolo Venini, came many interesting innovations such as vases decorated with areas of vividly coloured glass which were designed by Fulvio Bianconi. Some of the work, such as a series of vases designed by Flavio Poli for Seguso Vetri d'Arte, showed some influence from the thick-glass techniques of the north, but the modern Italian glass mostly retained a distinctly Venetian volatile character which stood in contrast to the more deliberately calculated work of Sweden and Finland.

Spain and Argentina.— In Spain the Catalan José Maria Gol decorated glasses with bold, enamel-painted designs of floral and other motifs in a highly personal style; while glassware with furnace decoration in a consciously impure material was made in the Balearic Islands. From Argentina, glassware of a distinctive style was seen in the productions of the Cristalerias Rigolleau, which included thick-walled manipulated shapes with random colour decoration. (H. W.)

GLASS PAPER. An abrasive material much used for smoothing the surface of wood manufactures. It consists of thick cartridge paper coated with powdered glass. The paper is coated with liquid glue and the glass particles powdered over the surface before the glue has set. *See* also Emery; Sakd-Paper.

GLASS PICTURES AND PRINTS. Glass transfer pictures were essentially English and in vogue from about 1690–1790, when colour prints started to replace them and their quality deteriorated. Famous engravers, such as J. and J. R. Smith, J. McArdell and J. Simon, were closely associated with transfer picture production. A moistened mezzotint was stuck face downward on a piece of crown glass previously coated with adhesive turpentine. The paper of the mezzotint was carefully rubbed away with the finger leaving the outline of the print on the glass, and the picture was then brilliantly coloured from behind. Line engravings and aquatints were also used.

Glass prints, or as the French call them, *clichés-verre*, somewhat resembled etchings, in the making of which the Barbizon school of artists, J. B. Corot, C. F. Daubigny, T. Rousseau and J. F. Millet, experimented occasionally betneen 18jj and 1860. In this technique a piece of glass is covered with a white opaque varnish, and in this covering the artist draws the lines of his subject with an etching needle, allowing the light to show through these lines when the glass is held up to the lipht. The artist then places a sheet of sensitized paper close to the back of the glass, so that, when the glass is exposed to the lipht, the lines of the design print off, as a photographic negative does, on the sensitized paper. The resulting print is therefore in the nature of a photograph, which, in fact, it closely resembles. Corot nas perhaps the most successful maker of these *cliche's-verres*.

GLASSPORT, a borough of Allegheny county, Pa., U.S., 10 mi. S.E. of Pittsburgh, on the Monongahela river. The leading industries are glassmaking. steel manufacture and oil refining. Glassport was settled about 1900.

For comparative population figures *see* table in PENNSYLVANIA: *Population.*

GLASSWORT, a group of about a dozen species of leafless seashore herbs belonging to the genus *Salicornia* of the Chenopodiaceae family. They are annual or perennial, tender or hardy fleshy herbs that are native in salt marshes of North America, Europe and Asia. They and other members of the family which grow in large quantities in the Mediterranean region were formerly used in making soap and glass, as a large percentage of soda was yielded on burning them. The ashes of these plants were known to the trade as barilla, especially those from S. *herbacea.* (J. M. BL.)

GLASTONBURY, a market town and municipal borough in the Wells parliamentary division of Somerset. Eng., 6 mi. S.S.W. of Wells and 26 mi. S.W. of Bath by road. Pop. (1951) 5,081. Area 7.8 sq.mi. The abbey of St. Mary was perhaps the oldest and certainly one of the richest in England. In the neighbourhood lake villages of the later Iron Age have been excavated. The town lies on the slopes of a group of orchard-clad hills that rise abruptly from the level meadowland of the Brue valley and culminate in the Tor, a green conical height crowned by the tower of St. Michael's church *(c* 1400).

The chief buildings, apart from the abbey ruins. are the churches of St. John the Baptist. Perpendicular nith a fine west tower *(c.* 1470); St. Bencdict, earlier; St. Benignus (*c.* 1500); the George hotel, built by the abbey to house pilgrims (c. 1470); the Tribunal, the abbot's law court *(c.* 1510); and the Abbey barn (14th century), a beautiful cruciform building still used for its proper purpose. The town hall, built in the early 19th century and extended in 1930, also houses the Glastonbury Antiquarian society museum. Sharpham park, where the last abbot. Richard Whiting, was arrested in 1539, and nhere Henry Fielding the novelist was born in 1707, is now a farmhouse.

The Lake Villages.—The low meadowland running northwest from Glastonbury toward the Bristol channel was once a peat bog with winding watercourses, reedy pools and oak, willow and alder thickets. In 1892 low mounds in a field $1\frac{1}{2}$ mi. N. of Glastonbury were found to contain remains of dwellings of the prehistoric Iron Age; these were excavated by A. Bulleid and H. St. George Gray between that date and 1907, and their results published. In 1908 they began work on two groups of similar mounds at Meare, $3\frac{3}{4}$ mi. N.W. of Glastonbury; their report on the excavation of part of the western group of mounds was in course of publication, and work on the eastern group was still continuing in 1956. At the Glastonbury lake village the peat has a depth of 15 ft. A substructure of timber and brushwood was laid and held in position by sharpened piles driven down into the peat, and on this foundation a floor of clay was spread and a circular hut built with a hearth of baked clay; these floors tended to sink in the soft peat and new floors and hearths were laid over them. Some huts had only one floor, but one had as many as ten.

At Meare some of the huts were built without the timber substructure, the peat being drier. and there are fewer traces of the postholes of circular huts, suggesting that many may have been of lighter construction. A few huts at Meare were built on a rectangular mortised framework, and fragments of similar timbers at Glastonbury suggest that rectangular huts preceded the round ones. The Glastonbury village was surrounded by a timber palisade, a feature not found at Meare.

The types of pottery found indicate occupation from about 60 B.C. At Glastonbury the village ended. possibly with a massacre, a few years before the Romans came; at Meare the village continued a few years longer and part of the site was reoccupied in the 4th century. Otherwise the pottery types were similar in the lo–er and higher levels and in the Glastonbury and Meare villages.

The discovery of parts of wooden looms. loom weights and many weaving combs and spindle whorls show that the manufacture of cloth was important. The people were skilled uorkers in wood, the peat having preserved many wooden objects, and their cutting tools were of iron. Many bronze objects were found, fibulae (of the La Tène III type). finger rings, brooches, harness parts and, at Glastonbury, a bowl of excellent design ornamented uith rounded rivets. The discovery of similar rivets. crucibles and slag show that this bowl was actually made in the village. Wheat, barley, peas and beans were grown and cattle, sheep, pigs, horses and dogs kept. Dugout canoes have been found and a broken axle shows that they used wheeled carts. Their trade goods included amber from the Baltic, jet from Whitby, Kimmeridge Shale for bracelets from Dorset and tin from Cornwall.

Pottery of the same types have been found in Wookey Hole cave and in excavating Ponters Ball, an earthwork protecting the high land at Glastonbury from the east. Several timber causeways crossing the peat marsh are similar in construction to the substructure of the lake village huts. The objects from the Glastonbury village are exhibited in the Glastonbury museum, and those from Meare at Taunton.

The Benedictine Abbey of St. Mary.—William of Malmesbury wrote his *De Antiquitate Glastoniensis Ecclesiae* between the years 1125 and 1130, when he was staying at the abbey, basing his work on the documents and other evidence that he was able to study there. His book has been added to by later Glastonbury writers, but the original sections can be distinguished. He says that "annals of good authority" state that the old church of the Blessed Virgin was built by missionaries sent from Rome at the request of King Lucius in A.D. 166; he would not commit himself to earlier stories of which he was auare. This little wattle church, which had later been enclosed in wood. was still in existence when William wrote; on either side of the altar were the tombs of St. Patrick and St. Indract.

King Lucius is a myth and other places claim the tomb of St. Patrick, but-there is no doubt that there was a Celtic monastery with strong Irish associations at Glastonbury before the time of the Saxon conquest. The burial ground of this period. lying to the south of St. Mary's chapel, was excavated in 1953 and 1954 by Ralegh Radford. At Beckery, on a little island 1 mi. W. of the town, excavations in 1891 proved the existence of a pre-Norman chapel of St. Bridget, standing in a Christian burial ground in use before the chapel was built; the name Beckery is Irish, meaning "Little Ireland."

The Saxons were already Christians when their advance after the battle of Pen in 658 brought Glastonbury within the Saxon kingdom and resulted in the introduction of the Benedictine rule in the monastery. Among the many grants of land to the abbey, two may be mentioned: in 678 King Centwine granted Glastonbury to Hemgisl the abbot, free of all service, 6 hides; and in 681 Baldred gave Hemgisl 6 hides on Pennard hill.

These two grants made up Glaston XII hides, the manor in which later abbots established wide privileges. None of the early charters granting land to the abbey has survived in the original, and many are only knonn in much altered copies made in the 13th century or later; nevertheless William of Malmesbury was able to extract a consistent story from the charters, nhich has been confirmed in many points from other sources.

Ine, king of Wessex from 688 to 726, is said by William of Malinesbury to have built the church of St. Peter and St. Paul as an appendix to the old church. Excavations carried out between 1927 and 1929 by C. R. Peers and A. W. Clapham revealed the foundations of Ine's church and its later enlargements, beneath the west end of the 13th-century nave. The proportions of the aisled plan correspond with churches at Canterbury, Rochester and Reculver built a few years earlier. At some date before the time of St. Dunstan (909–988) a narthex or porch was built joining the old church to the new.

Dunstan was made abbot of Glastonbury by King Edmund about 943, and was chief minister of state under Edred; exiled in 955 by Edwig, he returned to power as archbishop of Canterbury under Edgar. He extended Ine's church eastward with a tower and chapels. The importance of the abbey at this time was shown by the burial there of three kings, Edmund, Edgar and Edmund Ironside.

As a result of the Norman conquest, Glastonbury abbey lost several estates, but Domesday Book shows that it remained one of the wealthiest churches in the country, holding rich manors in Somerset, Wiltshire, Dorset. Gloucestershire and Berkshire. Turstin (Thurstan), the first Norman abbot, was active in recovering lost properties and began rebuilding the church of St. Peter and St. Paul, but he fell foul of the monks. who refused to change their Gregorian chant in favour of new music attributed to Abbot William of Fécamp. Turstin called in archers who shot arrows from an upper gallery at monks clustered round the altar, killing 3 and wounding 18. The long and vivid account in the Anglo-Saxon Chronicle under the year 1083 shows how deeply the English resented this incident.

Herlewin (1101–20) pulled down Turstin's partly built church and began afresh on a grander scale. In 1184 a disastrous fire destroyed his church (lead melted from the roof was found by the excavators between its reddened paving stones) and with it were burned most of the monastic buildings, whatever was left of the Saxon church and the old church of St. Mary.

King Henry II appointed Robert Fitz-Stephen to rebuild the abbey, and the new chapel of St. Mary, of the same dimensions as the old church and on its site, was dedicated by Bishop Reginald of Bath in 1186. The archaic style of the building, with round-headed windows and interlaced arcading, which contrasts with Bishop Reginald's work then in progress at Wells with pointed arches, may have been due to the venerable antiquity of the old church it replaced. The rebuilding of the church of St. Peter and St. Paul on a vast scale, in a Gothic style that retained some features of Romanesque, and in particular the free use of the chevron ornament, began before St. Mary's chapel was completed.

Savaric, an able and ambitious cleric who took part in the negotiations for the ransom of Richard I, was rewarded with the bishopric of Bath, to which was joined by papal edict the abbacy of Glastonbury. In 1193 Savaric became bishop of Bath and Glastonbury; the monks refused obedience, and a costly struggle continued with varying fortunes. In 1205 Jocelyn succeeded him as bishop of Bath and Glastonbury, and made a settlement with the monks in 1218; four manors were surrendered to the bishop, and the monks were allowed to choose an abbot. Building was resumed 20 years later, but the church of St. Peter and St. Paul was not completed for another 80 years. The galilee, linking the nave with St. Mary's chapel, mas built before the end of the 13th century in a mature Early English style.

Abbot Monington (1342–74) extended the choir, built the retrochoir, using the chevron ornament over the windows to harmonize with the earlier work, and refaced the interior of the choir with panelling in stone (as at Gloucester, 1337–40). Abbot Richard Bere (1493–1525) built the Edgar chapel east of the retrochoir, and holiowed out a crypt under St. Mary's chapel and part of the galilee, probably to provide a shrine for St. Joseph of Arimathaea; in so doing the floor of the chapel was raised.

Excavations south of the nave have revealed the foundations of the later monastic buildings: traces of walling and remains of a small glass furnace of the Saxon period and postholes of an earlier timber structure. The abbot's lodging was pulled down in the 18th century, but the abbot's kitchen stands. Probably early 14th century, but based on the design of the Romanesque kitchen at Fontevrault, it is square in plan with huge corner fireplaces making the square an octagon; the stone roof rises to a central louvered octagon containing a ventilating shaft.

Richard Whiting (abbot from 1525 till 1539) signed with his monks the declaration of royal supremacy in 1534. In 1539, however, he refused to surrender the abbey and was arrested and convicted of treason on a trumped-up charge of concealing the abbey treasure. He was executed on Tor hill with two monks; the abbey was iorfeited to the king.

The annual value of the abbey estates in 1536 was £3,509; a more detailed inquiry by the king's surveyors increased this to £4,228. A comparison between the values in Domesday Book and in 1536 shows the extent to which the abbey had improved land drainage near Glastonbury. A process which began with straightening and deepening watercourses led to the deposit of flood soil over new areas, and the conversion of peat bogs and alder thickets into rich meadows.

In 1550 the duke of Somerset installed a party of French and Flemish weavers in the abbey buildings, but as Protestant refugees they were forced to leave the country on Mary's accession. Her government considered restoring the monastery, but the difficulties were too great. From that time the abbey was used as a quarry for building and road stone; today the beautiful ruins of St. Mary's chapel remain, with enough of the galilee and of the choir, nave and transepts of the church of St. Peter and St. Paul to give some idea of the whole. Since 1909 the abbey has been the property of the Church of England.

King Arthur and **Avalon.**—William of Malmesbury, who was fully aware of Glastonbury records and traditions as they were known in 1135, refers to the many fanciful tales told of King Arthur, and adds that his burial place is unknown. His contemporary, Geoffrey of Monmouth, in his romantic *History of the Kings* of Britain, describes Arthur's many victories. After the last he retired to Avalon, the "Island of the Blest" of Celtic tradition, to cure his wounds. In 1191 a grave said to be that of Arthur and Guinevere his queen was discovered between two pyramids in the cemetery at Glastonbury; they were reinterred in the great church before the altar in the presence of Edward I. From that time the Isle of Avalon has been identified with Glastonbury.

St. Joseph **of Arimathaea.**—The earliest mention of the legend that St. Joseph of Arimathaea (*q.v.*) came to Glastonbury is in a mid-13th-century addition to William of Malmesbury's book. The story was fully told by John of Glastonbury before the end of that century. A shrine in the crypt of St. Mary's chapel, which itself came to be known as St. Joseph's, was a place of pilgrimage where miracles occurred in the early 16th century. Although John of Glastonbury quoted from a book called the "Holy Grail" in his account of St. Joseph, the monks completely ignored the Grail legend. The Glastonbury thorn (*Crataegus praecox*), which flowers at Christmas, is first mentioned in a poem of 1502, but the legend asserting that it sprang from the staff of St. Joseph must have appeared even later. It is probably a perpetual sport from the common thorn obtained by grafting; trees raised from its seeds revert to type.

The Town.—The name of Glastonbury has been the subject of philological speculation from Saxon times. A. G. C. Turner rejects previous theories and derives the name from Old Cornish, *glastann,* "an oak."

Until 1539 the town was the centre of the manor of Glaston XII hides, in which the abbot had judicial powers to the exclusion of the sheriff. In 1319 Glastonbury received a writ of summons to parliament, but made no return and has not since been represented. Tor fair: held on the second Monday in September, dates from 1127. The town declined after 1539; silk spinning and stocking knitting struggled on into the 19th century, when further improved land drainage increased agricultural prosperity. The borough was incorporated in 1705. The chief local industries today, apart from dairy farming, are dressing and dyeing woolled sheepskins (sheepskins dressed with the wool on), the manufacture of sheepskin rugs and gloves and of sheepskin-lined boots and slippers. The sheepskin industry dates from 1866.

GLATIGNY, JOSEPH ALBERT ALEXANDRE (1839–1873), French minor poet of the Parnassian school, whose adventures as journalist, playwright and strolling actor earned him a legendary reputation, was born at Lillebonne (Seine-Inférieure), May 21, 1839. He was apprenticed to a printer, but, inspired by reading Théodore de Banville's *Odes funambulesques,* began to write poetry. Verses written in 1857 were published as *Les Vignes folles* in 1860; later collections included *Les Flèches d'or* (1864) and *Gilles et Pasquins* (1872). Specializing in little poems of satirical comment on current affairs and personalities, he became a regular contributor to *Le Rappel.* For a time he exploited his talent for extempore composition by giving public recitals and then joined a traveling company of actors with whom he went to Corsica. There a misunderstanding with the police led to temporary imprisonment: he used his experiences in a one-act comedy in verse, *L'illustre Brizacier* (1873) ; the hero, a disillusioned actor, is a self-portrait. Other plays were *Le Singe* and *Les Folies-Marigny* (both 1872). He died at Sèvres, April 16, 1873. His life formed the subject of a book and a play, *Glatigny, drame funambulesque* (1906), by Catulle Mendès. (R. DL.)

GLATZ (Slav. Kladzko), a town in Wroclaw province, Pol., formerly in the Prussian province of Silesia, Ger., on the left bank of the Neisse, 58 mi. S.W. of Breslau. Pop. (1950) 17,200. The town with its narrow streets winds up the fortified hill which is crowned by the old citadel.

Across the river, on the Schäferberg, lies a fortress built by the Prussians about 1750. Before the town on both banks of the river there is a fortified camp by which bombardment from the neighbouring heights could be hindered and which afforded accommodation for 10.000 men. The inner ceinture of walls was razed in 1891, and their site is now occupied by new streets. There are a Lutheran and two Roman Catholic churches, one of which, the parish church, contains the monuments of seven Silesian dukes. Among the other buildings the principal are the Royal Catholic gymnasium and the military hospital.

Glatz existed as early as the 10th century, and received German settlers about 1250. It was besieged several times during the Thirty Years' War and during the Seven Years' War and came into the possession of Prussia in 1742. In 1821 and 1883 great devastation was caused there by floods. The county of Glatz was long contended for by the kingdoms of Poland and of Bohemia. Eventually it became part of the latter country, and in 1534 was sold to the house of Habsburg, from whom it was taken by Frederick the Great during his attack on Silesia.

GLAUBER, JOHANN RUDOLF (1604–70), German chemist, who because of his wide knowledge, has been proposed as the German Boyle (father of chemistry). Born at Karlstadt, Bavaria, he resided successively in Vienna, Salzburg, Frankfurt and Cologne before settling in Holland, where he made his living chiefly by the sale of secret chemical and medicinal preparations. His well-equipped laboratory in Amsterdam was described as magnificent. Though his writings abound in universal solvents and other devices of the alchemists, he made many real contributions to chemical knowledge. He clearly described the preparation of hydrochloric acid by the action of sulfuric acid on common salt, the manifold virtues of sodium sulfate—sal *mirabile,* Glauber's salt; and he noticed that nitric acid was formed when nitre was substituted for the common salt. He prepared many substances, including salts of lead, tin. iron, zinc, copper, antimony and arsenic. He also made a number of useful observations on dyeing and gave a clear description of the preparation of tartar emetic. One of his most notable works was his *Teutschlands Wohlfarth* in, which he urged that the natural resources of Germany should be developed for the profit of the country, giving various instances of how this might be done. He died on March 10, 1670.

The titles of his 40 books are Latin, but the text is German. The more important are contained in *Opera Omnia,* which appeared in German (1661), in French (1659) and English (1689). A reissue under the title *Glauberus concentratus* appeared in 1715. These writings had a great effect on both his contemporaries and successors.

Biographical details given by W. Brieger in *Geschichtsbl. Technik, Industrie und Gewerbe* (1918) ; *Chemisch Weekblad* (1918). *See* also Eva Armstrong and C. Deischer, *Journal of Chemical Education* (1942) ; P. Walden, Essay in Bugge's *Das Buch der grossen Chemiker* (1930). (R. E. O.)

GLAUBER'S SALT, the decahydrate of sodium sulfate, was named for the alchemist,. J. R. Glauber, who first described its medicinal properties. It occurs native as the mineral mirabilite in Spain, the western United States and the Caucasus, but much that is used today is manufactured from salt cake. *(See* ALKALI MANUFACTURE.) The chemical formula for Glauber's salt is $Na_2SO_4.10H_2O$.

The solubility of the Glauber's salt, which increases sharply with a rise in temperature, reaches a maximum value at 32.384' C. where the decahydrate is in equilibrium with the anhydrous salt. Below that temperature the Glauber's salt is stable and may be crystallized in colourless monoclinic prisms which effloresce in ordinary air. Above the trahsition temperature it changes to the anhydrous salt whose solubility decreases as the temperature rises. Glauber's salt readily forms supersaturated solutions in which crystallization may be initiated by adding a small particle of the solid hydrate. In medicine it is used as a cathartic and is the active principle in some mineral waters. (J. B. Ps.)

GLAUCHAU, a town of Germany, in the district of Karl-Marx-Stadt, on the right bank of the Mulde, 7 mi. N. of Zwickau and 17 mi. W. of Chemnitz by rail. Pop. (1950) 35,387. It has important manufactures of woollen and half-woollen goods. There are also dye-works, print-works and manufactories of paper, aluminum, thread and machinery. Glauchau possesses a weaving school. Some portions of the old castle date from the 12th century; the Gottesacker church contains objects of this period. Glauchau was founded by a colony of Sorbs and Wends, and belonged to the lords of Schonburg as early as the 12th century.

GLAUCOMA is a term applying to a group of diseases of the eye characterized by an abnormal elevation of the pressure within the eyeball. This is usually due to partial blocking of the channels through which the aqueous humour normally leaves the eye. The glaucomas of the human eye differ profoundly in their subjective and objective symptoms, their course and their final outcome. Some glaucomas are mild, transient and easily curable; others are characterized by dramatic, acute, painful attacks, and still others take the course of a gradual, insidiously progressive and entirely painless loss of vision. In almost all glaucomas medicinal or surgical treatment offers a good chance of arresting the disease and of thereby preventing further visual damage. For a broader discussion of glaucoma, *see* EYE, HUMAN: *Diseases of the Eyes;* EYE, SURGERY OF. (P. C. K.)

GLAUCONITE is a green, fine-grained crystalline mineral, a hydrous silicate of iron and potassium found in marine sedimentary rocks of all geologic ages since the Pre-Cambrian, and still in process of formation. Glauconite occurs commonly as globular to lobate bright green grains or pellets a millimetre (0.03937 in.) or less in diameter. It may also occur as irregular grains or flakes, or as clay. It may be confused with the minerals chamosite, celadonite, chlorite and greenalite. Some glauconite has natural bleaching qualities and can be used as a fuller's earth *(q.v.)* and glauconite marls, because of their base-exchange properties, have been used in water-softening units *(see* MARL).

Glauconite is composed of clay minerals and the name has been used interchangeably both as a mineralogic and a morphologic term. It has been defined as a specific micaceous mineral, although it is commonly described as small green pellets of heterogeneous mineral content. It forms in waters of normal salinity on continental shelves, swells and banks off coasts of crystalline land areas that lack important rivers. It is not known to form in fresh water deposits. Glauconite formation takes place principally in the upper part of the 10–400 fathom interval. The temperature range of formation is apparently wide but markedly warm water is not favourable. Very slow or interrupted sedimentation in more or less agitated water, and at least slightly reducing conditions, which may be facilitated by decaying organic matter, are conducive to glauconite formation. Source materials are principally bottom muds and clays of terrigenous origin, although biotite, feldspars, volcanic glass and other materials may contribute. Under the necessary physiochemical environmental conditions, glauconitization occurs as a marine alteration of terrigenous matter to glauconite. Formation of glauconite from a colloidal state may also occur, as this process tends toward the same crystallochemical equilibrium as that obtained in the alteration of clay. Common coagulation of all these amorphous and cryptocrystalline products with selective adsorption of potassium from the sea water leads to the formation of grains of glauconite.

Glauconite grains are common in calcareous sediments but rare in pure clay rocks, pure quartz sandstones or chemically precipitated carbonates. Glauconite is commonly found associated with remains of fecal pellets of sediment-ingesting organisms or as internal fillings of foraminifera. It is rare or absent in beds rich in algae, corals or bryozoans.

Sediments rich in glauconite grains are known as greensand (*q.v.*). (H. D. G.)

GLAUCOPHANE, a group of rock-forming minerals consisting of the iron-free sodium amphiboles (see AMPHIBOLE). The glaucophane group have all the characteristics of, but are distinguished from, the rest of the amphiboles by their distinct blue colour, especially in thin slices.

Glaucophane occurs exclusively in certain metamorphic schists. These schists present a problem in petrology. They contain sodium-rich amphiboles which form in a rock not especially enriched in sodium. In short, the sodium is present in the amphiboles rather than in the plagioclase feldspars where it is usually concentrated (see FELDSPAR). Because of this peculiarity and because they are dense rocks and associated with other dense minerals. glaucophane schists have been thought to represent high pressure mineral assemblages. Other workers have shown that localized introduction of sodium, magnesium and iron into sedimentary rocks has caused the formation of glaucophane without the presence of relatively high pressures. Thus, glaucophane schists might form at high pressures and, on the other hand, might represent a peculiar sequence of sodium introduction into pre-existing mineral assemblages. Glaucophane schist is used by some writers as a separate metamorphic facies. Glaucophane schists are widely distributed over the coast range of California but are unusual elsewhere in the United States.

The members of the glaucophane group vary in composition from $Na_2Mg_3Al_2Si_8O_{22}(OH)_2$ to $Na_3Mg_3Al_2Si_8O_{22}O(OH)$ to $Na_2CaMg_3Al_2Si_8O_{22}O_2$.

See also METAMORPHISM. (G. W. DEV.)

GLAUCUS, a word meaning "bright," and the name of several figures in Greek mythology, the most important of which are the following:

1. GLAUCUS, surnamed *Pontius,* a sea divinity. Originally a fisherman and diver of Anthedon in Boeotia, having eaten a certain magical herb, he leaped into the sea, where he was changed into a god, and endowed with the gift of unerring prophecy. According to others he sprang into the sea for love of the sea-god Melicertes, with whom he was often identified. He was worshipped in most parts of the Greek world by fishermen and sailors. In art he is depicted as a merman covered with shells and seaweed. Various legends, none very important, connect him with the saga of the Argonauts and other cycles. He was famous for his amours, especially those with Scylla and Circe. *See* especially Athenaeus, 296, 297.

2. GLAUCUS, of Potniae near Thebes, son of Sisyphus by Merope and father of Bellerophon. According to the legend he was torn to pieces by his own mares (Virgil, Georgics, iii. 267; Hyginus, Fab., 250, 273).

3. GLAUCUS, the son of Minos and Pasiphaë. When a child, while playing at ball or pursuing a mouse, he fell into a jar of honey and was smothered. His father, after a vain search for him, consulted the oracle, and was referred to the person who should suggest the aptest comparison for one of the cows of Minos which had the power of assuming three different colours. Polyidus of Argos, who had likened it to a mulberry (or bramble), which changes from white to red and then to black, soon afterwards discovered the child; but on his confessing his inability to restore him to life, he was shut up in a vault with the corpse. Here he killed a serpent which was revived by a companion, which laid a certain herb upon it. With the same herb Polyidus brought the dead Glaucus back to life. According to others, he owed his recovery to Asklepios.

4. GLAUCUS, son of Hippolochus, and grandson of Bellerophon. mythical progenitor of the kings of Ionia. He was a Lycian prince who, along with his cousin Sarpedon, assisted Priam in the Trojan War. When he found himself opposed to Diomedes, his guest friend, they ceased fighting and exchanged armour. Since the equipment of Glaucus was golden and that of Diomedes bronze, the expression "gold for bronze" (Iliad, vi. 236) came to be used proverbially for a bad exchange. Glaucus was afterward slain by Ajax, son of Telamon.

GLAZE: see GLAZING; POTTERY AND PORCELAIN.

GLAZING. In its simplest context, glazing means the fitting of panes of glass into suitable frames in order to form a window which will admit light into a building. In the middle ages and up to the end of the 17th century this meant the use of leaded lights, small areas of glass fastened together with specially formed strips of lead ("calms") and held in a frame of wood or wrought iron. From the end of the 17th century until the end of the 19th century this principle was followed, but developing skill in the making of large sheets of glass saw a gradual increase in the size of the panes and window areas, while the leaded light was replaced by sashes of wood in which the glass was held with wood beads or putty Until the end of the 19th century the architectural conception of a window was that of a comparatively small area of glazing placed in a thick load-bearing wall and restricted to the provision of daylight in a building, but the development of cast-iron buildings in the 19th century and the extensive use of steel and reinforced concrete framing in the 20th century considerably altered this. In framed structures the loads of floors and roof are concentrated on to comparatively slender columns, thus leaving large areas of walling which can as well be filled by glazing as by the more traditional materials such as brick or stone. Further technical development in the glass industry provided the means to fill these large areas, so that glazing is not only concerned with the transmission of light into a building but can also provide the whole external surface.

Method. — The normal process of glazing small windows into wooden or metal frames has changed little. The tools generally used are the diamond for cutting, laths or straight edges and tee square for accurate measurement and setting out, glazing knife. hacking knife and hammer. The materials used in addition to the glass are putty, priming or paint, glaziers' sprigs (small headless nails). wash leather or synthetic rubber strip. Putty is made of whiting and linseed oil and it should be stored so that it is kept moist and workable. Wood sashes must be primed before glazing, *i.e.,* given a thin coat of paint usually containing red lead; this enables the putty to adhere to the sash. When each square of glass is cut to size, allowing about $\frac{1}{16}$ in. tolerance all round, the glazier runs the putty round the rebate in the frame into which the glass is to fit with his hands pressing it firmly against the wood. He then beds the glass into it by pressing it down firmly on all the edges and the glass is further secured by the glaziers' sprigs, knocked in on the rebate side. He then trims off the protruding putty and fills the remainder of the rebate, beveling it off on the outside of the sash with the putty knife. When a broken pane is to be replaced the hacking knife is employed to cut out the old putty and remaining broken glass. Metal sashes are glazed in a similar way, although the putty used is usually modified by the addition of a dryer to enable it to set satisfactorily, as there is no absorption of the oil by a metal sash. Proprietory glazing compounds are manufactured for this purpose also and some sashes incorporate spring clips and other devices for securing the glass. In glazed doors and sashes used internally the panes of glass are generally fixed with wood beads, held in place with screws. In doors subject to vibration or slamming the panels are usually bedded in wash leather or synthetic rubber strip and secured by wood beads.

Types of Glass. — For all common glazing in small sizes sheet glass is used. It is available in several qualities and thicknesses and in sizes depending on the thickness up to 80–100 in., length and width combined. For larger areas and for work where a high degree of transparency is required, polished plate glass is used. This can be supplied in sues up to 98 in. wide and 300 in. long, but the practicable size for any particular job is governed more by problems of cutting, transporting and fixing than by manufacturing difficulties. For work requiring specially strong glass armour plate is used. This glass is specially toughened by heat treatment after cutting to size and is therefore supplied by the manufacturers ready for fixing and must not be subsequently cut. Where resistance to fire or danger of breaking makes ordinary glass a potential hazard, mired glass is used. A wire mesh is rolled into the glass during manufacture and even if large areas are shattered the glass adheres to the wire and is not broadcast. This makes it suitable for roof glazing and skylights, where generally the building regulations make its use obligatory. Prismatic glass, designed to refract light, is of use in increasing the light to rooms overshadowed by adjacent buildings. Anti-sun glass, which absorbs heat without reducing unduly the light transmission, is used in the glazing of schools, offices and airport control towers and where unusual climatic conditions make it especially suitable. An amber tinted anti-fly glass is an effective deterrent against houseflies and is therefore used for glazing the windows of buildings storing or manufacturing food.

Special Problems. — The design tendency for the elimination of the load-bearing wall in favour of a framed construction and the introduction of ever growing window areas presents some special glazing problems. The highest standards of heat insulation are demanded in modern buildings to save both in cost of heating and in actual fuel consumption, but large areas of thin sheet or plate glass cannot satisfy these conditions because large windows mean high heat loss and consequential problems such as excessive condensation. The solution is the use of double glazing, in which two sheets of glass are fixed instead of one so that there is a confined space between them. This may be done either by fixing the two sheets of glass in one frame or by having each in a separate frame. The use of two windows in double glazing has been practised for many years particularly to improve sound insulation, but it is cumbersome and expensive. However, manufacturers are now offering factory-made double glazed window units, simply fixed into a single frame, which consist of two sheets of glass separated by a suitable spacer at the edges, usually metal or plastic strip. This unit is hermetically sealed against the external atmosphere, the cavity being filled with clean dry air at the time of sealing. Experiment has shown that an interspace of $\frac{3}{4}$ in. gives the best insulation but that an efficiency of 90% can be obtained if the space is as little as $\frac{1}{4}$ in. The smaller spacing is therefore generally used as the resulting unit is more easily accommodated in a sash of normal dimensions. The operation of assembly and sealing calls for skill and accuracy, so that such units made under factory conditions are relatively expensive, but the extra cost is soon offset by the saving in fuel consumption and there are a number of additional advantages such as the fact that condensation is eliminated, there is no "misting" of the glass and there is a significant reduction in sound transmission.

Where large areas are to be lighted, particularly in industrial buildings, it is usually necessary to provide areas of glazing in the roofs. Although it is not easy to measure the relative amount of light obtained from a unit of roof glazing as compared with the same area in a vertical plane, it is probably as much as three times. Almost all roof glazing, or patent glazing as it is more usually called. is of special design and patent manufacture. There is a wide range of types but basically the systems consist of a bar, usually of steel or aluminum of special section which incorporates fixing clips on the upper part to hold the glass and condensation channels at the bottom. Steel bars are usually covered with a thin lead sheathing to protect them against rusting. The bars are normally placed at about 2 ft. centres and spans up to about 10 ft. can be obtained without extra support. Special devices are incorporated in each design to ensure that the roof remains watertight in spite of widely varying atmospheric conditions and most systems can be fixed at any desired angle.

(A. RD.)

GLAZUNOV, ALEXANDER CONSTANTINOVICH (1865–1936), Russian composer, was born in St. Petersburg (Leningrad), Aug. 10, 186 j, the son of a publisher and bookseller. He showed an early talent for music, and studied, on the advice of Mily Balakirev, with Nicolas Rimsky-Korsakov. At the age of 16 he composed a symphony (afterward elaborated and published as op. 5), but his *opus* 1 was a quartet in D. followed by a pianoforte suite on *S-a-c-h-a*, the diminutive of his name Alexander. In 1884, helped to some extent by Liszt, he began to make a name outside Russia. His first symphony was played that year at Weimar, and he appeared as a conductor at the Paris exhibition in 1889. In 189; he conducted his fourth and fifth symphonies in London. In 1900 he became professor at the St. Petersburg conservatoire, and in 1906 director. Glazunov was a leading representative of the modern Russian school. His ballet, *Raymonda*, shows that he also shared to the full the Russian love for oriental splendour and movement. Of his many compositions, the most famous are perhaps, among the orchestral works, the sixth symphony, in C minor (op. 58): among those for solo instruments, the theme and variations for pianoforte (op. 72), and the fine violin concerto in A minor (op. 73); and among those for the stage (very few in number) the ballet *Raymonda* (op. 57), already mentioned.

GLEAVES, ALBERT (1858–1937), U.S. naval officer, born in Nashville, Tenn., Jan. 1, 1858, was graduated from the U.S. Naval academy and commissioned an ensign in the navy on Jan. 1, 1881. During the Spanish-American War he commanded the torpedo boat "Cushing," was promoted through the grades with sea and land duty, being much interested in light naval craft, and established the first government torpedo factory in 1908. On July 29, 1915, he became a rear admiral, and he commanded the destroyer force of the Atlantic fleet until the beginning of World War I. Placed in charge of all convoy operations, with the temporary rank of vice-admiral, Gleaves safely shepherded the first American expeditionary force to France in June 1917. From July 16, 1917, to Sept. 1, 1919, he was in command of the cruiser and transport force, Atlantic fleet. being directly responsible for placing 2,000,000 men in France and for bringing the United States army home afterward. This achievement won him the distinguished service medal and the victory medal with star. He commanded the Asiatic fleet in 1920–21 and retired in 1922 with the rank of admiral. For four years, 1928–31, he was governor of the United States naval home, Philadelphia, Pa. He died Jan. 6, 1937, in Haverford, Pa. (W. B. CK.)

GLEBE, in ecclesiastical law the land devoted to the maintenance of the incumbent of a church. In English law the fee simple of the glebe is said to be in abeyance. that is, it exists "only in the remembrance, expectation and intendment of the law." But the freehold is in the parson, although at common law he could alienate the same only with the consent of the bishop and patron. The disabling statutes of Elizabeth (Alienation by bishops, 1559, and Dilapidations, etc., 1571) made void all alienations by ecclesiastical persons, except leases for the term of 21 years or three lives. By an Act of 1842 glebe land and buildings may be let on lease for farming purposes for 14 years or on an improving lease for 20 years. But the parsonage house and ten acres of glebe situate most conveniently for occupation must not be leased. By the Ecclesiastical Leasing acts of 1842 and 1858 glebe lands may be let on building leases for not more than 99 years and on mining leases for not more than 60 years.

In Scots ecclesiastical law, the manse now signifies the minister's dwelling house, the glebe being the land to which he is entitled in addition to his stipend.

GLEDITSIA, a genus belonging to the pea or pulse family (Leguminosae, *q.v.*), embraces 12 species of thorny shrubs and trees. These are widely distributed through the warmer regions of Asia and America. Fierce, branched thorns feature the twigs and even the bole of certain forms which, when planted in hedgerows, form an impenetrable barrier. Two trees of secondary importance, the honey locust (G. triacanthos) and the water locust (*G. aquatica*) are indigenous to the eastern and southern United States,

GLEE, a musical term signifying, broadly speaking, a piece of concerted vocal music, generally unaccompanied, and for male voices, though exceptions are found to the last two restrictions. The number of voices ought not to be less than three. As regards musical form, the glee has affinities with the madrigal (*q.v.*) though the two forms are by no means identical. Thus, while the madrigal does not show a distinction of contrasted movements, this feature is absolutely necessary in the glee. The originator of the glee in its modern form was Dr. Thomas Arne (1710–1778), and among other leading glee writers, all Englishmen, may be mentioned Webbe (1740–1816), Horsley (1774–1858), Callcott (1807–1882) and Stephens (1821–1892).

GLEIM, JOHANN WILHELM LUDWIG (1719–1803), German poet. was born on April 2, 1719, at Ermsleben, near Halberstadt. He studied law at Halle, where he founded the so-called *Anacreontik,* with other young poets. "Father Gleim" was the title accorded to him throughout all literary Germany because of his generosity to young poets. He looked with some suspicion on their revolutionary tendencies, but helped them none the less. Gleim himself wrote feeble imitations of Anacreon, Horace and the minnesingers. a dull didactic poem entitled *Halladat* oder das rote *Buch* (1774) and collections of fables and romances. Of higher merit are his *Preussische Kriegslieder von einem* Grenadier (1758), inspired by the campaigns of Frederick II. Gleim died at Halberstadt on Feb. 18, 1803.

GLEIWITZ (GLIWICE), a tomn in Katowice province, Pol., formerly in the Prussian province of Silesia, on the Klodnitz. and the railway between Oppeln and Cracow, 40 mi. S.E. of the former town. Pop. (1950) 119,968.

Gleiwitz is the centre of the mining industry of Cpper Silesia. There are also foundries with which are connected machine manufactories and boilerworks, and manufactories of wire, chemicals. glass, cement and paper.

GLENALMOND, a glen of Perthshire, Scot., southeast of Loch Tay. It comprises the upper two-thirds of the course of the Almond, a distance of 20 mi., For the greater part it follows a direction east by south, but at Newton bridge it inclines sharply to the southeast for 3 mi., and narrows to such a degree that this portion is known as the Small (or Sma') glen. At the end of this pass the glen expands and runs eastward as far as the well-know11 public school of Trinity college. where it may be considered to terminate. In Sma'glen is Ossian's stone, the traditional grave of Ossian, the Gaelic warrior and bard.

GLENCAIRN, EARLS OF. The 1st earl of Glencairn in the Scottish peerage was ALEXANDER CUNNINGHAM (d. 1488), a son of Sir Robert Cunningham of Kilmaurs in Ayrshire. Made a lord of the Scottish parliament as Lord Kilmaurs not later than 1469, Cunningham was created earl of Glencairn in 1488; and a few weeks later he was killed at the battle of Sauchieburn while fighting for King James III against his rebellious son, afterward James IV. His son and successor, ROBERT (d. *c.* 1490), was deprived of his earldom by James IV, but before 1505 this had been revived in favour of Robert's son, CUTHBERT (d. *c.* 1540), who became 3rd earl of Glencairn, and whose son WILLIAM (*c.* 1490–1547) was the 4th earl. This noble, an early adherent of the Reformation, was during his public life frequently in the pay and service of England.

William's son ALEXANDER, the 5th earl (d. 1574), was a more pronounced reformer than his father, whose English sympathies he shared, and was among the intimate friends of John Knox. He anticipated Lord James Stewart, afterward the regent Murray, in taking up arms against the regent, Mary of Guise, in 1558. When in Aug. 1561 Mary, queen of Scots, returned to Scotland, Glencairn was made a member of her council; he changed sides more than once, and was found fighting against Mary at Carberry hill and at Langside. The earl, who was a violent iconoclast, died on Nov. 23, 1574. His short satirical poem against the Grey Friars is printed by Knox in his History of *the* Reformation.

JAMES, the 7th earl (d. *c.* 1622), took part in the seizure of James VI, called the raid of Ruthven in 1582. WILLIAM, the 9th earl (c. 1610–64), was a somewhat lukewarm royalist during the Civil War. In March 1653 Charles II gave him temporary command of the royalist forces in Scotland, and the insurrection of this year is generally known as Glencairn's rising. After its failure he was betrayed and imprisoned; when Charles 11 was restored, he became lord chancellor of Scotland. He died at Belton, Haddingtonshire, on May 30, 1664.

GLEMCOE, a glen in Scotland, situated in the north of Argyllshire. Beginning at the northeastern base of Buachaille Etive, it takes a gentle northwesterly trend for 10 mi. to its mouth on Loch Leven, a salt-water arm of Loch Linnhe. On both sides It is shut in by wild and precipitous mountains and its bed is swept by the Coe—Ossian's "dark Cona"—which rises in the hills at its eastern end. About halfway down the glen the stream forms the tiny Loch Triochatan. Toward Invercoe the landscape acquires a softer beauty. Lord Strathcona, in 1894, purchased the heritage of the Macdonalds of Glencoe.

The principal mountains on the south side are the various peaks of Buachaille Etive. Bidean nam Bian (3,766 ft.), Meall Mor and Sgorr Dhearg, and on the northern side the Pap of Glencoe and the ridge of Xonach Eagach. Points of interest are the Devil's Staircase. a steep, boulder-strewn "cut" across the hills to Fort William; the Study; the cave of Ossian. where tradition says that he was born; and the Iona cross erected in 1883 by a Macdonald in memory of his clansmen who perished in the massacre of 1692. About 1 mi. beyond the head of the glen is Kingshouse inn, a relic of the old coaching days. Now the Glencoe excursion is usually made from Oban. One mile to the west of the glen lies the village of BALLACHULISH, with slate quarries. worked since 1760; the new road through the glen was built in 193j. About 13,000 ac. in and around Glencoe belong to the Scottish National trust.

GLEN COVE, a city of Nassau county, on north central Long Island, in southeastern New York. U.S., is bounded on the north by the waters of Long Island sound and on the west by Hempstead harbour. It was founded by colonial farmers in 1668, and was named Glen Cove in the 19th century as the result of a misunderstanding: a member of the group convened to rename the community corrupted the suggested name Glencoe into Glen Cove.

In the early decades of the 20th century, Glen Cove's character and economy were dominated by the great estates characteristic of this section of Long Island. Glen Cove was an unincorporated village governed by the town of Oyster Bay before it became a city on Jan. 1, 1918. After World War II, Glen Cove was absorbed increasingly into the greater New York metropolitan area. The city offers the facilities of a resort community with many beaches near the residential areas. For comparative population figures see table in NEW YORK: Population. (WI. M. D.)

GLENDALE, a city of Los Angeles county. at the southern extremity of the San Fernando valley in southwestern California, U.S.. is 8 mi. N. of the civic centre in the city of Los Angeles.

The land known as Glendale was first taken in a private land grant by José Maria Verdugo in 1784 as the Rancho San Rafael. Portions of the old rancho still remain as Glendale city shrines. The Verdugo title to Rancho San Rafael was confirmed by Mexico and again by the new state of California. In 1869, after the owners' failure to pay a mortgage, the rancho was sold at public auction.

During the early 1880s, portions of the private holdings were pooled and a survey was ordered for a townsite, completed early in 1887. In March of that year, the tomn of Glendale was recognized by Los Angeles county. The name was chosen in 1884 from six others by local residents. Glendale absorbed much of the population influx of the 1880s into the Los Angeles basin. During the boom, several buildings were constructed, including a hotel and a newspaper plant. Although its 1910 population was only 2,700, it had grown to 75.000 by the outbreak of World War II. It is part of the Los Angeles standard metropolitan statistical area. The population of Glendale was 95,702 by 1950 and 119,442 in 1960.

Industries include the manufacture of airplanes and aircraft products, optical instruments, pharmaceuticals and clay and plastic products. Glendale (junior) college was established as a public school in 1927. Forest Lawn Memorial park is a cemetery publicized for its elaborate statuary (which includes reproductions of famous works of art) and other special attractions. Glendale mas incorporated as a city in 1906 and in 1914 adopted the council-manager form of government. (J. M. Wo.)

GLENDALOUGH, VALE OF (also GLENDALOCH), about 20 mi. W. of Wicklom by road, County Wicklow, Ire., is noted for its ecclesiastical ruins. Two lakes lie in this wooded vale which is hemmed in by mountains. There, early in the 6th century, St. Kevin (*q.v.*) lived as a hermit for four years and later founded a monastery which; despite Danish raids, remained for centuries an important ecclesiastical and educational centre. There was a succession of bishops until 1214 when the see was united to that of Dublin. In close proximity are a round tower, about 110 ft. high and 52 ft. in circumference; the small St. Kevin's Kitchen, or church, with a high-pitched roof and round belfry; the cathedral, about 73 it. in total length by 51 ft. in width; a Lady chapel, remarkable for its doorway of wrought granite; a priest's house (restored); and slight remains of St. Kieran's church. There also is St. Kevin's cross, a granite monolith never completed; and the enclosure is entered by a fine though dilapidated gateway. Other remains are Trinity, or the Ivy, church, toward Laragh, and St. Saviour's monastery, while on the upper lough are Reefert church, the burial place of the O'Toole family, and the small Teampall na Sceillige (Teampullna Skellig), the church of the rock. St. Kevin's bed is a cave above the upper lough, and is linked with the legend of St. Kevin's hermitage.

GLENDOWER, OWEN (OWAIN GLYN DWR) (1359?–1415), the last independent prince of Wales, more correctly described as On-ain ab Gruffydd, lord of Glyndyvrdwy in Rlerioneth. Owen was probably born about 1359, studied law at Westminster, was squire to the earl of Arundel and a witness for Grosvenor in the famous Scrope and Grosvenor lawsuit in 1386. Afterward he was in the service of Henry of Bolingbroke, the future king. Welsh sympathies were, however, on the side of Richard II, and combined with a personal quarrel to make Owen the leader of a national revolt.

The lords of Glyndyvrdwy had an ancient feud with their English neighbours. the Greys of Ruthin. Reginald Grey neglected to summon Owen, as was his duty, for the Scottish expedition of 1400. and then charged him with treason for failing to appear. Owen thereupon took up arms: and when Henry IV returned from Scotland in September he found north Wales ablaze. A hurried campaign under the king's personal command was ineffectual. In the spring of 1401 Omen was raiding in south Wales.

A second campaign by the king in the autumn mas defeated, through bad weather and the Fabian tactics of the Welsh. Owen had already been intriguing with Henry Percy (Hotspur), who during 1402 held command in north Wales, and with Percy's brother-in-law, Sir Edmund Mortimer. During the winter of 1401–02 he treated with the rebel Irish, the Scots and the French. In the spring he attacked Ruthin, and took Grey prisoner. In the summer he defeated the men of Hereford under Edmund Mortimer at Pilleth, near Brynglas, in Radnorshire. Mortimer was taken prisoner and treated with such friendliness as to make the English doubt his loyalty: within a few months he married Omen's daughter. In the autumn the English king was for the third time driven "bootless home and weather-beaten back." In May 1403 Henry of Monmouth was allowed to sack Sycharth and Glyndyvrdwy unopposed. Owen had a greater plot in hand. The Percies were to rise in arms, and meeting Owen at Shrewsbury, overwhelm the prince before help could arrive. But Omen was defeated near Carmarthen on July 12, and Percy was crushed at Shremsbury ten days later. But the Welsh revolt was still formidable. Owen styled himself openly prince of Wales, established a regular government and called a parliament at Machynlleth. As a result of a formal alliance the French sent troops to his aid, and in the course oi 1404 the great castles of Harlech and Aberystwith fell into his hands.

In the spring of 1405 the tide turned. Prince Henry defeated the Welsh at Grosmont in March, and twice again in May. Scrope's rebellion in the north prevented the English from following up their success. The earl of Northumberland tool; refuge in Wales, and the tripartite alliance of Owen with Percy and Mortimer (transferred by Shakespeare to an earlier occasion) threatened a renewal of danger. But the English under Prince Henry pained ground steadily. and the recovery of Aberystwith, after a long siege (1408), marked the end of serious warfare. In Feb. 1409 Harlech was recaptured, and Omen's wife, daughter and grandchildren were taken prisoners. According to Adam of Usk Owen died in 1415.

GLENELG, a municipal town and the chief watering place of Adelaide county. South Australia, situated 6½ mi. S.W. of the city of Adelaide. Pop. (1954) 12.966. It is built on a plain and has a magnificent sandy beach. Glenelg is connected with Adelaide by bus and interurban streetcar systems. Gov. Sir John Hindmarsh landed in the vicinity in 1536 and proclaimed the state British territory.

GLEN ELLYN, a city and residential suburb of Du Page county, in northeastern Illinois, U.S., is 23 mi. W. of Chicago. Glen Ellyn assumed its present name in 1891. The first settlement mas made in the area in 1834. Initially the business centre (known as Stacy's Corners) was developed north of the present townsite along a stagecoach route between Chicago and St. Charles. In the 1850s, when Newton (later named Danby and in 1874 Prospect Park) was established as a station on the Galena and Chicago Union (later the Chicago and Northwestern) railroad, the present site became the centre of the village. Commuting to Chicago began in the 1880s and was the prevailing pattern of community life by 1900. In the 1890s an attempt was made to develop a resort business around artificially constructed Lake Glen Ellyn. but the enterprise was abandoned shortly after 1900. After 1940 Glen Ellyn shared moderately in the growth of the suburban communities west of Chicago. For comparative population figures see table in ILLINOIS: *Population.* (S. L. J.)

GLENGARRIFF or GLENGARIFF, a village of County Cork, Ire.. on an inlet of Bantry bay. 62 mi. S.S.W. of Cork by road. Pop. (1956) 398. Because of the beauty of its situation in a deep. wooded valley backed by mountains, and of its warm climate, which enables semitropical plants to grow. it is a well-known tourist and holiday resort.

GLENN, JOHN HERSCHEL, JR. (1921–), first U.S. astronaut to make an orbital space flight. was born July 18, 1921, in Cambridge, O. He attended Muskingum (O.) college but left in his third year to train as a naval aviation cadet. On March 16, 1943, he was commissioned a second lieutenant in the U.S. marine corps. Glenn flew 59 fighter-bomber missions in the Pacific theatre during World War II and another 90 missions during the Korean war. For his outstanding service while on active duty in both conflicts he was 5 times awarded the distinguished flying cross and 19 times the air medal.

Glenn was the oldest of the seven U.S. astronauts selected in April 1959 for space-flight training'in the Project "Mercury" program. In 1961 he served as "back-up" pilot for Comdr. Alan B. Shepard, Jr.. and Capt. Virgil I. Grissom, who made the first U.S. suborbital flights.

Glenn mas selected for the orbital flight on Nov. 29, 1961, and there followed more than two months of preparations and delays caused by mechanical and electronic difficulties and unfavourable weather. On Feb. 20, 1962, after ten postponements, Glenn's space capsule. "Friendship 7," was lifted off from Cape Canaveral, Fla., and put into an orbit that, ranged from approximately 99 to 162 mi. in altitude. He made three orbits about the earth in 4 hr. 56 min. at a speed of approximately 17,545 m.p.h., landing successfully in the Atlantic near the Bahamas.

GLENS FALLS, a city of Warren county, in eastern New York, U.S., on the Hudson river, is 52 mi. above Albany. Long noted for its water power, the city became a manufacturing centre of diverse products ranging from lingerie to heavy machinery and also a residential resort. A pioneer hydroelectric power development was established at nearby Spier falls. The Indians called the area Chepontuc, "a difficult place to climb." The earliest military settlement was at Halfway brook, where Fort Amherst was erected in 1759. In 1762 the Queensbury patent was granted to Abraham Wing and in 1765 Wing built a tavern near the falls. At first it was called Wing's Falls but in 1788 the name was changed to satisfy a debt of honour (so the story goes) owed by Wing to Col. Johannes Glen of Schencctady. Most of the settlers derived from French-Canadian. Scottish, English and Italian origins. Glens Falls was chartered as a city in 1908. For comparative population figures *see* table in NEW YORK: *Population.*

(G. L. F.)

GLIDDEN, CHARLES JASPER (1857–1927), best-known in connection with the tours for antique or classic motorcars conducted by the American Automobile association (A.A.A.) and named in his honour, also was a telephone pioneer and balloonist. Born Aug. 29, 1857, in Lowell, Mass., he became a telegraph messenger there at the age of 15. Later, as a telegraph operator, he held positions with two New England telegraph companies. Introduction of the electric telephone in 1877–79 led him to join a syndicate that opened the first telephone exchange in Lowell and built the first line between Lowell and Boston. This led to a career as promoter of telephone corporations from which he retired in 1900. He helped found the A.A.A., and organized the first Glidden tours (1905–1913) to demonstrate the reliability of early automobiles. He motored some 46,500 miles in 39 countries, and made 49 balloon ascensions in America and abroad. Glidden died Sept. 11, 1927, at Boston, Mass.

See M. M. Musselman, ***Get A Horse!*** (1950); Bellamy Partridge, *Fill 'er* ***Up*** (1952). (RH. E. M.)

GLIDING, a phase of flight by which a bird or aircraft descends on an inclined path toward the ground. Man-made gliders are heavier than air and have no engines. Soaring is the term applied to unpowered flight using the upward motions of the air or pulsations in the wind. Soaring permits man to fly long distances, to reach high altitudes and to remain aloft for days without any form of power except that in the air mass.

HISTORY OF GLIDING EXPERIMENTS

The history of gliding in the U.S. is mainly a record of the scientific achievements of the great pioneers, Samuel P. Langley, Octave Chanute and Wilbur and Orville Wright (*qq.v.*). In the first half of the 19th century the English pioneers, George Cayley, W. S. Henson and John Stringfellow, made valuable theoretical investigations and model flight experiments. It is this group of workers who may be said to have "invented" the airplane. But their invention would never have been reduced to practice without the subsequent efforts of the early exponents of gliding.

Captain Le Bris, a French sailor, carried out the first significant glider work in the 1870s, building gliders with wings shaped like those of an albatross and with a boat-shaped body. Le Bris made many remarkable glides, but he succeeded more by instinct than by scientific skill and did not make any substantial contribution to the science of flight. He merely imitated the bird's form and his gliders lacked any vertical stabilizing surface such as a fin or rudder.

The most famous exponent of gliding was undoubtedly Otto Lilienthal (*q.v.*), who with his brother Gustav began to make experiments in 1867. Lilienthal realized that data were needed for success and accumulated much information from a study of the flight of birds. He was perhaps the first man to understand the superiority of the cambered or curved surface over the flat plate as a lifting surface. In 1891 he built his first man-carrying glider, with a framework of peeled willow rods covered with tough cotton fabric. He attached himself to the glider by thrusting his arm through padded rubber tubes and holding on to a crossbar. His body hung in the air during flight and he attempted to control and stabilize the plane by moving his body. Lilienthal even built a conical hill of earth from which to launch himself and his glider. Lilienthal's great contribution to the aeronautical sciences was to improve the behaviour of wing lift and thereby show the feasibility of flight, which many scientists held impossible at that time.

In 1896, at the age of 64, Octave Chanute began to make gliding flights in the United States. He built a five-deck glider and followed this by a triplane and finally by a biplane. Chanute discarded Lilienthal's method of securing control and substituted a rudder and articulated wings. The wings could be swerved fore and aft to provide both longitudinal and lateral control although the pilot's body still hung beneath the glider. So stable did he make his gliders that they made 2,000 flights without a single accident.

One of America's great scientists, Dr. Samuel P. Langley, secretary of the Smithsonian institution, did fundamental research on the soaring flight of birds. With a large telephoto stereoscopic camera he photographed turkey buzzards in their circling effortless flight. He made studies of the nature of the wind in an effort to explain dynamic soaring. that is soaring by extracting energy from gusts of wind. One of Langley's assistants, Huffaker, wrote a paper entitled "On Soaring Flight" in 1898, in which he explained how birds achieved thermal soaring on rising drafts of warm air 30 years before man duplicated this process.

The next great U.S. exponents of gliding were the Wright brothers. Their first plan was to construct a glider which could be used as a man-carrying kite in a steady breeze. For their flights they selected the Kill Devil sand hills near Kitty Hawk, N.C.. which provided strong steady breezes. Through some errors in calculation. their man-carrying glider, tried out in 1900, proved a failure as a kite and they turned to gliding.

The Wright glider of 1900, though a biplane, differed in many respects from the Chanute glider. The pilot lay prone on the upper wing to reduce resistance; the vertical rudder was discarded; and the horizontal rudder was placed forward. By warping the wings they secured lateral control.

The Wrights' most successful glider was built in 1902. As a result of previous experiments, they now decided to use a vertical rudder, and later they made the rudder adjustable. In Sept. and Oct. 1902, nearly 1,000 flights were made, several of which covered distances of more than 600 ft.

The great glider achievement of the Wright brothers was in securing complete control by combining the horizontal rudder with an adjustable vertical rudder and warping the wings. It was this perfect control that made their gliding so safe and which enabled them to proceed to the building of the first successful powered plane. While the Wrights from 1903 onward devoted the greater part of their energies to power-driven craft, they never lost their interest in gliding.

In 1911 the Wrights returned to gliding and soaring because Wilbur had made some studies of dynamic soaring and wished to test his theories. With more powerful controls, and with the horizontal rudder in the rear, the brothers made many long glides, the longest lasting for 9 minutes 45 seconds in 1911. This remained the record until W. B. Klemperer, a German, on Aug. 30, 1921, soared over the Rhine valley for 13 minutes.

From the time of the Wrights' endurance record in 1911 until Glen Curtiss, whose interest was awakened by the German flights in 1922, began glider construction, no experiments were carried on in the United States. Curtiss built a flying boat hull with the tail surfaces carried on outriggers. The glider weighed 150 lb. and was launched by being towed by a motorboat. It performed admirably. The year 1922 also saw the first experimental congress for gliding held in France.

Gliding reached a high state of popularity in Germany after World War I for two reasons: the Versailles treaty forbade the construction of powered airplanes; and meteorological conditions in the Rhine valley provided upward currents of air that were extremely favourable to soaring flight. In the United States, on the other hand, gliding was neglected because full sway was given to the construction of powered craft, and meteorologically suitable localities such as Kitty Hawk were not readily accessible from large cities.

The remarkable flights of 1922 in Germany were achieved by a radical departure from the past. That year witnessed the advent of the first true sailplane. The sailplane, unlike the heavier, cruder machines hitherto used, is a highly refined glider, light and as near as possible to aerodynamic perfection. It has a sinking speed of 0.8 m. per second which is equivalent to saying that it is a machine that will soar in a wind that rises vertically at a speed of one and three-quarter miles per hour. The first machine of this type was the German "Vampyr."

NEW TECHNIQUES AND FLIGHT RECORDS

Up to 1929 soaring was of a strictly topographical nature using air currents deflected upward by local hills. Such flights were limited by the extent of the range of hills. An increased knowledge of meteorology gave rise to several methods of soaring by which long-distance flights could be made. Of these, thermal soaring and thunderstorm flight are most important. Thermal currents are formed by heat rising from the ground under certain conditions as for example, those existing on a hot summer afternoon. On reaching the cooler upper atmosphere. the moisture in the thermal current sometimes condenses, forming a cumulus cloud. A cumulus cloud indicates a thermal current and soaring flights can be made by circling in this current. Thunderstorm flight is accomplished by keeping near the boundary between two masses of air, one warm and the other cool, a condition that accompanies a thunderstorm. After 1929, constant refinement in glider design and improved methods of flight resulted in continuously better performance.

Until the early 1930s, all gliding records were held by Germany and Austria with little or no competition from other countries. Later, however, Great Britain, the U.S.S.R. and the United States took an active interest in gliding with the result that records moved back and forth between countries with amazing rapidity. In 1932 the Soaring Society of America was established to foster gliding and soaring in the United States.

In 1926 Max Kegel of Germany astonished the aeronautical world by flying 34 mi. in a thunderstorm. The world's distance record, held by a Russian woman pilot, 0. Klepikova, stood at 465.53 mi. in 1939. A flight of 21 hr. 34 min. by Lieut. William Cocke, Jr., although established in 1931, still stood in the mid-1950s as the longest by a U.S. citizen. The international duration record, j6 hr. 1 j min., was made by a Frenchman, Charles Atger, in 1952.

Modern soaring planes, flown by skilled pilots using modern technique, are capable of really amazing performances. They can be put through most of the acrobatic maneuvers practised by pilots of powered planes. In 1933 an American, Jack O'Meara. made 96 consecutive loops; his record mas broken by a Russian, Simonov, who made 300 loops in 1935. Gliders have been flown with as many as 130 men aboard. The world's record flight with two persons aboard nas extended to 513 mi. by the Russian, V. Ilchenko, and a passenger in 1954. During the German attack on Belgium. the Netherlands and Luxembourg in May 1940, the Wehrmacht, in order to take certain bridges and the Albert canal in Belgium, used glider trains, consisting of gliders towed by transport planes. Each glider contained six fully armed German soldiers. Gliders nere also used in taking the Belgian forts, particularly the Eben Emael forts, which resisted for approxirnately a week. The conquest of the island of Crete by the Germans in May 1941, was almost entirely by an air invasion in which gliders played a very prominent part as troop transports. *(See* AIR-BORNE TROOPS.)

Soaring. spurred by the return of technically trained students to its rank after World War II, took on the methods of science to improve performance. Ben Shupack, secretary of the Soaring Society of America. instituted a series of conferences on motorless flight with the idea of exchanging ideas among progressive sailplanists. In 1948 a meeting under the auspices of the Soaring Society of America and the Institute of the Aeronautical Sciences produced the basic concepts for a world-record-breaking sailplane. Richard H. Johnson, a student at Mississippi State university. built such a sailplane and flew it. on Aug. j, 1951, to an international distance record of 53 j mi. from Odessa, Texas. to Salina, Kan.. bettering by 70 mi. the former record held since 1939 by a Russian. The actual ground distance flown was 57 j mi. in 8 hr. 40 min., making an average speed of 65.2 m.p.h.

From 1935 to the mid-1950s the glider gained in reputation as a tool for meteorological and aeronautical research. Gliders equipped with radio and recording instruments were used in thunderstorm research sponsored by the U.S. weather bureau. Paul Tuntland flew one of these gliders into the core of a thunderstorm in order to collect data on the structure of this air mass.

As a result of these meteorological studies a project to study the air flow over the Sierra Nevada mountains by means of sailplanes was sponsored by the U.S. air force in 1950 and 1951. During the latter study. Lawrence Edgar and Harold Klieforth reached an altitude of 44 2 j j ft. above sea level and established two international records. one for absolute altitude and one for altitude gained. The source of lift for this flight was a mountain wave which extends to high altitudes.

The glider was again used, following 1952, in Germany as a means of youth training for aviation. The Germans also rejuvenated a prewar institute for glider research at Munich

Modern soaring planes owe their high performance characteristics in large measure to a high aspect ratio of the wing *(see* ASPECT RATIO). Wing spans are generally from 30 to 50 ft., chord depths from 4 to j ft. They also have an extremely "clean" aerodynamic shaping of the streamlined fuselage and other parts. They are of light, although adequately rigid construction, generally of plynood and fabric but in many instances of duraluminum metal. The controls of gliders and sailplanes are similar in action to those of airplanes. Instruments most commonly carried are the air speed indicator, the bank-and-turn indicator, the altimeter and some type of sensitive instrument to indicate rate of climb or descent. *(See* AIRCRAFT INSTRUMENTS.)

Launching Techniques. — As noted above, extensive gliding and soaring activities were at first limited to regions in which airmen could find reasonably steady ninds blowing up hillside slopes. For best results, slopes were sought rising from plains or from broad valley floors to a hilltop from 200 to 300 ft. high. An ideal slope was one uhich rose slowly from the plain at first and then rose more abruptly as it neared a rounded crest. From such a hilltop, gliders were launched most commonly by the so-called "shock-cord" method. A hook attached to the nose of the glider engaged a ring to which nas fastened two long lengths of rubber-stranded rope similar to that used in the shock-absorbing units of airplane landing gears. One or more persons would hold the glider stationary by grasping a short line fixed to its fuselage. Usually at least two other persons would stretch out each rubber-stranded rope until it reached its maximum stretch. Then, at a shouted signal, those holding the glider released it. Those stretching the ropes ran forward. The glider sprang forward and rose into the air, dropping the ring from its nose hook as it did so. From this point the subsequent flight varied with the nature of the aircraft involved. If it was of crude design its pilot could proceed out over the valley only in ever-descending flight. If of more advanced design, the pilot frequently was able to climb in the winds bloning up the face of the slope and remain for substantial periods in flight "crabbing" back and forth along the crest of the ridge.

Such were the main elements of the launching technique developed in Germany in the first decade after World War I. Young Americans were quick to substitute the auto-tom and the winch-tow techniques. In the first, a rope or cable 500 ft. or more in length is connected between the glider and the rear of an automobile. As the automobile moves across the field the glider rises much as a kite rises until several hundred feet in the air. At this point a hook and ring mechanism attached to the nose of the glider disengages the rope and the pilot is free to practise turns or other evolutions in a glide back to the field (or out over the valley if the launching takes place on a hilltop, but this is obviously no longer necessary). High-speed winches driven by automobile engine power have come into use as substitutes for the moving automobile. A final launching technique. used only by the most experienced pilots. is the airplane tow in which the sailplane is actually towed into the air behind a power-driven aircraft to be cut loose at any desired altitude.

Once launched, the pilot must, if he wishes to soar, immediately search out some current of air which is actually rising in relation to the surface of the earth beneath him. Experienced pilots find such currents along hillside slopes, beneath and within cumulus clouds and along fronts between narm and cold air masses. Long distance flights are frequently achieved through the use of all three types of currents. Altitude records are almost invariably set on flights within thunderhead cumuli. Ridge soaring is of limited use except in attempts merely to remain in the air for long periods.

GLINKA, KONSTANTIN DIMITRIEVICH (1867–1927), Russian soil scientist whose work had a tremendous influence throughout the world. He was born in Smolensk in Aug. 1867. While working for a degree in geology at the universities of Moscow and St. Petersburg, he became a student of V. V. Dokuchaiev, the founder of modern soil science (pedology). For the next 18 years he served as lecturer and professor at the Novo-Alexandria institute. In 1911 he returned to St. Petersburg and developed the first course in soil science there. Between 1908 and 1914 Glinka organized more than 100 soil-survey parties. He directed the soil survey of Siberia and of a part of European Russia. He published about 123 scientific books and papers and in 1927 with L. I. Prasolov, a soil map of the Soviet Union.

Although the general theory of soils as independent natural bodies had been proposed by Dokuchaiev and developed further by N. Sibirtsev, it was Glinka who organized the subject. His textbook, Soil Science, was first published in 1908 and went through three subsequent editions. Because of the language barrier, few outside of Russia read it. A German version, Die *Typen* der Bodenbildung, ihre *Klassifikation* und geographische Verbreitung, was published in 1914, and Curtis F. Marbut's translation appeared as The Great Soil Groups of the World and Their Development, 2nd ed. (1937). Glinka's influence reached its climax just before his death when he took an active part in the First International Congress of Soil Science held in the United States in 1927. He died on Nov. 2, 1927. See also RUSSIA: Soils and Their Influence; SOIL: Soil Classification. (C. E. K.)

GLINKA, MICHAEL IVANOVICH (1803–1857), Russian composer, was born at Novospassky, Smolensk, on June 2, 1803. The folk music of his native province made a deep impression on the child, and he himself said that perhaps the songs he heard in his early days suggested the idea to him of making use of the national music in his compositions. At 13 he was sent to an aristocratic school at St. Petersburg, the Blagorodrey pension, where he studied music under Carl Maier and John Field, the Irish composer and pianist, who had settled in Russia. In his 17th year he had already begun to compose romances and songs. From 1824 to 1828 he held a post in the civil service in St. Petersburg, and mixed in the literary and scientific society of the capital, where he had the reputation of being a good mathematician and something of a scientist. His thorough musical training began in 1830, when he spent three years in Italy studying the works of old and modern Italian masters. His thorough knowledge of the requirements of the voice may be connected with this course of study, but the study of Italian music did not wean him from his early passion for Russian national melody. His training as a composer was finished under the contrapuntist Dehn, with whom he stayed for several months at Berlin. In 1833 he returned to Russia. and devoted himself to operatic composition. On Sept. 27 (Oct. 9, N.S.), 1836, his opera *A* Life for the Tsar (the libretto by Baron de Rosen) was produced at St. Petersburg. This was the turning point in Glinka's life, and in Russian music, for the production marks the beginning of a Russian school of national music. The story is taken from the invasion of Russia by the Poles early in the 17th century, and the hero, Ivan Susanin, is a peasant. Glinka has wedded this patriotic theme to inspiring music. His melodies, moreover. show distinct affinity to the popular songs of the Russians, so that the term "national" may justly be applied to them. His appointment as imperial chapelmaster and conductor of the opera of St. Petersburg followed. His second opera *Russlan* and Ludmila, founded on Pushkin's poem, did not appear till 1842. Musically it was a great advance on *A* Life for the *Tsar*, but it had less popular success. Just as in his first opera he had contrasted Russian and Polish music, so in the second, oriental themes were set over against Russian melodies. An overture and four entreactes to Kukolnik's drama Prince Kholmsky followed. In 1844 Glinka went to Paris, where he made the acquaintance of Berlioz, and a mutual admiration sprang up between the two composers. Glinka's *Jota* Aragonesa (1847), and the symphonic work on Spanish themes, Une *Nuit à* Madrid, reflect the musical results of two years' sojourn in Spain. On his return to St. Petersburg he wrote and arranged several pieces for the orchestra, amongst which the so-called Kamarinskaya achieved popularity beyond the limits of Russia. He also composed numerous songs and romances. In 1852 he went abroad for the third time; he now wrote his autobiography, orchestrated Weber's Invitation *à* la valse, and began to consider a plan for a symphonic work on Gogol's *Taras-Bulba*. But he now developed a passion for ecclesiastical music, and went to Berlin to study the ancient church modes. There he died suddenly on Feb. 2, 1857.

See H. Berlioz, Michael Glinka (Milan, 1874); M. D. Calvocoressi, "Glinka," Les Musiciens *Célèbres* (Paris).

GLOBEFISH or SEA HEDGEHOG, the name of some sea fishes of the families Diodontidae and Tetrodontidae, which have the faculty of inflating their bodies by swallowing air or water. Their jaws resemble the beak of a parrot, the bones and teeth being coalesced into one sharp-edged mass. With these they are able to break off branches of corals, and to masticate other hard substances on which they feed. Usually they are of a short, thick, cylindrical shape, with weak fins. Their body is covered with tough skin, without scales, but provided with prickles, or variously formed spines. When they are inflated they assume a globular form, and the spines protrude, forming a defensive armour. A fish thus blown out with air turns over and floats belly upward, driving before the wind and waves. Many of these fishes are highly poisonous when eaten. They are most numerous in the tropics; a few species live in large rivers, as, for instance, Tetrodon fahaka, of the Nile. Nearly 100 species are known.

GLOBEFLOWER, any plant of the genus *Trollius* of the family Ranunculaceae (*q.v.*), of which there are about 15 species in northern regions. They take their name from the globelike shape of the flower. There are several North American and more Eurasian species, including the American globeflower (T. *laxus*), native to eastern North America, and the common European globeflower (T. europaeus). The latter is often cultivated, especially in some of its horticultural forms, one of which has orange flowers, while most species are yellow. Also cultivated is the handsome T. *ledebouri* from Siberia, often two to three feet high. (N. TR.)

GLOCKENSPIEL, or ORCHESTRAL BELLS, an instrument of percussion of definite musical pitch. used in the orchestra, and made in two or three different styles. The oldest form of *glockenspiel* consisted of a set of bells of graduated size mounted pyramid-fashion on a frame and played by one performer by means of steel hammers. The lyre-shaped glockenspiel, or steel harmonica (Stahlharmonika), is a newer model, which has instead of bells 12 or more bars of steel, graduating in size according to their pitch. These bars are fastened horizontally across two bars of steel set perpendicularly in a steel frame. Wagner has used the glockenspiel with exquisite effect in the fire scene of the last act of Die *Walküre* and in the peasants' waltz in the last scene of Die Meistersinger. When chords are written for the glockenspiel, as in Mozart's Magic Flute, the keyed harmonica is used. It consists of a keyboard having a little hammer attached to each key, which strikes a bar of glass or steel when the key is depressed.

STEEL-BARRED GLOCKENSPIEL

GLORIA, in general a doxology or ascription of praise, specifically two ancient Latin hymns Gloria in *excelsis* and Gloria Patri, referred to sometimes as the Greater and the Lesser Doxology respectively, and employed in the services of the Catholic Church.

The former, known as the angelic hymn, on the strength of a passage in Luke (ii, 14), is an important part of the Ordinary of the Mass; the latter is appended to the singing of the psalms.

For further particulars and for discussion of the Gloria in music, see MASS; also LITURGY, MISSAL and EUCHARIST.

GLORIOSA, a small genus of bulbous plants of the family Liliaceae (*q.v.*), natives of tropical Asia and Africa. They have slender stems which climb by tendrillike prolongations of the narrow generally lanceolate leaves. The flowers, which are borne in the upper leaf-axils, are very handsome. the six, generally narrow, orange or red petals are bent back and stand erect, the six stamens projecting beyond them. They are grown as greenhouse plants or outdoors in summer and often called climbing-lily or glory-lily.

GLORY, in works of art, is a general term for any radiance of light appearing around the body of a holy person, such as a nimbus, halo, aureole, mandorla or vesica *piscis*. Its purpose is to represent spiritual character through the symbolism of light. The sun disk was used in ancient Egypt to symbolize a divine being's specific relation to the sun. In Hellenistic and Roman art the sun god and emperors appear with a crown of rays. Because of its pagan origin, this form was avoided in early Christian art. By the 5th century, however, a disk-shaped form behind the head, called a nimbus or halo, was fully accepted. Originally reserved for Christ and the Virgin. the nimbus was soon used for the saints, also. A cross within a round nimbus became identified with representations of Christ in the middle ages. The triangular nimbus symbolized the Trinity. For some time, in the 5th century, living persons of eminence were equipped with a square nimbus; the memory of this custom is preserved in the academic mortarboard.

The aureole consists of a large circular or oval (from which the Italian name mandorla "almond") area representing illumination around the figure. Frequently, a nimbus was added. The aureole appeared only toward the end of the Romanesque period, probably inspired by the light symbolism of the Apocalypse. Its greatest artistic realization was reached in the 16th century when the abstract shape of the mandorla had changed into a more naturalistic representation of a radiating light (*e.g.,* Grunewald, "Ascension," Colmar; Raphael, "Liberation of St. Peter." Vatican).

In its development from the middle ages to the baroque the nimbus underwent a fuller artistic evolution than the aureole. Originally it appeared as a disk behind the head of the holy person. In Florentine painting of the Renaissance the disk began to be shown in perspective, following the movements of the figure. Increasingly, the nimbus became a material object and lost its spiritual quality (*e.g.,* angel in F. Cossa's "Annunciation," Dresden).

Another form of the nimbus became popular in Netherlandish painting of the 15th century. It consisted of a representation of light rays emanating from the head of the holy person (*e.g.,* the van Eyck altarpiece at Ghent). In this form, the historic character of the nimbus as a symbolic light m s recovered. A new idea was expressed by the German painters of the early 16th century who gave to the nimbus the character of a real light (*e.g.,* **A.** Diirer's engraving of "St. Jerome").

But it was only with Tintoretto in the middle of the 16th century that all these ideas were combined in one new form. The nimbus was now represented as a supernatural light emanating from the head of the holy person. This new interpretation was the standard form in the baroque period (*e.g.,* Rembrandt, "Christ at Emmaus." Louvre).

The nimbus as well as the aureole is also found in the Buddhist art of India. Their earliest date of appearance is the late 3rd century B.C. and it is likely that these ideas were originally brought to India by the Greek invaders.

See Joseph Wilpert, *Die roemischen Mosaiken* und *Malereien* der *kirchlichen Bauten* vom *4.–13. Jh.* (1917). (P. M. L.)

GLOSS AND GLOSSARY. The Greek word glossa, meaning originally a tongue, then a language or dialect, gradually came to denote any obsolete, foreign, provincial, technical or otherwise peculiar word or use of a word.

In late classical and medieval Latin, glosa was the vulgar and Romanic, glossa the learned form. The diminutive glossula occurs in Diomedes and elsewhere. The same meaning is borne by glos*sarium,* which also occurs in the modern sense of "glossary," as do the words giossa, glossae, *glossulae,* glossemata, expressed in later times by dictionarizrm, *dictionarius, vocabularium, vocabularius* (see DICTIONARY). Glossa and glossema are synonyms, signifying (1) the word which requires explanation; or (2) such a word (called lemma) together with the interpretation (*interpretamentum*); or (3) the interpretation alone.

Early History. — The making of collections and explanations of such glossai was at a comparatively early date a well-recognized form of literary activity. Even in the 5th century B.C., among the many writings of Abdera was included a treatise entitled Peri Homerou e *orthoepeies* kai glosseon. It was not, however, until the Alexandrian period that the glossographoi, glossographers (writers of glosses), or glossators, became numerous.

Of many of these perhaps even the names have perished; but Athenaeus the grammarian (c. A.D. 250) alone alludes to no fewer than 35. Among the earliest was Philetas of Cos (d. c. 290 B.C.), the elegiac poet, who mas the compiler of a lexicographical work entitled Atakta-or Glossai (sometimes Ataktoi glossai). Next came his disciple Zenodotus of Ephesus (early 3rd century B.C.), the compiler of Glossai Homerikai (uncommon words in Homer); he was succeeded by his greater pupil Aristophanes of Byzantium (c. 260–180 B.c.), whose great compilation Peri Lexeon (still partially preserved in that of Pollux), is known to have included Atttkai lexeis, Lakonikai glossai, and the like. From the school of Aristophanes issued more than one glossographer of name, — Diodorus, Artemidorus (Glossai, and a collection of lexeis *opsartytikai*), Nicander of Colophon (Glossai, of which some 26 fragments survive) and Aristarchus (c. 210 B.C.), the famous critic, whose numerous labours included an arrangement of the Homeric vocabulary (lexeis) in the order of the books. Contemporary with the last named was Crates of Mallus, who, besides making some new contributions to Greek lexicography and dialectology, was the first to create at Rome a taste for similar investigations in connection with the Latin idioms. From his school proceeded Zenodotus of Mallus, the compiler of *Ethnikai* lexeis or glossai, a work said to have been designed chiefly to support the views of the school of Pergamum as to the allegorical interpretation of Homer.

Of later date were Didymus Chalcenterus (c. 63 B.C.–A.D. 10), who made collections of lexeis *tragodoumenai komikai,* etc.; Apollonius Sophista (c. 20 B.C.), whose Homeric Lexicon has come down to modern times; and Neoptolemus. known distinctively as o glossoguaphos. In the beginning of the 1st century of the Christian era Apion, a grammarian and rhetorician at Rome during the reigns of Tiberius and Claudius, followed up the labours of Aristarchus and other predecessors with glossai Homerikai, and a treatise Peri tes *Rhomaikes dialektou;* Heliodorus or Herodorus was another almost contemporary glossographer; Erotian also, during the reign of Nero, prepared a special glossary for the writings of Hippocrates. To this period also Pamphilus, the author of the Leinzon, from which Diogenianus and Julius Vestinus afterward drew so largely, most probably belonged. In the following century one of the most prominent workers in this department of literature was Aelius Herodianus, whose treatise Peri *monerous* lexeos has been edited in modern times, and whose *Epimerismoi* survives in an abridgment; also Pollux, Diogenianus (Lexeis *pantodape*), Julius Vestinus (Epitome ton *Pamphilou glosson*) and especially Phrynichus, who flourished toward the close of the 2nd century, and whose *Eclogae nominum* et *verborum* Atticorum has frequently been edited.

To the 4th century belong Ammonius of Alexandria (*c.* 389), who wrote Peri *homoion,* kai *diaphoron* lexeon, a dictionary of words used in senses different from those employed by older and approved writers; Hesychius, nhose Lexikon has come down only in a 15th-century recension. From the jth century date, Cyril, the celebrated patriarch of Alexandria (one form of his work is the basis of Synagoge *lexeon* chresimon); Orus of Miletus (Peri *polysemanton* lexeon), and Orion of Egyptian Thebes who flourished in Alexandria, c. 425.

Compilations of *Justinian.*—To a special category of technical glossaries belong a large and important class of works relating to the law — compilations of Justinian. Although the emperor forbade under severe penalties all commentaries (*hypomnemata*) on his legislation, yet indexes (*indikes*) and references (*paratitla*), as well as translations (*hermeneiai kata* poda) and paraphrases (*hermeneiai* eis *platos*), were expressly permitted, and lavishly produced. Among the numerous compilers of alphabetically arranged *lexeis*

Rhomaikai or Lateinikai, and glossae nomikae, Cyril and Philoxenus are particularly noted; but the authors of paragraphai or semeioseis, whether exothen or esothen keimenai are too numerous to mention. A collection of these paragraphai ton *palaion,* combined with neai paragraphai on the revised code called ta basilika, was made about the middle of the 12th century by a disciple of Michael Hagiotheodorita. The collection of these glossaries is known as the Glossa ordinaria ton basilikon.

In Italy, also, during the period of the Byzantine ascendancy, and later, after the total extinction of Byzantine sway in the west, various glossae (glosae) and scholia on the Justinian code and various legal treatises were produced. The series of legal glossators was closed by Accursius (1182–1260) with the compilation known as the Glossa ordinaria or magistralis, the authority of which soon became very great. For some account of the glossators on the canon law, see CANON LAW.

Latin, like Greek glossography, had its origin chiefly in the practical wants of students and teachers, of whose names we only know a few. No doubt even in classical times collections of glosses (glossaries) were compiled, to which allusion seems to be made by Varro and Verrius-Festus. The scriptores glossematorum were distinguished from the learned glossographers like Aurelius Opilius, Servius Clodius, Aelius Stilo, L. Ateius Philologus, whose *liber* glossematorum Festus mentions.

Verrius Flaccus (who died under Tiberius), and his epitomists, Festus and Paulus, have preserved many treasures of early glossographers no longer extant. He copied Aelius Stilo, author of De *verborum* significatu, Aurelius Opilius, Ateius Philologus, the treatise De obscuris *Catonis.* He often made use of Varro and was also acquainted with later glossographers. Perhaps the glossae *asbestos* may be ascribed to him. Festus was used by Pseudo-Philoxenus (see below):

Bilingual Glossaries.—The bilingual (Gr.-Lat., Lat.-Gr.) glossaries also point to an early period, and were used by the grammarians (1) to explain the peculiarities (idiomata) of the Latin language by comparison with the Greek; and (2) for instruction in the two languages. The most important remains of bilingual glossaries are two well-known lexica; one (Latin-Greek), formerly attributed, but wrongly, to Philoxenus (consul A.D. 525), clearly consists of two closely allied glossaries (containing glosses to Latin authors, as Horace, Cicero, Juvenal, Virgil, the Jurists, and excerpts from Festus), worked into one by some Greek grammarian, or a person who worked under Greek influence (his alphabet runs A, B, G, D, E, etc.); the other (Greek-Latin) is ascribed to Cyril (Stephanus says it was found at the end of some of his writings), and is considered to be a compilation of not later than the 6th century. Furthermore, the bilingual medico-botanic glossaries had their origin in old lists of plants, as Pseudo-Apuleius in the treatise De *herbarum* virtutibus, and Pseudo-Dioscorides; the glossary, entitled Hermeneuma, printed from the Cod. Vatic. reg. Christ. 1260, contains names of diseases. Somewhat similar are names of animals in Polemius Silvius.

Of Latin glossaries of the first five or six centuries of the Roman emperors few traces are left, if Verrius-Festus is excepted. Of this early period we know by name only Fulgentius and Placidus. All that is known of the second of these tends to show that he lived in north Africa in the 6th century, from whence his glosses came to Spain, and were used by Isidore and the compiler of the *Liber* glossarum (see below). These glosses are known from (1) Codices Romani (15th and 16th centuries); (2) the Liber *glossarum;* (3) the Cod. Paris. nov. acquis. 1298 (11th century), a collection of glossaries, in which the Placidus-glosses are kept separate from the others. (Fabius Planciades) Fulgentius (*c.* A.D. 468–533) wrote Expositio *sermonum* antiquorum in 62 paragraphs, each containing a lemma (sometimes two or three) with an explanation giving quotations and names of authors. Next to him come the *glossae* Nonianae, which arose from the contents of the various paragraphs in Nonius Marcellus' work being written in the margin without the words of the text; these epitomized glosses were alphabetized and afterward copied for other collections. In a similar way arose the glossae Eucherii or glossae spiritales secundum *Eucherium episcopum* found in many manuscripts, which are an alphabetical extract from the formulae *spiritalis* intelligentiae of St. Eucherius, bishop of Lyons, c. 434–450. The so-called *Malberg* glosses, found in various texts of the Lex Salica, are not glosses in the ordinary sense of the word, but precious remains of the parent of the present literary Dutch, namely, the Low German dialect spoken by the Salian Franks who conquered Gaul from the Romans at the end of the 5th century. The antiquity and the philological importance of these glosses may be realized from the fact that the Latin translation of the Lex Salica probably dates from the end of the 5th century. See J. Grimm's preface to J. Merkel's edition (1850), and H. Kern's notes to J. H. Hessels's edition (1880) of the Lex Salica.

The Middle Ages.—During the 6th. 7th and 8th centuries glossography developed in various ways; old glossaries were worked up into new forms, or amalgamated with more recent ones. It ceased, moreover, to be exclusively Latin-Latin, and interpretations in Germanic (Old High German, Anglo-Saxon) and Romanic dialects took the place of or were used side by side with earlier Latin ones. Among Celtic glosses the most important are Old Irish, and of these Bishop Cormac's and O'Davoren's have been edited by Whitley Stokes, the former also by Kuno Meyer. The origin and development of the extant late classic and medieval glossaries can be traced with certainty. While reading the manuscript texts of classical authors, the Bible or early Christian and profane writers, students and teachers, on meeting with any obscure or out-of-the-way words which they considered difficult to remember or to require elucidation, wrote above them, or in the margins, interpretations or explanations in more easy or better-known words. The interpretations written above the line are called interlinear, those written in the margins of the manuscripts marginal glosses. Again, manuscripts of the Bible were often provided with interlinear literal translations.

Types of Glossaries.—I. From these glossed manuscripts and interlinear versions glossaries were compiled; that is, the obscure and difficult Latin words, together with the interpretations, were excerpted and collected in separate lists, in the order in which they appeared in the manuscripts, with the names of the authors or the titles of the books whence they were taken or placed at the head of each separate collection. In this arrangement each article by itself is called a gloss; when reference is made only to the word explained it is called the lemma, while the explanation is termed the *interpretamentum.* In most cases the form of the lemma was retained just as it stood in its source, and explained by a single word, so that lemmata appear in the accusative, dative and genitive, explained by words in the same cases; the forms of verbs were treated in the same way. Of this first stage in the making of glossaries, many traces are preserved, in the late 8th century Leyden Glossary, where chapter iii contains words or glosses excerpted from the Life of St. Martin by Sulpicius Severus; ch. iv, v and xxxv glosses from Rufinus, and so forth.

2. By a second operation the glosses came to be arranged in alphabetical order according to the first letter of the lemma, but still retained in separate chapters. Of this second stage the Leyden Glossary contains traces also.

3. The third operation collected all the accessible glosses in alphabetical order, in the first instance according to the first letters of the lemmata. Here the names of the authors or the titles could no longer be preserved, and consequently the sources of the glosses became uncertain.

4. A fourth arrangement collected the glosses according to the first two letters of the lemmata, as in the Corpus Glossary and in the still earlier Cod. Vat. 3321 (Goetz, *Corp.* iv, I sqq.), where even many attempts were made to arrange them according to the first three letters of the alphabet. A peculiar arrangement is seen in the Glossae *affatim* (Goetz, *Corp.* iv, 471 sqq.), where all words are alphabetized, first according to the initial letter of the word and then further according to the first vowel in the word (a, e, i, o. u).

No date or period can be assigned to any of the above stages or arrangements. For instance, the first and second are both found in the Leyden Glossary (end of 8th century) whereas the Corpus Glossary (beginning of 8th century) represents already the fourth stage. For the purpose of identification titles have been given to the various nameless collections of glosses, derived partly from their first lemma, partly from other characteristics, as glossae *abstrusae;* glossae *abavus major* and *minor;* g. *affatim;* g. *ab absens;* g. *abactor;* g. *Abba Pater;* g. *a, a;* g. *Vergilianae;* g. *nominum;* g. *Sangallenses.*

A chief landmark in glossography is represented by the *Origines* (*Etymologiae*) of Isidore (d. 636), an encyclopaedia in which he, like Cassiodorus, mixed human and divine subjects together, and the etymological part of which (book x) became a great mine for later glossographers. His principal source is Servius, the fathers of the church, and Donatus. Next comes the *Liber glossarum,* chiefly compiled from Isidore, but with all articles arranged alphabetically; its author lived in Spain *c.* A.D. 690–750; he has been called Ansileubus, but this name may be merely that of some owner of a copy of the book. Here come, in regard to time, some Latin glossaries already largely mixed with Germanic, more especially Anglo-Saxon interpretations: (1) the *Corpus Glossary* (eds. J. H. Hessels, W. M. Lindsay), of the beginning of the 8th century, in Corpus Christi college, Cambridge; (2) the *Leyden Glossary* (end of 8th century, ed. J. H. Hessels, Plac. Glogger), in Leyden manuscript Voss. Q° Lat. 69; (3) the *Epinal Glossary,* written in the beginning of the 9th century and published in facsimile by the London Philol. Society from the manuscript at Epinal; (4) the *Glossae Amplonianae, i.e.,* three glossaries preserved in the Amplonian library at Erfurt, known as Erfurt^1, Erfurt^2, and Erfurt^3, which are arranged alphabetically according to the first or the first two letters of the lemmata.

The first great glossary or collection of various glosses and glossaries is that of Salomon, bishop of Constance, who died A.D. 919. An edition of it was printed *c.* 1475 at Augsburg as *Salemonis ecclesie Constantiensis episcopi glosse ex illustrissimis collecte auctoribus.* Its sources are the *Liber glossarum,* the glossary preserved in the 9th-century manuscript *Lat Monac.* 14429, and the *Abavus major Gloss.* The *Liber glossarum* has also been the chief source for the important (but not original) glossary of Papias, of A.D. 1053, who also wrote a grammar chiefly compiled from Priscian. It is also the source of (1) the *Abba Pater Glossary,* published by G. M. Thomas (*Sitz. Ber. Akad. Münch.,* 1868, ii, 369 *sqq.*); (2) the Greek glossary *Absida lucida;* and (3) the Lat.-Arab. glossary in the *Cod. Leid. Scal. Orient.* No. 231 (published by Seybold in *Semit. Studien,* Heft xv–xvii, 1900). The *Paulus-Glossary* is compiled from the second *Salomon-Glossary* (*abacti magistratus*), the *Abavus major* and the *Liber glossarum,* with a mixture of Hebraica.

Osbern of Gloucester (*c.* 1123–1200) compiled the glossary entitled *Panormia* (ed. Angelo Mai as *Thesaurus novus Latinitatis,* from *Cod. Vatic.* reg. Christ. 1392), giving derivations, etymologies, testimonia collected from Paulus, Priscian, Plautus, Horace, Virgil, Ovid, Mart. Capella, Macrobius, Ambrose, Sidonius, Prudentius, Josephus, Jerome, etc. Osbern's material was also used by Hugucio, whose compendium was still more extensively used (Goetz enumerates 103 manuscripts of his treatise).

The great work of Johannes de Janua, entitled *Summa quae vocatur catholicon,* dates from the year 1286, and mostly uses Hugucio and Papias; its classical quotations are limited, except from Horace; it quotes the Vulgate by preference; it excerpts Priscianus, Donatus, Isidore, the fathers of the church; it borrows many Hebrew glosses, especially from Jerome; it mentions the *Graecismus* of Eberhardus Bethuniensis, the works of Hrabanus Maurus, the *Doctrinale* of Alexander de Villa Dei, and the *Aurora* of Petrus de Riga.

The gloss manuscripts of the 9th and 10th centuries are numerous, but a diminution becomes visible toward the 11th. A peculiar feature of the late middle ages are the medico-botanical glossaries based on earlier ones. The additions consisted in Arabic words with Latin explanations, while Greek, Latin, Hebrew and Arabic interchange with English, French, Italian and German forms. Glossaries of this kind are (1) the *Glossae alphita;* (2) *Sinonoma Bartholomei,* of the end of the 14th century, ed. J. L. G. Mowat; (3) the compilations of Simon de Janua (*Clavis sanationis,* end of 13th century), and of Matthaeus Silvaticus (*Pandectae medicinae,* 14th century).

There are many biblical glossaries, mostly mixed with glosses on other, even profane, subjects, as Hebrew and other biblical proper names, and explanations of the text of the Vulgate in general, and the prologues of Hieronymus. There is the *Glossae veteris ac novi testamenti* (beginning "Prologus graece latine praelocutio sive praefatio") in numerous manuscripts of the 9th to 14th centuries, mostly retaining the various books under separate headings. Special mention should be made of Guil. Brito, who lived about 1250, and compiled a *Summa* (beginning "difficiles studeo partes quas Biblia gestat pandere") which gave rise to the *Mammotrectus* of J. Marchesinus, about 1300, of which there are editions of 1470, etc. *See* also DICTIONARY.

Modern History.—The modern historical interest in glosses and glossaries began with J. Scaliger (1540–1609), who in his edition of Festus made great use of Ps.-Philoxenus, which enabled O. Müller, the later editor of Festus, to follow in his footsteps. Scaliger also planned the publication of a *Corpus glossarum,* and left behind a collection of glosses known as *glossae Isidori.* The study of glosses was greatly furthered through the publication, in 1573, of the bilingual glossaries by Henri Stephanus (Estienne). In 1600 Bonav. Vulcanius republished the same glossaries, adding (1) the *glossae Isidori,* which now appeared for the first time; (2) the *Onomasticon;* (3) *notae* and *castigationes,* derived from Scaliger. In 1606 Carolus and Petrus Labbaeus published, with the help of Scaliger, another collection of glossaries, republished, in 1679, by Du Cange, after which the 17th and 18th centuries produced no further glossaries, though glosses were constantly used or referred to by scholars at Leyden, where a rich collection of glossaries had been obtained by the acquisition of the Vossius library. In the 19th century came Osann's *Glossarii Latini specimen* (1826); the glossographical publications of Angelo Mai (*Classici auctores,* vol. iii, vi, vii, viii, 1831–36, containing Osbern's *Panormia,* Placidus and various glosses from Vatican manuscripts); Fr. Oehler's treatise (1847) on the *Codex Amplonianus* of Osbern, and his edition of the three Erfurt glossaries, so important for Anglo-Saxon philology; in 1854 G. F. Hildebrand's *Glossarium Latinum* (an extract from *Abavus minor*), preserved in a Cod. Paris. lat. 7690; in 1857, Thomas Wright's vol. of Anglo-Saxon glosses, which were republished with others in 1884 by R. Paul Wülcker under the title *Anglo-Saxon and Old English Vocabularies;* L. Diefenbach's supplement to Du Cange, entitled *Glossarium Latino-Germanicum mediae et infimae aetatis;* Ritschl's treatise (1870) on Placidus, which called forth an edition (1875) of Placidus by Deuerling; G. Loewe's *Prodomus Corporis Glossariorum Latinorum* (1876), and other treatises by him, published after his death by G. Goetz (1884); in 1885, H. Sweet, Latin-Anglo-Saxon glossaries in *Oldest English Texts;* in 1890, J. H. Hessels, apograph of the *Corpus Glossary,* 1906 of the *Leyden Glossary;* and in 1900, Arthur S. Napier, *Old English Glosses,* collected chiefly from Aldhelm manuscripts. Goetz's own great *Corpus glossariorum Latinorum,* appeared in seven volumes between 1888 and 1923, the last two being separately entitled *Thesaurus glossarum emendatarum,* containing many emendations and corrections of earlier glossaries by the author and other scholars. In the 20th century appeared W. M. Lindsay's *Corpus Glossary* and *The Corpus, Epinal, Erfurt, and Leyden Glossaries* both in 1921 and his *Palaeographia Latina,* in 1922. W. M. Lindsay with the collaboration of J. Whatmough, J. F. Mountford, J. H. Thomson *et al.,* edited *Glossaria Latina* (4 volumes) in 1926–1930 for the British Academy.

BIBLIOGRAPHY.—Among encyclopaedic articles the chief are J. Tolkiehn's article "Lexicographie" and G. Goetz's article "Lateinische Glossographie" in Pauly-Wissowa's, *Real-Encyclopädie der classischen Altertumswissenschaft.* Comparable to Goetz's *Corpus* is the great collection of Steinmeyer and Sievers, *Die althochdeutschen Glossen,* 4 vol. (1879–98), containing a vast number of glosses culled from Bible manuscripts and manuscripts of classical Christian authors. See also many important articles in *Anglia, Englische Studien, Archiv f. latein Lexicographie, Romania, Zeitschr. für deutsches Alterthum, Journal of English and Germanic Philology, American Journal of Philology, Classical Review.* On glossai *see* J. Whatmough, *Poetic, Scientific, and Other Forms of Discourse,* ch. 4 (1957); Lindsay and J. H. Thomson, *Ancient Lore in Mediaeval Latin Glossaries* (1921) is an important guide to the problem of gloss derivation. Modern writers on dialects commonly extract relevant items, *e.g.,* F. Bechtel, *Die Griechischen Dialekte,* 3 vol.

(1921–24); J. Whatmough, *Dialects of Ancient Gaul* (1949–51).
(J. H. Hes.; C. T. O.; J. Wh.)

GLOSSOP, an industrial town and municipal borough (1866) in the High Peak parliamentary division of Derbyshire, Eng., 14 mi. E.S.E. of Manchester by road. Pop. (1951) 18,004. Area 5.2 sq.mi. It is a centre of cotton manufacture in Derbyshire and has also woolen and paper mills, dye, print and bleaching works. It is situated near the northwestern boundary of Derbyshire, being built on the foothills which lead to Kinder Scout, the highest point of the Peak district (*q.v.*), and is surrounded on three sides by the Peak District National park. Although an industrial town, mostly stone built, its unique position as the natural gateway to the Peak makes it also a residential brea. Glossop hall, formerly the seat of Lord Howard, lord of the manor, was acquired by the corporation and houses Kingsmoor mixed boarding school. On a hill near the town is Melandra castle, the site of a Roman fort guarding Longdendale and the way into the Peak district. To the north, in Longdendale, there are five reservoirs belonging to the water-supply system of Manchester.

GLOUCESTER, GILBERT DE CLARE, Earl of (1243–1295), 8th earl of Gloucester and 9th earl of Clare, was born at Christchurch, Hampshire, on Sept. 2, 1243. He married Alice of Angoulême, niece of king Henry III, succeeded his father in July 1262, and joined the baronial party led by Simon de Montfort. With Simon Gloucester was at the battle of Lewes in May 1264, when the king himself surrendered to him, and after this victory he was one of the three persons selected to nominate a council. Soon, however, he quarreled with Simon. Leaving London for his lands on the Welsh border he met Prince Edward, afterward king Edward I, at Ludlow, just after his escape from captivity, and contributed largely to the prince's victory at Evesham in August 1265. But this alliance was as transitory as the one with Leicester. Gloucester championed the barons who had surrendered at Kenilworth in November and December 1266, and after putting his demands before the king, secured possession of London (April 1267). The earl quickly made his peace with Henry III and with Prince Edward. Under Edward I he spent several years in fighting in Wales, or on the Welsh border; in 1289 when the barons were asked for a subsidy he replied on their behalf that they would grant nothing until they saw the king in person (nisi *prius personaliter viderent* in *Anglia* faciem *regis*), and in 1291 he was fined and imprisoned on account of levying private war on Humphrey de Bohun, earl of Hereford. Having divorced his wife Alice, he married in 1290 Edward's daughter Joan, or Johanna (d. 1307). The "Red Earl," as he is sometimes called, died at Monmouth on Dec. 7, 1295, leaving in addition to three daughters a son. Gilbert, earl of Gloucester and Clare, killed at Bannockburn.

See references under Montfort, Simon de.

GLOUCESTER, HUMPHREY, Duke of (1391–1447), the fourth son of Henry IV by Mary de Bohun, was born in 1391. He was created duke of Gloucester by Henry V at Leicester on May 16, 1414. He served in the war next year, and was wounded at Agincourt, where he owed his life to his brother's valour. In the second invasion of France Humphrey commanded the force which during 1418 reduced the Cotentin and captured Cherbourg. Afterwards he joined the main army before Rouen, and took part in subsequent campaigns till January 1420. He then went home to replace Bedford as regent in England, and held office till Henry's own return in February 1421. He was again regent for his brother from May to September 1422.

Henry V measured Humphrey's capacity, and by his will named him merely deputy for Bedford in England. Humphrey at once claimed the full position of regent, but the parliament and council allowed him only the title of protector during Bedford's absence, with limited powers. He married (1423) Jacoba of Bavaria, heiress of Holland. to whose lands Philip of Burgundy had claims. In October 1424 Humphrey took up arms in his wife's behalf, but after a short campaign in Hainault went home, and left Jacoba to be overwhelmed by Burgundy. His marriage was annulled in 1428. Returning to England in April 142j he entangled himself in a quarrel with the council and his uncle Henry Beaufort, and stirred up a tumult in London. Open war was averted only by Beaufort's prudence, and Bedford's hurried return. With some difficulty Bedford effected a formal reconciliation at Leicester in March 1426. To check his indiscretion the council, in November 1429, had the king crowned, and so put an end to Humphrey's protectorate, but during Henry VI's absence in France he acted as warden in England. The defection of Burgundy roused English feeling, and Humphrey won popularity as leader of the war party. In 1436 he commanded in a short invasion of Flanders. In 1441 Eleanor Cobham, his former mistress, whom he had married (about 1430), was charged with practising sorcery against the king, and Humphrey had to submit to see her condemned, and her accomplices executed. Nevertheless, he continued to thwart Suffolk, who was now taking Beaufort's place in the council, by opposing the king's marriage to Margaret of Anjou. Under Suffolk's influence Henry VI grew to distrust his uncle altogether. The crisis came in the parliament of Bury St. Edmunds in February 1447. Immediately on his arrival there Humphrey was arrested, and four days later, on Feb. 23, he died.

Humphrey was buried at St. Albans Abbey, in a fine tomb, which still exists. He was long remembered, in spite of his bad political record, as the good Duke Humphrey, on account of his liberal patronage of scholars and of learning.

The most important contemporary sources are Stevenson's *Wars of the English in France*, Whethamstead's *Register*, and Beckington's *Letters* (all in the "Rolls Series"), with the various *London Chronicles*, and the works of Waurin and Monstrelet. For his relations with Jacoba *see* F. von Löher's *Jacobaa von Bayern und ihre Zeit*, 2 vols., (1869). For other modern authorities consult W. Stubbs's *Constitutional History; J. H.* Ramsay's *Lancaster and York; Political History of England*, vol. iv.; R. Pauli, *Pictures of* Old *England*, pp. 373–401 (1861); and K. H. Viekers, *Humphrey, Duke of Gloucester* (1907).

GLOUCESTER, RICHARD DE CLARE, Earl of (1222–1262), 7th earl of Gloucester, 6th earl of Hertford and 8th earl of Clare, was born on Aug. 4, 1222, the son of Gilbert de Clare, 6th earl of Gloucester and 7th earl of Clare. Upon his father's death in Oct. 1230, Richard succeeded to the earldoms. He refused to help Henry III on the French expedition of 1253, but was afterward with the king at Paris. Thereafter he went on a diplomatic errand to Scotland and was sent to Germany to work among the princes for the election of his stepfather, Richard, earl of Cornwall, as king of the Romans. About 1258 Gloucester became a leader of the barons in their resistance to the king, and he was prominent during the proceedings which followed the Mad parliament at Oxford in 1258. In 1259, however, he quarrelled with Simon de Montfort, earl of Leicester; the dispute, begun in England, was renewed in France and he was again in the confidence of the king. This attitude, too, was only temporary, and in 1261 Gloucester and Leicester were again working in concord. The earl died at his residence near Canterbury on July 15, 1262, and his son (see Gloucester, Gilbert de Clare) succeeded to the earldoms.

GLOUCESTER, ROBERT, Earl of (d. 1147), was a natural son of Henry I of England. He mas born, before his father's accession, at Caen in Normandy; but the exact date of his birth, and his mother's name are unknown. His father married him to a daughter of Robert Fitz Hamon, heiress of the lordships of Gloucester and Glamorgan. About 1121 the earldom of Gloucester was created for his benefit. After his father's death, he was sedulously courted by the rival parties of his half-sister the empress Matilda and of Stephen. He tendered his homage to Stephen upon strict conditions, the breach of which should be held to invalidate the contract. But in 1137 Robert left England for Normandy, renewed his relations with the Angevin party, and in 1138 sent a formal defiance to the king. Returning to England in 1139, he revolted, and won the greater part of western England and the south Welsh marches for the empress. By the battle of Lincoln (Feb. 2, 1141), in which Stephen was taken prisoner, the earl made good Matilda's claim to the whole kingdom. He accompanied her to Winchester and London; but was captured by the king's supporters after the siege of Winchester. He was exchanged for Stephen, and after his release continued to fight for Matilda until his death on Oct. 31, 1147.

J. H. Round, *Geoffrey de Mandeville* (1892); and O. Rossler, *Kaiserin Mathilde* (1897).

GLOUCESTER, THOMAS OF WOODSTOCK, DUKE OF (1355–1397), seventh and youngest son of the English king Edward III, was born at Woodstock on Jan. 7, 1355. Having married Eleanor (d. 1399), daughter and co-heiress of Humphrey de Bohun, earl of Hereford, Essex and Northampton (d. 1373), Thomas became constable of England, and was made earl of Buckingham by his nephew, Richard II, at the coronation in July 1377. He helped to defend the English coasts against the attacks of the French and Castilians, led an army through northern and central France, and unsuccessfully besieged Nantes.

Returning to England early in 1381, Buckingham found that his brother, John of Gaunt, duke of Lancaster, had married his wife's sister, Mary Bohun, to his own son, Henry, afterward King Henry IV. The relations between the brothers, already somewhat strained, were not improved by this proceeding. After taking some part in crushing the rising of the peasants in 1381, Buckingham became more friendly with John of Gaunt; and while marching with the king into Scotland in 1385 was created duke of Gloucester. Lancaster having left the country, Gloucester headed the party opposed to the royal advisers, Michael de la Pole, earl of Suffolk and Robert de Vere, earl of Oxford, whose recent elevation to the dignity of duke of Ireland had aroused profound discontent. Gloucester forced on the dismissal and impeachment of Suffolk; was a member of the commission appointed in 1386 to reform the kingdom and the royal household; and took up arms when Richard began proceedings against the commissioners. After defeating Vere at Radcot in December 1387 the duke and his associates entered London to find the king powerless in their hands.

Gloucester was restrained by his colleagues from deposing the king; but, as the leader of the "lords appellant" in the "Merciless Parliament," (February 1388), he took a savage revenge upon his enemies.

In 1396 uncle and nephew were again at variance. Gloucester disliked the peace with France and Richard's second marriage with Isabella of France; it was asserted that the duke was plotting to seize the king. On July 11, 1397 he was arrested by the king himself at his residence, Pleshey castle, Essex. He was taken at once to Calais, and it is probable that he was murdered by order of the king on Sept. 9 following.

Gloucester had one son. Humphrey (*c.* 1381–1399), who died unmarried, and four daughters, the most notable of whom was Anne (*c.* 1380–1438), who was successively the wife of Thomas, 3rd earl of Stafford. Edmund, 5th earl of Stafford and William Bourchier, count of Eu. Gloucester is supposed to have written *L'Ordonnance d'Angleterre pour le camp à l'outrance, ou gaige de bataille.*

GLOUCESTER (abbreviated as pronounced *Glo'ster*), city, county and parliamentary borough, port. county and cathedral town, Gloucestershire, Eng., 103 mi. W.N.W. of London by road. Pop. (1951) 67,280. Area 8.2 sq.mi. Gloucester lies on the River Severn between the Cotswolds, on the east, and the northern part of the Forest of Dean. The Gloucester and Berkeley or Gloucester and Sharpness ship canal, opened in 1827, runs 16 mi. S.W. to Sharpness docks in the Severn estuary.

The cathedral originated in the foundation of an abbey in 681, the present church being dedicated in 1100 and its first mitred abbot being appointed in 1381. At the Dissolution the abbey was disbanded and became the seat of a bishopric with the abbey church of St. Peter as its cathedral, rededicated to the Holy and Indivisible Trinity. Gloucester lay in the see of Worcester until 1541 when the separate see was constituted, with John Wakeman, last abbot of Tewkesbury, as first bishop. The diocese covers the greater part of Gloucestershire, with small parts of Wiltshire, Oxfordshire, Worcestershire, Herefordshire and Warwickshire. The cathedral consists of a Norman nucleus, with additions in every style of Gothic architecture, being especially rich in early Perpendicular work. It is 420 ft. long and 144 ft. broad and its beautiful 15th-century pinnacled tower, with an internal flying buttress, rises 225 ft. The nave is massive Norman with Early English roof; the aisles, chapter house and crypt, which is one of the four apsidal cathedral crypts in England, are Norman. The choir has Perpendicular tracery over Norman work and the splendid east window is the largest Perpendicular window in England. Between the apsidal chapels is a Perpendicular cross Lady chapel and north of the nave are the cloisters with the first example of fan vaulting (1351–77). There are shrines of Osric, Edward II, Robert Curthose (eldest son of William the Conqueror), Bishop Warburton, Edward Jenner and others. The Festival of the Three Choirs is held annually in this cathedral (the first time being in 1724), and those of Worcester and Hereford in turn.

Gabled and timbered houses preserve the ancient aspect of the city and there are some Regency terraces. None of the old public buildings is left, but the New inn (early 15th century), a beautiful timbered house with a galleried courtyard, was one of the original pilgrim hostels. The Bell inn (1650) was the birthplace of George Whitefield and Cardinal Vaughan. The Fleece hotel has a galleried courtyard (16th century) and a 12th-century vaulted cellar. Bishop Hooper's lodging (16th century) was opened as a folk museum in 1935. Of the churches St. Mary-de-Lode, with a Norman tower and chancel, is on the site of a Roman temple; St. Mary-de-Crypt is from the 11th century; St. Michael's was connected with the ancient abbey of St. Peter; and St. Nicholas' was originally the chapel of St. Batholomew's hospital (12th century). Near St. Mary-de-Crypt are remains of Greyfriars and Blackfriars priories and of the city wall. There are three endowed schools: the King's Cathedral school (1545); the Crypt grammar school, founded by Dame Joan Cooke (1539); and Sir Thomas Rich's school (1666). Robert Raikes held the first Sunday school in Gloucester in 1780.

Gloucester possesses factories for making railway rolling stock, aircraft and components, agricultural implements, "permali" (an insulating material), aluminum bungalows, furniture, matches, cine-cameras, etc., and has heavy and light engineering works, shipyards and many long-established timber mills. Its principal imports are timber, grain and petroleum products; its main exports are its own manufactured goods. It is also a market town.

The Severn fisheries for salmon and lampreys are important and in 1953 the city high sheriff revived the custom (begun in the reign of Henry I) of sending a lamprey pie to the sovereign. The tidal bore in the river attains its extreme height, 9 ft., just below the city, at Stonebench.

History.—Gloucester *(Caer Glow, Gleawecastre)* was the Roman municipality or *colonia* of *Glevum,* founded by Nerva, A.D. 96–98. Its situation and the foundation in 681 of the abbey of St. Peter by King Osric favoured the growth of the town. It became the capital of Mercia and before the Conquest was a borough with a royal residence and a mint. It has been granted numerous fairs and charters, the first by Henry II, and was incorporated by Richard III in 1483, being made a county in itself. The chartered port of Gloucester dates from 1580. James I raised Gloucester to city status in 1605. Its iron trade dates from before the Conquest, tanning was carried on before the reign of Richard III, bell-founding was introduced in the 14th and pin-making in the 17th century, and the long-existing coal trade became important in the 18th century. The cloth trade flourished from the 12th to the 16th century. The sea-borne trade in corn and wine existed before the reign of Richard I.

The town formerly returned two members to parliament, but after 188j returned one member.

GLOUCESTER, a manufacturing, fishing and summer resort city of Essex county on Cape Ann in northeastern Massachusetts, U.S., was originally settled in 1623. During the 17th and 18th centuries, Gloucester flourished as a shipbuilding, maritime and fishing centre, in competition with nearby Salem and Newburyport. The first ship to be called a schooner is said to have been built in Gloucester about 1713. Along with manufacturing, fishing and a declining foreign commerce dominated Gloucester's economic life during the 19th century. After 1900 the economy was primarily industrial, with fish processing the leading industry. Secondary dependence was on fishing and on a large seasonal tourist and resort business. drawn to Cape Ann by historical associations, the scenic rocky coast and salt-water recreational facilities, and to the city by its picturesque water-front, narrow streets and weathered colonial buildings. Of special interest are the reef of Xorman's Woe on the east coast of Cape Ann where occurred the wreck of the "Hesperus," immortalized in Longfellow's famous poem; Hammond's castle; and the well-known bronze statue of a fisherman, a memorial to Gloucestermen lost at sea.

In the later 19th and early 20th centuries, immigrants from Portugal, Italy and a few from the Scandinavian countries settled in Gloucester, adding their traditions to its culture.

Incorporated as a town in 1642 and as a city in 1873, it adopted the council-manager form of government in 1949. For comparative population figures see table in MASSACHUSETTS: *Population.*

Gloucester is described in many books including: Rudyard Kipling, *Captains Courageous;* James B. Connolly. *Gloucestermen* (1930) ; and Percy MacKaye, *Dogtown Common* (1921). Samuel Chamberlain's *Gloucester and* Cape Ann (1938) includes many photographs of the area. (E. L. S.)

GLOUCESTER CITY, originally the seat of Old Gloucester county, became a part of Camden county, in southwestern New Jersey, U.S., when Camden county was detached in 1844.

Gloucester city is on the Delaware river, opposite Philadelphia, Pa., and adjoins the city of Camden on its southern boundary.

The first settlement occurred in 1623, when Fort Nassau, the first Dutch outpost in the Delaware valley, was built near the mouth of Big Timber creek. In 1664 the English gained control and in 1677 a group of Irish Quakers occupied what the Indians called Arwamus. This was renamed Gloucester point after a place on the Severn river in England.

Prior to the American Revolution, Elizabeth Griscom, better known as Betsy Ross (*q.v.*), eloped from Philadelphia to Gloucester City where she married John Ross at Hugg's tavern. For this she was "read out of meeting" by the Quakers in 1774. Hugg's tavern was razed in 1929 to make way for a county park.

Incorporated as a city in 1868, Gloucester City grew with the expansion of the nearby shipbuilding works started in 1899 in Camden. In the second half of the 20th century its industries included the manufacture of building materials and roofing, paperboard boxes. cork products, infants dresses and chemicals. In 1957 it became the site of the New Jersey end of the Walt Whitman bridge over the Delaware. For comparative population figures see table in NEW JERSEY: Population. (H. F. WI.)

GLOUCESTERSHIRE, a county of the west midlands of England, bounded by Worcestershire, Warwickshire. Oxfordshire, Berkshire, Wiltshire, Somersetshire, Monmouthshire and Herefordshire. The area of the geographical county is 1,257.7 sq.mi.

Physical Features. — The outline is very irregular. but three physical divisions are well marked — the Cotswold hills. the vale of Severn and the Forest of Dean. (1) The eastern part of the county lies in the uplands of the Cotswolds (*q.v.*) whose westward face is the steep scarp slope made by the edge of the limestones. The line of heights. of an average elevation of joo ft. but exceeding 1.000 ft. at some points, bisects the county from southwest to northeast. The watershed between the Thames and Severn lies close to it. Thames Head near Cirencester and most of the upper feeders of the Thames being in Gloucestershire. (2) The rich valley of the lower Severn can be separated into the vale of Gloucester and, south of this and east of the Severn estuary, the vale of Berkeley. The great River Severn receives, near Tewkesbury, the Stratford Avon which joins it on the left. The latter is to be distinguished from the Bristol Avon, which rises in the county as an eastward flowing stream of the Cotswolds, sweeps round through Wiltshire. pierces the hills through a narrow valley which becomes a gorge where the Clifton suspension bridge crosses it below Bristol, and enters the Severn estuary at Avonmouth. For 1; mi. from its mouth it forms the boundary between Gloucestershire and Somersetshire, and for 8 mi. it is an important commercial waterway connecting the port of Bristol with the sea. The third great tributary of the Severn is the Wye. From its mouth in the estuary, 8 mi. north of that of the Bristol Avon, it forms the county boundary for 16 mi. northward and above this, over two short reaches of its beautiful winding course. it is again the boundary. (3) Between the Wye and the Severn lies the Forest of Dean, which, unlike the majority of English forests, maintains its ancient character. (*See* DEAN, FOREST OF.) There the collieries are hidden among the dense oak forest.

None of the minor rivers of the county is long. The vale is at no point within the county wider than 20 mi., and so does not permit the formation of any considerable tributary to the Severn from the Dean hills on the one hand or the Cotswolds on the other. The Leadon rises east of Hereford and joins the Severn near Gloucester. In the southern part the Stroud Frome traverses a narrow, picturesque and populous valley, and the Little Avon flows past the town of Berkeley, joining the Severn estuary on the left. The Bristol Frome runs southward to the Bristol Avon at Bristol. The principal northern feeders of the Thames are the Churn rising in the Seven Springs above Cheltenham. the Coln, a noteworthy trout stream, the Windrush and the Evenlode.

Geology. — Gloucestershire is divided. geologically as well as physically, into three distinct sections — the Mesozoic rocks on the east, the Palaeozoic and older rocks on the west and the heavy clay soil of the Severn valley between.

Rising up almost sheer from the Severn on the west is the plateau of the Forest of Dean which is a basin of Carboniferous rocks (limestones, shales, grits and coal measures) resting upon the Old Red Sandstone, the Carboniferous limestones forming scarp faces round most of the outlier. South of the Severn is the Bristol coal field. with Silurian rocks and included volcanic rocks north and northeast of it. The Silurian occurs as inliers (*e.g.,* Tortworth) and Old Red Sandstone rocks crop out beneath the Carboniferous of the coal field. Jurassic and Triassic rocks also occur. resting upon the older rocks. In the vale of the Severn, carved out by the river. the structure is comparatively simple. Between the Malvern hills and the Jurassic escarpment of the Cotswolds is a broad belt of clays, the Triassic on the west separated from the Liassic by a low wooded ridge of blue limestone. It is these soils which yield such excellent crops. The limestones forming the Cotswold hills lie more or less horizontally. Many of them are oölitic and are used for the beautiful Cotswold buildings. Small outliers appear in Robin's Wood hill (651 ft.), south of Gloucester, and Churchdown hill (511 ft.), between Gloucester and Cheltenham.

Early Settlement and History.—The most interesting prehistoric feature of Gloucestershire is its wealth of long barrows, two of the best examples being those at Belas Knap near Winchcomb and Hetty Pegler's Tump at Uley (*see* O. G. S. Crawford, *Ord. Survey, Professional Papers,* New Series no. 6 [1922]). Almost as striking is the absence of Beaker pottery so abundant in Wiltshire to the south and Oxfordshire to the east. The lower Severn valley was apparently largely forest and swamp in early times. The Cotswolds are again remarkably poor in brooches of the first period of La Tene though Wiltshire and Oxfordshire are again rich. In Roman times the Fosse way from Exeter via Seaton and Bath to Lincoln ran east of the Cotswold ridge with *Corinium* (Cirencester) as a station on it and branches west to *Glevum* (Gloucester), southeast and east.

There were numerous Roman villas not far from these roads, one of the largest and most magnificent in Britain being that at Woodchester.

The English conquest of the Severn valley began in 577. The Hwicce (*q.v.*) who occupied the district were an Anglo-Saxon people, but their territory had become a dependency of Mercia in the 7th century. No important settlements were made by the Danes. Gloucestershire probably originated as a shire in the 10th century and is mentioned by name in the *Anglo-Saxon* Chronicle in 1016. Toward the close of the 11th century the boundaries were readjusted to include Winchcomb, and at the same time the forest district between the Wye and the Severn was added to Gloucester. The divisions of the county for a long time remained very unsettled and at the time of the Norman invasion it offered slight resistance to the Conqueror. In the wars of Stephen's reign the cause of the empress Maud was supported by Robert of Gloucester who had rebuilt the castle at Bristol, and the castles at Gloucester and Cirencester mere also garrisoned on her behalf. Bristol and Gloucester actively supported the Yorkist cause during the Wars of the Roses. In 1643 Bristol and Cirencester were captured by the Royalists. but the latter was recovered in the same year and Bristol in 1645. Gloucester was garrisoned for the parliament throughout the struggle.

On the subdivision of the Mercian diocese in 680 the greater part of modern Gloucestershire was included in the diocese of Worcester, and shortly after the Conquest constituted the archdeaconry of Gloucester. The district west of the Severn, with the exception of a few parishes, was within the diocese of Hereford. In 1541 the diocese of Gloucester was created, its boundaries being identical with those of the county. On the erection of Bristol to a see in 1542 the deanery of Bristol mas transferred from Gloucester to that diocese. In 1836 the sees of Gloucester and Bristol were united; but in 1897 the diocese of Bristol was recreated, and included the deaneries of Bristol, Stapleton and Bitton. After the Conquest extensive lands and privileges were acquired by the church, the abbey of Cirencester alone holding seven hundreds. The large estates held by Roger, earl of Hereford, son of William Fitz-Osbern, escheated to the crown in 1075. The Berkeleys have held lands in Gloucestershire from the time of the Domesday survey, and the families of Basset, Tracy. Clifton, Dennis and Poyntz have figured prominently in the annals of the county. Gilbert de Clare, earl of Gloucester, and Richard, earl of Cornwall, king of the Romans, claimed extensive lands and privileges in the shire of the 13th century, and Simon de Montfort owned Minsterworth and Rodley.

In the Cotswold region the churches typically show Romanesque and Perpendicular work, thus illustrating two special periods of economic development in the county related to the manors and the wool trade respectively.

Bristol was made a county in 1373, and in 1483 Richard III created Gloucester an independent county, and both have continued to rank as independent counties, with separate jurisdiction, county rate and assizes. The chief officer of the Forest of Dean was the warden, who was generally also constable of St. Briavel castle. The first justice seat for the forest was held at Gloucester castle in 1282, the last in 1635.

Iron was worked in the county in Roman times and later, and the forest district was one of the chief sources of iron in the country until the 16th century. The Cotswolds became famous for their sheep flocks and wool in the 1 jth century which witnessed the expansion of such beautiful towns as Chipping Campden. Many of the forests had tanneries, and boat building was carried on because timber was available. Silk weaving was introduced in the 17th century and prospered in the Stroud valley. These varied industrial developments promoted the building of houses of local limestone specially characteristic of Cotswold country. The abundance of clay on the edges of the plains promoted industries of bricks, tiles and potteries. Accessory industries, such as the making of pins, buttons, lace, stockings, rope and sailcloth grew up in the 17th and 18th centuries and a good deal of flax was grown. The advent of coal and steam machinery ended the modified and somewhat reduced woollen industry, but the presence of water power and of fuller's earth led the district (especially Stroud) to specialize in the manufacture of broadcloth. Gloucester (*q.v.*) u-as a port of some consequence and Bristol (*q.v.*) very important. The Cotswolds have become a holiday and residential area.

Antiquities. — At Chedworth, near Cirencester, there are well preserved remains of Roman baths. The villa at Woodchester, the existence of which has been known since 1693, is of the courtyard type. The most remarkable feature is the great pavement, an unusually fine piece of mosaic work, 48 ft. 10 in. square. The cathedrals of Gloucester and Bristol, the magnificent abbey church of Tewkesbury, and the church of Cirencester with its great Perpendicular porch, are described under their separate headings. Of the abbey of Hailes near Winchcombe, founded in 1246, little more than the foundations are left. Most of the old market towns have fine parish churches: at Deerhurst, Coln Rogers and Bibury, there are churches of special interest because of their pre-Norman work. Bibury also has a famous row of 17th-century cottages called Arlington Row. Norman doorways are found in the beautiful church at Bishop's Cleeve, near Cheltenham; the Perpendicular church at Lechlade is unusually perfect; and that at Fairford, built c. 1500, contains a remarkable series of stained glass windows. The great Decorated Calcot Barn is an interesting relic of the monastery of Kingswood near Tetbury. The castle at Berkeley is a splendid example of a feudal stronghold; Thornbury castle is a lovely Tudor ruin. Near Cheltenham is a fine 15th-century mansion of timber and stone, which contains a tiled floor from Hailes abbey. Near Winchcombe (*q.v.*) is Sudeley castle (15th century). At Great Badminton is the mansion and vast domain of the Beauforts.

Agriculture and Industries. — Most of the county is under permanent pasture for the cattle in the numerous small dairy farms, and for sheep. The larger farms are in the Cotsmolds. Arable farming is declining though wheat. the chief grain crop. oats and barley are still important. In the vale, the deep rich black (Lias) or red (Trias) loamy soil is well adapted for pasturage. and a moist mild climate favours the growth of grasses and root crops, though less of the latter has been grown since the falling-off in sheep production. The cattle, save on the frontier of Herefordshire, are mostly shorthorns, of which many are fed for distant markets, and many reared and kept for dairy purposes. The rich grazing tracts of the vales of Berkeley and of Gloucester produce butter. A feature of the county is its apple and pear orchards. chiefly for the manufacture of cider and perry, which are attached to every farm. The Cotswold district is comparatively barren except in the valleys (though beech woods cover much of the scarp face), but it has been famous since the 15th century for the breed of sheep named after it. Oats and barley are the chief crops.

In 1953 the National trust owned 2,853 ac. including Roman remains and historic buildings, and protected 211 ac. in the county. The Severn Wildfowl trust has its headquarters on an area of land reclaimed from the river and known as the New Grounds on the left bank of the Severn near Slimbridge.

The most important industrial centre of the county is Bristol. As a port and with an extensive trade with the West Indies, such industries as the manufacture of tobacco, cocoa and chocolate, sugar refining and soap have become important. The leading industry, however, is engineering with aircraft manufacture predominating. There are also iron foundries, chemical works, shipbuilding yards, breweries, glass, earthenware and furniture factories and a long-established plastics factory. The district around Stroud is famous for the manufacture of the woollen cloth known as broadcloth, and hardware is also made in this neighbourhood. Gloucester manufactures railway cars. freight cars, agricultural implements, prefabricated houses, matches, aircraft and aircraft components. There are a number of smaller industries in the Cheltenham area. In other scattered parts of the county, gloves and silk manufactures and engineering are carried on. At Lydney tinplate and plywood are produced and at Coleford is a large factory for extracting fruit juice. Coal is mined in the Forest of Dean and the Bristol coal fields, limestone and freestone are quarried in the Cotswolds, bricks and tiles manufactured from the Lias clays. In the southern part of the county strontium is found.

There are a number of important public schools and colleges, and Bristol is the seat of a university.

The Thames and Severn canal starts from the Thames at Lechlade, but the section between Stroud and the Thames has been abandoned and the remainder is seldom used. It rises to a summit level in the tunnel (23 mi. long) through the Cotswolds at Sapperton and is continued from Wallbridge (Stroud) by the Stroudwater canal. The Gloucester and Berkeley ship canal (16 mi.) connects the port of Gloucester with its outport of Sharpness on Severn. It is also connected, via Worcester and Stourport, with the Midland canal system. The railway runs 4.33 mi. through the Severn tunnel to Wales from Redwick, 5 mi. northeast of Avonmouth. At Staverton, midway between Gloucester and Cheltenham, is the Gloucester and Cheltenham municipal airport for civil aviation.

Population and Administration.— The area of the administrative county with boroughs is 1,258 sq.mi. and the population (1951) was 939,433. Population movements caused by World War II raised the population of the county by 7% between Sept. 1939 and Feb. 1941. Gloucestershire contains 29 hundreds; is divided into four parliamentary divisions; contains two cities and county boroughs, Bristol and Gloucester; two municipal boroughs, Cheltenham and Tewkesbury; six urban districts, Cirencester, Charlton Kings, Nailsworth, Stroud, Kingwood and Mangotsfield; 15 rural districts and 296 rural parishes. There are several ancient market towns. Gloucestershire is principally in the diocese of Gloucester, but part is in that of Bristol and small parts in those of Worcester and Oxford. It has three courts of quarter sessions, city, county (both held at the Shire hall, Gloucester) and Tewkesbury borough, and there are 25 petty sessional divisions. For assize purposes Gloucester is in the Oxford circuit.

Gloucestershire was represented in parliament in 1290 and returned two members. Bristol and Gloucester acquired representation in 1295, Cirencester in 1572 and Tewkesbury in 1620. In 1832 the county returned four members in two divisions; Bristol, Gloucester, Cirencester, Stroud and Tewkesbury returned two members each, and Cheltenham returned one member. The act of 1868 reduced the representation of Cirencester and Tewkesbury to one member each. By the act of 1918 the county was divided into four divisions; viz., those of Cirencester and Tewkesbury, the Forest of Dean, Stroud, and Thornbury divisions, each returning one member. By the 1949 act the county was redivided into Cirencester and Tewkesbury, Gloucestershire West, Stroud and Thornbury, and Gloucestershire South, each returning one member. Bristol returns six members, Cheltenham and Gloucester one each.

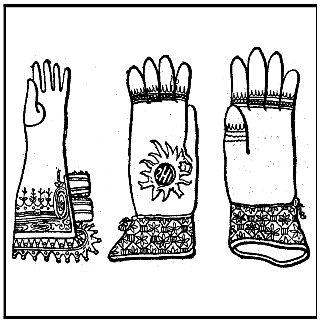
GLOVE, a covering for the hand, commonly with a separate sheath for each finger.

The use of gloves is of high antiquity, and apparently was known even to the pre-historic cave dwellers. In Homer Laërtes is described as wearing gloves in his garden. Herodotus tells how Leotychides filled a glove with money received as a bribe, and Xenophon records that the Persians wore fur gloves having separate sheaths for the fingers. Among the Romans also there are occasional references to the use of gloves. Varro remarks that olives gathered with the bare fingers are better than those gathered with gloves. In the northern countries the general use of gloves would be more natural than in the south, and it is not without significance that the most common mediaeval Latin word for glove (*guantus* or *wantus*, Mod. Fr. *gant*) is of Teutonic origin (O.H.G. *want*). Among the Germans and Scandinavians, in the 8th and 9th centuries, the use of gloves, fingerless at first, would seem to have been but universal; and in the case of kings, prelates and nobles they were often elaborately embroidered and bejewelled. This was more particularly the case with the gloves which formed part of the pontifical vestments. In war and in the chase gloves of leather, or with the backs armoured with articulated iron plates, were early worn; yet in the Bayeux tapestry the warriors on either side fight ungloved. So far as the records go, there is no evidence to prove that gloves were in general use in England until the 13th century. It was in this century that ladies began to wear gloves as ornaments; they were of linen and sometimes reached to the elbow. It was, however, not till the 16th century that Queen Elizabeth set the fashion for wearing them richly embroidered and jewelled.

Symbolical Uses.—Of the symbolical uses of the glove one of the most widespread during the middle ages was the practice of tendering a folded glove as a gage for waging one's law. The origin of this custom is probably not far to seek. The promise to fulfil a judgment of a court of law, a promise secured by the delivery of a *wed* or gage, is one of the oldest of all enforceable contracts. This gage was originally a chattel of value, which had to be deposited at once by the defendant as security into his adversary's hand; and that the glove became the formal symbol of such deposit is doubtless due to its being the most convenient loose object for the purpose.



FROM PLANCHÉ, "CYCLOPAEDIA OF COSTUME" LEFT, A GLOVE OF MARY QUEEN OF SCOTS, 1542–1587. RIGHT. GLOVES OF WILLIAM OF WYKEHAM, BISHOP OF WINCHESTER. 1367-1404

Associated with this custom was the use of the glove in the wager of battle. The glove here was thrown down by the defendant in open court as security that he would defend his cause in arms; the accuser by picking it up accepted the challenge. This form is still prescribed for the challenge of the king's champion at the coronation of English sovereigns, and was actually followed at that of George IV. (*see* CHAMPION).

The use of the glove as a pledge of fulfilment is exemplified also by the not infrequent practice of enfeoffing vassals by investing them with the glove; similarly the emperors symbolized by the bestowal of a glove the concession of the right to found a town or to establish markets, mints and the like. Conversely, fiefs were held by the render of presenting gloves to the sovereign. The most notable instance in England, however, is the grand serjeanty of finding for the king a glove for his right hand on coronation day, and supporting his right arm as long as he holds the sceptre.

Pontifical Gloves are liturgical ornaments peculiar to the Western Church and proper only to the pope, the cardinals and bishops, though the right to wear them is often granted by the Holy See to abbots, cathedral dignitaries and other prelates. According to the present use the gloves are of silk and of the liturgical colour of the day, the edge of the opening ornamented with a narrow band of embroidery or the like, and the middle of the back with a cross. They may be worn only at the celebration of mass (except masses for the dead) and only until the ablution before the canon of the mass.

During the middle ages the occasions on which pontifical gloves were worn were not so carefully defined as now, the use varying in different churches. Nor were the liturgical colours prescribed. Liturgical gloves have not been worn by Anglican bishops since the Reformation, though they are occasionally represented as wearing them on their effigies.

Gloves made of thin indiarubber or of white cotton, which may be thoroughly and easily sterilized, are worn by many surgeons while performing operations.

GLOVE MANUFACTURE. Modern gloves fall naturally into two main groups: (1) leather gloves; (2) fabric and knitted gloves. The character of a leather glove depends partly upon the type of skin used, but more particularly upon the processes by which the leather is produced.

Glove Skins.—A large variety of skins are used by the trade; but the humble sheep supplies the bulk of the raw material. Apart from sheepskin, the principal skins used for grain (or *glacé*) glove leathers (*i.e.,* those finished on the hair side of the skin) are kid, goat (chevrette) and lamb. French "national" skins from milk-fed kids are used extensively for ladies' high grade gloves; Tuscany, French "regord" and Kasan (Russia) lambskins are of high repute. In the grain group, also, the genuine Cape or South African hairy sheep furnish a strong, pliant leather for men's gloves. Many so-called "Capes," however, are made from Spanish, oriental or domestic sheepskins. Pigskin and coltskin are used for gloves to some extent in America, and dogskins are occasionally made into glove leather.

For velvet finished gloves. reindeer and buckskins yield the finest leathers. but they are expensive. The diminutive North African gazelle (a tiny creature, so small that three skins barely suffice for a single pair of gloves), the Arabian (or Mocha) sheep, and Sudanese sheep also furnish capital leather for velvet finishes. Suede leathers (*i.e.*, those finished on the flesh side of the skin) are produced from kid, lamb and sheepskins. Sheepskins, again, furnish most of the raw material for so-called "chamois," or washleather gloves, and also for what in the trade are called "doeskins."

Many glove manufacturers dress and dye skins for their own use; others purchase glove leather ready dressed. The skins are first partly cleansed in tanks or pits filled with water. They are then de-haired, the flesh side of the skins being painted with a solution of slaked lime and sodium sulphide or lime and red arsenic, which loosens the hair or wool and facilitates its removal by hand or machine. Any flesh adhering to the skin is next removed by "beaming" or "fleshing." Beaming is a hand operation, the skin being laid across a sloping beam let into the floor and the operative shaving away the flesh with a beaming knife. In the fleshing machine, which performs the same operation, the knives are mounted spirally upon a revolving cylinder, under which the skins are passed as through a mangle. The cleansed skins are steeped for some weeks in pits or vats containing a solution of slaked lime to loosen the sweatglands and hair cells and to remove grease, dirt, etc. Liming also makes the skins plumper. More washing follows, and the hides are then placed in a "puer" (or "bate") consisting either of a solution of dog manure, or a chemical solution of pancreatic extracts in combination with ammonium salts. "Drenching" is the next stage, wherein the raw material of the glove is immersed in vats containing a fermenting infusion of flour, pea-meal or bran, in which the skins swell or "rise" still more. Alternatively skins are pickled in a weak solution of sulphuric acid and salt. "Puering" and "drenching" or "pickling" complete the reduction of the hides to a soft, porous, pulpy, gelatinous condition which facilitates the entry of the dressing ingredients into the fibres of the skins. Further rinsings and cleansings follow, and the skins are then gently scraped with a scudding knife to remove the last vestige of hair or scum.

Dressing. — Dressing proper follows. There are several processes which may be adopted, according to the type of leather required and the practice of the factory. Different factories use different methods to produce the same kind of leather.

The "tawing" method, or white dressing, is very commonly used. A typical tawing mixture consists of 4 parts alum, 2 parts salt, 1 part egg-yolk and 5 parts flour. Sometimes a little vegetable oil is added. The mixture is dissolved in water (about 12 lb. to 2 gal.) and is applied by means of a drum-tumbler — a vessel shaped like a drum, the inner sides of which are fitted with pegs. The drum rotates on its own axis, and the pegs knead the mixture into the skins. Subsequently the skins are "stoved," or dried in heated chambers and emerge in the "crust" stage, resembling a piece of damp washleather which has dried hard in the sun. They are softened by "staking," a process in which the hides are drawn (flesh side downwards) over a blunt metal tool, fixed to a short stake or post set in the floor. Machine staking is now much used, especially for strong skins. The skins are later pared to an even thickness and usually stored for long periods before dyeing. Colour is applied either by brushing the dye on the outer surface of the leather, or by immersion in a drum tumbler. Vegetable or bark dyes are much used; but aniline and coal tar colours are suitable.

The foregoing process is much used for dressing *glacé* leathers, such as kid, lamb, nappa (a German term used to distinguish a drum-dyed article from a brush-dyed), and many so-called "Capes." *Clack* or grain leathers are finished by polishing the grain side with a lamb's wool pad, a glass slicker or a revolving felt wheel. Suede (named after Sweden, the country of its origin) is tanned by an alum and salt process, but it is finished by buffing the flesh surface on an emery wheel. Real "mochas" are dressed with lactic acid, alum and egg yolk; but the grain is first frized (raised with a frizing knife) and the grain side finished by buffing with emery and pumice.

Bark tanning (in which oak, chestnut, gambier, sumach and other barks are used) is adopted for leathers like genuine "Cape," goat, colt, pig and similar heavyweight skins.

An oil tannage is used to produce so-called "chamois" leather and washleather. For these, "fleshers" (the flesh section of the split sheepskins) are dressed with cod oil in a "stocking" machine, which pummels the oil into the leather. The process is sometimes termed "samming," and it involves repeated applications of oil, each dressing being followed by stove drying. Reindeer and buckskins are often oil-dressed, as are some "degrains"—leather with the grain "frized" or shaved off. These are then dyed as required. White washable leather is tanned by drumming skins in a solution of sodium carbonate and formaldehyde. later treating them with an emolient of egg yolk and neat's-foot or olive oil. Much progress has been made since 1920 with chrome dressing, and an entirely new range of coloured washable gloves is available in consequence. This process is much used for washable grain leathers, particularly in America; but velvet finished, especially "degrains" made from frized gazelle or Cape. Spanish and Sudanese sheep are successfully treated in this nay. The tannage is effected by drumming in a solution of chrome salts, after which the skins are treated with an oil emulsion. "Doeskins" are usually oil-dressed sheepskins or lambskins dyed with a liquid clay dye. In America, they are dressed by the formaldehyde process. Gazelle, antelope and the various deerskins are often "degrained" (or frized) and dressed with a velvet finish. Sometimes the white tannage is used and sometimes the formaldehyde or chrome process.

Glove-cutting. — Glove-cutting is a twofold operation. The cutters first stretch and manipulate the skins, and then cut them into oblong "tranks" of leather. Several tranks are placed together in a punching press fitted with a "calibre" (knives shaped like a double thumbless hand) and the shaped glove is punched out at one operation. "Fourchettes" (pieces for the sides of the fingers) and thumb pieces are punched out separately

The work of sewing is principally a cottage industry. Hand sewing is preferred for the highest class of work; but machine sewing is general Three special types of stitch are used: — (I) "round seam" (for light-weight gloves), in which the edges of the leather are brought together, back to back, and each stitch goes through the leather, and over the edge; (2) "prix-seam" (for heavyneight gloves), in which the edges are brought together and the stitching goes through and through, parallel to the edge; and (3) "pique," in which one edge is lapped over the other, and the stitches sewn through. When sewn, the gloves are dressed on heated metal "hands" and ironed and polished ready for boxing.

Fur gloves are made in much the same way, except that the fur is cut by hand.

The annual production of leather gloves fluctuates considerably; fashion and the severity of minter weather have an important bearing on demand.

The principal centres of manufacture are France, the United States. Italy. Germany, Czechoslovakia, England, Belgium, Luxemburg and Canada.

The French industry dates from the 11th century. It is carried on at Grenoble. Millau. St. Junien and Niort, and there are large dressing yards at Annonay in the Ardeche. Though France is the largest glove manufacturing country in the world, no figures of the annual production are available.

The output is chiefly in kids. lambs and lightweight suedes and washables.

The glove industry of the United States dates from 1760, when Sir William Johnson introduced a colony of Scottish glovers from Perth. These founded the town of Gloversville, Fulton county, N.Y., the chief seat of the industry.

Czechoslovakia manufactured mainly kid, nappa and chamois gloves. Prague became the chief centre. and Kaadan (or Caadan) famous for cheap washables.

The German industry developed chiefly in Bavaria. Munich being the principal centre; and factories were established in Berlin.

The chief Italian glove town is Naples (where cheap kid and lamb gloves are made); Milan, Turin and Genoa are smaller centres producing better quality gloves.

The British leather glove industry is centred mainly at Worcester and Yeovil; but it is carried on in many scattered hamlets in the west country and in Oxfordshire. Large quantities of lined and heavpaeight gloves are made.

Fabric Gloves.—Fabric gloves are of two kinds: (1) gloves cut from knitted cotton or silk fabric; and (2) knitted woolen gloves or "Ringwoods." The fabric for the former is knitted on warp-knitting machines of the Atlas or Milanese type, bleached or dyed and sometimes finished to simulate suede or washable or any other velvet-finished leather by treatment on an emery or other buffing wheel, or by teazles.

The fabric glove is cut out and sewn much in the same way as a leather glove. These gloves are made in Germany, in France at Paris and Lyons and in the English glove centres. Superfine silk gloves are made in New Jersey, U.S.

Woolen gloves are made in hosiery mills. The seamless type is produced, partly on circular knitting machines (wrist and hand) and partly on flat hand-operated machines (thumbs and fingers). Wrought gloves are usually knitted on straight bar machines, which enable various designs to be worked. The gloves are seamed on a cup-seaming machine. Leicester, Nottingham and the Scottish border towns are the main centres of manufacture.

GLOVER, RICHARD (1712–1785), English poet, son of Richard Glover, a Hamburg merchant, was born in London and educated at Cheam in Surrey. In 1737 he published an epic poem in praise of liberty. *Leonidas,* which was thought to have a special reference to the politics of the time; and being warmly commended by the prince of Wales and his court, it soon passed through several editions. In 1761 he entered parliament as member for Weymouth. He died on Nov. 25, 1785.

Glover was one of the reputed authors of *Junius;* but his claims —which were advocated in an *Inquiry concerning the author of the Letters of Junius* (1815), by R. Duppa—rest on very slight grounds. His other works include *London* (1739), a poem; *Hosier's Ghost* (1739). a ballad directed against the Spaniards; *Athenaid* (1787), an epic; and his diary, *Memoirs . . . from 1742 to 1757* (1813).

GLOVERSVILLE, a city of Fulton county about 45 mi. N.W. of Albany, in eastern New York, U.S., forms with adjoining Johnstown a small metropolitan centre in the industrialized Mohawk valley. The cities are adjacent to the Adirondack State park; forest land covers over 60% of the county and there are many lakes and streams in the immediate vicinity. Small dairy farms are the principal form of agriculture.

Glovemaking and the tanning of leather, which were still the most important industries of the region in the second half of the 20th century, began in the colonial period. After 1800, wide-ranging peddlers from Gloversville exchanged tinware for deerskins with the settlers in the Mohawk valley. The greater supply of skins, the large amount of tannin available and the abundant water supply accelerated the expansion oi the industries. By 1900 the region made 80% of the gloves manufactured in the United States. The factories were usually small, and the workers were often of English or German origin.

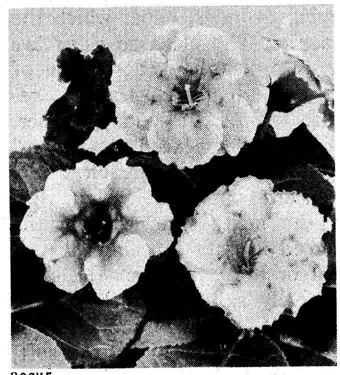
Located within 10 mi. of the New York State Barge canal, the New York State thruway and the New York Central railroad, Gloversville became a wholesale and retail distribution centre. It was called Stump City until 1828. Incorporated as a village in 1851, it became a city in 1890. For comparative population figures of both cities *see* table in NEW YORK: *Population.* (H. S. PR.)

GLOWWORM, a name chiefly applied to larviform, light-giving females of certain species of beetles of the families Lampyridae. Phengodidae and Drilidae. The best-known glowworm is the female of *Lampyris noctiluca* (fam. Lampyridae), a widespread European and Siberian insect, whose ability to emit a greenish-white light has been familiar for centuries. The light given out by the wingless female is believed to attract the flying male, ahose light organs are rudimentary. *Microphotus angustus* is a similar North American species. Many species of Lampyridae are knonn in which both sexes are luminous and winged; these are generally known as "fireflies" (*q.v.*).

The most remarkable glowworm is the female of a South American species of *Phrixothrix* (fam. Drilidae), which emits both red and greenish-yellow light, either simultaneously or independently; the red light emanates from the head, the green from a series of luminescent organs along the sides of the abdomen. The luminous larva of a New Zealand crane fly, *Bolitophila luminosa* (fam. Tipulidae, order Diptera) is knonn as glowworm. Certain luminous centipedes (fam. Geophilidae) are sometimes mistaken for glowworms.

See BEETLE. (R. L. WL.)

GLOXINIA. the common name for a plant botanically classified as *Sinningia speciosa,* belongs to the Gesneriaceae (*q.v.*) family and is a native of Brazil. The plants grow eight to ten inches in height and produce large tubular flowers surrounded by attractive foliage of a soft, velvety texture. The blooms of this well-known plant are characterized by the richness and variety of colouring, which ranges through all shades of blue and purple, pink and crimson and white. After blooming they need a rest period. The preferred method of propagation is by seed but choice varieties can be increased by cuttings of medium-sized leaves with a small portion of the stem attached.



ROCHE

HYBRID GLOXINIAS

(R. T. V. T.)

GLOZEL, a hamlet in France, about 12½ mi. southeast of Vichy, *département* of Allier. On March 1, 1924, the son of a local farmer named Fradin discovered the remains of a glass furnace of some antiquity of a type not uncommon in that region. In April 1925 Dr. Morlet, in consulting practice at Vichy, got into touch with Fradin, whose excavations continued. These included three bricks engraved before baking with alphabetic form signs, and the complete apparatus of a glass manufactory. Details were published by Dr. Morlet and Fradin. By 1926 twenty-one inscribed tablets had been found. Nine further tablets with new characters were found. In August 1926 M. Salomon Reinach, the distinguished scholar, visited Glozel and gave the weight of his authority in support of the authenticity of the objects thus discovered.

The attention of the learned world was drawn to Glozel by a letter from M. Reinach published in the London *Times.* He pointed out that the discoveries included objects akin to the Neolithic cultures of the Aegean, one of them being an idol in the shape of a violin, inscriptions closely related to those found in 1894 in an early Portuguese dolman and numerous engravings of animals on pebbles, in a degenerate Magdalenian style. Obviously, the most surprising objects were the inscribed clay tablets. If genuine and if datable to a remote period, many theories of the origin of the alphabet would need revision and the whole question of the content and scope of Neolithic civilization would have to be considered. It is the peculiar virtue of archaeology that it offers us from time to time discoveries which produce a revolution of hypotheses based on earlier, less accurate, less ample, data. Every science, too, demands periodic revision of its fundamental hypotheses. It is necessary, therefore, that discoveries of this nature should be completely free from doubt in order that their value as keys to accurate knowledge may be utilised.

The authenticity of these discoveries was criticised by the Abbe Breuil in *Anthropologie* xxxvi. 1926, pp. 543–558. Reinach contributed an article to *The Antiquary's Journal* supporting his views. In June, 1927, Mr. O. G. S. Crawford, the editor of *Antiquity* published an article in which, profiting by a visit to Glozel, he concluded that the majority of the objects were certainly forgeries. Some there were which, in his opinion, were genuine antiquities though not prehistoric and his emphatic opinion is that the inscriptions, engravings and the majority of the other finds are forgeries and that those who believe in their authenticity have been the victims of a hoax (*Antiquity* March and June, 1927). In September 1927 the International Institute of Anthropology at its meeting in Amsterdam appointed a Commission to visit Glozel to examine the site and the objects found therein and to pronounce their opinion upon the authenticity of the discoveries.

By this time the French government had taken official action to recognize the site as one of scientific importance meriting the protection of the law. The Commission consisted of eight members from Spain, France, Alsace, Great Britain, Belgium, Switzerland and Czecho Slovakia, one of whom was unable to take part in its investigations and deliberations. In November 1927 the Commission visited Glozel, examined and tested the site and the objects already found and reported unanimously the antiquity of the material discovered at Glozel had not been proved. It was admitted that authentic material of an early date may have been introduced by natural methods. In a series of articles in the *Mercure de France* Dr. Morlet maintained the authenticity of the discoveries, hotly repudiated the suggestion that the scientific world had been hoaxed, and vigorously criticized the methods and findings of the Commission. A remarkable degree of acrimony characterizes the controversy which has arisen and reference to the Law Courts has been made.

See Revue Anthropologique, Supplement No. 10–12, 1927.

GLUCINUM, an alternative name for the metal beryllium (*q.v.*). When L. N. Vauquelin in 1798 published in the *Annales de chimie* an account of a new earth obtained by him from beryl he refrained from giving the substance a name, but in a note to his paper the editors suggested glucine, from γλυκύς, sweet, in reference to the alleged taste of its salts, whence the name glucinum or glucinium (symbol Gl. or sometimes G).

GLUCK, CHRISTOPH WILLIBALD (1714–1787), operatic composer, German by birth, French by his place in art, was born at Weidenwang, near Neumarkt, in the upper Palatinate, on July 2, 1714. His father was gamekeeper to Prince Lobkowitz; and from his 12th to his 18th year he received a good general education, including music lessons, at the Jesuit school of Kommatan, near Prince Lobkowitz's estate in Bohemia. At the age of 18 he went to Prague, where he studied under Czernohorsky, and maintained himself by hand-to-mouth musical jobs, sometimes at village fairs and dances. Prince Lobkowitz introduced him to the best families of the Austrian nobility; and when in 1736 he proceeded to Vienna he was hospitably received at his protector's palace. Here he met Prince Melzi, an ardent lover of music, whom he accompanied to Milan, continuing his education under Giovanni Battista San Martini (or Sammartini), a great musical historian and contrapuntist, whose al fresco style of chamber-music was an important if unconscious step towards the dramatic orchestration of the future. Gluck soon becomes a fluent writer, producing nine operas at various Italian theatres between 1741 and 1745. Unimportant as they are in the light of his mature art, they were so well received that in 1745 he was invited to London to compose for the Haymarket, where he produced *La Caduta dei giganti* and followed it by a revised version of an earlier opera. He also appeared in London as a performer on the musical glasses (*see* HARMONICA).

The poor success of his two operas, as well as that of a *pasticcio* entitled *Piramo e Tisbe,* shortened his London visit. But his stay in England was not without important consequences for his future. Gluck at this time was rather less than an ordinary producer of Italian opera. Handel said that Gluck "knows no more counterpoint than my cook," which was probably true, seeing that that cook was an excellent bass singer who performed in many of Handel's own operas. Musical cookery demands more counterpoint than Gluck ever mastered; and, if Gluck did not as yet see any connection between counterpoint and drama, he learnt much from the surprising discovery that arias which in their original setting had been much applauded lost all effect when adapted to new words in the *pasticcio.* Handel's criticism was by no means irrelevant. The use of counterpoint is independent of contrapuntal display; its real and final cause is a certain depth of harmonic expression which Gluck attained only in his most inspired moments, and for want of which many of his subtle details are dangerously like oversights. And in later years his own mature view of the importance of harmony, which he upheld in long arguments with Grétry, who believed only in melody, shows that he knew that the dramatic expression of music must strike below the surface. At this early period he was simply producing operas on Handel's, or rather Hasse's lines without a sign of mastery. Yet the failure of his *pasticcio* is profoundly significant, since it shows that already the effect of his music depended upon its characteristic treatment of dramatic situations. This characterizing power was as yet only thus indirectly evident, and the art of music needed all the new resources of the rising sonata-forms (*q.v.*) before it could break through its architectural and decorative restraints and enter into dramatic regions at all.

The chamber music of Sammartini had already indicated to Gluck a style incompatible with the older art, and a short trip to Paris brought him into contact with the classic traditions and the declamatory style of the French opera — things which an intelligent prophet might have foreseen to be of immense importance to a pupil of Sammartini. Little change, however, is to be found in the works produced by Gluck with varying success during the 15 years after his return from England. His first opera written for Vienna, La *Semiramide riconosciuta,* is again a fashionable opera seria, and little more can be said of *Telemacco,* although 30 years later Gluck was able to use most of its overture and an energetic duet in one of his greatest works, *Armide,* and to adapt another number to the sublime purposes of a still greater work, *Iphigknie en Tauride.*

Gluck settled permanently at Vienna in 1756, having two years previously been appointed court chapel-master, with a salary of 2,000 florins, by the empress Maria Theresa. He had already received the order of knighthood from the pope after the success of two of his works in Rome. During the long interval from 1756 to 1762 Gluck seems to have been meditating his plans for the reform of the opera, producing little more than the ballet *Don Giovanni* and some French *airs nouveaux* with pianoforte. Several later *pieces d'occasion,* such as *Il Trinofo di Clelia* (1763), are still written in the old manner. But already in 1762 *Orfeo ed Euridice* had revolutionized the whole art of music. Gluck had for the first time deserted Metastasio for Raniero Calzabigi, who, as Vernon Lee suggests, was in all probability the immediate cause of the formation of Gluck's new ideas. He was a hot-headed dramatic theorist with a violent dislike for Metastasio, who had hitherto dominated the whole sphere of operatic libretto. Calzabigi reduced the operatic scheme from a complicated plot designed for working in three arias in each act for each of seven expensive singers, to the simplest possible means of expressing and concentrating the obvious emotions aroused by a classical myth.

In *Orfeo* there are only three characters besides the chorus. The chorus itself has to play a different part in each scene; human mourners in the first act; Furies in the first part of the second act, Elysian shades in the second part, and a rejoicing human crowd when, as in Monteverde's pioneer work of 150 years earlier, the pathos of the story becomes intolerable to the poet, the composer, and the audience, so that Eurydice has to be galvanized back into life and received with Orpheus and the thaumaturgic Amor by a triumphant chorus and a long series of ballets. For the rest, the pathos of the music is among the greater experiences of the art. Even in the first act, which is occupied, until the sudden entry of Eros (Amor), entirely with the chorus of mourners and the lament of Orpheus at Eurydice's tomb, there is no feeling of monotony, no lack of dramatic power, and no lapse from the highest activity of the composer's imagination. Nothing like it had been dreamt of before, and one of its most interesting features is that it is neither histrionic nor realistic. The echoes of Orpheus's cadences by a cor anglais behind the scene are sheer gratuitous poetry as far transcending real echoes as Shelley's skylark transcends a real bird. The central feature of *Orfeo* is, of course, his conquest of the Furies who would bar his way to Eurydice. Gluck lived to master more complex situations, but neither he nor anyone else ever achieved, even with Wagner's resources, a more perfect and touching piece of music-drama. From the cavernous reverberations of the first chords of the orchestra, interrupted by the approaching sounds of Orpheus's harp, to the last subdued assent of the vanquished Furies, the dramatic and musical power are of the highest order. The Furies sing throughout in the rhythm 
until they are reduced to interrupting Orpheus's gathering flow of melody by "No:—No," at first thunderous, then softer. For the later productions in Paris, Gluck had to rewrite the castrato-alto part of Orpheus for a tenor, with transpositions ruinous to the key-system of the whole; but this did not impair the wonderful power of Orpheus's declamation. The inspiration is fully maintained in the following Elysian scene, an even greater test of the composer's depth of feeling.

No surprise should be felt that Orpheus was followed by work of no importance. Even reformers of opera must live; and Gluck's five great reform-operas were enough to occupy him but not enough to support him for the remaining 25 years of his life. Besides, he constantly drew upon his inferior works for whole movements in his greatest. In 1767 Gluck and Calzabigi followed up *Orfeo* by a similar work on a larger scale. Gluck's dedication of the score to the grand-duke of Tuscany is the Magna Charta of opera. "I have tried," he wrote, "to reduce music to its real function, that of seconding poetry by intensifying the expression of sentiments and the interest of situations without interrupting the action by needless ornament. I have accordingly taken care not to interrupt the singer in the heat of the dialogue, to wait for a tedious ritornel, nor do I allow him to stop on a sonorous vowel, in the middle of a phrase, in order to show the nimbleness of a beautiful voice in a long cadenza." Less obvious and far more important is his principle that the orchestral instruments shall be "combined in accordance with the passions represented," an epitome of the whole difference between symphonic (or dramatic) orchestration and the decorative schemes of the continuo period. (*See* CHAMBER MUSIC and INSTRUMENTATION.)

Vienna was no easy town to conquer by principles apparently so hostile to music for music's sake; and neither *Alceste* nor *Paris and Helena* (1769) was received as cordially as Gluck had hoped. He therefore eagerly accepted the chance of bringing his art into contact with the encyclopaedists and dramaturgists of Paris, where his enthusiastic admirer, the *bailli* Le Blanc du Roullet, attaché of the French embassy at Vienna, set in motion the project of an opera for the Paris stage. Racine's *Iphigénie en Aulide* was the subject chosen. Obstacles, usual and unusual, were removed chiefly by the intervention of Gluck's former pupil, the dauphiness Marie Antoinette, and the opera was eventually performed at the Académie de Musique, on April 19, 1774.

Heated controversy immediately emphasized the importance of the new work, both in its musical and in its literary aspects. At first the upholders of French music were no more favourable to Gluck than the connoisseurs of Italian singing; they forgot that Lulli was no more a Frenchman than Gluck, and they could see only that Gluck was no Rameau. Marmontel, La Harpe and D'Alembert were his opponents, the Abbé Arnaud and others his enthusiastic friends. Rousseau had the sense to change his mind. Beginning as a violent partisan of Italian music, when Gluck himself asserted the merits and possibilities of French music, he acknowledged his genius, although he did not always understand it, as for example when he suggested that in *Alceste,* "Divinités du Styx," perhaps the most majestic of all Gluck's arias, ought to have been set as a rondo. But in a letter, written shortly before his death, to Dr. Burney, Rousseau gives a close and appreciative analysis of *Alceste,* the first Italian version of which Gluck had submitted to him for suggestions; and when after the first performance of the French version the composer exclaimed, *"Alceste est tombée,"* Rousseau replied, *"Oui, mais elle est tombée du ciel."*

The contest turned to fresh issues when Piccinni, a celebrated and by no means incapable composer, came to Paris as the champion of the Italian party at the invitation of Madame du Barry, who held a rival court to that of the young princess (*see* OPERA). It is a mistake to see in the war of Gluckists and Piccinnists a foreshadowing of the Wagnerian controversy; the issues were merely those of cliques, and anybody who has the patience to read Piccinni's music will be amused at his pathetic attempts to copy Gluck in every point where public applause had justified the shocking risks Gluck was always taking. Gluck was by far the better musician, but contemporaries could see the weaknesses of his technique as easily as they could see the vaguely different weaknesses of Piccinni's. Gluck's gift of melody was sublime, and Piccinni's was by no means contemptible; and both composers had the gift of making incorrect music sound agreeable. Gluck's indisputable dramatic power did not concern upholders of music for music's sake, and was no ground of opposition to the Piccinnists as far as they could understand it. The rivalry between the two composers was soon skilfully engineered into a quarrel. In 1777 Piccinni was given a libretto by Marmontel on the subject of *Roland,* to Gluck's intense disgust, as he had already begun an opera on that subject himself. This, and the failure of attempts in a lighter style furbished up from earlier works at the instigation of Marie Antoinette, inspired Gluck to produce his *Armide,* which appeared four months before Piccinni's *Roland* was ready, and raised a storm of controversy, admiration and abuse. Gluck did not anticipate Wagner more clearly in his dramatic reforms than in his caustic temper; and, as in Gluck's own estimation, the difference between *Armide* and *Alceste* is that "l'un (Alceste) doit faire pleurer et l'autre faire éprouver une voluptueuse sensation," it was extremely annoying for him to be told by Laharpe that he had made Armide a sorceress instead of an enchantress, and that her part was "une criaillerie monotone et fatiguante." He replied to Laharpe in a long public letter worthy of Wagner in its venom and its effect in immortalizing its recipient.

Gluck's next work was *Iphigénie en Tauride,* the success of which finally disposed of Piccinni, who produced a work on the same subject at the same time and who is said to have acknowledged Gluck's victory. It was followed by *Echo et Narcisse,* the comparative failure of which greatly disappointed Gluck; and during the composition of another opera, *Les Danaïdes,* an attack of apoplexy compelled him to give up work. He left Paris for Vienna, where he lived for several years in dignified leisure, disturbed only by failing health which ended in his death on Nov. 15, 1787. Burney gives a charming account of a day with Gluck, whom he visited in the same week as he visited Metastasio.

The dramatic importance of Gluck's reforms is apt both to overshadow and to idealize his merit as a musician. Where Gluck differs from the greatest musicians is in his absolute dependence on literature for his inspiration. Where his librettist failed him (as often in his last complete work, *Écho et Narcisse*), he had no first-rate routine to lean upon; and, even in the finest works of his French period, the less emotional situations are sometimes set to music which has little but historic interest. A mere inability to set a bad text to good music might be a sign rather of good literary sense than of poor musicianship. But it points to a certain weakness as a musician that Gluck could not be inspired except by the more emotional features of his libretti. When he was inspired he was unquestionably the first and only essentially dramatic composer before Mozart, except the miraculous and untimely born Purcell.

To begin with, he could invent sublime melodies; and his power of producing great musical effects by the simplest means was nothing short of Handelian. Moreover, if Haydn is the father of modern orchestration, the writer of the preface to *Alceste* is its godfather. He was by no means the first to use the timbre of instruments with a sense of emotional effect, for Bach and Handel well knew how to give a whole aria or whole chorus an appropriate tone by means of a definite scheme of instrumentation. But it is just such definite schemes that impeded the progress of music-drama. Gluck did not treat instruments as part of a decorative design, any more than he so treated musical forms. His instrumentation changes with every shade of feeling in the dramatic situation. Strings, oboes and flutes were an ordinary accompaniment for an aria; nor was there anything unusual in making the wind instruments play in unison with the strings for the first part of the aria, and writing a passage for one or more of them in the middle section. But it was an unheard-of thing to make this passage consist of isolated long appoggiaturas once every two bars in rising sequence on the first oboe, answered by deep pizzicato bass notes, while Agamemnon in despair cries: "J'entends retentir dans mon sein le cri plaintif de la nature." Gluck is a master of tragic irony and subconscious confession. When, for instance, in *Iphigénie en Tauride*, Orestes gasps "Le calme rentre dans mon coeur," the agitated rhythms of the strings belie him. Again, the power of orchestral climax shown in the oracle scene in *Alceste* was a thing inconceivable in older music and on that plane of absolute masterpieces that no later music can supersede. Its influence in Mozart's *Idomeneo* is obvious at a first glance.

The capacity for broad melody always implies a true sense of form, whether that be developed by skill or not; and Gluck's form is inspired not merely by melody but by a magnificent sense of free phrase-rhythm, worthy of the mature sonata-style of Mozart. And his power in persistent quantitative rhythms is Wagnerian. Hence he had plenty of resource for replacing by better things the civilization he destroyed. Moreover he, in consultation with his librettist, achieved great skill in holding together entire scenes, or even entire acts, by dramatically apposite repetitions of short arias and choruses. And thus in large portions of his finest works the music, in spite of frequent full closes, seems to move *pari passu* with the drama in a manner which for naturalness and continuity is surpassed only by the finales of Mozart and the entire operas of Wagner. This continuity is most impressive in both scenes of the second act of *Orfeo*. The damage done to the key-system of these perfectly unified scenes by the Parisian transposition of Orpheus's part is, as previously noted, dreadful, but easily remedied by transposing Orpheus's part back again; and in a suitable compromise between the two versions *Orfeo* remains Gluck's most perfect and inspired work. The emotional power of the music is such that the ruin of the story by a happy ending is a real relief from tension: it is like the gesture of Shakespeare's last works. where we know all about the tragic issues and may as well dismiss them with fairy-tales. Moreover, Gluck's genius was of that high order which is as great in happiness as in grief. He failed only in the business capacities of artistic technique; and there is less business in *Orfeo* than in any other music-drama. It was Gluck's first great inspiration, and his theories had not had time to become doctrinaire, though Calzabigi was disposed to magnify his office.

Alceste contains Gluck's grandest music and is also very free from weak pages; but in its original Italian version the third act had no adequate climax. a defect wholly inadmissible in Paris, where, after continual retouchings a part for Hercules was. in Gluck's absence, added by Gossec; and three pages of Gluck's music. dealing with the supreme crisis where Alceste is rescued from Hades (either by Apollo or by Hercules) were no longer required in performance and have been lost. The Italian version cannot help us to restore this passage. in which Gluck's music now stops short just where we realize the full height of his power. The stiffness of Gossec's rhythm reveals the immense distance Gluck had traveiled from all contemporaries as well as from the old ways; and the comparison between the Italian and French *Alceste* measures the pace of Gluck's development between 1767 and 1775. It would have been far easier for Gluck to write a new opera if he had not been so justly attached to his second Italian masterpiece. So radical are the differences that in retranslating the French libretto into Italian for performance with the French music not one line of Calzabigi's original text can be retained.

In *Iphigénie en Aulide* and *Iphige'nie en Tauride,* Gluck shows signs that the doctrinaire is beginning to gain on the spontaneous artist. This. at least, is the general impression left in a reflective memory, though one indignantly denies it on renewing acquaintance with the works in performance. Gluck had not. in *Orfeo,* gone out of his way to avoid rondos, or we should have had no "Che farò senza Euridice." We read with a respectful smile his assurance to the *bailli* Le Blanc du Roullet that "you would not believe *Armide* to be by the same composer" as *Alceste*. But there is no question that *Armide* is a very great work, full of melody, colour and dramatic point; and that Gluck has availed himself of every suggestion that his libretto afforded for orchestral and emotional effects of type almost entirely new to him. He has been absurdly blamed for his inability to write erotic music. The intention of the work is no more erotic than that of Tasso's *Gierusalemme liberata.* Love is *a* baleful enchantment, viewed through the eyes of crusading knights. Even so, the conflict of passions, where Armide summons the demons of Hate to exorcise love from her heart, and her courage fails her as soon as they begin, has never, even in *Alceste,* been treated with more dramatic musical power. The work as a whole is unequal, partly because Quinault's go-year-old poem had far too much action in it to suit Gluck's methods, but it shows, as does no other opera until Mozart's *Don Giovanni,* a sense of the *development* of characters, as distinguished from the mere presentation of them as fixed types.

In *Iphigénie en Aulide* and *Iphigénie en Tauride,* the very subtlety of the finest features reveals a self-consciousness which, when inspiration is lacking, becomes mannerism. Moreover, in both cases the libretti, though skilfully derived from Racine and Corneille, are more complicated than those of Gluck's first masterpieces; and where inspiration fails, the awkward technique has lost its earlier naïveté. Still, these works are immortal, and their greatest passages are equal to anything in *Alceste* and *Orfeo.* *Iphigénie en Tauride* is indeed, as realized by Gluck, an amazingly spiritual work to find its way to the operatic stage and prove itself so effective there. We must agree with Gluck's contemporaries to call *Echo et Narcisse* a failure. As in *Orjeo,* the pathetic story is ruined by a violent happy ending, but here this artistic disaster takes place before the pathos has begun to move us. Prettiness was the highest possibility of the subject; and with Gluck beauty, without emotional impulses, was less than skin-deep The great Pelletan-Damcke *édition de luxe* of Gluck's French operas includes this work, gives only the French version of *Orphée,* and excludes *Paride e Elena* which was never given in Paris. A modern full score of *Paride e Elena* is a desideratum to complete the study of Gluck's work with Calzabigi, to whom he owed more than he owed to France. Perhaps this may be given in the miniature scores inaugurated in 1927 by that of *Iphigénie en Tauride* with an excellent preface and critical revision by H. Abert (Eulenburg). (D. F. T.)

GLÜCKSBURG, a town of Germany, in the Prussian province of Schleswig-Holstein, on the Flensburg Fjord, 6 m. N.E. from Flensburg by rail. Pop. (1933) 1,792. It is a sea-bathing resort. The castle occupies the site of a former Cistercian monastery.

GLÜCKSTADT, a town of Germany, in the Prussian province of Schleswig-Holstein, on the right bank of the Elbe, 28 m. N.W. of Altona, by rail. Pop (1933) 6,839. It was founded by Christian IV. of Denmark in 1617, fortified in 1620, and soon became an important trading centre. In 1627–28 it was besieged unsuccessfully by the Imperialists under Tilly. In 1814 it was blockaded and its fortifications were demolished. In 1830 it was made a free port. It came into the possession of Prussia with the rest of Schleswig-Holstein in 1866.

The inhabitants are chiefly engaged in herring fishery, but have suffered frequent losses from inundations.

GLUCOSE: see CARBOHYDRATES.

GLUCOSIDES: see GLYCOSIDES, NATURAL.

GLUE, a valuable agglutinant, consisting of impure gelatin and widely used as an adhesive medium for wood, leather, paper and similar substances. Glues and gelatins merge into one another by imperceptible degrees. The difference is conditioned by the degree of purity; the more impure form is termed glue and is only used as an adhesive, the purer forms, termed gelatin, have other applications, especially in culinary operations and confectionery. (*See* GELATIN.) It is only necessary to state here that gelatigenous or glue-forming tissues occur in the bones, skins and intestines of all animals, and that by extraction with hot water these agglutinating materials are removed, and the solution on evaporating and cooling yields a jellylike substance—gelatin or glue. Glues may be most conveniently classified according to their sources: bone glue, skin glue and fish glue; these may be regarded as impure forms of bone gelatin, skin gelatin and isinglass.

Bone Glue.—For the manufacture of glue the bones are supplied fresh or after having been used for making soups; Indian and South American bones are unsuitable, since, by reason of their previous treatment with steam, both their fatty and glue-forming constituents have been already removed (to a great extent). On the average, fresh bones contain about 50% of mineral matter, mainly calcium and niagnesium phosphates, about 12% each of moisture and fat, the remainder being other organic matter. The mineral matter reappears in commerce chiefly as artificial manure; the fat is employed in the candle, soap and glycerin industries, while the other organic matter supplies glue.

The separation of the fat, or "degreasing of the bones," is effected (1) by boiling the bones with water in open vessels; (2) by treatment with steam under pressure; or (3) by means of solvents. The last process is superseding the first two, which give a poor return of fat—a valuable consideration—and also involve the loss of a certain amount of glue. Many solvents have been proposed; the greatest commercial success appears to attend Scottish shale oil and natural petroleum (Russian or American) boiling at about 100° C. The vessels in which the extraction is carried out consist of upright cylindrical boilers, provided with manholes for charging, a false bottom on which the bones rest; and with two steam coils—one for heating only, the other for leading in live steam. There is a pipe from the top of the vessel leading to a condensing plant. The vessels are arranged in batteries. In the actual operation the boiler is charged with bones, solvent is run in, and the mixture gradually heated by means of the dry coil; the spirit distils over, carrying with it the water present in the bones; and aiter a time the extracted fat is run off from discharge cocks in the bottom of the extractor. A fresh charge of solvent is introduced, and the cycle repeated; this is repeated a third and fourth time, after which the bones contain only about 0 2% of fat, and a little of the solvent, which is removed by blowing in live steam under 70 to 80 lb. pressure. The degreased bones are now cleansed from all dirt and flesh by rotation in a horizontal cylindrical drum covered with stout wire gauze. The attrition accompanying this motion suffices to remove the loosely adherent matter, which falls through the meshes of the gauze; this meal contains a certain amount of glue-forming matter, and is generally passed through a finer mesh, the residuum being worked up in the glue house, and the flour which passes through being sold as a bone meal, or used as a manure.

The bones, which now contain 5% to 6% of glue-forming nitrogen and about 60% of calcium phosphate, are next treated for glue. The most economical process consists in steaming the bones under pressure (1j lb. to start with, afterward 5 Ib.) in upright cylindrical boilers fitted with false bottoms. The glue liquors collect beneath the ialse bottoms, and when of a strength equal to about 20% dry glue they are run off to the clarifiers. The first runnings contain about 65% to 70% of the total glue; a second steaming extracts another 25% to 30%. For clarifying the solutions ordinary alum is used, one part being used for 200 parts of dry glue.

The clear liquors are now concentrated to a strength of about 32% dry glue in winter and 35% in summer. This is invariably effected in vacuum pans—open boiling yields a dark-coloured and inferior product. Many types of vacuum plant are in use; the Yaryan form, invented by H. T. Yaryan, is perhaps the best, and the double effect system is the most efficient. After concentration the liquors are bleached by blowing in sulphur dioxide, manufactured by burning sulphur; by this means the colour can be lightened to any desired degree. The liquors are now run into galvanized sheet-iron troughs, 2 ft. long, 6 in. wide and 5 in. deep, where they congeal to a firm jelly, which is subsequently removed by cutting round the edges. or by warming with hot water, and turning the cake out. The cake is sliced to sheets of convenient thickness, generally by means of a wire knife; *i.e.*, a piece of wire placed in a frame. Mechanical slicers acting on this principle are in use. Instead of allowing the solution to congeal in troughs, it may be "cast" on sheets of glass, the bottoms of which are cooled by running water. After congealing, the tremulous jelly is dried; this is an operation of great nicety: the desiccation must be slow and is generally effected by circulating a rapid current of air about the cakes supported on nets set in frames.

Skin Glue.—In the preparation of skin glue the materials used are the parings and cuttings of hides from tan yards, the ears of oxen and sheep, the skins of rabbits, hares, cats, dogs and other animals, the parings of tawed leather, parchment and old gloves and many other miscellaneous scraps of animal matter. Much experience is needed 'in order to prepare a good glue from such heterogeneous materials; one blending may be a success and another failure. The raw material or stock is first steeped for from two to ten weeks, according to its nature, in wooden vats or pits with limewater, and afterward carefully dried and stored. The object of the lime steeping is to remove any blood and flesh which may be attached to the skin, and to form a lime soap with the fatty matter present. The "scrows" or glue pieces, which may be kept a long time without undergoing change, are washed with a dilute hydrochloric acid to remove all lime, and then very thoroughly with water; they are now allowed to drain and dry. The skins are then placed in hemp nets and introduced into an open boiler which has a false bottom, and a tap by which liquid may be run off. As the boiling proceeds test quantities of liquid are from time to time examined, and when a sample is found on cooling to form a stiff jelly, which happens when it contains about 32% dry glue, it is ready to draw off. The solution is then run to a clarifier, in which a temperature sufficient to keep it fluid is maintained, and in this way any impurity is permitted to subside. The glue solution is then run into wooden troughs or coolers in which it sets to a firm jelly. The cakes are removed as in the case of bone glue (see above), and, having been placed on nets, are, in the Scottish practice, dried by exposure to open air. This primitive method has many disadvantages: on a hot day the cake may become unshapely, or melt and slip through the net, or dry so rapidly as to crack; a frost may produce fissures, while a fog or mist may precipitate moisture on the surface and occasion a mouldy appearance. The surface of the cake, which is generally dull after drying. is polished by washing with water. The practice of boiling, clarification, cooling and drying, which has been already described in the case of bone glue, has been also applied to the separation of skin glue.

Fish **Glue.**—Whereas isinglass, a very pure gelatin. is yielded by the sounds of a limited number of fish, it is found that all fish offals yield a glue possessing considerable adhesive properties. The manufacture consists in thoroughly washing the offal with water and then discharging it into extractors with live steam. After digestion, the liquid is run off, allowed to stand, the upper oily layer removed and the lower gluey solution clarified with alum. The liquid is then filtered, concentrated in open vats and bleached with sulphur dioxide. Fish glue is a light-brown viscous liquid which has a distinctly disagreeable odour and an acrid taste; these disadvantages to its use are avoided if it is boiled with a little water and 1% of sodium phosphate, and 0.025% of saccharine added.

Properties of **Glue.**—A good quality of glue should be free from all specks and grit, have a uniform, light brownish-yellow, transparent appearance, and should break with a glassy fracture. Steeped for some time in cold water it softens and swells up without dissolving, and when again dried it ought to resume its original properties. Under the influence of heat it entirely dissolves in water, forming a thin syrupy fluid with a not disagreeable smell. The adhesiveness of different qualities of glue varies considerably; the best adhesive is formed by steeping the glue, broken in small pieces, in water until they are quite soft, and then placing them with just sufficient water to effect solution in the gluepot. The hotter the glue, the better the joint; remelted glue is not so strong as the freshly prepared; and newly manufactured glue is inferior to that which has been long in stock. A well-prepared joint may withstand a pull of about 700 lb. per square inch. The following table, after Kilmarsch, shows the holding power of glued joints with various kinds of woods.

Wood	Pounds per square inch With grain	Pounds per square inch Across grain
Beech	852	434.5
Maple	484	346
Oak	704	302
Fir	605	132

Special Glues, Cements, **etc.**—By virtue of the fact that the word glue is frequently used to denote many adhesives, which may or may not contain gelatin, there will now be given an account of some special preparations. These may be conveniently divided into: (1) liquid glues, mixtures containing gelatin which do not jelly at ordinary temperatures but still possess adhesive properties; (2) waterproof glues, including mixtures containing gelatin, and also the "marine glues," which contain no glue; (3) glues or cements for special purposes, *e.g.*, for cementing glass, pottery, leather, etc., for cementing dissimilar materials, such as paper or leather to iron.

Liquid Glues.—The demand for liquid glues is mainly due to the disadvantages—the necessity of dissolving and using while hot--of ordinary glue. They are generally prepared by adding to a warm glue solution a reagent which destroys the property of gelatinizing. The reagents in common use are acetic acid; magnesium chloride, used for a glue employed by printers; hydrochloric acid and zinc sulphate; nitric acid and lead sulphate; and phosphoric acid and ammonium carbonate.

Waterproof Glues.—Numerous recipes for waterproof glues have been published; glue, having been swollen by soaking in water, dissolved in four-fifths its weight of linseed oil, furnishes a good waterproof adhesive; linseed oil varnish and litharge, added to a glue solution, is also used; resin added to a hot glue solution in water and afterward diluted with turpentine is another recipe. The best glue is said to be obtained by dissolving one part of glue in one and a half parts of water, and then adding one-fiftieth part of potassium bichromate. Alcoholic solutions of various gums, and also tannic acid, confer the same property on glue solutions. The "marine glues" are solutions of India rubber, shellac or asphaltum, or mixtures of these substances, in benzene or naphtha. Jeffrey's marine glue is formed by dissolving India rubber in four parts of benzene and adding two parts of shellac; it is extensively used, being easily applied and drying rapidly and hard. Another waterproof glue which contains no gelatin is obtained by heating linseed oil with five parts of quicklime; when cold it forms a hard mass, which melts on heating.

There are innumerable recipes for adhesives specially applicable to certain substances and under certain conditions. For repairing glass, ivory, etc., isinglass (*q.v.*), which may be replaced by fine glue, yields valuable cements. Bookbinders employ an elastic glue obtained from an ordinary glue solution and glycerin, the water being expelled by heating; an efficient cement for mounting photographs is obtained by dissolving glue in ten parts of alcohol and adding one part of glycerin; portable or mouth glue—so named because it melts in the mouth—is prepared by dissolving one part of sugar in a solution of four parts of glue. An India rubber substitute is obtained by adding sodium tungstate and hydrochloric acid to a strong glue solution.

See Thomas Lambert. *Glue, Gelatine and Their Allied Products* (1905); *R. L.* Fernbach, *Glues and Gelatine* (1907); *H. C.* Standage, *Agglutinants of all Kinds for all Purposes* (1907).

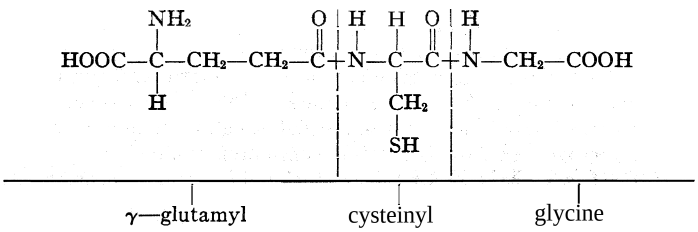
GLUTATHIONE is a sulfur-containing substance found within almost all kinds of living cells. It can protect an animal against radiation damage to some extent, if large dosages are administered almost simultaneously with exposure to radiation. This protective action may be associated with the ready reaction of glutathione with the peroxides that are formed on irradiation of the tissues.

Liver and yeast are particularly rich in glutathione. which may reach a concentration in tissues as high as 0.1 or 0.2%. Because of the expense of its chemical synthesis. glutathione is generally obtained by isolation from natural sources. When purified, it is usually obtained as a white, amorphous solid, which is exceedingly soluble in water.

The physiological function of glutathione has been investigated extensively since the discovery of the compound in 1921 by Sir Frederick Gowland Hopkins of Cambridge university. Great interest has centred on the fact that glutathione can affect the activity of a variety of enzymes, which are essential for the normal operation of any living cell. The activating effect of glutathione on enzymes is associated with the chemical action of the sulfur group. In glutathione, the sulfur normally is present in a reduced or sulfhydryl (-SH) form.

Enzymes also contain sulfhydryl groups, and often are inactivated by oxidation of these -SH groups to the disulfide (-SS-) form. Glutathione reacts with these -SS- groups to regenerate the -SH groups of the enzyme. The reaction involves a simultaneous conversion of the -SH groups of glutathione to -SS- groups, which are in turn reconverted to the -SH form by the action of an enzyme known as glutathione reductase. Thus, by a cyclic chemical process, the glutathione operates as an agent controlling the activity of enzymes within the cell.

The chemical name of glutathione, y-glutamyl-cysteinyl-glycine, indicates that it is made up of three amino acids, linked together as shown in the structural formula:



The bonds between the amino acids are known as peptide bonds. Glutathione is structurally related to proteins, which, however, have a greater molecular size because they contain many more amino acids. Because of the chemical similarity of glutathione to proteins, the biological synthesis of glutathione has been studied as a simple model for protein synthesis The latter process underlies the processes of growth and differentiation of all living cells, and thus constitutes one of the most fundamental biological problems.

See also ENZYMES; PROTEINS. (B. V.)

GLUTEN, a tough, tenacious, ductile, somewhat elastic, nearly tasteless, grayish-yellow albuminous substance, obtained from the flour of wheat by washing in water, in which it is insoluble. Gluten, when dried, loses about two-thirds of its weight, becoming brittle and semitransparent; when strongly heated it crackles and swells, and burns like feather or horn. It is soluble in strong acetic acid, and in caustic alkalis, which latter may be used for the purification of starch in which it is present. When treated with .1% to .2% solution of hydrochloric acid it swells up, and at length forms a liquid resembling a solution of albumin, and levorotatory as regards polarized light. Moistened with water and exposed to the air, gluten putrefies and evoives carbon dioxide, hydrogen and sulfuretted hydrogen. and in the end is almost entirely resolved into a liquid, which contains ieucin and ammonium phosphate and acetate. On analysis, gluten shows a composition of about 53% of carbon, 7% of hydrogen, and nitrogen 15% to 18%, besides oxygen, about 1% of sulfur and a small quantity of inorganic matter. According to H. Ritthausen, it is a mixture of glutencasein (Liebig's vegetable fibrin), glutenfibrin, gliadin (Pflanzenleim), glutin or vegetable gelatin and mucedin, which are all closely allied to one another in chemical composition. It is the gliadin which confers upon gluten its capacity of cohering to form elastic masses, and of separating readily from associated starch. In the so-called gluten of the flour of barley, rye and maize, this body is absent (H. Ritthausen and U. Kreusler). The gluten yielded by wheat which has undergone fermentation or has begun to sprout is devoid of toughness and elasticity. These qualities can be restored to it by kneading with salt, limewater or alum. Gluten is employed in the manufacture of gluten bread and biscuits for the diabetic, and of chocolate. and also in the adulteration of tea and coffee. For making bread it must be used fresh, as otherwise it decomposes and does not knead well. Granulated gluten is a kind of vermicelli, made in some starch manufactories by mixing fresh gluten with twice its weight of flour.

GLUTTON or WOLVERINE (*Gulo gulo*), a carnivorous mammal of the weasel family, Mustelidae (see CARNIVORA). The legs are short, the feet large, the claws sharp and curved and the tail thick and bushy. The fur, blackish-brown, with a broad band of chestnut on the sides of the body, consists of an undergrowth of short woollv hair, mixed with long, straight hairs, the latter giving it a shaggy appearance. Like all Mustelidae, the glutton possesses anal glands secreting a fetid-smelling, yellowish fluid. It inhabits the northern regions of the world, but is most abundant in arctic North America. A voracious animal, it feeds on small mammals, birds and carrion, and causes great annoyance to the trapper by robbing his traps of both bait and captives. Although inquisitive, the wolverine is both cunning and cautious. It has the habit of stealing and hiding all sorts of articles. The rutting season is in March, and the female brings forth four or five young in June or July, in defense of which she is exceedingly bold. It is nocturnal in habits, spending the day in its burrow. The fur is of some commercial value.

WOLVERINE (GULO GULO); IT BELONGS TO THE WEASEL FAMILY AND IS A COMMERCIAL FUR BEARER. BUT DESTROYS OTHER ANIMALS CAUGHT BY TRAPPERS

GLYCAS, MICHAEL, Byzantine historian (according to some a Sicilian, according to others a Corfiote), flourished during the 12th century A.D. His chief work is his *Chronicle* of events from the creation of the world to the death of Alexius I Comnenus (1118). Glycas was also the author of a treatise and a number of letters on theological questions. A poem of about 600 "political" verses, written during his imprisonment on a charge of slandering a neighbour and containing an appeal to the emperor Manuel, is still extant. The exact nature of his offense is not known, but the answer to his appeal was that he was deprived of his eyesight by the emperor's orders.

Editions: "Chronicle and Letters" in J. P. Migne, Patrologia Graeca, clviii; poem in E. Legrand, *Bibliothèque* grecque *vulgaire,* i; see also F. Hirsch, Byzantinische Studien (1876); C. Krumbacher in Sitzungsberichte *bayer.* Acad. (1894); C. F. Bahr in Ersch and Gruber, *Allgemeine* Encyklopadie.

GLYCERIDES: see OILS, FATS AND WAXES.

GLYCERIN, GLYCEROL (in pharmacy *Glycerinum*), is a trihydric alcohol, $C_3H_5(OH)_3$, which is a component part of all animal and vegetable fats and oils. A sweet, colourless, odourless, sirupy liquid in its pure state, it was discovered by Karl Wilhelm Scheele in 1779 and named *ölsüss*. Michel Chevreul, in working on fats in 1813, studied the substance further and gave it its present name (Gr. *glycus,* sweet). Theophile Pelouze (1836), Pierre Berthelot and others identified it chemically. Obtainable from fats and oils by saponification (see OILS, FATS AND WAXES), it also occurs widely in nature in combination with various acids in such substances as lecithin (eggs and various organs) and cephalin (brain, liver and other organs). It is customary to refer to the pure chemical product as glycerol, whereas the term glycerin denotes commercial grades with varying glycerol content.

Applications of Glycerin. — Applications fall into two distinct groups: (1) those arising from glycerin's physical properties: humectancy, viscosity, solvent power, nontoxicity, antifreeze properties and the like; (2) those arising from its three chemically reactive hydroxyl groups — used by nature in the structure of fats and oils (glycerides) and by industry for many derivatives. These range from explosive nitroglycerin (*q.v.*) to highly resistant resins.

Alkyd resins based on glycerin enter a wide range of protective coatings. The "short-oil" type is used in baking enamels for automotive and other machine finishes. "Long-oil" glycerin alkyds are used in brushing enamels and exterior house paints.

U.S. consumption of glycerin in the manufacture of alkyd resins was estimated in the late 1950s to exceed 70,000,000 lb. annually. Other major markets include explosives, tobacco (as a humectant), cellophane (as a plasticizer) and dentifrices. A highly diverse range of uses in the pharmaceutical and toilet goods field includes skin lotions, mouth washes, cough preparations, drug solvents, serums, vaccines and suppositories.

Growing application of mono- and di-glyceride emulsifiers — particularly in the food field — has led to increased use of glycerin in their manufacture. These derivatives act as softening agents in baked goods, plasticizers in shortening and stabilizers in ice cream. Another group of glycerol esters, the acetoglycerides, appear to have possibilities as protective food coatings.

Glycerin is no longer used in commercial quantities as an automotive antifreeze. However, many specialized applications for the antifreeze properties of glycerol solutions have been developed.

One of the most significant is its use as a protective medium for freezing red blood cells, sperm cells, eye corneas and other living tissue. For additional information on applications, see below, Commercial Grades.

.Physical Properties. — Pure glycerol has a molecular weight of 92.06. It has a specific gravity of 1.26j57 at 15° C., an average specific heat of 0.6469 in the range from 16° C. to 179° C.. a refractive index of 1.47399 at 20° C., a flash point of 174° C. and a melting point of 17.8° C. (although glycerin is seldom found in crystalline form). It boils at 290° C. with some decomposition at atmospheric pressure but is unchanged at diminished pressure (*e.g.,* 182°/20 mm. and 153.8°/5 mm.). It is miscible with water and alcohol in all proportions but less so with ether and with fixed and volatile oils.

Some of its more important physical characteristics are: (1) low vapour pressure and high boiling point, which make it nonvolatile at ordinary temperatures; (2) solubility and solvent properties that are comparable with those of water and the lower aliphatic alcohols; (3) high viscosity as an aid to lubrication; (4) low freezing point which is valuable in antifreeze mixtures; and (5) hygroscopicity which aids the retention of moisture and freshness in a wide variety of consumer products. Biologically, it has a food value comparable to that of carbohydrates and a sweetening value approaching that of sucrose.

Glycerin has been exempted from clearance under federal food additive legislation, being one of the products classified as "recognized by appropriately qualified experts as being safe for food use."

Chemical Properties. — Glycerol, because of its three hydroxyl groups, reacts readily with many organic and inorganic compounds to form esters (alkyd resins, ester gums, nitroglycerin and the fatty-acid esters), aliphatic and aromatic ethers, acetals, amines, halohydrins, tartrates, acetates and metallic glycerides. The more important derivatives are: (1) alkyd resins and ester gums, which are basic ingredients of many modern protective coatings; (2) nitroglycerin, which is used in the production of explosives; and (3) numerous further products which are used as solvents, emollients or emulsifiers in edibles, drugs and cosmetics. The reaction of glycerol with tartaric acid and the formation of polyesters were studied by Jons J. Berzelius in 1847, and later research on the glycerol-phthalic acid reactions laid the foundation of the present protective-coating industry. Ascanio Sobrero (1846) noted the reaction of nitric acid with glycerol to form nitroglycerin, and

Alfred B. Nobel (1868–75) converted this highly explosive material into safer and more convenient forms of use. Nitroglycerin is an important component of double-base powders and was used extensively in rocket powder in World War II. (See EXPLOSIVES: *Dynamite;* CORDITE.)

As originally shown by Louis Pasteur (1858), glycerol is a natural product (about 3%) of the alcoholic fermentation of sugar by yeast, and is therefore present in varying percentages in all wines and beers. Carl Neuberg (1912) and others showed that if the fermentation occurs in the presence of a salt such as sodium sulfite, sugar can yield in excess of 30% of its weight in glycerol.

Manufacture. — Most of the world's supply of glycerin is produced as a coproduct in the saponification or hydrolysis of fats. About 10% of the weight of fat is released as glycerol.

In the manufacture of soap by the kettle process, fats are treated nith alkali and yield (along with soap) a "spent lye" consisting of glycerol solution and salt. This spent lye is filtered and concentrated to "soap-lye crude," a grade of glycerin containing 80% glycerol.

More modern soapmaking starts with the production of fatty acids by hydrolysis. This reaction is carried out in a high-pressure splitting tower in which steam is caused to react continuously with the hot fat. Other fat-splitting methods, using autoclaves or using the Tnitchell (catalyst) process, are also employed in fatty acid production. All produce a salt-free "sweet nater" nhich upon evaporation yields a crude glycerin of 88% glycerol content, known as "saponification crude."

Fatty alcohols, in particular lauric alcohol and related types from coconut oil, have become increasingly important as intermediates for detergents. Production of fatty acids or esters for hydrogenation to alcohols. and sodium-reduction methods of fatty alcohol production. are secondary sources for crude glycerin.

Following World War II, glycerin faced increased competition from other polyols originally developed as wartime substitutes. However. U.S. production of refined glycerin rose about 2% per year to a level of about 240,000,000 lb. per year in the late 1950s.

Taken together, the production of glycerin from fats in the late 1950s constituted about 55% of the total U.S. production. The remaining 45% was produced by synthesis from propylene. Production of glycerin from propylene was stimulated by the decline in ioap production resulting from the expansion of synthetic detergents.

The key to glycerin synthesis is the direct, high-temperature vapour phase chlorination of propylene to give high yields of allyl chloride. a process first operated commercially in 1948. Alternative processes, involving the production of allyl alcohol. glycerol mono- and di-chlorohydrins or trichloropropane. lead to products which, upon hydrolysis, yield dilute glycerol solution. The particular route will depend on the specific coproducts, such as epichlorohydrin, for which there is industrial demand.

Concentration and purification yield a finished glycerin of 99% or more. The product is interchangeable with natural glycerin, and is produced to meet the specifications of the U.S. *Pharmacopoeia.*

Fermentation glycerin has never been produced commercially in the U.S , although experimental and pilot plants have been developed there and abroad. Various other reactions, such as the hydrogenolysis of carbohydrates. have also been proposed for glycerin production, but the separation of end products (mixed glycols and other polyhydric alcohols) has precluded their commercialization

Distillation in the presence of steam in vacuum stills is the primary means of purifying glycerin. Redistillation and bleaching are employed for the highest grade. Since 1950, the introduction of ion-exchange processes has provided an alternative means of purification without distillation.

Commercial **Grades.**—*Crude* Glycerin —This grade, in purities of 80% and 88%, although an important article of commerce, has little direct utility. A substantial tonnage moves from smaller plants and from foreign soapmakers to U S glycerin refiners to supplement their own production of crude glycerin.

Refined glycerin is sold by U.S. producers on individual product specifications which differ in minor respects from company to company. Glycerin for a particular field of use—say for cellophane or alkyd resins—may be designated as such by the producer in meeting special tests of the consuming industry.

Glycerin, *U.S.P.*—This clear, colourless product conforms to the specifications of the U.S. *Pharmacopoeia* (minimum specific gravity 1.249 at 25° C.), and is chemically pure except for some 4% of water. It is employed in drugs, foods, toilet goods, tobacco, food wraps, cork bottle-crown liners and wherever glycerin may be used for human consumption. Glycerin of the same quality, but sold at a higher concentration (minimum specific gravity 1.2595 at 25° C.), is also supplied. British standards for chemically pure glycerin (B.P.) are similar, except for specific gravity limits of 1.255 to 1.260 at 20° C.

High Gravity Glycerin.—This is a commercial grade of glycerin conforming to Federal Specification O-G-491a, grade B, and commonly supplied at not less. than 99.0% concentration (specific gravity 1.2595 at 25° C.). It is directed to glycerin's largest U.S. field of use. the manufacture of alkyd resins. Glycerin from propylene. referred to as synthetic glycerin, conforms to these specifications, but is commonly supplied at 99.5% glycerol content.

Dynamite glycerin is comparable in concentration with high-gravity grades, but less emphasis is placed on minimum colour requirements. Yellow distilled is a refined grade meeting less critical standards of colour, with concentration not less than 96% glycerol.

See C. S. Miner and N. N. Dalton, *Glycerol* (1953); Glycerine Producers Association, *Glycerine Properties and Applications* (1957).

(N. N. D.; E. S. PN.)

GLYCOLS, the generic name applied to a class of alcohols having two hydroxyl groups. The glycols of lower molecular weight are colourless, oily liquids boiling at about 180° C. Several of the lower glycols are important commercially, but the glycols of high molecular weight have little or no commercial importance. Hundreds of them have been prepared for scientific studies. This is particularly true of the pinacols which are obtained by the reduction of ketones and undergo the pinacolone rearrangement.

Ethylene Glycol. — Glycol, ethane-1,2-diol, $CH_2(OH)CH_2OH$, is a colourless, oily liquid possessing a sweet taste and mild odour.

The commercial importance of ethylene glycol and its derivatives (generally derived directly from ethylene oxide) increased rapidly. Large quantities of ethylene glycol are used annually as antifreeze in automotive cooling systems. Its availability at low cost, high antifreeze efficiency (low molecular weight) coupled with the relatively high heat capacities and low viscosities of its aqueous solution admirably suit ethylene glycol for this service. The second largest commercial use by the 1950s was the manufacture of glycol dinitrate. Because of its low freezing point, glycol dinitrate is used in the manufacture of low-freezing dynamites.

Ethylene glycol resembles glycerin in many of its chemical and physical properties. Ethylene glycol boils at 197.2° C., freezes at −13° C. and is heavier than water; its specific gravity at 20/20° C. is 1.115 It is completely soluble in water and in many industrial solvents. Unlike glycerin, ethylene glycol and all of its derivatives are toxic to warm-blooded animals and must not be used in food and pharmaceutical preparations. Ethylene glycol is produced commercially from ethylene gas. The oldest process consists in treating ethylene with hypochlorous acid to produce ethylene chlorohydrin $HOCH_2CH_2Cl$. The chlorohydrin is then converted into glycol by action of an alkali such as calcium hydroxide or sodium bicarbonate. Ethylene glycol is produced commercially from formaldehyde, hydrogen and carbon monoxide under heat and pressure or by the hydration of ethylene oxide. The ethylene oxide is obtained either by the oxidation of ethylene or by the dehydrochlorination of ethylene chlorohydrin.

In both processes, the glycols are obtained as dilute aqueous solutions and are recovered and purified by evaporation and distillation procedures.

Ethylene glycol exhibits many of the reactions common to primary alcohols. Careful oxidation yields glycolic acid. Heating the reaction mixture produces oxalic acid. With dehydrating agents. ethylene glycol yields acetaldehyde. Heat alone at 500° C. produces the same change. The ethers which would be expected, ethylene oxide and diethylene oxide, are both known, but only the latter is obtained by dehydration of glycol. Both are commercially prepared from ethylene chlorohydrin. Halide acids react readily with one hydroxyl group to produce halohydrins. Alkali metals replace the alcoholic hydrogen atoms. Glycols react with monocarboxylic acids to form mono- and di-esters. With dicarboxylic acids, linear polyesters are obtained; the fibre Dacron, for example, is such an ester with terephthalic acid (see PHTHALIC ANHYDRIDE).

As stated above, many glycol derivatives are manufactured from ethylene oxide or from combinations of ethylene oxide with glycol. Commercial products produced in this manner are diethylene glycol (from glycol plus ethylene oxide), triethylene glycol (from ethylene oxide plus diglycol). The ethers of ethylene glycol with the lower aliphatic alcohols are of considerable importance. These are made by the direct addition of ethylene oxide to the corresponding alcohol. Ethylene glycol monoethyl ether is produced by the reaction of ethylene oxide with ethyl alcohol. The corresponding ethers of diethylene glycol are prepared by the action of ethylene oxide on the glycol ethers.

Acetone Glycol, 2-methylpentane-2,4-diol, $(CH_3)_2C(OH)CH_2CH(OH)CH_3$, boiling point 192° C., is obtained by the reduction of diacetone alcohol which, in turn, is produced by the dimerization of acetone under the influence of alkalies. Its reactions are those that would be expected from a secondary and tertiary alcohol.

Pinacol, tetramethylethylene glycol, 2,3-dimethylbutone-2,3-diol, $(CH_3)_2C(OH)C(OH)(CH_3)_2$ (boiling point 172° C., melting point 42° C.), is obtained from the bimolecular reduction of acetone by amalgamated magnesium. Its most important reaction is its rearrangement to pinacolone, $(CH_3)_3C.COCH_3$, by dehydration with acid reagents.

Some commercial interest was shown in this compound in Germany during World War I, for by catalytic dehydration it is possible to obtain 2,3-dimethylbutadiene-1,3 (also called methylisoprene) from which methyl rubber can be made.

(D. G. Z.; N. C. S.)

GLYCONIC, a form of Aeolic verse, uhich may be described as a combination of one or more dactyls (or perhaps choriambi) with shorter feet. It has many forms,

as ⏒⏒ – ⏑⏑ – ⏑⏑ – ⏑⏑

or ⏒ – ⏑ ⏑ – ⏑ ⏓ (acephalous glyconic)

or grato Pyrrha sub antro (Pherecratic).

But the commonest is ⏒ ⏒ – ⏑ ⏑ – ⏑ ⏒, often called simply a glyconic; this is a great favourite of Catullus and Horace, as sic te *diva potens* Cypri; it may be imitated in English by immemorial harmonies.

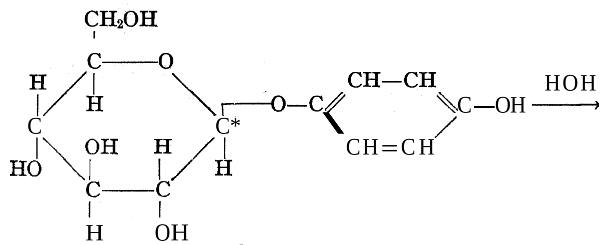
The name is from Glycon, a lyric poet.

GLYCOSE: see SUGAR.

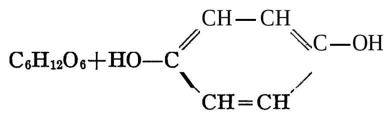
GLYCOSIDES, NATURAL. The term glycoside is applied to a large number of substances found mainly in plants. Formerly the names glucoside and aglucone were used, but these terms came to be restricted to those glycosides that contain only glucose as their sugar component. While the exact biological function of the plant glycosides is not established, it is probable that their formation provides the plant with a means of storing, in a harmless form, toxic and physiologically active materials which may be liberated by enzymes, in small quantities, when required. Glycosides are solids, generally crystalline, and most have a bitter taste. Their solutions show the property of rotating the plane of polarized light, usually to the left. Under the influence of aqueous solutions of acids they can be split (hydrolyzed) by the elements of water (H-OH) into one or more sugars and a nonsugar portion termed the aglycon. This change can also be effected by naturally occurring substances present in trace amounts in neighbouring cells. These substances are known as enzymes and are effective only for one glycoside or for a group of closely related glycosides. The aglycons are widely diversified in chemical structure but all contain a hydroxyl (OH) group through which they combine with the sugar. From the standpoint of chemical structure, a glycoside is a mixed acetal and shows all the properties of such a combination.

Most of the natural glycosides have been assigned names derived from the botanical names of their plant sources. Thus arbutin is a colourless, crystalline, bitter substance that was first extracted from the leaves of the small evergreen shrub Arbutus *uva-ursi;* later it was found in other plant sources, such as the leaves, bark and roots of many varieties of the common pear. Arbutin is hydrolyzed by acids or by the enzyme β-D-glucosidase present in the mixture of enzymes known as almond emulsin, extractable from the bitter almond. Arbutin thus can be split into the sugar D-glucose and the aglycon hydroquinone; its rational chemical name is therefore para-hydroxyphenyl β-D-glucopyranoside.

The term "pyranoside" refers to the size of the internal cyclic acetal in the sugar moiety and "β-D" designates the spatial orientation of the "glycosidic carbon," marked with an asterisk in the following formula:

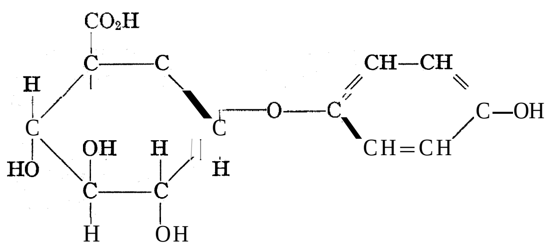


Arbutin



D-Glucose Hydroquinone
(1,4-dihydroxybenzene)

Glycosides are usually at least sparingly soluble in water and since only soluble substances are transportable in a plant by movements of sap, it is at least useful as a working hypothesis to assume that the plant converts into glycosides: (1) harmful or useless substances which must be transported to the barks, fruit rinds or seed coats, where they can do no harm and will eventually be shed; (2) necessary but harmful substances, which may be useful later; (3) decorative or attractive substances, such as floral pigments, formed in the leaves and transported at the proper season to the flowers or fruits. Experimental support for the theory that glycoside formation in the plant is a detoxication mechanism is provided by the finding that 2-chloroethanol $(ClCH_2CH_2OH)$, a substance which breaks the dormancy of tubers, is converted by plant tissue to 2-chloroethyl β-D-glucopyranoside. Such a detoxication mechanism also operates in animals, where harmful or unwanted substances are eliminated in the urine as glycosides of D-glucuronic acid. Thus, when hydroquinone is fed to a dog, the following substance appears in the urine:



Para-hydroxyphenyl β-D-glucopyranosiduronic acid

Many glycosides of D-glucuronic acid with steroidal fragments are normally present in urine and the nature of these materials is modified by such biological conditions as pregnancy.

Uses.—The plant glycosides exist in a bewildering variety both in regard to their sugar components and, especially, in the nature of their aglycons. To their presence in plants are ascribable the many uses of plant materials established by primitive peoples and exploited by modern civilization. The medicines, condiments and dyes from plant sources occur largely as glycosides. As their chemical nature has become established, most, but not all, of these substances have been replaced by synthetic products. This has been especially true of plant or vegetable dyes, but many condiments and some medicines are still derived from plant extracts.

Arbutin, described above, is an example of a simple, colourless, phenolic glycoside, many varieties of which are found in plants. Arbutin is accompanied by methylarbutin, which contains hydroquinone monomethyl ether as its aglycon.

Salicin is the active constituent of willow (Salix) bark and has long been used as a remedy against fever and in acute rheumatism. Its hydrolytic products are D-glucose and saligenin [salicyl alcohol, *ortho*-hydroxybenzyl alcohol, $C_6H_4(OH)(CH_2OH)$]. Phloridzin (phlorizin, phlorhizin), from the bark of the Rosaceae (apple, pear, cherry and plum tree), is the D-glucoside of a rather complicated phenolic aglycon. Its administration produces a type of diabetes in the dog and this circumstance has been utilized in studies of the disease.

Glycosides of aliphatic alcohols are represented by the purgatives convolvulin and jalapin, whose sugars are in glycosidic combination with the hydroxyl groups of hydroxylated fatty acids and are thus related to the constituents of castor oil. The β-D-glucopyranoside of the terpene alcohol geraniol occurs in Pelargonium odoratum. Although most glycosides,are characterized by their bitter taste, stevioside is one of remarkable sweetness. It is extractable from the leaves of *Stevia rebaudiana* Bertoni, a wild shrub of the Compositae family. native to Paraguay. Stevioside contains three units of D-glucose, two of which are in combination with each other; its aglycon, steviol, is a diterpenoid.

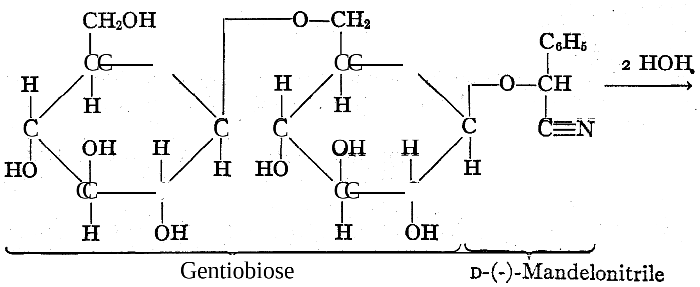
The saponins are glycosides of aliphatic alcohols and are widely distributed in plants. They are characterized by their property of producing foams when shaken in aqueous solution. They are toxic to fish and were used as a fish poison by primitive peoples, since the fish so killed were not toxic to humans when eaten. The saponins yield a variety of sugars on hydrolysis; some yield D-glucuronic acid. Their aglycons are termed sapogenins and may be classified as either triterpenoid or steroid. Glycyrrhizin, the saponin of licorice (*Glycyrrhiza* glabra) root, contains a triterpenoid sapogenin, while sarsasaponin, from Mexican sarsaparilla root, contains the steroid sarsasapogenin. (See SAPONINS AND SAPOGENINS.)

Another large group of steroid glycosides that are not saponins are collectively known as the cardiac glycosides. These are powerful heart poisons but are useful heart stimulants in minute dosages. The primitive tribes of Africa employ extracts of the seeds of Strophanthus and of the wood and bark of the ouabaio as arrow poisons. Extracts of the bulbs of the squill have been utilized in medicine since ancient times, but better known in modern medicine are the extracts of the leaves of Digitalis or common garden foxglove. The flower of the lily of the valley also yields such extracts. The cardiac glycosides from all of these divergent plant sources are related chemically. On hydrolysis they yield a large variety of unusual sugars but their physiological action lies in the aglycons which possess chemical structures related to those of the steroids.

A group known as the cyanogenetic glycosides is found in the kernels of peaches, cherries and plums and in other parts of a variety of plants. These are mainly glycosides of the cyanohydrin mandelonitrile. When hydrolyzed by enzymes or by acids they liberate poisonous hydrocyanic acid together with benzaldehyde and one or more sugars, chiefly D-glucose (see formula below). To this group belongs amygdalin, one of the earliest investigated glycosides. The sugars of amygdalin are two moles of D-glucose combined as the disaccharide gentiobiose.

The condiment mustard is prepared by grinding mustard seed with salt, spices and vinegar. A variety of mustard seeds are used, but all contain a glycoside in which a D-glucose entity is directly attached to a sulfur atom rather than to an oxygen atom.

Many of the vegetable dyes formerly so widely used were glycosides. One of the chief of these was madder (Rubia *tinctorum*), formerly grown commercially in the near east. The main glycoside of the madder root yields on hydrolysis the sugars D-glucose and D-xylose, present in disaccharide combination in the glycoside, and 1,2-dihydroxyanthraquinone or alizarin (*q.v.*). Alizarin is employed with mordants (certain metallic salts) to form lakes in a wide variety of colours. It was the first vegetable dye whose chemical structure was determined and as a result of this the natural product was replaced by a synthetic preparation of better quality. An interesting yellow dye, known as Indian yellow, is prepared in Bengal by feeding mango leaves to cattle and isolating the dye from the urine. It is a glycoside of D-glucuronic acid attached to a structure quite closely related to alizarin and known as 4,7-dihydroxyxanthone.



$$2\ C_6H_{12}O_6 + HCN + C_6H_5CHO$$

D-Glucose   Hydrocyanic acid   Benzaldehyde

The wide variety of pigments present in flowers and fruits are largely mixtures of glycosides with carotenoids. Most of the blue colours and some of the red are glycosides (anthocyanins) of aglycons known as anthocyanidins, which are reduction products of hydroxylated phenyl-benzo-y-pyrones. Glycosides of the latter constitute a large group of yellow pigments widely distributed in fruits, flowers, bark and other pigmented plant structures. A typical yellow glycoside is quercitrin, present in oak bark (see QUERCITRON BARK).

GLYPTODON, a gigantic extinct South American genus of edentate mammals, the type of a group, the Glyptodontia or tortoise-armadillos, in which the carapace is all in one piece, composed wholly of polygonal bony plates united together without any of the movable rings of the armadillos. The skull is short, with deep jaw and fluted teeth (whence the name), the backbone is welded into a rigid tube, and a complex joint in the neck permits the head to be retracted within the shell as in tortoises. The limb bones are stout and the feet short, rounded, with hoofs instead of claws on the toes. In Glyptodon and the related *Glyptotherium* of North America there are four toes on each front foot and five behind, and the tail is encased in a series of movable rings. *Doedicurus,* of the South American Pleistocene, the largest known glyptodont, has three toes on each front foot and four behind, and a tail tube covered by horny spikes. The pattern of the plates composing the carapace differs in each genus. The glyptodonts originated in South America where they are represented during the middle and later Tertiary by smaller and more primitive genera. In the Upper Pliocene and Pleistocene they invaded North America as far as southern United States. (W. D. M.)

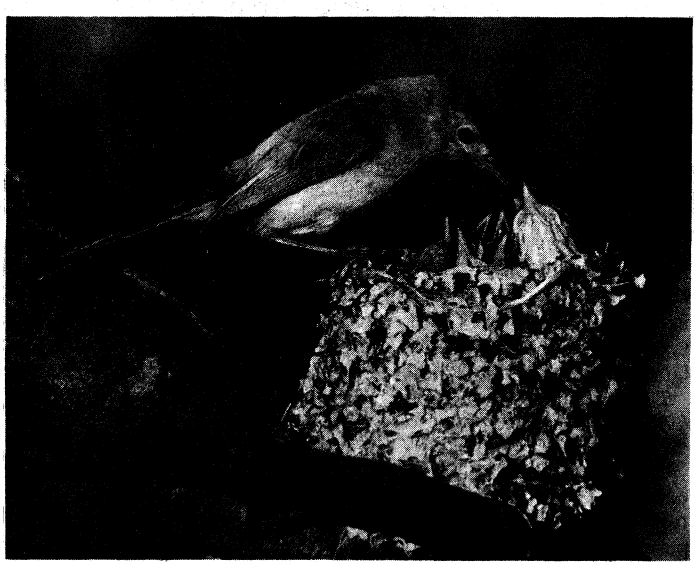
G-MEN, or government men, a journalistic term for special agents of the United States department of justice, bureau of investigation. The phrase is supposed to have obtained currency after the capture of a notorious criminal, George ("Machine Gun") Kelly, in Sept. 1933. *(See* FEDERAL BUREAU *OF* INVESTIGATION.) By analogy, investigative agents of the U.S. department of the treasury became known as T-men.

GMÜND (SCHWÄBISCH GMÜND), a town of Germany, in the *Land* of Baden-Württemberg, on the Rems, 31 mi. E.N E. of Stuttgart by rail. Pop. (1959 est.) 40,629. It was surrounded by walls early in the 12th century. It received town rights from Frederick Barbarossa, and after the extinction of the Hohenstaufen became a free imperial town. In 1803 it passed to Wurttemberg. The church of the Holy Cross, St. John's church, dating from the time of the Hohenstaufen, and the pilgrimage church of the Saviour are notable. Clocks and watches, optical instruments and gold and silver work are the chief manufactures. Trade is in precious stones.

GMUNDEN, an old town in Upper Austria at the issue of the Traun river from the lake of that name. It is a favourite summer health resort, for it lies about 1,400 ft. above sea level amid delightful scenery and has a variety of lake, brine, pine cone and other baths, and is an excellent centre for excursions to the Traun fall and other features of scenic interest in Salzkammergut. It shares in the salt industry of this region. Pop. (1961) 12,922.

GNAT, the common English name for various kinds of small flies *(see* DIPTERA), including more especially mosquitoes (*q.v.*) and other forms with piercing mouth parts; *e.g.,* buffalo gnats (family Simuliidae).

GNATCATCHER, the name given to birds of the American subfamily Polioptilinae (family Regulidae, kinglets). About 12 species are recognized. Gnatcatchers are small, slender, grayish and white birds with relatively long, slender tails. They build beautifully symmetrical compact nests of plant down and other



BY COURTESY OF L. H. WALKINSHAW

BLUE-GRAY GNATCATCHER (POLIOPTILA CAERULEA CAERULEA)

soft materials bound together with spider webs and covered with lichens. The nests occur at elevations of a few feet to as much as 70 ft. above the ground. Although the name gnatcatcher has come to be applied generally to these birds, they by no means are restricted in diet to. or even show any noticeable partiality for, these insects. They feed on all small insects, and occasionally have been known to seize others large enough to require tearing apart before they can swallow them. Stomach contents of these birds have revealed longicorn beetles, jointworm flies, caddis flies and other insects.

The best-known species is the blue-gray gnatcatcher *(Polioptila caerulea caerulea)* of the eastern United States, in which the male has a black forehead. The western gnatcatcher *(P. c. amoenissima)* breeds from California and Colorado south into Mexico. The plumbeous gnatcatcher *(P. melanura melanura)* breeds from southeastern California, southern Nevada and the Rio Grande valley southward; the black-tailed gnatcatcher (P. *m. california)* occurs in the San Diego district of California. Other races and species occur in Central and South America, extending as far south as Argentina and Chile. (G. F. Ss.; HT. FN.)

GNATIA (also GNATHIA, EGNATIA or IGNATIA), near Fasano, Italy, an ancient city of the Pevcetii, and their frontier town toward the Sallentini (*i.e.,* of Apulia toward Calabria), a port on the Via Traiana when a short cut from Butunti (mod. Bitonto) joined it, 38 mi. S.E. of Barium. Roman remains include part of the city walls and objects in museums at Fasano and at Bari.

GNEISENAU, AUGUST WILHELM ANTON, COUNT NEITHARDT VON (1760–1831), Prussian field marshal, son of a Saxon officer named Neithardt, was born on Oct. 27, 1760, at Schildau, near Torgau. He assumed the name of Gneisenau from the lost estates of the family in Austria. After two years' study at Erfurt he entered the Austrian army in 1779 and transferred in 1782 to the service of the margrave of Baireuth-Anspach. With one of that prince's mercenary regiments in English pay he fought in the American Revolution, and returning in 1786, applied for Prussian service. Gneisenau served in Poland in 1793–94 and in the next ten years devoted himself to military study. In 1796 he married Caroline von Kottwitz. In 1806 he was one of Hohenlohe's staff officers, fought at Jena, and commanded a provisional infantry brigade which fought under Anton von Lestocq in the Lithuanian campaign. Early in 1807 Gneisenau was commandant at Colberg, which succeeded in holding out until the peace of Tilsit. For this service he received the much-prized order *"pour le mérite,"* and was promoted to lieutenant colonel.

A wider sphere of work was now open to him. As chief of engineers, and a member of the reorganizing committee, he played a great part, with Scharnhorst, in the reorganization of the Prussian army. His energy aroused the suspicion of the dominant French, and Stein's fall was followed by Gneisenau's retirement. But, after visiting Russia, Sweden and England, he returned to Berlin and resumed his place as a leader of the patriotic party. In open military work and secret machinations his energy and patriotism were equally tested, and with the outbreak of the War of Liberation, Gneisenau, now a major general, became Bliicher's quartermaster general. With Bliicher, Gneisenau served to the capture of Paris; his military character was the exact complement of Bliicher's and under this happy guidance the young troops of Prussia, often defeated but never discouraged, fought their way into the heart of France. The plan of the march on Paris was specifically the work of the chief of staff. In reward for his distinguished service he was made a count.

In 1815, once more chief of Bliicher's staff, Gneisenau played a conspicuous part in the Waterloo campaign (*q.v.*). When the old field marshal was disabled at Ligny, Gneisenau assumed control of the Prussian army.

The precise part taken by Gneisenau in the events which followed is much debated. Gneisenau distrusted Wellington, who, he considered, had left the Prussians in the lurch at Ligny, and even considered falling back on the Rhine. Blucher, however, soon recovered from his injuries, and, with Grolmann, the quartermaster general, he managed to convince Gneisenau. The relations of the two may be illustrated by Brigadier General Hardinge's report. Blücher burst into Hardinge's room at Wavre, saying *"Gneisenau has given way,* and we are to march at once to your chief." On the field of Waterloo, however, Gneisenau was quick to realize the magnitude of the victory, and he carried out the pursuit with relentless vigour. In 1816 he was appointed to command the Prussian 8th corps, but soon retired. In 1818 he was made governor of Berlin and member of the *Staatsrat.* In 1825 he became general field marshal. In 1831 he was appointed to the command of the army of observation on the Polish frontier, with Clausewitz as his chief of staff. At Posen he was struck down by cholera and died on Aug. 24, 1831.

M. Grafen von Gneisenau,* 2 vol., *3rd* ed. (1907), based on Pertz's work, but containing much new material; W. von Unger, *Gneisenau* (1914).

GNEISS, in geology a generic term signifying a large and varied series of rocks with a banded and usually foliated structure in which layers of minerals with a granular texture alternate with thin layers composed of lamellar or fibrous minerals, usually in parallel arrangement. The term originally was used by the miners of the Erzgebirge in Germany to designate the country rock in which the mineral veins occur. The word is of Slavonic origin meaning rotted, or decomposed, in allusion to the altered character of the country rock in the immediate vicinity of the ore veins.

The foliation of gneiss may be frequently interrupted and the ease of splitting of the rock is usually much less in evidence than in the case of schists (*q.v.*). Gneisses, however, may also be built up wholly of granular minerals, the gneissose structure being given by the alternation of bands of different mineral composition; *e.g.*, pyroxene gneiss.

As used in its widest sense, gneiss is a structural term rather than a name applied to rocks of a particular mineral composition or genesis. Thus gneisses may be of igneous or metamorphic origin, and have a great range of chemical composition. The minerals of the granular bands usually consist of quartz, feldspar (orthoclase, microcline, plagioclase) or both, and the lamellar or fibrous bands are usually composed of chlorite, mica (muscovite, biotite), graphite, amphibole, sillimanite, etc.

According to their origin, gneisses are subdivided broadly into four groups: (1) primary gneisses, (2) injection gneisses, (3) orthogneisses and (4) paragneisses.

Primary gneisses are plutonic igneous rocks possessing a banded structure, in which a parallel arrangement of the lamellar or fibrous minerals (if present) is evident. These rocks owe their structures to a flow movement in a magma in which crystallization has already progressed. Primary gneisses are often of granitic composition and build up great areas of Pre-Cambrian Archean formations. Much of the Lewisian gneiss of Scotland, the Laurentian gneiss of Canada and the igneous gneisses of other continental shields may be rocks of this character. The setting up of gneissic banding in a fluid magma by flow movement presupposes a magmatic heterogeneity which in nature arises either by imperfect differentiation or by the incorporation of foreign material within the magma. In many Archean shields the granite gneisses are characterized by containing numerous bands of rock, usually of the nature of amphibolites or hornblende schists, representing basic igneous rocks of earlier date incorporated in the magma during intrusion. These basic bands become injected along planes of bedding or foliation by the granitic material and ultimately in places become so intimately intermingled with the magma as to produce a gneiss of hybrid origin. Less advanced stages of this process where injection takes place along the foliation planes of inclusions or of the country rock adjacent give rise to injection gneisses. Migmatite gneisses (from the Greek *migma,* "a mixture") are mixed, composite or injection gneisses sometimes extensively developed in crystalline schist formations u-hich have been invaded by granitic intrusions.

They develop both by mechanical injection of fluid between the folia of schists and by intimate soaking and metasomatism whereby new feldspar (orthoclase and plagioclase) arises in the body of the schist. conspicuously in the form of porphyroblasts, or large pseudoporphyritic crystals, but also in finer elements in the ground mass. In advanced stages. particularly where the schist is of argillaceous or clayey type, the resultant rocks may simulate primary granite gneisses with but vague remnants or "ghosts" of the original schist to tell the story of their origin.

The term orthogneiss refers strictly to igneous rocks in which a gneissic structure has been superimposed by metamorphism, but the name is used by some writers to include also primary gneisses. Criteria for the distinction of orthogneisses from primary gneisses are sometimes difficult to establish, and are chiefly provided in the textural and structural relations of the rocks. They may be evidenced by signs of crushing (cataclastic structure), relict textures, or where the uhole rock has been totally recrystallized by the textural relations of the minerals. In primary gneisses the form development of the crystals is largely dependent on the order in which the minerals have crystallized from the magma, while in totally recrystallized orthogneisses the growth of the minerals has taken place in an essentially solid environment, and the form development is dependent on the crystallizing power of the several minerals, giving rise to crystalloblastic texture (*see* METAMORPHISM). Some of the best-known orthogneisses are those of the granulite districts of Saxony and the Austrian Waldviertel near Krems.

Many gneisses are undoubtedly sedimentary rocks brought to their present state by such agents of metamorphism as heat, movement, crushing and recrystallization. This may be demonstrated partly by their mode of occurrence; they accompany limestones, graphite schists, quartzites and other rocks whose sedimentary origin is never in doubt. In many cases bulk chemical composition is a certain clue to their origin, since they correspond in this particular to normal sediments and not to any known igneous rocks. Structural or textural criteria, such as bedding, evidence of original pebbly or clastic character, are not infrequently to be found. The chemical composition of paragneisses is reflected in their mineralogical constitution.

Gneisses derived from argillites may be rich in biotite, muscovite, cordierite, almandine garnet, staurolite, chloritoid, kyanite and sillimanite, some of which minerals are practically unknown in metamorphosed igneous rocks, while gneisses derived from limestones or dolomites carry such characteristic minerals as grossularite, idocrase, wollastonite, scapolite or forsterite. Some paragneisses are rich in feldspar and quartz and may show so close a resemblance to gneisses of igneous origin that by no single character, chemical or mineralogical, can their original nature be definitely established. (C. E. T.)

GNEIST, RUDOLF VON (1816–1895), German jurist and political thinker who exercised a profound influence on the growth of German administrative law, was born in Berlin on Aug. 13, 1816, the son of a judge of the supreme tribunal. From 1833 to 1836 he studied law, especially Roman law under Karl Friedrich von Savigny, at Berlin university. In 1841 he became a judge, and from 1847 he sat in the high court in Berlin. Though he was no revolutionary, he soon had to resign because of his opposition to the reactionary policy of the Prussian government after 1848.

After resigning his judgeship, Gneist devoted himself to academic studies. Already in 1842 he had become a reader in Roman law at Berlin university. Gradually, however, he turned his attention from this subject and won a growing reputation with lectures on assizes, on public and oral proceedings, on English and French judicial organization and on Prussian, German and English constitutional and administrative law. Between 1850 and 1860, completely withdrawn from political affairs, he wrote his great work on English constitutional law.

Though he had remarkable success as a teacher, it was only in 1858 that he became a full professor in Berlin—a position that he was to hold until his death. In all his works, most of which even carried the words "English" or "self-government" in their titles. he drew upon English conditions past and present. His writings earned him a widespread reputation. For more than 20 years (from 1868) he was president of the German jurists' association; and he received honorary degrees from Edinburgh, Berlin (doctor of philosophy), Bologna and Rostock.

Gneist's political career began in 1845 with his election as a town councilor in Berlin. This gave him considerable experience in local politics, which was of great value to him for his later academic treatises on "self-government." He lost his seat because of his views on the reaction after 1848, but regained it in 1858 He was also a member of the Prussian house of representatives from 1859 to 1893, of the *Reichstag* from 1867 to 1884 and of the Prussian state council from 1884. A liberal by conviction, he joined the moderate National Liberal party in 1866, though originally he had been inclined more to the Progressive party. Later he turned to a more conservative liberalism, under the influence of Lorenz von Stein (Stein's theory—developed about 1850—is based on the dualism of state and society). Bismarck frequently asked his advice. In the *Kulturkampf* period (1871–78) Gneist opposed the Jesuits and the demand for denominational schools. He took a strong interest in political matters without holding any extreme views. This position is particularly apparent in his writings. Though these do not always stand up to scholarly criticism. they reveal a powerful and practical political mind that could at the same time present clearly defined legal conceptions. These assets also explain Gneist's great popular success.

At the height of his success Gneist resumed his career as a judge. His untiring advocacy of an independent administrative jurisdiction was rewarded when, at the founding of the Prussian supreme administrative court in 1875, Gneist was invited to become a member of it. This court was then the highest of its kind in Germany, and Gneist exercised a decisive influence in the development of its jurisdiction. Gneist died in Berlin on July 22, 1895.

Gneist's main field of work was public law. Here he emphasized the idea of "self-government"; by this he understood the administration of public affairs by self-responsible, honorary officials appointed by the king from among the aristocracy and the middle classes, in contrast to an administration from above by professional civil servants or elected bodies. His model was the administration of the English counties by the justices of the peace whereas most other contemporary advocates of "self-government" inclined rather to the Franco-Belgian systems. Though Gneist's presentation of English conditions was not always accurate. since he sometimes saw them in the light of preconceived political notions, his writings nevertheless provided a basis on which the German middle classes came to participate widely in public administration. The greater part of the German administration remained, however, in the hands of the professional civil service, mainly because the needs of the modern state favoured the growth of specialization in this field, so that the term "self-government" is hardly any longer applied in the specific meaning used by Gneist.

The most pregnant of Gneist's ideas proved to be his demand for the establishment of independent administrative courts run by legal and administrative experts charged with the control of the administration. The German states one after another set up an independent administrative jurisdiction which was repeatedly extended. The opening of the federal administrative court in Berlin on June 8. 1953, and the promulgation of the federal code for administrative procedure on Jan. 21, 1960, completed the development which Gneist had initiated.

Gneist's writings include *Das heutige englische Verfassungs- und Verwaltungsrecht*, 2 vol. (1857–60; later editions under different titles); *Englische Verfassungsgeschichte* (1882; Eng. trans.. *History of the English Constitution*, 1886'); *Verwaltung, Justiz, Rechtsweg: Staatsverwaltung und Selbstverwaltung nach englischen und deutschen Verkaltnissen* (1869); *Das englische Parlament* (1886; Eng. trans., *English Parliament*, 1889).

GNIEZNO, a town of Poland, in the Poznan *wojewodztwo* (voivodeship), is a district capital and one of the two capitals of the R'arsaw-Gniezno Roman Catholic archdiocese. Pop. (1960) 44,000. Gniezno lies on the Poznan-Torun railway in a region of many lakes. It is a trade centre and has industries processing the agricultural produce of the area. Gniezno is rich in fine old buildings, among which the cathedral is outstanding. Its Komanesque door, dating from the 12th century and cast in bronze, showing episodes from the life of St. Adalbert, is one of the finest examples of early medieval Polish art.

Gniezno was one of the oldest fortresses of the Polan tribe (8th century A.D.) and the first capital of the Piast state. The importance of the town increased greatly after the burial in the cathedral of the remains of St. Adalbert. In A.D. 1000 the town became the capital of the archdiocese (rendering the Polish church independent of the German) and the place of coronation of Polish kings. It obtained town rights in 1243. In 1793 Gniezno came under Prussian rule; it passed to Poland in 1919. During their occupation in World War II the Germans set up at Gniezno one of the first forced-labour camps in Poland. (K. M. WI.)

GNOME, AND GNOMIC POETRY. Sententious maxims, put into verse for the better aid of the memory, were known by the Greeks as gnomes. γνῶμαι, from γνώμη, an opinion. A gnome is defined by the Elizabethan critic Henry Peacham (1576?–1643?) as "a saying pertaining to the manners and common practices of men, which declareth, with an apt brevity, what in this our life ought to be done, or not done" The Gnomic Poets of Greece, who flourished in the 6th century B.C., were those who arranged series of sententious maxims in verse. These were collected in the 4th century, by Lobon of Argos, an orator, but his collection has disappeared. The chief gnomic poets were Theognis, Solon, Phocylides, Simonides of Amorgos, Demodocus, Xenophanes, and Euenus. With the exception of Theognis, whose gnomes were fortunately preserved by some schoolmaster about 300 B C., only fragments of the Gnomic Poets have come down to us Of the gnomic movement typified by the moral works of the poets named above, Prof. Gilbert Murray has remarked that it receives its special expression in the conception of the Seven Wise Men, to whom such proverbs as "Know thyself" and "Nothing too much" were popularly attributed. These gnomes or maxims were extended and put into literary shape by the poets. Theognis enshrines his moral precepts in his elegies, and this was probably the custom of the rest; it is improbable that there ever existed a species of poetry made up entirely of successive gnomes. But the title "gnomic" came to be given to all poetry which dealt in a sententious way with questions of ethics. It was, unquestionably, the source from which moral philosophy was directly developed, and theorists upon life and infinity, such as Pythagoras and Xenophanes. seem to have begun their career as gnomic poets. By the very nature of things. gnomes, in their literary sense. belong exclusively to the daun of literature; their naïveté and their simplicity in moralizing betray it. But it has been observed that many of the ethical reflections of the great dramatists, and in particular of Sophocles and Euripides, are gnomic distiches expanded It would be an error to suppose that the ancient Greek gnomes are all of a solemn character, some are voluptuous and some chivalrous; those of Demodocus of Leros had the reputation of being droll. In modern times, the gnomic spirit has occasionally been displayed by poets of a homely philosophy, such as Francis Quarles (1592–1644) in England and Gui de Pibrac (1529–1584) in France. The once-celebrated *Quatrains* of the latter, published in 1574, enjoyed an immense success throughout Europe; they were composed in deliberate imitation of the Greek gnomic writers of the 6th century B C These modern effusions are rarely literature and perhaps never poetry. With the gnomic writings of Pibrac it was long customary to bind up those of Antoine Favre (or Faber) (1557–1624) and of Pierre Mathieu (1563–1621). Gnomes are frequently to be found in the ancient literatures of Arabia, Persia and India, and in the Icelandic staves. (E. G.)

GNOMON, a term originally used to mean an instrument for allowing one to know the time (*γνώμων*, *gnōmōn,* from *γιγνώσκειν*, *gignōskein,* to know). In its simple and primitive form it seems to have been a stick placed vertically on a plane surface, and later upon the concave surface of a hemisphere. This second form is seen in pocket sundials still used in certain parts of the world. That the term was at one time substantially synonymous with "vertical line" is seen in an expression of Oenopides of Chios (*c.* 465 B.C.), for Proclus (*c.* 460) says that he called "the perpendicular in the archaic manner 'gnomon-wise' (κατὰ γνώμονα), because the gnomon is also at right angles to the horizon." From this early use it came to represent a figure like a carpenter's square, but usually with equal arms. Seeking, as the Pythagoreans especially did, to relate number to geometric forms, the early Greek mathematicians imagined squares as built up of gnomons added to unity. For example, they saw that $1+3$, $1+3+5$, $1+3+5+7$, and so on, are squares, and that the odd numbers in a figure like this were related to the geometric gnomon. Such numbers were, therefore, themselves called *gnomons.* The early idea of a geometric gnomon was extended by Euclid (*q.v.; c.* 300 B.C.) to include a figure consisting of two parallelograms forming an **L.** Four or five centuries later Heron extended the term still farther, using it to mean that which, added to any number or figure, makes the whole similar to that to which it is added. This usage is also found in the writings of Theon of Smyrna (c. 125) in connection with figurate numbers (*q.v.*). For example, the pentagonal numbers are $1+4$, $1+4+7$, $1+4+7+10$, . . ., and the gnomons in this case are 4, 7, 10, . . .; *i.e.,* they constitute an arithmetical series with a common difference of 3. In the same way gnomons are developed with respect to hexagonal and higher polygons. The gnomon with respect to the square was used by early writers in the finding of square roots, and may still be seen in various elementary arithmetics and algebras.

As to the sundial, with a gnomon as a vertical needle, this is said to have been introduced into Greece by Anaximander (*q.v.;* c. 575 B.C.), and Herodotus states that it came from the Babylonians.

BIBLIOGRAPHY.—A brief historical treatment of the subject may be found in Sir Thomas Heath, *A History of Greek Mathematics,* vol. i., pp. 77–83 (1921); Pauly-Wissowa, *Realencyclopädie der Classischen Altertumswissenschaft* (1894 *et seq.*); D. E. Smith, *History of Mathematics,* vol. ii., pp. 601, 603, 669, 671 (1925), and various other histories. (D. E. S.)

GNOSTICISM, derived from the Greek word *gnostikos* (one who has *gnosis,* "knowledge"), is a term used by modern scholars to designate a religious movement of late antiquity, with which the Christian church came into contact. Gnosticism is not primarily or exclusively a Christian heresy but rather a religion in its own right, which is also known from pagan sources such as the *Corpus Hermeticum* and the *Oracula Chaldaica,* and from the oldest sources of Jewish mysticism, which can be traced back to the 1st and 2nd centuries A.D. Though it is not always easy to distinguish Gnosticism from Greek philosophy and the Christian religion, it has certain characteristics of its own which are alien to Greek or Christian tradition, such as the depreciation of the cosmos and the rejection of atonement. Historically most important is Christian Gnosticism, the systems of which can be proved to have existed in the 2nd century and which extended into Manichaeism (*q.v.*), a Gnostic world religion.

Origins.—In the Dead sea scrolls (*q.v.*) the knowledge of God and the opposition of light and darkness are strongly stressed. Their authors, probably the Essenes, may be considered as forerunners of Gnosticism, though no coherent Gnostic system can be proved to lie behind their conceptions. More important for Gnosticism are the early Merkaba mystics of Palestinian Judaism, who conceived their doctrine concerning the ascent through the heavens and the "measuring of the body of God" as an esoteric lore for the elect, a higher knowledge of things heavenly and divine. This current may have been stimulated by the magic and syncretism of the contemporary Hellenistic world, but it developed in the very midst of Judaism itself. It has been shown that both the terminology and the concepts of this Jewish mysticism survive in later Gnosticism. At its Jewish stage, however, Gnosticism remained monotheistic and preserved the distinction between man, even at the highest point he can reach, and the transcendent God.

The first Gnostic about whom something can be said with confidence is Simon Magus (*q.v.*), a Jewish heterodox teacher from Gitta in Samaria, who may have considered himself as the magical incorporation of the great power of God (Acts viii, 9–10). In his school a certain Helen was venerated as the image of Sophia, the "first idea of God." who generated the world and fell. This seems to be mainly a combination of a local cult of Helen with elements of Jewish wisdom and Greek philosophy. The fundamental conception that evil is due to a break within the Godhead is new and remained characteristic for all Gnostic schools. There is, however. no trustworthy evidence that Simon Magus distinguished between the creator and the highest God. His *gnosis* was still Jewish and monotheistic. This is Gnosticism in its earliest form. The same must be said about the gnosticizing circles which are alluded to in the later part of the New Testament, especially in the Epistle to the Colossians. Stress on "knowledge," cult of angels, ascetic or libertinistic tendencies, though perhaps already gnostic, did not yet imply dyotheism.

This dualistic phase was reached after the expansion of Gnosticism into the Hellenistic world and under the influence of Platonic philosophy (especially that of the *Timaeus*) from which the doctrine was borrowed that a lower demiurge was responsible for the creation of this world. This teaching is to be found in the *Apocryphon* of John (early 2nd century) and other documents of popular *gnosis* found near Naj' Hammadi in upper Egypt in the 1940s and in the *Pistis Sophia,* a 3rd-century Gnostic work in Coptic belonging to the same school. The learned *gnosis* of Valentinus, Basilides (*qq.v.*) and their schools presupposes this popular *gnosis* which, however, has been thoroughly Hellenized and Christianized and sometimes comes very near to the views of middle-Platonism (especially the teaching of Numenius). Eastern Gnosticism took a somewhat different course. Under the influence of the Iranian religion Manichaeism developed an absolute cosmic dualism between soul and matter. Moreover. it shows the enormous influence of Syrian asceticism, but it is equally rooted in popular Gnosticism and has preserved its essential doctrines.

Nature.—Gnosticism has its own conception of man, the world and God. expressed in various ways and based on a typical religious experience. The unconscious self of man (or some man) is consubstantial with the Godhead. but because of a tragic fall it is thrown into a foreign world which is completely alien to its real being. Through revelation from above man becomes conscious of his origin, essence and transcendent destiny. This revelation is often identified with the call of Jesus (not to be found in the Gospels, which the Gnostics regard as merely an exoteric allegory, but rather in a visionary experience or the initiation into a secret doctrine). So Gnostic revelation is to be distinguished both from philosophical enlightenment, because it cannot be acquired by the forces of reason, and from Christian revelation, because it is not rooted in history and transmitted by Scripture. It is rather the intuition of the mystery of the self. The world, produced from evil matter and possessed by evil demons, cannot be a creation of a good God; it is mostly conceived of as an illusion, or an abortion, dominated as it is by Yahweh, the Jewish demiurge, whose creation and history are depreciated. This world is therefore alien to God, who is for the Gnostics depth and silence, beyond any name or predicate, the absolute. the source of good spirits who form together the pleroma or realm of light. These conceptions are expressed in various myths, which have used material from many oriental and Greek religions, but serve to express a basic experience which is new, the discovery of the unconscious self or spirit in man which sleeps in him until awakened by the Saviour.

Gnosticism in the technical sense of the word should be distinguished from Encratism, which taught the rejection of marriage as well as the heavenly origin of the soul and "knowledge" but did not express this view in myth and knew of no split within the Godhead. It is misleading to quote (as is often done) the Odes of Solomon, the teaching of Tatian, the Gospel of Thomas or the Acts of Thomas, which are encratic, as witnesses of Gnostic doctrine. Encratism, which is deeply rooted in primitive Christianity and for a long time and in various countries remained a current within Christianity, was rather older than classical Gnosticism. It served as a starting point for Gnostic speculations and made it possible for the Gnostics to link up their views with Christianity.

Influence.—Scholars differ in their assessment of Gnostic influence. Following R. Reitzenstein, R. Bultmann supposes that a pre-Christian Gnostic myth of the saved Saviour, of Iranian origin. had a considerable influence on St. Paul, on the author of the Gospel of John and on the Christology of the Synoptic Gospels. Neither the Valentinian "Gospel of Truth" nor the Dead sea scrolls contains such a myth and it remains uncertain that it existed at all before Manichaeism. The Mandaeans (*q.v.*), a Gnostic sect still existing in Iraq, may have developed out of a Jewish sect under the influence of Syrian Gnosticism in the 3rd century. It seems doubtful whether the nucleus of their teachings influenced primitive Christianity, though their writings contain many striking parallels to the Gospel of John. If Gnosticism is mainly a product of the 2nd century, it may preserve Christian elements which have been gnosticized and for the inexperienced eye appear to be Gnostic. So the influence of the learned *gnosis* of Valentinus, Rasilides and others upon Christianity seems to have been mainly negative:

1. They considered Christ primarily as the exclusive revealer, but they denied the reality and necessity of atonement. Therefore they very often negated the humanity of Christ, which led to so-called docetism (*q.v.*). Against this view the Fathers of the Church, especially Irenaeus, underlined the reality of the incarnation and stressed the importance of the work of Christ.

2. They denied the reality of the creation as the theatre of God's glory, and the place of fulfillment of his designs and of obedience to his commandments, thus rejecting the Old Testament. Against this the Fathers maintained the identity of Creator and Saviour and developed a theology of history.

3. They annulled the unity of the human race by dividing it into spiritual, psychic and material classes. This led the Fathers to extol free will and personal responsibility of each individual.

Thus the development of Christian doctrine was to a large extent a reaction against Gnosticism. Some Christians, however, especially Clement of Alexandria and Origen (*qq.v.*), tried to integrate Gnostic values into their own religion: Christ is the revealer of "true *gnosis*," pre-existent fall of the spirits, image of God in man, return of all to their spiritual origin. It was, however, more an atmosphere and a certain attitude than specific teachings that were adopted.

It is difficult to discern when and where the Gnostic movement was halted by the church. In Rome the Gnostics Valentinus and Cerdo as well as the semi-Gnostic Marcion (*q.v.*) were excommunicated as early as A.D. 150, but at the same time the Gnostics seem to have remained members of the church in Egypt. In the west the last remnants of Gnostic groups were dissolved in the 4th century only with the help of the state. In the Syrian east all sorts of Gnostic conventicles seem to have continued their existence and may even have influenced the Paulicians and so the Bogomils and Cathari (*qq.v.*) of the middle ages. Moreover, Gnostic Manichaeism spread in Asia as far as Turkistan and China. On the whole the history of extension and extinction of the Gnostic groups after the 4th century (with the exception of Manichaeism) remains largely unknown; therefore the relation of medieval Gnosticism (Catharism, Bogomilism, etc.) to ancient forms of *gnosis,* probable though it is, cannot be demonstrated with certainty.

After the opinions of the Gnostics had become known in the 16th century through the edition of the works of their opponents, the antiheretical Fathers, which contained large extracts from their teachings, and after the new appraisal of the heresies through the work of the German Protestant theologian Gottfried Arnold (in the late 17th century) and others, Gnostic ideas had a considerable influence upon such idealists as Goethe, Novalis and Hegel. The theosophical movement of the 20th century, with which Gnosticism has much in common, rightly claims the Gnostics as its spiritual ancestor (*see* THEOSOPHY). Jungian psychology, which owes not a little to this movement, can be of some help in interpreting Gnostic mythology and may help to show that behind it there is a religious experience of a certain type. Modern Gnosticism, however, is monistic, whereas ancient Gnosticism is basically dualistic.

GNU, the large white-tailed south African antelope (*q.v.*), known to the Boers as the black wildebeest and to naturalists as *Connochaetes gnou.* A second and larger species is the brindled gnu or blue wildebeest (*Gorgon taurinus*) of central and east Africa; its horns are directed laterally instead of forward.

GO (I-GO), a skilled maneuver game for two players, probably Japan's most popular board game, originated in China as *wei-ch'i.* An ancient Chinese encyclopaedia attributes its invention to Wu Ts'an; other sources credit it to the emperor Gio in 2356 B.C. It is also attributed to the emperors Yan and Shun. It was reportedly brought to Japan in A.D. 735 by Kibi Dajin, where it became popular with both feudal lords and the common people. The Go institute was founded by the first national champion, Hon-inbō-Sansa; the earliest recorded game is dated A.D. 1253. Go is played on a square wooden board (*goban*) checkered by 19 vertical lines and 19 horizontal lines. It is played with about 180 black and 180 white *go-ishi* or flat, round "stones." Each player in his turn places a stone on the intersection of two lines (a *me*) which constitutes one unit of territory. The winner is the player who has conquered the largest territory by the establishment of a boundary made of his own "stones." Go demands great skill, strategy and patience, and is capable of infinite variety; yet the rules and pieces are so simple that children can play. Special handicap rules allow players of unequal skill to play together enjoyably. A modern Japanese Go association, founded in 1924, supervises tournaments, rules and players. Gobang was an English version of the 19th century. (P. FR.)

GOA, the name of the capital of former Portuguese India (Estado da Índia) and of the surrounding territory, which was more exactly described as Goa settlement, prior to its annexation by India in Dec. 1961. It is situated on the western coast of India about 250 mi. S. of Bombay. The population of the settlement in 1950 was 547,448, and the area, 1,394 sq.mi. Goa is bounded on the north by the Terakhul or Araundem river (beyond which is the Ratnagiri district of Maharashtra state), east by the Western Ghats, south by North Kanara district of Mysore state and west by the Arabian sea.

With Damão and Diu (*qq.v.*), Goa settlement formed a single administrative province ruled by a governor general, and a single ecclesiastical province subject to the archbishop of Goa, who is primate of the east and patriarch of the East Indies. There were legislative and executive councils which worked in collaboration with the governor. Goa settlement comprised the four districts conquered early in the 16th century (1510) and known as the Velhas Conquistas (Old Conquests); seven districts acquired later (Novas [New] Conquistas); and the island of Angediva or Anjidiv. The settlement, with a coast line of 62 mi., is hilly, especially in the Novas Conquistas, including a portion of the Western Ghats rising to nearly 4,000 ft. The two largest rivers are the Mandavi and the Juari, which together encircle the island of Goa (Ilhas), being connected on the landward side by a creek. The island is triangular, the apex (called the *cabo* or cape) being a rocky headland separating the harbour of Goa into two anchorages: Aguada at the mouth of the Mandavi on the north and Mormugão (Marmagão) at the mouth of Juari on the south. There are three cities in Goa: Old Goa, New Goa (Pangim) and Mormugão.

Old Goa is, for the most part, a city of ruins. The chief surviving buildings include the cathedral, founded by Affonso d'Albuquerque in 1511, rebuilt in 1623 and still used for public worship; the convent of St. Francis (1517), a converted mosque rebuilt in 1661 (with a portal of carved black stone), the only relic of Portuguese architecture in India dating from the first quarter of the 16th century; the chapel of St. Catherine (1551); the fine church of Bom Jesus (1594–1603) containing the shrine of St. Francis Xavier (*see* XAVIER, ST. FRANCIS); and the 17th-century convents of St. Monica and St. Cajetan. The college of St. Paul is in ruins.

Pangim (Panjim or New Goa), originally a suburb of Old Goa, is built (like the parent city) on the left bank of the Mandavi estuary. Pop. (1950) 31,950. It is a modern port and contains the archbishop's palace, government house and barracks; it has a medical school, teachers' training college and several secondary and primary schools. Pangim became the residence of the viceroy in 1759 and the capital of Portuguese India in 1843.

Mormugão, with its modern breakwater and quay and sheltered by the promontory of Salsette, is the best port between Bombay and Kozhikode (Calicut). A railway connects it (south of the Juari estuary) with Castle Rock on the Western Ghats and so with the Southern railway (narrow or metre gauge). Goa exports coconuts, fruit, spices, manganese and iron ores, fish and salt, but its trade is small and its manufactures few. Rice is the staple product, with fruit, salt, coconuts and betel nut.

The population of the Velhas Conquistas is largely Christian and that of the Novas Conquistas Hindu. The Christians generally speak Portuguese. The Hindus speak Konkani. Economic conditions in Goa caused emigration on a large scale, mainly to the eastern coast of Africa and to India. More than 1,000 persons left Goa every year and large Goanese colonies have consequently been formed in Bombay, Mozambique, Natal, etc. Many Goanese are partly of Portuguese descent and bear Portuguese names as a result of intermarriage between early Portuguese settlers and the local inhabitants. They inherit the seafaring habits of their ancestors and many find employment as stewards, etc., in liners.

History. — The ancient Hindu city of Goa, of which hardly a fragment survives, was built at the southernmost point of the island and it was famous in early Hindu legend and history. In the *Puranas* and certain inscriptions its name appears as Gove, Govapuri. Gomant, etc. The medieval Arabian geographers knew it as Sindabur or Sandabur and the Portuguese as Goa Velha. It was ruled by the Kadamba dynasty from the 2nd century A.D. to 1312 and by Muslim invaders of the Deccan from 1312 to 1367. It was then annexed by the Hindu kingdom of Vijayanagar and later conquered by the Bahmani dynasty, who founded Old Goa in 1440.

With the subdivision of the Bahmani kingdom after 1482, Goa passed into the power of Yusuf Adil Shah, the Muslim king of Bijapur, who was its ruler when the Portuguese first reached India. At this time Goa was important as the starting point of pilgrims from India to Mecca, as a market with no rival except Kozhikode on the west coast and especially as the centre of the import trade in horses (Gulf Arabs) from Hormuz. It was easily defensible by any power with command of the sea, and was attacked in March 1510 by the Portuguese under Albuquerque. The city surrendered without a struggle, and Albuquerque entered it in triumph.

Three months later Yusuf Adil Shah returned with 60,000 troops, forced the passage of the ford and blockaded the Portuguese in their ships from May to August, when the cessation of the monsoon enabled them to put to sea. In November Albuquerque returned with a larger force and, after overcoming a desperate resistance, recaptured the city, massacred all the Muslims and appointed a Hindu, Timoja, governor of Goa.

Goa was the first territorial possession of the Portuguese in Asia. Albuquerque and his successors left almost untouched the customs and constitutions of the 30 village communities on the island, only abolishing the rite of suttee (*q.v.*). A register of these customs *(Foral de usos e costumes)* mas published in 1526.

Goa became the capital of the whole Portuguese empire in the east. It was granted the same civic privileges as Lisbon. In 1542 St. Francis Xavier mentions the architectural splendour of the city; but it reached the climax of its prosperity between 1575 and 1600 The appearance of the Dutch in Indian waters was followed by the gradual decline of Goa In 1603 and 1639 the city was blockaded by Dutch fleets, though never captured, and in 1635 it was ravaged by an epidemic. In 1683 only the timely appearance of a Mogul army saved it from capture by Maratha raiders, and in 1739 the whole territory was attacked by the same enemies and only saved by the unexpected arrival of a new viceroy with a fleet. The seat of the government was moved to Mormugão and in 1759 to Pangim. Cholera epidemics were one of the chief reasons for the migration of the inhabitants from Old Goa to New Goa. Between 1695 and 1775 the population of Old Goa dwindled from 20,000 to 1,600 and in 1835 it was inhabited by only a few priests, monks and nuns.

During the 19th century events of importance affecting the settlement were its temporary occupation by the British in 1809 as a result of Napoleon's invasion of Portugal ; the governorship (1855–64) of Conde de Torres Novas, who inaugurated a great number of improvements, and the military revolts of the second half of the century. The most notable of these was the revolt of Sept. 3, 1895, which necessitated the dispatch of an expeditionary force from Portugal. The infante Affonso Henriques, duke of Oporto, accompanied this expedition and exercised governor's powers with the title of viceroy from March to May 1896.

After Indian claims on Goa in 1948 and 1949, Portugal came under increasing pressure to cede Goa, with its other possessions in the subcontinent, to India. A crisis was reached in 1955 when satyagrahis (nonviolent resisters) from India attcmptcd to penetrate the territory of Goa. At first the satyagrahis were deported, but later when large numbers attempted to cross the borders the Portuguese authorities resorted to force and casualties were inflicted. This led to the severance of diplomatic relations between Portugal and India on Aug. 18, 1955. Tension between India and Portugal came to a head when on Dec. 18, 1961, Indian troops supported by naval and air forces invaded and occupied Goa, Damão and Diu. The annexation of Portuguese India thus became a military fact.

Christianity. — Some Dominican friars came out to Goa in 1510, but no large missionary enterprise was undertaken before the arrival of the Franciscans in 1517. A Franciscan friar, João de Albuquerque, came to Goa as its first bishop in 1538. In 1542 Francis Xavier took over the Franciscan college of Santa FC for the training of native missionaries; this was renamed the College of St. Paul, and became the headquarters of all Jesuit missions in the east, where the Jesuits were commonly styled *Paulistas*. By a bull dated Feb. 4, 1557, Goa was made an archbishopric with jurisdiction over the sees of Malacca and Cochin, to which were added Macao (1575), Japan (1588), Angamale or Cranganore (1600), Meliapur (Mylapur; 1606), Peking and Nanking (1610), together with the bishopric of Mozambique, which included the entire coast of east Africa. In 1606 the archbishop received the title of primate of the east, and the king of Portugal was named patron of the Catholic missions in the east; his right of patronage mas limited by the concordat of 1857 to Goa, Malacca, Macao and certain parts of British India. The Inquisition was introduced into Goa in 1560; five ecclesiastical councils, which dealt wth matters of discipline, were held at Goa—in 1567, 1575, 1585, 1592 and 1606. By the concordat and missionary agreement with the Vatican (May 7, 1940), Goa recognized the lawful existence of the Catholic church and the exercise of its spiritual mission according to the canon law. The additional protocol signed on Sept. 25, 1953, made the archdiocese of Goa coincident with Portuguese India.

GOALPARA, a town and district in the Brahmaputra valley of Assam, India. The town (pop., 1951, 10,192) stands on the left bank of the Brahmaputra, 75 mi. W. of Gauhati, with which it is connected by road. It was the frontier outpost of the Muslim power, and has long been a great centre of river trade. It has a college affiliated to Gauhati university. The town declined in importance after the district headquarters were removed to Dhubri in 1879.

GOALPARA **DISTRICT** covers an area of 3,983 sq.mi. Pop. (1961) 1,533,841. It is situated astride the Brahmaputra where the river bends southward from Assam into East Pakistan. Along the banks of the river grow clumps of cane and reed; farther back stretch fields of rice cultivation, broken only by the fruit trees surrounding the villages; and in the background rise the forest-clad hills overtopped by the white peaks of the Himalayas. The Brahmaputra annually inundates vast tracts of country. Extensive forests yield valuable timber and there are about 900 sq.mi. of reserved forest. Wild elephants, buffalo, boars. sambar and deer abound in the forest. Rice forms the staple crop of the district but jute is important in the flood plain, and pulses, mustard, tobacco, sugar and a little tea are also grown.

Dhubri (pop., 1951, 22,787), the administrative headquarters of the district, stands on the right bank of the Brahmaputra where that river takes its southward bend.

GOAT. Goats belong to the family of hollow-horned ruminants, or Bovidae (*q.v.*), and are members of the genus *Capra,* closely allied to the sheep. Domesticated goats are descended from the pasang (*Capra aegagrus*). Probably the east was its original home, the earliest records being Persian. *C. aegagrus* is probably represented in Europe by the Cretan and Cyclades races, now crossed with the common goat *(C. hircus)*. For other wild goats *see* IBEX; MARK-HOR; ROCKY MOUNTAIN GOAT; TAHR.

Products. — In China, Great Britain, Europe and North America the domestic goat is primarily a milk producer. By good management its limited breeding season and the consequent difficulty of maintaining a level supply of milk throughout the year can be largely overcome. For large-scale milk production, goats are inferior to cattle in the temperate zone but superior in the torrid or frigid zone.

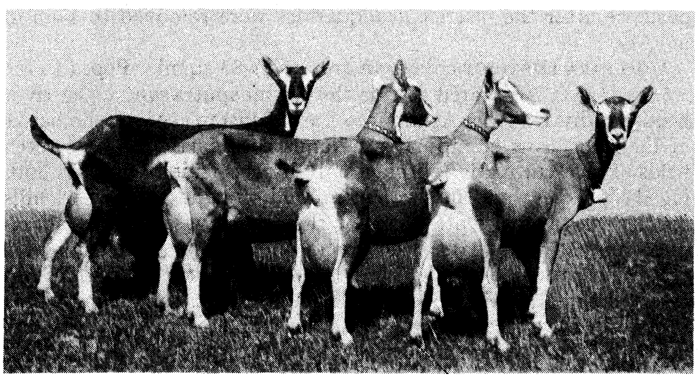
The goat is especially adapted to small-scale production of milk for the family table. One or two goats will supply sufficient milk for a family throughout the year and can be maintained economically in small quarters where it would not be practical to keep a cow.

Goat's milk is pure white in colour, and compares favourably with cow's milk in flavour and keeping qualities under sanitary conditions. It has certain characteristics differing from cow's milk which make it more easily digested by infants, invalids and persons allergic to cow's milk. The curds of goat's milk are much smaller, more flocculent and very soluble. The fat globules are smaller, finer, more easily assimilated and remain by nature in emulsion, so homogenization is unnecessary. These qualities explain why the goat has long been known in Europe as the "wet nurse" of infants. It has been estimated that the annual retail value of goat's milk sold in the United States is over $10,000,000. The retail price per quart varies from 40 to 55 cents. Large commercial dairies milk as many as 400 goats. Goat's milk is also used to make cheese. (For world production statistics *see* DAIRY INDUSTRY; MILK.)

The Angora and Cashmere goats produce wool or mohair (*q.v.*). *See* also CASHMERE. The flesh is edible, that from young kids being quite tender and more delicate in flavour than lamb, which it resembles. The goat has long been used as a source of milk, cheese, mohair and meat and its skin has been valued as a source of leather. (For world production and uses *see* LEATHER: *Sources* of *Hide and Skin Supply; Major Types of Leather.)* Goats are also used to keep sheep spread out and on the move.

Distribution and Kinds.—There are many breeds of goat, which may be roughly grouped: the prick-eared, *e.g.,* Swiss goats; the eastern or Nubian, with long drooping ears; and the wool goat, *e.g.,* Angora. While it is usually easy to distinguish goats from sheep, certain hair breeds of the latter are, to the layman. only distinguishable from goats by the direction of the tail, upward in goats, downward in sheep.

Of the Swiss goats, from which many of the best modern breeds are derived. the Toggenburg and Saanen are most important. The French breeds have much Swiss blood. In Germany the many



BY COURTESY OF MRS. CARL SANDBURG

FOUR TOGGENBURG DOES

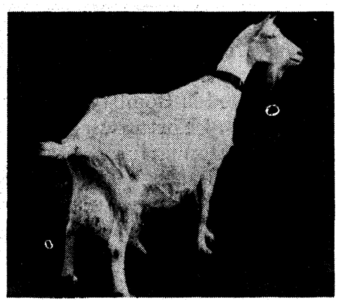
varieties trace to Swiss breeds. There are many goats of Swiss type throughout Scandinavia and the Netherlands, where they are held in high esteem.

The Maltese goat probably contains eastern blood and is an important source of milk on the island of Malta. Many goats are found in Spain, northern Africa and Italy, among them the Murcian. Grenada and La Mancha.

Nubians are African goats, chiefly Egyptian. They are usually large. short-haired goats with large lop ears and Roman noses. They may be of any solid colour, parti-coloured or spotted. The goats in Israel and Syria have long hair and large lop ears. Black, with or without white, is the commonest colour. Most Indian varieties have lop ears, the best coming from the Jumna river area.

In Britain the native goat was small, with short legs, long hair, usually gray but of no fixed colour and with no definite markings. The widespread use of pedigree males, mostly of Swiss extraction, to improve the milk yield, resulted in the almost total disappearance of the native types.

In 1896, a Jumna Pari (Indian) male goat (Sedgemere Chancellor) was imported by a British breeder. Since 1850 goats of Nubian and other lop-eared breeds had come to England in various ways. These eastern-type goats, variously described as Persian, Indian, Syrian, etc.. and characterized by long pendulous ears and convex facial outline, won prizes at shows and found public favour. With the importation of Chancellor, serious breeders took up the project of developing an improved Nubian-type goat. Eventually the Anglo-Nubian name was adopted for this made breed and a section of the herdbook established for registering approved progeny.



BY COURTESY OF MRS. CARL SANDBURG

SAANEN DOE

Interest in this new breed spread to the United States and in 1910 three Anglo-Nubians were imported, the first, of a long line of importations. In time this breed, its name shortened to Nubian, became one of the most popular goat breeds in the United States. In the second half of the 20th century about one-third of the goats registered annually by the American Milk Goat Record association were Nubians. The four breed clubs were the Alpine, Nubian. Saanen and Toggenburg. The record association handles registry. official testing and goat shows for all four breeds.

The goats of India, north Africa and Syria have been maintained since early times chiefly for their milk, and it is not surprising that Nubians have made fine milk records. In England a Nubian set a breed record with more than 4,250 lb. of milk in 365 days of lactation. This record compared favourably with a 305-day lactation record made in California by a Nubian which produced just under 4,250 lb. of milk and 185 lb. of butterfat.

In both England and the United States the Swiss breeds are considered, on the average, superior in quantity of milk produced, while the Nubians are known as leading in butterfat production. A Saanen goat in Great Britain produced more than 6,400 lb. of milk in 365 days of lactation. bearing out the reputation of the Saanen breed in its Swiss homeland and in the countries to which this breed has spread. In the U.S. a Saanen produced more than 4,900 lb. of milk and 180 lb. of butterfat; a Toggenburg produced more than 4,400 lb. of milk and 150 lb. of butterfat; and a French Alpine produced more than 4,600 lb. of milk and 130 lb. of butterfat. The last three records are for 305 days of lactation.

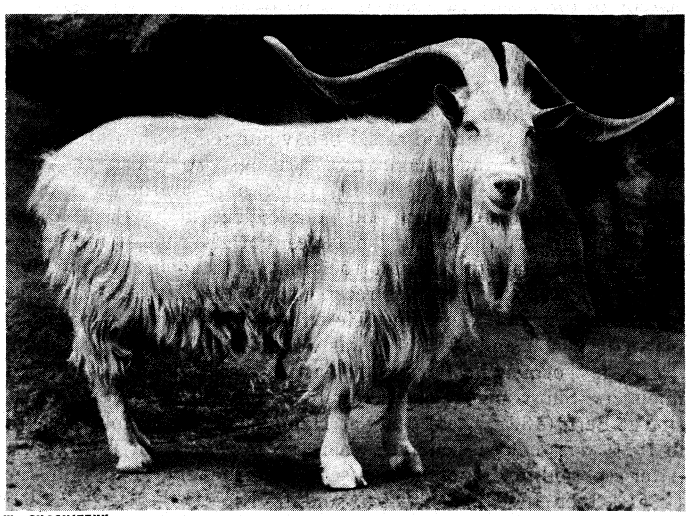
Of the wool goats there are two main types: the Angora, or Mohair, and the Cashmere, or Shawl, goat. Angoras have been established in South Africa, Australia, the United States and Canada. About three-quarters of the mohair produced in the United States comes from Texas. The Angora is a poor milker. The soft, silky hair covers the whole body and most of the legs with close-matted ringlets. If not shorn in spring the fleece drops off naturally as summer approaches. There is an undergrowth of short hair. The average weight of fleece is about $2\frac{1}{2}$ lb., though good specimens yield up to 12 lb. The Angora must have a dry climate and then stands cold well.

In the Cashmere, which is more like the common goat than the Angora, it is the undergrowth which is valuable. The longer the hair, the more abundant the fine undergrowth. These goats are rather small, with lop ears and twisted horns.

Husbandry.—Five dairy goats can be housed in a 10 ft. by 12 ft. shelter and will require less feed than one cow. They produce best on alfalfa or other leguminous hay as roughage, with a grain mixture coarsely ground of about 15% protein content. The subsistence ration for the dry doe is 1 lb. of grain daily. Milking goats are fed 1 lb. of grain daily, above the subsistence ration, for

3 lb. of milk produced. They should have free access to salt and water.

If they are kept dry, sufficiently exercised in fresh air and sunshine and intelligently fed, they are very hardy animals. If they are on pasture, or tethered, they should be moved frequently to fresh ground as a precaution against infestation by worms. They prefer browse to pasture, and goats that are stall-fed should have branches and leaves brought to them. They are relatively free from tuberculosis and goat's fever, or brucellosis (*q.v.*), in the



W. SUSCHITZKY

COMMON GOAT (CAPRA HIRCUS)

United States and Great Britain. The diseases and parasites that affect goats and sheep are discussed in the article SHEEP.

The normal lifespan of a goat is 8 to 12 years. They average two kids in a litter. Triplets are very common and quadruplets and quintuplets are occasionally dropped.

The female goat, variously called "Nanny" or "Doe," is ready for the male ("Billy" or "Buck") between September and February, during which time they come in heat every three weeks. The gestation period is 21-22 weeks. Goats are sexually mature at 6 months, but it is unwise to mate females before they are 15 months old, and a male should be used sparingly until 12 months old.

GOATSUCKER: *see* NIGHTJAR.

GOBAT, CHARLES ALBERT (1843–1914), Swiss philanthropist and worker for international peace, awarded the Nobel peace prize in 1902 jointly with his compatriot Elie Ducommun, was born at Tramelan in the Bernese Jura, on May 21, 1843. After studying at Basel, Heidelberg and Paris, he took his degree in law and set up practice in Berne. Concurrently he lectured on French civil law at the Paris Sorbonne. On transferring his office to Delémont, he took an increasingly active part in local government and public administration. He was elected to the cantonal council in 1882, presided over the government board of Berne in 1886 and 1887, and in 1884 was elected to the national council. In 1890 he became a member of the Swiss federal council.

Gobat was president of the fourth conference of the Inter-Parliamentary union held at Berne in 1892. In this capacity he helped to found its permanent bureau. Henceforth, for more than 20 years, the work of the bureau absorbed his time and his energy, and in 1906 Gobat succeeded Ducommun as director. He wrote several books on international affairs and on history, including *Le Cauchemar de l'Europe* (1911). He died at Berne on March 16, 1914. (L. R. A.)

GOBAT, SAMUEL (1799–1879), second Anglican bishop in Jerusalem, was born at Crémines, Bern, Switz., on Jan. 26, 1799. Trained as a missionary in Basel, Paris and London, he was sent by the Church Missionary society overseas, chiefly to Ethiopia. He became widely known as a missionary and linguist.

The Jerusalem bishopric had been founded as a joint Anglo-Prussian venture in 1841, on the suggestion of Frederick William IV of Prussia, to protect Protestant Christians in the middle east and to combine a united Protestantism with the Orthodox Eastern Church to counteract Roman Catholic influence in Jerusalem. Efforts were to be made to convert Jews but not members of other Christian churches. Co-operation between Anglicans and Lutherans was uneasy, since Tractarians in England disliked working with a nonepiscopal body and German Protestants opposed any form of episcopate.

On the death in 1845 of Michael Alexander, first Anglican bishop. it became the turn of the Prussian crown to nominate a successor. and Frederick William chose Gobat, who was consecrated in 1846. He was allowed some latitude in applying the canons of the Church of England but disregarded the terms of his appointment in proselytizing, particularly from the Orthodox Church, which caused bitter controversy at a time of deteriorating political relations. From 1851 Gobat was aided by the Church Missionary society in establishing schools and in starting medical work among the Muslims. He died in Jerusalem, May 11, 1879. In 1886 the connection with the Lutheran Church ended and the reconstructed bishopric became fully Anglican.

See *Samuel Gobat, His Life and Work*, Eng. trans. *by* S. M. S. Clarke (1884). (J. D. TA.)

GOBEL, JEAN BAPTISTE JOSEPH (1727–1794), archbishop of Paris and Hébertist, was born at Thann, Alsace, on Sept. 1, 1727. He became suffragan bishop of the French port of the diocese of Basel. As deputy to the states-general of 1789 he took the oath of the civil constitution of the clergy, and in 1791 was consecrated archbishop of Paris. On Nov. 7, 1793, he came before the bar of the Convention and resigned his episcopal functions, proclaiming that he did so for love of the people, and through respect for their wishes. The followers of J. R. Hébert (*q.v.*), who were then pursuing their "worship of reason," claimed Gobel as one of themselves, and he was thus involved in the fate of the Hébertists, being condemned to death with P. G. Chaumette, Hébert and Anacharsis Cloots. He was guillotined on April 12, 1794.

See G. Gautherot, *Gobel, évêque métropolitain constitutionnel de Paris* (1911).

GOBELIN, the name of a family of dyers and clothmakers who probably came from Reims and in the middle of the 15th century established themselves in the Faubourg St. Marcel, Paris. The first head of the firm, named Jehan (d. 1476), discovered a scarlet dyestuff and spent so much on his establishment that it was named *la folie Gobelin*. In the third or fourth generation some of the family purchased titles of nobility. Balthasar Gobelin (d. *c.* 1617), who became successively treasurer general of artillery, treasurer extraordinary of war, councilor secretary of the king, chancellor of the exchequer, councilor of state and president of the chamber of accounts, in 1601 received from Henry IV the lands and lordship of Brie-Comte-Robert. The name of the Gobelins as dyers cannot be found later than the end of the 16th century. In 1601 the Gobelins lent their works to Henry IV, who set up there 200 workmen from Flanders, to make tapestries; in fact the Gobelin family had never produced any tapestry.

In 1662 the works in the Faubourg St. Marcel were purchased by Colbert on behalf of Louis XIV and transformed into a general upholstery manufactory, in which designs were executed under the superintendence of the royal painter, Charles le Brun. The establishment, closed in 1694, was reopened in 1697 for the manufacture of tapestry, chiefly for royal use and presentation.

The industry, suspended during the Revolution, was revived by Napoleon; in 1826 the manufacture of carpets was added.

See also LE BRUN, CHARLES; TAPESTRY.

GOBI, one of the world's largest deserts, mostly in the Mongolian People's Republic and the Inner Mongolian Autonomous Region of China and covering parts of the province of Kansu and the Ningsia Hui Autonomous Region. It occupies a vast arc of land in the Mongolian plateau, 300–600 mi. wide and over 1,000 mi. long, running southeast from the eastern borders of Chinese Turkistan and the Mongolian Altai, and then east and northeast to the Hsing-an (Khinghan) mountains of Manchuria. The south slopes of the Khangai mountains in central Outer Mongolia (Mongolian People's Republic) bound it in the north and the plateau of Tibet and the Ho-lan Shan (Ala Shan) and Yin Shan ranges in the south.

The term Gobi desert often has not been well defined. At times it has been applied to all the desert and semidesert lands east of the Pamirs and north of the plateau of Tibet and the Great Wall. Properly, the Tarim (including Takla Makan; *q.v.*) and Dzungarian basins of Chinese Turkistan are separate from the Mongolian Gobi, as is the Ordos desert south of the Yin Shan. Gobi to the Mongol refers to the level, alkaline, often marshy and sometimes grassy bottoms of the broad, shallow basins which the Mongols call *tals*. Gobi is thus associated with basin structures believed to have been scoured out by the wind and is descriptive of terrain. By transference, the term Great Gobi or Gobi desert has come to be applied to the area here defined. Although the Gobi surface is a plateau with an altitude of about 3,000 ft. in the east and about 5,000 ft. in the west and south, the bounding mountains on all sides give it a basin character. In addition to the low swells separating the basins in the Gobi desert, its surface is interrupted occasionally by worn, flat-topped folded ranges and in the west by the complex uplifted fault blocks of the Altai which extends at diminishing altitude into the Gobi.

Sometimes in the plains. the edges of the sedimentary strata are exposed to view. and these form the great fossil fields of Mongolia, indicating that a change has occurred from a past humid climate to the present desert state. Lakes such as the Ulan Nuur, Orog Nuur and Boon Tsagaan Nuur northwest of Dalan Dzadagad in Outer Mongolia are only a small fraction of the size that elevated strand lines show they once were. Several culture horizons have been distinguished in the Gobi area. Finds have been made of relics representing Eolithic, Upper Paleolithic, Azilian, Neolithic and Metallic cultures.

The Chinese term sha-mo (sand desert) often applied to the Gobi gives a misleading impression of its character, for only small sections of the Gobi comprise sandy or dune deserts. Much of it is of bare rock over which one can drive by car easily for long distances in any direction. Toward the north and southeast of the desolate centre, the precipitation gradually increases from 1 or 2 in. to 6 or 8 in. Scattered bunch grass appears, then the short grass steppe grazed by livestock watered from wells or at rare streams. Such streams entering the Gobi are seasonal in their flow. The largest in the eastern Gobi is the Kerulen (Hereleng) which flows out of the Henteyn Kuruu (Khentei mountains) and diminishes in volume to terminate in Hu-lun Chih (Hulun Nuur), but during floods may continue on to become a tributary of the upper Amur. Flowing into the Gobi from the Tibetan rim lands in the south and irrigating oases are the branching O-Chi-na Ho (Etsin Gol) and, farther west, the Su-lo Ho. Gobi rivers terminate in salt lakes or disappear in the sand. Trees are almost nonexistent, although xerophytic shrubs such as saxaul may be found as well as stunted willows and tamarisk near streams and wells. Although the water table is high and water often may be found within 20 ft. of the surface, the water may be brackish. In the Gobi Altai which rises to over 9,300 ft. and in other similarly high mountains, desert steppe grass covers the entire lower two-thirds of the slopes. Above this, there appears a mountain variant of feather grass.

The animal life of the Gobi include the Djejran gazelle and the Dzeren antelope. Marmots or ground squirrels feed on grass seeds, and their holes are numerous in the steppelands. Sheep and goats are the most important domestic animals, constituting 57% of the total, followed by cattle (24%). Horses form only about 4% and with the cattle are concentrated in the moister southeast. Some 15% are the two-humped camels that comprise the desert transport animals. In the southeast, Chinese farmers long have invaded the nomad grasslands. Under the Communist regime nomad and farmer alike were regimented. State directed collectives were organized both in Outer Mongolia and in the Inner Mongolian Autonomous Region for livestock breeding and, in the latter, in mechanized farming. The Chinese Communist collectives were changed to communes in 1958, the latter being similar in character to the former state farms.

Soviet-Mongol exploration located coal deposits at Tawan-Tolgoi and an oil field at Sayn Shanda on the Trans-Mongolian railroad. In the western Gobi, exploitation of the Yu-men oil field was expanded by the Chinese Communists in the late 1950s. The extension of the Kansu railroad to the oil field brought large population increases to the oases towns in the southwest Gobi sections of the Kansu corridor. *See* also MONGOLIA. (*H. J. Ws.*)

GOBINEAU, JOSEPH ARTHUR, COMTE DE (1816–1882), French man of letters who in his career as a diplomat formed ideas on social and racial behaviour reflected in his ethnological, historical and imaginative writings, was born at Ville-d'Avray, near Paris, on July 14, 1816, of a Bordeaux family. Educated by private tutors and at a college in Switzerland, he developed an enthusiasm for languages, both European and oriental, and, after failing to enter the military academy at St. Cyr, settled in Paris, where he was received into the aristocratic circles of the Faubourg St. Germain. He wrote some *romans-feuilletons,* married (1845) and, in 1849, was appointed *chef de cabinet* by Alexis de Tocqueville during the latter's brief period as foreign minister. Subsequently he was first secretary to the French legation at Bern (1851), held posts at Hanover and at Frankfurt and, in 1855, was sent to Teheran, where he remained for four years. After a period in France he was sent hack to Teheran as minister (1861), then to Athens (1864) and to Rio de Janeiro (1869). Absent without leave in 1870, he witnessed the France-German War and the Paris Commune. His last diplomatic post was at Stockholm (1872). His liaison with the comtesse de La Tour (Marie Mathilde Ruinart), separating him from his wife and children, led to his retirement in 1877. Thenceforward he lived mainly in Italy. He died at Turin on Oct. 13, 1882.

Gobineau's reputation as a writer has passed through two phases. At first he was acclaimed as an ethnologist for his *Essai sur l'inégalité des races humaines,* 4 vol. (1853–55; partial Eng. trans., *The Moral and Intellectual Diversity of Races,* 1856, and *The Inequality of Human Races,* 1915). In the second half of the 20th century, however, he was chiefly respected for a novel, *Les Ple'iades* (1874; Eng. trans., *The Pleiads,* 1928). The *Essai* proposed that Aryan racial purity could be maintained only by the preservation and strengthening of its Nordic strains. This theory became fashionable in German intellectual circles, and its latent anti-Semitism was exaggerated to produce that *gobinisme* which Gobineau himself regarded as a distortion of his views.

In the years that followed the appearance of this essay Gobineau had the liberating experience of Persia. He continued to be the gifted amateur, publishing such works as the *Traitk des écritures cunéiformes,* 2 vol. (1864), and the *Histoire des Perses,* 2 vol. (1869). The formative influence on him, however, was *The Thousand and One Nights,* from which he took over the figure of the "king's son," using it as the central inspiration of *Les Ple'iades:* "the book of an aristocrat," he wrote, "which opposes the conversation of exceptional beings to the confused clamour of the masses." The three young men, his heroes, are "king's sons"; they travel, they converse, they tell each other stories and they are happy. Apart from *Les Ple'iades,* the best works of Gobineau's last years were *Souvenirs de voyage* (1872; Eng. trans., *The Crimson Handkerchief,* 1929), *Les Nouvelles asiatiques* (1876; Eng. trans.. *The Dancing Girl of Shamakha,* 1926, and *Tales of Asia,* 1947) and *La Renaissance* (1877; Eng. trans., 1913 and 1928), the latter a volume of dialogues in which, through such figures as Cesare Borgia and Michelangelo, Gobineau proclaimed his unchanging creed of individualism. There are critical editions of *Les Pléïades* and of *La Renaissance* by Jean Mistler (1946 and 1947).

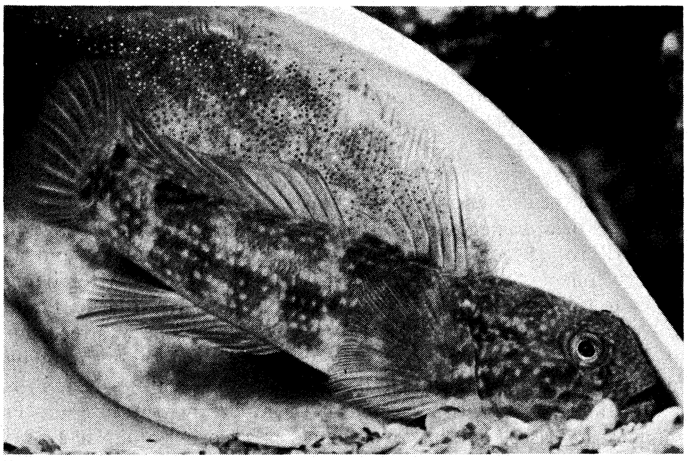
GOBLET, RENÉ (1828–1905), French politician, was born at Aire-sur-la-Lys, Pas de Calais, Nov. 26, 1828, and was educated for the law. He held a minor government office in 1879, and in 1882 became minister of the interior in the Freycinet cabinet He was minister of education, fine arts and religion in Henri Brisson's first cabinet in 1885, and again under Freycinet in 1886 He sat in the chamber on the extreme left. All through his life he mas frequently in conflict with his political associates, from Gambetta donnnard.

On the fall of the Freycinet cabinet in December he formed a cabinet in nhich he reserved for himself the portfolios of the interior and of religion The Goblet cabinet was unpopular from the outset, and it was with difficulty that anybody could be found to accept the ministry of foreign affairs which was finally given to Flourens.

Then came what is known as the Schnaebele incident, the arrest on the German frontier of a French official named Schnaebele, which caused immense excitement in France. For several days Goblet took no definite decision, but left Flourens, who stood for peace to fight it out with General Boulanger, then minister of war, who nas for the dispatch of an ultimatum. Although he finally intervened on the side of Flourens. and peace was preserved his neakness in face of the Boulangist agitation became a national danger.

Defeated on the budget in May 1887, his government resigned. In 1888 he nas foreign minister in the radical administration of Charles Floquet. He was defeated at the polls by a Boulangist candidate in 1889, and sat in the senate from 1891 to 1893, when he returned to the popular chamber. He died in Paris on Sept. 13, 1905.

GOBY, generally. any one of a numerous group—the Gobioidei —of largely marine and warm-water spiny-rayed fishes. characterized by having a few (usually six) flexible spines in the separate first dorsal fin: the pelvic fins are either set close together (in the family Eleotridae, known as "sleepers") or united into a sucking disc (in the Gobiidae, or gobies proper). Most of the several hundred known species range in length from one to four inches,



W N TAVOLGA

MALE FRILLFIN GOBY (BATHYGOBIUS SOPORATOR) GUARDING EGGS ATTACHED TO AN EMPTY BIVALVE SHELL

but a few of the sleepers exceed one foot; some, like *Pandaka pygmaea* of the Philippines, are the smallest known vertebrates. only about one-half inch long. Male gobies guard encapsulated oval eggs, which are attached at one end by short adhesive threads, in a layer on discarded shells or in crevices. Most gobies are bottom dwellers; many. *e.g., Bathygobius* species, are limited to the edge of tropical shores.

Well-known species include: a ten-inch rock-pool inhabiting species of Europe, *Gobius capito;* the mudskippers (*Periophthalmus*), bulging-eyed little fishes that inhabit mud Bats around the Indian ocean and the East Indian region, usually resting with the front parts out of water; the very hardy, burrow-inhabiting mudsucker, or long-jawed goby (*Gillichthys mirabilis*), the chief bait fish of southern California, with the upper jaw prolonged in the adult to beyond the gill opening; and a blind, pink species, *Typhlogobius californiensis,* which lives with a blind shrimp (a *Callianassa* species) in burrows under stones between tide marks along the shores of southern California. *See* also FISHES: *Sculpin-Like Fishes and Gobies.* (C. L. Hs.)

GOD, the common Teutonic word for a personal object of religious worship. It is thus, like Gr. *Theos* and Lat. *deus,* applied to all superhuman beings of heathen mythologies who exercise power over nature and man; and also to images of supernatural beings or trees, pillars, etc., used as symbols.

The word "god," on the conversion of the Teutonic races to Christianity, was applied to the one Supreme Being, and to the Persons of the Trinity.

Popular etymology has connected the word with "good." This is exemplified by the corruption of "God be with you" into goodbye. In Gothic it is *Guth;* Dutch has the same form as English; Danish and Swedish have *Gud,* German *Gott.* According to the *Oxford* English *Dictionary,* the original may be found in two Aryan roots, both of the form *gheu,* one of which means "to invoke," the other "to pour"; the last is used of sacrificial offerings. The word would thus mean the object either of religious invocation or of religious worship by sacrifice.

See RELIGION; JUDAISM; THEISM; etc.

GOD, CHURCHES OF, a group of 20 or more pentecostal denominations that developed from the so-called Latter Rain revival early in the 20th century. They adhere to the ultraconservative or fundamentalist theology, including holiness as a work of grace subsequent to conversion or justification, and "speaking in other tongues as the Spirit gives utterance."

The revival began in the Great Smoky mountains in 1886 under the leadership of R. G. Spurling and his son, Baptists, and W. F. Bryant, a Methodist. It was taken over by A. J. Tomlinson, a colporteur, who convened an assembly in 1906 at Camp creek in Cherokee county, N.C. Two years later he established headquarters at Cleveland, Tenn., under the name of Church of God. He promoted the movement with vigour, and churches were established in various parts of the country.

Splits began to occur in 1917 when the Chattanooga congregation seceded and took the name of the Original Church of God. Other divisions followed and numerous independent groups mere formed. The causes were not theological but were due to rivalries among local leaders and opposition to Tomlinson's absolute power as general overseer. He was virtually deposed in 1922.

On Tomlinson's death in 1943 disputes between his sons led to further schisms. Homer A. Tomlinson set up the Church of God, World Headquarters, at Queen's Village, N.Y., and his brother became head of the Cleveland group known as the Church of God Over Which M. A. Tomlinson Is General Overseer. Another Cleveland body is the Church of God (Cleveland, Tenn.), called the Elders' Church, from the form of government by a committee of elders.

Among the sects growing out of the Tomlinson movement are the Mountain Assembly Church of God; Church of God. Incorporated; Church of Jesus; Bishop Poteat's Church of God; Bible Church of God; Jesus and Watch Mission; Churches of Our Lord Jesus Christ of the Apostolic Faith; Remnant Church of God; Apostolic Church of Jesus Christ; Non-Digressive Church of God; Justified Church of God; Holstein Church of God; Church of God of the Bible; Glorified Church of God; and several others.

The Church of God (Anderson, Ind.) is not a pentecostal body and repudiates speaking in unknown tongues. The Church of God (Oregon. Ill.) is an Adventist body.

GODALMING, a municipal borough of Surrey, Eng., lies across the river Wey on the old London-Portsmouth road, 33 mi. S.W. of London by road. Pop. (1961) 15.771. It is a residential town with an attractive shopping centre in the rather crowded High street. The church of SS. Peter and Paul is principally Early English and Perpendicular, built of local Bargate stone which is no longer quarried. A fine old group of almshouses, dating from 1622, is administered by the Carpenters' company. Westbrook house, home of Gen. James Edward Oglethorpe, founder of the colony of Georgia, is now the Meath Home for Incurables. The old town hall, built in 1814 on the site of market house, is now a local history museum. Public open spaces include the Phillips Memorial ground, with a cloister to the memory of Jack Phillips, wireless operator of S.S. "Titanic." Charterhouse school, 1 mi. N. of Godalming, was transferred from Charterhouse square, London, in 1872 and has 120 ac. of grounds with spacious buildings in the Gothic style. *(See* also CHARTERHOCSE.) Godalming's industries include woolen manufactures and light engineering.

Local excavations have revealed evidences of a former Romano-British settlement. Godalming (Godelminge) belonged to King Alfred and was a royal manor at the time of Domesday. It was granted to the see of Salisbury by Henry II but reverted to the crown in the reign of Henry VIII. In 1563 it was constituted a market town by Elizabeth I who granted it a charter of incorporation with powers to hold a market, annual fair and a court of piepowder or piepoudre (a summary court of record formerly held at fairs and markets to administer justice in transactions) in 1575. This charter was confirmed in 1620 and a new charter granted by Charles II in 1666. Extensions were made to the borough in 1892, 1928 and 1933. (S. C. D.)

GODARD, BENJAMIN LOUIS PAUL (1849–189j), French composer of operas. light piano pieces and songs. Born in Paris, Aug. 18, 1849, he was a child prodigy on the violin. He studied composition under Henri Réber and in his youth wrote symphonies, concertos, chamber music and piano pieces. His opera, *Pédro de Zalaméa* (1884), was produced at Antwerp, and his *Symphonie legendaire,* Op. 100, was performed in Paris in 1886. His other operas include *Jocelyn* (1888), long-known for its "Berceuse," and *Lu Vivandière* (1895). Godard's music is slender and sentimental, showing at its best an affinity with Chopin and Schumann. He died of tuberculosis at Cannes, Jan. 10, 1895.

See M. Clavie, *Benjamin Godard* (1905). (E. LR.)

GODAVARI, a river of central India, flows across the northern Deccan from the Western Ghats to the Bay of Bengal. Its source is within 80 mi. of Bombay. near the Thal Ghat where the main railway from that city to the lower Ganges basin crosses the Ghats. Its general course is somewhat south of east. With its main southern tributary, the Manjra, it drains the larger part of the former state of Hyderabad, now partly in Maharashtra, partly in Andhra Pradesh. Near the 80th meridian it is joined by the Pranhita bringing from the north the drainage of the Mahadeo hills. Above this point the main river flows in a wide valley and frequently breaks up into several channels. At the Pranhita junction it leaves the lava plateau country and enters a trough of easily eroded rocks that extends to the sea. It is this feature which accounts for the wide break in the Eastern Ghats and the great depth of the coastal plain at the mouths of the Godavari and Krishna. Sixty miles from the sea it leaves the trough and breaks through the Ghats in a magnificent gorge only 200 yd. wide. The extensive delta is virtually continuous with that of the Krishna and is connected with that river by canal.

The upper river is almost dry during winter and spring and is almost useless for irrigation. The delta on the other hand is one of the richest rice-growing regions in India. The water is derived from the Godavari by an anicut—a low dam directing the stream flow into the head of the canal system. The Godavari is one of the rivers sacred to Hindus. (T. HER.; L. D. S.)

GODAVARI, EAST AND WEST, two districts of Andhra Pradesh, India, which were formerly part of Madras, comprising three dissimilar natural regions: the Agency tract in the northwest, underdeveloped and infertile; the exceedingly rich and fertile delta of the Godavari along the coast which is the largest rice granary of south India; the intermediate upland taluks. The Godavari river, after which they are named, divides the districts. Forty miles from the sea, at Dowlaishwaram, is the famous anicut (dam) nearly $2\frac{1}{2}$ mi. in length, constructed by Sir Arthur Cotton in 1890, which has made the delta a perennial rice field.

At the beginning of the 16th century this region was overrun by the Muslims. At the end of the struggle with the French in the Carnatic, Godavari with the Northern Circars was conquered by the British and finally in 1765 ceded to them, except for the small territory of Yanam (6 sq.mi.) which remained a French possession till 1954, when it was transferred to India. The districts were created in 1925 from the old Godavari and Krishna districts.

EAST GODAVARI district has an area of 5.773 sq.mi. and a population (1961) of 2,609,311. The present headquarters. Kakinada, lies on one of the mouths of the river, while Rajahmundry was the old capital. The port facilities at Kakinada are poor because of the heavy silting of the Godavari and ships must lie several miles offshore. There is an engineering college and a medical college. Rajahmundry has also an arts college, a government training college and two oriental colleges (one exclusively for women), all affiliated to Andhra university. At Samalkot, in the heart of the sugar-growing tract of the delta, is a large distillery and sugar refinery.

WEST GODAVARI district has an area of 2,988 sq.mi. and a population (1961) of 1,978,434. The district was carved out of the Krishna district in 1925. Its capital is at Eluru, noted for its woolen carpets, the dyes and wool for which are produced locally. Both districts were once famous for the manufacture of fine cotton cloths, especially saris, at such centres as Peddapur in East Godavari and Palakollu. (G. KN.)

GODDARD, CALVIN HOOKER (1891–1955), U.S. army officer, military historian and criminologist who is chiefly remembered for his pioneering work in scientific crime detection and for his writings on the history of firearms, was born in Baltimore. Md., Oct. 30, 1891. He graduated from the Johns Hopkins University school of medicine in 1915, served with the U.S. army medical corps in World War I (becoming a major in 1918), with the ordnance department in World War II, and with the corps of military police in the Korean war. He was promoted to the rank of colonel in 1950. A lifelong interest in guns. combined with medical knowledge, qualified Goddard as an expert witness in many famous legal cases of the 1920s and led him in 1930 to organize a scientific crime detection laboratory in Chicago, 111. He developed instruments and techniques for identifying the weapon from which a given bullet was fired. A talented writer, he contributed scores of articles to military and scientific publications. He died in Washington. D.C., on Feb. 22, 195j. (H. C. T.)

GODDARD, RAYNER GODDARD, BARON, OF ALDBOURNE (1877–), lord chief justice of England whose work in controlling the crime wave that followed World War II was of outstanding social importance at that time. He was born in London on April 10, 1877, and educated at hlarlborough college and at Trinity college, Oxford, where he graduated in 1898. After being called to the bar at the Inner Temple he became recorder of Poole in 1917 and took silk in 1923. From 192j to 1928 he was recorder of Bath, and from 1928 to 1932 recorder of Plymouth, being raised to the bench as a judge of the high court (king's bench division) in 1932. At the bar his most important practice was in commercial cases. but his experience as recorder doubtless laid the foundation of his wide knowledge of the criminal law, with which the general public learned chiefly to associate his name. In 1938 Goddard became a lord justice of appeal and in 1944 a lord of appeal in ordinary, being also in that year created a life peer. The most distinguished part of his career, however. started when, in 1936 and near an age when many judges contemplate retirement, he was appointed lord chief justice. He found himself confronted with a wave of crime following the end of World War II. and, by a combination of a certain measure of severity with a scrupulous regard for legal proprieties, he was the inspiration of the judiciary and magistracy in bringing this situation under control. He retired in 1958. (W. T. WS.)

GODDARD, ROBERT **HUTCHINGS** (1882–1945), the father of American rocketry. was born Oct. j, 1882, at Worcester, Mass. As a student at Worcester Polytechnic institute he began to speculate on means of reaching the fringes of outer space by the use of rockets. After taking his Ph.D. at Clark university in Worcester in 1911 he became a member of the Clark faculty and later attained the rank of full professor.

In 1919 the Smithsonian institution published Goddard's now classic report entitled "A Method of Reaching Extreme Altitudes" and provided funds for his rocket research. During the 1920s he turned from solid to liquid propelianrs and in 1926 fired his first liquid fuel rocket. Supported by Clark university and the Guggenheim foundation. he continued his experiments with liquid fuel rockets and gyroscopic controls at a desert site near Roswell. New Mexico. He demonstrated that rockets operated in a vacuum as well as in air and developed the theory of step rockets consisting of several stages as a means of reaching the moon. Progress was slow and few people recognized the potential importance of his work.

During World War II the U.S. naw employed Goddard to develop missile motors and jet-assisted take-off devices (JATOs) for aircraft and moved his laboratory to Annapolis, Md. He was engaged in this work at the time of his death on Aug. 10, 1945. Goddard deplored the use of rockets as military weapons but foresaw clearly the possibility of the rocket as a means of extending man's knowledge of the universe.

See Robert *H.* Goddard, *Rocket Development,* ed. *by* Esther C. Goddard and G. Eduard Pendray (1948). (S. P J.)

GODDARD AND TOWNSEND, tuo families of cabinetmakers of Newport, R.I.. during the 17th and 18th centuries. Both families were Quakers of English ancestry and they intermarried. In four generations, 20 Goddard and Townsend craftsmen are known, and the high point of their excellent productivity was reached during the early and mid-18th century. These cabinetmakers were especially noted for furniture in the Queen Anne and Chippendale styles, identified by an original type of shell carving, and a surface treatment called blocking No exact European prototypes existed for their innovations. Many of the best-known pieces. high chests of drawers and secretary bookcases, generally executed in mahogany from the West Indies or South America, have well-documented histories.

Noted individual craftsmen were Christopher Tounsend (1701–1792) and his son John (1732–1809); Job Townsend (1699–1765) and his sons Job, Jr. (1726–1778), and Edmund (1736–1811); and John Goddard (1724–178j) and his son Townsend (1750–1790).

See Wendell *D.* Garrett, "The Newport Cabinetmakers a Corrected Check List," *Antiques,* 73:558–561 (June 1958). (J. T. Br)

GODEFROY (Gothofredus), a French noble family which numbered among its members several distinguished jurists and historians. The family claimed descent from Symon Godefroy. who was born at Mons about 1320 and was lord of Sapigneulx near Berry-au-Bac, now in the *département* of Aisne.

Denis Godefxoy (Dionysius Gothofredus; 1549–1622), jurist, son of Léon Godefroy, lord of Guignecourt, was born in Paris on Oct. 17. 1549, and died at Strasbourg on Sept. 7, 1622. He studied law in the Low Countries and in Germany, and embraced Calvinism. This change of faith led to his residence abroad, first at Geneva (1580–89), where he became professor of law, and then at Heidelberg (1600), where he was head of the faculty of law and was employed from time to time on diplomatic missions by the Elector Palatine. His most important work u-as the *Corpus juris civilis* (Geneva and Lyons. 1583), which went through 20 editions. the most valuable of them being that printed by the Elzevirs at Amsterdam in 1663 and the Leipzig edition of 1740.

His eldest son, Théodore Godefroy (1580–1649), was born at Geneva on July 17, 1580. He abjured Calvinism and was called to the bar in Paris. He became historiographer of France in 1617 and was employed from time to time on diplomatic missions. He was employed at the congress of Miinster. where he remained after the signing of peace in 1648 as chargé d'affaires until his death on Oct. 5 of the next year.

The second son of Denis, Jacques Godefroy (1587–1652), jurist, was born at Geneva on Sept. 13. 1587. He was educated in France but returned to Geneva, where he held various important public offices. He died on June 22, 1652. His edition of the *Codex Theodosianus* (4 vol., Lyons, 1665; 6 vol., Leipzig. 1736–45), on which he worked for 30 years, became a standard authority on the decadent period of the western empire. Jacques Codefroy was held to be the most learned jurist of his time. Among his numerous other works were several dealing with historical and political questions.

Denis Godefroy (1615–81), eldest son of Théodore, succeeded his father as historiographer of France.

GODFREY of Bouillon (Godefroy de Bouillon) (*c.* 1060–1100), a leader in the first crusade, was the second son of Eustace II, count of Boulogne, by his marriage with Ida, daughter of Duke Godfrey II of Lower Lorraine. He was designated by Duke Godfrey as his successor; but the emperor Henry IV gave him only the mark of Antwerp, in which the lordship of Bouillon was included (1076). He fought for Henry. however, both on the Elster and in the siege of Rome, and he was invested in 1082 with the duchy of Lower Lorraine. His career as duke was not especially distinguished, hut he seems to have been notably pious. and when the first crusade was preached, he soon joined the expedition at considerable personal sacrifice. He sold to the bishop of Verdun his rights and possessions in that county and pledged his county and castle of Bouillon to the bishop of Liège.

Godfrey began his march in Aug. 1096. Accompanied by his brothers Eustace and Baldwin (the future Baldwin I of Jerusalem, *q.v.*) he led a body of perhaps 15,000 crusaders from the lands of the Meuse and the lower Rhine. He took the route through Hungary and the Balkans and arrived at Constantinople on Dec. 23, 1096. As the first of the crusading princes to arrive he had the difficult problem of reaching a satisfactory relationship with the emperor Alexius. Godfrey was at first unwilling to swear the oath of allegiance that the emperor required, but was prevailed upon to do so in April 1097. His example was followed by the other princes. From this time until the beginning of 1099 Godfrey appears as one of the minor princes, while men like Bohemund and Raymond, Baldwin and Tancred were determining the course of events.

In 1099 he came once more to the front. The mass of the crusaders were weary of the political factions that divided some of their leaders, and. Godfrey, who was more of a pilgrim than a politician, became the natural representative of this feeling. He was thus able to play his part in prevailing upon the reluctant Raymond of Toulouse to march southward to Jerusalem, and he was prominent in the siege, his division being the first to enter when the city was captured. It was natural therefore that. when Raymond refused the offered dignity, Godfrey should be elected ruler of Jerusalem (July 22. 1099). He refused the title of king, assuming that of "advocate" of the Holy Sepulchre. The new dignity proved more onerous than honourable, and during his short reign of a year Godfrey had to combat the Arabs of Egypt and the opposition of Raymond and the patriarch Dagobert. He was successful in repelling the Egyptian attack at the battle of Ascalon (Aug. 1099), but he failed to acquire the town of Ascalon after the battle; the citizens would surrender only to Raymond, and Godfrey refused to accept these terms.

Left alone. at the end of the autumn, with an army of about 2,000 men, Godfrey was yet able, in the spring of 1100, probably with the aid of nen pilgrims, to exact tribute from towns like Acre, Askalon. Arsuf and Caesarea. But already at the end of 1099 Dagobert. archbishop of Pisa. had been substituted as patriarch for Arnulf (who had been acting as vicar) by the influence of Bohemund; and Dagobert. whose vassal Godfrey had at once piously acknowledged himself, seems to have forced him to an agreement in April 1100, by which he promised Jerusalem and Jaffa to the patriarch, in case he should acquire in their place Cairo or some other town, or should die without issue. Thus were the foundations of a theocracy laid in Jerusalem; and when Godfrey died (July 1100) he left the question to be decided, whether a theocracy or a monarchy should be the government of the Holy Land.

Because he had been the first ruler in Jerusalem, Godfrey was idolized in later saga. He was depicted as the leader of the crusades, the king of Jerusalem, the legislator who laid down the assizes of Jerusalem. He was none of these things. Bohemund was the principal leader of the crusade; Baldwin was the first king; the assizes were the result of a gradual development. In reality he would seem to have been a quiet, pious, hard-fighting knight, who was chosen to rule in Jerusalem because he had no dangerous qualities and no obvious defects.

Godfrey was the principal hero of two French chansons de geste dealing with the crusade, the *Chanson d'Antioche* (ed. by P. Paris, 2 vol., 1848) and the Chanson de *Jérusalem* (ed. by C. Hippeau, 1868). In addition, the parentage and early exploits of Godfrey were made the subject of legend. His grandfather was said to be Helias, knight of the Swan, one of the brothers whose adventures are well known, though with some variation, in the familiar fairy tale of "The Seven Swans," almost identical with the Lohengrin (*q.v.*) legend. See also CRUSADES.

BIBLIOGRAPHY.—Godfrey is made the central figure of the first crusade in the history of that expedition by Albert of Aix, written c. 1130. For modern work see J. C. Andressohn, The Ancestry and *Life of* Godfrey of Bouillon (1947); S. Runciman, History of the Crusades, vol. i (1951); H. Pigeonneau, Le Cycle de la croisade et de la *famille* de Bouillon (1877); A. Hatem, Les *Poèmes épiques* des croisades (1932). Two later and interesting attempts to reassess Godfrey's character and achievement are H. Glaesener, "Godefroid de Bouillon était-il 'un médiocre,'" Revue d'histoire *ecclésiastique,* vol. xxxix (1943), and M. Lobet, Godefroid de Bouillon: Essai de biographie antilégendaire (1943).

GODFREY OF VITERBO (c. 1120–*c.* 1196), chronicler, probably an Italian by birth, passed some of his early life at Viterbo, where he also spent his concluding days, but he was educated at Bamberg. About 1140 he became chaplain to the German king Conrad III; but the greater part of his life mas spent as secretary (notarius) in the service of the emperor Frederick I, who employed him on many diplomatic errands. The only part of Godfrey's voluminous work which is valuable is the Gesta Friderici I, verses relating events in the emperor's career from 1155 to 1180. Concerned mainly with affairs in Italy, the poem tells of the sieges of Milan, of Frederick's flight to Pavia in 1167. of the treaty with Pope Alexander III at Venice, and of other episodes with which the author was intimately acquainted, and many of which he had witnessed. Attached to the Gesta Friderici is the Gesta *Heinrici VI,* a shorter poem which is often attributed to Godfrey, although W. Wattenbach and other authorities thought it was not written by him. His other works are *Speculum Regum* and the popular *Memoria saeculorum,* rewritten as Pantheon.

GODFREY, SIR EDMUND BERRY (1621–1678), English magistrate and politician, was born on Dec. 23, 1621, and educated at Westminster school and Christ Church, Oxford. After entering Gray's Inn he became a prosperous dealer in wood. He was made a justice of the peace for the city of Westminster, and in Sept. 1666 was knighted as a reward for his services during the great plague.

In Sept. 1678 Titus Oates (*q.v.*) and two other men appeared before him with written information about the alleged "popish plot" to kill the king, and swore to the truth of their statements. During the excitement which followed the magistrate expressed a fear that his life was in danger, but took no precautions. On Oct. 12 he did not return home as usual, and on the 17th his body was found on Primrose hill, Hampstead. The evidence proved that he had been murdered, and the excited populace regarded the deed as the work of the Roman Catholics. In Dec. 1678 Miles Prance, under arrest for conspiracy, confessed to having been present at Godfrey's murder, the deed being done by Robert Green, Lawrence Hill and Henry Berry, at the instigation of Roman Catholic priests. The three men were hanged in 1679, but Prance's confession was subsequently proved false, and he pleaded guilty to perjury. The secret of Godfrey's death was never solved.

GODIVA (c. 1040–*c.* 1080) was the wife of Leofric, earl of Mercia and lord of Coventry, and the benefactress of several religious houses.

Legend says that, the people of Coventry suffering grievously under Leofric's oppressive taxation, Lady Godiva appealed to her husband, who said he would grant her request if she would ride naked through the crowded market place. This she did, clothed only in her long hair. Her husband kept his word and abolished the obnoxious taxes.

A later version says that Godiva issued a proclamation that all persons should keep within doors and shut their windows. One person disobeyed her proclamation, a tailor, ever afterward known as Peeping Tom, who is said to have been struck blind. Still another version says that Godiva was made invisible. The oldest form of the legend is given in *Flores* historiarum by Roger of Wendover (d. 1237), who quoted from an earlier writer.

The Godiva procession, which was instituted May 31, 1678, as part of Coventry fair, was celebrated at intervals until 1826. The "Peeping Tom" in Hertford street, Coventry, was perhaps an image of St. George.

GODKIN, EDWIN LAWRENCE (1831–1902), Anglo-U.S. editor and founder of the Nation, was born in Moyne, County Wicklow, Ire., Oct. 2, 1831. After graduating in 1851 from Queen's college, Belfast, and studying law in London, he was special correspondent for the London Daily News in the Crimean War. After editorial work on the *Belfast* Northern Whig, he went to America late in 1856, writing letters descriptive of a southern tour for the London Daily News. He continued his connection with this journal while studying law in New York. He was admitted to the bar in 1858. and because of his impaired health he and his wife, Frances Elizabeth Foote, traveled in Europe 1860–62. At about this time Godkin was offered a partnership in the New York Times by its editor, Henry Jarvis Raymond; but although attracted by the offer, he in 1865 carried out a long-cherished dream by founding the Nation. This quickly became the foremost review in the country—as James Russell Lowell put it, because of the "ability, information and unflinching integrity" of the editor. Indeed, the periodical was so superior that Charles Dudley Warner, editor of the Hartford Courant, styled it the "weekly judgment day." In 1881 Godkin sold the Nation to Henry Villard, owner of the New York Evening Post, of which paper the Nation became the weekly edition. Godkin himself became associate editor of the Post, succeeding Carl Schurz as editor in chief, 1883–99, and shaping the policy of that journal. Under his leadership the Post broke with the Republican party in the presidential campaign of 1884, when Godkin's opposition to Blaine did much to create the so-called Mugwump party (see MUGWUMP), and his organ became completely independent. He consistently advocated currency reform, the gold basis, a tariff for revenue only, and civil service reform, rendering the greatest aid to the last cause. His attacks on Tammany Hall were so frequent and so fearless that he was several times sued for libel because of biographical sketches of certain leaders in that organization, but the cases were dismissed. His opposition to "jingoism" and to imperialism was able and forcible.

Godkin retired from his editorial duties in 1899 and died in Greenaay, Devonshire, England, May 21, 1902.

BIBLIOGRAPHY.—Rollo Ogden (ed.), Life and Letters *of* Edwin Lawrence *Godkin,* which has a list of Godkin's writings, 2 vol. (1907); accounts in W. G. Bleyer, Main Currents in the History of American Journalism (1927); O. G. Villard, Some Newspapers and Newspapermen (1926); Allan Nevins, The Evening Post (1922); and H. F. Pringle, "Godkin of the Post" in E. H. Ford and E. Emery (eds.), Highlights in the History of the American Press (1954).

GODMANCHESTER, a municipal borough in the Huntingdonshire parliamentary division of Huntingdonshire, Eng., on the right bank of the Ouse, 1 mi. S.S.E. of Huntingdon (its twin town) and 15 mi. S.E. of Cambridge by road. Pop. (1951) 2,502. Area 7.7 sq.mi. A Romano-British settlement occupied the site of Godmanchester. The town (Godmundcestre) belonged to the king before the Conquest and in 1213 King John granted the manor to the men of the town at a fee farm of £120 yearly. James I granted an incorporation charter in 1605, which recited that the burgesses were chiefly engaged in agriculture, and granted them a fair, which is now discontinued. The spire of the beautiful Perpendicular church of St. Mary the Virgin is a landmark for miles over the fens; it contains miserere stalls, traditionally from Ramsey abbey, Huntingdonshire. The 13th-century stone bridge over the river, on which swans are seen, connects the town with Huntingdon; the two Huntingdon arches are decorated, Godmanchester's are plain. The Elizabethan grammar school is one of many Tudor houses in Godmanchester and of these and the Georgian buildings, 77 were listed (1956) for preservation. The trade is agricultural, but many people find employment in Huntingdon. Many old customs survive, including the ringing of curfew: The court leet of the freemen appoints a swanherd and pinder (an officer who impounds stray beasts).

GODOLPHIN, SIDNEY (1610–1643), English Royalist and poet, born at Godolphin hall, Cornwall, was baptized on Jan. 15, 1610. Educated at Exeter college, Oxford. he became intimate with Ben Jonson, Thomas Hobbes and other men of letters. He was a member of parliament for Helston from 1628. A staunch Royalist, he was one of the last to leave the house of commons when the king ordered his supporters to withdraw. He joined the Royalist forces under Sir Ralph Hopton and on Feb. 9, 1643, was killed in action at Chagford, Devonshire.

The earl of Clarendon pays a notable tribute to Godolphin in his *History* and Hobbes praises him in *Leviathan.* A few of his poems were published in the 17th century; of these the chief is *The Passion of Dido for Aeneas,* a translation from the *Aeneid,* apparently unfinished at his death and completed and published by Edmund Waller (1658). Other poems survived in manuscript collections. Godolphin's best lyrics have a fine strength and delicacy.

The first complete edition was by *G.* Saintsbury, in *Minor Poets* of *the Caroline Period,* 3 vol. (1905–21). *See* also *Poems,* ed. by *W.* Dighton (1931), with a biographical introduction. (V. DE S. P.)

GODOLPHIN, SIDNEY GODOLPHIN, EARL OF (1645–1712), English statesman. was a cadet of an ancient Cornish family. In 1662 he was introduced into the royal household by Charles II, with whom he became a favourite, and in 1668 he entered the house of commons as member for Helston. Although he seldom addressed the house, he acquired a reputation as its chief financial authority. In March 1679 he was appointed a commissioner of the treasury and in Feb. 1680 a privy councillor; and by the following autumn he, with Hyde (afterward earl of Rochester) and Sunderland,—the "chits"—were regarded as the king's chief advisers. Though he voted for the Exclusion bill in 1680, he was continued in office after the dismissal of Sunderland. In April 1684 he became one of the secretaries of state, and in September he was created a baron and succeeded Rochester as first lord of the treasury. After the accession of James II he was made chamberlain to the queen and, uith Rochester and Sunderland, enjoyed the king's special confidence.

In 1687 Godolphin was again named a commissioner of the treasury. He was one of the council of five appointed by James to represent him in London when he went to join the army after the landing of William of Orange in England. and was afterward appointed a commissioner to treat with the prince. Under William III he was reappointed as a commissioner of the treasury (April 1689) and became first lord in Nov. 1690, but maintained, in conjunction with Marlborough. a treacherous intercourse with James II. After Sir John Fenwick's confession in 1696 regarding the attempted assassination of William III, Godolphin was prevailed upon to resign; but when the Tories came into power in 1700 he was again appointed lord treasurer and retained office for about a year. Though not a favourite with Queen Anne, he was, after her accession, appointed to his old office on the recommendation of Marlborough. He was made an earl in 1706. He played an active part in bringing about the union with Scotland. As the Spanish succession war developed he was driven more and more into alliance with the Whigs, He thus lost the support of Robert Harley and the Tories; and Harley began to supplant his influence and that of the Marlboroughs with the queen. After the Tory reaction which followed the impeachment of Henry Sacheverell, the queen abruptly dismissed Godolphin from office on Aug. 7, 1710. He died on Sept. 15, 1712. He married Margaret Blagge, whose life was written by John Evelyn, in 1675, She died in 1678.

See H. Elliott, *The Life of Sidney, Earl of Godolphin* (London, 1888) ; *Dictionary of National Biography,* vol. xxii (London, 1890).

GODOWSKY, LEOPOLD (1870–1938), Polish-American musician and composer, was born at Vilna on Feb. 13, 1870. He made his debut as a pianist there as a child of nine, and then toured Russia, Poland, Germany and the United States. After 1912 most of his tours were confined to the latter country. His compositions included 53 original studies after the *études* of Chopin, a sonata in E minor and many compositions for piano and violin. He died in New York city, Nov. 21, 1938.

GODOY, MANUEL (1767–1851), DCKE OF ALCUDIA and PRINCE OF THE PEACE, Spanish royal favourite and statesman. Born of a minor noble family in Badajoz on May 12, 1767, he entered the royal bodyguard in 1784 and soon established himself as the lover of Maria Louisa of Parma, whose husband became king as Charles IV in 1788. Godoy, clever enough to win the king's as well as the queen's favour, was created duke of Alcudia in April 1792 and eventually made prime minister (November). His support of the king's Bourbon sentiments in interceding for Louis XVI of France led to the French republic's declaring war in 1793, but after the French victories in Catalonia he negotiated the peace of Basle (July 179j), in which he ceded San Domingo but for which he was rewarded with the title "prince of the peace." A disastrous war with England followed the Franco-Spanish treaty of San Ildefonso (Aug. 1796). The archbishop of Seville and the grand inquisitor were exiled for plotting against Godoy in March 1797, and he was married to Maria Teresa, countess of Chinchón, a natural daughter of the king's uncle, in September, but in March 1798 envy of his position at court, together with the French Directory's mistrust, drove Godoy from office. Yet he remained influential and returned to office in 1801. He personally commanded the Spanish troops in the War of the Oranges. which won Olivenza from Portugal. War with England having been renewed after the peace of Amiens, his relations with Napoleon gradually deteriorated. though under the secret treaty of Fontainebleau (Oct. 27, 1807) Godoy was offered the kingdom of the Algarves for himself. Meanwhile the prince of Asturias, the future King Ferdinand VII, was plotting to displace him; Godoy had Ferdinand arrested (Oct. 29); but after Ferdinand's release, as French troops were overrunning Spain, popular resentment culminated in the riots of Aranjuez (March 1808), which enabled Ferdinand to arrest Godoy. Sent then on Napoleon's orders to Bayonne, Godoy stayed with Charles IV till the latter's death in Rome (1819). Having failed to recover his confiscated estates even after Ferdinand's death (1833), he had to live as Louis Philippe's pensioner till Isabella II restored them in 1847. He died in Paris on Oct. 4, 1851. (J. G. R.-S.)

GODUNOV, BORIS FEDOROVICH, tsar of Muscovy (c. 1552–1605), the most famous member of an ancient, now extinct Russian family of Tatar origin, which migrated from the Horde to Muscovy in the 14th century. Boris's career of service began at the court of Ivan the Terrible. He is mentioned in 1570 as taking part in the Serpeisk campaign as one of the archers of the guard. In 1571 he strengthened his position at court by his marriage with Maria, the daughter of Ivan's favourite, Malyuta Skuratov. In 1580 the tsar chose Irene, the sister of Boris, to be the bride of the tsarevich Theodore, on which occasion Boris was promoted to the rank of *boyar.* On his death-bed Ivan appointed Boris one of the guardians of his son and successor, Theodore. who was of somewhat weak intellect. The reign of Theodore began with a rebellion in favour of the infant tsarevich Demetrius, the son of Ivan's fifth wife Marie Nagaya, a rebellion resulting in the banishment of Demetrius, with his mother and her relations, to their appanage at Uglich. On the occasion of the tsar's coronation (May 31, 1584), Boris was loaded with honours and riches, yet he held but the second place in the regency during the lifetime of his co-guardian Nikita Romanovich, on whose death, in 1585, he was left without any serious rival. A conspiracy against him of all the other great *boyars* and the metropolitan Dionysy, which sought to break Boris's power by divorcing the tsar from Godunov's childless sister, only ended in the banishment or tonsuring of the malcontents.

Henceforth Godunov was omnipotent. The direction of affairs passed entirely into his hands, and he corresponded with foreign princes as their equal. His policy was generally pacific, but always most prudent. In 1595 he recovered from Sweden the towns lost during the former reign. Five years previously he had defeated a Tatar raid upon Moscow, for which service he received the title of *slugar,* an obsolete dignity even higher than that of *boyar.* Towards Turkey he maintained an independent attitude, supporting an anti-Turkish faction in the Crimea, and furnishing the emperor with subsidies in his war against the sultan. Gadunov encouraged English merchants to trade with Russia by exempting them from tolls. He civilized the north-eastern and south-eastern borders of Muscovy by building numerous towns and fortresses to keep the Tatar and Finn tribes in order. Samara, Saratov, and Tsaritsyn and a whole series of lesser towns owe their existence to him. He also re-colonized Siberia, which had been slipping from the grasp of Muscovy, and formed scores of new settlements, including Tobolsk and other large centres. It was during his government that the Muscovite Church received its patriarchate, which placed it on an equality with other eastern churches and emancipated it from the influence of the metropolitan of Kiev. It was Boris's internal policy to support the middle classes at the expense of the old nobility and the peasants, hence the ukase (1587) forbidding the peasantry to transfer themselves from one landowner to another, thus binding them to the soil, and leading to the institution of serfdom in its most grinding form. The sudden death of the tsarevich Demetrius at Uglich (May 1j, 1591) has commonly been attributed to Boris.

On the death of the childless tsar Theodore (Jan. 7 1598), a *Zemsky Sobor,* or national assembly, unanimously elected Boris tsar on Feb. 21. The Romanov family, who had been his chief rivals, were disgraced and banished. Boris was the first tsar to import foreign teachers on a great scale, the first to send young Russians abroad to be educated, the first to allow Lutheran churches to be built in Russia. He also felt the necessity of a Baltic seaboard, and attempted to obtain Livonia by diplomatic means. That Boris was one of the greatest of the Muscovite tsars there can be no doubt. But his great qualities were overbalanced by an incurable suspiciousness. He encouraged informers and persecuted suspects on their unsupported statements. The Romanov family in especial suffered severely from these delations. In 1603 a pretender appeared in Poland, who claimed to be the murdered tsarevich Demetrius, and, with the support of King Sigismund of Poland, he was leading a small army, reinforced by the Don Cossacks, into south-west Russia, when Boris died suddenly (April 13 1605), leaving one son, Theodore II., who succeeded him for a few months and then was foully murdered by the enemies of the Godunovs.

See Platon Vasilievich Pavlov, *On the Historical Significance of the Reign of Boris Godunov* (Rus.), (1850); Sergyei Mikhailivich Soloviev, *History of Russia* (Rus.), (2nd ed., vols. vii.–viii., 1897).

GODWIN, FRANCIS (1562–1633), English divine, son of Thomas Godwin, bishop of Bath and Wells, was born at Hannington, Northamptonshire, and studied at Christ Church, Oxford. After holding two Somersetshire livings he was in 1587 appointed subdean of Exeter, bishop of Llandoff (1601) and of Hereford (1617). His *Catalogue of the Bishops of England since the first planting of the Christian Religion in this Island* (1601; 2nd ed., 1615; Latin ed., 1616) was republished, with a continuation by William Richardson, in 1743. In 1616 Godwin produced *Rerum Anglicarum, Henrico VIII., Edwardo VI. et Maria regnantibus, Annales,* afterwards translated and published by his son Morgan under the title *Annales of England* (1630). His *The Man in the Moone, or a Discourse of a Voyage thither, by Domingo Gonsales,* written apparently between 1599 and 1603 and published posthumously in 1638, was imitated in several important particulars by Cyrano de Bergerac, from whom, if not from Godwin direct, Swift borrowed in writing of Gulliver's voyage to Laputa. Another work of Godwin's, *Nuncius inanimatus Utopiae* (1629), seems to have been the prototype of John Wilkins's *Mercury, or the Secret and Swift Messenger,* which appeared in 1641.

GODWIN, MARY WOLLSTONECRAFT (1759–1797), English miscellaneous writer, was born probably at Hoxton, London. Her family was of Irish extraction. Her father, Edward John Wollstonecraft, after dissipating the greater part of his patrimony, tried to earn a living by farming, which only plunged him into deeper difficulties, and he led a wandering, shifty life. The family roamed from Hoxton to Edmonton, to Essex, to Beverley in Yorkshire, to Lougharne, Pembrokeshire, and back to London.

After Mrs. Wollstonecraft's death in 1780, soon followed by her husband's second marriage, the three daughters, Mary, Everina and Eliza, sought to earn their own livelihood. Mary, the eldest, went in the first instance to live with her friend Fanny Blood, a girl of her own age, whose father, like Wollstonecraft, was addicted to drink. Mary helped Mrs. Blood to earn money by taking in needlework, while Fanny painted in water-colours. Everina went to live with her brother Edward, and Eliza made a hasty and, as it proved, unhappy marriage with a Mr. Bishop. A legal separation was afterwards obtained, and the sisters, together with Fanny Blood, took a house, first at Islington, afterwards at Newington Green, and opened a school, which was carried on with indifferent success for nearly two years. During their residence at Newington Green, Mary was introduced to Dr. Johnson, who, as Godwin tells us, "treated her with particular kindness and attention."

In 1785 Fanny Blood married Hugh Skeys, a merchant, and went with him to Lisbon, where she died in childbed after sending for Mary to nurse her. "The loss of Fanny," as she said in a letter to Mrs. Skeys' brother, George Blood, "was sufficient of itself to have cast a cloud over my brightest days. . . . I have lost all relish for pleascre, and life seems a burden almost too heavy to be endured." Her first novel, *Mary, a Fiction* (1788), was intended to commemorate her friendship with Fanny. After closing the school at Newington Green, Mary became governess in the family of Lord Kingsborough, in Ireland. Her pupils were much attached to her, especially Margaret King, afterwards Lady Mountcashel; and indeed, Lady Kingsborough gave the reason for dismissing her after one year's service that the children loved their governess better than their mother. Mary now resolved to devote herself to literary work, and she was encouraged by Johnson, the publisher in St. Paul's churchyard, for whom she acted as literary adviser. She also undertook translations, chiefly from the French. *The Elements of Morality* (1790) from the German of Salzmann, illustrated by Blake, an old-fashioned book for children, and Lavater's *Physiognomy* were among her translations. Her *Original Stories from Real Life* were published in 1791, and, with illustrations by Blake, in 1796. In 1792 appeared *A Vindication of the Rights of Woman,* the work with which her name is always associated.

It is not among the least oddities of this book that it is dedicated to M. Talleyrand Périgord, late bishop of Autun. Mary Wollstonecraft still believed him to be sincere, and working in the same direction as herself. In the dedication she states the "main argument" of the work, "built on this simple principle that, if woman be not prepared by education to become the companion of man, she will stop the progress of knowledge, for truth must be common to all, or it will be inefficacious with respect to its influence or general practice." In carrying out this argument she used great plainness of speech, and it was this that caused all, or nearly all, the outcry. For she did not attack the institution of marriage, nor assail orthodox religion; her book was really a plea for equality of education, passing into one for State education and for the joint education of the sexes. It was a protest against the assumption that woman was only the plaything of man, and she asserted that intellectual companionship was the chief, as it is the lasting, happiness of marriage. She thus directly opposed the teaching of Rousseau, of whom she was in other respects an ardent disciple.

Mrs. Wollstonecraft, as she now styled herself, desired to watch the progress of the Revolution in France, and went to Paris in 1792. Godwin, in his memoir of his wife, considers that the change of residence may have been prompted by the discovery that she was becoming attached to Henry Fuseli, but there is little to confirm this surmise; indeed, it was first proposed that she should go to Paris with Fuseli and his wife, nor was there any subsequent breach in their friendship. She remained in Paris during the Reign of Terror, when communication with England was difficult or almost impossible. Some time in the spring or summer of 1793 Capt. Gilbert Imlay, an American, became acquainted with Mary—an acquaintance which ended in a more intimate connection. There was no legal ceremony of marriage, and it is doubtful whether such a marriage would have been valid at the time; but she passed as Imlay's wife, and Imlay himself terms her in a legal document, "Mary Imlay, my best friend and wife." In Aug. 1793 Imlay was called to Havre on business, and was absent for some months, during which time most of the letters published after her death by Godwin were written. Towards the end of the year she joined Imlay at Havre, and there in the spring of 1794 she gave birth to a girl, who received the name of Fanny, in memory of the dear friend of her youth. In this year she published the first volume of a never completed *Historical and Moral View of the French Revolution.* Imlay became involved in a multitude of speculations, and his affection for Mary and their child was already waning. He left Mary for some months at Havre. In June 1795, after joining him in England, Mary left for Norway on business for Imlay. Her letters from Norway, divested of all personal details, were afterwards published. She returned to England late in 1795 and found letters awaiting her from Imlay, intimating his intention to separate from her, and offering to settle an annuity on her and her child. For herself she rejected this offer with scorn: "From you," she wrote, "I will not receive anything more. I am not sufficiently humbled to depend on your beneficence." They met again, and for a short time lived together, until the discovery that he was carrying on an intrigue under her own roof drove her to despair, and she attempted to drown herself by leaping from Putney bridge, but was rescued by watermen. Imlay now completely deserted her, although she continued to bear his name.

In 1796, when Mary Wollstonecraft was living in London, supporting herself and her child by working, as before, for Mr. Johnson, she met William Godwin. A friendship sprang up between them—a friendship, as he himself says, which "melted into love." Godwin states that "ideas which he is now willing to denominate prejudices, made him by no means willing to conform to the ceremony of marriage"; but these prejudices were overcome, and they were married at St. Pancras church on March 29, 1797. And now Mary had a season of real calm in her stormy existence. Godwin, for once only in his life, was stirred by passion, and his admiration for his wife equalled his affection. But their happiness was of short duration. The birth of her daughter Mary, afterwards the wife of Percy Bysshe Shelley, on Aug. 30, 1797, proved fatal, and Mrs. Godwin died on Sept. 10 following. She was buried in the churchyard of Old St. Pancras, but her remains were afterwards removed by Sir Percy Shelley to the churchyard of St. Peter's, Bournemouth.

Her principal published works are as follows:—Thoughts on the Education of Daughters, . . . (1787); Mary, a Fiction (1788); The Female Reader (selections) (1789); An Historical and Moral View of the Origin and Progress of the French Revolution, and the effects it has produced in Europe, vol. i. (no more published) (1790); Original Stories from Real Life (1791); Vindication of the Rights of Woman (1792); Vindication of the Rights of Man (1793); Letters written during a Short Residence in Sweden, Norway and Denmark (1796); Posthumous Works (4 vols., 1798). It is impossible to trace the many articles contributed by her to periodical literature.

A memoir of her life was published by Godwin in 1798. A large portion of C. Kegan Paul's work, William Godwin, his Friends and Contemporaries, was devoted to her, and an edition of the Letters to Imlay (1879), of which the first edition was published by Godwin, is prefaced by a somewhat fuller memoir. See also E. R. Pennell, Mary Wollstonecraft Godwin (1885), in the Eminent Women Series; E. Dowden, The French Revolution and English Literature (1897) pp. 82 et seq.; E. R. Clough, A Study of Mary Wollstonecraft and the Rights of Woman (1898); an edition of her Original Stories (1906), with William Blake's illustrations and an introduction by E. V. Lucas; the Love Letters of Mary Wollstonecraft to Gilbert Imlay (1908), with an introduction by Roger Ingpen; M. Linford, Mary Wollstonecraft (1924).

GODWIN, WILLIAM (1756–1836), English political and miscellaneous writer, son of a Nonconformist minister, was born on March 3, 1756, at Wisbech, Cambridgeshire. Both parents were strict Calvinists. William Godwin was educated for his father's profession at Hoxton Academy, where he was under Andrew Kippis the biographer and Dr. Abraham Rees of the *Cyclopaedia,* and was at first more Calvinistic than his teachers, becoming a Sandemanian, or follower of John Glas (*q.v.*), whom he describes as "a celebrated north-country apostle who, after Calvin had damned ninety-nine in a hundred of mankind, has contrived a scheme for damning ninety-nine in a hundred of the followers of Calvin." He then acted as a minister at Ware, Stowmarket and Beaconsfield. At Stowmarket the teachings of the French philosophers were brought before him by a friend, Joseph Fawcet, who held strong republican opinions. He came to London in 1782, still nominally a minister, to regenerate society with his pen—a real enthusiast, who contemplated, in theory, the complete overthrow of all existing institutions, political, social and religious. He believed, however, that calm discussion was the only thing needful to carry every change, and from the beginning to the end of his career he deprecated every approach to violence. He was a philosophic radical in the strictest sense of the term.

His first published work was an anonymous *Life of Lord Chatham* (1783). Under the inappropriate title *Sketches of History* (1784) he published under his own name six sermons on the characters of Aaron, Hazael and Jesus, in which, though writing in the character of an orthodox Calvinist, he enunciates the proposition "God Himself has no right to be a tyrant." Introduced by Andrew Kippis, he began to write in 1785 for the *Annual Register* and other periodicals, producing also three novels now forgotten. The "Sketches of English History" written for the *Annual Register* from 1785 onward still deserve study. He joined a club called the "Revolutionists," and associated with Lord Stanhope, Horne Tooke and Holcroft. His clerical character was now completely dropped.

In 1793 Godwin published his great work on political science, *The Inquiry concerning Political Justice, and its Influence on General Virtue and Happiness,* an inquiry into the principles of society, of government and of morals. For many years Godwin had been "satisfied that monarchy was a species of government unavoidably corrupt," and from desiring a government of the simplest construction, he gradually came to consider that "government by its very nature counteracts the improvement of original mind." Believing in the perfectibility of the race, that there are no innate principles, and therefore no original propensity to evil, he considered that "our virtues and our vices may be traced to the incidents which make the history of our lives, and if these incidents could be divested of every improper tendency, vice would be extirpated from the world." All control of man by man was more or less intolerable, and the day would come when each man, doing what seems right in his own eyes, would also be doing what is in fact best for the community, because all will be guided by principles of pure reason. In a day when the penal code was still extremely severe, he argued gravely against all punishments, not only that of death. Property was to belong to him who most wanted it; accumulated property was a monstrous injustice. Hence marriage, which is law, is the worst of all laws, and as property the worst of all properties. Perhaps no one received the whole teaching of the book. But it gave cohesion and voice to philosophic radicalism. Godwin himself in after days modified his communistic views, but his strong feeling for individualism, his hatred of all restrictions on liberty, his trust in man, his faith in the power of reason remained.

In May 1794 Godwin published the novel of *Caleb Williams, or Things as they are,* dramatized by the younger Colman as *The Iron Chest.* A theorist who lived mainly in his study, Godwin yet came forward boldly to stand by prisoners arraigned of high treason in that same year—1794. The danger to persons so charged was then great; and he deliberately put himself into this same danger for his friends. But when his own trial was discussed in the privy council, Pitt sensibly held that *Political Justice,* the work on which the charge could best have been founded, was priced at three guineas, and could never do much harm among those who had not three shillings to spare.

In 1797, the intervening years having been spent in strenuous literary labour, Godwin married Mary Wollstonecraft (*see* GODWIN, MARY WOLLSTONECRAFT). Since both held the same views regarding the slavery of marriage, and since they only married at all for the sake of possible offspring, the marriage was concealed for some time, and the happiness of the avowed married life was very brief; his wife's death on Sept. 10 left Godwin prostrated by affliction, and with a charge for which he was wholly unfit—his infant daughter Mary, and her stepsister, Fanny Imlay, who from that time bore the name of Godwin. His unfitness for the cares of a family, far more than love, led him to contract a second marriage with Mary Jane Clairmont in 1801. She was a widow with two children, one of whom, Clara Mary Jane Clairmont, became the mistress of Byron. The second Mrs. Godwin was energetic and painstaking, but a harsh stepmother; and it may be doubted whether the children were not worse off under her care than they would have been under Godwin's neglect.

Godwin's second novel, *St.* Leon, appeared in 1799. It is chiefly remarkable for the beautiful portrait of Marguerite, the heroine, drawn from the character of his own wife. His opinions underwent a change in the direction of theism, influenced, he says, by his acquaintance with Coleridge. Study of the Elizabethan dramatists led to the production in 1800 of the Tragedy of Antonio. Kemble brought it out at Drury Lana, but the failure of this attempt made him refuse Abbas, King of Persia, which Godwin offered him in the next year. He was more successful with his Life of Chaucer, for which he received £600.

The events of Godwin's life were few. Under the advice of the second Mrs. Godwin, and with her active co-operation, he carried on business as a bookseller under the pseudonym of Edward Baldwin, publishing several useful school books and books for children, among them Charles and Mary Lamb's Tales from Shakespeare. But for many years Godwin struggled with constant pecuniary difficulties, for which more than one subscription was raised by the leaders of the Liberal Party and by literary men. He became bankrupt in 1822, but during the following years he accomplished one of his best pieces of work, The *History* of the Commonwealth, founded on pamphlets and original documents, which still retains considerable value. In 1833 the Government of Earl Grey conferred upon him the office known as yeoman usher of the exchequer, to which were attached apartments in Palace Yard, where he died on April 7, 1836.

In his own time, by his writings and by his conversation, Godwin had a great power of influencing men, and especially young men. Though his character would seem, from much which is found in his writings, and from anecdotes told by those who still remember him, to have been cold and unsympathetic, it was not so understood by enthusiastic young people, who hung on his words as those of a prophet. The most remarkable of these was Percy Bysshe Shelley, who in the glowing dawn of his genius turned to Godwin as his teacher and guide. The last of the long series of young men who sat at Godwin's feet was Edward Lytton Bulwer, afterwards Lord Lytton, whose early romances were formed after those of Godwin, and who, in Eugene *Aram,* succeeded to the story as arranged, and the plan to a considerable extent sketched out, by Godwin, whose age and failing health prevented him from completing it. Godwin's character appears in the worst light in connection with Shelley. His early correspondence with Shelley, which began in 1811, is remarkable for its genuine good sense and kindness; but when Shelley carried out the principles of the author of Political Justice in eloping with Mary Godwin, Godwin assumed a hostile attitude that would have been unjustifiable in any case, and was ridiculous in the light of his professions. He was not, moreover, too proud to accept £1,000 from his son-in-law, and after the reconciliation following on Shelley's marriage in 1816, he continued to demand money until Shelley's death. His character had no doubt suffered under his long embarrassments and his unhappy marriage.

BIBLIOGRAPHY.—Godwin's more important works are—The *Enquiry concerning Polztical Justice, and its Influence on General Virtue and Happiness* (1793); *Things as they are, or the Adventures of Caleb Williams* (1794); *The Enquirer, a series of Essays* (1797); *Memoirs of the Author of the Rights of Woman* (1798); *St. Leon, a Tale of the Sixteenth Century* (1799); *Antonio, a Tragedy* (1800); *The Life of Chaucer* (1803); *Fleetwood, a Novel* (1805); *Faulkener, a Tragedy* (1807); *Essay on Sepulchres* (1809); *Lives of Edward and John Philips, the Nephews of Milton* (1815); *Mandeville, a Tale of the Times of Cromwell* (1817); *Of Population,* an answer to Malthus (1820); *History of the Commonwealth* (1824–1828); *Cloudesly,* a *Tale* (1830); *Thoughts on Man, a series of Essays* (1831); *Lives of the Necromancers* (1834). A volume of essays was also collected from his papers and published in 1873, as left for publication by his daughter Mrs. Shelley. Many other short and anonymous works proceeded from his ever busy pen, but many are irrecoverable, and all are forgotten. Godwin's life was published in 1876 in two volumes, under the title *William Godwin, his Friends and Contemporaries, by C.* Kegan Paul. The best estimate of his literary position is that given by Sir Leslie Stephen in his *English Thought in the 18th Century* (ii. 264–281, 3rd ed., 1902). *See* also the article on William Godwin in W. Hazlitt's *The Spirit of the Age* (1825), and "Godwin and Shelley" in Sir L. Stephen's *Hours in a Library* (vol. iii., ed. 1892); H. Roussin, *William Godwin* (1913); F. K. Brown, *The Life of William Godwin* (1926).

GODWIN-AUSTEN, ROBERT ALFRED CLOYNE (1808–1884), English geologist, the eldest son of Sir Henry E. Austen, was born on March 17, 1808. He was educated at Oriel College, Oxford, of which he became a fellow in 1830. He afterwards entered Lincoln's Inn. In 1855 he brought before the Geological Society of London his paper "On the possible Extension of the Coal-Measures beneath the South-Eastern part of England." In this paper he supported the theory of the fresh-water origin of the Old Red Sandstone, and discussed the relations of that formation, and of the Devonian, to the Silurian and Carboniferous. He was elected F.R.S. in 1849. He died at Shalford House near Guildford on Nov. 25, 1884. Mt. Godwin-Austen (K2 or Dapsang) 28,250 ft., in the Himalayas, is named in honour of his eldest son.

GODWINE (d. 1053), earl of the West-Saxons and the leading Englishman of his day, was the son of Wulfnoth, whose identity is uncertain. Of Godwine's youth, nothing is known except that he soon became a personal favourite of Canute, who, about 1018, conferred upon him the rank of earl—probably of some one shire in Wessex. In 1019 Godwine accompanied the king on his visit to Denmark, and shortly afterwards was given in marriage Gytha, sister of Ulf, and raised (1020) to the dignity of earl of all Wessex. On Canute's death in 1035, he assisted Queen Emma in supporting the claims of her son, Hardicanute, in opposition to those'of Harold Harefoot for whom the Witan at Oxford, led by Leofric, had declared (see HARDICANUTE). Meanwhile Aelfred, son of Emma by her former husband Aethelred II., had landed in England with the hope of gaining the crown, but, falling into Godwine's power, he was handed over to Harold and killed.

On the death of Hardicanute in 1042, after a reign of less than two years, Godwine secured an English succession to the throne by his promotion of the election of Edward the Confessor, the surviving son of Emma and Aethelred. He was now the first man in the kingdom, and though he had powerful rivals in the earl Leofric of Mercia and earl Siward of Northumbria, he secured the marriage of his daughter Eadgyth to the king (1045), an earldom in the Severn valley for his son Sweyn, one in East Anglia for his son Harold, and a third in the Chilterns for his nephew Beorn. Nevertheless, his opposition to the Norman favourites of the king, particularly to Robert, abbot of Jumieges,. who in 1051 became archbishop of Canterbury, and his attempt to cover up the misdeeds of his son Sweyn (d. 1052), was bringing the earl into disfavour. The climax came with his refusal to punish the men of Dover for stirring up a riot amongst the retinue of Eustace, Count of Boulogne, who was on a visit to the king in 1051. Godwine and his sons gathered their forces in Gloucestershire, and the earls of Mercia and Northumbria hastened to the assistance of the king Though war was averted by mediation, Godwine and his family were outlawed (see EDWARD THE CONFESSOR). In the following year, however, the suspicions of the English thegns having been aroused by a visit of Edward's kinsman, William, diike of Normandy, Godwine was enabled to return in triumph. Some six months later, the earl was taken ill while at the king's table, and died on April 15, 1053.

GODWIT, the name of wading birds of the genus *Limosa,* much esteemed for the table. The black-tailed godwit, *L. limosa,* or yarwhelp, formerly bred in the English fens. It is now only a visitor there but breeds commonly from Sweden over Russia and (L. *l.* melanuroides) in northeastern Asia. The bird is the size of a large pigeon but with long legs and bill, the latter slightly upturned; the winter plumage is grayish-brown but the breeding dress is marked by bright bay. The tail is white for a third of its length and then black with a white margin. As in many waders, in spring the males circle in the air and utter a special call or song. The bar-tailed godwit (L. *lapponica*) breeds in northern

Europe and Asia, its race the Pacific godwit (L. l. *baueri)* in northeastern Asia and western Alaska. The species is smaller than the preceding and the tail is barred with black and white throughout its length. The marbled godwit *(L. fedoa)* is very large and breeds from southern Alberta and Manitoba to South Dakota; the smaller Hudsonian godwit (L. *haemastica*) breeds in Alaska and Canada, migrating south to the Straits of Magellan. The Pacific godwit and Siberian black-tailed godwit uinter south to Australia and New Zealand. (G. F. Ss.)

GOEBBELS, JOSEF (1897–1945), German politician, was born at Rheydt in the Rhineland on Oct. 29. 1897. He was educated locally and at various universities, receiving the degree of doctor of philosophy at Heidelberg in 1920. In 1922 he joined the National Socialist party, then in its infancy, and took a leading part in organizing the student movement. In 1926 he was placed by Hitler in charge of the party organization for greater Berlin, and in 1929 became head of the entire party propaganda. In 1930 he entered the *Reichstag.* In 1933, after the advent to power of his party, he received the newly created post of *Reich* minister of enlightenment and propaganda. In that post he exercised strict control over the German press. radio and every other possible outlet for public information and used his control to promote the ideas of Adolf Hitler.

After the period of German victories in World War II had ended and the tide had turned in favour of the Allies. Goebbels employed the channels of information at his command to keep the morale of the German people aligned behind the war effort. During 1944 he repeatedly promised that new and marvelous secret weapons would snatch Germany from the abyss of almost certain defeat and result in ultimate triumph. He alternated these glowing promises with dire warnings to the German people that complete ruin and destruction faced the *Reich* if it failed to win the war. In April 1945, as Russian forces neared Berlin, he broadcast an appeal to the people of that city to hold out until reinforcements could arrive to defend the capital. He reportedly committed suicide just prior to the fall of Berlin in May 1945. (C. A M.; X.)

GOEBEL, KARL (IMMANUEL EBERHARD) VON (1855–1932), a leading German botanist of the 19th century, author of a celebrated work on the organs of plants, was born in Billigheim, Baden, March 8, 1855. He studied under Wilhelm Hofmeister, Heinrich Anton de Bary and Julius von Sachs, receiving a doctorate in 1877. After holding teaching positions at various places, in 1891 he was appointed professor at Munich. where in 1909–14 he built the Botanical institute and garden in Nymphenburg. He was devoted to objective research rather than speculation, and to observation of living plants in all their great variety. He traveled extensively, in the Indies, South America. Australia, New Zealand and the United States. His crowning publication was the great *Organography of Plants* (1898–1901), of which three editions appeared in German and one in English. He died in Munich on Oct. g, 1932, having retired as emeritus professor the year before. (H. W. Rt.)

GOEBEN, AUGUST KARL VON (1816–1880), Prussian general of infantry. was born at Stade, Hanover, on Dec. 10. 1816. He first saw active service with the Carlist army in Spain after uhich he re-entered the Prussian service. Transferred to the staff of the 4th army corps in 1848. he formed a lasting friendship with his immediate superior, Von Moltke. In 1860 he was with the Spanish troops in Morocco, and took part in the battle of Tetuan. He became major general commanding the 26th infantry brigade in 1863. Von Goeben distinguished himself at Rackebull and Sonderburg in 1864. In 1866. commanding the 13th division. he won further laurels at Dermbach. Laufach, Kissingen Aschaffenburg, Gerchsheim. Tauber-Bischofsheim and Würzburg. In 1870 he commanded the 8th (Rhineland) army corps, and was victorious at Spicheren (Xug. 6) and Gravelotte (Aug. 18). On Jan. 8, 1871, he succeeded Manteuffel in the command of the 1st army, and a fortnight later brought the war in northern France to a brilliant conclusion by the decisive victory of St. Quentin (Jan. 18 and 19, 1871). He commanded the 8th corps at Coblenz until his death there on Nov. 13. 1880.

Goeben's memoirs are to be found in his works *Vier Jahre in Spanien* (Hanover. 18.41). *Reise-und Lagerbriefe aus Spanien und vom spanischen Heere in Marokko* (Hanover, 1863) and in the Darmstadt *Allgemeine Militärzeitung.* The cruiser "Goeben" bore his name.

See G. Zernin, *Das Leben des Generals August von Goeben,* 2 vol. (1895–97), *A. von Goebrn in Seinen Briefen* (1903); *H.* Barth, *A. von Goeben* (1906); and for his share in the mar of 1870–71: H. Kunz, *Der Feldzug im N. und N.W. Frankreichs 1870–1871* (1889), and the 14th monograph of the Great General Staff (1891).

"GOEBEN" AND "BRESLAU." The escape of the German battle cruiser "Goeben" and light cruiser "Breslau" from Messina on Aug. 6, 1914, their flight to the Aegean sea and the bold decision to make for Constantinople turned what was for them a desperate situation into one of material advantage to Germany. Their arrival at the Sublime Porte undoubtedly had a considerable influence when Turkey was hesitating whether or not to cast in its lot with the Central Powers.

Position in **Aug. 1914.**—When World War I broke out, the naval forces of the powers concerned in the Mediterranean were as follows:

British forces under Vice-Adm. Sir A. Berkeley Milne:
Battle cruisers: "Inflexible." "Indomitable." "Indefatigable."
Armoured cruisers under Rear-Adm. E. C. Troubridge:
"Defence." "Black Prince." "Duke of Edinburgh." "Warrior." Light cruisers: "Chatham," "Dublin," "Gloucester," "Weymouth." Destroyers: 16.

French forces under Vice-Adm. de Lapeyrere:
Battleships: 1 dreadnought, 15 older type. Armoured cruisers: 6. Destroyers: 24.

Italian forces:
Battleships: 3 dreadnoughts, **3** older type.

Austrian forces:
Battleships: 3 dreadnoughts. 3 older type.

German forces under Rear-Adm. Souchon:
Battle cruiser: "Goeben."
Light cruiser: "Breslau."

The preliminary warning sent out on July 27 to Admiral Milne, then at Alexandria. directed him to return to Malta and, after completing with fuel and stores, to remain there for the purpose of watching the entrance to the Adriatic.' These orders were subsequently overridden by a series of telegrams from the admiralty. The first task given to Milne was to assist the French in transporting their African army. A lack of international cooperation is evident, because the French commander in chief knew nothing of these plans. Then followed orders to prevent the "Goeben" entering the Adriatic; to guard British trade in the east Mediterranean and to watch any Austrian ships which emerged from the Adriatic.

On July 31 the Italian government announce'd its intention to remain neutral, but this important fact was not communicated to Milne until Xug. 4, when he was further instructed to observe, strictly, the neutrality and allow no British warship to approach within six miles of the coast of Italy—a severe handicap to any operation in or near the Straits of Messina.

"Goeben's" Activities.—Admiral Souchon left Messina at 1 A.M. Xug. 3 and made a dash to the African coast where, on the following morning, he fired a fen. shots into the towns of Bona and Philippeville. He then made off to the east and, by a stroke of luck, narrowly missed meeting the French 1st squadron, but he was sighted and followed by the "Indomitable" and "Indefatigable." No hostile action could be taken, however, since war with Germany had not then been declared by Great Britain. Superior speed, aided by hazy weather, enabled Souchon to evade the British ships, and he returned to Messina where British ships could not follow if Italian neutrality was to be strictly observed.

Declaration **of** War.—At 7.02 P.M. on Aug. 4, Milne was informed the ultimatum would expire at midnight. When hostilities commenced at that hour the "Indomitable" and "Indefatigable" were between Sicily and Sardinia; the "Inflexible" was in the Malta channel steering to join her consorts; Troubridge, with the armoured cruisers, was near Cephalonia and the "Goeben" was approaching Messina, where she arrived, with the "Breslau." at 4 A.M. Aug. 5. Her presence there became known to Milne at 5:30 P.M. Aug. 5, and during that night the British battle cruisers patrolled between Bizerte and Sardinia.

"Goeben's" Escape.—Since Austria still hesitated to declare war against Great Britain. Souchon was given permission to act as he thought best. About 6 P.M. Aug. 6. Milne decided to close the northern entrance of the Straits of Messina. and. when off the northwest point of Sicily, he received news from the "Gloucester," that the "Goeben" and "Breslau" were leaving Messina by the southern entrance. Souchon made the bold decision to run for the Dardanelles. He steered to the northward, as if for the Adriatic, until 11 P.M., and then shaped a course for Cape Matapan, being shadowed throughout the night and the next day by the "Gloucester."

Troubridge steered north to intercept the German ships, but at midnight, realizing that their first course was only a feint. turned and proceeded south at full speed. Troubridge had decided not to risk his cruisers against the "Goeben's" 11-in. guns in a daylight action and, finding it impossible to intercept her before daylight, he abandoned the chase.

Milne took his battle cruisers to Malta, coaled and left again at midnight, Aug. 7, for the Aegean. A false alarm of war with Austria, sent out by the admiralty. induced Milne to alter his dispositions and wasted 24 hours. When the chase was resumed it was too late to overtake the "Goeben" and "Breslau," which ships, having coaled at the island of Denusa, reached the Dardanelles at about 5 P.M. Aug. 10. (J. E. T. H.)

GOEDEKE, KARL (1814–1887), German literary historian, born at Celle, April 5, 1814, was responsible for the compilation of the indispensable *Grundriss zur Geschichte der deutschen Dichtung,* 3 vol. (1857–81). A new edition was begun in 1884. Volume four, on the classical period, appeared in a third edition, 1910–16; and a supplement to it, a bibliography of the subject down to the death of Goethe, was begun in 1957. A continuation for the period 1830–80 by G. Minde-Pouet and E. Rothe was begun in 1955. Goedeke was a professor at Gottingen from 1873, and died there Oct. 27, 1887. He published many other works, among them a critical edition of Schiller.

GOEJE, MICHAEL JAN DE (1836–1909), Dutch orientalist, was born in Friesland in 1836. He devoted himself at an early age to the study of oriental languages and became especially proficient in Arabic, under the guidance of Dozy and Juynboll, to whom he was afterwards an intimate friend and colleague. He took his degree of doctor at Leyden in 1860 and then studied for a year in Oxford, where he examined and collated the Bodleian manuscripts of Idrisi (part being published in 1866, in collaboration with R. P. Dozy, as *Description de l'Afrique et de l'Espagne*). About the same time he wrote *Mémoires de l'histoire et de la gtographie orientales,* and edited *Expugnatio regionum.* In 1883, on the death of Dozy, he became Arabic professor at Leyden, retiring in 1906. He died on May 17, 1909. He wielded a great influence during his long professoriate, not only over his pupils, but over theologians and eastern administrators who attended his lectures, and his many editions of Arabic texts have been of the highest value to scholars, the most important being his great edition of Tabari.

Among his chief works are *Fragmenta historicorurn Arabicorum* (1869–71); *Diwan of Moslim-ibn-al-Wālid* (1875); *Bibliotheca geographorum Arabicorum* (1870–94); *Annals of Tabari* (1879–1901); edition of Ibn Qutaiba's biographies (1904); of the travels of Ibn Jubaye (1907, 5th vol. of Gibb Memorial). He was also the chief editor of the *Encyclopaedia of Islam* (vols. i.–iii.) and contributed many articles to periodicals. He wrote for the 9th and the 11th editions of the *Encyclopædia Britannica.*

GOES, HUGO VAN DER (1440?–1482), Flemish painter known to G. Vasari and posterity by a single picture in a Florentine monastery, "The Adoration of the Shepherds," was probably born at Ghent. As agent of the Medici at the port of Bruges Tommaso Portinari (a lineal descendant, it was said, of Folco. the father of Dante's Beatrix) ordered an altarpiece of Hugo van der Goes and commanded him to illustrate the sacred theme of *Quem genuit adoravit.* In the centre of a vast triptych, comprising numerous figures of life size, Hugo represented the Virgin kneeling in adoration before the newborn Christ attended by shepherds and angels. On the wings he portrayed Tommaso and his two sons in prayer under the protection of St. Anthony and St. Matthew, and Tommaso's wife and two daughters supported by St. Margaret and St. Mary Magdalen. The triptych, which has suffered much from decay and restoring. was for over 400 years at Sta. Maria Kuova, and is now in the Uffizi gallery.

ALINARI

CENTRE PANEL OF PORTINARI ALTARPIECE BY HUGO VAN DER GOES. IN THE UFFIZI GALLERY. FLORENCE

There are also pieces in public galleries which claim to have been executed by Van der Goes: the "Madonna" at Frankfurt and the diptych representing the "Fall" and the "Deposition" at Vienna. These are probably early works. To a maturer period may be ascribed the precious little triptych in the Liechtenstein collection representing the "Adoration of the Magi"; the two wings of an altarpiece at the National gallery of Scotland (on loan from Holyrood palace); the "Death of the Virgin" at Bruges; the "Adoration of the Shepherds" at Wilton house. To his last years are ascribed two fine pictures painted on a large scale acquired by the Berlin gallery from Spain representing the "Nativity" and the "Adoration of the Magi." Van der Goes, however. was not only a painter of easel pieces. He made his reputation at Bruges by producing coloured hangings in distemper. After he settled at Ghent. and became a master of his guild in 1467, he designed cartoons for glass windows. He also made decorations for the wedding of Charles the Bold and Margaret of York in 1468, for the festivals of the rhetoricians and papal jubilees on repeated occasions, for the solemn entry of Charles the Bold into Ghent in 1471–72 and for the funeral of Philip the Good in 1474. About the year 1475 he retired to the monastery of Rouge Cloître near Brussels. There, though he still clung to his profession, he seems to have taken to drinking. and at one time to have shown symptoms of insanity. But he was cured of his intemperance. He died in 1482.

GOES, a town in the province of Zeeland, Netherlands, on the island of South Beveland. $11\frac{1}{2}$ mi. E. of Rliddelburg by rail. Pop. (1957 est.) 14,353. The town had its origin in the castle of Oostende and received a charter early in the 15th century from Jacoba of Bavaria. countess of Holland, who frequently stayed at the castle. It is connected by a short canal with the East Scheldt, and has a good harbour (1819) defended by a fort. The principal buildings are the Gothic church (1423) and the old town hall (restored 1771). It is a centre of the linen industry and a market for wheat. Germany occupied Goes in May 1940.

GOETHALS, GEORGE WASHINGTON (1858–1928), American engineer and U.S. army officer known as the builder of the Panama canal. Born in Brooklyn, N.Y., June 29, 1858, he was graduated from the U.S. Military academy, West Point, in 1880. In the same year he was commissioned in the corps of engineers, U.S army. From 1880 to 1907 he obtained valuable training in canal, river and harbour construction work while on various assignments in connection with the civil works program of the army engineers. He also served as an instructor at the U.S. Military academy. In 1907 he was called to the White House by Pres. Theodore Roosevelt and told of his selection as chairman and chief engineer of the Isthmian Canal commission, succeeding John F. Stevens. In Jan. 1908 he was placed in complete charge of construction work and government in the Canal Zone by an executive order signed by President Roosevelt. "Now, I have both feet on the ground and I'll build the canal," he told the president.

In 1914 the Panama canal was declared open to commercial traffic; Pres. Woodrow Wilson appointed Colonel Goethals the first governor of the Panama canal, and the National Geographic society presented him with a special medal as "builder of the Panama Canal." In March 1915 he was promoted to major general and received the thanks of congress for distinguished service in building the Panama canal. In 1916 he retired from the army at his own request and in Jan. 1917 resigned as governor of the Panama canal. In Dec. 1917 he was recalled to active duty with the army, serving until March 1919, when he was relieved at his own request. From 1919 to 1928 he was president of the engineering firm of George W. Goethals and company and served as adviser to the Port of New York authority. The latter named a bridge in its area after the famous canal builder.

Goethals died at his home in New York city on Jan. 21, 1928 In March 1954 a monument of heroic size was dedicated in Balboa, Canal Zone, as a memorial to General Goethals. The monument mas authorized by congress in 1935. Pres. Dwight D. Eisenhower, in a message read at the dedication, said:

"During my own service in the Canal Zone, I came to appreciate the magnitude of the Panama Canal as an engineering triumph and the importance of its operations to international traffic. It is indeed fortunate that the nation was able to call upon a leader of General Goethals' stature to supervise our construction forces and to set the pattern for the Canal's successful operation."

(E. C. I.)

GOETHE, JOHANN WOLFGANG VON (1749–1832), greatest of German poets, was born at Frankfurt-on-Main. He came, on his father's side, of Thuringian stock, his great-grandfather, Hans Christian Goethe, having been a farrier at Artern-on-the-Cnstrut, about the middle of the 17th century. Hans Christian's son, Georg Friedrich, was brought up to the trade of a tailor, and in this capacity settled in Frankfurt in 1687. A second marriage, however, brought him into possession of the Frankfurt inn, "Zum Weidenhof," and he ended his days as a well-to-do innkeeper. His son, Johann Kaspar, the poet's father (1710–1782), studied law at Leipzig, and subsequently travelled in Italy. He hoped, on his return to Frankfurt, to obtain an official position in the government of the free city, but he had not sufficient personal influence to attain this end. In his disappointment he resolved never again to offer his services to his native town, and retired into private life. In 1742 he acquired, as a consolation for the public career he had missed, the title of kaiserlicher Rat, and in 1748 married Katharina Elisabeth (1731–1808), daughter of the Schultheiss or *Bürgermeister* of Frankfurt, Johann Wolfgang Textor. The poet was the eldest son of this union. Of the later children only one, Cornelia (b. 1750), survived the years of childhood; she died as the wife of Goethe's friend, J. G. Schlosser, in 1777. The best elements in Goethe's genius came from his mother's side; of a lively, impulsive disposition, and gifted with remarkable imaginative power, Frau Rat, who was hardly 18 when her son was born, was the ideal mother of a poet. From his father, whose stem, somewhat pedantic nature repelled warmer feelings on the part of the children, Goethe inherited, besides an unamiable stiffness of manner which grew on him with the years, that stability of character which brought him unscathed through temptations and passions, and held the balance to his all too powerful imagination.

Unforgettable is the picture which the poet has left us of his childhood spent in the large house with its many nooks and crannies in the Grosse Hirschgraben at Frankfurt. Books, pictures, objects of art, antiquities, reminiscences of Rat Goethe's visit to Italy, above all a marionette theatre, kindled the child's quick intellect and imagination. His education was conducted in its early stages by his father, and was later supplemented by tutors. Meanwhile the varied and picturesque life of Frankfurt was in itself a liberal education. In 1759, during the Seven Years' War, the French, as Maria Theresa's allies, occupied the town, and, much to the irritation of Goethe's father, who was a stanch partisan of Frederick the Great, a French lieutenant, Count Thoranc, was quartered on the Goethe household. The foreign occupation also led to the establishment of a French troupe of actors, and to their performances the boy, through his grandfather's influence, had free access. One of Goethe's most vivid memories was the picturesque coronation of the emperor Joseph II. in the Frankfurt Romer or town hall in 1764; he also dwells at some length in his autobiography on his first love affair. The object of this passion was a certain Gretchen, who seems to have taken advantage of the boy's interest in her to further the dishonest ends of one of her friends. The discovery of the affair and the investigation that followed cooled Goethe's ardour and caused him to turn his attention seriously to the studies which were to prepare him for the university. Meanwhile his literary instinct had begun to show itself; we hear of a novel in letters—a kind of linguistic exercise, in which the characters carried on the correspondence in different languages—of a prose epic on the subject of Joseph, and various religious poems of which one, Die Hollenfahrt *Christi,* found its way in a revised form into the poet's complete works.

In Oct. 1765, Goethe, then a little over 16, left Frankfurt for Leipzig, where a wider life awaited him. He entered upon his university studies with zeal, but his education in Frankfurt had not been the best preparation for the scholastic methods which still dominated the German universities; of his professors, only Gellert seems to have won his interest, and that interest was soon exhausted. The literary beginnings he had made in Frankfurt now seemed to him worthless; he committed them to the flames; and, under the guidance of E. W. Behrisch, a genial, if somewhat eccentric comrade, he turned over a new leaf; he acquired the art of writing those light Anacreontic lyrics which appealed to the taste of the polite Leipzig society of the day. Artificial as this poetry is, Goethe was, nevertheless, inspired by a real passion in Leipzig, namely, for Anna Katharina Schonkopf, the daughter of a wine-merchant at whose tavern he dined. She is the "Annette" after whom the collection of lyrics discovered in 1897 was named, although it must be added that neither these lyrics nor the Neue Lieder, published in 1770, let us see very much of Goethe's real feelings for Käthchen Schonkopf. To his Leipzig student-days belong also two small plays in Alexandrines, Die *Laune* des Verliebten, a comedy in one act, which reflects the lighter side of the poet's love affair, and Die Mitschuldigen (published in a revised form, 1769), a more sombre production, in which comedy is incongruously mingled with tragedy. In Leipzig Goethe also had time for what remained one of the abiding interests of his life, for art; he regarded A. F. Oeser (1717–1799), the director of the academy of painting in the Pleissenburg, who gave him lessons in drawing, as the teacher by whom he was most influenced in Leipzig. His art studies were also furthered by a short visit to Dresden. His stay in Leipzig came, however, to an abrupt conclusion; the distractions of student life proved too much for his strength; a sudden haemorrhage supervened, and he lay long ill, first in Leipzig, and, after it was possible to remove him, at home in Frankfurt. These months of slow recovery were a time of serious introspection for Goethe. He still corresponded with his Leipzig friends, but the tone of his letters changed; life had become more serious for him. He pored over books on occult philosophy; he busied himself with alchemy and astrology. A friend of his mother's, Susanne Katharina von Klettenberg, who belonged to pietist circles in Frankfurt, turned the boy's thoughts to religious mysticism.

On his recovery his father resolved that his legal studies should be completed at Strasbourg, a city, which although then outside the German empire, was, in respect of language and culture, wholly German. From the moment Goethe set foot in the narrow streets of the Alsatian capital, in April 1770, the whole current of his thought seemed to change. The Gothic architecture of the Strasbourg minster became to him the symbol of a national and German ideal, directly antagonistic to the French tastes and the classical and rationalistic atmosphere that prevailed in Leipzig. An event of the first importance in Goethe's Strasbourg period was his meeting with Herder, who spent some weeks in Strasbourg undergoing an operation. In this thinker, who was his senior by five years, Goethe found the master he sought; Herder taught him the significance of Gothic architecture, revealed to him the beauty of nature unadorned, and inspired him with enthusiasm for Shakespeare and the *Volkslied.* Meanwhile Goethe's legal studies were not neglected, and he found time to add to his knowledge in other fields. notably medicine. Another factor of importance in Goethe's Strasbourg life was his love for Friderike Brion, the daughter of an Alsatian village pastor in Sesenheim. Even more than Herder's precept and example, this passion showed Goethe how trivial and artificial had been the Anacreontic and pastoral poetry, which had occupied him in Leipzig; and the lyrics inspired by Friderike, such as *Kleine Blumen, kleine Blafter* and *Wie herrlich leuchtet mir die Natur!* mark the beginning of a new epoch in German lyric poetry. The idyll of Sesenheim, as described in *Dichtung und Wahrheit,* is one of the beautiful love-stories in the literature of the world. From the first, however, it was clear that Friderike Brion could never become the wife of the Frankfurt patrician's son; an unhappy ending to the romance was unavoidable, and, as is to be seen in passionate outpourings like *Wanderers Sturmlied,* and in the bitter self-accusations of *Clavigo,* it left deep wounds on the poet's sensitive nature.

In Strasbourg Goethe probably planned his first important drama, *Gotz von Berlichingen.* In estimating this drama we must bear in mind Goethe's own life, and the turbulent spirit of his age, rather than the historical facts, which the poet found in an autobiography of his hero published in 1731 The latter supplied only the rough materials; the Gotz von Berlichingen whom Goethe drew. with his humane ideals of justice and his enthusiasm for freedom. is a very different personage from the unscrupulous robber-knight of the 16th century. There is no historical justification for the vacillating Weisslingen in whom Goethe executed poetic justice on himself as the lover of Friderike, or for the women of the play, the gentle Maria, the heartless Adelheid. But there is genial, creative power in all the characters, and a vigorous dramatic life in the play's action, irresistible in its appeal even to a modern audience. With *Gotz von Berlichingen* the Shakespearian form of drama was established on the German stage, and the literary movement known as *Sturm und Drang* inaugurated.

Having received his licence to practice as an advocate, Goethe returned home in Aug. 1771, and began his initiation into the routine of his profession In the following year, in order to gain further experience in the practical side of his calling, he spent four months at Wetzlar, where the imperial law-courts mere established. But Goethe's professional duties had only a small share in the eventful years which lay between his return from Strasbourg and that visit to Weimar at the end of 1775, which turned the whole course of his career, and resulted in his permanent attachment to the Weimar court. Goethe's life in Frankfurt was a round of stimulating literary intercourse; in J. H Merck (1741–1791), an army official in the neighbouring town of Darmstadt, he found a friend and mentor, whose irony and common sense served as a corrective to his own exuberance of spirits Wetzlar brought new friends and another passion, that for Charlotte Buff, the daughter of the *Amtmann* there—an episode which has been immortalized in *Werthers Leiden;* again the young poet was obsessed by a love which was this time strong enough to bring him to the brink of that suicide which forms the culmination of the novel. A visit to the Rhine, where new interests and the attractions of Maximiliane von Laroche, a daughter of Wieland's friend, the novelist Sophie von Laroche, brought partial healing, his intense preoccupation with literary work on his return to Frankfurt did the rest. In 1775 Goethe was attracted by still another type of woman, Lili Schönemann, whose mother was the widow of a wealthy Frankfurt banker. A formal betrothal took place, and the beauty of the lyrics which Lili inspired leaves no room for doubt that here was a passion no less genuine than that for Friderike or Charlotte. But the gay, social world in which Lili moved was not congenial to him. A visit to Switzerland in the summer of 1775 may not have weakened his affection for her, but he began to see that marriage would impose intolerable fetters upon him, and without tragic consequences on either side, the engagement was allowed to lapse. Goethe's departure for Weimar in November brought about the final break.

The period from 1771 to 1775 was, in literary respects, the most productive of the poet's life. It had been inaugurated with *Gbtz von Berlichingen* and a few months later this tragedy was followed by another, *Clavigo,* peopled with equally living figures, and reflecting even more faithfully than *Gotz* the emotional experience Goethe had gone through in Strasbourg. Again poetic justice is effected on the unfortunate hero who is persuaded to choose his own personal advancement in preference to his duty to the woman he loves; more pointedly than in *Gotz* is this moral enforced; Clavigo's tragic end is due not so much to this defiance of moral laws, as to his vacillation and want of character With *Die Leiden des jungen Werthers* (1774), the literary precipitate of the author's own experiences in Wetzlar, Goethe succeeded in attracting, as no German had done before him, the attention of Europe. Once more it was the gospel that the world belongs to the strong in will, which lay beneath the surface of this romance. This, however, was not what Goethe's contemporaries read out of it; nor did they appreciate the wide range of spiritual experience which the book contains. *Werther* was to them merely a sentimental story of a lovelorn youth whose burden becomes too great for him to bear. While *Gbtz* inaugurated the manlier side of the *Sturm und Drang* literature, *Werther* was responsible for its sentimental excesses. In *Stella,* "a drama for lovers" (1776), the poet again reproduced, if with less fidelity than in *Werther,* certain aspects of his own love troubles. A lighter vein is to be observed in various dramatic satires written at this time such as *Gdtter, Helden und Wieland* (1774), *Hanswursts Hochzeit, Fastnachtsspiel vom Pater Brey, Satyros,* and in the *Singspzele, Erwin und Elmire* (1775) and *Claudine von Villa Bella (1776);* while to the *Frankfurter Gelehrte Anzeiger* (1772–73), Goethe contributed vigorous and provocative criticism. The exuberance of the young poet's genius is also to be seen in the many unfinished fragments of this period; at one time we find him occupied with dramas on *Caesar* and *Mahomet,* at another with an epic on *Der ewige Jude,* and again with a tragedy on *Prometheus,* of which a magnificent fragment has passed into his works. Greatest of all the torsos of this period, however, was his dramatization of the legend of *Faust.* Thanks to a manuscript copy of the play in its earliest form—discovered as recently as *1887,* and known as the *Urfaust*—we now know exactly how much of *Faust* was the immediate product of the *Sturm und Drang*, and are able to understand the intentions with which the young poet began his masterpiece. Goethe's hero changed with the author's riper experience and with his new conceptions of man's place and duties in the world, but the Gretchen tragedy was taken over into the finished poem, practically unaltered, from the earliest draft of the poem. With these wonderful scenes, the most intensely tragic in German literature, Goethe's poetry in this period reaches its climax. Still another important work, however, was conceived, and in large measure written at this time, the drama of *Egmont,* which was not published until *1788.* This work may, to some extent, be regarded as complementary to *Faust;* it presents the lighter, more cheerful and optimistic side of Goethe's outlook on liie in these years; Graf Egmont, the most winning and fascinating of the poet's heroes, is endowed with that "daimonic" power over the sympathies of men and women, which Goethe himself possessed in so high a degree. But *Egmont* is but an indifferent drama: it has little plot and its interest depends almost solely on two characters, Egmont himself and Klärchen, the young girl of the people whom he loves.

In Dec. 1774 the young "hereditary prince" of Weimar, Karl August, passing through Frankfurt on his way to Paris, came into touch with Goethe, and invited the poet to visit him in Weimar. In Oct. 1775 the invitation was repeated, and on Nov. 7 Goethe arrived in the little Saxon capital which was to remain his home for the rest of his life. During the first few months in Weimar the poet gave himself up to the pleasures of the moment as unreservedly as his patron; indeed, the Weimar court even looked upon him for a time as a tempter who led the young duke astray. But the latter, although himself a mere stripling, had implicit faith in Goethe's judgment, and enlisted his services in the government of the duchy. Goethe was not long in Weimar before he was entrusted with responsible state duties, and events justified the duke's confidence. Goethe displayed as minister of state, both energy and foresight. He interested himself in agriculture, horticulture and mining.. which were of paramount importance to the welfare of the duchy, and these interests led to his preoccupation with the natural sciences which took up so much of his time in later years. The inevitable love-interest was also not wanting. As Friderike had fitted into the background of Goethe's Strasbourg life, Lotte into that of Wetzlar, and Lili into the gaieties of Frankfurt, so now Charlotte von Stein, the wife of a Weimar official, was the appropriate muse of Goethe's Weimar life. We possess only the poet's share of his correspondence with Frau von Stein, but it may be inferred from it that, of all Goethe's loves, she was intellectually the most worthy of him. Frau von Stein was a woman of refined literary taste and culture, seven years older than he and the mother of seven children. She dominated the poet's life for 12 years, until his journey to Italy in 1786–1788. Of other events of this period the most notable were two winter journeys, the first in 1777, to the Harz mountains, the second, two years later, to Switzerland—journeys which gave Goethe opportunity for that introspection and reflection for which his Weimar life had left him little time. On the second of these journeys he revisited Friderike in Sesenheim, saw Lili, who had married and settled in Strasbourg, and made the personal acquaintance of J. R. Lavater in Zurich.

The literary results of these years cannot be compared with those of the preceding period; they are virtually limited to a few wonderful lyrics, such as *Wanderers Nachtlied, An den Mond, Gesang der Geister über den Wassern*, ballads, such as *Der Erlkonig, a* delicate little drama, *Die Geschwister* (1776), in which the poet's relations to both Lili and Frau von Stein seem to be reflected, a dramatic satire, *Der Triumph der Empfindsamkeit* (1778), and a number of *Singspiele, Lila* (1777), *Die Fischerin, Scherz, List und Rache,* and *Jery und Bately* (1780). But greater works were in preparation. A religious epic, *Die Geheimnisse*, and a tragedy *Elpenor,* did not, it is true, advance much further than plans; but in 1777, under the influence of the theatrical experiments at the Weimar court, Goethe began to write a novel of the theatre on a large scale which was to have borne the title *Wilhelm Meisters theatralische Sendung. A* manuscript copy of the novel in this early form was discovered as recently as 1910. In 1779 he himself took part in a representation before the court at Ettersburg, of his drama *Iphigenie auf Tauris.* This *Iphigenie* was, however, in prose; in the following year Goethe refashioned it in iambics, but it was not until he went to Italy that it received the form we know.

In Sept. 1786 Goethe set out from Carlsbad where he had been on holiday—secretly and stealthily, his plans known only to his servant—on that memorable journey to Italy, to which he had looked forward with such intense longing; he could not cross the Alps quickly enough, so impatient was he to set foot in Italy. He travelled by way of Munich, the Brenner and Lago di Garda to Verona and Venice, and from thence to Rome, where he arrived on Oct. 29, 1786. Here he gave himself up unreservedly to the new impressions which crowded on him, and he was soon at home in the circle of German artists there. In the spring of 1787 he extended his journey to Naples and Sicily, returning to Rome in June 1787, where he remained until his final departure for Germany on April 2, 1788. It is difficult to exaggerate the importance of Goethe's Italian journey. He himself regarded it as a kind of climax to his life; never before had he attained such complete understanding of his genius and mission as a poet; it afforded him a vantage-ground from which he could renew the past and make plans for the future. In Weimar he had already felt that he was no longer in sympathy with the *Sturm und Drang,* but it was Italy which first initiated him into that neo-classicism which superseded *Sturm und Drang* in German poetry. To the modern reader, impressed by Goethe's extraordinary sensitiveness to impressions, it may seem strange that his interests in Italy were so limited; for, after all, he had eyes for comparatively little of what Italy had to offer. He went to Rome in Winckelmann's footsteps; it was the antique he sought, and he was interested in the artists of the Renaissance only in so far as he saw in them the heirs of antiquity. The calm beauty of Greek tragedy is seen in the new iambic version of *Iphigenie auf Tauris* (1787); the classicism of the Renaissance gives the ground-tone to the drama of *Torquato Tasso* (1790), in which the conflict of poetic genius with the prosaic world is transmuted into imperishable poetry. Classic, too, in this sense, were the plans of a drama on *Iphigenie auf Delphos* and of an epic, *Nausikaa.* Most interesting of all. however, is the reflection of the classic spirit in works already begun in earlier days, such as *Egmont* and *Faust.* The former drama was finished in Italy, the latter was brought a step forward, part of it being published as a *Fragment* in 1790.

Disappointment in more senses than one awaited Goethe on his return to Weimar. He came back from Italy with a new philosophy of life, a philosophy at once classic and pagan, and with new ideals of literary beauty. But Germany had not advanced; in 1788 his countrymen were still admirers of that *Sturm und Drang* from which the poet had fled. The times seemed to him more out of joint than ever, and he withdrew into himself. Even his relations to the old friends were changed. Frau von Stein had not known of his flight to Italy until he had been several weeks there; but he looked forward to her welcome on his return. The months of absence, however, the change he had undergone, and, doubtless, lighter loves which had beguiled his leisure in Rome, weakened the Weimar ties; if he left Weimar as Frau von Stein's lover he returned only as her friend; and she naturally resented the change. Goethe, meanwhile, continuing the freer customs to which he had adapted himself in Rome, took into his household Christiane Vulpius (1765–1816), a young girl who could offer him no kind of intellectual companionship. But Christiane gradually filled a gap in the poet's life; she gave him, unobtrusively, without making demands on him, the comforts of a home. She was not accepted by court society; she was indifferent to the fact that even Goethe's intimate friends ignored her; but she, who had suited the poet's whim when he desired to shut himself off from all that might dim the recollection of Italy, became with the years an indispensable helpmate to him. On the birth in 1789 of his son, Goethe had some thought of legalizing his relations with Christiane, but this intention was not realized until 1806, when the invasion of Weimar by the French made both life and property insecure.

The period of Goethe's life which succeeded his return from Italy was restless and unsettled; relieved of his state duties, he returned in 1790 to Venice, only to be disenchanted with the Italy he had loved so intensely a year or two before. A journey with the duke of Weimar to Breslau followed, and in 1792 he accompanied his master on that campaign against France which ended ingloriously for the German arms at Valmy. In later years Goethe published his account of this *Campagne in Frankreich* as also of the *Belagerung von Mainz,* at which he was present in 1793. His literary work naturally suffered under these distractions. *Tasso,* and the edition of the *Schriften* in which it was to appear, had still to be completed on his return from Italy; the *Römische Elegien,* perhaps the most Latin in form and content of all his works, were published in 1795, and the *Venezianische Epigramme,* the result of the second visit to Italy, in 1796. The French Revolution, in which all Europe was engrossed, was in Goethe's eyes only another proof that the passing of the old régime meant the abrogation of law and order, and he gave voice to his antagonism to the new democratic principles in the dramas *Der Gross-Cophta* (1792), *Der Burgergeneral* (1793), and in the unfinished fragments *Die Aufgeregten* and *Das Madchen von Oberkirch.* The spirited translation of the epic of *Reineke Fuchs* (1794) he took up as a relief and an antidote to the perplexing state of the time. Two new interests, however, strengthened the ties between Goethe and Weimar—ties which the Italian journey had threatened to sever: his appointment in 1791 as director of the ducal theatre, a post which he occupied for 22 years, and his absorption in scientific studies. In 1790 he published his important *Versuch, die Metamorphose der Pflanzen zu erklaren,* which was even more fundamental for the new science of comparative morphology than his discovery some six years earlier of traces of a structure in the human jaw-bone analogous to the intermaxillary bone in apes; and in 1791 and 1792 appeared two parts of his *Beiträge zur Optik.*

Meanwhile, however, Goethe had again taken up the novel of the theatre which he had begun years before, with a view to its inclusion in the edition of his *Neue Schriften* (1792-1800). *Wilhelm Meisters theatralische Sendung* became *Wilhelm Meisters Lehrjahre;* the novel of purely theatrical interests was widened out to embrace the history of a young man's apprenticeship to life. The change of plan explains, although it may not exculpate, the formlessness and loose construction of the work. A hero, who was probably originally intended to demonstrate the failure of the vacillating temperament when brought face to face with the problems of the theatre, proved ill-adapted to demonstrate those precepts for the guidance of life with which the *Lehrjahre* closes; unstable of purpose, *Wilhelm Meister* is not so much an illustration of the author's life-philosophy as a lay-figure on which he demonstrates his views. *Wilhelm Meister* is, however, a work of extraordinary variety, its scenes ranging from the commonplace realism of the troupe of strolling players to the poetic romanticism of Mignon and the harper; its pages of intuitive criticism—notably of *Hamlet—add* to its value as a *Bildungsrontan* in the best sense of rhat word. Of all Goethe's works, this exerted the most immediate and lasting influence on German literature; it served as a model for the best fiction of the next 30 years.

In completing *Wilhelm Meister,* Goethe found a sympathetic critic in Schiller, to whom he owed in great measure his renewed interest in poetry. After years of tentative approach on Schiller's part, years in which that poet was not even himself clear that he desired a friendly understanding with Goethe, the favourable moment arrived. It was in June 1794, when Schiller was seeking collaborators for his new periodical *Die Horen;* and his invitation addressed to Goethe was the beginning of a friendship which continued unbroken until the younger poet's death. The friendship of Goethe and Schiller, of which their correspondence is a priceless record, had, however, its limitations; it was essentially a literary friendship, a certain barrier of personal reserve being maintained to the last. As far as actual work was concerned, Goethe went his own way as he had always been accustomed to do; but the mere fact that he devoted himself with increasing interest to literature was due to Schiller's stimulus. It was Schiller who induced him to undertake those studies on the nature of epic and dramatic poetry which resulted in the epic of *Hermann und Dorothea* and the fragment of the *Achilleis;* without the friendship there would have been no *Xenien* and no ballads, and it was again, his younger friend's encouragement which induced Goethe to betake himself once more to the "misty path" of *Faust,* and bring the first part of that drama to a conclusion.

Goethe's. share in the *Xenien* (1796) may be briefly mentioned. This collection of distichs, written in collaboration with Schiller, was prompted by the indifference and animosity of contemporary criticism, and its disregard for what the two poets regarded as the higher interests of German poetry. The *Xenien* succeeded as a retaliation on the critics, but the masterpieces with which both poets justified their attack, were in the long run a more effective antidote to the prevailing mediocrity. The collection of stories, *Unterhaltungen deutscher Ausgewanderten* (1797) was unworthy of Goethe's genius, and the translation of Benvenuto Cellini's *Life* (1796–1797) was only a translation. But in 1798 appeared *Hermann und Dorothea,* one of Goethe's most perfect poems. It is indeed remarkable—when we consider by how much theoretic discussion the composition of the poem was preceded and accompanied—that it should make upon the reader so simple and unsophisticated an impression; in this respect it is the triumph of an art that conceals art. Goethe has here taken a simple story of village life, mirrored in it the most pregnant ideas of his time, and presented it nith a skill which may well be called Homeric; but he has discriminated with the insight of genius between the Homeric method of reproducing the heroic life of primitive Greece and the same method as adapted to the commonplace happenings of 18th century Germany. In this respect, he was guided by a forerunner who had depicted the life of the German people in the epic manner and in hexameters, J. H. Voss, the author of *Luise.* Hardly less imposing in their calm, placid perfection are the poems with which, in friendly rivalry, Goethe seconded the more popular ballads of his friend; *Der Zauberlehrling, Der Gott und die Bayadere, Die Braut von Korinth, Alexis und Dora, Der neue Pausias* and *Die schöne Müllerin*—the latter a cycle of poems in the style of the *Volkslied*—are among the masterpieces of Goethe's poetry. On the other hand, even the friendship with Schiller did not help him to add to his reputation as a dramatist. *Dze naturliche Tochter* (1803), the first part of a trilogy, in which he proposed to embody his ideas of the Revolution on wide canvas, did not get beyond this. Goethe's abstract classic principles, when applied to the swift, direct art of the theatre, were ineffective, and *Die natürliche Tochter,* notwithstanding its good theoretic intention, remains the most lifeless and shadowy of all his dramas. Even less in touch with the living present were the various prologues and *Festspiele,* such as *Paläophron und Neoterpe* (1800), *Was wir bringen* (1802), which in these years he composed for the Weimar theatre.

Goethe's classicism brought him into inevitable antagonism with the new Romantic movement which had been inaugurated in 1798 by the *Athenäum,* edited by the brothers Schlegel. The sharpness of the conflict was, however, blunted by the fact that, without exception, the young Romantic writers looked up to Goethe as their master; they modelled their fiction on *Wilhelm Meister;* they regarded his lyrics as the highwater mark of German poetry; Goethe, Novalis declared, was the "Statthalter of poetry on earth." With regard to painting and sculpture, however, Goethe felt that a protest was necessary, if the ideas propounded in works like Wackenroder's *Herzensergiessungen* were not to bring back the confusion of the *Sturm und Drang;* and, as a rejoinder to the Romantic theorists, Goethe, in conjunction with his Swiss friend, Heinrich Meyer (1760–1832), published from 1798 to 1800 an art review, *Die Propyläen.* In *Winckelmann und Sein Jahrhundert* (1805) Goethe defended the classical ideal of beauty in art. But in the end he himself proved the greatest enemy to the strict classical doctrine by the publication in 1808 of the completed first part of *Faust,* a work which was accepted by contemporaries as a triumph of Romantic art. *Faust* is a patchwork of many colours. With the aid of the vast body of *Faust* literature which has sprung up in recent years, and the many new documents bearing on its history—above all, the so-called *Urfaust,* to which reference has already been made—we are able now to discriminate between the various phases of the work; on the original *Sturm und Drang* hero of the opening scenes and of the Gretchen tragedy—the brother of Gotz, and Clavigo—is superimposed, in the completed poem, a Faust of calmer moral and intellectual ideals, who corresponds to Hermann and Wilhelm Meister, in Goethe's work. In its first form the poem was concerned with very definite personai problems; in the years of Goethe's friendship with Schiller it was widened to embody the higher strivings of 18th-century humanism; ultimately, in the second part, it became a vast allegory of human iife and activity. Thus the elements of which *Faust* is composed were even more difficult to blend than were those of *Wilhelm Meister;* but the very want of uniformity is one source of the perennial fascination of the tragedy, and has made it in a peculiar degree the national poem of the German people, a mirror in which the national life and poetry are reflected, from the outburst of *Sturm und Drang* to the tranquil classicism of Goethe's maturity.

The third and final period of Goethe's long life may be said to have begun after Schiller's death. He never again lost touch with literature as he had done in the years which preceded his friendship with Schiller; but he stood in no active or immediate connection with the literary movement of his day. His life moved on comparatively uneventfully. Even the era of Napoleonic oppression, 1806–1813, disturbed but little his equanimity. Goethe, the cosmopolitan *Weltburger* of the 18th century, had himself no very intense feelings of patriotism, and, having seen Germany flourish as a group of small states under enlightened despotisms, he had little confidence in the dreamers of 1813 who hoped to see the glories of Barbarossa's empire revived, Napoleon, moreover, he regarded not as the scourge of Europe, but as the defender of civilization against the barbarism of the Slavs; and in the famous interview between the two men at Erfurt the poet's admiration was reciprocated by the French conqueror. Thus Goethe had no great sympathy for the war of liberation which in 1813 kindled young hearts from one end of Germany to the other; and when the national enthusiasm rose to its highest pitch he buried himself in those optical and morphological studies, which, with increasing years, occupied more and more of his time.

The events and writings of the last 25 years of Goethe's life may be briefly summarized. In 1805, as we have seen, he suffered an irreparable loss in the death of Schiller; in 1806, Christiane became his legal wife, and to the same year belongs the magnificent tribute to his dead friend, the *Epilog zu Schillers Glocke.* Two new friendships about this time kindled in the poet something of the passion of younger days. Bettina von Arnim came into touch with Goethe in 1807, and her *Briefwechsel Goethes mit einem Kinde* (published in 1835) is, in its mingling of truth and fiction, one of the most delightful products of the Romantic mind; but the episode was of less importance in Goethe's eyes than Bettina would have us believe. On the other hand, his interest in Minna Herzlieb, foster-daughter of the publisher Frommann in Jena, was of a warmer nature, and has left its traces on the novel, *Die Wahlverwandtschaften* and on his sonnets.

In 1808, as we have seen, appeared the first part of *Faust,* which in 1809 was followed by the novel just mentioned. That novel, hardly less than the drama, effected a change in the public attitude towards the poet. Since the beginning of the century the conviction had been gaining ground that Goethe's mission was accomplished, that the day of his leadership was over; but here were two works which not merely re-established his position, but proved that the old poet was in sympathy with the movement of letters, and keenly alive to the change of ideas which the new century had brought with it. The intimate study of four minds, which forms the subject of the *Wahlverwandtschaften,* was an essay in a new type of psychological fiction and pointed out the way for developments of the German novel after the stimulus of *Wilhelm Meister* had exhausted itself. Less important than *Die Wahlverwandtschaften* was *Pandora* (1810), the final product of Goethe's classicism and the most uncompromisingly classical and allegorical of all his works. And in 1810, too, appeared his treatise *Zur Farbenlehre.* In the following year the first volume of his autobiography was published under the title *Aus meinem Leben, Dichtung und Wahrheit.* The second and third volumes of this work followed in 1812 and 1814; the fourth, bringing the story of his life up to the close of the Frankfurt period in 1833, after his death. Goethe felt, even late in life, too intimately bound up with Weimar to discuss in detail his early life there, and he shrank from carrying his biography beyond the year 1775. But a number of other publications—descriptions of travel, such as the *Italienische Reise* (1816–17), the materials for a continuation of *Dichtung und Wahrheit* collected in *Tag-und Jahreshefte* (1830) are important additions to the documents of his life. Meanwhile, no less valuable biographical materials were accumulating in his diaries, his voluminous correspondence and his conversations, as recorded by J. P. Eckermann, the chancellor F. von Miiller and F. Soret. Several periodical publications, *Über Kunst und Altertum* (1816-32), *Zur Naturwissenschaft überhaupt* (1817-24), *Zur Morphologie* (1817-24), bear witness to the extraordinary width of Goethe's interests in these years. Art, science, literature—little escaped his ken—and that not merely in Germany: English writers, Byron, Scott and Carlyle, Italians like Manzoni, French scientists and poets, could all depend on friendly words of appreciation and encouragement from Weimar.

With *Westöstlicher Diwan* (1819), Goethe had another surprise in store for his contemporaries; this is a collection of lyrics, matchless in form and more concentrated in their apophthegmatic expression than those of earlier days; it was suggested by a German translation of the Persian poet, Hafiz. And, again, an actual passion—that for Marianne von Willemer, whom he met in 1814 and 1815—had rekindled in him the lyric fire. Meanwhile the years were thinning the ranks of Weimar society: Wieland, the last of Goethe's greater literary contemporaries, died in 1813, his wife in 1816, Charlotte von Stein in 1827 and Duke Karl August in 1828. Goethe's retirement from the direction of the theatre in 1817 meant for him a break with the literary life of the day. In 1822 a passion for a young girl, Ulrike von Levetzow, whom he met at Marienbad, inspired the fine *Trilogie der Leidenschaft,* and between 1821 and 1829 appeared the long-expected and long-promised continuation of *Wilhelm Meister, Wilhelm Meisters Wanderjahre.* The latter work, however, was a disappointment: perhaps it could not have been otherwise. Goethe had lost the thread of his romance, and it was difficult for him to find it again. Problems of the relation of the individual to society and industrial questions were to have formed the theme of the *Wanderjahre;* but after the French Revolution these problems had entered on a new phase and demanded a method of treatment which it was not easy for the old poet to acquire. Thus his intentions were only partially carried out, and the volumes were filled out by irrelevant stories, written at widely different periods.

But the crowning achievement of Goethe's literary life was the completion of *Faust.* The poem had accompanied him since early manhood and was the repository for the fullest "confession" of his life; it is the poetic epitome of his experience. The second part is far removed from the impressive realism of the *Urfaust* or even the classicism of the first part. It is a phantasmagory; a drama the actors in which are not creatures of flesh and blood, but shadows in an unreal world of allegory. The lover of Gretchen had, as far as poetic continuity is concerned, disappeared with the close of the first part. In the second part it is virtually a new Faust who, accompanied by a new Mephistopheles, goes out into a world that is not ours. Yet behind the elusive allegories of an imperial court with its financial difficulties, behind the classical *Walpurgisnacht,* the fantastic creation of the Homunculus, the noble Helena episode and the impressive mystery-scene of the close, where the centenarian Faust finally triumphs over the powers of evil, there lies a philosophy of life, a ripe wisdom born of experience, such as no other modern European poet has given us. *Faust* has been well called the "divine comedy" of 18th-century humanism.

The second part of *Faust* forms a worthy close to the life of Germany's greatest man of letters, who died in Weimar on March 22, 1832. His was the last of those universal minds which have been able to compass all domains of human activity and knowledge; for he stood on the brink of an era of rapidly expanding knowledge which has made forever impossible the universality of interest and sympathy which distinguished him. As a poet, his fame has undergone many vicissitudes since his death, ranging from the indifference of the "Young German" school to the enthusiastic appreciation of the closing decades of the 19th century—an enthusiasm to which we owe the Weimar *Goethe-Gesellschaft* (founded in 1885) and a vast literature dealing with the poet's life and work. That Goethe is Germany's greatest poet and the master of her classical literature has never been seriously questioned. The intrinsic value of his poetic work, regarded apart from his personality, may be smaller in proportion to its bulk than is the case with some lesser German poets and with the great poets of other literatures. But Goethe was a new type of literary man; a poet whose supreme greatness lay in his subjectivity. Only a small fraction of his poetical work sprang from what might be called a purely artistic and objective impulse; by far the larger—and the better—part is the immediate precipitate of his thought, emotions, and experiences.

It is as a lyric poet that Goethe's supremacy is least likely to be challenged; he has given his nation, whose highest literary expression has in all ages been essentially lyric, its greatest songs. No other German poet has succeeded in attuning feeling, sentiment and thought so perfectly to the music of words as he; none has expressed so fully that subtle spirituality in which the strength of German lyrism lies. Goethe's dramas, on the other hand, have not, in the eyes of his nation, succeeded in holding their own beside Schiller's; but the reason is rather because Goethe refused to be bound by the conventions of the theatre, than because he was deficient in the cunning of the dramatist. For, as a creator and interpreter of human character, Goethe is without a rival among modern poets, and there is not one of his plays that does not contain scenes and characters which bear indisputable testimony to this mastery. *Faust* is Germany's most national drama, and it remains perhaps for the theatre of the future to prove itself capable of popularizing psychological masterpieces like *Tasso* and *Iphigenie*. As a novelist, Goethe has suffered most by the lapse of time. The *Sorrows of Werther* no longer maintains its hold upon us, and even *Wilhelm Meister* and *Die Wahlverwandtschaften* require more understanding for the conditions under which they were written than do *Faust* or *Egmont*. Goethe could fill his prose with rich wisdom, but he was the perfect artist only in verse.

Less attention is nowadays paid to Goethe's work in other fields, work which he himself in some cases prized more highly than his poetry. It is only as an illustration of his many-sidedness and his manifold activity that we now turn to his achievement as a statesman, as a practical political economist, as a theatre-director. His art-criticism is symptomatic of a phase of European taste to which the growing individualism of Romanticism was repugnant. His scientific studies and discoveries now possess only an historical interest. We marvel at the obstinacy with which he, with inadequate mathematical knowledge, opposed the Newtonian theory of light and colour; and at his championship of "Neptunism," the theory of aqueous origin, as opposed to "Vulcanism," that of igneous origin of the earth's crust. Of real importance was, on the other hand, his foreshadowing of the Darwinian theory in his works on the metamorphosis of plants and on biological morphology. Indeed, the deduction to be drawn from Goethe's contributions to botany and anatomy is that he, as few of his contemporaries, possessed that type of scientific mind which, in the 19th century, has made for progress; he was Darwin's predecessor by virtue of his enunciation of what has now become one of the commonplaces of natural science—organic evolution. Modern, too, was the outlook of the aging poet on the changing social conditions of the age and on its new political ideals; unexpectedly sympathetic his attitude towards modern industry, which steam was just beginning to establish on a new basis. The Europe of his later years was very different from that of the enlightened autocracies of the 18th century, in which he had spent his best years; yet Goethe was at home in it too.

From the philosophic movement, in which Schiller and the Romanticists were deeply involved, Goethe stood apart. Comparatively early in life he had found in Spinoza the philosopher who responded to his needs; and for the subtle dialectic of later thinkers he had neither liking nor understanding. As a convinced realist he took his standpoint on nature and experience, and could afford to look on with indifference at the battles of the metaphysicians. Of Kant's work, however, he was not ignorant, and under Schiller's stimulus he learned from him; but of the younger thinkers, only Schelling, whose mystic nature-philosophy was akin to Spinoza's thought, touched a sympathetic chord in his nature. As a moralist and a guide to the conduct of life—an aspect of Goethe's work which Carlyle, viewing him through the coloured glasses of Fichtean idealism, emphasized and interpreted not always justly—Goethe was a powerful force on German life in years of intellectual and political depression. It is difficult even still to get beyond the maxims of practical wisdom he scattered so liberally through his works and the lessons to be learned from *Meisfer* and *Faust;* the calm optimism which never deserted Goethe, and was so completely justified by the tenor of his life, is still an uplifting element of his thought. If the philosophy of Spinoza provided the poet with a religion which made individual creeds and dogmas seem unnecessary, Leibnitz's doctrine of predestinism supplied the foundations for his faith in the divine purpose of human life.

Goethe's many-sided activity is a tribute to the greatness of his mind and personality; we may see in him merely the embodiment of his particular age, or we may regard him as a poet "for all time"; but with one opinion all who have felt the power of Goethe's genius are in agreement—the opinion which was condensed in Napoleon's often cited words, uttered after the meeting at Erfurt: *Voilà un homme!* Of all modern men of genius, Goethe is the most universal. It is the full, rich humanity of his personality—not the art behind which the artist disappears, or the definite pronouncements of the thinker or the teacher—that constitutes his claim to a place in the front rank of men of letters. His life was his greatest work.

BIBLIOGRAPHY.—(a) *Collected Works, Diaries, Correspondence, Conversations.* The following editions of Goethe's writings appeared in the poet's lifetime: *Schriften* (Leipzig, 1787–90); *Neue Schriften* (1792–1800); *Werke* (13 vols., Stuttgart, 1806–10); *Werke* (26 vols., Stuttgart, 1815–22); *Werke* (Vollstandige Ausgabe letzter Hand) (40 vols., Stuttgart, 1827–30). Goethe's *Nachgelassene Werke* appeared as a continuation of this edition in 20 volumes (Stuttgart, 1832–42). These were followed by several editions of Goethe's *Samtliche Werke,* published by Cotta of Stuttgart. The first critical edition with notes was published by Hempel, Berlin, 1868–79. The standard edition is that published at Weimar between 1887 and 1919; it is divided into four sections: I. *Werke;* II. *Naturwissenschaftliche Werke;* III. *Tagebiicher;* IV. *Briefe.* Of other recent editions the most noteworthy are: *Samtliche Werke* (Jubiläums-Ausgabe), ed. *E.* von der Hellen (Stuttgart, 1902–7); *Werke,* ed. *K.* Heinemann (Leipzig, 1900 ff.), the cheap edition of the *Samtliche Werke,* ed. *L.* Geiger (Leipzig, 1901), and the "Propyläen-Ausgabe" (Munich, 1909 ff.). There are also innumerable editions of selected works; reference need only be made here to the useful collection of the early writings and letters by M. Bernays, *Der junge Goethe* (Leipzig, 1875; new ed., 1909–11). A French translation of Goethe's *Œuvres complètes,* by J. Porchat, appeared at Paris in 1860–63. There is, as yet, no uniform English edition, but Goethe's chief works have all been frequently translated and most of them will be found in Bohn's Standard Library.

The definitive edition of Goethe's diaries and letters is that forming Sections III. and IV. of the Weimar edition. Collections of selected letters based on the Weimar edition have been published by E. von der Hellen (1901–13), and by P. Stein (1901–24). Of the many separate collections of Goethe's correspondence mention may be made of the *Briefwechsel zwischen Schiller und Goethe,* edited by Goethe himself (1828–29), by H. G. Graf and A. Leitzmann (1923); Eng. trans. (1877–79); *Briefwechsel zwischen Goethe und Zelter* (1833–34); Eng. trans. (1887); *Briefwechsel mit Bettina von Arnim,* ed. *R.* Steig (1922); *Goethes Briefe an Frau von Stein,* ed. A. Scholl (1848–51); ed. J. Wahle (1899–1900); *Briefwechsel zwischen Goethe und K. F. von Reinhard* (1850); *Briefwechsel zwischen Goethe und Knebel* (1851); *Briefwechsel zwischen Goethe und Staatsrat Schultz* (1853); *Briefwechsel des Herzogs Karl August mit Goethe* (1863; ed. *H.* Wahl, 1915–18); *Briefwechsel zwischen Goethe und Kaspar Graf von Sternberg* (1866); *Briefwechsel mit Christiane,* ed. H. G. Graf (1923); *Briefwechsel mit H. Meyer,* ed. *M.* Hecker (1920); *Goethes naturwissenschaftliche Korrespondenz,* and *Goethes Briefwechsel mit den Gebriidern von Humboldt* (ed. *F. T.* Bratranek (1874–76); *Goethes und Carlyles Briefwechsel* (1887), also in English; *Goethe und die Romantik,* ed. C. Schiiddekopf and O. Walzel (1898–99); *Goethe und Lavater,* ed. H. Funck (1901); *Goethe und Österreich,* ed. *A.* Sauer (1902–4). Besides the correspondence with Schiller and Zelter, Bohn's library contains a translation of *Early and Miscellaneous Letters,* by E. Bell (1884). The chief collections of Goethe's conversations are: J. P. Eckermann, *Gesprache mit Goethe* (1836; vol. iii., also containing conversations with Soret, 1848; ed. H. H. Houben, 1926; Eng. trans., 1850). *Cf.* J. Petersen, *Die Entstehung der Eckermannschen Gespräche* (1926). The complete conversations with Soret have been published in German translation by C. A. H. Burkhardt (1905); *Goethes Unterhaltungen mit dem Kanzler F. von Müller* (1870). Goethe's collected *Gesprache* were published by W. von Biedermann (1889–96); new ed. 1909–11.

(*b*) Biography.—Goethe's autobiography, *Aus meinem Leben: Dichtung und Wahrheit,* appeared in three parts between 1811 and 1814; part iv. in 1833 (Eng. trans., 1846); it is supplemented by other

biographical writings, as the *Italienische Reise, Tag- und Jahreshefte*, etc. The following are the more important biographies: H. Döring, *Goethes Leben* (1828, etc.); H. Viehoff, *Goethes Leben* (1847–54; 5th ed. 1887); J. W. Schäfer, *Goethes Leben* (1851; 3rd ed., 1877); G. H. Lewes, *The Life and Works of Goethe* (1855, etc.; Ger. trans., J. Frese; a shorter biography was published by Lewes in 1873 under the title *The Story of Goethe's Life*); W. Mézières, *W. Goethe, les œuvres expliquées par la vie* (1872–73); A. Bossert, *Goethe* (1872–73); K. Goedeke, *Goethes Leben und Schriften* (1874; 2nd ed., 1877); H. Grimm, *Goethe: Vorlesungen* (1876; 8th ed., 1903; Eng. trans. 1880); A. Hayward, *Goethe* (1878); H. H. Boyesen, *Goethe and Schiller, their Lives and Works* (1879); H. Düntzer, *Goethes Leben* (1880; 2nd ed., 1883; Eng. trans. 1883); A. Baumgartner, *Goethe, sein Leben und seine Werke* (1885; 4th ed., 1923–25); J. Sime, *Life of Goethe* (1888); K. Heinemann, *Goethes Leben und Werke* (1889; new ed., 1916); R. M. Meyer, *Goethe* (1894; 3rd ed., 1904); A. Bielschowsky, *Goethe, sein Leben und seine Werke* (1895–1903; over 30 editions; Eng. trans. 1905–8); G. Witkowski, *Goethe* (1899); H. G. Atkins, *J. W. Goethe* (1904); H. S. Chamberlain, *Goethe* (1912); F. Gundolf, *Goethe* (1916; 12th ed., 1925); W. Bode, *Goethes Leben* (1917 ff.); P. Hume Brown, *Life of Goethe* (1920); E. Ludwig, *Goethe* (1920–21); G. Brandes, *Goethe* (Ger. trans., 1922); J. G. Robertson, *Goethe* (1927).

Of writings on special periods and aspects of Goethe's life the more important are as follows (the titles are arranged as far as possible in the chronological sequence of the poet's life): K. Heinemann, *Goethes Mutter* (1891; 6th ed., 1900); P. Bastier, *La Mère de Goethe* (1902); *Briefe der Frau Rat* (2nd ed., 1905); F. Ewart, *Goethes Vater* (1899); G. Witkowski, *Cornelia, die Schwester Goethes* (1903); P. Besson, *Goethe, sa soeur et ses amies* (1898); H. Düntzer, *Frauenbilder aus Goethes Jugendzeit* (1852); W. von Biedermann, *Goethe und Leipzig* (1865); P. F. Lucius, *Friderike Brion* (1878; 3rd ed., 1904); A. Bielschowsky *Friderike Brion* (1880); F. E. von Dürckheim, *Lili's Bild geschichtlich entworfen* (1879; 2nd ed., 1894); W. Herbst, *Goethe in Wetzlar* (1881); H. Gloel, *Goethes Wetzlarer Zeit* (1911); A. Diezmann, *Goethe und die lustige Zeit in Weimar* (1857; 4th ed., 1906); H. Düntzer, *Goethe und Karl August* (1859–64; 2nd ed., 1888); *Aus Goethes Freundeskreise* (1868); *Charlotte von Stein* (1874); E. Hoefer, *Goethe und Charlotte von Stein* (1878; 7th ed., 1922); W. Bode, *Charlotte von Stein* (1909); J. Haarhaus, *Auf Goethes Spuren in Italien* (1896–98); O. Harnack, *Zur Nachgeschichte der italienischen Reise* (1890); H. Grimm, *Schiller und Goethe* (*Essays*, 1858; 3rd ed., 1884); G. Berlit, *Goethe und Schiller im persönlichen Verkehre, nach brieflichen Mitteilungen von H. Voss* (1895); S. Waetzoldt, *Goethe und die Romantik* (1888); C. A. H. Burkhardt, *Das Repertoire des weimarischen Theaters unter Goethes Leitung* (1891); J. Wahle, *Das Weimarer Hoftheater unter Goethes Leitung* (1892); O. Harnack, *Goethe in der Epoche seiner Vollendung* (3rd ed., 1905); J. Barbey d'Aurevilly, *Goethe et Diderot* (1880); A. Fischer, *Goethe und Napoleon* (1899; 2nd ed., 1900); J. G. Robertson, *Goethe and Byron* (1925); R. Steig, *Goethe und die Gebrüder Grimm* (1892).

(*c*) *Criticism.*—H. G. Graf, *Goethe über seine Dichtungen* (1901–14); J. W. Braun, *Goethe im Urteile seiner Zeitgenossen* (1883–85); T. Carlyle, *Essays on Goethe* (1828–32); X. Marmier, *Études sur Goethe* (1835); W. von Biedermann, *Goethe-Forschungen* (1879–99); J. Minor and A. Sauer, *Studien zur Goethe-Philologie* (1880); H. Düntzer, *Abhandlungen zu Goethes Leben und Werken* (1881); A. Schöll, *Goethe in Hauptzügen seines Lebens und Wirkens* (1882); V. Hehn, *Gedanken über Goethe* (1884, 7th ed., 1909); W. Kern, *Goethes Tasso* (1890); K. Fischer, *Goethes Tasso* (1890; 3rd ed., 1900); J. Schubart, *Die philosophischen Grundgedanken in Goethes Wilhelm Meister* (1896); M. Wundt, *Goethes Wilhelm Meister* (1913); E. Boas, *Schiller und Goethe im Xenienkampf* (1851); E. Schmidt and B. Suphan, *Xenien 1796, nach den Handschriften* (1893); W. von Humboldt, *Ästhetische Versuche: Hermann und Dorothea* (1799); V. Hehn, *Über Goethes Hermann und Dorothea* (1893); A. Fries, *Quellen und Komposition der Achilleis* (1901); K. Alt, *Studien zur Entstehungsgeschichte von Dichtung und Wahrheit* (1898); A. Jung, *Goethes Wanderjahre und die wichtigsten Fragen des 19. Jahrhunderts* (1854); F. Kreyssig, *Vorlesungen über Goethes Faust* (1866); the editions of *Faust* by G. von Loeper (1879; new ed., 1900); K. J. Schroer (1881; 5th ed., 1915–17); G. Witkowski (1909; 3rd ed., 1924), and R. Petsch (1925); K. Fischer, *Goethes Faust* (1878; 5th ed., 1904); O. Pniower, *Goethes Faust, Zeugnisse und Excurse zu seiner Entstehungsgeschichte* (1899); J. Minor, *Goethes Faust, Entstehungsgeschichte und Erklarung* (1901); E. Traumann, *Goethes Faust* (1913–14).

(*d*) *Bibliographical Works, Goethe-Societies &c.*—S. Hirzel, *Verzeichnis einer Goethe-Bibliothek* (1884), to which G. von Loeper and W. von Biedermann have supplied supplements. Goedeke's *Grundriss zur Geschichte der deutschen Dichtung* (vol. iv., 3rd ed., 1910–13); and the bibliographies in the *Goethe-Jahrbuch* (1880–1913). Also K. Hoyer, *Zur Einführung in die Goethe-Literatur* (1904). On Goethe in England *see* E. Oswald, *Goethe in England and America* (1899; 2nd ed., 1909); J. M. Carré, *Goethe en Angleterre* (1921); W. Heinemann, *A Bibliographical List of the English Translations and Annotated Editions of Goethe's Faust* (1886).

A *Goethe-Gesellschaft* was founded at Weimar in 1885; its publications include the annual *Goethe-Jahrbuch* (1880–1913); now *Jahrbuch der Goethe-Gesellschaft* (1914 ff.), and a series of *Goethe-Schriften*. A *Goethe-Verein* has existed in Vienna since 1887, and an English Goethe society since 1886 (*Publications*, 1880–1910; new series 1924 ff). (J. G. R.)

GOETHITE, a very common iron mineral consisting of hydrated iron oxide, the principal component of rusted iron. Goethite is the stable iron mineral under the hydrous, oxidizing conditions near the earth's surface. It occurs as a direct precipitate (*e.g.*, in bogs), and as a weathering product of other iron minerals, sometimes making an important ore of iron, as in Alsace. In most deposits goethite is very fine-grained, occasionally as fibrous radiating masses. The name goethite was originally given, in honor of the poet and natural philosopher Johann Goethe, to a less common iron mineral (now known as lepidocrocite) of identical composition but different structure. Ordinarily the two minerals can be distinguished only by X-ray diffraction; undifferentiated fine-grained material is usually called limonite (*q.v.*). The composition of goethite is FeOOH, equivalent to the chemical compound $\alpha-Fe_2O_3.H_2O$. The structure is based on a nearly close-packed arrangement of large oxygen or hydroxyl ions, with ferric ions between alternate layers. The packing gives a symmetry of structure and form that is pseudohexagonal (orthorhombic) and the weak interlayer bonding results in one perfect cleavage and in a tabular or prismatic external form. The colour is blackish brown in single crystals, ranging through all shades of brown and yellow as the size of crystals decreases. The hardness is 5 and specific gravity 4.2. (W. T. HR.)

GOG, a hostile power that is to manifest itself in the world immediately before the end of things (Ezek. xxxviii *sq.*, Rev. xx), Magog who is joined with Gog in the latter passage is the name of Gog's origin in the former. In Gen. x, 2 (and Ezek. xxxviii, 2) Magog appears to represent a locality in Armenia.

The legends attached to the gigantic effigies (dating from 1708 and replacing those destroyed in the Great Fire) of Gog and Magog in Guildhall, London, are of unknown date. According to the *Recuyell des histoires de Troye*, Gog and Magog were the survivors of a race of giants descended from the 33 wicked daughters of Diocletian; after their brethren had been slain by Brute and his companions, Gog and Magog were brought to London (Troynovant) and compelled to officiate as porters at the gate of the royal palace.

Effigies similar to the present existed in London as early as the time of Henry V.

GOGH, VINCENT WILLEM VAN (1853–1890), the greatest and most revolutionary Dutch painter after Rembrandt, was born on March 30, 1853, the eldest of six children of a Protestant pastor, at Groot Zundert (Brabant). The artistic career of Vincent van Gogh was extremely short, lasting only ten years

(1880–90); during the first part he was acquiring technical proficiency and confined himself almost entirely to drawings and water colours. His first productive period of oil painting begins in 1884. During the ensuing six years. he produced about 700 drawings and 800 oils, only one of which was sold during his lifetime. Vincent was always desperately poor. but he was sustained by faith in the urgency of what he had to communicate, and by a younger brother. Theo (1857–1891), who believed implicitly in his genius and provided for him out of his own meagre earnings. The letters which Vincent wrote to Theo (from 1872 on) give a graphic account of his aims and beliefs, hopes and disappointments, of his fluctuating physical and mental state. of his pictorial methods and of his daily life. Van Gogh expressed himself so vividly and analyzed things so acutely that his *Collected Correspondence* ranks not merely as a great autobiographical record but as great literature. Vincent's working life can be roughly divided into two periods. The first (1873–85), during which he wrestled with temperamental difficultiesand sought his true means of self-expression, was a period of repeated apprenticeships, failures and changes of direction. The second (1886–90) was a period of dedication, rapid development and fulfillment, until his progress was interrupted by a succession of mental crises (1889–90) ending in an attempted suicide on July 27, 1890, and his death two days later.

Vincent's early years in his father's parsonage uere happy, and he loved wandering in the countryside At 16. he was apprenticed to the art dealers Goupil and Co., of which his uncle was a partner. Vincent began at their branch in The Hague, going later to London (1873–74) and Paris (1874–75). Daily contact with works of art aroused Van Gogh's artistic sensibility and he soon formed a taste for Rembrandt, Hals. J. van Ruisdael, C. Troyon. Jules Dupré and J. Maris, although his preference mas for Millet and Corot, whose influence was to last throughout his life. Vincent disliked art dealing; moreover, his approach to life darkened when his love was rejected by a London girl (1874), for his burning desire for human affection had been thwarted. From then on he became increasingly solitary. He became a language teacher and lay preacher (England), and later (1877) a bookseller in Dordrecht. Impelled by a longing to give himself to his fellow men, Vincent envisaged entering the ministry and took up theology, but abandoned this project for short-term training as an evangelist in Brussels (Aug. 1878). A conflict with authority ensued, for Vincent disputed the orthodox doctrinal approach. failed to get a nomination and after three months left to do missionary work among the mining population of the Borinage. There he experienced the first great spiritual crisis of his life (winter, 1879–80). He was sharing the life of the poor completely, but in an impassioned moment gave away all his worldly goods and was thereupon dismissed for too literal an interpretation of Christian teaching. Penniless and with his faith destroyed, he sank into despair. cut himself off from everyone and began seriously to draw, thereby discovering (Aug. 1880) his true vocation. Vincent decided that his mission from then on would be to bring consolation to humanity through art, and this realization of his creative powers restored his self-confidence. He immediately went to study drawing at the Brussels academy, then in April 1881 moved to his father's parsonage at Etten and began to work from nature.

Van Gogh worked hard and methodically but soon perceived the difficulty of self-training and sought the guidance of more experienced artists. In Jan. 1882 he settled at The Hague to work with Anton Mauve; he made visits to museums and had meetings with painters such as Van Rappard and G. Breitner. Vincent thus extended his technical knowledge and experimented (summer 1882) with oil paint. In Sept. 1883 the urge to be "alone with nature" and the peasants took him to Drenthe. a desolate part of northern Holland frequented by Mauve, Van Rappard and Max Liebermann. where he spent three months before returning home, uhich was now at Nuenen. Vincent remained at Nuenen from Dec. 1883 till Nov. 1885 and during these years his art grew bolder and more assured. He painted three types of subject—still life, landscape and figure—all interrelated by their reference to the peasants' daily life, to the hardships they endured and the countryside they cultivated. Emile Zola's *Germinal* had greatly impressed Van Gogh, and in many of his pictures, *e.g.,* "Weavers" and "The Potato Eaters." sociological criticism is implicit. Eventually Vincent felt too isolated in Nuenen. His understanding of the possibilities of painting was evolving rapidly; through studying Hals he saw that academic "finish" destroys the freshness of a visual impression, while Veronese and Delacroix taught him that "colour expresses something by itself." This led to enthusiasm for Rubens and a sudden departure for Antwerp, where the revelation of Rubens' "simple means," of his direct notation. and of his ability to "express a mood . . . by a combination of colours" proved decisive. Simultaneously, Van Gogh "discovered" Japanese prints and began to use pure colours. His refusal to follow academic principles led to rows at the Antwerp academy, where he was enrolled, and after three months of hard work and near-starvation he left precipitately (early March 1886) to join Theo in Paris. There, still concerned with improving his drawing, Vincent worked for three months under F. Cormon, in whose studio he met Toulouse-Lautrec and Emile Bernard, who opened his eyes to the latest developments in French painting and subsequently introduced him to Paul Gauguin; at the same time, Theo showed him Impressionist paintings at Goupil's and introduced him to Camille Pissarro, Georges Seurat and others of the group. By this time Vincent was ready for such revelations, and the changes which his painting underaent in Paris (1886–88) led to the expansion of his personal idiom. His palette at last became colourful in a series of "Flower Still Lifes" (summer 1886) executed under the influence of Adolphe Monticelli; thereafter his vision became less traditional and his tonalities lighter (first views of Montmartre) until (spring 1887) the Impressionist influence became paramount (more views of Paris). Later (summer 1887), in outdoor views of Montmartre, Suresnes, Asnières and Chatou, Vincent was painting in pure colours and using a broken brushwork which is at times pointillistic. Finally his post-Impressionist style crystallized (Dec. 1887–Feb. 1888) in some interpretations of prints by Hiroshige and in masterpieces such as "Portrait of Père Tanguy" and "Self-Portrait in Front of an Easel."

BY COURTESY OF MUSEUM FOLKWANG, ESSEN, GERMANY

"PORTRAIT OF ARMAND ROULIN" BY VINCENT VAN GOGH (IN THE MUSEUM FOLKWANG, ESSEN)

After two years, Van Gogh was tired of city life, physically exhausted, and longing "to look at nature under a brighter sky," because he realized that the veiled light of the north obliged him to "respect tonal values," whereas his passion was for "the Japanese way of feeling and drawing" and for "a full effect of colour." He left Paris on Feb. 20, 1888, for Arles. In his pictures of the following 12 months—his first great period—Vincent strove to respect the external, visual aspect of a figure or a landscape. but found himself unable to suppress his own feelings about the subject. These found expression in vivid formal simplifications or exaggerations and an almost arbitrarily intense use of colour. Vincent's pictorial conception is thus partly expressionist and partly symbolist. His procedure was not scientific or calculated, however, but spontaneous and instinctive, for he worked with great speed and intensity, determined to capture an effect or a mood uhile it possessed him. His Arles subjects include blossoming fruit trees, views of the town and surroundings, self-portraits, portraits of Roulin the postman and his family and other friends, interiors and exteriors of his house, a series of sunflowers and a "starry night." Van Gogh knew that his approach to painting was revolutionary and individualistic, but he also knew that some tasks are beyond the power of isolated individuals to accomplish In Paris he had hoped to form a separate Impressionist group with Gauguin, Toulouse-Lautrec, Bernard and Anquetin. whom he supposed to have similar aims. He rented and decorated "a yellow house" in Arles with the intention of persuading them to join him and found a working community of "Impressionists of the South." Gauguin arrived on Oct. 20, 1888, and for two months they worked together; but while each influenced the other to some extent, their relations rapidly deteriorated because they had opposing ideas and were temperamentally incompatible. On Christmas eve, 1888, Vincent broke under the strain and cut off part of his left ear. Gauguin left and Van Gogh was taken to a hospital; he returned to the "yellow house" a fortnight later and resumed painting: "Self-Portrait With a Bandaged Ear," still lifes, "La Berceuse." Within a month he was back in the hospital. At the end of April 1889, fearful of losing his "capacity for work," which he felt returning and regarded as a guarantee of sanity, he asked to be "temporarily shut up" in the asylum at St. Rémy de Provence in order not to be alone and to be under supervision. Vincent stayed there for 12 months, haunted by recurrent attacks, alternating between calm and despair and working intermittently ("Garden of the Asylum," "Cypresses," "Olive Trees," "Les Alpilles," portraits of doctors, interpretations of Rembrandt, Delacroix, Millet). The keynote of this phase (1889–90) is fear of losing touch with reality and a certain sadness. Confined for long periods to his cell or the asylum garden and having no choice of subjects. Van Gogh fought against having to work from memory; his inspiration depended on direct observation and he distrusted Gauguin's process of "abstraction." At St. Rémy, Vincent toned down his violent colour contrasts of the previous summer and tried to be calmer; but as he repressed his excitement he involved himself more imaginatively in the drama of the elements and of natural growth and decay, developing a style based on dynamic forms and a vigorous use of line (line often equated with colour). The best of his St. Rémy pictures are thus bolder, more moving and more visionary than those of Arles.

Vincent himself brought this period to an end. Oppressed by homesickness—he painted souvenirs of Holland—and loneliness, he longed to see Theo and the north once more and arrived in Paris on May 16, 1890. Four days later he went to stay with Dr. Gachet, a friend of Pissarro and Paul Cézanne, at Auvers-sur-Oise. Back in a village community such as he had not known since Nuenen (1885), Van Gogh worked enthusiastically and his choice of subjects (fields of corn, the river valley, peasants' cottages, the church, the town hall) reflects his spiritual relief. A modification of his style follows; natural forms are less contorted, pale fresh tonalities, the brushwork is broader and more expressive, the vision of nature more lyrical. Everything in Van Gogh's pictures seems to be moving, living. But this phase was short. Quarrels with Gachet, feelings of guilt at his inescapable dependence on Theo (now married and with a son) and inability to succeed, despair of ever overcoming his loneliness or of being cured, drove him to suicide (July 1890). Six months later Theo, too, was dead (Jan. 25, 1891).

The name of Van Gogh was virtually unknown when he took his life. He had exhibited a few canvases at the Salon des Indépendants (1888–90) and at Les XX in Brussels (1890), and both *salons* showed small commemorative groups of his work in 1891; but his first one-man shows were posthumous (1892). Only one article on him appeared during his lifetime (Albert Aurier in *Mercure de France*, Jan. 1890). His fame was made largely by other painters (E. Bernard, M. Denis) and dates from the early years of the 20th century; since then his reputation has never ceased to grow and he has exerted a powerful influence on the development of modern painting (Matisse, Derain, Vlaminck, the German Expressionists, Picasso), especially in the field of colour. See also PAINTING: *The Netherlands*.

GOGOL, NIKOLAI VASILIEVICH (1809–1852), Russian novelist and dramatist, was born at Sorochintsky, province of Poltava, on March 31, 1809, of a family of Ukrainian Cossack gentry. Educated at the Niezhin gymnasium, he there started a manuscript periodical, *The Star*, and wrote several pieces including a tragedy, *The Brigands*. In 1829 he went to St. Petersburg, where he tried the stage but failed. In 1830 he obtained a clerkship in the department of appanages, but soon resigned it. In 1829 he published anonymously a poem called *Italy*, and, under the pseudonym of V. Alof, an idyll, *Han Küchelgarten*, which was so ridiculed that Gogol bought up all the copies ne could and burnt them. He was terribly disheartened, and thought of emigrating to America. Indeed, he got as far as Liibeck, but then returned to St. Petersburg, and entered the civil service. He made his way in literary circles, and was well received by Pushkin, whom he met in 1831.

In 1831 appeared *Evenings in a Farm near Dikanka: by Rudy Panko*, a volume of stories of Ukrainian life, which was enthusiastically received. Gogol then planned a history of Little-Russia of the middle ages, to be completed in eight or nine volumes. This remained a plan only, but served to win for him a chair of history in the university of St. Petersburg. His lectures were a failure, and he resigned in 1835. Meanwhile he had published his *Arabesques*, a collection of essays and stories; his *Taras Bulba*, the best known of the *Cossack Tales* translated into English by George Tolstoi (1860) and by J. Cournos (Everyman Edition, 1906), and a number of other short stories, including *Old World Gentlefolks*, a sketch of the tranquil life led in a quiet country house, also *The Cloak*, a description of the petty miseries endured by an ill-paid clerk in a government office, the great object of whose life is to secure the "cloak" from which his story takes its name. On April 19, 1836, his famous comedy, the *Revizor* (Eng. trans. by C. Garnett, *The Government Inspector*, 1926,) was produced. The *Revizor* is the greatest of Russian comedies; it is a brilliant satire on bureaucracy, which was received with enthusiasm by the intelligentsia and with horror by the official classes. But it is an error to look on its historical and political significance as its principal claim to rank among the great European comedies. Even when played in another language (and Gogol more than any other Russian author loses in translation), it is recognised as pure and universal comedy. The plot is very simple. A traveller who arrives with an empty purse at a provincial town is taken for an inspector whose arrival is awaited with fear, and he receives all the attentions and bribes which are meant to propitiate the dreaded investigator of abuses.

After the production of the *Revizor*, Gogol went abroad, and for twelve years (1836–48) lived mainly in Rome, while paying occasional short visits to Russia. Rome left a deep impression on his mind, but during his residence there he was occupied with purely Russian subjects. There he wrote the classic novel, *Mertvuiya Dushi*, or "Dead Souls," the first part of which appeared in 1842. The hero of the story is an adventurer who goes about Russia making fictitious purchases of "dead souls," *i.e.*, serfs who have died since the last census, with the object of pledging his imaginary property to the government. His adventures provide the occasion for a series of unforgettable pictures of Russian provincial life, and of types of Russian society. These amazingly vivid pictures are a fundamental part of the experience of all Russian students of their own language. Gogol had an individual vision which presented his types with a force and truth of the kind attained by Dickens at his best. No one can fully appreciate Gogol's merits as a humorist who is not intimate with the language in which he wrote, but there are good English versions by C. Garnett (1922) and by D. J. Hogarth (Everyman Edition, 1906). To the period of his residence in Rome belong also the recasting of *Taras Bulba* and his second comedy, *Marriage*.

Dead Souls was published in 1842; Gogol lived ten years longer. He was still a young man, only 43, and it was reasonable to expect that the creator of the *Revizor* and of *Dead Souls* would produce other great imaginative works. He was a great artist and though both the comedy and the novel were "events" in the history of Russia, they are what they are because of the imaginative genius of the author. Gogol the man found himself the hero of those who would regenerate Russia, and he seems at this point to have stifled his natural genius because of his conviction that he had a mission. However that may be, he began to work on the second part of his epic of *Dead Souls*, with the idea of showing the redemption of Chichikov and his kind. He failed, and destroyed the draft, but he wrote what he conceived to be his message to Russia in his *Selected Passages from a Correspondence With Friends* (1847). It called forth some bitter replies, especially from Belinsky, who accused him of "falsifying Christianity for the profit of those in power" (*see* D. Mirsky, *Hist. of Russ. Lit.*). Gogol felt the rebuff deeply, and sought compensation in a religious experience that was denied to him. In vain he went on pilgrimage to the Holy Land (1848). On his return he fell under the influence of a fanatic, Father Matthew Konstantinovsky, who persuaded him that his imaginative work was sinful. He fell into melancholy and destroyed some of his manuscripts. He died on Feb. 21, 1852.

The works of Gogol, translated by C. Garnett, are available. *See* Shenrok, *Materials for the Biography of Gogol* (in Russian) (1897); N. Bazhenov, "Illness and Death of Gogol," *Russkaya Muisl* (Jan. 1902); J. Lavrin, *Gogol* (1926); M. Theiss, *Nikolaus W. Gogol und seine Bühnenwerke* (1922).

GOGRA, a river of northern India. It rises in Tibet near Lake Manasarowar, not far from the sources of the Brahmaputra and the Sutlej, passes through Nepal as the Karnali and becomes the most important waterway in Uttar Pradesh. It joins the Ganges at Chapra after a course of 600 mi. Its tributary, the Rapti, is also commercially important. The Gogra is also called the Sarju, and in its lower course the Deoha.

GOHIER, LOUIS JEROME (1746–1830), French politician, son of a notary, was born at Semblançay (Indre-et-Loire) on Feb. 27, 1746. He practised law at Rennes. He was minister of justice (March 1793–April 1794), and in June 1799 succeeded Treilhard in the Directory. His wife was intimate with Josephine Bonaparte, and when Bonaparte returned from Egypt in Oct. 1799 he tried to gain over Gohier, who was then president of the Directory. Refusing to resign after the coup d'état, Gohier was detained for a time and on his release retired to Eaubonne. In 1802 Napoleon made him consul general at Amsterdam. He died at Eaubonne on May 29, 1830.

His *Me'moires d'un vétéran irre'prochable de la Révolution* was published in 1824, and his report on the papers of the civil list preparatory to the trial of Louis XVI is printed in *Le Procès de Louis XVI* (Paris, an III) and elsewhere.

GOHRDE, a forest of Germany, in the *Land* of Lower Saxony, immediately west of the Elbe, between Wittenberg and Liineburg. It has an area of about 85 sq.mi. and is famous for its oaks, beeches and game preserves. It is memorable for the victory gained there on Sept. 16, 1813, by the allies, under Wallmoden, over the French forces commanded by Pecheur, and on account of the constitution of Göhrde promulgated there in 1719.

GOIÂNIA, capital of the state of Goiás in Brazil, is about 70 mi. S.E. of Goiás. Pop. (1950) 39,871. Goiás, the old capital, is a mining town on a small tributary of the Rio Araguaia. Gold was discovered there in 1682 by Bartholomeu Bueno, the first European explorer of this region, and the settlement founded by him was called Santana, which is still the name of the parish. The site of the town is a barren, rocky mountain valley, 1,900 ft. above sea level, in which the heat is oppressive at times and the nights are unpleasantly cold. There is regular air service.

The state contains the area selected for a possible future federal capital on the plateau about 130 mi. N.E. of the city of Goibnia.

GOIÁS, an inland state of Brazil, formerly spelled Goyaz and Goiaz, is bounded by the states of Maranhão on the north, Mato Grosso and Pará on the west, Maranhão, Bahia and Minas Gerais on the east, and Minas Gerais and Mato Grosso on the south. Its area is 240,333 sq.mi. Its population (1950) was 1,209,368. The chief cities are Goibnia, the capital since 1937, Goiás, the old capital, Anápolis, Ipameri, and Catalão, all located in the southern part of the state.

Goiás lies wholly within the Brazilian highlands. In the south it occupies the larger part of the *planalto central*, or central plateau, the vast level surface of which stands between 2,500 and 3,000 ft. above sea level. A few rounded ridges stand higher than this, the highest being the Chapada dos Veadeiros (5,505 ft.). The *planalto central* forms the divide between three of Brazil's largest river systems: to the south Goiás is drained through the Paranaiba, a tributary of the Paraná; to the east it is drained by tributaries of the São Francisco; and the greater part of the state is drained northward through the Araguaia and the Tocantins. None of these rivers is navigable except for short distances. The southern part of the state is covered with a woodland savanna known in Brazil as *campo cerrado*. To the north, where the Araguaia and Tocantins have eroded deep valleys, the land is covered uith tropical rain forest, or selva. The whole area enjoys moderate temperatures, except in the deeper valleys which are warm enough to permit survival of malaria mosquitoes. The year is divided into a rainy season (October–March) and a dry season (April–September).

The first Portuguese exploration of this interior part of Brazil was carried on by expeditions from São Paulo in the 17th century. In a few places gold and diamonds were found in the stream gravels; one of the chief mining areas was in a tributary of the Araguaia and there the old colonial town of Goiás was located. In 1744 this large inland area, much of it still unknown by white men, was made a captaincy general, and in 1822 it became a province of the empire of Brazil. It became a state in 1889.

The greater part of Goiás is still very thinly populated. Only a few isolated settlements are scattered throughout the northern two-thirds of the area. The chief concentration of settlement is in the southeast, across the border from Minas Gerais. Anápolis, reached by rail from Rio de Janeiro and São Paulo, is a rapidly-growing frontier town, serving the new zone of pioneer settlement in an "island" of forest to the northwest, the Mato Grosso de Goiás. Farm settlement has also moved into smaller forested areas along the valleys of the southeast. The open campos, however, offer only poor pasturage, and their use for agriculture remains uncertain. The state produces quartz crystals, diamonds, titanium, nickel, and chromium. (P. E. J.)

GOIDÀNICH, PIER GABRIELE (1868–1953), Italian linguist, whose main scholarly interest was in the Romance languages, Old Latin and Indo-European, was born on July 30, 1868, in Volosca (Istria). He obtained his doctorate at the University of Pisa, where he also was professor of the comparative history of the classical and neo-Latin languages from 1899 to 1906. He then was transferred to the University of Bologna, where he remained until his retirement.

A prolific writer, he was, in philosophy and methods, in continued disagreement with the neolinguistic school, created and guided by his compatriot Bartoli. Goidànich's arguments can be seen in his "Neolinguistica o linguistica senza aggettivo?" *Archivio glottologico italiano* (AGI), vol. 21, pp. 59–105 (1927), and "Il mio insegnamento di glottologia," AGI, vol. 30. pp. 1–51 (1938), the latter of which, written in the year of his retirement, is his scholarly testament. He was editor of the AGI from 1910 to 1926, and coeditor from 1926 to 1953 (until 1946 with his rival Bartoli). In this journal he published numerous articles. Goidànich died on Nov. 1. 1953, at Bologna. (E. PM.)

GOIDELIC DIALECTS: *see* CELTIC LANGUAGES.

GÓIS, DAMIÃO DE (1502–1574), among the most outstanding of Portuguese humanists, was born of a patrician family at Alenquer on Feb. 2, 1502. Under King John III he was employed abroad after 1523 on diplomatic and commercial missions, and he traveled widely in Europe. He knew many leading scholars intimately, was acquainted with Luther and Melanchthon and in 1532 became the pupil and friend of Erasmus. Góis took his degree at Padua in 1538. He married in Flanders and settled at Louvain, then the literary centre of the Low Countries, where he was living in 1542 when the French besieged the town. Taken prisoner, he was confined for nine months in France, but was rewarded later for his services by a grant of arms from Charles V. He returned to Portugal in 1545 and in 1548 was appointed chief keeper of the archives and royal chronicler. In 1558 he was commissioned to write a history of the reign of King Manuel, and the first part appeared in 1566.

Damião de Góis was a man of wide culture and genial manners, and a skilled musician. He wrote both Portuguese and Latin with classic strength and simplicity. His portrait, by Albrecht Diirer, shows an open, intelligent face, and the record of his life proves him to have been upright and fearless. But his historical work gave offense to the great families; a denunciation to the Inquisition in 1545 was taken up later! and in 1j71 he was arrested. He was sentenced to a term of strict reclusion at the monastery of Batalha. Later he seems to have returned to Alenquer where he died suddenly on Jan. 30, 1574. (E. P.; A. B.; N. J. L.)

BIBLIOGRAPHY.—Gois's Portuguese works include the *Crdnica do felicissimo rei Dom Emanuel,* 4 pt. (1566–67), also ed. by D. Lopes and J. M. Teixeira de Carvalho in 4 vol. (1926); *Crdnica do principe Dom Jodo* (1567), ed *by* A. J. Gonçalves Guimarães (1905). Among his major Latin works are *Fides, religio, moresque Aethiopum* (1540) and *Deploratio Lappiae Gentis* (1540). Some of his Latin treatises are available in Portuguese translation in *Opúsculos histdricos de Damido de Gdis* (1945). *See* also G. *J.* C. Henriques, *Inéditos Goesianos,* 2 vol. (1896–98); J. de Vasconcelos, *Damião de Gdis* (1897); F. M. de Sousa Viterbo, *Estudos sobre Damido de Gdis* (1900); *M.* Lemos, "Damião de Góis," in *Revista da Historia,* vol. ix and x (1920–22); M. Bataillon, "Le Cosmopolitisme de Damião de Góis," in *Études sur le Portugal au temps de l'humanisme* (1952); *A.* F. G. Bell, "Damião de Góis, a Portuguese Humanist," in *Hispanic Review* (1941). (N. J. L.)

GOITRE. A goitre is an enlargement of the thyroid gland which is located in the neck just beneath the larynx. (See THYROID; ENDOCRINOLOGY: Thyroid Gland; HORMONES: Thyroid.) Goitres are usually confined to the neck but occasionally they are also found within the thorax. The normal thyroid weighs 20–30 g.; goitres may reach a size of 1 kg. The goitrous gland may exhibit a diffuse symmetrical hypertrophy, or the excessive growth may be nodular or adenomatous, disturbing the gross architecture of the gland. Most adenomatous growths are benign, but a small minority are or become malignant. The thyroid is also enlarged in the inflammatory disease, thyroiditis.

Endemic goitre occurs in a large proportion of the population in those areas of the world in which the iodine content of drinking water and food is exceedingly low. Switzerland and the Great Lakes region in the U.S. are notable in this regard. Iodine is an integral part of the hormonally active amino acid thyroxin and closely related compounds secreted by the thyroid. When the iodine is not supplied in sufficient quantity the gland hypertrophies, presumably in its effort to produce an optimum amount of hormone. At first there may be a diffuse enlargement of the gland, but eventually nodular growths evolve. When the iodine deprivation has been extreme for years, hypothyroidism develops and the children of such individuals may be cretins. (See CRETINISM.) Supplementing the usual iodine intake by the addition of iodide to table salt has been shown to prevent goitres effectively in endemic areas.

Nodular goitres also occur in nonendemic areas. The pathogenesis of these sporadic goitres is uncertain. However, the enlargement of the thyroid that occurs as a normal accompaniment of pregnancy and the fact that about 80% of these nodular goitres occur in women have suggested that cyclic variations in ovarian and pituitary activity may alternately stimulate and inhibit the thyroid and thus play a role in the genesis of nodular enlargements. It is also possible that goitrogenic chemicals found in small quantities in some foodstuffs (*i.e.,* cabbage) may be provocative in this regard.

Some drugs, most notably thiocyanates and thiourea derivatives, also possess goitrogenic properties. Thiocyanates inhibit the iodide trapping mechanism of the gland; the thioureas actually block the synthesis of the hormone. In either case thyroid hypertrophy results. Thiourea derivatives are frequently employed in the treatment of hyperthyroidism. Although the thyroid may enlarge during the administration of these drugs, this is seldom a contraindication to continued therapy.

Hyperthyroidism may occur with diffuse or nodular goitres. Graves' disease is characterized by the association of hyperthyroidism, exophthalmos (protrusion of the eyes) and a diffuse enlargement of the thyroid (exophthalmic goitre). Exophthalmos is rare indeed when nodular goitres become hyperactive. The diagnosis of thyrotoxicosis in patients with nodular goitre is especially difficult due to the usual insidious onset in these cases. Toxic goitres can be treated in one of several ways. The surgical removal of most of the gland, subtotal thyroidectomy, is the treatment of choice in younger patients. Such surgery must be preceded by medical control of the hyperthyroidism, which is conveniently carried out by combined treatment with iodine (Lugol's solution) and one of the thiourea derivatives such as 6-propylthiouracil. In older patients surgery can be avoided by employing radioactive iodine (I^{131}). This isotope, which can be given orally, is taken up by the thyroid cells which are then destroyed by the radioactive emanations. The dosage can be so regulated that a sufficient remnant of undamaged thyroid tissue remains to maintain normal thyroid function. In occasional patients with Graves' disease protracted treatment with one of the thiourea compounds alone has been successful in inducing lasting remissions.

Nodular goitres should be removed surgically whenever they interfere with the function of neighbouring organs. Tracheal compression which may embarrass respiration, and impaired deglutition due to oesophageal involvement are the most frequent indications. A relatively rapid growth of the tumour suggests the possibility of malignancy, and hence also calls for a subtotal thyroidectomy.

Carcinomas of the thyroid appear to develop with unusual frequency in nodular goitres, especially those with only a single nodule or adenoma. Despite the considerable frequency of goitres, the incidence of carcinoma of the thyroid is not great, being among the least frequent of malignancies. Nevertheless the low morbidity and mortality which attend thyroidectomies have persuaded many physicians to advise the removal of almost all solitary adenomas as a prophylactic measure. X-ray treatment of the head, neck and chest in children has been shown to be one of the causes of carcinoma of the thyroid.

Hashimoto's struma and Riedel's struma are chronic inflammatory disorders of the thyroid which may simulate other goitres. These are rare diseases of unknown aetiology which often terminate with the destruction of active thyroid tissue and the production of hypothyroidism. Acute thyroiditis is more readily distinguished because the enlarged gland is exquisitely tender and painful.

See Sidney C. Werner (ed.), *The Thyroid* (New York, 1955; London, 1956). (R. L. L.)

GOKALP, ZIYA (pseudonym of MEHMED ZIYA) (1875–1924), Turkish sociologist, writer and nationalist leader, was born in Diyarbekir. He entered the Istanbul Veterinary school in 1896 but his active membership in a secret revolutionary society led to imprisonment and then "exile" to his home town. After the Young Turk revolution (1908) Gokalp took part in a committee conference of the secret Society of Union and Progress in Salonika and, settling there, played an important part in the activities of the committee which later virtually ruled the country. His contributions to the literary periodical Gench *Kalemler* gave impetus to the campaign for language reform. When the Balkan War broke out he was appointed to the chair of sociology at Istanbul university, soon becoming the intellectual leader of the Nationalist movement. After the 1918 armistice, he was exiled to Malta with a number of leading Turkish politicians. Freed after the Nationalist victory, he went to Diyarbekir, publishing there the periodical *Küchük* Mecmua. Later he moved to Ankara, worked in the ministry of education and was elected member of parliament in 1923. He died in Istanbul on Oct. 25, 1924.

An ardent ideologist of Pan-Turanism, Gokalp greatly influenced the politicians and writers of his generation.

See Z. Fahri, *Ziya Gokalp, sa vie et sa sociologie* (1936); U. Heyd, *Foundations of Turkish Nationalism* (1950). (F. I.)

GOKCHA (Gok-Chai; Armen. Sevanga; anc. Haosravagha), a lake in Armenian S.S.R., U.S.S.R., 40° 20' N. and 45° 35' E., altitude 6,279 ft., triangular in shape, measures 45 mi. N.W.–S.E., max. width 25 mi., max. depth 325 ft., area 540 sq.mi. It is surrounded by barren mountains of volcanic origin 12,000 ft. high. Its outflow is the Zanga, a tributary of the Aras (Araxes); it never freezes, and its level undergoes periodical oscillations. It contains four species of *Salmonidae,* and two of *Cyprinidae,* peculiar to the drainage area of this lake.

GOKHALE, GOPAL KRISHNA (1866–191j), Indian politician, was born at Kolhapur. Graduating at the Elphinstone college, Bombay, in 1884, he became professor of history and political economy at the Fergusson college, Poona. He remained on the staff, finally as principal, until 1902.

He was associated with the Indian National congress from the beginning and was for some years its joint secretary. In 1902 he became a member of the Bombay legislature and was then elected to represent the nonofficial members thereof in the viceregal legislature. In 1905, although opposed by the extremist section of congress, he became president of that body. In the same year he founded at Poona his Servants of India society, whose members take vows of poverty and lifelong service to their country in a religious spirit. In the enlarged viceregal legislature set up in 1910, Gokhale was the commanding Indian figure. His quickness in debate, the attractive literary style of his speeches, his studied moderation, and the care which he took to master his subjects made him a most effective critic of the government, though he disclaimed the title of the leader of an opposition party.

He specialized as a critic of Indian official finance and was particularly brilliant in his handling of the annual budgets. He promoted measures for compulsory education on a basis of local option but did not survive to see this principle introduced from 1918 onwards in all the large provinces. His last public duty was to serve as a member of the Indian Public Services commission (1912–15). His death at Poona on Feb. 19, 1915, was a severe blow to the Constitutional party at a critical moment in India's political history. He was one of the last and greatest of the old school of congress politicians before the age of nonco-operation.

See *Speeches of the Honourable Mr. G. K. Gokhale* (Madras 1908, 3rd ed., 1920); R. P. Parāñjpye, *Gopal Khrishna Gokhale* (1915).

GOLASECCA is a village of Italy on the river Ticino, a few miles below the point at which it issues from Lago Maggiore. Extensive cemeteries of the iron age have been found all over this district, and the name Golasecca has come to be applied indiscriminately to the whole series, occupying an area of nearly forty square kilometres. Some of them are situated on the left bank of the Ticino at Somma, Vergiate, Sesto Calende and Golasecca itself; others on the right bank at Castelletto Ticino and the Lazzaretto of Borgo Ticino. After the first quarter of the 19th century all these sites were despoiled by excavators, very often unauthorized, and the objects found in them were broken up or scattered over the world. The only collection of any size or importance is in the museum at the Sforza castle in Milan. There may be seen the contents of the Sesto Calende tomb illustrated in the accompanying drawing, as well as the collection formed by Castelfranco, the only archaeologist of the 20th century to make any comprehensive study of the region.

All the cemeteries of the Somma plateau were of the cremation rite. The tombs were very simple, each containing a single cinerary urn, often enclosed in the centre of a circle of rough stones. In several instances these circles were approached by a corridor of similar stones. The most perfect example of this kind is a circle 17 metres in diameter enclosing a smaller circle 43 metres in diameter approached by a corridor 30 metres long. One burial was found within the small circle and three more within the outer circle. Castelfranco observed traces of about 50 stone enclosures and it is probable that there had been many more. Castelfranco, whose explorations were fairly extensive and systematic, states that he invariably found a tomb in the centre of every circle that he explored, and that the tombs found within the circles contained precisely the same pottery as those which stood isolated from any enclosure. The construction of the graves. moreover, was precisely the same whether enclosed within a circle or not. There were four varieties, viz.: (1) plain round holes in which the ossuary was placed without any protection; (2) a heap of small stones surrounding the ossuary, which rested in a bed of similar stones and was sometimes covered with a rough slab; (3) rough slabs forming an oblong protection; (4) regular cists made of several slabs. These four methods of grave-making are precisely those employed by the other cremating peoples of Italy, which shows that the Golaseccans belonged to the same original family as the Comacines, Atestines and Villanovans. The contents of the ossuaries were poor, consisting at most of one or two fibulae or weapons, or small objects of bronze, iron, amber or glass. Outside the cinerary urn itself were sometimes smaller jars and bowls.

It was principally upon a study of this pottery that Castelfranco based his division of the Golasecca antiquities into two periods. It expresses a theory which cannot be maintained. There are undoubtedly two schools of pottery-making represented at Golasecca, the one characterized by rough jars with incised ornamentation, the other by a finer ware with striped decoration obtained by double-burnishing. But the two styles were sometimes found together in a single tomb and are certainly not mutually exclusive. Similarly the attempt to establish the existence of two periods by the evidence of fibulae has broken down under analysis, so that there is only one period in all the Golasecca cemeteries.

As to the chronology there were for some time great divergencies of opinion, caused chiefly by the different interpretations given to the warrior's tomb of Sesto Calende.

The tomb of the warrior Sesto Calende is the most important single discovery in the Golasecca area. It was found by a farmer in the process of ploughing his field in 1867, and was described by Biondelli in the same year. Discussion as to the date centred upon the situla made of plates of hammered bronze ornamented with rudely executed figures and scenes. These are not embossed or engraved as on the fine situlae of the Etruscans or Atestines but outlined by the very primitive process of pointillé, that is to say with small consecutive dots. The technique is so infantile and the execution so poor that it was natural to suppose the situla to be a very archaic work. Actually, however, comparisons have shown that though childish art it is not primitive. For an attentive examination of the scenes brings out the fact that they are derivations with a good deal of travesty and misunderstanding from a well-known Etruscan original. And from the date of this original it is possible to fix the date of the Sesto Calende situla, which can be very little if at all earlier than 500 B.C. The theory therefore that this is the grave of some very early Celtic warrior, with all its implications of a Gaulish invasion in the early Iron Age, must be finally abandoned. Nor is there any reason for attributing the burial to a Celt even of the 5th century, for the weapons and accessories are not distinctively Gaulish; in fact the tomb, though richer than the average, is a fair representation of the usual Golasecca civilization.

The entire subject thus becomes much clearer. The Sesto Calende warrior and his famous situla find their natural place at the end of the Golasecca period. There are not two periods, as Castelfranco supposed, but only one, which ranges from 750 or 700 to 500 B.c., as the fibulae plainly show. The Golasecca period therefore is precisely conterminous with the Amoaldi period of Bologna.

The amount of material available for a study of Golasecca, though lamentably meagre, shows that in the 7th and 6th centuries B.C. that branch of the cremating invaders which had made its way by stages from the eastern Alps to a home on Lago Maggiore was backward in its civilization. The Golaseccans are far behind the Atestines and the Villanovans of the same period; they are distinctly poor relations, living in a remote province on the outskirts of the more progressive nations. They were not of much importance in the development of early Italy. There seems, however, to have been a trade system which extended all through the pre-Alpine region from the Ticino to Trieste, by which the products of the Adriatic filtered to this distant corner. And perhaps it is possible to detect in some of the metalwork and in the individual character of the pottery the beginnings of a native local style which is independent although barbaric. The Golaseccans, however, form only a part of the early population of Lombardy with neighbours and kinsmen living round Varese and Como. In this region the records begin earlier and the material though scattered is more abundant.

BIBLIOGRAPHY.—The Gaulish theory of Bertrand is given in his book written with S. Reinach in 1894, *Les Celtes dans les vallées du Po et du Danube*. D. Randall-MacIver, *The Iron Age in Italy* (1927), gives all the original references. The articles by de Mortillet and Castelfranco are out of date, though the latter has a certain value as an original record. The old-fashioned dissertation of the Abbé Giani

has been usefully summarized by Montelius, *La Civilisation primitive en Italie,* col. 231–247, with plates, reproducing the best of his drawings as well as those of Castelfranco and Biondelli. Déchelette, *Manuel d'Archéologie,* vol ii[2], pp 730–743, is useful Hoernes has a good discussion of the situla in his *Urgeschichte der bildenden Kunst.*

GOLCONDA, a fortress and ruined city of India, in the Deccan, 5 mi. W. of Hyderabad city. From 1512 to 1687 Golconda was the capital of a powerful Shi'ah kingdom, one of the five Moslem sultanates established in the Deccan after the disintegration of the Bahmani kingdom. Its rulers, the Kutb Shahis, were overthrown by Aurangzeb in 1687 whereupon Golconda was annexed to the Mogul empire.

The fortress of Golconda, on a granite ridge, is extensive and strong and contains many enclosures, but is commanded by the summits of the enormous and massive mausoleums of the ancient kings about 600 yd. distant. Golconda has given its name in English literature to the diamonds which were found in other parts of the dominions of the Kutb Shahi dynasty, and cut at Golconda.

See W. H. Moreland (ed.), *Relations of Golconda* (1931).

GOLD is an extremely dense, valuable, bright yellow metal. with a resplendent lustre. Because of its brilliant appearance, unalterability and occurrence in the native condition, gold was one of the first metals to attract the attention of man. It was known and highly valued by the earliest civilizations, Egyptian, Minoan, Assyrian and Etruscan, and from all these periods ornaments of great variety and of beautiful and elaborate workmanship survived, many of them being as perfect as when they were first made several thousand years ago. (See SILVERSMITHS' AND GOLDSMITHS' WORK.)

The making of gold from base metals by means of the philosopher's stone, and discovery of the elixir of life were the chief aims of the alchemists of the middle ages, and many of the advances in early chemistry were the direct outcome of such experiments. In this atomic age the transmutation of base metals into isotopes of gold is regarded as scientifically possible. The chemical symbol for gold is Au; its atomic number is 79 and atomic weight 197.0. (W. E. CL.)

Gold is of chief interest physically for its great density (19.3 times the weight of an equal volume of water), remarkable ductility and malleability, and high resistance to corrosion. A cubic foot of solid gold weighs about 1,200 lbs., and the standard gold "brick," or bullion bar contains 1,000 troy ounces (nearly 70 lb. avoirdupois). Gold can be drawn into extremely fine wire and beaten into the well-known gold leaf. With the exception of hot aqua regia, the alkali cyanides and free chlorine, gold will not readily combine with other chemical elements or compounds.

Gold has been the symbol of wealth in all of the great civilizations of which we have any record. Throughout history men have fought and toiled for this beautiful and enduring metal. Yet, it is estimated that the greater part of all the gold won from the earth in the last 10,000 years could still be accounted for in the bank and government vaults. and in the widely distributed wealth of ornaments, jewelry and other artifacts throughout the world. No other possession in all time has been so zealously and effectively guarded. (F. L. BI.)

Occurrence. — Gold is generally found in the native or uncombined state since it is the least chemically active of the metals. It is widely disseminated throughout igneous rocks in extremely small percentages, but hydrothermal waters have effected some concentration of it in quartz veins. As various other minerals, such as iron pyrites (FeS_2), galena (PbS) and chalcocite (Cu_2S), have been geochemically precipitated in underground fissures, gold has been deposited in association therewith, much of the gold being as the element or with sulfides. A minor occurrence of gold is in the mineral calaverite ($AuTe_2$). As weathering and stream erosion of earth masses containing gold in rock matrix have taken place, alluvial or placer gold has resulted. Because gold particles are about seven times as heavy as like-sized siliceous particles, an accumulation of gold as nuggets, flakes and specks has taken place in certain water-deposited gravels and sands near bedrock; water flow has carried away the bulk of the siliceous land mass in which the gold was originally deposited. Placer mining has the purpose of recovering this stream-deposited gold, whereas lode mining aims at obtaining gold from veins or reefs (hard-rock mining). The mother lode is a fictional vein which men seek and is said to be fabulously rich; it supposedly is the source of gold that has given rise to rich placer deposits in downstream channels. Many articles have been written about gold in sea water, and more than 30 patents have been issued on processes for recovery of gold from the sea. As methods for analysis for gold in sea water became more exacting, it was found that there is less than 0.1 mg. of gold in a metric ton of sea water and it is not considered an economically feasible project to try to recover this less than $0.0001 of gold per metric ton from sea water.

Naturally occurring metallic gold usually has variable amounts of silver, copper, platinum, palladium or certain other elements admixed with it. Purity of gold is reported as fineness, parts of gold per 1,000; pure gold is called 24 carat, whereas alloy gold may be 12, 14, 16, 22, etc., carat depending on the percentage of gold in the alloy. A 12-carat gold alloy is 50% gold.

The era of gold production that followed the discovery of America was in all probability the greatest the world had witnessed to that time. The exploitation of mines by slave labour and the looting of palaces, temples and graves in Central and South America resulted in an influx of gold that unbalanced the economic structure of Europe and disturbed its political structure. From the discovery of America by Columbus in 1492 to 1600 more than 8,000,000 oz. of gold came from South America, which was 35% of the world production during that time. That amount of gold would have the bulk of an 8-ft. cube and a value of $160,000,000. Although it seemed of fabulous value to people of the 16th century, it was small compared with money values involved in 20th-century world finance. South American mines (especially Colombian mines) continued in the 17th and 18th centuries to account for 61% and 80%, respectively, of world gold production; 48,000,000 oz. were mined between 1700 and 1800.

During the second era of intensive gold production, the 25 years following 1850, more gold was produced in the world than in the 358 years immediately previous, chiefly because of discovery of gold in California and Australia. A third marked increase in world gold recovery was in the period from 1890–1915, when gold discoveries in Alaska. the Yukon and on the Rand in Transvaal, U. of S. Af., were made. A big factor was the introduction of the cyanide process for recovery of gold from low-grade ores and ores containing minute particle-size gold.

Throughout the years gold production increased, until just prior to World War II the average yearly gold production was greater than production between 1493–1600 or 1600–1700. The 1954 world output, for example, was 35,100,000 oz., having a value of $1,228,500,000 (at $35 per oz.). This amount of gold stacked as gold bricks would make a 13-ft. cube. Since most mined gold goes through countinghouses and mints, a fairly accurate account of all gold mined since 1493 is recorded. The world production from 1493 to 1955 closely approximates 1,730,000,000 oz., which at a value of $35 per oz. amounts to $60,550,000,000. This gold would have the total bulk of a 50-ft. cube, which is indeed a small volume of matter to have so influenced the toil and destiny of so many people. (W. E. CL.)

GOLD MINING AND REFINING

The earliest mining work of which traces remain was on gold ores in Egypt, and gold washing is depicted on monuments of the 4th dynasty (2900 B.C.). The legend of the Golden Fleece, stripped of its heroic dress, describes an expedition (about 1200 B.C.) to seize gold which was being laboriously washed out of the river sands with the aid of sheepskins by the people of Armenia. It is interesting to note here, as an example of the value of some old ideas, that modern practice in the Transvaal frequently includes the use of corduroy blankets.

Ore Deposits. — Gold occurs in minute quantities in almost all rocks. It exists in association with most copper and lead minerals and although the quantity present is often extremely small, the gold is readily recovered as a by-product in the electrolytic or fire refining of the base metals.

Disseminations throughout large masses of rock rich enough to be called ores are unusual, and gold is generally obtained from quartz lodes or veins, or from deposits derived from them by denudation; *e.g.*, river gravels and the "banket" or conglomerate of the Transvaal. The origin of vein enrichment is not fully known, but it is believed that the gold was carried up from great depths with other minerals, at least partly in solution, and later precipitated. The mineral most commonly associated with gold, other than quartz, is iron pyrites, the yellow sulfide of iron, which is often mistaken for gold on casual examination. Others include copper pyrites, arsenical pyrites, zinc blende and stibnite, the antimony sulfide. Thus, where these sulfides have weathered to oxides at or near the surface of the ground, rich deposits of gold are sometimes encountered.

The gold in ores is generally in the free or "native" state, and rarely in chemical combination with other elements, the tellurides being an exception. Even the gold in iron pyrites is metallic, consisting of minute inclusions within the crystals or as thin films along their cleavage planes. For the most part the gold in rock is invisible to the naked eye, but sometimes it occurs in grains or flakes large enough to be seen, and more rarely, in "specimen rock!" in considerable masses. Crystals an inch or more across (belonging to the cubic system) have been found in alluvial deposits in California. Tellurides are found principally in western Australia and Colorado. The mineral calaverite, a bronze-yellow telluride, contains 40% gold; and sylvanite, a steel-gray mineral, contains up to 28% gold combined with some silver.

Alluvial deposits or "placers" are the sands, gravels and detritus of ancient or existing streams derived from the disintegration of auriferous veins or rocks. They were the most prolific source of gold in the past, although by 1927 they had become of little importance, with lode mining predominating. The gold, which may occur in the form of "gold dust," larger grains and irregularly shaped masses or occasional "nuggets," is dispersed through the sand or caught in crevices of the rocks. Sometimes the deposits are covered by thick beds of barren detritus or even lava flows, and can be reached only by sinking shafts and driving tunnels. The largest nugget on record was the "Welcome Stranger," weighing 2,500 oz., which was found in 1869 in Victoria, Austr., only a few inches deep in a rut made by a cart.

Among the most productive gold fields in ancient times were those in Egypt, where in the deep mines the labourers were cruelly maltreated, and in Asia Minor, the source of the riches of Croesus. The Romans obtained their gold in part from Transylvania. After the discovery of America the main supplies to Europe came from that continent.

In 1850–60 the gold diggings of California and Australia were at their zenith and at the end of the 19th century the "placers" of the Klondike and Alaska, the last-named a beach deposit, were famous for a short time. Soon after the turn of the century the Transvaal became the richest and most extensive gold field in the world, a position it continues to hold.

Placer Prospecting and Mining. — Prospecting and one-man mining operations still employ the miner's pan and batea (fig. 1 and 2). A few handfuls of the "dirt" are stirred and shaken with water in the pan to enable the gold to settle to the bottom. The upper layers are gradually washed away by dipping the pan into water and pouring it off, while imparting a twisting motion. Eventually only the gold and heavy minerals are left. The "cradle" or rocker (fig. 3), which resembled a child's cradle, was used to process larger quantities of earth and was more profitable. The gravel was shoveled onto the perforated iron plate and water poured on. The finer material dropped through onto the apron which distributed it across the "riffles," rocking being continuous. The gold was caught in these riffles,–which were cleaned out after enough had accumulated. This device is largely obsolete, though the riffle itself, which is any strip, bar or groove placed at right angles to the flowing stream to provide a protected spot where gold can settle. is still widely used in sluice boxes (fig. 4) and corduroy tables. The latter consist of wide, sloping plates with shallow sides on which are placed a commercial (coarser) form of the familiar corduroy cloth. Periodically the corduroy is removed and washed by hand in boxes partly filled with water, and the gold-rich concentrates further treated by amalgamation (*q.v.*).

FIG. 3. — ISOMETRIC DRAWING OF CRADLE OR ROCKER. USED FOR WASHING AURIFEROUS GRAVEL ON A SMALL SCALE

In California, thick beds of gravel on hillsides were extensively worked by hydraulic mining. Powerful jets of water at hundreds of pounds per square inch pressure were passed through giant swivel-mounted nozzles to break down the gravel banks and wash the material through lines of sluices. Great volumes of water were required and many miles of pipes and flumes. The cost of treatment was only a few cents per cubic yard and poor ground could be treated at a profit. The millions of tons of tailings, however, which were washed into the Yuba and Feather rivers had such an adverse effect on farming farther down the valleys that an injunction was obtained against the hydraulic miners in 1880 and their work thereafter was strictly limited.

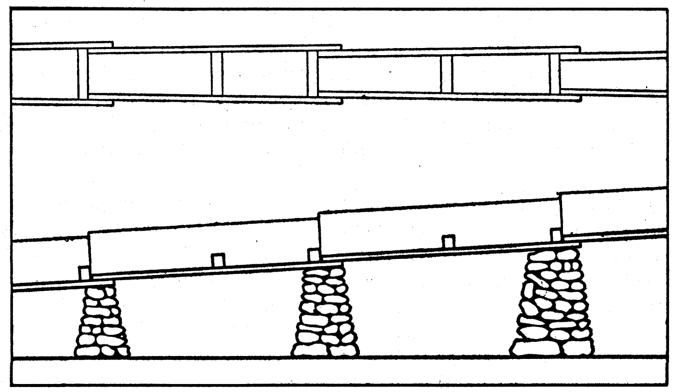

FIG. 4. — SLUICE BOXES, INCLINED WOODEN TROUGHS FOR SEPARATING GOLD FROM GRAVEL, SHOWING PLAN (TOP). GRAVEL. CONTAINING GOLD, IS CARRIED DOWN THE SLUICE BY A STREAM OF WATER. THE GOLD SINKS TO THE BOTTOM AND LODGES BEHIND THE CROSS-BARS

In the period 1900–15 dredging became the most important branch of placer working. The chain bucket dredge generally used is similar to those employed in deepening harbours and rivers. An endless chain of buckets provided with hardened steel lips is supported by heavy steel cables from a bridge across the foredeck of the vessel, and can be raised or lowered to suit the contours of the deposit. The gravel brought up by the buckets is broken up in revolving screens. Only the fine sands, containing the gold, pass through to the sluices or jigs. The coarser rock and fine tailings (after dewatering) are run out over the stern on a belt conveyor and stacked on the bank. Dredging originated in New Zealand and attained its greatest popularity on the rivers there and in California.

"Paddock dredging," a later development in the western U.S., enables all placer ground to be treated even if not in or near a river bed. The dredger floats in a pond continuously extended by its digging equipment at one end while the pond is filled up by the waste at the other. In this way the dredger moves across country taking its pond, or reservoir with it. By piling more gravel around the reservoir and increasing the water level, the dredger can be made to work its way up hill. In 1910 there were 72 operating dredges in California, but by 1945 only a few remained in operation. A typical large dredge weighs 2,500 tons, can dig to a depth of 70 ft. below water level and stack waste 165 ft. away; its yearly capacity is about 5,000,000 cu.yd.

Vein Mining and Ore Treatment. — The methods of mining and exploration of gold deposits are similar to those used for other metals (see MINING, METAL). Immense tonnages of gold ore are treated throughout the world. In the Transvaal alone 75,000,000 tons are treated annually. A typical treatment plant with a capacity of 4,000 tons per day employs hundreds of men and its buildings, storage bins and tanks cover many acres of ground. Gravity concentration, amalgamation, the cyanide process (*q.v.*) and various combinations of these methods are employed, depending upon the nature of the ore. Where much of the gold is closely associated with sulfides. the flotation process may also be a part of the treatment, and the enriched sulfide "concentrate" selectively treated (see METALLURGY: Ore Treatment). The first step is the crushing and wet grinding of the ore to a particle size such that the gold is sufficiently released from the enclosing minerals to be attacked and dissolved by the cyanide solution. Following separation of the waste solids from the 'clear gold-bearing solution, the latter is treated with zinc dust and the gold is precipitated in the form of a black powder, which is dried and melted with suitable fluxes. In some instances concentrated portions of the ore must be roasted before the gold can be extracted.

Refining. — Gold bars produced at the mines and gold dust and nuggets from placers are impure, containing about 90% gold with 8%–9% silver and smaller quantities of other metals. The gold is often brittle and is refined to make it suitable for use in industry. The ancients refined gold by "cementation." Plates of gold were stacked in an earthen pot and were surrounded and separated by powdered porous stone or brick dust, mixed with common salt and sulfate of iron. The pot was covered and heated to redness, but the temperature was not high enough to melt the gold. The silver and other impurities in the gold were gradually converted into chlorides, which melted and oozed out of the gold and were absorbed by the brick dust, and the gold was purified. Nitric acid was in use for refining gold in the 16th century. The gold was melted with at least three times its weight of silver (process of "inquartation"), and granulated by pouring into water. The granules were boiled in nitric acid which dissolved the silver and left the gold unchanged.

A chlorine process, invented in 1869 in Australia where acid was expensive, has become the usual method of refining. The gold is melted in clay pots and a stream of chlorine gas is bubbled through it (fig. 5). The chlorine reacts chemically with the silver which is present, and the silver chloride which is formed rises to the surface of the molten metal where it is skimmed off. The silver is recovered by electrolysis in another vessel. Most of the other metals react with chlorine like silver; but the gold is not attacked until nearly all the silver has been removed. Platinum is not recovered by the process and, if present, remains in the gold, but the impurities which cause brittleness in minting are always removed.

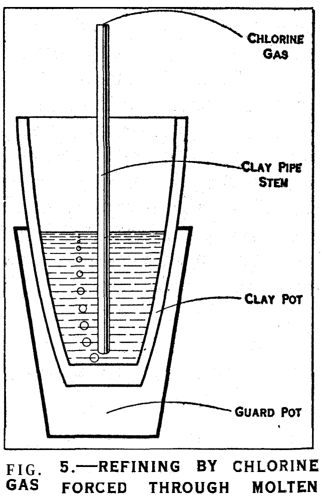

FIG. 5.—REFINING BY CHLORINE GAS FORCED THROUGH MOLTEN GOLD CONTAINED IN CLAY POT. REMOVING IMPURITIES. WHICH RISE TO THE SURFACE, PURIFYING THE GOLD

In U.S. mints the electrolytic process, introduced there in 1902, has since been in general use. The gold is cast into thick plates which are suspended on gold or silver hooks in a porcelain cell filled with a solution of gold chloride containing some hydrochloric acid. The hooks are hung on metal rods and the whole series of plates and hooks are connected and are made the anode (fig. 6). A series of thin rolled plates of pure gold are suspended in the cell alternately with the impure plates and connected to form the

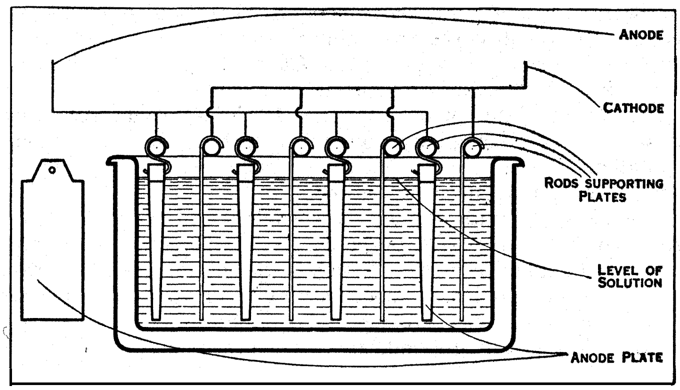

FIG. 6.— ELECTROLYTICREFINING, IN WHICH ANODE PLATES OF IMPURE GOLD HUNG BY HOOKS IN HOT ACID, WASTE AWAY BY THE ACTION OF A CURRENT OF ELECTRICITY PASSING FROM THEM THROUGH THE LIQUID TO THE THIN CATHODE PLATES, WHERE PURE GOLD IS DEPOSITED

cathode. The liquid in the cell is heated to about 60° C., and is continuously stirred. A current of electricity is passed from the anode plates to the cathode through the liquid. The gold is dissolved from the anodes and is precipitated on the cathodes. At the end of the run it is stripped off the cathode plates and melted into bars. The silver is converted into insoluble chloride which falls to the bottom of the cell, and other metals, including platinum, dissolve in the liquid and remain in solution. The platinum is, however, subsequently recovered and sometimes pays for the whole operation. The process is somewhat slow, occupying three or four days, but the cathode gold is over 999 fine.

Alloys of Gold. — Gold can be alloyed with silver in all proportions and the alloys are soft, malleable and ductile. The colour of gold gradually changes from yellow to white as the proportion of silver increases. When the silver is over 70% the alloys are white. "Green gold" (gold 75%, silver 25%) is used in jewelry. Gold-silver alloys are used to make trial plates, or standards of reference, with which the fineness of gold wares and coins are compared. Copper hardens gold and forms alloys of reddish-yellow colour at conveniently low melting points. These alloys blacken when heated, but the discoloration is removed by sulfuric acid. The triple alloys of gold, silver and copper are malleable and ductile, with a rich gold colour. They are much used for the production of gold wares. Some zinc is often present in 9-carat gold. Hot nitric acid attacks all but the richer alloys of gold with silver or copper or both, and if the proportion of gold is no more than 33%, practically the whole of the silver and copper are removed in solution. Some of the gold-palladium and gold-platinum alloys are ductile and fit for use in jewelry. The alloys containing 10%–20% of palladium are nearly white. Amalgams are alloys of gold and mercury. A piece of gold rubbed with mercury is immediately penetrated by it, turning white and becoming exceedingly brittle. The ductility is not always restored on driving off the mercury by heat. Solid amalgam contains 40% or more of gold, but any excess of mercury over 60% makes the amalgam pasty. The amalgam produced in gold mills is not a true amalgam but a collection of little nuggets of gold, coated and partly saturated with mercury. Gold is extracted from molten lead by adding zinc. The zinc and gold form a solid crust which floats on the surface of the lead. Advantage is taken of these properties in smelting. Gold forms alloys with many other metals but most of them are brittle, and none is of metallurgical importance. Even a minute quantity (0.02%) of tellurium, bismuth or lead makes gold brittle. (T. K. R.; F. L. BI.)

PROPERTIES

In the finely divided state the colour of gold is variable, depending upon the size of the particles. The usual colour of precipitated gold is brown, but black, purple, blue and pink shades are known. In very thin sheet or leaf, gold is translucent and transmits a greenish light. When pure, it is the most malleable and ductile of all the metals; it can be beaten to not more than 0.00001 mm. in thickness (see GOLDBEATING), and a single gram has been drawn into a wire 2 mi. long. Traces of other metals reduce considerably the malleability and ductility, lead being especially injurious in this respect. Cadmium, tin, bismuth, antimony, arsenic, tellurium and zinc act in like manner.

Gold is one of the softest metals, its hardness varying according to treatment and being between 2.5–3.0 on the Mohs' scale. Gold crystallizes in the face-centred cubic system, with a unit cell dimension of 4.0701 angstrom units.

The specific gravity of gold varies slightly and is dependent on treatment. For practical purposes the specific gravity of pure gold may be taken as 19.3, and such is the specific gravity of cast gold. Distilled gold has a specific gravity of 19.26, drawn gold 19.25, cold rolled sheet 19.296 and gold precipitated by CH_2O 19.39. This last figure indicates that precipitated gold has a greater specific gravity and that this property varies with the precipitant employed and the temperature of precipitation.

The melting point of gold is 1,063° C. and constitutes a fixed point for pyrometry. Liquid gold just above its melting point has a specific gravity of 17.1. Gold is comparatively easily volatilized at high temperatures; at its melting point the loss is insignificant but becomes appreciable at high temperatures, and at 1,250° C. it is 2.6 parts per 1,000 per hour (T. K. Rose). In all mints and gold refineries the flues are carefully swept periodically, and considerable quantities of the metal are thus recovered. Liquid gold boils at 2,600° C. and yields a purplish vapour. The heat of fusion of gold is 13.3 kilojoules per gram atom and the heat of vaporization is 368.0 kilojoules per gram atom.

The mean specific heat of gold is 0.0312, a number which agrees well with the law of Pierre Dulong and Alexis Petit. Its coefficient of linear expansion is about 0.000014 for 1° C.

The spark spectrum of gold is complicated; the most prominent lines in the visible spectrum lie at 6,278 and 5,957 in the orange and red, 5,837 and 5,656 in the yellow, 5,065 in the green, 4,793 and 4,437 in the blue and 4,065 and 3,898 in the violet.

The electrical conductivity of gold is greatly influenced by traces of impurities. The electrical resistance, which is the converse of conductivity, is 2.44×10^{-6} ohm/cm. for pure gold at 20° C; for silver and copper the values are 1.59×10^{-6} and 1.72×10^{-6} ohm/cm., respectively, at zo° C. The electrical resistance steadily diminishes with a lowering of the temperature, and at the boiling point of helium in *vacuo* (*i.e.*, below 5° K.) it has practically disappeared (H. K. Onnes), or, in other words, gold is then a perfect conductor of electricity.

The ionization potential of gaseous gold atoms is 9.18 volts. The potential of the electrode $Au = Au^+ + e^-$ compared with the hydrogen electrode as zero is -1.68 volts. The radius of gold ion in solids is 1.37×10^{-8} cm. Gold crystallizes in the isometric system as is true of many metals. The electron structure for a gold atom is designated as follows:

$$1s^2;\ 2s^2,\ 2p^6;\ 3s^2,\ 3p^6,\ 3d^{10};\ 4s^2,\ 4p^6,\ 4d^{10},\ 4f^{14};\ 5s^2,\ 5b^6,\ 5d^{10};\ 6s^1,$$

thus accounting for its atomic number of 79. It is evident gold will exhibit a chemical valence of one, and possibility of valence of two or three. One stable form of gold (mass number 197) and several radioactive isotopes of mass numbers 187–189 and 191–203 are known.

Chemical Properties. — The position of gold in B group of family I of the periodic table along with copper and silver, and the placement of gold at the bottom of the electromotive series of the metals. best indicates the general chemical properties of the element. Its characteristic valence is plus one in aurous compounds and plus three in auric compounds. Gold ions will receive electrons from any other metal to resume the metallic state, viz., $3\ Pt + 2Au^{+++} \rightarrow 3\ Pt^{++} + 2Au$. Gold exhibits a co-ordination number of four which helps to explain its complex compounds. It is insoluble in nitric, hydrochloric or sulfuric acids, but soluble in hot selenic acid forming gold selenate. Hot telluric acid also dissolves it. The usual solvent for gold is aqua regia (*q.v.*)—a mixture of three volumes of concentrated hydrochloric acid with one volume of concentrated nitric acid. which in practice is always diluted with a considerable volume of water. The ionic equation for this dissolution is:

$$Au + 5H^+ + 4Cl^- + NO_3^- = HAuCl_4 + NO + 2H_2O$$

The product is chlorauric acid which is the precursor of such salts as $NaAuCl_4.2H_2O$, which is used in toning photographic prints. Gold will also dissolve in aqueous solutions of alkaline sulfides and thiosulfates. Alkali cyanides, even in dilute solution, attack finely divided gold in slow chemical change if oxygen is available in the solution:

$$2Au + 4CN^- + \tfrac{1}{2}O_2 + H_2O = 2Au(CN)_2^- + 2OH^-$$

Gold and Oxygen.—Gold and oxygen do not combine directly under any conditions; hence, all oxides and hydroxides have to be made by indirect methods. When aurous chloride is treated with dilute potassium hydroxide, a violet-black powder is formed which is AuOH or hydrated Au_2O; it is also possible that the Au_2O changes to a mixture of spongy gold and Au_2O_3. If this violet-black powder is heated to about 200° C., it loses water, giving a violet-brown powder, which at 250° C. decomposes into gold and oxygen. The oxide and hydroxide have feebly basic properties and are capable of forming salts with halogen acids. When an excess of KOH is added to the violet-black powder obtained as KOH is added to AuCl, gold metal and AuO_2^- results.

Auric hydroxide is produced by precipitating a solution of auric chloride or of chlorauric acid, $HAuCl_4$, with a limited amdunt of caustic alkali. The hydroxide thus prepared cannot be entirely freed from alkali by washing, and the precipitation is preferably effected with magnesia or zinc oxide, excess of the precipitant being removed with dilute nitric acid. Auric hydroxide is a brownish-black powder which, on drying over phosphoric oxide, forms a brown powder of auryl hydroxide, AuO (OH), dehydrated at 140° C. to trioxide, and this oxide on further heating to 170° C. is said to lose oxygen and form the oxide Au_2O_2, which at a higher temperature reverts into oxygen and metal. Auric oxide is capable either of forming salts with halogen acids or of acting as an acidic anhydride by combining with strong bases to form aurates. Potassium aurate, $KAuO_2.3H_2O$, is a yellow crystalline compound; $Ba(AuO_2)_2$ is a yellow precipitate.

Halogen Compounds. — Fluorine does not act on gold in the cold, but only at a dull red heat whence a yellowish deposit is formed. The gold fluoride is completely hydrolyzed by water.

The chlorides of gold are known with certainty, aurous chloride, AuCl, and auric chloride, $AuCl_3$. The identity of an intermediate chloride, Au_2Cl_4, is doubtful. Aurous chloride is almost always formed by heating auric chloride. The optimum temperature is about 175° C., and several days are required to complete the reaction. If a higher temperature is used, complete decomposition into gold and chlorine occurs. This decomposition of auric into aurous chloride takes place to some extent even in hot aqueous solution.

Aurous chloride is a yellowish-white solid insoluble in cold water, but undergoing slow decomposition into gold and soluble auric chloride.

Auric chloride can be obtained either by heating chlorauric acid to 200° C. in a stream of chlorine, or by dissolving gold in chlorine water, preferably in darkness. It is obtained as a reddish-brown powder or as ruby-red crystals; it slowly decomposes in light, but can be sublimed unchanged in a stream of chlorine.

Gold ions, like many other metallic ions, have the capacity to accept electron pairs to form co-ordination valency compounds. The auric ion has the general tendency to accept four electron pair bonds and thus its co-ordination number of four. This tendency is typified in the formation of the chloraurate ion:

$Au^{+++} + 4Cl^- = AuCl_4^- =$ 
The aurous ions more commonly have a co-ordination number of two, and thus account for chloraurous ion, $AuCl_2^-$. Co-ordination valency explains the existence of chloraurous, $HAuCl_2$, and chlorauric, $HAuCl_4$, acids, and also the salts of these acids. As chlorauric acid crystallizes from solution as a brown deliquescent substance, it has the formula $HAuCl_4.3H_2O$, which on ionization would form $H_3O^+ + AuCl_4.2H_2O^-$, the gold in this case having a co-ordination valence of six. The salts of this acid such as $NaAuCl_4.2H_2O$ in water yield $Na^+ + AuCl_4.2H_2O^-$.

If gold is dissolved in aqua regia and the resulting solution freed from nitric acid by evaporation with further quantities of hydrochloric acid to the crystallizing point, brownish crystals of chlorauric acid are formed, having a strongly acid reaction. These crystals always contain a small amount of aurous chloride unless chlorine has been passed through the solution during evaporation. They are also frequently contaminated nith small amounts of silver chloride since this substance is soluble in strong solutions of auric chloride and is only precipitated therefrom by considerable dilution with water. Various chloraurate salts may be obtained either by neutralizing the acid with the metallic base or by treating the acid with the equivalent amount of the metallic chloride. The chloraurates of lithium, potassium and sodium are very soluble in water; those of rubidium and especially cesium are much less soluble. Furthermore, chlorauric acid combines with the chlorides of many organic bases to form well-defined crystalline chloraurates, frequently used in identifying and purifying such bases.

Two bromides of gold are known, AuBr and $AuBr_3$, corresponding with the two chlorides; the tribromide, prepared by the action of bromine water on finely divided gold. forms dark brownish-red crystals and in its reactions resembles the corresponding chloride; the monobromide is obtained by heating the tribromide or $HAuBr_4$ to 105°–200° C. Auric bromide forms bromaurates, $MAuBr_4$, similar to the chloraurates. These salts have been used in determining the atomic weight of gold.

On mixing aqueous solutions of potassium iodide and $AuCl_3$ or $HAuCl_4$, some auric iodide, AuI_3, is produced, but being somewhat unstable. it decomposes to a large extent into aurous iodide, AuI, and free iodine. The latter reaction is complete on warming. Although unstable by itself, in combination with alkali and alkaline-earth iodides, auric iodide forms a stable series of complex iodoaurates. The potassium salt, $KAuI_4$, crystallizes in black, lustrous prisms. Iodine in aqueous, or preferably aqueous-alcoholic. solution combines with metallic gold to produce aurous iodide, AuI, a white or lemon-yellow powder insoluble in water.

Other Compounds. — Cold Cyanides. — In the presence of air, gold dissolves in aqueous solutions of potassium or sodium cyanide to form potassium or sodium cyanaurite, $KAu(CN)_2$ or $NaAu(CN)_2$, and on precipitating this solution with dilute hydrochloric acid, aurous cyanide, AuCN, is deposited in yellow, insoluble. microscopic, hexagonal plates. Auric cyanide, $Au(CN)_3$, has not been isolated with certainty, but stable complex salts are known with alkali and other cyanides. Potassium cyanaurate, $KAu(CN)_4.3H_2O$, forms colourless efflorescent crystals. The silver salt, $AgAu(CN)_4$, is formed by precipitating a solution of $KAu(CN)_4$ with silver nitrate. From this salt cyanauric acid, $HAu(CN)_4.3H_2O$, is obtained by removing the silver with hydrochloric acid and crystallizing the solution.

Auric nitrate and sulfate hydrolyze so extensively that auric oxide will dissolve only in concentrated solutions of nitric or sulfuric acid. The yellow metal will not combine directly with sulfur but does readily form $AuTe_2$.

Fulminating Cold. — When auric oxide or a gold solution is treated with concentrated ammonia, a black powder is formed called fulminating gold ($2AuN.NH_3.3H_2O$). When dry it is a powerful explosive, since it detonates either by friction or on heating to about 145° C.; it should always be handled with great caution.

Purple of *Cassius.*—When a solution of auric chloride is precipitated with a solution of stannous chloride. a reddish or purplish precipitate is produced containing both metallic gold and tin hydroxide. The composition of this precipitate is as variable as is its colour. Formation of this purple precipitate is a delicate test for gold. Purple of Cassius is used in the preparation of ruby glass.

Analysis for Gold. — Gold will dissolve in sodium polysulfide forming sodium thioaurate, $NaAuS_2$, and thus is with arsenic and antimony in subgroup of group II in qualitative analysis. As the solution of $NaAuS_2$ along with such as Na_3AsS_4 is acidified with HCl, the gold precipitates as a sulfide (some free Au) along with arsenic sulfide. The sulfides are rendered soluble with Cl_2 and thence NH_4OH would give a solution of NH_4AuCl_4 with $(NH_4)_3AsO_4$. From this solution $H_2C_2O_4$ will selectively precipitate spongy gold and not precipitate arsenic.

The usual qualitative test for gold ion free from interfering metals is the formation of red-purple colloidal gold by adding some reducing agents such as $FeSO_4$, $SnCl_2$, HCHO or various organic compounds. Readily identifiable red crystals may be obtained by use of gold ion plus cocaine hydrochloride.

The prospector or expert with a gold pan can estimate the value of placer gold per cubic yard of stream-deposited gravel or sand by counting and evaluating the size of gold specks residual in panning a quantity of the deposit. Accurate determination of the gold content in rock is accomplished by a fire assay process which involves a fusion of a weighed quantity of the ground ore with fluxes to form a slag with the siliceous part of the rock and formation by chemical change in the fusion melt of a rain of metallic lead which dissolves and collects gold and silver. After solidification of the fusion mixture the glassy slag is cracked from the gold-silver containing lead button. which is again put in the furnace on a cupel from which the lead melts and oxidizes to liquid lead oxide as air is allowed to enter through the partially opened door of the furnace. The liquid lead oxide seeps into the semiporous cupel and leaves a silver-gold bead on the cupel which may be cooled and weighed. The silver may be parted from the gold by dissolving the silver in dilute nitric acid and leaving spongy gold which after annealing may be weighed. (W. E. Cl.)

GOLDBEATING. The art of goldbeating is of great antiquity, being referred to by Homer; and Pliny (N.H. 33.19) states that 1 oz. of gold was extended to 750 leaves. each leaf being four fingers (about 3 in.) square; such a leaf is three times as thick as the ordinary leaf gold of the present time. In all probability the art originated among the eastern nations, where the working of gold and the use of gold ornaments have been distinguished characteristics from the most remote periods. On Egyptian mummy cases specimens of original leaf-gilding are found, where the gold is so thin that it resembles modern gilding (*q.v.*). The minimum thickness to which gold can be beaten is not known with certainty. According to Mersenne (1621), 1 oz. was spread out over 105 sq.ft.; Réaumur (1711) obtained $146\frac{1}{2}$ sq.ft.; other values are 189 sq.ft. and 300 sq.ft. Its malleability is greatly diminished by the presence of other metals, even in very minute quantity. In practice the average degree of tenuity to which the gold is reduced is not nearly so great as the last example quoted above. A "book of gold" containing 25 leaves measuring each $3\frac{1}{4}$ in.. equal to an area of 264 sq.in. generally weighs from four to five grains.

The gold used by the goldbeater is variously alloyed, according to the colour required. Fine gold is commonly supposed to be incapable of being reduced to thin leaves. This, however, is not the case, although its use for ordinary purposes is undesirable on account of its greater cost. It also adheres on one part of a leaf touching another, thus causing a waste of labour by the leaves being spoiled; but for work exposed to the weather it is much preferable. as it is more durable, and does not tarnish or change colour. The external gilding on many public buildings, *e.g.*, the Albert memorial in Kensington gardens, London, is done with pure gold. The following is a list of the principal classes of leaf recognized and ordinarily prepared by British beaters, with the proportions of alloy per ounce they contain.

Name of leaf	Proportion of gold	Proportion of silver	Proportion of copper
	Grains	Grains	Grains
Red	456–460	..	20–24
Pale red	464	..	16
Extradeep	456	12	12
Deep	444	24	12
Citron	440	30	10
Yellow	408	72	..
Pale yellow	384	96	..
Lemon	360	120	..
Green or pale	312	168	..
White	240	240	..

Method of Manufacture.—The process of goldbeating is as follows: The gold, having been alloyed according to the colour desired, is melted in a crucible at a higher temperature than is necessary simply to fuse it, as its malleability is improved by exposure to a greater heat; sudden cooling does not interfere with its malleability, gold differing in this respect from some other metals. It is then cast into an ingot. and flattened, by rolling between a pair of powerful smooth 'steel rollers, into a ribbon $1\frac{1}{2}$ in. wide and 10 ft. in length to the ounce. After being flattened it is annealed and cut into pieces of about 63 grs. each, or about 75 per ounce, and placed between the leaves of a "cutch." which is about $\frac{1}{2}$ in. thick and 33 in. square, containing about 180 leaves of a tough paper. Formerly fine vellum was used for this purpose, and generally still it is interleaved in the proportion of about one of vellum to six of paper. The cutch is beaten on for about 20 minutes with a 17-lb. hammer, which rebounds by the elasticity of the skin, and saves the labour of lifting, by which the gold is spread to the size of the cutch; each leaf is then taken out and cut into four pieces and put between the skins of a "shoder," 43 in. square and $\frac{3}{4}$ in. thick, containing about 720 skins, which have been worn out in the finishing or "mold" process. The shoder requires about two hours' beating upon with a 9-lb. hammer. As the gold will spread unequally, the shoder is beaten upon after the larger leaves have reached the edges. The effect of this is that the margins of larger leaves come out of the edges in a state of dust. This allows time for the smaller leaves to reach the full size of the shoder, thus producing a general evenness of size in the leaves. Each leaf is again cut into four pieces, and placed between the leaves of a "mold," composed of about 950 of the finest goldbeaters' skins, 5 in. square and $\frac{3}{4}$ in. thick, the contents of one shoder filling three molds.

The material has now reached the last and most difficult stage of the process; and on the fineness of the skin and judgment of the workman the perfection and thinness of the leaf of gold depend. During the first hour the hammer is allowed to fall principally upon the centre of the mold. This causes gaping cracks upon the edges of the leaves, the sides of which readily coalesce and unite without leaving any trace of the union after being beaten upon. At the second hour, when the gold is about 150,000th part of an inch in thickness, it for the first time permits the transmission of the rays of light. Pure gold, or gold but slightly alloyed, transmits green rays, gold highly alloyed with silver transmits pale violet rays. The mold requires in all about four hours' beating with a 7-lb. hammer, when the ordinary thinness for the gold leaf of commerce will be reached. A single ounce of gold will at this stage be extended to $75\times4\times4=1{,}200$ leaves, which will trim to squares of about $3\frac{1}{4}$ in. each. The dryness of the cutch, shoder, and mold is a matter of extreme delicacy. The finished leaf is taken out of the mold. and the rough edges are trimmed off by slips of the ratan fixed in parallel grooves of an instrument called a wagon, the leaf being laid upon a leather cushion. The leaves thus prepared are placed into "books" capable of holding 25 leaves each, which have been rubbed over with red ochre to prevent the gold clinging to the paper. Dentist gold is gold leaf carried no farther than the cutch stage, and should be perfectly pure gold.

Silver is also beaten by the above process, but not so thin, the inferior value of the metal not rendering it commercially desirable to bestow so much labour upon it. Copper, tin, zinc, palladium, lead, cadmium, platinum and aluminum can be beaten into thin leaves, but not to the same extent as gold or silver.

Goldbeaters' Skin.—The fine membrane called goldbeaters' skin, used for making up the shoder and mold, is the outer coat of the caecum or blind gut of the ox. It is stripped off in lengths about 25 or 30 in. and freed from fat by dipping in a solution of caustic alkali and scraping with a blunt knife. It is afterward stretched on a frame; two membranes are glued together, treated with a solution of aromatic substances or camphor, in isinglass, and subsequently coated with white of egg. Finally it is cut into squares of 5 in. or $5\frac{1}{2}$ in.; and to make up a mold of 950 pieces, the gut of about 380 oxen is required, about $2\frac{1}{2}$ skins being obtained from each animal. A skin will endure about zoo beatings in the mold, after which it is fit for use in the shoder alone.

GOLDBERG, a town in former German Silesia, now in Wroclaw province, Pol. Renamed Zlotoryja. it is 14 mi. S.W. of Liegnitz by rail, on the Katzbach. Pop. (1950) 5,305. Goldberg owed its origin and name to a gold mine in the neighbourhood, abandoned after the Hussite wars. The town obtained civic rights in 1211. It suffered from the Tatars in 1241, from the plague in 1334. from the Hussites in 1428 and from various armies during the Thirty Years' War. The principal buildings are an old church dating from the beginning of the 13th century and the classical school (founded in 1524), which was famous in the 17th century. The chief manufactures are woolen cloth, gloves, stockings, cigars and beer. The town was incorporated into Poland in 1945.

GOLD COAST (GHANA), a former British colony in west Africa, comprised of the Gold Coast colony, Ashanti, the Northern Territories protectorate and the Trust Territory of Togoland administered under the Gold Coast, lying between 4° 45' and 11° 10' N. lat. and 1° 12′ E. and 3° 15′ W. long. On March 6, 1957, the Gold Coast became independent as the state of Ghana within the commonwealth; in 1960 it became the Republic of Ghana (*q.v.*). Its area is 92,100 sq.mi. The country has six administrative divisions, the northernmost being the Northern region. To the south of this is Brong-Ahafo. Ashanti lies between this and the former colony which has been subdivided into the Eastern and western regions. The Volta region is the sixth unit. The country is bounded on the south by the Atlantic ocean, by the Ivory Coast and Upper Volta republics on the west and north, respectively, and by Togo on the east.

PHYSICAL FEATURES

Geography.—The central feature of the country is a hilly plateau lying more than 500 ft. above sea level, approximately triangular in shape. with its apex close to the Volta river in the east. To the north the plateau is bounded by the Kwahu scarp, which runs southeast to join a range of hills running southwest from Togoland into Akwapim. The only area of even moderately high ground in the colony is there, the highest hills lying between 2,000 and 3,000 ft. The plateau is covered by thick tropical forest. North of the Kwahu scarp the land is undulating savanna country drained by the Black and White Volta rivers. After the junction of these two streams, the combined river flows 310 mi. in a southerly direction to the sea, passing through a narrow gap in the Togo-Akwapim hills at Ajena. The forest comes close to the sea in the west, but east of Takoradi there is a coastal belt of scrub vegetation which merges into grassy plains about the Volta mouth.

Apart from occasional rocky headlands, the 334 mi. of coast line are sandy and low-lying. Only the Volta. Pra and Ankobra rivers permanently pierce this sand barrier; lesser rivers generally terminate in brackish lagoons. There are no natural harbours and sand bars impede the navigation even of the major rivers.

(J. D. F.)

Geology.—The following summary of the rocks is based on the publications of the geological survey: Tertiary and Recent: sands, gravels, clays, laterite, bauxite, etc.; Cretaceous: sands, clays, shales, limestones; Devonian or Carboniferous: sandstones, shales, conglomerates, etc., of the Sekondi series; Devonian: sandstones, shales, etc., of the Accraian; Lower Palaeozoic-? Silurian: sandstones, shales, etc., of the Voltaian; Pre-Cambrian: shales, sandstones, quartzites, phyllites, graywackes, lavas, schists, gneisses, migmatites, granites.

The Pre-Cambrian is further subdivided into Buem, Akwapimian, Tarkwaian, Birrimian and Archaean. The intrusive igneous rocks include granites and granitic rocks, migmatites and mixed gneisses, basic and ultrabasic igneous rocks and alkaline rocks. Two distinct granites have been recognized in the past—the Cape Coast granite with micas and the Dixcove granite with hornblende.

Around Lake Bosumtwe there are thick well-bedded clays with fossil remains of fish and plants. Their exact age was not known at mid-century, but they are comparatively recent. (W. J. M.)

Climate.—The climate is governed by three air masses: (1) moist and relatively cool monsoon air coming from the southwest across the Atlantic; (2) hot and dry air (the harmattan) coming from the northeast across the Sahara; (3) the Inter-Tropical Convergence zone (I.T.C.Z.), formed by the mixing of the monsoon and harmattan air masses.

Seasonal variation in weather is caused by the oscillation in latitude of the I.T.C.Z., which reaches its most northerly point north of the colony in August and its most southerly, 7° N. (over the forest), in January.

The harmattan is dominant north of the forest. The months from November to March are dry, with hot days and cool nights. From March onward the influence of the approaching I.T.C.Z. results in a gradually increasing number of days with rainfall. The wet season reaches its peak in August and September and thereafter sharply recedes. The weather of the forest zone is more continually influenced by the I.T.C.Z. There are two rainy seasons, with peaks in May-June and October. The harmattan is felt from December to February. and July and August are relatively dry and cool months. In the coastal regions the harmattan is felt only about January; for the rest of the year the monsoon is dominant. Mean temperatures are low for the latitude and, though the atmosphere is humid and often cloudy, rainfall is moderate except in the extreme southwest, the area of the highest rainfall in the colony. There are two rainy seasons: a primary season with a peak in May–June and a subsidiary season, with its peak in October, which is rarely effective on the Accra plains, the driest area of the colony. (J. D. F.)

Vegetation.—The natural vegetation has been much changed by man. Most of the virgin forest has been replaced by secondary forest. throughout which are scattered permanent cocoa farms and more or less temporary mixed farms where banana, plantain, oil palm, maize and market garden crops are cultivated. Around villages mango, pawpaw, avocado, citrus and kola are common. On poor soils cassava is extensively grown.

Large trees are conspicuous throughout the forest zone, but the most luxuriant vegetation is found in the statutory forest reserves. There giant trees, such as silk cotton, which may be 200 ft. tall, overtop successive canopies of smaller trees and shrubs. Many climbers reach to the upper canopy and have stems of great thickness which, as their support plants die or are cut down, fall to lie in great coils on the ground. Herbaceous plants, especially ferns and orchids, occur as epiphytes on the high branches of the trees, and on the ground broad-leaved flowering plants abound amid saplings and low shrubs. Grasses are very few. In the swampy parts of the forest *Raphia*, bamboo and climbing plants and ferns are common. Useful forest timbers include African mahogany and cedar, odum, wawa (obeche), ofram and *Antiaris*.

The Accra plains are characterized by grassland with scattered *Elaeophorbia* and *Antiaris* trees and clumps of bush inhabiting old termite mounds. All savanna grasslands are subjected to regular dry season burning.

True Guinea savanna, with small, widely spaced trees or thin woodland and abundant grasses, occurs around the lower Volta, on the Afram plains and over almost all the Northern region. In the marginal areas around the forest fan palms are a conspicuous feature. In northern Ashanti and the Northern region yams and groundnuts are widely grown, as also are sorghum millet and Guinea corn. Such indigenous plants as *Parkia*, shea butter, *Landolphia* and *Strophanthus* are preserved near habitations for their various uses, and baobab, akee apple, *Acacia albida* and *Khaya senegalensis* are commonly planted. (C. D. A.)

Fauna.—The fauna, formerly rich but now much depleted, includes leopards, hyenas, potto lemurs, antelopes, elephants, buffaloes, wild hogs and many kinds of monkeys, including the chimpanzee and the black and white colobus. Among the snakes are pythons, cobras, horned and puff adders, green mambas and boomslange. Crocodiles and a diminishing remnant of manatees and otters frequent the rivers and lagoons and hippopotamuses are found in the Volta. Lizards of brilliant hue, tortoises and great snails are common. Birds, which are very numerous, include parrots and hornbills, kingfishers, ospreys, herons, crossbills, curlews, woodpeckers, doves, pigeons, storks, pelicans, swallows, vultures and plantain eaters. Shoals of herring frequent the coast seasonally; the other fish include mackerel, sole, skate, mullet, bonito, flying fish, fighting fish and shynose. Sharks abound at the mouths of the rivers. Edible turtles are fairly common, as are the swordfish, dolphin and sting ray. Oysters are numerous on rocks running into the sea and on the exposed roots of mangrove trees; of other invertebrates spiders are particularly numerous. Insect life is muititudinous; beetles, ants, fireflies, butterflies and jiggers abound. Mosquitoes, tsetse flies and simuliids transmit malaria, yellow fever, trypanosomiasis and onchocerciasis, which are among the endemic diseases of the country.

HISTORY

The Trading Companies.—The first Europeans to come to the Gold Coast were the Portuguese, who reached the country in 1471 in the course of their maritime expansion along the coast of west Africa. The Portuguese developed such a profitable gold trade with the coastal peoples that in 1482 they erected the castle of São Jorge da Mina (Elmina) on land rented from a coastal tribe. In subsequent years other forts were built, the most important of which were at Axim and Shama. The forts were intended to help the Portuguese to monopolize the sea-bone trade of the country, for merchants of other nations were soon attracted by the gold trade. At first Portugal's chief competitors were Castilians, but after 1530 French, Flemish, English and Dutch merchants began to appear on the scene. Though the increasing activity of these merchants made it impossible for the Portuguese to secure the monopoly they wanted, none of Portugal's competitors were strongly enough organized to challenge the Portuguese system of coastal forts until the appearance of the Dutch West India company after 1621. Beside building its own forts, between 1637 and 1642 the Dutch company captured all the Portuguese strong posts, established their headquarters at Elmina and emerged as by far the strongest European power on the coast.

By this time the motives for European interest in the Gold Coast had changed. Though gold was still an important attraction, European footholds on the coast were now chiefly valued as bases for the trade in African slaves which was fast developing to meet the labour needs of the sugar plantations which Europeans were establishing in the West Indies. This slave trade, which the Dutch pioneered, was extremely lucrative, and in the 17th and 18th centuries the Gold Coast became one of the chief west African sources of slave exports. The Dutch were soon joined by Swedish, Brandenburger, Danish and English trading companies, all of whom built forts on the coast during the 17th century. Ground rent for these forts (most of which were still in existence at mid-20th century) was paid to the coastal nations. By the 18th century, the Swedes and the Brandenburgers had dropped out and the Danes had limited their activities to the coast east of Accra. The English merchants, who had first visited the Gold Coast in 1553 and had built their first fort (at Kormantine) in 1631, were from 1618 to 1820 organized in a series of chartered west African monopoly or regulated companies. In 1662 the English established their headquarters at Cape Coast (*q.v.*), a few miles east of Elmina, and thereafter they offered strong competition to the Dutch. During the maritime wars of the 17th century the forts were constantly changing hands, but during the 18th century the Dutch held an average of 11 forts and the English commonly about 8. Nevertheless, the English secured the bulk of the trade, which by 1785 amounted to an export of about 10,000 slaves a year.

Domestic slavery was common among the Gold Coast peoples, but the effect of the European demand for slaves in large numbers was greatly to extend the practice of enslavement and to provide new mercenary grounds for intertribal warfare. The British trade in slaves was abolished in 1807, the Danish trade in 1804 and the Dutch in 1814, with the result that the export of slaves from the Gold Coast by sea had practically ceased by the middle of the 19th century.

But the general effectof European trade still remained disruptive of native society on the coast. Population moved to the coastal states and new towns sprang up around the European forts, inhabited by men and women of many different tribes, some with their share of European blood. These towns, and even some of the smaller states, became identified with the interests of the particular traders, Dutch or English, who held forts on their shores, and in some cases real authority came to rest with the Europeans rather than with the traditional rulers.

The interests of the coastal states as middlemen denied access to the interior to Europeans. There the Ashanti union had by the end of the 18th century developed into a widespread and powerful military force desiring to subordinate the coastal states and obtain direct access to European trade (*see* ASHANTI). The result was the seven Ashanti wars of the 19th century. The first three were waged for the most part only between the Ashanti and the southern states they were trying to dominate. But the close association between the commercial communities of these states and .the European merchants, and the desire of the latter for peace and order so that their trade could prosper, inevitably brought the Ashantis into conflict with the Europeans.

British Ascendancy. — The Dutch and the Danes gradually lost interest in the Gold Coast in the 19th century, but Britain and its merchants remained active, the government because it wanted to stamp out the vestiges of the slave trade and the merchants because they wanted to develop legitimate trade in place of the trade in slaves. In 1821 the British forts were transferred from the control of the merchants to that of the governor of the crown colony of Sierra Leone.

The new governor, Sir Charles McCarthy, determined to destroy the Ashanti threat to the coastal states. The result was his defeat and death in battle in 1824. Although the military situation was redeemed two years later, this reverse decided the British government to withdraw from the Gold Coast and in 1828 it handed over such of the British forts as were still in use to a committee of London merchants trading with west Africa.

From 1830 to 1843 the committee entrusted the direction of its affairson the coast to Capt. George Maclean, a man of outstanding ability who was determined to use British influence to bring peace and good order to the country. Maclean negotiated a firm peace treaty with Ashanti and began to exercise an informal jurisdiction over the coastal peoples. As a result of the improved conditions, imports through the British settlements on the Gold Coast increased threefold in ten years to an annual value of £400,000. Legally, however, Maclean's authority was restricted to the British settlements (*i.e.*, the forts), and his wider activities, though acceptable to the Fanti chiefs and people as bringing them some of the benefits of European civilization, led to criticism in England.

Consequently in 1843 the crown resumed control of the Gold Coast settlements, though the value of Maclean's work was recognized by his appointment as judicial assessor in the new administration. In 1844–45 Maclean's extraterritorial jurisdiction was given formal recognition through the negotiation of a series of treaties (called "bonds") with the leading coastal chiefs.

After Maclean's death in 1847, British relations both with Ashanti and the Fantis steadily deteriorated. The aspirations of the Ashantis could not be held in check, while it was proving difficult to gratify the Fanti desire for European-style amenities. Apart from the work done by the Christian missions. particularly in the educational field (the pioneers were the Basle mission in 1827 and the Wesleyan Methodists in 1835), roads, hospitals, schools. etc., could hardly be provided because there was no real means of raising money to pay for them. The people could not be taxed directly, since they were not British subjects, and an attempt at levying taxes through the co-operation of the indigenous authorities proved unsuccessful. Effective customs duties could not be imposed until the British controlled all the coastal forts and, though they purchased the Danish forts in 1850, the Dutch still retained theirs, interspersed with those in British hands.

In these circumstances the British government once again decided that responsibility on the Gold Coast was unrewarding and in 1865, as a preliminary to their eventual abandonment, the British settlements there were again subordinated to Sierra Leone. This policy led to increased trouble with the Fantis, who found the British officials hostile to the arrangements they were making for their own government. At length in 1872 the British acquired the Dutch forts, but difficulties connected with the transfer of Elmina led to another Ashanti invasion of the coastal states.

The British government now determined to take matters in hand. In 1874 Sir Garnet Wolseley led a punitive expedition into Ashanti, and Kumasi. the capital, was destroyed. The result was the treaty of Fomena. in which the Ashantis promised to pay an indemnity and to refrain from invading British protected territory. In the same year the territory under British protection as a result of the bonds was declared to be a British colony and given an administration independent of Sierra Leone. This decision was to give rise to difficulties. The boundaries of the colony were not defined, and its inhabitants protested that their relations with Britain ought still to be governed by the bonds.

The Ashantis did not accept the dictated Fomena treaty as a permanent settlement and remained a threat to the coastlands. After prolonged negotiations, the British sent an ultimatum to Kumasi in 189j charging Ashanti with failure to keep the treaty. The ultimatum was followed by a further military expedition. the enforced dissolution of the Xshanti union and the declaration of a British protectorate over the country. The need to preserve the commercial hinterland of Ashanti from occupation by the advancing French and Germans, and also to combat the activities of the notorious slave raider Samori, led during 1896–99 to the further extension of British influence to the north of Ashanti.

In 1901 orders in council defined the boundaries of the Gold Coast Colony, Xshanti and the Northern Territories. and declared the first to be a British colony by settlement, the second a British colony by conquest and the third a British protectorate. In 1914 British and French colonial troops occupied the German colony of Togoland and in 1922 the western portion of this territory was entrusted by the League of Nations to the United Kingdom as a class B mandate. In Dec. 1946 Togoland was placed under GN trusteeship and in Dec. 1956 it was integrated nith the Gold Coast which. on March 6, 1957, became an independent state within the commonwealth and changed its name to Ghana.

Constitutional Development. — The constitutional development of the Gold Coast as a British colony may be said to have begun in 1850 when executive and legislative councils were instituted for the British settlements. In 1853 a supreme court mas set up for the settlements. Until 1874, when the legislative council was empowered to legislate for the newly proclaimed colony, the British authorities did not concern themselves with the administration of Africans outside the settlements, though in the territories under British protection since 1844 British justice was administered by the judicial assessor, usually sitting with a panel of chiefs. The legislative council contained a majority of officials and a number of unofficialmembers appointed by the governor. The first African unofficial member was appointed in 1888. Even after 1874 relations with the native chiefs remained ill-defined. though the central government instituted a system of direct rule through district officers and in 1895 a beginning was made nith municipal government for the larger towns—Accra (after 1877 the capital), Cape Coast and Sekondi.

When British governments were set up for Ashanti and the Northern Territories, they were separate from that of the Colony. The new provinces were administered by commissioners responsible to the governor of the Gold Coast, but the competence of the legislative council at Accra remained limited to the Colony. The governor was the sole legislator for Ashanti until 1946 and for the Northern Territories until 1951, though he commonly applied to these territories laws passed for the Colony by its legislative council. However, in 1934 and 1935 respectively the competence of the executive council and of the supreme court at Accra was extended to Ashanti and the Northern Territories.

In 1925 three provincial councils of chiefs were instituted for the Colony, each electing two members of the central legislative council. Three members directly elected by the coastal municipalities were also added to the council, though the official majority was retained. In subsequent years efforts were made to introduce the principles of indirect rule through traditional native authorities into the Colony. Ashanti and the Northern Territories. In the Colony a joint provincial council developed out of the three smaller ones. and in 1935 the restoration of the Ashanti confederacy permitted the establishment of a similar council of chiefs for Ashanti. A council for the Northern Territories was instituted in 1946. In 1956 both Ashanti and the Northern Territories petitioned for independence.

In 1946 the legislative council was enlarged to include a majority of African elected members. including representatives from Ashanti. But the executive council, which since 1942 had included two nominated unofficial African members, remained responsible to the governor and not to the legislature. It soon became apparent that this system of representative government was inadequate to meet the political aspirations of a country in which the processes of social and economic change had been greatly accelerated by the effects of World War II. Elements in the European-educated urban communities, led by members of the professional classes, were not satisfied by the increased representation (principally of the traditional native authorities) accorded by the 1946 constitution, and pressed for complete self-government in which the executive would be responsible to a legislature wholly elected on a democratic franchise.

The organization of active political groups in defense of African interests dates in the Colony from 1897 if not earlier. But such groups had been mainly organized for specific and largely temporary ends, and in general their continued existence had been impeded by differences between the traditional rulers and the European-educated professional classes about ultimate political objectives. However, in 1947 the United Gold Coast convention (U.G.C.C.). led by J. B. Danquah, a barrister member of the legislative council, was founded with the object of securing complete self-government for the Gold Coast at the earliest opportunity. In 1948 there were riots in Accra and other towns, in which ex-servicemen and unemployed were principally involved, and the leaders of the U.G.C.C. were removed for a time to the Northern Territories. The subsequent commission of inquiry (Watson commission) recommended. among other things, further political advances for the colony. During 1949 an all-African committee. under the chairmanship of Henley Coussey, was appointed to draft a new constitution on the lines indicated in the Watson report.

The 1951 Constitution.—The Coussey recommendations formed the basis for a new constitution which became law in 1951. The legislative council was replaced by an assembly of 84 members. Seventy-five elected members represented the whole of the colony, including the Northern Territories: five of these members were directly elected by adult suffrage in urban constituencies and the remainder by various forms of indirect election in the rural areas. In addition there were six representatives of European economic interests and three nominated officials. The latter, together with eight members of the assembly elected by the assembly on the nomination of the governor and removable by it, formed the executive council, each member of which was responsible to the assembly for a group of administrative departments. One of the elected members was "leader of government business" in the assembly. The old system of local government through a combination of administrative officers and traditional native authorities was to give way to a system of elected councils on the British model.

But for the presence of the three irremovable officials (who controlled defense and external affairs, finance and justice), and reserve powers retained by the governor to veto legislation and, in emergency, to legislate without the assembly. the new executive council represented an appreciable step toward the nationalist goal of a responsible ministry. It was accepted as a reasonable step by all the political leaders except an element in the U.G.C.C. led by Kwame Nkrumah, the party's organizing secretary. This element seceded and formed a new party, the Convention People's party (C P P.), which denounced the new constitution as bogus and during 1950 tried to enforce its demand for full self-government by a campaign of "positive action," which resulted in the arrest and imprisonment of its principal leaders. However. at the general election in Feb. 1951 the C P.P. won a decisive victory; Nkrumah and his colleagues were released and became the leading members of the new executive council. In 1952 Nkrumah became the first prime minister of the Gold Coast.

The **1954** Constitution.—The C.P.P. policy was to achieve full self-government as quickly as possible by constitutional means As a further step toward this end, Nkrumah's government secured a new constitution in 1954. The Europeans disappeared from the assembly and the executive council, and the latter became a cabinet of African ministers responsible to an assembly of 104 members —all directly elected by nationwide single member constituencies —for all matters except defense. external affairs and control of the judiciary and civil service, which were entrusted to the governor or to special commissions. The governor's reserve poaers were retained, but it should be noted that they were never used during 1951–57. As the C.P.P won 71 seats in the assembly at the 1954 general election, the Nkrumah government was free to proceed with its plans for complete independence of British control. In the 1950s, however, a new opposition party, the National Liberation movement, emerged demanding a federal form of government to offset what it believed to be an undue growth of the power of the central government to the detriment of local interests and the traditional authorities. particularly in Ashanti and the Northern Territories. Thus. when the Gold Coast government issued a proposed constitution in May 1956 the British government replied that a resolution calling for full independence passed by the Gold Coast assembly would only be acceptable if supported by public opinion in an election.

In the general election of July 1956 the C.P P. obtained an overall majority which cleared the way for attainment of full independence. This was achieved on March 6, 1957, when the Gold Coast with British Togoland (which had been combined with it in 1956) became an independent state within the commonwealth and changed its name to Ghana. On July 1,1960, it became the Republic of Ghana.

POPULATION

The population of the country according to the 1948 census was 4,118,450, divided as shown below; and was 6,690,730 at the 1960 census.

The chief towns (mun. pop. 1960 census) are Accra (388,231), Kumasi (220,922) and Sekondi-Takoradi (120,793).

Native Peoples.—The native peoples are all of Segro stock. The greater part of the inhabitants of the coast regions and Ashanti belong to the Akan family, which can be divided today linguistically into two main and closely related groups, the Fanti and the Twi. Twi is the language of Ashanti and of the Akan nations such as the Denkera. Akim and Akwapim. Fanti is spoken by the inhabitants of the coastal zone from Sekondi to Winneba. East of the Pra there are a number of peoples, such as the Nzima, Ahanta and Evalue, who speak languages related to Twi and Fanti. The Accra plains are inhabited by peoples speaking variants of Ga, the Ga themselves to the west and the Adangme to the east. East of the Volta are found the westernmost elements of the Ewes who inhabit most of Togoland and Dahomey.

All these peoples seem to be comparatively recent arrivals in the country. The Akan immigration from the northwest was a long process which began about the 12th century and was virtually complete by about 1600. The Ga-Adangme came from Nigeria about the beginning of the 16th centurv. and the Ewes arrived. also from the east. during the 17th century.

Although tradition presents these movements as mass migrations, it seems more probable that they were really movements of comparatively small numbers who imposed their rule, and ultimately their language and much of their culture, on other Negro peoples already living in the country.

The majority of the inhabitants of the Northern region belong either to the great Moshi-Dagomba group of Voltaic peoples or to the Gonja, who seem to have some affinity with the Akan.

Social Conditions. — The mode of life of the Gold Coast peoples before the coming of Europeans was primarily subsistence agriculture. North of the forest cattle were kept, while the coastal peoples engaged in fishing. Alluvial gold and iron were mined and worked; goldsmiths, potters and woodcarvers produced work of considerable merit. Gold and kola nuts were exported from the forest to the markets of the western Sudan and there exchanged for manufactures brought from across the Sahara.

The rapid economic development which took place in the 20th century involved the increasing replacement of a system of self-sufficient tribal communities by a nation of individual wage earners and peasant farmers producing cash crops for the world economy. The value of land rose greatly, especially as a result of the extension of cocoa farming, and it tended to be treated as alienable private property rather than as tribal land. The decline of subsistence farming and the great increase of trade led to the growth of large urban communities of a kind which traditional tribal society could hardly encompass. and where in consequence problems of social morality and organization became complex and serious.

Religion. — The majority of the people are animists, though there is a general belief in a supreme deity. The leading Christian communities are Methodist. Presbyterian and Roman Catholic, and there is a substantial Moslem element.

Education.--With the increase of wealth and urbanization, the demand for social amenities and education in particular, on the European model, grew enormously. European education was pioneered by the missionary societies, but after 1882 government grants were made to schools achieving recognized standards. Later native authorities also sponsored schools. Increasingly the tendency was for the central government to pay more and more of the cost of recognized schools and also to sponsor schools directly. The University College was instituted in 1948 and in 1951 a college of technology was opened at Kumasi. In 1950 there were 204,253 children in the 1,952 primary schools recognized by the government and 2,776 pupils in 12 recognized secondary schools. The provision of schools by the recognized education authorities was lagging behind the demand for them, and it was estimated that there were about 65,000 children attending about 1,500 unrecognized primary schools. In 1952 the Nkrumah administration introduced free primary education.

ECONOMICS

Economic Development. — Before 1874 European commercial relations with the Gold Coast were confined to the coast. There was no penetration or development of the interior. The staple exports of the country, principally gold and slaves. were brought to the European forts by African merchants and there exchanged for European commodities, principally cloth. hardware, trinkets, spirits, arms and ammunition. Trade did not develop during the first three-quarters of the 19th century; Europeans ceased to purchase slaves, the alluvial gold deposits worked by the natives began to be exhausted, while the Ashanti wars created a situation of chronic unrest. In 1840 imports through the British settlements were £423,000 and exports £325,000; the figures for 1878 were £394,000 and £393,000 respectively.

The extension of British administration after 1874 brought the peace and order essential for the development of the interior and also offered inducements for the investment of European capital. The consequent expansion of external trade may best be illustrated in the following table:

Value of Products Imported and Exported by Sea, 1900-50
(In thousands of pounds)

Year	Imports	Exports		
		Total	Cocoa	Minerals
1900	1,099	852	27	38
1913	3,510	5,014	2,489	1,656
1927	11,703	14,186	11,728	1,922
1936	8,531	12,240	7,660	4,248
1947	22,584	27,420	16,632	8,184
1954	71,647	113,283	84,599	19,515

By far the greater part of this commercial expansion resulted from the exploitation of cash crops by African peasant farmers. The role of European enterprise and capital was to provide facilities for the purchase of native-grown crops, to distribute the manufactures imported in exchange, to exploit the mineral resources of the country and to provide the transport facilities essential for the expansion of trade and production.

The first cash crop exported on a large scale was rubber collected by the natives from wild rubber trees. In 1900 exports of rubber were worth £328,000 and accounted for 39% by value of all exports. Overcropping and the competition of rubber of better quality from plantations in Malaya and elsewhere led to the decline of the trade.

After 1911 cocoa became the most valuable single export from the Gold Coast and, indeed, the mainstay of the country's economy. The crop was introduced from Fernando Po in 1879 and first cultivated in the eastern part of the colony. Cultivation of cocoa on farms of less than five acres spread rapidly throughout the forest zone of the colony and into Ashanti. Cocoa was first exported in 1891 and by 1913 annual exports of the crop were averaging 50,000 tons and 50% by value of the country's total exports. The peak production period mas 1934–37 when annual exports averaged 287,000 tons. In 1954 214,152 tons of cocoa were exported worth £84,599,000 (74.7% of the total value of exports).

After 1930 the cocoa trees suffered increasingly from swollen-shoot disease, particularly in the areas where cocoa had been longest cultivated. The only proved treatment is to cut out the diseased trees and to plant anew. Since a diseased tree will continue to bear fruit for several years, the enforcement of a policy of systematic cutting-out proved unpopular with cocoa farmers despite the payment by the government of compensation and replanting grants. A large-scale cutting-out campaign was begun in 1945 and, by 1951, 1,431,553 ac. of cocoa had been surveyed and 11,856,802 trees cut out on 51,668 infected acres, but in the worst-affected districts the disease was still not under control. However, the high prices paid for cocoa in the postwar years kept the industry buoyant and encouraged a great extension of cocoa farming in Ashanti, where swollen-shoot had slight effect.

Though Ghana produces more cocoa than any other country in the world, the quality of the crop is not as consistently high as that grown elsewhere under plantation conditions. In 1947 the purchase of all cocoa for export was entrusted to a statutory marketing board, which, besides shielding the peasant producer from extreme fluctuations of the world price for cocoa, operated grading schemes and financed research to improve the quality of the crop.

The most important nonmineral export after cocoa is hardwood timber, chiefly mahogany, from the forest zone. Both Africans and Europeans engaged in the timber export trade.

The first mineral to be exploited by European enterprise in the Gold Coast was gold. Gold-mining concessions in the western part of the colony were taken up by European companies after 1877, but the industry did not prosper until after 1902, when the mining areas could be linked to the coast by rail. In 1908 exports of gold were worth £1,152,000 (49.5% by value of all exports). Exports in 1954 were 787,900 fine ounces, worth £9,822,000 (8.7% of all exports). The principal mines are at Tarkwa in the Colony and at Bibiani and Obuasi in western Ashanti. Mining of manganese ore at Nsuta, near Tarkwa, was begun during World War I. Bauxite mining began during World War II.

In 1954, 2,126,000 carats of diamonds worth £4,273,000 were exported; approximately half came from African diggers working on their own account.

The chief commodities imported in 1954 were cotton piece goods, motor vehicles and parts and oils and petroleum products.

There was little industry in the early 1950s though the government-sponsored Industrial Development corporation (set up in 1945), besides undertaking some manufactures itself, provided finance for the establishment of secondary industries. It also encouraged handicrafts which the import of European manufactures tended to destroy.

Transport. — The development of mechanized mining and of the cocoa and timber industries would have been impossible without the provision of modern transport facilities. Two main railways run from the coast to Kumasi, from Sekondi via Tarkwa (170 mi., completed 1903), and from Accra (189 mi.. completed 1923). A 99-mi. branch of the Sekondi line eastward through the centre of the Colony (opened 1927) was in 1956 extended to meet the Accra line 20 mi. from Accra, thus affording a direct link from Sekondi to Accra (189 mi.). The railways are of 3 ft. 6 in. gauge and are state owned and operated; 624 route miles were open to traffic in 1956.

After about 1930, road transport played an increasingly important role in the economic life of the country. In 1954 the central government maintained 3,633 mi. of trunk roads.

Port facilities tended to lag behind the development of internal transport. Until 1928 all goods entering or leaving the country by sea were handled by surfboats over open beaches, but in that year an artificial harbour at Takoradi was opened to traffic.

After extensions made in 1949–55, the harbour had five deep-water berths for general cargo and four for mineral traffic, plus moorings for a further eight ships. Construction of a second artificial harbour at Tema, to serve the eastern part of the Colony, was begun in 1955 and was expected to lead to the elimination of the surviving surf-ports at Accra, Cape Coast and Winneba.

Accra airport was one of the termini for the London-\Vest Africa service of the British Overseas Airways corporation and a calling point for U.S., French and Portuguese services.

Finance. — The provision of schools, medical services, railways, roads, water and electricity supplies, etc., was largely. financed by the government out of the great increases in revenue available to it after 1900.

In 1902 revenue was £492,000 (77.8% from customs duties) and expenditure was £523,000 (1.75% going to education). By 1926–27 the figures were revenue, £4,365,000 (55.1% customs); expenditure, £4,328,000 (4.67, on education). The figures for 1954–55 were revenue £80,566,000 (79% from customs, especially export duty on cocoa; 10% from direct taxation, income tax having been introduced in 1944); expenditure £79,860,000 (6% on education, about 10% on all social services).

GOLDCREST or GOLDEN-CRESTED KINGLET is the type of a small family Regulidae, related to old world warblers. The goldcrest (Regulus regulus) is the smallest of British birds, its whole length being about 3½ in., and its weight some 5 grams. Generally of an olive-green colour, the top of its head is bright yellow, deepening into orange, and bounded on either side by a black line. The wing coverts are dull black with a whitish bar. The cock has a pleasant but weak song, which has been compared to the squeaking of young mice. The nest is of moss, wool and spiders' webs, lined with feathers, and usually built under and near the end of the branch of a yew, fir or cedar, supported by the interweaving of two or three twigs. The six to ten eggs are dull white, sometimes freckled with reddish-brown. The species lives most of the year in family parties often in company with titmice. It breeds over most of Europe, well to the north, south to the Pyrenees, Italy, Asia Minor and Syria, with local races in the British Isles (R. *r.* anglorum), the Azores, the western Canaries, on Corsica and Sardinia, and others in the Caucasus and Asia. The rather similar diminutive golden-crowned kinglet, olive-green with a black-bordered yellow crown (R. satrapa), breeds from Alaska and southern Canada to the northern states, south in higher mountains to North Carolina, New Mexico and California. The ruby-crowned kinglet (R. calendula), with a tiny bright-red crown patch in the male and a beautiful little song, breeds in Alaska and Canada south in the western mountains to Arizona and Lower California. The firecrest (R. *ingnicapillus*), of temperate Europe and North Africa to Asia Minor, has a similar red patch, bordered with black. (G. F. Ss.)

GOLDEN BULL, the general designation of any charter decorated with a golden seal or *bulla*. The name, however, has become practically restricted to a few documents of unusual political importance, the golden bull of the empire, the golden bull of Brabant, the golden bull of Hungary, and the golden bull of Milan — and of these the first is undoubtedly the golden bull par excellence. The main object of the golden bull was to provide a set of rules for the election of the German kings, or kings of the Romans, as they are called in this document. Since the informal establishment of the electoral college about a century before (see ELECTORS), various disputes had taken place about the right of certain princes to vote at the elections, these and other difficulties having arisen owing to the absence of any authoritative ruling. Under these circumstances the emperor Charles IV determined by an authoritative pronouncement to make such uncertainty impossible in the future, and at the same time to add to his own power and prestige, especially in his capacity as king of Bohemia. In its first form the bull was promulgated at the diet of Nuremberg on Jan. 10, 1356, but it was not accepted by the princes until some modifications had been introduced, and in its final form it was issued at the diet of Metz on Dec. 25 following.

The text of the golden bull consists of a prologue and of 31 chapters. The early chapters are mainly concerned with details of the elaborate ceremonies which are to be observed on the occasion of an election. The number of electors is fixed at seven, the duke of Saxe-Wittenberg, not the duke of Saxe-Lauenburg, receiving the Saxon vote, and the count palatine, not the duke of Bavaria, obtaining the vote of the Wittelsbachs. The electors were arranged in order of precedence thus: the archbishops of Mainz, of Trier and of Cologne, the king of Bohemia, the count palatine of the Rhine, the duke of Saxony and the margrave of Brandenburg. The work of summoning the electors and of presiding over their deliberations fell to the archbishop of Mainz, but if he failed to discharge this duty the electors were to assemble without summons within three months of the death of a king. Elections were to be held at Frankfort; they were to be decided by a majority of votes, and the subsequent coronation at Aix-la-Chapelle was to be performed by the archbishop of Cologne. During a vacancy in the empire the work of administering the greater part of Germany was entrusted to the count palatine of the Rhine, the duke of Saxony being responsible, however, for the government of Saxony, or rather for the districts *ubi Saxonica jura* servantur. The chief result of the bull was to add greatly to the power of the electors. To these princes were given sovereign rights in their dominions, which were declared indivisible and were to pass according to the rule of primogeniture. Except in extreme cases, there was to be no appeal from the sentences of their tribunals, and they were confirmed in the right of coining money, of taking tolls, and in other privileges, while conspirators against their lives were to suffer the penalties of treason. One clause gave special rights and immunities to the king of Bohemia, who, it must be remembered, at this time was Charles himself, and others enjoined the observance of the public peace. Provision was made for an annual meeting of the electors, to be held at Metz four weeks after Easter. This arrangement, however, was not carried out, although the electors met occasionally. Another clause forbade the cities to receive *Pfahlbürger, i.e.,* forbade them to take men dwelling outside their walls under their protection. It may be noted that there is no admission whatever that the election of a king needs confirmation from the pope.

GOLDEN CLUB (Orontium aquaticum), a North American aquatic plant of the arum family (Araceae), found in shallow ponds and less frequently in swamps from Massachusetts to Florida, chiefly near the coast. It is a somewhat fleshy perennial, with thick oblong, ascending, or floating leaves, five to ten inches long, and bearing in early spring a narrow but dense cluster (spike) of small bright yellow flowers, terminating a flattened stalk, six inches to two feet long, which rises above the water. This handsome aroid, the only species of the genus, is sometimes transplanted in water gardens. See ARACEAE.

GOLDENEYE, a diving duck (Bucephala or Glaucionetta), breeding in far northern regions, from where it migrates south in winter. It nests in hollow trees and in burrows along banks of inland water. The adult male is mainly black above, with a round, white eye patch and white scapulars; the lower parts are white, the legs orange; in the female, dark brown replaces black. An elaborate courtship during which the drake may dive and bob up just in front of the female, occurs in the early spring. They are known also as whistlers, from their swift whistling flight.

The European goldeneye (B. clangula clangula) breeds across the northern half of Europe and Asia to the limit of trees. the American goldeneye (B. c. americana) in Canada and the plains border states and the Barrow's goldeneye (B. islandica), which has a crescent-shaped instead of a round white spot in front of the eye, in the mountains from Alaska to Colorado, and in Labrador, Greenland and Iceland. They winter south to the Mediterranean and Burma, South Carolina and California, rarely to the Gulf of Mexico. (G. F. Ss.; X.)

GOLDEN FLEECE, in Greek mythology, the fleece of the ram on which Phrixus and Helle escaped. (See ARGONAUTS.) For the knighthood of the Golden Fleece see KNIGHTHOOD AND CHIVALRY: Orders of Knighthood.

GOLDEN GATE, THE, a strait in California, U.S., connecting San Francisco bay with the Pacific ocean, and separating San Francisco from Marin county. The Gate is about three miles long and from one to two miles wide. Its channel is more than 300 ft. deep. In an earlier geologic period, the strait was the lower end of a river which poured fresh water into the Pacific, but subsidence of land in the region and a rise in the ocean level brought invasion by sea water and the formation of the present magnificent bay. The Gate may have been seen by Sir Francis Drake in 1579, but the effective discovery was made by Spanish explorers (1769–75). The name apparently originated with John C. Frémont and became popular during the gold rush period.

Although the strait is the ocean gateway to San Francisco and its harbour, it constituted a barrier to land travel in the area until the construction (1933–37) of the famous Golden Gate bridge at a cost of $35,000,000. A suspension bridge, with a central span of 4,200 ft. and towers that rise 746 ft. above the water, it was built by Joseph B. Strauss for a special bridge district consisting of six counties; it was financed by bonds secured by revenues from tolls and also by the general taxing powers of the district. The opening of the Golden Gate bridge on May 27, 1937, came only six and a half months after the opening of the San Francisco-Oakland Bay bridge. The latter, built by the state with federal aid at a cost of $77,000,000, consists of two suspension bridges over the west channel, a tunnel through Yerba Buena Island and a cantilever span over the east channel. Double-decked, it is over four miles long (over eight miles long counting approaches). In 1939 San Francisco celebrated these great achievements in bridge building at its Golden Gate exposition on Treasure Island. (D. E. F.)

GOLDEN GLOW, a double-flowered cultivated variety (Rudbeckia laciniata hortensis) of a tall coneflower, native to North America, widely grown in the United States, Canada and England as an ornamental plant. It is a showy summer bloomer, usually four feet to seven feet high, with smooth, much-branched stems, more or less divided leaves and numerous flowering heads $2\frac{1}{2}$ to $3\frac{1}{2}$ in. across, crowded with brilliant golden-yellow much-doubled ray flowers.

Originally derived from a weedy herb common from Quebec to Florida and westward, the cultivated golden glow has become ubiquitous in the garden. It has propensity to spread. To gardeners the plant is a coarse, invasive perennial. (N. TR.)

GOLDEN HORDE, a body of Tatars who in the middle of the 13th century overran a great portion of eastern Europe and founded in Russia the Tatar khanate, known as the empire of the Golden Horde or Western Kipchaks. They invaded Europe about 1237 under the leadership of Batu Khan, a grandson of Genghis Khan, passed over Russia with slaughter and destruction, and penetrated into Silesia, Poland and Hungary, finally defeating Henry II, duke of Silesia, at Liegnitz in the battle known as the Wahlstatt on April 9, 1241. So costly was this victory, however, that Batu, finding he could not reduce Neustadt, retraced his steps and established himself in his magnificent tent (whence the name "golden") on the Volga. The new settlement was known as Sir Orda ("Golden Camp," whence "Golden Horde"). Rapidly the powers of Batu extended over the Russian princes, and so long as the khanate remained in the direct descent from Batu nothing occurred to check the growth of the empire. But the death of Janibeg, in 1357, threw everything into confusion until in 1378 Toktamish of the Eastern Kipchaks ousted all rivals. For a short time the glory of the Golden Horde was renewed, but it was finally crushed by Timur in 1395. See MONGOLS.

GOLDEN MOLE, a burrowing molelike animal. species of which belong to the south African family Chrysochloridae, order Insectivora (*q.v.*). They are named from the bright metallic bronze to violet lustre of their fur. Although resembling true moles (*q.v.*) in habits and, to some extent, in appearance, they dig by means of enormous claws on the two middle digits of the forelimbs. an adaptation to the hard soil.

GOLDEN-RAIN TREE, a Chinese tree, *Koelreuteria paniculata*, uidely grown as an ornamental. It has leaves with 7–15 leaflets that are arranged alternately or in pairs along a central stalk and are toothed, lobed or divided into smaller leaflets. The yellow summer-blooming flowers, borne in clusters terminating the branches, produce three-angled, inflated, papery capsules about two inches long, containing three to six round, brown to black seeds.

The tree, which grows to 40 ft. tall and attains a trunkdiameter of 2 ft., is easily raised from seed. It does well in ordinary soil, prefers full sun and is hardy as far north as northern Illinois. In some areas it is called "pride-of-India," a name properly belonging to *Melia* azedarach, the Chinaberry or China-tree. The golden-rain tree is a member of the soapberry family (Sapindaceae). (J. W. TT.)

GOLDENROD, the popular name for plants of the botanical genus Solidago, of the family Compositae (*q.v.*), comprising about 120 species, natives chiefly of North America, a few, however, occurring in the old world and in South America. They are erect perennial herbs. mostly from two to eight feet high, often unbranched or slightly branched, uith undivided, toothed or entire, sessile or almost sessile leaves and very numerous small heads of brilliant yellow (rarely white) flowers arranged in conspicuous terminal or axillary clusters. Hybridization between closely related species occurs freely in nature, making species identification difficult.

The European goldenrod (S. *virgaurea*), the only British species, bearing a long cluster of showy flower heads, is found in woods and thickets. It is one of the best garden plants of the genus, many other species of which are cultivated for ornament, especially *S.* canadensis, *S. cutleri* and the seaside goldenrod, S. *sempervirens*. The goldenrods are characteristic plants in eastern North America, where about 60 species occur. They are found almost everywhere—in woodlands, swamps, on mountains, in fields and along roadsides.

With the asters, whose bright colours they complement, the goldenrods form one of the chief floral glories of autumn from the Great Plains eastward to the Atlantic. While numerous handsome species occur in the Rocky mountain region and on the Pacific coast, they are less abundant and conspicuous than in the eastern states. Among the best-known eastern species are the early goldenrod (*S. juncea*), the late goldenrod (*S. gigantea*), the tall goldenrod (*S. altissima*), the Canada goldenrod (*S. canadensis*), the dwarf goldenrod (*S. nemoralis*), the wreath goldenrod (*S. caesia*), the pale goldenrod or silverrod (*S. bicolor*), the sweet goldenrod (*S.* odora) and the showy goldenrod (*S. speciosa*). Among the western species are *S.* occidentalis, found from the Rocky mountains westward: *S. californica*, the *oreja* de *liebre* ("rabbit's ear") of the Spanish Californians; and the coast goldenrod (*S. spathulata*) of central Californian shores. The copious pollen of most species is responsible for many cases of hay fever. (N. Tr.)

GOLDEN ROSE, an ornament made of wrought gold and set with gems, generally sapphires, which is blessed by the pope on the fourth Sunday in Lent and sent, as one of the highest honours he can confer, to some distinguished individual, ecclesiastical body or religious community or. failing a worthy recipient, kept in the Vatican. Many of these historical examples of the goldsmith's art, being of great value, have been melted down; of the few remaining, one of the 14th century, sent to the bishopric of Basel by Clement V, is in the Musée de Cluny, and another, one of the 17th century, bestowed by Alexander VII on his native city, Siena, is in the Museo dell'opera della metropolitana di Siena. The origin of the custom is obscure, the first reliable accounts dating from the 11th century. Of more symbolic than material significance, the rose was usually sent, like the papal cap and sword, for political as well as religious reasons, together with an explanatory letter. Three were sent to Henry VIII of England, the first in 1510 by Julius II seeking support against Louis XII of France. In 1684 one was sent to the wife of John Sobieski, who aided Vienna against the Turks. Princess Charlotte of Nassau, who became grand duchess of Luxembourg in 1919, was accorded the golden rose in 1956.

See Sir C. Young, Ornaments and Gifts Consecrated by the Roman *Pontiffs* (1864).

GOLDENWEISER, ALEXANDER (1880–1940), U.S. anthropologist whose interests embraced a broad spectrum of cultural problems, was born on Jan. 29, 1880, in Kiev, Russia, and went to the United States in 1900. He studied anthropology under Franz Boas at Columbia university, where he took his Ph.D. in 1910 and lectured in anthropology from 1910 to 1919. He subsequently taught at the Rand School of Social Science, the New School for Social Research, the university of Oregon and Reed college.

Goldenweiser did field research among the Iroquois and published the first American textbook in anthropology (Early Civilize*tion*, 1922; rev. ed., Anthropology, 1937). In *Totemism* (1910) he stressed the psychological factors common to different tribal cultures. In dealing with problems of diffusion *v.* independent invention of culture traits he introduced the principle of limited possibilities, showing that in many cases this principle explained similarities in a satisfactory manner. He pointed out that diffusion was not a mechanical process but depended partly on the receptivity of cultures to proffered traits. He was interested in primitive man's knowledge and in primitive science, theoretical and applied. He noted the tendency toward overelaboration of a trait or a complex, especially in art, which he called "involution." His analyses and interpretations of cultural problems ranged widely, encompassing intellectual movements in psychology and psychoanalysis. He died on July 6, 1940, in Portland, Ore.

For bibliography, see Wilson D. Wallis, "Alexander Goldenweiser," American Anthropologist, vol. 43, no. 2, pp. 252–253 (April–June, 1941). (W. D. Wa.)

GOLD FERN, a handsome American fern (*Pityrogramma triangularis*), native to the Pacific coast region from Alaska to Lower California, so called because the leaves (fronds) are coated beneath with a bright orange-coloured powder. The dark-brown, glossy leafstalks (stipes), 6 in. to 12 in. high, rise from the rootstock in tufts, and bear triangular-shaped, somewhat leathery leaves, three to four inches long and broad, more or less deeply cut into rounded lobes. A tropical American species, P. *calomelanos,* popular in greenhouse cultivation, with golden-yellow powder on the undersurface of the fronds, is also called gold fern.

GOLDFIELD, a mining ghost town in the desert in southwestern Nevada, U.S., is the seat of Esmeralda county. Rich gold ore was discovered there in 1902 and the ensuing rush resulted in a city with an estimated population of 40,000. The mining boom lasted from 1903 to 1918, although the production of the mines started dropping off at the end of 1910, when production of ore reached an all-time high valued at more than $11,000,000. The mines were the scene of a bitter labour struggle in 1907 and 1908, with federal troops being sent to the area.

After 1918, Goldfield's population decreased rapidly to less than 200. The 200-room Goldfield hotel was closed, although it was reopened briefly during World War II to accommodate the servicemen stationed at nearby Tonopah air force station. In the second half of the 20th century tourists kept the few people still living in Goldfield in business. (D. W. Ds.)

GOLDFINCH, *Carduelis carduelis,* a well-known and beautiful bird found over the greater part of Europe and north Africa, and eastwards to Persia and Turkistan. It is a favourite cagebird. As a songster it is surpassed by other species, but its docility and attachment to its master or mistress make up for any defect in its vocal powers. Less than 5 in. long, it has a bright-red face, bordered white, with nape, tail, and wings black, with broad yellow wing-band. Though goldfinches may be observed in the coldest weather, most leave Britain in autumn, returning in spring, and resorting to gardens and orchards to breed. The nest is beautifully neat, generally well hidden by the leafy bough on which it is built. When the broods leave the nest they frequent pastures, commons, heaths and downs in flocks. The goldfinch is very fond of the seeds of thistles and other weeds. It has been introduced into New Zealand, where it has firmly established itself (see Thomson, *Naturalisation* of *Animals* and Plants in New Zealand). The American goldfinch (*Spinus tristis*) breeds from southern Canada to northern parts of the gulf states and California. It has a yellow body with black wings and tail, a black cap, undulating flight, and a plaintive call. It is duller, more brownish and greenish, in winter. The Arkansas goldfinch (*S. psaltria*) of the Rockies and Mexico has upper parts mostly black in the adult male, the allied green-backed goldfinch (*S. p. hesperophilus*) occurring along the Pacific coast and east to New Mexico. Lawrence's goldfinch (*S. lawrencei*), of California, is greenish- ello ow above, ellow below. (See FINCH.) (G. F. Ss.)

GOLDFISH (*Carassius auratus*), a cyprinid fish, like the carp, a native of eastern Asia, but introduced into many other parts of the world. It is closely related to the crucian carp of Europe and northern Asia; both species resemble the common carp in having a long dorsal fin, but differ from it in having no barbels. The goldfish flourishes in ponds and feeds on weeds and small invertebrates. In a wild state the coloration is generally greenish-brown, but specimens may occur with the brown or black pigment absent or restricted to some spots and patches, and bright orange in colour. These golden fish have been bred by the Chinese for centuries, and many strange and even monstrous types have been produced. Fish with silvery patches, or even pure white, are not uncommon; the telescope-fish, with protruding eyes, no dorsal fin and a large trilobed tail-fin, is one of the most extraordinary forms. Goldfish were introduced from China into Japan, and for hundreds of years they have been cultivated in ponds by the Japanese, who have produced new types by cross-breeding; many of these have a long double tail-fin. The most prized variety has a short rounded body, a broad head covered with protuberances, no dorsal fin and a short double tail-fin; as much as £20–£25 may be given for an exceptional pair. Annual exhibits of this breed are held in Tokyo; fish which are entirely bright red are considered best, but white fish with red fins are much admired.

Escaping from ornamental pools in parks and gardens the goldfish has become naturalized in many ponds and streams of the eastern United States, notably in the Potomac river. In some localities it occurs in sufficient abundance to be marketed as a food fish. Upon resuming life under natural conditions it reverts to its original greenish-brown color, and usually attains a length of from 6 to 12 inches.

See S. Matsubara, "Goldfish and their Culture in Japan," Bull. *U.S. Fish Bureau* (1908); *H.* M. Smith *Japanese Goldfish* (Washington, 1909).

GOLDIE, SIR GEORGE DASHWOOD TAUBMAN (1846–1925), English administrator, the founder of Nigeria, was born on May 26, 1846, at the Nunnery, Isle of Man, being the youngest son of Lieut.-Colonel John Taubman Goldie-Taubman, speaker of the House of Keys. Sir George resumed his paternal name, Goldie, by royal licence in 1887. He was educated at the Royal Military academy, Woolwich, and for about two years held a commission in the Royal Engineers. He travelled in all parts of Africa, gaining an extensive knowledge of the continent, and first visited the country of the Niger in 1877. He conceived the idea of adding to the British empire the then little known regions of the lower and middle Niger, and for over 20 years his efforts were devoted to the realization of this conception. The method by which he determined to work was the revival of government by chartered companies within the empire—a method supposed to be buried with the East India company. The first step was to combine all British commercial interests in the Niger, and this he accomplished in 1879 when the United African company was formed. In 1881 Goldie sought a charter from the imperial government (the 2nd Gladstone ministry). Objections of various kinds were raised. To meet them the capital of the company (renamed the National African company) was increased from £125,000 to £1,000,000, stations were founded on the Niger and the French traders established on the lower river were bought out in 1884. Meantime the Niger coast line had been placed under British protection, and over 400 political treaties—drawn up by Goldie—were made with the chiefs of the lower Niger and the Hausa states. The scruples of the British Government being overcome, a charter was at length granted (July 1886), the National African company becoming the Royal Niger company, with Lord Aberdare as governor and Goldie as vice-governor. In 1895, on Lord Aberdare's death, Goldie became governor of the company, whose destinies he had guided from the time of its foundation under its former name.

The building up of Nigeria as a British state had to be carried on in face of further difficulties raised by French travellers with political missions, and also in face of German opposition. From 1884 to 1890, Prince Bismarck was a persistent antagonist, and the strenuous efforts he made to secure for Germany the basin of the lower Niger and Lake Chad were even more dangerous to Goldie's schemes of empire than the ambitions of France. E. R. Flegel, who had travelled in Nigeria during 1882–84 under the auspices of the British company, was sent out in 1885 by the newly-formed German Colonial society to secure treaties for Germany, which had established itself at Cameroon. After Flegel's death in 1886 his work was continued by his companion Staudinger, while Hoenigsberg was despatched to stir up trouble in the occupied portions of the company's territory,—or, as he expressed it, "to burst up the charter." He was finally arrested at Onitsha, and, after trial by the company's supreme court at Asaba, was expelled from the country. Bismarck then sent out his nephew, von Puttkamer, as German consul-general to Nigeria, with orders to report on this affair, and when this report was published in a White Book, Bismarck demanded heavy damages from the company. Meanwhile Bismarck maintained constant pressure on the British government to compel the Royal Niger company to a division of spheres of influence, whereby Great Britain would have lost a third, and the most valuable part, of the company's territory. But he fell from power in March 1890, and in July following Lord Salisbury concluded the famous "Heligoland" agreement with Germany. After this event the aggressive action of Germany in Nigeria entirely ceased, and the door was opened for a final settleinent of the Nigeria-Cameroon frontiers. These negotiations, which resulted in an agreement in 1893, were initiated by Goldie as a means of arresting the advance of France into Nigeria from the direction of the Congo. By conceding to Germany a long but narrow strip of territory between Adamawa and Lake Chad, to which she had no treaty claims, a barrier was raised against French expeditions, semi-military and semi-exploratory, which sought to enter Nigeria from the east. Later French efforts at aggression were made from the western or Dahomeyan side, despite an agreement concluded with France in 1890 respecting the northern frontier.

The hostility of certain Fula princes led the company to despatch, in 1897, an expedition against the Mohammedan States of Nupé and Illorin. This expedition was organized and personally directed by Goldie and was completely successful. Internal peace was thus secured, but in the following year the differences with France in regard to the frontier line became acute, and compelled the intervention of the British government. In the negotiations which ensued Goldie preserved for Great Britain the whole of the navigable stretch of the lower Niger. It was, however, evidently impossible for a chartered company to hold its own against the state-supported protectorates of France and Germany, and in consequence, on Jan. 1, 1900, the Royal Niger company transferred its territories to the British government for the sum of £865,000. The ceded territory together with the small Niger Coast Protectorate, already under imperial control, was formed into the two protectorates of northern and southern Nigeria *(see* further NIGERIA).

In 1903–04, at the request of the Chartered company of South Africa, Goldie visited Rhodesia and examined the situation in connection with the agitation for self-government by the Rhodesians. In 1902–03 he was one of the royal commissioners who inquired into the military preparations for the war in South Africa (1899–1902) and into the operations up to the occupation of Pretoria, and in 1905–06 was a member of the royal commission which investigated the methods of disposal of war stores after peace had been made. In 1905 he was elected president of the Royal Geographical society and held that office for three years. From 1908 to 1919 he was an alderman of the London County Council, on which he served as chairman of the finance committee. Goldie was created K.C.M.G. in 1887, and a privy councillor in 1898. From 1905 to 1914, and from 1915 to 1920 he was president of the National Defence Association. He died in London on Aug. 22, 1925.

GOLDING, ARTHUR (*c.* 1536–*c.* 1605), English translator, son of John Golding of Belchamp St. Paul and Halsted, Essex, one of the auditors of the exchequer, was born probably in London about 1536. In 1549 he was already in the service of Protector Somerset. He seems to have resided for some time in the house of Sir William Cecil, in the Strand, with his nephew, the poet, the 17th earl of Oxford, whose receiver he was, for two of his dedications are dated from Cecil House. His chief work is his translation of Ovid. *The Fyrst Fower Bookes of P. Ovidius Nasos worke, entitled Metamorphosis, translation oute of Latin into Englishe meter* (1565), was supplemented in 1567 by a translation of the 15 books. Strangely enough the translator of Ovid was a man of strong Puritan sympathies, and he translated many of the works of Calvin. Golding translated also the *Commentaries* of Caesar (1565), Theodore Beza's *Tragedie of Abraham's Sacrifice* (1577) and the *De Beneficiis* of Seneca (1578). He completed a translation begun by Sidney from Philippe de Mornay, *A Worke concerning the Trewnesse of the Christian Religion* (1587, 3rd ed., 1604).

See the reissue of Golding's translation of Theodore Beza's *Tragedie of Abraham's Sacrifice* in the University of Toronto Studies, Philological Series (1906), which contains a biographical notice and complete bibliography.

GOLDINGEN (Lettish, *Kuldiga*), a town of western Courland in Latvia, 55 mi. by rail N.E. of Libau, and on Windau river, in 56" 58′ N. and 22° E. Population 6.921. It has several small industries including leather, woolen goods, food products, needles and other metal industries, matches and other products of wood. There are glass works and lime kilns in the neighbourhood, and ruins of a castle of the Teutonic Knights, built in 1248.

GOLDMAN, EMMA (1869–1940), international anarchist, was born in Kovno, Lithuania, on June 27, 1869, daughter of the manager of the subsidized theatre there. Her youth was spent in Konigsberg and St. Petersburg. When she was 17 years old she went to the U.S. and worked in a factory in Rochester. N.Y., and later in New Haven, Conn., where she first became associated with anarchists and espoused their views. In 1889 she went to New York city, where she met Alexander Berkman, who attempted to assassinate Henry C. Frick in Pittsburgh during the Homestead steel strike in 1892.

She resumed the association after Berkman completed a 14-year sentence in prison. She was sent to prison herself in 1893 for inciting a riot. During World War I she and Berkman were convicted of interfering with war preparations and were sentenced to prison. Both were deported from the United States, Dec. 1, 1919. They went to Russia but disapproved of the soviet regime and traveled to England and thence to Canada. She edited anarchist periodicals and was the author of two books on the U.S.S.R. She died in Toronto, May 14. 1940.

GOLDMARK, KARL (1832–1915), Hungarian composer, was born at Keszthely-am-Plattensee, Hungary, on May 18. 1832, the son of a poor cantor in the local Jewish synagogue. On a cheap violin and home-made flute, the future composer first gave rein to his musical ideas. After the revolution of 1848 he was to have been shot for a spy, and was only saved at the 11th hour by the happy arrival of a former colleague. There followed the *Sakuntala* and *Penthesilea* overtures, showing the influence of Wagner, and the delightful *Landliche Hochzeit* symphony. which carried his fame abroad. His first and best opera, *Die Königin von Saba* (Vienna, 18;5), was followed in Nov. 1886, also at Vienna, by *Merlin*, much of which was afterward rewritten. A third opera, a version of Dickens' *Cricket on the Hearth*, was given by the Royal Carl Rosa company in London in 1900.

He died at Vienna on Jan. 2, 1915.

GOLDONI, CARLO (1707–1793), a prolific Italian dramatist and reformer of the traditional Italian comedy of his day, was born at Venice, on Feb. 25, 1707, the son of a doctor. In 1721 he ran away from school at Rimini with a company of players, and was later expelled (1725) from the Collegio Ghislieri, Pavia, for a satire against the ladies of the town. In 1731 Goldoni took a degree in law at Padua university, after which, as well as holding diplomatic appointments and engaging in various theatrical activities, he practised as a lawyer at Venice (1731–33) and Pisa (1744–48).

The desire to write for the stage was always strong in Goldoni, and in 1734, after making a false start with a lyric tragedy called *Amalasunta* (1732), he joined the Imer company at the San Samuele theatre, Venice. *Belisario,* a tragicomedy in verse. pleased the public; and there he also wrote a number of successful interludes *(La birba)* and scenarios *(Le trentadue disgrazie di Arlecchino)* for the *commedia dell'arte* (*q.v.*). However, his belief that comedy ought to "correct defects" made him feel that a radical reform was necessary in the Italian theatre. Wishing to create a comedy of character, he followed the example of Molière and sought to delineate the realities of social life in as natural a manner as possible. His first essays in this style were *Mòmolo cortesan* (1738) and *La donna di gurbo* (1743), in which he suppressed improvisation by writing his parts in full and began to free the actors from the traditional practice of wearing masks on the stage. Other plays followed—some interesting for their subject, others for their characters—and in time Goldoni succeeded in replacing the improvised and frequently licentious farce typical of the comic theatre in Italy in his day with a new. yet essentially Italian, comedy of manners that was both moral in tone and a faithful "mirror of life" *(La vedova scaltra,* 1748; *Il cavaliere e la dama,* 1749; *La locandiera,* written 1752, first performed 1753).

Between 1748 and 1762 Goldoni worked as a professional playwright for the companies of Girolamo Medebac and the patrician Francesco Vendramin at the theatres of Sant'Angelo (1748–53) and San Luca (1753–62) in Venice. During this period he effected his dramatic reform. In one season alone (1750–51) he wrote 16 new plays, including *Il teatro comico, Pamela* and *La bottega del caffè,* embodying his theories. Throughout these years Goldoni's success was opposed by his rivals. Pietro Chiari and Carlo Gozzi, and in 1762 he left Venice for Paris, where he had been invited to direct the Comédie Italienne (1762–64). Goldoni subsequently taught Italian to the French royal princesses, and for the wedding of Louis XVI he wrote in French one of his best-known works. *Le Bourru bienfaisant* (1771). He also wrote his *Mémoires,* between 1783 and 1787, at Versailles. As a result of the Revolution Goldoni lost his pension and he died in poverty in Paris on Feb. 6?, 1793.

Goldoni wrote in both prose and verse, and in Italian, Venetian dialect and French. He composed librettos for the *opera buffa* and a wealth of occasional verse. His best plays are those in Venetian dialect, such as *I rusteghi* (1760). *La casa nova* (1760) and *Sior Todero brontolon* (1762), and especially the vivid "popular" comedies which mirror the elemental and passionate life of the poor (*Il campiello,* 17j6; *Le baruffe chiozzotte,* 1762).

Bibliography.—Goldoni's complete works were published in 44 vol. (1788–95 and 1827). Modern editions are the *Opere complete,* 39 vol. (1907–54), and *Tutte le opere,* ed. by G. Ortolani, 14 vol. (1935–56). *Opere,* ed. by F. Zampieri, is a good selection in one volume (1954). *Mémoires,* in French, Eng. trans. by John Black (1877) *See* also G. Ortolani, *Della vita e dell'arte di C. Goldoni* (1907); H. C. Chatfield-Taylor, *Goldoni* (1913); E. 'Rho, *La missione teatrale di Carlo Goldoni* (1936); M. Dazzi, *Carlo Goldoni e la sua poetica sociale* (1957). (D. M. We.)

GOLD PRODUCTION: *see* Natural Resources: The *Precious Metals.*

GOLD RESERVES. By tradition, currency is metallic. gold, silver, copper or an alloy. The basic coin in most western countries has been gold. Banks issued notes which were a promise to pay gold on demand. Also they accepted deposits withdrawable in gold. For this purpose they held a reserve of gold available at any time for the discharge of these obligations. The reserve was not as large as the corresponding liabilities to pay, for the assumption was that all holders of notes and all depositors would not apply for gold at the same time. A run on a bank meant that such customers, moved by misgivings, applied for payment simultaneously.

National treasuries have issued, or permitted banks to issue, paper money which is valued in terms of gold. As in the case of banks. the assumption was that holders of this money could obtain gold for it at any time by applying in the proper quarter; and gold up to a percentage of currency was held by the treasury or its agents. During and after World War I many governments, financially hard pressed, withheld gold from their own people, who were therefore compelled to use paper as the only alternative. In Great Britain the price of gold rose. and large accumulations of domestic ornaments were brought into the market. Italy (1936) went so far as to help finance her Ethiopian War by appealing to wives to surrender their wedding rings.

As a result of the depression and of the banking crisis, the United States congress passed a law in 1933 enabling the president to devalue the dollar by not over 50%. By presidential action all gold certificates were called in and the dollar devalued by approximately 40%. The gold reserve of the government. then about $2,500,000,000, rose until in the latter 1950s it was more than $22,000,000,000, well over half the world's gold reserves, and much more than the total outstanding currency in the U.S.

GOLDS: *see* Tunguses.

GOLDSBORO, a city in east central North Carolina. C.S.. and the seat of Wayne county. is on the north side of the Neuse river, about 50 mi. S.E. of Raleigh. Settled in 1838 and incorporated in 1847, Goldsboro was an early railway junction and was named after M. T. Goldsborough, a civil engineer for one of the railways. It soon became an important trading and shipping centre for the primarily agricultural North Carolina coastal plain. Though still predominately a railway shipping point and market for the surrounding area in the second half of the 20th century, Goldsboro had a number of small, diversified manufacturing plants, and was one of the larger bright-leaf tobacco markets.

The State Hospital for Negro Insane was established near Goldsboro in 1884. The state Oddfellows Orphans' home and Seymour Johnson Air base, an important training centre in World War II, are located there. In 1917 the city adopted the council-manager form of government.

For comparative population figures, see table in NORTH CAROLINA: *Population*. (DA. ST.)

GOLDSBOROUGH, LOUIS MALESHERBES (1805–1877), U.S. naval officer, was born Feb. 18, 1805, in Washington, D.C. He was senior naval member of a commission that explored California and Oregon in 1849–50, and superintendent of the United States Naval academy, 1853–57. On Sept. 23, 1861, Goldsborough was placed in command of the Atlantic blockading squadron, and on its division later in the year retained command of the North Atlantic squadron, which controlled the Virginia and North Carolina coasts.

His fleet captured Roanoke Island in Feb. 1862 and destroyed Confederate vessels, for which he received the thanks of congress and was promoted to the rank of rear admiral, July 16, 1862. He asked to be relieved of command of the blockading squadron, Sept. 4, 1862, after a dispute over naval participation in the attack on Richmond, and served in Washington until the end of the war. He retired in 1873 and died Feb. 20, 1877. (J. B. HN.)

GOLDSCHMIDT, MEÏR ARON (1819–1887), Danish writer of Jewish descent whose intimate knowledge of the customs and psychology of orthodox Jews in Denmark forms the background of many of his novels and short stories. He was born, Oct. 26, 1819, at Vordingborg, and, after going to school in Copenhagen, planned to study medicine but became a journalist instead. In 1840 he founded *Corsaren*, a satirical weekly expressing his radical. republican ideas. His own witty, and often politically ambiguous, contributions made it influential. A feud with Soren Kierkegaard caused him to give up the paper and go abroad in 1846. His first novel, *En Jode* (1845; Eng. trans., *The Jew of Denmark*, 1852), described the gulf between the Jew and Danish society. It was followed by *Fortællinger* (1846). Returning in 1847, Goldschmidt abandoned radicalism and founded a new periodical. *Novd og Syd*, in which his novel *Hjemlös* (which he himself translated into English as *Homeless*, 1861) was serialized (1853–57). He visited England several times and thought of settling there but decided that he ought to remain a Danish writer. In the 1860s he was regarded as Denmark's most important novelist, but later his conservatism created a gulf with the new radical movement led by Georg Brandes. He died at Copenhagen, Aug. 15, 1887.

Goldschmidt's finest descriptions of Jewish life are to be found in his short novels, included in collections "Maser," "Levi og Ibald," *Avromche Nattergal* (1871) and "Mendel Herz." and in *Ravnen* (1867). one of the outstanding Danish novels of the 19th century. in which Jews are depicted uith an unusual blend of sympathy and irony. Several works, notably "Erindringer fra min Onkels Hus" (in *Fortællinger*, 1846), describe life in a provincial town. *Hjemlös* and *Arvingen* (1865; Eng. trans. *The Heir)* are based on personal reminiscences. Goldschmidt is an equisite stylist, especially in his short stories. His philosophy of retributive justice. or nemesis, underlies most of his novels, and also his memoirs, *Livserindringer og Resultater* (1877).

GOLDSCHMIDT, VICTOR (1853–1933), German crystallographer. was born in Mainz on Feb 10, 1853. He studied in the mineral sciences at the Freiberg Mining academy and at Munich, Heidelberg and Vienna. His first major publication was *Index der Krystallformen*, three volumes appearing from 1887 to 1891—a catalogue of the known forms on crystals of all minerals. New tables of angles to meet his new needs were devised, calculated nith vast outlay of energy and published in 1897 as *Krystallographische Winkeltabellen*. Next began the compilation and publication of all published figures of crystals of minerals. This *Atlas der Krystallformen* in nine volumes appeared from 1912 to 1923. His interest in number series appearing in crystal symbols expanded to a philosophic theory of number and harmony which led to an analysis of musical harmony, of colour and the development of the colour sense in man and finally to the spacing of the planets about the sun. He died in Salzburg on May 8. 1933. (C. PE.)

GOLDSMID, the name of a family of Anglo-Jewish bankers, descendants of Aaron Goldsmid (d. 1782), a Dutch merchant who settled in England about 1763. Two sons, Benjamin (1753–1808) and Abraham (1756–1810), became important financial brokers in London during the Napoleonic war. A nephew, Sir Isaac Lyon Goldsmid. Bart. (1778–1859) was a successful financier, chiefly known for his efforts to obtain emancipation for Jews in England. and for founding University college in London. In 1841 he was made the first Jewish baronet. His son, Sir Francis Henry Goldsmid (1808–78), became the first Jewish barrister and was a member of parliament in 1860. A grandson of Benjamin Goldsmid, Sir Frederick John Goldsmid (1818–1908), was director-general of the Indo-European telegraph and helped to settle boundary disputes between Persia and Afghanistan in 1872. (J. R. LT.)

GOLDSMITH, OLIVER (1728–1774), English poet, playwright, novelist and man of letters, came of a Protestant and Saxon family which had long been settled in Ireland. He is usually said to have been born at Pallas or Pallasmore, County Longford; but recent investigators have contended, with much probability, that his true birthplace was Smith-Hill house, Elphin, Roscommon, the residence of his mother's father, the Rev. Oliver Jones. His father, Charles Goldsmith, lived at Pallas, supporting with difficulty his wife and children on what he could earn, partly as a curate and partly as a farmer.

Youth.—While Oliver was still a child his father was presented to the living of Kilkenny West, in the county of West Meath. This was worth about £200 a year. The family accordingly quitted their cottage at Pallas for a spacious house on a frequented road, near the village of Lissoy. Here the boy was taught his letters by a relative and dependent, Elizabeth Delap, and was sent in his seventh year to a village school kept by an old quartermaster on half-pay, who professed to teach nothing but reading, writing and arithmetic, but who had an inexhaustible fund of stories about ghosts, banshees and fairies, about the great Rapparee chiefs, Baldearg O'Donnell and Galloping Hogan, and about the exploits of Peterborough and Stanhope, the surprise of Monjuich and the glorious disaster of Brihuega. This man must have been of the Protestant religion; but he was of the aboriginal race, and not only spoke the Irish language, but could pour forth unpremeditated Irish verses. Oliver early became, and through life continued to be, a passionate admirer of the Irish music, and especially of the compositions of Carolan, some of the last notes of whose harp he heard. It ought to be added that Oliver, though by birth one of the Englishry, and though connected by numerous ties with the Established Church, never showed the least sign of that contemptuous antipathy with which, in his days, the ruling minority in Ireland too generally regarded the subject majority. So far indeed was he from sharing in the opinions and feelings of the caste to which he belonged that he conceived an aversion to the Glorious and Immortal Memory, and, even when George III was on the throne, maintained that nothing but the restoration of the banished dynasty could save the country.

From the humble academy kept by the old soldier, Goldsmith was removed in his ninth year. He went to several grammar-schools, and acquired some knowledge of the ancient languages. His life at this time seems to have been far from happy. He had, as appears from the admirable portrait of him by Reynolds at Knole, features harsh even to ugliness. The smallpox had set its mark on him with more than usual severity. His stature was small, and his limbs ill put together. Among boys little tenderness is shown to personal defects; and the ridicule excited by poor Oliver's appearance was heightened by a peculiar simplicity and a disposition to blunder which he retained to the last. He became the common butt of boys and masters, was pointed at as a fright in the playground, and flogged as a dunce in the school-room. When he had risen to eminence, those who had once derided him ransacked their memory for the events of his early years, and recited repartees and couplets which had dropped from him, and which, though little noticed at the time, were supposed, a quarter of a century later, to indicate the powers which produced the *Vicar of Wakefield* and the *Deserted Village*.

On June 11, 1744, being then in his 16th year, Oliver went up to Trinity college, Dublin, as a sizar. The sizars paid nothing for food and tuition, and very little for lodging; but they had to perform some menial services from which they have long been relieved. Goldsmith was quartered, not alone, in a garret of what was then No. 35 in a range of buildings which has long since disappeared. His name, scrawled by himself on one of its window-panes, is still preserved in the college library. From such garrets many men of less parts than his have made their way to the woolsack or to the episcopal bench. But Goldsmith, while he suffered all the humiliations, threw away all the advantages of his situation. He neglected the studies of the place, stood low at the examinations, was turned down to the bottom of his class for playing the buffoon in the lecture room, was severely reprimanded for pumping on a constable, and was caned by a brutal tutor for giving a ball in the attic story of the college to some gay youths and damsels from the city.

The Continent.—While Oliver was leading at Dublin a life divided between squalid distress and squalid dissipation, his father died, leaving a mere pittance. In Feb. 1749 the youth obtained his bachelor's degree and left the university. During some time the humble dwelling to which his widowed mother had retired was his home. He was now in his 21st year; it was necessary that he should do something; and his education seemed to have fitted him to do nothing but to dress himself in gaudy colours, of which he was as fond as a magpie, to take a hand at cards, to sing Irish airs, to play the flute, to angle in summer and to tell ghost stories by the fire in winter. He tried five or six professions in turn without success. He applied for ordination; but, as he applied in scarlet clothes, he was speedily turned out of the episcopal palace. He then became tutor in an opulent family, but soon quitted his situation in consequence of a dispute about pay. Then he determined to emigrate to America. His relations, with much satisfaction, saw him set out for Cork on a good horse, with £30 in his pocket. But in six weeks he came back on a miserable hack, without a penny, and informed his mother that the ship in which he had taken his passage, having got a fair wind while he was at a party of pleasure, had sailed without him. Then he resolved to study the law. A generous uncle, Mr. Contarine, advanced £50. With this sum Goldsmith went to Dublin, was enticed into a gaming house and lost every shilling. He then thought of medicine. A small purse was made up; and in his 24th year he was sent to Edinburgh. At Edinburgh he passed 18 months in nominal attendance on lectures, and picked up some superficial information about chemistry and natural history. Thence he went to Leyden, still pretending to study physic. He left that celebrated university, the third at which he had resided, in his 27th year, without a degree, with the merest smattering of medical knowledge, and with no property but his clothes and his flute. His flute, however, proved a useful friend. He rambled on foot through Flanders, France and Switzerland, playing tunes which everywhere set the peasantry dancing, and which often procured for him a supper and a bed. He wandered as far as Italy. His musical performances, indeed, were not to the taste of the Italians; but he contrived to live on the alms which he obtained at the gates of convents. It should, however, be observed that the stories which he told about this part of his life ought to be received with great caution; for strict veracity was never one of his virtues; and a man who is ordinarily inaccurate in narration is likely to be more than ordinarily inaccurate when he talks about his own travels. Goldsmith, indeed, was so regardless of truth as to assert in print that he was present at a most interesting conversation between Voltaire and Fontenelle, and that this conversation took place at Paris. Now it is certain that Voltaire never was within 100 leagues of Paris during the whole time which Goldsmith passed on the continent.

In London.—In Feb. 1756 the wanderer landed at Dover, without a shilling, without a friend and without a calling. He had indeed, if his own unsupported evidence may be trusted, obtained a doctor's degree on the continent; but this dignity proved utterly useless to him. In England his flute was not in request; there were no convents; and he was forced to have recourse to a series of desperate expedients. There is a tradition that he turned strolling player. He pounded drugs and ran about London with phials for charitable chemists. He asserted, upon one occasion, that he had lived "among the beggars in Axe Lane." He was for a time usher of a school, and felt the miseries and humiliations of this situation so keenly that he thought it a promotion to be permitted to earn his bread as a bookseller's hack; but he soon found the new yoke more galling than the old one, and was glad to become an usher again. He obtained a medical appointment in the service of the East India company; but the appointment was speedily revoked. Why it was revoked we are not told. The subject was one on which he never liked to talk. It is probable that he was incompetent to perform the duties of the place. Then he presented himself at Surgeons' hall for examination, as "mate to an hospital." Even to so humble a post he was found unequal. Nothing remained but to return to the lowest drudgery of literature. Goldsmith took a room in a tiny square off Ludgate hill, to which he had to climb from Sea-coal lane by a dizzy ladder of flagstones called Breakneck Steps. Green Arbour court and the ascent have long disappeared. Here, at 30, the unlucky adventurer sat down to toil like a galley slave. Already, in 1758, during his first bondage to letters, he had translated Marteilhe's remarkable *Memoirs of a Protestant, Condemned to the Galleys of France for his Religion*. In the years that now succeeded he sent to the press some things which have survived, and many which have perished. He produced articles for reviews, magazines and newspapers; children's books, which, bound in gilt paper and adorned with hideous woodcuts, appeared in the window of Newbery's once far-famed shop at the corner of Saint Paul's churchyard; *An Inquiry into the State of Polite Learning in Europe*, which, though of little or no value, is still reprinted among his works; a volume of essays entitled *The Bee;* a *Life of Beau Nash;* a superficial and incorrect, but very readable, *History of England*, in a series of letters purporting to be addressed by a nobleman to his son; and some very lively and amusing sketches of London society in another series of letters purporting to be addressed by a Chinese traveller to his friends.

All these works were anonymous; but some of them were well known to be Goldsmith's; and he gradually rose in the estimation of the booksellers for whom he drudged. He was, indeed, emphatically a popular writer. For accurate research or grave disquisition he was not well qualified by nature or by education. He knew nothing accurately; his reading had been desultory; nor had he meditated deeply on what he had read. He had seen much of the world; but he had noticed and retained little more of what he had seen than some grotesque incidents and characters which had happened to strike his fancy. But, though his mind was very scantily stored with materials, he used what materials he had in such a way as to produce a wonderful effect. There have been many greater writers; but perhaps no writer was ever more uniformly agreeable. His style was always pure and easy, and, on proper occasions, pointed and energetic. His narratives were always amusing, his descriptions always picturesque, his humour rich and joyous, yet not without an occasional tinge of amiable sadness. About everything that he wrote, serious or sportive, there was a certain natural grace and decorum, hardly to be expected from a man a great part of whose life had been passed among thieves and beggars, streetwalkers and merry-andrews, in those squalid dens which are the reproach of great capitals.

The Man of Letters.—As his name gradually became known, the circle of his acquaintance widened. He was introduced to Johnson, who was then considered as the first of living English writers; to Reynolds, the first of English painters; and to Burke, who had not yet entered parliament, but had distinguished himself greatly by his writings and by the eloquence of his conversation. With these eminent men Goldsmith became intimate. In 1763 he was one of the nine original members of that celebrated fraternity which has sometimes been called the Literary club, but which always disclaimed that epithet, and gloried in the simple name of the Club.

By this date Goldsmith had quitted his miserable dwelling at the top of Breakneck Steps, and, after living for some time at No. 6 Wine Office court, Fleet street, had moved into the Temple. But he was still often reduced to pitiable shifts, the most popular of which is connected with the sale of his solitary novel, the *Vicar* of *Wakefield*. Toward the close of 1764(?) his rent is alleged to have been so long in arrear that his landlady one morning called in the help of a sheriff's officer. The debtor, in great perplexity, dispatched a messenger to Johnson; and Johnson, always friendly, though often surly, sent back the messenger with a guinea, and promised to follow speedily. He came, and found that Goldsmith had changed the guinea and was railing at the landlady over a bottle of Madeira. Johnson put the cork into the bottle and entreated his friend to consider calmly how money was to be procured. Goldsmith said that he had a novel ready for the press. Johnson glanced at the manuscript, saw that there were good things in it, took it to a bookseller, sold it for £60 and soon returned with the money. The rent was paid, and the sheriff's officer withdrew. (Unfortunately, however, for this time-honoured version of the circumstances, it was later discovered that as early as Oct. 1762 Goldsmith had already sold a third of the *Vicar* to one Benjamin Collins of Salisbury, a printer, by whom it was eventually printed for F. Newbery, and it is difficult to reconcile this fact with Johnson's narrative.)

Traveller and Vicar of Wakefield.—But before the *Vicar* of *Wakefield* appeared in 1766, came the great crisis of Goldsmith's literary life. In Christmas week 1764 he published a poem, entitled the *Traveller*. It was the first work to which he had put his name, and it at once raised him to the rank of a legitimate English classic. The opinion of the most skilful critics was that nothing finer had appeared in verse since the fourth book of the *Dunciad*. In one respect the *Traveller* differs from all Goldsmith's other writings. In general his designs were bad and his execution good. In the *Traveller* the execution, though deserving of much praise, is far inferior to the design. No philosophical poem, ancient or modern, has a plan so noble, and at the same time so simple. An English wanderer, seated on a crag among the Alps, near the point where three great countries meet, looks down on the boundless prospect, reviews his long pilgrimage, recalls the varieties of scenery, of climate, of government, of religion, of national character, which he has observed, and comes to the conclusion, just or unjust, that our happiness depends little on political institutions, and much on the temper and regulation of our own minds.

While the fourth edition of the *Traveller* was on the counters of the booksellers, the *Vicar of Wakefield* appeared, and rapidly obtained a popularity which has lasted down to our own time, and which is likely to last as long as the English language. The fable is indeed one of the worst that ever was constructed. It wants, not merely that probability which ought to be found in a tale of common English life, but that consistency which ought to be found even in the wildest fiction about witches, giants and fairies. But the earlier chapters have all the sweetness of pastoral poetry, together with all the vivacity of comedy. Moses and his spectacles, the vicar and his monogamy, the sharper and his cosmogony, the squire proving from Aristotle that relatives are related, Olivia preparing herself for the arduous task of converting a rakish lover by studying the controversy between Robinson Crusoe and Friday, the great ladies with their scandal about Sir Tomkyn's amours and Dr. Burdock's verses, and Mr. Burchell with his "Fudge," have caused as much harmless mirth as has ever been caused by matter packed into so small a number of pages. The latter part of the tale is unworthy of the beginning. As we approach the catastrophe, the absurdities lie thicker and thicker, and the gleams of pleasantry become rarer and rarer.

The success which had attended Goldsmith as a novelist emboldened him to try his fortune as a dramatist He wrote the *Good Natur'd Man*, a piece which had a worse fate than it deserved. Garrick refused to produce it at Drury Lane. It was acted at Covent Garden in Jan. 1768, but was coldly received. The author, however, cleared, by his benefit nights, and by the sale of the copyright, no less than £500, five times as much as he had made by the *Traveller* and the *Vicar of Wakefield* together. The plot of the *Good Natur'd Man* is, like almost all Goldsmith's plots, very ill constructed. But some passages are exquisitely ludicrous—much more ludicrous indeed than suited the taste of the town at that time. A canting, mawkish play, entitled *False Delicacy*, had just been produced, and sentimentality was all the mode. During some years more tears were shed at comedies than at tragedies; and a pleasantry which moved the audience to anything more than a grave smile was reprobated as low. It is not strange, therefore, that the very best scene in the *Good Natur'd Man*, that in which Miss Richland finds her lover attended by the bailiff and the bailiff's follower in full court dresses, should have been mercilessly hissed, and should have been omitted after the first night, not to be restored for several years.

The Deserted Village.—In May 1770 appeared the *Deserted Village*. In mere diction and versification this celebrated poem is fully equal, perhaps superior, to the *Traveller;* and it is generally preferred to the *Traveller* by that large class of readers who think, with Bayes in the *Rehearsal*, that the only use of a plot is to bring in fine things. More discerning judges, however, while they admire the beauty of the details, are shocked by one unpardonable fault which pervades the whole. The fault which we mean is not that theory about wealth and luxury which has so often been censured by political economists. The theory is indeed false; but the poem, considered merely as a poem, is not necessarily the worse on that account. The finest poem in the Latin language—indeed, the finest didactic poem in any language—was written in defense of the silliest and meanest of all systems of natural and moral philosophy. A poet may easily be pardoned for reasoning ill; but he cannot be pardoned for describing ill, for observing the world in which he lives so carelessly that his portraits bear no resemblance to the originals, for exhibiting as copies from real life monstrous combinations of things which never were and never could be found together. What would be thought of a painter who should mix August and January in one landscape, who should introduce a frozen river into a harvest scene? Would it be a sufficient defense of such a picture to say that every part was exquisitely coloured, that the green hedges, the apple trees loaded with fruit, the wagons reeling under the yellow sheaves, and the sunburned reapers wiping their foreheads were very fine, and that the ice and the boys sliding were also very fine? To such a picture the *Deserted Village* bears a great resemblance. It is made up of incongruous parts. The village in its happy days is a true English village. The village in its decay is an Irish village. The felicity and the misery which Goldsmith has brought close together belong to two different countries and to two different stages in the progress of society. He had assuredly never seen in his native island such a rural paradise, such a seat of plenty, content and tranquillity, as his Auburn. He had assuredly never seen in England all the inhabitants of such a paradise turned out of their homes in one day and forced to emigrate in a body to America. The hamlet he had probably seen in Kent; the ejectment he had probably seen in Munster; but by joining the two, he has produced something which never was and never will be seen in any part of the world.

She Stoops to Conquer.—In 1773 Goldsmith tried his chance at Covent Garden with a second play, *She Stoops to Conquer*. The manager was, not without great difficulty, induced to bring this piece out. The sentimental comedy still reigned, and Goldsmith's comedies were not sentimental. The *Good Natur'd Man* had been too funny to succeed; yet the mirth of the *Good Natur'd Man* was sober when compared with the rich drollery of *She Stoops to Conquer*, which is, in truth, an incomparable farce in five acts On this occasion, however, genius triumphed. Pit, boxes and galleries were in a constant roar of laughter. If any bigoted admirer of Kelly and Cumberland ventured to hiss or groan. he was speedily silenced by a general cry of "turn him out," or "throw him over." Later generations have confirmed the verdict which was pronounced on that night.

While Goldsmith was writing the *Deserted Village* and *She Stoops to Conquer,* he was employed on works of a very different kind—works from which he derived little reputation but much profit. He compiled for the use of schools a *History of Rome,* by which he made £250; a *History of England,* by which he made 5500; a *History of Greece,* for which he received £250; a *Natural History,* for which the booksellers covenanted to pay him 800 guineas. These works he produced without any elaborate research, by merely selecting, abridging and translating into his own clear, pure and flowing language what he found in books well known to the world, but too bulky or too dry for boys and girls. He committed some strange blunders, for he knew nothing with accuracy. Thus, in his *History of England,* he tells us that Naseby is in Yorkshire; nor did he correct this mistake when the book was reprinted. He was very nearly hoaxed into putting into the *History of Greece* an account of a battle between Alexander the Great and Montezuma. In his *Animated Nature* he relates, with faith and with perfect gravity, all the most absurd lies which he could find in books of travels about gigantic Patagonians, monkeys that preach sermons, nightingales that repeat long conversations. "If he can tell a horse from a cow," said Johnson, "that is the extent of his knowledge of zoology." How little Goldsmith was qualified to write about the physical sciences is sufficiently proved by two anecdotes. He on one occasion denied that the sun is longer in the northern than in the southern signs It was vain to cite the authority of Maupertuis. "Maupertuis!" he cried, "I understand those matters better than Maupertuis." On another occasion he, in defiance of the evidence of his own senses, maintained obstinately, and even angrily, that he chewed his dinner by moving his upper jaw.

Yet, ignorant as Goldsmith was, few writers have done more to make the first steps in the laborious road to knowledge easy and pleasant His compilations are widely distinguished from the compilations of ordinary bookmakers. He was a great, perhaps an unequalled, master of the arts of selection and condensation. In these respects his histories of Rome and of England, and still more his own abridgments of these histories, well deserved to be studied. In general nothing is less attractive than an epitome; but the epitomes of Goldsmith, even when most concise, are always amusing: and to read them is considered by intelligent children not as a task but as a pleasure.

Personality.—Goldsmith might now be considered as a prosperous man. He had the means of living in comfort, and even in what to one who had so often slept in barns and on bulks must have been luxury. His fame was great and was constantly rising. He lived in what was intellectually far the best society of the kingdom, in a society in which no talent or accomplishment was wanting, and in which the art of conversation was cultivated with splendid success There probably were never four talkers more admirable in four different ways than Johnson, Burke, Beauclerk and Garrick; and Goldsmith was on terms of intimacy with all the four. He aspired to share in their colloquial renown but never was ambition more unfortunate. It may seem strange that a man who wrote with so much perspicuity, vivacity and grace should have been, whenever he took a part in conversation, an empty, noisy, blundering rattle. But on this point the evidence is overwhelming. So extraordinary was the contrast between Goldsmith's published works and the silly things which he said, that Horace Walpole described him as an inspired idiot. "Noll," said Garrick, "wrote like an angel, and talked like poor Poll." Chamier declared that it was a hard exercise of faith to believe that so foolish a chatterer could have really written the *Traveller* Even Boswell could say, with contemptuous compassion, that he liked very well to hear honest Goldsmith run on. "Yes, sir," said Johnson, "but he should not like to hear himself." Minds differ as rivers differ. There are transparent and sparkling rivers from which it is delightful to drink as they flow; to such rivers the minds of such men as Burke and Johnson may be compared. But there are rivers of which the water when first drawn is turbid and noisome, but becomes pellucid as crystal and delicious to the taste, if it be suffered to stand till it has deposited a sediment; and such a river is a type of the mind of Goldsmith. His first thoughts on every subject were confused even to absurdity, but they required only a little time to work themselves clear. When he wrote they had that time, and therefore his readers pronounced him a man of genius; but when he talked he talked nonsense and made himself the laughingstock of his hearers. He was painfully conscious of his inferiority in conversation; he felt every failure keenly; yet he had not sufficient judgment and self-command to hold his tongue. His animal spirits and vanity were always impelling him to try to do the one thing which he could not do. After every attempt he felt that he had exposed himself, and writhed with shame and vexation; yet the next moment he began again.

His associates seem to have regarded him with kindness, which, in spite of their admiration of his writings, was not unmixed with contempt. In truth, there was in his character much to love, but very little to respect. His heart was soft even to weakness: he was so generous that he quite forgot to be just; he forgave injuries so readily that he might be said to invite them, and was so liberal to beggars that he had nothing left for his tailor and his butcher. He was vain, sensual, frivolous, profuse, improvident. One vice of a darker shade was imputed to him, envy. But there is not the least reason to believe that this bad passion, though it sometimes made him wince and utter fretful exclamations, ever impelled him to injure by wicked arts the reputation of any of his rivals. The truth probably is that he was not more envious, but merely less prudent, than his neighbours. His heart was on his lips. All those small jealousies, which are but too common among men of letters, but which a man of letters who is also a man of the world does his best to conceal, Goldsmith avowed with the simplicity of a child. When he was envious, instead of affecting indifference, instead of damning with faint praise, instead of doing injuries slyly and in the dark, he told everybody that he was envious. "Do not, pray, do not, talk of Johnson in such terms," he said to Boswell; "you harrow up my very soul." George Steevens and Cumberland were men far too cunning to say such a thing. They would have echoed the praises of the man whom they envied, and then have sent to the newspapers anonymous libels upon him. Both what was good and what was bad in Goldsmith's character was to his associates a perfect security that he would never commit such villainy. He was neither ill-natured enough, nor long-headed enough, to be guilty of any malicious act which required contrivance and disguise.

The Spendthrift.—Goldsmith has sometimes been represented as a man of genius, cruelly treated by the world, and doomed to struggle with difficulties, which at last broke his heart. But no representation can be more remote from the truth. He did, indeed, go through much sharp misery before he had done anything considerable in literature. But after his name had appeared on the title page of the *Traveller,* he had none but himself to blame for his distresses. His average income during the last seven years of his life certainly exceeded £400 a year, and £400 a year ranked, among the incomes of that day, at least as high as £800 a year would rank a century later. A single man living in the Temple, with £400 a year, might then be called opulent. Not one in ten of the young gentlemen of good families who were studying the law there had so much. But all the wealth which Lord Clive had brought from Bengal and Sir Lawrence Dundas from Germany, joined together, would not have sufficed for Goldsmith. He spent twice as much as he had. He wore fine clothes, gave dinners of several courses, paid court to venal beauties. He had also, it should be remembered, to the honour of his heart, though not of his head, a guinea, or five, or ten, according to the state of his purse, ready for any tale of distress, true or false. But it was not in dress or feasting, in promiscuous amours or promiscuous charities that his chief expense lay. He had been from boyhood a gambler, and at once the most sanguine and the most unskilful of gamblers. For a time he put off the day of inevitable ruin by temporary expedients. He obtained advances from booksellers by promising to execute works which he never began. But at length this source of supply failed. He owed more than £2,000, and he saw no hope of extrication from his embarrassments. His spirits and health gave way. He was attacked by a nervous fever, which he thought himself competent to treat. It would have been happy for him if his medical skill had been appreciated as justly by himself as by others. Notwithstanding the degree which he pretended to have received on the continent, he could procure no patients. "I do not practise," he once said, "I make it a rule to prescribe only for my friends." "Pray, dear Doctor." said Beauclerk, "alter your rule; and prescribe only for your enemies." Goldsmith, now, in spite of this excellent advice, prescribed for himself. The remedy aggravated the malady. The sick man was induced to call in real physicians; and they at one time imagined that they had cured the disease. Still his weakness and restlessness continued. He could get no sleep. He could take no food. "You are worse," said one of his medical attendants, "than you should be from the degree of fever which you have. Is your mind at ease?" "No; it is not," were the last recorded words of Oliver Goldsmith. He died on April 4, 1774, in his 46th year. He was laid in the churchyard of the Temple; the actual spot is unknown, but a stone with a Latin inscription, erected nearby in 1856, notes the fact. The coffin was followed by Burke and Reynolds. Both these great men were sincere mourners. Burke, when he heard of Goldsmith's death, had burst into a flood of tears. Reynolds had been so much moved by the news that he had flung aside his brush and palette for the day.

A short time after Goldsmith's death, a little poem appeared, which will, as long as the language lasts, associate the names of his two illustrious friends with his own. It has already been mentioned that he sometimes felt keenly the sarcasm nhich his wild blundering talk brought upon him. He was, not long before his last illness, provoked into retaliating. He wisely betook himself to his pen; and at that weapon he proved himself a match for all his assailants together. Within a small compass he drew with a singularly easy and vigorous pencil the characters of nine or ten of his intimate associates. Though this little work did not receive his last touches, it must always be regarded as a masterpiece. It is impossible, however, not to wish that four or five likenesses which have no interest for posterity were wanting to that noble gallery, and that their places were supplied by sketches of Johnson and Gibbon, as happy and vivid as the sketches of Burke and Garrick.

Some of Goldsmith's friends and admirers honoured him with a cenotaph in Westminster abbey. Nollekens was the sculptor, and Johnson wrote the inscription. It is much to be lamented that Johnson did not leave to posterity a more durable and a more valuable memorial of his friend. A life of Goldsmith would have been an inestimable addition to the *Lives of the Poets.* No man appreciated Goldsmith's writings more justly than Johnson; no man was better acquainted with Goldsmith's character and habits; and no man was more competent to delineate with truth and spirit the peculiarities of a mind in which great powers were found in company with great weaknesses. But the list of poets to whose works Johnson was requested by the booksellers to furnish prefaces ended with Lyttelton, who died in 1773. The line seems to have been drawn expressly for the purpose of excluding the person whose portrait would have most fitly closed the series. Goldsmith, however, has been fortunate in his biographers. (M.)

Bibliography.—Goldsmith's *Miscellaneous Works* were first published by W. Osborne and T. Griffin (1775). Bishop Percy wrote a memoir for S. Rose's edition of Goldsmith's *Miscellaneous Works* (4 vols., 1806). For other editions *see* I. A. Williams, *Seven XVIII Century Bibliographies* (1924). The Oxford edition of Goldsmith's plays and *The Vicar of Wakefield* was issued in 1909. Some *New Essays* by him were edited by R. S. Crane (Chicago, 1927). Goldsmith's life has been written by Prior (1837), by Washington Irving (1844–49) and by John Forster (1848, 2nd ed. 1854). The diligence of Prior deserves great praise; the style of Washington Irving is always pleasing; but the highest place must, in justice, be assigned to the eminently interesting work of Forster. Subsequent biographies are by William Black (1878); Austin Dobson (1888, American ed. 1899); R. A. King (1910); F. F. Moore (1910); S. L. Gwynn (1935); *see* also K. C. Balderston, *The History and Sources of Percy's Memoir of Goldsmith* (1926). The above article by Lord Macaulay was slightly revised by Austin Dobson, as regards questions of fact for which there has been new evidence.

GOLDSMITH BEETLE, a name applied to certain species of the family Scarabaeidae, from their metallic lustre, and especially to *Cotalpa lanigera* of the eastern United States, a large form, nocturnal in habit, concealed often in willow trees, by day. It is allied to the common dung and burying beetles.

GOLDSMITHS' AND SILVERSMITHS' WORK: *see* Silversmiths' and Goldsmiths' Work.

GOLD STANDARD. The gold standard is the monetary system in which the monetary unit is, or is kept at the value of, a fixed weight of gold.

The method by which this result was originally attained was free coinage, free melting and free movement of gold. Under this method anyone had the right (1) to tender gold in unlimited quantities to the monetary authorities and to receive therefor an equal weight of gold in the coinage of the jurisdiction; (2) to melt down coins, of which the weight and fineness was specified and unchanging, for their gold content; and (3) to export or import gold coin or gold bullion at will; all without any, or at least no substantial, governmentally imposed charges.

When convertible paper currency gradually, and eventually in full degree, supplanted the use of coined gold, the same result was attained through an offer by the monetary authorities (1) to buy or sell gold, in unlimited quantities, at a fixed price in convertible paper money per unit of weight of the metal; and (2) to continue to refrain from putting any substantial restraints on the export or import of gold coin or bullion. So long as a two-way market for gold, at a fixed price in paper currency, was thus maintained, a more or less unexceptionable substitute for the free coinage and free melting of the metal was provided. As for free export and import of gold, most countries adhering to the gold standard made no changes in the original procedure. But, under the gold-exchange standard (a variant of the gold standard), a substitute for the export and import of gold was set up in the offer by the monetary authorities to buy and sell bills of exchange, on one or more gold-standard countries, at a fixed price in the paper currency of the country making the offer. This, in effect, provided *abroad,* rather than at home, the necessary two-way market for gold in the currency of the country concerned, but, since the cost of transfer of the metal from the foreign to the home country was negligible in relation to its value, the procedure did not impair the essentials of the gold standard.

It was, for several reasons, much cheaper to maintain a gold-exchange standard than to preserve the unqualified gold standard. The gold-exchange standard was therefore popular in poor countries, especially in the poorer colonies of relatively rich nations. Since, however, it was dangerous to keep monetary reserves in a foreign country, if for no other reason than that international violence might at any time break out, the gold-exchange standard was not widely used by independent nations.

History. — The gold standard was first put into operation in Great Britain in 1821. Prior to that time the principal world monetary metal had been silver. Gold had, for many centuries, been used intermittently as coin in one or another country, but never as the single *reference* metal, or standard, to which all other forms of money were co-ordinated or adjusted. The adoption of gold monometallism in Great Britain in 1821 was not imitated by any important country until the eighth decade of the 19th century. In the intervening period, silver, or a bimetallic regime of gold and silver, was the prevailing standard outside the British Isles. But, in the 1870s, the monometallic gold standard was adopted by Germany, France and the United States. Before the end of the century many other countries had followed the lead of the financially important nations, and the *international* gold standard may be held to have been inaugurated in 1893 when India (hitherto a stronghold of free silver and of the silver standard) adopted a rather imperfect version of the gold-exchange standard. After the turn of the century, only China, Mexico and a few small countries remained as representatives of the—at one time—practically universal use of silver as standard money.

The all but undisputed reign of the international gold standard was short, covering only the two decades from 1894 to the outbreak of World War I. That war saw recourse to inconvertible paper money in nearly every country in the world. Monetary units were then no longer based on a commodity asset, like gold, but were only the uncallable debts of the issuing authorities.

At the close of World War I, and throughout the following decade, there was a general tendency to revert to the gold standard, and by 1928 it was, in fact, widely re-established. But the international gold standard had thus scarcely been set once again upon its feet when, largely as a result of world-wide depression, a new wave of defections began. This went so far that, by 1937, there was left not a single country that could be said to be, fairly and squarely, on the gold standard. Unlike the period immediately following World War I there was now moreover, in many countries, no desire to return to the gold-standard fold. On the contrary, a definite hostility toward the gold standard had developed in several countries which had hitherto been among its strongest adherents. Unless inconvertible paper monetary systems are everywhere grossly abused it seems unlikely, therefore, that the gold standard, in its pristine form, will ever regain its quondam international position.

Theory. — Automatic operation was of the essence of the gold standard. In its heyday there was no attempt at central, or any, regulation of the volume of money in any jurisdiction. The supply of money was left to the action of individuals pursuing what they conceived to be their own interest. Gold was, of right, money, at a fixed price per unit of weight, whenever, and in whatever amount, anyone cared to turn gold into money; and money was, of right, gold, at a fixed weight per unit of price, whenever, and in whatever amount, anyone cared to turn money into gold. Moreover, the money of any one gold-standard country, through melting or redemption, the free export and import of gold, and free coinage or free purchase of gold in the country of destination, was readily convertible at a fixed price into the money of any other. The international gold standard therefore gave to the world an authentic, albeit defective, international medium of exchange and unit of account.

Whatever the virtues of automatism, and they are certainly not to be derided, the gold standard subjected countries adhering to it to wholly capricious movements in price levels. To prevent, in any jurisdiction, sudden changes in the supply of money, as the outcome of vicissitudes in the import or export of gold, certain offsetting techniques, involving substitution on a greater or smaller scale of convertible paper money for gold, were presently developed. London took the lead in this matter but the techniques became standard practice, in various countries, in the latter decades of the 19th century.

These techniques were reasonably successful in forestalling chaotic short-term changes in the supply of money in any given country, but they did nothing to nullify secular changes in the money supply, in all countries, in complete lack of correspondence with the requirements for a stable price-level. As the evil repercussions of secular movements in the money supply and in price levels became more apparent, the caprices of automatism became intolerable and, in the 1920s, a much more rigorous "management" of the gold standard was attempted. Gold was then indefinitely "sterilized" or "fecundized" in its influence on the monetary supply, according to the ideas of monetary authorities as to what was, at any given time, desirable. This managed *soi-disant* gold standard was, in the view of some eminent authorities, not a gold standard at all since the automatism, which was of the essence of that standard, had been removed.

It soon became obvious that something of great importance was now lacking. So long as the egress or ingress of gold had, in the several jurisdictions, been attended by proportionate if somewhat retarded alterations in their relative supplies of money, there was a world integration of the price levels of the various countries. Any tendency for prices in one country to rise above the level which would establish an equilibrium with the rest of the world would operate to increase the ratio of its commodity imports to its commodity exports. The ensuing lack of balance in its international accounts would be covered by an outward movement of gold which would continue until. through a consequent shift in the relationship between the price levels of this and other countries, balance had been restored. Aside from minor and evanescent deviations, the price levels of gold standard countries were thus kept in constant relationship with one another and moved up or down, according as the world supply of monetary gold was redundant or scarce, in the substantial unison necessary to establish equilibrium in international commercial and financial transactions. But when management of the "gold standard" was introduced, with the idea of controlling, in each country, the national price level, the hitherto prevailing constant relationship between national price levels was inevitably disrupted unless, by some all but miraculous chance, the management in the various countries should bring about identical price-level movements in each of them.

This more or less miraculous possibility did not come to pass and it further developed that the original self-adjusting mechanism of the gold standard had been all but reversed. Imports of gold into any country tend to depress the exchange value of its currency and, if the influx of gold is not permitted to affect prices, this operates to enlarge that increase in the ratio of the recipient country's commodity exports to its imports to which the inward movement of gold is attributable. Under the unmanaged gold standard the ensuing rise in the relative price level of a country receiving gold had nullified the effect of the (very minor) exchange rate movement. The movement of relative price levels more than compensated the comparatively small shift in exchange rates between the "gold points," supplanted the rise with a *fall* in the ratio of commodity exports to imports in the gold-receiving country, brought about equilibrium in the commodity flow and counterflow, and thus checked the influx of gold, But since, under the "managed gold standard," the import of gold, instead of reversing that excess of any country's commodity exports over imports which had occasioned the movement of gold to its shores, tended to augment it, the standard operated to maintain disequilibrium and to bring about a *persistent* influx of gold. Stability of prices in any gold-receiving country thereby thrust deflation, in chronic form, on all other gold-standard countries which, if they wished to preserve that standard, were forced to protect themselves, against the complete loss of their gold reserves, by a deliberately induced reduction of the domestic price and wage level. Since any such procedure involved severe unemployment, the conviction was in many countries established, not without reason, that the gold standard (as it had been developed) was a hair-shirt on those that wore it. It was therefore abandoned and was replaced by inconvertible paper money. Adjustments in international transactions were then effected through shifts in exchange rates far beyond the narrow limits set by the gold standard in the (slight) cost of transfer of gold.

In the original gold-standard theory the fixed price of gold, and the automatic injection of gold into monetary use, were indissolubly linked. However much the price level might vary, there could never be too much or too little gold. This was excluded by definition; whatever was was right. Any notion that there was too much or too little monetary gold was an indictment of the gold standard *per se,* for this meant that, by *some criterion other than the available gold,* the supply of money was considered excessive or deficient.

The clear inference was that, if the money supply issuing out of an unmanaged gold standard was unsatisfactory, the gold standard should not be modified, out of all recognition, but should be discarded. Since in any case there was to be management, and an inconvertible paper currency could be managed more easily than gold (to say nothing of being obviously cheaper), the insistent question arose as to why gold should be used at all for money, so far, at least, as domestic transactions were concerned. The only reasonably cogent answer was the allegation that gold furnished a fool-proof currency. Provided simple rules were adhered to, it was asserted that a gold currency could never develop the inflationary aberrations that have characterized many mismanaged paper monetary units. The question at issue thus became whether it was better to have an imperfect standard allegedly not subject to gross mismanagement, or a *potentially* better standard which was, however, open to the gravest abuse.

The case for the gold standard as a fool-proof currency was greatly weakened, however, by the legislated shift in the gold value of the dollar, and other currencies, in the decade preceding World War II. The great virtue of gold had always been held to be the fact that the supply was limited by nature. The rate at which the natural riches appeared, in the discovery of new and productive mines, was of course a matter of chance but it was clearly not possible to alter this rate at will. Such vagaries as there may have been in the supply of gold were at least not the result of arbitrary governmental action. So long as the monetary value of a given weight of gold was inviolably fixed, the production of gold was primarily, therefore, a consequence of natural forces and natural forces only. When, however, the policy of a presumably inviolable price for gold was abandoned, physical conditions became much less important than governmental decisions in the determination of the volume of gold and of money. The level at which a powerful legislature established the money price of gold made a tremendous difference both in the money value of the existing stock of gold and in the profitability of mining. Nature still holds the secret of the world's undeveloped gold resources but men now know that they have the key to the speed with which the known resources will be exploited. The supply of gold coming to the markets of the world is no longer a manifestation of nature's bounty or niggardliness but a consequence of man-made law. What man has once done he can do again, and the supply and money value of gold are now as truly subject to management as are purely fiat currencies. The "tinkering," in the United States and other countries, with the established money price of gold has perhaps therefore banished, once and for all, the belief that the gold (and gold money) supply is determined independently of the action of monetary authorities and that gold provides a fool-proof standard.

Prospect.—The gold standard always operated in the right *direction,* but inadequately and with ill-timed effect. When the general price level was rising the supply of gold coming from the mines tended to decline because of rising money costs of mining, with a fixed price for the product. This operated, slowly, to check the rise in the general price level and, in a situation where the supply of labour tended to be short, permitted the diversion of a small amount of labour to other industries. When, on the other hand, the general price level was falling, the supply of gold coming from the mines tended to increase because of the fall in money costs of mining. This operated, slowly, to check the decline in the general price level and, in a situation where the supply of labour tended to be long, absorbed a small amount of the labour released by other industries. The result, however, was merely to hold the movement of price levels to long cycles, rather than to effect a real price-level stabilization, and to exert nothing but a negligible influence in stabilizing employment.

The use of the accident of the discovery, or lack of discovery, of new gold mines, as the principal factor in "regulating" the world supply of money, was a so wholly irrational procedure as to induce a growing recognition of the fact that a better means of controlling the supply of money was indispensable. The evils of a volatile price level are too glaring to permit of complacency, and most countries are no longer willing to subject their economies to a monetary system which takes control of their money supply out of their own hands. This is one of the most compelling arguments against any truly *international* monetary system, whether or not it is based on gold, and accounts for the reluctance of the countries in question to tie to gold their now independent currencies through a system of fixed exchange rates against gold-standard countries. It is doubtful, therefore, whether an international regime of even approximately fixed exchange rates can count on a very lengthy life. The gold standard may be maintained, by one or another country, but its international hold may well have been permanently broken. The best possibility of restoration lies in effective measures designed to stabilize the purchasing power of gold. If such a stabilization were attained; the present reluctance of many countries to revert to the gold standard might gradually dissolve.

In any case, so long as gold is highly prized by individuals and banking authorities, a certain supply of it will be useful in the conduct of international trade and finance. Nothing else serves so well, in a nationalistic world, for meeting debit balances in international transactions. The project for an international monetary system, submitted for approval to the various governments of the world by the Bretton Woods conference in 1944, may perhaps do something to diminish the importance of gold in international transactions, but gold is still very much in the picture. Gold has ceased to play an important role in the domestic monetary system of most countries, and the gold standard in its earlier and only authentic form may have passed forever, but gold is a tangible asset while fiduciary money is merely a more or less readily collectible promise. In a world of international skepticism, if not active distrust, gold, even though its value now rests almost solely upon the none too secure basis of law and convention rather than deeply in the desires of men, will long be more highly regarded than foreigners' promises subject to repudiation either by the promissors or their governments. Gold, for the time being, possesses in pre-eminent degree the virtue of international vendibility. The prestige of gold is therefore still great enough to insure, for an indefinite period, its retention as international money, on the ground of its salability in international trade, even if it should everywhere lose its status as indefeasible domestic money. In the United States, at least, it is not likely at an early date to lose even this status, if only because of the large stocks of gold in the possession of that country. The British Empire and Russia, by reason of their large output of gold, have also a great stake in the maintenance of gold as money. It seems probable, therefore, that some more or less distant approximation to the original gold standard will for the foreseeable future be maintained in the United States and, perhaps, in many other countries. It should be said, however, that no country with any intention of putting into effect unilaterally, as occasion seems to demand, a change in the gold value of its monetary unit can pretend, in any significant sense, to be a gold-standard country.

GOLD STICK IN WAITING, an officer of the British royal household who waits in close attendance upon the sovereign and whose emblem of office is an ebony staff or stick with a gold head, engraved with the sovereign's cipher and crown. The office was instituted in 1678 and was held exclusively by "Colonels of the Regiment" of regiments of life guards until 1820 when the honour was extended to officers holding similar appointments in the royal horse guards. *Silver Stick in Waiting* is the officer who stands near the *Gold Stick* "ready to relieve him."

See Sir George Arthur, *The Story of the Household Cavalry* (1909).

GOLDSTUCKER, THEODOR (1821–1872), German Sanskrit scholar, was born of Jewish parents at Konigsberg on Jan. 18, 1821. From 1847 to 1850 he resided at Berlin, but his advanced political views caused the authorities to regard him with suspicion. In the latter year he removed to London, in 1852 he became professor of Sanskrit in University college. He was one of the founders and chief promoters of the Sanskrit Text society. He died in London on March 6, 1872.

GOLDZIHER, IGNAZ (1850–1921), Jewish Hungarian orientalist, was born in Stuhlweissenburg on June 22, 1850. He was educated at the universities of Budapest, Berlin, Leipzig and Leyden, and was the first Jewish scholar to become professor in the Budapest university (1894), and represented the Hungarian government and the Academy of Sciences at numerous international congresses. He received many foreign academic honours. Goldziher investigated pre-Mohammedan and Mohammedan law, tradition, religion and poetry. Among his chief works are: *Beiträge zur Literaturgeschichte der Schi'u* (1874); *Beiträge zur Geschichte der Sprachgelehrsamkeit bei den Arabern* (1871–73); *Der Mythos* bei den *Hebräern* und seine geschichtliche Entwickelung (Leipzig, 1876; Eng. trans. by R. Martineau, 1877); Muhammedanische Studien (Halle, 2 vol. 1889–90).

GOLETTA (LA GOULETTE), a port town on the Gulf of Tunis, south of the ruins of Carthage and on the north side of the ship canal which traverses the shallow Lake of Tunis and leads to the city of Tunis. The town contains many villas, gardens and pleasure resorts, as well as a summer palace of the bey and the old seraglio.

A short canal, 40 ft. broad and 8½ ft. deep, affords communication between the ship canal and a dock or basin 1,082 ft. long and 541 ft. broad. The port was completely destroyed by aerial bombing, from its occupation by the Axis, Nov. 14. 1942, until its capture by Allied forces in May 1943. An electric tramway connects Goletta with the city of Tunis (*q.v.*). Pop. (1956 est.) 26,323 (mun.), mostly Jews and Italian fishermen.

GOLF, a game which originated in Scotland, is played by striking a small ball with various clubs from a teeing ground into a series of holes on a course. The player who holes his ball in the fewest strokes is the winner.

The history and nature of the game are discussed under the following main headings:

I. HISTORY

While golf as the game is known today originated in Scotland, the place and time are obscure. However, it was so popular in the 15th century that the 14th parliament of King James II of Scotland decreed in 1457 that "fute-ball and golfe be utterly cryed downe, and not to be used" because they interfered with the practice of archery, an essential element in the defense of the realm. This legislation provided the first written reference to the playing of golf. That the game was well established is further supported by the fact that two subsequent Scottish parliaments found it necessary to issue similar decrees—in 1471 and 1491—in efforts to suppress the game, and it appears that none of the three was effective. The invention of gunpowder near the end of the 15th century may have contributed to ending the proscription by lessening the importance of archery. At any rate, James IV (1473–1513), whose third parliament had passed the last of the three decrees, developed into an avid golfer. James V of Scotland (1512–42) played golf at East Lothian. His daughter Mary, queen of Scots (1542–87), played golf at St. Andrews and her son James VI of Scotland, later James I of England (1566–1625), played at Blackheath common, London. The earliest rounds of golf, however, apparently had been played on linksland on the eastern coast of Scotland.

1. Precursors of Golf and Related Games. — The family tree of golf may go back to the Roman empire. The Romans played a game in the fields called paganica (from *paganus,* "countryman") in which a club and a ball stuffed with feathers were used. The Roman legions, as they advanced over Europe and into Britain, may have carried paganica with them. If so, that would account for the development of similar games in several European countries: cambuca (cambrel or cammock) in England, *jeu de* mail in France, het kolven in the Netherlands. All of these involved striking a ball across the countryside with a stick. Cambuca (a name also given to the club used in the game) was played in the 13th and 14th centuries and was described in a record of 1363, printed in Thomas Rymer's Foedera, as "the game of a crooked stick or curved club or playing mallet with which a small wooden ball is propelled forward." Coincidentally, cambuca was forbidden in 1363 in an order to the sheriffs of England, in order that man "shall in his sports use bows and arrows, pellets and bolts."

Het kolven, played in the Netherlands, provided some of the important terminology of the game (see *Glossary,* below) and some interesting references in art. The word golf stems from the Dutch kolf, which in turn is related to the German Kolbe and the Danish holbe, meaning "club." The mound on which the Dutchman placed his ball was a tuitje, pronounced "toytee." The hole to which he directed his ball was a put. If anything was in his way, he said, *stuit* mij, pronounced "stytmy" ("it stops me"). There is, too, an old Dutch proverb: "You must play the ball as it lies." The earliest reference to het kolven is in an illuminated Book of Hours, done by Simon Bennink with the assistance of pupils in his studio at Bruges between 1500 and 1520, and now in the British museum. A miniature depicts three players on a green with a hole, each player with a club and ball and one of them attempting to hole out. From the same period, a sketch by David Vinck-Boons and other evidence reflects a similar game played on ice. The Dutch painting "Frost Scene" by A. van de Velde, dated 1668, portrays four "golfers" in competition, two Dutchmen in knickerbockers and two Scots in kilts.

2. Early British Golfers' Associations. — It is generally conceded that the Royal Blackheath Golf club of London is the oldest existing golf club in the world, but its origin is as obscure as that of the game itself. James I, whose reign began in 1603, played golf on Blackheath common, and a society of golfers was formed at Blackheath in 1608. A group of golfers was flourishing there in 1766, for a silver club bears the inscription: "August 16, 1766, the gift of Mr. Henry Foote to the Honourable Company of Goffers at Blackheath." The Royal Burgess Golfing Society of Edinburgh claims to have been founded in 1735. The Company of Gentlemen Golfers, now the Honourable Company of Edinburgh Golfers, was formed in 1744 by a group that played over the five holes of the Leith links. The lord provost, the magistrates and the council of the city of Edinburgh presented to the company a silver club that was first played for in April 1745. The club subsequently transferred its activities to Musselburgh and finally to Muirfield, with which links it has been associated in modern times. The earliest known rules are the 13 recorded in the first minute book of the Honourable Company of Edinburgh Golfers. The first signer was John Rattray, who was captain in 1744, 1745 and 1751. The code, therefore, cannot be more recent than 1751 and more likely was entered in the minute book when the competition for the silver club was instituted, in 1745.

The Royal and Ancient Golf Club. — The Society of St. Andrews, now the Royal and Ancient Golf Club of St. Andrews, Scotland, was formed on May 14, 1754, by a group of 22 golfers who played there. The rules which the society adopted were almost identical with the Edinburgh Gentlemen Golfers' rules. An allusion to scholars' holes and soldiers' lines not constituting hazards indicates that the rules were copied from the Gentlemen Golfers' code when the St. Andrews golfers were playing at Leith, since there were both scholars' holes and soldiers' lines at Leith but no soldiers' lines at St. Andrews. These two clubs played major roles in the development of the game in Scotland. Eventually the Royal and Ancient Golf club (R.A.G.C.) became, by common consent, the oracle on rules. In 1919 it accepted the management of the British open and amateur championships. The R.A.G.C. thus became the governing body for men's golf in the British Isles and throughout most of the Commonwealth. The Musselburgh Golf club offered a prize for a women's competition, Dec. 14, 1810, and a Ladies Golf club was formed at St. Andrews in 1872. The Ladies Golf union, which governs women's golf, was organized in 1893.

3. United States. — Golf or something akin to it may have been played in the new world in the 17th and 18th centuries. The record of a court in Ft. Orange (now Albany, N.Y.) reveals that the sheriff there filed a complaint against three men who had been playing *het kolven* on the ice on a Sunday in 1657. The magistrates of Ft. Orange on Dec. 10, 1659, issued an ordinance to "forbid all persons to play 'het kolven' in the streets." While these documents are sometimes cited as evidence of the earliest playing of golf in the United States, the game does not seem to have been the linksland pastime handed down by the Scots. There seems little doubt, however, that the following advertisement, which appeared in James Rivington's *Gazette* in New York on April 21, 1779, referred to golf: "To the Golf Players: The season for this pleasant and healthy exercise now advancing, gentlemen may be furnished with excellent clubs and the veritable Caledonian balls by enquiring at the Printer's." However, there is no record of golf in New York during the subsequent century. The next evidence appears in the Carolinas. The *South Carolina and Georgia Almanac* of 1793 published, under the heading "Societies Established in Charleston," the following item: "Golf club formed 1786. Dr. Purcell — President. Edward Penman — Vice President. James Gardiner — Treasurer and Secretary." The *Charleston City Gazette and Daily Advertiser* of Sept. 18, 1788, reported: "There is lately erected that pleasing and genteel amusement, the kolf baan. Any person wishing to treat for the same at private sale will please apply to Mr. David Denoon in Charleston, or to the subscriber on the spot." Later notices dated 1791 and 1794 referred to the South Carolina Golf club, which celebrated an anniversary with a dinner on Harleston's green in the latter year. The *Georgia Gazette* of Sept. 22, 1796, carried an announcement of the anniversary of the Savannah Golf club, and one Miss Eliza Johnston was invited to a "Golf Club ball" in Savannah on New Year's Eve, 1811, according to an invitation in the possession of the Johnston family.

Although these fragments constitute the earliest clear evidence of golf clubs in the United States. the clubs appear to have been primarily social organizations that did not survive the War of 1812.

The first permanent golf club in the western hemisphere was the Royal Montreal Golf club, established in 1873. In subsequent years golf was played experimentally at many places in the United States without taking permanent root until. in 1885, it was played in Foxburg, Pa. The Foxburg Golf club has provided strong support for the claim that it was organized in 1887, is the oldest golf club in the United States with a permanent existence and has the oldest U.S. golf course. The course and club came into existence through the interest and generosity of Joseph Mickle Fox of Philadelphia, a summer resident of Foxburg who is believed to have been introduced to golf and to have acquired his first left-handed clubs and gutty balls while in Scotland in 1884. The next oldest course, after Foxburg, may be that of the Middlesborough (Ky.) Golf club which apparently was founded in 1889 by English immigrants. The course is still in existence, but there is a question as to whether play has been continuous on it. The next oldest club, after Foxburg, almost surely is the St. Andrew's Golf club of Yonkers, N.Y., named after the famous Scottish club and organized by John Reid and four friends on Nov. 14, 1888. This club played an outstanding role in channeling the main stream of golf in the United States. The story of its founding bears similarities to the story of Foxburg's less-celebrated origin. Robert Lockhart, a Scot living in New York, shipped home some golf clubs and balls while on one of his annual trips to Scotland. On his return he tried them out on the banks of the Hudson river where 72nd street ends and later used them to introduce the game to his friends, John Reid and John B. Upham, in a pasture across from Reid's home in Yonkers on Feb. 22, 1888. Following the blizzard of March 1888 the men convened again, with other potential converts, in another pasture at the corner of Broadway and Shonnard avenue, Yonkers, laid out a course and played through the summer, and organized as a club in the fall. The club moved several times but has been permanently established at Hastings-on-Hudson, N.Y., since 1897.

The United States Golf Association. — One of St. Andrew's many notable contributions to the welfare of the game was its leadership in organizing the United States Golf association (U.S.G.A.). In 1894, after having completed its links in Yonkers, the club planned a tournament for the amateur championship of the United States, on Oct. 11–12–13, and invitations were sent to the various golf clubs throughout the country. The tournament was to be played according to the rules of the R.A.G.C. and the prizes were diamond and gold, silver and bronze medals. At the same time the Newport (R.I.) Golf club decided to hold a championship in September, the prize to be a silver cup. As a result there were two U.S. championships in 1894. H. O. Tallmadge, secretary of the St. Andrew's club, suggested the formation of a national association to establish uniform rules and conduct tournaments; he was assisted by Laurence Curtis of The Country club of Brookline, Mass. On Dec. 22. 1894, the Amateur Golf Association of the Cnited States was formed by representatives of five of the leading golf clubs of the country. The name was soon changed to the American Golf association and finally to the United States Golf association. The five founding clubs were the St. Andrew's Golf club, the Newport Golf club, the Shinnecock Hills Golf club, Southampton, N.Y., The Country club, Brookline, and the Chicago Golf club. The U.S.G.A., which grew to include more than 2,300 clubs and courses, is a voluntary association of golf clubs whose purpose is to promote and conserve the best interests and true spirit of the game as embodied in its traditions. To this end it adopts, enforces and interprets rules of amateur status and rules of the game; conducts eight national championships (open. amateur, women's amateur. women's open, amateur public links, junior amateur. girls' junior and senior amateur); co-operates in sponsoring four international amateur team matches (Walker cup, Curtis cup, Americas cup and Eisenhower cup); finances turf-grass research and provides a turf-grass advisory service; maintains a golf museum and library in Golf house, its New York headquarters; and, in general, acts as a national authority.

The second oldest national organization in the United States is the Western Golf association. Founded in 1899 as a sectional organization to embrace the territory west of Buffalo, N.Y., it developed as a national authority on caddies and caddie welfare and sponsors the Evans Scholars foundation to assist deserving caddies in obtaining a college education.

Another prominent organization is the Professional Golfers Association of America (P.G.A), organized by professional golfers at the instigation of R. Wanamaker in 1916 to promote interest in the game. elevate the standards of professional golf and advance the welfare of its members. This association has a membership of nearly 3.000 professional golfers. In addition to its P.G.A. championship, it shares in the conduct of an international professional match for the Ryder cup and co-sponsors a series of tournaments for professionals in a circuit that circles the United States throughout the year.

4. **20th** Century. — The most significant growth in golf in the 20th century occurred in senior organizations after 1905, when Horace L. Hotchkiss arranged the first seniors' tournament, for players 55 and older, at the Apawamis club, Rye, N.Y. Hotchkiss, who was more than 60 at the time, attempted to prove that golf was not a young man's game. The tournament was such a success that within ten years the number of contestants had passed the 300 mark and it had become apparent that a senior organization was in order. The United States Seniors' Golf association was organized on Jan. 17, 1917, in New York, with a membership of 400, which within six months increased to 500 and subsequently to 900. The idea spread rapidly. While the United States seniors' tournament is the leading event of its kind, many other membership and invitation events of the same type developed to meet the demand— the American Seniors' Golf association, the Western Seniors' Golf

association, the North and South senior tournament and others. There are at least 46 senior golfing organizations in the United States alone. Members of the United States Senior Women's Golf association play annually. In 1918 the governor general of Canada presented a trophy to be played for annually by the United States Seniors' Golf association and the newly formed Canadian Seniors' Golf association. Another match was initiated with the Senior Golfers' society of Great Britain. After World War II an international team championship in Deauville, France, attracted teams from the United States, Belgium, France, Germany, Great Britain. Italy and Switzerland. In addition, the United States sent senior teams on tours of Sweden and Kenya.

Golf has achieved some popularity in at least 26 countries—the number which sent teams to the international tournament sponsored by John Jay Hopkins, a U.S. industrialist, in London in 1956. The teams represented Argentina, Australia, Belgium, Brazil, Canada, Chile, China, Colombia, Denmark, Egypt, France, Germany. Ireland, Italy, Japan, Korea, Mexico, the Netherlands, New Zealand, the Philippines, South Africa, Spain, Sweden, Switzerland, the United Kingdom and the United States.

The World's Amateur Golf council was organized by officials of the U.S.G.A. and the R.A.G.C. in 1958, and its first tournament, for the Eisenhower cup, was held that year at St. Andrews. The Australian team (Bruce Devlin, Robert Stevens, Doug Bachli and Peter Toogood) won the 18-hole play-off from the U.S. team (Charlie Coe, Billy Joe Patton, Frank Taylor and Bill Hyndman III).

Golf has achieved its greatest popularity in the United States, where more than 3,800,000 men, women and children played at least ten times a year on more than 5,000 golf courses in the second half of the 20th century, according to a survey conducted by the National Golf foundation. The same source estimated that over 500,000 ac. were devoted to golf and the value of the land, buildings and equipment was in excess of $1,300,000,000. Golf equipment represented about 38% of the total of athletic goods and sporting goods sold in the United States, exclusive of hunting and fishing equipment, in the mid-1950s.

II. EQUIPMENT AND THE DEVELOPMENT OF THE GAME

A. The Feather-Ball Era

1. The Feather Ball.—Golf, like *paganica,* was originally played with a leather-covered ball stuffed with feathers, and the principles of the modern rules were developed in this era. The feather ball or feathery remained the standard for at least four centuries, until about 1848. The making of feather balls was a tedious task, and most ball makers could produce only about four "specials" (top-grade balls) a day. The best balls sold for up to five shillings apiece; in bulk, rarely less than £1 for a dozen. In the making, the leather was softened with alum and water and cut into four, three or two pieces. These were stitched together with waxed thread outside in and reversed when the stitching was nearly completed. A small hole was left for the insertion of boiled goose feathers. The ball maker held the leather cover in his hand, in a recessed ball holder, and pushed the first feathers through the hole with a stuffing rod, a tapering piece of wrought iron 16 to 20 in. long and fitted with a wooden crosspiece to be braced against the ball maker's chest. When the stuffing iron failed, an awl was brought into play, and a volume of feathers which would fill the crown of a beaver hat eventually was inserted into the leather cover. The hole was then stitched up and the ball hammered hard and round and given three coats of paint. Feather balls were seldom exactly round. In wet weather they tended to become sodden and fly apart. They were easily cut on the seams and a player was fortunate if his ball endured through two rounds. Originally, there appear to have been ball makers in each golfing community, but in the middle of the 18th century the Gourlay family, of Leith and Musselburgh, became pre-eminent and a "Gourlay" was accepted as the best feather ball on the market. The patriarch of the family was Douglas Gourlay, at Leith, but it was his son, at Musselburgh, who brought the family name its greatest renown. Their principal competitor was Allan Robertson of St. Andrews. son of the noted player Davie Robertson. He turned out 2,456 feather balls in 1844 and was unalterably opposed to the introduction, shortly thereafter, of the gutta-percha ball. When he caught "Old Tom" Morris playing a gutta ball in 1852 they had words, and Morris left St. Andrews, not to return until after Robertson's death in 1858.

2. Early Clubs.—The full, free style known as the St. Andrews swing developed out of the feather-ball period. The clubs, at first rudimentary, tended toward the end of the period to be long, thin and graceful, and the feathery was swept from the ground with a full swing that also tended to be long and graceful. The shafts were whippy and the grips thick. There was a considerable elegance to these clubs. The earliest known club maker was William Mayne of Edinburgh, who received a royal warrant as club maker and spear maker from James VI in 1603. A notebook of that period indicates the nomenclature of clubs Mayne must have made by noting payments for the repair of "play clubis," "bonker clubis" and an "irone club." While there are no known examples of these clubs, their rudimentary nature is known from the art of the times. Among the oldest known clubs is a set of six woods and two irons at Troon Golf club, Scotland; these were found in Hull, Eng., with a copy of a Yorkshire paper dated 1741. All six are shafted with ash. Only one wood and one iron have grips. The woods are weighted with lead and faced with bone, the lead extending from near the toe two-thirds of the way to the heel.

Club making reached its zenith in the last century of the feather-ball era, with the advent of the real artists—Simon Cossar of Leith; the successive generations of McEwans of Leith and Musselburgh; Hugh Philp and James Wilson of St. Andrews; White of St. Andrews. Cossar, Philp, Wilson and the McEwans were noted for their woods; Cossar, Wilson and White for irons. White is credited with giving Robertson and "Young Tom" Morris such refined irons that they were able to introduce a wide range of new strokes into the game. Douglas McEwan made his club heads from small cuts of hedge thorn that had been planted horizontally on sloping banks so that the stems grew at an angle at the root and created a natural bend for the neck. The shafts, spliced onto the heads, were made of split ash.

By the first half of the 19th century, clubs had come to be divided into four classes: drivers, spoons, irons and putters. Drivers were distinguished by their long, tapering, flexible shafts and their small raking heads. They comprised "play clubs," which had little loft and were designed for use over a safe ground only, and "grassed drivers," which had more loft and were designed to lift a ball from a heavy or downhill lie or over a hazard. Spoons were of four types: long spoons, middle spoons, short spoons and baffing or baffy spoons, the distinction being in the degree of loft. For a time there was also a fifth spoon, variously known as a cleek and a niblick, a well-lofted club with a small head designed to drive a ball out of a rut. There were three irons: driving irons, irons known as cleeks and having narrow lofted faces and long shafts, and bunker irons. Driving putters were used for approach work over unencumbered terrain and green putters, on putting greens. With these sets, players negotiated their feather balls over holes measuring 80 to 400 yd. In the era of the feather ball there were no championships, but four of the great players of the period returned the following card in a feather-ball match at St. Andrews in 1849:

Out

Willie and Jamie Dunn	6	5	4	6	6	6	4	4	5	46
Allan Robertson and Tom Morris, Sr.	6	5	6	5	5	5	5	4	4	45

In

Willie and Jamie Dunn	5	3	5	6	5	5	5	6	6	46	92
Allan Robertson and Tom Morris, Sr.	6	4	5	6	5	5	5	6	6	48	93

B. The Gutta-percha Era

1. The **Gutta** Ball.—Gutta-percha is the evaporated milky juice or latex produced by various trees. It is hard and non-brittle, becomes soft and impressible at the temperature of boiling water and retains its shape when cooled. It is not affected by water except at boiling temperature.

The first gutta-percha ball is believed to have been made in 1845 by the Rev. Robert A. Paterson from gutta-percha packing which had been used around a statue of Vishnu sent from India. The earliest such balls, produced under the name "Paterson's patent," were brown in colour and were handmade by rolling the gutta-percha on a flat board. They had smooth surfaces lined to simulate the seaming of a feather ball, and ducked quickly in flight until they had been marked and cut in play. They were not introduced into the game generally until 1848, when the makers had learned to apply effective permanent markings or indentations to the surface so that the balls would fly properly.

Gutta balls were far easier to make than featheries, since they consisted solely of the single lump of molded gutta-percha. The best-known balls were the hand-marked private brands of the club makers, such as the Auchterlonies, Old Tom Morris and Robert Forgan, and the bramble-marked and patent brands such as the Eureka, Melfort, White Melfort (of white gutta-percha), White Brand, Henley. O.K., Ocobo, Silvertown No. 4, A.1, Clan, Thornton, Park's Special and Agrippa. The Agrippa, with bramble marking, became a great favourite. The A.1 floated, but most guttas did not. The gutta remained the standard ball until 1901–02, when the rubber ball replaced it.

The introduction of the gutta ball occasioned one of the great rejuvenations in the history of the game. Its lower cost, longer life, improved flight, truer run on the greens and the fact that it did not fall apart in the rain attracted an enormous number of new players, and the feathery was quickly replaced. The influx of new players, in turn, forced the conversion of the old course at St. Andrews to a full 18 holes. Until the gutta ball was developed, golfers played out along what later became known as the left-hand course, until they reached the end hole. There they turned around and played in to the same holes. If two groups approached a green simultaneously, preference was given to those playing out. However, as golfers multiplied with the advent of the gutta ball, the links proved to narrow to accommodate them, and about 1857 they were widened sufficiently to turn the greens into double ones so that two holes could be cut in each one.

Calibre of play improved greatly with the advent of the gutta ball. Robertson, when finally won over to it, shattered all precedent by scoring a 79 at St. Andrews in 1858, and this record stood until Young Tom Morris made a 77 in 1869.

2. Clubs.—The gutta-percha ball was harder than the feather ball and put considerable strain on the slender clubs with which feather balls had been stroked. Thus wooden heads gradually became shorter and squatter in shape. Hard thorn was discarded for the softer apple, pear and beech in the heads, and leather insets appeared in the faces. Hickory, originally from Russia and later from Tennessee, replaced ash in the making of shafts. Iron clubs increased in number and variety and became vastly more refined. The superlative play of Young Tom Morris at St. Andrews (see Outstanding Players, below) is credited with popularizing the iron clubs he used so deftly. A full range of clubs at the zenith of the gutta-ball period consisted of seven woods—driver, bulger driver (a wood with a convex face), long spoon, brassie, middle spoon, short spoon and putter—and six irons—cleek, midiron, lofting iron, mashie, niblick and cleek putter. From these the golfer usually selected about eight. The range of clubs that Willie Park, Jr., had in winning the British open championships of 1887 and 1889 was bulger driver. straight-faced driver, spoon, brassie niblick, wooden putter, cleek, iron, mashie, iron niblick and Park's patent putter.

The increase in the number of clubs brought about anotlier innovation in the early 1890s, the introduction of a simple sailcloth bag in which to carry them. Previously, the few clubs a player might need had been carried loose under the arm. The introduction of the gutta ball did not change the identity of the club makers, but required them to develop new designs and materials. Douglas McEwan lived until 1896 and bridged the periods of the feathery and the gutta. He was followed by his son Peter and by his four grandsons, who constituted the fifth generation of club-making McEwans. James Wilson. who had made clubs for the feather ball under Hugh Philp, set up shop at St. Andrews in 1652, and Philp then took in his nephew, Robert Forgan. Forgan and his son Thomas continued the business under their own name after Philp's death. R. Forgan was the first to appreciate the merit of hickory shafts and T. Forgan produced the bulger driver and the ebony putter. Old Tom Morris, the Andersons and the Auchterlonies were other noted club makers of St. Andrews. and there were Ben Sayers at North Berwick, Willie Park, Sr. at Musselburgh, the Simpsons at Carnoustie and many more.

In 1891 Willie Dunn, son of Willie of the famed Dunn twins of Scotland, arrived in the United States to lay out the course at Southampton, N.Y., for the Shinnecock Hills Golf club and remained to make clubs. Other Scottish professionals crossed the Atlantic in the 1890s and contributed to the establishment of U.S. club making. The trade itself was little changed. Wooden heads were cut out of a block, filed, spoke shaved, chiseled, gouged, leaded, boned, smoothed with glass paper (*q.v.*), sometimes stained and treated with a hare's-foot dipped in a mixture of oil and varnish. Whereas the club heads used by Robertson were only $\frac{5}{16}$ in. deep, the depth gradually increased to 1 in. and, for a time, 2 in. Iron heads were hand forged from a bar of mild iron, heated, hammered, tempered, emery wheeled and polished, and the socket was pierced for the rivet and nicked. Hickory shafts were seasoned, then cut, filed, planed, scraped and glass-papered down to the required length, shape and degree of whippiness, which was the real art. Shafts for wooden heads were finished in a splice, glued onto the heads and whipped with tarred or waxed twine. Shafts for irons were finished with a prong to fit into the socket and holed for the iron cross rivet. Strips of untanned leather, shaped with a chisel, were nailed to the top of the shafts. wound on spirally over a cloth foundation similarly applied, rolled tight between two polished boards and nailed at the bottom. Both ends of the grip were bound with twine and the whole grip was then varnished.

C. The Era of the Rubber Ball

1. Development of the Ball.—The rubber ball was the invention of Coburn Haskell, a golfer of Cleveland, O., in association with Bertram G. Work of the B. F. Goodrich company. In 1698 Haskell adapted the art of winding rubber thread produced by Goodrich under tension on a solid rubber core to produce a ball far livelier than the gutta. The earliest covers were of black gutta-percha, lightly lined by hand. Paint tended to fill the indentations, causing the ball to duck in flight just as the first, smooth gutta balls had. Dave Foulis, a Chicago professional, put a rubber ball in an Agrippa mold and produced the bramble marking that was common to both the late gutta and early rubber balls. Haskell balls, placed on the market in 1899, became known as "bounding billies." It is estimated that they could be hit about 25 yd. farther than the gutta. just as the gutta was about 25 yd. longer than the feathery. The consensus at first, however, was that the distance gained did not offset the difficulty of controlling the lively ball on the green. Walter J. Travis of New York, considered the best putter of his day, resolved this debate by using a Haskell ball from an Agrippa mold in winning the U.S. amateur championship in Sept. 1901. Thereafter, the gutta became a relic of the past, and the game was again revolutionized and popularized as it had been with the advent of the gutta.

The day of the ball made by hand in the professional's shop was ending. A. G. Spalding & Bros., at Chicopee, Mass., a manufacturer of sporting goods, had undertaken production of gutta balls in 1898 and obtained a licence to produce its first rubber ball, the Spalding Wizard, in 1903. Soon thereafter the balata cover was developed for Spalding, and its improved adhering qualities made it an important innovation. Earliest experiments with the rubber ball concerned the core. It was determined that, for resilience, mobile cores were best, offering the least resistance to the distortion to the ball caused by club-head impact. Operating on this theory, the Kempshall Golf Ball company produced the Kempshall water core, in which a small sac of water was substituted for solid rubber. The competition to produce a ball that could be driven longer distances was under way. Manufacturers tried lead in solution in an effort to combine weight with a mobile core, but this proved potentially injurious to curious children and animals. Zinc oxide was substituted, but the pigment tended to settle and unbalance the ball. In the 1920s true solutions involving glue, glycerin and water mere developed for the first-line balls.

More telling improvements were made in winding, the critical factor in the modern ball. Machines replaced men and were constantly improved. The object of the winding process is to obtain the greatest tension and closest possible approach to the breaking point of the rubber thread. The earliest thread mas of wild rubber from the Amazon basin; development of plantation rubber led to greatly improved quality.

Early rubber balls were made with the bramble and reverse-mesh markings of the gutta ball, but experiments led to improvements as they revealed the best relationship of both depth and area of indentation to the ball's total surface. William Taylor, in England, reversed the markings on his molds to produce the dimple, in contrast to the bramble, in 1908. The mesh, in contrast to the original reverse mesh, was a natural aftermath. Haskell balls at first were light and large, about 1.55 oz. in weight and 1.71 in. in diameter, and they floated. In the absence of regulations governing size or weight, manufacturers pursued one another's leads in the quest for the most efficient combination. Heavy solutions in the core increased the weight to about 1.72 oz. in the first decade. Then both size and weight underwent a gradual reduction to 1.62 oz. and 1.63 in. about the time the Haskell patent expired in 1915. Expiration of this patent increased the competition. which had tended to make courses obsolete. Therefore, in 1920 the U.S.G.A. and the R.A.G.C. agreed that after May 1, 1921, balls used in their championships must weigh not more than 1.62 oz. and measure not less than 1.62 in, and the two organizations would take such steps as were deemed necessary to limit the power of the ball. The ball actually was unchanged by this regulation; it continued to measure 1.63 in., .01 in. above the minimum. In 1923 the U.S.G.A. decided that the power should be reduced. A series of experiments under William C. Fownes, Jr., of Pittsburgh and Herbert Jaques, Jr., of Boston led to the introduction in the United States in 1930 of the so-called "balloon ball," weighing not more than 1.55 oz. and measuring not less than 1.68 in. in diameter. This ball, with no regulation of its velocity, became standard in the United States on Jan. 1, 1931, and was the first deviation from the British ball. It proved too light to hold on line in flight in a wind or on a green as it lost momentum, and it survived only one year. The slightly heavier ball, weighing not more than 1.62 oz. and measuring not less than 1.68 in., became standard in the U.S. on Jan. 1. 1932. The velocity of this ball was not regulated: however, until the U.S.G.A. completed a satisfactory testing machine in 1941. After Jan. 1, 1942, the U.S.G.A. required that the velocity of the ball be not greater than 250 ft. per second as measured on the association's machine under specified conditions.

2. Modern Clubs.—Golf was being overtaken by the industrial revolution when the rubber ball came into the game at the beginning of the 20th century. These two factors wrought major changes in the clubs and the methods by which they were produced as craftsmanship moved out of the individual professional's shop and into the factory. The harder rubber ball brought about the use of persimmon and, later, laminated club heads. Hard insets appeared in the faces. Increased demand led to the adaptation of shoe-last machine tools for the fashioning of wooden club heads. Sockets were bored in the club heads, and shafts were inserted rather than spliced. Drop forging completely replaced hand forging in the fashioning of iron clubs, and faces were deepened to accommodate the livelier ball and were machine lined to increase the spin on the ball in flight. Stainless steel replaced carbon steels. Seamless steel shafts took the place of hickory. Composition materials were developed as an alternative to leather in grips, and the grip foundations were molded in so many ways that they mere regulated in 1947. Inventive minds created novel clubs, not only centre-shafted and aluminum putters and the sand wedge but also types that were such radical departures from the traditional form and make that they could not be approved by the U.S.G.A. or the R.A.G.C. Modern club making in the United States began when Julian W. Curtiss of A. G. Spalding & Bros. purchased some clubs in London in 1892 for resale in his company's retail stores. Two years later, Spalding employed some Scottish club makers and began producing its own clubs. Hand modeling of woods and hand forging of irons did not long survive the demands of factory production. Within the first decade the Crawford. McGregor & Canby company in Dayton, O., a maker of shoe lasts. was turning out wooden heads; foundries were converting drop-forging processes to iron heads; and Allan Lard in Chicopee was experimenting with perforated steel rods for shafts. A. W. Knight of the General Electric company joined this inventive movement and produced an aluminum-headed putter with the shaft attached near the centre rather than at the heel. Travis used this "Schenectady" putter in winning the British amateur championship in 1904.

The importance of these developments was such that, in promulgating its revised code of rules in Sept. 1908, the R.A.G.C. appended the notation that it would not sanction any substantial departure from the traditional and accepted form and make of golf clubs. This principle has been invoked many times in an effort to preserve the original form of the game. When Jock Hutchison won the British open in 1921 with deeply slotted faces on his pitching clubs, the R.A.G.C. immediately banned such faces and the U.S.G.A. concurred with a regulation governing markings which became effective in 1924. After Horton Smith had so effectively used a sand wedge with a concave face designed by E. M. MacClain of Houston, Tex., the principle of concavity was banned in 1931. However, Gene Sarazen developed a straight-faced sand wedge and used it so well in winning the British and U.S.G.A. opens in 1932 that he completed the revolution of bunker play. Experiments with steel shafts went through several phases. Lard's perforated steel rod was no substitute for hickory, and the locked-seam shaft proved not to be the answer either. although the C.S.G.A. approved such shafts in 1924. However, in 1924 the Union Hardware company of Torrington, Conn., drew a seamless shaft of high-carbon steel which could be heat-treated and tempered. This came into the game in the late 1920s, was approved by the R.A.G.C. in 1929 and substantially replaced hickory in the early 1930s.

Improvement of the steel shaft was accompanied by the general introduction of numbered rather than named clubs, and by the merchandising of matched sets rather than individual clubs; clubs had become more numerous and more finely graduated than the names which had been applied to them and shafts could be manufactured to specifications for flexibility and point of flex. Whereas formerly a golfer seeking new clubs went through a rack of mashies until he found one that "felt right" and then tried to find other clubs of similar feel, he later bought a whole set manufactured to impart the same feel. The merchandising aspect of this development was. perhaps, something more than a happy coincidence for the manufacturers. In any case, the merchandising opportunities inherent in the numbered and matched sets were carried to an extreme. and in 1938 the U.S.G.A. limited the number of clubs a player might use in a round to 14. The R.A.G.C. concurred in a similar edict the next year.

III. OUTSTANDING PLAYERS

1. Great Britain.—As golfing associations. or clubs, developed, there arose a group of professionals who made golf balls, fashioned and repaired clubs and gave lessons. Many of them were great players. The first of these was Allan Robertson (1815–58) of St. Andrews nho, legend states, was never beaten in a stake (money) match played on even terms (that is, not giving his opponent a handicap). His apprentice was the man eventually known as Old Tom Morris (1821–1908), professional, greenkeeper and patriarch of St. Andrews. When Old Tom was 30, he moved to the Prestwick Golf club which offered a belt as a challenge trophy for an open championship in 1860. Willie Park, Sr. (1864–1925), one of the famous golfing brothers from Musselburgh, non it with a 36-hole score of 174; but Old Tom won in 1861, 1862, 1864 and 1867 His son, Young Tom Morris (1850–75). succeeded him and won for three successive years, retiring the prize belt. Young Tom won his first professional tournament at the age of 16. He was 18, 19 and 20 when he won his three successive open championships. In the absence of a prize, there was no championship in 1871, but a cup which has been in competition ever since was put up in 1872 by the Prestwick Golf club, the R.A.G.C. and the Honourable Company of Edinburgh Golfers and Young Tom won it to score a fourth successive victory. Shortly thereafter he died, at the age of 25.

The British amateur championship was not started until 1885 after the Royal Liverpool Golf club at Hoylake, Eng., had proposed a tournament "open to all amateur golfers." The tournament attracted nearly all the best amateurs of the time and the winner was Allan F. MacFie, but it was not immediately recognized as the championship. The following year, the Royal Liverpool suggested to the R.A.G.C. that the tournament be established as the amateur championship, and 24 clubs joined together to purchase a trophy and manage the event. Among British players who won the amateur championship at least two times after 1900 were John Ball (1907, 1910 and 1912), H. H. Hilton (1911 and 1913), E. Holderness (1922 and 1924), C. Tolley (1920 and 1929) and J. Carr of Ireland (1953 and 1958).

The Ladies Golf union was formed rather late, in 1893, and the first British women's championship was held that year, at St. Anne's, Eng., and won by Lady Margaret Scott, as were the next two championships.

One of the first outstanding woman golfers was Dorothy Campbell, who won the British women's championship in 1909 and 1911, was runner-up in 1908 and semifinalist in 1904, 1905 and 1906. She won the U.S. championship in 1909, 1910 and 1924 and the Canadian championship in 1910, 1911 and 1912. Twice married, she was Mrs. John V. Hurd, then Mrs. Edward Howe. She became a resident of the U.S. early in the century. She won more than 750 prizes in golf.

Another British woman, Joyce Wethered, won the women's open championship in 1922, 1924, 1925 and 1929, the English women's title five years in a row, 1920–24, and represented Britain in numerous international matches. In 1935 she toured the United States as a professional representing a London store, and competed most creditably against the best men and women golfers. She became Lady Heathcoat-Amory. Other British women's championship winners of note have included Enid Wilson, who won in 1931, 1932 and 1933; Mrs. Andrew Holm, in 1934 and 1938; Pamela Barton, in 1936, in which year she also won the U.S. championship, and 1939; Miss F. Stephens (Mrs. Roy Smith), in 1949 and 1954; and Mrs. G. Valentine, in 1955 and 1958.

At the end of the 19th century golf had taken hold in the United States and was soon played in almost every country in the world. Meanwhile England was producing great players. J. H. Taylor and H. Vardon, together with J. Braid, a Scotsman, won the open championship 16 times between 1894 and 1914. Vardon, the greatest player that the world had seen up to that time, won the title six times. These three supreme golfers were known as "the great triumvirate" and were primarily responsible for the formation of the Professional Golfers association in 1901. This body (which has about 1,400 members) is responsible for professional tournaments and for the biennial Ryder cup match (for professionals) when it is played in Great Britain.

2. United States.—The first official United States open, amateur and women's amateur championships were held in 1895, and the respective winners were Horace Rawlins, Charles B. Macdonald and Mrs. Charles S. Brown. An unofficial open, at match play. in 1894 was won by Willie Dunn.

After World War I the influence of the many Scottish golfers who had emigrated to the United States became evident. U.S. golfers (principally Walter Hagen and Robert T. (Bobby) Jones, Jr., who achieved the unparalleled performance of winning the open and amateur championships of Great Britain and the U.S. in the same year, 1930j monopolized the British open championship until T. H. Cotton won in 1934, a feat he repeated in 1937 and 1948.

By the early 1930s U.S. dominance of the international scene was growing. From 1933 until 1958 the only victories by British teams in the biennial matches against the United States were in 1938, when the amateurs won the Walker cup, in 1952 and 1956, when the women won the Curtis cup, which they retained in 1958 with a tie, and in 1957, when the professionals won the Ryder cup.

Walter J. Travis was the first great U.S. golfer. He was born in Australia, but his golf was wholly learned in the United States. Of striking appearance, with jet black beard and impeccable garb, he was unpopular with fellow golfers because of his austere, taciturn demeanour. But he proved his ability as a golfer by winning the U.S. amateur in 1900, 1901 and 1903, by reaching the semifinals in five other years and by winning the qualifying medal in 1900, 1901, 1902, 1906, 1907 and 1908. He won the British amateur title the only year he entered this event—1904.

Jerome D. Travers learned his golf at Nassau Country club, Long Island, under the tutelage of Alec Smith, famous Scots professional who went to the U.S. in 1898. Travers was a player with indomitable courage, an ability to outgame an opponent at match play and nerve that rarely failed him in a crisis. He won the amateur championship in 1907, 1908, 1912 and 1913, and was finalist in 1914; he won the open title in 1915; and he won a long list of sectional championships.

Francis D. Ouimet became a national hero in 1913 when, unknown as a golfer except around Boston, he tied Vardon and Ted Ray, two of the best British professionals, at 304 strokes for 72 holes in the U.S. open, held at Brookline, and defeated them in a play-off, enabling the U.S. to retain the title. The following year Ouimet won the amateur, and he repeated 17 years later, in 1931. He was a semifinalist in 1923, 1924, 1926 and 1927; and was runner-up in 1920. He was a member of the United States team against Great Britain for the Walker cup from the first of these international matches in 1922 to 1949, serving as captain in 1932, 1934, 1936, 1938, 1947 and 1949.

Charles ("Chick") Evans, Jr., first showed promise as a golfer around Chicago in the period 1906–10. He was runner-up in the U.S. amateur of 1912 and the U.S. open of 1914, winning the western amateur title in both those years and also in 1909 and 1915. In 1916 he became the first golfer to win the U.S. amateur and open in the same year; his score of 286 in the open stood as the record low for 20 years, until Tony Manero scored 282 in the 1936 open. In 1942, at the age of 52, Evans fought his way against excellent competition to the final of the Chicago city championship, where he was defeated by a youthful opponent. Evans competed in the open championship at Baltusrol Golf club, Springfield, N.J., in June 1954, where he had the honour of being the oldest contestant at the age of 64.

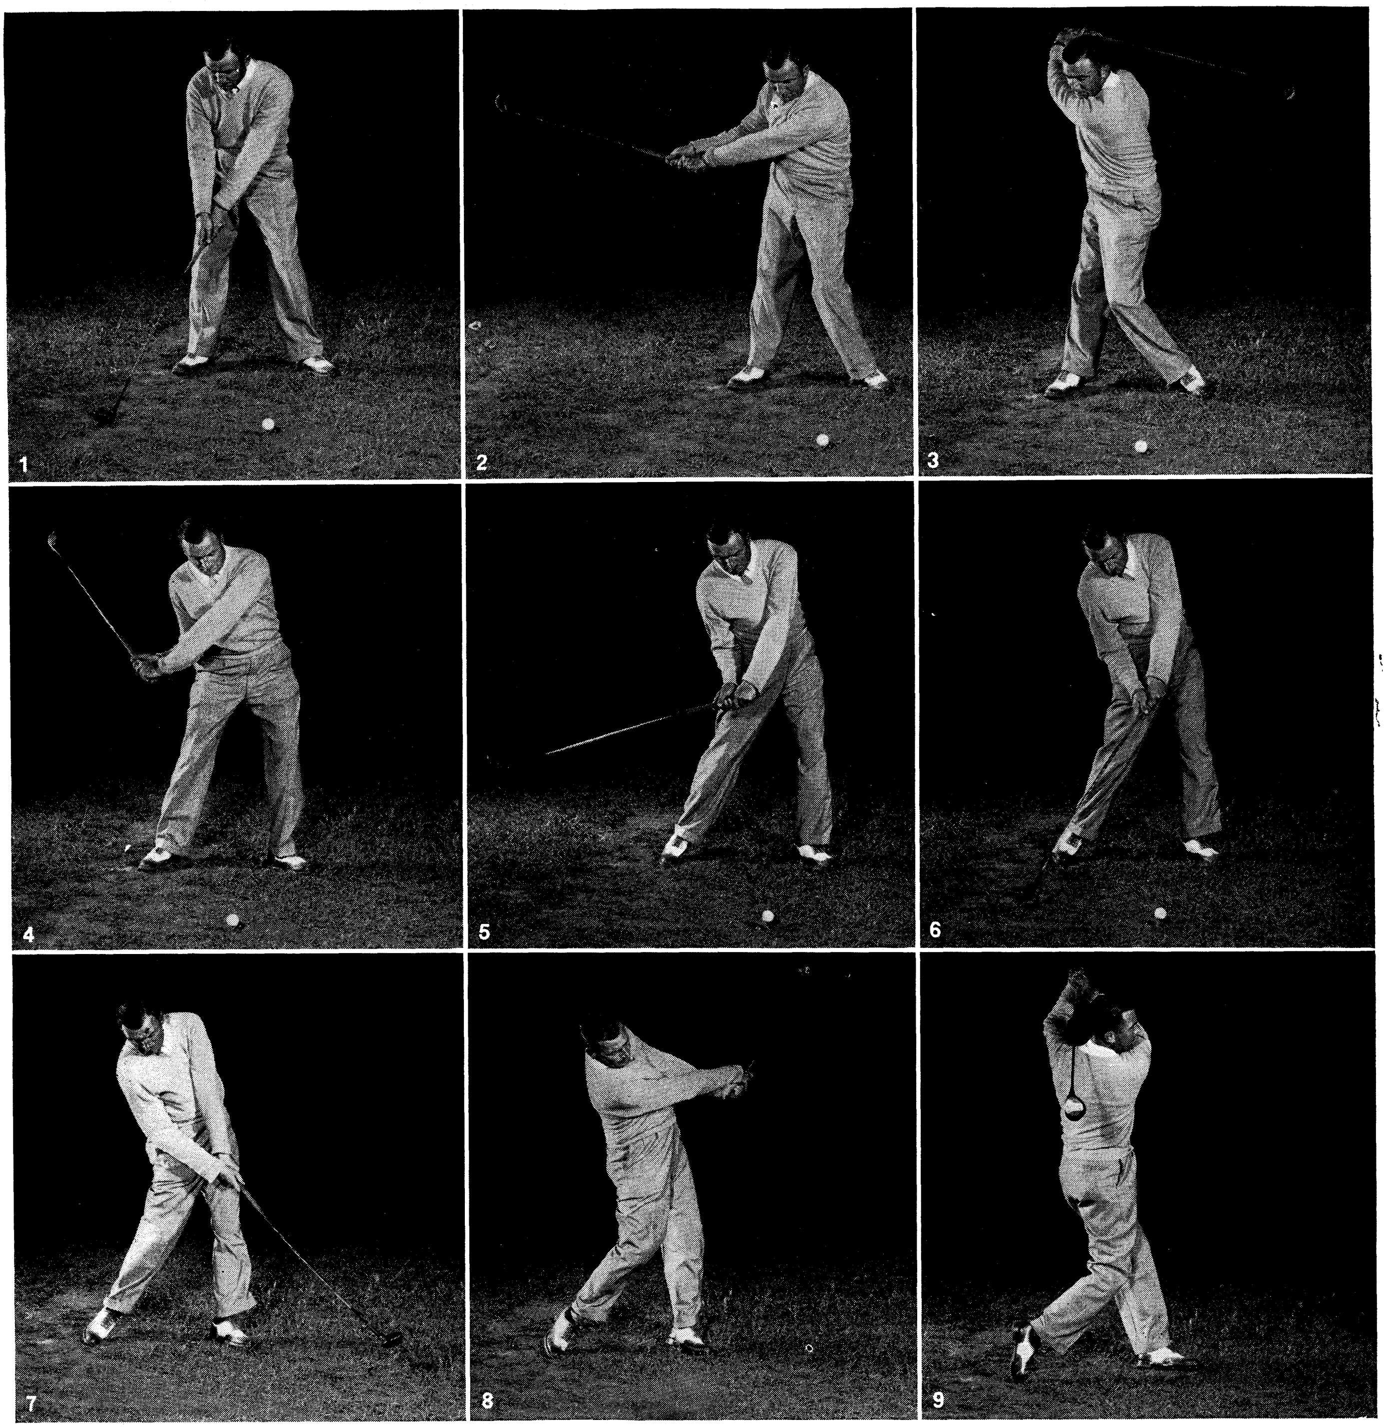
Bobby Jones is regarded as the greatest amateur golfer of modern times. His career was brilliant from his debut in national competition in the U.S. amateur of 1916 until his unparalleled performance in 1930 of winning all four of the world's most difficult titles—the British amateur, the British open, the U.S. amateur and the U.S. open. This feat became known as Jones's "grand slam." During his golfing career Jones won the British open three times, the British amateur once, the U.S. open four times and the U.S. amateur five times. He played for the U.S. against Britain in the Walker cup team matches in 1922, 1924, 1926, 1928 and 1930.

W. Lawson Little, Jr., first appeared in national competition in the 1929 U.S. amateur, where he was defeated in the semifinal round by Francis Ouimet. In 1934 he won both the United States and British amateur titles and the following year repeated his victories in both events. Little turned professional in 1936, won the Canadian open that year and the U.S. open in 1940.

Among other U.S. players who won the amateur championship have been H. Whigham (1896, 1897), C. Egan (1904, 1905), M. Ward (1939, 1941), W. Turnesa (1938, 1948) and H. Ward, Jr. (1955, 1956).

Professional golfers contributed richly to the history of the game in the United States, and while it was well into the 20th century before there was a native-born champion among them, the over-all record of the pros was remarkable. No other country produced so many able players; Walter Hagen and Gene Sarazen were particularly outstanding.

Walter Hagen first appeared on the national scene in the 1913 U.S. open at Brookline, where he gave an excellent account of himself, considering his competitive inexperience, and placed fourth



PHOTOGRAPHS. FRANK J. SCHERSCHEL

STROBO-FLASH PHOTOGRAPHS OF A WELL-EXECUTED FULL TEE-SHOT

1. The iritial movement of the backswing is a turn of the left hip to the right. As the body "winds up," the shoulders, arms, hands and club follow in one co-ordinated movement, with the club-shaft kept in line with a straight (but not tense) left arm. The club-head starts low aiong the ground and follows the body-turn

2. The wrists do not enter the swing in any way until this stage, at which point they begin to "cock," are fully cocked at the top of the swing, and remain so until just before the ball is hit. The greater part of the player's weight has shifted onto his braced right leg, the left side is relaxed, and the left heel has eased very slightly from the ground

3. At the top of the swing, there is a full body-turn, essential for power. The club-shaft has reached the horizontal, with both hands well under the shaft and fully cocked. A full grip is maintained with the left hand, and the left arm is held as straight as possible without tenseness

4. The left hip starts the downswing. As the body uncoils, it pulls the left arm down into the hitting area. The left arm continues to be held straight, with the cock of the wrists preserved. Observe in this and figs. 5 and 6 how the player's weight gradually shifts off the right leg

5. The left hip has turned well out of the way of the shot, clearing the path for the straight left arm. Wrists are uncocking to bring the club again into alignment with the left arm, thus delivering a powerful blow to the ball

6. As the club approaches impact with the ball, the wrists have straightened; so have the legs. There is a feeling of hitting against a firm left side. The whole right hand hits hard, as though slapping a flat object. Left hand grip must be firm enough to support this hit

7. The club-head, after impact, follows the line of flight until the wrists naturally begin to turn. The action is that of centrifugal force, applied from a solidly-grounded triangular foundation composed of the two feet and the head

8. Note that, until this view, the head has been held steady throughout the swing. This position is important in preserving balance. Observe also that, until now, the right elbow has been kept comfortably close to the right hip, to give the swing compactness

9. At the finish of the swing, the body has turned to face the line of flight. The head is not raised, but waits until it is pushed up by contact of the right shoulder on the chin. The player's balance continues to be retained, with most of his weight on his left heel

against an expert field. The following year at Chicago he won the event. His golf, entirely self-taught. was unorthodox; he had no desire to copy the smoother swings of his fellow professionals. He scorned to practise by the hour, as was the practice of other pros. To Hagen, more than to any other golfer, goes the credit for breaking down the barriers between amateurs and professionals. Between 1914 and 1936 Hagen won the U.S. open twice, the British open four times (a feat matched after World War I only by A. D. Locke of South Africa and P. W. Thomson of Australia), the P.G.A. championship five times (including four in a row—1924, 1925. 1926, 1927), the Canadian, French and Belgian opens once each and at least 45 other events of lesser importance. In all he participated in not less than 200 open tournaments and was rarely out of the money. In addition, he played in about 1,500 exhibition matches in the C.S. and other countries, many of them for high fees or stakes. He is said to have earned around $1,000,000 during the 22 years he was rated as a top-flight golfer.

Gene Sarazen reached golfing fame in 1922 by winning the U.S. open at Chicago and proved he was a golfer of more than passing ability by adding the professional title that same year at Oakmont, Pa., and the following year at Pelham. N.Y. No further titles of importance came his way for ten years, but during this period he was a constant competitive threat. In 1932 he reappeared as a champion, winning the British open with a brilliant 283 and the U.S. open with an equally brilliant 286, which tied the then low-scoring record established in 1916 by Chick Evans. In 1933 he won the P.G.A. title for the third time and came within one stroke of winning the British open. In 1940 he tied Lawson Little for the U S. open championship with a score of 287, but lost the play-off with 73 to Little's 70.

As Hagen, Sarazen and Tommy Armour passed their prime, other professionals carried on but it aas not until the late 1930s that the so-called pro circuit, underwritten by civic and club organizations throughout the country, began putting up major prize money for the experts. Robert E. Harlow developed this circuit and was the first tournament manager of the P.G.A. Fred Corcoran succeeded him in 1937. That year. aggregate prize monies totaled $100,000; when Corcoran left the field in 1947, they totaled $650,-000. Tournament purses had grown from a $3,000 minimum in 1937 to a $15,000 minimum after World War II. In the second half of the 20th century the P.G.A. circuit offered approximately $1,000,000 in prizes annually.

Other names in U.S. professional golf history include J. Barnes, who won the professional title in 1916 and 1919, L. Diegel, who won in 1928 and 1929, D. Shute, who won in 1936 and 1937, and R. Guldahl, who won the open title in 1937 and 1938. Byron Nelson, Ben Hogan and Sam Snead, after 1940, combined to win the major portion of prize monies. Following World War II Nelson retired from serious tournament participation. After winning the U.S. open and the P.G.A. title in 1948, Hogan, following his recovery from serious injuries suffered in an automobile accident, returned to the golfing circuit in 1950 and won the U.S. open in that year and in 1951 and 1953, the year he also won the British open to duplicate the historic feats of only two other Americans, Bobby Jones and Gene Sarazen.

After the open. the leading tournament in prestige became, perhaps, the masters, played each spring at Augusta, Ga. Instituted in 1934, the masters tournament, an invitational affair, receives national attention.

In the United States from 1900 to 1930, four women golfers were outstanding. First of these was Margaret Curtis. who won the women's chainpionship in 1907, 1911 and 1912. The next outstanding champion was Alexa Stirling of Atlanta, Ga.. who won her first national title while quite young in 1916 and repeated in 1919 and 1920. She nas runner-up in 1921 and 1923 and in 1925, as Mrs. W. G. Fraser. She also won the Canadian championship in 1920 and 1934.

Another great U.S. woman golfer is Mrs. Glenna Collett Vare, who learned her golf around Providence. R.I., won her first women's title in 1922 and repeated on five occasions—1925, 1928, 1929, 1930 and 1935. She made four attempts at the British crown, but was turned back twice in the final round. Mrs. Vare's extended hold on women's golf was broken when Virginia Van Wie of Chicago replaced her as champion during the three seasons of 1932, 1933 and 1934. Physical inability to continue in tournament play forced Miss Van Wie to forfeit her title without contest in 1935. Betty Jameson won the title twice in a row, in 1939 and 1940.

The greatest names in women's golf after World War II included Mrs. Mildred ("Babe") Didrikson Zaharias, Patty Berg, Louise Suggs and Betsy Rawls, all of whom played professionally. Mrs. Zaharias, an Olympic winner in track and field in 1932, picked up a golf club that year at the invitation of Grantland Rice and from that time played the game with astounding success. She regained her amateur status long enough to win the British women's amateur title in 1947—the first American to do so. She turned pro again and embarked on a series of successful golf tours. The women follow a professional circuit similar to if less demanding than that of their male counterparts. From 1946, when the women started their own open championship, Mrs. Zaharias continued to be the leading woman player until her death in 1956, the most famous competitor since the days of Mrs. Vare.

Television enhanced the popularity of golf, such tournaments as the open, masters and several others being given network coverage on the final day. It mas estimated, for example, that more than 20,000,000 viewers witnessed Lew Worsham's dramatic 104-yd. second shot into the cup on the final hole to win a tournament at Tam O'Shanter in 1953.

IV. THE MODERN GAME

A. Playing the Course

The game consists in playing the ball from a teeing ground into a hole by successive strokes in accordance with the rules. The stipulated round consists of 18 holes, and most golf courses have 18. Standard 18-hole courses measure from 6,500 to 6,800 yd.; individual holes, from 100 to 600 yd. However, some courses have only nine holes and these are played twice in a stipulated round. The clubs are designed for the various positions in which the ball may come to rest and for the various distances to the hole. The objective is to hole the ball in the fewest strokes.

There are two distinct forms of play: match play and stroke (medal) play. In match play the player and his opponent are playing together and competing only against each other, while in stroke play each competitor is competing against every other player in the tournament. In match play, the game is played by holes and each hole is won by the player who holes his ball in the fewer strokes. If both players hole in the same number of strokes, it is halved. When a player has won one more hole than his opponents, he is said to be one up. The match is won by the player who is leading by a number of holes greater than the number of holes remaining to be played, as, for example, three up and two to play. In stroke play, the competitor who holes the stipulated round or rounds in the fewest total strokes is the winner. Amateur championships usually are at match play and professional and open championships at stroke play, over 72 holes.

In both match and stroke play, players can compete as individuals or as partners. When two players compete as partners. each playing his own ball, the better ball on each hole is their score for that hole; this is a four-ball or best-ball match. Two players may compete as partners with two others, each pair playing alternate strokes on a single ball; this is a match foursome.

Players of varying abilities compete against each other by using handicaps. A handicap is the number of strokes a player receives to adjust his score to a common level. The better the player, the smaller his handicap, and the best players have handicaps of zero and are called scratch players. A scratch player whose average score is 70 can have an enjoyable match with a player whose average score is 80 by giving him a handicap of 10 strokes. Handicap golf is limited to amateur competitions, and championship tournaments are played without handicaps.

The starting place for each hole to be played is the teeing ground. The front is indicated by two markers, and the teeing ground is the rectangular space two club lengths in depth directly behind the line indicated by the markers. The player tees his ball anywhere within this space, usually setting it up on a small wooden or plastic peg. and strikes it toward the hole. The stroke from the teeing ground is called the drive.

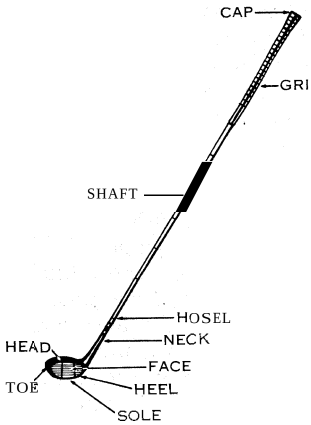


FIG I —PARTS OF A GOLF CLUB

The preferred line to the hole is generally a clear, mowed route called the fairway. The fairway is customarily bordered by longer grass called rough, and farther from the fairway there may be woods. At strategic places along the preferred line to the hole and guarding the putting green are obstacles called bunkers, depressions in the ground filled with sand (sand traps). Some holes require the player to skirt or cross streams or ponds. Both bunkers and bodies of nater are hazards.

The hole itself measures $4\frac{1}{4}$ in. in diameter, is at least 4 in. deep and is set in an area of turf specially prepared and maintained and closely mowed for putting. When the player putts, he uses a straight-faced club and rolls the ball across the putting green toward and eventually into the hole.

An expert player plays most holes in four strokes. a drive of 22j to 250 yd.. a shot to the green and two putts. However. every course contains a few short holes on which the expert might be expected to drive onto the putting green and a few long holes on which the expert might require a drive and two more strokes to reach the putting green. On the former. he would be expected to make 3 and on the latter 5, since two putts on each green is the standard.

Every course in the United States has a par. which is defined as the score an expert would be expected to make, and many courses also have a bogey. which is defined as the score that a moderately good golfer would be expected to make. Both par and bogey are defined by the U.S G.A as errorless play without flukes and under ordinary weather conditions, allowing two strokes on the putting green. However, par is essentially a U S term that came into use in the early 1900s as a base for computing handicaps under the system devised by L. Calkins of Plainfield, N J. Bogey is essentially a British term that came into use in England in 1891 and mas derived from a mythical Colonel Bogey, who was described as uniformly steady but never overbrilliant. As the terms developed, bogey was sometimes. although not always, one stroke higher than par.

Thus. colloquially in the United States, bogey often is used to indicate a score one stroke above par.

B. Clubs

In the average good player's set there are either 3 or 4 wood clubs and 9 or 10 irons (no more than 14 clubs may be carried during a round). No two clubs in a set are the same. There are differences in length and suppleness of shaft, weight, size and shape of head. the angle at which the shaft ends and the head begins (the lie) and the angle of the face of the club from the vertical (the loft). The various clubs are known both by number and by name. The names have come down from the early days of golf; the numbers are a U.S. innovation dating from the early 1920s, when matched sets came in and it was found more practical to indicate club gradations by consecutive numbering than to stamp the name on the club's sole. (See *Equipment* and the Development *of the* Game, above.)

1. Wood **Clubs.**—*Number* One (Driver). — Used from the tee for maximum distance: has a large head and a deep. almost vertical face. For the average player the driver is 42 to 43 in. long and weighs between 13 and 14 oz.

Number Two (Brassie).—So called because the sole of the club originally was covered with a brass plate. Used mostly for long shots from good fairway lies, the club has a slightly smaller and shallower face than a driver but nith more loft.

Number Three (Spoon). — Shorter shaft and shallower face than driver or brassie, but face has considerably more loft. The club is used to play the ball from lies too poor for a brassie, and also for strokes when the use of a driver or brassie would send the ball beyond the green.

Number Four *(Baffy)* — Smaller head, shallower face and more loft than a spoon. It will hit a ball about as far as a number one iron.

Number Five. —A great favourite with players who have an aversion to iron clubs, it replaces the number three or four iron. It has an extremely small and compact head.

2. **Irons.**—*Number* One (Driving Iron or *Cleek).*—A long shaft and very little loft to the club face. Used for tee shots and full shots of 190 to 205 yd. from lies too "heavy" for a wood A difficult club to use, it produces a long, low shot. Note: all distances here and below are calibrated for the medium-hitting player. The professionals get more distance.

Number Two *(Midiron).*—Slightly more loft, for shots from 180 to 190 yd.

Number Three (Mid Mashie). — For 165–175-yd shots.

Number Four *(Mashie* Iron) — For 150–165-yd. shots

Number Five *(Mashie).*—For shots between 140 and 150 yd. Ball pitches high and stops quickly after hitting the ground. This club is also used for pitch-and-run shots from 30 to 50 yd. off the green; the ball travels part of the way through the air, then rolls the rest of the nay.

Number Six (Spade Mashie).—For shots between 130 and 140 yd and also for playing the ball from high grass or difficult lies, when getting out is more important than distance.

Number Seven *(Mashie* Niblick). — Resembles the spade mashie, but has still more loft and head weight. Used for shots between 125 and 135 yd.; puts plenty of backspin on the ball.

Number Eight (Pztchzng *Niblick).*—Still more loft, for shots of from 120 to 130 yd.

Number Nzne (Niblick). — Face has a great deal of loft and the head is heavy. to carry it through long tough grass or heavy sand A ball, properly hit, rises almost vertically and upon hitting the

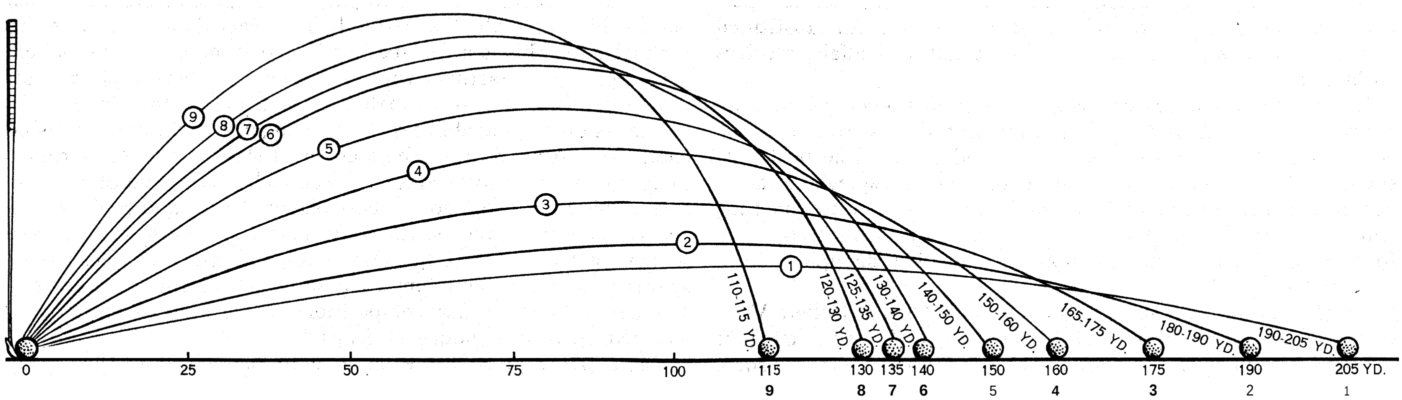

FIG. 2.— DISTANCESAN EXPERT PLAYER GETS WITH VARIOUS IRONS

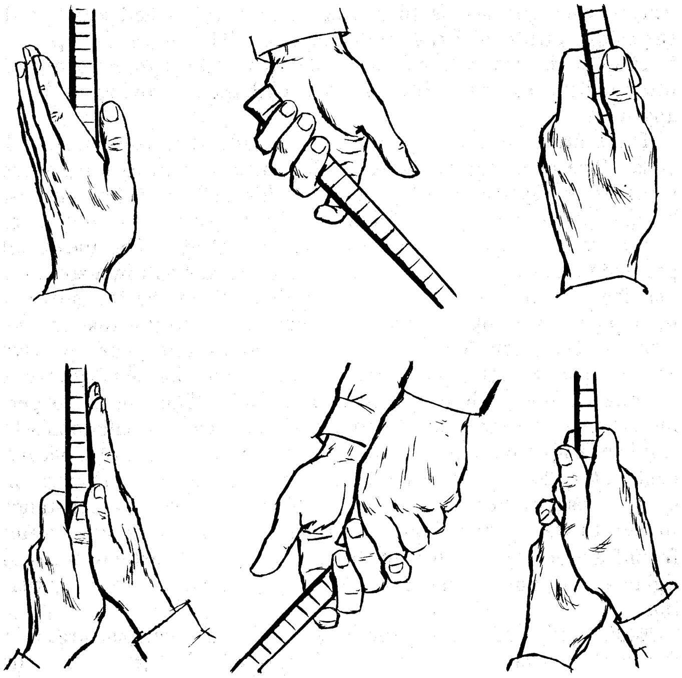

FIG 3 —PROGRESSIVE STAGES IN ASSUMING OVERLAPPING GRIP OF GOLF CLUB

ground may jump backward as a result of the backspin this club imparts.

Number Ten (Wedge).——Face has a great deal of loft, like the niblick, but the club has a broad flange on the sole There are two types of wedges—the sand wedge to use in bunkers and the pitching wedge for pitch shots.

The *Putter*.—A club with a short stiff shaft and a straight or nearly straight face, for rolling the ball on the green. There are many styles of putters.

C. The Grip

While a golf club may be gripped in various nays and satisfactory shots result, the so-called overlapping grip seems to be the most commonly used among expert players and the most frequently taught by golf instructors. Fig. 3 shows the progressive stages of the hands of a right-handed player in assuming this grip, which is used for all clubs except the putter. (For recommended putting grip, see under Putting, below.)

While the overlapping grip is almost universally used among golfers. the interlocking grip has its advocates. This grip differs from the overlapping in only one particular—the little finger of the right hand does not overlap the left forefinger, but instead fits down between the left fore- and middle fingers.

D. Types of Shots

Descriptions are for right-handed players.

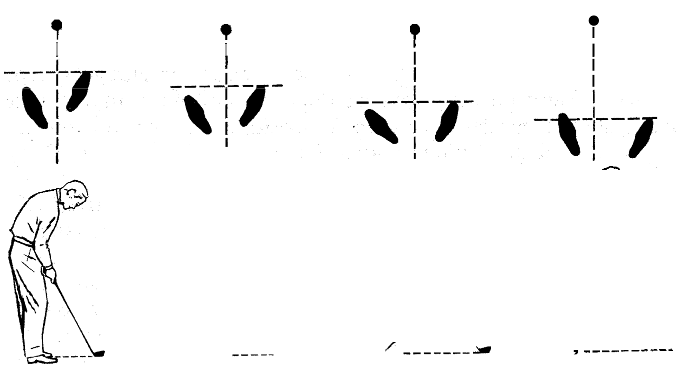

FIG 4 — VARIOUS STANCES LEFT TO RIGHT, CHIP SHOT, MASHIE SHOT, LONG-IRON SHOT. WOOD-CLUB SHOT

1. The Wood Shot.—With the wood clubs, the player assumes a generally square stance in relation to the intended line of flight. He should feel comfortable and well balanced. The club head is placed on the turf directly back of the ball, with the face at right angles to the flight line. Keeping his eye on the ball, the player starts the club back slowly along the ground until the extended arms naturally lift it. This action continues to the top of the swing, at which point the club shaft is approximately horizontal, with both wrists underneath it. The left arm is fairly straight but not rigid, with just enough elbow bend to permit freedom. The right elbow is kept close to the body. The backswing must be unhurried; a fast jerky backswing will destroy timing.

The downswing is started by a co-ordinated pull of the left hip, shoulder, arm and hand, slowly at first, then accelerated as the ball is neared. Care must be taken not to hit too soon; greatest acceleration should be achieved at the moment of impact with the ball. At impact the left arm and club shaft are in alignment and the club follows through along the line of flight until the arms naturally bring it up and around to the rear. The stroke with a wood club is a sweeping swing rather than the hit which characterizes play with irons.

2. The Iron Shot.—The technique employed in hitting an iron shot is somewhat different from that used with the woods. Iron shots are hit very crisply and downward; the club head comes in contact with the ball and continues down and through, taking some turf called a divot. This aids in control and imparts backspin to the ball so that it rises readily and comes to rest without much roll—a desirable feature, since irons are rarely used for distance but rather for shots of medium to short length. It is easier for the golfer to gauge the travel of a quick-stopping ball. Actually. contact with the ball and the turf must be almost simultaneous, since to hit the turf back of the ball will rob the shot of much of its power, while picking the ball clean mill result in a flat shot and too much roll.

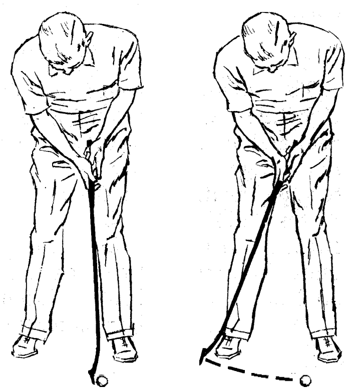

FIG. 8.—PUTTING STANCE AND BACKSTROKE

The stance for long irons is not greatly different from that employed with a wood, with the ball off the left heel, but as the iron selected for a shot becomes progressively shorter (that is, a shorter shaft and a face more laid back) the ball is played more and more toward the right foot. The swing is inclined to be more upright and. especially on the shorter shots, the backswing and follow-through are less full

3. Approaching.—When the player has come within close range of the green, two methods of play are open to him—he may pitch the ball all the way and depend on backspin to stop his ball near the pin, or he may play a chip shot in which the ball flies part way through the air, as to the edge of the close-clipped surface of the green, and then rolls the remaining distance.

4. Shots From Sand.—Even the most expert player will rarely complete his round without having to play his ball from the loose sand in a bunker adjacent to a green. For this purpose he uses his sand wedge. An open stance is used—that is, the left foot is considerably withdrawn from the line to the cup. Care is taken to norm the feet well into the sand to ensure a firm footing through the stroke. The club is carried up more vertically than in other shots and then sent down at a spot behind the ball, following a path that cuts across the line to the hole.

This places a layer of sand between the ball and the club head; the ball thus is blasted from the sand without actually being touched with the club.

When the player's ball is in a bunker at a distance from the green and lies well perched on the sand, it is possible to play an ordinary iron shot and get considerable distance.

5. Putting.— The putt, once the ball is on the green, is the

most delicate shot in golf. The player must hit the ball along a line that allows for very little margin of error, and with enough force to roll the ball to the hole but not too far beyond in case the hole is missed. And since most greens are not level but have numerous minor pitches and slopes great care must be taken to select the proper line, which may be quite far to one side or the other of the hole.

The grip for putting differs from the grip for other clubs. The hands are placed on the shaft so the palms are opposed and parallel to the putter blade. This is for the purpose of relieving all muscular strain in the wrists during the stroke. The player stands quite erect (see fig. 5) with his head directly over the ball and his feet close together and square to the line of putt. The ball is generally played off the left foot, in which case the player's weight is rather more over the left leg than the right, for the sake of balance.

Knees are slightly bent to avoid tenseness. Hands are kept close to the body, with the left elbow moved out to point along the line of putt. Head and body are not allowed to move during the stroke. The putter is soled square across the line of putt, then brought back low along the ground. On the downstroke the putter still maintains its position square in the line of putt, hits the ball crisply in dead centre, then follows through straight toward the hole.

E. Rules of Golf

The rule-making golf organizations are the R.A.G.C. and the U.S.G.A. As a result of a series of conferences in England and Scotland in 1951, the two bodies agreed on a uniform code of rules to govern play all over the world. The only difference is in the specifications for the ball. The minimum size for the United States ball is 1.680 in. in diameter; the minimum size for the British ball is 1.620 in. in diameter. The velocity of the United States ball may not be greater than 250 ft. per second when measured under prescribed conditions on an apparatus maintained by the U.S.G.A. but there is no velocity specification for the British ball.

The two bodies attempt to perpetuate the uniformity in rules by exchanging views on interpretations and on recommendations for revision.

While the basic principle of the rules is simple, the code itself has become complex over the years. The earliest known code, that of the Company of Gentlemen Golfers of Edinburgh, probably drawn up about 1745, contained only 13 rules (see History, above). However, they applied only to match play. As stroke play, foursomes, three-ball and four-ball play came into favour, additional rules had to be drawn. A rule that is fair for two opponents playing against each other might not work at all in stroke play, where each competitor is playing against the entire field. For example, if one ball strikes another on the putting green in singles match play, the owner of the ball struck may replace it or not as he chooses. No one except the two players involved has any interest in the incident. However, the owner of a ball so struck in stroke play must replace it, in fairness to all the other competitors in the field. Also, a rule that is satisfactory in individual play might be completely inadequate when two play as partners in either a match foursome or a four-ball match. There is an additional source of complexity in the fact that golf is played not on uniform fields or courts but on a wide variety of natural expanses.

The number of situations that can develop around a golf ball in play is almost limitless, and the rules makers have attempted over the years to cover as many as possible. Even so, it is impossible to cover all eventualities in rules, and both the U.S.G.A. and the R.A.G.C. issue a series of interpretations each year.

The basic principle of the rules is to require that the ball be played from the teeing ground into the hole by successive strokes with the club. The rules are designed to promote this objective and to prevent the game from becoming one of maneuver by hand. They have been summarized in the statement: "Play the ball as it lies and take the course as you find it." This means that, as a general rule, the ball is to be teed and not touched again with the hands until it is lifted from the hole. The player is expected to employ his own skill with his clubs to avoid rough, hazards and other difficulties and to play his ball without improving its lie in any way.

There are exceptions to this general rule that complicate the code. The rules, for example, provide means of proceeding when a player is physically unable to play his ball as it lies because he has lost it, hit it out of bounds where play is prohibited or into a water hazard where he cannot get at it. The means of proceeding in such cases involve playing another ball in a specified position. If, for example, a player's drive from the tee goes out of bounds, that stroke is counted as one and his next stroke is two. The U.S.G.A. adopted for a trial period of one year effective Jan. 1, 1960, a change in the rules eliminating the penalty stroke for a lost, unplayable or out-of-bounds ball. The rules also permit a player to take relief without penalty when his ball comes to rest in a temporary accumulation of water (as opposed to a permanent water hazard), in ground under repair, against a shed or in a paper bag or near any other artificial structure or substance foreign to the course. Thus the rules contain not only penalties for infractions or inability to proceed in normal fashion but also rights and privileges that a player may exercise in certain situations.

Additionally, of course, the rules define the various areas of the course, such as teeing ground, through the green, hazards and putting green, in each of which rules and procedures may differ. The rules also provide for orderly progress of play.

Golf is played on the honour system. A player is expected to count his own strokes even though he may miss the ball completely, to acknowledge the fact promptly if he violates a rule and incurs a penalty and to avoid interfering in any way with his opponent's or fellow competitors' play. When a referee accompanies players, his primary duty is to settle questions of fact and of golfing law. It is a basic requirement of good sportsmanship in golf to develop a working knowledge of the rules so that one will not through ignorance take advantage of another player, in either a tournament or an informal game. Few players or officials, however, are able to answer all questions that may arise in the differing forms of play, and the experienced ones usually carry rules booklets for reference.

F. Rules of Amateur Status

Golfing rules of amateur status are among the most strict. The U.S.G.A. and the R.A.G.C. both define an amateur as "one who plays the game solely as a non-remunerative or non-profit-making sport."

The rules prohibit an amateur from playing for a money prize, from accepting a prize readily convertible into money or having a retail value exceeding $150 (£30 in Great Britain) and from receiving compensation for giving instruction. The rules also prohibit amateurs from accepting payments in any form, directly or indirectly, toward expenses incurred in connection with a golf competition, with a few specific exceptions under which the British are slightly more liberal. British amateurs may accept payments toward expenses incurred as members of an international, county or club team or similar body. United States amateurs may accept payments toward expenses incurred as members of an international team only. The U.S.G.A. also permits amateurs to accept payments toward expenses incurred as participants in its amateur public links championship and in competitions limited to members of educational institutions, industrial organizations and military services.

Otherwise, amateur golfers are expected to adhere strictly to the classic ideal that amateurs play purely for pleasure and at their own expense.

Additional rules in both codes are designed to deter amateurs from commercializing in any way on their skills or reputations as golfers. However, professionals and amateurs may compete together at will and frequently do. Also, professionals in other sports may play as amateurs in golf provided they conduct themselves in accordance with the rules of amateur status. A golfer who has relinquished his amateur status but has not been a professional for more than five years may regain amateur status by applying to the governing body in his country and serving a probationary period of two years from the date of his last violation of the rules.

V. GLOSSARY

The following terms are used in printed accounts of golf matches and in books of instruction; also included are some vernacular expressions in common usage among players.

Ace.—A hole scored in one stroke.

Addressing the ball.—A player has "addressed the ball" when he has taken his stance by placing his ieet in position ior and preparatory to making a stroke and has also grounded his club (see Ground), except that in a hazard a player has addressed the ball when he has taken his stance preparatory to making a stroke.

All square.—An even score, neither side being a hole up.

Approach.—A stroke or shot to the putting green.

Apron.—The last few yards of iairway in iront oi the green.

Away.—The farthest from the hole.

Backspin.—Backward rotation of the ball, causing it to stop abruptly.

Bent grass.—A species of grass used ior putting greens.

Best ball.—Match in which a single player .competes against the best ball of two or more.

Birdie.—One stroke under par ior a hole.

Bisque.—A handicap stroke or strokes to be taken when desired, with the provision that the player must announce his choice to use a bisque on any hole before teeing off for the next hole.

Blind.—An approach position irom which the green cannot be seen.

Bogey.—Score a moderately good golfer would be expected to make on a hole, allowing two putts.

Borrow.—In putting, to play to either side of the direct line from the ball to the hole to compensate for roll or slant in the green.

Bunker.—An area of bare ground, often a marked depression, usually covered with sand. (See Sand trap; Hazard.)

Bye holes.—Holes remaining aiter a match is finished, that is, after one side is more holes up than remain for play.

Caddie.—Person who carries a player's clubs.

Carry.—Distance irom where a ball is hit to where it first strikes the ground.

Casual water.—Any temporary accumulation of water, as a puddle after rain.

Chip.—Short approach shot, on which the ball flies close to the ground.

Concede.—(*a*) To grant that an opponent will hole out a dead ball (see Dead) in one more stroke. (b) To grant that an opponent has won a hole beiore play has been completed.

Course.—The terrain over which the game is played; the whole area within which play is permitted. (See also Links.)

Cup.—The hole into which the ball is played, $4\frac{1}{4}$ in. in diameter and at least 4 in. deep. (See also Hole.)

Dead.—A ball is said to be dead when so near the hole that putting it in on the next stroke is a "dead" certainty; a ball is said to fall dead when it pitches with little or no run.

Default.—To concede a match to an opponent without playing against him; to fail to appear for a scheduled match.

Divot.—A piece of turf cut out by a club during a stroke, which should always be replaced before the player moves on.

Dog-leg.—A hole that bends sharply to leit or right between tee and green.

Dormie.—A side is dormie when it is as many holes up as remain to be played.

Doton.—In match play, a side is down when it has lost more holes than it has won.

Draw.—Controlled hook (see Hook).

Dub.—An unskilliul player; also, to hit the ball poorly.

Eagle.—Two strokes under par ior a hole.

Face.—(a) Slope of a bunker. (b) Part of the club head that strikes the ball.

Fade.—Controlled slice (see Slice).

Fairway.—The closely cut turf intended for play between tee and green.

Flagstick.—Movable straight indicator, usually a lightweight pole with a numbered flag, placed in the hole to show its location: sometimes referred to as the pin.

Follow-through.—Continuation of the swing of the club after the ball has been struck.

"Fore!"—Warning cry by a player to any person in the way of his ball.

Forecaddie.—A person employed to indicate the position oi balls on the course.

Four-ball match.—A match in which there are two players to a side, each side playing its better ball against the better ball of the other side

Foursome.—A match in which there are two players to a side, each side playing one ball.

Gobble.—A boldly hit putt which finds the hole.

Green.—Putting green around a hole.

Gross.—A player's score beiore deducting any handicap.

Ground.—To sole or rest the club lightly on the ground, preparatory to striking the ball (see Addressing the Ball).

Ground under repair.—Any portion oi the course under repair or maintenance. If a ball should land on ground under repair or if the ground under repair should interfere with the player's stance or swing, the ball may be lifted and dropped, without penalty, as near as possible to where it lay, but not nearer the hole.

Halved.—A hole is halved when each side has taken the same number of strokes.

Handicap.—The number of strokes a player receives to adjust his score to a common level, the generally accepted common level being scratch, or zero-handicap golf.

Hanging.—X hanging ball is one which lies on a downslope.

Hazard.—Any bunker or water hazard.

Heel.—(a) Part of the club head nearest the shait. (b) To hit from this part and send the ball at right angles to the line of play.

Hole.—(a) The hole into which the ball is played (see Cup). (b) One of the 18 units, or holes, on a course, consisting of teeing ground, fairway, rough, hazards and putting green.

Hole-high.—A ball that lies even with the hole (cup) but to one side or the other.

Hole out.—Make the final stroke in playing the ball into the hole.

Honour.—The privilege oi driving off, or playing from the teeing ground, first.

Hook.—To curve the ball widely to the left.

Hosel.—Socket on the club head into which the shait is fitted.

Lateral water *hazard.*—A water hazard running approximately parallel to the line of play and so situated that it is impractical to keep the spot at which a ball crosses the hazard margin between the player and the hole.

Lie.—(a) The inclination of a club when held on the ground in the natural position for striking. (b) The situation of the ball.

Like.—Stroke which makes a player's score equal to his opponent's on a given hole.

Line.—The direction in which a player desires his ball to travel.

Links—A golf course, especially a seaside course.

Loft.—(a) To elevate the ball. (b) Backward slant of the face of the club.

Long game.—The strokes where attaining distance is the more important factor

Loose impediments.—Natural object not fixed or growing, as a stone, leaf or twig.

Marker.—(a) A scorer in stroke play appointed by a tournament committee to record a competitor's score. (b) A marker indicating the iront edge oi a teeing ground or the boundaries of a hole.

Match play.—Reckoning the score by holes won and lost.

Medal play.—Stroke play (see Stroke Play).

Mixed foursome.—Foursome in which a man and a woman play as partners.

Nassau.—A system of scoring under which one point is awarded for winning the first 9 holes, one ior the second 9, and a third ior the full 18.

Net.—Score after deducting handicap.

Observer.—Person appointed by a tournament committee to assist a referee in deciding questions of iact and to report to him any breach of a rule or local rule.

Obstruction.—Anything artificial that has been erected, placed or leit on the course.

Odd.—Stroke that makes a player's score one more than his opponent's on a given hole.

Out of *bounds.*—Ground on which play is prohibited.

Outside agency.—Reieree, observer, marker, forecaddie or other agency not a part of the match or, in stroke play, not a part of a player's side. .

Par.—Theoretically periect play, or the score an expert would be expected to make on a hole, calculated on the number of strokes required to reach the green plus two putts. Par is calculated on the basis oi distance. Women's par for a course is slightly higher than par for men. U.S.G.A. standards ior computing par are:

	Men's par	Women's par
Par 3	Up to 250 yd.	up to 210 yd.
Par 4	251 to 470 yd.	211 to 400 yd.
Par 5	471 and over	401 to 575 yd.
Par 6		576 yd. and over

Penalty stroke.—A stroke added to the score of a side under certain rules.

Pin.—Rod or pole to which flag is attached (see Flagstick).

Pitch.—An approach on which the ball is lofted in a high arc (see Chip).

Pitch-and-run.—An approach on which a part of the desired distance is covered by the roll of the ball after it strikes the ground.

Pivot.—The turn of the body as a stroke is played.

Pull.—To hit the ball so that it will curve to the left.

Putt.—Stroke made on a putting green.

Putting green.—All ground oi the hole being played that is specially prepared for putting or is otherwise defined as such by the committee.

Referee.—Person appointed by the tournament committee to accompany players to decide questions of fact and rules of golf.

Rough.—Long grass bordering the fairway, also at times between tee and fairway; may include bushes, trees, etc.

Rub of the green.—Any deflection or stoppage of a ball by an outside agency; the ball is played as it lies, without penalty.

Run—(a) To run a ball along the ground in an approach, instead of chipping or pitching it. (b) Distance a ball rolls after it lands.

Sand trap.—A bunker having a layer of sand (see Bunker).

Sclaff.—To hit the ground behind the ball, derived from a Scots term meaning "a slight blow."

Scratch player.—One who receives no handicap allowance.

Short game.—Approach shots and putts.

Single.—Match between two players.

Slice.—To curve the ball widely to the right.

Square.—When a match is even.

Stance.—Position of player's feet and body when addressing the ball.

Stroke.—Forward movement of the club with the intention of fairly striking the ball.

Stroke hole.—Hole on which a handicap stroke is given.

Stroke play.—Reckoning the score by total strokes, also known as medal play.

Tee.—An artificial peg or a pinch of sand on which the ball may be placed for the first stroke on each hole.

Teeing ground.—Starting place for the hole to be played, indicated by two marks on the ground; also called the tee.

Three-ball match.—Match in which three play against one another, each playing his own ball.

Threesome—Match in which one player competes against two, who play alternate strokes with the same ball.

Through the green.—The whole area of the course except hazards and the teeing ground and putting green of the hole being played.

Up.—In match play, a side is up when it has won more holes than it has lost.

Water hazard.—Any water (except casual water) or watercourse, regardless of whether it contains water.

GOLGI, CAMILLO (1843–1926), Italian physician and Nobel laureate noted for basic researches in neurology, was born in Cortona, July 9, 1843 (or, according to some sources, July 7, 1844). After taking his degree at Pavia in 1865 he became physician at the home for incurables in the village of Abbiategrasso. There, despite the primitive means of investigation available, he discovered his silver nitrate method of staining nerve cells and fibres—a method which gave the key to the finer structure of the nervous system. In 1883 he demonstrated in the central nervous system multipolar cells with many branching processes (Golgi cells) that establish connections with other nerve cells. This discovery led to W. von Waldeyer's conception of the neuron as the unit of the nervous system and was fundamental for the development of modern neurology.

Apart from histological researches, Golgi was famous for his observations on malaria. He showed that the parasite of quartan fever differs from that of tertian, that malarial paroxysms are coincident with sporulation of the parasites and that the severity of a malarial attack depends on the number of parasites in the blood. He also made valuable observations on pellagra and on the causation of mental disease.

From 1875 Golgi held in succession the chairs of anatomy and histology and general pathology and histology in the University of Pavia.

In 1906 Golgi, jointly with S. Ramón y Cajal (*q.v.*), was awarded the Nobel prize for physiology or medicine for his work on the structure of the nervous system. He died in Pavia on Jan. 21, 1926.

(W. J. BP.)

GOLGOTHA, a skull, from the Aramaic Golgolta (גֻּלְגָּלְתָּא Targ. Onqelos of Ex. xvi, 16, with the second "l" omitted for euphony to Greek ears). The name of the spot where Christ was crucified (Matt. xxvii, 33; Mark xv, 22; John xix, 17), outside Jerusalem.

The exact location of Golgotha is uncertain. The traditional site may be the correct one. The location depends on the lines along which the walls of Jerusalem ran in Jesus' day. These lines are not now known with certainty.

GOLIAD, an incorporated village of southeast Texas, U.S., on the San Antonio river and the Southern Pacific railway, 85 mi. S.E. of San Antonio; the county seat of Goliad county. Goliad is surrounded by a very rich farming and grazing country.

In nearby Goliad State park are a restored Spanish mission and the well-preserved ruins of a presidio, moved there in 1749. The name Goliad, in use since 1829, is probably an anagram of the name of the Mexican patriot Hidalgo (1757–1811). During the struggle between Mexico and Spain the Mexican leader Bernardo Gutiérrez was besieged there. On the outbreak of the Texan War of Liberation, Goliad was garrisoned by a small force of Mexicans who were soon forced to surrender and, on Dec. 20, 1835, a preliminary "declaration of independence" was published there.

In 1836, when Santa Anna began his advance, Goliad was occupied by 350 American troops under Col. James W. Fannin. In obeying orders to withdraw and join Gen. Sam Houston, they were overtaken on Coletto creek, and after a sharp fight (March 19–20) were obliged to surrender; they were marched back to Goliad and shot down (March 27) by Santa Anna's command.

GOLIARD, a name applied to those wandering students (*vagantes*) and clerks in England, France and Germany, during the 12th and 13th centuries, who were better known for their rioting, gambling and intemperance than for their scholarship. The derivation of the word is uncertain, but it was connected by them with a mythical "Bishop Golias," also called "archipoeta" and "primas"—especially in Germany—in whose name their satirical poems were mostly written. The jocular references to the rules of the "guild" of goliards should not be taken too seriously, though their aping of the "orders" of the church, especially their contrasting them with the mendicants, was denounced by church synods.

Their satires were almost uniformly directed against the church, attacking even the pope. In 1227 the Council of Trèves forbade priests to permit the goliards to take part in chanting the service. In 1229 they played a conspicuous part in the disturbances at the University of Paris in connection with the intrigues of the papal legate.

During the century which followed they formed a subject for the deliberations of several church councils, notably in 1289, when it was ordered that "no clerks shall be jongleurs, goliards or buffoons," and in 1300 (at Cologne) when they were forbidden to preach or engage in the indulgence traffic. This legislation only became effective when the "privileges of clergy" were withdrawn from the goliards.

Along with their satires went many poems in praise of wine and riotous living. A remarkable collection of them, now at Munich, from the monastery at Benedictbeuren in Bavaria, was published by Schmeller (3rd ed., 1895) under the title Carmina

Burana. Many of these, which form the main part of songbooks of German students today, have been delicately translated by John Addington Symonds in a small volume, *Wine, Wonzen and Song* (1884).

The word "goliard" itself outlived these turbulent bands nhich had given it birth, and passed over into French and English literature of the 14th century in the general meaning of jongleur or minstrel, quite apart from any clerical association. It is thus used in *Piers Plowman*, where, however, the *goliard* still rhymes in Latin. and in Chaucer.

BIBLIOGRAPHY.—O. Hubatsch, *Die lateinischen Pagantenlieder des Mittelalters* (1870); B. Spiegel, *Die Vaganten und ihr Orden* (1892); M. Haezner, *Goliardendichtung und die Satire im 13ten Jahrhundert in England* (1905); the article in *La grande Encyclopédie;* Helen Waddell, *The Wandering Scholars* (1927); also K. Breul, *The Cambridge Songs* (1915).

GOLIATH, the name of the giant by slaying whom David achieved renown (I Sam. xvii). The Philistines had come up to make war against Saul, and this warrior came forth day by day to challenge to single combat. Only David ventured to respond, and armed with a sling and pebbles he overcame Goliath. The Philistines, seeing their champion killed, lost heart and were easily put to flight. The giant's arms were placed in the sanctuary, and it was his famous sword which David took with him in his flight from Saul (I Sam. xxi, 1–9). In another passage it is said that Goliath of Gath was slain by a certain Elhanan of Bethlehem in one of David's conflicts with the Philistines (II Sam. xxi, 18–22); the parallel II Chron. xx, 5 avoids the contradiction by reading "Elhanan . . . slew Lahmi the brother of Goliath." But this old popular story has probably preserved the more original tradition. and if Elhanan is the son of Dodo in the list of David's mighty men (II Sam. xxiii, 9, 24) the resemblance between the two names may have led to the transference.

GOLITSYN, BORIS ALEKSEYEVICH (1641–1713), Russian statesman, came of a princely family, claiming descent from Prince Gedymin of Lithuania. Boris became court chamberlain in 1676. He was the young tsar Peter's chief supporter when, in 1689, Peter resisted the usurpations of his sister Sophia, and the head of the loyal council which took refuge in the Troitsa monastery and won over the boyars of the opposite party. In 1690 he was created a boyar and shared with Naryshkin, Peter's uncle, the conduct of home affairs.

After the death of the tsaritsa Natalia, Peter's mother, in 1694, his influence increased further. He accompanied Peter to the White sea (1694–95); took part in the Azov campaign (1695); and was one of the triumvirate who ruled Russia during Peter's first foreign tour (1697–98). The Astrakhan rebellion (1706), which affected all the districts under his government, shook Peter's confidence in him and seriously impaired his position. In 1707 he was superseded in the Volgan provinces by Andrei Matveyev, and in 1713 entered a monastery. He was a typical representative of Russian society of the end of the 17th century in its transition from barbarism to civilization. In many respects he was far in advance of his age. He was highly educated, spoke Latin fluently, frequented the society of scholars and had his children carefully educated. Yet he was a habitual drunkard; it was his drunkenness which ruined him in the estimation of Peter the Great, despite his previous services.

See S. Soloviev, *History* of *Russia* (in Russian), vol. xiv (1858); R. N. Bain, *The First Romanovs* (1905).

GOLITSYN, BORIS BORISOVICH, PRINCE (1862–1916), Russian physicist known for his work on methods of earthquake observations and on the construction of seismographs. Born on Feb. 18 (old style), 1862, in St. Petersburg, he n-as educated in the naval school and naval academy. In 1887 he left the active service for scientific studies and went to Strasbourg. In 1891 he was appointed *Privatdocent* at the University of Moscow and in 1893 professor of physics at Dorpat. The same year he was elected fellow of the Academy of Sciences in St. Petersburg and in 1908 a member of the academy. His early research was in spectroscopy.

His valuable book, *Lectures on Seismometry,* was published in 1912 and translated into German in 1914. He received the degree of doctor of science from the University of Manchester in 1910 and in 1911 he was elected president of the International Seismological association. In 1913 he was appointed director of the Central Physical (later Geophysical) observatory at St. Petersburg and achieved good results in the organization of the meteorological service throughout Russia, especially during World War I. He died on May 4, 1916, in New Peterhof, near St. Petersburg.

(A. FOE.; X.)

GOLITSYN, DMITRY MIKHAILBVICH (1665–1737), Russian statesman, was sent in 1697 to Italy to learn "military affairs"; in 1704 he was appointed to the command of an auxiliary corps in Poland against Charles XII; from 1711 to 1718 he was governor of Belogorod. In 1718 he was appointed president of the newly erected *Kammer Kollegium* and a senator. In May 1723 he was implicated in the disgrace of the vice-chancellor Shafirov and was deprived of all his offices and dignities, which he only recovered through the mediation of the empress Catherine I. Golitsyn remained in the background till the fall of Menshikov, 1727. During the last years of Peter II (1728–30) his high aristocratic theories had full play. On the death of Peter II he conceived the idea of limiting the autocracy by subordinating it to the authority of the supreme privy council, of which he was president. He drew up a form of constitution which the empress Anne was forced to sign at Mittau before leaving for St. Petersburg. Anne lost no time in repudiating this constitution, and never forgave its authors. Golitsyn lived in retirement till 1736, when he was arrested on suspicion of being concerned in the conspiracy of his son-in-law Prince Constantine Cantimir. He was really prosecuted for his antimonarchical sentiments. A court, largely composed of his antagonists, condemned him to death, but the empress commuted the sentence to lifelong imprisonment in Schlusselburg and confiscation of all his estates. He died in prison on April 14, 1737, after three months of confinement.

See R. N. Bain, *The Pupils of Peter the Great* (1897).

GOLITSYN, VASILY VASIEEVICH (1643–1714), Russian statesman, spent his early days at the court of Tsar Alexius where he gradually rose to the rank of boyar. In 1676 he was sent to the Ukraine to keep in order the Crimean Tatars and took part in the Chigirin campaign. The revolution of May 1682 placed Golitsyn at the head of the *Posolsky Prikaz,* or ministry of foreign affairs, and during the regency of Sophia, sister' of Peter the Great, whose lover he became, he was the principal minister of state (1682–89) and "keeper of the great seal."

His foreign policy mas distinguished by the peace with Poland in 1683, whereby Russia recovered Kiev. By the terms of the same treaty, he acceded to the grand league against the Porte, but his two expeditions against the Crimea (1687 and 1689), "the First Crimean War," were unsuccessful and made him extremely unpopular. In the civil war between Sophia and Peter (Aug.–Sept. 1689), Golitsyn halfheartedly supported his mistress, and shared her ruin. He was banished successively to Kargopol, Mezen and Kologora, where he died on April 21, 1714. Golitsyn was unusually well educated. He understood German and Greek. and could express himself fluently in Latin. He was a great friend of foreigners, who generally alluded to him as "the great Golitsyn."

BIBLIOGRAPHY.—R. N. Bain, *The First Romanovs* (1905); A. Bruckner, *Fürst Golizin* (1887); S. Soloviev, *History of Russia* (in Russian), vol. xiii–xiv (1858).

GOLIUS or **GOHL, JACOBUS** (1596–1667), Dutch orientalist, born at The Hague, studied at the University of Leiden, where in Arabic and other eastern languages he was a pupil of Erpenius. In 1622 he accompanied the Dutch embassy to Morocco, and on his return he was chosen to succeed Erpenius (1624). He then spent five years traveling in Syria and Arabia. The remainder of his life was spent at Leiden where he held the chair of mathematics as well as that of Arabic. He died on Sept. 28, 1667. His most important work is the *Lexicon Arabico-Latinum* (Leiden, 1653), which, based on the *Sihah* of al-Jauhari, was only superseded by the corresponding work of Freytag. In

1656 he published a new edition, with considerable additions, of the *Grammatica Arabica* of Erpenius. After his death, there was found among his papers a *Dictionarium Persico-Latinum* which was published, with additions, by Edmund Castell in his *Lexicon heptaglotton* (1669).

GOLLANCZ, SIR HERMANN (1852–1930), Jewish rabbi, son of the Rev. S. M. Gollancz, studied at University college, London. He became an authority on the Hebrew language and literature, and in 1897 the Chief Rabbis in Galicia conferred on him the highest Rabbinical diplomas, "Hatarath Horaah." He was for 21 years Goldsmid professor of Hebrew at University college, and presented his library to the college at the end of this period (1902–24). From 1892 to 1923 he was predcher at the Bayswater synagogue, and was then appointed emeritus minister for his record service of 51 years. In that year he received a knighthood. He interested himself in many philanthropic works, and founded several synagogues for the working classes. He was a member of the commission on the birth-rate (1913–16), and other Government inquiries.

His publications include many translations from Hebrew and Aramaic and articles contributed to learned reviews.

GOLLANCZ, SIR ISRAEL (1863–1930), British scholar, was born in London July 13, 1863. He was educated at the City of London school and at University college, London and Christ's college, Cambridge. From 1892 to 1895 he was Quain student and lecturer in English at University college, London and in 1896 was appointed university lecturer in English at Cambridge, becoming in 1906 university professor of English language and literature at King's college, London. He became secretary of the British Academy on its foundation in 1903 and was knighted in 1919. He was general editor of the *Temple Classics* and *Kzngs Library* series and of the *Book* of *Homage to Shakespeare* which appeared in 1916. He died June 23, 1930. His published works include *Cynewulf's Christ* (1892); an edition of C. Lamb's *Specimens of Elizabethan Dramatists* (1893); *Exeter Book of Anglo-Saxon Poetry* (1895); *Hamlet in Iceland* (1898); and *The Caedmon Manuscript* of *Anglo-Saxon Biblical Poetry* (192;).

GOLOVIN, FEDOR ALEKSEYEVICH, Count (d. 1706), Russian statesman. During the regency of Sophia, sister of Peter the Great, he was sent to the Amur to defend the new Muscovite fortress of Albazin against the Chinese. In 1689 he concluded with the Celestial empire the Treaty of Nerchinsk. by which the line of the Amur, as far as its tributary the Gorhitsa, was retroceded to China. In Peter's grand embassy to the West in 1697 Golovin occupied the second place fmmediately after Lefort. It was his chief duty to hire foreign sailors and obtain everything necessary for the construction and complete equipment of a fleet. On Lefort's death, in March 1699, he succeeded him as admiral-general. The same year he was created the first Russian count, and was also the first to be decorated with the newly-instituted Russian order of St. Andrew. The conduct of foreign affairs was at the same time entrusted to him, and from 1699 to his death he was "the premier minister of the tsar." Golovin supplemented the Treaty of Carlowitz, by which peace with Turkey had only been secured for three years, by concluding with the Porte a new treaty at Constantinople (June 13, 1700), by which the term of the peace was extended to 30 years and, besides other concessions, the Azov district and a strip of territory extending thence to Kuban were ceded to Russia.

See R. N. Bain, *The First Romanovs* (1905). (R. N. B.)

GOLOVKIN, GAVRIIL IVANOVICH, Count (1660–1734), Russian statesman, was attached (1677), while still a lad, to the court of the tsarevitch Peter, afterwards Peter the Great, with whose mother Natalia he was connected, and vigilantly guarded him during the regency of Sophia. He accompanied the young tsar abroad on his first foreign tour, and worked by his side in the dockyards of Saardam. In 1706 he took over the direction of foreign affairs, and was created the first Russian grand-chancellor on the field of Poltava (1709). Golovkin held this office for 25 years. Under Catherine I. he became a member of the supreme privy council; the empress also entrusted him with her last will whereby she appointed the young Peter II. her successor and Golovkin one of his guardians. On the death of Peter II. in 1730 he declared in favour of Anne, duchess of Courland, in opposition to the aristocratic Dolgorukis and Golitsyns, and his determined support of the autocracy wrecked the proposed constitution, which would have converted Russia into a limited monarchy. Cnder Anne he was a member of the first cabinet formed in Russia. He was one of the wealthiest, and at the same time one of the stingiest, magnates of his day. His ignorance of any language but his own made his intercourse with foreign ministers very inconvenient.

See R. N Bain, *The Pupils* of *Peter the Great* (1897).

GOLOVNIN, VASILI MIKHAILOVICH (1776–1831), Russian naval officer, circumnavigator of the world. was born on April 8 (old style; April 20, new style), 1776, in the province of Ryazan. He received his education at the Kronstadt naval school and from 1801 to 1806 served as a volunteer in the English navy. In 1807 he nas commissioned by the Russian government to survey the coasts of Kamchatka and of Russian America, including also the Kuril Islands.

Golovnin sailed round the Cape of Good Hope, and on Oct. 5, 1809, arrived in Kamchatka. In 1810, while attempting to survey the coast of the island of Kunashiri. he was seized by the Japanese. remaining prisoner until Oct. 13, 1813. Golovnin was presently appointed to the command of a voyage of circumnavigation. He started from St. Petersburg on Sept. 7, 1817, sailed round Cape Horn, and arrived in Kamchatka in the following May He returned to Europe by way of the Cape of Good Hope, landing at St Petersburg on Sept. 1;. 1819.

He died on July 12. 1831. Golovnin's works include: *Journey to Kamchatka* (2 vol., 1819); *Journey Round the World* (2 vol. 1822); and *Narrative of My Captivity in Japan, 1811–1813* (2 vol, 1816). The last was translated into French, German and English (1824).

A complete edition of his works was published at St. Petersburg in five volumes in 1864, with maps and charts, and a biography of the author by N Grech.

GOLTZ, BOGUMIL (1801–1870), German humorist and satirist. uas born at Warsaw on March 20, 1801, and died at Thorn on Nov. 12 1870. Goltz wrote *Buch der Kzndheit* (Frankfort. 1847; 4th ed.. Berlin, 1877), in which he gives a charming and idyllic description of the impressions of his oun childhood Among his other works must be noted *Ein Jugendleben* (1852); *Der Mensch znd dze Leute* (1858); *Zur Charakterzstzk und Naturgeschichte der Frauen* (1859); *Zur Geschichte und Charakferzstik des deutschen Genius* (1864). and *Die Weltklugheit und die Lebensweisheit* (1869).

Goltz was a follower, in some respects, of Rousseau. He desired to see a freer. more natural system of education which should develop a robuster type of manhood.

GOLTZ, COLMAR, Baron von der (1843–1916), Prussian soldier and military writer, was born at Bielkenfeld, East Prussia on Aug. 12, 1843. and entered the Prussian infantry in 1861. In 1864 he entered the Berlin military academy, but was temporarily withdrawn in 1866 to serve in the Austrian war, in which he was wounded at Trautenau.

In 1867 he joined the topographical section of the general staff. and at the beginning of the Franco-German War of 1870–71 u-as attached to the staff of Prince Frederick Charles. In 1871 Goltz was appointed professor at the military school at Potsdam, and the same year was placed in the historical section of the general staff.

In 1878 Goltz became lecturer in military history at the military academy at Berlin, where he remained for five years He published. in 1883. *Rossbach und Jena* (new and rev. ed., *Von Rossbach bis Jena und Auerstadt,* 1906), *Das Volk in Waffen* (Eng. trans., *The Nation in Arms)* both of uhich quickly became military classics. In June 1883 his services were lent to Turkey to reorganize the military establishments of the country. He spent 12 years in this work, the result of which appeared in the Greco-Turkish War of 1897, and he was made a pasha and a *mushir* or field marshal. On his return to Germany in 1896 he became a lieutenant general In 1900 he uas made general of infantry. in

1908 colonel general and in 1911 field marshal. He retired in 1913.

In Aug. 1914 Goltz was appointed governor general of Belgium, then occupied by German forces. In November of the same year he was attached to the Turkish headquarters as aide-de-camp general to the sultan. He was placed in the chief command of the 1st Turkish army in Mesopotamia and succeeded in investing General Townshend's British forces at Kut-el-Amara in Dec. 1915. He died on April 19, 1916, at Baghdad; he was said to have been poisoned by the Young Turks.

Goltz's last work was *Kriegsgeschichte Deutschlands* im *19ten Jahrhundert, 2* vol. (1910–14).

GOLTZ, RUDIGER, COUNT VON DER (1865–1930), German lieutenant general. was born at Ziillichau on June *28, 1864.* He commanded a division of the *Landwehr* at the battle of the Masurian Lakes in Feb. 1915. In the spring of *1918* he led the Baltic division into Finland and was appointed chief in command in the Baltic countries in Nov. 1918. In 1919 he was leading a volunteer army professedly against the Bolshevists, but he was suspected of scheming to use his Baltic volunteers as an instrument for the royalist and reactionary movement and his recall was demanded. Sections of these troops *(Das Baltikum)* actually took part in the military occupation of Berlin which attended the Kapp *coup* in March 1920, and were with difficulty disbanded. He then took part in the youth movement, and in 1924 became president of the United Patriotic associations. Count von der Goltz wrote *Meine Sendung in Finnland und im Baltikum* (1920).

GOLTZIUS, HENDRIK *(1558–1617),* Dutch engraver, was born in *1558* at Mülebrecht. in the duchy of Jiilich. After studying painting on glass for several years under his father, he was taught the use of the burin by Dirk Volkertsz Coornlert, a Dutch engraver. He was employed by Philip Galle to engrave a set of prints of the history of Lucretia. Marriage with a rich widow at 21 enabled him to set up in independent business at Haarlem, where he spent the rest of his life. except for a tour in Germany and Italy in *1*590. He died at Haarlem on Jan. *1, 1617.*

Goltzius' portraits, mostly miniatures, are masterpieces of their kind, both on account of their exquisite finish and as fine studies of individual character. Of his larger heads, the life-size portrait of himself is probably the most striking example. Six scenes from the life of the Virgin are called his "masterpieces," from their being attempts to imitate the style of the old masters. In his command of the burin Goltzius is not surpassed even by Diirer; his eccentricities and extravagances are counterbalanced by the beauty and freedom of his execution. He began painting at the age of *42,* but none of his works in this branch of art displays any special excellences.

GOLUCHOWSKI, the name of an ancient family of Polish aristocracy, two members of which played an important part in Austrian politics. Count AGENOR GOLUCHOWSKI, the elder (1812–75), studied at Lemberg, served in the Galician *Statthalterei* under Stadion, and did excellent work on the Galician agrarian reform of 1847. In Nov. *1848* he became a member of Schwarzenberg's cabinet and was governor of Galicia, 1848–59, 1866–68 and 1871–75. From 1859–61 he was Austrian minister of the interior, during which period he secured for Galicia a degree of autonomy not enjoyed by any other Austrian crownland. while as governor of Galicia he secured the introduction of Polish as official language. He was the principal author of the federalist "October Diploma" of 1860 *(see* AUSTRIA, EMPIRE OF). An excellent administrator, Goluchowski transformed the policy of the Austrian Poles from romantic revolutionism to their eminently successful later policy of co-operation with the Austrian government in return for national concessions in Galicia, and was thus one of the true forerunners of Polish independence.

His son AGENOR GOLUCHOWSKI, the younger (1849–1921) was born on 'larch 25, *1849,* entered the Austro-Hungarian diplomatic service, served in Berlin. Paris and Budapest (1887–93) and became Austro-Hungarian minister of foreign affairs in May *1895.* The appointment caused surprise, but Goluchowski enjoyed Francis Joseph's personal confidence, and his policy was peaceable and practical, and generally conducted with an eye on economic necessities. In particular he showed a conciliatory spirit toward Russia for which he was often blamed by more bellicose spirits. He was author of the Austro-Russian agreement of *1897,* which temporarily ended the two Powers' rivalry in the Balkans and of the Macedonian reform plans of 1902 and 1903 (Mürzsteg program). At the same time, he contrived to pacify Italy's fears by guaranteeing the *status quo (1898)* and stood loyally by the German alliance. It was to Goluchowski that the German emperor William II addressed the famous telegram after Algeciras, saying that he had proved a "brilliant second" and could rely on the Imperial gratitude — a promise redeemed to Goluchowski's more aggressive successor, Aerenthal. in 1908. As a Pole and a Slav, Goluchowski was unpopular with the Magyars who believed him to be inspiring Francis Joseph's opposition to the use of Magyar in the army. He resigned office on Oct. 11, 1906, to ease the crisis in Hungary and did not return to office. He died in Lemberg on March *29, 1921.* (C. A. M.)

GÓMARA, FRANCISCO LÓPEZ DE *(1510–1560),* Spanish historian. author of the *Primera* y *Segunda Parte de la historia general de las Indias . . .* (1552), a panegyric of Hernán Cortés written in a pleasing style by a literary artist.

Gomara was educated at the University of Alcalá, where he took orders. Soon after *1 j40* he entered the household of the famous Cortés who supplied him with most of the material for his *Historia* and also with information which the historian used in his *Crónica de la conquista de Nueva España.* While the novel matter and the attractive style enchanted the Spanish public, the unmeasured laudations of Cortes at the expense of his lieutenants and companions brought about a violent reaction and both works were forbidden on Nov. *17,* 1553.

GOMARUS, FRANCISCUS (original surname GOMMER) *(1563–1641),* Dutch theologian and Calvinist leader, was born at Bruges on Jan. *30, 1563.* He studied at Strasbourg, Neustadt, Oxford and Cambridge, and was pastor of a Reformed Dutch church in Frankfurt am Main from 1587 till 1593, when the congregation was dispersed by persecution.

In *1 j94* he was appointed professor of theology at Leiden. where he became the leader of the opponents of Jacobus Arminius *(q.v.), 1603.* He disputed with Arminius before the assembly of the estates of Holland in *1608,* and was one of the five Gomarists who met five Arminians or Remonstrants in the same assembly of *1609.* On the death of Arminius, Konrad Vorstius. who sympathized with his views, was appointed to succeed him and as a result Gomarus resigned his professorship in *1611.* He became preacher at the Reformed church at Middleburg and taught theology and Hebrew in the newly founded *Illustre Schule.* Later he was professor at Saumur, then at Groningen. He took a leading part in the synod of Dort *(1618)* as an opponent of Arminianism *(q.v.).* He died at Groningen on Jan. 11, *1641.*

Gomarus' works were collected and published in one volume folio. in Amsterdam, in *1645.*

GOMEL (HOMEL), town in Gomel *oblast* of the Belorussian Soviet Socialist Republic, U.S.S.R.; latitude 52° 25' N., longitude 31° 0' E.. on the Sozh river, a tributary of the Dnieper. Pop. *(1959) 166.000.* It is situated on the great north road from Kiev, and is an important railway junction from which five lines radiate, one linking westward with Warsaw. It also has steamer routes to Kiev and Mogilev. Its industries include iron founding, agricultural machinery, sawmilling, the preparation of bristles, brewing and confectionery. It is situated in a forest and marsh-dotted county of the same name, drained by numerous tributaries of the Dnieper.

Its western position gives it a less extreme climate, average January temperatures $-6.j^o$ C., average July temperature 18.5° C. The rivers are frozen for 130 to 140 days.

The town is first mentioned in 1142, when it belonged to the prince of Chernigov. It was alternately in the occupation of Poland and Russia until 1772, when it was finally annexed by Russia. In 1648 it was captured by the Cossack chieftain Bogdan Chmielnicki *(q.v.).*

GOMER, the wife of the prophet Hosea. The first three chapters of the Book of Hosea are concerned with the marriage of Hosea and Gomer, a harlot, and the birth of their three children. *See* HOSEA.

GOMERA, an island in the province of Santa Cruz de Tenerife, part of the Spanish archipelago of the Canary Islands (*q.v.*). Pop. (1950) 29.899. Area 146 sq.mi. It lies 20 mi. W.S.W. of Tenerife and is almost circular, measuring 15¾ mi. from north to south and 13 mi. from east to west. The coasts, especially on the west, are rugged and precipitous and the land rises to the flattish dome of Garajonay (4,879 ft.) in the centre of the island. There is a nearly continuous plant cover consisting, above 1.600 ft., of tree heather scrub with some evergreens, *e.g.*, faya and Canarian holly; and in the lower areas composed mainly of euphorbias and sempervivum with thistles and brambles. Choughs are common and the scrub provides cover for partridges and other birds. The lower levels are semiarid but owing to the plentiful supply of fresh water from springs, the valley bottoms are irrigated and bananas and date palms are grown. In the south vines, figs. cereals and tomatoes arc cultivated. There are no industries other than agriculture and some salting of tunny fish, and the chief products are tomatoes and bananas.

Gomera has no harbour, but San Sebastian. on the east coast. has a sheltered roadstead and is backed by steep hills. It is the chief town, with a population of the municipio in 1950 of 6,664 It was the last stopping place of Christopher Columbus on his first voyage of discovery in 1492 and the house where he stayed and the church he attended are still standing (X)

The Whistled Language of **Gomera.**—Many Gomerans possess the ability to talk hy whistling, an art acquired from the Guanches (*q* a). Whistlers commonly insert tno fingers into the mouth, using the same modifications in position of lips, tongue etc., as in speech. In this manner they are able to produce greatly magnified birdlike sounds. nhich closely imitate the rhythm, tone and other intricacies of spoken Spanish, permitting them to converse across distances that the voice could not bridge. The most expert are found among the goatherds dnelling in the mountains around Chipude.

In the chronicle of the expedition of Jean de Bethencourt (*q.v.*) in 1402, an implausible legend of missing tongues is related, to account for the origin of the whistled language. A more scientific explanation is that it has been of slow development, perfected from necessity after generations of practice.

In 1934 an official test was conducted by the insular government in order to authenticate the fact that conversations phrased in simple words could be carried on. Separated beyond shouting distance. whistlers exchanged 13 unrehearsed messages, composed by a witness and dictated to them. All messages, as sent and as received. were thereupon recorded in writing. Upon subsequent comparison oi notes, 11 messages proved to have been transmitted and understood with exactitude; 2 showed inconsequential discrepancies: the expression "piece of paper" had been substituted for the word "newspaper"; and the command, "pick up two stones," was performed by picking up only one. (A. G. V.)

GOMES, DIOGO (fl. 1440–1482), Portuguese explorer of the Gambia and discoverer of the Cape Verde Islands, mas sent by Prince Henry the Navigator in about 1456 to explore the Guinea coast. Passing beyond the Rio Grande. he was swept back by currents and went far up the Gambia to the town of Cantor. There he made commercial treaties with the Negro chiefs and saw a flourishing trade in gold coming from the south. He had with him an interpreter called Jacob to facilitate communication with Prester John in Abyssinia. In 1460, on the second voyage, he joined with Antonio da Noli and on their return landed in Santiago in the Cape Verde Islands. Their ships later separated and Noli was the first to report the discovery and is credited with it. Portuguese records of exploration from 1448 to 1470 are almost nonexistent, but Gomes dictated accounts of his voyages, and of other earlier exploratory voyages under Prince Henry, to Martin Behaim about 1484. when both lived in the Azores.

Behaim made notes in German, which were translated into Latin by Valentim Fernandes. They were found in a codex in the Royal library at Munich in 1847.

See G. Pereira, "Diogo Gomez" *Bol. Soc. Georgra. Lisbon,* series xvii. *no.* 1. p. 267 ff. (1899) ; G. R. Crone, *The Voyages of Cadamosto,* Hakluyt Society, second series, no. lxxx, p. 91 ff. (1937). (A. Ds.)

GÓMEZ, JUAN VICENTE (c. 1857–1935), Venezuelan dictator, known as "the tyrant of the Andes," was a nearly full-blooded Indian. Of poor birth, he was raised in San Antonio, Táchira state, where he attained wealth and local influence before helping Cipriano Castro shoot his way into the presidency. He served as commander in chief of the army and vice-president and when Castro went to Europe in 1908 for medical treatment: the faithless Gómez seized power and had himself named president. He completely dominated the country until his death in 193j. He silenced the provincial *caudillos* and the Catholic Church and kept the army contented by providing it with modern equipment. Gómez' friendly relations with his neighbours, the U.S., and the nations of western Europe, and large-scale material development, made possible by revenues from the rapidly expanding petroleum industry, served to draw attention away from a brutal dictatorship. Gómez combined an insatiable acquisitiveness for money and power with an abundant capacity for immorality. When he died Dec. 17, 1935, he was the "dean" of all Latin-American tyrants, with 27 years to his credit, still busily adding to his riches, and, as a bachelor, to a long list oi illegitimate children. See VENEZUELA: *History*. (J. J. J.)

GOMEZ, LAUREANO ELEUTERIO (1889–), Colombian politician, was born Feb. 20, 1889 in Bogotá. He obtained an engineering degree in 1909 from the National university, where he entered politics and journalism. Gomez has held numerous high public offices and in 1932 became chief of the Conservative party leading its fight against the Liberal party in congress from 1932 to 1943. He exploited Liberal factionalism to restore Conservative control of government in 1946 and his presidential administration (1950–53) was noted ior economic development and intense rural political violence. Illness forced him to cease active presidential duties on Oct. 31, 1951, which he resumed on June 13, 1953, only to be immediately overthrown by Gen. Gustavo Rojas Pinilla, who seized the presidency.

In exile (1953–57) Gómez concluded agreements with Liberal chief Alberto Lleras Camargo establishing the national front which forced out Rojas on May 10, 1957. See COLOMBIA: *History*. (R. L. GE.)

GÓMEZ DE AVELLANEDA, GERTRUDIS (1814–1873), Spanish lyrical poet and dramatist remembered chiefly for her poems, was horn at Puerto Príncipe (now Camagiiey), Cuba, on March 23. 1814, and moved in 1836 to Spain, where she published her first poems (1841) under the pseudonym of LA PEREGRINA ("The Pilgrim"). Her novels. such as Sub (1841) and *Guatimozín* (1846), are of no great importance. She obtained, however. a series of successes on the stage with *Alfonso Munio* (1844). a tragedy in the new romantic manner; with *Saúl* (1849), *a* biblical drama; and with *Baltasar* (1858). La Avellaneda had a grandiose tragical vision of life, a vigorous eloquence rooted in pietistic pessimism. a dramatic gift eifective in isolated acts or scenes; but she was deficient in constructive power and in intellectual force. Her lyrics, though instinct with melancholy beauty or the tenderness of resigned devotion, too oiten lack human passion and sympathy. She died on Feb. 1, 1873.

See E. B. Williams, *The Life and Dramatic Works of G. Gómez de Avellaneda (1921); E.* Cotarelo y Mori, *La Avellaneda* y *sus obras* (1930).

GÓMEZ FARÍAS, VALENTÍN (1781–1858), Mexican liberal leader, notable for his social reforms of 1833–34 that make him a precursor of Benito Juárez. Born in Guadalajara on Feb. 14, 1781, and trained as a physician, he first became prominent in politics in 1822. In 1833 he was elected vice-president in the administration of Antonio López de Santa Anna (*q.v.*). His energetic support of laws that were designed to prune the temporal powers of the church. reduce the influence of the army and the landowning gentry and reform the university, caused his exile to New Orleans in 1835. A zealous lifelong advocate of federal republican government, his early admiration for the Cnited States changed to distrust by the time of the Mexican War. during which he was again vice-president. Personally devout, his anticlerical attitude has made him a controversial figure in Mexican history. He died in Mexico City on July 5, 1858.

See Vicente Fuentes Diaz, *Gómez Farías, padre de la reforma* (1948).
(C. A. Hn.)

GOMME, SIR GEORGE LAURENCE (1853–1916), knighted 1911, English archaeologist, was born in London on Dec. 17, 1853, and educated at the City of London school. As a boy he entered the service of the metropolitan board of works; but in 1891 he was appointed statistical officer to the London county council, becoming in 1900 clerk to the council. Few men have possessed a more profound knowledge of the past and present history of London, and his book The Making of London (1912) is a classic on the subject. He died at Long Crendon, Buckinghamshire, on Feb. 25, 1916.

GOMPERS, SAMUEL (1850–1924), U.S. labour leader, was born in London, Jan. 27, 1850, emigrated to New York in 1863 where he followed his father's trade of cigar making, and became a naturalized citizen in 1872. For years the leading U.S. labour leader, Gompers had a world-wide reputation for conservatism. He evolved the principles of "voluntarism" when the American community was bitterly hostile to labour organizations. "Voluntarism" stressed that unions should exert coercion by economic actions, *i.e.* strikes and boycotts. In 1886 Gompers led the national organization of cigar makers from the Knights of Labor to form the American Federation of Labor (A.F.L.), of which he was president from 1886 to 1924 (except for one year, 1895). He distrusted the influence of intellectual reformers, fearing any activity which would divert labour's energy from economic goals. To make unionism respectable as a bulwark against radicalism and irresponsible strikes, he encouraged binding written trade agreements and advocated the primacy of national organizations over both local unions and international affiliations.

Gompers kept the A.F.L. politically neutral until pressed by employer tactics, including an open-shop drive, and by federal court injunctions which greatly weakened labour's economic weapons, the strike, picket line and boycott. The Democratic platform of 1908 included an anti-injunction plank; accordingly, Gompers supported Bryan's unsuccessful presidential race. With the victory of Woodrow Wilson in 1912, the Clayton amendments to the Sherman Antitrust act (1914) and the Adamson act (1916) were passed and a cabinet post for labour was created (1913). Gompers hailed the Clayton amendments as "labour's Magna Carta," but the U.S. supreme court interpretation of the act vitiated this hope. He died at San Antonio, Tex., Dec. 13, 1924.

See J. R. Commons *et al.*, History *of Labour in the United States* (1921); Samuel Gompers, *Seventy Years of Life and Labour* (1925).
(R. M. R)

GOMPERZ, THEODOR (1832–1912), German philosopher and classical scholar, was born at Briinn on March 29, 1832. He studied at Briinn and under Herman Bonitz at Vienna. Professor of classical philology at Vienna from 1873 to 1901, he was elected a member of the Academy of Science in 1882. He received the D. Ph. *honoris* causa from Konigsberg and the D. Litt. from Dublin and from Cambridge and became correspondent for several learned societies. He died Aug. 29, 1912, at Baden-bei-Wien, Aus.

Gomperz supervised a translation of J. S. Mill's complete works (12 vol., 1869–80) and wrote a life of Mill (1889). His *Griechische* Denker: eine Geschichte der *antiken* Philosophie (2 vol., 1893–1902; new ed., 3 vol., 1922–24; Eng. trans., 4 vol., 1901–12) is the work for which he is chiefly remembered.

GONADS, DISORDERS OF. The male and female gonads, the testes and ovaries, secrete their respective sex hormones and are the site of maturation and development of spermatozoa and ova (gametogenesis). The sex hormones are responsible for the pubescent growth of the accessory sex organs and tissues and for their maintenance in a state compatible with normal function during adulthood. Pubescent maturation of the gonads and the rate of the secretion of the male and female hormones are controlled by gonadotropic hormones secreted by the anterior pituitary gland. The gonadal endocrine secretions in their turn have a suppressive influence on pituitary gonadotropin secretion. Normal testicular and ovarian functions are maintained in the adult by virtue of this delicately balanced interrelationship between the anterior pituitary gland and the gonads. The central nervous system may interject its modulating influence through the secretion of humoral products by the hypothalamus, that portion of the brain which lies just above the pituitary gland. It can be seen that gonadal disorders may arise from disturbances which affect primarily the hypothalamus, the pituitary or the gonads themselves. (See Endocrinology; Hormones.)

Several clinical syndromes have been explained by disturbances in fetal gonadal development. Although the sex of each embryo is determined genetically, the primordial gonad and the accessory sex apparatus have bisexual potentialities. The embryonic testes secrete a male organizing substance which causes the male accessory sex ducts, etc., to develop and those of the female to atrophy. The ovaries secrete no such organizing substance, but in the absence of the male morphogenetic secretion the female accessory system develops and the male ducts atrophy. Gonadal failure occurring prior to the expected time of sex differentiation of the primordial gonad would thus result in the persistence of the female accessory system.

In Turner's syndrome — in which girls fail to mature sexually, are stunted in growth and may have a variety of other congenital defects such as webbed necks and cardiovascular anomalies — the sexual infantilism is apparently due to such fetal gonadal failure. Microscopic examination of the chromatin in the nuclei of the cells of many of these individuals has revealed a pattern like that seen in normal males. This at first suggested that such individuals were genetic males whose fetal testes failed in early intra-uterine life, thus permitting the accessory sex structures of the female to develop. Recent studies have shown that at least some of these patients possess only 45 instead of the usual complement of 46 chromosomes. Either an X or a Y chromosome has been shown to be missing. Should the gonad on one side develop into a testis and that on the other into an ovary, or if both ovarian and testicular elements should survive in the same gonad, a true hermaphrodite would result. In these hermaphrodites bizarre combinations of male and female external genitalia and internal accessory sex apparatus may be found. Klinefelter's syndrome in men, which is characterized by sclerosis of the spermatogenic elements of the testis, incomplete virilization and prominent breast tissue, may also be ascribable to defective development of the early embryonic gonad. A number of such men have nuclear chromatin patterns like those seen in normal females. In several instances these individuals have been shown to have cells with 47 chromosomes, having two X and one Y sex chromosomes.

Pseudohermaphrodites are persons who have the gonads of one sex associated with a partial or complete sex reversal of the external genitalia. Male pseudohermaphrodites usually appear to be fully feminized both physically and psychologically, with full breasts, female figures and normal or almost normal vulva and vagina. The uterus and tubes are absent or extremely rudimentary. The gonads, which are testes, are usually found in the abdomen or inguinal region. Spermatogenic function is absent or irreparable impaired, and the testes apparently secrete feminizing amounts of estrogen. The sex chromatin pattern of these patients has usually been reported to be that of males.

The female pseudohermaphrodite has ovaries, a uterus with Fallopian tubes and usually a vagina which does not open to the exterior. The clitoris becomes hypertrophied, simulating the hypospadic male phallus. The condition usually is caused by a congenital abnormality of the adrenal cortex, which secretes large amounts of a male hormone before complete development of the normal female external genitalia in early fetal life. The excessive secretion continues throughout life, with some progression of the virilizing process and a suppression of ovaries as a result of the inhibition of pituitary gonadotropic secretions by the excess of androgen (male sex hormone). Treatment with cortisone stops the excessive androgen output. The defects in external genitalia can be corrected by surgery.

(See also Hermaphrodite.)

Hypogonadal states in both sexes may result from a primary defect in the hormone-secreting cells of the gonads or secondarily from any pituitary gonadotropin deficiency. In some patients the disturbance in gonadotropic function is the sole detectable pituitary defect. while in others it is just one aspect of a much broader functional deficiency. These pituitary deficiency states may result from interference in the vascular supply to the gland or from growing tumours in that area. Rarely tumours in the neighbourhood of the hypothalamus may result in deficient gonadal function (Froelich's syndrome). In hypogonadism sperm formation is impaired or absent, and impotence results in males. In females ovulation does not occur. It is possible to treat hypogonadism of both sexes with sex hormones so that sexual desire is normal and competent sexual performance possible; however, it is rare for the gametogenic functions to be restored by hormonal treatment.

Functioning tumours of the adrenal, ovaries and testes may on occasion secrete excessive quantities of either male or female hormones. An excess of male hormone would lead to precocious puberty in boys or to virilization in girls and women. An excess of the female hormone would induce precocious maturation in girls and feminization in men. In either case the gametogenic functions of the gonads would be severely disturbed, presumably in large measure as a result of inhibition of pituitary gonadotropin secretion.

Functional disturbances of the ovaries may occur as a result of a number of organic diseases, including other endocrine disorders, malnutrition and infectious diseases, as well as emotional upsets. The testicles may be damaged by failure to descend into the scrotum (*i.e.,* remain in the abdominal cavity. where the relatively high temperature causes damage), by infections, injuries or X-ray exposure.

A small percentage of men who appear physically and endocrinologically normal have spermatogenic defects which lead to infertility or a subfertile state. Explanations for these cases are wanting, and no treatment is available. *See* also GYNECOLOGY; STERILITY; UROLOGY.

See H. W. Jones, Jr., and W. W. Scott, *Hermaphroditism, Genital Anomalies and Related Endocrine Disorders* (1958). (*R.* L. L.)

GONAGUAS ("borderers"), descendants of a cross between the Hottentots and the Kafirs, before the arrival of the whites in South Africa, and in some districts scarcely distinguishable from other natives except for their broken speech.

GONCALVES CRESPO, ANTÓNIO CÂNDIDO (1846–1883), Portuguese poet who introduced Parnassianism into Portuguese literature. Born in Rio de Janeiro on March 11, 1846, he went to Portugal as a youth and studied at the University of Coimbra. He married the writer Maria Amália Vaz de Carvalho, who introduced him to Lisbon society and the literary *salons* of the capital. He was a member of parliament for a short time, and also editor of the *Jornal do Comércio* and a contributor to literary journals. He was a founder of the review *A Fôlha,* which stimulated Portuguese interest in French Parnassian poetry. Gonçalves Crespo produced only two volumes of verse: *Miniaturas* (1870) and *Nocturnos* (1882), both of which reveal the formal influence of Théophile Gautier, Leconte de Lisle and François Coppée. Though, as their titles suggest, many of his themes are romantic, he displays a greater precision, more careful observation and a finer sensibility than many of the romantics. Though he cannot be considered a great poet and some of his poems are only conventional *salon* art, he was a craftsman in verse who renewed and refreshed the poetic vocabulary of his day.

He died at Lisbon on June 11, 1883.

GONCALVES DIAS, ANTONIO (1823–1864), Brazilian poet, wrote the nostalgic "Song of Exile," probably the most memorized poem in the Portuguese language. Born near Caxias (Maranhão), Braz., he was educated at the University of Coimbra, Portugal. His collection of poems, *Primeiros Cantos* (1846), was enthusiastically praised by a distinguished Portuguese contemporary. Alexandro Herculano. The poet's immediate popularity was enhanced by *Segundos Cantos* e *Sextilhas de Frei Antão* (1848), and especially *Ultimos Cantos* (1851). which virtually closed the cycle of his lyrics.

In the final decade of his life he held various governmental posts, in which he surveyed the school system of northern Brazil, studied European educational institutions, did research on Brazilian historical sources in European archives and participated in a scientific expedition. The unfinished epic poem on the Indian tribe *Os Tambiras* (1857), an unsuccessful attempt at creating a "Brazilian Iliad," and the *Dicionário da Lingua Tupi* (1858) reflect his preference for indigenous subjects.

He uent to Europe in 1862 and upon his return trip was drowned in a shipwreck within sight of the coast of his native state (Nov. 3, 1864).

Many of his poems were inspired by a series of fleeting romances which consoled, and afflicted, his insatiable heart. In this and other respects, including the excessive vehemence of some of his amorous complaints, he remained a typical romanticist; but he often succeeded in attaining the utmost spontaneity, and a subtlety of expression in perfect consonance with the natural genius of his people.

Modern critics tend to consider him the most representative poet of Brazil.

GONCHAROV, IVAN ALEXANDROVICH (1812–1891), Russian novelist. was the son of a rich merchant in the town of Simbirsk. At the age of ten he was placed in one of the gymnasiums at Moscow, from which he passed into the Moscow university. He then entered the civil service, being first employed as secretary to the governor of Simbirsk, and afterward in the ministry of finance at St. Petersburg (Leningrad). Absorbed in bureaucratic work, Goncharov paid no attention to the social questions then ardently discussed by his contemporaries, Herzen, Aksakov and Bielinsky.

His first original work was *Obyknovennaya Istoria,* "A Common Story" (1847, Eng. trans. by C. Garnett, 1890, 2nd ed. 1917). In 1856 he sailed to Japan as secretary to Admiral Putiatin, returning by the then tedious land route through Siberia. He published a description of the voyage under the title of "The Frigate *Pallada.*"

In 1857 appeared his masterpiece, *Oblomov* (Eng. trans. by C. J. Hogarth, 1915), which was immediately recognized as a classic. He had been at work on it for ten years. What Prince Mirsky called the "indolent and impotent determinism of the hero" was recognized as of general significance in Russian life, especially in the life of the country gentry. Dobrolubov said of it, "Oblomovka (the country-seat of the Oblomovs) is our fatherland: something of Oblomov is to be found in every one of us." Pisarev, another celebrated critic, declared that "Oblomovism," as Goncharov called the sum total of qualities with which he invested the hero of his story, "is an illness fostered by the nature of the Slavonic character and the life of Russian society."

In 1858 Goncharov was appointed a censor, and in 1868 he published another novel called *Obryv* (Eng. trans., *The Precipice,* 191j), on which he had worked for 20 years. This contains a charming picture of a great Russian household, ruled by a despotic and benevolent grandmother, but aroused great hostility among the intelligentsia by the unsympathetic portrait of the nihilist. Goncharov was convinced that Turgenev borrowed from *The Precipice,* and wrote an account of his wrongs. He died on Sept. 27 (old style Feb. 15), 1891.

A translation of *Oblomov,* by Natalie A. Duddington, appeared in 1929.

GONCOURT, DE, a name famous in French literary history. EDMOND LOUIS ANTOINE HUOT DE GONCOURT was born at Nancy on May 26, 1822, and died at Champrosay on July 16, 1896. JULES ALFRED HUOT DE GONCOURT, his brother, was born in Paris on Dec. 17, 1830, and died in Paris on June 20, 1870.

Writing always in collaboration, until the death of the younger, it was their ambition to be not merely novelists, inventing a new kind of novel, but historians; not merely historians, but the historians of a particular century, and of what was intimate and what is unknown in it; to be also discriminating, indeed innovating, critics of art, but of a certain section of art, the 18th century, in France and Japan; and also to collect pictures and *bibelots,* always of the French and Japanese 18th century. Their histories *(Portraits intimes du XVIII^e^ siècle* [1857], *La Femme au XVIII^e^ siècle* [1862], *La du Barry* [1878], etc.) are made entirely out of documents, autograph letters, scraps of costume, engravings, songs, the unconscious self-revelations of the time; their three volumes on *L'Art du XVIII^e^ siècle* (1859–75) deal with Antoine Watteau and his followers in the same scrupulous, minutely enlightening way, with all the detail of unpublished documents; and when, they came to write novels, it was with a similar attempt to give the inner, undiscovered, minute truths of contemporary existence, the *ine'dit* of life. The same morbidly sensitive noting of the *ine'dit,* of whatever came to them from their own sensations of things and people around them, gives its curious quality to the nine volumes of the *Journal,* 1887–96, which will remain, perhaps, the truest and most poignant chapter of human history written by them.

Their novels, *Soeur Philomène* (1861), *Renke Mauperin* (1864), *Germinie Lacerteux* (186j), *Manette Salomon* (1865), *Madame Gervaisais* (1869), and by Edrnond alone, *La Fille Elisa* (1878), *Les Frdres Zemganno* (1879), *La Faustin* (1882), *Chérie* (1884), are however, the work by which they will live as artists. Learning something from Gustave Flaubert, and teaching a great deal to Émile Zola, they invented a new kind of novel, and their novels are the result of a new vision of the world, in which the very element of sight is decomposed, as in a picture of Claude Monet.

Seen through the nerves, in this conscious abandonment to the tricks of the eyesight, the world becomes a thing of broken patterns, conflicting colours and uneasy movement. A novel of the Goncourts is made up of an infinite number of details, set side by side, every detail equally prominent. While a novel of Flaubert, for all its detail, gives above all things an impression of unity, a novel of the Goncourts deliberately dispenses with unity in order to give the sense of the passing of life, the heat and form of its moments as they pass. It is written in little chapters, sometimes no longer than a page, and each chapter is a separate notation of some significant event, some emotion or sensation which seems to throw sudden light on the picture of a soul. To the Goncourts humanity is as pictorial a thing as the world it moves in; they do not search further than "the physical basis of life," and they find everything that can be known of that unknown force written visibly upon the sudden faces of little incidents, little expressive moments. The soul, to the Goncourts, is a series of moods, which succeed one another, certainly without any of the too arbitrary logic of the novelist who has conceived of character as a solid or consistent thing.

Their novels are hardly stories at all, but picture galleries, hung with pictures of the momentary aspects of the world. French critics have complained that the language of the Goncourts is no longer French, no longer the French of the past; and this is true. It is their distinction — the finest of their inventions — that, in order to render new sensations, a new vision of things, they invented a new language. (A. SY.)

In his will Edmond de Goncourt left his estate for the endowment of an academy, the formation of which was entrusted to Alphonse Daudet and Léon Hennique. The society was to consist of ten members, each of whom was to receive an annuity of 6,000 francs, and a yearly prize of 5,000 francs was to be awarded to the author of some work of fiction. Nine of the members of the new academy were nominated in the will. They were Alphonse Daudet, J. K. Huysmans, Léon Hennique, Octave Mirbeau, the two brothers, "J. H." Rosny, Gustave Geffroy and Paul Margueritte. On Jan. 19, 1903, after much litigation, the academy was constituted, with Elémir Bourges, Lucien Descaves and Léon Daudet as members in addition to those mentioned in de Goncourt's nill, the place of Alphonse Daudet having been left vacant by his death in 1897.

On the brothers de Goncourt *see* the *Journal des Goncourt* already cited; *M.* A. Belloc (afterward Lowndes) and M. L. Shedlock, *Edmond and Jules de Goncourt, with Letters and Leaves from their Journals* (1895); Alidor Delzant, *Les Goncourt* (1889), which contains a valuable bibliography; *Lettres de Jules de Goncourt* (1888), preface *by* H. Céard; R. Doumic, *Portraits d'écrivains* (1892); Paul Bourget, *Nouveaux Essais de psychologie contemporaine* (1886); Emile Zola, *Les Romanciers naturalistes* (1881).

GONDA, a municipal town and district in the Fyzabad division of Uttar Pradesh, India. Pop. of town (1951) 32,566. GONDA DISTRICT has an area of 2,826 sq.mi. It consists of an alluvial plain with very slight undulations, studded with groves of mango trees, and divided into three belts known as the *tarai* or swampy tract, the *uparhar* or uplands and the *tarhar* or wet lowlands, all three being fertile and closely tilled. Several rivers flow through the district, but only two, the Gogra and Rapti, are of any importance. On the outbreak of the mutiny, the rajah of Gonda, after honourably escorting the government treasure to Fyzabad, joined the rebels. His estates, along with those of the rani of Tulsipur, were confiscated and conferred as rewards upon the maharajas of Balrampur and Ajodhya, who had remained loyal. In 1951 the population was 1,877,484.

GONDAL, a town and taluk (subdivision), Madhya Saurashtra district, Bombay state. India. The town (pop., 1951, 37,046) is connected by rail with southeastern Saurashtra and with Rajkot, the state capital. 23 mi. N.

GONDAL TALUK (area 379 sq.mi.; pop., 1951, 92.963) contains part of the former princely state of Gondal (area 1,024 sq.mi.; pop., 1941, 244,514), which was within the Western Kathiawar subagency of the combined Baroda, Western India and Gujarat administration prior to its absorption into Saurashtra on Feb. 1j, 1948. Saurashtra became part of Bombay state on Nov. 1, 1956

The state consisted of two isolated tracts in the centre of the Kathiawar peninsula. The ruler, whose title was thakur, was a Jadeja Rajput.

GONDAR, one of the former capitals of Ethiopia, situated on a basaltic ridge approximately 7,500 ft. above the sea, about 21 mi. N.E. of Lake Tana. Pop. (1951 est.) 13,000. Two streams. the Angreb on the east side and the Gaha or Kaha on the west, flow from the ridge and, meeting below the town, pass onward to the lake. Gondar was a small village when at the beginning of the 16th century it was chosen by the Negus Sysenius (Seged I) as the capital of his kingdom. His son Fasilidas. or A'lem-Seged (1633–1667), was the builder of the castle which bears his name. Later emperors built other castles and palaces. the latest in date being that of the Negus Yasu II, erected about 1736, at which time Gondar appears to have been at the height of its prosperity. Thereafter it suffered greatly from the civil nars which raged in Ethiopia, and was more than once sacked; in 1887 the dervishes under Abu Anga inflicted very great injury, destroying many churches, damaging the castles and carrying off much treasure. The population was estimated by James Bruce in 1770 at 10,000 families. After the pacification of the Sudan by the British (1886–89) there was some revival of trade between Gondar and the regions of the Blue Nile. Among the inhabitants are numbers of Moslems, and a settlement of Falashas was established there.

Cotton, cloth, gold and silver ornaments, copper wares, fancy articles in bone and ivory, excellent saddles and shoes are among the products of the local industry.

Unlike any other buildings in Ethiopia, the castles and palaces of Gondar resemble, with some modifications, the mediaeval fortresses of Europe, the style of architecture being the result of the presence in the country of numbers of Portuguese. Fasilidas's castle was built by Indian workmen, under the superintendence of Ethiopians who had learned something of architecture from the Portuguese adventurers. The castle has two stories, is 90 ft. by 84 ft., has a square tower and circular domed towers at the corners. The most extensive ruins are a group of royal buildings enclosed in a wall. These ruins include the palace of Yasu II, which has several fine chambers. Christian Levantines were employed in its construction and it was decorated in part with Venetian mirrors, etc. In the same enclosure is a small castle attributed to Yasu I. The exterior walls of the castles and palaces named are little damaged and give to Gondar a unique character among African towns. Of the 44 churches, all in the circular Ethiopian style, which are said to have formerly existed in Gondar or its immediate neighbourhood, Maj. P. H. G. Powell-Cotton found only one intact in 1900.

The city fell to British, Sudanese and Ethiopian patriot troops, Nov. 28, 1941, after a siege of several months.

Views of the castle are given by Heuglin, Raffray, Powell-Cotton and Rosita Forbes.

GONDOKORO. A village in Sudan, on the east bank of the upper Nile in 4° 54' N., 31° 43' E., 1,077 mi. S. of Khartoum by river. was a stopping place for steamers until superseded by Juba just above it on the west bank, beyond which the Nile ceases to be navigable until Nimule (3° 40′ N., 32° 10′ E.).

The site of the village is at the top of a cliff 25 ft. above the river level. Pop. (1956) 500.

Gondokoro was first visited by Europeans in 1841–42, when expeditions sent out by Mohammed Ali, pasha of Egypt, ascended the Nile as far as the foot of the rapids above Gondokoro. It soon became an ivory and slave-trading centre. In 1851 an Austrian Roman Catholic mission was established there, but it was abandoned in 1859. It was at Gondokoro that J. H. Speke and J. A. Grant. descending the Nile after their discovery of its source, met. on Feb. 15, 1863, Samuel Baker and his wife who were journeying up the river. In 1871 Baker, who was at that time governor general of the equatorial provinces of Egypt, established a military post at Gondokoro which he named Ismailia after the then khedive. Baker made this post his headquarters, but Col. (afterward Gen.) C. G. Gordon, who succeeded him in 1874, abandoned the station on account of its unhealthy site, removing to Lado, 11 mi. downstream.

Gondokoro fell into the hands of the mahdists in 1885. After the destruction of the mahdist power in 1898 it was occupied by British troops and formed the northernmost post on the Nile of the Uganda protectorate. In 1914, however, the administration was transferred to the Sudan government, which thereby gained control of the whole stretch of the Nile navigable from Khartoum.

GONDOMAR, DIEGO SARMIENTO DE ACUNA, COUNT OF (1567–1626), Spanish diplomatist, born in Gondomar, Galicia, on Nov. 1, 1567. He inherited wide estates in Galicia and in Old Castile from his father, corregidor of Granada and governor of the Canary Islands. In 1583 Philip II gave him military command of the Portuguese frontier and coast of Galicia. Corregidor of Toro in 1593, he was sent in 1603 to superintend the distribution of the treasure brought from America by two galleons driven to take refuge at Vigo, and on his return was appointed on the board of finance. In 1609 he repelled a naval attack on Galicia made by the Dutch. In the Casa del Sol at Valladolid, where he resided, he collected a library which the marquis of Malpica, his descendant, ceded to Charles III; it is now in the royal library at Madrid.

His reputation, as a diplomatist rests on his two periods of service as ambassador in England (1613–18 and 1619–22). The excellence of his latinity pleased the literary tastes of James I, whose character he judged with remarkable insight. He flattered the king's love of books and of peace, and he made skilful use of his desire for an alliance between the prince of Wales and a Spanish infanta. Sarmiento's aim was to keep James from aiding the Protestant states against Spain and the house of Austria, and to avert English attacks on Spanish possessions in America. His success made him odious to the anti-Spanish and Puritan parties. The active part he took in promoting the execution of Sir Walter Raleigh aroused particular animosity. He was attacked in pamphlets and figured as the principal person in Thomas Middleton's *A Game* at Chess, a political play suppressed by order of the council. Count of Gondomar in 1617, he returned home on leave for his health. through Flanders and France, on a diplomatic mission in 1618. He resumed office in London in 1619; on his retirement in 1622 he was appointed on the royal council and sent on a complimentary mission to Vienna. He died near Haro in the Rioja on Oct. 2, 1626.

GONDWANA, the historical name for a large tract of hilly country in India which roughly corresponds with the greater part of the present Madhya Pradesh. The name is derived from the aboriginal tribe of Gonds, who ruled the country from the 12th to the beginning of the 18th century in three or four separate kingdoms. They maintained a barbaric civilization and though nominally subject to the Moguls they were not much disturbed, but when the Maratha invaders appeared in the 18th century the Gond kingdoms succumbed and the aboriginal population fled for safety to the hills. Gondwana was included in the dominions of the Bhonsla raja of Nagpur which passed to the British between 1818 and 1853.

FROM RUSSEL, "TRIBES AND CASTES OF CENTRAL INDIA"

MĀRIA GOND IN DANCING COSTUME

The Gonds are an aboriginal hill race of Central India

The Gonds, who call themselves Koitur or "highlanders," are the most numerous tribe of Dravidian stock in India. Their language, akin to the southern languages of India. is unwritten and, except for missionary productions, there is no literature: but it is still the spoken language of 7% of the population of Madhya Pradesh.

The Rajgonds, claiming to have Rajput blood, are on the skirts of Hinduism, but most of the Gonds are animistic in belief.

The term "Gondwana" is also used by geologists as a name for certain rock formations.

See R. V. Russell, "Gonds," in *The Tribes and Castes of the Central Provinces of India,* vol. iii (London, 1916).

GONDWANALAND. This name, derived from Gondwana ("land of the Gonds"), a district of India. was given by Austrian geologist Eduard Suess to the inferred ancient continent that at its greatest extension hypothetically spanned the South Atlantic and Indian oceans. It embraced all (except northwest) Africa, Madagascar, peninsular India, Australia, Tasmania. Antarctica: the Falklands and all South America except the extreme west and northwest. Its unstable margins were, between the Devonian and Jurassic. intermittently and widely transgressed by the oceans; the sea bounding it on the north, wherein deposition went on continuously down to the Tertiary, being called the Tethys.

The distribution of existing plants and animals, and especially of those having disjunctive distribution, *e.g.*, lungfish (Australia, South Africa, South America), marsupials (Australia. South America), sugarbush (Australia, South Africa), arucarian pines (South America, Falklands, Australia. South Pacific), antarctic, or false: beech (*Nothofagus*) (Chile, Tierra del Fuego, New Zealand and Australia-Tasmania) often led to the inference of former transoceanic land connections. P. L. Sclater's Lemuria (Africa, Madagascar, India) and Hermann von Ihering's Arch-hellenis (South America, Africa) are other examples.

Paleontologic data from the Paleozoic and Mesozoic eras have strongly bolstered the theory of Gondwanaland bridges, although the hypotheses of a huge, transverse southern continent is much less widely accepted. Devonian invertebrate, benthonic (bottom-dwelling), marine faunas of Brazil, Uruguay and the Falkland Islands and South Africa have so similar a stamp that John M. Clarke postulated "Flabellitesland" (based on the occurrence of a brachiopod), a continental mass bridging the South Atlantic, across which a shallow Devonian sea transgressed. The flabellites faunal type was recently discovered also in Tasmania. In the later Carboniferous-Permian strata a comparable type of fauna, characterized by the pelecypod (bivalve) *Eurydesma,* is known from Argentina, South Africa and Australia. There was a contemporary and ubiquitous Gondwana coal flora. characterized by the seed ferns *Glossopteris* and *Gangamopteris* (South America, Antarctica, Falklands, South Africa, the subcontinent of India, Australia). *Thinnfeldia,* also a seed fern *(see* PALAEOBOTANY), characterized the flora of Triassic Gondwanaland in the early Mesozoic era. The Permian "White Band" strata in Brazil, South Africa and Madagascar carries *Mesosaurus,* a diminutive aquatic reptile, usually judged to have been of fresh-water ecology. Triassic terrestrial reptiles, especially mammal-like forms, occur in south Brazil and South Africa. The force of their argument is however somewhat reduced by the discovery of related groups in Texas and Russia.

The stratigraphic sequence, and hence physical history, of the existent fragments of the hypothetical Gondwanaland are generally quite similar; between Brazil and South Africa the parallelism is close. Sedimentary analysis of the Gondwana sediments has repeatedly demonstrated sourcelands lying beyond the present strands.

A striking degree of ecologic uniformity appears from stage to stage in the geologic history of the vast continent. Synchronous continental glaciation recurred several times: Cambrian (Brazil, Australia, Africa ?), Siluro-Devonian (Australia. Brazil, Africa ?), Devonian (Brazil, South Africa, Australia), and especially Permo-Carboniferous glaciation in all Gondwana relicts. These cold episodes were apparently circumpolar, and the ice descended to sea level as attested by interlarded marine faunas and glacial beds. Considerable Gondwana coal was also formed interglacially on coastal plains. Glacial scratches and lineation phenomena in the Gondwanaland rocks commonly indicate flowage of the inland ice from areas now oceanic. Erratic elements in the glacial drift are often completely foreign to the lands where they now repose, *e.g.,* Brazilian diamonds.

Essentially the same nonrecorded hiatuses occur throughout Gondwanaland, suggesting synchronous episodes of uplift and erosion. The Late Triassic-Early Jurassic record is of widespread deserts. Local coal swamps and reptile oases occurred. Red beds are almost ubiquitous at this time. In Rhaetic (late Triassic) time widespread tensional faulting occurred and concomitantly the world's greatest episode of intrusion and extrusion of basic igneous rocks from the deep crust. All fragments of Gondwanaland shou this igneous episode. Following this period of diastrophism and vulcanism, virtually all biotic and physical parallelism in the Gondwanaland remnants ceases. Proponents of the Gondwanaland concept postulate that the continent broke up at this time and that vast segments foundered into the oceanic depths.

Paleoclimatologists have found Gondwanaland impossibly large, especially with respect to the Permo-Carboniferous extensive glaciations. Consequently both F. B. Taylor and Alfred Wegener visualized the Gondwanaland disruption as having been a drifting apart of sectors through the viscous basic subcrust. Hence the reassembled blocks would result in a far smaller Gondwanaland.

Neither the oceanic bridges of Suess nor continental drifting have received general geologic support. Oceanography and geophysics have failed to reveal significant areas of continental type rocks on the ocean floors. Basic rocks form the general abyssal floor. Continental drifting has also won few supporters among earth scientists.

Historical geologists argue that similar sequences of strata and physical history can occur in widely separated areas never connected or in close proximity. They suggest that some of the supposedly synchronous events in diverse parts of Gondwanaland may have been heterochronous, thus meeting the paleoclimatological argument for Gondwana of the proponents of the theory of continental drift. Probably the majority of biologists prefer to explain disconnected distributions of floral and faunal forms on the basis of established migrations along transitory isthmian links, island-hopping, swimming, floating and rafting, or of wind transport or carriage by flying organisms; and by parallel (analogous) evolution. These are seemingly generally adequate explanations, especially when considered against the vastness of geologic time, although by no means have all disjunctions been accounted for.

Both Suess's theory of a continent of Gondwanaland and Wegener's hypothesis of continental drift are discussed in some detail in the article CONTINENT. Examples of the application of the concept in explaining geologic phenomena, especially the widespread occurrence of the index fossil, *Glossopteris,* will be found in articles on the geologic systems and periods mentioned, as CARBONIFEROUS SYSTEM AND PERIOD: *Carboniferous of Southern Hemisphere and India;* PERMIAN SYSTEM, etc., and in the geology sections of AFRICA; ASIA; AUSTRALIA, COMMONWEALTH OE; INDIA. Hypotheses tending to disprove the possibility of a Gondwanaland are presented in ISOSTASY and related articles. *See* also FOSSIL; MARSUPIALIA; ZOOGEOGRAPHY.

See C. Schuchert, "Gondwana Land Bridges," in Bulletin *of the Geological Society of* America, vol. *43* (1932). (K. E. C.)

GONFALON, a banner or standard of the middle ages (the late French and Italian form, also found in other Romanic languages, of *gonfanon,* which is derived from the O.H.G. *gundfano, gund,* "war," and *fano,* "flag," *cf.* Mod. Ger. *Fahne,* and English "vane"). It took the form of a rectangular ensign, often slit into streamers at the foot, and swinging from a crossbar attached to a pole. This is the most frequent use of the word. The title of "gonfalonier," the bearer of the gonfalon, was in the middle ages both military and civil. It was borne by the counts of Vexin, as leaders of the men of St. Denis, and when the Vexin was incorporated in the kingdom of France the title. of *Gonfalonier de Saint Denis* passed to the kings of France, who thus became the bearers of the "oriflamme," as the banner of St. Denis was called. Gonfalonier was the title of civic magistrates of various degrees of authority in many of the city republics of Italy, notably of Florence, Siena and Lucca. At Florence the functions of the office varied. At first the gonfaloniers were the leaders of the various military divisions of the inhabitants. In 1293 was created the office of gonfalonier of justice, who carried out the orders of the signiory. By the end of the 14th century the gonfalonier was the chief of the signiory. At Lucca he was the chief magistrate of the republic. At Rome two gonfaloniers must be distinguished, that of the church and that of the Roman people; both offices were conferred by the pope. The first was usually granted to sovereigns, who were bound to defend the church and lead her armies. The second bore a standard with the letters S.P.Q.R. on any enterprise undertaken in the name of the church and the people of Rome, and also at ceremonies, processions, etc. This was granted by the pope to distinguished families.

GÓNGORA Y ARGOTE, LUIS DE (1561–1627), Spanish poet, who brought to perfection the poetic style called, after him, Gongorism, was born on July 11, 1561, at Córdoba, where his father was *corregidor* ("mayor") and owner of a famous library. He studied—not very seriously—at the University of Salamanca and was already known as a poet in 1585, when Cervantes praised him in the *Galatea.* He held a benefice in Córdoba cathedral and undertook important missions for the chapter. In 1612 he settled in Madrid, taking full orders and securing a court chaplaincy in 1617. In 1626 a stroke impaired his faculties and he returned to Córdoba, where he died, May 23, 1627.

Part of Góngora's work was, during his lifetime, the subject of the most furious controversy in Spanish literary history. His light *verse—romances, letrillas,* satires, songs for the guitar—was widely esteemed. but he was considered to have violated the principles of poetry and of language in his long poems *Polifemo* (1612) and *Soledades* (1613–17). In these he elaborated his style (known as *culteranismo)* by the introduction of numerous Latinisms of vocabulary and syntax, and by exceedingly complex imagery and mythological allusions. For three centuries his name was synonymous with obscurity and pedantry, but in the 20th century an astonishing revaluation of Góngora took place; he came to be considered one of Spain's greatest poets, and powerfully influenced contemporary poetry. *Polifemo* and *Soledades* are part pastoral, part epic; they are plotless and devoid of emotional content, but appeal brilliantly to the senses in their descriptions of persons, nature and rustic scenes, and in the music of their lines. Góngora also wrote three unactable plays; an important collection of his letters survives. There are indispensable commentaries on the longer poems.

(c. c. Sh.)

GONIOMETER, an instrument for measuring the angles of crystals; there are three kinds—the contact goniometer, the reflecting goniometer and the X-ray goniometer.

The Contact **Goniometer.**—This instrument consists of two metal rules pivoted together at the centre of a graduated semicircle (fig. 1). The instrument is placed with its plane perpendicular to an edge between two faces of the crystal to be measured, and the rules are brought into contact with the faces; this is best

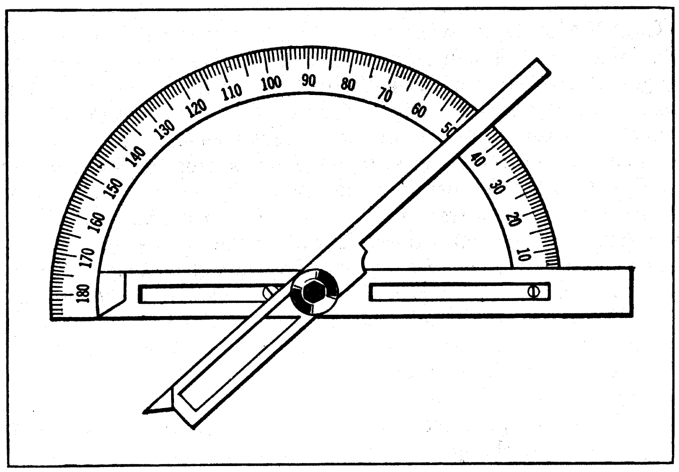

FIG. I.— CONTACT GONIOMETER

done by holding the crystal up against the light with the edge in the line of sight. The angle between the rules, as read on the graduated semicircle, then gives the angle between the two faces. The rules are slotted, so that they may be shortened and their tips applied to a crystal partly embedded in its matrix. The instrument represented in fig. 1 is employed for the approximate measurement of large crystals.

The Reflecting **Goniometer.**—This is an instrument of far greater precision, and is always used for the accurate measurement of the angles when small crystals with smooth faces are available. Such faces reflect sharply defined images of a bright object. By turning the crystal about an axis parallel to the edge between two faces, the image reflected from a second face may be brought into the same position as that formerly occupied by the image reflected from the first face; the angle through which the crystal has been rotated, as determined by a graduated circle to which the crystal is fixed, is the angle between the normals to the two faces.

Several forms of instruments depending on this principle have been devised. The earliest type consisted of a vertical graduated circle reading degrees and minutes, which turned about a horizontal axis. A great improvement was effected by placing the graduated circle in a horizontal position. Many forms of the *horizontal-circle goniometer* have been constructed; they are provided with a telescope and collimator (*q.v.*), and in construction are essentially the same as a spectrometer, with the addition of arrangements for adjusting and centring the crystal. The instrument shown in fig. 2 has four concentric axes, which enable the crystal holder A, together with the adjustment arcs B and centring slides D, to be raised or lowered, or to be rotated independently of the circle H; further, either, the crystal holder or the telescope T may be rotated with the circle, while the other remains fixed. The crystal is

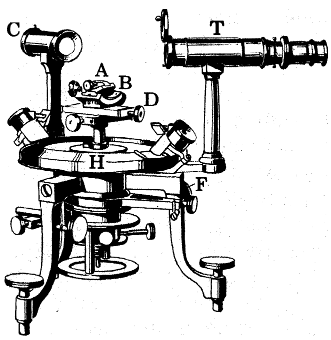

FIG 2 —HORIZONTAL-CIRCLE GONIOMETER

placed on the holder and adjusted so that the edge (zone-axis) between two faces is coincident with the axis of the instrument. Light from any convenient source passes through the slit of the collimator C, and the image of the slit (signal) reflected from the crystal face is then vieued in the telescope. The clamp and the slow-motion screw F enable the image to be brought exactly on the cross wires of the telescope, and the position of the circle with respect to the vernier is read through the lens. The crystal and the circle are then rotated together until the image from a second face is brought on the cross wires of the telescope, and the angle through which they have been turned is the angle between the two face normals.

With a one-circle goniometer, such as is described above, it is necessary to mount and readjust the crystal for the measurement of each zone of faces (*i.e.,* each set of faces intersecting in parallel edges). Further, in certain cases, it is not possible to measure the angles between zones. These difficulties have been overcome by the use of a two-circle goniometer. The crystal is set up and adjusted with the axis of a prominent zone parallel to the axis of either the horizontal or the vertical circle. The positions of the faces are fixed by the simultaneous readings of the two circles.

Some disadvantages are overcome by adding still another graduated circle to the instrument, with its axis perpendicular to the axis of the vertical circle, thus forming a three-circle goniometer. With such an instrument measurements may be made in any zone or between any two faces without readjusting the crystal.

Goniometers have been devised for measuring crystals during their growth in the mother liquid and for cutting section plates and prisms from crystals (precious stones) accurately in any desired direction. An ordinary microscope fitted with cross wires and a rotating graduated stage serves the purpose of a goniometer for measuring the plane angles of a crystal face or section.

The Weissenberg **X-ray Goniometer.**—This is an instrument used in recording X-ray reflections from crystals. The crystal oscillates through about 200° around an edge, as a cylindrical camera is translated back and forth parallel to the crystal rotation axis. In M. J. Buerger's design the angle nhich the rotation axis makes nith the X-ray beam is variable. *See* also Crystallography: *Diffraction by Crystals; Crystal-Structure Analysis.*

(L. J. S.; J. D. H. D.)

GONJA (Gbanya), the northern neighbours of the Ashanti and Bron peoples, living north of the Black Volta river in Ghana and related to the Mossi and Dagomba peoples.

GONORRHEA, a venereal disease initiated by the gonococcus, *Neisseria gonorrhoeae,* occurring nearly always as the result of direct sexual contact and treatable in most cases by penicillin. *See* Venereal Diseases.

GONTAUT, MARIE JOSÉPHINE LOUISE, Duchesse de (1773–1857), was born in Paris on Xug. 3. 1773, daughter of Xugustin François, comte de Montaut-Navailles. who had been governor of Louis XVI. She shared the lessons given by Madame de Genlis to the Orléans family, with whom her mother broke off relations after the outbreak of the Revolution. Mother and daughter emigrated to Coblenz in 1792; thence to Rotterdam, and finally to England, where Joséphine married the marquis Charles Michel de Gontaut-Saint-Blacard (d. 1822). They returned to France at the Restoration and resumed their place at court. Madame de Gontaut became lady in waiting to Caroline, duchess of Berry, and later governess to the princes and princesses of the blood. She remained faithful to the Bourbon cause. In 1827 she was created duchesse de Gontaut. She followed the exiled royal family to Prague, but in 1834 the duc de Blacas thought her comparatively liberal views dangerous and she received a brusque congé from Charles X. Her twin daughters. Joséphine (1796–1844) and Charlotte (1796–1818), married respectively Ferdinand de Chabot, prince de Léon, afterward duc de Rohan, and François, comte de Bourbon-Busset. She died in Paris in 1857.

See her *Memoirs* (Eng. ed., 2 vols., 1894), and *Lettres ine'dites* (1895).

GONVILLE (Gonvile), **EDMUND** (d. 1351), founder of Gonville hall. now Gonville and Caius college, at Cambridge. Eng., is thought to have been the son of William de Gonvile and the brother of Sir Nicholas Gonvile. The foundation of Gcnville hall at Cambridge was effected by a charter granted by Edward III in 1348. It was called, officially, the Hall of the Annunciation of the Blessed Virgin, but was usually known as Gunnel1 or Gonville hall. Its original site was in Free-school lane, where Corpus Christi college now stands. Gonville apparently wished it to be devoted to training for theological study. but after his death the foundation mas completed by William Bateman, bishop of Norwich and founder of Trinity hall, on a different site and with considerably altered statutes.

See also CAIUS, JOHN.

GONZAGA, an Italian princely family named after the town where it probably had its origin. Its known history begins with Luigi I (1267–1360), who, after fierce struggles, supplanted his brother-in-law Rinaldo Bonacolsi as lord of Mantua in 1328, with the title of captain general. and afterwards of vicar general of the empire, adding the designation of count of Mirandola and Concordia, which fief the Gonzagas held from 1328 to 1354. In 1335 his son Guido wrested Reggio from the Scaligeri and held it until 1371. Luigi was succeeded by Guido (d. 1369); the latter's son Luigi II came next in succession (d. 1382), then Giovan Francesco I (d. 1407), then Giovan Francesco II (d. 1444) who received for his military services to the emperor Sigismund the title of marquess of Mantua (1432), an investiture which legitimatized the usurpations of the house of Gonzaga. His grandson, Federigo I (d. 1484), served under various foreign sovereigns, including Bona of Savoy and Lorenzo de' Medici; subsequently he upheld the rights of the house of Este against Pope Sixtus IV and the Venetians, whose claims were a menace to his own dominions of Ferrara and Mantova. His son Giovan Francesco III (d. 1519) commanded the allied Italian forces against Charles VIII at the battle of Fornovo; he afterwards fought in the kingdom of Naples and in Tuscany, until captured by the Venetians in 1509. With the help of his wife, the famous Isabella d'Este, he promoted the fine arts and letters.

He was succeeded by his son Federigo II (d. 1540), captain general of the papal forces. After the peace of Cambrai (1529) his ally and protector, the emperor Charles V, raised his title to that of duke of Mantua in 1530; in 1536 the emperor decided the controversy for the succession of Monferrato between Federigo and the house of Savoy in favour of the former. His son Guglielmo subdued a revolt in Monferrato and was presented with that territory by the emperor Maximilian II. His grandson Vincenzo II (d. 1627) appointed as his successor Charles, the son of Henriette, the heiress of the French family of Nevers-Rethel, who was only able to take possession of the ducal throne after a bloody struggle; his dominions were invaded and he himself reduced to the sorest straits. His great grandson, Ferdinand Charles, acquired Guastalla by marriage in 1678, but lost it soon afterwards; he involved his country in useless warfare, with the result that in 1708 Austria annexed the duchy. On July j, 1708, he died in Venice, and with him the Gonzagas of Mantua came to an end.

GONZAGA, SAINT ALOYSIUS (1568–1591), one of the most venerated of modern saints and patron of Roman Catholic youth, was born at Castiglione in Lombardy on March 9. 1568, the eldest son of the marquis of Castiglione, cousin of Guglielmo Gonzaga, duke of Mantua. He was educated at the ducal courts of Florence and of Mantua and at the royal court of Madrid, where he was page to the heir of Philip II. In 1585, against the strongest opposition, he resigned his inheritance and entered the Society of Jesus at Rome. One of his spiritual directors was the renowned theologian St. Robert Bellarmine (*q.v.*). Shortly before ordination, while nursing plague victims, he caught the disease and died on June 21, 1591, at the age of 23.

Most characteristic of the virtues of Aloysius Gonzaga was his intense love of chastity. His practices of prayer, austerity, humility and charity were also heroic, while his all-absorbing love for God raised him to high mystical union. Yet his exalted holiness has much of human appeal, especially his strong and constant heroism and his generous enthusiasm for the Christian ideal. Aioysius' reputation suffered from pietistic biographers, but a truer estimation of him as a normal young man has been established by modern scholars, notably Cyril C. Martindale. S.J., and F. Schroeder, S.J. He was canonized in 1726 by Benedict XIII. Pius XI in 1926 renewed his designation as patron of Catholic youth (originally proclaimed in 1729), affirming that many of the newer canonized saints had been inspired to heroic sanctity by the example of St. Aloysius. His feast day is June 21.

(M. P. H.)

GONZAGA, TOMÁS ANTÓNIO (1744–1810), the finest 18th-century Portuguese writer of love poetry. He was born in Oporto on Aug. 11, 1744, his father being a magistrate of Brazilian origin and his mother the daughter of a British merchant. In 1752 he went to Brazil where his father held juridical appointments, but he returned in 1763 to study law at Coimbra, where he graduated in 1768. In 1782 he returned to Brazil on being appointed judge in Vila Rica. Here he fell in love with the 16-year-old Maria Joaquina Doroteia de Seixas, the *Marília* of his lyrics, but on the eve of marriage to her in 1789 he was arrested on a charge, almost certainly false, of being an accessory to a separatist, anti-Portuguese conspiracy. After three years' imprisonment he was sentenced to exile for life in Mozambique. There in 1793 he married a rich heiress and for the rest of his life held important legal positions in the colony. He died there early in 1810.

His reputation as a poet rests on *Marília* de Dirceu, the first section of which appeared in 1792. This group of lyrics, written before his arrest, expresses the joy of love and the expectation of married happiness, while his second group of poems, which were written in prison and appeared in 1799, express yearning for his beloved and past happiness. Gonzaga borrowed his forms from Anacreon and Theocritus, but the matter, the natural. elegant style and the harmonious versification are his own. *Marília* de **Dirceu** became one of the most frequently reprinted volumes of poetry in the 19th century in Portugal and Brazil.

Gonzaga's complete works were published in 1942. *See* also M. Rodrigues Lapa, *Marília de Dirceu e mais poesias* (1937). (N. J. L.)

GONZÁLEZ DE CLAVIJO, RUY (d. 1412), Spanish diplomat and traveler, was born in Madrid and became chamberlain to King Henry III of Castille and León. On the return of his first embassy from the court of Timur, Henry despatched another which included Gonzblez and a Tatar adviser. They sailed from St. Mary Port, near Cadiz, on May 22, 1403, touched at Gaeta, Rhodes and Constantinople, went by the south coast of the Black sea to Trebizond, and proceeded inland by Erzurum, Tabriz, Tehran and Meshed to Samarkand, where they were favourably received by Timur. They returned successfully after great difficulties and reached Spain on March 1, 1406.

Gonzblez de Clavijo died in Madrid on April 2, 1412. His narrative presents a unique account of Timur's court by a European observer.

BIBLIOGRAPHY.—Two manuscripts of Gonzblez de Clavijo's narrative are preserved in the Biblioteca Nacional, Madrid; his *Embajada a Tamor Lán* was edited by F. Lopez Estrada (1943); English versions of *Embassy to Tamerlane by* Sir Clement Markham (1859) and by G. Le Strange (1928).

(R. A. SN.)

GOOCH, SIR DANIEL, BART. (1816–1889), English mechanical engineer, was born at Bedlington, Northumberland, on Aug. 16, 1816. In 1837 he became the locomotive superintendent of the Great Western railway, and gradually replaced the unsatisfactory locomotives employed by a new and efficient eight-wheeled class. One of these broad gauge locomotives, the "Lord of the Isles" gained a gold medal at the Great Exhibition of 1851, and ran 789,300 miles, with its original boiler, before withdrawal in 1881. Gooch left the railway in 1864, and as a director of the Telegraph Construction company personally superintended the laying of the first two Atlantic cables by the steamship "Great Eastern" in 1865–6. He returned to the Great Western railway as chairman in 1866 and carried out many improvedents before his death at Clewer Park, near Windsor, on Oct. 15, 1889. He was an advocate of the "broad," or 7 ft., gauge for railways, but his death only preceded by three years the complete conversion of the Great Western railway to standard gauge.

GOOCH, GEORGE PEABODY (1873–), English historian, was educated at King's college, London, and Trinity college, Cambridge, and continued his studies in Berlin and Paris. He was Liberal member of parliament for Bath (1906–10), and for Reading (1913). He was joint editor of the Contemporary Review (from 1911); president of the Historical association (1922–25); joint editor of the British Documents on the Origins of the *War, 1898–1914* (from 1926), and president of the National Peace council (1933–36). Gooch made a special study of modem German history, and was one of the first English authorities on the subject.

His many writings include: *Germany and the French Revolution* (1920); *Recent Revelations of European Diplomacy,* 4th ed. (1940); *Studies in Modern History* (1931); *Before the War,* 2 vol. (1936–38); *Courts and Cabinets* (1944); *Studies in German History* (1949).

GOOD, JOHN MASON (1764–1827), English writer on medical, religious and classical subjects, was born on May 25, 1764, at Epping, Essex, the son of a Nonconformist minister. In 1794 he became a member of the British Pharmaceutical society, and in that connection, and especially by the publication of A History *of* Medicine (1795), he effected a greatly needed reform in the profession of the apothecary. In 1820 he took the diploma of M.D. at Marischal college, Aberdeen. He died at Shepperton, Middlesex, on Jan. 2, 1827. Good was acquainted with the principal European languages, and also with Persian, Arabic and Hebrew.

GOODE, GEORGE BROWN (1851–1896), U.S. zoologist, specialized in the study of salt water fish. He was born in New Albany, Ind., on Feb. 13, 1851; graduated from Wesleyan university at Middletown, Conn., and spent a year at Harvard studying natural history under J. L. Agassiz. In 1874 he became chief of the division of fisheries at the National museum, Washington, D.C., and in 1887 assistant secretary of the Smithsonian institution in charge of the National museum, which position he held until his death at Washington, on Sept. 6, 1896. Under his direction the collections at the museum were entirely reorganized and recatalogued in a scientific manner and displayed with an educational aim in view.

His ideas of museum administration and display influenced nearly every important museum of the period. They were also spread by the remarkable Government exhibits prepared by Goode for the Centennial Exhibition of 1876, the World's Columbian Exposition of 1893, exhibitions at Berlin (1880), London (1883) and Madrid (1892–93) and many others. Goode wrote American Fishes (1888) and in 1896 published his most important scientific work, Ocean Ichthyology.

The Annual Report of the U.S. Nat. Museum for 1897 contains a bibliography of Goode's publications together with memoirs by S. P. Langley and others.

GOOD FRIDAY, the English name for the Friday before Easter, kept as the anniversary of the Crucifixion. The term is probably a corruption of "God's Friday." It was called Long Friday by the Anglo-Saxons and Danes, possibly in allusion to the length of the services which marked the day.

The origin of the custom of a yearly commemoration of the Crucifixion is somewhat obscure. It may be regarded as certain that among Jewish Christians it almost imperceptibly grew out of the old habit of annually celebrating the Passover on the 14th of Nisan, and of observing the "days of unleavened bread" from the 15th to the 21st of that month. In the Gentile churches, on the other hand, it seems to be well established that originally no yearly cycle of festivals was known at all. (See EASTER.)

From its earliest observance, the day was marked by a specially rigorous fast, and also, on the whole, by a tendency to greater simplicity in the services of the church. Prior to the 4th century there is no evidence of noncelebration of the eucharist on Good Friday; but after that date the prohibition of communion became common. In Spain, indeed, it became customary to close the churches altogether as a sign of mourning; but this practice was condemned by the council of Toledo (633). In the Roman Catholic Church the Good Friday ritual at present observed is marked by many special features, most of which can be traced back to a date at least prior to the close of the 8th century (see the Ordo Romanus in Muratori's *Liturg.* Rom. Vet.). The altar and the officiating clergy are draped in black and the gospel for the day consists of the history of the Passion as recorded by St. John. This is often sung in plain chant by three priests, one representing the "narrator," the other two the various characters of the story. The singing of this is followed by bidding prayers for the peace and unity of the church, for the pope, the clergy, all ranks and conditions of men, the sovereign, for catechumens, the sick and afflicted, heretics and schismatics, Jews and heathen. Then follows the "adoration of the cross." In the Church of England the history of the Passion from the gospel according to John is also read; the collects for the day are based upon the bidding prayers which are found in the Ordo Romanus. The "three hours" service, borrowed from Roman Catholic usage and consisting of prayers, addresses on the "seven last words from the cross" and intervals for meditation and silent prayer, has become very popular in the Anglican Church, and the observance of the day is more marked than formerly among Nonconformist bodies even in Scotland.

GOODHUE, BERTRAM GROSVENOR (1869–1924), American architect, was born at Pomfret Hill, Conn., April 28, 1869. He studied architecture in New York city with James Renwick, and in 1891 entered the office of R. A. Cram in Boston, Mass., later becoming a partner. In 1903 the firm opened an office in New York city, of which Goodhue took charge. After 1914 he practised alone. He designed churches and cathedrals which were thoroughly modern, yet Gothic in inspiration. At the same time he was one of the most prominent exponents of the skyscraper building.

Among the structures designed by him are St. Thomas's church, the Chapel of the Intercession, and the Church of St. Vincent Ferrer, New York city; the Nebraska State capitol, Lincoln, Neb.; St. Mark's church, Mount Kisco, N.Y.; St. Thomas's college, and the National Academy of Sciences and National Research Council in Washington; University chapel at the University of Chicago; the California Institute of Technology, Pasadena, Calif.; and the Exposition buildings for San Diego, Calif. He was also the architect for the Cathedral of Maryland, Balt. He died in New York city, April 24, 1924.

GOOD-KING-HENRY (*Chenopodium* Bonus-Henricus), a rank-growing perennial herb of the family Chenopodiaceae, found in Great Britain and naturalized in North America. It is a smooth, dark green, little-branched plant, about 2 ft. high, with usually entire arrowhead-shaped leaves. The plant is sometimes cultivated as a pot-herb under the name mercury or all-good. See CHENOPODIUM.

GOODMAN, GODFREY (1583–1656), bishop of Gloucester, was born at Ruthin, Denbighshire, and educated at Westminster and Cambridge. He took orders in 1603, and, after holding various preferments, became bishop of Gloucester in 1625. From this time his tendencies towards Roman Catholicism constantly got him into trouble. In 1633 he secured the see of Hereford by bribery, but Archbishop Laud persuaded the king to refuse his consent. In 1640 he was imprisoned for refusing to sign the new canons denouncing popery and affirming the divine right of kings. He afterwards signed and was released on bail, but next year the bishops who had signed were all imprisoned in the Tower, by order of parliament, on the charge of treason. After 18 weeks' imprisonment Goodman was allowed to return to his diocese. About 1650 he settled in London, where he died a confessed Roman Catholic. His best known book is *The Fall of Man* (1616).

GOODNOW, FRANK JOHNSON (1859–1939), American educationalist, was born in Brooklyn (N.Y.), on Jan. 18, 1859. Educated at Amherst college (Mass.), he graduated in law at Columbia (1882), subsequently proceeding to the École Libre des Sciences Politiques, Paris, and the University of Berlin. He was appointed instructor in history and lecturer in U.S. administrative law at Columbia university in 1883, becoming professor in 1891, and Eaton professor of administrative law and municipal science in 1903. During 1906–7 he was acting dean of political science. He was legal adviser to the Chinese Government, stationed at Peking, during the years 1913 and 1914, and from 1914 to 1928 was president of Johns Hopkins university. Among his published works are *Comparative Administrative Law* (1893); *Municipal Home Rule* (1895) ; *Municipal Problems* (1897) ; *Politics and Administration* (1900); *City Government in the United States* (1904); *The Principles of the Administrative Law of the United States* (1905); *Municipal Government* (1909); *Social Reform and the Constitution* (1911); *Principles of Constitutional Government* (1916); and *China; an Analysis* (1926).

GOODRICH, ANNIE WARBURTON (1866–1954), U.S. nursing educator. was born at New Brunswick. N.J., on Feb. 6, 1866. She was educated at private schools and in 1892 graduated from the New York hospital training school for nurses. She was superintendent of nurses at St. Luke's, New York and Bellevue and allied hospitals and also inspector of nurses' training schools under the New York department of education (1900–14) as well as lecturer at Teachers college. Columbia university (1904–13). In 1914 she became assistant professor of the department of nursing and health at Teachers college. and in 1917 director of nurses. Henry St. settlement. Her services to nursing during World War I led to her appointment in 1918 as dean of the army school of nursing. When Yale university. with aid from the Rockefeller foundation. established its school of nursing in 1923, she accepted the invitation to become dean and held this position together with that of professor of nursing education until 1934 when she retired. She died Dec. 31, 1954, in Cobalt, Conn.

GOODRICH, SAMUEL GRISWOLD (1793–1860), an U.S. publisher and author known under the pseudonym of "Peter Parley," was born at Ridgefield, Conn., Aug. 19, 1793. Largely self-educated, he became a bookseller and publisher at Hartford and later in Boston. There, beginning in 1828, he published for 15 years an illustrated annual, the *Token*, to which he was a frequent contributor both in prose and verse. The *Token* contained some of the earliest work of Nathaniel Hawthorne, N. P. Willis, Henry W. Longfellow and Lydia Maria Child. In 1841 he established *Merry's Museum*, which he continued to edit until 1854. In 1827 he began, under the name of "Peter Parley," his series of books for the young, which embraced geography, biography, history, science and miscellaneous tales. Of these he was the sole composer of comparatively few, but in his *Recollections of a Lifetime* (2 vol., 1856) he wrote that he was "the author and editor of about 170 volumes,". of which about 7,000,000 copies had been sold. and gave a list both of the works of which he was the author or editor and of the spurious works published under his name.

Goodrich was chosen a member of the Massachusetts house of representatives in 1836, and of the state senate in 1837, and in 1851–53 he was consul at Paris, where he remained until 1855.

He died in New York May 9, 1860.

GOODRICH (GOODRICKE), THOMAS (d. 1554), English ecclesiastic, son of Edward Goodrich of East Kirkby, Lincolnshire, was educated at Corpus Christi college, Cambridge, afterward becoming a fellow of Jesus college in 1510. He was consulted about the legality of Henry VIII's marriage with Catherine of Aragon, became royal chaplain about 1530, and bishop of Ely in 1534. He was zealous for the Reformation, helped in 1537 to draw up the *Institution of a Christian Man* (known as the *Bishops' Book*). and translated the Gospel of St. John for the revised New Testament. On the accession of Edward VI in 1547 the bishop was made a privy councillor. He assisted in compiling the First Prayer Book of Edward VI, and he was one of the commissioners for the trial of Bishop Gardiner. In January 1551 he succeeded Rich as chancellor and held this office during the nine days' reign of Lady Jane Grey; but he made his peace with Queen Mary by associating himself with the order commanding the duke of Northumberland to disarm. He conformed to the restored religion, and, though deprived of the chancellorship, kept his bishopric until his death on May 10, 1554.

See the *Dict. Nat. Biog.*, where further authorities are cited.

GOODSIR, JOHN (1814–1867), Scottish anatomist, was born at Anstruther. Fife, on hlarch 20, 1814. He was educated at St. Andrews, and at Edinburgh. Years later he communicated to the British association a paper on the pulps and sacs of the human teeth, and about the same date, on the nomination of Edward Forbes, he was elected to the famous coterie called the "Universal Brotherhood of the Friends of Truth." which comprised artists, scholars, naturalists and others. whose relationship became a potent influence in science. With Forbes he worked at marine zoology: but human anatomy, pathology and morphology formed his chief study.

In 1840 he moved to Edinburgh. where he was appointed conservator of the museum of the College of Surgeons. in succession to William Macgillivray. In his lectures in the theatre of the college in 1842–43 he insisted on the importance of the cell as a centre of nutrition, and pointed out that the organism is subdivided into a number of departments. R. Virchow recognized his indebtedness to these discoveries by dedicating his *Cellular Pathologie* to Goodsir, as "one of the earliest and most acute observers of cell-life." In 1843 Goodsir became curator in the University of Edinburgh. He died at Wardie near Edinburgh, on March 6. 1867.

GOODWILL. In accounting, goodwill appears as an asset upon the balance sheet at the amount it originally cost, or at such lesser amount as it may have been written down out of profits. No attempt is ever made to re-value the goodwill of a business from year to year for balance sheet purposes. When, however, a change takes place in the owners of a business, the price to be paid for goodwill has necessarily to be agreed upon by the incoming and outgoing parties.

This price is a matter of bargaining. and has nothing to do with the figure that goodwill may appear at in the books of the business changing hands.

Gooduill represents the difference between an established successful business and one that has yet to establish itself and achieve success. The price that a purchaser is willing to pay for goodwill is the price he is prepared to pay for the right to stand in the shoes of his predecessor, and to represent himself as his successor in business. The price that the vendor of a goodwill is content to receive is the compensation that he is content to regard as adequate for his surrender of an income equal to the future profits of the business. The future profits of any business are, in the nature of things. incalculable.

The Result of Fair Dealing. — At one time it used to be thought that the goodwill of a business consisted solely of the goodwill of its customers, and represented the reputation that the business had acquired in their minds as a result of fair dealing over a reasonably extended period of time. Modern thought recognizes that. second only to the esteem of customers, is the esteem of supplying houses and employees.

Writing down Goodwill.--Many persons take the view that goodwill is an unsatisfactory item to appear in a balance sheet.

The earning power of every business fluctuates from year to year; thus, the actual value of goodwill also fluctuates. No attempt would ever be made to record these fluctuations in successive balance sheets, as that would give rise to confusion and serve no useful purpose; but goodwill is very commonly written down year by year when the profits are sufficiently large to make that practice possible. and many persons confuse this with the writing down of such wasting assets as plant and machinery to provide for depreciation. As a matter of fact, the goodwill of a business does not "depreciate" unless the business is a temporary one. Paradoxical as it may seem, goodwill is in practice written down only when in fact its value is increasing.

See L. R. Dicksee and F. Tillyard, *Goodwill and its Treatment in Accounts,* 4th ed. (1920). (L. R. D.)

GOODWIN, JOHN (*c.* 1594–1665), English Nonconformist divine, was born in Norfolk and educated at Queens' college, Cambridge, where he was elected fellow in 1617. He was vicar of St. Stephen's, Coleman street, London, from 1633 to 1645, when he was ejected by parliament for his attacks on Presbyterianism, especially in his *Theommachia* (1644). He established an independent congregation, and put his literary gifts at Oliver Cromwell's service. In 1648 he justified the proceedings of the army against the parliament ("Pride's Purge") in a pamphlet *Might and Right Well Met,* and in 1649 defended the proceedings against Charles I. (to whom he had offered spiritual advice) in *Hubristodikai.* At the Restoration this tract, with some that Milton had written to Monk in favour of a republic, was publicly burnt, and Goodwin was ordered into custody, though finally indemnified. He died in 1665.

Among his other writings are *Anti-Cavalierisme* (1642), a translation of the *Stratagemata Satanae* of Giacomo Aconcio, the Elizabethan advocate of toleration; *Redemption Redeemed, containing a thorough discussion of . . . election, reprobation and the perseverance of the saints* (1651, reprinted 1840). John Wesley published an abridged edition of his *Imputatio fidei.* See *Life by* T. Jackson (1839).

GOODWIN, THOMAS (1600–1680), English Nonconformist divine, was born at Rollesby, Norfolk, on Oct. 5, 1600, and was educated at Christ's college, Cambridge, and became a fellow of Catharine Hall. In 1625 he was licensed a preacher of the university; he became lecturer and then vicar (1632) of Trinity church, Cambridge. Worried by his bishop, who was a zealous adherent of Laud, he resigned all his preferments and left the university in 1634. He lived for some time in London; but in 1639 he withdrew to Holland. Returning to London soon after Laud's impeachment by the Long Parliament, he became minister of an independent congregation in Lime St., East London. In 1643 he was chosen a member of the Westminster Assembly, and at once identified himself with the Congregational party. In 1650 he became president of Magdalen college, Oxford, a post which he held until the Restoration. He was one of Cromwell's intimate advisers, attending him on his death-bed. He was also a commissioner for the inventory of the Westminster Assembly, 1650, and for the approbation of preachers, 1653, and together with John Owen (*q.v.*) drew up an amended Westminster Confession in 1658. From 1660 until his death on Feb. 23, 1680 he lived in London as pastor of the Fetter Lane Independent church.

See his *Works* (5 vols., 1681–1704; reprinted 12 vols., Edin., 1861–66); a memm. prefixed to vol. v. of his *Works;* and a sketch by Addison in No. 494 of the *Spectator.*

GOODWIN, WILLIAM WATSON (1831–1912), U.S. classical scholar, who specialized in Greek grammar and philology, was born in Concord, Mass., on May 9, 1831. He graduated at Harvard in 1851, studied at Bonn, Berlin and Gottingen, receiving his Ph.D. degree from there in 1855; was tutor in Greek at Harvard in 1856–60, and Eliot professor of Greek thereafter until his retirement in 1901. He became an overseer of Harvard in 1903. In 1882–83 he was the first director of the American School of Classical Studies at Athens. Goodwin edited the *Panegyricus* of Isocrates (1864) and Demosthenes' *De Corona* (1901), and assisted in preparing the 7th edition of Liddell and Scott's *Greek-English Lexicon.* He revised an English version by several writers of *Plutarch's Morals* (5 vol.. 1871), and published the Greek text with literal English version of Aeschylus' *Agamemnon* for the Harvard production of that play in June 1906. His most important work was his *Syntax of the Moods and Tenses of the Greek Verb* (1860, enlarged ed. 1890). Besides making accessible to American students the works of J. N. Madvig and P. Kriiger, it presented original matter, including a "radical innovation in the classification of conditional sentences," notably the "distinction between particular and general suppositions." Both this and his *Greek Grammar* (1870) in later editions were largely dependent on the theories of B. L. Gildersleeve for additions and changes. He died in Cambridge, Mass.. on June 16, 1912.

GOODWIN SANDS, a dangerous line of shoals at the entrance to the Strait of Dover from the North sea, about 6 mi. from the Kent coast of England, from which they are separated by and form shelter for, the anchorage of the Downs. The shifting sands, partly exposed at low water, are frequently the scene of wrecks, in spite of lights and bell-buoys. Attempts to erect a lighthouse have failed. Tradition finds in the Goodwins the remnant of an island called Lomea, which belonged to Earl Godwine (11th century) and was afterward submerged. Borings through the sand to the underlying chalk showed this to be highly improbable. Four lightships mark the limits of the sands, and are in communication with the lifeboat stations on the coast.

GOODYEAR, CHARLES (1800–1860), U.S. inventor, was born at New Haven, Conn.. Dec. 29. 1800, the son of Amasa Goodyear, an inventor (especially of farming implements) and a pioneer in the manufacture of hardware in the U.S. In 1821 he entered into a partnership with his father at Naugatuck, which continued till 1830. Already he was interested in an attempt to discover a method of treatment by which India rubber could be made into articles that would stand extremes of heat and cold. To the solution of this problem the next ten years of his life were devoted. For a time he seemed to have succeeded with a treatment of the rubber with aqua fortis. In 1836 he secured a contract for the manufacture by this process of mailbags for the U.S. government, but the rubber fabric was useless at high temperatures. In 1837 he worked with Nathaniel Hayward (1808–65), who had been an employee of a rubber factory in Roxbury and had made experiments with sulphur mixed with rubber. Goodyear bought from Hayward the right to use this imperfect process. In 1839, by dropping on a hot stove some India rubber mixed with sulphur, he discovered accidentally the process for the vulcanization of rubber. In 1844 his first patent was granted. Numerous infringements had to be fought in the courts, the decisive victory coming in 1852. In the same year he went to England, where articles made under his patents had been displayed at the International exhibition of 1851, but he was unable to establish factories there. In France a company for the manufacture of vulcanized rubber by his process failed, and in Dec. 1855 he was arrested and imprisoned for debt in Paris. He died in New York city July 1, 1860. He wrote an account of his discovery entitled *Gum-Elastic and Its Varieties* (2 vol., New Haven, 1853–55).

See also B. K. Peirce, *Trials of an Inventor, Life and Discoveries* of *Charles Goodyear* (New York, 1866); A. C. Regli, *Rubber's Goodyear: the Story of a Man's Perseverance* (New York, 1941).

GOOGE, BARNABE (1540–1594), English poet, son of Robert Googe, recorder of Lincoln, was born at Alvingham, Lincolnshire. He studied at Christ's college, Cambridge, and at New college, Oxford. He was attached to the household of his kinsman, Sir William Cecil, and in 1563 became a gentleman pensioner to Queen Elizabeth. His poems appeared in 1563 as *Eglogs, Epytaphes and Sonettes.* Googe was provost marshal of the court of Connaught, and about 20 letters of his in this capacity are preserved in the record office. He was an ardent Protestant, and his poetry is coloured by his religious and political views.

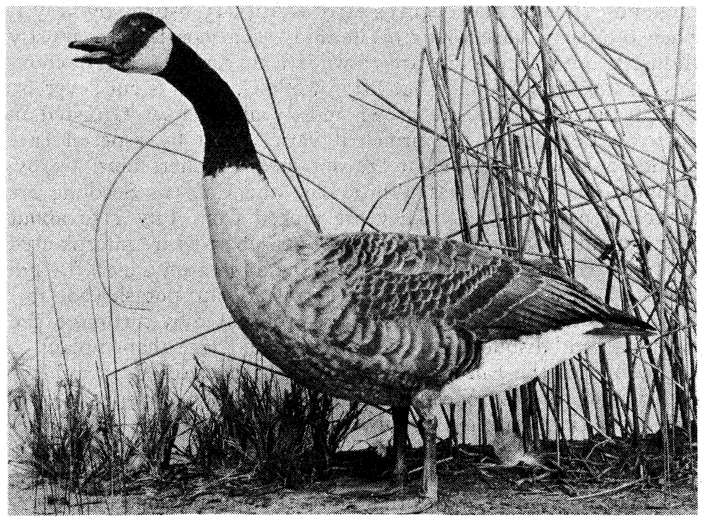
His other works include a translation from Marcellus Palingenius (said to be an anagram for Pietro Angelo Manzolli) of a satirical Latin poem, *Zodiacus vitae* (Venice, 1531?), in 12 books, under the title of *The Zodyake of Life* (1560); *The Popish Kingdome, or Reign of Antichrist* (1570), translated from Thomas Kirchmayer or Naogeorgus; *The Spiritual Husbandrie* from the same author, printed with the last; *Foure Bookes of Husbandrie* (1577), collected by Conradus Heresbachius; and *The Proverbs of . . . Lopes de Mendoza* (1579).

GOOKIN, DANIEL (*c.* 1612–1687), American colonial soldier and magistrate, was born in the British Isles but accompanied his father to Virginia at an early age and remained in the colonies for the greater part of his life. He lived in Virginia, except for a few years in England, until 1643, when he moved to Maryland and thence to Massachusetts because of his sympathy with Puritan teachings. He was a founder of the Roxbury public grammar school, was made captain of the militia in Cambridge, where he next settled, and in 1649 was elected to the Massachusetts house of representatives, becoming speaker of the house in 1651. In 1652 he was elected an assistant, the title given to members of the governor's council in Massachusetts, and held the position uninterruptedly until 1686 except for the year 1676 when he failed to be elected because he had befriended the Indians during King Philip's War. In 1655 Cromwell placed him in charge of the attempt to settle Jamaica, which England had recently acquired, with New Englanders, but the venture was not successful. The following year he was chosen superintendent of all Indians ruled by the Massachusetts government, a post he held, after his re-election in 1661, until his death. His attempts to protect the Indians from mistreatment at the hands of the whites made him widely unpopular with the citizens of Massachusetts. He helped John Eliot found several towns which were to be settled by natives converted to Christianity, the so-called "Praying Indians." He was made major general of Massachusetts in 1681. Gookin was the author of *Historical Collections of the Indians of Massachusetts* (1674); *Historical Account of the Doings and Sufferingsof the Christian Indians in New England;* and a history of New England which he never finished.

GOOLE, a municipal borough (1933), market town and port in the Goole parliamentary division of the West Riding of Yorkshire, Eng., 27 mi. S.W. of Hull and 23 mi. S.E. of York by road. Pop. (1951) 19,234. Area 2 sq.mi. Situated on flat land at the confluence of the Ouse and the Don, which later becomes the Humber, Goole is the terminus of the canal system of the former Aire and Calder navigation, to which it owes its existence. The docks were formally opened in 1826, and by 1956 Goole was the tenth port in the United Kingdom, with extensive coal shipments from the Yorkshire and east Midlands coalfields. Some 47 mi. from the North sea, the port can accommodate vessels of up to 2,000 tons burden, and larger vessels on the spring tides; it has nine interconnected wet docks and a quay length of 3 mi. The principal imports are food and provisions, strawboards, wool and scrap; exports include iron and steel manufactures, coke, pitch and textiles. Regular services operate between Goole and near continental ports and the town is also a railway centre. Other industries are shipbuilding and repairing, engineering, flour milling and the making of fertilizers and clothing, and the town is surrounded by an extensive agricultural area of rich warp land. A special feature is the system of conveying coal on the canal from the collieries by trains of compartment boats ("Tom puddings"), and of hydraulic lifts for discharging them without further handling into the holds of seagoing vessels. The 750,000 gal. water-storage tower is one of the largest in the country. In the town are two public parks, gardens. a market hall and cattle market.

GOOSE, the common name for birds forming the subfamily Anserinae of the Anatidae. Technically "goose" is the female, the male being "gander." Geese differ from ducks in that the sexes are alike in plumage and that the male assists the female in rearing the young. At the close of the breeding season they moult their wing quills and may then be easily approached. When in company, geese usually fly in a V-shaped formation.

The type of the subfamily is the graylag goose *(Anser anser),* from which the domestic goose has been derived. It breeds in suitable localities from Lapland to Spain, and from Scotland to China. The nest is placed in heather or grass and five or six eggs form a clutch. The genus *Anser* constitutes the "gray" geese, and includes, besides the graylag, the bean goose (A. *fabalis),* the pink-footed goose (A. *f. brachyrhynchus)* and the white-fronted goose (A. *albifrons*), all breeding in the northern part of the old world and migrating south in winter. American members of the genus are A. *albifrons* and, in the north, the snow geese, of which



BY COURTESY OF CHICAGO NATURAL HISTORY MUSEUM

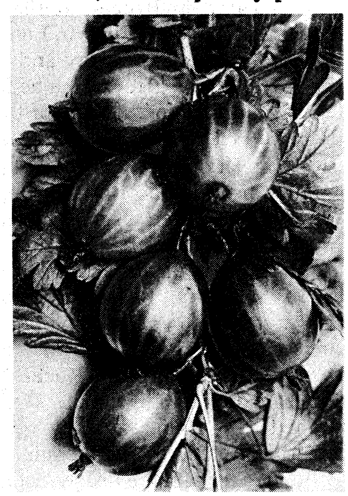
THE CANADA GOOSE (B. CANADENSIS)

the commonest is *Chen hyperborea,* the snow goose proper, white with black primaries, and *Philacte canagica,* the emperor goose of the Aleutian Islands. South America possesses the genus *Chloephaga,* which includes the kelpgoose, *C. hybrida,* and the upland goose, *C. leucoptera.*

The "black" geese include the barnacle goose *(Branta leucopsis),* breeding in Spitsbergen, northeast Greenland and northwest Siberia, supposed of old to be produced from barnacles (Lepadidae), and the brant goose, B. *bernicla,* with a circumpolar breeding range. To this group also belongs the well-known Canada goose (B. *canadensis)* of America. Other species occur in North America, Asia and the Hawaiian archipelago. The largest living goose is the Chinese goose, *Cygnopsis cygnoid,* the origin of the eastern domestic races. *Cnemiorius calcitrans* is a fossil goose from New Zealand, remarkable for its extraordinary patella and its loss of flight. The Egyptian and Orinoco geese *(Alopochen* and *Neochen)* are of doubtful affinities and possess an enlargement of the junction of the bronchial tubes and trachea—a characteristic of the ducks, Anatinae, to which they are now allocated.

GOOSEBERRY, a well-known fruit bush of the northern hemisphere, closely related to the currants, and frequently placed in the same genus, *Ribes,* of which there are about 150 species, mostly natives of western North America. If separated, the currants are *Ribes* and the gooseberries *Grossularia.* They belong to the family Saxifragaceae (*q.v.*). Currants are nonspiny and the flowers are borne in racemes, while gooseberries are spiny and produce their flowers singly or in twos and threes.

The gooseberry is far more important in Great Britain and northern Europe than in North America. In Europe it is made into preserves, and frequently eaten out of hand as berries are in the U.S. In the U.S. most varieties are used as jellies, preserves and in pies. European gooseberries are derived from the species G. *reclinata* (or *Ribes grossularia),* native in northern Africa and from Spain to the Caucasus north to Scandinavia. It was cultivated in English gardens as early as 1600. Hundreds of varieties are known and are classed as early, midseason or maincrop, and dessert kinds. May Duke is the chief early variety; Keepsake is also grown. Both are chiefly raised in the sourh of



J. HORACE MCFARLAND

THE KEEPSAKE GOOSEBERRY (G. RECLINATA)

England. Picking may begin as early as April 15, usually by May 1, when the berries are young. The midseason varieties are mostly Industry and Careless and are grown in Kent and the eastern counties. Industry is thinned but little, while Careless is cut severely. The dessert varieties are grown mostly about East Grinsted in Sussex. Leveller is the principal variety and by especial care berries one ounce in weight are obtained. Shiner, Lord Derby, Gunner, Leader, Careless, White Lion and Cousens Seedling are other dessert varieties. They are picked from July 1 to about Aug. 15 and are marketed ripe. Most gooseberries are interplanted in fruit orchards, the early 3 by 6 ft., the midseason 6 by 6 ft., and the late 4 by 4 ft. Stable manure (1 j tons) plus potash (200 lb.) are used as fertilizer. The bushes are propagated by cuttings taken in the fall and disbudded at the base to form a tree-shaped plant.

In America the European gooseberries are attacked by mildew. Hybridizing the European varieties with American species produced resistant varieties. Poorman and Pixwell are the chief varieties in the United States and Fredonia, Clark, Poorman and Silvia are good in Canada. Pixwell fruit is medium sized, Clark is large. Poorman is large fruited, bright red. Glenndale succeeds as far south as Maryland to Missouri. In Canada thornless varieties have been originated.

Powdery mildew, serious on European varieties, may be controlled with commercial lime-sulphur, $1\frac{1}{2}$ gal. to 50 gal. of water. Anthracnose and leaf spot may defoliate the plants unless controlled by spraying with Bordeaux mixture. The chief insect of red currants and gooseberries, the "imported" currant worm, quickly strips the plants of leaves but is readily controlled by powdered hellebore. The gooseberry, as well as the currant, spreads the blister rust and is prohibited from certain areas where white pine is important. State regulations regarding the planting of gooseberries may be obtained from state authorities. (G. M. D.)

GOOSSENS, a distinguished family of Belgian and English musicians.

1. EUGENE GOOSSENS (1845–1906), Belgian conductor, was born in Bruges, Belg., Feb. 25, 1845. He was admitted to the Brussels conservatory, where he studied the violin, when he was only 14. In 1882, after several years' experience as an operatic conductor in Belgium, France, Italy and England. Goossens was made conductor of the Carl Rosa Opera company, which had been founded in 1875 to travel through England performing operas in English. He died in Liverpool, on Dec. 30, 1906.

2. EUGÈNE GOOSSENS (1867–1958), son of the above, was also a conductor. He was born in Bordeaux, Fr., on Jan. 28, 1867, and was educated in Bruges, at the Brussels conservatory and at the Royal Academy of Music in London. He played the violin with the Carl Rosa Opera company and was a member of the orchestra of the Royal opera, after which he became conductor of the Carl Rosa Opera company in 1899 and of the British National Opera company in 1926. He died in London, Aug. 31, 1958.

3. SIR EUGENE GOOSSENS (1893–1962), English composer and conductor and son of the above, was born in London on May 26, 1893. He received his musical training at Bruges conservatory, the Liverpool College of Music and the Royal College of Music, London. In 1921, after he had for a number of years been associated with Sir Thomas Beecham, he organized an orchestra of his own and gave some concerts of modern chamber music. He was made conductor of the Rochester (N.Y.) Philharmonic orchestra in 1923 and remained in Rochester until 1931, when he became director of the Cincinnati (O.) Symphony orchestra. He remained in Cincinnati until 1946, and during this time he was musical director of the biennial Cincinnati May festivals.

In 1947 he became resident conductor of the Sydney (New South Wales, Australia) Symphony orchestra and director of the New South Wales Conservatorium of Music. He was knighted in 1955. In 1956 he resigned both his Australian positions.

In composition Goossens' output was considerable. Of particular interest is his chamber music which includes: *Suite* for flute, violin and harp (1914); *Five Impressions of a Holiday* for piano, flute or violin, and cello (1914); *Fantasy* for string quartet (1915); *Pastoral and Harlequinade* for flute, oboe and piano (1924); *Fantasy* for wind instruments. He also wrote two operas, *Judith* (produced. 1929) and *Don Juan de Mañara* (1937), both with librettos by the English novelist Arnold Bennett; a ballet, *L'École en crinoline* (1921); two symphonies (1940 and 1942–44); songs and piano, 'cello and violin pieces.

4. LEON GOOSSENS (1897–), English oboist, son of Eugène Goossens (2, above) was born in Liverpool on June 12, 1897. He was the first oboist of the Queen's Hall and Royal Opera House orchestras and of the London Philharmonic orchestra after it was founded in 1932, and made a great reputation as a solo and chamber music performer. His two sisters, Marie (b. 1894) and Sidonie (b. 1899) Goossens, are well known harpists.

GOOTY, a town and hill fortress and tehsil in the Anantapur district of Andhra Pradesh, India, 48 mi. E. of Bellary, with a station on the Southern railway. Pop. (1951) 15,437.

The town is surrounded by a circle of rocky hills, connected by a wall. On the highest hill stands the citadel, 2,100 ft. above sea level. This site was the stronghold of Morari Rao Ghorpade, a famous Maratha warrior and ally of the English, who was ultimately starved into surrender by Hyder Ali in 1775.

GOOTY TEHSIL covers an area of 896 sq.mi. and had a population of 214,851 in 1951.

GOPHER, a name applied in North America to three different groups of animals. The pocket gophers (Geomyidae) are burrowing rodents with large front claws, fur-lined cheek pouches, small ears and small eyes. They occur chiefly in the west and the south. Ground squirrels *(Citellus)* are often called gophers and so is the gopher tortoise *(Gopherus)* native to the southern states. "Gopher" is from an old French word, meaning to tunnel.

GÖPPINGEN, a town of Germany, in the *Land* of Baden-Wfrttemberg, on the Fils, 22 mi. E.S.E. of Stuttgart on the railway to Friedrichshafen. Pop. (1950) 39,360; (1959 est.) 48,003. Goppingen originally belonged to the Hohenstaufen, and in 1270 came into possession of the counts of Wiirttemberg. It was surrounded by walls in 1129, and was rebuilt after a fire in 1782. It possesses a castle built partly with stones from the ruined castle of Hohenstaufen, which stands 3 mi. N. of the town, by Duke Christopher of Württemberg in the 16th century and now used as public offices. The manufactures include linen and woolen cloth, electric motors, leather, glue, paper and toys. There are machine shops and tanneries in the town. It has a chalybeate spring.

GORAKHPUR, a city, tehsil and division of Uttar Pradesh, India. The city, which had a population in 1951 of 132,436 (including 8,592 persons living in the railway colony), is situated on the left bank of the Rapti river about 100 mi. N. of Varanas. It is believed to have been founded about A.D. 1400. It is the civil headquarters of the district and was an important depot for recruits coming from Nepal to join the Gurkha regiments of the Indian army. It is also the headquarters of the North-Eastem railway and the site of St. Andrew's college and the Maharana

Pratap college, both affiliated with Agra university.

Gorakhpur tehsil covers an area of 655 sq.mi. and had a population in 1951 of 823.644.

GORAKHPUR DISTRICT has an area of 2,439 sq.mi. Pop. (1951) 2,238,588. It lies immediately south of the lower Himalayan slopes, but itself forms a portion of the great alluvial plain. Only a few sand hills break the monotony of its level surface, which is, however, intersected by numerous rivers (Gogra, Gandak, Rapti and others) studded with lakes and marshes. In the north and centre dense forests abound, and the district is not subject to very intense heat, against which it is secured by its vicinity to the hills and the moisture of its soil. For this reason it has usually escaped severe famine.

Gautama Buddha was born, and died, near the boundaries of the district; and near Kasia are remains which were long (but probably erroneously) believed to mark his burial place. From the beginning of the 6th century the country was the scene of a continuous struggle between the Bhars and their Rajput antagonists, the Rathors.

FROM RUSSEL, "TRIBES AND CASTES OF CENTRAL INDIA"

BANJARA WOMAN WITH THE SINGH OR HORN

Toward the end of the 16th century the Mohammedans occupied Gorakhpur town, but they interfered very little with the district, and allowed it to be controlled by the local rajas. In the middle of the 18th century a formidable foe, the Banjaras from the west, so weakened the power of the rajas that they could not resist the fiscal exactions of the Oudh officials, who plundered the country to a great extent. The district formed part of the territory ceded by Oudh to the British under the treaty of 1801.

GORAKHPUR DIVISION comprises the four districts of Gorakhpur, Deoria, Basti and Azamgarh, and has an area of 9,563 sq.mi. The population in 1951 was 8,831,241, giving the very high average density figures of 923 persons per square mile.

GORAL (*Naemorhedus goral*), a small Asiatic goatlike bovine animal having slightly backward curving cylindrical horns and a coarse brownish-gray coat. It is a ruminant (cud chewer) related to the chamois and serow (*qq.v.*), but distinguished from them by peculiarities in skull form, by smaller size, shorter horns and the absence of face glands. Gorals range from the Himalayas to eastern Siberia. See also BOVIDAE. (J. E. HL.; X.)

GORBODUC, a mythical king of Britain. He gave his kingdom away during his lifetime to his sons, Ferrex and Porrex. The two quarrelled and the younger stabbed the elder. Their mother, loving the latter most, avenged his death by murdering the other, and the people, horrified at her act, revolted and slew both her and King Gorboduc.

This legend was the subject of the earliest regular English tragedy written by Thomas Sackville, Lord Buckhurst and Thomas Norton in collaboration. Produced in 1561, it was first published very corruptly in 1565, and in better form as The Tragedy of Ferrex and Porrex in 1570.

GORCHAKOV or GORTCHAKOFF, a noble Russian family, descended from Michael Vsevolodovich, prince of Chernigov, who, in 1246, was assassinated by the Mongols. PRINCE ANDREY IVANOVICH (1768–1855), general in the Russian army, took a conspicuous part in the final campaigns against Napoleon. ALEXANDER IVANOVICH (1769–1825) served with distinction under his relative Suvorov in the Turkish Wars, and took part as a general officer in the Italian and Swiss operations of 1799, and in the war against Napoleon in Poland in 1806–1807 (battle of Heilsberg). PETR DMITRIEVICH (1790–1868) served under Kamenski and Kutusov in the campaign against Turkey, and afterwards against France in 1813–14. In 1820 he suppressed an insurrection in the Caucasus, for which service he was raised to the rank of major-general. In 1828–29 he fought under Wittgenstein against the Turks, won an action at Aidos, and signed the treaty of peace at Adrianople. In 1839 he was made governor of Eastern Siberia, and in 1851 retired into private life. When the Crimean War broke out he offered his services to the emperor Nicholas, by whom he was appointed general of the VI. army corps in the Crimea. He commanded the corps in the battles of Alma and Inkerman. He retired in 1855 and died at Moscow, on March 18, 1868. Other members of the family are separately noted.

GORCHAKOV, PRINCE ALEXANDER MIKHAILOVICH (1798–1883), Russian statesman, cousin of Princes Petr and Mikhail Gorchakov, was born on July 16, 1798, and was educated at the lyceum of Tsarskoye Selo. On leaving the lyceum Gorchakov entered the foreign office under Count Nesselrode. When the German confederation was re-established in 1850 in place of the parliament of Frankfort, Gorchakov was appointed Russian minister to the diet, and formed with Bismarck a friendship which was afterwards renewed at St. Petersburg. Gorchakov was then transferred to Vienna, where he remained through the critical period of the Crimean War. Although he attended the Paris conference of 1856, he abstained from signing the treaty of peace. Alexander II. then appointed him minister of foreign affairs in place of Count Nesselrode. Gorchakov was appointed chancellor, and was, for a time, the most powerful minister in Europe.

When the conflict arose between Austria and Prussia in 1866, Russia remained neutral, and when the Franco-German war of 1870–71 broke out Russia answered for the neutrality of Austria. In 1875 Bismarck was suspected of a design of again attacking France, and Gorchakov let it be known that Russia would oppose any such scheme. Slavophil agitation produced the Russo-Turkish campaign of 1877–78. At the congress of Berlin (June 13 to July 13, 1878) the aged chancellor held nominally the post of first plenipotentiary, but left to Count Shuvalov the odium for the concessions which Russia had to make to Great Britain and Austria. He died at Baden-Baden on March 11, 1883.

See Charles-Roux, Alexandre *II.*, Gorchakov et Napoleon *III.* (1913).

GORCHAKOV, PRINCE MIKHAIL DMITRIEVICH (1793–1861), Russian army officer, served in the campaigns in Persia in 1810 and in 1812–14 against France. During the Russo-Turkish War of 1828–29 he was present at the sieges of Silistria and Shumla. He was appointed a general officer in 1830, served in the campaign in Poland, was wounded at the battle of Grochow and distinguished himself at the taking of Warsaw. In 1846 he became military governor of Warsaw. He was chief of staff of the Russian army serving in Hungary in 1849, and subsequently served as chief of staff of the Russian army and adjutant general to the tsar. In 1853, Gorchakov led the forces which entered Moldavia. When Russia subsequently declared war against Turkey in 1854, he was appointed commander in chief of the troops that occupied Moldavia and Walachia and besieged Silistria. In 1855, at a critical time in the operations, he was appointed commander in chief of the Russian forces in the Crimea, replacing Prince Menshikov. Gorchakov's defense of Sevastopol. the northern part of which he continued to defend until peace was signed in Paris, was conducted with skill. In 1856 he was appointed governor general of Poland to succeed Prince Paskevich, which post he held until his death on May 30, 1861. He was buried, in accordance with his wish, at Sevastopol. (R. L. GF.)

GORDIAN or **GORDIANUS,** the name of three Roman emperors. The first, Marcus Antonius Gordianus Sempronianus Romanus Africanus (A.D. 159–238), an extremely wealthy man, was descended from the Gracchi and Trajan. Alexander Severus made him governor of Africa, and during his proconsulship occurred the usurpation of Maximin. The universal discontent under Maximin ended in a revolt in Africa in 238, and Gordian reluctantly yielded to the popular clamour and assumed the purple. His son, Marcus Antonius Gordianus (192–238), was associated with him. The Senate and most of the provinces supported them. But after a siege of 36 days they fell before Cappellianus, a supporter of Maximin. The Senate continued the revolt against Maximin and elected M. Antonius Gordianus Pius (224–244), grandson of the elder Gordian, joint emperor with two

Senators. The death of Maximin and the murder of Gordian's colleagues by the praetorians left Gordian sole emperor. For some time he was under the control of his mother's eunuchs, till Timesitheus, his father-in-law and praefect of the praetorian guard, persuaded him to assert his independence. When the Persians under Shapur (Sapor) I. (*q.v.*) invaded Mesopotamia, the young emperor opened the temple of Janus for the last time recorded in history, and marched in person to the East. The Persians were driven back over the Euphrates and defeated in the battle of Resaena (243), and only the death of Timesitheus (under suspicious circumstances) prevented an advance into the enemy's territory. Philip the Arabian, who succeeded Timesitheus, stirred up discontent in the army, and Gordian was murdered by the mutinous soldiers in Mesopotamia.

GORDIAN KNOT: see GORDIUM.

GORDIUM, an ancient city of Phrygia on the road from Pessinus to Ancyra, and not far from the Sangarius. Its site lies opposite the village Pebi, a little north of the point where the Constantinople-Angora railway crosses the Sangarius.

According to the legend, Gordium was founded by Gordius, a Phrygian peasant who had been called to the throne by his countrymen in obedience to an oracle of Zeus commanding them to select the first person that rode up to the temple of the god in a wagon. The king afterwards dedicated his car to the god, and another oracle declared that whoever succeeded in untying the strangely entwined knot of cornel bark which bound the yoke to the pole should reign over all Asia. Alexander the Great, according to the story, cut the knot by a stroke of his sword. Gordium was captured and destroyed by the Gauls soon after 189 B.C. and disappeared from history. In imperial times only a small village existed on the site.

See *Jahrbuch des Instituts,* Erganzungsheft v (1904).

GORDON, the name of a Scottish family, no fewer than 157 main branches of which are traced by the family historians. A laird of Gorden, in Berwickshire, near the English border, is said to have fallen in the battle of the Standard (1138). The families of the two sons ascribed to him by tradition, Richard Gordon of Gordon and Adam Gordon of Huntly, were united by the marriage of their great-grandchildren Alicia and Sir Adam, whose grandson Sir Adam (killed at Halidon Hill, 1333) at first took the English side in the Scottish struggle for independence, and is the first member of the family definitely to emerge into history. He was justiciar of Scotland in 1310, but after Bannockburn he attached himself to Robert Bruce, who granted him in 1318 the lordship of Strathbogie in Aberdeenshire, to which Gordon gave the name of Huntly from a village on the Gordon estate in Berwickshire. He had two sons, Adam and William. The younger son, laird of Stitchel in Roxburghshire, was the ancestor of William de Gordon of Stitchel and Lochinvar, founder of the Galloway branch of the family represented in the Scottish peerage by the dormant viscounty of Kenmure (*q.v.*), created in 1633; most of the Irish and Virginian Gordons are offshoots of this stock. The elder son, Adam, inherited the Gordon-Huntly estates. He had two grandsons, Sir John (d. 1394) and Sir Adam (slain at Homildon Hill, 1403). Sir John had two illegitimate sons, Jock of Scurdargue, the ancestor of the earls of Aberdeen, and Tam of Ruthven. From these two stocks most of the northern Gordon families are derived Sir Adam's daughter and heiress, Elizabeth, married Sir Alexander Seton, and with her husband was confirmed in 1408 in the possession of the barony of Gordon and Huntly in Berwickshire and of the Gordon lands in Aberdeen. The Seton-Gordons are their descendants. Their son Alexander was created earl of Huntly (see HUNTLY, EARLS AND MARQUESSES OF), probably in 1445; and his heirs became dukes of Gordon, George Gordon (c. 1650–1716), 4th marquess of Huntly, being created duke of Gordon in 1684. His son Alexander, 2nd duke of Gordon (c. 1678–1728), joined the Old Pretender, but gained the royal pardon after the surrender of Gordon

A PIPER OF THE GORDON HIGHLANDERS, A SCOTTISH REGIMENT ORGANIZED IN 1796

castle in 1716. Of his children by his wife Henrietta Mordaunt, second daughter of Charles Mordaunt, earl of Peterborough, Cosmo George (c. 1720–1752) succeeded as 3rd duke; Lord Lewis Gordon (d. 1754) took an active part in the Jacobite rising of 1745; and General Lord Adam Gordon (c. 1726–1801) became commander of the forces in Scotland in 1782, and governor of Edinburgh Castle in 1786. Lord George Gordon (*q.v.*) was a younger son of the 3rd duke.

The title, with the earldom of Norwich and the barony of Gordon Huntly, became extinct on the death of George, 5th duke (1770–1836), a distinguished soldier who raised the corps now known as the 2nd battalion of the Gordon Highlanders. The marquessate of Huntly passed to his cousin and heir-male, George, 5th earl of Aboyne. Lady Charlotte Gordon, sister of and coheiress with the 5th duke, married Charles Lennox, 4th duke of Richmond, whose son took the name of Gordon-Lennox. The dukedom of Gordon was revived in 1876 in favour of the 6th duke of Richmond, who thenceforward was styled duke of Richmond and Gordon. Adam Gordon of Aboyne (d. 1537) took the courtesy title of earl of Sutherland in right of his wife Elizabeth, countess of Sutherland in her own right, sister of the 9th earl. The lawless and turbulent Gordons of Gight were the maternal ancestors of Lord Byron.

Among the many soldiers of fortune bearing the name of Gordon was Colonel John Gordon, one of the murderers of Wallenstein. Patrick Gordon (1635–99) was born at Auchleuchries in Aberdeenshire, entered the service of Charles X. of Sweden in 1651 and served against the Poles. He changed sides more than once before he found his way to Moscow in 1661 and took service under the tsar Alexis. He became general in 1687; in 1688 he helped to secure Peter the Great's ascendancy; and later he crushed the revolt of the Streltzi. His diary was published in German (3 vols., 1849–53, Moscow and St. Petersburg), and selections from the English original by the Spalding Club (Aberdeen, 1859).

The Gordons fill a considerable place in Scottish legend and ballad. "Captain Car," or "Edom (Adam) of Gordon" describes an incident in the struggle between the Forbeses, and Gordons in Aberdeenshire in 1571; "The Duke of Gordon's Daughter" has apparently no foundation in fact, though "Geordie" of the ballad is sometimes said to have been George, 4th earl of Huntly; "The Fire of Frendraught" goes back to a feud (1630) between James Crichton of Frendraught and William Gordon of Rothiemay; the "Gallant Gordons Gay" figure in "Chevy Chase"; William Gordon of Earlston, the Covenanter, appears in "Bothwell Bridge," etc.

Gordon's *A Concise History of the . . . House of Gordon* (1754) is little more than an abridgement; Charles, 11th marquess of Huntly, (ed), *The Records of Aboyne,* 1230–1681; J. M Bulloch, *The First Duke of Gordon* (1909), (ed), *The Gordon Book* (1902) and *The House of Gordon,* vol i (1903).

GORDON, AARON DAVID (1856–1922), theoretician and spiritual mentor of the Zionist co-operative movement, was born at Troyanov in the Ukraine on June 9 or 10, 1856. He distinguished between two sources of knowledge: cognition and experience. Man's unique faculty for self-awareness elevates him above nature (experience) but simultaneously alienates him from the cosmos. Only by working the soil, the particular sphere which the cosmos has entrusted to man, can man once again participate in creation and reintegrate himself into the cosmos. Gordon's Zionism derived from this central idea. Jews, he believed, could overcome their alienation if they returned to the homeland from which they were exiled and work its soil. He was particularly influenced by Nietzsche, Tolstoi and Bergson. The personal example he set by migrating to Israel in 1904 and turning farmer inspired Israel's early pioneers. He helped found Deganiah, Israel's first collective community, where he died on Feb. 22, 1922. His Hebrew works fill five volumes, and his *Selected Essays* were published in English in 1938. (EA. SR.)

GORDON, ADAM LINDSAY (1833–1870), one of the first Australian poets to write in a distinctively Australian idiom, was born at Fayal in the Azores on Oct. 19, 1833, the son of a retired Indian officer who taught Hindustani at Cheltenham college. Gordon was educated in England at Cheltenham and Worcester Royal grammar school.

Gordon's youth was so wild and reckless that in 1853 his father sent him to South Australia, where he joined the mounted police. He then became a horsebreaker, but on his mother's death in 1861 inherited £7,000 and also obtained a seat in the house of assembly. He had the reputation of being the best nonprofessional steeplechase rider in the colony. In 1867 he moved to Victoria, set up a livery stable at Ballarat and published two volumes of poems, *Sea Spray and Smoke Drift* and *Ashtaroth*. In 1869 he settled at New Brighton near Melbourne publishing a third volume of poetry, *Bush Ballads and Galloping Rhymes* (1870). It brought him more praise than money and, discouraged by his failure to make good his claim to property in Scotland and suffering from the effects of a bad fall from a horse, he committed suicide at New Brighton on June 24, 1870.

Gordon's poetry is chiefly English in inspiration but where it is local, it is vividly so. His nature lyrics contain his best poetry. His strong rhythms and simple homespun philosophy make his poetry memorable, and some of his lines have been adopted into the vocabulary of the average Australian.

GORDON, CHARLES GEORGE (1833–1885), British soldier and administrator, the ninth of the 11 children of Gen. H. W. Gordon (royal artillery)', was born at Woolwich on Jan. 28, 1833. In consequence of his father's military service, he early began that wandering life which was to characterize his adult years. After several years at Corfu, he spent four years at Taunton Grammar school and obtained a cadetship at the Royal Military academy, Woolwich, in 1848. His individuality and high temper asserted themselves during his cadetship, one escapade losing him a term's seniority; but he passed out high enough on the list to obtain a commission in the royal engineers, the more exacting of the two corps for which his training was designed. He showed a marked aptitude for surveying and cartography and in his last year as a cadet won the prize for "fortification." Commissioned as a second lieutenant, he was posted to Chatham, and in Feb. 1854 he was sent to work on the forts then in course of construction at Pembroke dock. There he formed a friendship with a deeply religious brother officer of evangelical views who awakened in him the strong convictions which were henceforth to dominate his life. On the outbreak of the Crimean War he volunteered for service, and he was present at the siege of Sebastopol and took part in the assault on the Redan.

After the war his cartographical skill led to his being appointed to the international commissions set up to demarcate the Russo-Turkish frontiers in Bessarabia and in Armenia, though he appealed in 1857 to be allowed to serve in India against the mutineers. He returned to England in the autumn of 1858, having acquired an interest in eastern peoples which he never lost, was promoted captain and given a staff appointment at Chatham.

In 1860 he volunteered for service with the Anglo-French forces operating against the Chinese in order to secure their acquiescence in the terms of the treaty of Tientsin (July 1858). He was present at the taking of Peking and at the burning of the Summer palace. After peace had been agreed upon, Gordon remained with the British troops left at Tientsin to ensure compliance with its terms and was employed first in constructing quarters for the troops and subsequently, in the winter of 1861–62, in exploring and surveying the country around Tientsin for the British army.

South China, however, had for several years been disturbed by a body of fanatical revolutionaries, whose leader, partly influenced by some ill-digested notions about Christianity, considered himself destined to inaugurate a "reign of peace" and styled himself Tien Wang, or "Heavenly King." Tien Wang had so much success against the Chinese imperial government that in 1862 the greater part of the British forces were moved from Tientsin, to protect the European communities at Shanghai against him. Gordon attracted attention in operations against the rebels and in Sept. 1862 was given an independent command. The Europeans of Shanghai had earlier raised a force for their own defense which went by the not entirely appropriate title of "the Ever-Victorious army" and was commanded by an American, Frederick Townsend Ward (1831–62). British and French forces cleared the area around Shanghai, but Ward was killed, and when the Chinese provincial governor asked the British commander to find a successor to him Gordon was appointed to the command (March 1863).

He at once established a moral supremacy over the "Ever-Victorious" troops, securing the loyalty of most of their American officers—no easy task at the time of the "Alabama" crisis—and winning the devotion of the soldiers by leading them into battle armed with no more than a cane. But for all his successful showmanship his victories owed something to technical military skill: he gave his troops the advantage of careful reconnaissance and planning and heavy gunfire at critical places in the enemy's line. By a skilful use of the waterways with which the country was intersected (particularly for the transport of heavy artillery) he soon established military superiority over an enemy whose strong points were almost always walled towns amid watercourses. His tactics were applied with unvarying success, and great areas were cleared of the rebel forces; on Nov. 29, 1863, his work was crowned by the capture of Suchow. But the fall of Suchow was attended with serious consequences which almost led to a breach between Gordon and his temporary Chinese superiors. He had been in contact with some of the rebel leaders inside the city before its fall and had given them assurances which in his opinion entitled them to expect clemency if they surrendered; but when they gave themselves up, together with the city, the Chinese imperial commander promptly had them beheaded.

This action, quite in accordance with Chinese practice, was utterly repugnant to Gordon, who felt moreover that his personal honour had been seriously slighted. He withdrew his forces from the Chinese army and retired from Suchow to Guinsan, where he kept them inactive until Feb. 1864 when, largely through the intervention of Robert (later Sir Robert) Hart, he once more came to an arrangement with the imperial commander. Nothing further was said of the Suchow affair. It is likely that Gordon was influenced by his sincere desire to see the country finally pacified and by his strong confidence in himself: "I do not apprehend," he wrote, "the rebellion will last six months longer if I take the field. It may take six years if I leave"; and in fact, although he suffered a wound and his first defeats in battle, the rebel stronghold Chanchufu fell in May 1864 and Tien Wang committed suicide in June. Gordon had once more withdrawn his forces and was in process of disbanding them when the capture of Nanking by the imperial army brought the rebellion to a close. Gordon had certainly played the major part in its suppression, and this fact was recognized by the Chinese and the British governments. From the emperor he received the *titu* (the highest Chinese military rank), together with the much-coveted right to wear the yellow jacket, and the offer of a large sum of money which he refused. By the British authorities he was raised to the rank of lieutenant colonel and appointed C.B. He had also achieved popular fame in England, where he was henceforth "Chinese Gordon."

For six years after his return to England from China, Gordon was employed on routine work of a kind little likely to attract attention; he was appointed commanding royal engineer at Gravesend, with the primary duty of supervising the erection of some new forts on the Thames. He consistently shunned the publicity consequent upon his exploits and refused to give any public addresses in connection with them. But at Gravesend he became aware of a further religious experience and as a result began to give his spare time wholly to religious and social work, particularly among boys. Although he was moved in this entirely by his religion, his work was of a practical nature and his concern for the education, clothing and employment of his protégés found recognition, after his death, in the setting up of the Gordon Memorial home for boys.

In Oct. 1871 Gordon was again posted overseas, to Galatz, as British representative on the international Danube commission—an appointment which led indirectly to his long and ultimately fatal connection with Egypt. On a holiday visit to Constantinople in 1872 he met Nubar Pasha, an Armenian subject of the khedive Ismail and in effect the khedive's minister for foreign affairs, who was looking for a successor to Sir Samuel Baker as governor of the Equatorial province (nominally a part of the Egyptian dominions in consequence of their southward expansion since about 1820, in the reign of Mohammed Ali Pasha). Nubar was attracted to Gordon and in 1873 made him an offer of service under the khedive. With the consent of the British government, Gordon accepted and travelled to Egypt early in 1874.

The chief factors which determined the course of Gordon's career in the service of Egypt were his strong sense that he was engaged upon a major civilizing mission and his successful personal relationship (unusual for a European of personal probity) with the khedive Ismail. Ismail is customarily remembered for luxury, periodic indolence and administrative inability; but he saw himself as a benevolent instrument of civilization and justice. Gordon saw and accepted this aspect of the khedive's character and built upon it a close, mutually confident relationship. Common ground between them was a desire, in Gordon's case a determination, to end the trade in Negro slaves; Ismail had made frequent public acts calculated to restrict it, but their effectiveness was much limited by the indifference or corruption of his officials.

Meeting the khedive in Cairo, Gordon insisted that his salary be reduced by £8,000 to £2,000 a year. He then proceeded to Khartoum and thence by river to Gondokoro, the administrative centre of the Equatorial province, where he spent two and one-half years of incessant activity, directed to the pacification of the province, to its exposure to Egyptian influence and commerce and in particular to the suppression of the slave trade. His policy was so far as possible to achieve these results peaceably, being, as he wrote to his sister, "averse to the loss of a single life." His small band of European and American assistants fell before the unhealthful climate and was early reduced to one only—the Italian Romolo Gessi, already a close friend. His first task was to extend his administrative grip southward. In the course of two years he pushed up the Nile until a small steamship (transported in pieces) was launched on Lake Albert. Characteristically he shunned the publicity which must arise from this achievement, moving away to let Gessi command the final dramatic stage. He established friendly relations with the powerful M'tesa, king of Uganda, through negotiations in which his agent was a German doctor, Eduard Schnitzer (soon, as Emin Pasha, to be himself governor of Equatoria). Egyptian authority was established as far as Lake Albert in the west and almost to Lake Victoria in the east. Uninterrupted communications were secured and slavery rigorously controlled. In Dec. 1876 Gordon returned to Cairo.

On reflection Gordon concluded that the great object of his governorship of Equatoria had been only partially accomplished. In his own province he had brought the slave trade to an end, but the traders had found alternative routes through the Sudan. If their activities were to be stamped out, the whole Sudan must be subjected to antislavery administration of equal rigour. When Gordon saw the khedive on Feb. 13, 1877, and stated his case, Ismail immediately appointed him governor general of the Sudan. "I am astonished," he wrote, "at the power he has placed in my hands . . . it will be my fault if slavery does not cease, and if those countries are not opened to the world." It was a task which matched both his ideals and his urgent sense of personal mission. Remembering the toll of sick men in Equatoria he determined to undertake it alone. "I go alone with an infinite Almighty God to direct and guide me" was his comment.

His first task was to restore friendly relations with King John of Abyssinia, but he failed to conclude a full agreement. From Abyssinia he proceeded to his capital, Khartoum, from the south, travelling across the desert on camel back. On his arrival he at once inaugurated a period of administrative reform, abolishing the use of the whip and ruthlessly dismissing corrupt and incompetent officials. But soon his attention was directed westward to the province of Darfur, which stretched away to the central African desert. Here Zobeir, greatest of contemporary slave dealers, had recently expelled the hereditary sultan and come to an agreement with the preceding governor general of the Sudan by which he retained the substance of his conquests under the khedive's nominal sovereignty. But Ismail had summoned Zobeir to Cairo, whence, though loaded with honours, he was not permitted to return, being sent instead, in the summer of 1877, to the Balkans at the head of an Egyptian contingent participating in the Russo-Turkish War. Zobeir's fate was much resented by his son Suleiman, who joined forces with a relative of the original sultan of Darfur with the intention of rejecting the Egyptian connection. Gordon acted swiftly, drove the rebel forces away from the Egyptian posts which they were menacing ("10,000 Egyptian troops had been relieved by Gordon with 300 men") and, riding in full dress as governor general but with no more than 50 men into Suleiman's camp, eventually tamed him by sheer force of character.

After a further unsatisfactory visit to the Abyssinian frontier, he was summoned to Cairo in Jan. 1878 on business of a very different order. The deterioration of Egypt's finances had reached a critical stage. European governments were pressing hard upon the khedive in the interests of the foreign bondholders. Ismail proposed to set up a commission of inquiry into the finances of the country; Gordon, invited to become its president, accepted the task on the understanding that the European debt commissioners were not to be members of it. This condition was rejected by the debt commissioners and led to a heated controversy between Gordon and the British commissioner, Evelyn Baring. The European consuls intervened. and Ismail was obliged to give way and was eventually deposed. Gordon returned to Khartoum, where he found that Suleiman, supplied with smuggled weapons by his father, had again rebelled. He collected a force of 2,000 men and dispatched them against the rebels under the command of his old comrade Gessi, eventually joining him in Feb. 1879 and engaging in an arduous desert campaign which ended in the destruction of the rebel forces and in the execution of Suleiman but reduced Gordon himself to a state approaching total exhaustion. After a further hazardous approach to the Abyssinians as a result of which he was made a prisoner, he returned to Cairo by way of Massawa and handed his resignation to Ismail's successor, the khedive Tewfik.

Gordon left Cairo a deeply disappointed man, for he had learned of the appointment to his place in Khartoum of an Egyptian whom he had previously dismissed for corruption and cruelty, and he foresaw the destruction of all that he had built. He worked closely with the Anti-Slavery society after his return to London (Jan. 1880), and it was his anxiety to combat slavery that led him to accept the suggestion of King Leopold II of Belgium (March 1880) that he should, in due course, succeed H. M. Stanley as administrator of the Congo. In May 1880 he agreed to go to India as private secretary to the new viceroy, the marquess of Ripon, but he resigned a few days after arriving in Bombay after a disagreement with his chief as to the propriety of restoring the deposed amir of Afghanistan, a step which Gordon advocated. From Bombay, at the instance of Sir Robert Hart (by now inspector general of customs for China), he went to Peking where he was successful in dissuading the Chinese from undertaking what, he felt, would be a suicidal war with Russia. On returning to England he exchanged with a brother officer and, in April, went in his place as commanding royal engineer to Mauritius. This post he was obliged to vacate on his promotion as major general in March 1882. Early in 1881 he had telegraphed an offer of mediation to the government of Cape Colony which was at war with the Basutos. This was remembered, and his help was sought more than a year later. At the Cape he saw much of Cecil Rhodes, who agreed with him as to the legitimacy of many of the Basuto grievances. After a discussion with the Cape ministers, he undertook a journey into Basuto territory for direct negotiation with one of the leading chiefs, Masupha, and was placed in considerable danger by an attack against Masupha's territories by another chief—at the instigation, as Gordon believed, of one of the Cape ministers. In consequence of this, he resigned and landed in England in Nov. 1882. From Jan. to Dec. 1883 he lived in Palestine, studying antiquities. Eventually he learned that his post in the Congo was now available—but by that time, he was about to be caught up again in Egyptian and Sudanese affairs.

In Aug. 1881 the peace of the Sudan was broken by the fanatical followers of Mohammed Ahmed (*q.v.*), who in that month proclaimed himself the mahdi; within a year the situation was dangerous. The Egyptian government, preoccupied with the rebellion of Arabi Pasha, did nothing to check the progress of the rebels, and the British government, with whom lay the responsibility for action after the British army had entered Cairo (Sept. 1882), was inhibited by its anxiety to avoid further commitments in the area. It was not until Nov. 1883, when an Egyptian force of 10,000 under William Hicks (Hicks Pasha), a retired British officer, was annihilated by the rebels, that the matter received serious official attention; in Dec. 1883 the British government ordered the abandonment of the Sudan.

Since Sept. 1883 Sir Evelyn Baring (the future Earl Cromer) had been back in Egypt, in effect as viceroy of the country although his title was British agent and consul general, charged among other things with the task of evacuating Egyptian soldiers and administrators from the Sudan. This would clearly be no light task, and it was suggested, by Lord Granville among others, that it was most likely to be successful if undertaken by Gordon. This opinion, canvassed in sections of the press, became widely held in England, where the publication in 1881 of Gordon's central African letters had revived that general enthusiasm for him which his self-effacement had allowed to lapse. The way had been partly prepared for some such step by Sir Evelyn Baring himself, who wrote that "It would be necessary to send an English officer of high authority to Khartoum with full power to withdraw all the garrisons in the Sudan and to make the best arrangements possible for the future government of the country." But neither the Egyptian government nor Sir Evelyn at first favoured the idea of employing Gordon, and the British government, apparently choosing to regard the Sudan as a purely Egyptian affair, temporized. On Jan. 8, 1884. Gordon returned to England and gave an interview to a distinguished journalist, W. T. Stead, in which he emphasized the difficulties of evacuation and the real peril that would face thousands of Egyptians and their families if proper measures were not taken for their protection. The publication of this interview aroused public opinion, and Queen Victoria asked why no reply had been sent to Baring's request for a British officer; but Baring returned a guarded refusal to the suggestion that Gordon should be sent. When Abd el-Kader, the Egyptian minister of war and a former governor general of the Sudan, declined the office, it was again offered to Gordon and accepted by him on Jan. 18, 1884, although in circumstances of such ambiguity as to lead to controversy and recrimination for years to come. The British government proposed to Baring that Gordon should be sent out in an advisory capacity to report on the situation. Meanwhile Baring telegraphed his conclusion that "Gordon would be the best man if he would pledge himself to carry out the policy of withdrawal from the Sudan." These messages crossed in transit, and the two utterly inconsistent proposals were perpetuated by Lord Granville in the form of instructions which ordered Gordon both to report and "to perform such other duties as may be entrusted to him by the Egyptian government through Sir Evelyn Baring." This confusion of ideas existed within the cabinet, some of whose members recognized that Gordon was now needed to supervise the withdrawal, while others (among them Gladstone, the prime minister, who was at Hawarden and received only reports of what took place) believed his mission to be no more than advisory. Gordon left at once, accompanied only by Lieut. Col. J. D. H. Stewart, and reached Cairo on Jan. 24.

Baring at once instructed him to conduct the withdrawal and required the khedive to name Gordon as the governor general of the Sudan. Gordon, with characteristic imaginativeness, sought to establish his former enemy Zobeir Pasha at Khartoum, as being likely, after the evacuation, to preserve some substance of order in the Sudan. But Baring mistrusted Zobeir, and the British government feared the effect on public opinion of such an elevation of a former slave trader. Gordon left Cairo, without Zobeir, on Jan. 26 and, travelling by Korosko and Berber, reached Khartoum on Feb. 18, where his reception was enthusiastic. He at once made approaches for peace with the mahdi and began evacuating Egyptians, of whom 2,000 civilians and 600 soldiers had been sent home when the hostility of the mahdi, whose rejection of peace had become apparent on March 12, made further movement impossible. A revolt in the eastern Sudan placed Egyptians there in jeopardy, and a British force which was sent to Suakin was withdrawn after defeating the mahdists, with the result that the Egyptian garrison at Berber surrendered. Khartoum was isolated by March 18. From that date until Jan. 26 Gordon defended the city against repeated attacks and in the face of a growing shortage of food. He continued to press for Zobeir and a few British or Indian troops (as late as Dec. 14 he wrote: "I ask for no more than 200 men"). But although public opinion grew increasingly vociferous, the cabinet and in particular Gladstone, who because of the initial misunderstanding regarded Gordon as having acted far beyond his instructions, did not decide until August to send a relief expedition; and it was November before this force assembled under Lord Wolseley at Wadi Halfa. In September Gordon had sent four steamers several days' journey down the Nile to await the army; but the British advance column had to fight hard, its leader, Sir Herbert Stewart, was killed, and it did not reach the steamers until Jan. 20. After a further delay of four days, in part because of the fact that the officer appointed to command the final dash was suffering from boils, the steamers set off back to Khartoum carrying British troops. The advance of the British in the face of the fiercest resistance deeply alarmed the mahdists. After a prolonged debate they determined upon a last assault on Khartoum, slipped through the defense lines where a falling Nile had left them unfortified and overcame the starving garrison. Gordon was killed at dawn on Jan. 26. Shortly before, he had written at the end of his last letter to his sister: "we are on our last legs. . . I am quite happy, thank God, and like Lawrence, I have *tried* to do my duty." In his journals he had written: "I altogether decline the imputation that the projected expedition has come to relieve me. It has come to save our national honour in extricating the garrisons."

Gordon's was an unusual, often a tortured and always an individual nature. After his death it became a matter for extravagant eulogy and interested belittlement. Perhaps the most appropriate of the many things said of him after his death came from the Austrian Sir Rudolf Carl von Slatin (Slatin Pasha), then a prisoner in the mahdi's camp, who, shown his head, is reported to have said: "What of it? a brave soldier who fell at his post; happy is he to have fallen; his sufferings are over."

GORDON, LORD GEORGE (1751–93), third and youngest son of Cosmo George, duke of Gordon, was born in London on Dec. 26, 1751. He was educated at Eton and entered the navy, rising to the rank of lieutenant in 1772; but Lord Sandwich, then at the head of the admiralty, would not promise him a command, and he resigned his commission shortly before the beginning of the Revolutionary War. In 1774 the pocket borough of Ludgershall was bought for him by Gen. Fraser, whom he was opposing in Inverness-shire, in order to bribe him not to contest the county. He was considered flighty and of little importance. In 1779 he organized, and made himself head of the Protestant associations formed to secure the repeal of the Catholic Relief act of 1778. On June 2, 1780, he headed the mob which marched in procession from St. George's Fields to the houses of parliament in order to present the monster petition against the acts. A terrific riot ensued which continued several days, during which the city was virtually at their mercy. At first, indeed, they dispersed after threatening to make a forcible entry into the house of commons, but reassembled soon afterward and destroyed several Roman Catholic chapels, pillaged the private dwellings of many Roman Catholics, set fire to Newgate and broke open all the other prisons, attacked the Bank of England and several other public buildings, and continued the work of violence and conflagration until the interference of the military, by whom no fewer than 450 persons were killed and wounded, before the riots were quelled. For his share in instigating the riots Lord Gordon was apprehended on a charge of high treason; but, mainly through the skilful and eloquent defense of Lord Erskine, he was acquitted on the ground that he had no treasonable intentions. His life was henceforth full of crackbrained schemes, political and financial. In 1786 he was excommunicated by the archbishop of Canterbury for refusing to bear witness in an ecclesiastical suit; and in 1787 he was convicted of libelling the queen of France, the French ambassador and the administration of justice in England. He was, however, permitted to withdraw from the court without bail, and made his escape to Holland; but on account of representations from the court of Versailles he was commanded to quit that country, and, returning to England, was apprehended, and in Jan. 1788 was sentenced to five years' imprisonment in Newgate, where he lived at his ease, giving dinners and dances. As he could not obtain securities for his good behaviour on the termination of his term of imprisonment, he was not allowed to leave Newgate, and there he died of delirious fever on Nov. 1, 1793. Some time before his apprehension he had become a convert to Judaism, and had undergone the initiatory rite.

A serious defense of most of his eccentricities is undertaken in *The Life of Lord George Gordon, with a Philosophical Review of his Political Conduct*, by Robert Watson, M.D. (1795). The best accounts of Lord George Gordon are to be found in the *Annual Registers* from 1780 to the year of his death.

GORDON, JOHN BROWN, (1832–1904), Confederate army officer and political leader in Georgia during the Reconstruction, was a popular hero in the state. Born Feb. 6, 1832, in Upson county, Georgia, he attended the University of Georgia and later practised law in Atlanta. At the outbreak of the Civil War he joined the Confederate army as captain of volunteers and passed successfully through the grades to lieutenant general. He participated in several major battles and during the course of the war was wounded eight times.

At Appomattox he commanded one wing of Gen. Robert E. Lee's army with the instructions to cut through Gen. U. S. Grant's line. Gordon made the last charge, and was taking the federal breastworks when news of his chief's surrender ended his action.

Following the war he settled in Atlanta, and was a member of the Democratic national conventions of 1868 and 1872. He served in the U.S. senate from 1873 to 1880, when he resigned, and again from 1891 to 1897. Brown was also governor of Georgia (1886–90), and from 1890 commander in chief of the United Confederate Veterans. He wrote *Reminiscences of the Civil War* (1903).

Gordon died in Miami. Fla.. Jan. 9, 1904.

GORDON, SIR JOHN WATSON (*c.* 1788–1864), Scottish portrait painter, who after Sir Henry Raeburn's death in 1823, succeeded to his practice, was born in Edinburgh, where he trained for four years under John Graham at the Trustees' academy. He began to paint historical subjects, but turned to portraiture. He lacked Raeburn's brilliant colour and dramatic modeling, preferring in his later work clear gray tonalities.

Gordon exhibited at the Royal Academy from 1817 on; he became an academician in 1851. A member of the Royal Scottish Academy in 1829, he succeeded to its presidency in 1850 and was knighted. His sitters included Sir Walter Scott (1820), Sir Alexander Hope (1835, Linlithgow) and Thomas De Quincey (1845, National Portrait gallery, London).

He died in Edinburgh on June 1, 1864. (D. L. FR.)

GORDON, LEON (originally JUDAH LOEB BEN ASHER) (1830–1892), Russian-Jewish poet and novelist (Hebrew), was born at Wilna in 1830 and died at St. Petersburg in 1892. He took a leading part in the modern revival of the Hebrew language and culture. His satires did much to rouse the Russian Jews to a new sense of the reality of life, and Gordon was the apostle of enlightenment in the ghettos. His Hebrew style is classical and pure. His poems were collected in four volumes, *Kol Shire Yehuda* (1883–1884); his novels in *Kol Kithbe Yehuda* (1889).

For his works see *Jewish Quarterly Review*, xviii, 437 *et seq.*

GORDON, PATRICK (1635–1699), Russian general, descended from a Scottish family, was brought up in Aberdeenshire, but entered in his 15th year the Jesuit college at Braunsberg, Prussia. In 1655 he enlisted at Hamburg in the Swedish service. In the course of the next five years he served alternately with the Poles and Swedes as he was taken prisoner by either. In 1661 he took service in the Russian army under Alexis I, and in 1665 he was sent on a special mission to England. After his return he fought against the Turks and Tatars in southern Russia. In 1678 he was made major general, in 1679 was appointed to the chief command at Kiev and in 1683 was made lieutenant general. He visited England in 1686, and in 1687 and 1689 took part as quartermaster-general in expeditions against the Crim Tatars in the Crimea. On the outbreak of the revolution in Moscow in 1689, Gordon with the troops he commanded virtually decided events in favour of the tsar Peter I, and against the tsaritsa Sophia. The tsar confided to him the command of his capital during his absence from Russia, employed him in organizing his army according to the European system and raised him to the rank of general in chief. He died on Nov. 29, 1699. The tsar was with him when he died, and with his own hands closed his eyes.

Gordon left a diary of his life in English, the manuscript of which was in the archives of the Russian foreign office. It was translated into German (1849, 1853. 1855). *Passages From the Diary of General Patrick Gordon of Auchleuchries* was printed in 1859.

GORDON-CUMMING, ROUALEYN GEORGE (1820–1866), Scottish traveler and sportsman, known as the "lion hunter," was born on March 15, 1820, the second son of Sir William G. Gordon-Cumming, second baronet of Altyre and Gordonstown. He was educated at Eton, and served in the Madras light cavalry and later in the Cape mounted rifles. At the end of 1843 he sold out, and with a few native followers set out for the interior, hunting in Bechuanaland and the Limpopo valley. In 1848 he returned to England and published his book, *Five Years of a Hunter's Life in the Far Interior of South Africa* (1850; 3rd ed., 1851). His collection of hunting trophies was shown at the Great exhibition of 1851, and afterward exhibited in various parts of the country. He died at Fort Augustus, Scot., on March 24, 1866.

An abridgment of his book, *The Lion Hunter of South Africa* (1856), has been frequently reprinted.

GORE, CATHERINE GRACE FRANCES (1799–1861), English novelist and dramatist, the daughter of Charles Moody, a wine merchant, was born at East Retford, Nottinghamshire. In 1823 she mas married to Capt. Charles Gore, and in the next year she published her first work, *Theresa Marchmont, or the Maid of Honour*. Then followed, among others, the *Lettre* de

Cachet (1827), The Reign of Terror (1827), Hungarian Tales (1829), Manners of the Day (1830), Mothers and Daughters (1831), The Fair of May Fair (1832) and Mrs. Armytage (1836). Every succeeding year saw several volumes from her pen: The Cabinet Minister and The Courtier of the Days of Charles *II*, in 1839; Preferment in 1840. In 1841 Cecil, or the Adventures of a Coxcomb, attracted considerable attention. Greville, or a *Season* in Paris appeared in the same year; then Ormington, or Cecil a Peer, Fascination, The Ambassador's Wife, and in 1843 The Banker's Wife. Mrs. Gore continued to write until her death on Jan. 29, 1861. She also wrote some dramas of which the most successful was the School for Coquettes.

Mrs. Gore's novels nad an immense temporary popularity; they were parodied by Thackeray in Punch, in his "Lords and Liveries by the author of Dukes and *Déjeuners*." Some of them deserve to be revived; her Cecil was reprinted with success in 1927.

GORE, CHARLES (1853–1932), English bishop, was born in 1853, the 3rd son of the Hon. Charles Alexander Gore, brother of the 4th earl of Arran. His mother was a daughter of the 4th earl of Bessborough. He was educated at Harrow and at Balliol college, Oxford, and was elected fellow of Trinity college in 1875. He was vice-principal (1880–83) of the theological college at Cuddesdon, and librarian of Pusey Library (1884–93). Gore exercised a wide influence over undergraduates and the younger clergy, and under his influence the "Oxford Movement" underwent a change which to the survivors of the old school of Tractarians seemed to involve a break with its basic principles. "Puseyism" had based itself on authority and tradition, and repudiated any compromise with the modern critical and liberalizing spirit. Gore, starting from the same basis of faith and authority, set himself the task of reconciling the principle of authority in religion with that of scientific authority by attempting to define their respective spheres of influence. In 1889 he published two works, The *Church* and the Ministry, a vindication of the principle of Apostolic Succession in the episcopate against the Presbyterians and other Protestant bodies; and Roman Catholic Claims, a defence of the Anglican Church and Anglican orders against the Roman Catholics.

So far his published views had been in consonance with those of the older Tractarians. But in 1890 there appeared under his editorship Lux Mundi, a series of essays by different writers, being an attempt "to succour a distressed faith by endeavouring to bring the Christian Creed into its right relation to the modem growth of knowledge, scientific, historic, critical; and to modern problems of politics and ethics." Gore himself contributed an essay on "The Holy Spirit and Inspiration." The book produced a profound effect far beyond the borders of the English Church, and the High Church movement developed thenceforth on "Modernist" rather than Tractarian lines.

In 1891 Gore delivered the Bampton lectures before the university. He chose for his subject the Incarnation, developing the doctrine, the enunciation of which in Lux Mundi had caused so much heart-searching. This is an attempt to explain how it came that Christ, though incarnate God, could be in error, *e.g.*, in his citations from the Old Testament. He interpreted St. Paul's saying (2 Phil. ii, 7) that Christ "emptied himself and took upon him the form of a servant" (*ἑαυτὸν ἐκένωσεν μορφὴν δουλοῦ λαβῶν*) as meaning that Christ, on his incarnation, became subject to all human limitations, and had, so far as his life on earth was concerned, stripped himself of all the attributes of the Godhead, including the Divine omniscience, the Divine nature being, as it were, hidden under the human.[1]

In 1893 Dr. Gore resigned his principalship and became vicar of Radley, a small parish near Oxford. In 1894 he became canon of Westminster. Here he gained commanding influence as a preacher and in 1898 was appointed one of the court chaplains. In 1902 he became bishop of Worcester and in 1905 was installed bishop of Birmingham, a new see, the creation of which had been mainly due to his efforts. While adhering rigidly to his views on the divine institution of episcopacy, Dr. Gore cultivated friendly relations with the ministers of other denominations, and advocated co-operation with them in all matters when agreement was possible. In social questions he became one of the leaders of the group of High Churchmen known, somewhat loosely, as Christian Socialists. He worked actively against the sweating system, pleaded for European intervention in Macedonia, and was a keen supporter of the Licensing Bill of 1908. In 1892 he founded the clerical fraternity known as the Community of the Resurrection. Its members are priests, who are bound by the obligation of celibacy, live under a common rule and with a common purse. Their work is pastoral, evangelistic, literary and educational. In 1898 the House of the Resurrection at Mirfield, near Huddersfield, became the centre of the community; in 1903 a college for training candidates for orders was established there, and in the same year a branch house, for missionary work, was set up in Johannesburg in South Africa.

From 1911 to 1919 Dr. Gore was bishop of Oxford; he then resigned and settled in London. Dr. Gore's works include The *Incarnation* (Bampton Lectures, 1891); The Creed of the Christian (1895); The Body of Christ (1901); The New Theology and the Old Religion (1908); Orders and Unity (1910); The Question of Divorce (1911); The Religion of the Church (1916); Belief in God (1921); The Holy *Spirit* and the Church (1924); Can We Then *Believe?* (1926); and expositions of The Sermon on the Mount (1896), *Ephesians* (1898), Romans (1899) The Epistles of *St.* John (1920). Dr. Gore died Jan. 17, 1932.

GOREE, an island in Senegal, off the west coast of Africa. It lies at the entrance of the large natural harbour formed by the peninsula of Cape Verde. The island, some 900 yd. long by 330 broad, and 3 mi. distant from the nearest point of the mainland, is mostly barren rock. The greater part of its surface is occupied by a town, formerly a thriving commercial entrepôt and a strong military post. With the rise of Dakar (*q.v.*), c. 1860, on the adjacent coast, Goree lost its trade and its inhabitants, mostly Jolofs, had dwindled in 1905 to about 1,500. Its healthy climate, however, makes it useful as a sanatorium. Goree was first occupied by the Dutch, who took possession of it early in the 17th century. It was captured by the English under Commodore Holmes in 1663, but retaken in the following year by de Ruyter. The Dutch were finally expelled in 1677 by the French under Admiral d'Estrées. Goree subsequently fell again into the hands of the English, but was definitively occupied by France in 1817 (see SÉNEGAL: History).

GORELL, JOHN GORELL BARNES, 1ST BARON (1848–1913), English judge, was born at Liverpool on May 16, 1848, the son of Henry Barnes, a shipowner. He was educated at Peterhouse, Cambridge. He began as a solicitor, but was called to the bar in 1876 becoming Q.C. in 1888. He was an expert in Admiralty cases, and in 1892 was made a judge of the Probate, Divorce and Admiralty division, becoming its president in 1905. He was made privy councillor in 1905, and in 1909 raised to the peerage. In 1909 he became chairman of the royal commission on divorce. Lord Gorell, who married in 1881 Mary, daughter of Thomas Mitchell, died at Mentone on April 22, 1913.

See J. E. G. de Montmorency, John *Gorell* Barnes, First Lord *Gorell* (1920).

GORETTI, SAINT MARIA TERESA (1890–1902), a devout Italian girl who was murdered while resisting attempted rape. She was born at Corinaldo on Oct. 16, 1890, the eldest child of farm workers. Her father died shortly after the family had moved to Nettuno in 1900. Wnile her mother worked in the fields, Maria looked aiter the house and younger children. On July 5, 1902, a youth of 20, Alessandro Serenelli, who lived in the same house, mortally wounded her with a stiletto when she resisted his attempt to ravish her. She died, after forgiving him, on July 6, which is kept as her feast day. She was canonized in 1950. After his release from prison, Serenelli received forgiveness from Maria's mother in 1947.

[1]*Cf.* the Lutheran theologian Ernst Sartorius in his Lehre von der *heiligen Liebe* (1844), Lehre vol. ii. pp. 21 et *seq.*: "the Son of God veils his all-seeing eye and descends into human darkness and as child of man opens his eye as the gradually growing light of the world of humanity, until at the right hand of the Father he allows it to shine forth in all its glory."

See J. Carr, *Blessed Maria Goretti* (1949); A. Gits, *A Modern Virgin Martyr* (1956). (H. R. Wn.)

GORGAS, WILLIAM CRAWFORD (1854–1920), U.S. army surgeon, who contributed greatly to the building of the Panama canal by introducing mosquito control to prevent yellow fever and malaria, was born at Mobile, Ala., on Oct. 3, 1854. He was educated at the University of the South, Sewanee, Tenn., and Bellevue hospital medical college, New York city, taking his M.D. in 1879. In 1880 he entered the medical corps of the U.S. army. During the Spanish-American War he served as major in the medical corps, and was sent, after the Santiago expedition, to Havana, where he was in charge of yellow fever patients. From 1898 to 1902 he was in charge of sanitation measures in Havana, and conducted many experiments on the transmission of yellow fever by the mosquito. Because of his success in eliminating yellow fever there he was made assistant surgeon general, U.S. army, with the rank of colonel in 1903.

In 1904 Gorgas was sent as chief sanitary officer to Panamá, where two of the main obstacles to building the canal were yellow fever and malaria (*qq.v.*). In two years he eliminated yellow fever from the canal region. Malaria also was brought under control. In 1907 he was appointed a member of the Isthmian canal commission by Pres. Theodore Roosevelt, and in 1908 was U.S. delegate to the first Pan-American medical congress. He was president of the American Medical association, 1908–09.

In 1913 he was called to the Rand gold mines in South Africa to suggest means for combating the frequent epidemics of influenza. These he found were largely due to crowding the labourers together in barracks.

In 1914 Gorgas was made surgeon general, U.S. army, with the rank of brigadier general, becoming major general in 1915. In 1918 he was retired. He then became the permanent director of the yellow-fever work of the International Health board of the Rockefeller foundation. He went to Central America, and under his direction investigations of yellow fever were made in Guayaquil, Ecuador, and in Guatemala. In 1919 he accepted a contract with Peru to carry out a sanitary program in that country. He died in London, July 3, 1920, and was buried in the Arlington National cemetery, Arlington, Va.

In his honour were established the Gorgas Memorial Institute of Tropical and Preventive Medicine, Inc., Washington, D.C., and the Gorgas Memorial Laboratory of Tropical Research, Panamá.

GORGEI, ARTHUR (1818–1916), Hungarian soldier, was born at Toporcz, in upper Hungary, on Jan. 30, 1818, of a Saxon family. In 1837 he entered the Hungarian bodyguard, transferring in 1842 to the Palatine hussars. In the revolutionary war of 1848, Gorgei offered his sword to the Hungarian government. Entering the Honvéd army with the rank of captain, he was employed in the purchase of arms, and soon became major and commandant of the national guards north of the Theiss (Tisa) river.

After various successes over the Croatian forces, notably at Ozora, where 10,000 prisoners fell into his hands, Gorgei was appointed commander of the army of the Upper Danube, but when Windischgrätz advanced across the Leitha (Dec. 15), he retreated, despite the remonstrances of Kossuth, whom he disliked; and on Jan. 5, 1849 he issued a public manifesto, blaming the Government for Hungary's recent failures. After conducting operations independently and with Klapka, he was appointed Hungarian commander-in-chief after the battle of Kapolna (Feb. 1849) and won a series of brilliant victories. The relief of Komoru (April 22) forced the Austrian troops to evacuate Hungary, and on May 21 Gorgei took Buda.

Meanwhile Kossuth at Debreczen had proclaimed Hungary a republic. Gorgei, who had, strangely enough, a strong dislike of Magyars, refused a field-marshal's baton but consented to become minister of war, while retaining the command of the troops in the field. The Russians had now intervened in the struggle, the allies were advancing into Hungary on all sides, and Görgei was defeated by Haynau at Pered (June 20–21). Kossuth resigned his position as dictator. Gorgei took his place, and finding the military position hopeless, surrendered at Vilagós to the Russian commander (Aug. 13). Alone of the ex-Austrian officers in his force, Gorgei escaped court-martial, at the tsar's personal intervention. He was interned at Klagenfurt till 1867, when he was pardoned and returned to Hungary, but took no part in public life, as his surrender and the personal pardon granted him led the Hungarians to accuse him of treason. After some years work as a railway engineer he retired to Visegrád, where he lived in retreat until his death on May 21, 1916.

Gorgei wrote a justification of his operations (*Mein Leben und Wirken in Ungarn 1848–1859* (Leipzig, 1852), an anonymous paper under the title *Was verdanken wir der Revolution?* (1875), and a reply to Kossuth's charges (signed "Joh. Demár") in *Budapesti Szemle*, 1881, 25–26. *See* also A. G. Horn, *Görgei, Oberkommandant d. ung. Armee* (Leipzig, 1850); Kinety, *Görgei's Life and Work in Hungary* (1853); and Hungary: *History*.

GORGES, SIR FERDINANDO (*c.* 1566–1647), English colonial pioneer in America and the founder of Maine, was born in Somersetshire, England, probably in 1566. From youth both a soldier and a sailor, he was a prisoner in Spain at the age of 21, having been captured by a ship of the Spanish Armada. In 1589 he was in command of a small body of troops fighting for Henry IV. of France, and after distinguishing himself at the siege of Rouen was knighted there in 1591. In 1596 he was commissioned captain and keeper of the castle and fort at Plymouth and captain of St. Nicholas Isle; in 1597 he accompanied Essex on the expedition to the Azores; in 1599 assisted him in the attempt to suppress the Tyrone rebellion in Ireland, and in 1600 was implicated in Essex's own attempt at rebellion in London. In 1603, on the accession of James I., he was suspended from his post at Plymouth, but was restored in the same year and continued to serve as "governor of the forts and island of Plymouth" until 1629, when, his garrison having been without pay for three and a half years, his fort a ruin, and all his applications for aid having been ignored, he resigned. About 1605 he began to be greatly interested in the New World; in 1606 he became a member of the Plymouth Company, and he laboured zealously for the founding of the Popham colony at the mouth of the Sagadahoc (now the Kennebec) river in 1607. For several years following the failure of that enterprise in 1608 he continued to fit out ships for fishing, trading and exploring, with colonization as the chief end in view. He was largely instrumental in procuring the new charter of 1620 for the Plymouth Company, and was at all times of its existence perhaps the most influential member of that body. He was the recipient, either solely or jointly, of several grants of territory from it, for one of which he received in 1639 the royal charter of Maine (*see* Maine). In 1635 he sought to be appointed governor-general of all New England, but the English Civil War—in which he espoused the royal cause—prevented him from ever actually holding that office. A short time before his death at Long Ashton in 1647 he wrote his *Briefe Narration of the Originall Undertakings of the Advancement of Plantations into the Parts of America.* He was an advocate, especially late in life, of the feudal type of colony.

See J. P. Baxter (ed.), *Sir Ferdinando Gorges and his Province of Maine* (Boston, 1890, in the Prince Society Publications), the first volume of which is a memoir of Gorges, and the other volumes contain a reprint of the *Briefe Narration*, Gorges's letters, and other documentary material. Also Henry Sweetser Burrage, *Gorges and the Grant of the Province of Maine*, 1622 (1923); and Raymond Gorges, "Sir Frederick Gorges and His Connection with the Essex Rebellion," *Soc. of Colonial Wars, Publication No. 37* (1926).

GORGET, the name applied after about 1480 to the collar-piece of a suit of armour (O.Fr. *gorgete*, dim. of *gorge*, throat). It was generally formed of small overlapping rings of plate and attached either to the body armour or to the armet. It was worn in the 16th and 17th centuries with the half-armour, with the plain cuirass, and even occasionally without any body armour at all. During these times it gradually became a distinctive badge for officers, and as such it survived in several armies—in the form of a small metal plate affixed to the front of the collar of the uniform coat—until after the Napoleonic wars.

GORGIAS (*c.* 483–376 B.C.), Greek sophist and rhetorician who made important contributions to rhetorical theory and practice, was a native of Leontini in Sicily. In 427 he headed an embassy to ask for Athenian help against the Syracusans. He later came to reside permanently in Greece, where he became a professional teacher of rhetoric. He died at Larissa in Thessaly. Two surviving rhetorical exercises, the *Helen* and the *Palamedes*, are probably genuine, and there are fragments of speeches. In a lost work, *On Nature or on That Which Is Not*, which is summarized by Sextus Empiricus and in the pseudo-Aristotelian treatise *De Melisso, Xenophane, Gorgia*, he argued that there is no being; or that if there is being, it cannot be known; or that if there is being and it can be known, it cannot be communicated to others. He is a central figure in Plato's *Gorgias*, but Plato treats him as a rhetorician rather than as a philosopher.

For fragments and testimonia *see* H Diels and W. Kranz, *Fragmente der Vorsokratzker*, vol. ii, 7th ed. (Berlin, 1954). For his philosophy *see* SOPHISTS; also M. Untersteiner, *The Sophists*, Eng. trans., vol. i, ch. iv–ix (London, New York, 1954) (speculative). For Gorgias as a rhetorician *see* F. Blass, *Die attische Beredsamkeit*, vol. i (Leipzig, 1887). (G. B. KD.)

GORGON, GORGONS, a figure or figures in Greek mythology. Homer speaks of only one Gorgon, whose head is represented in the *Iliad* (v. 741) as fixed in the centre of the aegis of Zeus. In the *Odyssey* (xi. 633) she is a monster of the underworld. Hesiod increases the number of Gorgons to three—Stheno (the mighty), Euryale (the far-springer) and Medusa (the queen), and makes them the daughters of the sea-god Phorcys and of Keto. Their home is on the extreme west; according to later authorities, in Libya (Hesiod, *Theog.* 274; Herodotus II. 91; Pausanias II. 21). The Attic tradition, reproduced in Euripides (*Ion*, 1002), regarded the Gorgon as a monster, produced by Ge to aid her sons the giants against the gods and slain by Athena.

The Gorgons are represented as winged female creatures; their hair consists of snakes; they are round faced, flat nosed, with tongues lolling out and with large projecting teeth. Medusa was the only one of the three who was mortal; hence Perseus was able to kill her by cutting off her head. From the blood that spurted from her neck sprang Chrysaor and Pegasus, her two sons by Poseidon. The head, which had the power of turning all who looked upon it into stone, was given to Athena, or buried in the market-place of Argos. The hideously grotesque original type of the Gorgoneion, as the Gorgon's head was called, was used generally as an amulet, a protection against the evil eye. Heracles is said to have obtained a lock of Medusa's hair from Athena and given it to Sterope, the daughter of Cepheus, as a protection for the town of Tegea against attack (Apollodorus II. 144). Later classical art showed Medusa as coldly beautiful; the realists of Hellenistic times gave her face an agonized expression. Various silly rationalistic accounts are given by late authors. More reasonable is the explanation of anthropologists that Medusa, whose virtue is really in her head, was originally a ritual mask. It also is possible that the staring or pursuing faces, common in nightmares, have a good deal to do with her.

BIBLIOGRAPHY.—N. G. Polites (Ὁ περὶ τῶν Γοργόνων μῦθος παρὰ τῷ Ἑλληνικῷ λαῷ, 1878) gives an account of the Gorgons, and of the various superstitions connected with them, from the modern Greek point of view, which regards them as malevolent spirits of the sea. W. H. Roscher, *Die Gorgonen und Verwandtes* (1870); J. Six, *De Gorgone* (1885), on the types of the Gorgon's head; articles by Roscher and Furtwangler in Roscher's *Lexikon der Mythologie*, by G. Glotz in Daremberg and Saglio's *Dictionnuire des antiquités*; Jane E. Harrison, *Prolegomena to the Study of Greek Religion* (1903).

GORGONZOLA, a town of Lombardy, Italy, province of Milan, from which it is 11 mi. E.N.E. by steam tramway. Pop. (1951) 5,948 (town); 7,444 (commune). It produces the well-known Gorgonzola cheese.

GORI, a town in the Georgian S.S.R. northwest of Tiflis, on the river Kura; altitude, 2,010 ft., lat. 42° 0′ N., long. 44° 7′ E. Population (1933) 13,100. It is the centre of a corn and wine district. The climate is delightfully cool in summer, owing to refreshing mountain breezes, though these are disagreeable in winter. It has timber mills and manufactures railway sleepers, and a jam industry.

Gori was founded (1123) by the Georgian king David II, the Builder, for the Armenians who fled their country on the Seljūk invasion. The earliest remains of the fortress are Byzantine; it was thoroughly restored in 1634–1658, but destroyed by Nadir Shah of Persia in the 18th century. There is a church constructed in the 17th century by Capuchin missionaries from Rome. Five miles east of Gori is the remarkable rock-cut town of Uplis-Tsikhe, which was a fortress in the time of Alexander the Great of Macedon, and an inhabited city in the reign of the Georgian king Bagrat III (975–1014).

GORILLA, the largest of the anthropoid (manlike) apes, inhabiting forest regions of West Africa from the Cameroons to the Congo river and represented by a somewhat different form in mountainous regions of the eastern Belgian Congo. The popular reputation of the giant ape (*Gorilla gorilla*) is largely due to the writings of the explorer Paul B. du Chaillu in 1861 and later. In 1903 a somewhat different type of gorilla was discovered in high mountains of the eastern Belgian Congo, where it thrives at an altitude of 10,000ft. and is protected from the cold by much longer and thicker fur than the western form. This mountain species, or race, is known as *Gorilla beringei*.

Though nearly related to the chimpanzee, the gorilla is a far larger and heavier animal, the males attaining a weight of 450 lb. or more, and a standing height of 5½ feet. The naked skin of the face is black and wrinkled; the hair in general black, commonly with a reddish tinge on the crown and tending to become grey on the back in adult males. The animals inhabit dense forests, commonly in small family groups, feeding on fruits and tender shoots and occasionally raiding plantations. The West African gorillas construct sleeping nests in the branches of trees, which seem to be used chiefly by the females and young. These beds, commonly used only for a single night, are also sometimes constructed on the ground; the American explorer Carl Akeley always found them thus placed by the mountain gorilla. Adult males, owing probably to their great weight, generally remain on the ground. The gorilla is shy and not usually inclined to attack man unless provoked in which case the males are extremely dangerous. A peculiar habit, mentioned by du Chaillu, and observed in all captive gorillas, is a rapid drumming on the chest with both hands. Comparatively few gorillas have been kept in captivity and most of these have survived for only a short time. They seem to react far less favourably to captivity than the chimpanzee, lacking the friendly curiosity, imitativeness and general social adaptability of that animal, and exhibiting in contrast a self-centred repression and lack of interest in their surroundings. A few examples, however, captured when quite young have remained fairly tractable up to the age of five or six years.

The American psychologist R. M. Yerkes, as a result of extensive observations and experiments on the mentality of a young female mountain gorilla, found that this animal showed considerable ability in the solution of problems involving the use of sticks as tools, stacking boxes to secure suspended food, and in experiments involving multiple choice and delayed response. Some insight, memory and anticipation of experience were clearly demonstrated. Though he cautiously avoids generalizing from a single case, Yerkes finds this gorilla, as "compared with chimpanzees and orang-utans of like age . . . remarkably slow in adaptation and limited in initiative, originality and insight." (*See* CHIMPANZEE and PRIMATES.) (J. H. McG.; X.)

GORINCHEM or GORCUM, a town of Holland in the province of south Holland, on the right bank of the Merwede at the confluence of the Linge, 16 mi. by rail E. of Dordrecht. It is connected by the Zederik and Merwede canals with Amsterdam. Pop. (1947) 14,802. Gorinchem possesses several old houses, and overlooking the river are some fortified gateways of the 17th century. It has an old church dedicated to St. Vincent. Gorinchem possesses a good harbour, and a considerable trade in grain, hemp, cheese, potatoes, cattle and fish, the salmon fishery being noted. At three miles distance is the mediaeval castle of Loevestein, where Hugo Grotius was kept a prisoner until he escaped in 1619, hidden in a carton loaded with bboks.

GORING, GEORGE GORING, LORD (1608–1657), English Royalist, soldier, son of George Goring, earl of Norwich, was born on July 14, 1608. He served in the Dutch army, and was lamed at Breda in 1637. Returning in 1639 he became governor of Portsmouth, and won favour with parliament by betraying the "First Army Plot." He then became a Royalist, and obtained Dutch recruits in Dec. 1642. In March 1643 he defeated Fairfax at Seacroft Moor, but was taken prisoner in May. In April 1644 he effected an exchange, and commanded the Royalist left at Marston Moor, being routed by Cromwell. Later, as lieutenant-general of the Royalist horse, his excesses gave the Royalist cause a bad name. In 1645 he went to relieve Oxford, was engaged in the operations round Taunton, and on July 10 was defeated by Fairfax at Langport. He retired in November. Later he commanded some English regiments in the Spanish service.

GORING, HERMANN (1893–1946), German politician, was born on January 12, 1893, and joined the army in 1912. During World War I he transferred to the air arm, in which he won the highest honour "pour le mérite," and commanded the Richthofen squadron in 1918. He became an early associate of Adolph Hitler (*q.v.*), and was wounded in the Munich putsch (Nov. 1923). Goring was one of the first nazi members of the reichstag and in 1932 he became president of that body. When Hitler became chancellor in Jan. 1933, Goring was made reich minister for air and Prussian minister president and minister of the interior. In 1940 Hitler conferred the newly created title of marshal of the reich on him. During World War II he had supreme control over Germany's economic life, and was generally regarded in Germany as second only to Hitler. He was indicted as a war criminal and sentenced to hang by the International Military Tribunal at Nürnberg, Germany, on Oct. 1, 1946, but committed suicide on Oct. 16.

GORIZIA (German *Görz;* Slovene *Gorica*), the capital of a province in Venetia Giulia, Italy, 25 mi. east of Udine by rail. Pop. (1936) 30,265 (town); 46,640 (commune). It lies on the left bank of the Isonzo in a valley almost surrounded by hills. It is the seat of an archbishopric. The richly decorated 17th-century church of St. Ignatius was built by the Jesuits. The old castle, formerly the seat of the counts of Gorizia, dominates the town. Owing to its mild climate, Gorizia was called the Nice of Austria.

Its topographical position made Gorizia the centre of important battles in World War I. On the right bank of the river the village of Podgora, opposite Gorizia, with the hill of the same name dominating, constituted one of the most formidable bulwarks of the Austrian bridgehead, and the Sabotino, farther north, with its vast network of dugouts and caverns, capable of sheltering many regiments, was the other. Repeated attacks on the two hills from June 1915 onward were repulsed with heavy loss, and the attempts to capture the Oslavia saddle between them resulted in desperate engagements at various points which were captured and lost many times. In the general offensive against Gorizia of Aug. 1916, after elaborate preparations conducted by Colonel (later Field Marshal) Badoglio, Hill 188, Oslavia, the Sabotino and Podgora were finally captured with comparatively small loss, and the operations on San Michele having been equally successful, the Italians were able to occupy Gorizia on the 8th. The positions north and east were never completely held, owing to heavy enemy fire, while those to the east remained for the most part in Austrian hands. After Caporetto (Oct. 1917) Gorizia itself had to be evacuated together with all the positions on both banks of the Isonzo. It was reoccupied after Vittorio Veneto (Oct. 1918). The town, which suffered great damage, was almost entirely reconstructed.

GORKY, MAXIM (1868–1936), pen name of the Russian author Alexey Maximovich Peshkov, born at Nizhni-Novgorod. His father, an upholsterer, died when the boy was five; his mother married again, and he grew up in the family of his maternal grandfather, a dyer, whose affairs went from bad to worse. At nine, the boy was made to earn his own bread. In the following 15 years he changed many trades, and covered in search of work all east and south Russia from Nizhni to the Danube and to Georgia. At the same time he contrived to give himself an education, read voraciously and early began to write. While at Tiflis, where he was working in the railway workshops, he succeeded in getting published a story in a local daily, over the signature that has become famous. He now became a provincial journalist, and in 1895 a tale of his (Chelkash, first Eng. trans. 1902) was accepted by a leading St. Petersburg review. Two years later his stories appeared in book form. The success was unprecedented. Gorky found himself placed in public opinion by the side of Tolstoy. Before long his fame crossed the frontier and he became one of the foremost world celebrities. His play The Lower Depths (*Na* Dne, 1903, Eng. trans. 1912) had a run of almost two years at Berlin. His association (from 1899) with the Social Democrats brought on him police persecution, but this only increased his popularity at home. In 1905 he took an active part in revolutionary activities, and in 1906 left Russia for an anti-tsarist campaign abroad. In 1907 he settled in Capri. About the same time he contracted a friendship with Lenin. In 1913 he returned to St. Petersburg and started a review (*Letopis*). During World War I he took a pacifist attitude, and in 1917 he gave his support to the bolsheviks, After their victory he became the official spokesman for culture before the new government, and did much to alleviate the hardships of the intellectual- classes, as well as to preserve cultural treasures. In 1922 his health compelled him to go abroad. After a stay in Germany, he settled at Sorrento. In 1928 he visited the U.S.S.R., where he was given an enthusiastic reception. Gorky's literary work falls into three periods. In the '90s he wrote the short stories that first made him famous. Their subject matter is taken mainly from the lives of tramps and social outcasts, whom he represents with a mixture of outspoken realism and romantic gusto. It was the latter quality that most endeared them to the Russian public. The romantic colouring he gave his tramps and thieves has become somewhat the worse for wear, but the best of these early stories (*My* Fellow-traveller and Twenty-Six Men and a Girl, Eng. trans. 1902) fall little short of being masterpieces. After 1899 Gorky wrote longer and more ambitious novels and plays, which aimed at presenting a broad and comprehensive picture of Russian life and at finding the solution of burning social problems. Most of them lack constructive unity, and are disfigured by interminable conversations on "the meaning of life." The plays especially are hopelessly formless. Toward 1906 Gorky's popularity with the intelligentsia began to decline, but it increased among the working class, who came to regard him as their literary spokesman. His proletarian novel Mother (1907, Eng. trans. 1921, publ. in U.S.A.) which has been turned into a splendid film by the soviet film director Pudovkin, is not, however, by itself a work of great value. Gorky's third period begins with the publication in 1913 of Childhood (Eng. trans. 1915), the first part of an autobiographical trilogy, of which the other parts are In the World (V Lyudyakh, 1915, Eng. trans. 1917) and My Universities (1923, Eng. trans. Reminiscences of my *Youth,* 1924). Together with a volume of Recollections (it includes the famous Recollections of Tolstoy, Eng. trans. 1920, a document of quite exceptional value), and Fragments from my Dzary (1924, Eng. trans. 1924) these works are the best Gorky has written. The penetrating and plastic realism with which he presents a vast gallery of Russian characters is unrivalled. After 1926 Gorky turned to fiction dealing with social problems: The *Artamonov's* Business (trans. Decadence, 1927); The Bystander (trans., B. G. Guerney, 1930). (D. S. M.)

GORKY, region, U.S.S.R.: see NIZHEGOROD.

GORKY, U.S.S.R.: see NIJNI-NOVGOROD.

GÖRLITZ, a town in the Prussian province of Silesia, Germany, on the Neisse, 62 mi. E. from Dresden on the railway to Breslau, and at the junction of lines to Berlin, Zittau and Halle. Pop. (1939) 93,669. Gorlitz is an ancient village which, as Drebenau, received civic rights at the beginning of the 12th century. After a fire in 1131, it was rebuilt and called Zgorzelice. About the end of the 12th century it was strongly fortified, and for a short time it was the capital of a duchy of Gorlitz. It also suffered considerably in the Thirty Years' War and the Seven Years' War. In 1815 the town, with the greater part of Upper Lusatia, came into the possession of Prussia. Gorlitz is wealthy, owing to the extensive municipal forests of 70,000 acres. The fine Gothic church of St. Peter and St. Paul dates from the 15th century; the Frauen Kirche (end 15th cent.) possesses a fine portal and choir in pierced work; the Kloster Kirche, restored in 1868, has handsome choir stalls and a carved altar dating from 1383. The old bastion, named Kaisertrutz, has been used as a guardhouse and armoury. Near the town is the chapel of the Holy Cross, where there is a model of the Holy Sepulchre at Jerusalem made during the 15th century. In the public park there is a bust of Schiller and a monument to Alexander von Humboldt, also a statue of the mystic Jakob Böhme (1575–1624). There is a large library and a rich collection of antiquities, coins and articles of *virtu*. Görlitz, next to Breslau, is the largest and most flourishing commercial town of Silesia, and is classic for study of German Renaissance architecture. Cloth is manufactured, also various linen and woollen wares, machines, railway wagons, glass, sago, tobacco, leather, chemicals and tiles.

GÖRRES, JOSEPH VON (1776–1848), German writer, was born on Jan. 25, 1776, at Coblenz, and educated at a Latin college under clerical direction. Young Görres sympathized with the French Revolution, harangued the revolutionary clubs in the Rhineland, and insisted on the unity of interests which should ally all civilized States. He then began a Republican journal called *Das rote Blatt* (afterwards *Rübezahl*), in which he eloquently defended French principles.

After the peace of Campo Formio (1797) there was some hope that the Rhenish provinces would be constituted into an independent Republic. In 1799 the provinces sent to Paris an embassy of which Görres was a member; it arrived two days after Napoleon had assumed the supreme direction of affairs. After much delay he received the embassy; but the only answer they obtained was "that they might rely on perfect justice, and that the French Government would never lose sight of their wants." Görres on his return published a tract called *Resultate meiner Sendung nach Paris,* in which he reviewed the history of the French Revolution. He was thoroughly disillusioned. During the 13 years of Napoleon's dominion Görres lived a retired life. In 1801 he married Catherine de Lasaulx; from 1806 to 1808 he lectured at Heidelberg. With K. Brentano and L. von Arnim he edited the famous *Zeitung für Einsiedler* (subsequently re-named *Tröst-Einsamkeit*), and in 1807 he published *Die deutschen Volksbücher.*

He loved the German folk-tale, not as a vehicle for romantic ideas, but in its stark realism. His versions have none of the fanciful adornments given to the folk-tale by Novalis and Tieck, but are more akin to those of the brothers Grimm. He returned to Coblenz in 1808. He now studied Persian, and published a *Mythengeschichte der asiatischen Welt* (2 vols., 1810) and *Das Heldenbuch von Iran* (1816), a translation of part of the *Shahnama,* the epic of Firdousi. In 1813 he was drawn into the movement for national independence and in 1814 founded the *Rheinische Merkur.* The intense earnestness of the paper, its hostility to Napoleon, and its fiery eloquence secured for it a position unique in the history of German newspapers. Napoleon himself called it *la cinquième puissance.* It advocated a united Germany, with representative government, but under an emperor after the fashion of other days—for Görres now abandoned his early revolutionary ideas. He inveighed most bitterly against the second peace of Paris (1815), declaring that the territory comprising Alsace and Lorraine should have been demanded back from France.

Stein was glad enough to make use of the *Merkur* at the time of the meeting of the congress of Vienna, but Hardenberg in May 1815 warned Görres to remember that he was not to attack France but only Bonaparte. The *Merkur* evinced an antipathy to Prussia, a desire for an Austrian emperor, and also a tendency to pronounced liberalism—which made it most distasteful to Hardenberg and Frederick William III. Görres disregarded the warnings of censorship, and accordingly his paper was suppressed early in 1816 at the instance of the Prussian Government; soon afterwards Görres was dismissed from his post as teacher at Coblenz. In the wild excitement which followed Kotzebue's assassination the reactionary decrees of Carlsbad were framed, and these were attacked by Görres in his pamphlet *Deutschland und die Revolution* (1820). He reviewed the circumstances which had led to the murder of Kotzebue, and, while expressing horror at the deed itself, he urged the danger of repressing the free utterance of public opinion by reactionary measures. The pamphlet was suppressed by the Prussian Government, and orders were immediately issued for the arrest of Görres and the seizure of his papers. He escaped to Strasbourg, and thence went to Switzerland. Görres later became a vehement Ultramontane. King Ludwig of Bavaria gave him the chair of history at Munich. His *Christliche Mystik* (1836–42) was an exposition of Roman Catholic mysticism. Görres died on Jan. 29, 1848.

Görres's *Gesammelte Schriften* (only his political writings) appeared in six volumes (1854–60), to which three volumes of *Gesammelte Briefe* were subsequently added (1858–74). *See* J. Galland, *Joseph von Görres* (1876, 2nd ed. 1877); J. N. Sepp, *Görres und seine Zeitgenossen* (1877) and by the same author, *Görres,* in the series *Geisteshelden* (1896); J. G. Uhlmann, *Joseph Görres und die deutsche Einheits und Verfassungsfrage* (1912); M. Berger, *Görres als politischer Publizist* (1921). A *Görres-Gesellschaft* was founded in 1876 to encourage the Catholic aspect in culture.

GORRIE, JOHN (1802?–1855), U.S. physician and inventor. His parentage and place and date of birth are uncertain, but there is reason to believe that he was born on the island of Nevis in the West Indies and was taken to Charleston, S.C. by his parents in Oct. 1803. He was educated in the schools of Charleston and was graduated from the Western College of Physicians and Surgeons at Fairfield, N.Y. in 1829. After four years in Abbeville, S.C., he set up practice at Apalachicola, Fla. in 1833, soon becoming one of the town's leading citizens. He was elected mayor in 1836 or 1837, but retired to give more time to his profession. Much of his time was taken with the treatment of malaria and other fevers. He foresaw that if sleeping rooms could be cooled, much could be done to prevent or relieve fevers, and thus was led to the invention of the first cool-air machine on record. He received little recognition for this work during his lifetime, but in 1914 he was designated as one of Florida's representatives in Statuary Hall. Dr. Gorrie died June 16 (or June 29), 1855.

GORSAS, ANTOINE JOSEPH (1752–1793), French publicist and politician, son of a shoemaker, was born at Limoges (Haute-Vienne) on March 24, 1752. He set up an army school at Versailles. In 1781 he was imprisoned in the Bicêtre on an accusation of corrupting the morals of his pupils, his real offence being the writing of satirical verse. On Sept. 10, 1792 he was elected to the Convention (Seine-et-Oise). He sat at first with the Mountain, but his agreement with the Girondists became gradually more pronounced; during the trial of Louis XVI. he voted for the king's detention during the war and subsequent banishment. An attack on Marat in the *Courrier* led to a raid on his printing establishment on March 9, 1793, but he escaped to Normandy to join Buzot, and after the defeat of the Girondists at Pacy-sur-Eure he found shelter in Brittany. The Convention passed a resolution forbidding representatives to engage in journalism. On June 2 he was ordered by the Convention to hold himself under arrest. He was imprudent enough to return to Paris in the autumn, where he was arrested on Oct. 6, and guillotined the next day.

See the *Moniteur,* No. 268 (1792), Nos. 20, 70 new series 18 (1793); M. Tourneux, *Bibl. de l'hist. de Paris,* 10,291 *seq.* (1894).

GORSE: *see* Furze, Gorse or Whin.

GORST, SIR JOHN ELDON (1835–1916), English statesman, was born at Preston, the son of Edward Chaddock Gorst, who took the name of Lowndes on succeeding to the family estate in 1853. He graduated third wrangler from St. John's College, Cambridge, in 1857, and was admitted to a fellowship. After beginning to read for the bar in London, he sailed for New Zealand, where he married in 1860 Mary Elizabeth Moore. The Maoris had at that time set up a king of their own in the Waikato district and Gorst, who had made friends with the chief Tamihana (William Thomson), acted as an intermediary between the Maoris and the Government. Sir George Grey made him inspector of schools, then resident magistrate, and eventually civil commissioner in Upper Waikato. Tamihana's influence secured his safety in the Maori outbreak of 1863. In 1908 he published a volume of recollections, under the title of *New Zealand Revisited: Recollections of the Days of my Youth.* He returned to England and was called to the bar at the Inner Temple in 1865, becoming Q.C. in 1875. He sat in parliament for Cambridge from 1865 to 1868. After the Conservative defeat of that year he was entrusted by Disraeli with the reorganization of the party machinery, and in five years of hard work he paved the way for the Conservative success at the general election of 1874. At a bye-election in 1875 he re-entered parliament as member for Chatham, which he continued to represent until 1892. He joined Henry Drummond-Wolff, Randolph Churchill and Arthur Balfour in the "Fourth Party," and he became solicitor-general in the administration of 1885–86 and was knighted. On the formation of the second Salisbury administration (1886) he became under-secretary for India and in 1891 financial secretary to the Treasury. At the general election of 1892 he became member for Cambridge university. He was deputy chairman of committees in the House of Commons from 1888 to 1891, and on the formation of the third Salisbury administration in 1895 he became vice-president of the committee of the council on education (until 1902). Sir John Gorst adhered to the principles of Tory democracy which he had advocated in the days of the fourth party, and took an active interest in the housing of the poor, the education and care of their children, and in social questions generally, both in parliament and in the press. But he was always "independent" in his political action. He objected to Chamberlain's proposals for tariff reform, and lost his seat at Cambridge at the general election of 1906 to a tariff reformer. He then withdrew from the vice-chancellorship of the Primrose League, of which he had been one of the founders, on the ground that it no longer represented the policy of Lord Beaconsfield. In 1910 he contested Preston as a Liberal, but failed to secure election. He died in London on April 4, 1916.

His elder son, Sir J. Eldon Gorst (1861–1911), was financial adviser to the Egyptian government from 1898 to 1904, when he became assistant under-secretary of state for foreign affairs. In 1907 he succeeded Lord Cromer as British agent and consul-general in Egypt. He died at Castle Combe, Wiltshire, on July 12, 1911.

An account of Sir John Gorst's connection with Lord Randolph Churchill will be found in the *Fourth Party* (1906), by his younger son, Harold E. Gorst.

GORTER, HERMAN (1864–1927), Dutch poet, was born on Nov. 26, 1864, at Wormerveer. He taught for some time in the gymnasium at Amersfoort, and then settled at Bussum. His strong impressionistic tendencies colour his three chief publications—Mei, *een Gedichte* (1893), *De School der Poëzie* (1897) and *Pan, een Gedichte* (1912). His translation of Spinoza's *Ethics* appeared in 1895.

See Hauser, *Die niederländische Lyrik von 1875–1900* (1901).

GORTON, SAMUEL (1592–1677), colonial fighter for religious and civil liberty, was born in Gorton, England, in 1592. For a time a clothier in London, he sailed for Boston, Mass., "to enjoy liberty of conscience." Failing to find it there and being involved in religious, political and property disputes at Plymouth, Aquidneck, Providence and Shawomet successively, he went to England, where he published in 1646 *Simplicities Defence against Seven Headed Policie* (reprinted in the R. I. Hist. Soc. *Collections*, vol. ii), giving an account of his grievances against the Massachusetts government.

He returned to Shawomet in 1648 with a letter from the earl of Warwick, after whom he renamed the settlement, and lived there in peace and honour until his death on or before Dec. 10, 1677. He left several religious treatises, both in print and manuscript, some of them surprisingly modern in concept in spite of their quaint phraseology.

Estimates of him have shifted from his contemporaries' denunciations as "a most prodigious minter of exorbitant novelties" and "a man whose spirit was stark drunk with blasphemies and insolences," to his later biographers' tributes as "a forgotten founder of our liberties," "the premature John the Baptist of New England Transcendentalism."

Edward Winslow's attack on Gorton, *Hypocrisie Unmasked* (1646), was issued by the Club for Colonial Reprints (Providence, 1916). Among his biographers are J. M. Mackie in J. Sparks, *Library of American Biography*, 2nd ser., vol. v (184;) ; L. G. Janes (1896), and Adelos Gorton (1907).

GORTYNA or Gortyn, an important ancient city of Crete on the small Lethaeus (Mitropolipotamo) river. It was about three hours distant from the south coast with which it communicated by means of two harbours, Metallum and Lebena. Near the town was the spring, overhung by an evergreen plane tree, which in popular belief marked the scene of the amours of Zeus and Europa.

Gortyna was, next to Cnossus, the largest and most powerful city of Crete, but neither played a conspicuous part in the history of Greece. Under the Romans Gortyna became the metropolis of the island.

Extensive ruins remained in existence at the village of Hagii Deka, including the great inscription containing many of the ancient laws. The ruinous church of St. Titus dates from about the 4th century.

See also Crete, and for a full account of the laws *see* Greek Law.

(J. L. My.)

GÖRTZ, GEORG HEINRICH VON, Baron von Schlitz (1668–1719), Swedish statesman, entered the Holstein-Gottorp service, and after the death of the duchess Hedwig Sophia. Charles XII.'s sister, became influential during the minority of her son, Duke Charles Frederick. His earlier policy aimed at strengthening Holstein-Gottorp at the expense of Denmark. With this object, during Charles XII.'s stay at Altranstädt (1706–07), he tried to divert the king's attention to the Holstein question, and six years later, when the Swedish commander, Magnus Stenbock, crossed the Elbe, Gortz surrendered the fortress of Tonning to the Swedes.

He next attempted to undermine the grand alliance against Sweden by negotiating with Russia, Prussia and Saxony for the purpose of isolating Denmark, or even of turning the arms of the allies against it. The plan foundered on the refusal'of Charles XII to save the rest of his German domains by ceding Stettin to Prussia.

Another simultaneous plan of procuring the Swedish crown for Duke Charles Frederick failed. Gortz first suggested the marriage between the duke of Holstein and the tsarevna Anne of Russia.

On the arrival of Charles XII. from Turkey at Stralsund, Görtz was the first to visit him, and emerged from his presence virtually chief minister. Gortz owed his extraordinary influence to the fact that he was the only one of Charles's advisers who believed, or pretended to believe, that Sweden was still far from exhaustion, or at any rate had a sufficient reserve of power to give support to an energetic diplomacy. Ostensibly, Gortz was only the Holstein minister at Charles's court, in reality he was everything in Sweden except a Swedish subject—finance minister, plenipotentiary to foreign Powers, factotum, and responsible to the king alone, though he had not a line of instructions. His chief financial expedient was to debase, or rather ruin, the currency by issuing copper tokens redeemable in better times; but it was no fault of his that Charles XII., during his absence, flung upon the market too enormous an amount of this copper money for Gortz to deal with. By the end of 1718 the hatred of the Swedes towards him was so intense and universal that they blamed him for Charles XII.'s tyranny as well as for his own.

Gortz hoped to conclude peace with at least some of Sweden's numerous enemies before the crash came and then, by means of fresh combinations, to restore Sweden to her rank as a great power. In pursuance of his "system," Görtz displayed a genius for diplomacy which would have done honour to a Metternich or a Talleyrand. He desired peace with Russia first of all, and at the congress of Aland even obtained relatively favourable terms, only to have them rejected by his obstinately optimistic master. Simultaneously, Görtz was negotiating with Cardinal Alberoni and with the whigs in England. On the sudden death of Charles XII. the whole fury of the Swedish nation fell upon Görtz. After a trial before a special commission which was a parody of justice —the accused was not permitted to have any legal assistance or the use of writing materials—he was condemned to be beheaded, and promptly executed. His death was certainly a judicial murder, and some historians even regard him as a political martyr.

See R. N. Bain, *Charles XII* (1895), *Scandinavia,* ch. 12 (1905); B. von Beskow, *Freiherre Georg Heinrich von Görtz* (1868).

GORZ: *see* GORIZIA.

GOSCHEN, GEORGE JOACHIM GOSCHEN, 1ST VISCOUNT (1831–1907), British economist and administrator. did useful work under both Liberal and Conservative governments in the last part of the 19th century. The son of William Henry Goeschen, a London banker of German origin. he was born in London on Aug. 10, 1831. He was educated in Saxony. at Rugby and at Oriel college. Oxford. where he was president of the union and took a first class in classics in 1853. He became prominent in the banking world early and was made a director of the Bank of England at 27. His *Theory of the Foreign Exchanges* (1861) was long famous. Goschen entered parliament in 1863 as Liberal member for the City of London, a seat he held till 1880, when he was elected for Ripon. He made his mark at once in the house of commons. became a junior minister in Nov. 1865 and sat in the cabinet as chancellor of the duchy of Lancaster for the first half of 1866. In Gladstone's great cabinet of 1868 Goschen was at first president of the poor law board. where he projected useful reforms, and then, from March 1871 to Feb. 1874, first lord of the admiralty. He and the French negotiated (1876) with the khedive in Cairo the decree that established the dual Anglo-French control of Egyptian bonds.

Goschen stoutly opposed Disraeli's policy in the eastern crisis in 1876–78. He did not join Gladstone's government in 1880 because he disapproved of the impending extension of the franchise. but he did accept the post of special ambassador to Constantinople and helped to settle various Balkan frontier questions in 1880–81. He refused Gladstone's successive offers of the viceroyalty of India. a secretaryship of state or the speakership. He found himself more and more at variance with extreme Liberals, and carried East Edinburgh in 1885 against a radical. When Gladstone declared for Irish Home Rule. Goschen opposed him vigorously. But he lost his Edinburgh seat in the election of July 1886 and only returned to the house of commons in Feb. 1887 for St. George's, Hanover square. When Lord Randolph Churchill resigned in Dec. 1886. Goschen took his place as chancellor of the exchequer ("I forgot Goschen." said Churchill) and operated a successful conversion of the national debt in 1888. He was in opposition from 1892 to 1895. and returned to the admiralty as first lord in Salisbury's coalition cabinet (1895–1902) where he supervised large expansions of the fleet. He retired with a viscountcy in 1900. but kept up an interest in politics and economics: he was one of the weightiest free-trade Unionists in the tariff controversy of 1903–06. He became chancellor of Oxford university in 1903. He died at his home in Sussex on Feb. 7, 1907.

One of his brothers, SIR (WILLIAM) EDWARD GOSCHEN (1847–1924), was British ambassador in Berlin on the outbreak of war in 1914. His elder son, GEORGE JOACHIM (1866–1952), who succeeded him as 2nd viscount; was Conservative member of parliament for East Grinstead from 1895 to 1906 and governor of Madras. 1924–29.

See A. R. D. Elliot, *Life of Lord Goschen,* 2 vol. (1911).

(M. R. D. F.)

GOSFORTH, an urban district of Northumberland, Eng.. adjoins Newcastle upon Tyne on its northern side. Pop (1961) 27,072. The Great North road approximately halves the district and provides its main shopping street. Gosforth is a modern and almost entirely residential town for industrial and commercial Tyneside. St. Nicholas parish church was rebuilt on the present site in 1799. In the district. wholly or partly. are two golf courses, three rugby football fields and one cricket field. The Woolsington airport is about 4 mi. to the northwest. Gosforth house, built by James Paine in 1755–64, was restored in 1921 after being burned by suffragettes in 1914. It lies behind the Newcastle race course. (C. S. PE.)

GOSHAWK, *i.e.,* goose hawk (*Accipiter gentilis),* the largest short-winged hawk used in falconry. The genus *Accipiter* may be distinguished from *Falco* by the smooth edges of its beak. its short wings and its long legs and toes. The sexes differ greatly in size.

The goshawk feeds on small mammals. especially squirrels, and birds of all kinds, including game birds and domestic pigeons and poultry. It ranges across central and northern parts of Europe and Asia. south to Corsica. Sardinia Albania and northwest Iran, a dozen races being recognized: the eastern goshawk *(A. g. atricapillus)*, from northwestern Alaska to Michigan and Maine, south in the mountains to Pennsylvania, and the western goshawk *(A. g striatulus)*, from Alaska to California and New Mexico, are well known in America. About 20 other species are found throughout Africa, southern Asia, the Malays and nearby islands and Australia.

GOSHEN, an Old Testament place name of unknown meaning.

1. The region in Egypt in which Jacob and his sons were settled as shepherds (Gen. xlv, 10; xlvii, 1, etc), praised as "the best of the land' (Gen. xlvii. 6). called also. anachronistically, "the land of Rameses" (Gen xlvii, 11). It was spared by the plagues (Ex. viii. 22, in Hebrew text verse 18; ix. 26). Apparently Goshen was situated on the eastern edge of the Nile delta, close to the desert. but. since no certain mention of Goshen (Gesem in the Septuagint) has been found in the Egyptian documents. the exact location is disputed, as is its extent (Judith i, 9, 10 being hyperbolic).

2 One of the districts of southern Palestine conquered by Joshua (Josh. x, 41: xi. 16), probably so called after its main town Goshen (Gosom in the Septuagint), not yet identified, but according to its position in the list of Josh xv. 51 to be found southaest of Hebron. (L. H. GR.)

GOSLAR, a toun in Lower Saxony. Federal Republic of Germany, on the Gose. at the north foot of the Harz. 24 mi. S.E. of Hildesheim and 31 mi. S.S.W. of Brunswick. Pop (1950) 40.689; (1959 est) 40.666.

Goslar, probably founded under Henry the Fowler (920). became important under Otto the Great nhen minerals were discovered there. It nas often the meeting place of Gerinan diets and about 1350 it joined the Hanseatic league. In the middle of the 14th century the famous Goslar statutes, a code of laws, adopted by many other towns, was published. Fires in 1632, 1728 and 1780 damaged the town's prosperity. In 1802 Goslar came into the possession of Prussia, in 1807 it was joined to Westphalia and in 1866 it was, along with Hanover, reunited nith Prussia.

Goslar is surrounded by walls. Among the noteworthy buildings are the "Zwinger," a tower with walls 23 ft. thick. and the market church, in Romanesque style, restored after its partial destruction by fire in 1844, containing a library in which are some of Luther's manuscripts. The old town hall (Rathaus) has interesting antiquities and the Kaiserhaus is the oldest secular building in Germany, built by the emperor Henry III before 1050. A small chapel is all that remained after 1820 of the cathedral of St. Simon and St Jude founded by Henry III about 1040; it contains an old altar supposed to be that of the idol Krodo which formerly stood on the Burgberg near Neustadt-Harzburg. The church of the former Benedictine monastery of St. Mary, or Neuwerk, is Romanesque of the 12th century The house of the bakers' guild is a hotel. Other buildings include the birthplace of Marshal Saxe; a natural science museum. containing a collection of Harz minerals; and a museum of antiquities. Sulfur, copper, silver and other mines are important. The tom, long noted for beer, possesses small manufactures and trades in fruit.

GOSLICKI, WAWRZYNIEC (1533?–1607), Polish bishop, better known under his Latinized name of Laurentius Grimalius Goslicius, nas born about 1533. After having studied at Cracow and Padua, he entered the church, and was successively appointed bishop of Kaininietz and of Posen. It was chiefly through Goslicki's influence that the Jesuits were prevented from establishing their schools at Cracow. He died on Oct. 31, 1607.

Goslicki's principal work is *De optimo senatore,* etc. (1568). Two English translations were published respectively under the titles *A Commonwealth* of *Good Counsaile,* etc. (1607), and *The Accomplished Senator,* translated into English by William Oldisworth (1733).

GOSNOLD, BARTHOLOMEW (d. 1607), English navigator. In 1602, in command of the "Concord." chartered by Sir Walter Raleigh and others, he crossed the Atlantic. coasted from what is now Maine to Martha's Vineyard, landing at and naming Cape Cod and Elizabeth Island (now Cuttyhunk) and giving the name Martha's Vineyard to the island now called No Man's Land, and returned to England with a cargo of furs, sassafras and other cominodities obtained in trade with the Indians about Buzzard's bay. In London he actively promoted the colonization of the regions he had visited and, by arousing the interest of Sir Ferdinando Gorges and other influential persons, contributed toward securing the grants of the charters to the London and Plymouth companies in 1606. In 1606–07 he was associated with Christopher Newport in command of the three vessels by which the first Jamestown colonists were carried to Virginia. As a member of the council he took an active share in the affairs of the colony, seconding the efforts of John Smith to introduce order, industry and system in the colony. He died from swamp fever on Aug. 22, 1607.

See *The Works of John Snzith,* Arber's edition (1884); and J. M. Brereton, *Brief and True Relation of the North Part of Virginia* (reprinted by B. F. Stevens, 1901). an account of Gosnold's voyage of 1602.

GOSPELS, derived from the Anglo-Saxon *godspell,* "good tidings," which translates the Latin *evangelium* (from Greek euaggelion) It is commonly assumed that the term gospel denotes primarily a written account of Jesus' life. In fact. homever. as the German poet-philosopher Johann Gottfried Herder remarked. Christianity did not start with the writing of gospels but with preaching, and Peter's first sermon at Pentecost was already the complete Christian gospel. Indeed. the word was used by the early Christian church in a quite distinct sense long before any written account of Jesus' life existed.

Earliest Christian Use of the Word.—It is quite certain that the term "evangel" (as well as the verb "to evangelize") was first employed in the Greek-speaking church rather than by Jesus and the Aramaic-speaking Christians of Palestine. In the Greek world, this term was widely used for "news" or "message" of any kind—profane or sacred, political or private. A pre-Christian occurrence of the word in connection with the emperor cult is found in the Priene inscription in praise of Augustus (9 B.C.): "The birthday of the God was the beginning of the evangels due to him." In the Greek version of the Old Testament, the Septuagint, the noun is used three times, twice meaning "reward for good news." The verb occurs more frequently, but neither it nor its Hebrew equivalent is used in a technical sense. Only in a few passages (mainly from Deutero-Isaiah) does the word seem to have a special religious meaning, but the influence of these on the early Christian use of the word cannot be proved. Thus it seems to have been a profane word adopted by the Christians to denote the act of proclaiming the message as well as the message itself.

No emphasis can be placed on the etymological meaning "good" news. In certain New Testament passages (Luke iii, 18; Acts xiv, 15; Rev. x. 7 and xiv. 6) it does not mean good news at all but simply nens, and it is elsewhere used as synonymous with other words denoting preaching, proclamation and word. It was used for the oral preaching of the early Christian missionaries (not for written documents), and this meaning continued in use through the 2nd century A.D. Already in the Pauline Epistles (excluding the Pastorals). the term gospel is used frequently (56 times), often in a technical Christian sense. without reference to any content. Whether or not this is an originally Pauline contribution (the noun and verb never occur in this sense in the Johannine literature, James. Jude or II Peter), it is certainly an inner Christian development, without any pagan or Jewish antecedents. The consciousness that there was only *one* saving message, the gospel, is uniquely Christian.

Gospel as a **Name** for Writings.— Paul also provides the first indication of how the term gospel developed into the designation for a written document. I Cor. xv, 1 ff. and Rom. i, 1 ff. speak of the gospel as an orally transmitted formula which describes the Christ-event, Jesus' death and resurrection. A more developed creedal formula is called gospel by Ignatius of Antioch (early 2nd century A.D.). Since our Gospels basically are expanded creedal formulations, gradually extended backward to include the narratives of Jesus' life, it is easy to see why such written accounts later were called Gospels. In the Gospel of Mark, however— apparently the first of these written accounts— the "gospel" is not yet identified with the written book but denotes the history of that revelation which is identical with Jesus' life, death and resurrection.

Nevertheless. Mark's work is the potential beginning of a new use of the term, by which not only the oral preaching of the Christ-event but also its written account could be called gospel. Such use mas transferred to other writings, Matthew and Luke. which include the "remembered words of the Lord," as originally distinct from the oral gospel (cf. I Clem. xiii. 1–2; Acts xx, 35), within the Marcan framework. The earliest witness to this new use of the term is the heretic Marcion (early 2nd century A.D.), who described Luke's Gospel as "the Gospel" in contradistinction to "the Apostolicon" (a collection of Pauline epistles). A few years later Justin Martyr speaks of the "Memoirs of the Apostles" —a term derived from the "remembrance of the words of the Lord"—and in a few instances adds "which are called gospels." This is the first witness to the use of the plural. Since then the word gospel has come to be used for a great number of other unrelated accounts of Jesus' life and collections of his words. such as John's Gospel and numerous noncanonical writings.

The present article deals only with the four Gospels received by the church in general. and mith the history of the tradition which led to their composition. For further information see BIBLE: Canon of the *New* Testament; MATTHEW. GOSPEL ACCORDING TO SAINT; MARK, GOSPEL ACCORDING TO SAINT; LCKE, GOSPEL ACCORDING TO SAINT; and JOHN. GOSPEL OF SAINT.

Formation of the Gospel Tradition.— Between Jesus' crucifixion and the first composition of a written gospel at least one generation elapsed. Older criticism tried to bridge this gap either by reference to the oral testimony of disciples and eyewitnesses, who were said to have written at least one or two of the Gospels (Matthew and John); or by the hypothetical reconstruction of primitive written sources of the canonical Gospels. Later New Testament criticism has attempted to discover the tradition behind the written accounts. So-called form criticism (M. Dibelius. R. Bultmann. V. Taylor, F. C. Grant and others) has opened up the possibility of reconstructing the history of the material incorporated in the Gospels. This is a history of transmitted oral traditions, which were primarily small. independent units (such as single stories or short sayings). and not of extended accounts. oral or written. By isolating these small units or forms, determining their original "life situation," evaluating the motives of alterations and recognizing editorial techniques used when such tradition became written gospel, it is possible to describe the preliterary history of the gospel formation.

The earliest church conceived of Jesus' words and works not as biography or objective history. From the very beginning the "life situation" of all the tradition about Jesus was the preaching and teaching of the church, in the course of which the transmitted stories and sayings served as a guide for the new life of the Christian people. The need of instructing new believers and of defending the faith, the expression of church life in worship and liturgy and the development of theology as a matter concerned mith the saving event in the man Jesus of Nazareth were moving factors in the formation of the tradition. In this sense it was the church that created the gospel tradition.

The traditional material incorporated in the Gospels is basically of two kinds. each with numerous subclassifications: (1) narratives, including legends about the person of Jesus (birth legends, baptism, passion and resurrection), miracle stories (healings and wonders) and tales (such as the Emmaus road incident); and (2) sayings—prophetic and apocalyptic, proverbial, legal, ecclesiastical, Christological and parable. Often also single sayings were transmitted as the central features of little anecdotes, which Dibelius calls paradigms. With regard to form, almost all the above categories have parallels in Hellenistic oral folklore and late Jenish oral traditions. Thus, stories of Greek heroes and Hellenistic wondermen provided a pattern for the legends about

Jesus, and the form of the sayings is clearly patterned after Old Testament prophecy, Jewish apocalyptic and wisdom speculation and rabbinic law. A peculiarly Christian "form" is found only in the narratives centred around the passion of Jesus and in the sayings about the theological significance of Jesus as "the one nho has come." Just as this unique form is integral to the core of the gospel proclamation, so the literary form "gospel" is unique to Christianity. without precedent or parallel. To compare the Gospels with the Greek writing of history or biography would precisely miss their uniqueness. which is rooted in the fact that here the church preached the coming of the divine in a particular historical person—Jesus Christ.

The "Synoptic Problem."--The first three Gospels, Matthew, Mark and Luke, are known as Synoptic Gospels because they have such an agreement in structure, content and wording that they can easily be arranged in parallel columns so as to provide a synoptic view of their content (from Gr. synopsis; *syn,* "along with." *opsis,* "view"). By such an arrangement. the question of the kind of literary relationship that exists among these three Gospels is necessarily forced upon the observer. This question, called the Synoptic problem, has been elaborately studied in modern times.

The traditional solution explains the striking similarities on the basis of the priority of Matthew or of a supposed primitive Matthew in a Semitic language; this is sometimes identified with the so-called Gospel According to the Hebrews (see APOCRYPHA, NEW TESTAMENT). Mark is consequently seen as dependent on Matthew Luke on both Matthew and Mark (and John on all three Synoptic Gospels). This view remains the prevailing Roman Catholic explanation, even if elaborately modified.

Theologians of the rationalistic period were the first to challenge this long-accepted hypothesis. (1) J. J Griesbach (in 1774–75) held that Mark used not only Matthew but also Luke (hypothesis of usage). (2) G. E Lessing (in 1776 and 1778) and J G. Eichhorn (in 1794) argued that all three Synoptics utilize a lost Aramaic gospel (primitive Gospel hypothesis). (3) J G. Herder (in 1796–97) and J C L Gieseler (in 1818) thought this primitive Gospel was transmitted orally (tradition hypothesis). (4) F. Schleiermacher (in 1832) assumed the existence of small written collections or fragments out of which the Evangelists composed their writings (fragments hypothesis).

All these attempted explanations have survived in one form or another, and though all of them certainly contain some truth, most Protestant and some Roman Catholic scholars hold that only one hypothesis explains the Synoptic problem satisfactorily the so-called two-source hypothesis. The evidence given by K. Lachmann (in 1835), that Mark as the earliest Gospel must have been the source for both Matthew and Luke, was supplemented by the philosopher C. H Weisse (1838). who suggested a second source besides Mark which Matthew and Luke also used. Through the work of H. J Holtzmann (1863), B. H. Streeter (1925) and many others, the two-source hypothesis has taken the following form, in which it is widely accepted among Protestant scholars:

1. Matthew and Luke used the Gospel of Mark, from which they drew most of their narrative material as well as the basic outline of the life of Jesus.
2. Matthew and Luke used a second source (Q), no longer extant. which contained for the most part only sayings.
3. Matthew and Luke each had one or more other sources for the material peculiar to their respective Gospels.

Mark.—The hypothesis may be stated as follows: Mark, either in its present form or in a slightly different earlier Greek form, was the first written Gospel and was a source for Matthew and Luke.

Of the 661 verses contained in the authentic text of Mark, more than 600 are reproduced or represented in Matthew and about 350 in Luke. Only 31 verses in Mark are wholly unrepresented in either Matthew or Luke. Furthermore. in the material common to all three Gospels. there is very seldom verbatim agreement of Matthew and Luke against Mark. although such agreement is common between Mark and Matthew or Mark and Luke or all three. Where Matthew and Luke agree against Mark, several explanations are possible: (1) secondary harmonization of the texts of Matthew and Luke; (2) Matthew and Luke in particular instances preferred a parallel tradition rather than Mark's wording; (3) possibly the present Mark is slightly different from the recension used by Matthew and Luke.

The following sections in Mark are represented in both Matthew and Luke according to the Marcan sequence. although Matthew and Luke often insert other material into this framework: Mark i, 1–15. 39; ii, 1–iii. 12; iv, 1–12; vi, 14–16, 30–44; viii, 29–ix, 8, 14–37; x. 13–30, 32–34. 46–52; xi, 1–11, 15–19. 27–33; xii. 1–27, 35–40; xiii. 1–20. 24–32; xiv–xv (almost completely) Many Marcan passages not contained in this list are entirely missing in Luke but are still to be found in Matthew, often in the Marcan order; thus. Matt xiv, 1–xxviii, 10 completely follows Mark's order (Mark vi, 14–xvi, 8) throughout without any changes of position. On the other hand the first part of Mark (i, 40–iii, 12 and iv. 1–v. 23) is almost entirely taken over in Luke (v, 12–vi, 19 and viii, 4–56), whereas Matthew often deviates here. These findings cannot be explained except on the supposition that the Greek Gospel of Mark mas the direct source for Matthew and Luke.

It must be emphasized that since Matthew and Luke used the Greek Mark. they cannot be considered as translations from Aramaic prototypes, though, of course, non-Marcan materials in Matthew and Luke may well have a more direct Semitic background.

Q—The postulation of a second common source of Matthew and Luke, the "Saying-Source," conventionally designated Q (from German *Quelle,* "source") constitutes a more complicated problem The sayings found in both Matthew and Luke but absent from Mark are the chief reason for this postulation. Many of these saying parallels show a great verbatim agreement; moreover, they are sometimes given in the same sequence, though usually this is not true on a large scale. Furthermore a number of sayings are "doublets": i e., they are given twice in Matthew or Luke or both, once in a setting from the Marcan context and a second time according to Q. Examples of such doublets are: (1) Matt xiii, 12 (=Luke viii, 18) taken from Mark iv, 25; the same saying in Matt xxv, 29 (=Luke xix, 26) without Marcan parallel (*i.e.,* from Q). (2) Matt. xvi, 24 ff. (=Luke ix. 23 ff.) taken over within the Marcan context from Mark viii, 34 ff ; the same sayings in Matt. x. 38 ff. (=Luke xiv. 27; xvii, 33) from Q

These and other phenomena seem to justify the hypothesis that Q was one written document available to Matthew and Luke alike. But other observations make such a conclusion less certain: within the Q material, Matthew and Luke show less agreement than they do in their reproduction of Mark Especially the sequence and order of the Q material lacks consistency. For this reason attempts to reconstruct Q, though numerous. have remained entirely speculative, at least as far as the original order of sayings in Q is concerned. In addition, the extent of the Q-recension used by Matthew seems to have been different from that used by Luke. Thus. Q certainly was not such a clearly defined written document as was Mark Nevertheless. some statements about Q can be made with relative confidence: (1) it was available to Matthew and Luke as a written source; (2) the language was certainly Greek, although most of the Q material contains distinct "translation Greek" with a strong Semitic flavour. Often such linguistic peculiarities are found in the Q material of both Matthew and Luke in parallel passages, thus indicating that these Q traditions must go back to one and the same translation of an Aramaic original, which might have already existed in a written form.

Attempts have been made to refer to this Aramaic Q a statement about Matthew made by Papias and quoted in Eusebius: "Matthew compiled the sayings in the Hebrew language. and every man translated them as he was able." Papias himself meant to speak of the Gospel of Matthew but his statement in no way fits our Matthew, which is not a collection of sayings and which never existed in an original Aramaic form. Possibly Papias mistook a tradition about an Aramaic Q for a staternent about Matthew But even if Papias thus witnesses to a written Aramaic Q, it could not have contained all the present Q material. In many instances Matthew and Luke do contain parallel sayings that originated from different translations of the same Aramaic saying; on the other hand, a few Q sayings are Greek formulations without Semitic background.

Thus it may be concluded that Q represents the still flexible but at least partly written sayings tradition of the Greek-speaking church, which rested largely on similar Palestinian collections in Aramaic. Though Q reflects certain theological tendencies, mainly those of the first decades of the church in Palestine, it could not be called the work of an "author," and thus is not literature and certainly not a Gospel. Q may have taken written form before the middle of the 1st century and was translated into Greek probably before A.D. 70. The early Greek church, of course, as well as Paul himself, knew sayings of the Lord in the Greek language. But all attempts to prove a direct use of the Saying-Source Q in any other apostolic, postapostolic or 2nd-century literature have failed. After Matthew and Luke used it, Q apparently proved to be no longer of any value and quickly disappeared.

Other Sources.—The authors of Matthew and Luke also clearly depend upon other sources for most of the material peculiar to each of them. Most probably this is the case with the material in the great Lucan digression, or "travel narrative" (Luke ix, 51–xviii, 14), for which a special written source (containing among other traditions the most valuable "great parables") apparently was available to Luke. The infancy stories of Luke, and of Matthew as well, also go back to special traditions, whether written or oral. Finally, the resurrection narrative in Luke is not from Mark but has a tradition of its own. Scholars have tried to reconstruct a "proto-Lucan Gospel," but none of the suggestions is conclusive, although the existence of special literary sources available to Luke cannot be doubted. The character of the material peculiar to Matthew forbids even more the reconstruction of a special proto-Matthew. This material is largely nonliterary, having its origin and life situation mainly in the liturgy and the regulations of the church's life. All attempts to exploit the peculiarities of Matthew and Luke to establish a new hypothesis about the origin of and relationship among the Gospels have not shaken the two-source hypothesis but rather have served to supplement and confirm it.

The Fourth Gospel.—The Gospel According to St. John stands apart. Developments in higher criticism do not even favour dependence of John upon the Synoptic Gospels. Nevertheless, this Gospel is in some ways related to the Synoptic tradition. Its account of Jesus' passion and resurrection is parallel to and evidently more primitive than the source used by Mark. It employs a written narrative containing signs and miracles of Jesus, which again is very close to the tradition recorded in Mark but at the same time shows some rather primitive features. The Johannine tradition about the Baptist also goes back to the same root as the parallel Synoptic accounts and has preserved much valuable information now lost in the Synoptics. On the other hand, John's Gospel always presents the material with its own peculiar interpretation, adding discourses from traditions that have no parallels in the Synoptic Gospels, a feature that gives the Fourth Gospel an entirely different character. In appearance it is more theological, sometimes called more spiritual, yet John's Gospel was written with even more emphasis upon the historicity of the revelation than were the Synoptic Gospels. Thus John presents a mature interpretation of the gospel of revelation in the historic person Jesus of Nazareth, as seen consciously from the distance of a third-generation Christianity in the last decades of the 1st century.

Character of the Gospels.—The oral gospel was not preached in order to give historical or even biographical information; neither did the Gospel literature, as the final fruit of early-Christian preaching, come into existence in the interests of history in the modern scientific (objective) sense of that word. The tradition behind the Gospels was sustained at every stage for the sake of preaching and edification, with apologetic and theological motivation. The Gospels and the tradition behind them must be described as tendentious and slanted. Nonetheless, there is some material of historical value in them. Not only do they attest the fact that Jesus was truly a historic person, but also they include several historical "blocks" that are not entirely dissolved by theological interpretation—the passion narrative, for example, and many of the sayings and parables (especially those that show Jesus' unique eschatological consciousness). Thus the venture of writing a "life of Jesus" remains a legitimate task for the historian.

But for understanding of the character of the Gospels it is important to recognize that even such historical data were handed down only as they served theological purposes and not for their own sake. This does not suggest that the essence of the Gospels is spiritual information or "eternal truth" as opposed to "history." Rather it is the announcement that revelation has come as the Jesus of history. The Gospels present this historical revelation in its true meaning; *i.e.*, history in its real, theological dimension. History and theology, historical Jesus and risen Lord, are thus inseparably bound together in one story. See JESUS CHRIST; see also references under "Gospels" in the Index volume.

GOSPORT, a municipal borough (1922) in the Gosport and Fareham parliamentary division of Southampton, Eng., on a peninsula between the west side of Portsmouth harbour and the Solent, 18 mi. S.E. of Southampton. Pop. (1961) 62,436. Area 9.7 sq.mi. Gosport, originally part of the manor of Alverstoke held by the bishops of Winchester, prospered during the 16th and 17th centuries because of the rising importance of the Royal Navy. Primarily a victualing station, it flourished during the Napoleonic Wars. Later it shared in the navy's development of Portsmouth harbour, and is now the site of many important naval establishments. Gosport was one of the main embarkation areas for the Allied invasion of France on June 6, 1944. The town suffered considerable damage during World War II, and redevelopment schemes were undertaken, chiefly the virtual clearance of parts of the old town and their replacement with industrial and residential developments respectively. Holy Trinity church contains the organ, originally belonging to the duke of Chandos, on which Handel is said to have played. Industries connected with the sea are well established in Gosport, particularly shipbuilding and sailmaking. The other principal industries include the making of wallpaper and paint, radios and radar, tools, air components, pens, clothing and general and light engineering.

GOSS, SIR JOHN (1800–1880), English composer, was born at Fareham on Dec. 27, 1800. His church music includes the anthems "O Taste and See," "O Saviour of the World," and others;

and in the history of the glee he has also an honoured place. He died in London on May 10, 1880.

GOSSAERT, JAN: *see* MABUSE, JAN.

GOSSE, SIR EDMUND (1849–1928), English man of letters, eminent for his valuable work in bringing foreign literature home to English readers, was born in London, Sept. 21, 1849, son of the religious zoologist P. H. Gosse. His early life, recounted in the best and most enduring of his many books, *Father and Son* (1907), followed a pattern common in his generation: a love-hate relationship with a puritan father, followed by escape into the exhilarating world of belles-lettres. Gosse, however, never became an aesthete or a bohemian; he kept to decorous beaten tracks: the British museum, the board of trade (where he was "translator" for nearly 30 years) and the house of lords (librarian: 1904–14).

Gosse was a prolific versifier, translator, literary historian, critic and journalist, and in his own time he was very influential. He had the misfortune, however, to be working just before the modern revolution in standards of scholarship and criticism, so that much of his output now appears amateurish. Moreover, most of his best books, such as his translations of Ibsen (*Hedda Gabler,* 1891; with W. Archer, *The Master-Builder,* 1893), his literary lives and editions (*e.g., Thomas Gray,* 1884; *Donne,* 1899; *Sir T. Browne,* 1905), his literary histories (*18th Century Literature,* 1889; *Modern English Literature,* 1897) and his critical essays (*e.g., Critical Kit-Kats,* 1896; *French Profiles,* 1905), though written with charm and gusto, have been outclassed by subsequent work in these fields. Nevertheless he deserves credit as a pioneer, particularly in the study of Scandinavian and French literature, and English literature of the 17th and 18th centuries. And his evident relish for literature, as a thing to be savoured and enjoyed, is something that modern critics too often lack. In *Father and Son* all Gosse's finest gifts—grace, irony, wit and tolerance—combine to form a minor classic of autobiography. Gosse was knighted in 1925 and died in London, May 16, 1928. (B. WY.)

GOSSE, PHILIP HENRY (1810–1888), British naturalist and popularizer of zoological subjects, was born at Worcester on April 6, 1810. In 1827 he became a clerk in a seal-fishery office at Carbonear, Nfd., where he beguiled the tedium of his life by investigations into natural history. After an unsuccessful interlude of farming in Canada he traveled in the United States, taught for some time in Alabama and returned to England in 1839.

A visit to Jamaica in 1844 led to accounts of the birds of that island and to his *A Naturalist's Sojourn in Jamaica* (1851). For the rest of his life he devoted himself to the description of the animal life, mainly the invertebrates, of the British seas and fresh waters. The nature of the numerous successive popular or semi-popular volumes is shown by specimen titles, such as *A Naturalist's Rambles on the Devonshire Coast* (1853); *Evenings at the Microscope* (1859); and *A Year at the Shore* (1865). His books were illustrated with his own meticulously drawn and coloured figures. Technical accounts of the British sea anemones and corals, and a larger work on the minute rotifers (with C. T. Hudson) retain usefulness for reference.

Gosse's membership in the Plymouth Brethren involved him in the complete rejection of all ideas of evolution. Two years before the appearance of *On the Origin of Species* he expressed the non-evolutionpry position in a unique book, *Omphalos* (1857). Gosse was elected fellow of the Royal society in 1856. He died at St. Marychurch, Devon, on Aug. 23, 1888.

See Peter Stageman *et* al., *Bibliography of the First Editions* of *Philip Henry Gosse, F. R. S.* (1955). (K. P. S.)

GOSSEC, FRANÇOIS JOSEPH (1734–1829), French musical composer, son of a small farmer, was born at the village of Vergnies, in Belgian Hainaut, and became a choirboy at Antwerp. He went to Paris in 1751 and was introduced by Rameau to La Popelinière, a wealthy amateur who made him conductor of his private hand. His first symphony was performed in 1754, and as conductor to the prince de Condé's orchestra he produced several operas and some 30 symphonies. Gossec gave enormous stimulus to the development of orchestral and chamber music in France.

Gossec died at Passy on Feb. 16, 1829.

GOSSON, STEPHEN (1554–1624), English writer, notable for his attacks on the theatre, was baptized at Canterbury, Kent, on April 17, 1554. Educated at Corpus Christi college, Oxford, he became a playwright and actor but later attacked the stage, poetry, music and other pastimes in *The Schoole of Abuse* (1579), probably commissioned by the city authorities. In *The Ephemerides of Phialo* (1579), an imitation of John Lyly's *Euphues,* Gosson parried the first retaliations of the players, mentioning in the appended *Apologie of the Schoole of Abuse* that they had "got one in London to write certaine *Honest excuses."* This spokesman for the players was Thomas Lodge. *Playes confuted in five Actions* (1582) closed Gossun's career as a controversialist. Between 1579 and 1583 he was a tutor. In April 1584 he entered the English college at Rome but later took Anglican orders. His preferment was rapid and in 1600 he was appointed rector of St. Botolph's, Bishopsgate, London, where he died on Feb. 13, 1624. A sermon, a few early occasional poems and the titles of three plays complete his acknowledged work. According to Francis Meres, he also wrote pastoral poetry. The theatre controversy sheds more light on the academic training of the disputants than on the drama. Its literary interest is slight except insofar as Gosson's dedication of *The Schoole of Abuse* to Sir Philip Sidney, for which he was "scorned," may have prompted Sidney to write his *Defence of Poesie* (1595).

GÖTA, a river of Sweden, draining Lake Vener. The name is also applied to the canal which leads from Goteborg to Stockholm The river flows out of the southern extremity of the lake almost due south to the Cattegat, which it enters by two arms enclosing the island of Hisingen, the eastern forming the harbour of the port of Goteborg. The Gota river is 58 mi. long and is navigable for large vessels, a series of locks surmounting the falls of Trollhattan (*q.v.*). Passing the wooded Halleberg and Hunneberg Lake Vener is reached. From Sjotorp, midway on the eastern shore, the western Gota canal leads southeast to Karlsborg. Locks raise it from the Vener level (144 ft.) to 300 ft., and lower it to Lake Vetter (289 ft), which the route crosses to Motala. The eastern canal then descends to Lake Boren, after uhich the canal crosses a rich plain. Lake Rox with its ruined castle of Stjernarp is next traversed. At Norsholm a branch canal connects Lake Glan to the north, giving access to Norrköping. Passing Lake Asplången, the canal follows a cutting, and then resumes an elevated course to Soderkoping, after which the Baltic is reached at Mem. The whole distance from Goteborg to Stockholm is about 360 mi. The length of artificial work on the Gota canal proper is 47 mi.

The idea of a canal dates from 1516, but the construction was organized by Baron von Platten and engineered by Thomas Telford in 1810–32.

GOTARZES or GOTERZES, king of Parthia (c. A.D. 38–51). When the troublesome reign of Artabanus II ended in A.D. 39, he was succeeded by Vardanes, probably his son; but against him rose Gotarzes, who also belonged to the king's family. He soon made himself detested by his cruelty—among many other murders he even slew his brother Artabanus and his whole family—and Vardanes regained the throne in 42; Gotarzes fled to Hyrcania and gathered an army from the Dahan nomads, but the war ended by treaty, as both kings were afraid of their nobles. When Vardanes was assassinated in 47, Gotarzes was acknowledged in the whole empire. He then placed on his coins the usual Parthian titles, "king of kings Arsaces the benefactor, the just, the illustrious (*Epiphanes*), the friend of the Greeks *(Pkilhellen)*," without mentioning his proper name. The hostile party brought from Rome an Arsacid prince, Meherdates (Mithradates), who lived there as hostage, but he was taken prisoner by Gotarzes, who died soon after. According to Tacitus, Gotarzes died of illness; Josephus says he was murdered.

An earlier "Arsakes with the name Gotarzes" appears to have reigned in Babylonia *c.* 87 B.C.

GÖTEBORG (GOTHENBURG), the second city of Sweden and its largest seaport, situated in the valley and on the heights of the Gota alv (Gota river) estuary, the centre being 5 mi. above the river mouth in the Kattegat.

Pop. (1960) 404,349.

Goteborg was founded in 1619 by Gustavus Adolphus II (charter dated June 4, 1621), but earlier urban settlements had already existed on the site. A settlement of the same name had been founded on the island of Hisingen, to the north, by Charles IX, but it had been destroyed by the Danes. A considerable number of the earliest inhabitants of the present town were foreigners. mainly Dutchmen, but also Englishmen, Scots, Belgians and Germans. As a result of the Dutch settlement. Goteborg took on a certain Dutch quality. Evidence of this is still provided by the canals, built in the Dutch style, and by the planning of the city centre.

The city's prosperity was laid in the early 18th century by the founding of the Swedish East India company, and during Napoleon's continental blockade it became Europe's chief market for British goods. A second period of wealth started with the opening of the Gota canal (1832) and the setting up of a transoceanic service. The town was strongly fortified until 1807, and around the main wall a moat was dug, which still encircles the old part of the city. The forts called Skansen Lejonet ("the Lion") and Skansen Kronan ("the Crown") are other relics of the old iortifications. Part of the canal system has been filled in, and in its place are two important streets, Östra Hamngatan and Vastra Hamngatan. Two other principal streets of the old town are Norra Hamngatan and Sodra Hamngatan, one on each side of the Great Harbour canal. Gustav Adolfs Torg (market place), including the town hall (1750), the exchange (meeting place of the city council and the town's administrative centre; 1849), and the law courts (1672, restored 1732, 1817) with an annex (an interesting example of modern Swedish architecture; 1935–37) is also in the old town. In Norra Hamngatan, west of the Kristine church (1648, rebuilt 1780), stand the former office and warehouse buildings of the Swedish East India company (1750–62) and the house of its manager, Nicholas Sahlgren (1753); the company's premises house the Cultural History museum, and the house is occupied by the city finance department. In this part of the town also is the cathedral (1633, rebuilt 1815–25, restored 1956–57). Southward, Ostra Hamngatan continues as Kungsportsavenyen, familiarly called "the Avenue," leading to Gotaplatsen, round which stand the city theatre (1934), the art gallery (1923) and the concert hall (1935).

Outside the old moat and alongside it lies a continuous park area more than a mile long traversed by Nya Allén. At the junction of the Avenue with Nya Allén stands the city's opera house, Stora Teatern (1859). The city contains a university, a technical college, a commercial college, a school of social studies and a navigation school. Museums include the Maritime museum and aquarium, the Natural History museum, and the Rohss Museum of Art and Craits. Among the larger parks are Slottsskogen, with a zoological section and bird lakes, the botanical gardens and the Trädgårdsföreningen (the Garden society). Principal exports are paper, cardboard, timber, paper pulp; imports are mineral oils, fruit and iron. The shipbuilding yards on Hisingen island are the largest in Sweden. Other big industries are the manufacture of ball bearings, cars, textiles and food. (Lo. S.)

GOTHA, a town of Germany, in the district of Erfurt, alternately with Coburg the former residence of the dukes of Saxe-Coburg-Gotha, on the Leine canal, 6 mi. N. of the slope of the Thiiringenian forest. Pop. (1959 est.) 56,470.

Gotha (in old chronicles called *Gotegewe* and later *Gotaha)* existed as a village in the time of Charlemagne. In 930 its lord, the abbot of Hersfeld, surrounded it with walls. It was a town as early as 1200, when it came into the possession of the landgraves of Thiiringen. On the extinction of that line it fell to the electors of Saxony, and later to the Ernestine line of dukes. After the battle of Miihlberg in 1547 the castle of Grimmenstein was partly destroyed, but it was again restored in 1554. At the end of the 16th century it came into the possession of Ernest the Pious. In 1825 it was united to the dukedom of Coburg. The old inner town is encircled by suburbs, and is dominated by the castle of Friedenstein, begun in 1643, lying on the Schlossberg.

The new museum, south of the castle, contains the picture gallery, cabinet of engravings, natural history museum, Chinese museum and a collection of antiquities. The church of St. Margaret has a beautiful portal and a lofty tower (12th century), twice burned down, and rebuilt in its present form in 1652; the church of the Augustinian convent has an altarpiece by the painter Simon Jacobs; and the old town hall dates from the 11th century. The schools include a gymnasium founded in 1524.

Gotha makes sausages, porcelain, tobacco, rubber, machinery, mechanical instruments, musical instruments, shoes, furniture and toys.

The book trade is represented, including the firm of the great geographical house of Justus Perthes, founded in 1785.

GOTHAM, WISE MEN OF, the early name given to the people of the village of Gotham, Nottingham, in allusion to their reputed simplicity. But if tradition is to be believed the Gothamites were not so very simple. The story is that King John intended to live in the neighbourhood, but that the villagers, foreseeing ruin as the cost of supporting the court, feigned imbecility when the royal messengers arrived. John, on this report, determined to have his hunting lodge elsewhere, and the "wise men" boasted, "We ween there are more fools pass through Gotham than remain in it." The "foles of Gotham" are mentioned as early as the 15th century in the *Towneley Mysteries;* and a collection of their "jests" was published in the 16th century under the title *Merrie Tales of the Mad Men of Gotham, gathered together by A.B., of Phisicke Doctour*. As typical of the Gothamite folly is usually quoted the story of the villagers joining hands round a thornbush to shut in a cuckoo so that it would sing all the year.

GOTHIC ARCHITECTURE is a term used generally to signify the style of architecture that developed from Romanesque during the 12th century and became general in Europe by the middle of the 13th century. For a discussion of the structural principles involved in the development of Gothic, *see* ARCH AND VAULT; BUTTRESS; ARCHITECTURE; ARCHITECTURAL ENGINEERING. The architecture of the periods preceding Gothic is traced in BYZANTINE ARCHITECTURE and ROMANESQUE ARCHITECTURE; the period following Gothic is traced in RENAISSANCE ARCHITECTURE. The development of specific types of buildings during the Gothic period will be found in RELIGIOUS ARCHITECTURE; MONASTERY; GOVERNMENTAL ARCHITECTCRE.

The article is divided into these sections:

I. INTRODUCTION

The Word Gothic. — The interest of the early humanists (Petrarch, Boccaccio, etc.) in classical culture inspired Italian artists to employ classical forms. In 1419 Filippo Brunelleschi introduced the classical orders in Florence. According to his biographer, Manetti, 'Brunelleschi revived the good architecture of the Romans, which the Vandals, Goths, Lombards and Huns destroyed and replaced with their own inferior architecture. Filarete held that the barbarians in general, and the French and Germans in particular, were responsible for the bad architecture that thereafter was usually called *maniera tedesca* ("German style"). The so-called Pseudo-Raphael, in 1510, attributed the discovery of the pointed arch to the Germans, who, having no hatchets, bent together the branches of trees to form a roof. Later Giorgio Vasari in 1550 narrowed down the list of culprits to the Goths who had sacked Rome in 410. The architecture then termed Gothic spanned the period from 410 to 1419 and its characteristic member was said to be the pointed arch. Christopher Wren (1632–1723), knowing that Moslems used pointed arches, evolved the theory that Gothic was of Saracenic origin.

In the 18th century the Byzantine and Carolingian styles were distinguished and historians found it useful to divide the long period that remained. François Blondel the Younger in 1771 divided the entire medieval development into two periods: *architecture gothique ancienne,* from the 6th to the 11th century; and *architecture gothique moderne* up to Francis I (1515). The term Romanesque was first applied to 11th- and 12th-century architecture by W. Gunn and C. de Gerville in 1819, and thereafter the word Gothic was confined to its present meaning. The style was praised with certain reservations by J. G. Soufflot in 1743 and M. A. Laugier in 1755 and 1765 in France. Goethe praised it without reservations in his dithyramb on the façade of the Strasbourg cathedral (1773), and enthusiastic comments, somewhat better substantiated, by romanticists followed. The 19th century saw the beginning of the serious study of the topography and history of the style. Scholars were aware that Gothic had nothing to do with the Goths. Some of them introduced new terms, *e.g.,* stile ogival, *Germanischer Stil,* but the abusive name Gothic had become a name of honour. Ultimately it came to signify a neutral concept.

The Definition of Gothic **Architecture.**—The term came to be applied to buildings of such different forms that a clarification of the concept became desirable. In the 18th century, writers attempting to determine the essence of Gothic associated it with the picturesque (William Gilpin, 1768), but found in it also an aspiration toward the sublime and infinite. Although this theorizing was of great importance, the pointed arch continued to be regarded as the specific feature. What was required was a descriptive analysis such as was used. for example, in zoology. This was furnished by the apothecary Thomas Rickman in 1817. He described the parts in succession: portals., windows, arches, piers, capitals, buttresses, etc., and even indicated the transformations which took place in the phases of English Gothic. After this model many books were written, better and more nearly complete, and this method of classification is still in use. The first attempt to give a real definition of Gothic.was made by the architect Johannes Wetter. In a footnote to his guide to the cathedral of Mainz (1835) he emphasized four architectural members of Gothic churches, placing each one in functional relation to an element of the style. The first member was the pier and it was related to the stylistic element of attenuation of all members; second, the buttressing system was related to the dissolution of the walls; third, the pointed arch was related to verticalism; fourth, the ribbed vault was related to structural character. Prior to Wetter, Rickman and others had listed Gothic forms without connecting them, but Wetter offered a clear system. But since it was derived from High Gothic buildings, it became the task of later historians to investigate the origin of those characteristics and their transformations to the end of Late Gothic. Gothic style represents a historical process which requires a dynamic, not a static, definition.

II. THE ORIGINS OF GOTHIC ARCHITECTURE AND THE TRANSITIONAL STYLE

English scholars believed that the Gothic style originated in England; German scholars were convinced that the *maniera* tedesca came from Germany. G. D. Whittington, a young English theologian, established the fact in 1809 that St. Denis near Paris (1137–44) preceded all Gothic edifices in other countries. Forgotten for a time, this fact was rediscovered by Franz Mertens in 1843 and now is universally accepted. But since the construction of the ribbed vault in the St. Denis choir showed a mastery of the technique, historians searched for more primitive examples. John Bilson in 1899 demonstrated that in the middle ages ribs were first connected with groin vaults in the choir of Durham cathedral (1093). During the two generations prior to the building of the St. Denis choir (1140), the geometric construction, the technique of scaffolding and the statics were improved in France.

The Introduction of the **Rib.**—A lengthy controversy arose concerning the reason for the introduction of ribs. It was useless to investigate ribs (*i.e.,* transverse arches) in barrel vaults, ribs in domes or arches supporting flat ceilings (Syria) because the point to be determined was why ribs mere combined with Romanesque groin vaults, transforming them into Gothic ribbed vaults. Ribs composed of bricks had been employed in Roman architecture to serve as scaffolds and to reinforce the finished vaults. These ribs, however, being covered with plaster and small slabs, were invisible; they became visible much later when the buildings fell into ruin. It is unlikely that the master of Durham was acquainted with such ruins. Actually, the ribs represented the final step in the formation of scaffolds. Originally scaffolds consisted of wooden barrel vaults crossing one another. In oblong bays, which mere usually preferred, the resulting groins were doubly curved, three-dimensional lines, in many cases distorted by the great weight of the stones supported by the scaffold. After various experiments which can still be traced, the method was radically changed. First wooden arches were constructed for the diagonal groins, then from these arches the boards were laid for the severies (*i.e.,* compartments of the vault). This ensured precise lines for the groins. To avoid distortions the wooden diagonal arches were replaced by arches of stone, called ogives by Villard de Honnecourt, ribs by the English and cintres permanents by Viollet-le-Duc. While the attempt to solve certain problems of geometric construction, technique and statics was important in the development of the rib, its real function was aesthetic: to furnish precise lines. The diagonal rib was not a continuation of a structural member of the wall; since these members were frontal their continuations could only be frontal transverse arches. Diagonal ribs, on the contrary, required diagonal supporting shafts. The statement that Gothic developed from the top down is valid. but it must be emphasized that the structural character of the ribs conformed to Norman stylistic use of strong articulation.

The Principle of **Division.**—The rib was an aesthetic improvement suited to the structural character of a Romanesque building, such as Durham cathedral. However, its diagonality opposed the frontality of the capitals and plinths of the piers and, still more, it disturbed the spatial character of the architecture. All compartments of Romanesque churches were built as separate units combined according to the principle of addition. The space of a Romanesque groin vault looks like a single unit resting horizontally upon the space below. The rib, however, divides the space of the vault into interdependent parts. Each arch involves the imagination of the plane in which it lies. As a result the vault and the space beneath it become a unit divided by the planes of the diagonal ribs. This led the architects to turn the shafts in a diagonal direction. The chief reason for the transformation from the Romanesque into a new style was the principle of division and fusion of the bays. which governed the building in all its aspects. Thus, a building resulted which seemed to be a whole differentiated into parts, like an organism, while in Romanesque buildings one form was added to another, producing a whole by addition, as in the formation of crystals. The process of transformation continued through more than four centuries. It can be studied first as a process immanent in the history of architecture. The equally important question of its relation to the culture of the time may be considered later.

Transitional Style.—At Durham the segmental form of the diagonal ribs was chosen in order to bring the crowns of all three pairs of arches (diagonal ribs. transverse and wall arches) to the same level. (See fig. 2.) In Lessay (c. 1100) the diagonal rib was given the more satisfying form of a half circle, but it started at a level below the transverse and longitudinal arches, nhich resulted in irregularity. In Trinité in Caen the ribs were originally segmental arches combined with the Romanesque diaphragm system. This may have led the other master. who at the same time vaulted St. Étienne in Caen (c. 1120). to create the sexpartite ribbed vaults to fit the alternating forms of the Romanesque piers. In the porch of St. Pierre in Moissac (c. 1125) an architect tried for the first time to bring the crowns of all three pairs of arches to the same level by using pointed arches, but the diagonal ribs began at an angle of less than 90°. forming a segmental pointed arch. In the aisles of St. Étienne in- Beauvais (c. 1130) the diagonal ribs are semicircular, as are the transverse and longitudinal arches of the bays. but they are stilted and very heavy with broad rectangular profiles. However, there for the first time the shafts for the diagonal ribs are turned in the diagonal direction. In the transepts the progressive master made the transverse arches pointed and gave them a riblike profile, thus making the whole lighter and the bays less strongly separated. This treatment was repeated in the transverse arches in St. Germer near Beauvais (after 1132), but the gallery openings and the windows had round arches. In the choir of St. Germer the boss of the ribbed vault was decorated with sculpture for the first time. Other innovations of the early 12th century were the substitution of a ribbed vault for the quarter-sphere vault in an apse in the little chapter house in Jumieges (1109), an important step, as the form of a dome points to the interior, the severies of a ribbed vault to the exterior. The ribbed vault was introduced into the narrow ambulatory of Morienval about 1125. The ribs received spurs at their extrados so that the severies could lean on them and the vaulting be executed freehand. At the time of all these advances the first experiments were made in adding ribs to the crowns. The first ridge ribs were constructed in Airaines (c. 1140) and Montivilliers near Le Havre (c. 1150).

The adaptation of the building to the rib and the improvement of the geometric construction of the ribbed vault itself have been rightly called the active transition; the passive transition occurred where details were copied and freely combined with Late Romanesque forms. In Germany ribbed vaults were introduced after about 1120 (Petersberg near Erfurt); in Burgundy about 1135 in the porch of Cluny; in Anjou in 1145 (in the cathedral in Angers); in Italy not before 1150. The Italians did not create the ribbed vault by themselves; *e.g.,* early dates given by Kingsley Porter for the ribbed vaults in St. Ambrogio in Milan are erroneous.

III. EARLY GOTHIC

St. **Denis and Sens.**—Abbot Suger began the reconstruction of

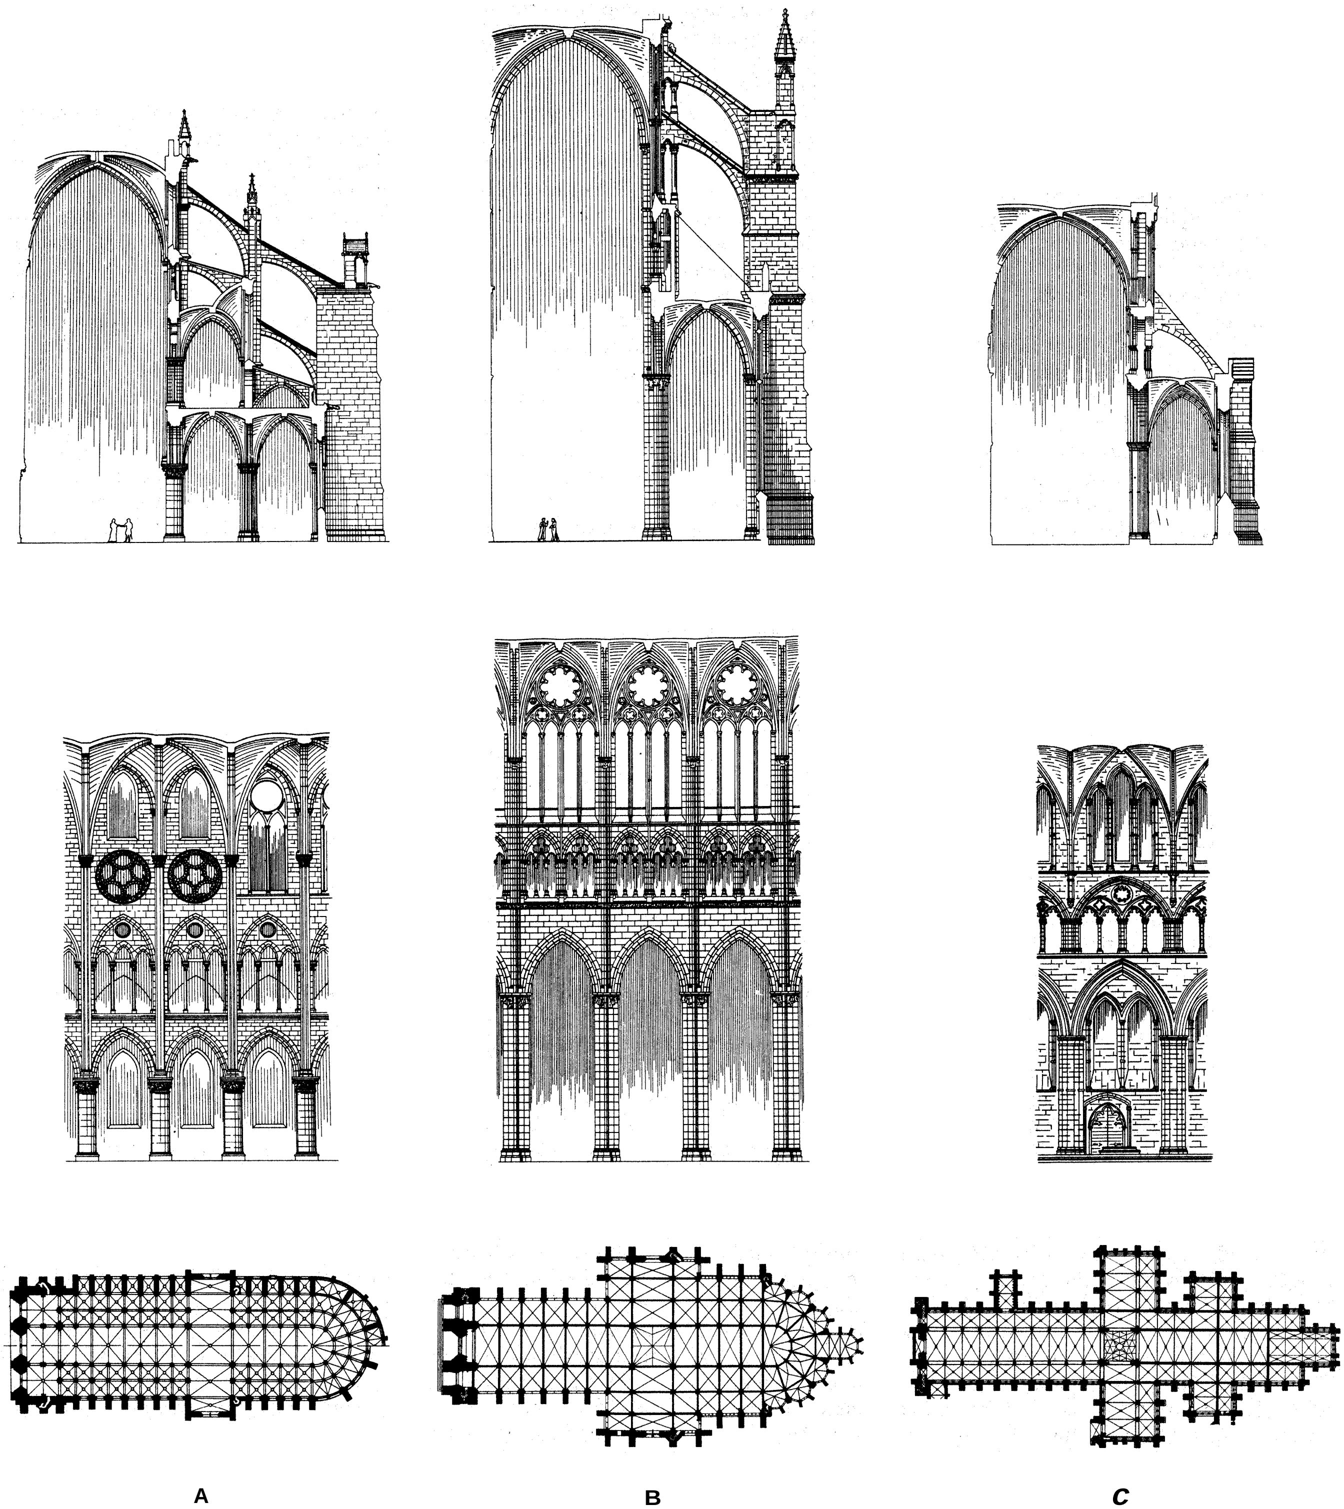

FIG. 1.— EXAMPLES OF GOTHIC CATHEDRALS. SHOWING HOW THE GROUND PLAN

his church, St. Denis (c. 1137), by building t o bays at the west of the old Carolingian nave and erecting the west facade. The architect was not yet able to solve all the problems presented by ribbed vaults. He set the springers of the ribs, even within the same bay, at different levels. but his design of the facade became the model for succeeding Gothic facades. The three portals, adorned with columns and statues, form a continuous zone; the oculus window in the centre above the window of the upper story, although still small, concentrates the whole composition; the towers, originally two, continue with their buttresses those of the lower parts. The choir was built from 1140 to 1144 by a second master. Its central part had to be replaced in 1231, but the ambulatory and the second ambulatory. a continuous row of chapels, are still intact. There all difficulties in the construction of ribbed vaults were overcome by using pointed arches. The diagonal ribs are half circles, but light and with round profiles. The capitals of the thin columns which separate and at the same time fuse the two ambulatories are chalice shaped, at least in the lower parts, so that the force seems to rise through them without interruption. (The advanced crocket capitals of the columns toward the chancel date from a restoration of about 1200.) Suger was proud of his church and especially of the stained glass in the chapels, which, he wrote, created a continuous light. Contemporary with this first truly Gothic architecture was the choir of Sens. Its interior elevation (arcade, triforium and clerestory) perhaps like the lost central part of St. Denis, except that Sens had alternating piers with sexpartite vaults. This vault form was repeated in Senlis and other churches.

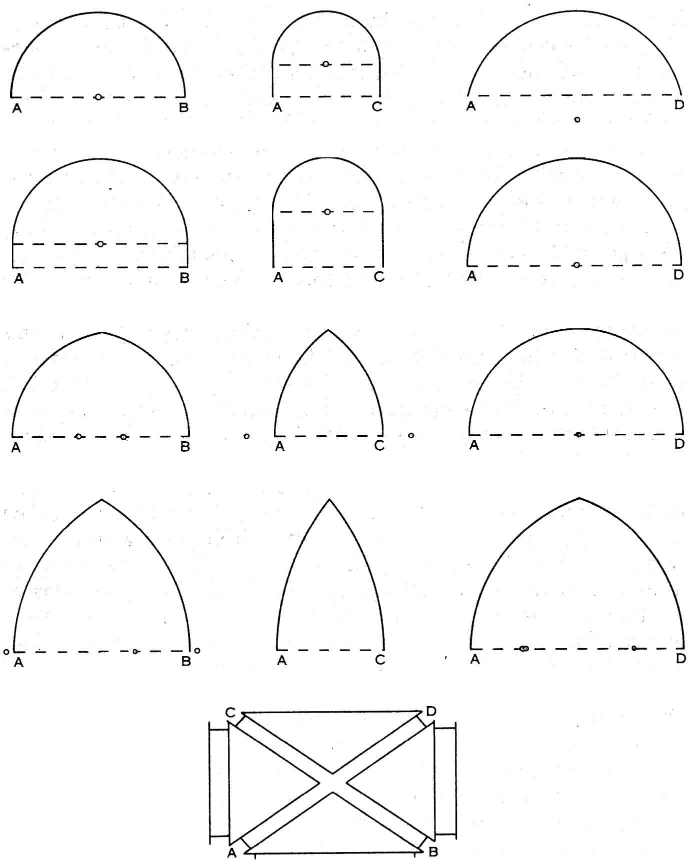
Paris, **Laon** and **Noyon.**—The next main Early Gothic cathedrals of France were Noyon (after c. 1150), Laon (after *c.* 1160) and Paris (1163) Though all used alternating piers with the sexpartite vault, each has individual features. Noyon has transept arms with semicircular endings like apses. At Laon the arms of the transept have strong extensions and flat endings. Notre Dame at Paris (fig. 1A) has double aisles, the flat endings of its transept having been flush with the outer aisles before they were extended (*c.* 1250). A major problem at this time was how to form piers. In the main apse of Noyon the clustered shafts rise above the abaci of the column capitals; there, equal supports were required. In the nave the use, originally, of the sexpartite vault required the alternation of piers and columns. As seen from the west this variety gives the effect of richness, but lacks uniformity. The master of Laon, therefore, repeated in his choir and transepts the form of the supports used in the apse at Noyon. A second master continued it in the nave, after experimenting with thin, free columns around the main thick round piers at the uneven places. It was logical to raise five shafts above the abaci at the uneven places and three at the even places, corresponding to the number of ribs springing from each in sexpartite vaults. This, however, was not consistent with the uniform row of columns in the arcades. Therefore the master of Notre Dame at Paris mounted groups of three shafts above all round piers. In this he was progressive, but he retained the round form of the main apse, while the master of Laon, a few years before, had already introduced the polygonal apse (in its original stage). The straight sides of the polygon were better suited to the straight stained glass, the severies and the basic diagonality of the style. The diagonal principle also effected the development of crocket capitals. Romanesque capitals were designed to have the four sides seen separately and frontally. In early capitals each side had flat palmettes pressed between parallel surfaces; later the ornament was freed of this constraint and the leaves curled forward. Finally emphasis was placed on the diagonal leaf and, after about 1180, the crocket capital became a characteristic feature of the style. Relief also developed as a consequence of the rib. As the ribs protruded from the surface of the severies, so all members seem to protrude. Geometrically, it is equally correct to say that the shaft protrudes or that the wall recedes, but aesthetically it depends on whether there are enough points on the foremost plane to give an impression of a continuity from which the other forms recede, or whether these points are too few to maintain this continuity, in which case they seem to advance individually from the rear. From Noyon on the change of relief is notable. In the Romanesque style, relief emphasizes the distance between the object and the beholder; in the Gothic style the relief draws us to it.

Early Gothic produced a system for the church interior and slowly altered stylistically the exterior as well. This occurred automatically when windows and portals received pointed arches. Round arches lead the eye from one springing point over the crown to the other, emphasizing the horizontal diameter. Pointed arches, on the contrary, lead the eye from both sides at the same time up to the crown, emphasizing the vertical axis. The Gothic profiles



PARTLY AFTER JOHN BILSON

FIG. 2—SCHEMATIC SURVEY (IN FOUR STAGES) OF THE DEVELOPMENT OF RIB VAULTS

Letters on each stage correspond to the plan below. Small circles indicate the radius point of the arc

of windows and portals made the walls look thin.

The exterior also has the effect of attracting rather than repelling the beholder, especially at the portals. This effect was greatly enhanced by the introduction of flying buttresses at the choirs and naves, in France first at Notre Dame in Paris. The aesthetic impression given by these quarter-circle arches is that they counteract, in an upward direction, the thrust of the vault and roof. In reality they lead the thrust down to the buttresses at the walls of the aisles; but their chief stylistic function is to surround the clerestory with space which belongs to the building and to the limitless space beyond. The limits of the cathedral become fluid.

In the west façade of Laon (c. 1190) a monumental example of Gothic relief was created by placing the main part of the façade with its wheel window in such a way that it stood out from the plane of the towers, and the three portals in turn stood out from the main wall. The arches of the three entrances are crowned with Gothic gables, thrust down so that they touch the arches and both spaces penetrate each other. Pinnacles rise between the gables, and simpler ones rise above the dwarf gallery of the second floor. The towers end in octagons with diagonally advancing tabernacles. In Laon appear the first Gothic gargoyles. The master of Notre Dame at Paris (c. 1208) sought a harmonious balance between vertical and horizontal, but he also used Gothic relief. Characteristically, the socle of each portal jamb is fused into a single unit diagonal in direction.

Canterbury, Lincoln, **Wells.**—Although ribbed vaults were built in England after Durham (Winchester, 1107; the crypt of Gloucester cathedral, 1120), Early Gothic was not really introduced until 1174, when William of Sens rebuilt the choir of Canterbury cathedral using forms borrowed from the French. Even the introduction of a second transept was modeled after the French Romanesque abbey of Cluny, and the coloured columns are supposed to have been patterned after a church at Valenciennes no longer extant. Flying buttresses may have been used for the first time at Canterbury (now hidden). A specifically English form of Gothic began with Hugh's choir in Lincoln (1192). In England this phase is called Early English, but if the Gothic style is regarded as European, the general term Earlv Gothic should be used for both England and France, despite the national differences. As early as about 1180, when the cathedral at Wells was begun, the English horizontal fusion of the bays was used instead of the French vertical fusion. The architect of Lincoln invented a new pattern of ribbed vault with two bosses in each ridge rib and with extra ribs rising from the springing point to these bosses. These ribs were called tiercerons and lay on the surface of the severies. These vaults collapsed when the central tower fell in 1239 and were rebuilt in their original form. They were the forerunners of the star vaults in the nave of the same building. See EARLY ENGLISH PERIOD.

IV. HIGH GOTHIC

A. THE DEVELOPMENT OF THE INTERIOR

Chartres.—The system of flying buttresses used in Canterbury and Notre Dame in Paris made the already existing galleries seem superfluous, at least from the standpoint of statics. The master who built the cathedral of Chartres after the fire in 1194 omitted the galleries, heightened the aisles and lengthened the upper windows downward, returning to a three-story elevation like that at Sens. The flying buttresses also made it possible to broaden the windows of the clerestory and, as they were to be filled in with stained glass, it was found practical to design pairs of lancet windows, each of nearly the same breadth as those in the aisles. Each pair was surmounted by an oculus or circular window which harmonized with the round wall arches of the quadripartite ribbed vaults. The alternating system of piers used with sexpartite vaults therefore became unnecessary. It was retained, however, and round and octagonal piers alternate. They have shafts on each of four sides: and the shaft facing the nave supports five colonnettes (*i.e.*, small columns) rising to the transverse arches, the diagonal ribs and the wall arches. The triforium, which is at the same level as the roof of the aisles, is treated as a wall passage with rows of small arcades. This elevation improves on those of Laon and Paris; the entire building is simpler and more unified. The criticism that from the interior it is impossible to see that the flying buttresses maintain equilibrium, and that from the exterior it is impossible to understand why they are there, is not valid. Anyone acquainted with interior and exterior will recognize their organic unity. In Chartres most of the original stained glass has been preserved; more than a thousand representations of legends, parables, saints and donors are depicted in its warm colours and mystic light. Many subtle irregularities in the edifice are not immediately apparent, but are felt. They contribute to the exceptional impression of a living. sacred space. The unknown master opened the way for High Gothic. See CHARTRES.

Bourges.—The cathedral of Bourges, built about 1200. has equal round piers. The vaults are sexpartite, like those at Notre Dame in Paris, but higher and differently proportioned. The cross section with double aisles was also copied from Paris. The transept is omitted; flying buttresses bridge both pairs of aisles in the upper part. Special flying buttresses for the lower aisles are evidence of this generation's enthusiasm for this specifically Gothic member.

Rouen.—In the cathedral of Rouen. begun after the fire in 1200. the shafts supporting the quadripartite vaults rise up to the vault with only a slight interruption at the springing line of the

GOTHIC ARCHITECTURE OF THE 14TH AND 15TH CENTURIES

Top left: Town hall, Louvain, Belgium, 1448. Late Gothic. Gothic proportions combined with emphasis on horizontal lines. Profusely decorated with statues between the windows and on the turrets

Top right: One wing of the cloister of Gloucester cathedral, England, 1351. English Late Gothic. The first use of fan-vaults to fuse the bays. All ribs are of the same curve and profile; curvilinear tracery is spread between all ribs

Bottom left: Ca d'Oro, Venice, Italy, 1421, by Giovanni and Bartolomec Buon. Asymmetrical, employing a combination of different forms of arches and tracery. Emphasis on texture instead of structure is characteristic of Late Gothic

Bottom right: Wladislav hall, Hradčany castle. Prague, Czech., 1493–1502, by Benedict Ried. The hall has doubly curved ribs similar to those of St. Anna, Annaberg, Germany arcade. Galleries were planned, but omitted. However, their openings were kept and in the aisles a group of thin colonnettes was arranged on the level of the omitted vaults, a unique and extremely attractive invention, but by no means classic.

Reims.—The cathedral of Reims (1210) continued the tradition of Chartres. The master of Reims, probably Jean d'Orbais, clarified the form of the piers. They are all round with single shafts in the four main directions. The abaci of the shafts join the abacus of the main column and give the impression that the entire pier is turned 45°, corresponding to the ribs. The ribs are pointed; the round arch was thereby finally driven from its last stronghold. The most important new detail was Gothic tracery. Each clerestory window at Chartres was a group of three separate units, one juxtaposed with the other. The master of Reims transformed them into a single unit, designing first the outer contour as a pointed arch, then dividing the whole by a central colonnette supporting two pointed arches and an oculus between them. Not only did the principle of division replace that of addition, but the profiles were fused at the points where the arches and oculus touched. This form was to be the germ of countless variations (fig. 4). Reims, the church of the coronation of the French kings, is majestic in all its parts. All members are strong; the ornaments are naturalistic but stylized foliage, and the exterior is adorned with exquisite sculpture.

Amiens and St. Denis.—The master of the nave of Amiens cathedral, 1220, excelled the design of Reims. All members seem to have attained an ultimate correctness: the piers, in their relation to the arcades and the shafts of the vault; the tracery in the triforium; and, by means of the common shafts, the fusion of the triforium with the clerestory. Again the diagonal rib has the form of a half circle, perhaps in order not to exaggerate the enormous height. The nave of Amiens, 1220–36, has been praised as the culmination of Gothic style (fig. 1B).

There are scholars who claim that the decadence had already begun with the choir of Amiens, but this is a misconception. Later architects thought of themselves as continuing the stylistic trend that led to the nave of Amiens. Pierre de Montereau, rebuilding the nave of St. Denis (in 1231), continued the trend of Amiens by more closely combining the triforium with the clerestory and by flattening the roof of the aisles, so that the triforium could be lightened with stained glass. This reduced the elevation of the nave to only two stories, as had been done before, though in another way, in the festive choir of Le Mans (1218).

Salisbury.—Contemporaneous with Amiens was the cathedral of Salisbury (begun 1220), representative of classic English horizontalism. The shafts of the vaults begin between the arches of the triforium. The flow of space is strengthened by the specifically English round form of all abaci (without decoration). There is no French tracery, nor flying buttress. (See fig. 1C.)

Sainte **Chapelle.**—The Sainte Chapelle (1243–48), in Paris, rising above an undercroft. has, like all chapels of the great cathedrals, only one story. The windows dissolve the walls completely. The building consists of structural groups of shafts, and the grill formed by the tracery and of the light passing through the stained glass. This chapel, built to house the crown of thorns and other relics of Christ's martyrdom and to serve as the private room for religious contemplation of Louis IX (St. Louis), is as classically Gothic as the nave of Amiens. On the exterior, Gothic gables. which before were combined only with portals, crown the tracery windows. They overlap the eaves of the high roof and, together with the accompanying pinnacles. weaken the horizontal line. This combination of tracery, Gothic relief of the jambs and vertical radiation into the air became a pattern usable anywhere for openings as well as for blind forms.

Troyes.—The most progressive work of its generation was a church of comparatively small size, St. Urbain in Troyes (1262). The choir has no ambulatory and a single chapel on each side parallel to the chancel. A triforium was not required because the roofs of the chapels are saddle roofs, but the apse received a pseudo triforium as continuation of the chapel windows, uhich have different tracery patterns inside and out, both being visible together. These complexities make the most of forms developed earlier. The structural members are so reduced in breadth as almost to suggest metalwork. The capitals are omitted partly to produce a continuous upward flow, an innovation that appeared in the southern portal of Notre Dame in Paris shortly before.

Rouen.—The French High Gothic style was perfectly realized in monumental form in that portion of St. Ouen at Rouen that followed the first design of 1318. There we feel that all problems were solved and that all forms are self-evident from the standpoint of Gothic style. The perfection of style represented in this masterpiece has been called doctrinaire, which, however, is a misinterpretation.

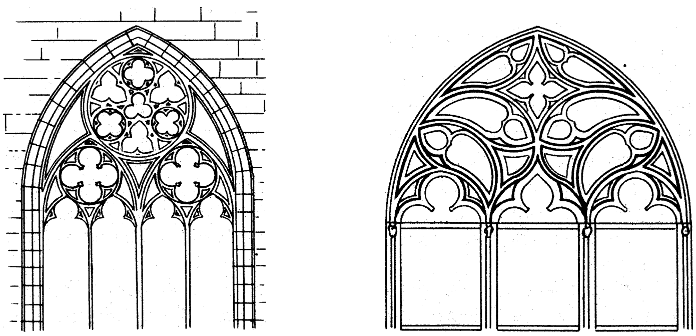
Other European Cathedrals.—The nave of Strasbourg minster (begun c. 1245) was based on that of St. Denis. U'estminster abbey (1245), in London, was influenced by common features of French Gothic rather than a single model. Strasbourg and Cologne were works of Germans, Westminster abbey the work of an Englishman, all of them able to continue the French tradition with deep understanding. Even the angel choir of Lincoln cathedral (1255) has a big French tracery window at the straight east end, although otherwise the elevation of the chancel follows pure English tradition and the vaults with ridge ribs and tiercerons emphasize the horizontal unity of the space. Churches of French High Gothic style elsewhere are: in Germany, Our Lady's church at Trier (1227), St. Elizabeth at Marburg (1235) and the cathedral at Halberstadt (1239); in Spain, the cathedral of Toledo (*c.* 1225); in Belgium, St. Gudula at Brussels (c. 1225); and in the Netherlands, the cathedral of Utrecht (1254).

B. The Development of the Exterior

In the faqade of Reims cathedral (c. 1240), elements of the façade of Laon were translated in a highly imaginative fashion into High Gothic. The entire structure is a transparent skeleton of gables, pinnacles and tracery. The tracery in the big oculus window transformed the wheel into the rose, as was first done in the transepts of St. Denis (1231). It was repeated with further refinements in the rose windows of the transept of Notre Dame (after c. 1250) and in St. Nazaire at Carcassonne (c. 1320).

The design of the west faqade of Strasbourg cathedral (1277), by Master Erwin, shows the autonomy of tracery, as does the splendid composition of the *portail* des libraires, the entrance of the north transept of Rouen cathedral (c. 1280). In both cases the gable of the portal is perforated and grows up freely before the parapet, the row of tracery and the tight pattern of the rose. In Strasbourg the tracery is, continuous, forming a grill before the faqade. Although it seems unreasonable to perforate the roof of a tower with tracery, this did occur in the stylistic development. It is to be seen in Freiburg im Breisgau (1310), and again later in the design for the towers of Cologne (executed in 1848 after the original .plans drawn during the Gothic period). The preponderance of tracery led also to such richly decorated works as the southern side of St. Catherine in Oppenheim (1317).

Tracery is one of the most striking details with which to evaluate the various phases of the Gothic style. The first form of tracery (*i.e.,* two pointed arches and a circle between them at the top) was followed by the forms of three and more lights with



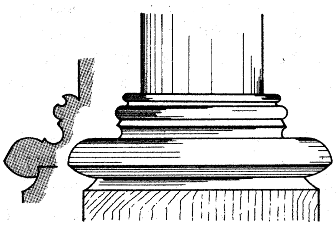
A B

AFTER DEHIO-BEZOLD AND AFTER L BEHLING

FIG. 4.— TRACERIES

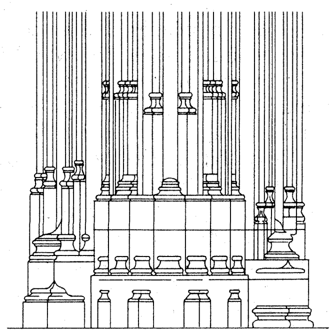
(A) High Gothic, Herford, Germany, and (B) Late Gothic, Strasbourg, France three and more circles (fig. 4). In St. Nicaise in Reims (begun 1231; sold as building material, 1798) cusps were introduced; these were small, pointed members growing out of the profiles of the pointed arches. The transfer of tracery to the big round windows led Frenchmen to call their phase of High Gothic the Rayonnant style (*q.v.*). In the second half of the 13th century the circles were replaced by spherical triangles, quadrangles, etc. These were polygons consisting of three or more curved sides. This form appears for the first time in the small triangular windows of the undercroft in Sainte Chapelle and soon thereafter in Westminster abbey and elsewhere. Later it supplanted all circles in the traceries. It has rightly been interpreted as an attempt to destroy the circles as the last vestige of the Romanesque. The spherical polygon is a continuous series of pointed arches around a centre. In England big rose windows are exceptions (Durham, eastern transept, 1235), and rectangular windows with pointed arches or groups of lancet windows are the rule. In Germany, too, long windows were sometimes preferred; for example, in the faqade of St. Elizabeth in Marburg (c. 1275). In France the big oculus remained an almost indispensable means of achieving aesthetic balance in the composition. Yet it was in France that the slenderness of proportions became exaggerated. The limit was reached in the choir of Beauvais cathedral (1247), which collapsed in 1284. (See TRACERY; ORNAMENT, ARCHITECTURAL.)

Originating in the midst of the development of this style, the Gothic gable is a grandchild, so to speak, of the ribbed vault. This gable can make any building Gothic, even one with a flat ceiling or an open timber roof. It is to be seen in abundance in the choir at Amiens cathedral (1256–69) and in Cologne cathedral (1248), which was designed by a master who knew the plans for Amiens before the choir was continued. (See GABLE; SPIRE.)



AFTER DEHIO AND BEZOLD

FIG. 5.— PLINTHOF HIGH GOTHIC Cross section is shown at left



AFTER DEHIO AND BEZOLD

FIG. 6.—LATE GOTHIC PLINTH OF A PILLAR. TOLEDO CATHEDRAL, SPAIN

Meanwhile the style spread through Europe. The Cistercians, often said to have brought Gothic to all countries, were slow to accept the style. Its rich detail was antipathetic to their asceticism. They replaced the triforium with closed walls. although the windows, with their Gothic relief, created the impression of thinness and gave the walls qualities of Gothic lightness and tension.

Italy was hesitant in adopting Gothic forms. There, wall surfaces were used extensively for frescoes as in Assisi (1228) and in Sta. Croce in Florence (1295). The latter even had an open timber roof like many other churches of the mendicant orders.

V. LATE GOTHIC

In Arniens ribs received a sharp edge to emphasize their middle line. Later architects developed pear-shaped profiles for ribs, shafts and mullions of tracery. Those lines consisting of a convex part continued by a concave one were then used as ogee arches in traceries at places where the pointed arches of the lights continued directly into adjoining circles. They appeared first, perhaps, in St. Urbain in Troyes, 1262, and not much later in Heiligenkreuz in Austria.

England. — In England the ogee arches isolated from tracery were used in the Eleanor crosses after 1292. They became the prevailing form of the Curvilinear style. The upper part of the ogee arch was bent forward to form the nodding arches. The most splendid example of this three-dimensionality is the row of niches in the Lady chapel in Ely (after 1321). In traceries the concave-convex line could be substituted for all concave figures of the High Gothic style. Such tracery is fully developed in the reredos of Beverley minster (1334). In the big western window of York cathedral (1338) it suggests growing leaves.

In the Curvilinear style, soft "textile" lines replaced the rigid structural curves of the earlier style, and in tracery the emphasis was upon the creation of complete continuity. These modifications also affected the vaults. In the chancel of Exeter cathedral (c. 1300) the diagonal ribs, together with the ridge rib and the tiercerons, although still suggesting structure, formed a continuous pattern without emphasis upon the transverse arches marking the limits of the bays. There, however, the basic form was still the quadripartite vault; the cone of the fan vault had not yet appeared. An approach to the latter was the vault in the chapter house in Wells (c. 1300), where ribs of different function have the same profile and the central portion looks like a complete fan vault, except that it rests on the central pier and is continued by severies to the walls. The vaults in the choir of Wells (c. 1329), Tewkesbury (c. 1335) and Gloucester (after 1337) have the basic form of barrel vaults. Fragmentary ribs (liernes), rising like branches from diagonal ribs or from tiercerons, counteract the feeling of structure to give the impression of textile nets.

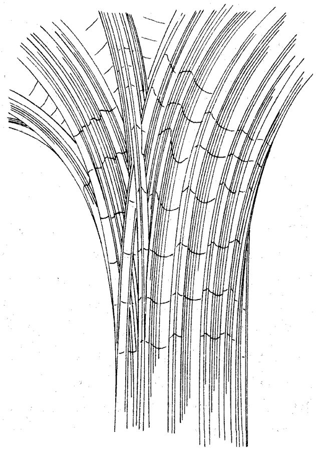
In London the so-called court school, in building St. Stephen (1292, burned 1834), created the Rectilinear (Perpendicular) style which, with its rigid vertical and horizontal lines, was the opposite of the Curvilinear (Decorated). Yet these grill-like patterns also were applied in such a way as to create continuity and the feeling of infinite expansibility. The rows of vertical mullions climbing up the extrados of the pointed arch were not static anymore. The spandrels filled with these fragmentary forms were seemingly cut by the arch. The most impressive work in this style was the choir of Gloucester cathedral, where the Late Gothic decorative grill stands in front of the original Romanesque structure. In the transept the vertical lines are crossed by the oblique lines of enormous buttresses. In Gloucester true fan vaults were used in the cloister for the first time (1351). They consist of concave, inverted cones. Halves of these cones rise on each side of the gallery. All the ribs are equal; the space between them is filled with Curvilinear tracery. The separation of bays is practically eliminated, and there is a continuous flow of space.

See DECORATED PERIOD; PERPENDICULAR PERIOD.

Germany. — In Germany the Rectilinear form was little used, although a parallel can be seen in the west faqade of Strasbourg (1277). In High Gothic times hall churches were preferred and there almost exclusively used after 1330. The tendency toward spatial continuity altered the form of the piers; *e.g.*, in the Wiesenkirche in Soest (1331). The shafts mere combined with the pier so that its core was scarcely recognizable; capitals were omitted; and the ribs continued the shafts with the same profile. The leading architect of Germany was Peter Parler who, at the age of 23, was called to Prague, the capital of the empire at the time of Charles IV, to continue the cathedral. He built complicated vaults with hanging bosses and ribs rising free through the space. A hanging boss is, of course, the opposite of structural, and ribs that do not bear severies are a denial of High Gothic ideals. The doctrine that High Gothic represents the apogee of Gothic and Late Gothic its decadent phase should be rejected. Late Gothic is actually a quite consistent culmination of the entire development of Gothic style. Parler seems to have been influenced by English Late Gothic, as free ribs were used in the screen in Southwell (c. 1325). The vault in Prague was the first real net vault on the continent. Parler was also the first to use an even number of sides for the polygon of a choir in Kuttenberg (1360). This meant that there was no longer a wall frontal to the axis, and that diagonality prevailed.

Later architects transferred the form of the hall to the choirs. The ambulatory and the chapels were then drawn into the unified flow of the entire space. An early work of this kind was the choir of Schwabisch Gmiind (1351); a late one was that of St. Lorenz in Nuremberg (1445); and a still later one was Our Lady's church in Munich (1468). Many of these churches, built on the one-story system, had extraordinarily elongated windows which also dominated the exterior, together with the enormous roofs covering both nave and aisles. In German territories the translation of High into Late Gothic was also accomplished in the tower designs. Outstanding works were the towers of St. Stephen in Vienna (after 1359) and of Strasbourg minster (its octagon. 1400; its spire finished in 1439). The tower in Vienna rises with continuously diminishing extension; the stories are not sharply separated and are pushed upward like the parts of a telescope. The tower of Strasbourg has a spire dissolved in wreaths of small tabernacles containing staircases leading up to the highest point.

France. — In France the development was retarded by the Hundred Years' War. The English Curvilinear was adopted in Amiens in the chapel of Bishop La Grange (1373). The traditional verticalism applied to the tracery of the Curvilinear transformed its character into upward flaming forms, hence the name Flamboyant style (q.v.). It changed the rose windows into explosive patterns such as that of Lyons cathedral (1392) or of the Sainte Chapelle, Paris (148j). One of the most impressive works in this style is the upper part of the facade of Rouen cathedral (c. 1490).



AFTER DEHIO AND BEZOLD

FIG 7 — LATE GOTHIC RIBS WITH INTERPENETRATIONS. ST.

National Variations.—While in High Gothic times French rationality and English imagination created two leading variants of Gothic, in Late Gothic times other nations created their own versions. Materialists emphasizedthe inheritedand supposedly permanent qualities;idealists emphasized the spiritual tradition of acquired qualities. Of course both work together, but it is easier to prove the consistency of the tradition from master to pupil. Some regional variations of Gothic are obviously dependent also on the material available. Regions which had no stone suitable for building used bricks and adapted Gothic forms to this material; e.g., in northeastern Germany. Bavaria, southern France and Holland. Specifically national talents are clearly evident in the Late Gothic churches of Spain and Portugal. The cathedral of Gerona (1417), with its vault 73 ft. in width, is the widest in Gothic architecture. Many Spanish churches are notable for their extraordinary dimensions. Seville, 1412, is the largest. Yet Spanish architecture is also individual in its decorative detail, based in part on Moorish ornamentation. In Portugal the church of Belém (c. 1500) is unique by reason of the west-east extension of the transept and its extremely rich cloister.

As Late Gothic in Spain shows the influence of Islamic architecture, so Italian Gothic is influenced by classical models. That the proportions of Roman buildings were retained is best shown by comparing the cathedral of Florence (1296) with that of Amiens. Florence, however, should not be criticized on this basis. The way from the majestic nave to the crossing with its cupola must rather be seen as a symbol of the way to salvation through endeavour. The totally diiferent cathedral of Milan, 1387, must also be judged on its own merits.

Common Features. — Obvious as are the national differences, it must be recognized that there mas a trend common to all countries. Rotating foliage on capitals appeared in the nave of Wells cathedral (c. 1250) and in the chapter house in Southwell (before 1300). It was followed by rotating patterns in tracery. by spiral columns and by vaults with ribs in the form of three-dimensional double curves. These forms were found in Spain, Germany and even in Italy. Vasari criticized spiral columns because they cannot carry any weight. We understand today that all these forms were based on the desire to produce endless movement, continuity, multiplicity of views, recession and, insofar as possible, the substitution of texture for structure

Culminating features of the style were found in many countries: the Laurentius portal of Strasbourg cathedral (1495); the church of Xnnaberg in Saxony (1499), where complicated, curved ribs and piers with concave sides pushed through the vault (fig. 1 E); Palencia cathedral in Spain (after 1500); the totally perforated Flamboyant porch of St. Maclou in Rouen (c. 1500); the Henry VII chapel in Westminster (1500), with hanging fan vaults. In all these cases the aim was not to display skill and ingenuity. but to carry to its extreme the principle of division, introduced by the first ribs. Strangely enough, this led to those double curved lines, as at Annaberg. that the architect of Durham choir was trying to avoid. By the time the Gothic style was superseded by the Renaissance style its possibilities had been practically exhausted by the various nations.

Ultimately the form of the whole and the detail was determined by the individual masters who were influenced not only by their patrons and national traditions, but also by the ideas of their colleagues. More than a thousand names of masons have come down to us but, apart from their work, we know little about them. We know more about the organization of the guilds.

VI. SECULAR ARCHITECTURE OF THE GOTHIC PERIOD

The same masters who built the cathedrals also made the designs for their cloisters like Gloucester and for monasteries like Mont St. Michel (q v.) Insofar as the ribbed vault in all its stages, tracery. Gothic profiles, etc.. was used in secular buildings, such buildings may be included in a survey of the history of Gothic style. But whether the monasteries, castles, town halls and private houses themselves may be called Gothic is another question. The same question may be raised in regard to the fortifications of cities and to the many types of parish churches in every country. Gothic is essentially ecclesiastical, and we would do better to speak of secular architecture of the Gothic period rather than of secular Gothic architecture. Yet the palace of the archbishop in Sens (1240) has big High Gothic windows. with tracery and buttresses adorned nith tabernacles and crowned by pinnacles. In the facade of the Palazzo Vecchio in Florence (1299), on the other hand, although it too has Gothic windows, the heaviness of the closed malls prevails. The ducal palace in Venice shows in its two lower stories the Gothic dissolution of the wall by the arrangement of open galleries combined with Late Gothic tracery in the second floor, but the wall rising above is flat and adorned with a definitely "textile" pattern. This facade was built about 1300–1424. From this mixture of principles of structure and texture the composition of the palace Ca d'Oro in Venice (1421) is derived. The palace of the popes in Avignon, 1334, shows closed walls and contains occasional Gothic details. Late Gothic style is felt strongly in the Flamboyant decoration of the *salle des pas perdus* in the palace of the dukes in Poitiers (1393); in the picturesque private house of Jacques Coeur in Bourges (c. 1430); and the richly decorated exterior of the council house in Löwen (1447). The last phase may be represented by the Albrechtsburg in Meissen (1471), with its many varieties of Late Gothic vaults and its picturesque irregularity, the Wladislav hall in the castle in Prague, 1493; and the Palais de Justice in Rouen. aith its big rectangular windows which are nearly Renaissance in character, but with free tracery rising before the dormer windows (c. 1500).

See also CASTLE; HALL; HALF-TIMBER WORK.

VII. THE CONCEPT OF GOTHIC

The sculpture and painting. including stained glass (q.v.), of the Gothic period may properly be called Gothic. It must not be overlooked that Gothic style was already at its height when the fine arts began to be assimilated into the building ahich they were to adorn. The concept of Gothic has been so enlarged that today one speaks of Gothic music. Gothic liturgy, Gothic metaphysics and even of the Gothic man. Since the middle of the 19th century scholars have debated the question of whether the Gothic spirit manifested itself in all fields; one art historian demanded derisively to be shown the transmission belts between them. Yet there is no need to look for transmission belts if one understands that all art is form as symbol of the Zeitgeist. We saw that the first ribs disturbed the formal unity of Romanesque style because they introduced the principle of division. But they were accepted and their possibilities were exploited up to the latest Gothic because the culture tended to accept the belief that the individual is only a part of a transcendent whole, a fragment of the universe and of infinity. The unity of form and meaning resulted primarily from the profound desire of men to be united in themselves, to have style themselves. In this sense one might use the term "Gothic man."

VIII. THE SURVIVAL AND REVIVAL OF GOTHIC ARCHITECTURE

It is understandable why the Italian "Renaissance man" rejected Gothic; why in the north traditional Gothic was mixed with Renaissance; *e.g.,* in St. Pierre in Caen (1518) and St. Eustache in Paris (1532). The so-called German Renaissance may be seen as an expression of the desire to bridge the irreconcilable differences of Reformation and Counter Reformation. Gothic remained a specific Catholic style and lost its original meaning until romanticism began to revive Gothic forms. An early revival occurred in England at Strawberry Hill (begun 1750), where Horace Walpole built a "Gothic castle." Gothic revival works were built quickly with cheap materials. A. W. N. Pugin (*q.v.*) became a Catholic, believing this to be the prerequisite for the revival of Gothic. With Charles Barry he built the Houses of Parliament in London (1836). K. F. Schinkel had built the neo-Gothic Werder Kirche in Berlin (1821) without espousing Catholicism. The spiritual background had changed. Viollet-le-Duc (*q.v.*) restored French Gothic buildings and wrote theoretical and historical treatises. The 19th century revived all styles in succession. Heinrich von Ferstel in Vienna built the Votive church (1856) in French High Gothic and the university (1873) in Renaissance. The occasional use of Gothic was a manifestation of generations imbued with the idea of historism. The 20th century created a new style based on the exploitation of concrete, steel and glass, expressing the fundamentally different modern view of society and existence. There is still a demand for the Gothic style for churches and colleges which feel themselves rooted in the medieval tradition. In 1928 Princeton university finished a Gothic chapel and in 1948 adorned its most modern library with details derived from Gothic models. The Gothic spirit is remote from contemporary life. To love and appreciate Gothic in its original masterpieces the history of the forms must be understood to be symbolic of the endeavour to create sacred places for the worship of God. See MODERN ARCHITECTURE.

GOTHIC ART is the climactic medieval style of western Europe an art that followed Romanesque art and preceded Renaissance art (*qq.v.*). The Gothic synthesis was first achieved in the fle de France (an area roughly within a roo-mi. radius of Paris), then spread outward to England, Germany, Italy and Spain. Originating about the middle of the 12th century, the style ran a course from an early linear, straightforward and sinuous stage, during which the major architectural and aesthetic problems were solved, to a Rayonnant style (*q.v.*) in the 13th and 14th centuries, and finally to a later flamboyant style (*q.v.*) in the 15th and 16th centuries, full of complicated tracery, lavish detail and elaborate filigree designs. While continental and American historians usually refer to these aspects as early, high and late Gothic, their British counterparts generally distinguish three periods: the Early English period, the Geometric and Curvilinear phases of the Decorated period (*q.v.*), and the Perpendicular period (*q.v.*).

Renaissance classicism never completely supplanted the Gothic in northern Europe, and the style received a new impetus from the romantic movement beginning about the middle of the 18th century. This Gothic revival (though it is also partially a survival) continues with diminishing intensity to the present day where it is still encountered in churches, university buildings and occasionally in skyscrapers.

The great century of Gothic art, however, was the 13th when its focal centre was in northern France. The prototype of the style has been recognized in the Abbey church of St. Denis, near Paris, begun in 1140 by that trusted councilor of French kings, Abbot Suger. The significance of St. Denis is not so much in its originality as in its creative combination of such successful features of the late Romanesque as the pointed arch for raising the crowns of the vaulting, ribbed groin vaults resting on slender clustered columns, and the use of spur and flying buttresses at points of particular stress. Thereafter, Laon, Paris, Chartres, Rheims, Amiens, Rouen, Beauvais and Bourges became French cathedral towns. Surviving examples of Gothic secular architecture are found in such castles as Carcassonne, France, and Eltz, Ger.; town halls as the Palais de Justice (Rouen), Westminster hall (London), Doge's palace (Venice), the Palazzo Publico (Siena), the Bargello and Palazzo Vecchio (Florence); college and university buildings as in Italy, France and England; civil and commercial structures in city squares as those of Brussels and Niirnberg; guild halls as the Cloth Hall at Ypres; domestic houses of stone and wood construction as those of Jacques Coeur at Bourges, Diane de Poitiers at Rouen, numerous houses with half-timber work (*q.v.*) in England, and the steep-gabled, multistoried houses of the Hanseatic League cities. (See also GOTHIC ARCHITECTURE; ARCH AND VAULT.)

Gothic sculpture existed in close relationship to the buildings it was intended to embellish and was consequently incorporated directly into the architectural design. There was less emphasis than there had been during the Romanesque on carved capitals of interior columns, because the greater height placed them beyond the range where specific representations could be seen, and because the clustered piers were less conducive to unity. Hence a generalized type of foliated capital evolved, while more specific representations were transferred to the stained glass windows and the sculpture of the exterior. Otherwise interiors included: baptismal fonts, choir screens, sarcophagi with effigies of the deceased, and altars, all of stone; carved wooden choir stalls and small statues of carved or polychromed wood; metalwork of beaten gold, silver and copper gilt; enamel on metal, and cloisonné work in such forms as chalices, monstrances, reliquaries and crucifixes.

Exterior sculpture was found in profusion in niches along wall surfaces, and especially in the monumental compositions of the portals of façades and transepts where the columns enframing the portals, the doorjambs, lintels, tympana, voussoirs and archivolts, all provided surfaces for sculptural representation. The exterior orientation, furthermore, focused the sculptor's attention on problems of light and shade, and carving in depth became important. (See also SCULPTURE: *Romanesque* and Gothic.)

The more monumental pictorial compositions of the Gothic are found in the luminous, translucent window panels of stained glass and in wall hangings such as embroideries and tapestries, rather than in mosaics and fresco murals as in previous periods. (See STAINED GLASS; TAPESTRY.) Miniature painting (*q.v.*) was far more important than its diminutive size would indicate. The art of the book, at this time, achieved a peak of craftsmanship that has never been surpassed. The pages of these missals, psalters, books of hours and lectionaries contain all the elements of the Gothic style in miniature form. In such outstanding examples as the Duc de Berry's *Très* Riches Heures, the pages are designed as frameworks for such details as the initial letters, text and illuminations. In the margins the minutiae of nature are portrayed with the greatest skill and delicacy. (See ILLUMINATED MANUSCRIPTS.) Such sacred books as well as their secular counterparts in the epics

and courtly romances often had covers of carved ivory and richly jeweled hammered gold work. While these art forms and representations have primarily an aesthetic appeal for the modern eye, in Gothic times they had practical, didactic, instructional and inspirational objectives.

The various functions of the cathedral as religious centre, shrine for pilgrimages, university building, choir school, and theatre for liturgical and nonliturgical drama account for its comprehensive iconography. The veneration of the Virgin Mary and the chivalric ideal of womanhood were the sacred and secular sides of the Gothic coin. The numerous dedications of cathedrals to Notre Dame (*e.g.,* Paris, Chartres, Rheims, Rouen, Amiens), the inclusion of Lady chapels on the main axis of church plans, and the histories of the Virgin in sculpture and glass testify to the importance of Marian worship. Aristocratic preoccupation with genealogy is reflected in the tree of Jesse designs, uhich traced the 'kingly ancestors of Christ. A farming community's concern with the calendar is seen in such representations as the signs of the zodiac and labours of the month.

Number symbolism played a major role in such iconographic plans and arrangements. The tympanum space above portals was divided into bands or zones in strict hierarchical fashion. Elsewhere trefoil and quatrefoil forms were employed as geometrical frames for serial representations in stone and glass. The number three, reflected in the many tripartite divisions of space, alluded to the Trinity, and four to such quaternities as the elements of fire, earth, air and water. Their sum added up to seven as the symbol for man, whose nature was both spiritual and physical. Their product indicated such series as the twelve Apostles, tribes of Israel, signs of the zodiac, labours of the month and the like. Such glass and stone representations have often been characterized as the Bible of the poor and the books of the illiterate. But since they also included compendiums of human knowledge as vast in range as any of the treatises or encyclopaedias compiled by the scholastic philosophers, they were addressed to literate minds as well.

The Gothic cathedral, as a dramatic spatial composition, thus became a kind of visual *summa* that embraced the entire life and art of the period. Here architecture, sculpture, glass painting, and a host of minor arts combined to create a sublime theatre for the Gothic liturgy. By the meeting and merging of technical and aesthetic factors, these material means succeeded in achieving the desired immaterial and spiritual ends. The masses of masonry, which had remained essentially static with the Romanesque, were activated with the Gothic so as to quicken the pulse of spatial motion. The accent on aspiring pinnacle forms, the rhythmic repetitions of vertically ascending lines, and the soaring perpendicular perspectives carried the eye irresistibly upward. Gazing at the interior alone, a sense of mystery is created because the slender supporting piers seem inadequate to carry the superstructure to such breath-taking heights. The high vaulting and labyrinthine interior space, moreover, provided a resonant acoustical chamber for the choral chant; the exterior walls were brought to life through the myriad of eloquent sculptural forms; and the incorporation of the flow of light through the medium of stained glass added the dimension of kaleidoscopic colour to etherealize the interior space still further. And just as St. Thomas Aquinas' *Summa theologiae,* by its logical divisions and subdivisions of premises and propositions, brought together all the tenets of Christian thought, just as the trivium, quadrivium and expanded Gothic university curriculum provided for the imparting of all human knowledge, so also did the Gothic cathedral, with its systematic divisions and subdivisions of space, encompass an encyclopaedic scope of subject matter in its sculptural and glass representations that made it a veritable mirror of the Gothic mind.

GOTHS, a Teutonic people who in the 1st century A.D. appear to have inhabited the middle part of the basin of the Vistula. They were probably the easternmost of the Teutonic peoples. According to their own traditions they had come originally from the island Scandza, *i.e.* Skåne or Sweden and landed first in a region called Gothiscandza. Thence they invaded the territories of the Ulmerugi (the Holmryge of Anglo-Saxon tradition), which were probably in the neighbourhood of Riigenwalde in eastern Pomerania, and conquered both them and the neighbouring Vandals.

Early History.—Under their sixth king Filimer they migrated into Scythia and settled in a district which they called Oium. The rest of their early history, as it is given by their historian Jordanes, is due to an erroneous identification of the Goths with the Getae, an ancient Thracian people. The credibility of the story of the migration from Sweden has been much discussed by modern authors. The legend was not peculiar to the Goths, similar traditions being current among the Langobardi, the Burgundians and apparently several other Teutonic nations. Although so many populous nations can hardly have sprung from the Scandinavian peninsula the existence of these traditions certainly requires some explanation. In part, at least, they are probably due to a Scandinavian element in the royal families of the various nations which participated in them. It is also probable that a portion of the Gothic nation came from the island of Gotland in the Baltic, for it is clear from archaeological evidence that this island had an extensive trade with the coasts about the mouth of the Vistula.

The first certain references to the Goths in ancient literature go back to the first years of the Christian era, when they seem to have been subject to the Marcomannic king Maroboduus. They do not enter into Roman history until the 3rd century, when their frontier seems to have been advanced considerably farther south, and the whole country as far as the lower Danube was frequently ravaged by them. The emperor Gordian is called "victor Gothorum" by Capitolinus, and further conflicts are recorded with his successors, one of whom, Decius, was slain by the Goths in Moesia. The emperor Gallus was forced to pay tribute to them, and during the next twenty years they frequently ravaged the maritime regions of Asia Minor and Greece. Aurelian is said to have won a victory over them, but the province of Dacia had to be given up. In the time of Constantine the Great, Thrace and Moesia were again plundered by the Goths, A.D. 321. Constantine drove them back and then concluded peace with their king Ariaric.

Though by this time the Goths had extended their territories far to the south and east, it must not be assumed that they had evacuated their old lands on the Vistula. Jordanes records several traditions of their conflicts with other Teutonic tribes, in particular a victory won by Ostrogotha over Fastida, king of the Gepidae, and another by Geberic over Visimar, king of the Vandals, about the end of Constantine's reign, in consequence of which the Vandals sought and obtained permission to settle in Pannonia. Geberic was succeeded by the most famous of the Gothic kings, Hermanaric (Eormenric, Iormunrekr), one of the greatest figures of Germanic saga, whose deeds are recorded in the traditions of all Teutonic nations. According to Jordanes he conquered the Heruli, the Aestii, the Venedi and a number of other tribes who seem to have been settled in the southern part of Russia. From Anglo-Saxon sources it seems probable that his supremacy reached westwards as far as Holstein. To his time belong a number of other heroes whose exploits are recorded in English and Northern tradition, amongst whom we may mention Wudga (Vidigoia), Hama and several others, who in *Widsith* are represented as defending their country against the Huns in the forest of the Vistula. Hermanaric committed suicide in his distress because of an invasion of the Huns about A.D. 370, and the portion of the nation called Ostrogoths then came under Hunnish supremacy. (F. G. M. B.)

Later History.—From about this time the history of the East and West Goths parts asunder. The East Goths do not at first enter into the history of the Empire. In 376 a great part of the West Gothic people, under their chief, Frithigern, crossed the Danube into the Roman province of Moesia with the approval of the imperial government. Disputes between the new settlers and the Roman officials soon led to a war, marked by the great Gothic victory at Adrianople in 378, when the emperor Valens was killed. His successor Theodosius the Great made terms with the Goths in 381 and the mass of the Gothic warriors entered the Roman service as *foederati*. Athanaric, the Gothic leader, came to Constantinople in 381; he was received with high honours, and had a solemn funeral when he died.

The death of Theodosius in 395 broke up the union between the West Goths and the Empire. The Goths threw off their allegiance, and chose Alaric as their king. Under him, the Goths are an independent people under a national king; their independence is in no way interfered with if the Gothic king, in a moment of peace, accepts the office and titles of a Roman general. But under Alaric the Goths make no lasting settlement. Cessions of territory are offered to them, provinces are occupied by them, but as yet they do not take root anywhere; no Western land becomes *Gothia*.

Greece was the scene of Alaric's first great campaign, in 395–6. His Italian campaigns fall into two great divisions, that of 402–3, when he was driven back by Stilicho, and that of 408–10, after Stilicho's death. In this second war he thrice besieged Rome (408, 409, 410). The second time it suited a momentary policy to set up a puppet emperor of his own, and even to accept a military commission from him. The third time he sacked the city. The intricate political and military details of these campaigns are of less importance in the history of the Gothic nation than the stage which Alaric's reign marks in the history of that nation. It stands between two periods of settlement within the Empire and of service under the Empire. Under Alaric there is no settlement, and service is quite secondary and precarious; after his death in 410 the two begin again in new shapes.

Under Ataulf, the brother-in-law and successor of Alaric, another era opens, the beginning of enterprises which did in the end lead to the establishment of a settled Gothic monarchy in the West. His position is well marked by the speech put into his mouth by the Roman historian Orosius. He had at one time dreamed of destroying the Roman power, of turning *Romania* into *Gothia*, and putting himself in the place of Augustus; but he had learned that the world could be governed only by the laws of Rome and he determined to use the Gothic arms for the support of the Roman power. In many shiftings of allegiance, Ataulf seems never to have wholly given up the position of an ally of the Empire. His marriage with Placidia, the daughter of the great Theodosius, was taken as the seal of the union between Goth and Roman, and, had their son Theodosius lived, a dynasty might have arisen uniting both claims. But the career of Ataulf was cut short by his murder at Barcelona in 415. Under Wallia, who became king in that year, a more settled state of things was established. The Empire received again, as the prize of Gothic victories, the Tarraconensis in Spain, and Novempopulana and the Narbonensis in Gaul. The Roman "Aquitania Secunda" became the West Gothic kingdom of Toulouse. The dominion of the Goths was strictly Gaulish; their lasting Spanish dominion had not begun.

Under Wallia's successor Theodoric I. (419–451) Goths and Romans became for a time united against their common enemy Attila King of the Huns. But they met Gothic warriors in his army. By the terms of their subjection to the Huns, the East Goths came to fight for Attila against Christendom at Châlons, just as the Serbs came to fight for Bajazet against Christendom at Nicopolis. Theodoric fell in the battle (451). After this momentary meeting, the history of the East and West Goths again separates for a while. The West Gothic kingdom of Toulouse grew within Gaul at the expense of the Empire, and in Spain at the expense of the Suevi. Under Euric (466–485) the West Gothic power again became largely a Spanish power. The kingdom of Toulouse took in nearly all Gaul south of the Loire and west of the Rhone, with all Spain, except the north-west corner, which was still held by the Suevi. Provence alone remained to the Empire. The West Gothic kings largely adopted Roman manners and culture; but, as they still kept to their original Arian creed, their rule never became thoroughly accep able to their Catholic subjects. They stood, therefore, at a great disadvantage when a new and aggressive Catholic power appeared in Gaul through the conversion of the Frank Clovis. In 507 the West Gothic king Alaric II. fell before the Frankish arms at Campus Vogladensis, near Poitiers, and his kingdom, as a great power north of the Alps, fell with him. That Spain and a fragment of Gaul still remained to form a West Gothic kingdom was owing to the intervention of the East Goths under the rule of the greatest man in Gothic history.

When the Hunnish power broke in pieces on the death of Attila, the East Goths recovered their full independence. Even before this time, in 406, a large body of Goths, apparently belonging to the eastern branch of their race, had invaded Italy under their king Radagais. Later in the century, the East Goths entered into relations with the Empire and obtained a settlement in Pannonia. Subsequently, they play in south-eastern Europe nearly the same part which the West Goths played in the century before. Towards the close of the jth century their royal house produced a great figure, famous alike in history and in romance, in the person of Theodoric, son of Theodemir. Theodoric the Great is sometimes the friend, sometimes the enemy, of the Empire, but in all cases alike he remains the national East Gothic king. It was both as Gothic leader and as ally of the Empire that he set out in 488, by commission from the emperor Zeno, to recover Italy from Odoacer. By 493 the East Gothic power was fully established over Italy, Sicily, Dalmatia and the lands to the north of Italy. Under Theodoric the history of the East and West Goths converges again, through the marriage of a daughter of Theodoric to the Visigothic king Alaric II. After Alaric's fall in 507 his heir was protected by Theodoric, in whose later years the kingdoms of the East and West Goths were in effect united.

The East Gothic dominion was now again as great in extent and far more splendid than it could have been in the time of Hermanaric. But it was now of a wholly different character. The dominion of Theodoric was not a barbarian but a civilized power. His twofold position ran through everything. He was at once national king of the Goths, and successor, though without any imperial titles, of the Roman emperors of the West. The two nations, differing in manners, language and religion, lived side by side on the soil of Italy; each was ruled according to its own law, by the prince who was, in his two separate characters, the common sovereign of both. The Goths seem to have been thick on the ground in northern Italy; in the south they formed little more than garrisons. In Theodoric's theory the Goth was the armed protector of the peaceful Roman; the Gothic king had the toil of government, while the Roman consul had the honour. All the forms of the Roman administration went on, and the Roman polity and culture had great influence on the Goths themselves.

Such a system as that which Theodoric established needed a Theodoric to carry it on. On his death (526) the East and West Goths were again separated. Amalaric, son of Alaric II., succeeded to the West Gothic kingdom in Spain and Septimania. Provence was added to the dominion of the new East Gothic king Athalaric, the grandson of Theodoric through his daughter Amalaswintha. But the essential weakness of the East Gothic position in Italy now showed itself. The long wars of Justinian's reign (535–555) recovered Italy for the Empire, and the Gothic name died out.

The West Gothic kingdom lasted much longer, and came much nearer to establishing itself as a national power in the lands which it took in. But its history was long influenced by the difference of race and faith between the Arian Goths and the Catholic Romans of Gaul and Spain. The Arian Goths ruled over Catholic subjects, and were surrounded by Catholic neighbours. The Catholics everywhere preferred either Roman, Suevian or Frankish rule to that of the heretical Goths; even the unconquerable mountaineers of Cantabria seem for a while to have received a Frankish governor. In some other mountain districts the Roman inhabitants long maintained their independence, and in 534 a large part of the south of Spain, including the great cities of Cadiz, Cordova, Seville and New Carthage, was, with the good will of its Roman inhabitants, reunited to the Empire, which kept some points on the coast as late as 624. That is to say, the same work which the Empire was carrying on in Italy against the East Goths was at the same moment carried on in Spain against the West Goths. But in Italy the whole land was for a while won back, and the Gothic power passed away for ever. In Spain the Gothic power outlived the Roman power, but it outlived it only by itself becoming in some measure Roman. The greatest period of the Gothic power as such was in the reign of Leovigild (568–586). He reunited the Gaulish and Spanish parts of the kingdom which had been parted for a moment; he united the Suevian dominion to his own; he overcame some of the independent districts, and won back part of the recovered Roman province in southern Spain. He further established the power of the crown over the Gothic nobles, who were beginning to grow into territorial lords. The next reign, that of his son Reccared (586–601), was marked by a change which took away the great hindrance which had thus far stood in the way of any national union between Goths and Romans. The king and the greater part of the Gothic people embraced the Catholic faith. A vast degree of influence now fell into the hands of the Catholic bishops; the two nations began to unite; the Goths were gradually romanized and the Gothic language began to go out of use. In short, the Romance nation and the Romance speech of Spain began to be formed. The kingdom, however, still remained a Gothic kingdom. "Gothic," not "Roman" or "Spanish," is its formal title; only a single late instance of the use of the formula "regnum Hispaniae" is known. In the first half of the 7th century that name became for the first time geographically applicable by the conquest of the still Roman coast of southern Spain. The Empire was then engaged in the great struggle with the Avars and Persians, and, now that the Gothic kings were Catholic, the great objection to their rule on the part of the Roman inhabitants was taken away. The modern Spanish nation is the growth of the long struggle with the Mussulmans, which followed the overthrow of the Visigothic kingdom in 711. Nevertheless, the Goths hold altogether a different place in Spanish memory from that which they hold in Italian memory. In Italy the Goth was but a momentary invader and ruler. In Spain the Goth supplies an important element in the modern nation. And that element has been neither forgotten nor despised. Part of the unconquered region of northern Spain, the land of Asturia, kept for a while the name of Gothia, as did the Gothic possessions in Gaul and in the Crimea. The name of the people who played so great a part in all southern Europe, and who actually ruled over so large a part of it has now wholly passed away; but it is in Spain that its historical impress is to be looked for.

Among the West Goths written laws had already been put forth by Euric. Alaric II. (484–507) put forth a *Breviarium* of Roman law for his Roman subjects; but the great collection of West Gothic laws dates from the later days of the monarchy, being issued by King Recceswinth about 654. Of special Gothic histories, besides that of Jordanes, already so often quoted, there is the Gothic history of Isidore, archbishop of Seville, a special source of the history of the West Gothic kings down to Svinthala (621–631). Not for special facts, but for a general estimate, no writer is more instructive than Salvian of Marseilles in the 5th century, whose work *De Gubernatione Dei* is full of passages contrasting the vices of the Romans with the virtues of the barbarians, especially of the Goths. In all such pictures we must allow a good deal for exaggeration both ways, but, there must be a ground-work of truth. The chief virtues which the Catholic presbyter praises in the Arian Goths are their chastity, their piety according to their own creed, their tolerance towards the Catholics under their rule, and their general good treatment of their Roman subjects. He even ventures to hope that such good people may be saved, notwithstanding their heresy. For the Gothic language see below. (E. A. F.)

There is now an extensive literature on the Goths, and among the principal works may be mentioned: T. Hodgkin, *Italy and her Invaders* (Oxford, 1880–99); F. Dahn, *Die Konige der Germanen* (1861–99); E. von Wietersheim, *Geschichte der Völkerwanderung* (1880–81); R. Pallmann, *Die Geschichte der Völkerwanderung* (Gotha, 1863–64); B. Rappaport, *Die Einfälle der Goten in das romische Reich* (Leipzig, 1899), and K. Zeuss, *Die Deutschen und die Nachbarstämme* (Munich, 1837). Other works which may be consulted are: E. Gibbon, *Decline and Fall of the Roman Empire*, edited by J. B. Bury (1896–1900); J. B. Bury, *History of the Later Roman Empire* (1889); P. Villari, *Le Invasioni barbariche in Italia* (Milan, 1901); and F. Martroye, *L'Occident a l'époque byzantine: Goths et Vandales* (Paris, 1903). There is a popular history of the Goths by H. Bradley in the "Story of the Nations" series (London, 1888). For the laws *see* the *Leges* in Band I. of the *Monumenta Germaniae historica, Leges* (1902); A. Helfferich, *Entstehung und Geschichte des Westgotenrechts* (Berlin, 1858); F. Bluhme, *Zur Textkritik des Westgotenrechts* (1872); F. Dahn, *Lex Visigothorum. Westgotische Studien* (Würzburg, 1874); C. Rinaudo, *Leggi dei Visigote, studio* (Turin, 1878); and K. Zeumer, "Geschichte der westgotischen Gesetzgebung" in the *Neues Archiv der Gesellschaft fur ältere deutsche Geschichtskunde*. *See* also THEODORIC.

Gothic Language.—Our knowledge of the Gothic language is derived almost entirely from the fragments of a translation of the Bible which is believed to have been made by the Arian bishop Wulfila or Ulfilas (d. 383) for the Goths who dwelt on the lower Danube. The mss. which have come down to us and which date from the period of Ostrogothic rule in Italy (489–555) contain the Second Epistle to the Corinthians complete, together with more or less considerable fragments of the four Gospels and of all the other Pauline Epistles. The only remains of the Old Testament are three short fragments of Ezra and Nehemiah. There is also an incomplete commentary on St. John's Gospel, a fragment of a calendar, and two charters (from Naples and Arezzo, the latter now lost) which contain some Gothic sentences. All these texts are written in a special character, which is said to have been invented by Wulfila. It is based chiefly on the uncial Greek alphabet, from which indeed most of the letters are obviously derived, and several orthographical peculiarities, *e.g.*, the use of *ai* for e and *ei* for ī reflect the Greek pronunciation of the period. Other letters, however, have been taken over from the Runic and Latin alphabets. Apart from the texts mentioned above, the only remains of the Gothic language are the proper names and occasional words which occur in Greek and Latin writings, together with some notes, including the Gothic alphabet, in a Salzburg ms. of the 10th century, and two short inscriptions on a torque and a spear-head, discovered at Buzeo (Walachia) and Kovel (Volhynia) respectively. The language itself, as might be expected from the date of Wulfila's translation, is of a much more archaic type than that of any other Teutonic writings which we possess, except a few of the earliest Northern inscriptions. This may be seen, *e.g.*, in the better preservation of final and unaccented syllables and in the retention of the dual and the middle (passive) voice in verbs. It would be quite erroneous, however, to regard the Gothic fragments as representing a type of language common to all Teutonic nations in the 4th century. Indeed the distinctive characteristics of the language are very marked, and there is good reason for believing that it differed considerably from the various northern and western languages, whereas the differences among the latter at this time were probably comparatively slight (see TEUTONIC LANGUAGES). On the other hand, it must not be supposed that the language of the Goths stood quite isolated. Procopius (*Vand.* i. 2) states distinctly that the Gothic language was spoken not only by the Ostrogoths and Visigoths but also by the Vandals and the Gepidae; and in the former case there is sufficient evidence, chiefly from proper names, to prove that his statement is not far from the truth. With regard to the Gepidae we have less information; but since the Goths, according to Jordanes (cap. 17), believed them to have been originally a branch of their own nation, it is highly probable that the two languages were at least closely related. Procopius elsewhere (*Vand.* i. 3; *Goth.* i. 1, iii. 2) speaks of the Rugii, Sciri and Alani as Gothic nations. The fact that the two former were sprung from the north-east of Germany renders it probable that they had Gothic affinities, while the Alani, though non-Teutonic in origin, may have become gothicized in the course of the migration period.

In the 4th and 5th centuries the Gothic language—using the term in its widest sense—must have spread over the greater part of Europe together with the north coast of Africa. It disappeared, however, with surprising rapidity. There is no evidence for its survival in Italy or Africa after the fall of the Ostrogothic and Vandal kingdoms, while in Spain it is doubtful whether the Visigoths retained their language until the Arabic conquest. In central Europe it may have lingered somewhat longer in view of the evidence of the Salzburg ms. mentioned above. Possibly the information there given was derived from southern Hungary or Transylvania where remains of the Gepidae were to be found shortly before the Magyar invasion (889). According to Walafridus Strabo (de Reb. Eccles. cap. 7) also, Gothic was still used in his time (the 9th century) in some churches in the region of the lower Danube. Thenceforth the language seems to have survived only among the Goths (*Goti* Tetraxitae) of the Crimea, who are mentioned for the last time by Ogier Ghislain de Busbecq, an imperial envoy at Constantinople about the middle of the 16th century. He collected a number of words and phrases in use among them which show clearly that their language was still essentially a form of Gothic. (H. M. C.)

The more important phonetic changes are:—

(1) e became *i* always; e.g., wigs (road). But *i* later became e (written *ai* in Ulfilas' orthography) before r, h; e.g., *hairdeis* (herdsman).

(2) *u* became o (written au) before *r*, h; e.g., *baurgs*. (In Ulfilas' orthography the letters transcribed e, o are used for long vowels only.)

(3) *ai, au* became *ē, ō;* but the digraphs were still written.

(4) short vowels (except u) in final syllables were lost; e.g., *dags, gasts: dagaz*, -gastiz.

(5) final nasals and explosives were lost; e.g., *sunu* (Acc. sing.): Skr. *sūnum.*

(6) final long vowels (including those which had become final through the last change) were (in general) shortened (*ī>i, ō>a, ē>a*); e.g., waurhta (1 sing. pret.): (N. inscr.) *worahtō; liuba* (N. sing. fem.): (N. inscr.) *liubu.*

(7) voiced spirants when final (also before s) became voiceless; e.g., bap (3 sing. pret. of bidjan).

All these changes which occurred before or during the 4th century rendered the Gothic language hardly intelligible to a person who spoke a northern or western language. At a later date Gothic underwent further changes which do not appear in Ulfilas' version (c. 370 A.D.), or only to a slight extent.

(1) *i* became a close e- sound; e.g., *Venethae* (Jordanes), for *Winid-*.

(2) *u* became a close *o* sound: *e.g.*, Ῥόγοι (Procopius) : *Rugii;* later o became a in unaccented syllables, e g., *ūraz* (for -us).

(3) *ē* became i; e.g., *leikeis* for *lekeis* (not infrequently in the MSS.).

(4) *ō* became *ū;* e.g., *sunjus* for *sunjos.*

The Gothic and Scandinavian (*q.v.*), languages have one or two characteristics in common, the most important of which is the treatment of intervocalic j and w in a number of words. In the former case we find Goth. *-ddj-* and O.N. *-ggi-*, whereas in German a diphthong developed; e g., Goth. twaddje (Gen. of *twai,* "two"). In the latter case both Goth. and Scand. had *ggw* while a diphthong appears both in English and German, *e.g.,* Goth. *triggws* ("true"), Anglo-Saxon getriowe, getriewe, Old High German *gitriuwi.* Gothic and Scandinavian preserved the ending *-t* in the 2 singular of the strong Preterite, while English and German had a different form with the stem of the plural. By the 4th or 5th century the Scandinavian languages had far more resemblance to English and German than to Gothic.

See H. C. von der Gabelentz and J. Joebe, *Ulfilas* (Altenburg and Leipzig, 1836–46); E. Bernhardt, *Vulfila* oder die gotische *Bibel* (Halle, 1875). For other works on the Gothic languages see J. Wright, *A* Primer of the Gothic Language (Oxford, 1892), p. 143 f. To the references there given should be added: C. C. Uhlenbeck, *Etymologisches* Worterbuch d. got. Sprache (Amsterdam, 2nd ed., 1901); F. Kluge, "Geschichte d. got. Sprache" in H. Paul's Grundriss d. germ. Philologie (2nd ed., vol. i, Strassburg, 1897); W. Streitberg, *Gotisches* Elementarbuch, 1920.

GOTLAND, an island in the Baltic sea belonging to Sweden, lying between 57° and 58° N., and having a length from S.S.W. to N.N.E. of 75 mi., a breadth not exceeding 30 mi. and an area of 1,220 sq.mi. The nearest point on the mainland is 50 mi. from the westernmost point of the island. With the island Fårö, off the northern extremity, the Karlsoe, off the west coast, and Gotska Sando, 25 mi. N. by E., Gotland forms the administrative district (lan) of Gotland. The island is a level plateau of Silurian limestone, rising gently eastward, with a few low isolated hills inland, and with steep coasts fringed with free-standing columns of limestone (raukar). The climate is temperate, and the soil, although in parts dry and sterile, is mostly fertile. Rye, wheat and oats are grown, and especially barley, which is exported to the breweries on the mainland. The sugar beet is also produced and exported, and there are beet-sugar works on the island. Sheep and cattle are kept; there is a government sheep farm at Roma, and the cattle may be noted as belonging principally to an old native breed, yellow and horned. Some lime-burning, cement-making and sea-fishing are carried on. The capital of the island is Visby, on the west coast. The shrunken walled town of Visby was one of the richest commercial centres of the Baltic from the 11th to the 14th century, and its prosperity was shared by the whole island. It retains ten churches besides the cathedral. Tht massive towers of the village churches are often detached, and doubtless served purposes of defense. The churches of Roma, Hemse, with remarkable mural paintings, Othen and Larbo may be specially noted. Some contain fine stained glass, as at Dalhem near Visby. The natives of Gotland speak a dialect distinguished from that of any part of the Swedish mainland. Pop. of *län* (est. 1940) 58,444. Density per sq.mi. 48.

HISTORY

Gotland has a remarkable history, the most important part of which goes back to mediaeval times. Already in the early period of the Stone Age the island was a centre of trade and shipping in the Baltic, and its commercial importance increased during the Bronze and Iron Ages. Out of the 7,000 Roman coins dating from the two first centuries after Christ which have been found in Scandinavia more than 5,000 have come from Gotland, while most of the Byzantine solidi and of those from the Western empire were dug up on the islands of Gotland, Öland and Bornholm. About 30,000 Arabic coins have been found in Scandinavia, more than half of them in Gotland. Hence it is deduced that the island was a commercial centre for Sweden, Denmark, Germany and eastern Europe with connections extending far beyond this region After the Scandinavian countries had been converted to Christianity, pilgrims from Norway and Sweden often travelled to the Holy Land by way of Gotland.

During the 9th century Gotland ranked as part of Sweden although in administration and government it was largely autonomous. The peasants of the island were also traders and their wealth was famous far and wide. Nearly 100 churches were built or restored during the island's great days. A town came into existence at Visby and German merchants took up their abode there. The peasant-traders found their competition injurious and open strife broke out between the townsfolk and the countryfolk. About A.D. 1280 the Swedish king, Magnus Ladulås, bound the island closer to Sweden and levied taxes as a punishment for these disturbances. During the 14th century Visby continued to be talked about as the richest city in Scandinavia. Covetous neighbours were tempted by this and the Danish king, Valdemar Atterdag, invaded the island in the year 1361 and defeated an army of peasants outside Visby, which became his prey. Visby was a member at this period of the Hanseatic league which now united with Sweden and Norway against Denmark, but owing to dissensions among the allies the Danish king went unscathed. During the later portion of the middle ages Visby and the whole island of Gotland were a resort for pirates and for foreign invaders such as the *Vitelianerna* (from Mecklenburg), the Teutonic knights, the Danes, and Erik of Pomerania who from the vantage point of the newly-built castle of Visborg spread terror over this part of the Baltic during the years 1437–49. The Danish country nobles, the brothers Tott, exercised the lofty calling of Sea-rovers from the island during the years 1449–87. The island belonged de facto to Denmark and was formally transferred to the Danish throne by Sweden by the Peace of Stettin in 1570. Through the Peace of Bromsebro, in 1645, Sweden regained the island, which has since continued to belong to her except during the years 1676–79, when the Danes occupied it and for some weeks in 1808.

During the middle ages the special laws of Gotland were kept on the island. The importance of Visby in the sea-trade of the world is conclusively attested by the famous code of maritime law which bears its name. This "sea law which the merchants and seamen have made at Visby" *("Waterrecht dat de Kooplude en de Schippers gemakt hebben to Visby")* was based upon the Liibeck code and was first printed in Low German in 1505 but probably dated back to about 1240 (*see* MARITIME LAW).

Visby boasts a number of fine ruins of churches and a large portion of its walls dates from mediaeval times. It has become in consequence one of Sweden's principal tourist resorts.

GOTŌ-RETTŌ, Japanese archipelago (literally, five-island chain) lying off the western coast of Kyushu, administered by Nagasaki prefecture. There are more than 100 islands (34 are inhabited) with a total area of 266 sq.mi. stretching about 62 mi. from northeast to southwest.

The five largest and most densely settled islands are Fukue, Hisaka, Naru, Wakamatsu and Nakadōri, in south-north sequence. Largely created by volcanic activity, the islands have mountainous interiors. Intensive dry-field farming is practised on terraces and slopes, with irrigated rice restricted to a few slender coastal plains. Fishing is the main economic activity for large ports like Fukue (Fukue Island), Narao (Nakadōri Island) and many smaller ports. In the northern half of the archipelago, fishing leads agriculture in importance and the islands' economy focuses on Sasebo. However. fishing is secondary to agriculture in the southern half and regular ferry service ties the regional economy to Nagasaki. (J. D. EE.)

GOTTER, FRIEDRICH WILHEEM (1746–1797). German poet and dramatist, the chief exponent of French classicism in the German literary life of his time. Born on Sept. 3, 1746, at Gotha, he studied at Gottingen, and, after a minor diplomatic appointment at Wetzlar, returned in 1768 to Gotha as tutor to two young nobles. There with Heinrich Christian Boie (*q.v.*) he founded the famous *Gottinger Musenalmanach* (1768), in which much of the poetry of the *Göttinger Bund* was published. In 1770 he was once more in Wetzlar, where he held a diplomatic secretarial post, and became associated with Goethe's circle. He settled in Gotha in 1774 and died there. March 18, 1797.

Gotter's poetry is elegant and polished but lacks imaginative depth. Most of his plays were based on French originals.

See Gotter's collected *Gedichte,* 3 vol. (1787–1802); R. Schlosser, F. *W. Gotter. sein Leben und seine Werke* (1894). (A. Gs.)

GOTTFRIED VON STRASSBURG (*fl.* 1210), one of the greatest medieval German poets. The dates of his birth and death are unknown, as are the circumstances of his life. and the only information about him consists of references to him in the work of other poets and inferences from his own work. The breadth of learning displayed in his epic *Tristan und Isolde* reveals that he must have enjoyed the fullest education offered by the cathedral and monastery schools of the middle ages, and this, together with the authoritative tone of his writing, indicates that. although not himself of noble birth, he spent his life in the society of the well-born. *Tristan* was probably written about 1210. Gottfried is thus a literary contemporary of Hartmann von Aue, Walther von der Vogelweide and Wolfram von Eschenbach.

The Celtic legend of Tristan (*q.v.*) and Iseult (Ger., Isolde) reached Germany through French sources. The first German version is that of Eilhart von Oberge (*c.* 1180), but Gottfried, although he probably knew Eilhart's poem, based his own work on the Anglo-Norman version of Thomas of Brittany (1160–70). The story centres in Tristan's journey to Ireland on behalf of his uncle, King Mark of Cornwall. to bring back Isolde as the king's bride. On the return voyage, Tristan and Isolde unwittingly drink a magic potion which makes them fall in love with each other. They seek to outwit Mark. but are eventually discovered, and Tristan flees to Brittany, where he marries another Isolde, "Isolde of the white hands." Here Gottfried's poem breaks off and the story is completed by Gottfried's continuators, Ulrich von Turheim and Heinrich von Freiberg. In the course of further adventures Tristan receives a wound from a poisoned spear, and only the first Isolde, who has since become Mark's wife, can heal him. She is summoned from Cornnall. Word is to be brought to the sick Tristan when the vessel returns: it is to mount a white sail if she is on board. a black sail if she is not. The ship is sighted, flying a white sail. Tristan's jealous wife, however, tells him that the sail is black. and when Isolde arrives, she finds Tristan dead. Overcome with grief. she joins her lover in death.

Gottfried's moral purpose, as he states it in the prologue to his poem, is to present to courtiers of fine feeling (edeliu *herzen,* literally "noble hearts") an ideal of the love relationship. The core of this ideal. which derives from the romantic cult of woman in medieval courtly society, is that love (*minne*) ennobles through the suffering with which it is inseparably linked. This Gottfried enshrines in a story in which actions are motivated and justified, not by a standard ethic, but according to the fictional "rules of love" affected by court circles. Thus the love potion, from being the direct cause of the tragedy. has become (as already in Thomas's version) the mere outward symbol of a situation brought about by the inner nature of the relationship between the lovers—an adulterous relationship, yet approved by the "courts of love" by reason of its spontaneity, its exclusiveness and its completeness.

Although unfinished, Gottfried's is the finest of the medieval versions of the Tristan legend and one of the most perfect creations of the medieval courtly spirit, distinguished alike by the refinement and elevated tone of its content and by the elaborate skill of its poetic technique.

Apart from *Tristan* Gottfried is known also to have written lyric poems, but only two *Sprüche* have survived which can with reasonable certainty be ascribed to him.

BIBLIOGRAPHY.—Gottfried's *Tristan* has been edited many times, notably by R. Bechstein, 4th ed. (1923). There is an Eng. trans. by A. T. Hatto (1960). *See* also Gottfried Weber, *Gottfrieds von Strassburg Tristan und die Krise des nochnzittelalterlichen Weltbildes um 1200* (1953); G. Ehrismann, *Geschichte der deutschen Literatur bis zum Ausgang des Mittelalters* ii, 2, 1, pp. 297-336 (1954), both containing full bibliographies. (RD. J. T.)

GOTTHELF, JEREMIAS: *see* BITZIUS, ALBERT.

GOTTINGEN, a town in the *Land* of Lower Saxony, Germany, at the west foot of the Hainberg, in the valley of the Leine. 67 mi. S. of Hanover. Pop. (1959 est.) 77,696. A village of Goding or Gutingi is named in documents of about A.D. 950. The place received municipal rights from the German king Otto IV about 1210, and during the 14th century it held a high place in the Hanseatic League. In 1531 it joined the Reformation movement. and in the following century it suffered considerably in the Thirty Years' War. After a century of decay, it was anew brought into importance by the establishment of its university; and a marked increase in its industrial and commercial prosperity has again taken place in recent years. Toward the end of the 18th century Gottingen was the centre of a society of young poets of the *Sturm und Drang* period of German literature, known as the *Gottinger Dichterbund* or *Hainbund* (*see* GERMAN LITERATURE).

The town is traversed by the Leine canal, which separates the Altstadt from the Neustadt and from Masch, and is surrounded by ramparts. The old streets are crooked and narrow. Gottingen possesses a mediaeval town hall, built in the 14th century and restored in 1880. Industries include branches of the publishing trade, manufacture of cloth and woollens and of scientific instruments. The university, founded by George II in 1734 and opened in 1737, rapidly attained fame. Political disturbances, in which both professors and students were implicated, and the expulsion in 1837 of seven professors—Die *Gottinger Sieben*—for protesting against the revocation by King Ernest Augustus of Hanover of the liberal constitution of 1833, reduced the prosperity of the university. The events of 1848. on the other hand, told somewhat in its favour; and, after the annexation of Hanover in 1866, it was carefully fostered by the Prussian government. The main university building lies on the Wilhelmsplatz, and, adjoining, is the library with the richest collection of modern literature in Germany. There are zoological, ethnographical and mineralogical collections, the most remarkable being Blumenbach's collection of skulls. The Society of Sciences *(Sozietat der Wissenschaften)* is well known and publishes the *Göttingische gelehrte Anzeigen.*

GOTTSCHALK [GODESCALUS, GOTTESCALE] (*c.* 808–867?), German theologian, was born near Mainz, the son of a Saxon noble who obliged him to enter the Benedictine monastery of Fulda, then under the abbot Hrabanus Maurus. In 829, at the synod of Mainz, on the pretext that he had been unduly constrained by his abbot, he obtained his liberty, withdrew first to Corbie and then to Orbais where his study of St. Augustine led him to support the doctrine of absolute predestination and the denial of liberty and responsibility. Between 835 and 840 Gottschalk was ordained priest, and went to Italy. Driven out through the influence of Hrabanus Maurus, now archbishop of Mainz, he travelled through Dalmatia, Pannonia and Norica, preaching and writing. In 848 he presented to the synod at Mainz a profession of faith and a refutation of the accusations by Hrabanus Maurus. He was convicted of heresy however, obliged to swear that he would never enter the territory of Louis the German, and handed over to Hincmar, archbishop of Reims.

The next year at a provincial council at Quierzy, presided over by Charles the Bald, Gottschalk attempted to justify his ideas, but was again condemned, was degraded from the priesthood, and shut up in the monastery of Hautvilliers. There Hincmar tried again to induce him to retract, but he continued to defend his doctrine, and a great controversy resulted. Prudentius, bishop of Troyes, Wenilo of Sens, Ratramnus of Corbie, Loup of Ferrières and Florus of Lyons wrote in his favour. Hincmar wrote *De praedestinatione* and *De una non trina deitate* against his views, and called in Erigena. The question was discussed at the councils of Kiersy (853), of Valence (855) and of Savonnihres (859). Finally Pope Nicolas I. took up the case, and summoned Hincmar to the council of Metz (863). Hincmar declared that Gottschalk might defend himself before the pope. Nothing came of this, and Gottschalk died without recanting. Of his many works we have only the two professions of faith *(cf.* Migne, *Patrol. Lat.,* cxxi.), and some poems, ed. L. Traube in *Mon. Germ. hist.: Poetae Latini aevi Carolini* (t. iii., 1896). Fragments of his theological treatises have been preserved in the writings of Hincmar, Erigena, Ratramnus and Loup of Ferrières.

From the 17th century, when the Jansenists exalted Gottschalk, much has been written on him. Mention may be made of F. Picavet's "Les Discussions sur la liberté au temps de Gottschalk, de Raban Maur, d'Hincmar, et de Jean Scot," in *Comptes rendus de l'acad. des sciences morales et politiques* (1896); and A. Freystedt's "Studien zu Gottschalks Leben und Lehre," in *Zeitschrift* fur *Kirchengeschichte* (1897). Further bibliography in Uberweg's *Gesch. der Philosophie.*

GOTTSCHALL, RUDOLF VON (1823–1909), German man of letters, was born at Breslau on Sept. 30, 1823, the son of a Prussian artillery officer. He studied law at Konigsberg, but was expelled on account of his Liberalism. Breslau and Leipzig proved equally intolerant, and he completed his studies in Berlin. During this period he wrote *Lieder der Gegenwart* (1842) and *Zensurflüchtlinge* (1843) — the poetical fruits of his political enthusiasm. In 1852 he married Marie, baroness von Seherr-Thoss, and for the next few years lived in Silesia. In 1864 he settled in Leipzig, Down to 1887 Gottschall edited the *Brockhaus'sche Blatter fur litterarische Unterhaltung* and the monthly periodical *Unsere Zeit.*

Among Gottschall's volumes of lyric poetry are *Sebastopol* (1856), *Janus* (1873), *Bunte Blüten* (1891); among his epics, *Carlo Zeno* (1854), *Maja* (1864), dealing with an episode in the Indian Mutiny, and *Merlins Wanderungen* (1887). *Pitt und Fox* (1854) was his best comedy. The tragedies, *Mazeppa, Catharine Howard, Amy Robsart* and *Der Gotze von Venedig,* were written in imitation of Schiller. His historical novels, *Im Banne des schwarzen Adlers* (1875; 4th ed., 1884), *Die Erbschaft des Blutes* (1881), *Die Tochter Rübezahls* (1889), and *Verkiimmerte Existenzen* (1892), enjoyed great popularity. His critical work includes *Die deutsche Nationalliteratur des 19. Jahrhunderts* (1855; 7th ed., 1901–02), and *Poetik* (1858; 6th ed., 1903). *See* his autobiography, *Aus meiner Jugend* (1898).

GOTTSCHED, JOHANN CHRISTOPH (1700–1766), German literary theorist and critic who introduced French 18th-century classical standards of taste into German literature, especially drama, was born on Feb. 2, 1700, at Judithenkirch near Konigsberg. He studied at Konigsberg. In 1730 he was appointed professor of poetry at the University of Leipzig, and in 1734 became professor of logic and metaphysics there. His lectures, writings, editorship of several literary journals and work for dramatic reform, in which he collaborated with the actress Karoline Neuber (*q.v.*), led to the establishment of a so-called "Leipzig school" of acting and criticism. He died at Leipzig, Dec. 12, 1766.

Gottsched's most influential work was his *Versuch einer kritischen Dichtkunst fur die Deutschen* (1730), the first German treatise on the art of poetry to apply the French classical standards of reason and good taste advocated by Nicolas Boileau. His aims to purify German as a literary language and to develop a classical German style were advanced by his *Ausführliche Redekunst* (1728) and *Grundlegung einer deutschen Sprachkunst* (1748). He wrote several plays on classical principles, of which *Der sterbende Cato* (1732), an adaptation of Joseph Addison's tragedy, is the most notable. His *Deutsche Schaubühne* (6 vol., 1740–45), containing mainly translations from the French, provided the German stage with a classical repertory, to replace the improvisations and melodramas previously popular. He also prepared a bibliography of German drama, *Nötiger Vorrat zur Geschichte der deutschen dramatischen Dichtkunst* (1757–65). His influence decreased after 1740 when he came into conflict with the Swiss writers, J. J. Bodmer and J. J. Breitinger (*qq.v.*), who demanded that poetic imagination should not be hampered by artificial rules.

Gottsched's wife, LUISE ADELGUNDE VIKTORIE, née KULMUS (1713–1762), helped her husband in his work of dramatic reform, and was the author of several popular comedies. She also translated French classical dramas, Addison's *Spectator* (9 vol., 1739–43), Pope's *Rape of the Lock* (1744) and other French and English works.

BIBLIOGRAPHY.—Gottsched's *Gesammelte Schriften* were ed. by E. Reichel (1902–06). *See* also E. Wolff, *Gottscheds Stellung im deutschen Bildungsleben,* 2 vol. (1895–97); H. Lachmann, *Gottscheds Bedeutung für die Geschichte der deutschen Philologie* (1931); G. Schimansky, *Gottscheds deutsche Bildungsziele* (1939). Frau Gottsched, *Lustspiele,* R. Buchwald and A. Koster (eds.), 2 vol. (1908). *See* P. Schlenther, *Frau Gottsched und die bürgerliche Komodie* (1886). (A. Gs.)

GÖTZ, JOHANN NIKOLAUS (1721–1781), German poet, was born at Worms on July 9, 1721. He studied theology at Halle (1739–42), where he became intimate with the poets J. W. L. Gleim and J. P. Uz, acted for some years as military chaplain, and afterward filled various other ecclesiastical offices. He died at Winterburg on Nov. 4, 1781. Gotz wrote short lyrics and several translations, of which the best is a rendering of Anacreon. The best known of his poems is the elegy, *Die Mädcheninsel.*

GOUACHE, a type of opaque water colour, and, by extension, a picture painted in this medium. Water colour (French and German *aquarelle)* is the specific term for the transparent method *(see* WATER-COLOUR PAINTING); gouache is applied opaquely. Whites and pale tints are produced by the addition of white pigment, ordinarily zinc white (Chinese white). Gouache colours contain the same ingredients as water colours but are compounded with more vehicle and inert pigment. Artists sometimes combine gouache, water colour and pastel in the same picture. Water colour is like a stain in the paper, and the tiny pigment particles become enmeshed in its fibres; gouache colour lies on the surface, forming a continuous layer or coating. Tinted papers and smooth papers can be used instead of the special rough-finish, handmade papers which are indispensable in creating the sparkling, transparent water colour. Gouache paintings are characterized by a directly reflecting brilliance, different from that of water colour. The medium has its own kind of freshness, lightness and spontaneity of free brushstrokes. When applied with bristle brushes it exhibits a slight but effective impasto quality; gouache paint is also capable of being worked out to smooth, fla less colour fields with sable brushes. (RH. M.)

GOUDA, a town of the Netherlands, in the province of South

Holland, on the Gouwe at its confluence with the Ysel, and a junction station 12½ mi. by rail N.E. of Rotterdam. Pop. (1957 est.) 42,181 mun. Tramways connect it uith Bodegraven on the old Rhine and Oudewater on the Ysel; there is a regular steamboat service along canals in various directions. The Groote Markt is the largest market-square in Holland. Among the numerous churches belonging to various denominations. the first place must be given to the Groote Kerk of St John. It was founded in 1485, but rebuilt after a fire in 1552, and is remarkable for a celebrated organ, and a series of 40 stained-glass windows, mostly from the hand of Crabeth. Other buildings are the Gothic town hall, founded in 1449 and rebuilt in 1690, and the weigh-house, built in the 17th century and adorned with a fine relief.

In the time of the counts Gouda was busy with brewing and cloth-weaving; but at a later date the making of clay tobacco pipes became the staple trade. and, although this industry somewhat declined, the churchwarden pipes of Gouda are well known. It also manufactures candles. The transit and shipping trade is considerable, and as one of the principal markets of South Holland, the round, white Gouda cheeses are known throughout Europe Boskoop, 5 mi. N. by W. of Gouda on the Gouwe, is famous for its nursery gardens; and the little town of Oudewater, as the birthplace of the famous theologian Arminius in 1560. In World War II Gouda was occupied by Germany.

GOUDIMEL, CLAUDE (c. 1510–1572), musical composer of the 16th century, born about 1510. Both French and Belgians claim him as their countryman. In all probability he was born at Besançon, for in his edition of the songs of Arcadelt, as well as in the mass of 1554, he calls himself "natif de Besançon" and "Claudius Godimellus Vescontinus." The excellent Latin in which his letters were written proves that, in addition to his musical knowledge, he had a good classical training. In 1555 he published, with Nicolas Duchemin, a musical setting, now lost, some odes of Horace, and in 1557 and 1558 a Magnificat and two Masses. He was living in Metz in 1557, and at about this time, probably, joined the Huguenots. For them he composed a setting of the celebrated French version (1565) of the Psalms by Marot and Beza. The French version of the Psalms was at first used by Catholics as well as Protestants, until their use was forbidden in Catholic churches. Goudimel moved to Lyons, where he perished during the St. Bartholomew massacres of August 27–28, 1572.

Among modern books containing examples of Goudimel's work see especially O. Douen, *Clément Marot et le psautier huguenot* (2 vols., 1878), and *Choix de Psaumes* (1879); H. Expert, *Le Psautier huguenof du XVI^e^ siècle* (1902); J. Tiersot, *Ronsard et la musique de son temps* (Leipzig, 1903); and T. Gerold, *Clément Marot, Psaumes avec les mélodies* (Bibliotheca Romanica, Strasbourg, 1919).

GOUGE, a tool of the chisel type with a curved blade, used for scooping a groove or channel in wood, stone, etc. (*see* TOOL). *A* similar instrument is used in surgery for operations involving the excision of portions of bone. "Gouge" is also used as the name of a bookbinder's tool, for impressing a curved line on the leather, and for the line so impressed. In mining, a "gouge" is the layer of soft rock or earth sometimes found in each side of a vein of coal or ore, which the miner can scoop out with his pick, and thus attack the vein more easily from the side.

GOUGH, SIR HUBERT DE LA POER (1870–), British soldier, was born on Aug. 12, 1870, a son of Gen. Sir C. Gough, V.C., and joined the 16th Lancers in 1889. In 1911 he became brigadier-general commanding the III. Cavalry Brigade at the Curragh, where his attitude with regard to Ulster and the use of the troops in 1914 caused a grave political crisis (*see* ENGLISH HISTORY). He took his brigade to France in August of that year, and after successive promotions, was given command of the newly constituted V. Army; with this he played an important part in the battle of the Somme. In 1917 he was for some time in charge of the Ypres offensive, where his conduct of the operations received considerable criticism. The brunt of the great German offensive of March 1918 fell on his troops, who were unable to withstand the pressure and fell back with heavy loss in personnel and material. Gough's dispositions under circumstances of the utmost difficulty were appropriate, but he was deprived of his command. In 1919 he was head of the British Mission to the Baltic States. He retired in 1922, nith the rank of general. He then became a director of Siemens Bros. Gough received K.C.B (1916), K C V.O (1917), and G.C B. (1937).

GOUGH, HUGH GOUGH, VISCOUNT (1779–1869), Irish field marshal, a descendant of Francis Gough who was made bishop of Limerick in 1626, was born at Woodsdown, Limerick, on Nov 3, 1779. Having entered the army in Aug. 1794, he served with the 78th Highlanders at the Cape of Good Hope, taking part in the capture of Capetown and of the Dutch fleet in Saldanha bay in 1796. His next service was in the West Indies, where, with the 87th (Royal Irish Fusiliers), he shared in the attack on Porto Rico, the capture of Surinam, and the brigand mar in St. Lucia. In 1809 joining the army in Portugal under Wellington, he commanded his regiment as major in the operations before Oporto, by which the town was taken from the French. At Talavera he was severely wounded, and had his horse shot under him. For his conduct on this occasion he was afternard promoted lieutenant-colonel, his commission, on the recommendation of Wellington, being antedated from the day of the duke's dispatch. He was thus the first officer who ever received brevet rank for services performed in the field at the head of a regiment. He was next engaged at the battle of Barrosa, at which his regiment captured a French eagle. At the defense of Tarifa the post of danger was assigned to him, and he compelled the enemy to raise the siege. At Vittoria, where Gough again distinguished himself, his regiment captured the baton of Marshal Jean Baptiste Jourdan. He was again severely wounded at the battle of Nivelle, and was soon after created a knight of St. Charles by the king of Spain.

After a short respite from active service he served in southern Ireland In 1837 he took command in Mysore, whence he was sent to China during the first Chinese War (1841–42). After the conclusion of the treaty of Nanking in Aug. 1842 the British forces were withdrawn. Gough was created a baronet. In Aug. 1843 he was appointed commander in chief of the British forces in India, and in December he took the command in person against the Mahrattas and defeated them at Maharajpur, capturing more than 50 guns. In 1845 occurred the rupture with the Sikhs, who crossed the Sutlej in large numbers. Gough conducted the operations. Successes in the hard-fought battles of Mudki and Ferozeshah were succeeded by the victory of Sobraon, and shortly afterwards the Sikhs sued for peace at Lahore. Gough was then raised to the peerage as Baron Gough (April 1846). The war broke out again in 1848, and again Lord Gough took the field; but the result of the battle of Chillianwalla being equivocal, he was superseded by the home authorities in favour of Sir Charles Napier; before the news of the supersession arrived Gough had finally crushed the Sikhs in the battle of Gujrat (Feb. 1849). His tactics during the Sikh wars were the subject of an embittered controversy (*see* SIKH WARS). Lord Gough then returned to England and was raised to a viscountcy. A pension of £2,000 per annum was granted to him by parliament, and an equal pension by the East India company.

In Nov. 1862, he was made field marshal. He died on March 2, 1869.

See R. S. Rait, *Life and Campaigns of Viscount Gough*, 2 vol. (1903); W. Lee-Warner, *Life of the Marquis of Dalhousie*, 2 vol. (1904).

GOUIN, SIR LOMER (1861–1929), Canadian politician, was born at Grondines, Que.. on March 19, 1861. Educated at Laval and McGill universities, he was called to the bar in 1884 and became Q.C. in 1900. In 1897 he was elected to the Quebec legislature and from 1905 to 1920 was prime minister and attorney general of the province. He declined to join Sir Robert Borden's coalition ministry, subsequently declaring his allegiance to the Liberal opposition. Gouin was included in the King cabinet of 1921 as minister of justice. He was a Canadian representative at the fourth assembly of the League of Nations at Geneva. In 1924 he attended the imperial and economic councils in London as one of Canada's representatives. He died at Quebec on March 28, 1929.

GOUJON, JEAN (c. 1510?–1568?), the greatest French sculptor of the mid-16th century. The first record of him documents his activity in 1540 as an architectural sculptor in Rouen. His earliest mature masterpiece was the superb relief decoration made in 1544–45 for the rood screen of the church of St. Germain l'Auxerrois, Paris, now in the Louvre, which also marked the beginning of his collaboration with the architect Pierre Lescot. The especially beautiful relief of the Pietà illustrates all of the characteristics of Goujon's personal variation of mid-16th-century mannerism, in which the highly subjective and rarefied ideals of beauty created by the artist's imagination were not compromised by reference to what was thought "imperfect Nature." These attenuated and hypersensitive human forms were skillfully coerced onto a plane in poses which are audaciously unliteral and suggest aesthetic movements as unreal as those of the ballet; the whole was then exquisitely embroidered with a linear play of nervous, finely divided draperies.

GIRAUDON

APOSTLE JOHN BY JEAN GOUJON, FORMERLY IN ST GERMAIN L AUXERROIS, NOW IN THE LOUVRE, PARIS

Goujon's masterpiece was the famous relief ornamentation of the later altered Fontaine des Innocents in Paris (1547–49), where the six extraordinarily narrow spaces between the pilasters are filled with elegantly elongated figures of nymphs. At about the same time Goujon must have made the less fine reliefs on the Hôtel Carnavalet, which were executed largely by assistants. Goujon's brilliant reliefs on the court façade of the Old Louvre (*c.* 1549–53) were irresponsibly recut by 19th-century restorers. The later ones in the attic above show how his late work was bolder in relief and freer from his early architectural restraint. The great hall inside contains Goujon's most ambitious sculpture, especially the famous gallery with caryatids carved in the round, but these too were falsified by restoration. Recent scholarship has refuted many traditional attributions to Goujon. His career after 1562 remains largely a mystery; some have thought that as a Protestant he fled Paris.

See Pierre du Colombier, *Jean Goujon* (1949); Anthony Blunt, *Art and Architecture in France, 1500–1700* (1953). (J. HM.)

GOUJON, JEAN MARIE CLAUDE ALEXANDRE (1766–1795), French publicist and statesman, was born at Bourg on April 13, 1766. After a number of years at sea, he became *procureur-général-syndic* of the *département* of Seine-et-Oise (1792), and subsequently took his seat with the Mountain in the Convention.

After the revolution of 9 Thermidor (July 27, 1794) he denounced the Jacobin club, and on 1 Prairial (May 20, 1795) supported the demands of the populace who invaded the legislature. The failure of the insurrection brought about his arrest, and he committed suicide after his trial.

GOULBURN, HENRY (1784–1856), English statesman associated with Sir Robert Peel and his policies, was born in London on March 19, 1784, and educated at Trinity college, Cambridge. Member for Horsham in 1808, he sat in the unreformed parliament for a series of small constituencies before being elected for Cambridge university, which he represented from 1831 until his death near Dorking, Surrey, on Jan. 12, 1856. Undersecretary at the home office from 1810 to 1812 under Spencer Perceval, and for war and the colonies under Lord Liverpool from 1812 to 1821, Goulburn was chief secretary for Ireland from 1821 until his resignation when George Canning became prime minister in 1827. Holding this office during a difficult period, he proved efficient and conciliatory, although frequently denounced as an Orangeman; and he became the close associate of his predecessor, Sir Robert Peel, whose views he shared on most questions, notably Ireland and Catholic emancipation. Chancellor of the exchequer under the duke of Wellington from 1828 to 1830, Goulburn successfully continued and extended the fiscal and financial policies initiated by William Huskisson and Viscount Goderich. In 1834–35 he was home secretary in the first ministry of Peel, under whom he returned to the exchequer in 1841, retaining his position until the defeat of the government five years later. The prime minister, as first lord of the treasury, himself introduced the important budgets of 1842 and 1845, the Bank Charter act and the provisions for the repeal of the Corn laws. Consequently, Goulburn's role has often been regarded as that of a chief clerk, with little responsibility for directing policy. Nevertheless, as a trusted adviser, and an administrator capable of implementing great changes, he was invaluable to Peel. In the last phase of their association, Goulburn came to differ from his leader, though never publicly. In 1845 he agreed to repeal of the Corn laws with the greatest reluctance; and after 1846, when he ceased to play any prominent part in politics, he was a persistent if private advocate of that Conservative reunion to which Peel remained opposed.

Goulburn was a generally respected figure of the second rank who sat in parliament for 48 years, during 25 of which he held office. In addition, he was narrowly defeated for the speakership in 1839. Deeply Conservative in outlook, he was much influenced by "liberal Toryism," particularly in economic matters. Throughout his career, but especially as a member of Peel's inner circle, Goulburn was a prime example of the "man of business" in politics, concerned to preserve the existing order through efficient administration and judicious attention to "proved abuses." (A. F. T.)

GOULBURN, a city of Argyle county, N.S.W., Austr., 134 mi. S.W. of Sydney by the Great Southern railway. Pop. (1954) 19,183. The municipality was created in 1859 and became a city in 1864. It lies in a productive agricultural and pastoral district at an altitude of 2,129 ft., and is a thriving commercial centre. There are Anglican and Roman Catholic cathedrals.

Goulburn is a railway centre. There the railway to Canberra, Cooma and Bombala branches to the south, and to Crookwell and Taralga to the north.

GOULD, AUGUSTUS ADDISON (1805–1866), U.S. conchologist, author of a systematic study of Pacific mollusks and shells and expert on Massachusetts invertebrates, was born in New Ipswich, N.H., April 23, 1805, and graduated at Harvard in medicine in 1830. His reputation was world-wide; his writings fill many pages of the publications of the Boston Society of Natural History. He published with Louis Agassiz (*q.v.*) the *Principles of Zoology* (2nd ed., 1851); he edited the *Terrestrial and Air-breathing Mollusks* (1851–55) of Amos Binney (1803–47). The two most important monuments to his scientific work are *Mollusca and Shells* (vol. xii, 1852) of the U.S. Pacific ocean exploring expedition (1838–42) under Lieut. Charles Wilkes, published by the government, and the *Report on the Invertebrata of Massachusetts* (1841). He died in Boston Sept. 15, 1866.

His other works include *The Study of Botany in Connection with Medicine* (1835); *Description of Shells* (1848); *The Naturalists' Library* (1849); *Animal Life in the Ocean at Great Depths* (1862); *Otia Conchologica* (1863); *Search Out the Secrets of Nature* (1885).

See National Academy of Science, *Biographical Memoirs,* vol. v, pp. 91–113, and *Bibliography,* pp. 106–113 (1905).

GOULD, BENJAMIN APTHORP (1824–1896), U.S. astronomer, best known for his work in connection with longitude determinations, was born at Boston, Mass., Sept. 27, 1824. He graduated from Harvard college in 1844, studied mathematics and astronomy under C. F. Gauss at Göttingen, and returned to the U.S. in 1848. He was in charge of the longitude department of the U.S. coast survey (1852–67); he developed and organized the service, was one of the first to determine longitudes by telegraphic means and employed the Atlantic cable in 1866 to establish longitude relations between Europe and America. The *Astronomical Journal* was founded by Gould in 1849; and its publication, suspended in 1861, was resumed by him in 1885. From 1855 to 1859 he was director of the Dudley observatory at Albany, N.Y.; and in 1859 published a discussion of the places and proper motions of circumpolar stars to be used as standards by the U.S.

coast survey.

He undertook (1868), on behalf of the Argentine republic, to organize a national observatory at Córdoba; began to observe there with four assistants in 1870; and completed in 1874 his *Uranometria Argentina* (published 1879). He then made a zone catalogue of 73,160 stars (1884), and a general catalogue (1885) compiled from meridian observations of 32,448 stars. He died in Cambridge, Mass., Nov. 26, 1896.

GOULD, JAY (1836–1892), American financier, was born in Roxbury, Delaware county (N.Y.), on May 27, 1836. Though he left school in his 16th year, he devoted himself assiduously thereafter to private study, chiefly of mathematics and surveying. In 1852–56 he worked as a surveyor in preparing maps of Ulster, Albany and Delaware counties in New York, of Lake and Geauga counties in Ohio, and of Oakland county in Michigan, and of a projected railway line between Newburgh and Syracuse, in New York state. In 1863 he was appointed manager of the Rensselaer and Saratoga railway. He bought and reorganized the Rutland and Washington railway.

In 1859 he removed to New York city, where he became a broker in railway stocks, and in 1868 he was elected president of the Erie railway, of which he and James Fisk, Jr., (*q.v.*), had gained control. The management of the road under his control, and especially the sale of $5,000,000 of fraudulent stock in 1868–70, led to litigation, and Gould was forced out of the company in March 1872 and compelled to make restitution. It was during his control of the Erie that he and Fisk admitted Tweed to the directorate of the Erie, and Tweed in turn arranged favourable legislation for them at Albany. With Fisk in Aug. 1869 he began to buy gold, his hope being that, with the advance in price of gold, wheat would advance to such a price that western farmers would sell, and there would be a consequent great movement of bread-stuffs from west to east, which would result in increased freight business for the Erie road. His speculations in gold culminated in the panic of "Black Friday," on Sept. 24, 1869, when the price of gold fell from 162 to 135.

Gould gained control of the Union Pacific, from which in 1883 he withdrew after realizing a large profit. Buying up the stock of the Missouri Pacific, he built up the "Gould System" of railways in the South-western States. In 1880 he was in virtual control of 10,000m. of railway. He obtained a controlling interest in the Western Union Telegraph Company, and after 1881, in the elevated railways in New York city. He died on Dec. 2, 1892.

His eldest son, GEORGE JAY GOULD (born 1864), was prominent also as an owner and manager of railways, and became president of the Little Rock and Fort Smith railway (1888), the St. Louis, Iron Mountain and Southern railway (1893), the International and Great Northern railway (1893), the Missouri Pacific railway (1893), The Texas and Pacific railway (1893), and the Manhattan Railway Company (1892); he was also vice president and director of the Western Union Telegraph Company. It was under his control that the Wabash system became transcontinental.

The eldest daughter, HELEN MILLER GOULD SHEPARD (1868–1938), became widely known as a philanthropist, and for her gifts to American Army hospitals in the war with Spain.

GOUNOD, CHARLES FRANÇOIS (1818–1893), French composer, was born in Paris on June 17th, 1818, the son of F. L. Gounod, a talented painter. He studied at the Paris Conservatoire under Reicha, Halévy and Lesueur, and won the "Grand Prix de Rome" in 1839. In Rome he devoted much of his time to the study of the works of Palestrina and Bach. In 1843 he went to Vienna, where a "requiem" of his composition was performed. On his return to Paris he tried in vain to find a publisher for some songs which he had written in Rome. He became organist to the chapel of the "Missions Étrangères," and seems to have contemplated entering holy orders. Through the intervention however of Madame Viardot, the celebrated singer, he was commissioned (1851) to compose an opera on *Sapho*, a text by Émile Augier, for the Académie Nationale de Musique. Its success was not very great but it brought its composer's name to the fore, though for a time not to any great purpose, since neither his second dramatic attempt consisting of some choruses written for *Ulysse*, a tragedy by Ponsard, played at the Théâtre Français in 1852, conducted by Offenbach, nor his third *La Nonne sanglante*, given at the Paris Opéra in 1854, advanced his reputation.

Goethe's *Faust* had for years exercised a strong fascination over Gounod, and he at last determined to turn it to operatic account. The performance at a Paris theatre of a drama on the same subject delayed the production of his opera for a time. In the meanwhile he prepared a pleasing operatic version of Molière's comedy, *Le Médecin malgré lui* (Théâtre Lyrique, 1858). The first performance of *Faust* took place at the Théâtre Lyrique on March 19, 1859. The subject had already inspired in various ways Spohr, Schumann, Berlioz, Liszt and Wagner among others. *Faust* was given in London in 1863, when its success at first doubtful, became enormous, so that it was heard concurrently at Covent Garden and Her Majesty's theatres.

Gounod's next opera was *Philémon et Baucis a* charming setting of the mythological tale (Théâtre Lyrique, 1860) in which the composer followed the traditions of the Opéra Comique, employing spoken dialogue, though without abandoning the individuality of his own style. *La Reine de Saba* (Grand Opéra, Feb. 28, 1862) a four-act opera, was a more ambitious work, but had little success, although the score contains some of the composer's happiest inspirations. *La Reine de Saba* was adapted for the English stage under the name of *Irene*. *Mireille*, which followed (Théâtre Lyrique, March 19, 1864), founded upon the *Mireio* of the Provençal poet Mistral, contains much charming and characteristic music, but again the public was unresponsive; nor did *La Colombe*, heard at Baden in 1860, and at the Opéra Comique, succeed.

Gounod next sought inspiration in Shakespeare, and in the result *Rome'o et Juliette* (Théâtre Lyrique, April 27, 1867) had a success second only to that of *Faust*. Some have even preferred it to the latter. Gounod expressed his own opinion of the relative value of the two operas enigmatically by saying, "*Faust* is the oldest, but I was younger; *Rome'o* is the youngest, but I was older." The success of *Rome'o et Juliette in* Paris was great from the outset. In London it was not until the part of Romeo was sung by Jean de Reszke that the work was fully recognized.

Corneille's *Polyeucte* provided the subject of Gounod's next opera, but its production was delayed by the Franco-German war, during which Gounod visited London. There he composed the "biblical elegy" *Gallia* for the inauguration of the Royal Albert Hall, and a number of songs to English words, many of which have attained an enduring popularity, such as "Maid of Athens," "There is a green hill far away." On his return to Paris he hurriedly set to music an operatic version of Alfred de Vigny's *Cinq-Mars* (Opéra Comique, April 5, 1877), which found little favour. *Polyeucte*, which appeared at the Grand Opéra on Oct. 7, 1878 was no better received; nor was *Le Tribut de Zamora* (1881).

But Gounod had other strings to his bow besides the theatre. As Saint-Saens put it in his *Portraits et Souvenirs:*

> Gounod did not cease all his life to write for the church, to accumulate masses and motets; but it was at the commencement of his career, in the *Messe de Sainte Cécile*, and at the end, in the oratorios *The Redemption* and *Mors et vita*, that he rose highest.

Saint-Saens held that the three works mentioned will survive all the master's operas and however this may be they certainly contain many beautiful pages which have won them warm admirers along with the *Messe du Sacré Coeur* (1876) and the *Messe à la mémoire de Jeanne d'Arc* (1887). *The Redemption*, a "sacred triology," dedicated to Queen Victoria, and produced at the Birmingham Festival of 1882 bears the unmistakable imprint of the composer's hand, but the work in its entirety is not exempt from monotony. *Mors et vita*, dedicated to Pope Leo XIII., was first produced in Birmingham, at the Festival of 1885.

Gounod was a great worker. Besides the works already mentioned may be named two symphonies which were played during the 1850s, but have long since fallen into neglect. He also attempted to set Molière's comedy, *Georges Dandin*, to music, keeping to the original prose, but this work was never performed. Gounod died at St. Cloud on Oct. 18, 1893.

See his own posthumous *Mémoires d'un artiste (1896)*; C. Saint-Saens, *Charles Gounod et le Don Juan de Mozart* (1893) and *Le Livret* *de Faust (Monde Musicale,* 1914–19). *See* also P. L Hillemacher (1906); C. Bellaigue (1910), and Prod'homme and Daudelot (1911).

GOURAMI *(Osphronemus goramy).* a large. fresh-water food fish native to Asia, where it is widely cultured in ponds. Being omnivorous and tenacious of life, it often attains a length of 2 ft. and a weight of 12 to 14 lb. or more. It possesses an accessory respiratory organ above the gills, enabling it to live in warm, stagnant water and even for some time out of water. The flat oblong giant gourami is the largest member of the family Osphromenidae, to which belong also many small aquarium fish called gourami—pearl gourami *(Trichogaster),* kissing gourami *(Helostoma),* etc. *See* also AQUARIUM; FISHES.

GOURAUD, HENRI JOSEPH ÉTIENNE (1867–1946), French general, was born at Paris on Nov. 17, 1867. He entered St. Cyr in 1888, and was commissioned to the infantry in 1890. In 1894 he was seconded for duty under the colonial administration; and thereafter he served in the French Sudan for two years. He was serving in Morocco at the outbreak of World War I.

On Sept. 17, 1914, Gouraud was promoted temporary general of division, and the following January was appointed commander of the colonial army corps. On Feb. 15, 1915, he was made a substantive general of division. In May he replaced D'Amade as commander of the force in Gallipoli, where he was so badly wounded that his right arm had to be amputated. He was awarded the *médaille militaire* on July 10, 1915. On recovering from his wound he went to Italy in charge of a mission, and then in Dec. 1915 he was appointed to command the 4th army. A year later he was sent temporarily, as commissioner general, to Morocco; but he again took command of the 4th army in June 1917. From 1915 to the summer of 1918 the sector of the 4th army was relatively quiet, save for one moment in the spring of 1917 in which it was drawn into the ambit of Nivelle's offensive on the Aisne, and at that time Gouraud was in Morocco. Thus, when on July 1j, 1918, the Germans launched their last offensive on the Champagne front, Pétain had difficulty in winning him to the necessity of a "coil spring" defense. But when the time came Gouraud carried out its principles admirably, and brought the Germans' last effort to a standstill in his battle zone. In Oct. 1919 he became high commissioner in Syria and commander in chief in the Levant. He was appointed military governor of Paris in 1924. He died at Paris on Sept. 16, 1946.

GOURD, a name commonly used to designate the hard-shelled, ornamental fruits of two very different species, *Cucurbita pepo* var. *ovifera* and *Lagenaria siceraria.* These species are members of the gourd family, Cucurbitaceae (*q.v.*). Technically, botanists have broadened the term to include fruits of the wax gourd—*Benincasa hispida;* teasel *gourd—Cucumis dipsaceous;* sponge gourd—*Luffa cylindrica;* and snake *gourd— Trichosanthesanguina.*

Cucurbita pepo var. *ovifera,* the yellow-flowered gourd, includes the small ornamental gourds used for decorative purposes. The nest egg gourd, pear-shaped gourd, bicolour gourd, spoon gourd, and ladle gourd are common forms of this species. *Lagenaria siceraria,* the white-flowered gourd, has extremely large fruits. Some may attain a length of three feet or more, and fruits with diameters of one and one-half feet are not uncommon. Typical varieties are the bottle gourd, kettle gourd, Hercules club, dipper gourd and sugar-trough gourd.

Both species have a long history of association with man, and neither has ever been found in the truly wild state. *C. pepo* var. *ovifera* is native to northern Mexico and the eastern United States. L. *siceraria* probably comes from tropical Africa but evidence on this point is not decisive. Archaeological specimens of this species have been recovered in both hemispheres. Specimens found in an Egyptian tomb are dated at the time of the 5th Dynasty (3500–3300 B.C.), while in Peru seeds, shells and some intact fruits have been recovered from a large midden at Huaca Prieta in strata dated at about 3000 B.C. For primitive peoples without either metalware or pottery, the *Lagenaria* gourds served many purposes. They were used for cutlery, utensils, scoops, ladles, containers of all sorts, fish-net floats, whistles and rattles. In modern times the immature fruits have been used to a limited extent for food, but their chief use is for ornamental purposes. They are frequently painted bright colours, then used to decorate gardens, patios and even living rooms. Many of the smaller gourds of *C. pepo* var. *ovifera* are naturally banded, striped or mottled in various shades of green and yellow, while the solid white ones may be painted to suit the decorator's taste. Others are warted, and some are prized for their bizarre shapes.

These plants are vigorous, trailing annuals. C. *pepo* var. *ovifera* has comparatively large triangular-shaped leaves that are often deeply lobed. Stems and leaves are covered with short bristles that give them a harsh touch. The flowers are large, showy, and orange-yellow in colour. They are of two kinds, male and female, both produced on the same plant. Usually the male flowers appear a week or more in advance of the female flowers and are located toward the extremities of the runners. *Lagenaria* has musky-scented, large, heart-shaped leaves, of soft, velvety texture. The beautiful snow-white flowers open in the evening and close late the following morning. Like *C. pepo,* each plant bears male and female flowers.

Identical methods of culture can be followed with both the yellow-flowered and white-flowered gourds. The seeds should be planted in the spring immediately after danger from frost has passed. They require a long growing season to mature a crop of fruits and are killed with the first autumn frost. Well-drained mellow soils of good fertility are preferred. A warm, sunny location is best for maximum growth. A trellis built for the purpose, a fence or wall for the vines to crawl over are excellent for obtaining clean, well-shaped fruits, of maximum colour, without blemishes or ground spots. (T. W. W.)

GOURGAUD, GASPAR, BARON (1783–1852), French soldier, was born at Versailles on Sept. 14, 1783. He served in the campaigns of 1803–5, at Saragossa, and in the Danubian campaign of 1809. He acted as ordnance officer to Napoleon throughout the Russian campaign of 1812, served in the campaign in Saxony, and saved the emperor's life at Brienne. Though one of the royal guards of Louis XVIII. in 1814, he joined Napoleon in the Hundred Days (1815), was named general and aide-de-camp, and fought at Waterloo. He shared Napoleon's exile at St. Helena, but tired of the life at Longwood and the friction with Montholon, and went to England, where he published his *Campagne de 1815.* He returned to the army in 1830, became a deputy to the Legislative Assembly in 1849, and died in Paris in 1852.

Gourgaud's works include: La *Campagne de 1815* (1818); *Napoléon et la Grande Armée en Russie: examen critique de l'ouvrage de* M. *le comte P. de Ségur* (1824); *Réfutation de la vie de Napoléon par Sir Walter Scott* (1827); *Mémoires pour servir a l'histoire de France sous Napoldon,* with Montholon (1822–23); and *Bourrienne et ses erreurs,* with Belliard *et al.,* 2 vol. (1830). His most important work is the *Journal inkdit de Ste.-Hélène,* 2 vol. (1899).

See B. Jackson, *Notes and Reminiscences of a Staff Officer* (1904), and the bibliography to the article LOWE, SIR HUDSON.

GOURKO, JOSEPH VLADIMIROVICH, COUNT (1828–1901), Russian general, of Lithuanian extraction, was born on Nov. 15, 1828. He entered the imperial bodyguard, rose rapidly in the service, and at the outbreak of the Russo-Turkish war of 1877 he was placed in command of the van of the Russian invasion. He took Tmovo on July 7, crossed the Balkans by the Hain Bogaz pass, debouching near Hainkioi, and, notwithstanding considerable resistance, captured Uflani, Maglish and Kazanlyk; on July 18 he attacked Shipka, which was evacuated by the Turks on the following day. Thus within sixteen days of crossing the Danube Gourko had secured three Balkan passes and created a panic at Constantinople. He then made a series of successful reconnaissances of the Tunja valley, cut the railway in two places, occupied Stara Zagora (Turkish, Eski Zagra) and Nova Zagora (Yeni Zagra), checked the advance of Suleiman's army, and returned again over the Balkans. In October he was appointed commander of the allied cavalry, and attacked the Plevna line of communication to Orkhanie with a large mixed force, captured Gorni-Dubnik, Telische and Vratza, and, in the middle of November, Orkhsnie itself. Plevna was isolated, and after its fall in December Gourko crossed the Balkans, totally defeated Suleiman, and occupied Sophia, Philippopolis and Adrianople, the armistice at the end of January 1878 stopping further operations *(see* RUSSO-TURKISH WARS). Gourko was made a count, and decorated with the 2nd class of St. George and other orders. In 1879–1880 he was governor of St. Petersburg, and from 1883 to 1894 governor-general of Poland. He died on Jan. 29, 1901.

GOURMANCHE, an agricultural, cattle-raising people closely related to the Mossi, whom they resemble in social characteristics, in the Gourma province of the Upper Volta, Africa. They are organized in territorial groups under a paramount chief descended from the conqueror of the Mossi. *(See* Delafosse, ***Haut Sénégal*** Niger [1912]).

GOURMONT, REMY DE (1858–1915), French critic, essayist and novelist, was born on April 4, 1858, at the Château de la Motte, Bazoches-en-Houlme (Orne). He went to Paris in 1883, after having studied at Caen, and entered the Bibliothèque Nationale, where he remained for eight years; he was obliged to leave in 1891 in consequence of having published an article which was considered antipatriotic. In 1890 he founded, with several friends—including J. Renard and others—the *Mercure de France,* of which he was one of the chief collaborators for about 20 years. In his critical works, a distinction must be made between (1) notes on contemporary life published in the *Mercure* under the title of *Epilogues* (1903–13); (2) the series of *Promenades litte'raires* and *Promenades philosophiques* (1904–13), which are sometimes comparable with the *Causeries du Lundi* of Sainte-Beuve; (3) the series of studies dealing with pure literature, style and versification *(Le Latin mystique,* 1892; *L'Esthétique de la langue française,* 1899; *La Culture des idées,* 1900; *Le Chemin de velours,* 1902; *Le Problème du style,* 1907). As a critic, he had the great merit of drawing attention to the intellectual importance of Villiers de l'Isle Adam, Huysmans, Mallarmé, Nietzsche, etc., when the work of these authors was still little known.

He also had an original and precise conception of style. He was always on the alert to break up ideas or images associated by tradition or custom and to analyze them separately in order to set up new associations which, in their turn, might eventually be broken. From the philosophical point of view. Remy de Gourmont agreed, in principle, with the symbolists, in admitting that there exist other realities than those of the mind; but this idealism tended in his case to be sceptical and, at times, even cynical.

Like Schopenhauer and Nietzsche, with whose works he was so fully conversant, he owed much to the French moralists of the 18th century and to Montaigne. This quality of cynicism is clearly apparent in his *Physique de l'amour* (1903), in which he attempts to eliminate from the philosophy of love all mystical and romantic elements and to bring it into line with biology.

Remy de Gourmont was also the author of plays and symbolist poems which are no longer interesting except to the student, and of various novels, of which the most important are *Sixtine,* a *roman de la vie cérébrale* (1890); *Les Chevaux de Diomède* (1897); *Le Songe d'une femme* (1899); *line Nuit au Luxembourg* (1906); and *Un Coeur virginal* (1907). His gift for creating living characters is lacking in these books, but those of his works inspired by the philosophical romances of the 18th century, especially Diderot, are noteworthy for their lucidity and are marked by a fantastic and alert individuality. Remy de Gourmont wrote on many subjects, and with Anatole France was one of the last representatives of the *grande culture générale* in France.

JEAN DE GOURMONT (1877–1928), brother of the above, also contributed largely to the *Mercure de France.* He wrote some poems and a novel, *Le Toison d'or* (1908).

GOUROCK, a small burgh and seaside town of Renfrewshire, Scot., on the south bank of the Clyde, $25\frac{1}{2}$ mi. W.N.W. of Glasgow by road. Pop. (1951) 9,107. Gourock pier is the railhead for most of the Clyde passenger steamers, and Cardwell bay, at the eastern end of the town, is extensively used by Clyde yachtsmen. Tower hill (480 ft.) rises behind the town and divides it into three parts: Kempock (east), Ashton (west) and Midton (centre). A relic of pagan times is the tall gray stone. locally known as "Granny Kempock." formerly regarded as a talisman. Gourock's industries include yacht building and repairing and marine engineering.

GOURVILLE, JEAN HERAULD (1625–1703), French adventurer, was born at La Rochefoucauld, and in 1646 became secretary to François de la Rochefoucauld, author of the *Maximes,* whom he served during the Fronde, in his intrigues with the parliament, the court and the princes. In these negotiations he came into contact with Condé, Mazarin and Nicolas Fouquet. In 1658 he farmed the *taille* in Guienne. He bought depreciated *rentes* and had them raised to their nominal value by the treasury; he extorted gifts from the financiers for his protection, being Fouquet's confidant in many operations of which he shared the profits. In three years he accumulated an enormous fortune, still further increased by his unfailing good luck at cards, playing even with the king. He was involved in the trial of Fouquet and in April 1663 was condemned to death for peculation and embezzlement of public funds; but, escaping, was executed in effigy. He sent a valet one night to take the effigy down from the gallows in the court of the Palais de Justice and then fled the country. He remained abroad for five years, being excepted from the amnesty accorded by Louis XIV to the condemned financiers. Having returned secretly to France, he entered the service of Condé who, unable to meet his creditors, had need of a clever manager to put his affairs in order. In this way he was able to reappear at court, to assist at the campaigns of the war with Holland and to offer himself for all the delicate negotiations for his master or the king. He received diplomatic missions in Germany, in Holland and especially in Spain, though it was only in 1694 that he was freed from the condemnation pronounced against him by the chamber of justice. From 1696 he fell ill and withdrew to his estate where he dictated his *Mémoires,* an important source for the history of his time. In spite of several errors, introduced purposely, they give a clear idea of the life and morals of a financier of the age of Fouquet and throw light on certain points of the diplomatic history.

See his *Mémoires* (1724), of which there is a modern edition, with notes, an introduction and appendix, by L. Lecestre, 2 vol. (1894–95).

GOUT is a disease associated with an inborn error of metabolism, manifest by acute attacks of distress in one or more of the joints of the extremities. It is one of the oldest diseases described in medical literature. Colchicine, the drug most useful in treatment, is one of the oldest in therapeutics *(see* COLCHICUM). Gout is not rare; the incidence is at least 5% of all significant problems in the field of systemic arthritis. There is a hereditary element in the causation, incidence in some families being very high. The male-female ratio is 20:1.

Some patients develop gout secondary to a chronic blood disease. It may appear initially in any decade of life, and between attacks the patient experiences no articular symptoms. Kidney stone, albumin in the urine and elevation of blood pressure are related phenomena.

Acute symptoms of gout develop suddenly and persist for days or weeks if proper treatment is not followed. Heat, redness, tenderness and pain of the affected joints are observed. The body temperature may rise several degrees. The concentration of uric acid in the blood is elevated. A number of factors—including acute infection, emotional upset, surgical operation, direct injury, overindulgence in food or alcohol or administration of certain drugs—may precipitate an acute attack. Precipitation of microscopic amounts of uric acid in the cartilage precedes the first attack.

Appearance of uric acid deposits in the ear or under the skin about the joints appears many years later and only in a minority of patients.

Significant progress in the management of gout was a product of the mid-20th century. This resulted in a form of therapy more satisfactory than any available for other major types of joint disease. Full amounts of colchicine are used in the treatment of the acute attack. Following regression of acute symptoms, prophylaxis requires daily ingestion of colchicine as well as of an agent for eliminating uric acid from the body, the preferred drug in this group being probenecid. The prophylactic regimen should be maintained for several years, depending upon the severity of the affliction.

A high intake of water aids in the elimination of uric acid from the body. A normal balanced diet is recommended save for the avoidance of high purine foods; *i.e*, liver, kidney and sweetbreads. Alcohol in moderation is permitted. A patient who adheres to the prophylactic regimen should lead a normal life. pursue normal activities and should suffer little or no distress from acute attacks.

A few patients die prematurely because of kidney disease, but longevity in gout is normal. Chronic deforming changes are not common (J. H. T.)

GOUTHIÈRE, PIERRE (1732–*c* 1813), French metalworker, perhaps the most celebrated of his time, was baptized at Bar-sur-Aube on Jan 19, 1732, the son of a saddler. He obtained his diploma as a master gilder at the same time as he married the widow of his former employer, Ceriset (1758). He executed a great quantity of metalwork, the best of which was superior to that of any of his rivals in that great period of French craftsmanship. He collaborated with the most eminent cabinetmakers and interior designers of his day. The severity of his design was felicitously counterbalanced by the grace and suppleness of the molding. He invented the process of dull gilding.

His personal reputation began in 1769 with the magnificent jewel chest for Dauphiness Marie Antoinette. From then onward he did work at Fontainebleau, supplied the duc d'Aumont in Paris, Madame du Barry at Louveciennes and the cornte d'Artois at Bagatelle. Nevertheless he ran into financial difficulties and became bankrupt in 1788. The Revolution completed his downfall. He died in Paris in 1813 or 1814.

Gouthière's immense prestige is partly explained by the famous public sale in Paris in 1782 of the collection of the duc d'Aumont, in the course of which Louis XVI and Marie Antoinette acquired many columns and vases in porphyry or marble mounted by the famous metalworker. Pieces from the sale include a splendid red jasper bowl in the Wallace collection, London, and pieces at the Louvre. Paris.

See Jacques Robiquet, *Vie et oeuvre de Pierre Gouthière* (1921). (S GR)

GOUVION-SAINT-CYR, LAURENT DE (1764–1830), French marshal, mas born at Toul on April 13, 1764 At the age of 18 he nent to Rome with the view of prosecuting the study of painting, but although he continued his artistic studies after his return to Paris in 1784 he never definitely adopted the profession of a painter.

In 1792 he was chosen a captain in a volunteer battalion, and served on the staff of Gen. Adam de Custine. Promotion followed rapidly, and in the course of two years he had become a general of division. In 1796 he commanded the centre division of Jean Victor Moreau's army in the campaign of the Rhine, and by coolness and sagacity greatly aided him in the celebrated retreat from Bavaria to the Rhine. In 1798 he succeeded André Masséna in the command of the army of Italy. In the following year he commanded the left wing of Jean Baptiste Jourdan's army in Germany, but when Jourdan was succeeded by Masséna, St.-Cyr joined the army of Moreau in Italy, where he distinguished himself in face of the great difficulties that followed the defeat of Novi. When Moreau. in 1800, was appointed to the command of the army of the Rhine, Gouvion-St.-Cyr was named his principal lieutenant, and on May 9 gained a victory over Gen. Paul Kray von Krajova at Biberach. He was not, however, on good terms with his commander and retired to France after the first operations of the campaign.

In 1801 he was sent to Spain to command the army intended for the invasion of Portugal, and was named grand officer of the Legion of Honour. When a treaty of peace was shortly afterward concluded with Portugal, he succeeded Lucien Bonaparte as ambassador at Madrid. In 1803 he was appointed to the command of an army corps in Italy, in 1805 he served with distinction under Masséna and in 1806 was engaged in the campaign in southern Italy. He took part in the Prussian and Polish campaigns of 1807 and in 1808, in which year he was made a count, he commanded an army corps in Catalonia; but, not wishing to comply aith certain orders he received from Paris (for which *see* Sir Charles Oman. *A Hzstory of the Peninsular War*, vol. iii, 1807–14), he resigned his command and remained in disgrace until 1811. He was still a general of division. having been excluded from the first list of marshals because of his action in refusing to influence the troops in favour of the establishment of the empire. On the opening of the Russian campaign he received command of an army corps, and on Aug. 18. 1812, obtained a victory over the Russians at Polotsk. in recognition of which he was created a marshal of France He received a severe wound in one of the actions during the general retreat. St.-Cyr distinguished himself at the battle of Dresden (Aug. 26–27, 1813), and in the defense of that place against the allies after the battle of Leipzig, capitulating only on Nov. 11, when Napoleon had retreated to the Rhine. On the restoration of the Bourbons he was created a peer of France and in July 1815 was appointed war minister, but resigned his office in the following November. In June 1817 he was appointed minister of marine, and in the following September again resumed the duties of war minister, which he continued to discharge until Nov. 1819. During this time he effected many reforms, particularly in respect to measures tending to make the army a national rather than a dynastic force. He exerted himself also to safeguard the rights of the old soldiers of the empire, organized the general staff and revised the code of military law and the pension regulations He was made a marquess in 1817. He died at Hyères (Var) on March 17, 1830.

Gouvion-St.-Cyr would doubtless have obtained better opportunities of acquiring distinction had he shown himself more blindly devoted to the interests of Napoleon, but Napoleon paid him a high compliment by referring to his "military genius," and entrusted him with independent commands in secondary theatres of war. It is doubtful, however. if he possessed energy commensurate with his skill, and in Napoleon's modern conception of war, as three parts moral to one technical, there was more need for the services of a bold leader of troops whose doctrine predisposed him to self-sacrificing and vigorous action, than for a savant in the art of war of the type of St.-Cyr. Contemporary opinion, as reflected by Jean de Marbot, did justice to his "commanding-talents," but remarked the indolence which was the outward sign of the vague complexity of a mind that had passed beyond the simplicity of mediocrity without attaining the simplicity of genius.

He was the author of the following valuable works: *Journal des opkrations de l'armke de Catalogne en 1808 et 1809* (1821); *Mémoires sur les campagnes des armkes de Rhin et de Rlzin-et-Moselle de 1794 à 1797* (1829); and *Mkmoires pour servir à l'histoire militaire sous le Directoire, le Consulat et l'Empire* (1831).

See Gay de Vernon, *Vie de Gouvion Saint-Cyr* (1857).

GOVERNMENT is concerned specifically with that side of social life which is focused upon consent, control, power and authority. Wherever men attempt to work together through organization, government arises, for no organization can function without some pattern of rule nhich determines who is in ultimate charge. Government as a field of study is, therefore. inseparable from the study of man and society in all times and places.

The rich materials which modern critical history and anthropology have made available, if properly implemented by what psychology. sociology, economics, jurisprudence and the other social studies have to contribute to the analysis of the process of governing men. provide an unprecedented opportunity for developing a science of government.

DEFINITION AND CLASSIFICATION

Government, State and Nation.—Government has been defined in many different ways by a long list of philosophers and social scientists from Plato and Confucius to those of the present day. These definitions have frequently been cast in terms of the purpose of government.

The most commonly acknowledged end or purpose of government has been either justice or the public good. But there have always been conflicting views which, while admitting that justice or the public good ought to be the end of government, have insisted that it has rarely, if ever, actually achieved any such ideal. Conceiving of themselves as realists, such writers and students of government have alleged that the actual end of government appears to be some sort of self-satisfaction of those who do the governing, be this the acquisition of additional power, or glory, or riches or any combination of these and other desires of the human heart.

Looking back over the last 2.500 years of this debate, the detached observer is obliged to conclude that none of these views represents the whole truth, and that all of them contain some truth. As a result, there has been a tendency since the 19th century to discard ends as a key to defining government and a predisposition to concentrate on the process of government—how government works. This is known as the functional view. It might be summed up in the definition that a government is a group of human beings. large or small, who control the operations and the changes of an organization. The "revolution of nihilism," however, has taught the perils of ignoring the ends of government.

While it is usual to think of a nation or other large group when speaking of a government, and employing the expression the government, it is obvious that all other groups as well have some kind of government, whether they be families, business enterprises, trade unions, churches, universities or anything else. But in modern times, these group governments are typically subordinated to the government; they operate within the framework of a legal system which owes its authority, if not its existence, to the government and is enforced by the government. This fact of being on top of all the other governments, which characterizes the government of a modern nation, is by no means as self-evident as one is inclined to assume. In other times and places other groups, such as churches, have had independent and sometimes superior authority. If the world community ever gets to the point of developing fully its own government, that government probably will be superior to the governments of nations.

When viewed as independent and legally self-sufficient organizations, modern nations are spoken of as states. The word state arose in Europe during the 16th and 17th centuries in the course of the very development which made the nation the focal point of power and authority. In fact, the concepts of state and nation are so intimately linked that the expression national state is really a pleonasm. It is important to distinguish the much broader phenomenon of government (defined above) from the concept of the state, although many writers, especially in Europe, continually confuse the two and speak of the theory of the state when they really mean the theory of government.

The concept of the state crystallized in the period of determined struggle of secular rulers against the medieval notions of independent power. These rulers needed a concept which might effectively challenge the church by investing the nation with a halo comparable to that possessed by the mystic body of the believers. Medieval writers had laboured to develop the idea of the visible and the invisible church. State and nation came to occupy a comparable position in the social philosophy of secular writers. It is no accident that the founders of the modern theory of the state—Niccolo Machiavelli, Jean Bodin, Thomas Hobbes—were all violently antiecclesiastical. The portions of their works in which they denounce the ecclesiastical authorities as "the kingdom of darknesse" (Hobbes) and the like are now rarely read, but they show that the concept of the state arose in the fight against the church. At the same time, it is interesting that Richard Hooker's great treatise on government is entitled The Laws of Ecclesiastical Polity; in defending the Elizabethan settlement, the judicious Hooker had to face the transfer of authority from church to state.

Classification of Governments.— Since the days of Plato and Aristotle, governments have been classified in a great many different ways. The Greek philosophers adopted a scheme of classification which was compounded of a strictly numerical criterion and a very general value judgment.

In doing this, they undoubtedly built upon an older tradition of which some evidence survives, such as the famous discussion of the Persian king Darius, reported by Herodotus, and the work of the sophist Hippodamus of Miletus. Plato saw the several forms of politeia, or political order, as corruptions of the ideal order which he delineated in the Republic. It has often been overlooked that he addressed himself to the order in the polis (city) only; his classification is not supposed to cover the political systems of the barbarians, though broadly speaking he inclines, as most Greeks, to see these despots as analogues to the tyrant in the polis. Tyrannos was, of all the politeias, the worst and most corrupt. with the tyrant himself the most unhappy of men. It is the rule of one who is completely lacking in virtue. Its opposite is, relatively speaking, the best, the rule of one who is a man of virtue. The same distinction holds for the other four possible political orders: if a few virtuous men rule, the result is aristocracy; if a few unvirtuous ones, oligarchy; if many possessing some virtue, timocracy; if many without virtue, democracy. This classification which turns upon virtue (arete) in the rulers was eventually qualified by Plato in two directions. On the one hand, he recognized that for the virtue of rulers may be substituted a law of comprehensive scope, and on the other hand he came to feel that a mixture of the three numerical schemes (one, the few, the many) might be best. These ideas found comprehensive expression in his late works, especially The Laws.

Aristotle built upon this foundation, while introducing some significant changes. The discussion is not cast in terms of an ideal, but rather in those of a standard or model. This model is conceived in relation to the end (telos) of the polis: the happiness of its citizens. Happiness itself is comprehensively conceived, embracing as it does the largely contemplative life of the few philosophers, as well as the more mundane concerns of wealth, friends and family. Aristotle's model he calls politeia or political order as such. In Aristotle's terms there was a good and a bad rule of one, of a few and of many. These he called monarchy and tyranny, aristocracy and oligarchy, polity and democracy. His concept of the polity corresponds to the idea of a constitutional democracy in the United States, whereas he uses the term democracy to denote. a constitutionally unrestrained rule of the majority. Without retaining their precise Aristotelian meaning, these terms have become a part of the general political vocabulary of modern man. Yet other writers and thinkers have added many a differentiating concept to this group of six. Thus, the rule of the rich has been called a plutocracy, the rule of the priests theocracy, the rule of officials bureaucracy (*q.v.*). The last term is of modern origin. In the 16th and 17th centuries it was customary to divide governments into monarchical and republican, a usage which finds expression in the U.S. constitution when it provides that each state shall have a "republican form of government." The mid-20th century brought to the fore a classification into democratic and dictatorial or totalitarian governments, while other ideas such as socialism, liberalism and conservatism have also served as a basis of classification.

Perhaps the classification of most universal significance is that which is determined by the key aspect of the pattern of control: whether power is concentrated or divided. All more stable power is based on organization and the control of organization. Without common objectives there can be neither organization nor power. Power, therefore. always presupposes several human beings who are joined together in pursuing a common objective. "All human associations are established for some purpose," is the opening phrase of Aristotle's Politics. That would seem to preclude a genuine division of power. Yet actually objectives may be common because: (1) they are spontaneously shared; (2) they are mutually supplementary; or (3) though conflicting, they are outweighed by other considerations. If organization results in the third case, it is because those who want it get the others to cooperate by constraining or coercing them, and thus making them prefer the avoidance of the threatened penalty to whatever induced them to object.

In order to avoid a situation in which conflicting objectives predominate, power may be divided; different groups in the community may be entrusted with different tasks and charged with restraining other groups.

This theory of constitutionalism, which has been stated in many different forms (*see* CONSTITUTION AND CONSTITUTIONAL LAW), affords a basis for classifying governments according to whether they are constitutional or not, or more exactly according to the extent to which they are constitutionalized. Force or constraint and consent are the two intertwined bases of power and control, with complete constraint and complete consent the unreal extremes between which most human organizations and their governments can be ranged. All power situations contain both force and consent, although in crude, everyday speech we often talk as if there were some governments which are completely based on consent and others completely on force. Actually, governments may be classified according to the degree of either force or consent involved in their operation.

Finally. there is found a species of informal classification which characterizes the government by naming the class or group which is in control. Plutocracy and theocracy are really part of this classification. But we often speak of undertakings such as military government, colonial government and feudal government. It is obvious that such a scheme of classification is indeterminate as long as it does not comprise all conceivable groups which might control. But sociologists using these terms have often failed to analyze adequately what they assumed; namely. that the particular group actually governed. On the whole, it is fair to state that too much has been made of the problem of mere classification.

In opposition to all such schemes of classification, there have been from time to time students of government who have set out to discover the common features of all schemes of government. The phrase "invisible government" has been coined to suggest that no matter what the outward form there always is an invisible government of the few, and that all governments are merely formal disguises for the rule of an elite or special class. Perhaps the most ambitious attempt along this line was made by the Italian Gaetano Mosca, who in his The *Ruling* Class maintained this view with much show of historical learning. Although further refined and generalized by Vilfredo Pareto in his general sociology with its theory of the elite, it is not a tenable view; the task of governing cannot be divorced from the wielding of legitimate authority. and the informal participation of diverse individuals does not constitute these as a class in the sense of Mosca, or an elite in Pareto's understanding.

COMPARATIVE GOVERNMENT

The comparative study of governments is an uncompleted task. Modern governments have been effectively compared and an overall theory based on experience has been presented by such writers as James Bryce, G. D. H. Cole, Herman Finer and Carl J. Friedrich. But these undertakings have been strictly limited to contemporary governments of western European origin. The much more extensive task of systematic comparison and evaluation of the process of government covering all cultures and groups remains to be done. It will be well, however, to present some of this knowledge in general survey form in the following sections. We may conveniently use a historical plan and discuss the following major fields of experience: (1) primitive government. (2) large-scale (Asian) despotism, (3) Greco-Roman republicanism, (4) medieval (European) government, (5) modern western government.

HISTORICAL SURVEY

Primitive Government. — The government of so-called primitive peoples displays a great variety of forms. Anthropologists have shown conclusively that all these people do possess governments, be they ever so rudimentary. Many of them combine religious and governmental functions, so that high priests are often kings and vice versa. Frequently kings are deified in that they are supposed to be endowed with supernatural powers and are regarded with awe. These views are reflected in a number of institutions of the Greek city-state, as well as of Rome. They are also recognizable in the institutions of imperial Japan, China and elsewhere. Rut it would be a mistake to assume that these primitive forms of government are necessarily despotic in their practical workings. As a matter of fact, few of them are. Even in warlike tribes where the king is often the military leader some species of consent pattern is worked. The characteristic feature which differentiates primitive government from the later forms is the lack of any kind of regularized or institutionalized administration. If writing is used at all, it is primitive, and the frequent lack of any considerable employment of currency prevents the development of accounting practices. Primitive government, in its most general connotation, may be described as a government incidental to tribal life and informally linked to its general patterns of behaviour and belief.

Asian Despotism. — Throughout Asia there arose, in conjunction with the development of literacy, the general increase in culture and the forward march of technology, especially in warfare, a species of government which is passing only in modern times. These governments are usually spoken of as despotic, although this term is something of a misnomer, because they were quite limited in scope and, while extending over large land masses, they often included the greatest variety of governmental practice in local jurisdictions. These great systems seem really to have been slow extensions of primitive tribal governments, usually were based upon an underlying homogeneous group growing out of the conquering tribe, and on the whole showed a remarkable viability. They were invariably monarchical in structure, and the monarch was usually invested with divine attributes, if he was not actually deified. They were, it has been held by some, in no sense states, as the west has understood this term, and the trials and tribulations which China encountered in its efforts to grow into a modern state are in part attributed to the fact that the preceding pattern of government had not yet developed any such close-knit system of administration or of legislation as had been established by the monarchies of the west when they were overthrown by their several revolutions (see below). It was contended by others that these oriental despotisms were "states" in a particularly virulent sense. Karl Wittfogel, for instance. argued that these despotisms, especially Chinese despotism, represent a power system which embodies total power in the sense of totalitarian dictatorship. He believed that this kind of government arose in response to the technical requirements of an agriculture which depended wholly upon irrigation. Hence he called these societies "hydraulic." The central piece of this form of government would then be a bureaucracy, described as monopolistic and characterized by "total terror, total submission and total loneliness." This elaborately argued contention has met with sharp criticism.

Whatever may be the eventual conclusion regarding the nature and value of this type of government. there can be little doubt that while it is ill-adapted to the modern world and a machine technology, it served the people reasonably well as long as they lived under a system of handicraft production, whether in industry or agriculture. As the remarkable state of culture in all its forms (literature, arts, music and religion) attests, these systems were fairly tolerant of, if not positively interested in, human creativity. An occasional outburst of violence such as that which occurred in China under Shih Huang Ti (246–210 B.C.) merely shows that this system of government is habitually ill-adapted to extreme governmental control. Its worst feature, in the long run, was unquestionably its tendency to fall to pieces when the court circles grew corrupt. lazy and indifferent. At such times these systems often plunged into anarchy and became exposed to sudden invasions by outsiders, especially barbarians of bellicose disposition. But these despotic systems lasted longer than any other known form of government to date, and were swept away only by the onrush of modern industrial civilization with its multiplicity of governmental tasks.

Greco-Roman Republicanism. — When the city-states of the so-called classical world are considered, one is on more familiar ground. Not only have the great writers of antiquity, such as Aristotle, Thucydides and Polybius, left an explicit record of the government of these remarkable communities, but a vast amount of the most searching learning has gone into the critical examination of these records. a learning associated with names such as Numa D. Fustel de Coulanges and Theodor Mommsen, which combined a deep grasp of the problems of government with thorough historical scholarship.

The remarkable cultural flowering that occurred in Greece at the height of the power of the city of Athens cast a golden glow over these city-states. As later ages marveled at the Periclean age, they inclined toward idealizing its political institutions. Yet, from a modern viewpoint, it is all-important to remember that even the most democratic of these republics, such as Athens, rested upon a broad basis of slavery. The citizenry was in other words, an upper class whose privileged position permitted it to participate in public affairs. The defense of slavery by both Plato and Aristotle, though often treated as a deplorable aberration. is really of central importance to their political philosophy. They believed in a superior race, and not in the "common man everywhere."

Upon the substratum of this slave population, the size of which has been variously estimated, the city-states were originally organized as monarchies under tribal kings. These were gradually superseded by military aristocracies, which in turn gave way to an aristocracy of wealth and to an ever-widening body of citizens. The divergent rate of progress in different cities toward this kind of democracy eventually led to a situation in which most Greek cities were split into a democratic and an aristocratic faction, each epitomized by one leading city—Athens or Sparta. The conflict between the two types of government culminated in the disastrous and long-drawn-out struggle known as the Peloponnesian War (*q.v.;* 431–404 B C.). While frequently represented as a fight between two ideologies, it was in fact as much a war between rival imperialisms, and it prepared the way for the final subjugation of all Greek cities by the kingdom of Macedon and later by Rome. The Greeks experimented extensively with federation as a solution to their problem of combining unity with independence of the cities, but the federations proved no match for enemies whose government rested upon the more solid basis of territorial control. (See GREECE. History.)

The Roman republic, which eventually achieved the overlordship of all Greek cities. in Sicily, in Asia Minor and in Greece proper, followed the tradition of the Greek cities at first, but soon grew beyond it by developing a solid territorial foundation. This foundation was provided by the conquest of the Italic cities and the subsequent settlement of Romans on the land, conferral of Roman citizenship upon the inhabitants, or both. Furthermore, Rome evolved a complex constitutional structure in which monarchical, aristocratic and democratic elements were skillfully blended. Perhaps the most extraordinary feature of this government was its dual executive, welding the imperium. or power to command. After a time, tno consuls replaced the monarch as the chief executives; they had practically identical functions, and could not act one without the other (see CONSUL). Finally, there was the praetor, who also shared the imperium. At the heart of the republic's government we find a legislative establishment, compounded of the fathers (patres) and the "people" (populus). Originally, the people were only the patricians, but after a long struggle the nobles had to allow the plebeians to share in the offices (magistratus) and to adopt decisions of their own (plebiscita). The military assembly (Comitia centuriata) and plebs decided what laws were wanted. expressing their preferences, but only upon proposals (*rogationes*) by the magistrates. The fathers, organized as the senate, were presumably only consulted, and their decisions took the form of a *senatus consultum.* But actually the senate became the dominant body in Rome to uhich both magistrates and people deferred. Thus the letters SPQR (*Senatus Populusque Romanus,* "the senate and the Roman people") were the magic symbols of Roman power, as well as of Roman subjection to law. Among the offices, the most important were the fiscal (quaestors) and the judicial ones, primarily a number of praetors holding *jurisdictio.* Among these last, the praetor *peregrinus* exerted a profound influence upon the development of Roman law, because he interpreted the Roman civil law for the many foreigners doing business in Rome. This body of law, known as the *jus gentium,* implemented the *jus civile* and came to form the hard core of the Corpus Juris Civilis as it was eventually codified by Justinian (6th century). There were other important officers. such as the censors and the tribunes of the people. who provided a further check to the consuls and other magistrates, and, finally, there was the dictator. This office. which superseded all others, came into being only in emergencies and was strictly limited to six months. It eventually became the basis for the destruction of the republic. The subtle mixture of monarchical, aristocratic and democratic elements which has evoked the admiration of students of government ever since continued as an outward ritual long after the effective power had become completely concentrated in the hands of the Caesar imperator. (See ROME.)

It was a common trait of all the republics of the ancient world that the city or polis combined in interlocking functions the task of government with the exercise of religion. Thus, the great temples, such as the Acropolis in Athens, mere the centres of the city's life. and their architecture clearly reflects this function. While all the Greek cities acknowledged the common Olympus with its Zeus. Hera and the other gods and goddesses, each city had its own special god from whom the local gentry claimed to be descended. Citizenship was, therefore, invested with the religious halo of belonging to the cult community, and it is not surprising that to the Greeks the good life appeared inconceivable outside the polis. Patriotism, under such conditions. had a deeper foundation and a nobler appeal than within modern nations whose religious life and ideals transcend the nation and its government. Much confusion has resulted from the attempts of modern philosophers, from Machiavelli to Georg F. W. Hegel and the fascists, to apply Greek ideas concerning the polis to the modern nation-state.

This close tie between religion and politics caused the basic difficulty the Roman empire faced with the rise of Christianity. For the Christians refused to accept the deification of the emperor which had been evolved in response to problems which Roman rule in Asia had posed. Hence, the very best emperors, more especially Marcus Aurelius. were inclined to persecute the Christians most severely. because of their attachment to the religio-spiritual foundation of their empire. Even after the Christian faith had become the Roman state religion. under Constantine, the situation of the Roman government was an equivocal one: a church as a radically autonomous corporate entity, unrelated to and not seen as the creation of the Roman government (state), was not accepted until much later. Pope Gelasius I (5th century), uho is usually though incorrectly credited with stating the doctrine of the "two swords," first effectively argued this position. In the eastern part of the empire it never achieved ascendancy. But in the west, the dualism of church and government became accepted doctrine, and it is within this context that the heritage of Roman law was bequeathed to medieval Europe.

Medieval Government.—The medieval system of government was extraordinary in its rich diversity combined with a claim to resplendent unity. Centred in the unity of Christianity, the universal empire and the universal church both gloried in aspirations which they never succeeded in realizing. The doctrine of the two swords, the secular suord of worldly empire and the ecclesiastical sword of spiritual guidance toward salvation, rationalized the dominant fact of medieval government: a continuing struggle between temporal and ecclesiastical authorities to achieve supremacy. By the time the Holy Roman empire came essentially to be "of the German nation" (14th century), the emerging national monarchs, especially of England. Scotland, France and Spain, were much concerned with claiming for themselves the position of imperator and Caesar, and the curious competition for the imperial office between Francis I of France, Henry VIII of England and Charles V of Spain and Germany highlights how long this idea of universal empire persisted in spite of the obvious independence of the great kingdoms.

These kingdoms and principalities themselves underwent an interesting evolution in the course of which their governments became constitutionalized. The system of "government by estates" (Standestaat), which was common throughout Europe (except in Italy) on the eve of the Reformation, provided a genuine division of power betueen the monarch, the aristocracy and the commoners. Its pattern is most familiar through the English system of a king in parliament, but it was actually more highly developed elsewhere. Tudor absolutism foreshadowed the breakdown of this type of government by skillfully manipulating the estates into a position of impotence.

But there was a third pattern of government to be found in the medieval world; namely, city republics. These republics were strongest in Italy, but they achieved a powerful position likewise in Germany and the Low Countries. Bruges and Antwerp, Lubeck and Cologne, Strasbourg and Augsburg, Venice. Milan and Florence—all these and many more were brilliant centres of an urban secular culture which grew up under the aegis of a republican scheme of government. These city republics underwent a governmental evolution resembling that of the cities of the ancient world until they were absorbed into the rising territorial states or became, like Milan and Florence, themselves such states. But since they were, unlike the cities of Greece! embedded in a broader pattern of government — the universal realm of emperor and pope — their preoccupation with commerce as contrasted with politics made them the precursors of the great trading nations of the present time.

Modern Government. — Modern government is not a clearly defined term; but it roughly includes three different types: monarchical absolutism, constitutionalism and totalitarianism.

Monarchical Absolutism. — Of these three forms of government, monarchical absolutism is pretty much a thing of the past, but it was the predominant form from the 16th to the end of the 18th centuries. Indeed, modern government owes one of its most distinguishing features, bureaucracy, primarily to these absolute monarchs. Using the term dispassionately to designate the body of public officials engaged in administering the government's business: we are justified in saying that this bureaucracy constitutes the core of modern government. Arising in England and in the papal administration in the 14th century, and subsequently in other realms, such as France, Spain, Austria, Prussia and the Netherlands, the bureaucracy rationalized administration by regularizing its operations, such as bookkeeping, recordkeeping and correspondence, by differentiating its functions and by training its personnel. Without these achievements, modern government is unthinkable.

But modern government is likewise unthinkable without legislation; *i.e.*, a growing body of explicit, man-made rules by which the individual can live without fear of interfering with his neighbour. This point became clear in the 16th century, when the growing commerce and industry necessitated numerous alterations in existing lam. While some, like Jean Bodin (*Six Livres* de la *république,* 1576), claimed this function of legislating for the monarch, others, especially in England, claimed it for the people or their representatives. To be sure, the term "people" had a rather restricted connotation, limited as it was to the more well-to-do in town and country, but it served as a harbinger of the coming democratization.

A third element in the evolution of modern government is the courts of law. The majesty attributed to the lam was reflected in the social position of judges. Even such absolutists as Frederick the Great of Prussia found it expedient to recognize the importance of leaving a good deal of independence to the judges. While the principle that judges should be bound only by the law is actually an extension of the general principle of administration that demands objectivity, it acquired a distinct significance in Great Britain and the United States, and later in Europe, as a pillar of modern government.

Legislation by popular representatives and an independent judiciary were steps on the road toward constitutionalism. Both implied a division of power between the monarch, or crown, and others, and hence led away from the concentration of powers characteristic of monarchical absolutism. Either or both may find a place in an authoritarian pattern, such as those of Prussia and Austria after the Napoleonic Wars (1805–15), but their full development is not possible except after the establishment of genuine constitutionalism.

Modern Constitutionalism. — Constitutionalism in its broadest connotation may be defined as a government which is limited by a constitution. Such a constitution may be constructed in a great variety of ways. It may be built around a monarchy, or it may be a republican scheme; it may provide a unitary or a federal system; it may set up a parliamentary executive or some other kind; it may contain a bill of rights or it may not; but whatever the detailed arrangements, it will always seek to make sure that no one man, or group of men, is in a position to exercise legitimate power nithout some effective restraint placed upon him to relinquish it, share it or seek it periodically at the hands of the electorate. No matter how skillfully balanced. the ultimate sanction for the maintenance of any constitutionalism lies in the determination of the people to maintain it. This determination, which has been called constitutional morality and of which Jean Jacques Rousseau as a Swiss proudly spoke as the unwritten law "graven upon the hearts of the citizens," has in the last analysis decided the success or failure of constitutional government.

There used to be much concern over whether a constitution was rigid or flexible. Students comparing the situation in the United States and Great Britain, as for instance Bryce, were fond of dwelling upon this theme. More realistic analysis has disclosed this difference to be rather elusive. Rigid and flexible are ill-defined terms which hide rather than explain the real problems. The third French republic had a constitution which proved too easy as well as too difficult to change. It was not a question of general rigidity or flexibility. but rather that it was badly drawn. The U.S. constitution used to be classed as rigid, but it acquired and lost again a provision for prohibiting the sale of intoxicating liquor. such as has not been adopted in Great Britain.

Much more central and significant is the problem of federalism. A constitution which guarantees to a number of component units of government an independent jurisdiction is characterized thereby as a federal constitution. Extended controversies have raged over how to define a federal government or state. This formalistic battling over words has delayed a realistic study of the political nature of these federal schemes. Leaving the insoluble problem of uho is the sovereign in a federal setup, we may say that federalism is a system of government that divides political power territorially under a constitution. Even the most effectively centralized government will grant some measure of decentralized authority to local bodies. In terms of objectives, federalism seeks to balance. under a constitution, partly general and common objectives, and partly particular and conflicting objectives when these objectives are distributed in space. Thus, the Swiss constitution leaves all educational matters to the cantons so that cantons with a French-speaking majority may differentiate themselves from the German-speaking majority in the country as a whole.

Federal patterns of government frequently owe their existence to a preceding federation or league of governments. It is. therefore, possible to analyze such governments pragmatically in terms of the institutions which are characteristic of such federations. The United States, Switzerland and Germany, as well as several dominions, are examples of this. Three characteristic federal institutions may be mentioned here: (1) a legislative assembly composed of representatives of the component units, be they called states, cantons or provinces, as if they were equals or near-equals; (2) an executive in which, or in the selection of which, the component local units participate; (3) a judicial body or bodies for the settlement of disputes between the component local units and the union government according to the charter or constitution. (See FEDERAL GOVERNMENT.)

Even more imaortant than the question of federal government is that of parliamentary government. Is the executive dependent upon the support and confidence of the elected representative assembly or has he an independent position and a separate mandate from the people? England is the home of parliamentary government, and it is principally in England and the dominions that this system has worked well. The admirers of the system are generally inclined to credit it with the superior performance of British politics, but comparative analysis suggests at least two contravening considerations. First, it would seem that parliamentary government depends for its success upon unwritten conventions which in turn depend for their operation upon certain common beliefs and behaviour patterns found only in Britain and its dominions. Second, parliamentary government does not in actual operation correspond to the alleged theory. The supposed responsibility to the parliament is actually restricted to a few dominant issues, whereas many minor matters are decided by the party in power in accordance with considerations of expediency and tactics which may not be shared by the majority of the people or even of parliament. This may also be true of major issues.

In England, the system itself is a congeries of conventions which grew from small beginnings as the party system developed. There was an increasing tendency for the house of commons to be divided into a majority and a minority party, with the result that the majority party controlled the body and presented itself to the crown as the obvious basis of a solid government whose leader might reasonably be asked to head the government. The party leader would then naturally invite his leading associates to share the government with him, and hence Britain has always been inclined toward collective responsibility of the cabinet (see CABINET). However, since the turn of the 19th century the prime minister has become increasingly important, and general elections tend to focus attention upon him much as quadrennial elections do upon presidential candidates in the United States.

Such leading students of parliamentary government as Sir Ivor Jennings suggest that the term parliamentary government is not accurate, so far as the 20th-century British system is concerned, and that one should rather speak of cabinet government. The function of parliament seems to them to be rather that of a deliberative assembly in which various views concerning proposed policies of the government are subjected to analysis and criticism, while the actual government is carried on by a cabinet which is organized by the party and its leader on the basis of a mandate directly from the people. In support of this view one can point to the fact that since World War I no cabinet which had an actual majority in the house of commons has been overthrown by vote of parliament. Elections have been held either because the five-year term was nearly over or because the party in power deemed it strategic to do so.

In France a rather different system was constructed by men whose intention it had been to establish parliamentary government on the British model. Under the third and fourth republics the French parliament became paramount. It is important to know that this omnipotent parliament was not clearly divided into a majority party supporting the government and a minority party opposing it, but consisted of a great many groups, more or less related to a complex multiparty system. The great committees of parliament (unknown in England), and more especially its leading members, secured a considerable share in the governing functions, and in co-operation with the permanent high bureaucracy really ruled the country. This system, while giving excellent results in the sphere of administration, was characterized by stalling, when major decisions had to be taken, and finally collapsed when the fourth republic was confronted with the task of solving the M-gerian problem. A different and more authoritative system which purported to be a blend of British and U.S. (presidential) elements was established in 1958.

The French kind of parliamentary system was adopted in Germany after World War I with disastrous consequences. To be sure, there the situation was complicated by other factors, including the aftermath of a lost war and federalism, but the parallel developments in Italy and elsewhere suggest that this system of government by parliament is not viable. It should be noted that its abandonment by Germany after World War II, and the substitution of a more stable form which is a skillful adaptation of the British model, gave good results, even though combined with federalism.

The Scandinavian countries, Belgium and the Netherlands also made a reasonable success of parliamentary government. Whether this fact is attributable to a basis of beliefs and traditions comparable to those that prevail in England, or to the presence of a monarchy with a settled willingness to accept constitutionalism, or to both, it is difficult to determine.

The nonparliamentary executive may be of two prevailing kinds. In the United States, the president is, for all practical purposes, elected directly by the people and is or becomes thereby the leader of his party. In all matters of general policy involving legislation or the spending of funds he must successfully manage his party in congress, both senate and house. or his hands are tied. Grave difficulties confront him if, as a result of a congressional election, the representative assembly becomes dominated by the opposition party, as happened to Woodrow Wilson in 1918, to Herbert Hoover in 1930, to Harry S. Truman in 1946 and to Dwight D. Eisenhower in 1956. However, the lack of party discipline sometimes makes it possible to carry on with the support of votes from the opposition (as was done for many years in the state of New York where Democratic governors had to work with Republican legislatures. The nonparliamentary executive type of government of the presidential form has been vigorously attacked and critically contrasted with the parliamentary type by students of U.S. government, such as Woodrow Wilson (Congressional Government, 1885). Its failings are generally admitted, but it is doubtful that they are more serious than those of the parliamentary type.

The conciliar type of nonparliamentary executive is illustrated by Switzerland. Its stable and ably conducted democratic government is under a federal council composed of the heads of the various departments who choose a chairman as president of the republic for one year. The members of this council separate their administrative function clearly from their legislative tasks. When the legislature repudiates a proposed policy, the council does not resign, but either drops it or prepares another proposal. It is curious, indeed. that the Swiss system has not found more imitators, for it appears well adapted to the task of governing a small country on a republican basis. (See SWITZERLAND: Government.)

Totalitarian Dictatorship.--In spite of profound differences in general outlook and objective, as a pattern of government the totalitarian dictatorships have a great deal in common. They represent a distinct and ultramodern pattern of government. The totalitarian dictatorships all claim to be set up for the people and they all make a show of some sort of popular support, either through unfree sham elections, through plebiscites or through other forms of mass acclaim, customarily reinforced by denunciations of constitutional democratic regimes as capitalist and imperialist plutocracies. Yet, these regimes are usually characterized by several of the following practices and institutions.

First, totalitarian dictatorship originates in a coup *d'état* through which an organized minority seizes power by armed force or constitutional fraud or both. Second, it continues because this minority, organized as a party, takes over complete ultimate control of the government, the leader of the party becoming, in effect, the monocratic head of the government. Third, it constitutes this controlling party as an aggressive elite which seeks to abolish all other pre-existing social and class differentiations and thus atomizes the electorate, dissolving even the family into often warring individuals. Fourth, it establishes as complete a control over all forms of expression. including science, religion and the arts, as possible, subordinating all persons engaged in these creative pursuits to rigid governmental supervision and control. Fifth, it institutes an elaborate governmental propaganda which continually swamps all subjects with news and opinions, with the end of securing their allegiance or at least acquiescence. Sixth, it develops a systematic reign of terror for the purpose of crushing all opposition by spying upon, summarily arresting and liquidating all enemies of the state. using summary procedures and arbitrary sentences, including long detention in concentration camps and every species of physical torture. Seventh, it establishes complete control over all economic activities for the purposes of integrating the economy and subordinating all enterprise to the ends of the government. Eighth, it invariably includes a vast military establishment among these purposes of government, on the ground that the defense of the state is of paramount importance.

This kind of government is sometimes identified with despotism, tyranny and absolutism. These identifications are misleading. Any careful comparison of the traits just delineated with the structure of government in those older autocracies will immediately disclose striking contrasts. Most important among these is the totalitarian mass party, fired by a faith in a total reconstruction of society—a kind of secular religion—which is completely lacking in past autocratic government. It is the actual autocrat in a totalitarian dictatorship, speaking through its leader or leaders who are bound to it by faith and ritual. These governments have shown themselves capable of accomplishing extraordinary feats. The industrialization of the U.S.S.R., the near-conquest of all of Europe by Hitler Germany, the revolutionary transformation of the ancient Chinese society, politically, socially, culturally and economically—these are outstanding examples of totalitarian governmental achievement. The stupendous sacrifices in human suffering involved in these undertakings seem amply justified in the eyes of the rulers and the ruling party by the achievements. The ominous appeal of totalitarianism in Asia and Africa results from these accomplishments. Since freedom in most of these formerly colonial peoples is at best a vague hope, whereas national independence and the standard of living are pressing, ever-present realities, it appeared quite possible in the second half of the 20th century that totalitarian government would continue to spread.

So all-inclusive a system of governmental control was never before in the history of mankind developed by anyone. Even the extreme tyrannies of men such as Shih Huang Ti, Domitian and the condottieri of the Italian Renaissance lacked, because of technological inefficiencies, the asphyxiating effect of modern totalitarianism. The extraordinary effectiveness of modern weapons, such as tanks, airplanes and nuclear bombs, as well as their initial cost, render individual revolutionary effort hopeless at the outset. Consequently, not one of these totalitarian dictatorships has been overthrown from within. Only superior external force has brought on their downfall.

Local Government.—The ever-increasing size and complexity of government on the national and international level in the second half of the 20th century revived interest in the local community, and the growth of great metropolitan centres further contributed to this concern. The importance of the local community in the functioning of constitutional government is generally recognized. Even the totalitarian systems, in attempts at administrative decentralization or communalization, manifested the abiding role of the local community. These tendencies were in part motivated by the fact that local communities have proved rather resistant to the pressures of totalitarian government. Politico-sociological analysis discovered a fruitful area of field studies in the more intimate life of local communities. The slogan of "grass roots democracy" testified to the trend.

But it is one thing to recognize the importance of the local community and another to organize it effectively for self-government in an age of mass industry. While local functions increased, along with other governmental trends, these functions were continually more in need of effective integration within larger governmental units. Britain's proud tradition of local self-government, for example, had to yield to the point where the local activities became largely centrally directed. Under these circumstances, a general tendency developed to make the selection of local personnel the focal point of local autonomy. But unless such personnel have policy issues on which to contend for acceptance, their autonomy will be precarious and party bureaucracy will be able to subject them to the party will.

There is no one pattern of local government that is clearly preferable to all the rest. Britain, France, Switzerland, Germany and other European countries each evolved one or more patterns of their own, in which mayors. clerks, councils and local officials were arranged in various ways. The United States too has a number of patterns. Noteworthy are the so-called city-manager type, the newest form, in which local government is assimilated to the operation of a business enterprise, and New England town-meeting government, the oldest form, where the whole community decides basic policy. (See CITY GOVERNMENT; LOCAL GOVERNMENT; UNITED STATES [OF AMERICA]: Administration and Social Conditions: Local Government in the States.)

Military Government.—The end of World War II brought in its train military occupations on an unprecedented scale. In Italy, Austria, Germany, Japan—wherever the fascist government collapsed—the victors had to assume governmental authority for a transition period. Such military government, defined as government by the military over occupied enemy populations, when conducted by constitutional democracies, is comparable with emergency government. Military government is directed toward the establishment of a constitutional democracy, but as an emergency government it is obliged to extend its authority far beyond the usual limits. Military government is in its nature authoritarian, but according to international law it is neither lawless nor despotic. In working for the establishment of popular government in the occupied country, military government endeavours to re-establish first of all government according to law (the "rule of law") as the necessary basis for free institutions. In the process of eliminating the totalitarian elements, it is often very severe and obliged to create new law retroactively. The lawless nature of the preceding totalitarian system makes this unavoidable.

World Government.—The San Francisco charter, drafted and adopted in 1945, became the constitution of a confederation of nations, the United Nations. While originally hopes were high that this constitution might mean the start of a world government, the sharp conflicts which arose between the United States, Great Britain and their friends on one side, and the Soviet Union and its satellites on the other, made it abundantly clear that the United Nations was not going to operate as a functioning government, but rather as a permanent gathering of the representatives of most of the governments of the world. Several important governments were, in the late 1950s, outside the UN. Because of the division of Germany between Communist and non-Communist regimes, agreement on UN membership for neither could be secured. Equally symbolic was the situation of China. While the vast majority of Chinese, living under Communist rule, remained unrepresented, the nationalist government of Formosa occupied a ,permanent seat on the UN council.

The organization of the United Nations consists of two general bodies for policy decisions, the general assembly in which each member state is represented by one vote. and which in the late 1950s had over 80 members. and the Security council, composed of 5 permanent members, the U.S., the U.S.S.R., Great Britain, France and nationalist China, and of 6 nonpermanent members, elected by the assembly. The permanent members of the council have a veto on certain decisions, which protects their sovereignty (*q.v.*). These vetoes aroused a great deal of indignation and criticism, not only of the power principally exercising them, the U.S.S.R., but also of the Security council as such. Its importance accordingly declined, but this decline also reflected the fact that the UN was in process of becoming a world forum rather than a world government.

In spite of its weakness as an instrument of government, the UN must not be underestimated as a political instrument. A number of serious conflict situations were attenuated by means of its good offices, and the secretary general at times took important initiatives. Furthermore, certain of its affiliated bodies, such as the European Economic commission (EEC) and the UN Educational. Scientific and Cultural organization (UNESCO), accomplished important tasks. Thus, while the UN was not an effective world government, it was developing a number of governmental functions. Both the United States and the U.S.S.R. looked upon it as an important factor in the world community and in cooperation with their allies and satellites sought to mold it to their purposes. Yet in the long run what is perhaps more significant, since these two super powers would have readily at their disposal other means of international action, is the fact that the UN organization activates and gives a measure of real power to small nations which when well represented often wield an influence out of proportion to their position in the world of pure power politics. This influence, on the whole, proved a power for good, though there were also cases of abuse, especially on the part of some of the newly independent nations.

The various problems inherent in so loose an organization as the UN led to insistent demands for amending the charter. A great deal of devoted labour went into these reform efforts, but nothing came of them because the very conditions which led to the complaint, such as the veto of the great powers, or the position of Formosa, also prevented any change. Given a radical change in international relations, and a sharp decline of world tensions, such plans might, however, take concrete shape. The UN, it was felt by its supporters, deserved to be maintained, if only to be in existence when such a day should arrive. Genuine world government did not seem feasible, though some world governmental functions were in operation. The danger existed that the prestige of the UN might decline to the point where it could no longer be maintained, but in view of the solid work that was being accomplished in special fields, and because of the value of a meeting ground of all nations for the discussion of the world's problems, the continued operation of the United Nations was generally believed assured.

See also WORLD GOVERNMENT MOVEMENTS.

BIBLIOGRAPHY.—Systematic consideration of comparative government has been a virtual monopoly of British and U.S. scholarship. *See*, however, Gunnar Heckscher, *The Study of Comparative Government and Politics* (1957). Of the many works in this field, the most complete are Herman Finer, *Theory and Practice of Modern Government*, rev. ed. (1949, 1951, etc.) and Carl J. Friedrich, *Constitutional Government and Denzocracy*, rev. ed. (1950).

French and German studies of the same general problem usually adopt a more legalistic and juridical viewpoint. Among these works three are of outstanding merit: Léon Duguit, *Traité de droit constitutionnel*, and ed. (1921); Jean P. H. E. Esmein, *Eléments de droit constitutionnel français et compare'*, 8th ed., rev. by H. Nezard (1927–28); and Georg Jellinek, *Allgenzeine Staatslehre*, new ed. by W. Jellinek (1922). To these may be added the later *Manuel de droit constitutionnel et de science politique* by Maurice Duverger (many editions) and Georges Burdeau, *Traitd de science politique* (1949–57).

Of the more theoretical analyses of modern government, Charles E. Merriam's *Systematic Politics* (1945) supersedes earlier works. *See* also Karl Loemenstein. *Political Power and the Governmental Process* (1957); David Easton, *The Political System* (1953); Walter Lippmann, *The Public Philosophy* (1955). An abstract, systematic treatment is found in Harold Lasswell and Abraham Kaplan, *Power and Society* (1950). A. D. Lindsay's *The Modern Denzocratic State* (1947) is incomplete but valuable. For the totalitarian dictatorships *see* Sigmund Neumann, *Permanent Revolution* (1942), which constituted a useiul beginning; also C. J. Friedrich and Z. Brzezinski, *Totalitarian Dictatorship and Autocracy* (1957); and Karl A. Wittfogel, *Oriental Despotism* (1957).

There are also certain broad sociological studies of society with a major focus on government interpreted as persistently oligarchic, especially Arthur F. Bentley, *The Process of Government* (1908); Max Weber, *The Theory of Social and Economic Organization*, Eng. trans. by A. M. Henderson and T. Parsons from *Wirtschaft und Gesellschaft* (1947); G. Mosca, *The Ruling Class*, Eng. trans. by Hannah D. Kahn from *Elenzenti di scienza politica* (1939); and V. Pareto, *Mind and Society*, Eng. trans. by Andrew Bongiorno and Arthur Livingston from *Trattato di sociologia generale*, 4 vol. (1935). The studies by Bertrand de Jouvenel, *La Pouvoir* (1947) and *De la Souveraineté* (1955), deserve mention.

The works cited above contain ample bibliographical guides to the literature covering the more specialized areas of the broad subject considered in this article. (C. J. FR.)

GOVERNMENTAL ARCHITECTURE comprises those buildings whose function is to serve governmental purposes, such as town halls, capitols, courthouses, parliament buildings, post offices, customhouses and similar structures.

HISTORY

The history of governmental building goes back to the dawn of human society and may be found as an adjunct of the temple, the royal residence or the communal dwelling, according as the governmental organization was theocratic, autocratic or communal. When the king was also priest. or the primitive communism was surrounded by religious taboos, these three types overlapped. Thus, among some savage peoples, there were structures which were at once temples and meeting houses and also served as council chambers.

Primitive developments of the communal idea were found among the American Indians; the council house of the Onandagas was such a structure, 80 ft. long and 17 ft. wide. Among the town-building Indians of the southwest where the tie between religion and government was strong. round rooms called kivas or estufas, sometimes built underground, were used for secret rites and for council deliberations.

In such autocratic civilizations as that of Egypt, governmental functions were centred in the royal palace, which had halls of audience and courts where the king and his counselors met. and where executive orders and judicial decisions were rendered. The great columned halls of the Persian palaces at Susa and Persepolis (6th and 5th centuries B.C.) and the palace of Solomon at Jerusalem, especially the "House of the Forest of Lebanon" (I Kings vii, 2) were built for official rather than residential use.

Greece.—In prehistoric Greece, a combination of the autocratic and democratic appeared, as in the courtyards, reception halls and throne room of the palace of Cnossus in Crete (c. 1800–1200 B.C). On the mainland, the autocratic element prevailed, as in the residential palace of Tiryns (c. 1200 B.C.).

The growing complexity of governmental systems in the independent cities of Greece necessitated special governmental buildings. At first only subdivisions of an open place or agora, these later became well-articulated structures adjacent to the agora. The most important of these was the *bouleuterion*, or council hall, in which were located the legislative and executive functions. Nearby stood the prytaneum, or town hall, where the city hearth fire continually burned, banquets were held and the commanding general had his residence. The courts, usually held in colonnades, or stoas, were occasionally convened in open areas reserved for them. such as the Areopagus (Ares' hill) in Athens. At Priene and Miletus in Asia Minor extensive remains of the *bouleuterion* exist which show a building nearly square with seats arising in stages on three sides. At Miletus the seats are curved like those in a Greek theatre. At Megalopolis a much larger hall (late 4th century B.C.), known as the Thersilion, was built for the meeting of a large governmental council. This building, 220 ft. long by 172 ft. wide, had a roof supported on columns placed behind each other in radiating lines, thus affording the widest possible view of the centre of the hall where the speaker stood. At Olympia the *bouleuterion* was an even more complex structure, consisting of a square central hall with an apse-ended building on each side, divided by ranges of columns down the centre.

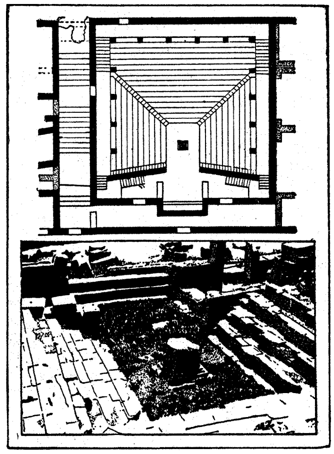

FIG. 1.—GREEK BOULEUTERION: ABOVE, GENERAL GROUND PLAN; BELOW, PORTION OF RUINS

There were two forms of prytaneum: (1) a circular primitive form, recalling the tholos, or early Greek beehive hut, and (2) a more developed sort in which the megaron or hall of the Mycenean palace is recognizable. At Priene, the resemblance to the typical Greek house was particularly strong; at Olympia, the hearth fire was kept in a hall at the front with a large court at the rear, smaller courts on each side and halls for banquets. *See* PRE-HELLENIC ARCHITECTURE; GREEK ARCHITECTURE.

Rome.—The highly developed governmental life of the Roman empire was reflected in its mature types of governmental architecture. The group of governmental buildings surrounding the Roman Forum formed, in fact, the earliest prototype of the modern national capitol. The buildings themselves, however, were merely developments of such structures in smaller Roman cities, like Pompeii. There, one end of the forum was filled by three buildings sharing a common façade, the central being the *curia* (town council chamber) and those at the sides the offices of the duumvirs and the aediles. The central building thus served the legislative function and those at the sides an executive function. All three were rectangular with apses at the end. On one side of this group was an enclosed court. thought to have been the comitium or voting place of the citizens. On the opposite side stood the basilica (*q.v.*). Thus. all the functions were housed in buildings designed for governmental purposes.

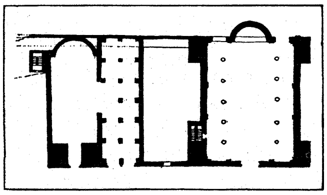

FIG. 2.—GENERAL GROUND PLAN OF A ROMAN CURIA IN THE 16TH CENTURY

In Rome itself the details were different, and additional elements appeared, yet the basic idea was the same. The Curia or senate house, whose walls still stand as the church of S. Adriano (rebuilt by Julius Caesar and Augustus, following a fire, and rebuilt again by Diocletian after the great fire of A.D. 283). was a rectangle 75 ft. wide and 85 ft. long, probably with columns dividing it into three aisles, and an apsidal tribune at the end. This senate house was at the end of a large structure; at the other end was a smaller apsidal hall, originally the *secratarium senatus,* now the church of S. Martina. Between these were two other halls used as archives and executive offices. Stairs led to the second floor. The whole formed a richly decorated and magnificent building. Not far away on the slope of the Capitoline hill stood the national archives building known as the Tabularium, built by Sulla, the massive masonry and monumental arcades of which still overlook the Forum. Across the Forum from the Curia stood the Roman treasury, incorporated into the temple of Saturn. The judicial functions were carried on in various basilicae, especially the Basilica Aemilia and Basilica Iulia.

At the opposite end of the Forum stood the regia, the Roman equivalent of the Greek prytaneum and the ritual centre of Roman life and government. The official residence of the *Pontifex Maximus,* it was closely related to the Atrium Vestae and the temple

of Vesta with the ever-burning city fire. *See* ROMAN ARCHITECTURE.

Middle Ages.—The social pattern of the feudal system was not conducive to the development of governmental architecture. With the rise of the powerful municipalities of the 12th century, however, the modern concept of governmental architecture had its origin. Throughout Europe the reaction against feudalism found expression in the building of town halls. At first the town hall was merely a meeting place for the citizens, frequently only a belfry erected adjacent to a public square. By the middle of the 12th century, types in Italy and France became definite.

In Italy, the *palazzo pubblico* resembled the town houses of the wealthy, being built around a court and having high castellated walls. Often it served as the official building. with meeting halls for governing bodies, and also as the residence of the commanding general. In Florence two separate buildings, the Palazzo Vecchio (1298) and the Bargello (1256), were used, the first as the town hall, the second as the residence of the chief magistrate and the prison. These, like most Italian town halls, have belfries attached. Other contemporary municipal halls were the Palazzo Pubblico at Siena (1293–1309) and the Palazzo della Ragione at Padua (1172–1219), whose upper hall, added in 1420, is 267 ft. long and 89 ft. wide, entirely free of interior supports. The *broletti* or town halls in many of the smaller cities are not less characteristic than the governmental palaces which have been cited.

The French town halls usually combined an arcaded market hall on the ground floor with the governmental halls above and a belfry near by. The 12th-century town halls at St. Antonin, in almost perfect preservation, and at La Réole are typical of the period. As the power of the municipalities increased, the richness of the town halls did likewise, as those at St. Omer (14th century) and St. Quentin (16th century) demonstrate. Meanwhile the market hall was forced out and the entire building devoted to governmental purposes.

Between 1400 and 1600, the town hall received its greatest development in the powerful commercial cities of the north. In these a new influence was operative, that of the guildhall. The merchant guilds had become closely related to municipal government; in some cases the governing body of a city was called a guild. Thus. the hall of the corporation of the city of London is known as the Guildhall. In some towns of the Low Countries, the town hall and the guildhall were combined, as at Ypres where the town hall was known also as the Cloth Hall. This splendid building (1200–1304), a rectangle 50 ft. wide and 462 ft. long, had a cloth market on the ground floor, its upper floor containing meeting halls, law courts, banquet rooms and municipal offices. The structure was rated one of the most monumental examples of secular Gothic in Europe, before it was destroyed during World War I. Other commendable Flemish examples are those at Arras (completed in 1494, the belfry 1554), Louvain (1448–63), Brussels (1402–54) and Ghent (completed 1533). In Germany, the most beautiful town halls are those at Lübeck (13th century), Tangermünde (1373–78), with remarkable brick Gothic detail, Brunswick (14th century) and Goslar (15th century). *See* GOTHIC ARCHITECTURE.

Renaissance.—This type of town hall design continued in use throughout the Renaissance period except in Italy. The prevailing taste in Italy led to the erection of smaller but more elegant single buildings such as the beautiful Palazzo del Consiglio at Verona (*c.* 1500, by Fra Giocondo) whose exquisite early Renaissance polychrome façade has been much admired, and the equally rich Municipio of Brescia (c. 1500). The Palazzo del Senatore (1592–98), by Michelangelo, on the Capitoline hill in Rome is significant for its successful attempt to give the structure a form both dominant and monumental, yet differing from the early Renaissance forms of north Italy.

Outside of Italy, where the medieval tradition persisted, the Renaissance town halls simply applied classical details to such building types as had been developed before; *e.g.,* the town hall of Bremen (15th century, reconstructed 1609) and the old city hall of Paris (destroyed in the civil war of 1871). In rebuilding the latter, the old plan was merely enlarged and the old style preserved. The modern tradition of municipal building was founded on the medieval town hall.

Another important type of governmental building that took form during the middle ages was the courthouse or *palais de justice.*

LEGISLATIVE AND JUDICIAL BUILDINGS

1. Parliament House, Budapest, Hungary; Steindl, architect (1883–1902). An interesting attempt is made in this building to take a plan of the type set by the Capitol at Washington (fig. 3) — two wings, one on each side of a central rotunda — but to treat the whole in a picturesque and romantic Gothic style. The result is impressive, although the detail is sometimes crowded. 2. Houses of Parliament. London, England; Sir Charles Barry, architect (1840–50). The first great modern legislative building in an adapted Gothic style was that in London. It forms one of the most convincing examples of Modern Gothic. There is no attempt to express the plan or arrangement of the buildicg on its exterior; on the other hand there is no attempt at false or forced picturesqueness. In addition to the legislative chambers and their offices, the building contains the Speaker's residence, and many robing rooms and other quarters required for royal ceremonials. 3. The United States Capitol, Washington, D.C. Begun in the last decade of the 18th century with Dr. William Thornton as architect, it was carried on through the early 19th century by Stephen Hallet, B. H. Latrobe, and Charles Bulfinch. In its earlier form it had the central rotunda (then with a low dome) and a wing on either side, one for the Senate, and one for the House of Representatives. In 1853 these old rooms were found too small, and a great wing was added at each end, from the designs of Thomas U. Walter. At the same time the present great dome with its column-circled drum was added. 4. The former Parliament buildings, Vienna; Hansen, architect (1874–83). One of the most monumental in plan, and most gracious in its classic detail of any of the national parliament buildings, this simple composition is one of the distinguished decorations of its city. 5. Hôtel de Ville, Ypres, Belgium. 13th–15th centuries. Sometimes called the "Cloth Hall," this building (destroyed during the World War) was an expression of the close relationship of merchants' guilds and city government which was usual in Flanders. It contained the hall of the Cloth Merchacts' Guild, a market hall beneath, and the offices of the city government as well as a great banqueting hall. 6. The Palais de Justice, Brussels, Belgium; Polaert, architect (1866–83). The enormous bulk of this craggy and powerful building set on a hill top dominates the city; although lavish and in questionable taste, it conveys, nevertheless, by virtue of simple conception, monumental arrangement, and stark strength of design, a compelling impression of the dignity of government, and the power of law

U.S. STATE AND MUNICIPAL BUILDINGS

1. The skyscraper state capitol of Louisiana at Baton Rouge, surrounded by a 50-ac. park
2. The civic centre at Columbus, Ohio. The building with the tower is the American Insurance Union building. The low building at the left is the city hall; at the right, the state office building
3. The Nebraska state capitol at Lincoln. The base is but two stories high; from it rises the central 400-ft. tower
4. The city hall at Buffalo, N.Y., located in the civic centre
5. New York city's civic buildings. The city hall (1802–09) is in the foreground, with the court building to the left. In the background are the municipal building and hall of records
6. The city hall at Houston, Texas

royal, monastic or feudal domination to necessitate separate buildings. The earliest existing are the Maison de Pierre at Chartres and the Salle le Roi at Montdidier (both 14th century). By far the most famous is the lavish Palais de Justice at Rouen. begun before 1474 and completed before 1509. This magnificent building. built around three sides of a courtyard, contains in addition to smaller courtrooms, two splendid halls and a beautiful chapel. It is in this use of large halls that originated the tradition for providing for every courthouse a great lobby where lawyers may confer with their clients.

No such development of national governmental buildings can be found during this period. What national unity existed was centred in the residence of the sovereign and when national councils or legislative bodies finally arose, they were housed either in a royal palace or in religious buildings. To this day the French senate sits in the palace of the Luxembourg. In England, the king's council met wherever the monarch happened to be, and the English parliament convened at the nearest convenient spot to the royal palace at Westminster, which was the chapter house of Westminster abbey, until 1547 when parliament moved to St. Stephen's chapel within the palace itself. This remained the meeting place of the house of commons until 1834 when the palace was burned. See RENAISSANCE ARCHITECTURE; BAROQUE ARCHITECTURE; MODERN ARCHITECTURE, 18TH AND 19TH CENTURIES.

MODERN GOVERNMENT BUILDINGS

In planning governmental architecture, the relationship of the working units and the means of communication between them and the outside are highly important. Simplicity of plan and beauty of form are also desirable. Many public places—lobbies, rotundas, halls and committee rooms—are treated in as monumental a fashion as is possible. and axial symmetry is an almost inevitable result.

Capitols and Legislative Buildings.—The *United States.*—

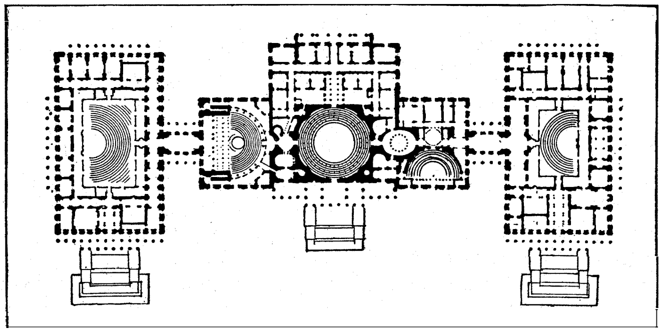

FIG. 5.—GENERAL PLAN OF THE NATIONAL CAPITOL. WASHINGTON. D.C.

A national capitol building, built solely for the housing of a national government. was first projected in the U.S. A competition for the design of the Capitol at Washington, D.C.. was held in 1792 and was won by William Thornton. His carefully articulated plan provided large halls for the senate and house of representatives. separated by a central rotunda. Begun in 1793 and burned during the War of 1812. it was not completed in its original form until the 1830s. The earlier Capitol may be described as the work of Thornton, Étienne Sulpice Hallet, Benjamin Henry Latrobe and Charles Bulfinch. successively its architects. The old House of Representatives became Statuary Hall and the old Senate was long used by the supreme court. By the 1850s, the structure was considered inadequate and a wing was added at each end to accommodate the house and the senate. The original low dome was replaced by the commanding cast-iron dome which now crowns the rotunda. these changes being completed in 1865 by Thomas U. Walter. One of the world's monumental structures, the Capitol has influenced the design of governmental architecture around the world.

The domical legislative hall became almost a convention in the building of state capitols. Even such a proper Greek temple as Gideon Shryock's old capitol in Frankfort. Ky. (1828–29), is crowned by a dome and a lantern to light the circular rotunda. The gilded dome of the earlier Massachusetts statehouse, by Bulfinch (1798–1808), added its authority to the domical convention. The old statehouse, now the city hall at Hartford, Conn., also by Bulfinch (1792–96), received its cupola in 1822. The rotunda at Ohio's statehouse at Columbus (1838–59) is lantern crowned, but the cupola is not domical. The work of several architects, it is one of the finest U.S. state capitols. Illinois's old capitol (1837), now the Sangamon County courthouse in Springfield, originally had a low dome which capped the rotunda. The capitol at Nashville, Tenn., by William Strickland (1850–55), has a lantern modeled after the choragic monument of Lysicrates. The earlier capitol at Jefferson City, Mo. (burned 1911), was something of a replica of the old capitol of Pennsylvania at Harrisburg (1810); both were designed by the same architect, Stephen Hills, who employed low, copper-clad domes.

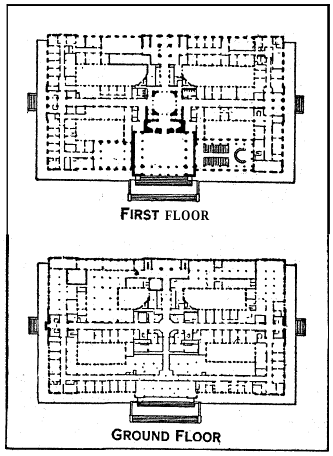

FIG. 6.—PLAN OF CITY HALL AT LOS ANGELES. CALIF.; AUSTIN. PARKINSON & MARTIN. ARCHITECTS

Many domical capitol structures have been built in the 20th century: at Providence, R.I., by McKim, Mead and White (completed 1902); at Jackson, Miss., by Theodore C. Link (1901–03); at St. Paul. Minn., by Cass Gilbert (completed 1905); at Harrisburg. Pa., by Joseph M. Hutson (1905–08); at Charleston, W.Va., by Cass Gilbert (1925–32); and elsewhere.

George B. Post. in the Wisconsin capitol at Madison (1904–14), was compelled by the nature of the site to adopt a cruciform plan with four equal wings radiating from the dome-cronned rotunda. Although some consider the plan somewhat compromised, the massing contributes to an enhancement of the dome. In his masterful Nebraska state capitol at Lincoln (completed 1932), Bertram G. Goodhue designed a vast rectangle, divided into four light courts. The legislative halls, the supreme court and such other functions as need large ground areas were placed in the base. The departmental and other offices were placed in a 400-ft. central tower which forms a monumental beacon, dominating the Nebraska landscape for miles. Of somewhat similar massing is the Louisiana state capitol at Baton Rouge (1930–32), by Weiss, Dreyfous and Seiferth. Other U.S. state capitols which reflect a different approach in planning and design are the North Dakota capitol at Bismarck and that at Salem, Ore. Several statehouses have become so crowded that state office buildings have been erected adjacent to them, but usually detached. In some western states, room for a capitol group is provided; *e.g.,* the state capitol group at Olympia. Wash., where the buildings of architects Wilder and White may expand in response to the state's needs.

Europe.—The addition to the old Palais Bourbon (the building used by the *chambre des députés* in France), by Bernard Poyet (1807), of a 12-columned, pedimented front, and the influence of the U.S Capitol, established the classical direction in modern legislative architecture for the next century. The Chambre des Députés, reconstructed (1822–23) by Jean de Joly, and the Senate in the Luxembourg palace (1836–41) by Henri de Gisors, were ornamental developments of a classical amphitheatre plan. This plan. which had been used so successfully in the U.S. Capitol. had simplicity and directness, and was widely copied in halls for bicameral legislative bodies.

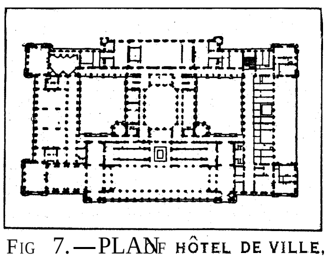

FIG 7.—PLAN OF HÔTEL DE VILLE, PARIS

The English houses of parliament on the Thames in London, by Sir Charles Barry (1840–60), form a unique group, both in style and plan. There the house of lords and house of commons are only parts of a vast unsymmetrical composition which includes members' dining rooms and libraries, the speaker's residence and all the apartments required by a lavish tradition. The picturesque details and ornament were the work of A. W. N. Pugin, a specialist in medieval design, who succeeded in harmonizing two soaring towers and the main horizontal mass of the structure with little reference to interior function. Governmental architecture at Ottawa and elsewhere in Canada was influenced by this precedent.

A somewhat baroque edifice was the Reichstag in Berlin. by Paul Wallot and Friedrich von Tiersch (1882–94; burned during World War II). The plan featured a great assembly hall approached through an arched entrance and a grand foyer. Distributed around two lateral light courts were lounges, refreshment rooms, libraries. writing rooms, committee rooms and consultation chambers. A single domical roof reflected the unicameral legislative body.

In the Budapest. Hung., Parliament House, by Emmerich von Steindl (1883–1902), a central dome and flanking pavilions were veneered with Gothic finery. The Austrian Parliament House in Vienna, by Theophilus von Hansen (1874–83), is as classic as Hungary's capitol is romantic. and compares favourably with legislative buildings around the world.

The United Nations. — The headquarters of the United Nations, fronting the East river in New York city, was designed by an international board of archifectural consultants. Construction began in 1948. The group consists of three principal structures: the General Assembly, the Conference building and the 39-story Secretariat. The Secretariat is a tall, steel-framed, glass-clad office building of rectangular form. The General Assembly encloses a great auditorium for delegations, with extensive communication facilities. The Conference building which connects the General Assembly and the Secretariat has special rooms for the Security, Economic and Social, and Trusteeship councils, and provides meeting places for committees.

City and Town Halls. — A modern town hall requires a chamber or hall for the town council meetings, offices for the mayor and councilmen and their secretaries, offices for the town clerk and offices for the financial and administrative departments of the town government; *e.g.*, the tax board, the chief of police, the building inspector. European town halls frequently contain rooms for receptions and banquets. In the U.S., the town hall frequently provides an auditorium for public gatherings.

France. — The most monumental example of the continental city hall is the Hôtel de Ville in Paris, rebuilt after the Commune by Ballu and Deperthes (1874–82). Following the original Francis I style on the exterior, it was elaborated inside with all the decorative lavishness then in vogue. Its great salles des *fêtes* and magnificent stairways make it one of the most gorgeous and effective official suites in the world. This precedent has affected French municipal building ever since. Later French city halls, showing a similar type of Renaissance classicism, lavish decoration and elaborate plan, include those at Neuilly-sur-Seine, by Dutocq and Simonet (1885) ; at Versailles, by Le Grand (1897) ; and at Tours, by Laloux (1896–1904).

Great Britain. — In England, the Gothic revival of the mid-19th century affected much municipal building. The town hall at Manchester. by Alfred Waterhouse (1868–77), with its picturesque outline and original detail, is typical of the best Gothic revival design. Most recent examples show a greater simplicity of composition and freedom of style. That at Sheffield, by Mountford (1897), in a free early Renaissance style, is representative of the larger examples; that at Oxford, by H. T. Hare (1897), in modified Jacobean, is characteristic of the smaller. The growing complexity of city government has led to a type of building in which the council chamber and mayor's suite are subsidiary to the great amount of clerical space required. The London County Council Hall. by Ralph Knott (1908–22), which best exemplifies this tendency, is a vast structure in the late English Renaissance style.

Elsewhere in Europe. — In Germany, the most interesting municipal buildings are those couched in modern forms. The somewhat bizarre Stadthnlle at Hanover, by F. E. Scholer and Paul Bonatz (1913), contains a large circular hall which functions as a municipal auditorium. As restrained as the *Stadthalle* is fantastic is the town hall at Joensuu, Fin. (1913), by Eliel Saarinen. The city hall at Stockholm. Swed.. by Ragnar Östberg (completed 1924), presents a dignified mass. surmounted by a graceful tower and skirted on the ground floor by a charming arcade. Inside, it is enhanced by brilliant colour decorations; the mosaics in the great reception hall are among the world's finest.

The United States. — Town and city halls in the United States reflect their regional environments. In the east, colonial types predominate; in the west. Spanish colonial and other sun-loving vernaculars are found, as in the Highland Park city hall in Dallas, Tex.. by Lang and Witchell. The colonial town hall at Tewksbury, Mass., by Kilham and Hopkins, and the town hall at Peterborough, N.H., by Little and Russell, illustrate smaller examples in the east, while Bigelow and Wadsworth's town hall at Wheaton, Mass., typifies the larger ones.

Perhaps New Uork city shows the evolution of the U.S. city hall better than any other municipality. By 1802, the demand for an adequate city hall resulted in the erection of an exquisite structure, long outgrown but still in use, by architects Mangin and McComb (1803–12). The French precedent is sensed, particularly in its domed rotunda, the monumental staircase, council chamber, offices and reception rooms. It was hailed as the most perfect example of U.S. municipal building. With the growth of the city, however, new and bigger quarters were called for. The solution was the New Uork Municipal building, by McKim. Mead and White (1908–10), a skyscraper of 23 stories treated in a classical vein to offset the appearance of a commercial structure. The Oakland, Calif., city hall, by Palmer, Hornbostel and Jones (1908–13), has a 3-story classical base, from which a tower of 11 stories arises, crowned by a cornice. Above it stands a lantern of baroque design. Although classical, the structure accords well with its surroundings. Sometimes cities and counties unite to erect a city-county building. Chicago and Cook county, Ill., did this (1907–11), as did Detroit and Wayne county. Mich. In 1957 Indianapolis and Marion county, Ind., collaborated on a 23-story city-county building.

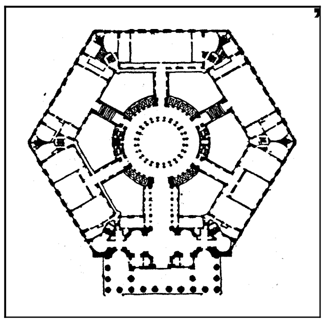

FIG 8. — PLAN OF NEW YORK COUNTY COURT HOUSE: GUY LOWELL. ARCHITECT

Sometimes the city hall is the key structure in a square or park. This is the case at Springfield, Mass., where two classical. colonnaded buildings flank a municipal clock tower, Pell and Corbett, architects (1908–13). In 1957, Toronto, Can., held an international competition for the design of the city hall and the public square.

The huge city hall at San Francisco, Calif., by Bakewell and Brown (1913), rivals a state house in scale and magnificence. It is domical. with a central pavilion in the form of a classic temple, flanked by Doric colonnades on a high basement. The dome on a high drum is beautifully profiled and carries an ornate lantern. The exterior is sedate and majestic; the interiors, of baroque design, are palatial. This structure is a part of the civic centre. (The concept of the civic centre is an outgrowth of the simpler town square, and has found wide acceptance in U.S. cities.) An auditorium, an opera house, the library and other structures are grouped together.

Perhaps the most successful U.S. solution for a metropolitan city hall is that at Los Angeles, Calif.. by Austin, Parkinson and Martin, completed in 1928. For the first time, the two elements — the town hall and the municipal office building — were combined in the same structure and given an adequate architectural expression. This building is also a part of the civic centre.

Judicial Buildings. — The modern courthouse, in its essential elements, has remained almost as close to its traditional ancestry as has the modern court system. The monumental lobby, the courtrooms and rooms for judges. lawyers and witnesses and the archives, all were found in the courthouse of the 15th century.

The differencebetween the Law Courts of London, by George E. Street (completed in 1882), and the Palais de Justice in Rouen, built 400 years earlier, is principally one of detail. The Palais de Justice in Paris is typical of the 19th-century continental courthouse. It dates fromvarious construction periods, from the 13th century onward. Its present formis largely a result of rebuildings after the Commune. Two other elaborate courthouses illustrate European precedent: the Palazzo di Giustizia in Rome, by Calderini and Basile (1883–87), monumental in composition but somewhat marred by much meaningless, small-scaled ornament; and the rather more interesting Palais de Justice at Brussels, by Joseph Poelaert (1866–83), which, set atop an eminence, dominates the city. The Peace Palace at The Hague, the Netherlands (1907–13), by Cordonnier and Van der Steur, also belongs in this category.

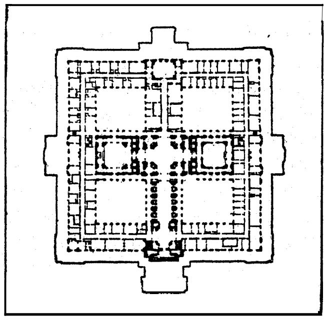

FIG. 9 — PLAN OF THE STATE CAPITOL OF NEBRASKA. BERTRAM GROSVENOR GOODHUE, ARCHITECT

The United States.—In the U.S. the courthouse received a definitive form. Such buildings go back to the somewhat medieval Talbot County courthouse in Maryland (1680–81), a brick structure with end chimney, a steep roof and dormers. The lovely brick Chowan County courthouse at Edenton, N.C. (1767), is full-blown Georgian. By 1724, the embryo of the present-day courthouse could be found in the courthouse at Chester, Va. As late as 1770, a log-cabin courthouse, 20 ft. wide by 24 ft. long with "two small sheads at each end, for jury rooms," was built in Betetourt county, Va. The annals of almost every county in the old Korthwest Territory indicate that the early county buildings were of log construction, as were the prisons and jailers' houses. These structures were much like the cabin homes which the western pioneer built. Benches, jury boxes and judges' stands in these rude centres of justice were of puncheon construction The traditional elements have remained the same. the basic unit consisting of: the courtroom proper, with space for the public, witnesses, jury box. judge's bench, counsel, clerks and the press; the judge's chambers; and the jury room

Of sourthern origin were the square, brick courthouses, popular in the southern communities of Ohio, Indiana. Illinois and as far west as Independence, Mo.. during the 1830s. Until 1870, courthouses of two types were erected: (1) a square. two-story. brick building with a hip roof, crowned by a cupola, and (2) the typical Greek Revival temple, with or without a cupola. The courtroom was generally on the second floor, with offices on the ground floor The early state capitol buildings at Corydon. Ind. (1812), built as the courthouse of Harrison county, and at Chillicothe, O. (1800), were of similar design. Since the time of the Greek Revival, the classical style has been almost universally used for judicial architecture. Many trends in courthouse design culminated in the New York County courthouse (completed 1927), built by Guy Lowell. The original design called for a circular plan but. for practical considerations. it was changed to a hexagon, with a circular rotunda and six light courts providing ideal communication. The result is a structure at once functional, beautiful and interesting.

Post Offices.—Many European governments have relegated public services to existing structures, as in Rome where a former monastery was adapted to the postal service. Naples erected a new post office, by G. Vaccaro and G. Franzi (1932–36). Other imposing postal facilities are the general post office in Paris, by Gaudet, and the general post officein London (1910), by Sir Henry Tanner. Far more interesting, honever, is J. Crouwel's post office in Utrecht. Neth (1918–24).

In the middle of the 19th century Robert Mills designed, among other governmental structures in Washington, D.C.. an officebuilding for the post office department that exhibited simple and straightfornard planning. U.S. post offices present a good cross section of the architectural vicissitudes that have befallen the nation. Some achieve real distinction, others do not. Post officesat Peoria, Ill., Gary, Ind., and Miami. Fla., illustrate high standards of design. Many postal structures throughout the U.S. have been designed by government architects in Washington, but the post office in the national capital (1911–14) was designed by private architects, Graham, Burnham and company. The post offices of New York city were designed by McKim, Mead and White (1913), and those of Denver, Colo., by Tracy, Swartwout and Litchfield. Many small officesare still housed in rented quarters.

Customhouses.— In Europe, customhouse architecture has been largely neglected. Almost the only one of dignity and adequate convenience is the customhouse in London, by David Laing (1817). partially rebuilt by Robert Smirke. Its Thames river façade is distinctive, and its long room (200 ft.). where most of the business is transacted. is much admired. The customhouses at Dublin. Ire., by James Gandon (1791), and at Liverpool (1828), by John Foster (destroyed by bombing in 1941), have been generally admired. The Port of London Authority, begun in 1912 by Sir Edwin Cooper, but not opened until 1922, is a splendid example of English neoclassical design. The absence of adequate buildings in which these services could be carried on led to the development of new types. The early customhouse in New York city (later the U.S. subtreasury), by Town and Davis (1834–41), the customhouse in Boston, by Young and Rogers (1837–47), and the customs structures at Newburyport, Mass. (1835), and at New Bedford. Mass. (1836), both by Robert Mills. constituted milestones in U.S. customhouse design. All were of Greek Revival extraction. The present Renaissance-style New York city customhouse (1899–1905) is the work of Cass Gilbert.

Administrative Buildings.— Ministries and kindred administrative structures sometimes lack distinction because they closely resemble office buildings. In European capitals, ministries are often housed in altered palaces, as in Paris and Vienna. In London, where they are assembled along Whitehall and Parliament streets. they make an impressive ensemble. although individual buildings are not distinguished. In Washington, D.C., which Pierre Charles L'Enfant laid out along classical lines, governmental architecture has closely followed classical precedent. Among the earlier classical examples were the Post Office. the Patent Office and the Treasury building, all the work of Robert Mills. The Library of Congress, by Smithmeyer, Pelz and Casey (1886–97), the Senate and House office buildings, by Carrère and Hastings (1906–09; additions 1933), the Department of Commerce. by York and Sawyer (1928–32), the Kational Archives building, by John Russell Pope (1927–35), the Supreme Court building, by Cass Gilbert (1934), and the Kational Gallery of Art are illustrative of the classical trend. On the other hand, the Smithsonian institution. by James Renwick (1846–52), and the State. War and Navy building. by A. D. Mullet (1871–88), interesting in their nay, can scarcely be said to belong in this company. The Washington

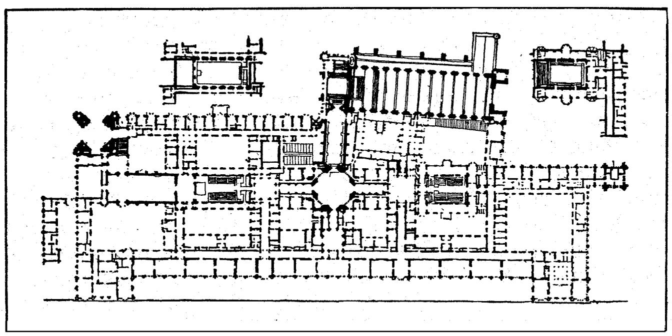

FIG. 10.— PLAN OF PRINCIPAL FLOOR. HOUSES OF PARLIAMENT, WESTMINSTER

monument by Robert Mills (1848–84), the Lincoln memorial, by Henry Bacon (1912–22), and the Jeffersonmemorial, by John Russell Pope. accord beautifully with the capital's classical pattern.

The federal government maintains ministries or embassies in all foreign capitals with which the United States carries on diplomatic relations. For some of these, the government leases existing quarters; for others, special buildings are erected. In 1956, the state department named architect Eero Saarinen as winner of a competition for the design of a new U.S. embassy "in the contemporary idiom" to harmonize with its neighbours in Grosvenor Square in London. The winning design showed a five-story mass, depending upon pleasant fenestration and sober surface treatment to achieve its dignified appeal.

At about the same time, the state department, through its office of foreign buildings, approved designs for a supplemental office building for the U.S. embassy in Manila. P.I.; A. L. Aydellot and Associates, architects, conceived a structure in the contemporary style but "sympathetic to local background and indigenous forms."

The erection of foreign embassies often gives local planners serious qualms, especially when local building regulations are disregarded.

The erection of the Pentagon was something of a break with classic precedent, but structures erected since, although contemporary in trend, harmonized with existing buildings. This was important, since something of a boom in governmental building costing upward of $300,000,000 took place in mid-20th century. All governmental agencies employ private architects on major construction projects but some departments maintain architectural staffs for the purpose of maintenance, minor repairs and alterations.

Capital City Planning. — Flexibility is not always possible except by the establishment of an entirely new capital city, such as Washington, D.C., or New Delhi, India (1910). In 1911 a competition for the design of the Australian capital city of Canberra was won by Walter Burley Griffin of Chicago. The first of the buildings was opened in 1928. For New Delhi, Sir Herbert Baker and Sir Edwin Lutyens designed a circular legislative hall. When India became independent and the state of Punjab was divided, the former capital went to Moslem Pakistan, leaving Hindu Punjab without a capital. It was decided to build a new capital city (Chandigarh), designed by world-renowned architects and planners. The design of the city was entrusted to an European team headed by Le Corbusier. Associated with him were E. Maxwell Fry, the English architect, Pierre Jeanneret and a group of Indian architects and planners. The Supreme Court is of concrete frame with brick partitions. To meet climatic conditions, a structural umbrella was raised above the roof top, cantilevered out from the main frame.

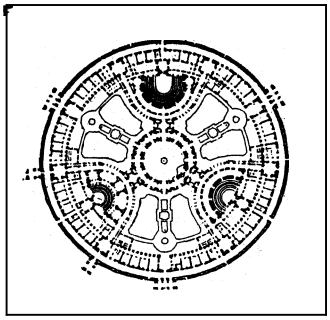

FIG. 11. — LEGISLATIVE HALL. NEW DELHI: SIR HERBERT BAKER AND SIR EDWIN LUTYENS, ARCHITECTS

In 1957, President Kubitschek of Brazil broke ground for a new capital city in the state of Goiás to be called Brasilia. Architect Oscar Niemeyer designed a "skeleton capital," consisting of a governmental palace, a presidential residence, a hotel and a chapel, which were to serve as provisional headquarters of the government while the new capital was being built. The seven-story hotel was to house the presidential assistants and other administrative personnel. The governmental palace, in the centre of the group, provided offices for the president and his staff, conference rooms for the cabinet and halls for state receptions. See also ARCHITECTURE; MODERN ARCHITECTURE, 18TH AND 19TH CENTURIES.

(T. F. H.; R. N.)

GOVERNMENT CORPORATIONS are corporate bodies that are wholly or partly owned by the government and are utilized primarily for business-type functions or services. First widely employed during World War I to provide the operating and financial flexibility required by certain emergency programs involving construction and operation of merchant vessels, trading in commodities and comparable government activities, the government corporation later became a common form of organization for public enterprises in nearly all countries and at all levels of government. The incorporated agency became the instrument for carrying out major parts of the United States economic recovery program in the 1930s; for developing great river valleys of Afghanistan, India and the United States; for administering nationalized industries in Great Britain and other countries; for financing, constructing and operating superhighways in Pennsylvania, New York and other states; and for promoting the economic development of "underdeveloped" nations, particularly in Asia and Latin America.

The activities in which government corporations have been most widely employed — transportation, communications, manufacturing, mining, resource development, atomic energy, marketing, port development and management, utility services, various types of banking, credit and insurance functions — reflect the radical change in the economic role of the state during the 20th century. Older and more traditional public enterprises such as postal services; tobacco, match and salt monopolies; and, to some extent, telephone and telegraph services are rarely incorporated, and continued to be administered in the 20th century as government bureaus. This form of organization continued to exist when the main purpose of the enterprise was to supplement public revenues. as with the football pools in Norway and other government lotteries, or to control consumption, as with liquor monopolies in a number of U.S. states and Canadian provinces.

As defined by Pres. Franklin D. Roosevelt when he recommended establishment of the Tennessee Valley authority in 1933, the government corporation's purpose is to provide an agency "clothed with the power of government but possessed of the flexibility and initiative of private enterprise." Although the organization and powers of government corporations differ significantly, not only from country to country but also within a single country, most have the following attributes which distinguish them from public enterprises organized as normal government agencies: (1) legal personality separate and distinct from the government which enables the corporation to sue and be sued, enter into contracts and acquire property in its own name; (2) independent financing from revenues and treasury or public borrowing rather than from annual appropriations by the legislature; (3) freedom from many of the restrictive statutes applicable to government supply activities and general budget, accounting and audit laws and regulations; and, in most countries, (4) authority to hire and determine the compensation of employees without regard to civil service laws.

The special powers granted to corporations are designed to enable the government, when it is acting more as a business agent than a sovereign, to render service and discharge its obligations to purchasers of its goods and services as nearly as possible in the same manner as a private business.

Use has also been made of the corporate form of organization to avoid constitutional or statutory limitations on public borrowing. As separate legal entities, government corporations may be authorized to issue revenue bonds or other evidences of debt without creating general state obligations. The desire to find means of financing public improvements that would not conflict with constitutional debt limitations accounts in large measure for the great increase in the number of incorporated public authorities such as the Alabama Building corporation and the New York Thruway authority at the state and municipal level in the United States.

Corporations may be acquired or created by the government in several ways. The government has converted a number of corporations, originally established for private purposes, to public enterprises by obtaining control of some or all of the corporation's capital stock. The United States, for example, became the owner of the Panama Railroad company (merged with Panama Canal company, 1951) when it purchased the assets of the French Canal company in 1904. The Railroad company had been chartered as a private corporation by New York state in 1849. The Renault and Gnôme-Rhône motor companies were taken over by the French government and became government corporations because their private owners had collaborated with Germany during World

War 11.

Many government corporations have been organized as joint-stock companies under authority of general incorporation lams applicable to privately owned corporations Except for the War Finance corporation. for instance, World War I corporations were chartered by the United States under general incorporation laws either of states or the District of Columbia. In 1945, however, congress prohibited this practice and required that existing state-chartered corporations such as the Commodity Credit corporation and the RFC Mortgage company either be liquidated or reincorporated by federal law. Great Britain and Canada also came to regard the joint-stock company as not well suited to a public enterprise, but this view was not fully accepted elsewhere. Joint-stock companies were set up extensively in France, Italy. Belgium. Turkey and other countries favouring mixed enterprises nhose stock is partially owned by private interests. The only examples of mixed enterprises in the United States are the federal intermediate credit banks banks for co-operatives, and the Federal National Mortgage association. The first and second banks of the Cnited States were also created on this pattern.

The trend continued toward organization of government-owned enterprises as public corporations with no capital stock. A public corporation is created by a special law defining its powers, duties and immunities and prescribing the form of management and its relationship to established departments and ministries. Great Britain pioneered in developing this type of agency with the Port of London authority (1908) and made this device the vehicle for carrying out the nationalization of the Bank of England and a number of basic industries. Examples of public corporations were the British Broadcasting corporation, British Overseas Airways corporation Tennessee Valley authority (U.S). St. Lawrence Seaway Development corporation (U.S.), St Lawrence Seaway authority (Canada), Water Resources authority (Puerto Rico), Sumerbank (Turkey) National Insurance institute (Israel) Air-India International and Overseas Telecommunications commission (Australia). State trusts in the Soviet Union also acquired many of the characteristics of public corporations.

Enterprises jointly owned by central and state governments or by two states represent a special type of government corporation. The Damodar Valley corporation (1948), as an example, was set up by the government of India and the states of Bihar and West Bengal. New Tork and New Jersey created the Port of New York authority in 1921 by interstate compact to operate bridges, tunnels, airports, port and terminal facilities serving New York city and nearby communities.

With the rapid growth in the number and economic significance of government corporations, the issue of public accountability assumed critical importance. In the effort to insulate corporations against bureaucratic red tape and partisan interference in management existing controls to assure public accountability and responsiveness to direction by politically responsible officials were abandoned without providing adequate substitutes. Except in the United States, corporations generally were made independent of established government agencies and departments. Corporate policies, budgets and accounts were subject to limited or no review by the executive or legislature. Management of government corporations was frequently vested in boards dominated by directors appointed to represent trade and professional associations and other private groups. In France public enterprises are administered by boards uhose members are nominated by the three interests represented thereon: government departments and employee and consumer organizations. Mixed enterprises partly owned by private interests have presented unique and peculiarly difficult problems of public control. These factors led some to fear that corporations might, along with the independent regulatory commissions, become an irresponsible fourth branch of government.

Great Britain, the United States. Canada and Turkey have employed various means to assure public accountability without impairing essential operating and financial flexibility. The practice in Great Britain and Canada has been to make public corporations subject to direction by the minister concerned with the program area of the corporation. While the minister is expected not to interfere in day-to-day operations and cannot be questioned in parliament about such matters, he is often empowered to issue directions of a general character when the national interest is affected. Ministers may also possess authority to veto or approve issuance of bonds, large capital outlays, pensions and comparable corporate actions 4 British Select Committee on Nationalized Industries proposed that control be further strengthened by the appointment of a house of commons committee to examine the reports and accounts of public corporations.

The United States recognized the need for developing special controls over government corporations in enacting the Government Corporation Control act of 1945 which provided for a business-type budget and audit "with due allowance given to the need for flexibility." The Canadian counterpart of the Government Corporation Control act was the Financial Administration act of 1951. The state comptroller of Israel recommended enactment of a similar law. The Law for State Economic Enterprises in Turkey provided for an annual review by the General Economic commission and an annual audit inspection by the prime minister's High Control board.

GOVERNMENT DEPARTMENTS. The administration of the various governmental functions is entrusted to specialized agencies often called departments. such as the department of commerce and the department of agriculture in the United States. Taken together, the departments are sometimes referred to as the departmental system. In contrast to the legislative and the judicial branches, the executive branch is the government's arm of action, the instrument for the performance of its continuing functions. Responsible operation of the departmental system requires not only executive control in each department but also direction and co-ordination by a chief executive. After a general introductory discussion. this article considers government departments in the United States and in Great Britain.

Departmental organization is found on the several levels of government, local and state as well as national. Examples are the municipal police and fire departments on the one hand and state highway departments on the other. The departmental form of organization is also extensively used in private business. especially in large enterprises, where activities are usually divided among such departments as manufacturing, sales and advertising.

The governmental agencies which make up the departmental system in various countries frequently bear designations other than department. Illustrations of other designations are ministry. administration, service, authority. board, commission and even foundation. In many instances the choice of the designation is based on the logic of a legislative or administrative intent. even though the intent may remain obscure to the citizenry. In other cases the designation has been the fruit of passing circumstance. In most countries nomenclature has proved hard to stabilize.

Government departments may be viewed from quite different angles. To the administrative official they represent rationally designed machinery for the accomplishment of desirable public purposes. To the politician they are power structures to be captured and held in the contest for control. To the citizen they may be forbidding bastions of authority, indifferent to his own needs, but perhaps inexcusably subservient to various organized interest groups. To the rank and file of government employees who spend their working days in its offices, the department may be both an unrelenting taskmaster and an animating social centre.

In the sense of human beings who identify themselves with a department as its management or its personnel, one may speak of a departmental point of view or a departmental tradition. Usually the greatest influence on the formation of these characteristics has been exerted by the higher civil servants. But where the political leadership in the departments does not change frequently, the man at the top can impress himself strongly upon the institutional mind of his department. In the same way, however, in which departments tend to fight for their interests and their position on particular issues, so continuing struggles go on within each. department among different specialized staff groups and between these and the agents of general control. Effective direction of a department requires considerable resources of personal strength as well as of technical knowledge and experience.

While differences of internal organization and of cultural development between countries have produced inevitable differences —superficial or profound—in their governmental machinery, it will be found under modern conditions that common political, social and economic needs tend to give the same functions to government departments in one country as another, however diverse their theory of the proper arrangement and scope of governmental organs.

Organization Types.—It is less important to know that the number of departments and the allocation of jurisdictions among them differ (subject to frequent changes in the individual countries themselves) than it is to realize that the various countries follow different patterns of departmental organization. Thus, United States practice treats each department as one great administrative body, including headquarters and field agencies, all of these performing their duties under the name of the department. European tradition favours using different designations for headquarters (ministry, etc.) and field offices, and keeping the ministries small by several devices. One method is that of delegating ample discretionary powers to regional offices, called in Great Britain divisional; another is to transfer large-scale operations that must remain centralized to special agencies of a secondary, or subordinate, character. For instance, the collection of customs and internal revenues, as well as governmental minting. engraving and printing, are functions performed in the United States within the treasury department, while in Great Britain these functions are separate institutions, without cabinet rank, which in their political and financial decisions depend on the treasury but constitute no part of it; in France they are entrusted to so-called *directions générales* under (dependent on) the ministry of finance, as is the administration of state-owned land and enterprises.

The policy of detaching operations from the ministries has been systematically followed in the German *Reich,* where almost all operations that required a considerable number of employees were transferred to subordinate agencies, which in contrast with the *Oberste Reichsbehorden* (*i.e.*, the ministries) were called *Hohere Reichsbehörden,* and worked each under the supervision of one of the ministries (e.g., *Statistisches Reichsamt* under the ministry of economics. *Patentamt* under that of justice). Methodical use of this device kept the German ministries so small that at the end of the Weimar republic (1932) two of them had less than 200 employees, most had less than 400 and the largest (finance ministry) had less than 1,000. This old tradition was resumed in the Federal Republic of Germany after World War II.

It is common practice in the major countries to place each department under the administrative responsibility of a single head. The apparent exceptions to this rule in Great Britain are nominal rather than actual in most of the cases, as with the treasury and the boards of education and of trade. Collegial boards have kept practical significance, however, for the admiralty in Great Britain and for agencies with quasi-legislative or quasi-judicial functions. such as the U.S. Interstate Commerce commission. the British Transport commission or the civil service commissions in both countries, for government corporations, for some policy-forming agencies in smaller states and in local government units.

Next in line under the department head. Great Britain and Germany developed the office of the permanent undersecretary (called secretary in some British, and after 1920 *Staatssekretar* in all German. ministries), who constitutes a one-man channel that must not be by-passed in official contacts between the lower levels and the department head. The duties of U.S. undersecretaries are, in most cases, more specific and their rights less inclusive. In French ministries—except that of foreign affairs, which has a *secrétaire général—directeurs,* each in charge of one division, are placed immediately under the minister. In Germany, such division heads, called *Ministerialdirektoren,* constitute the next lower level under the *Staatssekretäre.* Likewise, in Great Britain and the United States, assistant secretaries or similar officers are often given directive functions over large fields of work under the undersecretary. But this is not always so; especially in the United States many assistant secretaries work independently of the undersecretary. Parliamentary undersecretaries have often been appointed not only in Great Britain but also in France for political or specific functions. They are unknown in the United States and in Germany.

The greatest difference in organization, however, prevails at the base of departmental headquarters. European practice favours systematic distribution of the entire work among a body of subject-matter aides, trained for ministerial service and for the consideration of over-all viewpoints; they are called principals in Great Britain, *chefs de bureau* in France and *Referenten* or *Sachbearbeiter* (in various grades, such as *Ministerialrat*—formerly *Geheimer Regierungsrat*—*Oberregierungsrat* and *Regierungsrat*) in Germany. The functions of these aides are, of course, greatly affected by the detachment or nondetachment of operational services (*see* above). The more operational functions are transferred to subordinate agencies. the less the ministerial aides have to deal with operations and the more their work concentrates on planning, advice, initial steps in the execution of decisions made at headquarters, contacts with other departments and contacts with subordinate field agencies or operating services. This is the usual situation of the *Referenten* in German ministries, of British principals and French *chefs de bureau.* On the other hand, the fact that operating services in the United States usually constitute part of the departments makes the U.S. bureau chiefs the heads of such operating services. In their respective fields they function also as the direct advisers of their superiors, with no permanent aides between them and the secretary's level. In criticizing this type of organization it has been said that the natural weight of the large operating services tends to impair the desirable balance within departmental headquarters and to make the over-all organization heavy-footed and lopsided.

In the Soviet Union, state ownership of all means of production greatly increased the operating functions of the government and, consequently, multiplied the number of departments, which has at times exceeded 50 on the national level. There are, for example, several separate departments for various branches of industry. A considerable part of the management of the national economy and of industrial operations is passed on to public trusts (government corporations) as well as to the individual republics; in the latter case, the individual republic appoints the department head in charge of the execution, who then has a dual responsibility—on the one hand to the all-union ministers, on the other to the government of the constituent republic.

UNITED STATES

Types of Agencies.—It is not unusual in the United States to hear the three great branches of the government—legislative, executive and judicial—referred to as departments. In the more familiar sense, the departments are the apparatus by means of which the government carries on its various functions other than those of a legislative or judicial character. This broadly inclusive meaning of the term is identical with what in the usage of the federal government are called agencies. In the period after World War II the total number of federal agencies remained at about 60. But only certain of these agencies were designated as departments.

Not all agencies of the government, in the first place, are part of the executive branch, in the sense of being under the president's control. Some are agencies of the legislative branch—for instance, the Library of Congress, with its legislative reference service as a pool of experts available to the committees of congress and its individual members alike; the government printing office, headed by the pubiic printer; and the federal government's audit agency, the general accounting office under the comptroller general, who serves for an exceptionally long term of 15 years. A somewhat larger number of agencies are neither in the legislative branch nor under the president's orders. These agencies are often spoken of as the independent regulatory commissions and boards, usually created by statute as bipartisan establishments and deliberately placed outside the reach of the president's power of command. Most of the principal agencies of the federal government having quasi-legislative and quasi-judicial functions are of this type. such as the Interstate Commerce commission, the Federal Trade commission. the Federal Power commission, the Securities and Exchange commission and the National Labor Relations board.

Within the executive branch thus narrowly defined, there are further distinctions between agencies. One group is formed by the government corporations; for example, the Tennessee Valley authority, the Export-Import bank of Washington and the Panama Canal company. Another category is represented by the considerable number of agencies which are comparable in many respects to departments but lack this title. These agencies include the Atomic Energy commission, the Veterans administration, the Housing and Home Finance agency, the National Science foundation and the General Services administration. Many of them are single-headed, like the departments; others are directed by plural bodies, like the independent regulatory commissions and boards. Again, like the departments. most of these executive agencies perform functions that in some direct way affect the public or parts of it, as so-called line activities. But a few executive agencies have the task of attending to needs of management which exist throughout the executive branch—for instance, the civil service commission for recruitment, classification and other aspects of personnel administration and the General Services administration for office space, procurement of supplies and disposition of records. But the most important category of federal agencies is formed by the so-called executive departments, relatively few in number but collectively the backbone of the executive branch.

Number, Rank and Size.—The ten executive departments of the federal government, in order of their official rank, are these: state and, next, treasury, both since 1789; defense, established in 1949, with its three military departments, army (created as war department in 1789), navy (1798) and air force (1947); justice (1870) and post office (1872), both with antecedents reaching back much further; interior, since 1849; agriculture (1862), commerce (1903) and labour (1913, previously joined with commerce); and, finally, health, education and welfare (1953), as an elevation of the former federal security agency.

The executive office of the president, a staff organization created in 1939 to assist him in the general direction and co-ordination of the departments as well as the other agencies of the executive branch, is not itself a department. It is a presidential establishment for purposes of program planning, analysis of problems and issues, review and formulation of proposals, and administrative control. The executive office of the president is made up of the White House office, the bureau of the budget, the council of economic advisers, the national security council, the Office of Civil and Defense Mobilization and, when activated, an Office for Emergency Management. On the president's level, the concerns with particular functions which come forth from the departments and the other agencies of the executive branch are met by the counterpressure of a government-wide orientation. Such broader orientation is typical of the presidency, as the foremost organ for the expression of national points of view under the constitution.

Between the executive office of the president, as a staff organization looking at matters across the board, and the departments and other agencies of the executive branch, each absorbed in the particular operating functions entrusted to it, there develops a mutual challenge, a creative tension. The outcome, ideally, is a constructive interchange, with a maturing effect upon decisions. Realistically, however, it is also possible that the result, in the individual case, is determined by a crude test of strength.

Departmental strength is a product of many factors, one of which is size. By quantitative measurements, the departments, like the other agencies of the executive branch, show striking variations. Metaphorically speaking, the departmental system of the federal government resembles a chance meeting of a dinosaur and several lesser creatures, including a few mice. The dinosaur, needless to say, is the department of defense.

One measure of the growth of the departmental system is the increase in civilian and military personnel in the executive branch. The grand total rose steadily from less than 1,000 civilian employees and 1,300 military personnel during Washington's administration to more than 2,300,000 and some 3,000,000, respectively, in the second half of the 20th century.

Common Characteristics.—Like the heads of almost all executive agencies, department heads are appointed by the president with the consent of the senate. But only department heads bear the distinctive title of secretary—as, for instance, secretary of labour. The title is not common to all, however. The top officers of the department of justice and the post office department have the designation of attorney general and postmaster general, respectively, dating back to the beginnings of the republic.

Department heads have neither the right nor the duty of participation in the affairs of congress, as is normally the case under parliamentary government. On the other hand, the principle of acceptability to the senate of the president's choices for his official team carries with it certain limitations to be observed in the exercise of his appointive power. For one thing, men with a passion for unpopular causes, a reputation for unorthodox opinions or a lofty disdain for politicians do not make good material for presidential nominations, though such men may be pillars of wisdom and integrity. There is also the matter of geographic balance in picking candidates, besides other factors of political strategy which no president can ignore. But affiliation with the other party is no bar, for on occasion a bipartisan appearance is politically profitable.

As far as their relationship with the legislative branch is concerned, department heads confine their role essentially to supplying information, often as pleaders, mostly in testimony before congressional committees. In such testimony, as in other public statements, the members of the president's team are supposed to reflect his policies. But the interest they have in advancing their departmental programs may induce them to be more responsive to the legislative committee dealing with the department's affairs or to organized groups which regard themselves as the department's clientele than to the goals sought by the president. To be sure, in a formal sense, expressed by the constitution, department heads are the subordinates of the president; he can fire them at will. Yet a disciplinary action so extreme is practical only on very rare occasions, when in the nature of all circumstances its application would not inflict serious damage upon the prestige of the president's administration. As a matter of fact, therefore, department heads are able to move rather freely in a no man's land of political convenience, checked only by such factors as their loyalty to the president and their fear of the price of a full-scale conflict with him.

Only department heads are automatically members of the cabinet. But the president is free to request the regular attendance of other officials, such as the director of the bureau of the budget, who first sat with the cabinet in 1953. The practical importance of the cabinet and its efficiency in performance are roughly proportionate to the president's own intentions and working methods. For lack of a necessary constitutional function, the cabinet operates as a meeting of presidential advisers. who may also serve as the president's audience. Constitutionally. the president cannot withdraw behind the cabinet. There is thus no collective responsibility of the cabinet for the government's program, in the sense of British political doctrine.

Nevertheless, if only because of the implied exclusiveness, cabinet rank is valued highly. Automatic cabinet status also has certain small but conspicuous privileges. For example, by law only cabinet members among the heads of executive agencies enjoy the privilege of being called for at their homes in the morning and driven back at the end of the day in their own official car. On the other hand, cabinet status does not imply great willingness of the cabinet member to use the cabinet for the making of decisions. When it comes to getting the president's approval for a particular matter, a department head may be more inclined to settle the business directly with the president than to propose it for the cabinet agenda. It is then left for the president to make sure that the subject has the benefit of scrutiny by additional eyes before he commits himself.

Assurance that such scrutiny is provided as a normal procedure is perhaps most evident in the field of proposed legislation. Under arrangements made initially in 1921, the bureau of the budget became the presidential clearinghouse for legislative proposals advanced by executive agencies. The test question in this matter is whether or not the individual proposal is in accord with the president's program. In furnishing clearance, the budget bureau not only is guided by decisions made by the president but also seeks the advice of all other agencies having an interest in the particular matter, thus helping to establish a common position within the executive branch. In addition. when agencies are asked by congressional committees to convey their views on pending bills. the same clearance procedure is applied. Agencies are not censored in their replies to congress But they must add the finding of the bureau of the budget concerning the relationship of the bill to the president's program. The same kind of consultation throughout the executive branch is obtained by the budget bureau before a proposed executive order is passed on to the president for his consideration and signature.

In basic internal organization. the departments show considerable similarities. The top nucleus is generally known as the secretary's office. Upon it converge the demands for decisions which rise constantly in the normal course of business from the next lower level—the great functional groupings made up of bureaus, offices or divisions. These, in turn. are subdivided successively as need requires, down to the smallest working unit. It is natural to imagine the departments as a mighty cluster of central agencies. In actual fact, however. the headquarters organization of the departments at the nation's capital in Washington, D.C., is usually only the smallest part. More than nine-tenths of all federal employees are stationed in the field. mostly in the United States. but partly also on foreign soil, as in the case of the foreign service and various specialized missions, for example.

Departmental direction is therefore in great part a matter of communication, as in all far-flung and large-scale organizations. No department can be much more than the reflection of its sense of purpose. Such sense of purpose does not exist apart from the men and women who arrive at a specified time in the morning and fill a dead building with their devotion to duty as well as their familiar routines. But solidarity and cohesion around aims to be accomplished develop more easily in the small working group than in a vast organization. Moreover, conflicts of purposes and interests between difierent components, specialization in the performance of particular functions and the localized perspective of the personal workplace keep the individual parts of a department from appreciating the importance of the departmental mandate as a whole. Thus the objectives of the department, however frequently emphasized from the top, may yet lack a strong appeal internally. They may remain distant and rather blurred images for the rank and file, preoccupied with what is closest to the individual desk. This tendency toward personal isolation, never completely overcome by even the most resourceful kind of co-ordination, makes the department as a unified whole a rather distant objective for all but those occupied with general management.

Withdrawal into the small-scale world of the individual uorking group—a world to be kept secure, agreeable, neat and unmolested by bigger things outside—is a familiar trait of bureaucratic behaviour. It is a trait that should not be condemned rashly because. paradoxically, it also has a certain therapeutic value. It is an antidote to the growth of a bureaucracy so unified in an independent concept of mission as to rise above control by elective policy makers. The vast physical expansion of the executive branch of the federal government during the first half of the 20th century has often been lamented. It has been seen as a forerunner to what is predicted by some as the coming tyranny of the managers. But the habits of bureaucracy as they manifest themselves in the departmental operations of the federal government are all on the other side. In the United States, bureaucracy, in public administration. is a force of division; it is not a single body, with its onn sense of direction.

Lack of unity in the permanent officialdom is thus a natural condition, promoted by the absence of a recognized higher career service reaching up right below the department head and his political aides, like the British administrative class. On the other hand. the respect accorded the administrative class in England demonstrates that a higher career service. under the pervasive influence of its own ethics, can be a strong restraint upon the zest for power among its members. So indoctrinated, the civil service is able to guard itself against both excessive solidarity and bureaucratic self-aggrandizement. U.S. bureaucrats, under a weaker service spirit, are more inclined to put priority on that part of the departmental program for which they have individual responsibility, as contrasted with other parts. A strong-willed subordinate, convinced of the public benefits of his division's work, may feel free to concentrate on building up support for it. He may go out to re-enforce his position by clandestine alliances with good friends in congress and among the leaders of interest groups even though the head of his department may see things quite differently. Under auspices of a loosely organized party system, congressional-presidential government is characterized by a high degree of dispersal of power. Thus channels of command both within the departments and from the president downward can be obstructed by underlings with greater ease than one might expect at first thought.

All of this makes the job of managing a department a good deal harder than need be. Singlehanded, of course, a department secretary would accomplish little. He must multiply himself. so to speak, by leaving part of the job to lieutenants in whom he can repose his full political as well as personal confidence. These are the undersecretary and the assistant secretaries, occasionally also a deputy secretary, as in the defense department. Like the secretary himself, they are among the political officers who are appointed by the president with the consent of the senate. In contrast with past practice, these selections are rarely mere patronage appointments. The reason is the increased public pressure upon the president—in the day of the service state—to make a satisfactory record in the conduct of his administration, as a matter of good politics.

Yet presidents face considerable difficulty in persuading well-qualified citizens to undertake this kind of public service and to stay in the post after having accepted. Businessmen in particular, but also labour leaders and members of the professions, often require vigorous prompting to make themselves available for an indefinite tour of duty in Washington, D.C. This is not merely a matter of personal and family finances but also the reflection of a political environment nptorious for its frustrations and its lack of charity in public criticism. Recruitment of top calibre for high political positions, especially for the leadership of the executive departments, emerged as one of the unsolved problems of U.S. government.

In each department, the number of presidentially appointed top officials is small, although the impetus they give the department is noticeable. To extend themselves sufficiently far, both outside and inside the department, they need special assistants, mostly brought in from other walks of life as policy advisers, contact men or confidential assistants. whose appointments last usually only as long as the presidential tenure. The great bulk of the departmental personnel consists of permanent employees having regular civil service status.

Although civil servants can be shifted around to suit the preference of an incoming departmental high command, no department is easily stripped of its established ways. Like other large-scale organizations, departments carry their burden of inertia, as they also display their share of initiative, persistence and drive. Departmental management must seek to cope with these conflicting impulses in such a way as to meet desirable standards of performance. Actual performance, by and large, though shoving variations within departments and from department to department, compares fully with the standards of private business.

In their day-by-day administration, almost all departments have come to place considerable reliance on groups of management specialists. Most of these are engaged in program planning, review of operations, budgeting, organization and methods work, personnel administration, accounting and the like. In several departments. in 1950, all or most of these specialized elements of departmental management were combined under the new office of administrative assistant secretary. intended to be filled by career men. In the department of commerce the post was abolished in 1954.

Executive Reorganization. — Year upon year, new administrative activities are authorized by congress, and established ones either change or disappear because of changing circumstances and policies. In their cumulative effects, these changes make it necessary to re-examine the organizational structure of the executive branch at frequent intervals. Good organization might rapidly deteriorate in time if additions, modifications or eliminations of activities were allowed to happen without any thought of a general plan. Bad organization might fall into an intblerable state under such conditions.

Some rudimentary logic underneath the departmental system of the federal government can be discovered from the historical record of its growth. The dates, given earlier, of the beginnings of the ten executive departments supply a key. Finance, foreign affairs and defense, together with justice and the postal service, were a natural grouping for an era when the federal government was mainly concerned nith the administration of functions suitable for the common agency of an association of sovereign states. Eventually, the diversified natural resources under federal control, including the public lands. called for recognition on the cabinet level and brought forth the department of the interior. Then, with the full momentum of a development that led the republic from its agrarian start into the charged atmosphere of an industrial order, there followed the parade of clientele departments with nationwide responsibilities — one looking after the farmer, another serving the businessman, and the last acknowledging the interests of the worker. A further step was taken with the establishment of a full-fledged department underwriting important aspects of minimal economic equality — the department of health, education and welfare. Its emergence demonstrated the degree to which social policy had become accepted as one of the foremost domestic concerns of the federal government.

If that much underlying reason is conceded, it must not be concluded that the departmental system, as a product of history, ought to be left in peace. On the contrary, proposals for achieving a more rational structure of the executive branch have been made quite frequently. Many of these proposals rest on fairly abstract theories of what is variously assumed to be the essence of sound organization. The departments, however, are massive structures re-enforced by precedent and tradition and cannot be easily changed. They are singularly unresponsive to the preaching of people stirred by a sense of organizational tidiness. Moreover, all the organized interests. economic and social. that have a stake in the departmental set-up, view with deep suspicion any marked departure from familiar arrangements. Each interest is fearful of coming out the loser. As a result, a sweeping overhauling of the executive branch is practically out of the question, except under conditions of a full-scale emergency.

But real gains may be attained even by some patient, piecemeal improving. That has been done rather persistently. The usual procedure. applied on all levels of government in the United States, is to set up a formal inquiry into existing conditions, in the hope of bringing forth concrete recommendations with a fair chance of adoption. Inquiries of this type on the federal level include the president's committee on administrative management with Louis Brownlow as chairman (reporting in 1937) and the (first) commission on organization of the executive branch headed by former president Herbert Hoover (reporting in 1949). Examples on the state level were the so-called "little Hoover commissions" set up on the federal model. It was not surprising that one of the first steps taken by Eisenhower upon assuming office as president in 1953 was to add an official advisory committee on government organization, under the chairmanship of Nelson A. Rockefeller. In addition, shortly afterward a second Hoover commission was created. which was to deal with the more explosive question of the proper scope of governmental functions. Its reports proved correspondingly more subjective and controversial.

These bodies, pursuing a broadly evolutionary approach. have done useful work. Cumulatively, they managed not only to get action on a whole series of proposals for desirable changes but also to shape a working doctrine of executive reorganization. The Brownlow committee, for instance, made history by breaking ground for the concept of the executive office of the president. Implicit in this concept was the idea that executive responsibility should be matched with sufficient authority and clearly centred in the top man, but its exercise should be bolstered by a balanced grouping of staff units bringing co-ordinating skill as well as specialized judgment to bear upon decisions. Another element in the working doctrine of executive reorganization, reaffirmed by the first Hoover commission, was the demand that activities be fitted into patterns, each dominated by a basic governmental purpose. This criterion of departmentalization sounds simple but is much less simple in practical application. Still another point of doctrine is the general rule that both the number of departments and the total number of agencies of the executive branch ought to be held to a minimum; that, ideally, the lesser agencies ought to be brought into some defined relationship with one or another department, as the president's span of control is naturally limited; and that novel public functions, especially while still experimental or when undertaken for the duration of an emergency, might best be constituted as — possibly temporary — agencies rather than as new departments.

As in the federal government, so also in state and local governments, the desirable structure of the departmental system was linked with the concept of a fully responsible chief executive. The strengthening of the governor's position, on the one hand, and the gradual replacement of the weak-mayor type of municipal organization by the strong-mayor type or the council-manager plan, on the other. led to some consolidation of the executive branch. This included a reduction of the number of agencies practically accountable only to themselves. Both in local and in state government, however. various officials are elected side by side with the chief executive. who therefore has no effective control over them.

Together with placing limitations on the number of departments and making each a repository of reasonably related functions, staff units have been built around the chief executive in state and local government. In addition, the concept of a department of administration gained some popularity, especially on the state level. This department is usually visualized as an agency combining responsibilities for budgetary planning, fiscal control, improvement of management and procedures, periodic inspection and provision of central services, such as purchasing and car pools. Not surprisingly, in the states as well as the counties and municipalities, progress along the lines of executive reorganization has been slow. In state government, for example, it is not exceptional to encounter more than 30 departments and a total of more than 100 agencies. including many not subject to the governor's general direction.

With the president constitutionally the coequal partner of congress in the performance of the tasks that have fallen to the federal government with the growth of an industrial society, it might be thought that he can do as he pleases in reorganizing the executive branch. This could be regarded as an obvious inference from his role as the responsible chief executive of the nation. But it is not widely assumed that such actually is the legal authority of the president. As a practical matter. it appears accepted that the president requires congressional authorization to reorganize the executive branch. Securing adequate authority for him is doubly important because evidence shows. as could perhaps be expected, that congress, left to itself, is not a particularly good architect of executive structure.

Despite much urging from official and unofficial quarters before as well as after World War II, congress failed to see compelling reasons for granting the president continuing authority to carry out reorganizations. Instead, taking its cue from the report of the Brownlow committee. congress passed a succession of short-term reorganization acts (of 1939. 1945 and 1949, the last prolonged repeatedly by new legislation). Each of these acts laid down essentially the same procedure for setting in motion the wheels of organizational change, first written into law in the act of 1939. In briefest outline, the president would come forth with specific reorganization plans and transmit them to congress. Congress then could express its disapproval of the individual plan. If no such disapproval had been voted, the plan would take effect after 60 days. having practically the force of law. Each reorganization act, as a limitation, extended a protective hand over certain agencies for various reasons. For disapproval. the acts of 1939 and 1945 required agreement by both the senate and the house of representatives. whereas under the act of 1949 objection on the part of either of the two chambers was sufficient if expressed by a majority of the total membership of that chamber. In the consideration of the prolongation act of 1953, a move in the committee stage to whittle down this majority requirement by substituting a simple majority was stopped in the nick of time. The prolongation act of 1957 eliminated the requirement that disapproval be expressed by a majority of the chamber's "authorized membership," thus greatly increasing the chance of congressional disapproval. The legislative veto, obviously, should operate only on the basis of substantial congressional sentiment against any particular reorganization plan.

Although in part because it was never employed in disregard of political realities. this novel procedure, on the whole, was notably successful. Instances of disapproval remained the distinct exception. On the side of accomplishments, reorganization plans provided the structure of the executive office of the president, one of the most important events in the modern administrative history of the federal government: strengthened the authority of top management on the departmental level; created the department of health, education and welfare; established such other important agencies as the Housing and Home Finance agency (1947) and the U.S. Information agency (19j3); and improved the organization of the defense department. More often, reorganization plans were used to achieve a more satisfactory allocation of particular activities to existing agencies. It has also happened that congress incorporated the substance of a reorganization plan into legislation.

A number of reorganization plans were aimed specifically at creating better conditions for effective management within the individual agencies. In the first place. in regard to plural bodies like the Federal Trade commission an effort was made to build up the position of the chairman into a kind of administrative chief, without affecting the prerogative of the body as a whole to settle important business by vote. Secondly, in single-headed agencies it was sought to do away with impediments to the freedom of the man at the helm to organize his agency for greatest efficiency. This meant the elimination of statutory barriers, a difficult obstacle to overcome. The campaign in support of wider managerial lee ay at the top level in the various agencies advanced a considerable distance but also suffered telling defeats in congress.

A reorganization program of such scope calls for extensive analysis of what is wrong in the first place, careful determination as to what to tackle and what to leave untouched for the time being and shrewd exploration of the strategy and tactics of how to formulate individual proposals and when to act. Some of these judgments are necessarily political. Many of them are technical, though often involving very complex situations. Staff work for the president in the technical development of reorganization plans has been an assignment of the bureau of the budget, more particularly of its office of management and organization, until 1952 the administrative management division.

Below is outlined the machinery for the conduct of the principal executive functions of the federal government.

Foreign Affairs.—In this field the primary agency is the department of state. Its head, the secretary of state, serves as the principal adviser to the president and congress in the determination and execution of the country's foreign policy. But, as Pres. Franklin D. Roosevelt demonstrated, a chief executive, in the fullness of his constitutional powers in foreign affairs, is able to take the reins of international relations pretty well into his own hands.

The secretary of state is also a top co-ordinator interdepartmentally. He is the ranking department head in the national security council, part of the executive office of the president. A statutory cabinet committee created in 1947, the council is to assess and appraise for the president the objectives, commitments and risks of the United States in relation to the country's actual and potential defensive strength. The council also advises the president on a unified approach by the entire executive branch to the attainment of national security and to the resolution of particular issues that often burst forth unexpectedly. The head of the policy planning staff in the department of state simultaneously serves as his department's representative in the top staff organization of the national security council. The co-ordinating responsibility of the secretary of state also extends to giving policy guidance to other agencies carrying on functions in the field of foreign relations. This applies especially to the administrative organization in charge of economic and military aid to friendly nations, such aid going back to the Marshall plan. The agencies in charge were named successively Economic Cooperation administration, Mutual Security agency, Foreign Operations administration and International Cooperation administration (the last a semi-autonomous element within the state department). State department policy guidance is also supplied to the U.S. Information agency, concerned with winning understanding for the American point of vie and American ways among the leaders of public opinion in other countries.

Within the state department, attention is given to both political and economic affairs. A large task is the business of keeping together the threads of diplomacy. The business of administration includes the management of the foreign service. The members of the foreign service have traditionally formed a separate corps of career officers, distinct from the general civil service, and thus also from the departmental personnel of the state department. Pressure for a merger of the two groups increased after the end of World War I Two areas of special emphasis are effective communication of the department's goals and interests to congress and to the public, respectively. The first activity is doubly important because the relations between the department and congress have been marred by many a misunderstanding. The extensive security interests of the department are in the care of its bureau of security and consular affairs. The Passport office and the Visa office are also part of this bureau.

The steady flow of dispatches and reports, typical of the day-to-day activities of diplomacy. runs through the so-called regional bureaus of the department. Each deals with the affairs of a different section of the globe. The principal groupings are inter-American affairs, European affairs, far eastern affairs and near eastern, south Asian and African affairs.

Another group of specialized offices provides guidance and support for the participation of the United States in international organizations. It represents the headquarters staff doing much of the desk work for the role the federal government plays in the Security council, the Economic and Social council and the general assembly of the United Nations, largely through the United States mission to the United Nations.

The need for bringing standards of scientific accuracy to bear upon information coming from all corners of the earth has been the main cause of the formation of a bureau of intelligence and research. Its work, too, is divided geographically to provide the advantages of specialization of knowledge. Co-ordination of the intelligence activities throughout the executive branch is the task of the central intelligence agency, which is under the direction of the national security council.

The most striking addition to the traditional means of carrying on U.S. foreign relations occurred in 1948 with the establishment of a large program of assistance to foreign countries. The program was first outlined in the famous commencement address by Secretary of State George C. Marshall at Harvard university. For the administration of this program a specialized agency with its own country missions was created, ahich was brought into the state department only in 1955, in continuation of its separate status within the department. (See also FOREIGN AID PROGRAMS.)

Finance: Revenue and Debt.—In Great Britain the treasury, in its historic development, has become a vital factor in the operations of the entire national administrative system. Treasury control means not only co-ordination of fiscal and economic policies but also central superintendence over the departments in the performance of such management functions as budgeting and personnel. Thus the British treasury has a good deal of government-wide responsibility for the general efficiency of the executive branch.

In the United States. on the other hand, responsibilities for over-all management have gravitated toward the presidency--organizationally speaking, to the executive office of the president, especially the bureau of the budget. Basically the treasury department is a line establishment like the other departments But it also discharges indispensable staff assignments for the president.

For example, although under the Budget and Accounting act of 1921 it is the duty of the budget bureau to assist the president in the preparation of the budget, elaboration of the revenue side has always been the task of the treasury department. It is the secretary of the treasury and his experts who present to congress for the president the tax proposals of the executive branch, and who in turn serve congress as principal sources of technical information when the initiative in tax legislation is taken by the revenue committees. Legislative initiative is quite normal. under congressional-presidential government. The proposals of the executive branch in these as in all other matters are simply presidential recommendations, which congress is constitutionally free to ignore.

Another indication of the treasury's government-wide responsibilities is supplied in the secretary's role as chairman of the National Advisory Council on International Monetary and Financial Problems. in effect a cabinet committee for purposes of interdepartmental co-ordination in this field, but less important than the national security council. Of great practical consequence for the economy is the effectiveness of the treasury's relationships with the organizationally independent federal reserve system, backbone of the country's private banking business and chief guardian of sound money conditions. Although federal reserve policy may directly affect rates of interest on treasury financing. the treasury has no legal authority over the federal reserve system. Nor has the treasury effective control over all governmental lending programs, like those providing building loans or agricultural credit.

In the treasury department the fiscal and the administrative assistant secretaries represent the growth of the career idea on the highest level. The administrative assistant secretary supervises the department's work in matters of general management. The fiscal assistant secretary is in charge of financial administration, including the department's accounting activities and supervision over the bureau of the public debt and the office of the treasurer of the United States, which is essentially the banking facility for the federal government.

In the making of treasury decisions about taxation, financing and debt management, the support furnished by the analytical staff in the secretary's office is of great importance. More specialized is the office of international finance. The duties of this office include collection and analysis of current information about the economic positions and policies of other nations having a bearing upon the country's financial and monetary programs. The office also participates in negotiations with foreign governments involving questions of international finance.

The main divisions of work in the treasury demonstrate how far it is burdened nith operating functions. Its chief components are: the bureau of the mint, the bureau of engraving and printing, the United States savings bonds division, the office of the comptroller of the currency (who supervises the so-called national banks), the internal revenue service (with an extensive field service of its own), the bureau of customs (also with a field organization), the bureau of narcotics (administering the federal narcotics lams), the United States secret service (*q.v.*) (guardian also of the president's safety and that of his family, and separate from the Federal Bureau of Investigation in the department of justice) and, finally, the United States coast guard (a detachable service, so to speak, for in time of war or upon the president's direction the coast guard moves under the command of the navy department).

Defense.—The department of defense is the result of a determined effort to achieve a unification of the military services. A decisive step was taken with the creation by the National Security act of 1947 of a single national military establishment composed of army, navy and air force. The amendments to this act in 1949 strengthened the position of the secretary of defense. Reorganization plan 6 of 1953 and additional legislation passed in 1958 carried this development still further.

With installations as well as military interests spread over most of the world. the defense department became a realm by itself. It is also a necessary partner in almost all important decisions affecting the U.S. national interest. Its performance casts a broad shadow across the entire executive branch.

The machinery by which the defense department asserts its control over the three service departments is technically called the office of the secretary of defense. The secretary is a member of the national security council and such other policy-making bodies as the North Atlantic council. One of the secretary's assistants gives special attention to the application of atomic energy. another to guided missiles. Responsibility for the various segments of the department's program is distributed on such lines as manpower and personnel, supply and logistics, international security affairs, research and engineering, and public affairs. The National Aeronautics and Space administration, created in 1958 to solve flight problems within and outside the earth's atmosphere, is separate.

The armed forces policy council is advisory to the secretary. The council brings together the top men throughout the department, including the civilian secretaries of the three service departments and the military chiefs. The joint secretaries form a separate organ of advice. leaving out the military spokesmen. The joint chiefs of staff, in turn. consist of military representatives only: the chairman (who while so serving tnkes precedence over all other officers of the armed services). the chief of staff of the army, the chief of naval operations and the chief of staff of the air force. The chairman has charge of the joint staff, comprising under its director a joint strategic plans group, a joint intelligence group and a joint logistics plans group. Perhaps no other body has as much potential influence in giving unity to defense planning in its developing phases throughout the three services as have the joint chiefs of staff. On the other hand, the adequacy of this type of staff organization was questioned by various groups, including military leaders. Bringing together men from the three armed services in itself produces no higher loyalty.

There are variations in departmental organization as well as in military staff structure among the three service departments, but the formal relationship to the office of the secretary of defense is the same. The secretary of defense, below the president as the constitutional commander in chief, is the immediate superior of the secretary of the army, the secretary of the navy and the secretary of the air force. Each, in turn, has as his principal adviser in military matters the ranking officer who represents the department on the joint chiefs of staff. One navy component with a great tradition of its own is the United States marine corps. When the joint chiefs of staff deal with its affairs, the commandant of the marine corps sits with them as an equal.

The department of the army. through its corps of engineers. also performs important civil functions in improving rivers, harbours and waterways for navigation, in constructing flood control and similar projects in various parts of the country, and in administering the laws for the protection and preservation of navigable waters.

The new stature and ramifications of national defense, together with the impact of science on strategy, tactics and weapon development. have made the military a crucially important profession. Extensive schooling is therefore indispensable. The joint service schools are the National War college. the Industrial College of the Armed Forces, both located in Washington, D.C.. and the Armed Forces Staff college, Norfolk, Va. Most of the military schooling, however, is provided under the auspices of each individual service, with some participation from the others.

Justice.—Justice is administered, in the main, through the courts. In addition to the role of the judicial branch, however, certain important responsibilities in this field are discharged by executive agencies, especially by the department of justice This department provides the means, together with other agencies in their special fields, for the enforcement of federal legislation, supplies legal counsel in federal cases and construes the laws under which the other departments act. It also supervises the federal penal institutions and contains two services which conduct their business in considerable independence—the Federal Bureau of Investigation and the immigration and naturalization service. The attorney general is the federal government's chief law officer. As head of the department, he also directs the prosecuting and other activities of the United States attorneys and marshals in the various judicial districts. The solicitor general represents the federal government in litigation before the supreme court and. at the attorney general's request. before other courts as well. Formal opinions of the attorney general and informal advice to executive agencies are prepared in the office of legal counsel, which also examines proposed executive orders of the president for their legality, in connection with the clearance of the draft by the bureau of the budget. The office of alien property exercises the functions of the attorney general in controlling and vesting foreign-owned property under the Trading With the Enemy act. Applications for pardon and other forms of executive clemency are reviewed by the pardon attorney.

The main functional groupings within the department include the antitrust division, engaged in combating monopoly and restraints of trade; the tax division, the federal government's tax attorney, as it were, and also its chief of prosecution under the internal revenue laws; the civil division, which supervises all matters relating to civil suits and claims against the United States and its officers not otherwise assigned; the lands division, concerned with such cases as condemnation proceedings and protection of water rights, including litigation with respect to Indians and Indian affairs; the criminal division; and the civil rights division.

Still larger elements are the bureau of prisons, which keeps its eyes on the federal penitentiaries, reformatories and correctional institutions; the Federal Bureau of Investigation. the main detective arm of the federal government, which occupies a unique place in congressional sentiments as well as the attitude of the newspaper reader; and the immigration and naturalization service, which administers the laws that govern the admission, exclusion, deportation and naturalization of aliens, maintaining also the federal border patrol. These last two bureaus have substantial field services for their specialized functions.

Postal Administration.— Although the post office department manages the largest business in the world, ancient political practice has persisted in leaving all postmasters of the first, second and third class in the category of presidential appointments.

In addition to the bureau of the chief postal inspector. there are five basic divisions in the department. These are: the bureau of operations, as the central management for all normal post office activities; the bureau of transportation, attending to the physical means of maintaining the steady flow of mail, and also administering the so-called international postal service; the bureau of finance. with functions that extend to supervision of the conduct of the money-order system and of the sale of government savings bonds by the post offices; the bureau of facilities, including buildings and special equipment; and the bureau of personnel. The postal savings system is under a board of trustees, which also determines the proper investment of the savings paid in at the individual post offices. One of the incidental functions of the department is the prevention of the use of the mails in violation of federal law. This covers such matters as fraud. espionage and obscenity. As in other countries, the postal appraisal of literature has given rise to some memorable court decisions.

Resources and Guardianship.— In this field the most important role is played by the department of the interior. The activities of this department centre upon the management. conservation and development of the natural resources of the United States—public lands. water. power, oil, gas. other mineral assets, fish and wildlife resources and the national parks. The department also promotes the welfare of the inhabitants of the island possessions of the United States and of the trust territory of the Pacific islands. in addition to exercising guardianship over U.S. Indians and promoting the interests of the natives of Alaska, the 49th of the states. entering the union in 1959.

The principal division of work on the department's top level is in terms of fish and wildlife, mineral resources. public land management and water and power development. The technical review staff conducts studies of various programs and maintains liaison between the department and its field committees, which serve as organs of co-ordination in the main geographic areas.

The interior department is divided into these main elements: the bureau of Indian affairs, trustee of the lands belonging to the Indians and source of public services to them, as long as they are not yet absorbed into American life: the bureau of land management, responsible also for the granting of grazing permits on the public range; the bureau of mines. which has as its tasks the conservation of mineral resources, the conduct of research in mining and utilization of mineral substances and the promotion of safety in the mineral industries; the bureau of reclamation, in many respects a rival of the army corps of engineers as the builder of public works to bring water to the lands of the west, including development of power; the fish and wildlife service, part of which is the bureau of commercial fisheries; the geological survey, a research bureau engaged in compiling and publishing information about the nation's mineral, water and other resources; the national park service. with about 180 national parks, historic sites and recreation areas; and the Bonneville. Southwestern and Southeastern Power administrations, which market electric power generated at federal reservoirs.

Agriculture.— It is the foremost goal of the department of agriculture to promote the general interests of those who produce from the soil—"agriculture" being a collective term that includes enterprises organized as private corporations, owners of family farms, homesteaders, tenants and sharecroppers. The difficulty of establishing a common denominator among all these groups—even in the department's extensive educational publication program—has often been a source of political trouble for the department.

One functional grouping concentrates on federal-state relations, under which are co-ordinated the agricultural conservation program service, the agricultural research service, the farmer cooperative service, the extension service (carrying the fruit of research to the farms through county agents), the forest service with its 150 national forests and the soil conservation service. Another functional grouping is marketing and foreign agriculture, including the agricultural marketing service, the Commodity Exchange authority (overseer of fair commodity trading) and the foreign agricultural service. Agricultural stabilization is promoted by the Commodity Credit corporation, the commodity stabilization service and the Federal Crop Insurance corporation. The Farm Credit administration being an independent agency, the department's agricultural credit services are limited to the Farmers Home administration and the Rural Electrification administration, both in the main being loan programs.

More specifically, the agricultural research service lends support to the experiment stations and carries on work in agricultural and industrial chemistry, animal industry, dairy industry. entomology and plant quarantine, human nutrition and home economics. plant industry, soils and agricultural engineering. The farmer co-operative service carries on research and educational and service activities of help to the large number of farmers who belong to agricultural co-operatives. The extension service operates on the basis of a co-operative relationship between the department. the land-grant colleges and the county governments in the provision of educational programs in rural communities. Like the extension service, the soil conservation service, through soil conservation districts organized and managed by farmers and ranchers. deals directly with local needs The agricultural marketing service provides research and statistics as well as marketing services, including the standardization of farm products and the administration of the school lunch program, financed from federal and state funds. The foreign agricultural service has primary responsibility for developing markets abroad to absorb U.S. surplus production. The commodity stabilization service is responsible for such matters as acreage allotment and marketing quotas with respect to agricultural commodities for which supplies are out of line with demand; it also administers price supports by loans. purchase agreements or purchases. A body loosely related to the department is the U.S. Department of Agriculture Graduate school. a nonprofit institution of higher learning for federal employees at Washington. D.C.. supported essentially by student fees.

Commerce. — The responsibilities of the federal government in the field of commerce, broadly defined, are widely scattered. The commerce department is essentially a service agency. with almost no regulatory duties. These are exercised for the most part by such independent bodies as the Federal Trade commission. which seeks to guard fair competition; the Securities and Exchange commission. which polices the stock market; and the Interstate Commerce commission, the Civil Aeronautics board, the Federal Communications commission and the Federal Power commission. with regulatory powers over surface transport, air transport. aire and radio communication and hydroelectric power and natural gas, respectively.

The department of commerce deals with both domestic and international commercial affairs. The first field is handled by the office of business economics. devoted to long-range as well as short-run analyses of the national economy. which are made generally available in the form of the monthly *Survey of Current Business;* the Business and Defense Services administration, and the bureau of the census The second field falls within the competence of the bureau of foreign commerce. which publishes the *Foreign Commerce Weekly*

The department performs a number of basic national services. These are represented by the bureau of the census as one of the federal government's major fact-finding and statistical agencies; the weather bureau; the national bureau of standards. conducting for the government fundamental research and related technical activities in physics, mathematics chemistry and engineering; the patent office; and the coast and geodetic survey. which carries on studies to provide data for navigation charts. In addition. there are tno major services which concentrate on different forms of transportation The Maritime administration is concerned with aid to shipping and related functions. The bureau of public roads develops the country's highway system in co-operation with the states on the basis of federal financial aid to the states. The Federal Aviation agency, created in 1958 outside the commerce department, has mainly promotional aims with respect to civil air traffic. but also enforces air safety regulations.

Of considerable importance to the national economy, in addition to the commerce department, are such independent agencies as the Housing and Home Finance agency. the Federal Home Loan Bank board. the Federal Deposit Insurance corporation and the Atomic Energy commission.

Labour. — The fundamental mandate of the department of labour is to foster the welfare of the nage earners. improve their working conditions and advance their opportunities for profitable employment.

One of the most important bureaus of the department is the bureau of labour statistics. It is the main repository within the federal government of information about employment and manpower, productivity, earnings, hours and wages, industrial relations, accidents, price trends and costs as well as standards of living. This information is made public in special bulletins and in the *Monthly Labor Review.* The bureau also keeps abreast of labour conditions in other countries, on which it reports in its *Labor Developments Abroad.* The bureau of labour standards is a service to state labour departments and organized groups interested in better working conditions. This bureau promotes industrial safety and health, develops standards for labour legislation and its administration and assists in giving effect to international labour standards. The women's bureau looks after the interests of all women at work or seeking work; its directors have traditionally been women of exceptional calibre.

Other principal services maintained by the department are the bureau of apprenticeship. which formulates standards for the training of skilled workers in industry; the bureau of employees compensation, charged with the administration of the accident compensation program for federal employees and certain types of private employment subject to federal legislation; the bureau of employment security, providing a combined placement and unemployment insurance system, the insurance part being a joint federal-state responsibility under the social security legislation; the consolidated wage and hour and public contracts divisions, the former assuring minimum rates of pay in general and protection of youthful workers against exploitation in particular, and the latter supervising the observation of stipulations in government contracts with respect to minimum wages and other safeguards of fair employment; the bureau of veterans' re-employment rights: and the office of international labour affairs, which has primary responsibility for the participation of the United States in the International Labour organization, in line with the general policies of the department of state. This office. in addition, serves as the secretariat to the trade union advisory committee on international affairs appointed by the secretary of labour

Essential additional functions are carried out by such separate agencies as the National Labor Relations board concerned with protecting collective bargaining and eliminating unfair labour practices; the Federal Mediation and Conciliation service; and the National Mediation board, applicable to railway labour.

Health, Education and Welfare. — The department of health, education and welfare was established in 1953 as an elevation of the Federal Security agency. As one of the department's big operating bureaus, the public health service, under the surgeon general, strives to protect and improve the health of the people. Its main parts are the bureau of medical services. which administers hospitals and outpatient stations for seamen, coast guard personnel and other beneficiaries as defined by law. enforces quarantine regulations and supplies office health services for the employees of federal agencies: the bureau of state services. attending to federal-state programs for the control of communicable and other diseases and for such related matters as public-health nursing and education; and the national institutes of health as the research arm of the public health service. dealing with cancer, heart disease. dental research mental health. arthritis allergy. infectious diseases, neurological diseases and blindness. The office of education is an agency of specialized information and technical advice, especially to state and local school officials. It also administers a grant-in-aid program — a customary form of federal participation in the conduct of nationally important functions not within the immediate jurisdiction of the federal government.

The Social Security administration, another large component of the department, is divided into the bureau of old-age and survivors insurance, the bureau of public assistance, the children's bureau and the bureau of federal credit unions. The first of these supervises the great direct federal insurance system under the social security legislation, whereas the second — more typically — provides a federal financial contribution in support of what was originally an exclusively local responsibility. The children's bureau. like the women's bureau in the labour department, is in the main a clearinghouse of research and technical information. The bureau of federal credit unions is the supervisor of co-operative associations organized to foster thrift among their members and to meet their credit needs.

The office of vocational rehabilitation is the ambassador of the vocational interests of the mentally as well as the physically handicapped. The Food and Drug administration deals for the most part with the enforcement of the federal laws that aim to assure standards of manufacturing purity and truthful labeling. Saint Elizabeths hospital, Washington, D.C., in the care of the department, is a government institution for the mentally ill. A looser supervisory relationship exists between the department and three federally aided corporations: the American Printing House for the Blind, Louisville, Ky.. Gallaudet college for deaf students, Washington, D.C., and Howard university. Washington. D.C., founded in 1867 to mitigate the lack of higher educational facilities for Negroes.

GREAT BRITAIN

The executive powers of the central government in Britain are, by law or convention. vested in ministers who sit in parliament. Each minister is individually answerable to parliament for any exercise of the powers vested in him. whether action is taken by him personally or in his name by subordinates. Each minister has a retinue of officials who form a single establishment over which he presides personally. Some ministers in addition are responsible for other establishments which are separately organized and are often distinct legal entities, but which through constitutional evolution have come to work in ultimate subordination to a particular minister. All these official establishments are generally called government departments. Those over which ministers preside personally, and through which they perform their main executive duties, are often referred to collectively as ministries, and taken together form the heart of the central administration. Most of the others are charged with routine and relatively uncontroversial administrative tasks. The two groups comprise an immensely variegated collection of institutions, the range of whose functions and internal organization makes accurate brief generalization almost impossible. Three characteristics are common to all but a few. however: each is the entire responsibility of a minister, each is financed by direct grants from parliament voted by an orthodox procedure and each is staffed by members of a centrally recruited and integrated civil service.

All the ministries and a few of the other establishments can usefully be classified as major departments. and the rest as minor departments, but there is much room for argument as to exactly where the line between them should be drawn. Moreover, there is even doubt in some cases as to whether an institution is or is not a government department. There are a host of public authorities. variously entitled generically "nondepartmental bodies." "independent administrative authorities." "public corporations." etc., which are usually collegiate in form and in respect of which ministers have certain statutory powers. A few of them have certain characteristics—for instance in their financing and staffing—similar to those of unmistakable government departments. while a few of those institutions usually referred to as departments share certain characteristics common to public bodies which could not conceivably be regarded as government departments. In short, the very term government department cannot be precisely defined. In this context. the most that can be said safely is that in the late 1950s there were some 25 to 30 major and at least 50 minor government departments.

General Background, Nomenclature and Status.—Contemporary Britain is used to the concept of a government department as a body of officials having its own continuous existence. its own traditions and philosophy. apart from the ministers who preside over it or are responsible for its actions for at most a few years at a time and often for much shorter periods. This does not imply that the minister is a mere cipher whose presence is nothing more than a necessary constitutional formality: indeed. while the strengths of ministers vary widely, the impact of the weakest on a department will have at least the effect of lowering its status in relation to other departments. whereas a strong minister can not only raise a department's relative status but can mold its stored traditions and procedures into a powerful and characteristic personal instrument which may bear the impress of his suzerainty for a generation. Nonetheless, his mastery is based on a delicate balance betneen his own personal and political authority on the one hand. and his officials' expertise and experience on the other hand.

This whole concept reflects complete acceptance of the modern system of responsible cabinet government, but that system only came to full maturity in the middle of the 19th century. The origins of the oldest departments go back centuries before that, to a time when the central government was contained in the personal household of the medieval king: when there mas no question of responsibility to anyone except the king. no "constitutional" opposition and, therefore, no distinction between a "political" executive and a "neutral" civil service.

The present major departments have sprung from three main sources—from individual officers of household and state, from the privy council and from parliament. The first source had produced by the end of the Tudor period at least the embryo forms of the lord chancellor's department, the treasury, the admiralty. the post office and the ministry of works. It also produced the office of secretary of state, which was shared by two men of equal standing as early as 1540 and, while remaining a single office, has since been divided between as many as eight heads of departments simultaneously. The board of trade (set up in the 17th century) and four scientific research organizations are in form committees of the privy council, while the ministry of education and the ministry of agriculture. fisheries and food derive from similar committees. The remaining ministries or their immediate forerunners were created by acts of parliament in the 19th and 20th centuries. Until 1915, it was usually the practice of parliament to establish in each case a board composed of some existing ministers plus a new minister who was made president of the board. Since 1915, new ministerial offices have been set up by statute without any hint of collegiate authority.

The variety of origins is reflected in the variety of titles and constitutions of departments, because the British have indulged an indigenous weakness for retaining outward institutional forms after the realities have long ceased to correspond with them. Thus, the basic constitutional simplicity and uniformity of the system is by no means apparent from a list of contemporary ministers and departments. The straightforward "minister of . . ." and "ministry of . . ." is used for less than half the departmental chiefs and their major departments. The other ministries are either the "offices" of secretaries of state or have unique collegiate forms and are headed by ministers with equally unique titles—the board of trade with its president, the admiralty and its first lord, the treasury answerable to the chancellor of the exchequer, and so on.

It would be incorrect to declare that government departments form a hierarchy, if by this is implied the existence of a strict line of command running downward from one supreme department through various strata of major and minor departments. Each minister must answer personally to parliament for anything done in his name by his officials: he cannot escape responsibility by claiming that he was merely carrying out the instructions of a "senior" colleague, for the constitution does not recognize any inequality between ministers, and therefore cannot do so between their departments. But just as the prime minister has become more than the traditional "first among equals" in a ministerial context, so there is to some extent if not a hierarchy at any rate a degree of aristocracy among departments in Whitehall which perhaps has to be felt rather than explained. Some of the departments which are in the front rank are also among the most ancient, simply because they deal and have dealt for centuries with the most fundamental functions of government. But formal precedence derived from origins and nomenclature is no longer a safe guide to relative status. Tangible proofs of current political and administrative importance, rather than antiquity or title, are the hard main bases of such distinctions as exist. Thus, now that there are too many ministries for all their chiefs to be members of the cabinet, those which are directly represented in the highest council of the state are inevitably lifted a little above their fellows. A department whose minister was unknown to the constitution 20 years ago but who now sits in the cabinet may carry more weight, for the nonce at any rate, than a department headed by a secretary of state and dating back to the 15th century.

Departments are shown in a proper perspective if they are grouped roughly according to their functional affinities, though there can be no absolute precision about what each major function of government comprises. In the following sections all the ministries are mentioned, but only a selection of the minor departments is included. Administrative organization exclusively concerned with Scotland and Wales is referred to briefly in a final paragraph. (See also SCOTLAND: Government.) Most of the text treats of departments which deal with the whole of the United Kingdom or with England and Wales as one unit. The first section, while covering financial administration, has pride of place because it includes the treasury, whose position in the central administration is unique and whose influence extends far beyond normal financial boundaries.

The Treasury and Associated Departments.— The treasury began in the 12th century as one part of the financial machinery of the kingdom which was concerned exclusively with the receipt and issue of money. At its head was the lord high treasurer, but his office was put "in commission" on several occasions in the late 17th century, and permanently in 1714. The lords commissioners of the treasury are the formal heads of the department, but the first lord is now always prime minister, the junior lords are government whips in the house of commons, and the effective ministerial chief is the second lord or chancellor of the exchequer, who first appeared on the treasury scene in the reign of Henry III.

The modern treasury is the nearest equivalent in Britain to a ministry of finance and economic affairs, but it does both more and less than the ministry of finance in other countries. The treasury does not collect revenue: this is done mainly by two large departments also answerable to the chancellor of the exchequer—the board of inland revenue and the board of customs and excise. Moreover, much specialized financial work is carried on by such minor departments as the national debt commission, the paymaster general's office, the royal mint and the public works loan board, all ultimately responsible to the chancellor of the exchequer. The treasury itself is a relatively small department, concerned primarily with the big aspects of fiscal policy, domestic and external, including the preparation of the annual budget. Between 1947 and 1953, it also became, and continues to be, the departmental home of a central staff of economists and planning officers whose tasks are to co-ordinate the economic policies of other departments and to advise the chancellor of the exchequer on the making of national economic policy.

But the function which gives the treasury its peculiar prestige in British administration is its responsibility for controlling departmental expenditure—a responsibility always latent in the department though forced into great prominence by parliamentary pressure for economy in the mid-19th century. This control gives the treasury far-reaching powers over the structure, the pay and the conditions of work of the civil service. It also extends its influence into the sphere of organization and methods, and into the general arrangement of the whole central administration. The control is not simply a straightforward exercise of crude authority. The treasury does not have officers attached to other departments to watch over their spending, nor is it concerned with the audit of departmental accounts. Control is achieved rather through continuous and delicate negotiations between the treasury and departments before the former gives its approval for proposed expenditure by the latter. In the last resort, treasury control depends for its effectiveness on the strength of the chancellor of the exchequer in the cabinet, but as the chancellor is always a very senior minister his political strength is usually considerable. In addition, the connection of the prime minister with the department (even if largely nominal), the high calibre of the treasury staff, the conventional high status of the department and the well-understood "rules of the game" in Whitehall combine to make the treasury, though not the master, at least more than the equal of the other departments.

The permanent headship of the treasury has been formally recognized as the most important post in the home civil service since 1920. In the 20th century, it has on a few occasions been shared by two or three men, and since 1956 it has been held jointly. One permanent secretary holds the title of head of the home civil service: he is at the same time secretary of the cabinet and thus presides over the cabinet office, a nonpolicy-making secretariat whose origins go back to the secretariat of the committee of imperial defense set up in 1904, and which took its present form in Dec. 1916. This secretary, in his threefold capacity, advises the prime minister and the chancellor of the exchequer on all matters of personnel and organization; his colleague answers to the chancellor of the exchequer for the fiscal and economic side of the treasury's work.

Justice and Public Order.—One of the most distinctive characteristics of British government, which marks it off from the other countries of western Europe, is the relatively low degree of central executive control over local administration, particularly in the context of police power. There are over 150 police forces, and all save the metropolitan police, whose area covers Greater London, are under local control. Nor are there any "regional" officers equivalent to the French prefect whose primary loyalty is to, and whose supervisory powers over local units are wielded primarily in the interests of, the central government. In British central administration the extent of local autonomy is also reflected in the lack of any departments which a continental European would readily recognize as ministries of the interior and of justice. Central powers relating to matters of justice and internal order are exercised in England and Wales by the home office and the lord chancellor's department. Neither is charged, however, with any general supervision over the local government system; insofar as there is such supervision it is undertaken principally by the ministry of housing and local government, a department mainly interested in social service matters.

The home office is the main department of the secretary of state for the home department (or home secretary) and took its present basic form in 1782. It was throughout most of the 19th century the natural choice for any new functions needing domestic administration, but as this sphere of government grew, various blocks of work were removed and became the nucleus of the business of new departments. The practice of turning first to the home office has remained, however, with the result that in addition to its major continuing functions, the department is responsible for exercising a miscellaneous group of powers to which no other department has a better claim. Its major continuing task is helping to ensure the maintenance of public order—a term which covers inspecting and giving advice to local police forces, the organization of the lower criminal courts, a general interest in the working of the criminal law and the promotion of necessary amendments, and the duty of advising the home secretary on the exercise of the prerogative of mercy. It also deals with such matters as immigration and naturalization: civil defense, aliens, certain safety regulations, election administration, control of dangerous drugs, inspection of local fire services, liquor licensing, etc. Prison administration is the responsibility of a separate prison commission; the metropolitan police is headed by a commissioner. Both he and the prison commissioners are answerable to the home secretary.

In England and Wales, the organization of the lower civil courts and all the superior courts, the appointment of minor judicial officers and the duty of advising the crown on the appointment of judges of the supreme court are the principal administrative functions of the lord chancellor, whose small department has grown from the dimensions of a mere private office in the course of the 20th century. The lord chancellor is also answerable to parliament for the work of the public trustee, the land registry and the public record office. Responsibility for the conduct of the most important crown prosecutions and for all litigation to which government is a party rests in England and Wales with the attorney general and solicitor general, who are served by a small professional staff comprising the law officers' department. The attorney general also supervises the work of the director of public prosecutions.

External Affairs.—The earliest secretaries of state were primarily occupied with diplomatic duties. and from 1640 divided their interests geographically, one secretary taking the countries of northern Europe as his sphere of influence, the other dealing with southern Europe and with the relatively little domestic administrative business which came the way of the secretaries. In the 17th and 18th centuries. Scottish and colonial business was added and a third secretary of state held office from 1707 to 1725. from 1741 to 1745, and between 1768 and 1782. In the latter year, the geographical division of interest was changed: the northern secretary became in effect the foreign secretary, and the southern secretary became responsible for home and colonial affairs. In 1801, a third secretary of state was appointed. this time for war and colonies, and in 1854 these two subjects each became the responsibility of a separate secretary. Meanwhile, since 1786, the British government had assumed certain responsibility for India, where the East India company still held sway, and had appointed a board of commissioners for the affairs of India. Full governmental control followed in 1858, under a new secretary of state for India. For the next 70 years, there were three "external" departments—the foreign, colonial and India offices. After World War I, as a result of the development of self-government in some of the larger colonies—called dominions after 1907—the dominions branch of the colonial office was made into a separate dominions office in 1925, and a new office of secretary of state for dominion affairs was created. In 1937, a Burma office was established, though it and the India office remained the responsibility of a single minister. Ten years later, the dominions office was renamed the commonwealth relations office. and its work steadily extended as relations with formerly dependent territories passed either to it or to the foreign office. The India and Burma offices disappeared in 1947–48.

The foreign office conducts relations with all independent noncommonwealth states except the Republic of Ireland, and with the United Nations It is unique among government departments in that it is staffed by members of a foreign service whose posts are interchangeable uith posts at missions overseas. The commonwealth relations and colonial offices are staffed by members of the home civil service. who are liable to be posted overseas. The personnel of the commonwealth relations office and of the British high commissioners' offices in commonwealth countries is, however, practically a separate service whose members are moved about as frequently as their counterparts in the foreign service. The commonuealth relations office is responsible for relations with all the self-governing nations of the commonwealth. with the sultanate of the Maldive Islands and with the Republic of Ireland; it is also responsible for the administration of three territories within or adjacent to the borders of the Union of South Africa—Basutoland Bechuanaland and Swaziland. The colonial office is concerned with direct administration and with the constitutional, economic and social development of the remaining dependent British territories. *See* also FOREIGN SERVICE.

Defense.—The evolution of two departments to deal comprehensively with the administration and control of the navy and army was slow and complicated. The admiralty and war office are, in short, the results of bringing together over a long period of time a large assortment of naval and military administrative authorities, and the air ministry, established in 1918 by removing the relevant sections of the two older departments and merging them, took the same constitutional form, which reflects a compromise between the special military need for operational flexibility and the insistence of parliament on ultimate civil control. Each department is headed by a board or council comprising the highest service officers together with the minister as chairman, a junior minister and the secretary, who is a civil servant. In the event of disagreement, the minister's will ultimately prevails, but the strong professional body of advisers and the special character of the function of defense means that the administration of the armed forces is more a matter for genuine collegiate authority (this is particularly so in naval matters) than any other branch of central administration.

The concept of a single, interservice strategy, of co-ordinated naval and military planning, was first given institutional recognition in the creation of the committee of imperial defense and its secretariat in 1902–04. The value of this device was demonstrated by its being the basis in World Wars I and II of the war cabinet organization, and in 1946 the military secretariat was adapted and extended to form a ministry of defense. The minister of defense sits in the cabinet and his powers in general defense matters have been steadily increased. In 1958 a defense board on the lines of the board of admiralty and the army and air councils was appointed with the minister of defense as chairman. The three service departments have retained a direct responsibility for the detailed administration of the navy. army and air force, but their ministers have not sat in the cabinet since 1946.

A fifth unit makes up the set of modern defense departments. This is the ministry of supply, whose most ancient predecessor was the board of ordnance set up in the 15th century and abolished in 1855 during the Crimean War, when the need to consolidate administrative authority in the war office was the prevailing view. In World War I, the task of supplying the army was entrusted to a ministry of munitions which was disbanded in 1921. The ministry of supply was established in 1939, and in 1946 took over the functions of a wartime ministry of aircraft production. For some years during and after World War II, the ministry of supply had, as well as its military duties, wide civil responsibilities, especially in connection with the control of raw materials for industry, and under the Labour government of 1945–51 was charged with the general supervision of the iron and steel and heavy engineering industries. After 1951, however, the department was relieved of much of its nonmilitary work, and concentrated on supplying the army and air force with most of their stores. It has relatively little to do for the navy; the admiralty remains both an operational and a supply department.

Trade, Industry, Agriculture, Communications.—One of the features of contemporary British administration is the existence of recognized channels of contact between the state and every trade and industry. through uhich there is a two-way traffic—various degrees of control, advice and assistance passing down from the government, and information and requests for help and co-operation passing upward from producers and traders. The responsibility for dealing with these economic units or groups is widely distributed among the major departments. Some trades and industries have special links with departments whose primary administrative interests are not economic—for example, the shipbuilding industry turns to the admiralty, the manufacturers of drugs and medical appliances look to the ministry of health, and so on. But there are departments whose whole concern is with either one or more groups of producers and traders, or with a range of administrative matters of general concern to the commercial world. In addition, there is the post office, which is sometimes regarded as a revenue department but deserves to be treated as an industry in itself.

The post office is, in fact, the oldest of these departments. A master of the posts was appointed about 1512, and a general post office was established by Cromwell in 1657. It has remained a self-contained unit whose enormous growth has encompassed not merely the postal service but also a near monopoly of telecommunications; it is, in addition, a savings bank and it provides a ubiquitous "counter" service which is used extensively by various other departments on an agency basis. (*See* also POSTAL SERVICES.)

The board of trade has been the main progenitor of departments dealing with economic matters. As a committee of the privy council, the board has had an almost continuous existence since 1621, but its present constitution dates from 1786, and its formal duties laid down in an order-in-council of that year are "the consideration of all matters relating to trade and foreign plantations." Until the middle of the 19th century, the board's role was mainly consultative and advisory. but thereafter it became. under the unequivocal leadership of its president, a powerful executive department exercising regulatory powers over commercial practice, over shipping and railways! over patents, over fisheries, etc., while also developing further as the central department concerned with domestic industry and external trade.

The range of the board of trade's functions was greatest in 1914, but as a result of two world wars and a further expansion of governmental activity the board's wide jurisdiction was later divided among several departments. The board itself now plays a triple part: As the senior trade and industry department it has a general advisory, stimulative and consultative role in relation to the whole world of manufacture and commerce; it is a regulatory department with many routine functions concerning companies, bankruptcy. patents, etc.; and it is the department which all trades and industries other than those allotted to other departments consider to be "their" channel of communication with the central government. But the board's previous responsibilities relating to employment matters, to transport and to public utilities are now exercised in an extended form by three additional departments. The ministry of labour and national service, first detached from the board of trade in 1917, offers a wide range of services to employers and employees, mainly through a national network of employment exchanges. The ministry of transport and civil aviation, set up in a more limited form in 1919, has within its jurisdiction all the mediums of transportation. The ministry of fuel and power, dating from 1942 and renamed the ministry of power in 1957, is concerned with the development and regulation of power resources. The last two ministries are the central departments most in touch with the nationalized transport and power industries.

Government did not become administratively interested in agriculture until 1883, when a privy council committee was set up which gave place six years later to a statutory board of agriculture with its own president. It had very limited functions and in 1903 was strengthened by acquiring responsibility for fisheries from the board of trade, thereupon taking the title of board of agriculture and fisheries. After 1912, it was only concerned with agriculture in England and Wales, and it was never concerned with fisheries in Scotland. In 1919, the board became a ministry. During World Wars I and II, the department had no part in the administration of controls on the distribution of food, which was handled on both occasions by a separate ministry of food. After 1945, the interest of government in agriculture was sustained at almost its wartime intensity, and the greatly expanded ministry of agriculture and fisheries continued to administer an enormous range of subsidies, technical advisory services and a variety of controls. In 1955, when the second ministry of food was abolished, most of its remaining functions were handed over to the ministry of agriculture and fisheries which has since been known as the ministry of agriculture. fisheries and food. The department has within its purview domestic food production and marketing in England and Wales, all external procurement and the internal distribution of foodstuffs.

Social Services.—It is now regarded as the duty of the state to ensure that the welfare of its citizens is enhanced by the provision of personal medical attention, education, housing, environmental health services. insurance and assistance to soften the economic effects of unemployment, sickness, old age, widowhood, etc.

Governmental concern for education began in the 1830s with a modest grant of public money for schools, and in 1839 a committee of the privy council was set up to take charge of the distribution of subsequent grants. A department appeared under the committee in 1856, and in 1899 both gave place to a board of education with its own president. In 1944, the board became the present ministry of education, and the central supervision of the service (the whole of the detailed administration being handled by local education authorities) is compact and self-contained.

The other social services have three main roots—one the ancient concern for the state of the poor. with a starting point so far as government is involved in the Poor Law act of 1601; the second a by-product of industrialization—the mid-19th century movement to improve the health of towns; and the third the adoption in 1911 of the insurance principle as the basis of national schemes of social security. Between 1830 and 1930, the adaptation of the poor law and the various manifestations of interest in public health brought about the evolution of two new administrative phenomena—a national structure of "all-purpose" elected local councils, and central departments whose main work was to co-operate with and in some respects to supervise those councils. In the period between World Wars I and II, the principal central department in this context was the ministry of health. which was set up in 1919 to replace the local government board of 1871, whose antecedents in turn go back to the poor law commission of 1834 The ministry of health was responsible not only for the central supervision of poor law work and public health services, and for the general constitutional and financial aspects of the local government system, but was also involved in the supervision of most of the growing contributory insurance schemes. Unemployment insurance, however, was administered first through the board of trade and then through the ministry of labour. Mass unemployment in the interwar years disorganized the scheme so badly that a special body had to be formed in 1934—the unemployment assistance board—to relieve the strain on both the unemployment insurance scheme and on the local authorities who were providing public assistance.

The acceptance of the basic proposals of Sir William (later Lord) Beveridge's *Report on Social Insurance and Allied Services* during World War II made it inevitable that the central administrative organization of the relevant social services, which had grown up piecemeal, should be much extended but at the same time be concentrated in fewer departments. In 1944, a ministry of national insurance was established and in 1953 it was combined with the ministry of pensions—a department which dated from 1916 and had been charged with the care of war pensioners—to form the present ministry of pensions and national insurance. It deals with the whole of the schemes of national insurance, industrial injuries insurance, war pensions and family allowances; it is, in fact, a "cash payments" department with a national jurisdiction and no connection at all with the work of local authorities.

Betueen 1943 and 1951 there was a separate ministry of town and country planning which relieved the ministry of health of part of its general responsibility for environmental services. During that period, the national health service began to operate (1948), and at the same time the old unemployment assistance board, which had been renamed the assistance board in 1940, became the national assistance board and was made responsible for all necessary residual financial assistance, thus "nationalizing" public assistance and freeing the local authorities and the ministry of health of all their old poor law functions. Even with these changes and with the loss of insurance work, the burden on the ministry of health became very great, and in 1951 the department was divided. The older sections, which dealt with general local government matters and with environmental services such as housing, water supply and sewerage, were combined with the ministry of town and country planning to form what is now the ministry of housing and local government—the direct descendant of the local government board of 1871–1919. The central administration of the national health service was left to the ministry of health. *See* also SOCIAL SECURITY.

Common Services.—There is a very considerable amount of work done by departments for each other on an agency basis, and there are also a number of departments whose main purpose is to provide services common to all or a large number of departments. The largest of these is the ministry of works, the modern counterpart of the surveyor general of works, whose immediate predecessor was the office of works set up in roughly its present form in

1851 and converted into a ministry in 1940. Its main task is to provide accommodation, furnishings, heating and cleaning, etc., for departments. but in addition it has certain responsibilities for parks and palaces, museums and ancient monuments, and it is the government's channel of communication with the building industry. No other common service department is presided over by a minister personally; her majesty's stationery office, which provides stationery and printing services and is concerned with the supply of mechanical office equipment, is ultimately responsible to the chancellor of the exchequer. So, too, is the treasury solicitor, whose department handles the legal work of various departments which do not wish or whose functions do not demand their own legal officers, and the central office of information which provides publicity material on request from other departments. Among minor departments which are largely if not always primarily concerned to provide common services are the government chemist, the ordnance survey, the government actuary, the central statistical office and the general register office.

Scientific Research. — Large-scale participation in scientific research by the government only began in the 20th century. Research for defense purposes is carried on mainly by the service departments and the ministry of supply. Research for civil purposes by private organizations and universities is assisted by government grants, but in addition there are several governmental research establishments. The largest is the department of scientific and industrial research, first set up in 1916. It is unequivocally a government department, and its operating units are some 14 laboratories or groups of laboratories. Three other research organizations — the medical research council, the agricultural research council and the nature conservancy — are not, in the normal sense. government departments, as they are financed by grants-in-aid and only in a few instances do their staffs include civil servants. They and the department of scientific and industrial research are linked, however, by their constitutional form: all four answer in theory to committees of the privy council, which means in practice to the lord president of the council, a minister whose other light and nonscientific duties are carried on by the privy council office.

Ministerial supervision of scientific work is much less stringent, however, than it is in the case of orthodox departments — a practice which reflects the conviction that the organization of scientific research must be flexible and that as much autonomy as possible should be guaranteed to the scientists.

Scotland and Wales. — Since the appointment of a secretary for Scotland in 1885, there has been a steady process of domestic devolution from Whitehall to Edinburgh. Scotland's minister—now a secretary of state — exercises his powers through four departments — home, education, agriculture and health. Much of the legal administration in Scotland is carried on through the lord advocate's department. Many London departments have jurisdiction in Scotland, however, and all "English" domestic departments operate in Wales. Several of those departments have established decentralized organizations for dealing with Wales, and since 1951 one of the departmental ministers in the cabinet has been charged specifically with a general responsibility for Welsh affairs.

(F. M. G. W.)

GOVERNOR, a common political title for the official head of a dependent or component unit in a larger constitutional structure. Governorships of one type have existed in the British, French, Dutch and other empires; those of another type exist in the states of the Cnited States, and in Brazil and Mexico. (For the first type, see Governor-General.)

In the state governments of the United States, the governorship derived from British origins but traced a separate course. The earliest state constitutions, through reaction against nonresponsible colonial executives, subordinated the executive branch to the legislative. In 11 states governors were elected by the legislatures, generally for short terms. Subsequent discontent with overpowerful legislatures. and the analogy of the strong presidency, created a counteraction to emancipate the governor from legislative dominance. In the mid-19th century, further constitutional changes in many states, conforming to the doctrines of Jacksonian democracy, necessitated a long ballot to fill the principal executive positions, the governorship included, by popular election. The governor. co-ordinate with the legislature. consequently lacked adequate authority over the officials elected with him. By 1900, as state governments assumed new functions, legislatures also proceeded to multiply the number of separate administrative agencies. These were largely exempt from control by the governor, because they were too numerous to supervise and many were headed by virtually independent boards.

In a state whose executive branch was structurally unfit for its growing burdens, leadership sometimes gravitated from constitutionally elected officials to a party "boss" beyond the people's reach.

A reform movement, gathering momentum before World War I, proposed to democratize the government by simplifying its machinery and throwing squarely upon a strengthened executive branch the responsibility of public service. Following World War II, renewed interest in the improvement of state government resulted in further recommendations and action.

Among specific remedies suggested were the short ballot, reducing the number of elective officials; reorganization of administrative agencies by a reduction in their number and consolidation of their functions; the executive budget, prepared and proposed by the governor; and centralization of many administrative and finance management functions in departments of administration or finance.

Governors increasingly emerged as leading figures in most state governments. By the late 1950s, they served for terms of four years in 34 states and of two years in the remaining states. More truly than in the 19th century, they functioned as chief executives. wielding effective authority over most administrative agencies and shouldering political responsibility.

Simultaneously, governors with public appeal actively initiated legislative policy. When occupying the position of party leaders, they placed between the executive and legislative branches a political link belying the dogma of the separation of powers.

Of the nine United States presidents between 1900 and 1950, four were former state governors.

GOVERNOR, an automatic device designed to regulate the speed of a steam or gasoline engine or other prime mover. In most governors this speed is measured 'with the aid of centrifugal flyneights. The flyweights are driven at a speed proportional to that of the prime mover. The centrifugal force of the flyweights is

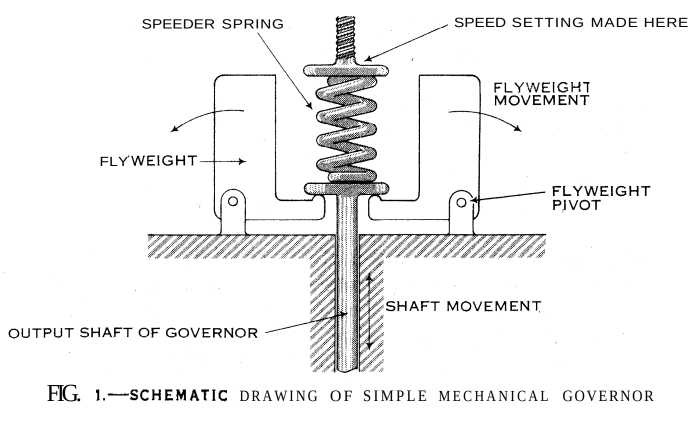

FIG. 1.—SCHEMATIC DRAWING OF SIMPLE MECHANICAL GOVERNOR

balanced; completely or in part, by the force of compression of a speeder spring. In the simplest governor the motion of the flyweights is mechanically transmitted through the output shaft of the governor to the throttle or some equivalent device that meters the rate at which energy is fed to the prime mover (fig. 1). The steady state speed of the prime mover is set by the position of the end of the speeder spring opposite to that at which the flyweight force is applied.

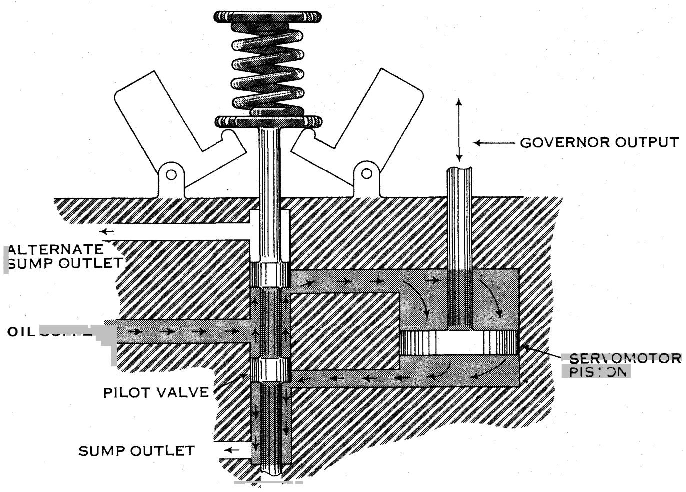

FIG. 2—SCHEMATIC DRAWING OF SIMPLE ISOCHRONOUS HYDRAULIC GOVERNOR

A governor is designed to keep the prime m'over speed at its assigned value regardless of variations in the load and changes in ambient conditions.

Where precise control is required, or an appreciable amount of power must be drawn from the governor to move the energy metering mechanism, a hydraulic governor is generally employed. A hydraulic governor (fig. 2) has as one component a mechanical governor. called in this instance a ballhead, similar to that shown in fig. 1. The output of the ballhead is amplified by a pilot valve and servomotor. The servomotor is usually a cylinder containing a piston and the output shaft of the governor is connected to the piston.

The valve controls the flow of oil to the two sides of the piston in the cylinder. In the case of a gasoline engine, or a dual fuel oil and gas engine operating on gas, the governor output shaft is often attached to the throttle.

An aircraft propeller governor controls the speed of the engine driving the propeller by varying the pitch of the propeller and thus changing the engine load. A diesel engine is controlled by connecting the governor output shaft to the rack which meters the rate at which fuel is injected.

On a steam turbine the governor positions the steam valve or valves which control the steam flow to the turbine. Similarly, a governor for a hydraulic reaction turbine of the Francis type positions the gates which vary the rate of water flow to the turbine. For a Kaplan turbine the governor also varies the pitch of the propeller blades through an extra servomotor. Governors for Pelton impulse turbines vary the areas of the jets of water striking the turbine buckets. The areas are varied rapidly by cutting into the jets with blades, and at the same time varied slowly by positioning needles in valves from which the jets emerge.

The output shaft of a gas turbine governor is connected to the fuel valve of the turbine. Provision is normally made to bring a combustion chamber temperature measurement, obtained directly or through the use of a computer, to the governor so as to limit the maximum and minimum fuel rates and thus keep this temperature within design limits. Computation of the combustion chamber temperature is necessary for fast limiting, and is based on the laws of thermodynamics relating this temperature to other physical variables.

Governors on oil and gas pipeline turbine-compressor units actually control pressure in the line. With the aid of pneumatic components the governor speed setting is adjusted from a measurement of this pressure.

The speed of the compressor is increased or decreased so as to keep the pressure constant.

Hydraulic positive displacement pump-motor units are used to provide infinitely variable speed ratio drives. The governor is driven by the motor. while the governor output is connected to a "wobble plate" which adjusts the rate of fluid flow out of the pump to the motor.

The speed of the output shaft of a hydraulic torque converter is controlled by a double governor, one driven by the engine and the other by the convertor, with the governors in a series combination rather than parallel.

The simplest mechanical governor is of the proportional type. 4 governor is said to be proportional if its output mechanism takes a position in proportion to the prime mover speed. For a speed droop governor, or governor on droop. on an isolated prime mover, the steady state prime mover speed is a function of the load, decreasing when the load is increased, and increasing when the load is decreased.

FIG. 3.—CUTAWAY VIEW OF ISOCHRONOUS DASH-

The simplest type of mechanical governor is both a proportional and speed droop governor.

The simplest type of hydraulic governor is of the constant-speed isochronous type. Such a governor will continue to make a correction as long as the prime mover speed deviates from the set value. The standard aircraft propeller governor is of this type.

The simple isochronous governor is an integral or reset governor. in that the output is a mathematical integral of the input. Since such a governor will often indulge in "hunting," or self-oscillation about the preset value of speed, a governor with a dashpot (fig. 3) is often employed to yield both proportional and integral control.

The dashpot is a differentiating device whose output is the rate of change of the input.

The input to the dashpot is the servomotor piston position, while the output of the dashpot is a force applied to the ballhead of the governor in parallel with the speeder spring force. The addition of the dashpot to the governor makes the governor sensitive to engine acceleration as well as speed.

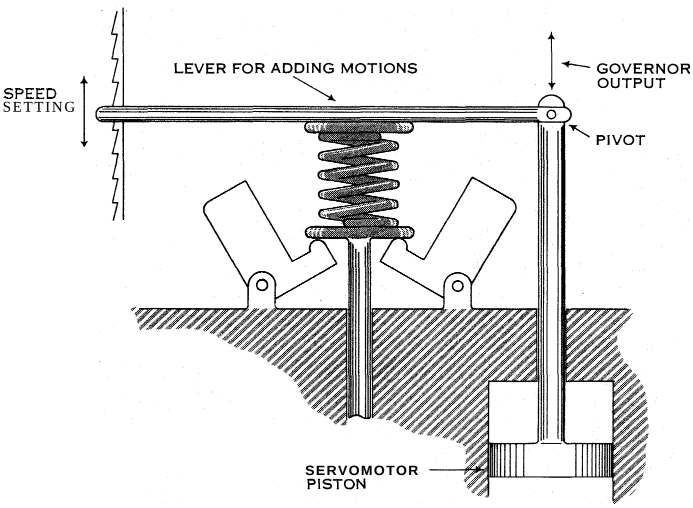

FIG. 4.— SPEED DROOP GOVERNOR

The amount of acceleration sensitivity increases with the time lag in the dashpot.

An inertial element in parallel with the flyweights is sometimes employed in place of the dashpot.

Any governor may be made into a speed droop governor (fig. 4) by the proper use of feedback from the output of the governor to the ballhead.

When two or more prime movers are operated in parallel, as when they drive alternators connected to the same electrical load, only one of the governors can be isochronous. The others must be on speed droop. Through adjustment of the amounts of feedback in the governors arbitrary division of load between the units can be achieved.

The load on a prime mover may be measured directly to produce a load control governor whose output depends on this load as well as the speed of the prime mover.

The speed of a prime mover is sometimes measured by a pump instead of a ballhead, using the output pressure of the pump as a measure of speed.

Electrical governors are employed in various installations where the prime mover drives an electrical generator whose output is an indication of prime mover speed. (R. O.)

GOVERNOR-GENERAL. The term governor-general indicates primarily that the officer holding the title is set over a number of officers holding that of governor or even lieutenant-governor.

An alternative term sometimes used was governor-in-chief, which in British usage still survives in the formal title of the governor of Jamaica which is captain-general and governor-in-chief. In this sense governor-general has occurred in the usage of most colonial powers.

In British constitutional practice the powers of a governor-general, like those of a governor (*q.v.*), must be derived either from the commission which he has received from the crown, or from some other statute either of imperial or local legislation, but in the case of dependent territories the title governor-general is now usually restricted to federations, such as that of The West Indies.

During the evolution of the British empire into the Commonwealth of Nations, the status and function of the office of governor-general have undergone changes corresponding to the progress of territories toward self-government and independence. These changes have been of the same character as those in the status and functions of governor from the time of the earliest colonies to the 20th century. in which local legislatures have developed from official and nominated bodies into elected bodies with, eventually, full autonomy.

By 1890 it had become the practice that the government of a self-governing colony should be asked to approve the selection of the governor made by the British government, and when the Irish Free State was created in 1922, a further advance was made. for the governor-general was chosen by the Free State government and approved only by the crown.

Prior to this the representative of the crown in Ireland held the rank of viceroy, but the Government of Ireland act of 1920 constituted the office of governor-general for the Irish Free State and that of governor for Northern Ireland, the former being appropriate for the Irish Free State since it had dominion status.

In 1926, in the course of developing events in Canada, it was decided that the functions of the governor-general should be limited to representation of the crown, unless any dominion preferred that he should also perform any functions on behalf of the British government.

Following the recommendations of the Imperial conference of 1926, the Statute of Westminster was enacted in 1931 to give legal effect to a constitutional relationship which already existed, but New Zealand did not fully adopt it until 1947.

In 1930 the Imperial conference laid down that appointment of a governor-general should rest on the authority of the commonwealth nation concerned. It concluded that the following statements flowed naturally from the governor-general's new position. The parties interested in the appointment are the croun and the dominion concerned; the constitutional practice that the crown acts on the advice of responsible ministers applies; the ministers who tender advice and are responsible for it are those in the dominion concerned; they tender formal advice after informal consultation with the crown; the channel of communications between the crown and any dominion government solely concerns the crown and such government.

In 1932 the Irish Free State asserted successfully its right to secure removal by the king of a governor-general who was *persona non grata:* this revealed the difference between the position of the governor-general and that of the crown, for it showed that the former held office only at the pleasure of the government of the day. In the exceptional constitutional position of the Federation of Rhodesia and Nyasaland the position of governor-general in all matters in which he has no discretion under the constitution is similar to that in an independent commonwealth country. In cases in which the constitution authorizes him to use his discretion in exercising any power conferred on him, he may do so either contrary to ministerial advice or without it, though in practice he ought to act in accordance with such advice unless either the advice conflicts with instructions given by the crown or he considers he ought to reject it even at the risk of causing the ministers to resign.

In India, the evolution of the office of governor-general was slightly different. In accordance with the provisions of the Regulating act of 1773 Warren Hastings became the first governor-general. When the rule of the East India company came to an end and the Indian empire was created, Lord Canning, the first governor-general of the imperial government, received also the title of viceroy. The holder of the office was generally known by that title until the Indian Independence act of 1947 which constituted the offices of governor-general for India and for Pakistan. The filling of these posts necessitated a departure from normal practice because there could be no ministers formally to advise the crown until a governor-general had been appointed and ministers had taken office. In these circumstances the leaders of the Congress party and the Moslem league were consulted and their advice was formally tendered to the crown by the U.K. government. Much the same happened in the case of Ceylon in 1948 and Ghana in 1957. On commonwealth nations' becoming republics recognizing the crown as head of the commonwealth the office of governor-general disappears and a president takes his place. In the case of Malaya, which became an independent commonwealth nation in 1957, a new form of limited monarchy was devised.

(W. H. Is.)

GOW, NIEL (1727–1807), Scottish musician of humble parentage, famous as a violinist and player of reels, but more so for the part he played in preserving the old melodies of Scotland. His compositions, and those of his four sons, Nathaniel, the most famous (1763–1831), William (1751–1791), Andrew (1760–1803) and John (1764–1826), formed the "Gow Collection," comprising various volumes edited by Niel and his sons. a valuable repository of Scottish traditional airs.

The "Gow Collection" includes *A Collection of Strathspey Reels* (1784); *Second, Third, Fourth* and *Fifth Collections* (1788, 1792, 1800. 1809, 1822).

GOWER, JOHN (d. 1408), English poet, died at an advanced age in 1408, so that he may be presumed to have been born about 1330. He belonged to a good Kentish family and owned the manors of Feltwell in Suffolk and Moulton in Norfolk. In a document of 1382 he is called an "Esquier de Kent," and he was certainly not in holy orders. That he was acquainted with Chaucer we know, first because Chaucer in leaving England for Italy in 1378 appointed Gower and another to represent him in his absence, secondly because Chaucer addressed his *Troilus and Criseide* to Gower and Strode (whom he addresses as "moral Gower" and "philosophical Strode") for criticism and correction and thirdly because of the lines in the first edition of Gower's *Confessio amantis,* "And gret wel Chaucer whan ye mete," etc. There is no sufficient ground for the suggestion, based partly on the subsequent omission of these lines and partly on the humorous reference of Chaucer to Gower's *Confessio amantis* in the introduction to the *Man* of *Law's Tale,* that the friendship was broken by a quarrel. From his Latin poem *Vox clamantis* we know that he was deeply and painfully interested in the peasants' rising of 1381; and by the alterations which the author made in successive revisions of this work we can trace a gradually increasing sense of disappointment in the youthful king, whom he at first acquits of all responsibility for the state of the kingdom on account of his tender age. That he became personally known to the king we learn from his own statement in the first edition of the *Confessio amantis,* where he says that he met the king upon the river, was invited to enter the royal barge, and in the conversation which followed received the suggestion which led him to write his principal English poem. At the same time we know, especially from the later revisions of the *Confessio amantis,* that he was an admirer of the king's brilliant cousin, Henry of Lancaster, afterwards Henry IV., whom he came eventually to regard as a possible saviour of society from the misgovernment of Richard II.

The first edition of the *Confessio amantis* is dated 1390, and this contains, at least in some copies, a secondary dedication to the then earl of Derby. The later form, in which Henry became the sole object of the dedication, is of the year 1393. Gower's political opinions are further embodied in the *Cronica tripartita.*

In 1398 he was married to Agnes Groundolf, and from the special licence granted by the bishop of Winchester for the celebration of this marriage in John Gower's private oratory we gather that he was then living in lodgings assigned to him within the priory of St. Mary Overy, and perhaps also that he was too infirm to be married in the parish church. It is probable that this was not his first marriage, for there are indications in his early French poem that he had a wife at the time when that was written. His will is dated Aug. 15, 1408, and his death took place very soon after this. He had been blind for some years before his death. A magnificent tomb with a recumbent effigy was erected over his grave in the chapel of St. John the Baptist within the church of the priory, now St. Saviour's, Southwark.

The effigy on Gower's tomb rests its head upon a pile of three folio volumes entitled *Speculum meditantis, Vox clamantis* and *Confessio amantis.* These are his three principal works. The first of these was long supposed to have perished, but a copy of it was discovered in the year 1895 under the title *Mirour de l'omme.* It is a French poem of about 30,000 lines in 12-line stanzas, and under the form of an allegory of the human soul describes the seven deadly sins and their opposing virtues.

Gower's next work was the *Vox clamantis* in Latin elegiac verse, in which the author takes occasion from the peasants' insurrection of 1381 to deal again with the faults of the various classes of society. In the earlier portion the insurrection itself is described in a rather vivid manner.

Gower's chief claim, however, to reputation as a poet rests upon his English work, the *Confessio amantis,* in which he displays in his native language a real gift as a story-teller. He is himself the lover of his poem, in spite of his advancing years, and he makes his confession to Genius, the priest of Venus, under the usual headings supplied by the seven deadly sins. These with their several branches are successively described, and the nature of them illustrated by tales drawn from very various sources and often extremely well told. The metre is the short couplet, and it is very smooth and regular. The great fault of the *Confessio amantis* is the extent of its digressions.

Gower also wrote in 1397 a short series of French ballades on the virtue of the married state (*Traitié pour essampler les amantz mariés*), and after the accession of Henry IV. he produced the *Cronica tripartita,* a partisan account in Latin leonine hexameters of the events of the last 12 years of the reign of Richard II. About the same time he addressed an English poem in seven-line stanzas to Henry IV. *(In Praise of Peace),* and dedicated to the king a series of French ballades *(Cinkante Balades),* graceful and even poetical in expression. Several occasional Latin pieces also belong to the later years of his life.

On the whole Gower must be admitted to have had considerable literary powers; and though not a man of genius, and by no means to be compared with Chaucer, yet he did good service in helping to establish the standard literary language, which at the end of the 14th century took the place of the Middle English dialects. The *Confessio amantis* was long regarded as a classic of the language, and Gower and Chaucer were often mentioned side by side as the fathers of English poetry.

A complete edition of Gower's works in four volumes, edited by G. C. Macaulay, was published in 1899–1902, the first volume containing the French works, the second and third the English, and the fourth the Latin, with a biography. Before this the *Confessio amantis* had been published in the following editions: Caxton (1483); Berthelette (1532 and 1554); Chalmers, *British Poets* (1810); Reinhold Pauli (1857); H. Morley (1889, incomplete). The two series of French ballades and the *Praise of Peace* were printed for the Roxburghe Club in 1818, and the *Vox clamantis* and *Cronica tripartita* were edited by H. O. Coxe for the Roxburghe Club in 1850. The *Cronica tripartita,* the *Praise of Peace* and some of the minor Latin poems were printed in Wright's *Political Poems* (Rolls series, 14) The *Praise of Peace* appeared in the early folio editions of Chaucer, and has been edited also by Dr. Skeat in his *Chaucerian and other Pieces.* Reference may be made to H. J. Todd, *Illustrations of the Lives and Writings of Gower and Chaucer* (1810); the article (by Sir H. Nicolas) in the *Retrospective Review* for 1828; F. J. Child, "Memoirs on the Language of Chaucer and Gower," in *Early English Pronunciation* (1869 etc.); H. Morley, *English Writers* (1887 etc.), vol. iv.; B. ten Brink, *History of Early English Literature* (Eng. trans., 1883, etc.), vol. ii.; and W. J. Courthope, *History of English Poetry* (1895), vol. i. (G. C. M.)

GOWER, a Welsh seigniory and district in the county of Glamorgan (*q.v.*), lying between the Tawe and Loughor rivers and between Brecknockshire or Breconshire and the sea, its length from the Breconshire border to Worms head being 28 mi.. and its breadth about 8 mi. It corresponds to the ancient commote of Gower (in Welsh, *Gwyr*) which in early Welsh times was grouped with two other commotes stretching westward to the Towy, and so formed part of the principality of Ystrad Tywi. What is meant by Gower in modern popular usage, however, is only the peninsular part or "English Gower," with its striking coast line. lying mainly to the south of a line drawn from Swansea to Loughor.

The numerous limestone caves of the coast are noted for their animal remains, and finds of Palaeolithic flints and a skeleton of Upper Palaeolithic date have been made (*see* W. J. Sollas, "Paviland Cave: an Aurignacian Station in Wales," *J. R. Anthrop. Inst.,* xliii, London, 1913). The bones, found in the Goat cave, Paviland, near Rhossili, by Dean W. Buckland, were known for a time as the "Red Lady of Paviland," but turned out to be those of a young man. Red ochre was sprinkled on them and there were remains of ornaments of ivory and sea shell.

The high ground of the centre of the peninsula has megaliths and tumuli. Mesolithic remains have been found. The south coast has evidences of a Bronze Age culture, while hilltop camps seem to have been occupied by different groups up to the time of the Viking raids. At Loughor was a Roman settlement. In the Arthurian romances Gower appears in the form of Goire, as the island home of the dead. It was also surmised by Sir John Rhys that Malory's *Brandegore* (*i.e.,* "Brân of Gower") represents the Celtic god of the other world (J. Rhys, *Studies in Arthurian Legend,* pp. 160, 329 *et seq.,* 1891). Traces of the more or less temporary Scandinavian occupation are found in such place names as Burry Holms, Worms head and Swansea.

About 1100 Gower was conquered by Henry de Newburgh, earl of Warwick, whose followers settled for the most part on the southern side of the peninsula. These invaders were probably reinforced later by Flemings from south Pembrokeshire. bloated mounds, which in some cases developed into castles, were built for the protection of the various manors. The castles included those of Swansea, Loughor and Oystermouth. These were repeatedly attacked and burned by the Welsh during the 12th and 13th centuries.

About 1189 the lordship passed from the Warwick family to the crown and then to the De Braoses, in whose family it remained practically continuously for over 120 years. In 1208 the Welsh and English inhabitants received each a charter from King John. Later the king's officers of the newly organized county of Carmarthen repeatedly claimed jurisdiction over Gower. De Braose resisted the claim and organized the English part of his lordship on the lines of a county palatine. Troubles befell the De Braose family and the region passed to John de Mowbray.

Gower frequently changed hands between the Mowbrays and the Beauchamps, representatives of the original owners (earls of Warwick). The 4th duke of Norfolk (the Mowbrays) exchanged it in 1489, for lands in England, with William Herbert, earl of Pembroke. It passed through Charles Somerset to the dukes of Beaufort. Gower was included in 1535 in Glamorgan.

The characteristically English part of Gower lies to the south and southwest of its central ridge of Cefn y Bryn. The present line of demarcation between English and Welsh is one drawn from Swansea in a west-northwest direction to Llanrhidian on the north coast. The boundary nearly coincides with the outcrop of the Coal Measures, the industrial population to the north being Welsh-speaking, the agriculturists to the south English.

GOWN, formerly the term for a loose outer garment worn by either sex but now generally for that worn by women. It is also the name for the distinctive robes worn by holders of particular offices or by members of particular professions or universities, etc. *(see* ROBES).

GOWRIE, JOHN RUTHVEN, THIRD EARL OF (*c.* 1577–1600), Scottish conspirator, was the second son of William, 4th Lord Ruthven and first earl of Gowrie (?1541–1584), by his wife Dorothea, daughter of Henry Stewart, second Lord Methven. The Ruthven family was of ancient Scottish descent; the earldom dated from 1581. The first earl of Gowrie and his father Patrick, third Lord Ruthven (c. 1520–1566), had both been concerned in the murder of Rizzio in 1566; and both took an active part on the side of the Kirk in the constant intrigues of the period. Gowrie had been custodian of Mary, queen of Scots, during her imprisonment in Loch Leven, and had also been the chief actor in the "raid of Ruthven" in 1582 when King James VI. was seized while a guest and kept prisoner. Though pardoned, he continued to plot, and was executed for high treason in 1584.

When, therefore, on the death of his elder brother the second earl in 1588 John Ruthven succeeded to the earldom, he inherited family traditions of treason and intrigue. He received an excellent education at the grammar school of Perth and at the University of Edinburgh, after which he joined with Atholl and Montrose in offering to serve Queen Elizabeth, and had thus already been engaged in conspiracy when, in 1594, he went to study at Padua. On his way home in 1599, moreover, it is probable that he communicated at Paris with the exiled Bothwell.

In 1600 the earl and his brother, Alexander Ruthven, were murdered at Gowrie house in mysterious circumstances. Three solutions of the mystery of this "Gowrie conspiracy" have been suggested: first, that Gowrie and his brother had plotted to murder or to kidnap King James at Gowrie house; second, that James visited Gowrie house with the intention of murdering the two Ruthvens; third, that the tragedy sprang from a brawl.

According to James the facts were as follows: on Aug. 5, 1600, James was asked while hunting near Falkland to go to Gowrie house to examine a prisoner with a quantity of foreign gold there. When he arrived with a small retinue, he was taken alone into a small turret by Alexander Ruthven. Here, instead of the prisoner with the foreign gold, he found an armed man. His retainers, who had been told that the king had left, were setting out to overtake him when they saw him struggling at a window, and heard his cry for help. They thereupon forced an entrance to the turret, and in the struggle Ruthven and Gowrie were killed.

The tragedy caused intense excitement throughout Scotland and the investigation of the circumstances was followed with much interest in England also. The preachers of the Kirk. whose influence in Scotland was too extensive for the king to neglect. were only with the greatest difficulty persuaded to accept James's account of the occurrence. Their belief was that the king had invented the story to cover his own design to extirpate the Ruthven family and James gave some colour to this belief by the severity with which he pursued the two younger, and unquestionably innocent, brothers of the earl.

GOWRIE, a belt of fertile alluvial land in Perthshire, Scot Occupying the northern shore of the Firth of Tay, the Carse of Gowrie extends east of Perth city to the confines of Dundee. It measures 15 mi. in length and is one of the richest tracts in Perthshire, being especially suitable for small fruit cultivation of which the strawberry is the most famous. The district is noteworthy for the number of its castles and mansions, among which may be mentioned Megginch castle near Errol, dating from 1575; Kinnaird castle, erected in the 12th to 15th centuries and restored in the 1850s; Rossie priory, the seat of Lord Kinnaird; and the 15th-century Huntly castle.

GOYA, a town and port of Corrientes province, Argentina, on the east bank of the Paraná river. 618 mi. N. of Buenos Aires and 147 mi. S. of the city of Corrientes. Goya is a distributing centre for agricultural products and timber on the Urquiza railway. It dates from 1807. Pop. (1956 est.) 25.208.

GOYATACAN, an independent linguistic stock of South American Indians, so called from the Goyatacas, one of its important tribes. The Goyatacas (so named from the Brazilian state of Goyaz, in which, however, few of these Indians appear to have lived) occupied a large part of the state of Minas Geraeas and the southern edge of the state of Bahia, in the highlands of eastern Brazil. In early times tribes of this stock probably occupied the Atlantic coast in this region, but at the time of arrival of the Portuguese, the coastal strip was in the hands of Tupian (*q.v.*) tribes. The bow and throwing-club were their chief weapons.

GOYA Y LUCIENTES, FRANCISCO JOSÉ DE (1746–1828), Spanish artist and engraver, who, trained in the foreign traditions fashionable in 18th-century Spain, became one of the most characteristically Spanish artists of all times and a foremost European painter and engraver of the 19th century. He was born on March 30, 1746, at Fuendetodos, near Saragossa, and died in Bordeaux, France, on April 16, 1828. His enormous and varied production of paintings, drawings and engravings, relating to nearly every aspect of contemporary life, reflects the period of political and social upheavals in which he lived.

Goya began his studies in Saragossa under José Luzán, a local artist trained in Naples, and was later a pupil in Madrid of the court painter Francisco Bayeu, whose sister he married in 1773. He went to Italy to continue his studies and was in Rome in 1771. In the same year he returned to Saragossa where he obtained his first important commission for frescoes in the cathedral, which he executed at intervals during the next ten years. These and other early religious paintings made in Saragossa are in the baroque-rococo style current in Spain and are influenced in particular by the great Venetian painter G. B. Tiepolo, who spent the last years of his life in Madrid (1762–70), where he was invited to paint ceilings in the royal palace.

Goya's career at court began in 1775, when he painted the first of a series of over 50 cartoons (mostly preserved in the Prado, Madrid) for the royal tapestry factory, Santa Barbara, on which he was engaged until 1792. These paintings of scenes of contemporary life, of aristocratic and popular pastimes. were begun under the direction of the German artist A. R. Mengs, the great exponent of neoclassicism who. after Tiepolo's death, had become undisputed art dictator at the Spanish court. In Goya's early cartoons the influence of Tiepolo's decorative style is modified by the teachings of Mengs, particularly his insistence on simplicity. The later cartoons reflect his growing independence of foreign traditions and the development of an individual style, which began to emerge through his study of the paintings of Velizquez in the royal collection, many of which he copied in etchings (c. 1778). Later in life he is said to have acknowledged three masters: Velázquez, Rembrandt and, above all, nature. Rembrandt's etchings were doubtless a source of inspiration for his later drawings and engravings. while the paintings of Velizquez directed him to the study of nature and taught him the language of realism.

In 1780 Goya was elected a member of the Royal Academy of San Fernando. Madrid. his admission piece being a "Crucifixion" (Prado), a conventional composition in the manner of Mengs but inspired by the naturalistic style of Velázquez' "Crucifixion." then in the royal palace. In 1785 he was appointed deputy director of painting at the academy and in the following year painter to the king. Charles III. To this decade belong his earliest known por-

"FAMILY OF CHARLES IV" BY FRANCISCO GOYA. IN MUSEO DEL PRADO. MADRID

traits, of court officials and members of the aristocracy, whom he represented in conventional 18th-century poses. The stiff elegance of his figures, in full-length portraits of society ladies as the "Marquesa de Pontejos" (National gallery, Washington), and the fluent painting of their elaborate costumes also relates them to Velázquez' court portraits; and his representation of "Charles III as Huntsman" (of which several versions exist) is based directly on Velázquez' royal huntsmen.

The death of Charles III in 1788, a few months before the outbreak of the French Revolution, brought to an end the period of comparative prosperity and enlightenment in which Goya reached maturity. The rule of reaction and political and social corruption that followed, under the weak and stupid Charles IV and his clever. unscrupulous queen Maria Luisa Teresa, ended with the Napoleonic invasion of Spain. It was under the patronage of the new king, who raised him at once to the rank of court painter, that Goya became the most successful and fashionable artist in Spain; he was made director of the academy in 1795 (but resigned two years later for reasons of health) and first court painter in 1799. Though he uelcomed official honours and worldly success uith undisguised enthusiasm, the record that he left of his patrons and of the society in which he lived is ruthlessly penetrating. After a serious illness in 1792, which left him permanently deaf, his art began to take on a new character which gave free expression to the observations of his searching eye and critical mind and to his newly developed faculty of imagination. During his long convalescence he painted a series of small compositions which he described in a letter to the director of the academy (1794) as enabling him "to make observations for which there is no opportunity in commissioned works, in which fantasy and invention have no scope." He referred to the subjects as "popular diversions" but those that survive (Academy of San Fernando, Madrid) include a "Madhouse," a "Procession of Flagellants," a "Tribunal of the Inquisition," these unconventional themes being painted in a bold, sketchy technique and strong colours with an effect of exaggerated realism that borders on caricature. For his more purposeful and serious satires, however, he now began to use the more intimate mediums of drawing and engraving. In the "Caprichos," a series of 80 etchings published in 1799, he attacked political, social and religious abuses, adopting the popular imagery of caricature, which he enriched with highly original qualities of invention. His masterly use of the recently developed technique of aquatint gives them astonishing dramatic vitality and makes them a major achievement in the history of etching (*q.v.*). Despite the veiled language of designs and captions and Goya's announcement that his themes were from the "extravagances and follies common to all society." they were probably recognized as references to well-known persons and were withdrawn from sale after a few days. However, a few months later Goya was made first court painter. Later he was apparently threatened by the Inquisition and in 1803 he presented the plates of the "Caprichos" to the king in return for a pension for his son.

While uncommissioned works gave full scope for "observations," "fantasy" and "invention," in his commissioned paintings Goya continued to use conventional formulas. His decoration of the church of San Antonio de la Florida, Madrid (1798), is still in the tradition of Tiepolo; but the bold, free execution and the expressive realism of these popular types used for religious and secular figures are unprecedented. In his numerous portraits of friends and officials a broader technique is combined with a new emphasis on characterization. The faces of his sitters reveal a lively discernment of personality which is sometimes appreciative, particularly in his portraits of women, as that of "Doña Isabel Cobos de Porcel" (National gallery, London), but is often far from flattering as in his royal portraits. In the group of "Charles IV and His Family" (1800, Prado), which recalls the composition of Velázquez' "Meninas," Goya. despite his position as court painter, has portrayed the ugliness and vulgarity of the principal figures so vividly as to produce the effect of caricature.

In 1808 Goya was at the height of his official career when Charles IV and his son Ferdinand were forced to abdicate in quick succession. Napoleon's armies entered Spain and his brother Joseph was placed on the throne. Goya retained his position as court painter to the usurper; but in the course of the war he portrayed Spanish as well as French generals and in 1812 he painted an equestrian portrait of the "Duke of Wellington" (Apsley house, London). It was, however, in a series of etchings, "Los Desastres de la Guerra" (first published 1863), for uhich he made drawings during the war, that he recorded his personal reactions to the invasion and to the horrors and disastrous consequences of the war. The violent and tragic events. which he doubtless witnessed, are represented not with documentary realism but in dramatic compositions—in line and aquatint—with brutal details which create a vivid effect of authenticity.

On the restoration of Ferdinand VII in 1814, after the expulsion of the invaders, Goya was pardoned for having served the French king and reinstated as court painter. The "Charge of the Mamelukes" and "Execution of the Defenders of Madrid" (Prado) were painted to commemorate the popular insurrection on May 2, 1808. Like the "Desastres" they are compositions of dramatic realism and their monumental scale makes them even more powerfully moving. The impressionistic style in which they are painted foreshadowed and influenced later 19th-century French artists, particularly Edouard Manet, who was also inspired by the composition of the "Execution." In several portraits of Ferdinand VII, painted after his restoration: Goya evokes more forcefully than any description the personality of the cruel tyrant, whose oppressive rule drove most of his friends and eventually Goya himself into exile. He painted few other official portraits but those of his friends and relations and his "Self-Portraits" (1815, Prado; Academy of San Fernando) are equally subjective. Some of his religious compositions of this period, the "Agony in the Garden" and "Communion of S. Joseph of Calasanz" (1819, 1820, Madrid) are more suggestive of sincere devotion than any of his earlier church paintings. The enigmatic "black paintings," with which he decorated the walls of his country house, the "Quinta del Sordo" (1819–23, now in the Prado) and the "Proverbios" or "Disparate~,'à series of etchings made at about the same time (though not published until 1864) are, on the other hand, nightmare visions in expressionist language, that seem to reflect cynicism, pessimism and despair.

In 1824, when the failure of an attempt to establish a liberal government had led to renewed persecution, Goya applied for permission to go to France for reasons of health. After visiting Paris he settled in voluntary exile in Bordeaux, where he remained, apart from a brief trip to Madrid, until his death. There, in spite of old age and infirmity, he continued to record his impressions of the world around him in paintings and drawings, and in the new technique of lithography, which he had begun to use in Spain. His last paintings include genre subjects and several portraits of friends in exile: "Muguiro" (Prado), "Moratin," "Pio de Molina" (private collections), which show the final development of his style toward a synthesis of form and character in terms of light and shade, without outline or detail and with a minimum of colour. If there is no evidence for the legends of Goya's rebellious character and violent actions, he was undoubtedly a revolutionary artist. He had no immediate followers, but his many original achievements, from the "Caprichos" to his late paintings, profoundly impressed later 19th-century French artists—Eugène Delacroix was one of his great admirers—who were the leaders of new European movements, from romanticism and realism to Impressionism; and his works continued to be admired and studied by the Expressionists and Surrealists in the 20th century.

GOYDER'S LINE, named after G. W. Goyder (1826–1898), a surveyor general of South Australia, was an early and interesting use of ecological principles to assist in determining limits of pioneer settlement.

As the colony was suffering from severe drought conditions, Goyder made a survey of the northern portion of South Australia (about 1864) and laid down a line beyond which it was not feasible for the wheat farmer to settle. He used the southern limit of the "Saltbush, Mulga and dwarf Mallee country" as his criterion. Later, this line was found to agree fairly with the 12-in. isohyet (line of rainfall). It runs from Moonta to Pekina, then southeast to Murray bridge. Wheat is grown on the dry side of this line, but it illustrated a principle which was of value in determining the expansion of Australian agriculture. *See* also SOUTH AUSTRALIA: *Agriculture and Industry.*

GOYEN, JAN JOSEPHSZOON VAN (1596–1656), one of the most gifted of Dutch landscape painters, was born at Leyden on Jan. 13, 1596, learned painting under several masters at Leyden and Haarlem, and settled at The Hague about 1631. He was one of the first to emancipate himself from the tradition of minute painting of detail embodied in the works of Brueghel and Savery. Though he preserved the dun scale of tone peculiar to those painters, he studied atmospheric effects in black and white with considerable skill. His influence on Dutch art was marked. He died at The Hague on April 27, 1656.

Between 1610 and 1616 Goyen wandered from one school to another. In the latter year he joined Esaias van der Velde, and some of his earlier pictures show the influence of Esaias very perceptibly. The landscape is minute; details of branching and foliage are given, and the landscape serves as a stage for genre scenes After 1625 these peculiarities gradually disappear. Atmospheric cool tints are the principal feature of Goyen's landscapes His buildings, water and shipping sometimes have the strength. if not the colour, of Albert Cuyp.

Though he visited France once or twice, Goyen chiefly confined himself to the scenery of Holland. One of his largest pieces is a view of The Hague, executed in 1651 for the municipality, and now in the town collection of that city. Most of his panels represent reaches of the Rhine, the Waal and the Maas. But he sometimes sketched the downs of Scheveningen, or the sea at the mouth of the Rhine and Scheldt; he liked to depict the inshore calm and rarely painted seas stirred by more than a cooling breeze. He painted winter scenes, with ice, skaters and sledges. More than 1,000 of Goyen's pictures are catalogued by Hofstede de Groot. They may be seen at museums in Boston, New York city (Metropolitan Museum of Art), Detroit and Toledo, among others. The National gallery, London, has several of his works.

GOYENECHE, JOSÉ MANUEL (1775–1846), South American royalist soldier, was born in Arequipa, Peru, June 13, 1775. In 1795 he went to Spain. where he remained until 1808. In that year he returned to South America as the agent of the junta of Seville. It is thought that he had been instructed by the French (whose armies had recently invaded Spain) to promote the French cause in South America, but in Seville he transferred his affiliation to Ferdinand VII and when he arrived in South America devoted himself to winning loyalty to the Spanish king. At that time several South American colonies were beginning to break away from Spanish rule and Goyeneche became a leader of the antirevolutionary army. He was responsible for several victories in Argentina, but the defeat of a subordinate forced him to abandon much of the territory he had captured. He returned to Spain (1813) and served against the French. He was count of Guaquí and held the rank of lieutenant general in the Spanish forces. He died in Madrid, Oct. 15, 1846.

GOZLAN, LÉON (1803?–1866), French author, was born at Marseilles. His father had been a wealthy man but lost his money during Gozlan's youth, forcing the latter to leave school and ship as an apprentice on a coastal trading vessel. His experiences in Senegal during this period of his life later formed the basis for several of his novels and short stories. After his return to France, he became a clerk in a Paris bookstore, but in a short time his stories began to be published in various French magazines and thereafter he was able to devote himself to writing. Gozlan was a prolific writer, and his work was characterized by a great deal of spirit and charm. His most successful works were his novels, which included *Le Notaire de Chantilly* (1836), *Washington Levert et Socrate Leblanc* (1838), *Le Mkdecin du Pecq* (1839), *Aristide Froissart* (1843) and *Les Emotions de Polydore Marasquin* (1857). He also wrote *Balzac en pantoufles* (1865), a light biography of the French writer; *Les Tourelles,* a history of French châteaux, later reprinted under the title of *Les Châteaux de France,* a moderately valuable historical study; and numerous short stories and plays. Two of his plays, *La Pluie et le Beau Temps* and *Une Tempête dans un verre d'eau* became part of the repertory of the Comédie Française and achieved some success, but most of the rest were insignificant, even during Gozlan's lifetime. Gozlan died in Paris, Sept. 14, 1866.

GOZO or Gozzo, an island of the Maltese group in the Mediterranean sea. It lies N.W. and $3\frac{1}{4}$ mi. from the nearest point of Malta, is 9 mi. in length and $4\frac{1}{2}$ mi. in extreme breadth, and has an area of 26 sq.mi. Its chief town, Victoria, formerly called Rabat (1957) 6,350, stands near the middle of the island on one of a cluster of steep conical hills. The prehistoric temple "Gigantia" is of the same type as Hagiar Kim in Malta but larger. Population (1957) 27,475.

GOZZI, CARLO, CONTE (1720–1806), Italian dramatist and a fanatical controversialist with a persecution mania, who spent his life in defending Italian culture against foreign influences, was born at Venice on Dec. 13,1720. He joined the purist *Accademia dei Granelleschi* and in a satirical almanac called *La tartana degli influssi* (1757) directed his wit against the theatrical innovations of Pietro Chiari and Carlo Goldoni. Between 1761 and 176j Gozzi produced ten grotesque *Fiabe* (*L'amore delle tre melarance*— the basis for Prokofiev's *The Love of Three Oranges, Turandot*— the basis of Puccini's opera, and *L'augellin belverde;* modern ed. by E. Masi. 1885) or dramatizations of popular and oriental tales: with which he sought to revitalize the dying *commedia dell'arte.* His other works include the *Marfisa bizzarra* (1761–68; modern ed. by C. Ortis, 1911)—a verse satire on 18th-century Venice—and the *Memorie inutili* (1797; modern ed. by D. Bulferetti, 1928; Eng. trans., 1890), an autobiography in which he described, vividly and with humour, his military experiences in Dalmatia (1741–44), his stormy relations with the actress Teodora Ricci and with Pier Antonio Gratarol, his rival in her affections, and his many literary polemics.

Gozzi died at Venice on April 4, 1806. His *Opere* were published in 8 vol. (1772–74) and in 14 vol. (1801–03).

See T. Mantovani, *Carlo Gozzi* (1926); G. Ziccardi, *Forme di vita e d'arte nel Settecento,* pp. 111–180 (1931). (D. M. WE.)

GOZZI, GASPARO, CONTE (1713–1786), Italian poet and essayist, elder brother of Carlo Gozzi (*q.v.*), was born at Venice Dec. 4, 1713. He published (1760–62) the *Gazzetta Veneta* (modern ed. by B. Romani, 2 vol., 1943), a chronicle of Venetian life, and the *Osservatore* (modern ed. by E. Spagni, 1914), both written in a pure Italian style. His other works include satirical verse *Sermoni* (1763), the *Difesa di Dante* (1758) against Saverio Bettinelli, which marks the beginning of the revival of interest in the *Divina Commedia* in Italy, and a program for educational reform. He died at Padua, Dec. 27, 1786. His *Opere* were edited by A. Dalmistro, 16 vol. (1818–20).

See M. A. Viglio, *Gasparo Gozzi* (1916) G. de Beauvillé, *Gasparo Gozzi, journaliste vénitien* (1937). (D. M. WE.)

GOZZOLI, BENOZZO (1420–1497), Italian painter, whose masterpiece is the fresco cycle in the chapel of the Palazzo Medici, Florence, was born in Florence in 1420. In 1444 he was engaged with Lorenzo and Vittorio Ghiberti on work on the third bronze door of the baptistry in Florence and in 1447 was active as an assistant of Fra Angelico in Rome, where his hand has been identified in a number of Xngelico's frescoes in the chapel of Nicholas V in the Vatican. In 1447 he was engaged, as Angelico's principal assistant, on the fresco on the ceiling of the Cappella di S. Brizio in the cathedral at Orvieto, which he appears to have completed after Xngelico's return to Rome (1448/49). In the second half of 1449 he was employed at Montefalco (near Foligno). From Montefalco, Gozzoli moved to Viterbo, where after 1453 he painted nine frescoes of scenes from the life of St. Rose of Viterbo (destroyed). and then to Perugia in connection with an altarpiece for Collegio Gerolominiano (signed, dated 1456; Galleria Nazionale dell' Umbria, Perugia).

ALINARI

SELF-PORTRAIT DETAIL FROM "PROCESSION OF THE MAGI" BY BENOZZO GOZZOLI. IN THE PALAZZO MEDICI, FLORENCE

In 1458 he was in Rome, and thereafter returned to Florence. Gozzoli's masterpiece, the frescoed chapel of the Palazzo Medici. dates from 1459/60. By 1463 he was at work at San Gimignano on a cycle of 17 scenes from the life of St. Augustine in the choir of S. Agostino (last scene signed and dated 1465) and in 1464 completed a fresco of St. Sebastian there.

Between 1469 and 1485 Gozzoli's attention was monopolized by his most extensive commission, for a series of 25 frescoes of Old Testament scenes for the walls of the Camposanto at Pisa. He is mentioned in Florence in 1497 and died at Pistoia on Oct. 4 of that same year. An exceptionally prolific artist. Gozzoli made extensive use of studio assistants and his work as a whole has a rather empty facility. His work at Orvieto is distinguished from Angelico's by its dry schematic forms. In the "Procession of the Magi" on the walls of the Palazzo Medici, on the other hand, he emerges as an artist of great decorative talent. with a pronounced gift for landscape and portraiture. The views of the Val d'Arno which form the background of these frescoes and the portraits of the Medici included contributed to their enduring popularity.

See R. van Marle, *The Development of the Italian Schools of Painting,* vol. xi (1929); B. Berenson, *The Drawings of The Florentine Painters,* 2nd ed. (1938). (J. W. P.-H.)

GRAAF, REGNIER DE (1641–1673), Dutch physician known for his studies on the pancreas and on the reproductive organs of mammals, was born July 30, 1641, at Schoonhoven. He was educated at Louvain, Utrecht. Leiden and Angers and for a short time practised medicine in Paris but returned to Delft in 1667 and remained there until his death. Aug. 17, 1673.

Graaf was the discoverer of the ovarian follicles, which are still known as Graafian follicles. His writings include *Disputatio medica de natura et usu succi pancreatici* (1663); *Epistula de nonnullis circa partes genitales inventis novis* (1668); *Tractatus de virorum organis generationi inservientibus* (1668); *De mulierum organis in generatione inservientibus* (1672); and *Partium genitalium defensio adversus J. Swammerdam* (1673). An edition of his complete works was published in 1677.

GRAAFF REINET, a town in the Cape Province of the Union of South Africa 32° 15′ S., 24° 32′ E. Alt 2.463 ft. Pop. (1951) 14,136 (4,902 white, 3,409 natives, 5,759 "coloured," 46 Asiatics). It was founded by the Dutch in 1786, and named after the then governor of the Cape, C. J. van de Graaff, and his wife. The town was built near the Sunday river, from which water is led to irrigate the gardens, and across which a large dam has been constructed just above the town to create a reservoir, capable of irrigating 17,000 ac. of adjacent land. The average annual rainfall is about 17 in. The surrounding country is Karroo Veld, in the midst of which the tonn stands as an oasis. The district produces considerable quantities of mohair and merino wool. (R. U. S.; X.)

GRABAU, AMADEUS WILLIAM (1870–1946), U.S. paleontologist, mas born at Cedarburg. Wis., Jan. 9, 18jo, educated at hfassachusetts Institute of Technology (Sc.B., 1896) and Harvard (Sc.D., 1900). He served as assistant and instructor in paleontology at Massachusetts institute, 1892–97, professor of geology at Rensselaer Polytechnic institute. Troy. N.Y., 1899–1901 and at Columbia university as lecturer, adjunct professor and professor of paleontology 1901–19. In 1919 he became professor of paleontology at the National university in Peking, China. and also chief paleontologist of the Chinese geological survey. He accompanied the third Asiatic expedition of the American Museum of Natural History as research associate in paleontology.

The subjects of his special researches include *North American Index Fossils* (with H. W. Shimer, 1909–10); *Palaeozoic Corals of China* (1921); *Ordovician Fossils of North China* (1921); *Stratigraphy of China,* vol. 1 (1924–25); *Silurian Fossils of Yunnan* (1926). He died in Peking in March 1946.

GRABBE, CHRISTIAN DIETRICH (1801–1836), German dramatist, was born at Detmold on Dec. 11, 1801. He lived an extremely irregular life, and though both Tieck and Immermann tried to reform him, he died prematurely as a result of his excesses on Sept. 12, 1836. His tragic life provided the matter of a play by E. Johst, *Der Einsame* (1917) and a novel by P. Friedrich (192j). Many of Grabbe's dramas contain fine passages and a wealth of original ideas; though they are little suited to the requirements of the stage. The boldly conceived *Don Juan und Faust* (1829) and the historical dramas *Friedrich Barbnrossa* (1829). *Heinrich VI* (1830) and *Napoleon oder die Hundert Tage* (1831), the last of which places the battle of Waterloo upon the stage, are his best works.

GRABSKI, WLADYSLAW (1874–1938), Polish statesman who reorganized his country's monetary and financial system, was born at Borow, near Lowicz, on July 7, 1874. He studied history in Paris and economics in Halle, Ger. A Socialist in his youth, he later joined the National Democratic party and was elected a member of three successive Russian *dumas* (1906–12). In Jan. 1919 he was elected a member of the Polish constituent sejm, but soon left for Paris as third Polish delegate at the peace conference. Returning to Warsaw, he became minister of finance in Dec. 1919. From June 23 to July 24, 1920, he was prime minister. In this capacity he went to Spa. Belg., to ask the Allied supreme council for immediate aid to Poland in arms and munitions. He served again as minister of finance from Jan. to Sept. 1923. On Dec. 19, 1923, he became prime minister again. To stop inflation he created, on Feb. 1, 1924, a new Polish currency, the zloty (exchanged at 1,800.000 Polish marks for one zloty, the U.S. dollar being equivalent to 5.18 zlotys); and on April 28. 1924, he founded the Bank of Poland, whose capital was subscribed by the nation. In the summer of 1925, however, he had to face a new crisis. Germany declared a "tariff war" on Poland, and the Deutsche Bank sold massive quantities of zlotys on the money markets of Berlin and Vienna. The new Polish currency declined in July, losing almost 50% of its gold value. Criticized in the *sejm*, Grabski resigned on Nov. 14, 1925. After Pilsudski's *coup d'état* of May 1926, Grabski retired from active politics, becoming professor at the Warsaw Agricultural high school. He published his own account of his greatest achievement. Dwa lata *pracy u podstaw państwowości naszej* ("Two Years' Work at the Foundation of Our State"), in 1927 and a summary of his democratic political philosophy, Idea *Polski* ("Poland's Mission"), in 1935. Grabski died in Warsaw on March 1, 1938. (K. SM.)

GRACCHUS, in ancient Rome, the name of a plebeian family of the Sempronian *gens.* Its most distinguished representatives were the famous tribunes of the people, Tiberius and Gaius Sempronius Gracchus, mentioned below, usually called "the Gracchi."

GRACCHUS, GAIUS SEMPRONIUS (153–121 B.C.), younger brother of Tiberius, was a man of greater abilities, bolder and more passionate, although possessed of considerable powers of self-control, and a vigorous and impressive orator. When 20 years of age he was appointed one of the commissioners to carry out the distribution of land under the provisions of his brother's agrarian law. At the time of Tiberius's death, Gaius was serving under his brother-in-law Scipio in Spain, but probably returned to Rome in the following year (132). In 131 he supported the bill of G. Papirius Carbo, the object of which was to make it legal for a tribune to offer himself as candidate for the office in two consecutive years, and thus to remove one of the chief obstacles that had hampered Tiberius. The bill was then rejected, but appears to have subsequently passed in a modified form, as Gaius himself was re-elected without any disturbance. Possibly, however, his re-election was illegal, and he had only succeeded where his brother had failed. For the next few years nothing is heard of Gaius. Public opinion pointed him out as the man to avenge his brother's death and carry out his plans, and the aristocratic party, warned by the example of Tiberius, were anxious to keep him away from Rome. In 126 Gaius accompanied the consul L. Aurelius Orestes as quaestor to Sardinia, then in a state of revolt. Here he made himself so popular that the senate in alarm prolonged the command of Orestes, in order that Gaius might be obliged to remain there in his capacity of quaestor. But he returned to Rome without the permission of the senate, and, when called to account by the censors, defended himself so successfully that he was acquitted of having acted illegally. The disappointed aristocrats then brought him to trial on the charge of being implicated in the revolt of Fregellae, and in other ways unsuccessfully endeavoured to undermine his influence. Gaius then decided to act; against the wishes of his mother he became a candidate for the tribuneship, and was elected for the year 123.

Legislative Work. — The following is a summary of his legislation, apart from special measures aimed at his brother's opponents. He revived his brother's agrarian law, which, although it had not been repealed, had fallen into abeyance, and stabilised the price of corn in Rome. He founded the first over-sea colony at Iunonia, on the site of Carthage, with a citizen status. He also remodelled the voting system of the comitia centuriata in such a way as to reduce the influence of the aristocrats. A further group of laws aimed at strengthening the hands of the equites, to whom he gave the right to farm the taxes of Asia, and at the same time he provided that the members of the *quaestiones perpetuae,* which included the court that dealt with extortion in the provinces, should be drawn from the equites. These measures raised Gaius to the height of his popularity, and during the year of his first tribuneship he may be considered the absolute ruler of Rome. His legislation also involved him in an immense amount of administrative work, at which according to Plutarch he was very successful. Store-houses were built for the state-controlled corn (*Horrea Semproniana*), roads built and improved in the country districts to facilitate transport, and so on. He was chosen tribune for the second time for the year 122. To this period is probably to be assigned his proposal that the franchise should be given to all the Latin communities, and that the status of the Latins should be conferred upon the Italian allies. This proposal would have saved the Social War, but of course lost him favour with his own supporters, and the senate put up Livius Drusus to outbid him with proposals never meant to be carried out. On his return from superintending the organisation of his new colony he failed to secure the tribunate again, and the new consul, L. Opimius, at once proposed the abandonment of Iunonia. A riot during the voting resulted in Gaius being proclaimed a public enemy — the consuls were given plenary powers, and Gaius, who escaped over the Tiber, was found dead next day.

GRACCHUS, TIBERIUS SEMPRONIUS, consul in 238 B.C., defeated the Ligurians, and, at the conclusion of the Carthaginian mercenary war, was in command of the fleet which took possession of Sardinia.

GRACCHUS, TIBERIUS SEMPRONIUS, probably the son of the preceding. Consul in 215, during the-second Punic War, he defeated the Capuans, and in 214 beat Hanno near Beneventum with the help of slave volunteers, fighting under promise of freedom. In 213 Gracchus was consul a second time and carried on the war in Lucania; in the following year, while advancing on Capua, he was betrayed by a Lucanian and trapped and killed by Mago.

GRACCHUS, TIBERIUS SEMPRONIUS (c. 210–151 B.C.), father of the tribunes, and husband of Cornelia. Although an opponent of the two Scipios (Asiaticus and Africanus), as tribune in 185 he was a member of the commission sent to Macedonia to investigate the complaints made by Eumenes II. of Pergamum against Philip V. of Macedon. In 181 he went as praetor to Hither Spain, where he was successful both as a soldier and administrator. Censor in 169, he was associated with the somewhat reactionary policy of his colleague Claudius Pulcher. They tried to curb the growing power of the capitalists (the equites), and restricted the political influence of the freedmen by confining them to the city tribes. He visited Asia as an ambassador in 165 and 161, and was consul again in 163.

GRACCHUS, TIBERIUS SEMPRONIUS (163–133 B.C.), son of the preceding, whose agrarian reforms, together with the reforms of his younger brother Gaius Sempronius Gracchus (*q.v.*) raised constitutional issues of great importance in the history of the Roman republic (see ROME: Ancient History). He and his brother were brought up by their mother Cornelia, assisted by the rhetorician Diophanes of Mytilene and the Stoic Blossius of Cumae. He served under his brother-in-law, the younger Scipio Africanus, in Africa during the last Punic War (147). Quaestor in 137, he served in the Numantine Wars in Spain, and saved the army by concluding an agreement with the enemy. This agreement was repudiated by the senate.

As tribune in 133, he was obsessed with the problem, which contemporary census figures reflect, of declining Roman manpower, from the particular point of view of recruitment for the legions. Much of Italy had been depopulated of Romans in the previous half-century through the absorption of independent small farms into the great ranches (*latifundia, saltus*), and Tiberius proposed to reclaim state land (ager publicus) occupied, often since several generations, by squatters (possessores; chiefly owners of the large estates), and to distribute it in small holdings, probably of 30 iugera (roughly 19 ac.) each; he aimed thus to improve and increase Roman stock by putting Romans back on the land. He hoped to soften opposition on the part of the possessores by allowing them to convert part of their existing holdings of ager *publicus* (500 to 1,000 iugera, according to the size of their families) into privately owned freehold. For the administration of the scheme a permanent board of three with, in all probability, a rotating chairmanship, was to be established. Romans alone were to be beneficiaries of the scheme, but as Latins and Italians were among the possessores, the scheme was bound to have repercussions on Roman relations with them.

A tribune, M. Octavius, having vetoed the proposal when it came before the concilium plebis ("assembly of the people"), Tiberius, in an altogether unconstitutional fashion, secured his deposition by vote of the plebs, and the bill was passed. The three commissioners elected were himself, his brother and his father-in-law, Appius Claudius Pulcher. The difficulties in establishing title were far more difficult and the practical issues more complicated than Tiberius had foreseen. When the senate tried to sabotage the bill by voting the commissioners no money for its implementation. Tiberius proposed that the wealth recently bequeathed to Rome by Attalus III of Pergamum be applied to this purpose. He then offered himself as a candidate for re-election to the tribunate for 132. While re-election without interval in the case of the curule magistracies was forbidden by law, the position concerning the tribunate was uncertain. The presiding tribune was undecided. Rioting started, Tiberius being at a disadvantage because his supporters, chiefly men living outside Rome, were working in the harvest fields and were not available. The consul P. Mucius Scaevola refused to intervene, and P. Scipio Nasica Serapio (consul in 138) assumed the responsibility of leading out a party of senators. in conflict with whom Tiberius was killed. The consuls of the following year, acting as a tribunal, tried and executed many of his supporters. Wisely, however, the work of the commission (on which Tiberius' place was taken by P. Licinius Crassus) was allowed to continue. That it was active down to 129, when Scipio Aemilianus secured a restriction of its powers. is evident from surviving boundary stones which record its adjudications. The problem of the inadequacy of recruits for the Roman legions, which Gracchus' land bill could never have solved, was solved in the event partly by Marius (*q.v.*) and partly by the enfranchisement of the Italians after the Social War of 90–89 B.C.

GRACE, EDWARD MILLS (1841–1911), English cricketer, was born at Downend. near Bristol on Nov. 28, 1841, and was an elder brother of William Gilbert Grace (*q.v.*). He played first at Lord's cricket ground, London. in July 1861, for South Wales against the Marylebone Cricket club. and by 1862 his reputation was established. He played 12 times for Gentlemen v. Players. 1863–69, and for the last time in 1886. In 1880 he and his brothers William Gilbert and George Frederick (1850–SO), played together for England against Australia. He died at Thornbury. May 20, 1911.

GRACE, WILLIAM GILBERT (1848–1915), greatest English cricketer of Victorian times, was born July 18, 1848, at Downend. Gloucestershire, and died at Eltham, London, Oct. 23, 1915. During his career he scored 54,896 runs (including 126 centuries) and took 2.876 wickets in first-class cricket, which he played from 1865 until 1908. He could still handle a bat much later: in his last match his not-out score was 69 for Eltham v. Grove Park on July 25, 1914, when he was 66. At 16 he went in first for Gentlemen v. Players at Lord's cricket ground, London, and on his last appearance for the Gentlemen at the Oval cricket ground, London, in 1906, he made 74 on his 58th birthday. In 84 matches for Gentlemen v. Players he amassed 6,000 runs and took 271 wickets. His prowess and achievement were comprehensive: in Aug. 1876 he scored, in consecutive innings, 344 out of 546 for Marylebone Cricket club v. Kent; 177 out of 262 for Gloucestershire *v.* Nottinghamshire; and a not-out score of 318 for Gloucestershire v. Yorkshire at Cheltenham. In 1880 he was on the team which played the first match against Australia in England.

The legend of "W. G." presents him as shaggy and ponderous with a huge yellow cap atop a swarthy head and face; the earliest extant photographs show him bearded like the pard. But in his heyday he was an athletic figure, a swift runner and able to throw a ball 100 yd. At 24 his weight was not more than 12 stone, 7 lb. (175 lb.). Grace evolved the first principles of modern batting, combining forward and back techniques; many of his performances were achieved on rough and untrustworthy wickets, such as are unknown to modern players. His personality, his inexhaustible energy and gusto and his physical power of dominance made him a national figure. He was Johnsonian in that cricket was his life and dictionary, though in his spare time he practised medicine. "I puts the ball where I likes," said J. C. Shaw, famous and accurate bowler of the period, "but he ["W. G."] puts it where he likes."

GRACE is a word with several meanings; all are related to the notion of favour. The English word is derived through the French and Latin (*grâce* and gratia) from the Greek *charis,* which has four principal meanings: (1) a pleasing quality, gracefulness; (2) good-will, beneficence; (3) gift, benefit; (4) gratitude. Of these four meanings, the second and third contain the theological sense accepted by all theistic religions. The same idea is contained in the Hebrew words חן (favour, good-will) and חֶסֶד (loving-kindness, a benefit conferred gratuitously).

History shows positively man's need for religion. Religion is the submissive acknowledgment of man's complete dependence on a power exterior and superior to human nature. If this power is recognized as a person, the generic notion of grace must be accepted as an inseparable factor of human existence; for then the life of man is a series of objective benefits, which depend ultimately on the beneficent will of a personal and supramundane power. Granted this basic notion of grace common to all theistic religions, one can see that all further particularizations of the concept of grace will depend on one's understanding of a personal God, the nature of man and the nature of the relations between man and God. The major developments of grace have occurred in Christian thought. Since this article is limited in length, only a brief analytic statement of the views of the chief adherents of Christianity is possible.

The Roman Catholic view on grace is distinguished from others mainly by its affirmation of a supernatural order. The word "supernatural," as applied to grace, is a relative term, and denotes a benefit, conferred by God alone gratuitously, which elevates its recipient to a perfection to which he has no right or title whatsoever. It is natural for God to have complete happiness in the intuitive knowledge and love of His infinite perfection; but an intuitive knowledge of divine perfection is not in any way due to any finite nature. The fundamental Roman Catholic doctrine on grace is that God has destined men to a supernatural share in His divine life, and actually confers upon them supernatural gifts, intrinsically proportioned to the direct vision of His essence, even as the seed is proportioned to the full flower.

God intended that the supernatural gift of divine life, originally conferred on Adam, should be transmitted to the newly created soul of each individual. It was to have been a supernatural property of human nature, even as sense faculties are natural properties. The gift on God's part was absolute; the transmission was conditioned solely on Adam's not sinning. But Adam sinned and in his sin all men shared, not by wilful co-operation, but by physical incorporation in him as the head of the human race. By his sin, Adam lost for himself and for all men his share in divine life and the attendant, subordinate, preternatural gifts of immortality and immunity from suffering and from internal conflict (concupiscence). In the Roman Catholic view, the transmission of hereditary guilt is possible only in the hypothesis of supernatural gifts, whose loss has left human nature essentially unchanged.

God could have left men in original sin; He could have condoned it; but to show forth equally His mercy and justice, He freely determined that man's supernatural life should be won back through the meritorious and redemptive death of the second Adam, the incarnate Son of God. The positive will of God as to the application of Christ's merits has been revealed in the New Testament. Infants receive justification in baptism without any personal co-operation; adults. however, can be justified only by the free consent of their wills co-operating with actual (*i.e.*, transitory) supernatural graces. These free acts must include the intellectual assent of faith to revealed truth because of the authority of God, and, in the case of those who have sinned seriously, an act of penance; *i.e.,* a sincere detestation of sin with a firm purpose of amendment.

These acts constitute a positive, supernatural and internal preparation for the permanent gift of justification, infused into the soul by God alone either in actual baptism, or in the baptism of desire which is contained implicitly in any supernatural act of perfect love of God.

Justification is the complete remission of all serious sin and a complete internal renovation; it includes sanctifying grace, the infused virtues of faith. hope and charity and the indwelling of the Holy Spirit. By justification, man is elevated supernaturally to the very life of God; he is made an adopted son of God entitled to see Him face to face after death, and is capable of performing free acts which merit before God an increase of justification itself and a correspondingly greater clarity in the future vision of the divine essence. By every serious sin, this supernatural life is lost, but may be regained through the sacrament of penance received with proper dispositions. In justification, the lesser effects of original sin, especially concupiscence, are not removed, although their power as stimuli of sin is tempered by internal transitory and supernatural graces of intellect and will.

In the Roman Catholic system of grace and salvation, the whole initiative lies with God. No grace, no free acceptance of grace are possible except by the efficacy of God's eternal decree. No man is ever saved unless he has been elected and predestined by God. Nevertheless, neither God's eternal decrees nor His internal graces impede the exercise of man's liberty, which is equally necessary for the salvation of adults. The sacraments, which are the divinely chosen channels of grace, cannot exercise their effect in adults, unless they are freely received with proper dispositions. Christ died that all men should possess supernatural life; therefore all men receive from God sufficient grace for salvation. There is no antecedent positive reprobation of any man on the part of God. Damnation is due to the free rejection of sufficient grace on the part of man. However. the distribution of grace is unequal. This inequality is due, not to any merits or demerits of men, but to the good pleasure of God. Therefore all adults who are saved receive supernatural helps decreed by God from eternity with the foreknowledge that they would be accepted freely and that perseverance in justification would last until death. The Catholic view is objective and ontological rather than subjective and psychological. Its validity depends, not on human experience, but on the question whether it is the revealed truth of God.

The doctrine of the early Protestant reformation (Lutheran, Calvinist and Anglican) is based on a denial of the supernatural order. The original justice of Adam, his immortality and freedom from concupiscence are conceived as natural. By original sin, which consists essentially in concupiscence, human nature is no longer integral, but totally corrupt; the human will has no freedom to do good rather than evil; all human actions are sinful. The sole remedy for original sin is the expiatory death of Christ. But the merits of Christ are not applied to sinful men in the form of internal sanctification and a total destruction of sin. Men are justified externally by fiducial faith; *i.e.,* a subjective conviction that their sins are covered by the merits of Christ and are no longer imputed by God, even though the soul remains internally corrupt. Justification is merely an external declaration of God and not an internal renovation of man. Calvinism particularly insisted that men are saved or lost, not by their free wills, but solely by the antecedent predestination or reprobation of God.

In later Protestantism, the harsh views of the early Reformers, founded on private interpretation of Scripture and St. Augustine, were greatly modified by the Arminian controversy, the rise of Deism and the influence of Rationalism. The Arminian insistence on human liberty, the Deistic denial of divine providence and the Rationalistic rejection of scriptural inspiration, original sin, Christ's divinity and the sacramental system brought large sections of Protestantism to a view on grace not far removed from Pelagianism, namely, to a belief in the unaided power of human nature to attain complete perfection and ultimate happiness. The influence of World Wars I and II (1914 and 1939) with the intervening spiritual unrest of two decades dealt a severe blow to the gospel of indefinite human progress without divine aid and caused a more serious investigation into the entire question of religion and of man's absolute need for divine help, not merely for the spiritual welfare of the individual, but also for his temporal prosperity as a member of national and international society. Among English speaking theologians of the 20th century, Reinhold Niebuhr's works manifested a trend in Protestantism away from the Pelagian naturalism of the preceding century. This tendency is a praiseworthy attempt to sift and synthesize basic elements of traditional Christian thought on grace into a new system, which may exercise a more profound and practical influence on men's lives.

GRACES, Greek goddesses of fertility. The name (cf. Venus) refers to the ".pleasing" or "charming" appearance of a fertile field or garden. (Gr. Charites, Lat. Gratiae.) Their number varies; sometimes only one Charis is mentioned, but usually they are three: Aglaia (brightness), Euphrosyne (joyfulness) and Thalia (bloom). They are daughters of Zeus and Hera (or Eurynome, daughter of Oceanus), or of Helios and Aegle, a daughter of Zeus. At Sparta there were two Graces, Kleta and Phaenna; at Athens two, Auxo and Hegemone, associated with the goddess Aglauros in the oath taken by youths belonging to the military college of the ephebi. Frequently the Graces are taken as goddesses of charm or beauty in general and hence are associated with Aphrodite, Peitho, Hermes; the union of Hephaestus with Charis in the Iliad is probably a mere allegory (Craftsmanship weds Beauty). In works of art they were represented in early times draped, later as nude female figures.

GRACIÁN Y MORALES, BALTASAR (1601–1658), the most important 17th-century Spanish prose writer after Quevedo (*q.v.*), was baptized at Belmonte near Calayatud, Jan. 8, 1601, studied at Calatayud and Saragossa, became a Jesuit (1619) and later rector of the Jesuit college of Tarragona. His educational and literary theories, enunciated respectively in El *discreto* (1646; Eng. trans. The Compleat *Gentleman,* 2nd ed., 1730) and in his rhetorical treatise on the "conceited" style, Agudeza y *arte* de ingenio (definitive version, 1648), are exemplified in his masterpiece. the great philosophical novel El Criticdn (1651–53–57; monumental ed. by M. Romera-Navarro. 3 vol., 1938–40; Eng. trans. The Critick, 1681), published pseudonymously in defiance of his superiors, whose disciplinary action precipitated his unsuccessful petition for release from the society. He died at Tarazona. Dec. 6. 1658. There are numerous modern editions and studies of his major works. which also include El hkroe (1637; Eng, trans. The Hero, 1726) and El *Oráculo manual* (1647; Eng. trans. *The* Oracle, 1953); his influence on Schopenhauer was notable.

GRACKLE, a name given to various birds of the family Sturnidae in the old world and of the Icteridae in the new world. The former include the hill mynas of India and southeastern Asia, especially *Eulabes* religiosa, which is about 10 in. long and has black iridescent plumage, a white patch on the wing and yellow wattles behind thb eyes. The bill is orange and the legs are yellow. It feeds on fruit and can be taught to talk.

The American grackles include 12 species classified in 8 genera restricted to or best represented in the tropics. Most have uniform glossy black plumage, but the females of *Quiscalus, Holoquiscalus* and Cassidix are dingy gray or brownish, and certain tropical species are in part bright yellow or scarlet. Their habits vary, but most grackles are omnivorous and when in abundance may damage crops locally. They also destroy the eggs and young of other birds. and the rice grackle (*Scaphidura oryzivora*) of Central and South America customarily lay their eggs in the nests of other birds. Best known is the common grackle (*Quiscalus quiscula*) that occurs in most of eastern North America. It is a beautiful bird, purplish or bronzy black in colour with a long. graduated tail, and grows to a length of about 12 in. The boat-tailed grackle (Cassidix *mexicanus*), which ranges from Delaware and the Gulf toast to Colombia, is much larger (16 in) and has a more expansive, keellike tail It is known locally as the crow blackbird. or jackdaw, the latter in reference to its imagined similarity to the common jackdan (*Corvus monedula*) of Europe. AMERICAN BRONZEDGRACKLE. FOUND THROUGHOUT NEW ENGLAND AND THE MISSISSIPPI VALLEY

GRADIENT WIND, a generalization of the geostrophic wind (*q.v.*) for flow along curved trajectories. Friction is disregarded. and the wind is assumed to be parallel to the isobars (lines of constant pressure). The gradient wind gives a better representation of the true wind than the geostrophic, particularly when the wind speed and trajectory curvature are large, as in the case of hurricanes. and fast jet streams between 25,000–50,000 ft. elevation.

Whereas the geostrophic wind needs for its computation only the pressure distribution along a constant level surface or the slope distribution of a constant pressure surface, the gradient wind needs in addition the knowledge of trajectory curvature. In general this is not known; however in cases in which the wind speed is much greater than the speed of the flow patterns (a condition generally satisfied when the gradient wind is most useful), the curvature of the stream lines is a good approximation to the trajectory curvature. Further, streamline curvature above the friction layer is well represented by curvature of isobars or contour lines of isobaric surfaces (see EKMAN SPIRAL). The figure illustrates the theory of gradient wind. Conditions in the northern hemisphere, *i.e.,* where the Coriolis force acts to the right of the mind, are assumed (see MOTION, PRINCIPLES AND LAWS OF). When the Coriolis force exceeds the pressure gradient force (fig 1) the air is continually deflected to the right, leading to anticyclonic (clockwise in the northern hemisphere) curvature of flow. This situation can be represented by a balance between the

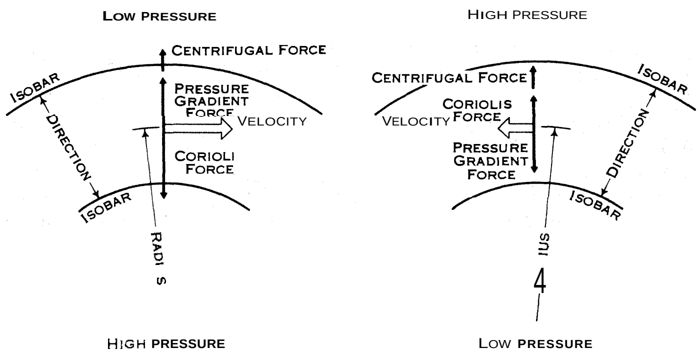

FIG. 1 AND 2.—THE BALANCE OF FORCES FOR GRADIENT WINDS IN THE NORTHERN HEMISPHERE WITH (FIG. 1) CLOCKWISE ROTATION AND (FIG. 2) COUNTERCLOCKWISE ROTATION OF THE AIR

Coriolis force and the sum of pressure gradient and centrifugal forces. Then, the wind speed is larger than geostrophic. Since the centrifugal force depends on the square of the wind speed. and the Coriolis force only on its first power, gradient equilibrium in the anticyclonic case is impossible for fast winds; hence anticyclones (high pressure centres) cannot become intense.

Figure 2 illustrates the case in which the pressure gradient force exceeds the Coriolis force so that the flow is curved in a counterclockwise sense (cyclonically). Here. the pressure gradient force balances the sum of Coriolis and centrifugal forces. Under these conditions, the wind is less than geostrophic; however, the speed of the wind is not limited, so that the strength of counterclockwise storms (cyclones) may be very large.

In the southern hemisphere, where the Coriolis force acts to the left of the wind, the term cyclonic refers to clockwise flow and anticyclonic to counterclockwise flow. The discussion of gradient wind above can be applied to the southern hemisphere, provided that the terms "cyclonic" and "anticyclonic" are used in this sense throughout. However, clockwise must be replaced by counterclockwise, and vice versa. (H. A. A. P.)

GRADO, an island of the province of Gorìzia, It., 4 mi. from Belvedere. Pop. (1951) 8,733. The inhabitants of Aquileia took shelter there in 452 and 568 and the patriarchate of Grado began in 557–569 and continued till 1451 when it passed to Venice. The cathedral was rebuilt in 571–586.

GRADUATE, in Great Britain, a verb now used only in the academic sense intransitively, *i e.,* "to take or proceed to a university degree." and figuratively of acquiring knowledge of or proficiency in anything. The original transitive sense of "to confer or admit to a degree" is still preserved in the U.S. where the word is not strictly confined to university degrees, but is used also of those successfully completing a course of study at any educational establishment. As a substantive, a "graduate" (Med. Lat. *graduatus*) is one who has taken a degree in a university. Those who have matriculated at a university but not yet taken a degree are known as undergraduates. The word student. used of undergraduates in the U.S. and. in Scottish universities. is not applied generally to those of the English and Irish universities At Oxford the only students are the "senior students" (fellows) and "junior students" (undergraduates on the foundation or scholars) of Christ Church The verb "to graduate" is also used of dividing anything into degrees or parts in accordance with a given scale. For scientific applications, *see* GRADUATION AND CALIBRATION. It may also mean "to arrange in gradations" or "to adjust or apportion according to a given scale." Thus a graduated income tax refers to the system by which the perceniage paid depends on the income level.

GRADUATION AND CALIBRATION. Graduation is the process of dividing an interval into a number of smaller ones. Usually these divisions are of equal magnitude but occasionally they are related to each other according to some mathematical formula, as is the case for the distances between graduating marks on the dial of an alternating-current electric meter.

The word "graduation" is derived from the Latin *gradus*, "step," implying that graduation is performed by "stepping off" equal intervals in the larger interval to be divided.

Calibration is the process of comparing an article with a standard to determine the extent to which it meets specified requirements. The term is most frequently applied to the testing of measuring devices; *e.g.*, electric meters, surveying tapes, speedometers, thermometers, etc. It applies equally well to the testing of precise machine articles, *e.g.*, bearings, shafts, screw threads, etc., which must fit to close tolerances.

The word "calibration" is derived through the French *calibre* and Italian *calibro* from the Arabic *qálib*, a "form" or "mold." in connection with gunnery terms introduced at the beginning of modern times. Thus the meaning is clear since the mold for the bullets had to conform to the bore or calibre of the gun.

The term is also used by some instrument manufacturers to describe the process of adjusting an instrument and its scale reading at the time of manufacture so that the indications of the instrument will be correct. They prefer the term "standardization" for subsequent processes of determining residual errors or errors which develop after the original adjustment. Graduation usually means the placing of the original marks on a scale or dial; and calibration, the determination of the correctness with which they were placed.

Development of modern technology owes much to the art of precise graduation for without it parts would not work properly when fitted together. Prior to the 18th century all graduation was performed strictly as handwork. During the 18th century a number of dividing engines were developed. Henry Hindley, about 1739, constructed an engine for accurately cutting the teeth in clock gears. Jesse Ramsden, in 1766, constructed an engine to divide circles for surveying and navigating instruments.

Graduating engines attained a high state of development during the 19th century. Machines were developed for ruling optical diffraction gratings with as many as 30,000 equally-spaced lines per inch *(see* SPECTROSCOPY: *Grating Spectrographs).* Toward the end of the century most well-equipped instrument shops were capable of performing both linear and circular graduation with high accuracy since the facilities required for precise machining, gear cutting, etc., and precise graduation are similar.

Most precise graduation is accomplished by special engines designed for this purpose, Modern graduating engines are commercially available with guaranteed accuracies of 1 sec. of arc for circular graduation (better than 1 part per 1,000,000) and of .0001 in. for linear graduations. Special ruling engines for optical gratings have been developed in nhich the position of the ruling tool is electronically controlled and guided by means of photocells which are actuated by interference fringes, thus governing its position to within a fraction of the wave length of light.

Process of **Graduation.**—Original graduation can be performed in two ways. One involves bisecting the interval to be graduated with a beam compass, or similar instrument, and successively bisecting the intervals obtained until the desired fineness of division is attained. The other involves the use of a trial subinterval and stepping off intervals of the larger interval with a pair of dividers or a similar device. This process can be repeated until the desired accuracy of the divisions is attained. The former process can be employed if the total number of divisions desired is a power of 2; if not, the second process must be employed. Both may be used if the number of divisions is a multiple of a power of 2 and other numbers.

The accuracy with which graduation can be performed is limited only by the care and patience of the graduator. After a graduation has been performed the subdivisions may be compared with each other and the errors of each subdivision assessed. A new graduation can then be made by copying the original with corrections for its known errors and the process repeated until the desired accuracy is achieved.

The precise commercial graduating engines incorporate automatic correcting mechanisms. Although the gears, racks and screws which position the graving tool in each engine are fashioned with great care, some residual errors remain. A system of levers operated by a correcting cam adjusts the position of the graving tool to correct for the errors of each engine. Another device which is used in graduating and ruling engines to improve accuracy is the employment of multiple lead screws and multiple ways so that irregularities in any single part will be averaged out. By means of these devices and by allowing for measured errors in earlier graduations, successive graduations can be carried out to any refinement desired.

Calibration. — The concept of calibration involves measurement. In its broadest sense it includes comparison with a standard which may result in acceptance or rejection of the article because it does not conform closely enough to the specifications set forth for it, issuance of a certificate or construction of a table or chart for it stating the extent to which it departs from the standard or adjustment of the article so that it conforms with the standard to within allowable errors. Underlying this must be a sound science of measurement and a statistical theory of errors.

Importance of Calibration. — The high technological development of modern life has resulted in increased importance for the process of calibration. In earlier times only the weights and measures used in commerce were subjected to any verification, and often even this was not done well or at all. Most manufactured articles consisted of parts that were individually made according to the pattern of the particular artisan. Parts of an article made by one person were not required to fit with parts made by another. With the development of quantity production, however, this procedure had to change. Large plants began to manufacture goods for commerce, and different parts of various articles were made by different individuals. After manufacture these parts were required to fit together, and this was possible only if they had been made to specified dimensions. Therefore, gauges had to be distributed in the various departments of each manufacturing plant to serve as standards by which the dimensions of each part were fixed. As these gauges were used continually they would change and therefore they required calibration by comparison with master gauges.

At the present stage of technological development various component parts are not made in the same plant or even under the same proprietorship, but are purchased as finished parts from another manufacturer. Often the end use of a part is not known to its manufacturer; sometimes the manufacturers are in different countries. Such a system is workable only because the individual manufacturers produce their goods in accord with accepted standards of measurement.

Calibration of measuring devices is also important in the exchange of scientific information between various laboratories, both intranationally and internationally. The information of modern physical science is highly quantitative and is usually expressed to high precision in terms of the relationship of units of one quantity to units of another. In order that one scientist be able to collate his work with another it is necessary that there be agreement between them on the sizes of units and that the measuring devices which each uses be calibrated by comparison with agreed upon standards.

International Standards. — The first great step toward realization of an international system of standards was taken by 17 nations when they signed a treaty on May 20, 1875, to establish an organization to improve and maintain the metric system of units. The metric system was brought into being by the French national assembly through decisions made between 1791 and 1795. Its use in commercial transactions was made compulsory in that country on July 4, 1837, and by many other nations subsequently, and its commercial use was made permissive in the United States and the British empire. It is based on the metre as a unit of length and the kilogram as a unit of mass.

In order to carry out its mission, the organization set up by the treaty of 1875 had a number of prototype standards fabricated and distributed among the participating nations. They were standards of length, consisting of bars of platinum-iridium on which were engraved two parallel lines 1 m. apart; and standards of mass, consisting of platinum-iridium cylinders weighing 1 kg. each.

One of the prototype metre bars and one of the prototype mass standards were selected as the international standards and placed in the International Bureau of Weights and Measures at Sèvres, a suburb of Paris. The various national standards are frequently sent to the international bureau for comparison with the international standards to determine how much change, if any, has occurred in them.

The standards of length and mass, together with a standard of time fixed by the motion of the earth, and a standard of temperature, fixed by the temperature at which water is in equilibrium with its vapor and ice, serve to fix the sizes of all other units of measurement in accordance with certain agreed upon definitions. The major standardizing laboratories of the world construct standards for other units such as the volt, the unit of electromotive force, and the ohm, the unit of electrical resistance. The standards so constructed are intercompared and a "best" value for each national standard is adopted by international agreement.

Because of this system the metric standards of all nations are kept on a uniform basis. Instruments calibrated in terms of the standards of one nation agree with those calibrated in standards of another to within the error of observation.

Prior to an international agreement in 1959 some differences existed between certain units used by the English-speaking countries. For example, one U.S. yard was approximately equal to 0.9144018 m. by its definition and the British yard was equal to 0.9143986 m. as given by comparison with the British standard yard. The U.S. and British pounds mere 0.4335924277 kg. and 0.453592338 kg., respectively. Although these differences are trivial for most purposes, they become bothersome in precise calibration work. For this reason the directors of the national standardizing laboratories of the English-speaking countries agreed to adopt an international yard (0.9144 m., exactly) and an international pound (0.54359237 kg., exactly) and to use these equivalents in all calibrations from 1959 on unless otherwise required. This makes the international inch equal to 2.54 cm., exactly. However, for most international comparisons the metric system is used and scientific results are usually stated in metric units. Electric units are based on the metric system.

Accuracy of Calibration. — In order that required accuracy be achieved in the calibration of a device it is necessary that the accuracy of the standard with which it is compared be considerably greater, since some uncertainty is bound to be attached to any intercomparison. Suppose that some instrument. which we will designate as A, is compared with another, which we mill designate as B. We will designate the uncertainty in the value given by A as the result of this intercomparison by ϵ_{AB}. B. in turn, mas previously compared with another, C, and the uncertainty involved is ϵ_{BC}. Then the best estimate of the uncertainty in A as compared with C is $\sqrt{\epsilon^2_{AB} + \epsilon^2_{BC}}$. If there is a long chain of such intercomparisons by which the value of A is related to the basic standard then considerable uncertainty is involved in the calibrated value of A, since the uncertainties of all the calibrations must be added together in quadrature to give the uncertainty of A. For example, the uncertainty in the length of a 50-m. surveying tape expressed in terms of the international prototype metre is bound to be considerably greater than the uncertainty in a national prototype metre; and a 1-lb. weight certified by a local sealer of weights and measures is subject to considerably more uncertainty than a national prototype kilogram.

To assure adequate precision of intercomparison a very high standard of accuracy is maintained in national standardizing laboratories. High-quality metre bars can be compared with each other with a probable error of 3 parts in 10^8. (The meaning of this is that in a large number of repeated intercomparisons 50% of the results will agree to within this range.) Masses of 1 kg. may be intercompared with a probable error of 4 parts in 10^9. Frequency and time standards may be compared with probable errors of a few parts in 10^{10}, using atomic standards of frequency introduced in the later 1950s. although these comparisons may not be referred to the defined standard of time—the tropical year 1900 at 12 hr. E.T. (see TIME MEASUREMENT: *Uniform* Time)—with equal accuracy. Some of the electric standards may be intercompared with probable errors smaller than 1 part in 10^6, although standards for the defined units themselves are not realized with this accuracy. Lower accuracies are associated with the best practice in calibrating standards for some other quantities.

Where the magnitude of the quantities being measured differs appreciably from the defined standard, lower accuracies result. Thus 50-m. base-line tapes are calibrated with probable errors of 2 or 3 parts in 10^7 and end gauges of 1 in. with probable errors of 1 part in 10^6, at best.

Another illustration of the importance of accuracy in calibration of measuring devices is afforded by the application of quality control. Suppose a commodity such as sheet metal is required to be produced having a certain thickness with a tolerance of plus or minus 0.003 in. If the gauge used to test specimens of the material has an uncertainty in its calibration of plus or minus 0.001 in., any specimen which gauges more than 0.002 in. from the specification must be rejected because the gauge error plus the measured departure from specifications may add to more than 0.003 in. Obviously, many satisfactory specimens will be unnecessarily rejected if the unknown gauge error and the measured departure are opposite in sign. If the uncertainty of the gauge calibration is as small as 0.0001 in. the number of specimens unnecessarily rejected will be greatly reduced.

Laboratory Calibration. — Many laboratory instruments are, by nature, so variable in performance that frequent calibrations are required. This is also true for relatively stable equipment when results of the highest accuracy are required. Under such conditions calibrations of the instrument are conducted before and after each measurement, or as often as circumstances require. This calibration is performed by making measurements with the instrument on a standard sample similar to the unknown to be measured.

A few illustrations: In determining the composition of a gas of unknonn composition with a mass spectrometer, a gas of similar but known composition is often tested by the spectrometer before and after the unknown. If a certain component of the known gas is found to be 1% loner in abundance than it is known to be, then the same component in the unknown gas will be estimated to be 1% higher then it was measured to be. Similarly when a chronometer is used in timing astronomical events such as eclipses, the chronometer is checked with radio time signals immediately before and after the event is observed. The checking of the chronometer constitutes a calibration of that instrument and a more correct timing of the event is obtained through the use of radio time signals as a standard than if complete reliance had been placed on the chronometer alone.

GRADUS (GRADUS AD PARNASSUM, "a step to Parnassus"), a Latin (or Greek) dictionary, in which the quantities of the vowels of the words are marked. Synonyms. epithets and poetical expressions and extracts are also included under the more important headings. the whole being intended as an aid for students in Greek and Latin verse composition. The first Latin gradus was compiled in 1702 by the Jesuit Paul Aler (1656–1727), a famous schoolmaster. There is a Latin gradus by C. D. Yonge (1850); English-Latin by A. C. Ainger and H. G. Wintle (1890); Greek by J. Brasse (1828) and E. Maltby (1815), bishop of Durham.

GRADY, HENRY WOODFIN (1850–1889), U.S. journalist and orator, was born in Athens, Ga.. May 24, 1850. He graduated from the University of Georgia in 1868 and took postgraduate work at the University of Virginia. A letter to the *Atlanta Constitution,* written while he was a student, evidenced his journalistic talents and led him into journalism. He became the editor of several small newspapers and then Georgia representative of the *New York* Herald before buying a quarter interest in the *Atlanta Constitution* in 1880. He was editor of that paper until his death. A capable journalist, he was also a talented orator. During the late 1880s he made a number of famous addresses. including one on "The New South" in Dec. 1885, that helped to pacify north-south animosities of the post-Civil War period. He died in Atlanta. Ga., Dec. 23, 1889. (H. J. SG.)

GRAECO-PERSIAN WARS, 546–466 B.C. The great Assyrian kingdom which had ruled and terrorized Asia for centuries came to an end with the fall of Nineveh in 612 B.C. Of it the Greeks knew little or nothing. Only the Greeks of Cyprus had come into contact with it, and that only on one brief occasion. It had never ruled within the peninsula of Asia Minor.

For half a century after the fall of Nineveh the old dominions of Assyria were divided between two Powers, the Median and Babylonian kingdoms. The Median monarchy conceived ambitions beyond the Taurus, so that a war arose between it and Lydia, which was brought to a practical, though not formal, conclusion by that strange incident on the Halys in 585, when the armies, prepared for battle, withdrew from the unfought fight in consequence of an eclipse of the sun. Freed from danger from the east, Lydia turned her attention westwards, and in the next 40 years brought into subjection those Greek cities of the Asiatic coast of the Aegean on whose liberties the Lydian kings had been making desultory attacks for more than a century past.

Rise of **Cyrus.**—The independent kingdom of Media had lasted little more than half a century when there came a change of dynasty within it, a change which seems, judging from the contemporary records of Nabonidus, king of Babylon, to have been little more than a domestic matter. The history of the next two centuries makes it almost certain that the Persians in the southwest of modern Persia were either a Median tribe or of a race near akin to the Medes. In 552 Cyrus the Persian king of Anshan, a part of Elam, revolted and set himself up as ruler of the Median kingdom. Lydia and Babylonia got alarmed at his vigour and success, and concluded an alliance which aimed at checking, or even suppressing, Cyrus. Of that alliance he got wind; so about 546 he made an attack on Croesus of Lydia which ended in the capture of Sardes, the fall of the Lydian kingdom, and the passing of the continental Greeks of the Asiatic coast under Persian dominion.

The fall of Lydia made a great impression on the Greek world, for it had loomed large as an oriental empire in contrast to the small and comparatively poor States of Greece.

Of the relations between the Persians and the Greeks during the later part of the reign of Cyrus and during the reign of his successor Cambyses but little is known. The islands of the eastern Aegean, with the exception of Samos, seem to have fallen early under Persian rule.

A certain Polycrates ruled at Samos as tyrant for some years, and used the wealth he acquired in trade in carrying out some great architectural and engineering works. But about 424 he fell into the hands of the Persians and was put to death. In 516 a Persian force captured the island. Thus Persian rule now extended to a line drawn north and south through the middle of the Aegean. Cambyses had died in 522, and had been succeeded by a pretender who was slain by certain Persian nobles, of whom the leader, Darius, succeeded to the throne.

Reign of Darius.—Everything that is known of him suggests that Darius was one of the greatest men that the ancient world produced, at least capable—perhaps great—as a commander in war, and in peace a ruler and organizer such as the world was never to see till the days of Augustus. The system of government which he established is all the more remarkable because it is in strong contrast with the crude and often barbarous methods of government which races ruling before him in the East had applied to the peoples which they had brought into subjection; for it was a system which recognized the wisdom, if not the justice, of respecting the rights of subjects of various races, and of allowing them as much local freedom as was consistent with the calls which the interests of the empire as a whole made upon them. The Greek cities were left with considerable local autonomy under tyrants of their own race, who were indeed agents of Persia, but do not seem to have been harsh in their rule. Tribute had to be paid; but not even the Greeks themselves ever alleged that it was a crushing burden. They had also in time of war to provide military and naval contingents for the Persian forces. But, however lightly the hand of Persia lay upon them, the Greeks of Asia, being Greeks, resented any form of subjection which circumscribed their political freedom.

Scythian Expedition.—Either before or after Darius' accession the Persians had acquired two *têtes-du-pont* in Europe, the Thracian Chersonese (Gallipoli peninsula), and Byzantium. This may have signified nothing more than a desire to control the narrow passages of the Hellespont and Bosporus. But somewhere about 512 Darius took a step which has seemed to some writers, ancient and modern, to have signified a deliberate policy of extending the empire into Europe. This is what is known as the Scythian expedition. For this incident Herodotus is the chief authority among ancient writers, though Ctesias and Strabo contribute matter of importance. The outstanding element in the ancient tradition is that the expedition was directed against the Scyths. Darius may have wished to teach that people the lesson that they must keep their hands off Asia and Asiatic kingdoms. It was much easier to attack the Scyths through Thrace than through the twofold barrier of the Armenian mountains and the Caucasus.

Misled, it would seem, by exaggerated reports of some disaster having overtaken the Persians in Scythia, the Greek cities of the Propontis region, which had submitted to Darius on his march northwards, revolted; so, when Darius himself returned to Asia, he left Megabazus in Europe to deal with those towns. Herodotus represents him as having subdued all Thrace, a statement inconsistent with the story of some years later; nor is the story of Macedonia having given the earth and water of submission at this time quite free from suspicion. The only element in the story of this aftermath of the Scythian expedition which lends colouring to the Greek conception of its having been preparatory to a future advance into Europe, that is to say, against Greece, is the tale of what happened at Myrcinus. That leads to the next act in the Perso-Greek tragedy—the Ionian revolt.

A certain Histiaeus, tyrant of Miletus, had been rewarded for his services in the Scythian expedition by the grant of Myrcinus, a town which commanded the narrow route along the north Aegean coast which was practically the only line of communication from the Hellespont region westwards. When he proceeded to fortify this place the suspicions of Megabazus were aroused. Representations made by him to Darius caused the latter to recall Histiaeus and to take him with him to Susa, where he would be out of mischief. Histiaeus did not like detention at Susa, and was anxious to get back to his own people. But, before he took any measures to bring about his return, certain other events of great significance in the relations between Persia and Greece took place.

Political Movements at Athens.—In 510 the Athenians, aided by the Spartans, had expelled the tyrant Hippias, who had alienated the sympathies of Sparta by making an alliance with its sworn foe Argos. The expulsion of the tyrant Hippias was followed by a struggle at Athens between the oligarchs, or, more probably, the conservative[1] element and the extreme democrats, in

[1]The term "conservative" in relation to Athenian politics will be used hereafter to denominate the moderate democrats at Athens together with the oligarchs, who voted with the moderates because the oligarchical vote was too small to carry any policy.

which Sparta intervened in a half-hearted and ineffective way on behalf of the former, a half-heartedness due to the fact that a strong party at Sparta was opposed to incurring obligations abroad which might keep Spartan troops away from home; and events at Athens had shown that an oligarchy could only be maintained by something like permanent military support from Sparta. But to the democrats it seemed as if they had to face political foes who were backed by the strongest military power in Greece, against which no alliance with any other Greek State would be of effective value. Thus they turned to Persia for support, having no suspicion that Persia had any designs on the Greeks in Europe. An embassy was sent to Artaphernes, the satrap of Sardis, asking for an alliance. He demanded earth and water from the envoys, which they gave, evidently under the impression that it was part of the contract of alliance. Artaphernes did not regard it in that light; but assumed that the Athenians had accepted subjection to the Great King. Not till the time of Marathon were the Athenians undeceived on this point. The date of this embassy is not known; but it must have been about 507. Matters became complicated a year or two later when Artaphernes took up the cause of the exiled Hippias, and demanded of the Athenians that they should receive him back as tyrant. The Athenian democrats who had expelled him had to swallow that bitter pill as the price of the continuance of the supposed alliance, for politics at Athens were finely balanced.

The **Ionian** Revolt.—Such was the position when Histiaeus at Susa found means of intervening in the affairs of the Greek cities of the Asiatic coast. His hope was that if Persia had trouble in those parts he might be sent down to settle it. It is evident, however, from incidental references in Herodotus' account of the preliminaries to the Ionian revolt that, before Histiaeus moved, a conspiracy had been formed. The prime mover in the matter was a certain Aristagoras, a cousin and son-in-law of Histiaeus, and his successor in the tyranny of Miletus. Certain exiles from Naxos applied to him for help against political opponents. The main difficulty of the conspirators would be the question of getting together at the outset of the revolt such a force as could cope successfully with the Persian fleet. To the astute Aristagoras the affair of Naxos afforded such an opportunity, for, if Artaphernes could be induced to take up the matter, he would almost certainly mobilize an Ionian Greek fleet. Artaphernes was quite ready to add Naxos to the empire of the Great King, and did mobilize the Greek fleet, whereon someone—almost certainly Aristagoras—warned the Naxians of what was impending and they, being prepared, beat off the attack. Aristagoras came back with the fleet, apparently a disgraced man, but, in fact, a man who had got what he wanted. Just about that time, says Herodotus, he received from Histiaeus at Susa a message tattooed on the head of a slave urging revolt. The first act of Aristagoras and the conspirators was to seize certain tyrants who were on the fleet and to depose the rest. This must have taken place in the autumn of 499. Then Aristagoras went off to Greece to get help. Sparta refused assistance; but at Athens, where the conservatives were for the moment controlling affairs, he was offered help. The story of the revolt, as told by Herodotus, shows that it was a brave venture bravely carried out; it took all the power of Persia six years to suppress the effort.

In the spring of 498 twenty ships from Athens and five from Eretria in Euboea arrived on the Asiatic coast. The hoplites which they brought over seem to have taken part in a march on Sardes, which was partly taken. The danger to Sardes, so Plutarch says, forced Artaphernes to raise the siege of hliletus and come to the rescue of his capital. The Greeks had to fall back to the sea, and were, according to Herodotus, badly defeated near Ephesus. Subsequent events suggest that he exaggerated the disaster. Be that as it may, the Athenian fleet sailed home shortly afterwards, recalled, it may be presumed, by the democrats who had once more got control of affairs. So the year closed for the rebels. They opened the next year 497 by sending their fleet to Byzantium and winning it and the cities of the Propontis over to their side. The absence of the Persian fleet from Herodotus' story of the revolt up to this time is perhaps to be explained by a story preserved by Plutarch to the effect that the Ionians had defeated that fleet in a battle off the Pamphylian coast. This had probably taken place in the summer or autumn of 498, and it would account for the unimpeded action of the Ionian fleet in 497.

The news of the revolt of Ionia had stirred the Cypriote Greeks to action. The Greeks proceeded to attack Amathus, the stronghold of the Phoenician minority in the island. Onesilus, the leader of the revolt, sent urgent messages to the Ionians for help. Before coming to the aid of the Cypriote Greeks the Ionian fleet brought about the revolt of Caria, a formidable addition to the resources of the rebels. The Hellespontine and Carian ventures must have taken some time, so that it is not possible to put the arrival of the Ionian fleet at Cyprus earlier than the late summer of 497. In a sense it arrived too late, for a Phoenician fleet had shipped a Persian force over to the island, and, though the fleet gained another naval victory over the Phoenicians, treachery in the Greek land force led to disaster, and by the beginning of 496 the island was again in the hands of the Persians.

After the recapture of Cyprus by the Persians the chronology of the revolt, always shadowy, vanishes for some years into thin air. One thing seems certain—that the spread of the revolt in 497 must have called for great efforts on the part of Persia. It was not till 496 that Persia was ready. In the earlier half of that year Daurises seems to have subdued the Asiatic side of the Propontis. The Greeks on the European side and the Thracians behind them seem to have thrown off whatever allegiance they had had to Persia at the time when north-west Asia Minor revolted. Caria, with a population which had apparently for some centuries past made a living by fighting the battles of others, was a much more serious problem for Persia. Three great battles took place there, the first on the Marsyas river, in which the Carians were defeated; the second shortly afterwards at Labraunda, in which they were again defeated, and a third near Pedasus, in which they inflicted a terrible defeat on the Persians. These three battles took place, it would seem, in the campaigning season of 496. It was probably after the two defeats in Caria that Aristagoras proposed and carried out the plan of establishing, in case of the failure of the revolt, a refuge for the surviving rebels at that Myrcinus on the Strymon which had been granted to Histiaeus. But there he and all his company perished in battle with the Thracians.

Just about the time of Aristagoras' death Histiaeus arrived at Sardes. His own plan had so far worked excellently, in that he had won his escape from Susa by persuading Darius to let him go down to the coast and settle the revolt; but on his arrival there he found that nobody trusted him. At last the Mytilenians gave him eight ships with which he set himself up as a pirate in the Propontis in the rebel interests, making things unpleasant for the merchant ships of any city which showed a tendency to weaken in its enthusiasm for the continuation of the revolt. These doings of Histiaeus form probably the sum of all that Herodotus has to tell of the events of the revolt in 495. In 494 the Persians began to besiege Miletus as being the true centre of the revolt. Nothing further is told of the fate of Caria, save that after the fall of Miletus some of its cities submitted, while some were subdued by the Persians. To aid in the attack on Miletus the Persians brought up a large fleet composed of Phoenician, Cilician, Cypriote and Egyptian contingents, numbering in all 600 vessels. Against this the rebels put to sea with 353 ships, Miletus, Chios, Lesbos and Samos furnishing the largest contingents. The fight took place at Ladé off Miletus. The story of it as told by Herodotus is much distorted by anti-Ionian bias; but the battle ended in a great defeat of the Greeks. This defeat was practically the end of the revolt. Miletus fell late in 494. Histiaeus was finally caught and executed by Artaphernes. After that the Persians spent part of 493 in extinguishing the dying embers of the rising.

Even from Herodotus' account it is clear that the revolt was one of the most glorious incidents in the story of the Greek race. It took the Persians six years to suppress it, and taxed severely the resources of the greatest empire of the time.

Very little is known of the history of Athens during these years; but what is known suggests that a lively and varying struggle for supremacy was going on between the ultra-democrats and the conservatives. The end of the revolt in 493 brought it indirectly to a climax. Phrynichus, in his play, *The Capture of Miletus,* attacked the democrats who five years before had withdrawn Athenian aid from the rebels, and was prosecuted and fined for so doing. Also Miltiades returned a fugitive from his tyranny in the Thracian Chersonese and was prosecuted by the democrats for tyranny, but acquitted. This acquittal was a conservative victory of such a decisive character that that party seems under the leadership of Miltiades to have controlled Athenian affairs up to the time of Marathon three years later.

Mardonius in **Thrace.**—After sweeping up the mess in Asia in 493 the Persians proceeded in the next year to bring Thrace and Macedonia once more under their control; but the expedition of 492 was not confined to these limited aims. It was commanded by Mardonius who had been appointed to supreme authority in the control of this extreme western part of the empire. He seems also to have received at Susa orders for the settlement of affairs in the Asiatic Greek cities, a settlement showing a policy which aimed at the abolition of the recent discontents. But when it comes to the expedition into Europe it is clear that its object was larger than the mere re-establishment of Persian authority in Thrace and Macedonia. Herodotus says that it was aimed at Athens and Eretria in punishment for the aid they had sent to the Ionian rebels. That it was intended to advance beyond Macedonia is shown by the fact that the disaster which stopped its further progress took place after Macedonia had been pacified. That it was an expedition of great magnitude and importance is shown by the employment of the fleet to co-operate with the land army. The expedition of 492 seems to have aimed at a large, perhaps complete. conquest of Greece. It was brought to an end by a great disaster to the fleet in a storm off Mt. Athos.

But Darius did not forget Athens and Eretria. They at least must be taught the lesson that it did not pay to interfere with Persian rule on the east side of the Aegean. The year 491 passed without movement on the part of Persia; but in 490 came the famous Marathonian Expedition.

The Marathon Expedition. — The story of Marathon soon became a legend, a legend in which the truth was both exaggerated and suppressed. The most important suppression was the successful elimination from the tale of the part which the Athenian ultrademocrats had played in the matter. On the side of exaggeration the magnitude of the Persian numbers was multiplied many times. As far as numbers are concerned the only trustworthy element in the legend is that the army was transported across the Aegean in 600 ships. That may be an overstatement; but it is not likely to be an understatement. It would imply that the land force cannot have been more than 60,000, and possibly not more than 40,000.

Since the return of Miltiades in 493 the Athenian ultrademocrats had been viewing with apprehension the possibility of an oligarchical reaction. Kow, if ever, was that alliance [sic] with Persia, which had been made with a view to provide against such a contingency, to bear fruit. Therefore they regarded the expedition as in their interest, and were quite ready to co-operate with it, Even Herodotus cannot disguise the fact, though he tries to tone it down in the interests of the democracy of 30 or 40 years later. Pindar and Aristophanes, however, backed by the evidence of the 20 years preceding Marathon, make the situation clear.

In the course of its passage across the Aegean the expedition attacked Naxos and did damage there; but the inhabitants escaped to the hills. Delos was treated with respect, for the Persians did not wish to arouse the whole Greek world against them. Then, after visiting some other islands, they came to Eretria. In answer to an appeal for help the Athenians ordered the 4,000 Athenian κληροῦχοι (allotment holders) who had been settled in Chalcis after its capture in 506 to go to the assistance of Eretria. This they did not do, urging, so Herodotus relates, certain excuses which are not very credible. The siege of Eretria only lasted six days. The resistance was brave; but then the Persians got into the town — through treachery, so Herodotus says. It was destroyed, and the inhabitants were carried away to be eventually settled at Ardericca near the mouth of the Euphrates. After capturing the place the Persians took ship across the Euripus and landed on the plain of Marathon 24 mi. northeast of Athens.

There can be little doubt that the strategy of the Persians in the brief campaign which ensued in Attica was dictated by the assumption that they would receive considerable aid from their ultrademocratic sympathizers. The country party, the moderate democrats, from which the hoplite force was mainly drawn, seem to have been aware that the ultrademocrats were prepared to support the invaders. The latter were probably hampered by the presence of the hoplite force in Athens, and the suggestion of the landing at Marathon, at the extreme end of Attica, may have come from them. When the news of the landing reached Athens a council of war was held. A message had already been sent to Sparta for assistance, a natural measure on the part of those conservatives who had looked for, and to a certain extent obtained aid from Sparta in the internal political struggles of the last 20 years.

The council of war was composed of the polemarch and the ten generals, the commanders of the regiments of the ten tribes. Herodotus reads into the Athenian army organization of 490 that of the time at which he wrote, some 30 or 40 years later. The application in 487 of the lot to the election of archons rendered it thenceforth impossible to entrust the supreme military command to the polemarch; and thereafter the direction of military and naval affairs passed to the board of ten generals, and the command on active service to one or more appointed for the expedition or campaign. But at the time of Marathon the polemarch still had the supreme command in battle, though the strategy of a campaign was decided by a council of war in which the generals had each an equal vote with the polemarch. It is evident from the story that the council was at first very nervous about leaving Athens for Marathon. But this nervousness seems to have vanished; and the army marched out. Moreover, no movement of the ultrademocrats took place, though their leaders, the Alcmaeonid family, did not renounce their connection with Persia.

Battle of **Marathon.**—Miltiades was not commander in chief of the Athenian forces, though the council of war adopted his advice and design. He may have advised the march of the Athenians from Athens to Marathon. He was almost certainly the conceiver of the strategy they adopted when they got there. The council of war decided that it was safe for the hoplite force to leave Athens for Marathon, and thither it went. The Persians, who did not as yet know the change of feeling among their quondam friends at Athens, regarded the Athenians as having fallen into the trap set for them — as having left Athens exposed to a surprise attack which would be supported by sympathizers within the city. It may be assumed that Miltiades' idea was that, as the Persian army had landed at Marathon, it could not, if the Athenians were there, either re-embark the army without exposing a covering force to attack and possible destruction, or advance on Athens without fighting its way through one or other of the narrow passages which led from the plain to Athens. That is why, in accordance with his advice, the Athenian army remained inactive at Marathon until the Persians developed one of these two designs. On arriving at Marathon the Athenians took up a position at the Heracleum, a sanctuary and precinct the remains of which have been discovered high up the valley now called the valley of Vrana, but called in old times the Aulon or Funnel. There they were amid rugged hills on the actual upper road to Athens, and within striking distance—about 2 mi.—of any force which either tried to cover an embarkment or attempted to use the lower road. Either there or at Athens 1,000 Plataeans had joined them, assistance sent in gratitude for the protection which Athens had given to Plataea against Thebes for some 29 years past. Then ensued some days of inactivity, the Athenians waiting for the Persians to move, and for the arrival of the promised Spartan assistance, the Persians for a signal that their partisans in Athens were ready. But the Persians moved before the signal came, anxious to decide the matter before the Spartans arrived. The Persian plan was to re-embark a part of their army under the protection of a covering force, and, while the latter held the Athenians at Marathon, to land at Phalerum and make a dash on Athens. So soon as the design developed its general nature must have become clear to the Athenian command, also it was quite evident that the Athenian army must be back at Athens before the Persians landed at Phalerum.

That being so, the Athenians attacked the Persian covering force without delay. The remains of the mound which was raised over the Athenian dead after the battle show that the covering force was drawn up between the lower end of the Aulon and the sea with its back to the latter. Down the Aulon the Athenians advanced and took up battle formation at the mouth of the valley, probably about three quarters of a mile from the Persian front. For the actual tactics in the battle the polemarch Callimachus, who took the unusual step of strengthening both wings and weakening the centre, with the idea, actually realized in the course of the battle, that the enemy's centre would force back the Athenian centre, follow it up, and so expose both its flanks to attack by the troops massed on the Athenian wings.

As has been said, the battle developed as Callimachus had foreseen. The enemy drove in the Athenian centre with their own centre which, advancing in pursuit, was defeated and apparently wiped out by the Athenian wings. The rest of the army fled to the ships, on which, after a struggle, most of them managed to escape. That the battle was not by any means a walk-over for the Athenians is clear from their own account of it. Later tradition represented the numbers of the Athenians as 10,000, which was probably the truth. The number of the Persians was exaggerated at discretion. The Persian losses are said to have amounted to 6,400, a loss which must have fallen mainly on the centre, and perhaps included nearly the whole of it. If this number be accepted, and be taken as about one-third of the Persian troops in the battle, then their total number was about 20,000.

From Marathon the Athenians marched with all speed to Athens in order to anticipate the arrival of the Persian fleet and the rest of the Persian army at Phalerum. The latter did not attempt a landing. The rapid movements of the Athenian army had rendered their plan hopeless, and so they sailed back to Asia. The expected signal came late—probably after the battle was already engaged. After the Athenian army arrived in Athens the promised force from Sparta, 2,000 strong, arrived at the city. The battle made an enormous, indeed an exaggerated, impression on the Greek mind. This great Persia, which to the Greek stood for all that was great in the contemporary world, had been defeated in battle by a Greek State which was at the time hardly a first-class Power in contemporary Greece. The Athenian State had suddenly emerged from a position of second-rate obscurity into a blaze of reputation. Exaggerated or not, Marathon was a great victory, and in one sense epoch-making in the history of warfare. It demonstrated the superiority of the Greek hoplite over any form of soldiery that Persia could put into the field. Nevertheless, the glory of Marathon nearly proved the undoing of Greece, in that it made the Greek world incredulous as to the reality and the extent of the danger which threatened it from Persia ten years later, so that it was caught only half prepared to meet it.

The Ten Years After Marathon.—Of the history of Greece in the decade following Marathon very little is known, and of that little less still has a bearing on the relations between the Greek and the Persian. Aegina, jealous of the growth of Athenian rivalry in trade, renews a war with Athens which the events of 490 had interrupted. Miltiades comes to political ruin the year after Marathon; and a miscellaneous list of prominent Athenian politicians are ostracized in the years which follow. The legislation of 487, to which reference has been made already, brings about a change in the Athenian military and naval organization. Then comes the great increase of the Athenian fleet—of which more later. That Darius intended to take vengeance for Marathon is undoubtedly the case. He lost no time in beginning preparations with that end in view. Their magnitude prolonged them, and Greece was saved by a revolt in Egypt which broke out in 486. It was not suppressed till 484, and Darius had died the previous year.

During these years there had been coming to the front in the ultra-democratic party a new leader not of the Alcmaeonid family. Themistocles had been archon in 493; but his name does not come into prominence until the second half of this decade, when he comes to the front as the advocate of the increase of the Athenian fleet. The silver mines at Laurium were bringing in a much larger income than aforetime to the State, an income which Themistocles proposed to use in the building of a great fleet instead of distributing it in doles among the citizens.

There were political circumstances which were probably the real efficient cause of the support given by democracy to his naval policy. If the democratic position had been an anxious one before Marathon, it was certainly still more anxious afterwards, even allowing for the fact that Miltiades had in 489 prejudiced conservative supremacy by his failure at Paros. Sparta was still to all appearance ready to support the conservatives, and the democrats had lost the support of Persia. There was nothing in Greece to substitute for it. A great fleet would give security for the vital import of foreign corn; but it could also be used to cut off the supply: in other words the crews of the fleet would have the last say on the fate of Attica, and any oligarchy which might be set up there could be starved to death. During those years, there came to Greece reports of great preparations being made in Asia for a repeated attack on the Greeks of Europe.

Preparations of **Xerxes.**—Xerxes had inherited the policy of Darius, and from the time when in 484 the revolt of Egypt was suppressed, he began preparations for a grand attack on the Greeks of Europe. By the autumn of 481 all was ready for an advance. Athens had no delusions on the object of the expedition. Corinth and Aegina with their trade connections with Asia would be in a position to ascertain the truth, and it was perhaps Corinth that convinced Sparta of it. The Peloponnese, with the exception of Argos, took the patriotic side. Boeotia, so Herodotus says, medized outright, a statement which Plutarch (*De Herodoti Malignitate* 31) indignantly denies. Phocis took the patriotic side because, so Herodotus says, the Thessalians took the other. In Thessaly the feudal barons, led by the Aleuadae of Larissa, medized; but the mass of the population took the other side. Corcyra was inclined to be neutral. The Sicilian cities had their hands full with a Carthaginian attack arranged by Persia.

Meanwhile Xerxes had marched from Sardes to the Hellespont, where he had caused two bridges to be constructed, a considerable engineering feat across a wide strait with a strong current; also a canal had been cut across the peninsula of Mt. Athos to avoid the stormy and ill-omened passage round the cape. Its line is traceable at the present day.

Greek Plans of Defence.—The Greek council of war now knew that no help was to be expected from outside Greece; so it planned the defence on that assumption. As in the expedition of 492 the Persian strategy centred on the co-operation between army and fleet. The plan's one drawback was that it limited the mobility of the fleet, since it had to keep in close touch with the army. That the Greeks recognized this is apparent from their designs, even if they were not unanimous as to how and where they should be carried out. That lack of unanimity came nigh to bringing the cause of the Greeks to ruin. There was only one State north of the isthmus, Athens, which really counted in the defence. The minor Peloponnesian States were therefore anxious to concentrate the defence at the isthmus, and there can be little doubt that Sparta and Corinth were in sympathy with them. According to this design Athens was to sacrifice her territory for the time being, and her population was to take refuge in Peloponnese. With this intent the Peloponnesians set about fortifying in feverish haste the four and a half miles breadth of isthmus. It is plain that the Athenians refused to assent to a plan which involved at least the temporary sacrifice and devastation of their territory. It is also plain that the Peloponnesians or, at any rate, the Spartans, knowing that the Athenian fleet was necessary even for a defence of the isthmus, made a show of falling in with the Athenian designs.

The co-operation of fleet and army in the Persian attack rendered a similar co-operation necessary on the part of the defence. But it is possible that the question arose whether the main effort of the Greeks should be on land or on sea. Physiography decided the question. The passage from the north frontier of Thessaly to the isthmus is, owing to the difficult nature of the country, a well-defined line, which offers no alternatives save in Thessaly itself. There it is possible, in passing from Larissa to Thermopylae to go either via Halos and Larissa Cremaste to Lamia, or to take a more inland route over the pass of Thaumacium. South of Thermopylae the line is single, through Thermopylae and a low passage through the Oeta range near Abae; then by the narrow passage between the foot of Helicon and Lake Copais, and so by one of the passes of Mt. Cithaeron — preferably the Dryoscephalae — into the Megarid and Attica. There were various defensible points on this route: at Tempe, where, however, the very narrow passage through that valley could be turned; at Thermopylae, where a turning movement involved great difficulty and danger; and at the narrow strip of traversable ground in Boeotia on the route between Coronea and Haliartus. By sea, on the other hand, there was no place where the passage of the Persians could be blocked. The Euripus could be turned by passing outside Euboea. The Athenian plan of campaign assumed rightly that, if either arm of the invaders' force could be brought to a stand, the other would be brought to a stand also. Physiography determined that this could only be done in the case of the army. At the same time the Greek fleet would have to cooperate with the Greek army to prevent the landing of troops in the rear of any position the latter might take up. Had this design been carried out it is probable that the invaders would never have got south of Thermopylae. That it was not carried out was due to the Peloponnesian dislike of any defence north of the isthmus, and to the further fact that, when forced into compliance with the Athenian designs, their compliance was at best half-hearted.

The first attempt at land defence was made at Tempe, where the Peneius river breaks through the mountains between Ossa and Olympus. The available passage is very narrow indeed. To this place they despatched 10,000 hoplites. This must have been in the spring of 480. The Thessalian commons had begged them to come thither. But, says Herodotus, the Greeks found that the pass could be turned by a route through Gonnos, and so gave up the idea of defending it, and so the Greek army and fleet went back to Attica and the isthmus.

Battle of **Thermopylae.**—There must have been much controversy as to the next line of defence to be adopted; but the views of the Athenians again prevailed, and it was determined to send a force to Thermopylae, and the fleet to the north Euripus to cover the rear of the defenders of the pass. The tale of this episode of the war as told by Herodotus, a Spartan version of a story of which there was much that the Spartan Government would be glad to conceal, is one of the strangest in literature. So far as it goes it is true. Only 7,300 men, nearly all hoplites, were sent to defend the pass. About 4,000 came from the Peloponnese, and the rest from Phocis and Boeotia. No Athenians could be spared, for, now that the 200 vessels of the fleet were mobilized, all the Athenian hoplites would be serving as marines aboard the fleet. This land force was but a fraction of what the Peloponnesians could put into the field. This force, says Herodotus, was represented by Leonidas, the Spartan king, as a sort of vanguard of a larger army; but no other troops were ever sent, not even when Leonidas sent an urgent message asking for reinforcements.

Leonidas was, however, prepared to make a desperate defence of the pass; and it might have succeeded had not the Phocians who guarded the very narrow path of the Anopaea been taken unawares. The Middle Gate of Thermopylae was at that day of such a nature that the front of an attacking force could only be a few men wide. The light-armed Persian or the Persian bowmen could not make any impression on a Greek hoplite force in such a strong position. The path of the Anopaea was a mere forest track on which a small force could have stopped an army. The defence of Thermopylae showed the grandeur of the Spartan nature at its best; but for the Spartan Government it was fortunate that the circumstances of the battle made it possible for it to give its own version of a very embarrassing story. The Greek world all but accepted in full a tale which redounded to the glory of the Greek race as a whole; but there were those who, in moments of irritation and candour, were inclined to remind Sparta of the truth: "the Mede had time to come from the ends of the earth to Peloponnese ere any force of yours worthy of the name went out to meet him," said a speaker to the Spartans some 50 years later (Thuc. i. 69).

While these things had been going on at Thermopylae the Greek fleet in the north Euripus had successfully prevented the Persian fleet from landing troops behind the pass, and had, generally speaking, tried conclusions with the enemy. The Persian fleet had suffered greatly in a storm near Cape Sepias off the mouth of the Euripus, and in a later srorm a Persian detachment of 200 vessels had been wrecked in the Hollows of Euboea. After the disaster at Thermopylae the Greek fleet withdrew southwards to the strait of Salamis on the Attic coast.

Athenian Retirement to Salamis. — That the Athenians had expected the defence of the pass to be a real effort on the part of the land army is evident from the fact that they did not until after the disaster take any measures to secure the safety of their people. Moreover, Herodotus says that, even after the disaster, they had expected a Greek army to oppose the Persians in Boeotia. The miscalculation was such that, though some of the Attic population could be shipped over the Saronic gulf to Troezen, a large number could only, owing to lack of time, be transferred to the island of Salamis, less than a mile from the Attic coast. That was why the fleet went to the Salamis strait. The refugees in the island had to be protected. The fleet in the strait did not in any sense cover the fortifications at the isthmus 30 miles away. The Persian fleet might have ignored it, and sailed on to land troops south of the fortifications, in which case the Greek fleet would have been forced to give battle in open waters, which was what the Persians wished to force it to do, and exactly what the more intelligent of the commanders of the Greek fleet wished to avoid. That the subsequent battle in the strait was brought about by Themistocles is doubtless a fact; but Eurybiades, the Spartan commander-in-chief of the Greeks, seems to have shared his views. The enemy's fleet was not merely superior in numbers to that of the Greeks, but some of its contingents, especially the Phoenician, must have been superior to it in manoeuvring power. The great Athenian contingent of zoo ships, more than half of the 366 triremes in the fleet, was manned by imperfectly trained crews. Even after the disasters at the Sepiad strand and in the Hollows of Euboea, the Persian probably outnumbered the Greek fleet by two to one. With regard to the army, calculations of a more convincing kind may be made which reckon the total numbers at this period of the war at about 400,000 fighting men. The passage of the Persian army from Thermopylae to Attica was marked by a raid on Delphi. A considerable interval must have intervened between its departure from Artemisium and its arrival at the bay of Phalerum on the Attic coast, a few miles outside the eastern end of Salamis strait. It put in there, not apparently with any intent of attacking the Greeks, but to afford supplies to the Persian army in Attica.

Battle of Salamis. — The extant evidence as to what occurred at Salamis is contained in Herodotus and Diodorus together with a few but important details which may be gathered from the Persae of Aeschylus. Diodorus' version is plagiarized from Ephorus, whose story, though not so dramatic as that of Herodotus, gives what is probably a more correct account of the course of events in and before the great fight. The transhipment of the population to Troezen or Salamis seems to have been all but complete. A few, indeed, seem to have deliberately remained behind on the Acropolis. The Greeks inside the strait of Salamis were in a very divided state of mind. The Peloponnesian contingents in the fleet wanted naturally to sail to the isthmus; but any move thither without the Athenian contingent would have been suicidal. As far as the Athenians were concerned it was plain that they could not desert the refugees on the island of Salamis. At the same time if the fleet remained in the strait the Persians would be able to land troops behind the isthmus defence, which would have been a capital disaster to the Greek cause. Strategically the position of the Greeks before the battle of Salamis was a very desperate one. There was only one way out, and Themistocles saw it—to induce the Persians to attack the Greek fleet in the strait. The less experienced seamen had to make up for inferior skill by resorting to boarding tactics, which could only be really effective in narrow waters. Moreover, the Persian superiority in numbers would be discounted if the battle were fought on a necessarily narrow front.

In view of these considerations, Themistocles took what was the desperate measure of simulating treachery by sending a message to Xerxes saying that the Greek fleet was ready to betray the Greek cause. This message reached Xerxes in the late afternoon of the day preceding the battle. Unfortunately for the Persian he had had too many experiences of treachery within the ranks of Greek opponents to suspect the genuineness of the message; and so, early in the night, Xerxes moved the main part of his fleet from Phalerum bay to the eastern entrance of Salamis strait, to a line of which the small island of Psyttaleia formed more or less the centre. To prevent any escape of the Greeks through the western strait of Salamis he sent the Egyptian squadron of 200 vessels to block its passage. What actually took place on the day of battle may be deduced from the Persae. The Persian fleet had to advance into the strait. Up to that time it had been hidden from the Greeks by the promontory of Cynosura; but the latter were aware that they were shut in, since Aristides had arrived at Salamis from Aegina during the night, and had informed them of the Persian movement.

North of Psyttaleia the strait of Salamis turns at right angles from north to west, and thus the Persian fleet, advancing on both sides of Psyttaleia, had to execute a wheeling movement. The strait after turning becomes somewhat narrower, a fact for which the Persians do not seem to have allowed, so that when they tried to advance into the inner strait with as broad a front as they had had when south of Psyttaleia a certain amount of confusion arose. It was during this confusion that the Greeks, who had advanced eastwards down the inner strait, attacked. Everything must have been in favour of the Greeks. The two fleets must have become almost literally jammed in the strait to the north of Cynosura, and that would favour the boarding tactics of the Greeks who had on their vessels hoplites serving as marines. Of the details of the fight a few are related by Herodotus, but they are rather picturesque stories than real contributions to its history. Before the day was done the Persians had been either driven, or forced to retire, from the strait.

The Greeks themselves seem not to have realized the extent of their victory until, shortly afterwards, the Persian fleet retired altogether from European waters and their army fell back northwards, part of it to winter in Thessaly with a view to further attack next year, part of it to Asia. Though Salamis was not decisive of the war, for the attack of Mardonius in 479 was very formidable, yet it is one of the decisive battles of the world in that, had it turned out otherwise, Greece would have fallen under the dominion of Persia. When the Greeks discovered that the Persian fleet had retreated they sailed as far as Andros. Proposals were made to break down the Hellespont bridges; but these were overruled.

In this same year Gelon of Syracuse inflicted on the Carthaginian invaders of Sicily such a defeat that, had he followed it up on the African coast, the career of Carthage might have come to an end. Thus the great scheme of Persia had failed in both east and west. When the year 479 opened, the Persian fleet seems to have been on the Ionian coast with a view to preventing any movement of revolt in the Ionian cities. Mardonius was in Thessaly with an army which Greek authors reckoned at 400,000 men. Half that number would probably be nearer the truth. In the campaign of 480 Themistocles had held supreme command of the Athenian contingents, both naval and military; but in 479 he vanishes from the picture. No Greek author gives any explanation of his disappearance.

Battle **of Plataea.**—In the spring the Persians seem to have made, through a certain Alexander of Macedon, an attempt to detach Athens from the Greek cause. Sparta intervened, perhaps superfluously, and the attempt came to nothing. Then Mardonius started from Thessaly on his march south. It is evident that at the back of what follows is a resuscitation of the Peloponnesian design to concentrate the land defence at the isthmus. Sparta was reluctant to move northwards, but fearing that Athens might desert the Greek cause, the Spartans, whose army was mobilized, made a surprise march northwards at the very time that an Athenian embassy was at Sparta imploring them to act. But meanwhile Mardonius had overrun Attica. When, however, he heard that the Greek army was marching north he retreated to Boeotia with a base at Thebes. The Peloponnesian contingents of the Greek army now moved north from the isthmus, advancing to Eleusis, where the Athenian army met them. Then the whole force marched through the Dryoscephalae pass into Boeotia, and took up a position low down on the north side of the pass. Here the position was across a valley, the Greek centre being on low ground, and the wings on higher ground on either side. The position was close to the little town of Erythrae. The Persians were encamped on the Asopus river about three miles north of this point. The Persian cavalry assailed the Megarians in the Greek centre but the Athenians went to their help, and the cavalry attack was driven off. During the night the Greeks moved in a north-north-westerly direction to a hollow on the north side of which rose a ridge, the Asopus ridge. The Persians got wind of the movement, and moved up the Asopus to a position fronting the Greeks. About this time reinforcements were coming in which raised the numbers of the Greek army to a total of 108,200. The number of hoplites, the real fighting force, was about 39,000. The Persians numbered about 200,000. With them, however, were some Phocians and a large force of Thebans.

A position of stalemate then supervened, neither side attempting anything for eight days. Then, as the Greeks were some two miles from the passes which debouch on to the field, the Persians began to send cavalry round their flanks, which attacked and interfered with the Greek provision trains. Then came a grand attack by the Persian cavalry which harassed the Greeks with long-range missiles, and destroyed the spring of Gargaphia on which the Greeks were dependent for water. It lay in a hollow behind the Greek line. The Greek position on the Asopus ridge became untenable, and a retreat was necessary. The new position which was to be taken up was at the "island," which is a mound on a ridge at the foot of Cithaeron about a mile east of the town of Plataea, and almost surrounded by two branches of the Ōeroë river. But, though the army generally was to make for this position, it is evident from what followed that the Spartans were to go in the first place to the relief of the Greek baggage trains in the passes. As the retreat was to be made at night there was every possibility of confusion. The Greek centre started first, but missed the "island" and arrived at the town of Plataea. The Spartans started later south-south-east towards the pass of Dryoscephalae. The Athenians, who had waited for the Spartans to move, then started for the "island." Neither the Spartans nor the Athenians reached their objectives, for the Spartans, after they had gone a little more than a mile from the summit of the Asopus ridge, were assailed by the Persian cavalry and brought to a standstill at a point near a temple of Eleusinian Demeter, which stood on the ridge next east of the Asopus ridge. Mardonius seems to have thought that the Greek retirement meant defeat, and to have determined to make the rout complete. So long as the Persian cavalry employed missiles the Spartans suffered considerable loss. Then the Persian infantry came up. The battle was an unequal one, for the light-armed Persian had no chance against the hoplite. In the mêlée Mardonius himself perished, and eventually the Persians were driven back in rout and tried to take refuge in their camp. Meanwhile the Athenians on the Greek left had started for the "island." They had only reached the plain south-west of the Asopus ridge when they received a message from the Spartans asking for assistance, and seem to have started off in their direction. But in the hollow south of the Asopus ridge they were assailed by the Greeks who were fighting on the Persian side. They defeated the Thebans after an obstinate fight. The Greek centre at Plataea had by this time received news of the two battles, and part of it seems to have hurried to aid the Spartans, while the other part went to help the Athenians. The latter were badly cut up by the

Theban cavalry, and so never reached the Athenians, while the former may possibly have taken part in the last stages of the fight beneath the temple of Demeter. The last phase of the battle was a combined assault by the Greeks on the Persian camp and a general massacre of the enemy, 30,000 of whom are said to have perished. The Greeks celebrated their victory by dedicating to Delphi a tenth of the spoils and setting up the famous serpent column surmounted by a bowl, the remains of which still survive at Constantinople. The leaders of the medizing party at Thebes they captured and executed. Plataea set the seal on Salamis. The two battles saved Hellenism in Europe from becoming orientalized, and thus modified the history of the world.

Naval Operations in the Aegean: Mycalk.—While these things were taking place in European Greece, a Greek fleet was operating on the Asiatic coast of the Aegean. The Ionians had appealed for help. The fleet was commanded by the Spartan Leutychides. For some unknown reason the Phoenician contingent of the Persian fleet had been sent home, and therefore the weakened remnant dared not try conclusions with the Greeks on the open sea. They sought refuge at Mycalé where was a strong land army which had been overawing the Greek cities. As the Persians declined a naval battle, Leutychides disembarked his troops and attacked them on land. The result was an obstinate battle but a great Greek victory to which the Ionian contingent on the Persian side contributed by turning against their masters. From that time forward the fate of the Greek cities of Asia became a factor in the relations between Persia and the European Greeks. The year 478 was spent partly in the reconstitution of Attica and in that rebuilding of the walls of Athens which the Spartans would have prevented had they not been tricked by Themistocles.

The Delian Confederacy.—As far as the patriotic Greeks were concerned the action of the Ionians at Mycalé had practically committed them to the liberation of the Greek cities of Asia from Persian rule, and so the war had to be carried on in the form of an attack on the Persian hold on the Greek cities of the Aegean, the Propontis and Cyprus. Pausanias the Spartan who had commanded at Plataea led in 478 what was probably a very miscellaneous fleet drawn from the Greek mainland and islands in an attack on the Persian possessions. Under his command Cyprus and Byzantium were taken, the former a base for Persian attack on the Aegean, the latter the key to the corn route from the Euxine. At Byzantium Pausanias developed certain strange habits which the Greek patriots interpreted as medism. Sparta recalled him, and sent out a successor whom the Greeks refused to accept as commander; and so the leadership passed to Athens. Sparta withdrew from the war, and it is probable that all the other States of the mainland save Athens withdrew at this time. With the new league came the tribute from those States which paid Athens to furnish ships and crews on their behalf, an ever-increasing number as time went on. How long it took to set free the Greek cities of the Asiatic coast is not known. It is probable that one of the main motives of the campaigning was the complete restoration of the passage through the Hellespont and Bosporus to the Euxine corn region. The restiveness of the allies culminating in the revolt of Naxos in 467, shows that there were many of them who thought that the danger from Persia was over by that time. Whatever may have been the case before 466 the battle of the Eurymedon in that year put Persia completely out of action as far as the Aegean was concerned. That great victory by land and sea was less dramatic and less decisive of the future than Salamis had been; but for 50 years after the battle Persia left Greece alone. Still the experience of 50 years later was to show that those members of the league who supposed that the danger from Persia was over for ever were mistaken. It was the continued existence of the great Athenian fleet which kept the Persians from interfering in Greek affairs. Within a brief period after its destruction at Syracuse the interference began again, and within 30 years of that time Persia had become arbiter even in the internal politics of Greece.

GRAECO-TURKISH WAR, 1897. This war between Greece and Turkey (*see* GREECE: *Modern History*) involved two practically distinct campaigns, in Thessaly and in Epirus. Upon the Thessalian frontier the Turks, early in March, had concentrated six divisions (about 58,000 men), 1,500 cavalry and 156 guns, under Edhem Pasha. A seventh division was rendered available a little later. The Greeks numbered about 45,000 infantry, 800 cavalry and 96 guns, under the crown prince. On both sides there was a considerable dispersion of forces along the frontier. The Turkish navy, an important factor in the war of 1877–78, had became paralytic ten years later, and the Greek squadron held complete command of the sea. Expeditionary forces directed against the Turkish line of communications might have influenced the course of the campaign; but for such work the Greeks were quite unprepared, and beyond bombarding one or two insignificant ports on the coast-line, and aiding the transport of troops from Athens to Volo, the navy accomplished nothing. On April 9 and 10 Greek irregulars crossed the frontier, either with a view to provoke hostilities or in the hope of fomenting a rising in Macedonia. On the 16th and 17th some fighting occurred, in which Greek regulars took part; and on the 18th Edhem Pasha, whose headquarters had for some time been established at Elassona, ordered a general advance. The Turkish plan was to turn the Greek left and to bring on a decisive action, but this was not carried out. In the centre the Turks occupied the Meluna pass on the 19th, and the way was practically open to Larissa. The Turkish right wing, however, moving on Damani and the Reveni pass, encountered resistance, and the left wing was temporarily checked by the Greeks among the mountains near Nezeros. At Mati, covering the road to Tyrnavo, the Greeks entrenched themselves. Here sharp fighting occurred on the 21st and 22nd, during which the Greeks sought to turn the right flank of the superior Turkish central column. By the 23rd the Turkish forces had drawn together, and the Greeks were threatened on both flanks. In the evening a general retreat was ordered, and the loose discipline of the Greek army was at once manifested. Rumours of disaster spread among the ranks, and wild panic supervened. There was nothing to prevent an orderly retirement upon Larissa, which had been fortified and provisioned, and which offered a good defensive position. The general *débâcle* could not, however, be arrested, and the mass of the Greek army fled southwards to Pharsala. There was no pursuit, and the Turkish commander-in-chief did not reach Larissa till the 27th. Thus ended the first phase of the war, in which the Greeks showed tenacity in defence, which proved fruitless by reason of initially bad strategic dispositions entailing far too great dispersion, and also because there was no plan of action beyond a general desire to avoid risking a defeat which might prevent the expected risings in Macedonia and elsewhere. The handling of the Turkish army showed little skill or enterprise.

Larissa being abandoned, Velestino, the junction of the Thessalian railways, where there was a strong position covering Volo, seemed to be the natural rallying point for the Greek army. Here the support of the fleet would have been secured, and a Turkish advance across the Othrys range upon Athens could not have taken place until the flanking position had been captured. Whether by direction or by natural impulse, however, the mass of the Greek troops made for Pharsala, where some order was re-established. The importance of Velestino was recognized by sending a brigade thither by railway from Pharsala, and the inferior Greek army was thus split into two portions, separated by nearly 40m. A Turkish reconnaissance on Velestino was repulsed, but on May 5 the Greeks were driven from their positions in front of Pharsala by three divisions. Further fighting followed on the 6th, and in the evening the Greek army retired in fair order upon

Domokos. It was intended to turn the Greek left with the first division under Hairi Pasha, but the flanking force did not arrive in time to bring about a decisive result. The abandonment of Pharsala involved that of Velestino. Again delaying, Edhem Pasha did not attack Domokos till the 17th, giving the Greeks time to entrench their positions. The attack was delivered in three columns, of which the right was checked and the centre failed to take the Greek trenches and suffered much loss. The left column, however, menaced the line of retreat, and the Greek army abandoned the whole position during the night. No effective stand was made at the Furka pass, which was evacuated on the following night. Colonel Smolenski, who arrived on the 18th from Velestino, was directed to hold the pass of Thermopylae. The Greek forces being much demoralized, the intervention of the tsar was invoked by telegraph; and the latter sent a personal appeal to the sultan, who directed a suspension of hostilities. On the 20th an armistice was arranged.

In Epirus at the outbreak of war about 15,000 Greeks under Colonel Manos occupied a line of defense from Arta to Peta. The Turks, about 28,000 strong, under Achmet Hifsi Pasha, were distributed mainly at Iannina, Pentepagadia and in front of Arta. On April 18 the Turks commenced a three days' bombardment of Arta; but successive attempts to take the bridge were repulsed, and during the night of the 21st they retired on Philippiada, 26 mi. distant, which was attacked and occupied by Manos on the 23rd. The Greeks then advanced to Pentepagadia, but the position held by their advanced force near Homopulos was attacked on the 28th and 29th, and no Greek reinforcements were forthcoming when needed. The Evzones made a good defense, but were driven back by superior force, and a retreat was ordered, which quickly degenerated into panic-stricken flight to and across the Arta. Reinforcements were sent to Arta from Athens, and on May 12 another incursion into Turkish territory began, the apparent object being to occupy a portion of the country in view of the breakdown in Thessaly and the probability that hostilities would shortly end. The advance was made in three columns, while 2,500 Epirote volunteers were landed near the mouth of the Luro river with the idea of cutting off the Turkish garrison of Prevesa. The centre column attacked the Turks near Strevina on the 13th, but although the Greeks fought well, they ultimately had to retreat. The volunteers landed at the mouth of the Luro, were attacked and routed with heavy loss.

The campaign in Epirus thus failed. Under the terms of the treaty of peace, signed on Sept. 20, and arranged by the European powers, Turkey obtained an indemnity of £T4,000,000 and a rectification of the Thessalian frontier. (G. S. C.)

GRAF, URS (c. 1485–1527), Swiss draftsman, engraver and goldsmith, was born at Solothurn, the son of the goldsmith Hugo Graf, and probably studied under his father and then at Basel. His art is inspired by that of Durer and of Baldung Grün. After a period of travel he settled in Basel in 1509. In 1514 he executed a reliquary of St. Bernard for the monastery of St. Urban. This, his chief work as a goldsmith, was sold by the city of Lucerne in 1850 and has since disappeared. Graf is best known for his dra ings, executed in sure and bold line work. There are extant 100 woodcuts for which he made the drawings; a number of engravings, etchings and nielli, and some zoo drawings by his hand.

The greater part of Graf's work is dated and signed by his monogram.

GRÄFE, the name of a German family noted for its contributions to medicine and surgery.

KARL FERDINAND VON GRAFE (1787–1840), surgeon, was born in Warsaw, Pol., on March 8, 1787, studied in Germany and became professor of surgery in Berlin. He was a pioneer in German plastic surgery and was responsible for significant surgical innovations including technical improvements of blood transfusion, Caesarean section, rhinoplasties and repair of cleft palate. Grafe has been called the father of modern plastic surgery. He died at Hanover on July 4, 1840.

ALBRECHT VON GRAFE (1828–1870), his son, considered the founder of modern ophthalmology and a pioneer in ophthalmic surgery, was born on May 22, 1828, at Berlin. He studied in Berlin, Vienna, Prague, Paris, London, Dublin and Edinburgh as an ophthalmic specialist and became one of the greatest eye surgeons of the century and an authority on diseases of the brain and nervous system. He was noted also as a great and revered teacher and as the founder, with F. C. Donders (*q.v.*), of the Archiv fur *Ophthalmologie*, which contains most of his important publications. Albrecht von Grafe is connected historically with the operation for cataract by linear extraction (1867–88). He is best known to medical students for the eye sign in exophthalmic goitre which is named for him. Among his other contributions are iridectomy for glaucoma (1857), the establishment of sympathetic ophthalmia as a clinical entity (1866), his demonstration that often blindness and visual defects connected with cerebral disorders are traceable to optic neuritis (1860) and the introduction of the use of Helmholtz' ophthalmoscope in diagnosis. He died of tuberculosis at the age of 42, on July 20, 1870.

ALBRECHT VON GRAFE (1868–1933), his son, a German politician and army major, was born at Berlin on Jan. 1, 1868. He was a member of the German National party in the Weimar national assembly (1919), a member of the Reichstag (1920–28) and was cofounder (1922) and leader of the German National Independent party. He joined Hitler's National Socialist party but soon left it. He died on April 18, 1933. (I. H. L.)

GRAFFITO, from the Italian word meaning "scribbling" or "scratching," has been adopted by archaeologists as a general term for the casual writings, rude drawings and markings on ancient buildings, in distinction from the deliberate writings known as inscriptions. These graffiti, either scratched on stone or plaster by a sharp instrument or, more rarely, written in red chalk or black charcoal, are found in great abundance, *e.g.,* on the monuments of ancient Egypt. The subject matter of these scribblings by boys, street idlers and the casual passer-by, includes scrawls, rude caricatures, election addresses and lines of poetry. Apparently private owners of property felt the nuisance of the defacement of their walls; at Rome near the Porta Portuensis was found an inscription begging persons not to scribble (scariphare) on the walls.

Graffiti are important to the paleographer as illustrating the forms and corruptions of the various alphabets used by the people, and may guide the archaeologist to the date of the building. But their chief value is twofold. First, they are important to the linguist for the information they furnish about the spoken language of the period and place and occasionally about other languages as well, as in the case of the ancient Greek mercenaries who scribbled their names, in the Cypriote dialect and syllabary, on an Egyptian sphinx, or the Greek "tourist" from Pamphylia who carved his name on the great pyramid at Giza. And secondly, graffiti are invaluable to the historian for the light they throw on the everyday life of the man in the street of the period, and for the intimate details of customs and institutions. The graffiti dealing with the gladiatorial shows at Pompeii are in this respect particularly noteworthy.

The most famous graffito is that generally accepted as representing a caricature of Christ upon the cross found on the walls of the Domus Gelotiana on the Palatine in Rome in 1857, and now preserved in the Kircherian museum of the Collegio Romano.

GRAFT HYBRIDS: see CHIMERA.

GRAFTING (IN PLANTS), is the operation of placing a portion of one plant (bud or scion) into or on a stem, root or branch of another (stock) in such a way that a union will be formed and the partners will continue to grow. This term includes bud grafting, scion grafting and approach grafting or inarching. The first two differ only in the amount of wood used for the scion. In modern horticulture grafting is used for many reasons: to repair injured trees, to produce dwarf trees and shrubs, to avoid certain diseases, to retain varietal characteristics, to adapt varieties to adverse soil or climatic conditions, to insure pollination, to produce multifruited or multiflowered plants and as the only method of propagation for some species.

Although grafting was known to the ancients, it was not fully understood by them. Many records existed before the birth of Christ calling attention to instances of grafts which occurred in nature. Pliny the elder, writing on the various kinds of natural grafting, called attention to combinations of cherry growing on willow, plane on laurel and laurel on cherry, which resulted from the germination of foreign seeds that were caught in a crack or hollow of an established tree. The subsequent independent growth of the seedling, upon hasty observation, might be construed as resulting from actual tissue union between the two plants. Many of these reports can be attributed to the observer's imagination, since plants having widespread genetic make-up are not generally compatible.

In theory any two plants which are closely related botanically and which have a continuous cambium can be grafted. Grafts between species are often successful, between genera occasionally so, between families nearly always failures. Within the genus closeness of botanical relationship is not an infallible guide as to probable success, but in the absence of recorded experience it is the best available. The ability of two plants to continue to grow or be compatible when joined together by the asexual practice of grafting is mediated by many complex physiological and environmental factors.

Compatibility or congeniality in grafting is of various degrees. Apple grafted on oak fails immediately; apple grafted on pear may grow well for one or two years, but gradually weakens and dies. Some lilacs exist for a number of years on privet stocks, but fail ultimately. The common apricot is, other things being equal, the best stock for apricot varieties, but in moist soils in cool regions apricot trees flourish better on certain plum stocks than on apricot. These differences in adaptability of closely related plants that can be successfully grafted permit a greater degree of adjustment to soil conditions than would ordinarily be possible.

The establishment of union between grafted components is effected through the formation of a loose growth of cells (callus) contributed by both elements. These cells fuse into a mass so continuous in compatible grafts that the precise location of the line of union is frequently impossible to determine. There is, however, no evidence of a fusion of individual cells. At the initial union the cells are usually isodiametric; in the secondary stage tissue differentiation begins. Just as in wound healing, union proceeds more rapidly if the wounded areas are protected against drying out, and in most forms of grafting rapid knitting is essential to maintenance of life in the scion.

The principles involved in grafting are based on the matching of scion and stock cambiums (meristematic tissue, the cells of which are undifferentiated and capable of frequent cell division). Cambial tissue in most woody trees and shrubs is an inconspicuous single cell layer covering the central core of wood and lying directly beneath the bark.

The success or failure of any grafting operation is based upon the compatibility of each plant part, closeness of fit and cambial contact. The union is initially held in place by pressure exerted by the stock, grafting tape or by rubber budding strips applied over the point of union.

The numerous operative procedures by which grafted plants are produced fall into two major groups known as budding and grafting. Though these terms are well understood in ordinary usage, definite separation between them is impossible in some cases. Perhaps the best differentiation between budding and grafting is that offered by Charles Baltet, who defined grafting as any method which employs as a scion, a portion of a plant comprising the complete circumference, no matter how long it may be. This distinction considers only the mechanical operations involved with no reference to the manner in which union is established.

Budding. — As generally understood, budding is effected by raising or removing a segment of bark of the stock and inserting a segment of the scion, containing a bud, into the wound thus made. The piece inserted may be shield or patch shaped. In budding apple, pear, peach, orange, etc., the bark is lifted away from around an upright or inverted T-shaped incision (fig. 1 A) and the bud is then inserted under the bark (fig. 1 B) and tied securely in place with raffia or rubber budding strips (fig. 1 C). In budding nut trees better results are usually obtained by removing a piece of bark, generally rectangular in shape, from the stock and replacing it with a piece of bark carrying a bud from the tree whose

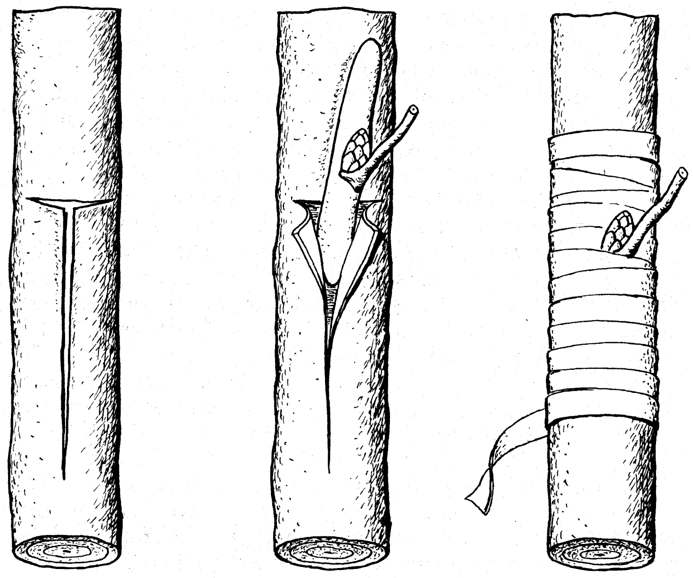

FIG. 1.—THE TECHNIQUE OF BUDDING SHOWING (A) BARK OF STOCK OPENED FOR INSERTION OF BUD; (B) METHOD OF INSERTING BUD INTO INCISION; (C) STOCK WITH BUD TIED IN PLACE WITH A RUBBER BUDDING STRIP

reproduction is desired. In these cases tying and waxing are generally employed in order to insure cambial contact and to protect the bud from desiccation and disease organisms.

Ordinarily budding is practicable only during the period in which the bark slips freely on the stock. Most budding operations in nurseries in temperate zones are done from midsummer to late summer. The shield of the inserted bud usually unites with the stock within 14 days, but growth from the bud is not expected or desired until the following spring when the stock is cut back close to the inserted bud to force its development.

In southern and Pacific coast states of the United States the long growing season permits June budding of peach and other stone fruits as early as stocks are workable, *i.e.,* when the stock is pencil-size in diameter. Stone fruit seedlings growing from seed planted in early spring or the preceding fall are budded actually in May rather than in June in many nurseries. The top of the stock being broken over at once (to stimulate bud growth) but not removed until the bud has grown several inches; this procedure produces a budded tree ready for planting in the orchard in the autumn of the same propagating year in which the seed for the stock was sown.

Budding may also be employed in producing double-worked trees. A bud of the intermediate variety is first placed on the selected rootstock in the usual manner and forced. The following year the desired scion variety is budded on the intermediate; the whole process taking about three years.

Grafting. — In one form or another, grafting proper is used on plants either in the growing or dormant stage. Deciduous fruit trees are grafted ordinarily with dormant scions and frequently when the stocks are also dormant. In many of them (*e.g.,* apple) callus formation takes place at relatively low temperatures while the plant is dormant, thereby resulting in a graft which at planting time has an incipient union. This permits bench grafting, a process in which dormant scions are grafted on small roots or pieces of roots, also dormant, during winter by workmen indoors. The grafted plants are stored in moist sand, sawdust or peat moss until spring, when they are lined out in nursery rows. Dormant scions may be grafted onto growing trees throughout the growing season, but the growth of the scion and healing of the stub consequent upon late grafting are much inferior to those obtained from spring grafting.

In grafting plants having evergreen foliage, such as the orange, the leaf blades are removed from the scion in order to restrict moisture loss while the union is forming. Grafted conifers, however, are not defoliated, but are placed in a somewhat shaded position in a closed case. In many plants, including most conifers, root regeneration is so slow that they seldom can be grafted successfully bare rooted, and therefore the stocks must be well established in pots previous to the time of grafting. In grafting the mango, which is particularly difficult, small potted stocks are sometimes placed close to young shoots of the mother tree which may then be united to the stock by inarching or approach grafting (see below). In this procedure the scion remains attached to the mother tree, being cut free only after it has united with the potted stock.

The various types of operation by which stock and scion are so fitted together that they may unite by grafting number into the hundreds. Six methods, however, will satisfy almost all requirements, since choice depends principally on ease of execution and on the relative sizes of the stock and scion. When the stock is much larger than the scion the cleft graft (fig. 2 A, B) or a bark (crown) graft (fig. 2 E) is more advantageous.

Cleft Grafting.—The cleft graft, usable when the stock is dormant (*i.e.,* its bark does not slip) involves sawing the stock at right angles to its stem, splitting the stem and then inserting scions with the bases cut approximately wedge shaped so that their cambial zones (between the bark and wood) lie alongside the cambial zones of the stock.

Bark *(Crown)* and Inlay *Grafting.*—These methods involve cutting off the stock, as with the cleft graft, and either inserting a wedge-shaped scion between bark and wood of the stock (true bark graft) or removing a portion of the bark into which is fitted exactly the scion from which half the circumference of the basal portion has been removed (inlay graft). The bark graft is practicable only when the bark of the stock separates readily from the wood. Since these grafts are usually made above the ground, all cut surfaces should be coated with one of the proprietary grafting compounds or with grafting wax; to protect against drying out. These grafts can be made on stems of any size, but satisfactory healing is rarely obtained without undue effort when the stubs exceed 2 in. in diameter.

Splice and Tongue Grafting.—The splice graft and its modified form, the tongue graft (fig. 2 C, D), are suited to cases in which stock and scion are very nearly of the same diameter. A straight slanting cut, at a rather narrow angle, removes the top of the stock. A similar cut is made at the base of the scion. The two are joined so that the cambial zones match, after which they are tied securely in place. The tongue graft adds to the slanting cut a longitudinal split in the cut surfaces of stock and scion, in each case about one-third of the distance in toward the centre from the longest lip. These two pieces are then fitted together giving increased contact of the cambium zones and one which is less easily displaced than the simple splice graft. Both splice and tongue grafts which are to stand above ground are waxed or coated with grafting compound in order to prevent excessive drying from sun and wind exposure. Similarly, if these grafts are to stand below ground it is common to wrap the graft union with cloth-backed grafting tape.

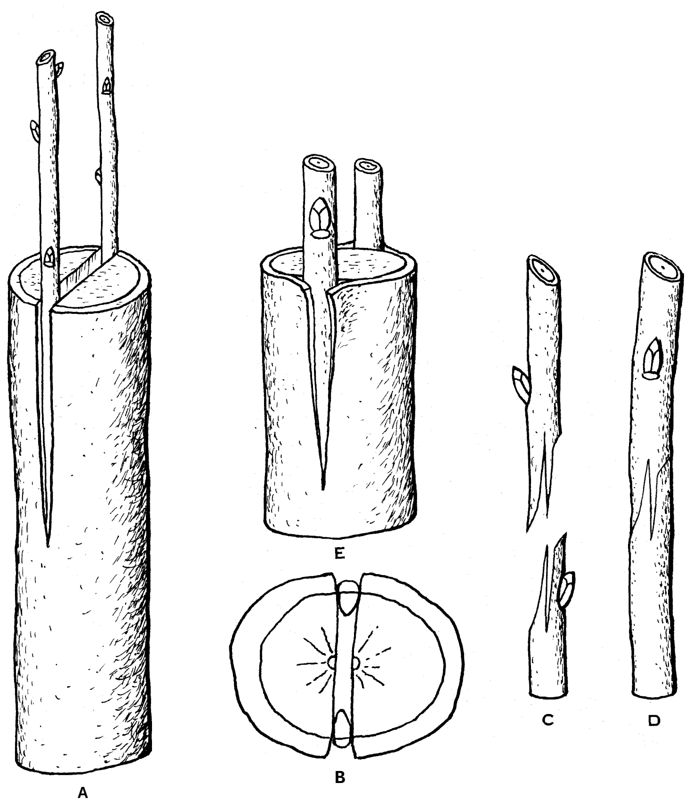

FIG. 2.—(A) CLEFT GRAFT; (B) CROSS SECTION OF CLEFT GRAFT; (C, D) TONGUE (WHIP) GRAFT: (E) BARK (CROWN) GRAFT

Side and Veneer Grafting.—With conifers and with some other plants one of the side grafts is generally employed. Into the stem of the stock, generally rather close to the soil line, a long diagonal downward cut, traversing about a third of the diameter, is made; into this is fitted the scion with its base trimmed to a wedge shape. If the cut portion of the wood is removed and the scion, cut only on one side, is fitted against the exposed surface of the stock, the operation is known as veneer grafting. These two methods are suitable for use in cases where union of stock and scion are slow to take place.

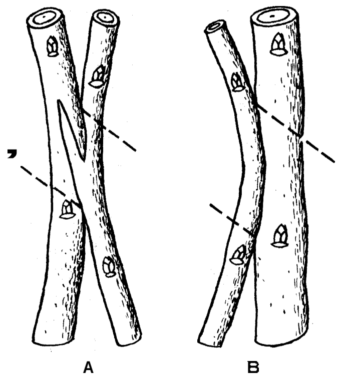

FIG. 3.—TYPES OF INARCHING

Scion on left, stock on right. Dotted line shows where cuts are made after scion and stock grow together

Inarching.—This may be accomplished by making an upward diagonal incision in the scion and a similar downward incision in the stock, fitting together the two tongues thus created, tying in position and treating with a grafting compound (fig. 3 A). It may also be effected by removing a small longitudinal piece of bark and wood from the scion and fitting exactly the exposed portion of the scion into a slot on the stock from which the bark has been removed (fig. 3 B). Both of these methods permit union of stock and scion to be established before either is severed.

Bridge Grafting.—Closely related to the above methods in the structure of the approaches made is bridge grafting, but its use is in tree repair rather than in propagation. Where a portion of the bark of a tree has been removed by an injury (severe frost or foraging animals), the wound may be bridged over by a number of long scions, whose ends eventually unite with the healthy tissue above and below the wound.

GRAFTON, DUKES OF. The English dukes of Grafton are descended from HENRY FITZROY (1663–1690), the natural son of Charles II by Barbara Villiers (countess of Castlemaine and duchess of Cleveland). In 1672 Henry was married to the daughter and heiress of the earl of Arlington and created earl of Euston; in 1675 he was created duke of Grafton. At James II's coronation he was lord high constable. In the Monmouth rebellion he commanded the royal troops in Somersetshire; but in 1688, with Churchill (duke of Marlborough), he seceded to William of Orange. He died of a wound received at the storming of Cork.

AUGUSTUS HENRY FITZROY, 3rd duke of Grafton (1735–1811), grandson of the preceding, was educated at Westminster and Cambridge. In 1765 he was secretary of state under the marquis of Rockingham; but retired the next year, and Pitt (becoming earl of Chatham) formed a ministry in which Grafton was first lord of the treasury (1766) but only nominally prime minister, until

Chatham's illness at the end of 1767. Political differences and the attacks of "Junius" led to his resignation in Jan. 1770. He was lord privy seal in Lord North's ministry (1771), but resigned in 1775, being in favour of conciliatory action toward the American colonists. In the Rockingham ministry of 1782 he was again lord privy seal. In later years he was a prominent Unitarian.

GRAFTON, RICHARD *(c. 1513–1573)*. English chronicler and printer of "The Great Bible" *(1539)* and the first and second *Book of Common Prayer*, received the freedom of the Grocers' company in 1534 and was its warden, 1555–56. In conjunction with Edward Whitchurch he published a modified version of Miles Coverdale's English Bible, which was printed in Antwerp in 1537 and known as the Matthew Bible *(see* ROGERS, JOHN *[c. 1500–1555])*. In 1538 he went to Paris, where the revised Coverdale New Testament was reprinted "for Richard Grafton and Edward Whitchurch." They began printing the folio known as "the Great Bible," by special license obtained from Francis I at Henry VIII's request. The work was suddenly stopped by the French government and the presses seized. Grafton fled, but his patron, Thomas Cromwell, bought the presses and type, and printing was completed in England. In 1544 Grafton and Whitchurch secured the exclusive right of printing church service books, and on Edward VI's accession Grafton was appointed king's printer. In this capacity he produced the *Book of Homilies (1547)*. the *Book of Common Prayer* (1549 and 1552) and the *Acts of Parliament (1552* and *1553)*.

In 1553 he printed Lady Jane Grey's proclamation and signed himself the queen's printer. For this he was imprisoned for a short time by Mary; he seems thereafter to have retired from active business.

His historical works include a continuation (1543) of John Hardyng's *Chronicle* from the beginning of the reign of Edward IV to Grafton's own times. After retiring from printing he published *An Abridgement of the Chronicles of England* (1562), *A Manuell of the Chronicles of Englande* (1565), *Chronicle at large, and meere Historye of the affayres of England* (1568). Grafton was interested in London hospitals, being master of Bridewell, 1559–60, and of Christ's hospital. 1560.

He died in London in 1573 and was buried on May 14.

See J. A. Kingdon, *Incidents in the Lives of Thomas Poyntz and Richard Grafton (1895)* and *Richard Grafton, Citizen and Grocer of London* (1901). *(Rd. C. G.)*

GRAFTON, a city of Clarence county, N.S.W., Austr.. on the Clarence river 42 mi. from its mouth and 342 mi. N.E. of Sydney. Pop. of Grafton and South Grafton (1954) 14,201. It became a municipality in 1859 and a city in 1861. Grafton is the seat of an Anglican bishop. The river is navigable to the city for ships of moderate burden and for small vessels to a point 35 mi. beyond. The entrance to the river and the river channel is being artificially improved for deep-sea ships. Rail and air services link the city with Sydney and Brisbane. Primary industries include dairying, production of sugar cane, maize, vegetables, timber, fruit and beef cattle. Secondary industries are the processing of timber, meat and dairy products, match manufacture and brewing. It is a popular tourist resort.

GRAHAM, SIR JAMES ROBERT GEORGE, BART. *(1792–1861)*, English statesman who played an important part as Sir Robert Peel's confidant and adviser, was born at Netherby, Cumberland, on June 1, 1792, and educated at Westminster and Christ Church, Oxford. Member for Hull and then for St. Ives from 1818 to 1820, Graham withdrew from politics to manage the family estates in Cumberland, gaining repute as an expert in agricultural economics and technique. Returning to parliament for Carlisle in 1826, he sat for Cumberland from 1827 until 1837, and from 1838 for Pembroke, Dorchester and Ripon, before representing Carlisle from 1852 until his death at Netherby, Oct. 25, 1861.

From the beginning an advanced Liberal, Graham became first lord of the admiralty under Lord Grey in 1830. He proved an efficient, economical administrator and was a member of the cabinet committee which drafted the first Reform bill. In office Graham's radicalism rapidly waned, and in 1834 he resigned with his friend Lord Stanley (later Lord Derby) over proposals to divert revenue from the Irish Church. While refusing to join Peel's first ministry, he abandoned the Whigs in 1835. and soon emerged as Peel's most valuable lieutenant in the commons, bitterly hostile to his old colleagues. Home secretary from 1841 to 1846, Graham's influence upon social and economic policy was considerable, notably over the corn laws; but, despite his talents. his record in his own office was neither popular nor successful since he was particularly disliked by protectionist Tories. After 1846 Graham readily accepted Peel's support for the Whigs, though refusing office several times. When the latter died in 1850, Graham became the leading Peelite in the commons and helped to promote the Aberdeen coalition of 1852 in which he returned to the admiralty. The performance of the navy in the Crimean War suggests that his insistence upon economy did not conduce to efficiency. Graham resigned soon after the formation of Palmerston's ministry in 1855 and ceased to play any prominent part in politics, though remaining active behind the scenes.

Industrious, well informed and authoritative, Graham never attained the success his ability merited. Pompous and repellent in manner, incapable of conciliation, he was unpopular in parliament, being regarded as both vindictive and unreliable. Nevertheless, he was highly esteemed by all leading politicians, and his importance lies in his standing as an adviser and consultant. Next to Peel, he was the main architect of the new conservatism, and acted as Peel's right-hand man in his most famous administration. Moreover, after 1850 the younger generation of Peelites, such as W. E. Gladstone and Sidney Herbert, looked mainly to Graham for guidance if not leadership; and his counsel tended toward collaboration with the Whigs and Radicals, out of which the later Liberal party was to develop, rather than Conservative reunion. (A. F. T.)

GRAHAM, MARTHA *(1895–   )*, U.S. dancer, choreographer and teacher, one of the most important and controversial exponents of the modern dance, was born in Pittsburgh. She was educated in California, and in 1916 began dance studies there under Ruth St. Denis and Ted Shawn. Following her debut with the Denishawn company two seasons later, she was given the leading role in Shawn's Aztec ballet *Xochifl (1920)*.

In 1923 Martha Graham left the Denishawn company to appear in the *Greenwich Village Follies*. She made her debut as a concert soloist in 1926. in New York city. She had already begun to formulate her personal technique, exploring uncharted worlds of movement in her search for the form of dance which would most clearly express inner emotion.

A theatrical artist of intense power and individuality, she has drann her subjects from such diverse sources as the American Indian *(Primitive Mysteries,* El *Penitente)*, American frontier life *(Appalachian Spring)*, literature *(Letter to the World, Deaths and Entrances)*. and Greek legend *(Cave of the Heart, Night Journey)*. Vitally concerned with contemporary music, she has commissioned scores from Aaron Copland, Norman Dello Joio, William Schuman and other distinguished American composers.

In 1955, under the auspices of the C.S. state department's cultural exchange program, Martha Graham toured the orient. (Ln. Me.)

GRAHAM (afterward CUNNINGHAME-GRAHAM), **ROBERT** (d. 1797?), Scottish poet famous for his lyric "If Doughty Deeds My Lady Please," was the son of Nicholas Graham of Gartmore and Lady Margaret Cunninghame. He started life as a planter in Jamaica, where he was for a time receiver-general. In 1784 he was elected rector of Glasgow university and from 1794 to 1796 was M.P. for Stirlingshire. Politically he is remembered as the mover of a bill of rights, in which the Reform bill of 1832 was foreshadoued, and as an ardent advocate of the ideals of the French Revolution; but it is for his lyrics that he has remained famous.

GRAHAM, THOMAS (1805–1869), British chemist often referred to as "the father of colloid chemistry" was born at Glasgow on Dec. 21. 1805. He was educated at Glasgow university, now the Royal Technical college, under Thomas Thomson and then at Edinburgh under Thomas Hope. His father, a wealthy businessman, wished him to become a clergyman and when the boy persisted in his intention to become a chemist. withdrew his support. He then made his living by teaching and writing. He was professor of chemistry in the Anderson institution. Edinburgh (1830–37), then at University college. London (1837–55) and master of the mint (1855–69). He succeeded Edward Turner at London in 1837. being chosen from among numerous aspirants for this desirable post. He was a fellow of the Royal society (1836), and one of the founders of the London Chemical and the Cavendish societies. He was the first president of the London Chemical society (1841) and president of the Cavendish society in 1846.

His first paper, published in 1825, dealt with the absorption of gases by liquids, and the first of his important memoirs on gaseous diffusion appeared in 1829. By measuring the rate at which gases diffuse through a plug of plaster of Paris. Graham developed the law, known by his name. "that the diffusion rate of gases is inversely as the square root of their density." *(See* DIFFUSION.) He further studied the flow of gases through fine tubes, and by effusion through a minute hole in a platinum disk; he found that the relative rates of effusion of gases are, like their rates of diffusion, inversely proportional to the square roots of their densities.

His early work led him to examine the diffusion of one liquid into another. and as a result of the experiments he divided bodies into two classes — crystalloids. such as common salt and colloids, of which gum arabic is a type — the former having high and the latter low diffusibility; this division has since been modified. He invented many of the terms used in colloid chemistry. Graham observed that in the passage through a parchment membrane these differences still held. and so was led to devise a method. "dialysis." for the separation of colloids from crystalloids. He also proved that the process of liquid diffusion causes partial decomposition of certain chemical compounds, the potassium sulfate. for instance. being separated from the aluminum sulfate in alum by the higher diffusibility of the former salt.

In 1833 Graham studied the three forms of phosphoric acid (ortho, meta and pyro). The differences among them were attributed to the fact that they contained different amounts of basic water. replaceable by metallic oxides, united n·ith a given quantity of phosphoric anhydride. (See *Alembic Club Reprint,* No. 10, 1906.) From this work the important concept of polybasic acids developed (see ACIDS AND BASES). In 183j he published the results of an examination of the properties of water of crystallization as a constituent of salts: definite compounds of salts and alcohol. analogous to hydrates. can be obtained. and these were called "alcoholates." In his final paper he described palladium hydride. the first known instance of a solid compound formed from a metal and a gas. He was led to assume the existence of a metal hydrogenium. Although his lectures were characterized by accuracy and breadth. his manner was nervous and hesitant and he was not fluent of speech. Graham never married. His health was not robust and his tastes were simple. His quiet life was devoted entirely to scientific pursuits. He died on Sept. 16. 1869.

BIBLIOGRAPHY.—Graham's *Elements of Chemistry,* first published in 1833, went through several editions, and also appeared in German, remodeled under J. Otto's direction. His *Chemical and Physical Researches* were collected by James Young and Angus Smith and printed "ior presentation only" at Edinburgh in 1876, Smith contributing a valuable preiace and analysis of its contents. See also T. E. Thorpe, *Essays in Historical Chemistry* (1923); Angus Smith, *The Life and Works* of *Thomas Graham* (1884); A. W. Hofmann, *Zur Erinnerung an vorangegangene Freunde* (1888); E. Jordis. *Ostwald's Klassiker,* No. 179 (1911); W. Ramsay, *Essays, Biographical* and *Historical;* M. Speter, essay in Bugge's *Das Buch der Grossen Chenziker* (1930).

(R. E. O.)

GRAHAME-WHITE, CLAUDE (1879–1959), English aviator and engineer, who pioneered in British aviation, was born on Aug. 21. 1879. He was educated at Bedford and studied engineering. He owned one of the first gasoline-driven motorcars in England, and worked at a motor engineering business in London until he became interested in aeronautics in 1909. In that year he gained an aviator's certificate of proficiency, being the first Englishman to do so. The following year he entered many flying races in Europe and in the United States. where he won the Gordon Bennett cup. He founded the first British flying school at Pau in France, in 1909. In 1910 he joined a company to run the Hendon aerodrome of London. At the outbreak of World War I in 1914, he mas commissioned in the royal flying corps, but later was recalled to superintend the construction of government planes. He wrote many treatises on aircraft, dealing with its history, its technical development and its use in warfare, including: *The Aeroplane, Past, Present and Future* (1911); *The Aeroplane in War* (1912); *Flying, an Epitome and a Forecast* (1930).

Grahame-White died in Nice, France, Aug. 19, 1959.

GRAHAMSTOWN, a town in Union of South Africa. 33° 19′ S., 26° 31′ E.; alt. 1.769. Pop. (1951) 23.789 (8.630 white, 11.814 native. 3,117 "coloured." 178 Asiatics). It is 106 mi. from Port Elizabeth and is reached by a branch line from Alice Dale, on the main Port Elizabeth-Pretoria line. The first settlement, established here in 1812, near the headwater of the Kowie river, and on the slopes of the Zuurberg. was a military post. founded by Col. John Graham. to hold in check the Kafir tribes. The town is named after its founder. After the arrival of the 1820 settlers. the site was chosen as a central rallying point in case of need. Since that time. in spite of its present somewhat isolated position. Grahamstown has retained its importance. It is the capital of the Eastern province of Cape Colony, and here the Eastern province law courts are placed. It is also the seat of Anglican and Roman Catholic bishops. The town is pleasantly laid out with broad, straight streets. often lined with trees. It is often regarded as the most English town in Cape Colony. The slopes of the neighbouring ridge are planted with trees, and from the top a magnificent view of the surrounding country can be obtained; a view of much geological interest. The town is also an important educational centre. It has several good schools. and a training college. The Rhodes University college. a constituent college of the University of South .Africa, stands in its own grounds. and is equipped with fine hostels. college buildings and playing fields. Among the public buildings mention may be made of St. George's cathedral (Anglican). built from designs by Sir Gilbert Scott. St. Patrick's cathedral (R.C.), and the commemoration chapel (Wesleyan), erected in 1845 by the British 1820 settlers. The Albany museum ranks high for its specimens of South African fauna and its collection representing early African cultures. (R. U. S.; X.)

GRAHN, LUCILE (1819–1907), Danish ballerina and choreographer, was one of the most celebrated dancers of her time: noted for lightness and technical virtuosity. Especially memorable was her appearance with Marie Taglioni, Fanny Cerrito and Carlotta Grisi in Jules Perrot's famous *Pas de Quatre* at Her Majesty's theatre, London, in 1845.

Born June 30, 1819, in Copenhagen, she studied under Auguste Bournonville, and in 1836 was the first to dance the title role in his version of *La Sylphide* at the Danish Royal theatre. A quarrel with Bournonville led to her virtual exile from Denmark after 1839. but she danced successfully throughout Europe and was choreographer at the Munich opera, 1869–75. She died April 4, 1907, in Munich. (LN. ME.)

GRAIL, THE HOLY, the famous talisman of Arthurian romance. the object of quest on the part of the knights of the Round Table. It is mainly. if not wholly, known to English readers through the medium of Sir Thomas Malory's translation of the French *Quête del Suint Graal*, where it is the cup or chalice of the Last Supper. in which the blood which flowed from the wounds of the crucified Saviour has been miraculously preserved. Students of the original romances are aware that there is in these texts an extraordinary diversity of statement as to the origin and nature of the Grail. and that it is extremely difficult to determine the precise value of the differing versions.

The word *grail* undoubtedly originally signified *dish;* we read in an early French text of "boars' heads on grails of silver," and Robert de Borron. the author of the first Christian Grail romance, represents it as the dish on which. at the Last Supper, the Paschal Lamb was served. Helinandus describes it as a "wide and somewhat shallow dish." This is certainly the primary sense of the word. which later on became attached to the varying manifestations of this mysterious object. Thus it may be a direct food-providing talisman. as in the version attributed to the Welshman. Bleheris (probably identical with the Bledhericus to whom Giraldus Cambrensis refers as "*famosus ille fabulator*"). Here the king and his guests are fed by the "rich" Grail. which acts automatically, "*sans serjant et sans seneschal,*" the butlers providing the wine. Or it may be indirectly such a talisman. as in the *Perceval* romances and the Galahad *Queste*, where its appearance synchronizes with the feast provided, but we are not told that it is, as in the first case, the actual source of the food. It may be a crystal vase. filled with blood, from which the Fisher king drinks. through a golden reed (*Diu Crône,* first visit) or a reliquary containing the Host (*ibid.*, second visit). It may be a cup or dish, accompanied by a lance, which bleeds into it (Bleheris and *Perlesvaus*); the dish of the Last Supper (Borron's *Joseph*), or the cup (*Queste*). It may be a stone, as in the *Parzival;* or its place in procession may be taken. as in the Welsh *Peredur,* by a bleeding head on a dish. The task of the critic is to discover a solution which shall admit of all these diverse objects being one and the same, all equally "the Grail." Modern criticism is gradually arriving at the conclusion that there is only one solution which will meet these apparently contradictory demands: that which lies in the direction of what is now termed the "ritual" origin, rather than in that of purely Christian legend or modified folk tale. The theory of a Christian origin. once very generally accepted. has now been practically abandoned in face of the fact that no story of Joseph of Arimathea and the Grail exists in any legendary; it makes its first appearance in the romance of *Joseph of Arimathea* by Robert de Borron. composed in the closing years of the 12th century, and by no means the earliest Grail romance. The connection of Joseph with Glastonbury. still credited in some circles, is even later, and is obviously imitated from the much earlier "Saint Sang" legend of Fescamp, of which Nicodemus is the protagonist. Glastonbury and Fescamp were alike Benedictine foundations, both enjoyed royal patronage, and their abbots were closely connected by family ties both with each other and with the royal family of England. The *Joseph-Glastonbury* story, which in its earliest form knows nothing of the Grail, is thus easily to be accounted for. The folk-tale theory has more in its favour, as there are undoubted folklore features in some of the romances, such as, *e.g.*, the food-providing powers of the Grail, but we have no popular tale. even fragmentary, which provides us with the requisite *mise en scène*.

On the other hand. it is now very generally recognized that the machinery of the earlier romances—the Fisher king. sick, wounded or in extreme old age, whose incapacity entails disastrous consequences upon his land and folk, both alike ceasing to be fruitful; the quester, whose task is to heal the king, and restore fruitfulness to the land—bear a striking resemblance to the cults associated with such deities as Tammuz, Adonis and Attis, the object of which was the renewal of vegetation and the preservation of life. Further, we now know that a certain early Christian sect, the Naassenes, identified the Logos of the Christian worship with these earlier deities, practised a triple initiation into the sources of life, physical and spiritual, and boldly proclaimed themselves to be "alone the true Christians, accomplishing the mystery at the Third Gate." The evidence for the connection between Christianity and the Attis cult in particular is clear, and has been commented upon by A. B. Cook in the second volume of his monumental work on *Zeus*. Scholarly opinion is steadily coming round to the view that the only interpretation of the obscurities and apparent contradictions of the Grail story is to regard it as the confused record of a form of worship, semi-Christian, semi-pagan, at one time practised in these islands, the central object of which was initiation into the sources of life: physical and spiritual. This. and this alone, will account for the diverse forms assumed by the Grail, the symbol of that source. Thus it may be the dish from which the worshippers partook of the communal feast; it may be the cup in juxtaposition with the lance, symbols of the male and female energies, source of physical life, and well-known phallic emblems. It may be the "Holy" Grail, source of spiritual life, the form of which is not defined, and which is wrought of no material substance—"'twas not of wood, nor of any manner of metal, nor was it in any wise of stone, nor of horn, nor of bone"; it is a spiritual object, to be spiritually discerned. but always, and under any form, a source of life. Thus Wolfram's stone, the mere sight of which preserves all inhabitants of the Grail castle. not only in life, but in youth, is what is popularly known as "the philosopher's stone," that stone of the alchemist which was the source of all life. Even the bleeding head of *Peredur* may be interpreted on the same lines. A passage in the Tork Breviary, for the Feast of the Beheading of St. John the Baptist. states "*Caput Johannis in disco signat Corpus Christi quo pascimur in sancto altari.*" When the Grail had once been elevated to the purely Christian orthodox plane, as was done by Borron, and became the source, no longer of physical, but of spiritual life, such a substitution, by one familiar with the York Breviary, wns possible. even as the author of Wolfram's source. or one before him, had introduced the alchemical stone. As the record of the perennial, too often unsuccessful, quest for the source of life, all the puzzling features of the Grail story are capable of satisfactory explanation. There is no other clue to the maze.

The versions of the Grail Quest which have come down to us are (1) those of which Gawain is the hero: the version by Bleheris, incorporated in the first continuation of Chrétien de Troyes' *Perceval*, and *Diu Crône*, a long and rambling series of *Gawain* adventures. the source of which is unknown. (2) The important group of which Perceval is the central figure: the *Conte del Graal* or *Perceval* of Chrétien, with its three continuations, respectively due to Wauchier de Denain. Gerbert (probably Gerbert de Montreuil, author of *Lc Roman de In Violette*), and Manessier; the *Perceval* of Robert de Borron; *Perlesvaus*, by an unknown writer. and *Parzival*, by Wolfram von Eschenbach. the finest romance of the cycle. Of the three continuations of Chrétien's poem that of Gerbert is the most interesting, as it witnesses to the existence of a tradition connecting the Swan Knight with the Grail hero, a tradition known also to Wolfram and to the author of *Sone de Nansai*, and familiar to the present generation through the medium of Wagner's *Lohengrin*. (3) The latest of the Grail romances is the *Queste*, or *Quête del Saint Graal*, a section of the prose *Lancelot*, known to English readers through the medium of Malory's translation. Thus we have two romances of which Gawain is the hero; seven, if we include the three continuations of Chrétien, connected with Perceval; one only which knows Galahad, with Perceval as a good second. To treat Galahad as Grail hero *par excellence*, as is too often done, is a grave mistake.

See J. L. Weston, *From Ritual to Romance* (1920); J. D. Bruce, *The Evolution of Arthurian Romance* (1923); J. Armitage Robinson, *Two Glastonbury Legends* (1926); R. S. Loomis, *Celtic Myth and Arthurian Romance* (1927). (J. L. W.)

GRAIN, the fruit or caryopsis of cereals, and hence cereal plants generally (from Lat. *granum*, "seed"). (*See* GRAIN PRODUCTION AND TRADE.) The word also refers to the malt refuse of brewing and distilling, and to many hard rounded small particles, such as grains of sand, salt, gold, gunpowder, etc. A grain is also the smallest unit of weight, both in Great Britain and the United States. Its origin is supposed to be the weight of a grain of wheat. The troy grain $= \frac{1}{5,760}$ of a pound, the avoirdupois grain $= \frac{1}{7,000}$ of a pound. In diamond weighing the grain $= \frac{1}{4}$ of the carat $= .7925$ of the troy grain. The word "grains" was early used of the small seedlike insects supposed formerly to be the berries of trees, from which a scarlet dye was extracted (*see* COCHINEAL). The imitating in paint of the grain of wood is called graining.

GRAIN ELEVATORS: *see* GRANARIES AND GRAIN ELEVATORS.

GRAINGER, PERCY ALDRIDGE (1882–1961), Australian pianist and composer, was born at Melbourne, on July 8, 1882. He studied there with Louis Pabst, with James Kwast at Hoch conservatorium. Frankfurt-on-Main, Ger., and later with Ferruccio Benvenuto Busoni. From 1901 to 1914 he lived in London, making extensive concert tours and also collecting the folk tunes of which his effective arrangements became widely known. In 1914 he settled in the United States. In 1935 he founded the Grainger museum at Melbourne. Grainger died at White Plains, N.Y., on Feb. 20, 1961.

Grainger's compositions include: *Molly on the Shore; Shepherd's Hey; Mock Morris; Irish Tune from County Derry;* a clog dance, *Handel in the Strand;* paraphrase on the "Flower Waltz" from Tschaikovsky's *Casse Noisette,* choruses with instruments; *Brigg Fair; Country Gardens;* and many settings from Rudyard Kipling's *Jungle Book.*

GRAIN PRODUCTION AND TRADE. True grains are the fruits of the grasses (*q.v.*), members of the botanical family Gramineae. They are characterized by monocotyledonous seed kernels, as contrasted to the pulses (peas, beans, etc.) and oilseeds (castor-oil seed, linseed, etc.), most of which are members of Leguminosae and have dicotyledonous seeds. These grains are grown primarily for their starch or calorie content. The pulses and oilseeds are cultivated largely for their protein and fat content. The cereal grains contain from 70% to 80% starch by weight, except for oats, barley, paddy rice and millet, which because of their fibrous hulls, have somewhat less.

This article deals with the principal uses of grain, including its importance in human diet, grain production and competition among grains for land, marketing arrangements and functions and world trade. Additional information on production will be found in the *Agriculture* sections of articles on countries, states and provinces, as ARGENTINA; INDIA; MICHIGAN; SASKATCHEWAN. *See* also articles on specific grains: BARLEY; CORN; RICE, etc.

USES

Importance in Human Diets.—Since the dawn of civilization, the true grains have been fundamental to human life. No considerable densities of population can be sustained without either considerable production of grain within the area or access to imports. Hunting and pastoral production yield much less food per hectare. Root crops such as potatoes, yams and cassava usually yield more calories than grain; however, these crops require more labour, are difficult to store and transport and provide a less balanced diet.

TABLE I.—*Comparison of Pre- and Post-World War II Total Per Capita Calorie Supplies and Per Cent From Cereals and Other Foods by Regions*

Region	Total calories		Cereals				Other foods			
	Prewar Cal. per day	Postwar Cal. per day	Prewar		Postwar		Prewar		Postwar	
			Cal. per day	%	Cal. per day	%	Cal. per day	%	Cal. per day	%
Western Europe.	2,885	2,855	1,285	44.5	1,170	41.0	1,600	55.5	1,685	59.0
North America	3,140	3,085	895	28.5	715	23.2	2,245	71.5	2,370	76.8
Latin America	2,250	2,470	835	37.1	890	36.0	1,415	62.9	1,580	64.0
Far east	1,995	1,830	1,370	68.7	1,245	68.0	625	31.3	585	32.0

*Based on data from 36 countries comprising about 65% of the world's population but excluding China and the U.S.S.R. Postwar data refer to 1954–55 and 1955–56 levels of consumption. Prewar data from Food and Agriculture Organization of the United Nations, *Second World Food Survey.*

Source: Food and Agriculture Organization of the United Nations, *Monthly Bulletin of Agricultural Economics and Statistics,* Oct. 1956.

The cereals are grown principally for their energy content, but they also provide a considerable share of the proteins needed in human and animal diets. The protein content of whole wheat is 11% to 13%, and that of ordinary white wheat flour about 10% to 12½%. Oatmeal has a slightly higher protein content; rice contains only 7%; corn (maize), 9%; millets, 6½% to 12%; and sorghum, 10%. Relatively low-income countries heavily dependent on cereal diets balance their protein needs primarily with pulses, oilseeds and fish. Relatively high-income countries, which consume a high proportion of animal products, get their protein from this source and use oilseed cake and meal to supplement the cereals and roughage fed to their animal populations.

Low-income countries with limited land and other resources are forced to consume a large share of their grain production directly for human food. A much greater population can subsist on a given level of agricultural resources by utilizing the primary cereal production directly instead of feeding it to livestock.

The world (excluding the Chinese mainland and the U.S.S.R.) obtains about half of its calorie intake from cereals (Table I), about one-fourth from other crops and one-fourth from animal products. In the pre-World War II period, China obtained an estimated 70% to 80% of its calorie intake from cereals. Little data are available on the U.S.S.R. However, after the death of Stalin in 1953, the government stated that animal numbers had changed little from Czarist times, indicating a heavy dependence on cereals and other crops to feed the growing population. The diets of the northern European countries, the United States, Canada, New Zealand and Australia have the lowest proportion of cereals ranging from one-fourth to one-third of the total calorie intake. *See* also CEREALS.

Declining Proportion of Cereals in Human Diets.—All regions except Latin America, Africa and the near east had a decline in total calorie intake after World War II as compared to the prewar period. All regions except Oceania had a decrease in the percentage of calories supplied by cereals. Any considerable shift in human diets from cereals to animal products would have to be accompanied by large increases in the production of the feed grains (oats, barley, sorghums, corn) relative to that of the food grains (wheat, rye, rice). However, for a large proportion of the world's population, the primary problem is securing a higher level of calorie intake; improving the quality of diets is of secondary importance.

Industrial Uses.—In addition to their use as human food and animal feed, grains have long been the principal raw material for the brewing and distilling industries. Cereals are also used for industrial alcohol, starches, films, polymers and other products. Total utilization for these purposes is small, however. Even in the United States where supplies are abundant and relatively cheap, industrial uses account for only 5% to 7% of cereal grain production. Industrial uses for cereals are probably declining in spite of considerable research effort aimed at finding new uses.

PRODUCTION

The importance of cereal production to human nutrition is indicated by the proportion of arable land devoted to it. In the world (excluding U.S.S.R.) approximately half the estimated area of arable land, fallows and orchards is used for cereal production (Table II). In the far east where there is heavy population pressure upon the land resources, approximately three-fourths of the land area is devoted to the cereals. In other parts of the world where population pressures are not so great, the proportion devoted to cereals is smaller, amounting to only one-fifth in Africa. When allowance is made for the necessary fallow in dry areas, somewhat over half the world's arable land is devoted to cereal grains.

TABLE II.—*Area Used for Cereals as a Per Cent of Total Arable Land and Orchards by Regions**

Region	Total arable land and orchards† (in 000,000 ha.)	Used for cereal crops	
		Area in grain (in 000,000 ha.)	% of total

Regional Production Patterns.—The results of different combinations of environmental, consumer preference and economic factors are shown in Table III. Wheat, because of wide adaptation and high favour with consumers, is an important grain in all regions. Rye is important only in Europe and the U.S.S.R. where the combination of infertile soils and a cool climate restrict the choice of crops. Barley, like wheat, is important in all regions. Oats production is confined to Europe, North America and Oceania; the remaining regions are largely too hot or dry for it.

Corn (maize) is produced in all regions of the world, but the major concentrations are in the western hemisphere countries (the United States, Mexico, Brazil and Argentina); and in Africa (the Union of South Africa). The millets and sorghums are important crops in only three regions: the near east, far east and Africa. They are the best cereal crops for the extensive hot, dry areas in these regions.

Rice production is geographically the most concentrated of any of the cereals. It is the dominant crop in the far east. It is not a very important crop in any other region as a whole, but is important in individual countries; *e.g.,* Brazil, Spain, Italy and Egypt. The bulk of the crop is grown in the alluvial plains around the edge of the Asian land mass from India to China and in the Japanese, Philippine and Indonesian islands off the coast of Asia.

Relative Importance and Requirements of the Individual Cereal Grains.—Farmers' and peasants' chbices of the crop or crops grown depend on a number of environmental and economic considerations. The individual grains compete with each other and with other crops for land. Estimates of the proportion of cereal land occupied, the proportion of the total cereal crop accounted for by each cereal by region and world totals (exclusive of the U.S.S.R.) are given in Table III.

TABLE 111.—*Relative Importance of the Principal Cereal Crops by Area and by Production, by Regions**

Region	e a t	R e	Barley	Oats	o n	Millet and sorghum	Rice

*Average 1954–55. Total areas harvested and total production by regions shown in Table IV. †1955. ‡Data not available.

Source: Food and Agriculture Organization of the United Nations, *Yearbooks of Pood* **and** *Agricultural Statistics; Monthly Bulletin of Agricultural Economics and Statistics.*

Wheat occupies the largest area, about one-fourth of that devoted to cereals, followed by rice (20%), millet and sorghum (19%) and corn (17%). Barley occupies about 10%, oats 7% and rye less than 3%. Much of the U.S.S R is either too dry or too cold for rice or corn. Almost two-thirds of the U.S.S.R. cereal area was devoted to wheat and rye in 1955 (Table III). Only about 11% was in corn, millet and sorghum and rice combined.

Rice accounted for 28%, and wheat and corn about 21% each of world cereal production in the second half of the 20th century (Table III). Sorghums and barley accounted for about 10% each, oats 7% and rye less than 3%.

In general, three factors determine the competitive position of the individual cereals within a region: (1) biological adaptation to the physical environment; (2) consumer preferences; and (3) economic considerations.

Biological Adaptation to the Physical Environment.—*Wheat.*—Wheat grows well under a wide variety of conditions in the temperate regions of the world. It grows best where the natural vegetation is grass, but also does well in many of the more fertile. temperate forested areas. The greater part of the world's wheat is fall-sonn winter wheat. It is relatively winter hardy; however, it will not thrive in many localities above 55°–60° N. latitude or 40° S. latitude. Wheat is damaged by high temperatures in the maturing stages; therefore, little wheat is grown (except in a few localities at higher altitudes) between 30° N. and 30° S. latitude, because temperatures warm up too rapidly in the spring.

Rye.—Rye is noted for its hardiness to cold, disease and pests, and for its ability to perform more satisfactorily than wheat on poor, sandy soils. This combination of characteristics has relegated rye to the marginal land in the temperate climates.

Barley.—Barley grows where wheat and other temperate region cereals are adapted but is less winter hardy than wheat and rye. It usually competes with corn, oats, rye and low-grade wheat as feed, although special types are grown in the United States and Europe for the malting industry for beer production.

Oats.—The oat is less winter hardy than wheat or barley but is more successful in wet climates. Like barley, it is used largely for animal feed.

Corn.—Corn (maize) requires a combination of warm, humid weather. Generally nighttime temperatures must remain above 58° F., and annual precipitation should total 30 in. or more with the bulk falling within the growing season.

Millets and Sorghums.—These are warm-weather crops more tolerant to drought than corn. Millet yields considerably less than sorghum, but will make a crop in a very short season under soil and climatic conditions too rigorous for sorghums.

Rice.—Unlike the other cereals, rice thrives in hot, humid weather on alluvial soils. The lowland varieties, which comprise the bulk of the crop, require waterflooding. Only the upland varieties important in some parts of China and a few other localities compete for land with other cereals.

Consumer Preferences—Wheat is the preferred grain for human consumption in most of the western world. It makes a white bread of light texture because of the elastic nature of the protein or gluten in the wheat flour. In the U.S.S.R. and Europe, rye bread is eaten where wheat yields are unsatisfactory, but rye makes a heavy, less satisfactory, dark bread. Wheat is gradually displacing rye as a bread grain as world real incomes rise. Further decreases in the use of rye for food are likely.

Rice is the preferred food grain in the greater part of the orient. Wheat and other grains are substituted where rice cannot be grown or is not available.

The remaining so-called coarse grains are more likely to be used for animal feed than for human food and compete on the basis of relative yields rather than consumer preference. Human populations ordinarily use these coarse grains for food only where the relative costs of producing wheat or rice are too high for them to afford. Corn is used extensively in parts of Latin America and the millets and sorghums are used in the relatively poorer and drier sections of Asia and Africa.

Economic Considerations.—The returns from grain production are the result of yields, prices and the costs of production. Thus, while the costs of producing the small grains (wheat, rye, barley and oats) are not greatly different, wheat is so much favoured by consumers that it has a considerable price advantage over all the other temperate region grains.

Corn derives its competitive position by virtue of its very high yield relative to the other cereals and its consequent low cost per unit of production. This makes it the most competitive livestock feed in regions environmentally suited to corn production.

Rice has relatively high costs of production because of the labour involved, but its adaptation to hot, humid climates and favour with oriental consumers makes it the staple food crop in south and east Asia. including Japan, the Philippines and Indonesia.

Area Harvested and Production.—An average of 557,000,000 ha. (1 ha. equals 2.471 acres) was devoted to cereals in the world (excluding the U.S.S.R.) in the middle 1950s (Table IV). This was an increase of about one-fifth from 1934–38. The largest increases in cereal area were in the near east and the far east with increases of over 40%. Latin American and African areas each increased more than 25%. There were small decreases in North America, Europe and Oceania.

The U.S.S.R. had apparently just about regained its prewar level after a decline caused by World War II disruptions.

An average of 733,000,000 metric tons of cereals were produced in the world (excluding the U.S.S.R.) in 1954–56 (Table IV).

TABLE IV.—*World Cereal Production by Regions, 1934–38, 1948–52 and 1954–j6*

Region	Area in cereals (in 000,000 ha.)			Production (in 000,000 metric tons)		
	1934–38	1948–52	1954–56	1934–38	1948–52	1954–56
Europe	79.7	73.2	73.5	1180	110.4	124.8
North America	99.3	103.9	97.1	108.5	169.1	171.1
Latin America	27.1	27.7	33.9	31.0	30.9	39.2
Near east	21.9	26.7	32.0	21.8	25.0	31.5
Far east	192.0	244.2	272.5	244.8	260.8	328.4

Source: Food and Agriculture Organization of the United Nations, *Yearbooks of Food and Agricultural Statistics; Monthly Bulletins of Agricultural Economics and Statistics.*

This represents an increase of about one-third from 1934–38. All regions of the world shared in the gains, the largest increases being in Africa and North America.

The increased world production was the result of the increase of about one-fifth in harvested area coupled with about a 10% increase in average yields as compared to the 1934–38 period (Table IV). All regions except the near east and far east had higher average yields Increased yields in Europe, North America and Oceania permitted these regions to increase production substantially in spite of decreased areas harvested. What sketchy information was available on the U.S.S.R indicated it about kept pace with world increases in cereal production up to the middle 1950s. Extensive plans to increase grain production by adding to planted area and increasing average yields were under way.

Competition Among Grains.—As noted above, the percentage of cereals in human diets appeared to be declining, particularly in the western hemisphere and Europe. with some tendency for replacement by animal products Barley, corn and sorghum production grew at a faster rate than wheat and rice. while world rye production actually decreased (Table V). Only oats of the feed grains showed a very modest growth in production, probably because of the increasing replacement of horses with tractor power. The same general trends also applied to the U.S.S.R. where rye production decreased and strenuous efforts were under way to increase corn and other feed grain production.

While in some limited cases there may be substitution of corn for wheat or rice, resulting in a lower quality diet, the net effect of the rapidly rising production of feed grains should be an increase in the world animal numbers and a move to better quality diets. The increase in barley production was general over most of the world; however, a large share of the increase in corn and sorghums was concentrated in North America, which already had a high-quality diet. Africa and the far east also shared in the corn and sorghum increase.

Until the second half of the 20th century wheat had historically exceeded corn production because of its wide regional adaptability and high preference with consumers. The gradual increase in world real incomes and the slow replacement of cereal food by animal products in many areas permitted corn and sorghum production to expand faster than wheat after World War II. The gradual adoption of hybrid corn and sorghum varieties should both increase yields and permit extension of the corn and sorghum growing area. These developments should permit corn and sorghum to continue their rapid growth in production and compete successfully with other cereals for a larger share of both land area and total cereal production.

TABLE V.—*Indices of World (excl. U.S.S.R.) Production of Individual Crreal Crops, 1934–38, 1948–52 and 1954–56*

Crop	1934–38	1948–52	1954–56
Wheat	100	108.5	120.9
Rye	100	94.8	96.7
Barley	100	130.1	169.4
Oats	100	111.1	115.7
Corn	100	128.7	143.1
Millet and sorghum	100	117.6	147.5
Rice	100	107.4	133.9
Seven cereals	100	114.4	133.7

ARRANGEMENTS AND FUNCTIONS IN MARKETING

The marketing system for grain consists of a chain of intermediary firms which value, transfer title, store. process and transport the grain as it moves through the channels of trade from producers to consumers. The organization of the system varies somewhat among countries, but in general the following pattern is used by the major exporters.

The first points of assembly are local country elevators which buy from producers. From local elevators part of the grain is shipped to processors, but most of it goes to large terminal or subterminal elevators for storage and distribution to domestic users or exporters. Grain sold for overseas export is delivered to port elevators, from where it is shipped to port elevators in importing countries. In the major importing countries many processors have riparian locations in the port cities. Inland users procure their supplies by rail from the port elevators. (See also GRANARIES AND GRAIN ELEVATORS.)

The Marketing System.—In markets with flexible prices, the stimuli for keeping supply and demand in balance are provided by prices developed by the marketing system. The major function of an efficient price-oriented marketing system is to develop prices which perform the following functions:

First, guide production by reflecting to producers both short-term and long-term changes in demand with respect to kind, quantity and quality. The demand for grain is constantly changing with changes in consumer income, preferences. population. changes in price relative to competing commodities and improvements in processing and merchandising.

Second, move supplies through the channels of trade and into uses where the net return is highest. Grains have several alternative uses, and the marketing system must allocate available supplies to their highest value uses.

Third maintain economically justified stocks within and between marketing seasons. Stocks must be maintained to provide a continuous supply. but storage charges generally prevent stocks from being carried longer than from one marketing year to the beginning of the next, governmentally owned stocks excepted.

Fourth, reflect quality differences. To a large extent this is facilitated by grading systems which make possible different prices for different qualities.

Fifth. organize the marketing system as efficiently as possible and maintain marketing charges at a minimum.

Prices.—In order to perform these functions, prices must be free from manipulation and should deal alike with all producers, marketing firms and consumers. Prices should at all times accurately reflect all the forces of supply and demand. This implies perfect commercial intelligence, and an absence of price discrimination and monopoly control, but these conditions seldom, if ever, exist.

In actual operation the marketing system is affected by numerous institutional arrangements. These arrangements are designed to improve the functioning of the system and are generally thought to be in the interests of the countries concerned. National goals for self-sufficiency in grain production and a desire to protect domestic producers and consumers from adverse price changes take the form of various trade restrictions, export subsidies, price supports, governmental storage operations, consumer subsidies, etc. These arrangements give rise to administered prices. both governmental and private. and tend to make prices less flexible and of less importance in the marketing system.

Risk.—In markets with flexible prices risk is inherent in the ownership of grain. Grain must be owned as it moves from producer to consumer, and the owner is constantly confronted with monetary losses resulting from price declines unless such risk is shifted. To a large extent such risk can be shifted. Three methods are commonly employed. One is by forward sales by which the owner contracts to deliver a specified amount of grain or grain products (*e.g.,* wheat flour) at a specified time and place at a specified price. Another is by governmental pricing in which the price is set by the government, and owners of stocks no longer face the risk of losses resulting from price changes.

Risk can in many instances be shifted by hedging in the futures market. In hedging the owner makes an offsetting sale to speculative interests who then assume the risk. If the price of cash grain declines, the owner can usually recover at least part, if not all or more, of the loss by profit on his original sale in the futures market when he makes an offsetting purchase in the futures, or delivers on his sale in the futures.

The futures market is essentially an institution to assist in the determination of prices which will move supplies through the channels of trade. Prior to World War II the major futures market for wheat was the Liverpool market. In the second half of the 20th century international wheat prices have been largely determined by the United States governmental price policy. The range of fluctuation in the price of wheat tended to narrow, and the major market for futures shifted from Liverpool to Chicago. Other futures markets of primary importance are for rye and barley in Winnipeg, and for corn and oats in Chicago.

Other Arrangements.--Other important arrangements prerequisite to an efficient marketing system include a grading system and grades meeting the needs of the trade, a uniform system of weights and measures, organized and readily available trading places, provisions for arbitration in case of dispute concerning terms of contract, standardized forms of contract, ample credit facilities, determination of financial responsibility and a system for dissemination of information relating to the marketing system in general and to supply and demand factors in particular.

In markets not organized along lines of flexible prices, the functions of the marketing system are generally performed by governmental agencies. The functions that must be performed are essentially the same as those performed by price oriented markets. It is only the methods employed that are different.

WORLD TRADE

Most of the import supply of grain is utilized as human food, and only a relatively small proportion is used as animal feed and in industrial uses. The major food grains traded are wheat, rye and rice. The major feed grains are barley, oats, corn and sorghums and millets. The lower grades of wheat, a considerable proportion of rye. in addition to millfeeds (by-products of the milling industry), are also utilized as animal feeds and in industrial uses. Feed grains are also widely consumed as food in relatively low-income countries, but most imports are used as animal feed.
