The world order is eternal, an "ever-living fire kindling in measures and being extinguished in measures." (It was a Stoic interpretation, perhaps following Theophrastus, that assigned to Heraclitus the idea of a periodic universal conflagration.) Fire is in one respect a concrete manifestation of the logos, since its own changes are proportionate and "measured" in terms of fuel, flame and smoke. Pure fire fills the sky, as ether or the shining upper air. Parts of it "turn to" sea (presumably as rain), while parts of sea turn to earth. Simultaneously equivalent masses of earth and sea throughout the world as a whole are reverting to sea and fire; thus a continuous world order is preserved. Heraclitus illustrated this kind of persistence of unity through change by the analogy of the river: "Upon those who step into the same rivers different and ever different waters flow down." Plato, who may have been thinking in terms of the exaggerated version of Heraclitus' doctrine propagated by Cratylus, took this to mean that all things absolutely are in constant flux, though this often escapes the senses. But Heraclitus, who said "The things of which there is seeing, hearing, understanding, are those that I prefer," is unlikely to have favoured an explanation of change which contradicted the senses unnecessarily. He was acutely aware of the "strife" of things, without which, indeed, the reaction between opposites, and thus their essential connection, would cease; but not all parts of the cosmic battlefield need be in strife at the same time: rocks and mountains, for example, can be temporarily stable, though they too will eventually change.

God was identified by Heraclitus with the opposites, persisting through their changes and thus able perfectly to comprehend their unity. Thus God knows "how all things are steered through all" and is completely wise. The rites of conventional religion were ridiculed by Heraclitus, unless by accident they symbolized the true relation of opposites.

The soul is made of fire and is bound up in the same cycle of changes as individual parts of the world as a whole. Death involves the total extinction of soul; sleep, drunkenness, or stupidity, its partial moistening. It seems that particularly fiery and virtuous souls (notably of those who died suddenly and bravely in battle, unmoistened by sickness) might survive for a time as beneficent daemons, before returning to ethereal fire.

HERACLIUS (Ἡρακλεῖος) (c. 575–641), East Roman emperor, was born in Cappadocia. His father held high military command under the emperor Maurice, and as governor of Africa maintained his independence against the usurper Phocas (*q.v.*). When invited to head a rebellion against the latter, he sent his son with a fleet which reached Constantinople unopposed. and precipitated the dethronement of Phocas. Proclaimed emperor (610), Heraclius set himself to reorganize the utterly disordered administration At first he found himself helpless before the Persian armies (see PERSIA: *History;* and KHOSRAU) of Khosrau, which conquered Syria and Egypt and since 616 had encamped opposite Constantinople; in 618 he even proposed to abandon his capital and seek a refuge in Carthage, but at the entreaty of the patriarch he took courage. By securing a loan from the church and suspending the corn-distribution at Constantinople, he raised sufficient funds for war, and after making a treaty with the Avars. who had nearly surprised the capital during an incursion in 619, he was at last able to take the field against Persia. During his first expedition (622) he failed to secure a footing in Armenia, whence he had hoped to take the Persians in flank, but by his unwearied energy he restored the discipline and efficiency of the army. In his second campaign (624–26) he penetrated into Armenia and Albania, and beat the enemy in the open field. After a short stay at Constantinople, which his son Constantine had successfully defended against renewed incursions by the Avars. Heraclius resumed his attacks upon the Persians (627). Though deserted by the Khazars, with whom he had made an alliance upon entering into Pontus, he gained a decisive advantage by a brilliant march across the Armenian highlands into the Tigris plain, and a hard-fought victory over Khosrau's general, Shahrbaraz, in which Heraclius distinguished himself by his personal bravery. A subsequent revolution at the Persian court led to the dethronement of Khosrau in favour of his son Kavadh II (*q.v.*); the new king promptly made peace with the emperor, whose troops were already advancing upon the Persian capital Ctesiphon (528). Having secured his eastern frontier, Heraclius returned to Constantinople with the true cross, which in 629 he brought back in person to Jerusalem. On the northern frontier of the empire he kept the Avars in check by inducing the Serbs to migrate from the Carpathians to the Balkan lands so as to divert the attention of the Avars.

The triumphs which Heraclius had won did not bring him lasting popularity. In his civil administration he followed out his own ideas without deferring to the nobles or the Church, and the opposition which he encountered from these quarters went far to paralyze his attempts at reform. Worn out by continuous fighting and weakened by dropsy, Heraclius failed to show sufficient energy against the new peril that menaced his eastern provinces

towards the end of his reign. In 629 the Saracens made their first incursion into Syria (see CALIPHATE: *The* First Four Caliphs); in 636 they won a victory on the Yermuk (Hieromax), and in the following years conquered all Syria, Palestine and Egypt. Heraclius made no attempt to retrieve the misfortunes of his generals, but evacuated his possessions in sullen despair. The remaining years of his life he devoted to theological speculation and ecclesiastical reforms. His religious enthusiasm led him to oppress his Jewish subjects; on the other hand he sought to reconcile the Christian sects, and to this effect propounded in his *Ecthesis* a conciliatory doctrine of monothelism. Heraclius died of dropsy in 642. He had been twice married; his second union, with his niece Martina, was frequently made a matter of reproach to him. In spite of his partial failures, Heraclius must be regarded as one of the greatest of Byzantine emperors, and his early campaigns were the means of saving the realm from almost certain destruction.

HERALD; for the mediaeval and modern functions of a herald, see HERALDRY.

Greek Heralds, So-called.—The word "herald" is commonly used to translate Gr. κῆρυξ, which has various meanings. (1) In Homer, a κῆρυξ is mostly a trusted attendant or retainer of a chieftain, one might almost say a gentleman of the bedchamber. We several times hear of them attending and waiting on their lords, performing confidential Services for them, and so forth. But they also have official and public functions; they proclaim and execute the king's will—in which capacity it would seem that their persons are inviolable—and summon and keep order at the folk-moot. (2) These functions continue at later times, and we find heralds acting as inviolable messengers between states, even in time of war, proclaiming meetings of a senate, popular assembly, or court of law, reciting the formulae of prayer, etc., thereat, and summoning persons to attend. Hermes, himself the herald of the gods, is their patron and carries' a herald's staff (caduceus, κηρύκειον; see HERMES). (3) Besides these paid functionaries of the State, there was a clan of kerykes at Eleusis, who had certain duties in connection with the mysteries. (4) The word, however, often means no more than a crier, whether at the Olympian or other games or simply at a sale or the like.

Latin "Heralds."—Setting aside the misuse of "herald" to translate praeco (crier, auctioneer), or *apparitor* (summoner, attendant on a magistrate), we may notice the real equivalent of the Greek κῆρυξ in his capacity as an inviolable messenger, the *fetialis*. A college of jetiales existed from very early times; such an institution was by no means confined to Rome, and parallels to it are found among quite low savages, giving us the right to suppose that it had long been recognized in Italy before our earliest historical documents. At Rome, if a breach of international law by a neighbouring state was alleged, two fetiales at least were appointed, the *pater* patratus, who was the senior member of the deputation, and the Verbenarius, or carrier of the sacred herbs (verbenae, sagmina), which apparently represented the Roman territory. These went to the State in question and thrice solemnly demanded redress (clarigeratio); if this was not obtained within 30 days, they reported the matter at Rome; when war was voted they returned to the frontier, and flung a javelin, made of cornel-wood and having either an iron point or one end sharpened and hardened by fire (this clearly is the older form), into the hostile territory, calling on the gods to witness the justice of their cause. In later times, a plot of land in Rome, containing the famous *columna* bellica or pillar of war, was by a legal fiction made to represent hostile territory, and the javelin cast into it, thus avoiding the long journeys overseas to perform the ceremony. They also made treaties of peace, when the terms had been agreed upon and ratified. For this purpose, the deputation carried flint knives, or a flint knife, which was the embodiment of Jupiter, and kept in one of his temples (*Iuppiter* lapis). They met the deputation of the other state; the terms of the treaty were read aloud; a pig was killed with the knife (hence the phrase foedus *ferire*, to smite a treaty-victim, for "to make a treaty," the Greeks said ὅρκια τάμνειν, to cut oath-victims, and had a very similar rite), and Jupiter was invoked to smite Rome in like manner, if Rome were the first wantonly to violate the treaty. The college of fetiales, though little is heard of it after 201 B.C., continued to exist throughout the empire.

HERALDRY. Although the word heraldry properly belongs to all the business of the herald (*q.v.*), it has long attached itself to that which in earlier times was known as armory, the science of armorial bearings.

History of Armorial Bearings.—In all ages and in all quarters of the world distinguishing symbols have been adopted by tribes or nations, by families or by chieftains. Greek and Roman poets describe the devices borne on the shields of heroes, and many such painted shields are pictured on antique vases. Rabbinical writers have supported the fancy that the standards of the tribes set up in their camps bore figures devised from the prophecy of Jacob, the ravening wolf for Benjamin, the lion's whelp for Judah and the ship of Zebulon. In the East we have such ancient symbols as the five-clawed dragon of the Chinese empire and the chrysanthemum of the emperor of Japan. In Japan, indeed, the systematized badges borne by the noble clans may be regarded as akin to the heraldry of the West, and the circle with the three asarum leaves of the Tokugawa shoguns has been made as familiar to us by Japanese lacquer and porcelain as the red pellets of the Medici by old Italian fabrics. Before the landing of the Spaniards in Mexico the Aztec chiefs carried shields and banners, some of whose devices showed after the fashion of a phonetic writing the names of their bearers; and the eagle on the new banner of Mexico may be traced to the eagle that was once carved over the palace of Montezuma. That mysterious business of totemism, which students of folk-lore have discovered among most primitive peoples, must be regarded as another of the forerunners of true heraldry, the totem of a tribe supplying a badge which was sometimes displayed on the body of the tribesman in paint, scars or tattooing. Totemism so far touches our heraldry that some would trace to its symbols the white horse of Westphalia, the bull's head of the Mecklenburgers and many other ancient armories.

When true heraldry begins in Western Europe nothing is more remarkable than the suddenness of its development, once the idea of hereditary armorial symbols was taken by the nobles and knights. Its earliest examples are probably still to be discovered by research, but certain notes may be made which narrow the dates between which we must seek its origin. The older writers on heraldry, lacking exact archaeology, were wont to carry back the beginnings to the dark ages, even if they lacked the assurance of those who distributed blazons among the angelic host before the Creation. Even in our own times old misconceptions give ground slowly. Georg Ruexner's Thurnier Buch of 1522 is still cited for its evidence of the tournament laws of Henry the Fowler, by which those who would contend in tournaments were forced to show four generations of arms-bearing ancestors. Yet modern criticism has shattered the elaborated fiction of Ruexner. In England many legends survive of arms borne by the Conqueror and his companions. But nothing is more certain than that neither armorial banners nor shields of arms were borne on either side at Hastings. The famous record of the Bayeux tapestry shows shields which in some cases suggest rudely devised armorial bearings, but in no case can a shield be identified as one which is recognized in the generations after the Conquest. So far is the idea of personal arms from the artist, that the same warrior, seen in

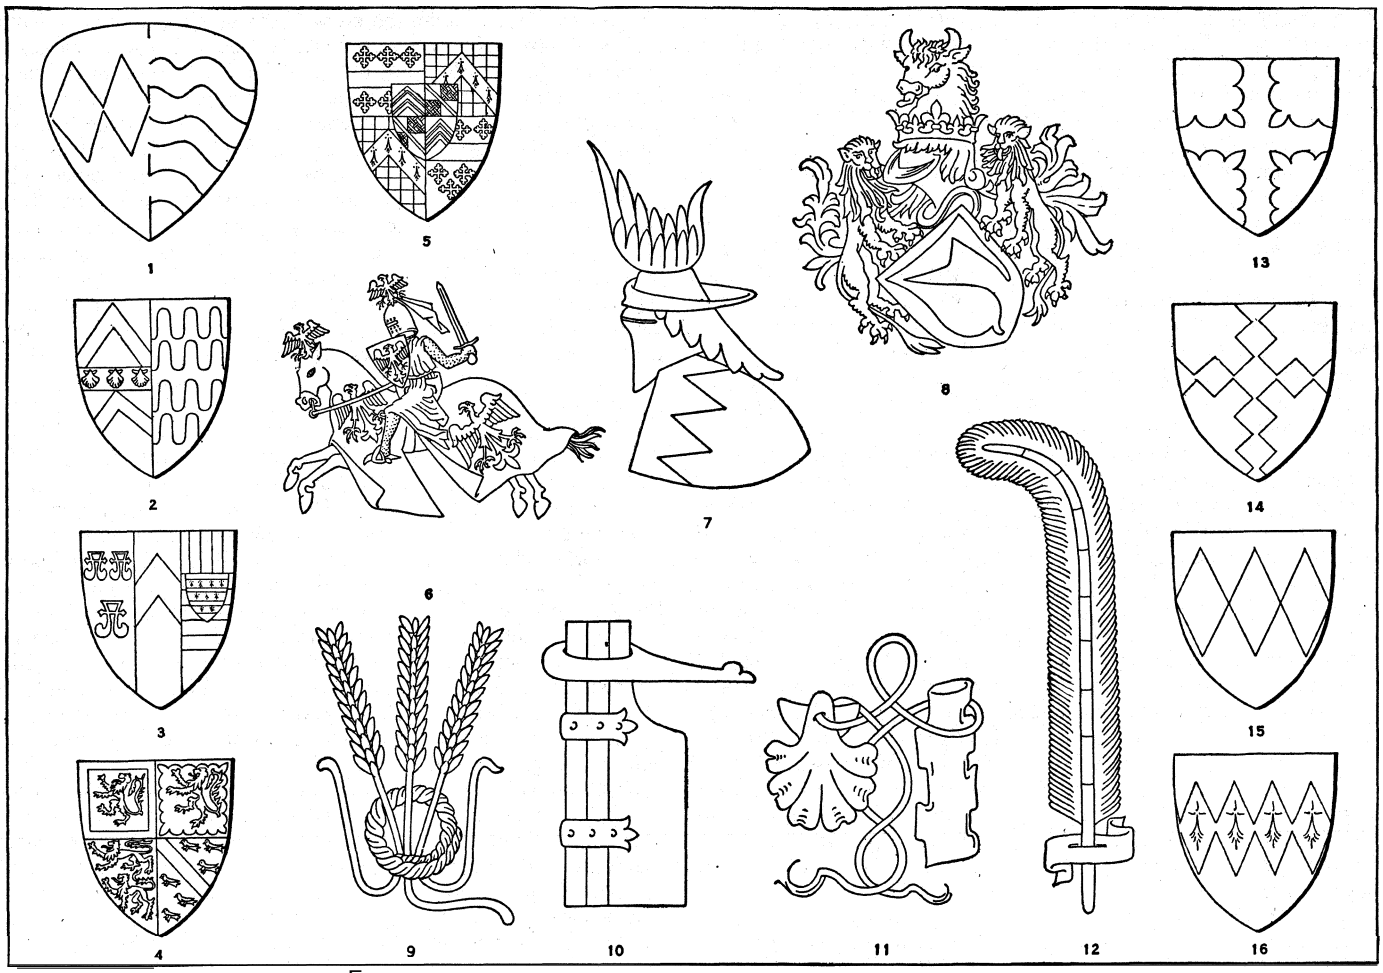

FIG. I.—SHIELDS BEARING ARMS CHARACTERISTIC OF THE MIDDLE AGES

(1) Shield from seal of Robert de Pinkeny, an early example of parted arms. (2) Shield of Joan atte Pole, widow of Robt. Hemenhale, from her seal (1403), showing parted arms. (3) Shield of Beatrice Stafford from her seal (1404), showing her arms of Stafford between those of her husbands—Thomas, Lord Roos, and Sir Richard Burley. (4) Shield of John Taibot, first Earl of Shrewsbury (d. 1453), showing four coats quartered. (5) Shield of Richard Beauchamp, Earl of Warwick, from his garter stall-plate (after 1423). The arms are Beauchamp quartering Newburgh with a scocheon of Clare quartering Despenser. (6) Ralph de Monhermer (1301) showing shield of arms, helm with crest and mantle, horse-crest and armorial trappings. (7) Shield and crested helm with hat and mantle of Thomas Hengrave (1401). (8) Arms of William, Lord Hastings, from his seal (1477), showing shield, crowned and crested helm with mantle and supporters. (9) Badge of John of Wethamstede, abbot of St. Albans (d. 1465), from his tomb in the abbey church. (10) Rudder badge of Wilioughby. (11) Badge of Dacre of Gilsland and Dacre of the North. (12) Ostrich feather badge of Beaufort, from a garter stall-plate of 1440. The silver feather has a quill of gobony silver and azure. (13 and 14) Mohun. (15) Montagu. (16) Dynham

different parts of the tapestry's history, has his shield with differing devices. A generation later, Anna Comnena, the daughter of the Byzantine emperor, describing the shields of the French knights who came to Constantinople, tells us that their polished faces were plain.

Of all men, kings and princes might be the first to be found bearing arms. Yet the first English sovereign who appears on his great seal with arms on his shield is Richard I. His seal of 1189 shows his shield charged with a lion ramping towards the sinister side. Since one half only is seen of the rounded face of the shield, English antiquaries have perhaps too hastily suggested that the whole bearing was two lions face to face. But the mounted figure of Philip of Alsace, count of Flanders, on his seal of 1164 bears a like shield charged with a like lion, and in this case another shield on the counterseal makes it clear that this is the single lion of Flanders. Therefore we may take it that, in 1189, King Richard bore arms of a lion rampant, while, nine years later, another seal shows him with a shield of the familiar bearings which have been borne as the arms of England by each one of his successors.

That seal of Philip of Alsace is the earliest known example of the arms of the great counts of Flanders. The ancient arms of the kings of France, the blue shield powdered with golden fleurs-de-lys, appear even later. Louis le Jeune, on the crowning of his son Philip Augustus, ordered that the young prince should be clad in a blue dalmatic and blue shoes, sewn with golden fleurs-de-lys, a flower whose name, as "Fleur de Loys," played upon that of his own, and possibly upon his epithet name of Florus. A seal of the same king has the device of a single lily. But the first French royal seal with the shield of the lilies is that of Louis VIII. (1223–1226). The eagle of the emperors may well be as ancient a bearing as any in Europe, seeing that Charlemagne is said, as the successor of the Caesars, to have used the eagle as his badge. The emperor Henry III. (1039–1056) has the sceptre on his seal surmounted by an eagle; in the 12th century the eagle was embroidered upon the imperial gloves. At Molsen in 1080 the emperor's banner is said by William of Tyre to have borne the eagle, and with the beginning of regular heraldry this imperial badge would soon be displayed on a shield. The double-headed eagle is not seen on an imperial seal until after 1414, when the bird becomes the recognized arms of the king of the Romans.

There are, however, earlier examples of shields of arms than any of these. A document of the first importance is the description by John of Marmoustier of the marriage of Geoffrey of Anjou with Maude the empress, daughter of Henry I., when the king is said to have hung round the neck of his son-in-law a shield with golden "lioncels." Afterwards the monk speaks of Geoffrey in fight, "pictos leones preferens in clypeo." Two notes may be added to this account. The first is that the enamelled plate now in the museum at Le Mans, which is said to have been placed over the tomb of Geoffrey after his death in 1151, shows him bearing a

long shield of azure with six golden lioncels, thus confirming the monk's story. The second is the well-known fact that Geoffrey's bastard grandson, William with the Long Sword, undoubtedly bore these same arms of the six lions of gold in a blue field, even as they are still to be seen upon his tomb at Salisbury. Some ten years before Richard I. seals with the three leopards, his brother John, count of Mortain, is found using a seal upon which he bears two leopards, arms which later tradition assigns to the ancient dukes of Normandy and to their descendants the kings of England before Henry II., who is said to have added the third leopard in right of his wife, a legend of no value. Mr. Round has pointed out that Gilbert of Clare, earl of Hertford, who died in 1152, bears on his seal to a document sealed after 1138 and not later than 1146, the three cheverons afterwards so well known in England as the bearings of his successors. An old drawing of the seal of his uncle Gilbert, earl of Pembroke (*Lansdowne* MS. 203), shows a cheveronny shield used between 1138 and 1148. At some date between 1144 and 1150, Waleran, count of Meulan, shows on his seal a pennon and saddle-cloth with a checkered pattern: the house of Warenne, sprung from his mother's son, bore shields checky of gold and azure. In the inventory of Norman seals made by M. Demay, there is among the archives of the Manche a grant by Eudes, seigneur du Pont, sealed with a seal and counterseal of arms, to which M. Demay gives a date as early as 1128; but this is an error; the date should be 1218. Another type of seal common in this 12th century shows the personal device which had not yet developed into an armorial charge. A good example is that of Enguerrand de Candavène, count of St. Pol, where, although the shield of the horseman is uncharged, sheaves of oats, playing on his name, are strewn at the foot of the seal. Five of these sheaves were the arms of Candavène when the house came to display arms. In the same fashion three different members of the family of Armenteres in England show one, two or three swords upon their seals, but there is no evidence of a coat of arms derived from these devices.

From the beginning of the 13th century arms upon shields increase in number. Soon the most of the great houses of the west display them with pride. Leaders in the field, whether of a royal army or of a dozen spears, saw the military advantage of a custom which made shield and banner things that might be recognized in the press. Although it is probable that armorial bearings have their first place upon the shield, the charges of the shield are found displayed on the knight's long surcoat, his "coat of arms," on his banner or pennon, on the trapper of his horse and even upon the peaks of his saddle. An attempt has been made to connect the rise of armory with the adoption of the barrel-shaped close helm; but even when wearing the earlier Norman helmet with its long nasal the knight's face was not to be recognized. The Conqueror, as we know, had to bare his head before he could persuade his men at Hastings that he still lived. Armory satisfied a need which had long been felt. When fully armed, one galloping knight was like another; but friend and foe soon learned that the gold and blue checkers meant that Warenne was in the field and that the gold and red vair was for Ferrers. Earl Simon at Evesham sent up his barber to a spying place and, as the barber named in turn the banners which had come up against him, he knew that his last fight was at hand. In spite of these things the growth of the custom of sealing deeds and charters had at least as much influence in the development of armory as any military need. By this way, women and clerks, citizens and men of peace, corporations and colleges, came to share with the fighting man in the use of armorial bearings. Arms in stone, wood and brass decorated the tombs of the dead and the houses of the living; they were broidered in bed-curtains, coverlets and copes, painted on the sails of ships and enamelled upon all manner of goldsmiths' and silversmiths' work. And, even by warriors, the full splendour of armory was at all times displayed more fully in the fantastic magnificence of the tournament than in the rougher business of war.

There can be little doubt that ancient armorial bearings were chosen at will by the man who bore them, many reasons guiding his choice. Crosses in plenty were taken. Old writers have asserted that these crosses commemorate the badge of the crusaders, yet the fact that the cross is the symbol of the faith was reason enough. No symbolism can be found in such charges as bends and fesses; they are on the shield because a broad band, aslant or athwart, is a charge easily recognized. Mediaeval wisdom gave every noble and magnanimous quality to the lion, and therefore this beast is chosen by hundreds of knights as their bearing. We have already seen how the arms of a Candavène play upon his name. In ancient shields almost all beasts and birds other than the lion and the eagle play upon the bearer's name. No object is so humble that it is unwelcome to the knight seeking a pun for his shield. Trivet has a three-legged trivet. The legends which assert that certain arms were "won in the Holy Land" or granted by ancient kings for heroic deeds in the field are for the most part worthless fancies.

Tenants or neighbours of the great feudal lords were wont to make their arms by differencing the lord's shield or by bringing some charge of it into their own bearings. Thus a group of Kentish shields borrow lions from that of Leyborne, which is azure with six lions of silver. Shirland of Minster bore the same arms differenced with an ermine quarter. Detling had the silver lions in a sable field. The Vipont ring or annelet is in several shields of Westmorland knights, and the cheverons of Clare, the cinquefoil badge of Beaumont and the sheaves of Chester can be traced in the coats of many of the followers of those houses. Sometimes the lord himself set forth such arms in a formal grant, as when the baron of Greystock grants to Adam of Blencowe a shield in which his own three chaplets are charges. The Whitgreave family of Staffordshire still show a shield granted to their ancestor in 1442 by the earl of Stafford, in which the Stafford red cheveron on a golden field is four times repeated.

Differences.—By the custom of the middle ages the "whole coat," which is the undifferenced arms, belonged to one man only and was inherited whole only by his heirs. Younger branches differenced in many ways, following no rule. In modern armory the label is reckoned a difference proper only to an eldest son. But in older times, although the label was very commonly used by the son and heir apparent, he often chose another distinction during his father's lifetime, while the label is sometimes found upon the shields of younger sons. Changing the colours or varying the number of charges, drawing a bend or baston over the shield or adding a border are common differences of cadet lines. Beauchamp, earl of Warwick, bore "Gules with a fesse and six crosslets gold." His cousins are seen changing the crosslets for martlets or for billets. Bastards difference their father's arms, as a rule, in no more striking manner than the legitimate cadets. Towards the end of the 14th century we have the beginning of the custom whereby certain bastards of princely houses differenced the paternal arms by charging them upon a bend, a fesse or a chief, a cheveron or a quarter. Before his legitimation the eldest son of John of Gaunt by Katharine Swinford is said to have borne a shield party silver and azure with the arms of Lancaster on a bend. After his legitimation in 1397 he changed his bearings to the royal arms of France and England within a border gobony of silver and azure. Warren of Poynton, descended from the last earl Warenne and his concubine, Maude of Neirford, bore the checkered shield of Warenne with a quarter charged with the ermine lion of Neirford. By the end of the middle ages the baston under continental influence tended to become a bastard's difference in England and the jingle of the two words may have helped to support the custom. About the same time the border gobony began to acquire a like character. The "bar sinister" of the novelists is probably the baston sinister, with the ends couped, which has since the time of Charles II. been familiar on the arms of certain descendants of the royal house. But it has rarely been seen in England over other shields; and, although the border gobony surrounds the arms granted to a peer of Victorian creation, the modern heralds have fallen into the habit of assigning, in nineteen cases out of twenty, a wavy border as the standard difference for illegitimacy.

Although no general register of arms was maintained it is remarkable that there was little conflict between persons who had chanced to assume the same arms. The famous suit in which Scrope, Grosvenor and Carminow all claimed the blue shield with

the golden bend is well known, and there are a few cases in the 14th century of like disputes which were never carried to the courts. But the men of the middle ages would seem to have had marvellous memories for blazonry; and we know that rolls of arms for reference, some of them the records of tournaments, existed in great numbers. A few examples of these remain to us, with painted shields or descriptions in French blazon, some of them containing many hundreds of names and arms.

To women were assigned, as a rule, the undifferenced arms of their fathers. In the early days of armory married women—well-born spinsters of full age were all but unknown outside the walls of religious houses—have seals on which appear the shield of the husband or the father or both shields side by side. But we have some instances of the shield in which two coats of arms are parted or, to use the modern phrase, "impaled." Early in the reign of King John, Robert de Pinkeny seals with a parted shield. On the right or dexter side—the right hand of a shield is at the right hand of the person covered by it—are two fusils of an indented fesse: on the left or sinister side are three waves. The arms of Pinkeny being an indented fesse, we may see in this shield the parted arms of husband and wife—the latter being probably a Basset. In many of the earliest examples, as in this, the dexter half of the husband's shield was united with the sinister half of that of the wife, both coats being, as modern antiquaries have it, dimidiated. This "dimidiation," however, had its inconvenience. With some coats it was impossible. If the wife bore arms with a quarter for the only charge, her half of the shield would be blank. Therefore the practice was early abandoned by the majority of bearers of parted shields although there is a survival of it in the fact that borders and tressures continue to be "dimidiated" in order that the charges within them shall not be cramped. Parted shields came into common use from the reign of Edward II., and the rule is established that the husband's arms should take the dexter side. There are, however, several instances of the contrary practice. On the seal (1310) of Maude, wife of John Boutetort of Halstead, the engrailed saltire of the Boutetorts takes the sinister place. A twice-married woman would sometimes show a shield charged with her paternal arms between those of both of her husbands, as did Beatrice Stafford in 1404, while in 1412 Elizabeth, Lady of Clinton, seals with a shield paled with five coats—her arms of la Plaunche between those of four husbands. In most cases the parted shield is found on the wife's seal alone. Even in our own time it is recognized that the wife's arms should not appear upon the husband's official seal, upon his banner or surcoat or upon his shield when it is surrounded by the collar of an order. Parted arms, it may he noted, do not always represent a husband and wife. Richard II. parted with his quartered arms of France and England those ascribed to Edward the Confessor, and parting is often used on the continent where quartering would serve in England. In 1497 the seal of Giles Daubeney and Reynold Bray, fellow justices in eyre, shows their arms parted in one shield. English bishops, by a custom begun late in the 14th century, part the see's arms with their own. By modern English custom a husband and wife, where the wife is not an heir, use the parted coat on a shield, a widow bearing the same upon the lozenge on which, when a spinster, she displayed her father's coat alone. When the wife is an heir, her arms are now borne in a little scocheon above those of her husband. If the husband's arms be in

an unquartered shield the central charge is often hidden away by this scocheon.

The practice of marshalling arms by quartering spread in England by reason of the example given by Eleanor, wife of Edward I., who displayed the castle of Castile quartered with the lion of Leon. Isabel of France, wife of Edward II., seals with a shield in whose four quarters are the arms of England, France, Navarre and Champagne. Early in the 14th century Simon de Montagu, an ancestor of the earls of Salisbury, quartered with his own arms a coat of azure with a golden griffon. In 1340 we have Laurence Hastings, earl of Pembroke, quartering with the Hastings arms the arms of Valence, as heir of his great-uncle Aymery, earl of Pembroke. In the preceding year the king had already asserted his claim to another kingdom by quartering France with England, and, after this, quartered shields became common in the great houses whose sons were carefully matched with heirs female. When the wife was an heir the husband would quarter her arms with his own, displaying, as a rule, the more important coat in the first quarter. Marshalling becomes more elaborate with shields showing both quarterings and partings, as in the seal (1368) of Sibil Arundel, where Arundel (Fitzalan) is quartered with Warenne and parted with the arms of Montagu. In all, save one, of these examples the quartering is in its simplest form, with one coat repeated in the first and fourth quarters of the shield and another in the second and third. But to a charter of 1434 Sir Henry Bromflete sets a seal upon which Bromflete quarters Vesci in the second quarter, Aton in the third and St. John in the fourth, after the fashion of the much earlier seal of Edward II.'s queen. Another development is that of what armorists style the "grand quarter," a quarter which is itself quartered, as in the shield of Reynold Grey of Ruthyn, which bears Grey in the first and fourth quarters and Hastings quartered with Valence in the third and fourth. Humphrey Bourchier, Lord Cromwell, in 1469, bears one grand quarter quartered with another, the first having Bourchier and Lovaine, the second Tatershall and Cromwell.

The last detail to be noted in mediaeval marshalling is the introduction into the shield of another surmounting shield called by old armorists the "innerscocheon" and by modern blazoners the "inescutcheon." John the Fearless, count of Flanders, marshalled his arms in 1409 as a quartered shield of the new and old coats of Burgundy. Above these coats a little scocheon, borne over the crossing of the quartering lines, had the black lion of Flanders, the arms of his mother. Richard Beauchamp, the adventurous earl of Warwick, who had seen most European courts during his wanderings, may have had this shield in mind when, over his arms of Beauchamp quartering Newburgh, he set a scocheon of Clare quartering Despenser, the arms of his wife Isabel Despenser, co-heir of the earls of Gloucester. The seal of his son-in-law, the King-Maker, shows four quarters — Beauchamp quartering Clare, Montagu quartering Monthermer, Nevill alone, and Newburgh quartering Despenser. An interesting use of the scocheon *en surtout* is that made by Richard Wydvile, Lord Rivers, whose garter stall-plate has a grand quarter of Wydvile and Prouz, quartering Beauchamp of Hache, the whole surmounted by a scocheon with the arms of Reviers or Rivers, the house from which he took the title of his barony. On the continent the common use of the scocheon is to bear the paternal arms of a sovereign or noble, surmounting the quarterings of his kingdoms, principalities, fiefs or seigniories. The prince of Wales bore the arms of Saxony above those of the United Kingdom differenced with his silver label. Marshalling takes its most elaborate form, the most removed from the graceful simplicity of the middle ages, in such shields as the "Great Arms" of the Austrian empire, wherein are nine grand quarters each marshalling in various fashions from three to eleven coats, six of the grand-quarters bearing scocheons ***en*** *surtout,* each scocheon ensigned with a different crown.

Crests. — The most important accessory of the arms is the crested helm. Like the arms it has its pre-heraldic history in the crests of the Greek helmets, the wings, the wild boar's and bull's heads of Viking headpieces. A little roundel of the arms of a Japanese house was often borne as a crest in the Japanese helmet, stepped in a socket above the middle of the brim. The 12th-century seal of Philip of Alsace, count of Flanders, shows a demi-lion painted or beaten on the side of the upper part of his helm, and upon his seal of 1198 King Richard Coeur de Lion's barrel-helm has a leopard upon the semicircular comb-ridge, the edge of which is set off with feathers arranged as two wings. Crests, however, came slowly into use in England, although before 1250 Roger de Quincy, earl of Winchester, is seen on his seal with a wyver upon his helm. Of the long roll of earls and barons sealing the famous letter to the pope in 1301 only five show true crests on their seals. Two of them are the earl of Lancaster and his brother, each with a wyver crest like that of Quincy. One, and the most remarkable, is John St. John of Halnaker, whose crest is a leopard standing between two upright palm branches. Ralph de Monhermer has an eagle crest, while Walter de Moncy's helm is surmounted by a fox-like beast. In three of these instances the crest is borne, as was often the case, by the horse as well as the rider. Others of these seals to the barons' letter have the fan-shaped crest without any decoration upon it. But as the furniture of tournaments grew more magnificent the crest gave a new field for display, and many strange shapes appear in painted and gilded wood, metal, leather or parchment above the helms of the jousters. The Berkeleys, great patrons of abbeys, bore a mitre as their crest painted with their arms, like crests being sometimes seen on the continent where the wearer was *advocatus* of a bishopric or abbey. The whole or half figures or the heads and necks of beasts and birds were employed by other families. Saracens' heads topped many helms, that of the great Chandos among them. Astley bore for his crest a silver harpy standing in marsh-sedge, a golden chain fastened to a crown about her neck. Dymoke played pleasantly on his name with a long-eared moke's scalp. Stanley took the eagle's nest in which the eagle is lighting down with a swaddled babe in his claws. Many early helms, as that of Sir John Loterel, painted in the Loterel psalter, repeat the arms on the sides of a fan-crest. Howard bore for a crest his arms painted on a pair of wings, while simple "bushes" of feathers are seen in great plenty. The crest of a cadet is often differenced like the arms, and thus a wyver or a leopard will have a label about its neck. The Montagu griffon on the helm of John, marquess of Montagu, holds in its beak the gimel ring with which he differenced his father's shield. His brother, the King-Maker, following a custom commoner abroad than at home, shows two crested helms on his seal, one for Montagu and one for Beauchamp—none for his father's house of Nevill. It is often stated that a man, unless by some special grace or allowance, can have but one crest. This, however, is contrary to the spirit of mediaeval armory in which a man, inheriting the coat of arms of another house than his own, took with it all its belongings, crest, badge and the like. The heraldry books, with more reason, deny crests to women and to the clergy, but examples are not wanting of mediaeval seals in which even this rule is broken. It is perhaps unfair to cite the case of the bishops of Durham who ride in full harness on their palatinate seals; but Henry Despenser, bishop of Norwich, has a helm on which the winged griffon's head of his house springs from a mitre, while Alexander Nevill, archbishop of York, seals with shield, supporters and crowned and crested helm like those of any lay magnate. A seal cut for the wife of Thomas Chetwode, a Cheshire squire, has a shield of her husband's arms parted with her own and surmounted by a crowned helm with the crest of a demi-lion; and this is not the only example of such bearings by a woman.

Before passing from the crest let us note that in England the juncture of crest and helm was commonly covered, especially after the beginning of the 15th century, by a torse or "wreath" of silk, twisted with one, two or three colours. Coronets or crowns and "hats of estate" often take the place of the wreath as a base for the crest, and there are other curious variants. With the wreath may be considered the mantle, a hanging cloth which, in its earliest form, is seen as two strips of silk or sendal attached to the top of the helm below the crest and streaming like pennants as the rider bent his head and charged. Such strips are often displayed from the conical top of an uncrested helm, and some ancient examples have the air of the two ends of a stole or of

the *infulae* of a bishop's mitre. The general opinion of antiquaries has been that the mantle originated among the crusaders as a protection for the steel helm from the rays of an Eastern sun; but the fact that mantles take in England their fuller form after our crusading days were over seems against this theory. When the fashion for slittering the edges of clothing came in, the edges of the mantle were slittered like the edge of the sleeve or skirt, and, flourished out on either side of the helm, it became the delight of the painter of armories and the seal engraver. Modern heraldry in England paints the mantle with the principal colour of the shield, lining it with the principal metal; this in cases where no old grant of arms is cited as evidence of another usage. The mantles of the king and of the prince of Wales are, however, of gold lined with ermine and those of other members of the royal house of gold lined with silver. In ancient examples there is great variety and freedom. Where the crest is the head of a griffon or bird the feathering of the neck will be carried on to cover the mantle. Other mantles will be powdered with badges or with charges from the shield, others checkered, barred or paled. More than thirty of the mantles enamelled on the stall-plates of the mediaeval Garter-knights are of red with an ermine lining, tinctures which in most cases have no reference to the shields below them.

Supporters.— Shields of arms, especially upon seals, are sometimes figured as hung round the necks of eagles, lions, swans and griffons, as strapped between the horns of a hart or to the boughs of a tree. Badges may fill in the blank spaces at the sides between the shield and the inscription on the rim, but in the later 13th and early 14th centuries the commonest objects so serving are sprigs of plants, lions, leopards, or, still more frequently, lithe-necked wyvers. John of Segrave in 1301 flanks his shields with two of the sheaves of the older coat of Segrave: William Marshal of Hingham does the like with his two marshal's staves. Henry of Lancaster at the same time shows on his seal a shield and a helm crested with a wyver, with two like wyvers ranged on either side of the shield as "supporters." It is uncertain at what time in the 14th century these various fashions crystallize into the recognized use of beasts, birds, reptiles, men or inanimate objects, definitely chosen as "supporters" of the shield, and not to be taken as the ornaments suggested by the fancy of the seal engraver. That supporters originate in the decoration of the seal there can be little doubt. Some writers, the learned Menêtrier among them, will have it that they were first the fantastically clad fellows who supported and displayed the knight's shield at the opening of the tournament. If the earliest supporters were wild men, angels or Saracens, this theory might be defended; but lions, boars and talbots, dogs and trees are guises into which a man would put himself with difficulty. By the middle of the 14th century we find what are clearly recognizable as supporters. These, as in a lesser degree the crest, are often personal rather than hereditary, being changed generation by generation. The same person is found using more than one pair of them. The kings of France have had angels as supporters of the shield of the fleurs de lys since the 15th century, but the angels have only taken their place as the sole royal supporters since the time of Louis XIV. Sovereigns of England from Henry IV. to Elizabeth changed about between supporters of harts, leopards, antelopes, bulls, greyhounds, boars and dragons. James I. at his accession to the English throne brought the Scottish

unicorn to face the English leopard rampant across his shield, and, ever since, the "lion and unicorn" have been the royal supporters.

An old herald wrote as his opinion that "there is little or nothing in precedent to direct the use of supporters." Modern custom gives them, as a rule, only to peers, to knights of the Garter, the Thistle and St. Patrick, and to knights who are "Grand Crosses" or Grand Commanders of other orders. Royal warrants are sometimes issued for the granting of supporters to baronets, and, in rare cases, they have been assigned to untitled persons. But in spite of the jealousy with which official heraldry hedges about the display of these supporters once assumed so freely, a few old English families still assert their right by hereditary prescription to use these ornaments as their forefathers were wont to use them.

Badges.—The badge may claim a greater antiquity and a wider use than armorial bearings. The "Plantagenet" broom is an early example in England, sprigs of it being figured on the seal of Richard I. In the 14th and 15th centuries every magnate had his badge, which he displayed on his horse-furniture, on the hangings of his bed, his wall and his chair of state, besides giving it as a "livery" to his servants and followers. Such were the knots of Stafford, Bourchier and Wake, the scabbard-crampet of La Warr, the sickle of Hungerford, the swan of Toesni, Bohun and Lancaster, the dun bull of Nevill, the blue boar of Vere and the bear and ragged staff of Beauchamp, Nevill of Warwick and Dudley of Northumberland. So well known of all were these symbols that a political ballad of 1449 sings of the misfortunes of the great lords without naming one of them, all men understanding what signified the Falcon, the Water Bowge and the Cresset and the other badges of the doggerel. More famous still were the White Hart, the Red Rose, the White Rose, the Sun, the Falcon and Fetterlock, the Portcullis and the many other badges of the royal house. The Prince of Wales's feathers are as well known to-day as the royal arms. The Flint and Steel of Burgundy make a collar for the order of the Golden Fleece.

Mottoes.—The motto now accompanies every coat of arms in Great Britain. Few of these Latin aphorisms, these bald assertions of virtue, high courage, patriotism, piety and loyalty have any antiquity. Some few, however, like the "Espérance" of Percy, were the war-cries of remote ancestors. "I mak' sicker" of Kirkpatrick recalls pridefully a bloody deed done on a wounded man, and the "Dieu Ayde," "Agincourt" and "D'Accomplir Agincourt" of the Irish Montmorencys and the English Wodehouses and Dalisons, glorious traditions based upon untrustworthy genealogy. The often-quoted punning mottoes may be illustrated by that of Cust, who says "Qui Cust-odit caveat," a modern example and a fair one. Ancient mottoes, as distinct from the war or gathering cry of a house, are often cryptic sentences whose meaning might be known to the user and perchance to his mistress. Such are the "Plus est en vous" of Louis de Bruges, the Flemish earl of Winchester, and the "So have I cause" and "Till then thus" of two Englishmen. The word motto is of modern use, our forefathers speaking rather of their "word" or of their "reason."

Lines.—Eleven varieties of lines, other than straight lines, which divide the shield, or edge our cheverons, pales, bars and the like, are pictured in the heraldry books and named as engrailed, embattled, indented, invected, wavy or undy, nebuly, dancetty, raguly, potenté, dovetailed and urdy. As in the case of many other such lists of the later armorists these eleven varieties need some pruning and a new explanation. The most commonly found is the line engrailed, which for the student of mediaeval armory must be associated with the line indented. In its earliest form the line which a roll of arms will describe indifferently as indented or engrailed takes almost invariably the form to which the name indented is restricted by modern armorists.

The cross may serve as our first example. A cross, engrailed or indented, the words being used indifferently, is a cross so deeply notched at the edges that it seems made up of so many lozenge-shaped wedges or fusils. About the middle of the 14th century begins a tendency, resisted in practice by many conservative families, to draw the engrailing lines in the fashion to which modern armorists restrict the word "engrailed," making shallower indentures in the form of lines of half circles. Thus the engrailed cross of the Mohuns takes either of the two forms which we illustrate. Bends follow the same fashion, early bends engrailed or indented being some four or more fusils joined bendwise by their blunt sides, bends of less than four fusils being very rare. Thus also the engrailed or indented saltires, pales or cheverons, the exact number of the fusils which go to the making of these being unconsidered. For the fesse there is another law. The fesse indented or engrailed is made up of fusils as is the engrailed bend. But although early rolls of arms sometimes neglect this detail in their blazon, the fusils making a fesse must always be of an ascertained number. Montagu, earl of Salisbury, bore a fesse engrailed or indented of three fusils only, very few shields imitating this. Mediaeval armorists will describe his arms as a fesse indented of three indentures, as a fesse fusilly of three pieces, or as a fesse engrailed of three points or pieces, all of these blazons having the same value. The indented fesse on the red shield of the Dynhams has four such fusils of ermine. Four, however, is almost as rare a number as three, the normal form of a fesse indented being that of five fusils as borne by Percys, Pinkenys, Newmarches and many other ancient houses. Fesses of six fusils are not to be found. Note that bars indented or engrailed are, for a reason which will be evident, never subject to this counting of fusils. Fauconberg, for example, bore "Silver with two bars engrailed, or indented, sable." Displayed on a shield of the flat-iron outline, the lower bar would show fewer fusils than the upper, while on a square banner each bar would have an equal number —usually five or six.

While bends, cheverons, crosses, saltires and pales often follow, especially in the 15th century, the tendency towards the rounded "engrailing," fesses keep, as a rule, rheir bold indentures —neither Percy nor Montagu being ever found with his bearings in aught but their ancient form. Borders take the newer fashion as leaving more room for the charges of the field. But indented chiefs do not change their fashion, although many saw-teeth sometimes take the place of the three or four strong points of early arms, and parti-coloured shields whose parting line is indented never lose the bold zig-zag.

While bearing in mind that the two words have no distinctive force in ancient armory, the student and the herald of modern times may conveniently allow himself to blazon the sharp and saw-toothed line as "indented" and the scalloped line as "engrailed," especially when dealing with the debased armory in which the distinction is held to be a true one and one of the first importance. One error at least he must avoid, and that is the following of the heraldry-book compilers in their use of the word "dancetty." A "dancetty" line, we are told, is a line having fewer and deeper indentures than the line indented. But no dancetty line could make a bolder dash across the shield than do the lines which the old armorists recognized as "indented." In old armory we have fesses dancy—commonly called "dances"—bends dancy, or cheverons dancy; there are no chiefs dancy nor borders dancy, nor are there shields blazoned as parted with a dancy line. Waved lines, battled lines and ragged lines need little explanation that a picture cannot give. The word invecked or invected is sometimes applied by old-fashioned heraldic pedants to engrailed lines; later pedants have given it to a line found in modern grants of arms, an engrailed line reversed. Dovetailed and undy lines are mere modernisms. Of the very rare nebuly or clouded line we can only say that the ancient form, which imitated the conventional cloud-bank of the old painters, is now almost forgotten, while the bold "wavy" lines of early armory have the word "nebuly" misapplied to them.

CHARGES

The Ordinary Charges.—The writers upon armory have given the name of Ordinaries to certain conventional figures commonly charged upon shields. Also they affect to divide these into Honourable Ordinaries and Sub-ordinaries without explaining the reason for the superior honour of the Saltire or for the subordination of the Quarter. Disregarding such distinctions, we may begin with the description of the "Ordinaries" most commonly to be found.

From the first the Cross was a common bearing on English shields, "Silver a cross gules" being given early to St. George, patron of knights and of England, for his arms; and under St. George's red cross the English were wont to fight. Our armorial crosses took many shapes, but the "crosses innumerabill" of the Book of St. Albans and its successors may be left to the heraldic dictionary makers who have devised them. It is more important to define those forms in use during the middle ages, and to name them accurately after the custom of those who bore them in war, a task which the heraldry books have never as yet attempted with success.

The cross in its simple form needs no definition, but it will be noted that it is sometimes borne "voided" and that in a very few cases it appears as a lesser charge with its ends cut off square, in which case it must be clearly blazoned as "a plain Cross."

Andrew Harcla, the march-warden, whom Edward II. made an earl and executed as a traitor, bore the arms of St. George with a martlet sable in the quarter. Crevequer of Kent bore "Gold, a voided cross gules." Newsom (14th century) bore "Azure, a fesse silver with three plain crosses gules."

Next to the plain Cross may be taken the Cross paty, the *croiz patée* or *paté* of old rolls of arms. It has several forms, according to the taste of the artist and the age. So, in the 13th and early 14th centuries, its limbs curve out broadly, while at a later date the limbs become more slender and of even breadth, the ends somewhat resembling fleurs-de-lys. Each of these forms has been seized by the heraldic writers as the type of a distinct cross for which a name must be found, none of them, as a rule, being recognized as a cross paty, a word which has its misapplication elsewhere. Thus the books have "cross patonce" for the earlier form, while "cross clechée" and "cross fleurie" serve for the others. But the true identification of the various crosses is of the first importance to the antiquary, since without it descriptions of the arms on early seals or monuments must needs be valueless. Many instances of this need might be cited from the British Museum catalogue of seals, where, for example, the cross paty of Latimer is described twice as a "cross flory," six times as a "cross patonce," but not once by its own name, although there is no better known example of this bearing in England. Latimer bore "Gules, a cross paty gold."

The cross formy follows the lines of the cross paty save that its broadening ends are cut off squarely. Chetwode bore "Quarterly silver and gules with four crosses formy countercoloured"—that is to say, the two crosses in the gules are of silver and the two in the silver of gules.

The cross flory or flowered cross, the "cross with the ends flowered"—*od les boutes floretes* as some of the old rolls have it—is, like the cross paty, a mark for the misapprehension of writers on armory, who describe some shapes of the cross paty by its name. Playing upon discovered or fancied variants of the word, they bid us mark the distinctions between crosses "fleur-de-lisée," "fleury" and "fleurettée," although each author has his own version of the value which must be given these precious words. But the facts of the mediaeval practice are clear to those who take their armory from ancient examples and not from phrases plagiarized from the hundredth plagiarist. The flowered cross is one whose limbs end in fleur-de-lys, which spring sometimes from a knop or bud but more frequently issue from the square ends of a cross of the "formy" type. Swynnerton bore "Silver, a flowered cross sable."

The mill-rind, which takes its name from the iron of a mill-stone—fer de *moline*—must be set with the crosses. Some of the old rolls call it *croiz recercelé,* from which armorial writers have leaped to imagine a distinct type. Also they call the mill-rind itself a "cross moline" keeping the word mill-rind for a charge having the same origin but of somewhat differing form. Since this charge became common in Tudor armory it is perhaps better that the original mill-rind should be called for distinction a mill-rind cross. Willoughby bore "Gules, a mill-rind cross silver."

The crosslet, cross botonny or cross crosletted, is a cross whose limbs, of even breadth, end as trefoils or treble buds. It is rarely found in mediaeval examples in the shape—that of a cross with limbs ending in squarely cut plain crosses—which it took during the 16th-century decadence. As the sole charge of a shield it is very rare; otherwise it is one of the commonest of charges. Brerelegh bore ('Silver, a crosslet gules."

Within these modest limits we have brought the greater part of that monstrous host of crosses which cumber the dictionaries. A few rare varieties may be noticed.

Dukinfield bore "Silver, a voided cross with sharpened ends." Skirlaw, bishop of Durham (d. 1406), the son of a basket-weaver, bore "Silver, a cross of three upright wattles sable, crossed and interwoven by three more." Drury bore "Silver, a chief vert with *a* St. Anthony's cross gold between two golden molets, pierced gules." Brytton bore "Gold, a patriarch's cross set upon three degrees or steps of gules."

The crosses paty and formy, and more especially the crosslets, are often borne fitchy, that is to say, with the lower limb somewhat lengthened and ending in a point, for which reason the 15th-century writers call these "crosses fixabill." In the 14th-century rolls the word "potent" is sometimes used for these crosses fitchy, the long foot suggesting a potent or staff. From this source modern English armorists derive many of their "crosses potent," whose four arms have the T heads of old-fashioned walking staves. Howard bore "Silver, a bend between six crosslets fitchy gules." Scott of Congerhurst in Kent bore "Silver, a crosslet fitchy sable."

The Saltire is the cross in the form of that on which St. Andrew suffered. whence it is borne on the banner of Scotland, and by the Andrew family of Northamptonshire. Nevile of Raby bore "Gules, a saltire silver." Nicholas Upton, the 15th-century writer on armory, bore "Silver, a saltire sable with the ends couped and five golden rings thereon." Aynho bore "Sable, a saltire silver, having the ends flowered, between four leopards gold."

The chief is the upper part of the shield and, marked out by a line of division, it is taken as one of the Ordinaries. Shields with a plain chief and no more are rare in England, but Tichborne of Tichborne has borne since the 13th century "Vair, a chief gold." According to the heraldry books the chief should be marked off as a third part of the shield, but its depth varies, being broader when charged with devices and narrower when, itself uncharged, it surmounts a charged field. Fenwick bore "Silver, a chief gules with six martlets countercoloured," and in this case the chief would be the half of the shield. Clinging to the belief that the chief must not fill more than a third of the shield, the heraldry books abandon the word in such cases, blazoning them as "party per fesse."

Hastang bore "Azure, a chief gules and a lion with a forked tail over all." Walter Kingston seals in the 13th century with a shield of "Two rings or annelets in the chief."

With the chief may be named the Foot, the nether part of the shield marked off as an Ordinary. So rare is this charge that we can cite but one example of it, that of the shield of John of Skipton, who in the 14th century bore "Silver with the foot indented purple and a lion purple." The foot, however, is a recognized bearing in France, whose heralds gave it the name of champagne.

The Pale is a broad stripe running the length of the shield. Of a single pale and of three pales there are several old examples. Four red pales in a golden shield were borne by Eleanor of Provence, queen of Henry III.; but the number did not commend itself to English armorists. When the field is divided evenly into six pales it is said to be paly; if into four or eight pales, it is blazoned as paly of that number of pieces. But paly of more or less than six pieces is rarely found.

The Yorkshire house of Gascoigne bore "Silver, a pale sable with a golden conger's head thereon, cut off at the shoulder." Ferlington bore "Gules, three pales vair and a chief gold."

When the shield or charge is divided palewise down the middle into two tinctures it is said to be "party." "Party silver and gules" are the arms of the Waldegraves. Bermingham bore "Party silver and sable indented." Such partings of the field often cut through charges whose colours change about on either side of the parting line. Thus Chaucer the poet bore "Party silver and gules with a bend countercoloured."

The Fesse is a band athwart the shield, filling, according to the rules of the heraldic writers, a third part of it. By ancient use, however, as in the case of the chief and pale, its width varies with the taste of the painter, narrowing when set in a field full of charges and broadening when charges are displayed on itself. When two or three fesses are borne they are commonly called Bars. "Ermine *four* bars gules" is given as the shield of Sir John Sully, a 14th-century Garter knight, on his stall-plate at Windsor; but the plate belongs to a later generation, and should probably have three bars only. Little bars borne in couples are styled Gemels (twins). The field divided into an even number of bars of alternate colours is said to be barry, barry of six pieces being the normal number. If four or eight divisions be found the number of pieces must be named; but with ten or more divisions the number is unreckoned and "burely" is the word.

Colevile of Bitham bore "Gold a fesse gules." West bore "Silver, a dance (or fesse dancy) sable." Fauconberg bore "Gold, a fesse azure with three pales gules in the chief." Cayvile bore "Silver, a fesse gules, flowered on both sides." Devereux bore "Gules, a fesse silver with three roundels silver in the chief" Chamberlayne of Northamptonshire bore "Gules, a fesse and three scallops gold." Harcourt bore "Gules, two bars gold." Manners bore "Gold, two bars azure and a chief gules." Wake bore "Gold, two bars gules with three roundels gules in the chief."

The Bend is a band traversing the shield aslant, arms with one, two or three bends being common during the middle ages in England. Bendy shields follow the rule of shields paly and barry, but as many as ten pieces have been counted in them. The bend is often accompanied by a narrow bend on either side, these companions being called Cotices. A single narrow bend, struck over all other charges, is the Baston, which during the 13th and 14th centuries was a common difference for the shields of the younger branches of a family, coming in later times to suggest itself as a difference for bastards.

The Bend Sinister, the bend drawn from right to left beginning at the "sinister" corner of the shield, is reckoned in the heraldry books as a separate Ordinary, and has a peculiar significance accorded to it by novelists Mediaeval English seals afford a group of examples of Bends Sinister or Bastons Sinister, but there seems no reason for taking them as anything more than cases in which the artist has neglected the common rule.

Mauley bore "Gold, a bend sable." Harley bore "Gold, a bend with two cotices sable" Wallop bore "Silver, a bend wavy sable." Bishopsdon bore "Bendy of six pieces, gold and azure, with a quarter ermine." Montfort of Whitchurch bore "Bendy of ten pieces gold and azure." Henry of Lancaster, second son of Edmund Crouchback, bore the arms of his cousin, the king of England, with the difference of "a baston azure" Adam Fraunceys (14th century) bore "Party gold and sable bendwise with a lion countercoloured" The parting line is here commonly shown as "sinister."

The Cheveron, a word found in mediaeval building accounts for the barge-boards of a gable. is an Ordinary whose form is explained by its name. Perhaps the very earliest of English armorial charges, and familiarized by the shield of the great house of Clare, it became exceedingly popular in England Like the bend and the chief, its width varies in different examples. Likewise its angle varies, being sometimes so acute as to touch the top of the shield, while in post-mediaeval armory the point is often blunted beyond the right angle. One, two or three cheverons occur

in numberless shields, and five cheverons have been found. Also there are some examples of the bearing of cheveronny.

The earls of Gloucester of the house of Clare bore "Gold, three cheverons gules" and the Staffords derived from them their shield of "Gold, a cheveron gules." Chaworth bore "Azure, two cheverons gold." Peytevyn bore "Cheveronny of ermine and gules." St. Quintin of Yorkshire bore "Gold, two cheverons gules and a chief vair." Sheffield bore "Ermine, a cheveron gules between three sheaves gold."

Shields parted cheveronwise are common in the 15th century, when they are often blazoned as having chiefs "enty" or grafted. Aston of Cheshire bore "Party sable and silver cheveronwise" or "Silver, a chief enty sable."

The Pile or stake (estache) is a wedge-shaped figure jutting from the chief to the foot of the shield, its name allied to the pile of the bridge-builder. A single pile is found in the notable arms of Chandos, and the black piles in the ermine shield of Hollis are seen as an example of the bearing of two piles. Three piles are more easily found, and when more than one is represented the points are brought together at the foot. In ancient armory piles in a shield are sometimes reckoned as a variety of pales, and a Basset with three piles on his shield is seen with three pales on his square banner. Chandos bore "Gold, a pile gules."

The Quarter is the space of the first quarter of the shield divided crosswise into four parts. As an Ordinary it is an ancient charge and a common one in mediaeval England, although it has all but disappeared from modern heraldry books, the "Canton," an alleged "diminutive," unknown to early armory, taking its place. Like the other Ordinaries, its size is found to vary with the scheme of the shield's charges, and this has persuaded those armorists who must needs call a narrow bend a "bendlet," to the invention of the "Canton," a word which in the sense of a quarter or small quarter appears for the first time in the latter part of the 15th century. Writers of the 14th century sometimes give it the name of the Cantel, but this word is also applied to the void space on the opposite side of the chief, seen above a bend.

Blencowe bore "Gules, a quarter silver." Basset of Drayton bore "Gold, three piles (or pales) gules with a quarter ermine." Wydvile bore "Silver, a fesse and a quarter gules." Odingseles bore "Silver, a fesse gules with a molet gules in the quarter."

Shields or charges divided crosswise with a downward line and a line athwart are said to be quarterly. An ancient coat of this fashion is that of Say who bore (13th century) "Quarterly gold and gules"—the first and fourth quarters being gold and the second and third red. Ever or Eure bore the same with the addition of "a bend sable with three silver scallops thereon."

With the 15th century came a fashion of dividing the shield into more than four squares, six and nine divisions being often found in arms of that age. The heraldry books, eager to work out problems of blazonry, decide that a shield divided into six squares should be described as "Party per fesse with a pale counterchanged," and one divided into nine squares as bearing "a cross quarter-pierced." It seems a simpler business to follow a 15th-century fashion and to blazon such shields as being of six or nine "pieces." Thus John Garther (15th century) bore "Nine pieces erminees and ermine" and Whitgreave of Staffordshire "Nine pieces of azure and of Stafford's arms, which are gold with a cheveron gules." The Tallow Chandlers of London had a grant

in 1456 of "Six pieces azure and silver with three doves in the azure, each with an olive sprig in her beak."

Squared into more than nine squares the shield becomes checky or checkered and the number is not reckoned. Warenne's checker of gold and azure is one of the most ancient coats in England and checkered fields and charges follow in great numbers. Even lions have been borne checkered. Warenne bore "Checky gold and azure." Clifford bore the like with "a fesse gules." Cobham bore "Silver, a lion checky gold and sable." These checkered fesses, bars, bends, borders and the like, will commonly bear but two rows of squares, or three at the most. The heraldry writers are ready to note that when two rows are used "counter-compony" is the word in place of checky, and "compony-counter-compony" in the case of three rows. It is needless to say that these words have neither practical value nor antiquity to commend them. But bends and bastons, labels, borders and the rest are often coloured with a single row of alternating tinctures. In this case the pieces are said to be "gobony." Thus John Cromwell (14th century) bore "Silver, a chief gules with a baston gobony of gold and azure."

The scocheon or shield used as a charge is found among the earliest arms. Itself charged with arms, it served to indicate alliance by blood or by tenure with another house, as in the bearings of St. Owen whose shield of "Gules with a cross silver" has a scocheon of Clare in the quarter. In the latter half of the 15th century it plays an important part in the curious marshalling of the arms of great houses and lordships. Erpingham bore "Vert, a scocheon silver with an orle (or border) of silver martlets." Davillers bore at the battle of Boroughbridge "Silver, three scocheons gules."

The scocheon was often borne voided or pierced, its field cut away to a narrow border. Especially was this the case in the far North, where the Balliols, who bore such a voided scocheon, were powerful. The voided scocheon is wrongly named in all the heraldry books as an orle, a term which belongs to a number of small charges set round a central charge. Thus the martlets in the shield of Erpingham, already described, may be called an orle of martlets or a border of martlets. This misnaming of the voided scocheon has caused a curious misapprehension of its form, even Dr. Woodward, in his *Heraldry, British* and *Foreign,* describing the "orle" as "a narrow border detached from the edge of the shield." Following this definition modern armorial artists will, in the case of quartered arms, draw the "orle" in a first or second quarter of a quartered shield as a rectangular figure and in a third or fourth quarter as a scalene triangle with one arched side. Thereby the original voided scocheon changes into forms without meaning. Balliol bore "Gules, a voided scocheon silver." Surtees bore "Ermine, with a quarter of the arms of Balliol."

The *Tressure* or flowered tressure is a figure which is correctly described by Woodward's incorrect description of the orle as cited above, being a narrow inner border of the shield. It is distinguished, however, by the fleurs-de-lys which decorate it, setting off its edges. The double tressure which surrounds the lion in the royal shield of Scotland, and which is borne by many Scottish houses who have served their kings well or mated with their daughters, is carefully described by Scottish heralds as "flowered and counter-flowered," a blazon which is held to mean that the fleurs-de-lys show head and tail in turn from the outer rim of the outer tressure and from the inner rim of the innermost But this seems to have been no essential matter with mediaeval armorists and a curious 15th-century enamelled roundel of the arms of Vampage shows that in this English case the flowering takes the more convenient form of allowing all the lily heads to sprout from the outer rim. Vampage bore "Azure, an eagle silver within a flowered tressure silver." The king of Scots bore "Gold, a lion within a double tressure flowered and counter-flowered gules."

The Border of the shield when marked out in its own tincture is counted as an Ordinary. Plain or charged, it was commonly used as a difference. As the principal charge of a shield it is very rare, so rare that in most cases where it apparently occurs we may, perhaps, be following mediaeval custom in blazoning the shield as one charged with a scocheon and not with a border. Thus Hondescote bore "Ermine, a border gules" or "Gules, a scocheon ermine." Somerville bore "Burely silver and gules and a border azure with golden martlets."

The Flaunches are the flanks of the shield which, cut off by rounded lines, are borne in pairs as Ordinaries. These charges are found in many coats devised by 15th-century armorists. "Ermine, two flaunches azure with six golden wheat-ears" was borne by John Greyby of Oxfordshire (15th century).

The Label is a narrow fillet across the upper part of the chief, from which hang three, four, five or more pendants, the pendants being, in most old examples, broader than the fillet. Reckoned with the Ordinaries, it was commonly used as a means of differencing a cadet's shield, and in the heraldry books it has become the accepted difference for an eldest son, although the cadets often bore it in the middle ages. John of Hastings bore in 1300 before Carlaverock "Gold, a sleeve (or maunche) gules," while Edmund his brother bore the same arms with a sable label. In modern armory the pendants are all but invariably reduced to three, which, in debased examples, are given a dovetailed form while the ends of the fillet are cut off.

The Fret, drawn as a voided lozenge interlaced by a slender saltire, is counted an Ordinary. A charge in such a shape is extremely rare in mediaeval armory, its ancient form when the field is covered by it being a number of bastons—three being the customary number—interlaced by as many more from the sinister side. Although the whole is described as a fret in certain English blazons of the 15th century, the adjective "fretty" is more commonly used. Trussel's fret is remarkable for its bezants at the joints, which stand, doubtless, for the golden nail-heads of the "trellis" suggested by his name. Curwen, Wyvile and other northern houses bearing a fret and a chief have, owing to their fashion of drawing their frets, often seen them changed by the heraldry books into "three cheverons braced or interlaced."

Huddlestone bore "Gules fretty silver." Trussel bore "Silver fretty gules, the joints bezanty." Hugh Giffard (14th century) bore "Gules with an engrailed fret of ermine."

Another Ordinary is the Giron or Gyron—a word now commonly mispronounced with a hard "g." It may be defined as the lower half of a quarter which has been divided bendwise. No old example of a single giron can be found to match the figure in the heraldry books Gironny, or gyronny, is a manner of dividing the field into sections, by lines radiating from a centre point, of which many instances may be given. Most of the earlier examples have some twelve divisions although later armory gives eight as the normal number, as Campbell bears them.

Bassingbourne bore "Gironny of gold and azure of twelve pieces." William Stoker, who died Lord Mayor of London in 1484, bore "Gironny of six pieces azure and silver with three popinjays in the silver pieces." A pair of girons on either side of a chief were borne in the strange shield of Mortimer, commonly blazoned as "Barry azure and gold of six pieces, the chief azure with two pales and two girons gold, a scocheon silver over all." An early example shows that this shield began as a plain field with a gobony border.

With the Ordinaries we may take the Roundels or Pellets, disks or balls of various colours. Ancient custom gives the name of a bezant to the golden roundel, and the folly of the heraldic writers has found names for all the others, names which may be disregarded together with the belief that, while bezants and silver roundels, as representing coins, must be pictured with a flat surface, roundels of other hues must needs be shaded by the painter to represent rounded balls. Rings or Annelets were common charges in the North, where Lowthers, Musgraves and many more, differenced the six rings of Vipont by bearing them in various colours.

Burlay of Wharfdale bore "Gules, a bezant." Courtenay, earl of Devon, bore "Gold, three roundels gules with a label azure." Caraunt bore "Silver, three roundels azure, each with three cheverons gules." Vipont bore "Gold, six annelets gules." Avenel bore "Silver, a fesse and six annelets (*aunels*) gules." Stourton bore "Sable, a bend gold between six fountains." The fountain is a roundel charged with waves of white and blue.

The Lozenge is linked in the heraldry book with the Fusil. This

Fusil is described as a lengthened and sharper lozenge. But it will be understood that the Fusil, other than as part of an engrailed or indented bend, pale or fesse, is not known to true armory. Also it is one the notable achievements of the English writers on heraldry that they should have allotted to the lozenge, when borne voided, the name of Mascle. This "mascle" is the word of the oldest armorists for the unvoided charge, the voided being sometimes described by them as a lozenge, without further qualifications. Fortunately the difficulty can be solved by following the late 14th-century custom in distinguishing between "lozenges" and "voided lozenges" and by abandoning altogether this misleading word Mascle.

Thomas of Merstone, a clerk, bore on his seal in 1359 "Ermine, a lozenge with a pierced molet thereon." Braybroke bore "Silver, seven voided lozenges gules." Charles bore "Ermine, a chief gules with five golden lozenges thereon."

Billets are oblong figures set upright. Black billets in the arms of Delves of Cheshire stand for "delves" of earth and the gads of steel in the arms of the London Ironmongers' Company took a somewhat similar form. Sir Ralph Mounchensy bore in the 14th century "Silver, a cheveron between three billets sable."

With the Billet, the Ordinaries, uncertain as they are in number, may be said to end. But we may here add certain armorial charges which might well have been counted with them.

First of these is the Molet, a word corrupted in modern heraldry to Mullet, a fish-like change with nothing to commend it. This figure is as a star of five or six points, six points being perhaps the commonest form in old examples, although the sixth point is, as a rule, lost during the later period. Mediaeval armorists are not, it seems, inclined to make any distinction between molets of five and six points, but some families, such as the Harpedens and Asshetons, remained constant to the five-pointed form. It was generally borne pierced with a round hole, and then represents, as its name implies, the rowel of a spur. In ancient rolls of arms the word Rowel is often used, and probably indicated the pierced molet. That the piercing was reckoned an essential difference is shown by a roll of the time of Edward II., in which Sir John of Pabenham bears "Barry azure and silver, with a bend gules and three molets gold thereon," arms which Sir John his son differences by piercing the molets. Beside these names is that of Sir Walter Baa with "Gules a cheveron and three rowels silver," rowels which are shown on seals of this family as pierced molets. Probably an older bearing than the molet, which would be popularized when the rowelled spur began to take the place of the prick-spur, is the Star or Estoile, differing from the molet in that its five or six points are wavy. It is possible that several star bearings of the 13th century were changed in the 14th for molets. The star is not pierced in the fashion of the molet; but, like the molet, it tends to lose its sixth point in armory of the decadence. Suns, sometimes blazoned in old rolls as Sun-rays--rays de *soleil* —are pictured as unpierced molets of many points, which in rare cases are waved.

Harpeden bore "Silver, a pierced molet gules." Gentil bore "Gold, a chief sable with two molets goles pierced gules." Grimston bore "Silver, a fesse sable and thereon three molets silver pierced gules." Ingleby of Yorkshire bore "Sable, a star silver."

The Crescent is a charge which has to answer for many idle tales concerning the crusading ancestors of families who bear it. It is commonly borne with both points uppermost, but when representing the waning or the waxing moon—decrescent or increscent—its horns are turned to the sinister or dexter side of the shield. Peter de Marines (13th century) bore on his seal a shield charged with a crescent in the chief. William Gobioun (14th century) bore "A bend between two waxing moons."

Tinctures.— The tinctures or hues of the shield and its charges are seven in number—gold or yellow, silver or white, red, blue, black, green and purple. Mediaeval custom gave, according to a rule often broken, "gules," "azure" and "sable" as more high-sounding names for the red, blue and black. Green was often named as "vert," and sometimes as "synobill," a word which as "sinople" is used to this day by French armorists. The song of the siege of Carlaverock and other early documents have red, gules or "vermeil," sable or black, azure or blue, but gules, azure, sable and vert came to be recognized as armorists' adjectives, and an early 15th-century romance discards the simple words deliberately, telling us of its hero that

> His shield was black and blue, sanz fable,
> Barred of azure and of sable.

But gold and silver served as the armorists' words for yellows and whites until late in the 16th century, when, gold and silver made way for "or" and "argent," words which those for whom the interest of armory lies in its liveliest days will not be eager to accept. Likewise the colours of "sanguine" and "tenné" brought in by the pedants to bring the tinctures to the mystical number of nine may be disregarded.

A certain armorial chart of the duchy of Brabant, published in 1600, is the earliest example of the practice whereby later engravers have indicated colours in uncoloured plates by the use of lines and dots. Gold is indicated by a powdering of dots; silver is left plain. Azure is shown by horizontal shading lines; gules by upright lines; sable by cross-hatching of upright and horizontal lines. Diagonal lines from sinister to dexter indicate purple; vert is marked with diagonal lines from dexter to sinister. The practice, in spite of a certain convenience, has been disastrous in its cramping effects on armorial art, especially when applied to seals and coins.

Besides the two "metals" and five "colours," fields and charges are varied by the use of the furs ermine and vair. Ermine is shown by a white field flecked with black ermine tails. and vair by a conventional representation of a fur of small skins sewn in rows, white and blue skins alternately. In the 15th century there was a popular variant of ermine, white tails upon a black field. To this fur the books now give the name of "ermines"—a most unfortunate choice, since ermines is a name used in old documents for the original ermine. "Erminees," which has at least a 15th-century authority, will serve for those who are not content to speak of "sable ermined with silver." Vair, although silver and blue be its normal form, may be made up of gold, silver or ermine, with sable or gules or vert, but in these latter cases the colours must be named in the blazon. To the vairs and ermines of old use the heraldry books have added "erminois," which is a gold field with black ermine tails, "pean," which is "erminois" reversed, and "erminites," which is ermine with a single red hair on either side of each black tail. The vairs, mainly by misunderstanding of the various patterns found in old paintings, have been amplified with "countervair," "potent," "counter-potent" and "vair-en-point," no one of which merits description.

No shield of a plain metal or colour has ever been borne by an Englishman, although the knights at Carlaverock and Falkirk saw Amaneu d'Albret with his banner all of red having no charge thereon. Plain ermine was the shield of the duke of Brittany and no Englishman challenged the bearing. But Beauchamp of Match bore simple vair, Ferrers of Derby "Vairy gold and gules," and Ward "Vairy silver and sable."

Only one English example has hitherto been discovered of a field covered not with a fur but with overlapping feathers. A 15th-century book of arms gives "Plumetty of gold and purple" for "Mydlam in Coverdale."

Drops of various colours which variegate certain fields and charges are often mistaken for ermine tails when ancient seals are deciphered. A simple example of such spattering is in the shield of Grayndore, who bore "Party ermine and vert, the vert dropped with gold."

A very common variant of charges and fields is the sowing or "powdering" them with a small charge repeated many times. Mortimer of Norfolk bore "gold powdered with fleurs-de-lys sable" and Edward III. quartered for the old arms of France "Azure powdered with fleurs-de-lys gold," such fields being often described as flowered or flory. Golden billets were scattered in Cowdray's red shield, which is blazoned as "Gules billety gold," and bezants in that of Zouche, which is "Gules bezanty with a quarter ermine." The disposition of such charges varied with the users. Zouche as a rule shows ten bezants placed four, three, two and one on his shield, while the old arms of France in the

royal coat allows the pattern of flowers to run over the edge, the shield border thus showing halves and tops and stalk ends of the fleurs-de-lys. But the commonest of these powderings is that with crosslets, as in the arms of John la Warr "Gules crusily silver with a silver lion."

Trees, Leaves and Flowers.—Sir Stephen Cheyndut, a 13th-century knight, bore an oak tree, the *cheyne* of his first syllable, while for like reasons a Piriton had a pear tree on his shield. Three pears were borne *(temp.* Edward III.) by Nicholas Stivecle of Huntingdonshire, and about the same date is Applegarth's shield of three red apples in a silver field. Leaves of burdock are in the arms (14th century) of Sir John de Lisle and mulberry leaves in those of Sir Hugh de Morieus. Three roots of trees are given to one Richard Rotour in a 14th-century roll. Malherbe (13th century) bore the "evil herb"—a teazle bush. Pineapples are borne here and there, and it will be noted that armorists have not surrendered this, our ancient word for the "fir-cone," to the foreign *ananas.* Out of the cornfield English armory took the sheaf, three sheaves being on the shield of an earl of Chester early in the 13th century and Sheffield bearing sheaves for a play on his name. For a like reason Peverel's sheaves were sheaves of pepper. Rye bore three ears of rye on a bend, and Graindorge had barley-ears. Flowers are few in this field of armory, although lilies with their stalks and leaves are in the grant of arms to Eton College. Ousethorpe has water flowers, and now and again we find some such strange charges as those in the 15th-century shield of Thomas Porthelyne who bore "Sable, a cheveron gules between three 'popyebolles,' or poppy-heads vert."

The fleur-de-lys, a conventional form from the beginnings of armory, might well be taken amongst the "ordinaries." In England as in France it is found in great plenty. Aguylon bore "Gules, a fleur-de-lys silver." Peyferer bore "Silver, three fleur-de-lys sable." *(See* also FLEUR-DE-LIS.)

Trefoils are very rarely seen until the 15th century, although Hervey has them, and Gausill, and a Bosville coat seems to have borne them. They have always their stalk left hanging to them. Vincent, Hattecliffe and Massingberd all bore the quatrefoil, while the Bardolfs, and the Quincys, earls of Winchester, had cinqfoils. The old rolls of arms made much confusion between cinqfoils and sixfoils *(quintefoilles e sisfoilles)* and the rose. It is still uncertain how far that confusion extended amongst the families which bore these charges. The cinqfoil and sixfoil, however, are all but invariably pierced in the middle like the spur rowel, and the rose's blunt-edged petals give it definite shape soon after the decorative movement of the Edwardian age began to carve natural buds and flowers in stone and wood. Hervey bore "Gules, a bend silver with three trefoils vert thereon." Vincent bore "Azure, three quatrefoils silver."

Quincy bore "Gules, a cinqfoil silver." Bardolf of Wormegay bore "Gules, three cinqfoils silver." Cosington bore "Azure, three roses gold."

Beasts and Birds.—The book of natural history as studied in the middle ages lay open at the chapter of the lion, to which royal beast all the noble virtues were set down. What is the oldest armorial seal of a sovereign prince as yet discovered bears the rampant lion of Flanders. In England we know of no royal shield earlier than that first seal of Richard I. which has a like device. A long roll of English earls, barons and knights uore the lion on their coats—Lacy, Marshal, Fitzalan and Montfort. Percy, Mowbray and Talbot. By custom the royal beast is shown as rampant, touching the ground with but one foot and clawing at the air in noble rage. So far is this the normal attitude of a lion that the adjective "rampant" was often dropped, and we have leave and good authority for blazoning the rampant beast simply as "a lion," leave which a writer on armory may take gladly to the saving of much repetition. In France and Germany this licence has always been the rule, and the modern English herald's blazon of "Gules a lion rampant or" for the arms of Fitzalan, becomes in French *de gueules au lion d'or* and in German *in Rot ein goldener Loewe.* Other positions must be named with care and the prowling "lion passant" distinguished from the rampant beast, as well as from such rarer shapes as the couchant lion, the lion sleeping, sitting or leaping. Of these the lion passant is the only one commonly encountered. The lion standing with his forepaws together is not a figure for the shield, but for the crest, where he takes this position for greater stableness upon the helm, and the sitting lion is also found rather upon helms than in shields. For a couchant lion or a dormant lion one must search far afield, although there are some mediaeval instances. The leaping lion is in so few shields that no maker of a heraldry book has, it would appear, discovered an example. In the books this "lion salient" is described as with the hind paws together on the ground and the fore paws together in the air, somewhat after the fashion of a diver's first movement. But examples from seals and monuments of the Felbrigges and the Merks show that the leaping lion differed only from the rampant in that he leans somewhat forward in his eager spring. The compiler of the British Museum catalogue of mediaeval armorial seals, and others equally unfamiliar with mediaeval armory, invariably describe this position as "rampant," seeing no distinction from other rampings. As rare as the leaping lion is the lion who looks backward over his shoulder. This position is called "regardant" by modern armorists. The old French blazon calls it *rere regardant* or *turnaunte le visage arere,* "regardant" alone meaning simply "looking," and therefore we shall describe it more reasonably in plain English as "looking backward" The two-headed lion occurs in a 13th-century coat of Mason, and at the same period a monstrous lion of three bodies and one head is borne, apparently, by a Sharingbury.

The lion's companion is the leopard. What might be the true form of this beast was a dark thing to the old armorist, yet knowing from the report of grave travellers that the leopard was begotten in spouse-breach between the lion and the pard, it was felt that his shape would favour his sire's. But nice distinctions of outline, even were they ascertainable, are not to be marked on the tiny seal, or easily expressed by the broad strokes of the shield painter. The leopard was indeed lesser than the lion, but in armory, as in the Noah's arks launched by the old yards, the bear is no bigger than the badger. Then a happy device came to the armorist. He would paint the leopard like the lion at all points. But as the lion looks forward the leopard should look sidelong, showing his whole face. The matter was arranged, and until the end of the middle ages the distinction held and served. The disregarded writers on armory, Nicholas Upton, and his fellows, protested that a lion did not become a leopard by turning his face sidelong, but none who fought in the field under lion and leopard banners heeded this pedantry from cathedral closes. The English king's beasts were leopards in blazon, in ballad and chronicle, and in the mouths of liegeman and enemy. Henry V.'s herald, named from his master's coat, was Leopard Herald; and Napoleon's gazettes never fail to speak of the English leopards. In our own days, those who deal with armory as antiquaries and students of the past will observe the old custom for convenience sake. Those for whom the interest of heraldry lies in the nonsense-language brewed during post-mediaeval years may correct the mediaeval ignorance at their pleasure The knight who saw the king's banner fly at Falkirk or Crécy tells us that it bore "Gules with three leopards of gold" The modern armorist will shame the uninstructed warrior with "Gules, three lions passant gardant in pale or."

As the lion rampant is the normal lion, so the normal leopard is the leopard passant, the adjective being needless. In a few cases only the leopard rises up to ramp in the lion's fashion, and here he must be blazoned without fail as a leopard rampant.

Parts of the lion and the leopard are common charges. Chief of these are the demi-lion and the demi-leopard, beasts complete above their slender middles, even to the upper parts of their lashing tails. Rampant or passant, they follow the customs of the unmaimed brute. Also the heads of lion and leopard are in many shields, and here the armorist of the modern handbooks stumbles by reason of his refusal to regard clearly marked mediaeval distinctions. The instructed will know a lion's head because it shows but half the face and a leopard's head because it

is seen full-face. But the handbooks of heraldry, knowing naught of leopards, must judge by absence or presence of a mane, speaking uncertainly of leopards' faces and lions' heads and faces. Here again the old path is the straighter. The head of a lion, or indeed of any beast, bird or monster, is generally painted as "razed," or torn away with a ragged edge which is pleasantly conventionalized. Less often it is found "couped" or cut off with a sheer line. But the leopard's head is neither razed nor couped, for no neck is shown below it. Likewise the lion's fore leg or paw—"gamb" is the book word—may be borne, razed or couped. Its normal position is raised upright, although Newdegate seems to have borne "Gules, three lions' legs razed silver, the paws downward." With the strange bearing of the lion's whip-like tail cut off at the rump, we may end the list of these oddments.

Fitzalan, earl of Arundel, bore "Gules, a lion gold." Simon de Montfort bore "Gules, a silver lion with a forked tail." Segrave bore "Sable, a lion silver crowned gold." Havering-bore "Silver, a lion rampant gules with a forked tail, having a collar azure." Felbrigge of Felbrigge bore "Gold, a leaping lion gules." Esturmy bore "Silver, a lion sable (or purple) looking backward." Marmion bore "Gules, a lion vair." Mason bore "Silver, a two-headed lion gules." Lisle bore "Gules, a leopard silver crowned gold." Ludlowe bore "Azure, three leopards silver." Brocas bore "Sable, a leopard rampant gold."

John Hardrys of Kent seals in 1372 with arms of "a sitting leopard." John Northampton, Lord Mayor of London in 1381, bore "Azure, a crowned leopard gold with two bodies rampant against each other." Newenham bore "Azure, three demi-lions silver." A deed delivered at Lapworth in Warwickshire in 1466 is sealed with arms of "a molet between three demi-leopards."

The tiger is rarely named in collections of mediaeval arms. Deep mystery wrapped the shape of him, which was never during the middle ages standardized by artists. A crest upon a 15th-century brass shows him as a lean wolf-like figure, with a dash of the boar, gazing after his vain wont into a looking-glass; and the 16th-century heralds gave him the body of a lion with the head of a wolf, head and body being tufted here and there with thick tufts of hair. But it is noteworthy that the arms of Sir John Norwich, a well-known knight of the 14th century, are blazoned in a roll of that age as "party azure and gules with a tiger rampant ermine." Now this beast in the arms of Norwich has been commonly taken for a lion, and the Norwich family seem in later times to have accepted the lion as their bearing. But a portion of a painted roll of Sir John's day shows on careful examination that his lion has been given two moustache-like tufts to the nose. A copy made about 1600 of another roll gives the same decoration to the Norwich lion, and it is at least possible we have here evidence that the economy of the mediaeval armorist allowed him to make at small cost his lion, his leopard and his tiger out of a single beast form.

Take away the lions and the leopards, and the other beasts upon mediaeval shields are a little herd. In most cases they are here to play upon the names of their bearers. Thus Swinburne of Northumberland has the heads of swine in his coat and Bacon has bacon pigs. Three white bears were borne by Barlingham, and a bear ramping on his hind legs is for Barnard. Lovett of Astwell has three running wolves, Videlou three wolves' heads, Colfox three foxes' heads.

An elephant was brought to England in the days of Henry III., but he had no immediate armorial progeny, although Sanders of Northants may have borne before the end of the middle ages the elephants' heads which speak of Alysander the Great, patron of all Sanderses. Of dogs the greyhound and the talbot, or mastiff, are found most often. Thus Talbot of Cumberland had talbots, and Mauleverer, running greyhounds or "leverers" for his name's sake. The alaund, a big, crop-eared dog, is in the 15th-century shield of John Woode of Kent, and "kenets," or little tracking dogs, in a 13th-century coat of Kenet. The horse is not easily found as an English charge, but Moyle's white mule seems an old coat; horses' heads are in Horsley's shield, and ass heads make crests for more than one noble house. Askew has three asses in his arms. Three bats or flittermice are in the shield of Burninghill and in that of Heyworth of Whethamstede.

As might be looked for in a land where forest and greenwood once linked from sea to sea, the wild deer is a common charge in the shield. Downes of Cheshire bore a hart "lodged" or lying down. Hertford had harts' heads, Malebis, fawns' heads (*testes* de *bis*), Buckingham, heads of bucks. The harts in Rotherham's arms are the roes of his name's first syllable. Reindeer heads were borne by Bowet in the 14th century. Antelopes, fierce beasts with horns that have something of the ibex, show by their great claws, their lion tails and their boar muzzles and tusks that they are midway between the hart and the monster. The yale, eale or gall, is found among fifteenth century supporters, an antelope-like creature sometimes shown with one horn curving behind and the other curving to the front.

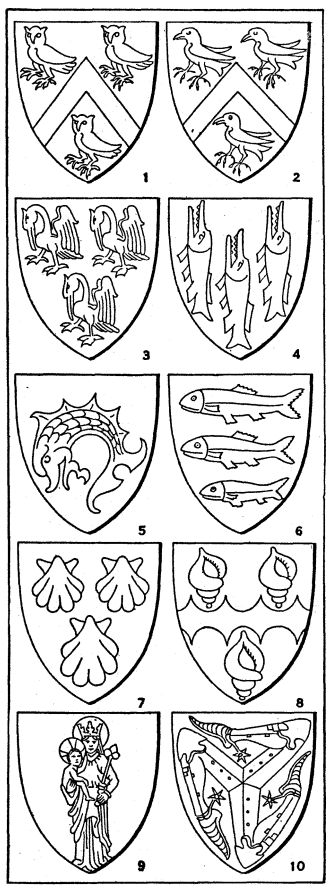

FIG. 6.— BRITISH SHIELDS OF ARMS (1) Burton. (2) Rokeby. (3) Pelham. (4) Lucy. (5) Fishacre. (6) Roche (7) Dacre. (8) Shelley. (9) See of Salisbury. (10) Isle of Man

Of the outlandish monsters the griffon is the oldest and the chief. With the hinder part of a lion, the rest of him is eagle, head and shoulders, wings and fore legs. The long tuft under the beak and his pointed ears mark him out from the eagle when his head alone is borne. At an early date a griffon rampant, his normal position, was borne by the great house of Montagu as a quartering, and another griffon played upon Griffin's name.

The wyver, who becomes wyvern in the 16th century, and takes a new form under the care of inventive heralds, was in the middle ages a lizard-like dragon, generally with small wings. Sir Edmund Mauley in the 14th century is found differencing the black bend of his elder brother by charging it with three wyvers of silver. During the middle ages there seems small distinction between the wyver and the still rarer dragon, which, with the coming of the Tudors, who bore it as their badge, is seen as a four-legged monster with wings and a tail that ends like a broad arrow. The monster in the arms of Drake, blazoned by Tudor heralds as a wyvern, is clearly a fire-drake or dragon in his origin.

The unicorn rampant was borne by Harlyn of Norfolk; unicorn's heads by the Cambridgeshire family of Paris. The mermaid with her comb and looking-glass makes a 14th-century crest for Byron, while "Silver, a bend gules with three silver harpies thereon" is found in the 15th century for Entyrdene.

Concerning beasts and monsters the heraldry books have many adjectives of blazonry which may be disregarded. Even as it was once the pride of the cook pedant to carve each bird on the board with a new word for the act, so it became the delight of the pedant herald to order that the rampant horse should be "forcené," the rampant griffon "segreant," the passant hart "trippant"; while the same hart must needs be "attired" as to its horns and "unguled" as to its hoofs. There is ancient authority for the nice blazonry which sometimes gives a separate colour to the tongue and claws of the lion, but even this may be set aside. Though a black lion in a silver field may be armed with red claws, and a golden leopard in a red field given blue claws and tongue, these trifles are but fancies which follow the taste of the painter, and are never of obligation. The tusks and hoofs of the

boar, and often the horns of the hart, are thus given in some paintings a colour of their own which elsewhere is neglected.

As the lion is among armorial beasts, so is the eagle among the birds. A bold convention of the earliest shield painters displayed him with spread wing and claw, the feat of a few strokes of the brush, and after this fashion he appears on many scores of shields. Like the claws and tongue of the lion, the beak and claws of the eagle are commonly painted of a second colour in all but very small representations. Thus the golden eagle of Lymesey in a red field may have blue beak and claws, and golden beak and claws will be given to Jorce's silver eagle upon red. A lure, or two wings joined and spread like those of an eagle, is a rare charge sometimes found. When fitted with the cord by which a falconer's lure is swung, the cord must be named.

Monhermer bore "Gold, an eagle vert." Siggeston bore "Silver, a two-headed eagle sable." Gavaston, earl of Cornwall, bore "Vert, six eagles gold." Bayforde of Fordingbridge sealed (in 1383) with arms of "An eagle bendwise, with a oorder engrailed and a baston." Graunson bore "Paly silver and azure with a bend gules and three golden eagles thereon."

Commoner than the eagle as a charge is the martlet, a humbler bird which is never found as the sole charge of a shield. In all but a few early representations the feathers of the legs are seen without the legs or claws. The martlet indicates both swallow and martin, and in the arms of the Cornish Arundels the martlets must stand for "hirundels" or swallows.

The falcon or hawk is borne as a rule with close wings, so that he may not be taken for the eagle. In most cases he is there to play on the bearer's name: and this may be said of most of the flight of lesser birds.

Naunton bore "Sable, three martlets silver." Heron bore "Azure, three herons silver." Fauconer bore "Silver, three falcons gules." Hauvile bore "Azure, a dance between three hawks gold." Twenge bore "Silver, a fesse gules between three popinjays (or parrots) vert." Cranesley bore "Silver, a cheveron gules between three cranes azure." Asdale bore "Gules, a swan silver." Dalston bore "Silver, a cheveron engrailed between three daws' heads razed sable." Corbet bore "Gold, two corbies sable." Sumeri (13th century) sealed with arms of "A peacock with his tail spread" John Pyeshale of Suffolk (14th century) sealed with arms of "Three magpies."

Fishes, Reptiles and Insects.—Like the birds, the fishes are borne for the most part to call to mind their bearers' names. Unless their position be otherwise named, they are painted as upright in the shield, as though rising towards the water surface. The dolphin is known by his bowed back, old artists making him a grotesquely decorative figure.

Lucy bore "Gules, three luces (or pike) silver." Heringaud bore "Azure, crusilly gold, with six golden herrings." Fishacre bore "Gules, a dolphin silver." La Roche bore "Three roach swimming" John Samon (14th century) sealed with arms of "Three salmon swimming."

Shell-fish would hardly have place in English armory were it not for the abundance of scallops which have followed their appearance in the banners of Dacre and Scales. The crest of the Yorkshire Scropes, playing upon their name, was a pair of crabs' claws. Dacre bore "Gules, three scallops silver." Shelley bore "Sable, a fesse engrailed between three whelk-shells gold."

Reptiles and insects are barely represented. The lizards in the crest and supporters of the Ironmongers of London belong to the 15th century. Gawdy of Norfolk may have borne the tortoise in his shield in the sarne age. "Silver, three toads sable" was quartered as a second coat for Botreaux of Cornwall in the 16th century—Botereau or Boterel signifying a little toad in the old French tongue—but the arms do not appear on the old Botreaux seals beside their ancient bearing of the griffon. Beston bore "Silver, a bend between six bees sable" and a 15th-century Harbottle seems to have sealed with arms of three bluebottle flies. Three butterflies are in the shield of Presfen of Lancashire in 1411, while the winged insect shown on the seal of John Mayre, a King's Lynn burgess of the age of Edward I., is probably a mayfly.

Human Charges.—Man and the parts of him play but a small part in English shields, and we have nothing to put beside such a coat as that of the German Manessen, on which two armed knights attack each other's hauberks with their teeth. But certain arms of religious houses and the like have the whole figure, the see of Salisbury bearing the Virgin and Child in a blue field. And old crests have demi-Saracens and falchion men, coal-miners, monks and blackamoors. Sowdan bore in his shield a turbaned soldan's head; Eady, three old men's "'eads"! Heads of maidens, the "winsome marrows" of the ballad, are in the arms of Marow. The Stanleys, as kings of Man, quartered the famous three armed legs whirling mill-sail fashion, and Tremayne of the west bore three men's arms in like wise. "Gules, three hands silver" was for Malmeyns as early as the 13th century, and Tynte of Colchester displayed hearts.

Miscellaneous Charges.—Other charges of the shield are less frequent but are found in great variety, the reason for most of them being the desire to play upon the bearer's name.

Weapons and the like are rare, having regard to the military associations of armory. Daubeney bore three helms; Philip Marmion took with his wife. the coheir of Kilpek, the Kilpek shield of a sword (espek). Tuck had a stabbing sword or "tuck." Bent bows were borne by Bowes, an arblast by Arblaster, arrows by Archer, birding-bolts or bosouns by Bosun, the mangonel by Mangnall. The three lances of Amherst is probably a mediaeval coat; Lewestone had battle-axes.

Of horse-furniture we have the stirrups of Scudamore and Giffard, the horse-barnacles of Bernake and the horse-shoes borne by many branches and tenants of the house of Ferrers.

Of musical instruments there are pipes, trumps and harps for Pipe, Trumpington and Harpesfeld. Hunting horns are common among families bearing such names as Forester or Horne. Remarkable charges are the three organs of Grenville, who held of the house of Clare, the lords of Glamorgan.

The most notable of the charges derived from clothing is the hanging sleeve familiar in the arms of Hastings, Conyers and Mansel.

Chess-rooks, hardly to be distinguished from the roc or roquet at the head of a jousting-lance, were borne by Rokewode and by many more. Topcliffe had pegtops in his shield, while Ambesas had a cast of three dice which should each show the point of one, for "to throw ambesace" is an ancient phrase used of those who throw three aces.

Although the British are a sea-going people, there are few ships in British armory, most of these in the arms of sea-ports. Anchors are commoner.

Castles and towers, bridges, portcullises and gates have all examples, and a minster-church was the curious charge borne by the ancient house of Musters of Kirklington.

Letters of the alphabet are very rarely found in ancient armory; but three capital T's, in old English script, were borne by Toft of Cheshire in the 14th century. In the period of decadence whole words or sentences, commonly the names of military or naval victories, are often seen.

Blazonry.—All ill-service has been done to the students of armory by those who have pretended that the phrases in which the shields and their charges are described or blazoned must follow arbitrary laws devised by writers of the period of armorial decadence. One of these laws, and a mischievous one, asserts that no tincture should be named a second time in the blazon of one coat. Thus if gules be the hue of the field any charge of that colour must thereafter be styled "of the first." Obeying this law the blazoner of a shield of arms elaborately charged may find himself sadly involved among "of the first," "of the second" and "of the third." It is needless to say that no such law obtained among armorists of the middle ages. The only rule that demands obedience is that the brief description should convey to the reader a true knowledge of the arms described.

The examples of blazonry given in that part of this article which deals with armorial charges will be more instructive to the student than any elaborated code of directions. It will be observed that the description of the field is first set down, the

blazoner giving its plain tincture or describing it as burely, party, paly or barry, as powdered or sown with roses, crosslets or fleurs-de-lys. Then should follow the main or central charges, the lion or griffon dominating the field, the cheveron or the pale, the fesse, bend or bars, and next the subsidiary charges in the field beside the "ordinary" and those set upon it. Chiefs and quarters are blazoned after the field and its contents, and the border, commonly an added difference, is taken last of all. Where there are charges both upon and beside a bend, fesse or the like, a curious inversion is used by pedantic blazoners. The arms of Mr. Samuel Pepys of the Admiralty Office would have been described in earlier times as "Sable, a bend gold between two horses' heads razed silver, with three fleurs-de-lys sable on the bend." Modern heraldic writers would give the sentence as "Sable, on a bend or between two horses' heads erased argent, three fleurs-de-lys of the first." Nothing is gained by this inversion but the precious advantage of naming the bend but once. On the other side it may be said that, while the newer blazon couches itself in a form that seems to prepare for the naming of the fleurs-de-lys as the important element of the shield, the older form gives the fleur-de-lys as a mere postscript, and rightly, seeing that charges in such a position are very commonly the last additions to a shield by way of difference. In like manner when a crest is described it is better to say "a lion's head out of a crown" than "out of a crown a lion's head." The first and last necessity in blazonry is lucidity, which is cheaply gained at the price of a few syllables repeated.

Modern Heraldry. — With the accession of the Tudors armory began a rapid decadence. Heraldry ceased to play its part in military affairs, the badges and banners under which the mediaeval noble's retinue came into the field were banished, and even the tournament in its later days became a renascence pageant which did not need the painted shield and armorial trappers. Treatises on armory had been rare in the days before the printing press, but even so early a writer as Nicholas Upton had shown himself as it were unconcerned with the heraldry that any man might see in the camp and the street. From the Book of St. Albans onward the treatises on armory are informed with a pedantry which touches the point of crazy mysticism in such volumes as that of Sylvanus Morgan. Thus came into the books those long lists of "diminutions of ordinaries," the closets and escarpes, the endorses and ribands, the many scores of strange crosses, and such wild fancies as the rule, based on an early German pedantry, that the tinctures in peers' shields should be given the names of precious stones and those in the shields of sovereigns the names of planets. Blazon became cumbered with that vocabulary whose French of Stratford atte Bowe has driven serious students from a business which, to use a phrase as true as it is hackneyed, was at last "abandoned to the coachpainter and the undertaker."

With the false genealogy came in the assumption or assigning of shields to which the new bearers had often no better claim than lay in a surname resembling that of the original owner. The ancient system of differencing arms disappeared. Now and again we see a second son obeying the book-rules and putting a crescent in his shield or a third son displaying a molet, but long before our own times the practice was disregarded, and the most remote kinsman of a gentle house displayed the "whole coat" of the head of his family.

The art of armory had no better fate. An absurd rule current for some three hundred years has ordered that the helms of princes and knights should be painted full-faced and those of peers and gentlemen sidelong. Obeying this, the herald painters have displayed the crests of knights and princes as sideways upon a full-faced helm; the torse or wreath, instead of being twisted about the brow of the helm, has become a sausage-shaped bar see-sawing above the helm, and upon this will be balanced a crest which might puzzle the ancient craftsman to mould in his leather or parchment. A ship on a lee-shore with a thunderstorm lowering above its masts may stand as an example of such devices. "Tastes, of course, differ," wrote Dr. Woodward, "but the writer can hardly think that the épergne given to Lieut.-General Smith by his friends at Bombay was a fitting ornament for a helmet." As with the crest, so with the shield. It became crowded with ill-balanced figures devised by those who despised and ignored the ancient examples whose painters had followed instinctively a simple and pleasant convention. Landscapes and seascapes, musical lines, military medals and corrugated boiler-flues have all made their appearance in the shield. Even as on the signs of public houses, written words have taken the place of figures, and the often-cited arms exemplified to the first Earl Nelson marked, it may be hoped, the high watermark of these distressing modernisms. Of late years, indeed, official armory in England has shown a disposition to follow the lessons of the archaeologist, although the recovery of mediaeval use has not yet been as successful as in Germany, where for a long generation a school of vigorous armorial art has flourished.

OFFICERS OF ARMS

Officers of arms, styled kings of arms. heralds and pursuivants, make their appearance at an early period of the history of armory as the messengers both in peace and in war of princes and magnates. It is probable that from the first they bore in some wise their lord's arms as the badge of their office. In the 14th century we have heralds with the arms on a short mantle; witness the figure of the duke of Gelderland's herald painted in the Armorial *de Gelre*. The title of Blue Mantle pursuivant, as old as the reign of Edward III, suggests a like usage in England. When the tight-laced coat of arms went out of fashion among the knighthood the loose tabard of arms with its wide sleeves was at once taken in England as the armorial dress of both herald and cavalier. and the fashion of it has changed but little since those days. Clad in such a coat the herald was the image of his master and, although he himself was rarely chosen from any rank above that of the lesser gentry, his person. as a messenger, acquired an almost priestly sacredness. To injure or to insult him was to affront the coat that he wore.

We hear of kings of arms in the royal household of the 13th century, and we may compare their title with those of such officers as the King of the Ribalds and the King of the Minstrels; but it is noteworthy that, even in modern warrants for heralds' patents, the custom of the reign of Edward III is still cited as giving the necessary precedents for the officers' liveries. Officers of arms took their titles from their provinces or from the titles and badges of their masters. Thus we have Garter, Norroy and Clarenceux, March, Lancaster, Windsor, Leicester, Leopard, Falcon and Blanc Sanglier as officers attached to the royal house; Chandos, the herald of the great Sir John Chandos; Vert Eagle of the Nevill earls of Salisbury, Esperance and Crescent of the Percys of Northumberland. The spirit of Henry VII's legislation was against such usages in baronial houses, and in the age of the Tudors the last of the private heralds disappears.

In England the royal officers of arms were made a corporation by Richard III. Nowadays the members of this corporation, known as the College of Arms or Heralds' College, are Garter Principal King of Arms, Clarenceux King of Arms South of Trent, Norroy Xing of Arms North of Trent. the heralds Windsor, Chester, Richmond, Somerset, York and Lancaster, and the pursuivants Rouge Croix, Bluemantle, Rouge Dragon and Portcullis. Another king of arms, not a member of this corporation, has been attached to the order of the Bath since the reign of George I, and an officer of arms, without a title, attends the order of St. Michael and St. George.

There is no college or corporation of heralds in Scotland or Ireland. In Scotland "Lyon-king-of-arms," "Lyon rex *armorum*," or "Leo *fecialis*," so called from the lion on the royal shield, is the head of the office of arms. When first the dignity was constituted is not known, but Lyon was a prominent figure in the coronation of Robert II in 1371. The office was at first, as in England. attached to the earl marshal, but it has long been conferred by patent under the great seal, and is held direct from the crown. Lyon is also king-of-arms for the national order of the Thistle. He is styled "Lord Lyon," and the office has always been held by men of family, and frequently by a peer who would appoint a

"Lyon depute." He is supreme in all matters of heraldry in Scotland. Following him there are the Scottish heralds, Albany, Ross and Rothesay, with precedence according to date of appointment; and the pursuivants, Carrick, March and Unicorn. Heralds and pursuivants are appointed by Lyon.

In Ireland also there is but one king-of-arms, Ulster. The office was instituted by Edward VI in 1553. The patent is given by Rymer, and refers to certain emoluments as "*praedicto officio . . . ab antiquo spectantibus.*" The allusion is to an Ireland king-of-arms mentioned in the reign of Richard II and superseded by Ulster. Ulster holds office by patent, during pleasure; under him the Irish office of arms consists of two heralds. Cork and Dublin, and a pursuivant, Athlone. Ulster is king-of-arms to the order of St. Patrick. He held visitations in parts of Ireland from 1568 to 1620, and these and other records, including all grants of arms from the institution of the office, are kept in Birmingham tower, Dublin.

The armorial duties of the ancient heralds are not clearly defined. The patent of Edward IV. creating John Wrythe king-of-arms of England and the style of Garter, speaks vaguely of the care of the office of arms and those things which belong to that office. We know that the heralds had their part in the ordering of tournaments. wherein armory played its greatest part, and that their expert knowledge of arms gave them such duties as reckoning the noble slain on a battlefield. But it is not until the 15th century that we find the heralds following a recognized practice of granting or assigning arms, a practice on which John of Guildford comments, saying that such arms given by a herald are not of greater authority than those which a man has taken for himself. The *Book of St. Albans,* put forth in 1486, speaking of arms granted by princes and lords, is careful to add that "armys bi a mannys proper auctorite taken, if an other man have not borne theym afore, be of strength enogh," repeating. as it seems. Nicholas Upton's opinion which, in this matter, does not conflict with the practice of his day. It is probable that the earlier grants of arms by heralds were made by reason of persons uncunning in armorial lore applying for a suitable device to experts in such matters, and that such setting forth of arms may have been practised even in the 14th century.

The earliest-known grants of arms in England by sovereigns or private persons are, as a rule, the conveyance of a right in a coat of arms already existing or of a differenced version of it. Thus in 1391 Thomas Grendale, a squire who had inherited through his grandmother the right in the shield of Beaumeys, granted his right in it to Sir William Moigne, a knight who seems to have acquired the whole or part of the Beaumeys manor in Sawtry. Under Henry VI we have certain rare and curious letters of the crown granting nobility with arms, "*in signum hujusmodi nobilitatis*" to certain individuals, some and perhaps all of whom were foreigners who may have asked for letters which followed a continental usage. After this time we have a regular series of grants by heralds who in later times began to assert that new arms, to be valid, must necessarily be derived from their assignments, although ancient use continued to be recognized.

An account of the genealogical function of the heralds, so closely connected with their armorial duties, will be found in the article GENEALOGY. In spite of the work of such distinguished men as Camden and Dugdale they gradually fell in public estimation until Blackstone could write of them that the marshalling of coat armour had fallen into the hands of certain officers called heralds, who had allowed for lucre such falsity and confusion to creep into their records that even their common seal could no longer be received as evidence in any court of justice. From this low estate they rose again when the new archaeology included heraldry in its interests, and several antiquaries of repute later wore the herald's tabard.

In spite of the vast amount of material which the libraries catalogue under the head of heraldry, the subject has as yet received little attention from antiquaries working in the modern spirit. The old books are as remarkable for their detachment from the facts as for their folly. The work of Nicholas Upton, De *studio militari,* although written in the first half of the 15th century, shows, as has been already remarked, no attempt to reconcile the conceits of the author with the armorial practice which he must have seen about him on every side. Gerard Leigh. Bossewell, Ferne and Morgan carried on this bad tradition, each adding his own extravagances. The *Display* of *Heraldry,* first published in 1610 under the name of John Guillim, is more reasonable if not more learned, and in its various editions gives a valuable view of the decadent heraldry of the 17th century. In the 19th century many important essays on the subject were to be found in such magazines as the *Genealogist,* the *Herald and Genealogist* and the *Ancestor,* while Planché's *Pursuivant of Arms* contained some slight but suggestive work which attempted original inquiry But Woodward's *Treatise on Heraldry, British and Foreign* (1896), in spite of many errors arising from the author's reliance upon unchecked material, must be counted the only scholarly book in English upon a matter which has engaged so many pens. Among foreign volumes may be cited those of Menestrier and Spener, and the vast compilation of the German Siebmacher. Notable ordinaries of arms are those of Papworth and Renesse, companions to the armorials of Burke and Rietstap. The student may be advised to turn his attention to all works dealing with the effigies, brasses and other monuments of the middle ages, to the ancient heraldic seals and to the heraldry of mediaeval architecture and ornament.

(O. B.)

HERAT, city and province, Afghanistan. The city lies in 34° 20′ 30″ N. and 62° 11′ 0″ E., 2,500 ft. above sea level. Estimated pop. about 50,000. It has quite lost its ancient commercial importance. From it lines of communication radiate to Russian, British. Iranian and Afghan territory. The city forms a quadrangle about 1,600 yd. by 1,500 yd.; on the west, south and east, only the gateways project from the line of defense, but on the north there is a double outwork consisting of the Ark, or citadel, and a lower work at its foot, called the Ark-i-nao, or "new citadel," which extends 100 yd. beyond the line of the city wall. That which distinguishes Herat from all other oriental cities is the stupendous earthwork upon which the city wall is built. This earthwork averages 250 ft. in width at the base and about 50 ft. in height, and as it is crowned by a wall 25 ft. high and 14 ft. thick at the base, supported by about 150 semicircular towers, and is further protected by a ditch 45 ft. in width and 16 in depth, it presents an appearance of imposing strength.

Defenses.—When the royal engineers of the Russo-Afghan Boundary commission entered Herat in 1885 they found its buildings in various stages of disrepair and lacking all effective defenses Outside, ancient ruins and mounds impeded all field of fire. To the northwest, beyond the Tal-i-Bangi, the magnificent outlines of the Mosalla filled a wide space with the glorious curves of dome and gateway and the stately grace of tapering minars. The needs of defense, however, called for its destruction, but four minars standing at the corners of the wide plinth still remain to attest to its glory and to exhibit samples of decorative tilework of intricate beauty of design and exquisite taste in the blending of colour. At the same time the ancient graveyards round the city were swept smooth and levelled; obstructions were demolished, outworks constructed and the defenses generally renovated. Whether or not the strength of this bulwark of northwestern Afghanistan should ever be practically tested, the general result of investigations into the value of Herat as a strategic centre was largely to rnodify the once widely accepted view that the key to India lay within it. Abdur Rahman and his successor Habibullah steadfastly refused the offer of British engineers to strengthen its defenses; and though the Afghans themselves occasionally undertook repairs, it is doubtful whether the old walls of Herat were maintained in a state of efficiency.

The **City** Gates.—The city possesses five gates, two on the northern face, the Kutab-chak near the northeast angle of the wall, and the Malik at the re-entering angle of the Ark-i-nao; and three others in the centres of the remaining faces. the Irak gate on the west, the Kandahar gate on the south and the Kushk gate on the east face. The main streets, the *Chahar-súk,* are well built, the principal one having a vaulted roof. Sear the cenlral quadrangle of the city is a vast domed reservoir of water. The only other

public building of any consequence in Herat is the Jamma Musjid or Great Mosque which comprises an area of 800 yd. square, and must have been a most magnificent structure. It was erected towards the close of the 11th century, during the reign of Shah Sultan Hussein of the family of Timur, and is said when perfect to have been 465 ft. long by 275 ft. wide, to have had 408 cupolas, 130 windows, 444 pillars and 6 entrances, and to have been adorned in the most magnificent manner with gilding, carving, precious mosaics and other elaborate and costly embellishments.

Ancient **Ruins.**—Along the slopes of the northern hills there is a space of some 4 m. in length by 3 m. in breadth, the surface of the plain, strewn over its whole extent with pieces of pottery and crumbling bricks, and also broken here and there by earthen mounds and ruined walls, the débris of palatial structures which at one time were the glory and wonder of the East. Of these structures indeed some have survived to the present day in a sufficiently perfect state to bear witness to the grandeur and beauty of the old architecture of Herat. Scarcely inferior to the mosque of the Mosalla though of more moderate dimensions, is the tomb of the saint Abdullah Ansari, in the same neighbourhood. This building, erected by Shah Rukh Mirza, grandson of Timur, over 500 years ago, contains exquisite Oriental sculpture. Adjoining the tomb also are marble sepulchres of princes of the house of Timur; and especially deserving of notice is a royal building tastefully decorated by an Italian artist named Geraldi, in the service of Shah Abbas the Great. It is held in high veneration by all classes, and the famous Dost Mohammed Khan is himself buried at the foot of the tomb of the saint. Two other royal palaces named respectively Bagh-i-Shah and Takht-i-Sefer, are on the same rising ground somewhat farther to the west.

Character of Inhabitants. — The original inhabitants of Ariana were no doubt of the Aryan family, cognate with the Persian race, but they probably intermixed at a very early period with the Sacae and Massagetae, who seem to have held the mountains from Kabul to Herat and to whom must be ascribed — rather than to an infusion of Turco-Tartaric blood introduced by the armies of Jenghiz and Timur — the peculiar broad features and flattish countenance of the inhabitants of Herat, Seistan and the eastern provinces of Persia. Under Herat, however, there are a very large number of tribes, ruled over by separate and semi-independent chiefs, and belonging probably to different nationalities. The principal group of tribes is called the Chahar-Aimak, or "(four races," the constituent parts of which, however, are variously stated by different authorities both as to strength and nomenclature. The Heratis are agricultural and not nearly so warlike as the Pathans from the neighbourhood of Kabul or Kandahar.

Environs of Herat. — The long narrow valley of the Hari Rud, starting from the western slopes of the Koh-i-Baba, extends almost due west for 300 m. before it takes its great northern bend at Kuhsan, and passes northwards through the broken ridges of the Siah Bubuk (the western extremity of the range which we now call Paropamisus) towards Sarakhs. For the greater part of its length it drains the southern slopes only of the Paropamisus and the northern slopes of a parallel range called Safed Koh. The Paropamisus forms the southern face of the Turkistan plateau, which contains the sources of the Murghab river; the northern face of the same plateau is defined by the Band-i-Turkistan. On the south of the plateau we find a similar succession of narrow valleys dividing parallel flexures, or anticlinals, formed under similar geological conditions to those which appear to be universally applicable to the Himalaya, the Hindu Kush, and the Indus frontier mountain systems. From one of these long lateral valleys the Hari Rud receives its principal tributary, which joins the main river below Obeh, 180 m. from its source; and it is this tributary (separated from the Hari Rud by the narrow ridges of the Koh-i-Safed and Band-i-Baian) that offers the high road from Herat to Kabul, and not the Hari Rud itself. From its source to Obeh the Hari Rud is a valley of sandy desolation. Masses of melting snow annually give rise to floods, irequently rendering the river impassable and cutting off the crazy brick bridges at Herat and Tirpul. It is impossible, whilst watching the rolling, seething volume of flood-water which swirls westwards in April, to imagine the waste stretches of dry river-bed which in a few months' time (when every available drop of water is carried off for irrigation) will represent the Hari Rud. The soft shales or clays of the hills bounding the valley render these hills especially subject to the action of denudation, and the result, in rounded slopes and easily accessible crests, determines the nature of the easy tracks and passes which intersect them. At the same time, any excessive local rainfall is productive of difficulty and danger from the floods of liquid mud and loose boulders which sweep like an avalanche down the hill sides. The intense cold which usually accompanies these sudden northern blizzards of Herat and Turkistan is a further source of danger.

Cultivated Area. — From Obeh, 50 m. east of Herat, the cultivated portion of the valley commences, and it extends, with a width which varies from 8 to 16 m., in Kuhsan, 60 m. west of the city, presenting a remarkable scene of luxurious fertility. The system of irrigation by which these agricultural results are attained is most elaborate. The Herati Tajik, adopts the karez (or, Persian, *kanat*) system of underground irrigation and brings every drop of water that he can find to the surface. The valley about Herat includes a flat alluvial plain. Three miles to the south of the city the river flows from east to west, spanned by the Pal-i-Malun. East and west stretches the long vista of the Hari Rud. Due north lie the hills called the Koh-i-Mulla Khwaja about 3 m. distant from the city. This northern line of barren, broken sandstone hills is geographically no part of the Paropamisus range, from which it is separated by a stretch of sandy upland about 20 m. in width, called the Dasht-i-Hamdamao, or Dasht-i-Ardewan, formed by the talus or drift of the higher mountains. Through this stretch of *dasht* the drainage from the main water-divide breaks downwards to the plains of Herat, where it is arrested and utilized for irrigation purposes.

The Korokh Valley. — To the north-east of the city a very considerable valley has been formed between the Paropamisus and the subsidiary Koh-i-Mulla Khwaja range, called Korokh. Here there are one or two important villages and a well-known shrine marked by a group of pine trees which is unique in this part of Afghanistan. The valley leads to a group of passes across the Paropamisus into Turkistan, of which the Zirmast is perhaps the best known. The main water-divide between Herat and the Turkistan Chol (the loess district) has been called Paropamisus for want of any well-recognized general name. To the north of the Korokh valley it exhibits something of the formation of the Hindu Kush (of which it is apparently a geological extension), but as it passes westwards it becomes broken into fragments by processes of denudation, until it is hardly recognizable as a distinct range at all. The direct passes across it from Herat (the Baba and the Ardewan) wind amongst masses of disintegrating sandstone for some miles on each side of the dividing watershed, but farther west the rounded knolls of the rain-washed downs may be crossed almost at any point without difficulty.

HISTORY

The name of Herat first appears in the list of primitive Zoroastrian settlements contained in the *Vendidād Sadē*, where it seems to apply to the river or river-basin, which was the special centre of population. Of the foundation of Herat (or Heri) nothing is known. We can only infer from the colossal character of the earthworks which surround the modern town that, like the similar remains at Bost on the Helmund and at Ulan Robat of Arachosia, they belong to that period of Central-Asian history which preceded the rise of Achaemenian power, and which in Grecian romance is illustrated. by the names of Bacchus, of Hercules. and of Semiramis. To trace in any detail the fortunes of Herat would be to write the modern history of the East, for there has hardly been a revolution, or war, in Central Asia since the time of the prophet in which Herat has not played a conspicuous part. Under the Tahirids of Khorasan, the Saffarids of Seistan, and the Samanids of Bokhara it flourished for some centuries in peace and progressive prosperity; but during the succeeding rule of the Ghaznevid kings its metropolitan character was for a time obscured by the celebrity of the neighbouring capital of Ghazni

(*q.v.*) until finally in the reign of Sultan Sanjar of Merv, about 1157, the city was entirely destroyed by an irruption of the Ghuzz, the predecessors of the modern Turkomans. Herat gradually recovered under the enlightened Ghorid kings, so that at the time of Jenghiz Khan's invasion it equalled or even exceeded in populousness and wealth its sister capitals of Balkh, Merv, and Nishapur, the united strength of the four cities being estimated at three millions of inhabitants. But this Mongol visitation was most calamitous: only 40 persons are said to have survived the general massacre of 1232, and a similar catastrophe overtook the city in 1398 on the fall of the Kurt dynasty (*see* MONGOLS). It is, therefore, astonishing to find that early in the 15th century Herat was again flourishing and populous, and the favoured seat of the art and literature of the East. It was under the princes of the house of Timur that most of the noble buildings were erected, of which the remains still excite our admiration at Herat, while all the great historical works relative to Asia, such as the *Rozet-es-Sefā*, the *Habīb-es-Seir*, *Hafiz Abrū's Tarikh*, the *Matlā a-es-Sa'adin*, etc., date from the same place and the same age. Four times was Herat sacked by Turkomans and Usbegs during the centuries which intervened between the Timuride princes and the rise of the Afghan power, and it has never in modern times attained to anything like its old importance. Afghan tribes, who had originally dwelt far to the east, were first settled at Herat by Nadir Shah, and from that time they have monopolized the government and formed the dominant element in the population. It is needless to trace the revolutions and counter-revolutions which have followed each other in quick succession at Herat since Ahmad Shah Durani founded the Afghan monarchy about the middle of the 18th century; it is enough to say that Herat has been throughout the seat of an Afghan Government, sometimes in subordination to Kabul and sometimes independent. Persia indeed for many years showed a strong disposition to reassert the supremacy over Herat which was exercised by the Safawid kings, but Britain steadily resisted the encroachment; and, indeed, after helping the Heratis to beat off the attack of the Persian army in 1838, the British at length compelled the shah in 1857, at the close of his war with them, to sign a treaty recognizing the further independence of the place, and pledging Persia against any further interference with the Afghans. In 1863 Herat, which for 50 years previously had been independent of Kabul, was incorporated by Dost Mohammed Khan in the Afghan monarchy.

HÉRAULT, a *de'partement* in the south of' France, formed from Lower Languedoc. Pop. (1954) 471,429. Area, 2,403 sq.mi. It is bounded northeast by Gard, northwest by Aveyron and Tarn, and south by Aude and the Golfe du Lion.

The southern prolongation of the Cévennes mountains, composed of Archaean and Paleozoic rocks, with Mesozoic rocks on the southern edge and in the plateau of Larzac, occupies the northwest of the *dkpartement*, the highest point being about 4,250 ft. above sea level. Southeast of this come hills and plateaus decreasing as they approach the rich coastal plains at the mouth of the Orb and the Hérault river and, farther to the northeast the line of intercommunicating coastal salt lagoons (Etang de Thau, etc.). Northwest the Garrigues, a district of dry Mesozoic limestone plateaus and hills, stretches into the neighbouring *de'partement* of Gard. Southwest of this is the plain of Pliocene rocks with recent eruptive rocks near Agde. The mountains of the northwest form the watershed between the Atlantic and Mediterranean basins. From them flow the Hérault, its tributary the Lergue, and more to the southwest the Livron and the Orb, the main rivers of the *de'partement.*

The climate is colder and more rainy in the mountains than on the plain which has dry summers with occasional storms. Hérault ranks first among French *départements* for area of vineyards; the red wines of St. Georges, Cazouls-lès-Béziers, Picpoul and Maranssan, and the white wines of Frontignan and Lunel are famous. Mulberries. olives and chestnuts flourish. Silkworms are reared. Considerable numbers of sheep are raised, their milk being utilized for the preparation of Roquefort cheeses. There are quarries of marble, limestone, gypsum, etc.; the marshes supply salt. The most important mineral springs are at Lamalou-les-Bains and Balaruc-les-Bains. Woolen and cotton cloth, especially for military use, silk (Ganges), casks, soap and fertilizing stuffs are made. There are also oil works, distilleries (Béziers) and tanneries (Bédarieux).

Fishing is important; Sète and Mèze are the chief ports. Hérault exports salt fish, wine, liqueurs, timber, salt, building material, etc. It imports cattle, skins, wool, cereals, vegetables, coal and other commodities.

The railway lines belong chiefly to the Southern and P.L.M. companies. The Canal du Midi traverses the south of the *département* for 44 mi. and terminates at Siite. The canal des Étangs traverses the *de'partement* for about zo mi., forming part of a line of communication between Sbte and Aigues-Mortes. Montpellier, the capital, is the seat of a bishopric of the province of Avignon, and of a court of appeal and centre of an *acade'mie* (educational division).

The *de'partement* belongs to the 16th military region (Montpellier). It is divided into the *arrondissements* of Montpellier and Béziers, with 36 cantons and 342 communes.

Montpellier, Béziers, Lodève, Bédarieux, Sète, Agde, Pézenas, Lamalou-les-Bains and Clermont-l'Hérault are the more important towns.

Among the other interesting places in the *dkpartement* are St. Pons, with a church of the 12th century, once a cathedral; Villemagne, which has two ruined churches, one of the 13th, the other of the 14th century; Pignan, a medieval town, near uhich is the 13th-century abbey church of Vignogoul in the early Gothic style; and St. Guilhem-le-Désert, which has a church of the 11th and 12th centuries Maguelonne, which in the 6th century became the seat of a bishopric transferred to Montpellier in 1536, has a cathedral of the 12th century.

HÉRAULT DE SÉCHELLES, MARIE JEAN (1759–1794), French politician, was born at Paris on Sept. 20, 1759. He made his debut as a lawyer at the Châtelet, and later was *avocat général* to the parliament of Paris. He devoted himself to literature, and his account of his visit to the comte de Buffon at Montbard has with some justice been called a masterpiece of interviewing, before the day of journalists. Hérault took part in the taking of the Bastille and on Dec. 8, 1789, was appointed a judge in Paris.

On his return from a mission to Alsace (Jan.–April, 1791) he was appointed *commissaire du roi* in the court of cassation. He was elected as a deputy for Paris to the Legislative Assembly, where he gravitated towards the extreme left, and, as a member of the diplomatic committee, presented a famous report demanding that the nation should be declared to be in danger (June 11, 1793). After the revolution of Aug. 10, 1792 (*see* FRENCH REVOLUTION), he co-operated with Danton, and on Sept. 2, was appointed president of the Legislative Assembly.

Hérault was several times president of the Convention, notably on June 2, 1793, the occasion of the attack on the Girondins and on Aug. 10, 1793, when the passing of the new constitution was celebrated. On the rejection of the projected constitution drawn up by the marquis de Condorcet, he was entrusted with the task of preparing a fresh one; his plan became the constitution of 1793, which was passed, but never applied. As a member of the committee of public safety Hérault was employed on a mission in Alsace (Oct.–Dec. 1793) which made him an object of suspicion to the other members of the committee of public safety, and especially to Robespierre. He mas accused of treason, condemned with Danton, and executed on the 16th Germinal in the year II (April 5, 1794).

Hérault de Séchelles' *Oeuvres littéraires* were edited by E. Dard in 1907.

HERB, any plant whose stem or stalk dies entirely or down to the ground each year and does not have, as in shrubs or trees, a woody or permanent stem above ground; such plants are also called herbaceous.

The term "herb" is also used of those herbaceous plants which possess certain properties and are used for medicinal purposes. for flavouring or garnishing in cooking, and also for perfumes (see FLAVOURINGS and HORTICULTURE). Some herbs are slightly woody, but have no true bark.

HERBARIUM, a collection of dried and pressed plants preserved and mounted to illustrate as far as possible their characters. A herbarium can be a very useful teaching aid or an absorbing hobby, but far more important is its use as a reference collection for botanical identification of plants and as a body of information for botanical research. Because the same kind of plant may vary greatly according to the environmental conditions, both as a direct response and by genetic adaptation, it is only by gathering together for comparison and study a large series of specimens of each species that the limits of variation within species, and the differences among them, can be satisfactorily determined.

Herbarium specimens of flowering plants ferns and the larger algae are customarily dried between sheets of heavy blotting paper or construction felt under pressure so that the dried specimen is flat Most specimens will dry in about a week. if the blotters are changed several times. The drying can be hastened by interspersing ventilators of corrugated cardboard among the blotters, and by the gentle application of heat.

Although the colours of flowers and leaves eventually fade, herbarium specimens last indefinitely, some being more than 300 years old.

After being dried the specimens are customarily attached to sheets of heavy white paper for permanent storage. Heavy all-rag (linen) paper is preferred because of its lasting qualities. The standard size of a herbarium sheet in the United States is $11\frac{1}{2} \times 16\frac{1}{2}$ in.; in Europe a slightly longer and narrower sheet is more common. One or more plants (depending on the size of the individuals) of the same kind, collected at the same time and place, are mounted on a herbarium sheet. Traditionally the specimens have been attached to the sheet with gummed cloth tape. or glue. or both glue and tape, the coarser parts sometimes also being sewn. During the 1950s many institutional and research herbarium~especially in the United States, began using a plastic containing ethyl cellulose and a proprietary resin in place of glue and tape.

A label is affixed to the lower right hand corner of a herbarium sheet. The label properly bears the name of the plant, the exact locality and habitat in which it was collected. the date of collection, the collector's name and a number. All specimens of the same kind collected at the same time and place are given the same number; these specimens may thereafter be deposited at several different herbariums. The colour of the flowers and any other significant information that may not be permanently shown by the specimen should also be given on the label. Many herbariums also stamp a serial specimen accession number on each sheet.

The mounted specimens are arranged according to the species, genus and family, placed in folders of heavy paper. and filed on shelves in airtight cases, preferably metal. since they lessen the chance of damage by fire or destructive insects. The sequence of species in a genus, and genera in a family, differs in different herbariums.

Some herbariums have a strictly alphabetical order for ease in filing and reference. Others have a systematic sequence according to supposed relationship to facilitate comparison and identification of specimens. In large herbariums the species of a genus are often also segregated geographically, with a separate sequence for each region.

Herbarium specimens of mosses, liverworts and some of the smaller algae are customarily put in small paper packets rather than being mounted, and boxes of these packets are stored in the herbarium cases. Fleshy fungi are usually dried without pressure and filed in small cardboard boxes in the cases.

Herbarium specimens are subject to attack by the larvae of several species of skin beetles (family, Dermestidae) and sometimes by other insects as well. Mildly aromatic plants such as the composites. crucifers and umbellifers are especially favoured, while some other groups such as grasses and ferns are seldom eaten. Newly dried specimens are particularly subject to attack. In some herbariums the specimens are treated with an alcoholic solution of mercuric chloride when mounted. This protects them for usually several years, but eventually the poison flakes off, and there has been some concern about its being a health hazard. Repellents such as paradichlorobenzene and naphthalene may also be placed in the cases, and the specimens may be periodically fumigated.

A herbarium is the most essential tool for research in plant classification. serving as a permanent record of the distribution of each species. its range of variability and the correlation of that variability with the geography and habitat. A botanist writing a flora of a region relies largely on herbarium specimens, which he studies against a background of his own observation on living plants. In more critical studies of smaller groups of species, cultural and breeding experiments, determination of chromosome number and other detailed analyses are also customary. The herbarium, however, remains the essential foundation for the work, because no one individual can expect to see each of even a small group of species in all localities and all habitats in which they occur. and under the varying conditions of different years and seasons.

Although herbariums serve as samples of natural populations of plants, they must be interpreted with caution because they tend to be biased toward the unusual. When a region is first explored. collectors have all they can do to make specimens of the common plants. Thereafter, the less common species and unusual forms of common species are likely to be collected out of proportion to their abundance Thus the usefulness of a specimen may be greatly enhanced by some indication on the label as to the frequency of such specimens in the wild.

In a group which produces occasional hybrids, the hybrids are likely to be over-represented in herbariums, obscuring the relatively clear distinction which can be seen in nature. Thus the usefulness of a specimen is greatly enhanced by some indication on the label as to the abundance of such plants. and especially by a record of any evidence suggesting that it may not be typical of a population.

Herbariums are repositories for type specimens on which names of species are founded. A scientific name. in order to be accepted must be properly published together with a description, but it is the type specimen nhich permanently determines the application of the name. In many herbariums the types are segregated from the rest of the collection in order to minimize the likelihood of damage.

Of the major herbariums, the one at Kew Gardens (*q.v.*), England, has about 6,000,000 specimens and is the largest in the world. The Berlin herbarium, almost as large as the one at Kew. suffered large-scale destruction during World War II. Other herbariums with 3,000,000 or more specimens are at Leningrad. Paris, Geneva, Florence, Washington D.C.. Cambridge, Mass, and New York city. The original herbarium of Linnaeus was purchased from his widow for the Linnean Society of London, which continues to maintain it.

Cultivated plants. not well represented in most institutional herbarium~are strongly emphasized in only one major herbarium in the United States, the Bailey Hortorium in Ithaca, N.Y., with about 300,000 specimens. (A. CT.)

HERBART, JOHANN **FRIEDRICH** (1776–1841), German philosopher, the founder of a system embracing logic, metaphysics and aesthetics but of particular importance for its psychology and for the educational theory stemming from it, was born at Oldenburg on May 4, 1776. After studying under J. G. Fichte at Jena (1794), he worked as a tutor at Interlaken in Snitzerland from 1797 to 1800, during which period he made the acquaintance of J. H. Pestalozzi (*q.v.*). Becoming a licentiate of Gottingen university in 1802, he was appointed extraordinary pro-

fessor there in 1805. At the close of 1808 he went as professor to Konigsberg. There he also conducted a seminary of pedagogy till 1833, when he returned as professor of philosophy to Gottingen. He died at Gottingen on Aug. 14. 1841.

Philosophical System. — Philosophy, in Herbart's view, is the analysis and elaboration of experience. Logic is the clarification of concepts and reasoning. being concerned with the form of thought; metaphysics and aesthetics are concerned with the content of thought. Logical analysis reveals contradictions in the concepts with which thought begins, and much of Herbart's analysis is devoted to the resolution of these contradictions. He develops a philosophical methodology which can be compared with the Hegelian dialectic *(see* HEGEL, GEORG WILHELM FRIEDRICH). In his metaphysics he starts from the scepticism of Hume and Kant (*qq.v.*) and attempts to determine by reflection alone the nature of what is real. The position finally reached is a "pluralistic realism" — the doctrine that there is a multiplicity of things which have absolute existence.

When one and the same thing, *A*, given in experience. combines a number of contradictory characters, it must be concluded that *A* is resolvable into a plurality of things, $A_1+A_2+A_3$, etc. Analysis ends in the conception of a plurality of absolutely simple beings. Such things tend to disturb each other, and each resists the disturbing effect exercised by the others. In so doing it manifests a variety of "self-preservations.': This general metaphysical doctrine has profoundly important implications for Herbart's psychology.

Psychology. — Herbart's position in the history of philosophy is mainly due to his contributions tn the philosophy of mind. These contributions are presented in two works: the *Lehrbuch zur Psychologie* (Königsberg, 1816; Eng. trans., *A Textbook in Psychology,* New York, 1894) and the *Psychologie als Wissenschaft, neu gegründet auf Erfahrung, Metaphysik und Mathematik,* 2 vol. (1824–25). His central thesis was that the facts of experience with which psychology is concerned are to be explained, not by reference to "faculties." but by reference to the laws governing the combination and interaction of those ultimate mental states variously described as sensations, images, ideas or presentations (*Vorstellungen*). This conception mas derived from his general metaphysics. The soul is one and simple, and its separate acts of "self-preservation" must also be simple. Presentations are the simple elements of mind. Though derived by Herbart from a distinctive metaphysical theory, the doctrine itself does not require to be supported by this theory. It is indeed closely similar to that of the associationist school derived from the British empiricists *(see* EMPIRICISM). He differs from the latter in the attempt to develop, in mathematical form, the statics and mechanics of mental processes and, more importantly, in distinguishing, within the interactions of presentations, conflicts or repulsions from combinations or associations.

The soul has no inherent tendency to change from one state to another. Once in a given state there is no reason why it should change unless there is interference from the outside. Hence, the disappearance of any presentation from consciousness constitutes a problem. There is no problem of explaining memory either as persistence of an idea in consciousness or as recall; the problem is to explain the passage from consciousness and to explain forgetting. The explanation is found in the mutual conflict of presentations opposed in quality. Ideas are forces which exercise attractive or repulsive effects on each other. Presentations may be similar, as one sensation of blue is similar to another sensation of blue a moment before; or they may be disparate, as blue is disparate from sweetness; or they may be contrary, as blue is contrary to yellow. Similar presentations fuse into a unity; disparate presentations combine to form complex presentations; contrary presentations are mutually exclusive. The fundamental laws of the interaction of presentations describe the processes of fusion, of compounding and of arrest. Arrest, or the expulsion of a presentation from consciousness, does not involve its annihilation. The excluded idea continues to exist in an unconscious form and tends, on the removal of obstacles, to return spontaneously to consciousness. The process varies in degree. Arrest may involve not complete repression but only obscuration. When arresting forces are adequate, and no more than adequate, to obscure a presentation, it is said to be "on" the threshold of consciousness. When the forces are greater, it is said to be "below" the threshold. If it is in consciousness at all. it is "above" the threshold. If it is above, on or below the threshold when the conditions require it to be so it is said to be above, on or below the "statical" threshold. If it is above, on or below the threshold when conditions require that it should not be so, it is said to be above. on or below the "dynamical" threshold. Presentations below the statical threshold have no influence on conscious processes, but those below the dynamical threshold may profoundly influence the course of events in consciousness.

All this part of Herbart's doctrine shows striking resemblances to doctrines prominent in 20th-century psychology and might seem to anticipate the laboratory findings which were to establish the influence upon consciousness of certain forms of subliminal stimuli. Especially notable are the similarities between the Herbartian doctrine of conflict and the theories of conflict and repression in Freudian theory. The Herbartian doctrine, however, was "intellectualist," attributing the conflict to the ideas themselves conceived as "forces," whereas in modern theories conflicts between ideas are taken to reflect and derive from conflicts betneen affective or instinctual forces. It is likely, however, that the Herbartian doctrine was influential in determining the earlier form of Freudian theory, in which the concept of a "complex" had much in common with the Herbartian concept of an "apperception mass."

Herbart's doctrine of "apperception" is likewise of interest by reason of its influence upon general theories of motivation and, especially, upon the course of educational psychology.

Presentative activity is exhibited not only in conflicts and repulsions but also in the combination and attraction of ideas. Presentations attract other presentations so as to form complex systems. Presentation masses are formed corresponding to the many "interests" of the individual (*e.g.,* his home and his hobbies) and to larger or smaller systems of concepts such as a philosophy or a body of religious doctrines. "Apperception" is the process by which a presentation mass assimilates new material or works smaller into larger systems. In the course of mental development certain constellations of ideas acquire a permanent dominance which exercises a powerful selective facilitating influence upon the ideas struggling to enter or re-enter consciousness. One most important constellation is the ego itself. This is a mass which enters into every activity which is described as an activity of oneself; *e.g.,* I remember, I think. I feel, etc.

"Feeling." "desire," "volition" are all concepts which in Herbart's psychology are defined and described in terms of the interaction of presentations and presentation masses, the rise and fall of sensations and ideas into consciousness under facilitating conditions and against resistances. As in many earlier accounts, "agreeable feelings" are said to arise under conditions of facilitation; disagreeable feelings under conditions of inhibition and resistance.

Desire exists when a presentation rises by help of another in spite of resistance by a third. This involves feeling, pleasant or painful. generally both. When a presentation reaches a certain stage of distinctness, action follows, if action is possible. A characteristic feature of desire is the state of tension persisting when action is not immediately possible. The disposition of the psychological mechanism which results from desire and issues in action when opportunity occurs is called "volition."

Theory of Education. — As Herbart's metaphysical system lay behind and supported his psychology, so his psychology lay behind and supported his pedagogic theory. It was in having a general theory that he was distinguished from educational reformers such as Friedrich Froebel (*q.v.*) and Pestalozzi, with whose practice he was in general sympathy. The essential principles are set out in two works: the *Aesthetische Darstellung der Welt* (Gottingen, 1804), which, though complete in itself, was published as part of the second edition of his *Pestalozzi's Idee eines A B C der Anschauung* (1st ed., 1802); and the *Allgemeine Padagogik* (Göt-

tingen, 1806), which put forward ideas that had been formed and expressed while Herbart was tutoring at Interlaken several years earlier. In rejecting the traditional doctrines of faculties and the doctrine of innate ideas Herbart was in the line of development of the educational theory which derived from Locke (*q.v.*) and other philosophical empiricists, but in his dynamical treatment of presentational activity he introduced something in advance of the associationist psychology with which empiricism had been generally combined. In the importance that he attached to observation *(Anschauung)* he was following Pestalozzi, but in his psychological analysis of the mental processes involved he provided a theoretical basis for Pestalozzi's practice. In his systematic account of the nature of education, Herbart conceives the process as beginning with the presentation masses which the child has previously acquired from experience and from social intercourse. The teacher, through an "educating instruction," creates knowledge from the former and "sympathy" from the latter. The ultimate objective is the formation of character by the development of an enlightened will, capable of making judgments on right and wrong. Moral judgments are absolute, springing from contemplation, incapable of proof and not requiring proof. They are like the judgments passed on harmonies and discords in music.

Ethics is thus, in the Herbartian system, a branch of aesthetics. It is concerned nith "relations among volitions which unconditionally please or displease." Five such relations are distinguished, corresponding to five comprehensive concepts: (1) inner freedom; (2) perfection; (3) benevolence; (4) right; (5) equity or retribution. The application of ethics to social affairs, with a view to the realization of a well-ordered social life, can be described as a moral technology, comprising politics and pedagogy.

Herbart's educational theories thus form part of a comprehensive and closely knit philosophy. But, though presented as "deduced" from general principles, they are also the expression of his personal cast of mind. His own talents and interests were such that the "educating instruction" which he imparted to his pupils combined science and the humanities in a balanced way seldom achieved in systems of education. The conflict between the demand for specialization and the demand for a general education was resolved by him in the formula "Every man must have a love for all activities, each must be a virtuoso in one." Similarly, his resolution of the conflict between the demand for freedom and self-expression and the demand for discipline had its theoretical basis in his treatment of the subject of "individuality."

BIBLIOGRAPHY.—There are collected editions of Herbart's works by G. Hartenstein, 12 vol. (Leipzig, 1850–52; reprinted 1883–93), and by K. Kehrbach and O. Fliigel, 19 vol. (Leipzig, 1887–1912). The most important books, other than those mentioned in the text above, are: *Hauptpuncte der Metaphysik* (Göttingen, 1808); *Allgemeine practische Philosophie* (Gottingen, 1808); *Lehrbuch zur Einleitung in die Philosophie* (Konigsberg, 1813; 4th ed., 1837); *Allgemeine Metaphysik*, 2 vol. (Konigsberg, 1828–29); *Umriss padogogischer Vorlesungen* (Göttingen, 183;; 2nd ed., 1841); and *Psychologische Untersuchungen*, 2 vol. (Gottingen, 1839–40). English versions of his educational writings include: *The Science of Education* (London, 1892), *Letters and Lectures on Education* (London, 1898); *A B C of Sense Perception and Minor Pedagogical Works* (New York, 1896); *The Application of Psychology to the Science of Education* (London, 1898); *Outlines of Educational Doctrine* (New York, 1901).

HERBELOT DE MOLAINVILLE. BARTHELEMY D' (1625–1695), French orientalist, was bdrn on Dec. 14, 1625, in Paris. He was educated at the University of Paris, and devoted himself to the study of oriental languages, going to Italy to perfect himself in them by converse with the orientals who frequented its sea-ports. There he also made the acquaintance of Holstenius, the Dutch humanist (1596–1661), and Leo Allatius, the Greek scholar (1586–1669). On his return to France after a year and a half, he was received into the house of Fouquet, superintendent of finance, who gave him a pension of 1,500 livres. On Fouquet's disgrace in 1661, he was appointed secretary and interpreter of Eastern languages to the king. On a second visit to Italy the grand-duke Ferdinand II. of Tuscany presented him with a large number of valuable oriental mss., and tried to attach him to his court. Herbelot, however, was recalled to France by Colbert, and in 1692 he succeeded D'Auvergne in the chair of Syriac, in the Collège de France. He died in Paris on Dec. 8, 1695. His great work is the *Bibliothkque orientale, ou dictionnaire universel contenant tout ce qui regarde la connoissance des peuples de l'Orient,* based mainly on the Arabic dictionary of Hadji Khalfa, which occupied him nearly all his life, and was completed in 1697 by A. Galland.

The *Bibliothèque* was reprinted at Maestricht (1776), and at The Hague (4 vols., 1777–99). The latter edition is enriched with the contributions of the Dutch orientalist Schultens, Johann Jakob Reiske (1716–74), and by a supplement provided by Visdelow and Galland.

HERBERAY DES ESSARTS, NICOLAS DE (d. about 1557), French translator, was born in Picardy. He served in the artillery, and at the expressed desire of Francis I he translated into French the first eight books of *Amadis de Gaul* (1540–48). His other translations from the Spanish include *L'Amant maltraité de sa mye* (1539); *Le Premier Livre de la chronique de dom Florès de Grèce* (1552); and *L'Horloge des Princes* (1555) from Guevara. The *Amadis de Gaul* was translated into English by Anthony Munday in 1619.

HERBERT (FAMILY). Earlier generations of a pedigree which carries the origin of the Herberts to Herbert the Chamberlain. a Domesday tenant, being disregarded, their patriarch may be taken to be one Jenkin ap Adam (temp. Edward 111), who had a small Monmouthshire estate at Llanvapley and the office of master sergeant of the lordship of Abergavenny, a place which gave him precedence after the steward of that lordship.

Sir William Herbert, called by the Welsh Gwilim Ddu or Black William, was a baron in 1461 and a Knight of the Garter in the following year. With many manors and castles on the Marches he had the castle, town and lordship of Pembroke, and after the attainder of Jasper Tudor in 1468 was created earl of Pembroke. When in July 1469 he was taken by Sir John Conyers and the northern Lancastrians on Hedgecote, he was beheaded with his brother Sir Richard Herbert of Coldbrook. The second earl while still a minor exchanged at the king's desire in 1479 his earldom of Pembroke for that of Huntingdon. In 1484 this son of one whom Hall not unjustly describes as born "a mean gentleman" contracted to marry Katharine the daughter of King Richard III, but her death annulled the contract and the earl married Mary, daughter of the Earl Rivers, by whom he had a daughter Elizabeth, whose descendants, the Somersets, lived in the Herbert's castle of Raglan until the cannon of the parliament broke it in ruins. With the second earl's death in 1491 the first Herbert earldom became extinct. The ancestor of the present earls of Pembroke and Carnarvon and of the Herbert who was created marquess of Powis was a natural son of the first earl, one Richard Herbert, whom the restored inscription on his tomb at Abergavenny incorrectly describes as a knight. He was constable and porter of Abergavenny Castle, and his son William, "a mad fighting fellow" in his youth, married a sister of Catherine Parr and thus in 1543 became nearly allied to the king, who made him one of the executors of his will. The earldom of Pembroke was revived for him in 1551.

The honours and titles of this clan of marchmen make a long list. They include the marquessate of Powis, two earldoms with the title of Pembroke, two with that of Powis, and the earldoms

of Kuntingdon and Montgomery, Torrington and Carnarvon, the viscountcies of Montgomery and Ludlow, fourteen baronies and seven baronetcies. Seven Herberts have worn the Garter. The knights and squires must be sought among the Raglans. Morgans, Parrys, Vaughans, Prqgers, Hugheses, Thomases. Philips, Powels, Gwyns, Evanses and Joneses, as well as Herberts.

HERBERT, EDMOND (1812–1890), French geologist, was born at Villefargau, Yonne, on June 12, 1812. He was educated at the Collège de Meaux, Auxerre, and at the École Normale in Paris. After holding various appointments he was appointed in 1857 professor of geology at the Sorbonne. To him we owe the first definite arrangement of the Chalk into palaeontological zones *(see* Table in *Geol. Mag.*, 1869, p. 200). During his later years he was regarded as the leading geologist in France. He was a member of the Institute, and was three times president of the Geological Society of France in the course of his life. He died in Paris on April 4, 1890.

HERBERT, GEORGE (1593–1633), English poet, was born at Montgomery castle, on April 3, 1593, the fifth son of Sir Richard Herbert and a brother of Lord Herbert of Cherbury. His mother, Lady Magdalen Herbert, a woman of great good sense and sweetness of character, and a friend of John Donne, exercised great influence over her son. Educated privately until 1605, he was then sent to Westminster and in 1609 he became a scholar of Trinity college, Cambridge, where he was made major fellow in 1616. In 1616 he became reader in rhetoric and in 1619 orator for the university. In this capacity he spent most of his time at court, and was not often at Cambridge except when the king was there. He hoped, indeed, that the post would lead for him, as it had for his predecessors, to political advancement; but the death of James I in 1625 put an end to these hopes and he accepted an appointment as prebendary of Layton Ecclesia (Leighton Bromswold), Huntingdon, where he rebuilt the church. In his Cambridge days he had already written some Latin satiric verses in defence of the universities and the English Church in reply to Andrew Melville's *Anti-Jami-Cami-Categoria.* His friends at this period included Dr. Donne, Sir Henry Wotton, Izaak Walton, Bishop Andrewes and Francis Bacon, who dedicated to him his translation of the Psalms. At Leighton he was within two miles of Little Gidding, and came under the influence of Nicholas Ferrar. There is little doubt that the close friendship with Ferrar had a large share in Herbert's definite adoption of the religious life. We have Herbert's own authority for saying that this period and some space of time after was for him a time of intense religious conflict, out of which eventually came the serenity mirrored in his verse.

In 1630 Charles I, at the instance of the earl of Pembroke, whose kinsman Herbert was, presented him to the living of Fuggle-stone with Bemerton, near Salisbury, and he was ordained priest in September. A year before, after three days' acquaintance, he had married Jane Danvers, whose father had been set on the marriage for a long time. The story of the poet's life at Bemerton, as told by Walton, is one of the most exquisite pictures in literary biography. He devoted much time to explaining the meaning of various parts of the prayer-book, and held services twice every day, at which many of the parishioners attended, and some "let their plough rest when Mr. Herbert's saints-bell rung to prayers, that they might also offer their devotions to God with him."

Next to Christianity itself he loved the English Church. He was passionately fond of music, and his own hymns were written to the accompaniment of his lute or viol. He usually walked once or twice a week to attend the cathedral at Salisbury and before returning home, would "sing and play his part" at a meeting of music lovers. Walton illustrates his kindness to the poor by many touching anecdotes, but he had not been three years at Bemerton when he succumbed to consumption. He was buried beneath the altar of his own church on March 3, 1633.

None of Herbert's English poems was published during his lifetime. On his death-bed he gave to Nicholas Ferrar a manuscript with the title *The Temple; Sacred Poems and Private Ejaculations,* published at Cambridge, apparently for private circulation, almost immediately after Herbert's death. *The Temple* is a collection of religious poems connected by unity of sentiment and inspiration. There is apparent throughout great neatness of execution, particularly in the conclusion, which often comes as a surprise. Herbert was thoroughly imbued with the "metaphysical" tendencies of the age. He was a notable amateur of the "conceit," which, like Donne, he "transplanted" to religious uses. Nothing in his own church at Bemerton was too commonplace to serve as a starting-point for the epigrammatic expression of his piety. The church key reminds him that "it is my sin that locks his handes," and the stones of the floor are patience and humility, while the cement that binds them together is love and charity. The same use is made of illustrations from everyday life. and the curious store of medical and chemical information beloved of the time.

BIBLIOGRAPHY.—Nicholas Ferrar's translation (1638) of the *Hundred and Ten Considerations* . . . of Juan de Valdes contained a letter and notes by Herbert. In 1652 appeared *Herbert's Remains; or, Sundry Pieces of that Sweet Singer of the Temple, Mr. George Herbert.* This included *A Priest to the Temple; or, The Country Parson, his Character, and Rule of Holy Life,* in prose; *Jacula prudentum,* a collection of proverbs with a separate title page dated 1651, which had appeared in a shorter form as *Outlandish Proverbs* in 1640; and some miscellaneous matter. The most complete edition of his works is that by A. B. Grosart in 1874, this edition oi the poetical works being reproduced in the "Aldine edition" in 1876. *The English Works of George Herbert* . . . (3 vol., 1905) was edited in much detail by G. H. Palmer; *Works* (London, New York, 1941) was edited by F. E. Hutchinson.

HERBERT, SIR THOMAS (1606–1682), English traveller and author, born at York in 1606, became a commoner of Jesus college. Oxford. in 1621, but afterward removed to Cambridge. In 1627 he joined the suite of Sir Dodmore Cotton. then starting as ambassador for Persia with Sir Robert Shirley. En route they visited the Cape, Madagascar, Goa and Surat and reached Persia in 1628. After both Cotton and Shirley died at Kazvin. Herbert travelled throughout Persia. On the return voyage he visited Ceylon, the Coromandel coast. Mauritius and St. Helena. He reached England in 1629, travelled in Europe in 1630–31, married in 1632 and retired from court in 1634. During the Great Rebellion he sided with parliament till his appointment to attend on the king in 1646. He was rewarded with a baronetcy at the Restoration (1660). He died at Petergate house, York, on March 1, 1682.

Herbert's chief work is the *Description of the Persian Monarchy* (1634); reissued with additions. etc., in 1638; a third edition followed in 1664 and a fourth in 1677.

HERBERT, VICTOR (1859–1924), U.S. musical composer, was born in Dublin, Ire.. Feb. 1, 1859. He received thorough musical training in Germany where he became active as a composer and violoncello virtuoso (studying with Max Seifritz and Bernhard Cossmann respectively). In 1886 he went to the United States with his wife (Therese Forster), a prima donna in the Metropolitan Opera, played in the Metropolitan orchestra and under Anton Seidl and Theodore Thomas. His earlier compositions, romantic and melodious, were performed by the New York Philharmonic society; he himself was soloist in his two cello concertos.

In America Herbert won fame as composer of brilliant operettas, also as a conductor. In 1893 he assumed leadership of the celebrated 22nd regiment band (formerly Gilmore's); from 1898 to 1904 he conducted the Pittsburgh Symphony orchestra; in the latter year he organized his own concert orchestra which was immensely popular throughout the country.. He energetically led the fight for favourable copyright legislation, passed in 1909, and he benefited all American composers by founding ASCAP (American Society of Composers, Authors and Publishers) in 1914.

Herbert's first operetta was *Prince Ananias* (1894). It was followed by more than 40 others, many of them of the greatest importance in operetta literature. Among the best are *The Serenade* (1897), *The Fortune Teller* (1898), *Babes in Toyland* (1903), *Mlle. Modiste* (1905), *The Red Mill* (1906), *Naughty Marietta* (1910), *Sweethearts* (1913), *The Only Girl* (1914), *Eileen* (1917). His operetta music was superbly orchestrated. He also wrote two grand operas, *Natoma* (1911) and *Madeleine* (1914), and the music for the motion picture, *The Fall of a Nation* (1916). The last-named work was probably the first original symphonic score composed for a feature film. thus a landmark in music and cinema history. Late in life he wrote for revues, notably the *Ziegfeld Follies.* He died in New York city May 26. 1924. (E. N. W.)

HERBERT OF CHERBURY, EDWARD HERBERT, BARON (1583–1648), English soldier, diplomatist, historian and religious philosopher! was born at Eyton-on-Severn on March 3, 1583, and educated at University college, Oxford. On the accession of James I he presented himself at court and was created a knight of the Bath in 1603. In 1610 he served as a volunteer in the Low Countries under the prince of Orange, whose intimate friend he became. and distinguished himself at the capture of Juliers from the emperor. He then traveled in Italy, and two years after his return to England in 1617, Buckingham made him ambassador at Paris, but a quarrel with De Luynes occasioned his recall in 1621. After the death of De Luynes, Herbert resumed his post in Feb. 1622, and tried to 'accomplish the union between Charles and Henrietta Maria and secure the assistance of Louis XIII for the unfortunate elector palatine. On being dismissed in April 1624, he received the Irish peerage of Castle Island in 1624 and the English barony of Cherbury, or Chirbury, in 1629. In 1632 he was appointed a member of the council of war. He attended the king at York in 1639, and in May 1642 was imprisoned by the parliament for urging the addition of the words "without cause" to the resolution that the king violated his oath by making war on parliament. He retired to Montgomery castle, and declined the king's summons. On Sept. 5, 1644, he surrendered the castle to the parliamentary forces. He died in London on Aug. 20, 1648. Lord Herbert's most important work is the De *veritate prout distinguitur a revelatione, a verisimile, a possibile et a falso* (1624), which combines a theory of knowledge with a partial psychology, a methodology for the investigation of truth and a scheme of natural religion. His other writings include the *De religione gentilium* (1663). a natural history of religion; *Expeditio Buckinghami ducis* (1656); *Life and Raigne of Henry VIII* (1649), based on authentic papers; a volume of poems (1665); and an autobiography, first published by Horace Walpole in 1764, and edited by Sidney Lee (1886; 2nd ed., 1907). His English and Latin poems were edited by G. C. Moore Smith (Oxford, 1923).

See Lee's article in *Dictionary of National Biography; C.* de Rémusat, *Lord Herbert de Cherbury* (1874); *C.* Güttler, *Eduard, Lord Herbert von Cherbury* (1897).

HERBERT OF LEA, SIDNEY HERBERT, 1ST BARON (1810–1861), English statesman notable for his association with Florence Nightingale to improve sanitary conditions in the British army during the Crimean War, was born at Richmond, Surrey, on Sept. 16, 1810. He was educated at Harrow and Oriel college, Oxford, where he was a member of that group of brilliant young men, including his close friend W. E. Gladstone, who first attained prominence as admirers of Sir Robert Peel.

Sitting for Wiltshire from 1832 onward. Herbert served under Peel as secretary of the board of control in 1834–35, and as secretary to the admiralty between 1841 and 1845, when he joined the cabinet as secretary at war. The ministry resigned in 1846 after the repeal of the corn laws, and Herbert soon emerged as a leading Peelite. From 1852 he was again secretary at war until Lord Aberdeen's coalition fell in 185j, when he briefly became colonial secretary under Lord Palmerston. During the Crimean War, which revealed grave weaknesses in military administration, Herbert strove for improvement, and the Sebastopol committee on the conduct of the war reported favourably on his efforts. Thereafter, in conjunction with Florence Nightingale, his personal friend, whom he had first sent out to Scutari. Turkey, Herbert promoted successive inquiries, notably the royal commission of 1856, with a view to extensive reform. His opportunity came when he entered Palmerston's ministry of 1859 as secretary for war; but under protracted strain his health broke down. Herbert was raised to the peerage in 1860. and died at Wilton, near Salisbury, on Aug. 2, 1861, shortly after his resignation.

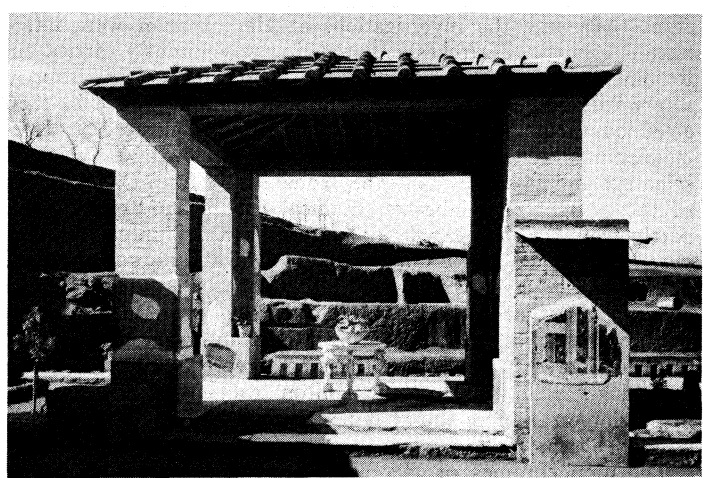
Highly regarded and much loved by his contemporaries. Herbert was a charming, talented man, who failed to fulfill his early promise and is best remembered for his collaboration with Florence Nightingale. Frail and sensitive, with a keen sense of personal responsibility, he could not survive the physical and psychological stresses of the Crimean War and its aftermath; but he succeeded in initiating important reforms at the war office. (A. F. T.)

HERBERTON, a small mining town of Cardwell county, Queensland, Austr., 55 mi. S.W. of Cairns. Pop. (1954) 1,101. Herberton is about 3,000 ft. above sea level. The rainfall is 44 in. The town is one of the main educational centres of north Queensland, with three secondary schools. It is the centre of administration of Herbertonshire. The principal industries are tin and wolfram mining and sawmilling.

HERBIG, GUSTAV (1868–1925), German scholar in Etruscan. was born on June 3, 1868, at Kaiserslautern (Pfalz) and educated at the universities of Munich and Leipzig. He came much in contact with Carl Pauli. the university librarian at Munich, who was also editor of the *Corpus Inscriptionum Etruscarum* (begun in 1893, still incoinplete), the foundation of all modern scientific study of Etruscan. His successive appointments as Pauli's successor, as professor at Rostock (1913), where he served as rector in its quinquecentennial celebrations (founded 1419j, at Breslau (1921) and finally at Munich again (1922) gave him enough leisure to pursue his study of Etruscan. Besides his editorial work. he contributed many articles directed at the solution of its problems on the combinatorial method. He died in Munich on Oct. 1. 1925. (J. WH.)

HERCEGOVINA: *see* BOSNIA AND HERCEGOVISA.

HERCULANEUM, an ancient city of Italy, about two-thirds of a mile from the Portici station of the railway from Naples to Pompeii. The small part of the city, which was investigated at the spot called *Gli scavi nuovi* (the new excavations), was discovered in the 19th century. But the more important works



BY COURTESY OF ITALIAN STATE TOURIST OFFICE

VIEW OF AN EXCAVATED ARBOUR OF A HOUSE AT HERCULANEUM

were executed in the 18th century; of the buildings then explored at a great depth, by means of tunnels, none is visible except the theatre, the orchestra of which lies 85 ft. below the surface.

Herculaneum was a small city of Campania between Neapolis and Pompeii, situated between two streams at the foot of Vesuvius on a hill overlooking the sea, with a safe harbour. It fell under the power of Rome during the Samnite wars. It remained faithful to Rome for a long time. but it joined the Italian allies in the Social War. Having submitted anew in June of the year 665 (88 B.C.), it appears to have been less severely treated than Pompeii. It enjoyed great prosperity toward the close of the republic and in the earlier times of the empire, since many splendid villas were built there, one belonging to the imperial house, another to the family of Calpurnius Piso. By means of the Via Campana it had easy communication northwestward with Neapolis, Puteoli and Capua, and thence by the Via Appia with Rome; and southward with Pompeii and Nuceria, and thence with Lucania and the Bruttii. In the year A.D. 63 it suffered terribly from an earthquake; and hardly had it completed the restoration of some of its principal buildings when it fell beneath the great eruption of the year 79, described by Pliny the younger (*Ep.*, vi. 16, 20), in which Pompeii also was destroyed, with other cities of

Campania. On August 23 Pliny the elder, who had command of the Roman fleet at Misenum, set out to render assistance to Rectina and others dwelling on that coast, but, as there was no escape by sea, the harbour having been filled up, he was obliged to abandon those who had managed to flee from their houses, overwhelmed in a moment by the material poured forth by Vesuvius. Thus, while many made their escape from Pompeii (which was overwhelmed by the fall of the small stones and afterwards by the rains of ashes), comparatively few could manage to escape from Herculaneum, and these found shelter in Neapolis, where they inhabited a quarter called after the buried city. The name of Herculaneum, which for some time remained attached to the site of the disaster, is mentioned in the later itineraries.

In 1719, while Prince Elbeuf was seeking crushed marble, he learned from the peasants that there were in the vicinity some pits from which they had extracted many statues. In 1738, excavations were begun on the spot. At first it was believed that a temple was being explored, but afterwards the inscriptions proved that the building was a theatre, and many scholars hastened to Naples to see the marvellous statues of the Balbi and the paintings on the malls. Bernardo Tanucci, secretary of state in 1755, founded the Accademia Ercolanese, which published the principal works on Herculaneum (*Le Pitture ed i bronzi d' Ercolano,* 8 vols., 1757–1792; *Dissertationis isagogicae ad Herculanensium voluminum explanationem pars prima,* 1797). The excavations, which continued for more than forty years (1738–1780), were executed at first under Xlcubierre (1738–1741), and then with the assistance of the engineers Rorro and Bardet (1 741–1745), Carl Weber (17jo-I764), and Francesco La Vega. After the death of Alcubierre (1780) the last-named was appointed director-in-chief, but from that time the investigations at Herculaneum were intermitted, and the researches at Pompeii were vigorously carried on. Resumed in **1827,** the excavations at Herculaneum were shortly afterwards suspended, nor were the new attempts made in **1866** attended with any success. The antiquities excavated at Herculaneum in the 18th century form a collection of the highest scientific and artistic value. They come partly from the buildings of the ancient city (theatre, basilica, houses and forum), and partly from the private villa of a great Roman family (*cf.* Comparetti and de Petra, *La Villa Ercolanese dei Pisoni,* Turin, 1883). From the city come, among many other marble statues, the two equestrian statues of the Balbi, and the great imperial and municipal bronze statues. Mural paintings of extraordinary beauty were also discovered here, such as those that represent Theseus after the slaughter of the Minotaur, Chiron teaching Achilles the art of playing on the lyre and Hercules finding Telephus who is being suckled by the hind.

The monochromes of Herculaneum remain among the finest specimens of the exquisite taste and consummate skill displayed by the ancient artists. Among the best preserved is Leto and Niobe. The Villa Suburbana has given up a good number of marble busts, and the so-called statue of Aristides, but above all that splendid collection of bronze statues and busts (mostly reproductions of famous Greek works) now to be found in the Naples Museum, the reposing Hermes, the drunken Silenus, the sleeping Faunus, the dancing girls, the bust called Plato, that wrongly believed to be Seneca, the two quoit-throwers or discoboli, and other masterpieces. But a still further discovery made in the Villa Suburbana contributed to magnify the greatness of Herculaneum; within its walls was found the famous library, of which, counting both entire and fragmentary volumes, **1,803** papyri are preserved. Among the nations which took the greatest interest in the discovery of the Herculaneum library, the most honourable rank belongs to England, which sent Hayter and other scholars to Naples to hasten the publication of the volumes. Of the 341 papyri which have been unrolled, **195** have been published (*Herculanensium voluminum quae supersunt* [Naples, 1793–1809]; *Collectio altera,* 1862–1876). They contain works by Epicurus, Demetrius, Polystratus, Colotes, Chrysippus, Carniscus and Philodemus. The names of the authors are in themselves sufficient to show that the library belonged to a person whose principal study was the Epicurean philosophy. But of the great master of this school only a few works have been found. Of his treatise Περὶ φύσεως, divided into **37** books, it is known that there were three copies in the library. Even the other authors above mentioned are but poorly represented, with the exception of Philodemus, of whom **26** different treatises have been recognized. But all these philosophic discussions, belonging for the most part to an author less than secondary among the Epicureans, fall short of the high expectations excited by the first discovery of the library. Among the many volumes unrolled only a few are of historical importance—that which treats of the philosophers of the Academy and that which deals with the Stoics. There are in the library some volumes written in Latin, all so damaged that hardly any of them can be deciphered. One with verses relating to the battle of Actium is believed to belong to a poem of Rabirius. The plan of the villa is the only satisfactory document for the topography of Herculaneum.

HERCULANO DE CARVALHO E ARAÚJO, ALEXANDRE (1810–1877), Portuguese historian, novelist and poet, who with Almeida Garrett introduced romanticism into Portugal. He was born in Lisbon on March 28, 1810. After taking part in the revolt against the absolute power of Dom Miguel, he fled to England and France, returning in 1832 with the army that established the liberal regime in Portugal. His first important works are *A Voz do Profeta,* a lampoon against the popular revolution of 1836, and *A Harpa do Crente* (1838), poems referring mostly to the civil war between **1832** and **1834.** From **1837** to **1839** he was editor of O *Panorama,* a review influenced by the English *Penny Magazine,* in which he first published the historical novels issued later in book form (*Lendas e narrativas,* 2 vol., 1851) and also essays propagating the new European literary tendencies. He was inspired by the conviction that an important cultural reform should complete the reform of political institutions. Elected to the *cortes* in **1840,** he campaigned for a democratic reform of education.

In 1841 António Bernardo da Costa Cabral established an authoritarian regime and Herculano withdrew from politics. As librarian from 1839 of the Royal Library of Ajuda he was able to devote all his time to the composition of the *História de Portugal.* This work was preceded by some preparatory essays (*Cartas sobre a história de Portugal,* 1842; *Apontamentos para a história dos bens da Coroa e dos forais,* 1843–44); and by historical novels, all showing the influence of Sir Walter Scott and Victor Hugo, which introduced this literary genre into Portugal: *Eurico o presbítero* (1844), a narrative in poetical prose of the Arab invasion of the peninsula; O *Bobo* (1843), dealing with the origins of the Portuguese monarchy; and *O Monge de Cister* (1848), set in the reign of John I.

In 1846 appeared the first volume of *Histdria de Portugal.* One of the finest achievements of romantic historiography, this work covers the political and social history of Portugal to 1279 and resembles Jacques Thierry's *Histoire du Tiers État* (1853) in stressing the origin and rise of a middle class. To his contemporaries its most striking characteristic was its exposure of many traditional legends, such as the appearance of Christ to the first king of Portugal in the battle of Ourique. Attacked by the clergy, Herculano answered by denouncing their ignorance and fanaticism.

In **1851** the Costa Cabral regime was overthrown by the movement of the "*Regeneração,*" in which Herculano took part. To support the new regime and to combat the right-wing elements which were undermining it, he helped to found two newspapers, *O País* (1 851) and O *Portuguez* (**18***j*3), in which he wrote against political centralism and the increase in clerical influence. To this period belongs *Da origem e estabelecimento da Inquisição em Portugal* (1854–59; Eng. trans. **1926**). Based on hitherto unknown documents, it attempted to demonstrate that royal absolutism and clerical power were allies in the confiscation of the property of the "New Christians" (converted Jews) through the Inquisition. Herculano was a Roman Catholic of strong opinions and during his early literary career he tried to reconcile Catholicism and liberalism (*Pároco da Aldeia,* 1844), but his quarrel with the clergy and the revival of clerical influence made him consider Ultramontanism the main enemy of liberal institutions. He protested

against the Concordat of 1857, led the campaign against the restoration of the monastic orders and advocated civil marriage. His book on this subject, *Estudos sobre o casamento civil* (1866), was immediately placed on the Roman Index. From 1871 he was openly critical of the new dogmas of the Immaculate Conception and papal infallibility.

The fourth and last volume of the *História de Portugal* was issued in 1853. Grieved by the appointment of a personal enemy as director of the national archives in 1856, Herculano then ceased to write and turned to farming in Vale de Lobos, near Santarém. However, he continued to direct the compilation of the *Portugaliae Monumenta Historica* (vol. 1, 1856) and began to collect his essays and polemical writings in *Opusculos*, 6 vol. (1873–84), which contains some of his best work: vigorous polemic, forceful in expression and terse and elegant in style. He died at Santarém on Sept. 13. 1877.

Herculano impressed his contemporaries deeply not only by his works but by his austere and adamant character. He refused all official honours but enjoyed a national prestige equalled only by that of Victor Hugo in France. His collected works were edited in 33 vol. by Livraria Bertrand.

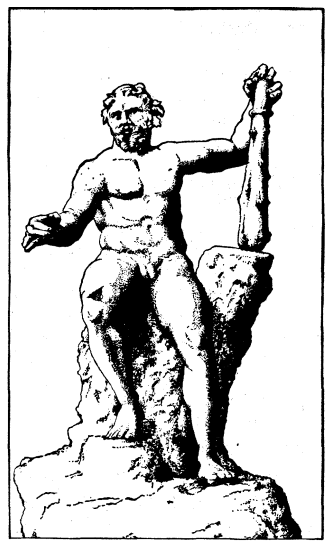
HERCULES, the latinized form of the Greek HERACLES, the most famous Greek hero. His name (Gr. Ἡρακλῆς, probably "glorious gift of Hera," cf. Diocles) shows that he cannot be originally a god, since no Greek god ever has a name compounded of that of another deity. Probably a real man, a chieftain of Tiryns in Mycenaean times and vassal to Argos, lies behind the very complicated mythology of Heracles. As told in later ages, the story in its main outline runs as follows:

Zeus loved Alcmene, wife of Amphitryon of Tiryns, who at the time was living in exile at Thebes. Taking the shape of Amphitryon, he begat a son who he intended should be lord of the Argolid; but by a trick of Hera that position was won for Eurystheus, who was born shortly before Heracles. Hera pursued Heracles with her hatred. In his cradle she sent serpents to kill him, which, however, he despatched. In young manhood, after his first adventure (the killing of the lion of Mt. Cithaeron), Heracles won for his wife Megara, daughter of Creon, king of Thebes, but again Hera interfered, and in a fit of madness sent by her he murdered Megara and her children. For this or for some other reason he became the servant of Eurystheus, son of Sthenelus and king of Argos. The numerous tasks imposed by his master were arranged at some unknown but not early date in antiquity into a cycle of 12 (the 12 Labours or *Dodekatklos)*, usually in the following order: 1, capture of the lion of Nemea; 2, the Hydra of Lerna; 3, capture of the hind (or stag) of Arcadia; 4, capture of the boar of Erymanthus; 5, cleansing of Augeias' stables in Elis; 6, shooting the birds of Stymphalus (so far we have Peloponnesian advenrures only, and these are probably the oldest); 7, capture of the Cretan bull: 8, capture of the mares of Diomedes in Thrace; 9, taking the girdle of Hippolyte, queen of the Amazons: 10, seizing the cattle of Geryon; 11, bringing the apples of the Hesperides; 12, fetching up Cerberus from the lower world. It will be seen that the last two take place in the other world; there is little doubt that they represent a forcible seizure of immortality, and are parallel to the adventure mentioned by Homer *(Iliad,* v., 395) in which he fights and wounds Hades.

Subsidiary to the *Dodekathlos* is a series of minor adventures called *Parerga.* For example, during the 4th labour. he met and fought the Centaurs; during the 11th. he wrestled with the giant Antaeus. A further series of enterprises, undertaken after he was freed from the service of Eurystheus, are known as πράξεις. These include the campaigns against Troy, Elis and Pylos. Other notable incidents are his struggle with Apollo for the sacred tripod at Delphi, stopped by Zeus throwing a thunderbolt between the combatants, and his share in various famous exploits, such as the battle of the gods and giants, and the Argonautic expedition. His last series of adventures was as follows:

His second wife was Deianeira, daughter of Oeneus king of Calydon, for whom he wrestled with her other suitor, the river Achelous. As he was taking her home, the centaur Nessus tried to violate her, and was shot by Heracles with an arrow dipped in the venom of the Hydra. Dying, the centaur bade Deianeira take the blood from his wound and keep it safe, for anyone wearing a garment rubbed with it would love her for ever. Years after, when Hyllus and several other children had been born to them, Heracles fell madly in love with Iole, daughter of Eurytus king of Oechalia. He was repulsed by Eurytus when .he demanded her, and the matter was further complicated by his killing Eurytus' son, for which he had to go into exile for a year, as slave to the Lydian queen Omphale, who set him to do women's work. According to some accounts, Heracles loved her and served her to gain her favours. Returning, he captured Oechalia and took Iole prisoner. Deianeira realized that she was a dangerous rival, and sent Heracles a garment smeared with the blood of Nessus. This was a powerful poison. and Heracles was seized with terrible agonies. At last he had himself brought up to the top of Mt. Oeta where a huge pyre was built. On this he was put and induced a shepherd, Poeas, with the gift of his bow and arrows, to' light it. His mortal part was burned, but his divine part ascended to heaven. was reconciled to Hera, and wedded Hebe. The story of the burning is connected with a very ancient ceremony on Oeta at which victims and also puppets in human shape were burned; *see* Nilsson in *Journ. Hell. Studies,* xliii. (1923) p. 144. This is the latest form of the persistent theme of the winning of immortality.



BY COURTESY OF THE METROPOLITAN MUSEUM OF ART

HERCULES RESTING. FROM A CAST MODELLED AFTER A ROMAN BRONZE STATUE IN THE NAPLES MUSEUM

Even this short sketch shows how complex the saga is. The Peloponnesian adventures may well be in origin an exaggerated account of the exploits of a real man, a great tighter and hunter; many of the others may have been originally accredited to some local hero, afterwards absorbed by Heracles. The incident of Omphale sounds like the tale of some Oriental mother-goddess and her male consort. There are several other traces of Heracles being identified with foreign gods; *e.g.,* he is equated with the Phoenician Melqart.

In cult, he is sometimes a hero, sometimes a god; Athens claimed to have been the first to give him divine honours. His titles are numerous, among the most characteristic being ἀλεξίκακος (averter of evil, also a title of Apollo) and καλλίνικος (nobly victorious). In art and literature, he is represented as an enormously strong man, of moderate height, a huge eater and drinker, very amorous, generally kindly but with occasional outbursts of brutal rage. He generally ears the skin of the Nemean lion; his characteristic weapon is the bow, frequently also the club (whether this is original 'or not, is doubtful). Numerous representations of him survive; of statues the most notorious is the hideous muscle-bound figure, now at Naples, known as the Farnese Hercules.

There is another Heracles. one of the Idaean Dactyli, who has only the name in common with the son of Alcmene.

In Italy, his name is corrupted in various ways, the most familiar being the Latin Hercules. He is worshipped as a god only, hero-cult not being Italian, and is principally a god of merchants and traders, although others also pray to him for his characteristic gifts of good luck or rescue from danger. Tithes of commercial profits, etc., were often presented to him, and feasts held in his honour. His best-known cult was at the Ara

Maxima: in the Forum Boarium at Rome. Though very early, this cult is probably not to be identified with that of any native deity. Late and artificial legends represented him as returning from the raid on Geryon's cattle by way of Italy. visiting the future site of Rome and there introducing more humane rites in place of human sacrifices and teaching Evander's people to worship himself, having earned their gratitude by killing the monster Cacus (really an ancient fire god).

For Heracles *see* Preller-Robert, *Griechische Mythologie;* L. R. Farnell, *Hero-Cults.* For Hercules, *see* Preller-Jordan. *Römische Mythologie;* Wissowa, *Religion und Kultus.* (H. J. R.)

Hercules was a favourite figure in French mediaeval literature. In the *Romance of Alexander* the tent oi the hero is decorated with incidents from his adventures. In the prose romance *Les Prouesses et vaillances du preux Hercule* (Paris, 1500), the hero's labours are represented as having been performed in honour of a Boeotian princess; Pluto is a king dwelling in a dismal castle; the Fates are duennas matching Proserpine; the entrance to Pluto's castle is watched by the giant Cerberus. Hercules conquers Spain and takes Merida from Geryon. The book is translated into English as *Hevcules of Greece* (n.d.). Fragments oi a French poem on the subject will be found in the *Bulletin de la soc. des anciens textes français* (1877). Don Enrique de Villena took from *Les Prouesses* his prose *Los Doze Trabajos de Hercules* (Zamora, *1483* and 1499), and Fernandez de Heredia wrote *Trabajos y afanes de Hercules* (Madrid, 1682), which belies its title, being a collection of adages and allegories. *Le Fatiche d'Ercole* (1475) is a romance in poetic prose by Pietro Bassi, and the *Dodeci Travagli di Ercole* (1544), a poem by J. Perillos.

HERCULES, in astronomy, a constellation of the northern hemisphere. Represented by a man kneeling. this constellation was first known as "the man on his knees," and was afterward designated Cetheus, Thescus and Hercules by the ancient Greeks. Hercules contains a famous globular star cluster (Messier 13) which is the finest example in the northern hemisphere. The sun's motion through space is directed toward a point in this constellation. The light of the third magnitude star α Hercules varies irregularly.

HERCYNITE: *see* SPINEL.

HERCZEG, FERENC (1863–1954), Hungarian novelist and playwright, a leading conservative-nationalist writer of the early 20th century, who also played an active part in politics. was born at Versecz, Sept. 22, 1863. He published his first novel in 1890. In 1895 he founded *Új Idők,* which remained for half .a century the literary magazine of the right-wing upper and middle classes. His many novels contained just enough irony and social criticism to cause a harmless shock to the conservative public for whom they were mitten. and brought him great popularity. The main interest of even the best of them, such as *Gyzcrkovics lányok* (1893), which describes the foibles of the gentry. is in the insight they give into the tastes of Herczeg's public. His social comedies. such as *A három testőr* (1895) and *Kék rdka* (1917), are amusing and skilful. *Bizánc* (1904) and *A hid* (1925) are the best oi many historical dramas: the former is set in 15th-century Constantinople, the latter deals with the conflict between the 19th-century statesmen Louis Kossuth and Istvan Széchényi. Herczeg died in Budapest, Feb. 24, 1954. (Ds. SR.)

HERDER, JOHANN GOTTFRIED VON (1744–1803), German critic, philosopher, preacher and educator, was born at Mohrungen, East Prussia, on Xug. 25, 1744, of humble parents. An imaginative and precocious child, he grew up to be one of the most fertile and suggestive thinkers Germany has produced, and not only inspired the literary revolution known as the *Sturm und Drang* but also exercised a profound influence upon German philosophical and political thought and upon the development of the nationalities of eastern Europe. He studied theology and philosophy at Konigsberg from 1762 to 1764, supporting himself by teaching at the Collegium Friedericianum in that city. Some small literary efforts! occasional poems and reviews. belong to those years. At the university he heard the lectures of Iminanuel Kant, from whom he acquired an enthusiasm for geography and anthropology and an interest in critical inquiry that never left him. He formed a close friendship with J. G. Hamann, the "Magus im Norden," who turned his attention to poetry and criticism and emphasized the value of emotion in the production and appreciation of literature. Hamann directed him to the primitive beginnings of literature in the Old Testament, since he considered poetry, religion and revelation to be one and the same thing. Any elements of system that Kant might have taught Herder were destroyed by the influence pf this incoherent but stimulating writer.

Late in 1764 Herder went to Riga as assistant master at thé cathedral school. He stayed in that city until 1769. where he became an important preacher and educator. His first major work, *Fragmente über die neuere deutsche Literatur,* published in 1767, placed him in a leading position in literary criticism. However, his restless imagination and unorthodox views: as well as personal *maladresse* and social dissatisfaction. caused him to decide to leave Riga. His idea was to travel in order to acquire the experience of the world which he had missed hitherto, and upon his return, as headmaster of the Livonian *Lyzeum* in Riga, to initiate important educational reforms. He sailed to Nantes, on the way reflecting upon the course of his life and outlining tremendous plans for the future in the fields of education, philosophy, literature and religion. It became clear to him that his mission in life was to study the whole history of mankind from its primitive beginnings onward and in all its manifestations, in order to show the direction which human society should take in the future. He visited Paris, and while there he received an offer to become travelling companion to the son of the prince-bishop of Lubeck. On the way back to Germany he was shipwrecked off the Dutch coast, but was saved. With his charge, Herder visited Darmstadt. where he met his future wife. Caroline Flachsland, and Strasbourg. where he became acquainted with Goethe. To Goethe he transmitted all his bold ideas on the origins of poetry and introduced him to the fnlk song. the poems of Ossian, Shakespeare, the *Edda* and the Old Testament, presenting them all as the unrepressed utterances of human creative genius and recommending that German literature base itself upon unspoiled native folk-song foundations *(see* GOETHE, JOHANN WOLFGANG VON). He thus initiated the revival in German literature called the *Sturm und Drang.* In 1771 he became court preacher to the count of Schaumburg-Lippe at Bückeburg, continuing to inspire the new literary movement and writing a number of polemical religious and philosophical works. He married in 1773 and in 1776 accepted an invitation! secured for him through Goethe's influence, to become general superintendent and court preacher at Weimar. Excessive sensitivity on his part, jealousy, a strong censorious tendency, ill health and financial difficulties all made his life at Weimar, where he stayed until his death. a story of dreary dissatisfaction. Yet he enjoyed the close friendship of Goethe in the years 1783–93 (although they were alienated from one another at the end), and the poet has testified to the virtual identity of their philosophical ideas; there is no doubt of the strong mutual influence. C. M. Wieland was also among his chief friends. He had a great attraction for men of the younger generation, many of whom visited him and imbibed his instruction; among these were Novalis (Friedrich von Hardenberg) and, more especially. Jean Paul (Johann Paul Friedrich Richter). His greatest works belong to the Weimar years—his *Volkslieder* (1778–79) and his *Ideen* (1784–91), which attempted to realize the dreams of his sea journey, and many others. He died on Dec. 11, 1803.

His Works.—Herder's main works were as follows: *Fragmente über die neuere dezitsche Literatur* (1767), *Kritische Wälder* (1769), which supplemented Lessing's *Literaturbriefe* and *Laokoon; Journal meiner Reise im Jahre 1769,* not published in his lifetime; *Über den Ursprung der Sprache* (1772), a prize essay; fragments on Ossian and Shakespeare in *Von dezctscher Art und Kunst* (1773), the manifesto of the *Sturm und Drang; Die Älteste Urkunde des Menschengeschlechts* (1774–76), a mystical study of Hebrew archaeology; *Auch eine Philosophie der Geschichte zur Bildung der Menschheit* (1774), an attack upon rationalism; *Plastik* (1778), *Von Erkennen und Empfinden der menschlichen Seele* (1778), on human psychology and aesthetic appreciation; *Volkslieder* (1778–79), translations of folk songs of many lands; *Vom Geiste der Ebraischen Poesie* (1782–83), an epoch-making study of the Old Testament as Hebrew national literature; *Ideen zur Philosophie der Geschichte der Menschheit* (1784–91), an un-

finished study of human origins and history; *Zerstreute Blatter* (1785–97), essays and poems teaching the moral conclusions arrived at in the *Ideen; Gott* (1787), stating the religious background of the *Ideen; Briefe zu Beforderung der Humanität* (1793–97), the projection of the conclusions of the *Ideen* into social and political life; *Christliche Schriften* (1794–98). interpreting the ideals of Christianity in accordance with his historical studies; *Metakritik zur Kritik der reinen Vernunft* (1799), *Kalligone* (1800), attempts to refute the Kantian philosophy; *Adrastea* (1801–04), a periodical containing his famous *Cid;* and many other poems, essays, lyric dramas, cantatas, addresses, sermons, fragments and translations from classical and modern languages.

The feature which all Herder's works have in common is the genetic or historical idea, which he originated and developed from many converging currents of thought in Germany and other countries. He applied his idea, with novel and far-reaching results, to all fields of thought. He began by studying the evolution of poetry and from that proceeded to concern himself with the whole process of the history of man and man's self-expression.

Herder believed that great poetry could not come into being without a poetic language, and he claimed, by a study of the phonetic and syntactical qualities of German, that that language, though prematurely aged by rationalism, possessed riches that were still untapped, in the speech of the popular song. those native sources unspoiled by foreign infiltration. He thought that the powerful literary development of the middle ages had been interrupted in Germany by the Renaissance and wars of religion and by the vast external influences that had made themselves felt, and that only by going back across the chasm of time could lost strength be regained. Just as Elizabethan literature in England was the logical outcome of the folk literature of earlier times; so he believed that adherence to the folk-song tradition would bring about a revival of German literature. It was his conviction that all poetry was originally folk song, the spontaneous expression of nature in poetic form. This led him to an awkward enthusiasm for the poems of Ossian; to regard the book of Genesis as the result of the combination of numerous primitive ballads; to anticipate F. A. Wolf's theory of the lyrical origins of Homer; to consider Shakespeare as having dramatized folk-song material; and to collect and publish folk songs from all the world, in order to encourage in his countrymen a larger interest in this basic and instinctive form of poetry. Thomas Percy's *Reliques* had a great influence upon him in this matter. In the folk song he found the direct expression of emotion, and this he regarded as the main factor in all literature. His collection included specimens from as far afield as Greenland and Peru. He desired to prove that poetry was a gift belonging to the whole human race, and in this way to destroy the current belief that the Greeks and Romans and French should hold a monopoly in literature. Literary nationalism followed as a matter of course; poetry, that universal possession, being held to change its character according to place, time, climate, national temperament, etc. He saw, in consequence, that poetry was a valuable source of information concerning the working of the human mind in all countries, and it thus became the indispensable handmaiden of his historical studies.

In a hundred fields Herder's evolutionary ideas caused him to reject the contemporary view that language either was directly communicated by God to man or mas a ready-made product of some early philosophical mind, and he argued instead that speech grew from elementary emotional articulations and was conditioned by the power of reflection which he considered to be a specifically human gift. He thus approached the modern standpoint, but did not agree that the primitive sounds common to man and the higher animals constitute speech. The development of language, therefore, reflects and conditions the development of human thought, and the study of language is a necessary approach to the study of human history or human psychology. Herder thus prepared the way for the science of comparative philology.

Language. literature, tnythology and religion all went hand in hand in Herder's view, and he regarded them as mutually illustrative. He looked back to their early beginnings. He did not agree with David Hume that religion grew from primitive man's fears; he considered that it was man's first attempt to explain the universal phenomena of creation and that it grew to be the primary educative and moral force in man's development. Herder's own religious belief placed the concept of a personal transcendental God within the outer framework of pantheism. Pantheism. as a creed by itself, he regarded as an error. "God is not the world," he said, "and the world is not God." But the world is the expression of God's greatness, which is at once in and above all things; it is always changing, growing and developing, since creation is inexhaustible, and an even balance presides over its operations. Man's highest duty, he felt. was to apprehend this and to follow out its teachings reverently in his own life. For man is himself part of nature and governed by its laws. He believed in the inherent goodness of man, not in original sin. "Idleness," he said, "is the original sin of mankind." In addition, he rejected sectarian dogmatism. Herder's appreciation of the Bible as literature has already been noticed. He brought to its study such sciences as history, philology and psychology, and laid the foundations of the modern study of comparative religion.

Herder's philosophy of history, contained in the *Ideen,* was dominated by these religious views. He explained human life by reference to its origins and its physical environment. This involved a study of geography, astronomy; zoology, botany, physics, etc. Herder was an evolutionist. after the manner of G. W. Leibniz, not of Charles Darwin, although he came near to the latter's view. He regarded man as a special creation and as the topmost rung in nature's scale of being. From the physical factors determining man's growth, he proceeded to human factors. such as speech, religion and nationality, and speculated, in a manner that profoundly affected Goethe, on the matter of the immortality of the soul, postulating the continuance of personality, provided the personality has already been developed in this life. His survey of world history, which included a classic section on the Greeks, only reached the late middle ages. Herder is rightly regarded as the fountainhead of German nationalism. But his view of national self-development was emphatically nonaggressive.

Herder's later works were concerned with his attempt to apply these views to the conduct of contemporary life. He looked forward to a rejuvenation of human culture, once the fullness .of human development. which his compendious ideal of *Humanität* implied, could be realized, the whole of man's emotional. intellectual and spiritual faculties co-operating harmoniously. Such was his answer to the question posed by the French Revolution. He himself was democratically inclined and believed in the nation-state (in so far as he can be said to have believed in the state at all), but the violence of the Revolution (which he at first welcomed) antagonized him, and he pinned his faith more and more to cultural and moral values rather than to political forces. Developing ideas of Benjamin Franklin, he wrote of a "league of humanity" in which all nations and epochs of history might find a place. He stressed the moral value of literature, attacked Kantianism for its threat to religion and its view that man is "radically evil," as well as for its analytic separation of the mental processes. He demanded a close connection between the beautiful and the good and believed that art should represent human life and effort in its completeness. In the last decade of his life he opposed the work of Goethe and Schiller because he believed they exalted form over moral content, and spent his last years vainly striving to produce literature in which the moral content should be in the forefront.

Herder's influence has been incalculable. His meeting with Goethe set German literature on new lines; the doctrines of spontaneity and naturalness, the Faustian idea of striving, the cult of genius, patriotism, the interest in the folk song, the substitution of emotion for reason: which mark the *Sturm und* Drang, derive in the main from him. Similarly, the teaching of the *Ideen* and his other mature works—his idea of Humanitat—affected Goethe's Classical doctrines. At the end of his life the Romantic writers, many of whom sought his society, were profoundly affected by his ideas. They absorbed his philosophy of history, his mediaevalism, his orientalism, his interest in language, his study of comparative literature, his vitalistic conception of nature, his stress upon the

instinctive, his view of poetry as a great educative agent, his cult of the folk song and his critical method. Holderlin, Jean Paul, Novalis. the brothers 4. W. and F. von Schlegel. Schelling, Hegel, F. D. E. Schleiermacher. W. and A. von Humboldt, among others, are all in his debt. Indeed the very concept of "romantic" as signifying "modern" in opposition to "classic" or "ancient" is Herderian in origin. A. W. von Schlegel's lectures, the folk-song collection called *Des Knaben Wunderhorn,* Grimm's *Märchen,* to mention only three works, follow upon lines which Herder indicated. His *Ideen* were translated into English in 1800 by T. O. Churchill and into French in 1827 by Edgar Quinet. Among his English admirers were William Taylor of Norwich. Henry Crabb Robinson and De Quincey; Coleridge disliked him, while in France not only Quinet but Benjamin Constant, Victor Cousin, Jules Michelet and Ernest Renan were eminent students of his works. He appealed to Mazzini. but his greatest effect was in eastern Europe, where his favourable account of the Slavs in the *Ideen* caused him to be regarded as the father of the Slav national Renaissance — Czechoslovak and Yugoslav nationalism, in particular; and he found a major disciple in modern times in Thomas Masaryk, whose political idealism had a great deal in common with Herder's *Humanitätsideal.* He has had influence also in Finland. Argentina: Scandinavia, Poland and Russia, in the literary and political thought of those countries.

BIBLIOGRAPHY.—Herder's *Sämmtliche Werke* were published by his widow, M. C. von Herder, in 45 vol. (Tubingen, 1805–20); late editions were superseded by the critical edition by B. Suphan, 33 vol. (Berlin, 1877–1913). Of many selections, mention may be made of those by T. Matthias, 5 vol. (Leipzig, 1903) and H. Lambel, H. Meyer and E. Kiihnemann in J. Kurschner, *Deutsche Nationalliteratur,* 10 vol. (Stuttgart, Berlin, 1885–94). Correspondence: H. Duntzer and F. G. von Herder (eds.), *Aus Herders Nachlass,* 3 vol. (Frankfurt-on-Main, Darmztadt, 1856–57), *Herders Reise nach Italien* (Giessen, Darmstadt, 1859) and *Von und an Herder: Ungedruckte Brieje,* 3 vol. (Leipzig, 1861–62); O. Hoffmann (ed.), *Herders Briefwechsel mit Nicolai* (Berlin, 1887) and *Briefe an Hamann* (Grafenbainichen. 1885); H. Schauer (ed.), *Herders Briefwechsel mit Caroline Flachsland,* 2 vol. *(Schrzften der Goethe-Gesellschaft,* vol. 39, 41) (Weimar, 1926–28), and *Herders Dresdener Reise* (Dresden, 1929); J. von Müller, ed. by K. E. Hoffmann, *Briefwechsel mit J. G. Herder und Caroline von Herder* (Schaffhausen, 1552). *See* also M. C. von Herder, ed. by J. G. Miiller, *Erinnerungen aus dem Leben Herders,* 2 vol. HÉRÉDIA, JOSÉ MARIA DE (1842–1905), French poet, the modern master of the French sonnet, was born at Fortuna Cafeyere. near Santiago de Cuba, being in blood part Spanish Creole and part French. At the age of eight he went from the West Indies to France, and received his classical education with the priests of St. Vincent at Senlis. After a visit to Havana he returned to study at the École des Chartes at Paris. In the later '60s, with F. Coppée, Sully-Prudhomme, P. Verlaine and others less distinguished, he made one of the band of poets who gathered round Leconte de Lisle, and received the name of Parnassians. To this new school, form — the technical side of their art — was of supreme importance, and, in reaction against the influence of Musset. they rigorously repressed in their work the expression of personal feeling and emotion. "True poetry," said Hérédia in his discourse on entering the academy, "dwells in nature and in humanity, which are eternal, and not in the heart of the creature of a day, however great." Hérédia's place in the movement was soon assured. He was the *élève bienaimé* of the master. He wrote very little, and published even less, but his sonnets circulated in manuscript, and gave him a reputation before they appeared in 1893, together with a few longer poems, as a volume, under the title of *Les Trophies.* He was elected to the academy on Feb. 22, 1894, in the place of L. de Mazade-Percin, the publicist. Few purely literary men can have entered the academy with credentials so small in quantity: a small volume of verse, a translation. with introduction, of Diaz del Castillo's *History of the Conquest of New Spain* (1878–81), a translation of the life of the nun Alferez (1894), De Quincey's *Spanish Military Nun* and one or two short pieces of occasional verse and an introduction or so. But the sonnets are of their kind among the most superb in modern literature. "A *Le'gende des siècles* in sonnets," F. Coppée called them. Each presents a picture, striking, brilliant, drawn with unfaltering hand, the picture of some characteristic scene in man's long history. Each line is flawless. Hérédia was one of the most skillful craftsmen who ever practised the art of verse. In 1901 he became librarian of the Bibliothèque de l'Arsénal at Paris. He died at the Château de Bourdonné (Seine-et-Oise) on Oct. 3, 1905, having completed his critical edition of A. Chénier's works;

HEREDIA Y CAMPUZANO, JOSÉ MARLA DE (1803–1839), Cuban poet, whose compositions are characterized by a pervading melancholy and a deep awareness of nature, was born in Santiago on Dec. 31, 1803. His father was a diplomat of liberal principles, in Venezuela (1812–17) and in Mexico (1819–21). The son studied law in Mexico and wrote his famous ode "En el Teocalli de Cholula" in 1820. After his father's death he returned to Cuba. completed his education and practised law. In 1823 he participated in a conspiracy to free Cuba and was exiled, taking refuge in the U.S. After visiting Niagara falls (June 1824), he wrote his celebrated ode "Al Niagara," included in his volume of poems published in New York city in 1825. At the invitation of Pres. Guadalupe Victoria, Heredia went to Mexico in 1825, where he married and, except for a short visit to Cuba, spent the rest of his life. A revised edition of his poems appeared in 1832. He died in Mexico City on May 7, 1839.

HEREDITAMENT, in law, every kind of property that can be inherited. Hereditaments are divided into corporeal and incorporeal; corporeal hereditaments are "such as affect the senses, and may be seen and handled by the body; incorporeal are not the subject of sensation, can neither be seen nor handled, are creatures of the mind, and exist only in contemplation" (Blackstone, *Commentaries).* An example of a corporeal hereditament is land held in freehold, of incorporeal hereditaments, tithes, advowsons, pensions, annuities, rents, franchises, etc. *(See* FREEHOLD.)

HEREDITARY PENSIONS: *see* PENSIONS: *Perpetual or Hereditary.*

HEREDITY may be defined as the study of all those aspects of living organisms which are specifically governed by certain determining elements derived from the parents but not from the

external environment. As a consequence of the activity of these determinants of hereditary characters, which are called *genes*, an individual plant, animal or microbe resembles its parents in a great many ways, characteristic of its race and species. Sometimes an individual is like its grandparents or other more remote relations in characters not evident in the parents: because genes may be present in an organism without necessarily having an effect on its appearance.

It is convenient to divide all factors controlling the appearance of organisms into two categories: (1) heredity and (2) environment. or, in the words of Francis Galton. "nature" and '.nurture." Resemblances between parents and offspring may be attributable to either of these two things, and usually the classification of a given factor as "hereditary" or "environmental" is unambiguous. Some confusion may arise in connection with certain infectious diseases, such as syphilis, where the causative agent is transmitted from one individual to another in conjunction with, but not inside, the reproductive cells of the host. In this example the infectious agent is clearly a foreign organism and would be classified as an "environmental" factor. Occasionally, however, it becomes difficult to distinguish between infection and heredity, as will be discussed below, under *Cytoplasmic Heredity* and *Heredity in Bacteria and Viruses*.

The decision as to whether a given trait can be ascribed to hereditary or environmental determinants can be made only after examination of the parents. offspring or other close relatives of the individual exhibiting the trait. For example. with poor nutrition, animals may attain an adult weight much below the average. but such an etiect is not hereditary; *i.e.,* it is not reproduced in the animal's descendants, provided adequate food is given to the latter. Many animals, however. exhibit dwarf races. and members of these, no matter how much food they are given. never reach the weight of the normal races. Dwarfs. and many other variations. may be produced by two entirely different factors. hy nature or by nurture, and only breeding experiments, conducted under standard environmental conditions, can establish with certainty the underlying cause of a given variation.

The interactions of environmental and hereditary determinants are often so complex that controversies about which is the more important may be meaningless. Every part of an organism is subject to the control of both kinds of factor. All animals require a favourable environment (*e.g.*, adequate air, food, water, warmth, etc.) for their development. Equally, all animals must start with a favourable array of genes. In certain instances it is possible to make up for some hereditary deficiency by adding a particular substance to the food (see *Heredity of Biochemical Characters* below); or in a more general way, an exceptionally favourable environment may permit the survival of weaker individuals which could not withstand severe competition. But the possibilities of alleviating hereditary defects in this way are limited by the mode of action of the genes concerned. Furthermore, certain traits seem to be controlled solely by hereditary factors; *e.g.,* the blood group antigens in man and other mammals. No amount of environmental treatment is at present known which will modify a person's blood group. On the other hand, certain less specific traits, such as weight. as mentioned above. are rather easily modified environmentally, and the same may be true of the more intangible mental and emotional qualities; but exact data on these matters are not available.

Having agreed that the final form of an organism is related to the environment in which the organism has lived from the start of growth and development (*i.e.*, from the moment of fertilization of the egg), it is necessary next to consider the extent to which the environment *of parents* affects the development of their offspring. In mammals the development of a foetus may be favoured or disturbed by the state of health of the mother and this may be modified by the environment. But maternal effects of this kind do not affect the hereditary constitution of the young: *i.e.,* are not transmitted to further generations. In rare instances (*e.g.,* the direction of coiling of snails) a given trait may be governed by materials which are fully formed in the cytoplasm of the unfertilized egg, but here again the maternal influence extends only to the immediate progeny. The genes are on the whole remarkably uninfluenced by environmental changes, though very drastic agents, such as X-rays (see *Mutation* below), do in fact change the genes specifically.

This statement is not to be taken as implying that the environment is without any influence on the hereditary constitution of a *population* of organisms. As is discussed in detail elsewhere (*see* GENETICS OF POPULATIONS; LAMARCKISM), populations change and evolution occurs through the operation of natural selection. Here it is sufficient to note that changes in genes do not as a rule result in the production of an organism more favourably adjusted to the particular environment under which the change occurred. As will be described below, mutations are essentially random events, and the concept of "inheritance of acquired characters" is not accepted by biologists concerned with the study of heredity, except by T. D. Lysenko and his followers in the U.S.S.R. (see *Societ Genetics* below).

Precise experiments on the inheritance of environmentally induced variations were first carried out by W. Johannsen (1857–1927), with negative results. He self-fertilized bean plants for several generations, and obtained a number of pure lines. The average weights of beans from different pure lines were sometimes different, and such differences were consistent from generation to generation; *i.e.,* they were hereditary. Within a given pure line; variation in bean weight also occurred, but this variation was not inherited. for the heaviest and the lightest classes of beans from the same pure line gave progeny not significantly differing from one another in the average weight of beans produced.

These considerations do not apply with the same force to characters of individual cells, whether the latter be independent organisms such as bacteria. yeasts, protozoa. etc., or constituent parts of a multicellular organism. Some cells can be rather easily modified by the environment. and the induced modifications may persist in daughter cells for prolonged periods of time. Examples will be given below (under *Heredity and Variation of Individual Cells).* However, such cellular modifications are not comparable with true gene changes or mutations and are thought to be concerned with cellular elements less permanent than the genes. In any case it is not true to state that genes are totally unaffected by any environmental stimuli and proceed along a course determined exclusively by themselves. On the contrary. certain agents, such as ionizing radiation. ultra-violet rays and certain chemical substances, are known to cause gene mutations, as will be described below (under *Mutation).* Moreover the activity of the genes is much influenced by the nature of the materials surrounding them in the cell. There is no support for the view that heredity is some mysterious force which cannot be modified or counteracted in any way by human agencies.

In considering heredity it is constantly necessary to bear in mind that the various parts of an organism are not received intact from the parents but developed out of comparatively simple structures present in the egg. There is no real analogy between heredity and the legal notion of inheritance of property. One speaks loosely of a given hereditary character being "transmitted" from parent to offspring. but obviously this is impossible since the only materials which can be thus transmitted are those contained in the uniting sex cells, the eggs and spermatozoa in higher animals. An individual receives from his parents not a set of fully formed characters but a set of determinants or genes. as a consequence of whose activities the hereditary characters are developed. This concept of hereditary determinants is fundamental for an understanding of the nature of heredity. We therefore begin with a few general remarks about the gene.

GENES, CHROMOSOMES AND LIFE CYCLES

According to the theory of genetics, the basis of heredity in all organisms is a unit named by Johannsen in 1909 the "gene." As knowledge has accumulated, the conception of the gene has undergone changes, and some biologists have even wanted to deny its existence altogether. But for the present it can be said that genes are discrete units, probably made up of an extremely complex chemical substance, desoxyriborenucleic acid. bound to a protein.

There is some evidence that the hereditary specificity resides in the nucleic acid part of this substance (denoted as DNA), but this is by no means certain.

Genes are arranged in a very precise way in the cells of an organism. They are arranged linearly in threadlike structures known as chromosomes, of which every organism has a characteristic set. When an egg is fertilized by a spermatozoon, a set of chromosomes from the mother is mixed together with a similar set from the father. In man the unfertilized egg and sperm nuclei each contain a set of 23 chromosomes, which is known as the haploid number. In the fertilized egg there are 46 chromosomes, consisting of 23 pairs in females and 22 pairs and two odd chromosomes in males. Forty-six is the diploid chromosome number in man, and as a result of a very precise duplication of the chromosomes at every cell division, by mitosis, sets of chromosomes are distributed to all the cells of the organism. Thus every part of the body is permeated with hereditary materials like those derived from the two parents. In higher organisms, the actively dividing cells contain diploid sets of chromosomes, while the unfertilized eggs and the sperm cells, or gametes, contain the haploid number. These haploid cells arise from diploid ones by a complex process known as meiosis. It should be mentioned that the chromosomes of paternal and maternal origin are distributed at random in the gametes; *i.e.*, all the "paternal" chromosomes are not found in one gamete. and all the "maternal" chromosomes in another, except by chance. Fusion of the male and female gametes restores the diploid number of chromosomes. In general the cell in which this occurs is called a zygote. (See CYTOLOGY; SEX.)

The life of every organism showing sexual reproduction is differentiated into two phases, the haploid and diploid phases. In higher animals the haploid phase is very brief, consisting only of the gametes themselves. In flowering plants also there are very few haploid cells—just a few nuclei in the pollen tubes and embryo sac. But among lower organisms the situation is quite different. In mosses, haploid and diploid phases are roughly of equal duration. while in some fungi (*e.g.*, the mould *Neurospora*, with which much work on heredity has been done) there is only a single diploid nucleus, namely the zygote itself, all other nuclei being haploid. These variations in life cycles have important consequences which affect the behaviour of hereditary characters in the different groups of organisms.

The fact that the genes are located on the chromosomes. and the precise behaviour of the latter, aids the regular distribution of the genes to the various cells of an organism, and through the gametes to the zygote and the cells of the next generation of organisms. However this is not a passive transport of inert material, but essentially involves the synthesis of new genes at every cell division. In fact the genes are duplicated with extraordinary exactness for enormous numbers of cell cycles. Very rarely indeed there may be a mutation or change of a gene from one form, or allele, to another; and this is recognized by the sudden appearance of a new hereditary character in some part of the organism or in its progeny. The new, mutant gene then continues to be replicated in the same regular manner as the one from which it arose by mutation.

Genes are hypothetical entities in the sense that they cannot be individually seen under the microscope. But their existence is inferred from a series of rigorous experiments, starting with those first performed by G. Mendel (1822–84). Just as in physiology we study the effects of varying environmental factors on the course of development of an organism, so in the study of heredity, or genetics, we study the effects of varying the internal factors, the genes. Experiments of this kind inevitably involve exploitation of the sexual processes, since only with their aid is it possible to effect the desired replacements and recombinations of genes.

MENDEL'S LAWS OF HEREDITY

Mendel studied inheritance in garden peas (*Pisum sativum*) which were cultivated in the monastery garden at Briinn (Brno). Moravia (see also MENDEL, GREGOR JOHANN). His most important results were published in 1866 and 1869 but received practically no notice from the biologists of the time; it was not till 1900, after Mendel's death, that the value of his work was recognized. In that year H. de Vries. C. Correns and E. von Tschermak simultaneously rediscovered and confirmed Mendel's results. Thereafter a great many workers. notably W. Bateson (*q.v.*; 1861–1926), performed similar experiments on many different kinds of animals and plants, and it soon became clear that Mendel's conclusions were valid for the most diverse organisms, from protozoa to man. A few examples from different groups are considered here.

Inheritance in Diploids, Without Dominance.— If a yellow guinea pig is mated with a pink-eyed white, the offspring are cream. Both yellows and whites breed true. but if two creams are mated together, the offspring are yellow, cream or white. and the proportions of the three classes are approximately in the ratio 1:21 Further, if creams are mated to yellows, equal numbers of creams and yellows are obtained; if creams are mated to whites, equal numbers of cream and white. If the genes in animals possessing ability to form the yellow pigment are represented as YY, and animals lacking this ability as yy, and the genes in their gametes as Y and y, respectively, then the product of their fusion —*Yy*—is a cream, producing *Y* and y gametes in equal numbers. In Table I are shown the results of the nine possible matings. Of

TABLE I.—*Inheritance of Coat Colours in Guinea Pigs*
(*YY*=yellow; *Yy*=cream; *yy*=white)

			Mother			
	Colour	Gametes	Yellow *Y*	Cream ½*Y* ½*y*	White *y*	Colour Gametes
Father	*White*	*y*	*Yy*	½*Yy* ½*yy*	*yy*	
	Cream	½*y* ½*Y*	½*YY* ½*Yy*	¼*YY* ¼*Yy* ¼*yy*	½*Yy* ½*yy*	
	Yellow	*Y*	*YY*	½*YY* ½*Yy*	*Yy*	
			Offspring			

course the theoretically expected ratios are not generally obtained unless large numbers of animals are counted. any more than the numbers of red and black cards in a hand taken at random from a pack are in general equal. It is to be noted that the results of all these matings are the same whichever type of animal is used as male and which as female parent.

A zygote (and the animal or plant into which it develops) possessing two identical genes (*e.g.*, YY or yy in the above example) is called a *homozygote;* one possessing two unlike genes—Yy—is a heterozygote The generation produced by crossing two individuals is denoted by F_1, their offspring when self-fertilized or mated among themselves by F_2.

Dominance.— Usually the course of events is slightly obscured by the phenomenon of dominance. If pure-breeding black and blue rabbits are mated, the young are all black, but if these hybrid blacks are mated to blues they give equal numbers of blacks and blues, and if mated among themselves the hybrid blacks give blacks and blues in the ratio 3:1. If the pure-bred blacks are denoted **II**, the blues ii (I symbolizes a gene intensifying blue to black. *i* its absence) the hybrid (F_1) blacks are *Ii*, giving equal numbers of I and i gametes. The situation is essentially the same as in the previous example of the guinea pigs, except that the rabbit heterozygote **Ii** is not intermediate in appearance between the two homozygotes *II* and *ii*, but is indistinguishable from **II**. Black is said to be dominant to blue; blue is *recessive* to black.

Examples of this type show how it is possible for a given animal or plant to contain a particular gene without exhibiting any outward sign of its presence. Proof that recessive genes are present in heterozygotes can be obtained only by examination of the progeny or by knowledge of the parents.

Inheritance in Haploids.——In the haploid cells of higher organisms, and in the entire vegetative tissue of a fungus such as *Neurospora*, each nucleus contains only a single gene of each kind. Thus in maize the pollen grains normally contain a carbohydrate (starch) which stains blue with iodine, but there is a strain known as "waxy," bearing pollen which contains another carbohydrate,

staining red with iodine. If waxy plants are crossed with normal. a heterozygous plant (denoted *Wx/wx*) is obtained, but the pollen produced by such a heterozygote gives exactly half waxy (wx) and half normal (Wx) grains. A similar pollen character is known in rice. Similarly. in *Neurospora crassa* there are two mating types denoted "plus" and "minus." Successful fusion of gametes occurs only between strains of opposite mating type. In *Neurospora* there is only a single diploid cell. the zygote itself. The latter produces haploid cells (the ascospores), of which exactly half are plus and half minus mating types. Similar results are obtained with many other characters in *Neurospora; e.g.,* those concerned with the colour of the mycelium, with the biochemical capabilities and so on.

These examples illustrate the first "law" of Mendel. which states that there are factors (now called genes) which affect development; that these factors retain their individuality from generation to generation and do not become contaminated when they are mixed in a hybrid: and further, that the factors become sorted out from one another when the gametes are formed.

Lethal Genes.—Sometimes the expected Mendelian ratios are not seen to appear because certain types have a much lower viability than others. In fowls there is a breed known as "Creepers," with shortened wings and legs. When Creepers are crossed to normal, the result is an equal proportion of Creepers and normals; when Creepers are crossed together, Creepers and normals are found in the offspring in the ratio 2:1. More careful examination of the results of the last cross shows that there is a third class of progeny which die in the shell at about the fourth day of incubation. Creepers are in fact heterozygotes (*Cc*), and on intercrossing them we really obtain normals (*cc*), heterozygous Creepers (Cc) and the lethal homozygous type (*CC*) in a ratio 1:2:1.

Completely recessive lethal genes are also found very commonly. For example. in maize the most frequent of all genic variations results in a failure to develop chlorophyll. and such plants die because they cannot achieve photosynthesis. Again, in some breeds of cattle. a proportion of the animals are heterozygous for a lethal gene, and when two such animals happen to be mated together, one quarter of the progeny die at an early age. (If death occurs very early, in the uterus. it may not be noticed.) The only way to eliminate these recessive lethal genes from a population is by determining which animals are heterozygotes and which homozygotes by preliminary matinps and examination of the progeny. The proved homozygotes should then be used for further breeding even though the heterozygotes may appear to be more desirable in their appearance. However, such a procedure is slow and expensive with cattle.

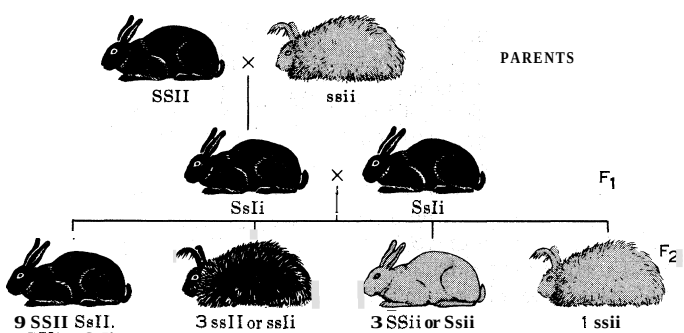

FIG. I.—INHERITANCE OF HAIR LENGTH AND COLOUR IN RABBITS

Inheritance **of** Several Genes.—Mendel also studied the inheritance of two pairs of differentiating characters simultaneously. Another example may be taken from rabbits. Shortness of hair is dominant over length, and due to a gene which may be called S. If a homozygous short-haired black (SSII) is mated with a long-haired (so-called "Angora") blue. having the genes ssii (see Fig. 1), the offspring (F_1's) are double heterozygotes (SsIi) and in appearance short-haired blacks. Half their gametes carry I and half i, and the same is true for S and *s*. The significant finding here is that the four possible classes of gametes *SI, sI,* Si and *si* are formed in equal numbers, and it can be easily shown that random fusion of two lots of such gametes (one from the male F_1 and one from the female F,) will produce in the F_2 generation four classes of rabbit; namely short-haired blacks (SSII, *SsII, SSIi,* SsIi). long-haired blacks (*ssII, ssIi*), short-haired blues (*SSii,* Ssii) and long-haired blues (iiss), in a ratio of 9:3:3:1. Thus in the F_2 not only the two "parental" types of rabbit are obtained, but also two new "recombination" types in which characters from two different individuals have been combined in a single individual. The genetical behaviour of double heterozygotes is precisely the same whether they .are made by the mating *SSII* × *ssii* as above, or from *ssII* × SSii (long-haired black × short-haired blue).

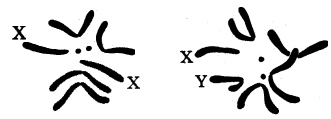

FIG. 2.—CHROMOSOMES IN THE SOMATIC CELLS OF DROSOPHILA MELANOGASTER

Experiments of this kind illustrate the second "law" of Mendel, which states that each pair of factors (genes) behaves independently of every other pair. Further work, to be described below, will show the limitations of this lam of independent assortment. That there are such limitations was shown as early as 1906 by Bateson and R. C. Punnett working with sweet peas (*Lathyrus odoratus*). Crossing together two varieties, the one bearing purple flowers and long pollen. the other red flowers and round pollen, they obtained an F_1 and in the F_2 derived from the latter the following numbers of plants: purple flowers and long pollen, 1,528; purple flowers and round pollen, 106; red flowers and long pollen, 117; red flowers and round pollen, 381. Clearly these figures do not conform with a 9:3:3:1 ratio. There is a surplus of the parental classes and a deficit of the recombination classes of F_2 offspring. The reason for these discrepancies will be made clear below, under Linkage and Crossing Over.

Alleles **and** Multiple Alleles.—Bateson introduced the word "allelomorphic" to describe the characters which segregate from each other in the progeny of hybrids; *e.g.,* the black and blue alternative colours of rabbits are allelomorphic characters. Subsequently the word was applied to the genes rather than to the characters determined by the genes, and is often abbreviated to the form "allelic." Genes which are alternative, in the sense that only one of a given kind can be present in a single gamete (or other haploid cell), are called alleles. As will become clear after presentation of the chromosome theory (see below), in a haploid cell there is only a single chromosomal site—called the locus—at which allelic genes can be placed. In diploid cells, however, there are two such sites, one in each member of a pair of homologous chromosomes. Both members of a pair of alleles may be present in the same cell, as in heterozygotes, or, alternatively, each cell may contain two identical alleles, as in homozygotes. Alleles are usually denoted with the same letter of the alphabet.

Although the cells of an individual diploid organism can contain at the most two different allelic genes, there map be many more than two alleles in a population of many individuals. For example, in rabbits there is a series of four coat-colour variations: full-coloured. chinchilla (silver gray), Himalayan (coloured extremities) and white. The rules of inheritance here are as follows: F_1 hybrids between any two of these types yield F_2 offspring consisting of the same two types (and sometimes intermediates) but no other types. For example, if chinchilla is mated with white there is obtained in the F_2 chinchilla and white but not full-coloured or Himalayan. Here there is a series of four so-called multiple alleles—C, c^{ch}, c^{H}, c—in order of dominance and decreasing pigmentation.

Sometimes the number of allelic forms of a given gene is very large. In a number of plants there is a system of S alleles controlling .self-incompatibility; *e.g.,* in *Nicotiana, Antirrhinum,* some clovers, sweet cherries, etc. Pollen containing, say, the alleles S_1 or S_2 cannot fertilize the ovules borne on a plant having the constitution S_1S_2, but pollen containing the alleles S,, S_3 or any one of possibly 100 other alleles is completely successful. This explains why a cherry orchard containing trees of only a single variety may fail to set any fruit, but will do so abundantly when

a few trees of another variety are mixed in.

The concept of allelism is complex, as will be discussed below (see Position *Effects* and *Pseudoalleles*).

CHROMOSOME THEORY OF HEREDITY

Although cytologists such as E. Strasburger (1844–1912), O. Hertwig (q *v.;* 1849–1922) and others, as well as A. Weismann (*q.v.;* 1834–1914), having observed the very precise behaviour of the chromosomes at mitosis. meiosis, fertilization, etc., believed that the chromosomes were the seat of hereditary factors as early as the 1880s. definite proof of the chromosome theory of heredity could be established only after the rediscovery of Mendel's work in 1900. Thereafter cytologists and geneticists showed. in ever-increasing detail, the exact conformance between the behaviour of the chromosomes seen under the microscope, and the hypothetical genes. whose existence had only been inferred from breeding experiments of the Mendelian type.

The first character shown to be clearly correlated with the presence of a particular chromosome was sex (*q.v.;* see also CYTOLOGY). In higher animals the commonest arrangement is that in which females have two sets of autosomes (chromosomes not specifically concerned with sex) and two identical sex chromosomes (XX). while the males have the same two sets of autosomes but an odd pair of sex chromosomes (XY). In a few groups, such as the birds and Lepidoptera. the situation is reversed, males having two identical X chromosomes and females an X and a Y. In some organisms. notably the fruit fly *Drosophila* melanogaster, the X and Y chromosomes can be seen to be distinct from each other and the autosomes (see fig. 2). Elsewhere, where the X and Y chromosomes look alike, their existence may be inferred from a number of genetic phenomena, of which sex linkage (see below) is the most important. The correspondence between the sex chromosomes and the outward manifestations of the sexual characters is especially clear in gynandromorphs, animals which have half male and half female tissues. Such abnormalities are known in *Drosophila,* one side being male and the other female. On the female side the cells contain the usual two X chromosomes, while on the male side there is only a single X, the other one having been lost at an early stage in development.

Sex Linkage. — Many traits are known to be determined by genes situated on the X chromosome. Such are called sex-linked traits, but this does not mean that they are necessarily limited to one sex, as will be shown. In cats, yellow colour (as distinct from the normal black) is due to a sex-linked gene which may be called b. Dominance is incomplete, and the following are the three possible types: black (BB). tortoise-shell (Bb) and yellow (bb). Among males, however, tortoise-shells are not found, since males have only a single X chromosome and the Y chromosome is practically devoid of genes. In Table II the six possible matings and the progeny obtained are set out. The difference between reciprocal matings of black and yellow is striking. Basically the same situation is found when dominance is complete, as in human colour-blindness or haemophilia, which are due to sex-linked recessive

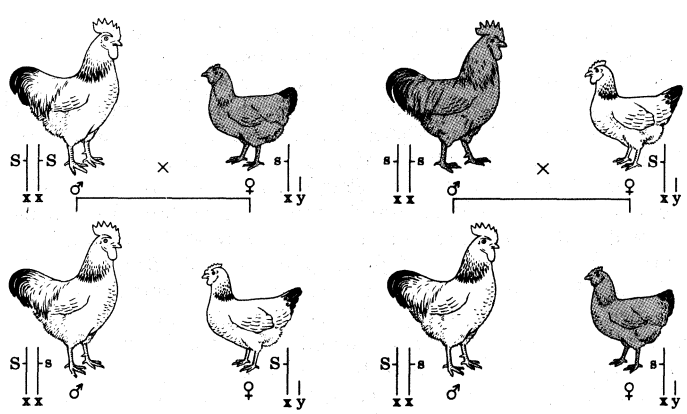

FIG. 3. — SEX LINKAGE IN POULTRY

genes. In interpreting cases of sex linkage generally two facts should be remembered: (1) in most groups of animals, males derive their X chromosome from their mother, their Y chromosome from their father, while females derive one X chromosome from each parent; and (2) sex-linked genes are borne on the X chromosome. The Y chromosome bears very few genes.

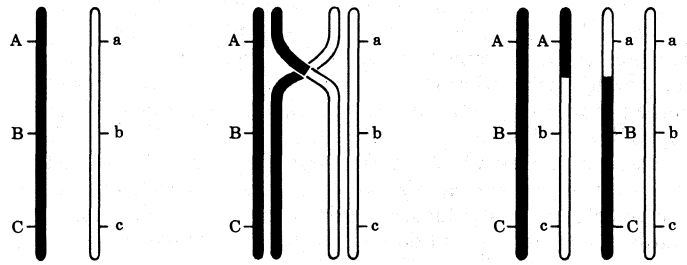

FIG. 4. — DIAGRAM OF CROSSING OVER. SHOWING FORMATION OF TWO CROSS-OVER AND TWO NONCROSSOVER CHROMOSOMES

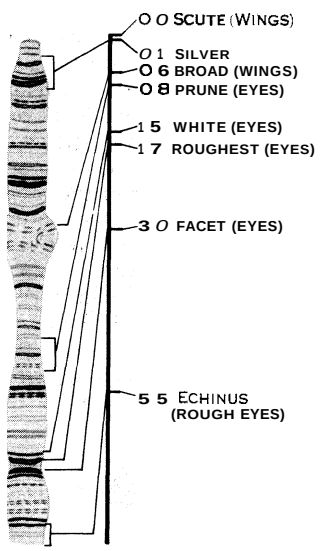
The following example shows the inheritance of a sex-linked trait in birds, which are exceptional. Here it is the female which is XY and the male XX. The Light Sussex breed of fowls carries a dominant gene (*S*) inhibiting pigment. Rhode Island Reds carry the recessive allele s. The results of reciprocally crossing birds of these two breeds are shown in fig. 3. It should be rioted that matings of Light Sussex hens with Rhode Island cocks yield red pullets and white cockerels, and this has been made use of in the determination of sex in very young chicks.

Linkage and Crossing **Over.** —In 1909 T. H. Morgan (*q.v.;* 1866–1945) put forward his hypothesis of crossing over (suggested by F. A. Janssens' interpretation of the crosslike structures known as chiasmata which hold the pairing chromosomes together at meiosis). Morgan proposed that if t o genes A and B are located at different points of the same chromosome, they would usually be linked together in one chromosome in the cells of the descendants, but sometimes, through breakage and rejoining of the chromosome threads, the two genes could be separated, so that *A* would be borne on one chromosome and B on another. Thus, if an organism were heterozygous for two linked genes (*AB/ab*), most of the gametes would be AB or ab, but a proportion would be "crossover" types Ab or *aB,* and these if used in the production of the offspring would be recognized by the new combinations of characters produced.



FROM C. B. BRIDGES "JOURNAL OF HEREDITY," VOL. 26 (1935) BY COURTESY OF THE AMERICAN GENETIC ASSOCIATION

FIG. 5 — SECTION OF A CHROMOSOME MAP OF DROSOPHILA MELANOGASTER.

The location of eight genes, as determined by crossing over, is shown, with corresponding sections of a salivary gland chromosome

Such a mechanism accounts for the figures given earlier in the sweet pea experiments of Bateson and Punnett.

Morgan also proposed that the farther apart two linked genes were, the more likely would they be to cross over, and thus the distance apart of two genes on the same chromosome could be estimated, in a relative manner, by the frequency of crossing over between them. (Crossover values are expressed numerically as the proportion of crossover gametes to the total.) Furthermore, considering three linked genes, crossing over between the two most extreme ones would be approximately the sum of the crossing over between each of the other two. All these possibilities have been verified. For example, C. B. Bridges (*q.v.;* 1889–1938) studied

the simultaneous inheritance of the following three genes in the fruit fly *Drosophila melanogaster:* ruby eye (*rb*), cut wing (*ct*)

TABLE 11.—*Inheritance of Yellow Colour, Due to a Sex-Linked Gene* (b), *in the Cat*

It will be noticed that the figure of 29.4 is slightly less than the sum of 16.7 + 14.5 = 31.2. This discrepancy is ascribable to the occasional double crossovers (*i.e.,* simultaneous crossing over in the two regions), leading to a restitution of the original combination of genes at the extreme ends.

A vast amount of work has been done on *linkage* (as the association of genes on the same chromosome is called) in *Drosophila* by Morgan, Bridges. A. H. Sturtevant. H. J. Muller and others. There are three large linkage groups (one of them sex-linked) and a fourth very small linkage group. These four groups correspond to the four pairs of chromosomes known in *Drosophila melanogaster (see* fig. 2). The details of crossing over are complex, and the mechanism is not fully understood. The phenomenon is most satisfactorily studied in those organisms in which all four nuclear products of meiosis in a given diploid cell can be recovered and studied in the progeny, by a procedure known as tetrad analysis. This is easily done with certain micro-organisms such as the mould *Neurospora,* the alga *Chlamydomonas,* yeasts and also with some bryophytes. By tetrad analysis. it is shown that crossing over at a given point on the chromosomes involves only two out of the four strands present in the paired chromosome "bivalents" *(see* CYTOLOGY), for of the four cells in a tetrad, two contain crossover and two noncrossover chromosomes *(see* fig. 4).

Detailed chromosome maps have been constructed for a number of organisms, the most elaborate being those of *Drosophila melanogaster.* Here the presence of the giant chromosomes in the salivary glands has enabled cytogeneticists to establish the positions of the genes with great precision. In maize also much chromosome mapping has been done. In this plant there are ten linkage groups and ten pairs of chromosomes. In both maize and *Drosophila* this work has been much aided by the fact that chromosomes can be broken and variously rearranged by treatment with X-rays (see *Mutation* below). A small sample of one of the chromosome maps of *Drosophila* is shown in fig. 5.

In man, very few linked genes are known, apart from the sex-linked group. Where the number of chromosomes is large, linkage studies are very laborious, and in man they are particularly so because of the impossibility of deliberately breeding together individuals containing certain rare genes suspected of being linked.

The conformance between the linkage groups inferred from breeding experiments and the chromosomes observed directly under the microscope is good evidence for the chromosome theory of heredity. More exact proofs of the latter are furnished by certain structural modifications of the chromosomes and the consequential altered behaviour of the genes located on them. Among these modifications are deficiencies, inversions, duplications and translocations of chromosome segments, all of which occur in nature. Their frequency becomes much higher, however. when plants or animals are exposed to ionizing radiation (see *Mutation*).

Polyploidy.—Many cultivated plants contain multiple sets of chromosomes. Plants containing in their somatic cells three times the haploid number of chromosomes are called triploids. those with four times. tetraploids, and so on. Among wheats are found. for example *Triticum monococcum,* diploid with 14 chromosomes; *T. durum* (macaroni wheat), tetraploid with 28 chromosomes; and *T vulgare* (bread wheat), hexaploid with 42 chromosomes. Other polyploid plants are to be found among varieties of oats. apples, pears, plums, cherries, strawberries, raspberries. roses, dahlias, etc. Moreover, among wild plants the different species of a genus often contain series of chromosomes which are all simple multiples of a basic number Evidently polyploidy has played a role in the evolution of such species. In animals the condition is much less common in nature. and when artifically induced may lead to serious disturbances. Among amphibia (*e g.,* some newts) triploids occur occasionally in nature and may be produced artificially by exposing the eggs to unusually low or high temperatures. Triploid and tetraploid newts are sometimes able to complete metamorphosis, but they are all sterile. In some parthenogenetic animals (*i.e.,* those able to bring forth young without fertilization of the ova), polyploidy is known to occur in nature; *e.g.,* among certain weevils, earthworms, etc.

In both animals and plants, cells which have ceased division (especially differentiated cells) may contain highly polyploid numbers of chromosomes. In plants, a certain part of the seed known as the endosperm consists entirely of triploid cells, formed by the fusion of two haploid nuclei from the embryo sac and one haploid nucleus from the pollen tube. These quantitative variations do not in any way contradict the concept of a regular distribution of chromosomes to cells in all parts of the body, a concept which led the early cytologists to foresee the chromosome theory of heredity. Regularly dividing somatic tissues, and especially those of the germ line, show a remarkable constancy in number of chromosomes per cell, characteristic for the species.

Polyploidy in plants has two effects: (1) it may result in an increase in size; and (2) a certain degree of sterility usually follows. The increase in size is by no means universal, though polyploid cells are usually larger than diploid ones. As for the sterility, this could be an advantage or a disadvantage. according to the nature of the crop and the method of propagation. Edible fruits may be better without seeds; *e.g.,* the banana. of which the common varieties are triploid. Again, among ornamental plants, failure to set seed may lead to a prolongation of flowering. On the other hand, with grain crops it is obvious that no reduction in seed setting could be tolerated.

Two kinds of polyploids are distinguished, allopolyploids and autopolyploids. *Primula kewensis* is an example of the former. If P. *floribunda* and *P. verticillata* (both having nine pairs of chromosomes) are crossed, the hybrids (also containing 18 chromosomes) are completely sterile. Such plants have occasionally produced a tetraploid branch (with 36 chromosomes per cell). The latter is self-fertile and the seeds from it gave the new species P. *kewensis.* In this the nine pairs of chromosomes from each parent are able to pair with each other, so that the gametes receive one haploid set of chromosomes from each parent species, and the hybrids breed true. Some other species are thought to have arisen as allopolyploids; *e.g., Galiopsis tetrahit* (from *G. pubescens* × *G. speciosn), Spartina townsendii* (from *S. stricta* × *S. alternifolia)* and some of the cultivated wheats. In autotetraploids there are four similar representatives of each chromosome per cell, and these at meiosis form complex structures which may lead to the development of unbalanced sets of chromosomes in the gametes. Polyploids may be produced artificially by a number of treatments, such as by wounding. by heat shocks or by application of certain chemicals. For example, if tomato plants are cut down, about 2% of the regenerating shoots are tetraploid. Branches of (diploid) apple trees. bearing young flower buds, if subjected to a heat shock of 45° C. for one to two hours, produce a small proportion of unreduced (*i.e.,* diploid) pollen grains. which can be used for fertilization and the production of triploids. Of the chemicals used. the most effective is colchicine, a potent drug extracted from the plant *Colchicum autumnale* and having a destructive action on the mitotic spindles *(see* CYTOLOGY; PLANT BREEDING). With the aid of col-

chicine, tetraploid races of certain cultivated plants, such as clover, have been developed, notably in Sweden. Such races on first development are often sterile. but it is possible to eliminate this disadvantage by prolonged programs of selection and breeding. .

Mendelian heredity is complicated in polyploids by the existence of multiple sets of genes at each locus and by the occurrence of complex chromosomal configurations at meiosis. Simple genic segregation is therefore not usually found.

HEREDITY OF QUANTITATIVE CHARACTERS

Mendel's laws and the chromosome theory of heredity were developed from experiments on easily distinguishahle characters. For example. in Mendel's own experiments there was never any difficulty in assigning a given plant to one of the two classes—tall or dwarf—for the differences were so striking that variations in height resulting from environment did not obscure the segregation. However. much hereditary variation is not of this kind. For example, the height of men varies from about 60 in. to about 78 in., with a mean of about 68 in. (these figures vary. of course, for different nations). No Mendelian segregation appears to occur for such quantitative variation. Commonly it is found that hybrids between two individuals differing markedly in such a character are intermediate between the two parents. and in the F_2 a range of types is obtained, extending continuously between those of the two parents and sometimes beyond them.

Francis Galton (*q.v.*, 1822–1911), who was the first to study this matter statistically, formulated the regression law. according to which parents which deviate from the average type of the "race" in a negative or positive direction beget progeny which on the average deviate in the same direction, but to a lesser extent; the children's type shows regression to the personal type of the parents. At first it was thought that quantitative characters did not obey the Mendelian rules. and a violent controversy arose in England in the early years of the 20th century between two schools known as the biometricians. led by K. Pearson (*q.v.;* 1857–1936), and the Mendelians. led by Bateson. The issue nas confused by the failure of those concerned to distinguish between the hereditary characters of an organism and the underlying determining factors, or genes. Johannsen (as a result of his experiments with beans, already referred to) clarified the situation by formulating the concepts of genotype and phenotype. The latter was defined as the appearance of the adult animal or plant—a measurable reality—resulting from the action both of genetic elements inside the organism and of the environment. The genotype—somewhat more hypothetical—referred to the constitution of the two gametes which unite to form the zygote and the new individual; the genotype is the total of all the genes in an organism.

The conflict between the biometricians and the Mendelians was resolved when it was realized that quantitative characters were governed by Mendelian factors, but that there were many such factors. each individually having only a small effect on the phenotype, all together acting cumulatively. Such views were put forward by H. Nilsson-Ehle (1908) and E. M. East (1910), and later developed mathematically by R. A. Fisher (1918). Consider two plants differing in respect of three pairs of alleles, *A-a,* B-b, C-c, concerned with a metric character such as height. Imagine that each of the three genes written with capital letters makes a small contribution to the height. Thus tall plants (AABBCC) mould contain six effective genes, and small plants (aabbcc) none. The F_1 derived by crossing these two plants (*AaBbCc*) would contain three height-producing genes and would be intermediate between the two parents, assuming no dominance. In the F_2, as many as 27 genotypes are possible, and this would result in the production of a large assortment of plants of different height, ranging between the two parents. If small environmental changes also occur, then a practically continuous range of gradations would be easily understood. If one of the parents had been *aabbCC* and the other *AABBcc,* one could get in the F_2 the two types AABBCC and aabbcc, which would both be more extreme than either parent.

Such a hypothesis of multiple factors, sometimes called polymeric factors or polygenes, satisfactorily accounts for the facts of quantitative inheritance and is consistent with Mendelian theory. but direct proof is difficult to obtain. One piece of supporting evidence is the fact that when two inbred lines (*e.g.,* of maize) are crossed together and F, and F_2 generations produced, the variance in F_2 is usually greater than in F_1. Again, in *Drosophila* it is possible to assess the effects of genes on given chromosomes on a particular metric character. Difficulties arise, however, when one has to consider nonadditive "interactions" of the effects of different alleles at one locus or of genes at different loci. That such interactions must occur is evident from the widespread occurrence of heterosis (or hybrid vigour), a phenomenon having very great economic value in the maize-growing industry (see PLANT BREEDING).

In maize. and also in many other plants and animals. hybrids between individuals of two different inbred lines are often strikingly more vigorous than either parent. This may be due to two causes: (1) heterozygotes for genes at certain loci are more vigorous than either homozygote; *i.e.,* there is an "overdominance" of the heterozygote; and (2) there may be a complementary interaction between dominant genes at different loci.

Another feature of hybrids, which may be allied to heterosis, is their greater stability, under varying environments. as compared with the inbred parents. This is of some importance when using laboratory animals such as mice for assaying drugs, nutritional factors, e t ~ .In testing a given drug, it is desirable that the reaction of the animal be as consistent as possible. If unselected mice obtained from a dealer are used, different mice differ in their genotypes, and may respond differently to the drug. If a single strain of mice is inbred, genotypic variation is reduced, but the reactions of such animals to slightly varying environments may be erratic. If two different inbred lines are hybridized, the result should be mice which are the most uniform of all.

MUTATION

Genes are ordinarily said to be very "stable"; *i.e.,* they are reproduced with great constancy for very long periods. Very rarely, sudden mutations occur, and the new or *mutant* allele is then reproduced in the same regular manner as the original; reverse mutations from a mutant to a wild-type allele also occur. In diploid organisms mutations involve only one of the two genes present in each cell at homologous loci, thus showing that the cause of the mutation process must be localized in very small volumes, possibly limited to the gene itself.

Gene mutations can be recognized only by the appearance of an organism of altered phenotype—a mutant—and this may not be seen till long after the actual genic event. The length of this time lag in manifestation of mutations varies according to the class of mutant gene produced, whether dominant or recessive. autosomal or sex-linked. Mutations to alleles which are partially or fully dominant to the original allele are manifest in the progeny of the individual in whose germ cells the mutation occurred. Several human pedigrees are on record in which a dominant abnormality, such as brachydactyly or neurofibromatosis, arose by mutation. Mutations of sex-linked genes (*i.e.,* those in the X chromosome) to recessive alleles appear according to the following rules (assuming the male to be XY and the female XX, as in man). If the mutation occurs in a female, some of the sons but none of the daughters will show a mutant phenotype. If the mutation occurs in .the germ cells of a male, none of the immediate progeny will appear mutant, but some of the daughters will be heterozygotes and consequently half their sons will be mutants. Finally when a mutation to an autosomal recessive allele occurs, no phenotypic effect need be shown for many generations, in the absence of inbreeding. All the mutant alleles will be present at first in heterozygotes, and if the mutant is rare in the population, the chance occurrence of mating between two heterozygous individuals is unlikely. Inbreeding, as in the marriage of cousins or other close relatives, would, of course, result in a much more rapid manifestation of autosomal recessive mutations. In haploid organisms, such as fungi, algae, some protozoa and bacteria, and in the haploid phase of flowering plants, the long lag periods described above do not occur.

The frequency with which mutations occur in nature is very

difficult to estimate, because of their extreme rarity. It is clear, however, from the work of H. J. Muller and N. W. Timofeev-Ressovsky, that mutations having different effects occur with different frequencies. In Drosophila the rarest mutations are those having an obvious visible effect. "Lethal" mutations, which kill the animal at an early stage, are about eight times as common as "visibles." "Viability" mutations, which slightly lower the viahility, are much commoner even than "lethals."

As for the actual rates, it has been estimated that in the gametes of Drosophila melanogaster one X chromosome in 600 contains a spontaneous lethal mutation somewhere along the chromosome. In *Drosophila* and maize, mutant alleles of individual genes have been found to arise about once in 100,000 or once in 1,000,000 gametes. In man, mutation rates of about 1/100,000 per gene per generation have been estimated; *e.g.*, for haemophilia (a sex-linked recessive), for retinoblastoma (an autosomal dominant) and for albinism (an autosomal recessive). However, these calculations, especially those for man, involve a number of uncertain assumptions. It is known. moreover, that mutation rates vary considerably under different conditions. Increasing temperature has been found to raise the mutation rate in Drosophila. It is believed that mutations occur more commonly in actively dividing cells than in resting cells, but even in the latter (for example, in stored sperm of *Drosophila*) some mutations are found. Genetic factors are also known to modify the mutation rate considerably, for in some races a given gene may be much more mutable than in others. If different organisms are compared (on the basis of admittedly very scanty data) it is found that the rate of mutation per gene per generation is very roughly the same in man as in *Drosophila,* but as the life cycle of man is 10,000 times as long as that of Drosophila, the mutation rate per unit of time must be very much lower in man than in Drosophila; if it were not so, every man would be a repository of large numbers of harmful genes, and could not survive.

Mutagenic Agents: Ionizing Radiation. — In 1927 hluller proved that treatment of *Drosophila* with X-rays leads to the production of mutations in quantities much above those occurring in untreated populations (see NATURALIZATION OF PLANTS AND ANIMALS). Shortly afterward L. J. Stadler reported similar results with maize, and it later became certain that all ionizing radiations induce the production of mutations in all organisms, ranging from bacteria to man. The mutants thus produced (in Drosophilo at least) resemble those previously found in unirradiated material. Moreover, not only gene mutations but also structural alterations of the chromosomes, such as deficiencies, inversions, translocations, etc.. are produced in .quantities by X-irradiation.

The relationship between the dose of X-rays delivered to the cells and the number of mutations produced is strictly linear. In *Drosophila* about 3% of X chromosomes subjected to 1.000 roentgen units develop lethal mutants, and the effects of smaller or larger doses are in proportion. A given dose of 2,000 r may be given in a short period of very intense exposure (eight minutes), or, alternatively, spread out over 30 days from a radium source emitting y-rays. In both cases Muller found that about 6% sex-linked lethal mutations were produced in the gametes of irradiated males.

Even if the exposure is broken up into separate periods. with intervals of rest between. the final result is the same and proportional to the dose. As far as genetic effects of X-irradiation are concerned, there is no "recovery." These considerations do not. however, apply to certain radiation effects on gross chromosomal rearrangements.

The above-mentioned facts have obvious significance in connection with exposure of human beings to ionizing radiation, which is much used in industry, medical diagnosis and therapy, etc.. and which is an inevitable product of atomic energy establishments and atomic explosions. Very small doses, when continued over prolonged periods, or when delivered to very large populations of millions of individuals, may produce as many mutations as the exposure of a few individuals to a massive dose. To the population as a whole. the result may be equally serious, or more so.

The magnitude of the effect depends greatly on the kind of cell irradiated. In Drosophila, a given dose of X-rays produces only one-third as many mutations in spermatogonia (*i.e.*, the cells of the gonad which divide repeatedly to give finally the spermatozoa) as in spermatozoa. while spermatids (cells which transform without division directly into spermatozoa) are even more sensitive than spermatozoa. In maize, a 15-fold increase in mutations produced by X-rays has been reported from the time of minimum sensitivity (just before meiosis) to the maximum (one week before shedding of the pollen). In maize, again, growing tissues have produced eight times the number of X-ray-induced mutations as have resting cells.

As to the relative sensitivity of different organisms, no exact data are available. It is thought likely, however, that mice are more sensitive to the mutation-producing effect of X-rays than Drosophila, and it is reasonable to believe that in this respect man resembles mice more closely than Drosophila. In *Drosophila* the dose of X-rays necessary to double the spontaneous rate is estimated at about 100 r. Just as with spontaneous mutations. X-ray-induced mutations are usually deleterious or lethal. However, with barley, Å. Gustafsson in 1937 succeeded in obtaining, after X-ray treatment, some mutants showing qualities which are desirable from the point of view of man (*e.g.*, giving an increased yield of grain and straw), but such mutants occur at a very low frequency, possibly 1/1,000 of all mutations produced. Again. strains of the mould *Penicillium* giving a much-increased yield of penicillin have been obtained after X-ray treatment. But "improvements" of this kind can be obtained only when it is possible to reject the overwhelming majority of individuals and select the very few having the desired characteristics.

Ultra-Violet Radiation. — Gene mutations (though probably not gross chromosomal rearrangements. such as large deficiencies or translocations) are induced by ultra-violet rays of wave lengths between 2,300 and 3,100 Å, the maximum effect being produced in the range .2,650–2,800 A. This corresponds with the optimum absorption (2.600 Å) of ultra-violet rays by deoxyribosenucleic acid. Because of the fact that ultra-violet rays are rapidly absorbed by living tissues, mutations are induced only when the treated nuclei are near to the surface; *e.g.,* in pollen grains or sperm. or in micro-organisms.

It is believed that the mutagenic action of ultra-violet radiation is indirect. Thus. W. S. Stone and others showed that a small proportion of mutations were induced in bacteria and in *Neurospora* when the latter were grown on a nutrient medium which had been irradiated with ultra-violet rays shortly before the organisms were inoculated. Presumably the irradiation of the food forms a chemical substance which subsequently acts as a mutagen. Exposure of organisms to visible light during or shortly after treatment with ultra-violet rays reduces the number of mutations which finally appear. a phenomenon known as "photorecovery." Lastly, if a pollen grain is irradiated and then used for pollination, the new plant produced may be a "mosaic" consisting of half mutant and half nonmutant cells. This is taken to mean that irradiation initially changes the gene or the surrounding cytoplasm into a condition such as will favour the occurrence of a mutation some time later.

Chemical *Mutagens.*—A great many chemical substances are known to produce gene mutations. In 1941 C. Xuerbach and J. M. Robson, after noticing that mustard gas had an effect on living tissues resembling X-ray burns, placed some individuals of *Drosophila* melanogaster in the vapour of this substance and found that a large number of sex-linked lethal mutations were produced. Later the substance was shown to be mutagenic to a large variety of other organisms. Like X-irradiation, mustard gas induces the occurrence of many kinds of lethal and visible mutations, and also certain chromosome rearrangements. Among many other chemical mutagens may be mentioned the following: nitrogen mustard, phenol, urethane. formaldehyde, caffeine. In general these substances do not have any chemical affinity with one another.

Some mutagens (*e.g.,* urethane and nitrogen mustard, as well as X-rays) are also carcinogens, but there is no general correlation between ability to induce mutations and ability to induce cancer. No chemical mutagen is known which will induce specifically the

mutation of a particular gene, though certain loci may be more susceptible to the action of one kind of mutagen, other loci to others.

Conclusion. — The mode of action of the various mutagenic agents and the detailed nature of the changes produced in the genes and chromosomes are not understood. According to some specialists — though others disagree — X-rays do not produce "genuine" mutations from one allele to another. but act destructively to produce small deficiencies and other chromosoinal changes which may have phenotypic effects indistinguishable from recessive mutations at the locus affected.

The role of these mutagenic agents in producing mutations in nature is probably a minor one. It is true that some known chemical mutagens (*e.g.,* formaldehyde, caffeine, mustard oil) occur in plants, but only at low concentrations. Ionizing radiation (cosmic rays, radioactivity from the earth) occurs naturally, but the intensity would be insufficient to account for the known rate of mutation in Drosophila; though in a slow-breeding organism like man natural radiation may well account for an appreciable proportion of the "spontaneous" mutations. Ultra-violet radiation would not penetrate to the germ cells of higher animals, but might induce some mutations in pollen grains or micro-organisms blown through the air. It is concluded that the cause of "spontaneous" mutations (or the majority of them) is to be sought in the structure and behaviour of the gene itself, which may be naturally unstable, but the whole subject is obscure, especially in view of the phenomena of position effect and pseudoallelism, to be described in the next section.

POSITION EFFECTS AND PSEUDOALLELES

It has been a basic principle of genetics, stemming originally from the work of Mendel himself, that the primary functioning of a given gene is independent of that of other genes in the same cell. It is now known. however, that the behaviour of a given gene may be markedly affected by the presence of neighbouring chromosomal materials. Several different types of this position effect are known. For example, if the wild-type allele of the gene white eye in *Drosophila melanogaster* is translocated to a position near to heterochromatin (*i.e.,* regions of the chromosomes having special staining properties) a variegated eye is produced, consisting of a mosaic of white and wild-type facets. Similar variegation connected with five other genes in the immediate vicinity of white eye is found, and it is thought that such variegation is due to an irregular inhibition of the normal functioning of the wild-type alleles. (It is known that very small deficiencies may produce phenotypic effects indistinguishable from those of recessive mutants at the same loci.) Conversely, genes which are in normal circumstances close to heterochromatin may change their behaviour when moved far away from it. Position effects of this general type are also known in maize and *Oenothera blandina.* Sometimes the inhibition is complete, producing a wholly "mutant" phenotype. A given gene is not irreversibly altered by the change in position, for on returning the gene to its original place the position effect disappears. However if a gene is kept permanently in the "new" position, then an effect very like mutation is produced, and some workers have even suggested that all mutation may be of this type.

A second type of position effect is found when the effect of two closely linked genes is compared side by side on the same chromosome with the effect of the same two genes on opposite, homologous, chromosomes. Before considering this it is necessary to introduce the concept of *pseudoalleles.*

Studies of chromosome maps show that genes are not ordered in the chromosomes in any way obviously connected with phenotypic effect. A given segment of a chromosome may contain genes affecting the most varied characters. However, when a segment is studied in minute detail, clusters of tightly linked genes are often found having similar or even identical phenotypic eifects. For example, in 1953, working with the mould *Aspergillus nidulans,* G. Pontecorvo and J. A. Roper produced a number of biochemical mutants (see Heredity *of Biochemical* Characters below) and made a series of crosses between pairs of apparently identical mutants. Thus a series of adenine-requiring mutants may be taken and crossed in pairs. It is then found that recombinant strains of the fungus. able to grow without added adenine, are formed at very low frequencies, ranging from 1/1,000 to 1/1,000,000. These results are interpreted to mean that mutation at any one of a number of closely adjacent sites on the chromosomes can produce a similar phenotypic effect, but that if sufficiently large numbers are taken. crossing over between pseudoallelic genes at these sites can be demonstrated.

Returning now to the second type of position effect, the "lozenge" locus in Drosophila may be taken as an example. Here it is found that two pseudoalleles when arranged on different chromosomes produce a characteristic roughening effect on the eye. but when combined in the same chromosome they produce the wild type.

These facts render the concept of allelism and of the gene itself less clear than when these terms were first defined. Indeed, some geneticists, such as R. Goldschmidt, have proposed that the notion of discrete genes arranged along the chromosomes like strings of beads must be abandoned altogether, and that the chromosome should be considered as a continuum, containing vaguely defined regions concerned with various synthetic processes. Most geneticists do not take this extreme view and continue to believe in the existence of discrete, separable chromosomal factors. The functioning of adjacent members of a cluster of genes cannot be considered in isolation, however.

HEREDITY OF BIOCHEMICAL CHARACTERS

A great deal of research has been done on problems concerned with the biochemical processes which are initiated by the genes and which finally result in the formation of some product by which the phenotype is recognized. Attention was first directed to such problems by A. E. Garrod (1857–1936), who in 1902 described the rare and harmless human condition alkaptonuria as "an inborn error of metabolism." Alkaptonuric persons excrete homogentisic acid into the urine, which consequently stains black on exposure to the air. The essential peculiarity of the persons concerned is their inability to break down in metabolism the benzene rings of the aromatic amino acids. Studies of pedigrees show that alkaptonuria is usually due to an autosomal recessive gene. Hence it may be inferred that normal persons contain a wild-type gene specifically concerned with some step in the metabolism of these aromatic amino acids.

Many examples of similar phenomena are known. and in some the consequences may be serious or fatal. In galactosuria (also probably due to a recessive gene), persons are unable to metabolize galactose. If milk is given in the diet to affected children, they excrete galactose in the urine and become very ill. They may die if the milk is not replaced by a synthetic mixture containing some sugar other than galactose. In other inherited abnormalities there may be a large excretion in the urine of some metabolite, not because of a block in intermediary metabolism, but because of some specific peculiarity of kidney function. For example. in renal glycosuria (a harmless condition caused by an autosomal dominant gene) the renal tubules have an impairment in capacity to absorb glucose from the glomerular filtrate. Utilization of glucose by the tissues is, however, normal. In cystinuria (probably caused by one or more recessive genes) there is an impairment of renal absorption of the amino acids cystine, lysine and arginine. which consequently appear in the urine and may cause stone formation in the renal pelvis.

A number of inherited disorders of the red blood cells of man are known One of the most important is sickle-cell anaemia, which is nidespread among Negroes in Africa and the United States. It is controlled by a gene which in the homozygous condition produces a severe haemolytic anaemia. Heterozygous persons appear to be perfectly healthy, but if their blood is examined the red cells are seen to exhibit the sickling trait. L. Pauling and others discovered that the red cells of patients suffering from sickle-cell anaemia contain a haemoglobin having a different isoelectric point from the haemoglobin in normal persons. No chemical differences between the two kinds of haemoglobin could be identified, though it is known that the difference resides in the

globin fraction. It is concluded that the wild-type allele controls some step in the synthesis of normal haemoglobin, and the sickle-cell gene is unable to control this step in the same way. A further point is that persons whose blood contains the sickle cells have a diminished susceptibility to malaria. In areas where malaria is common, heterozygotes for sickle-cell anaemia are therefore at an advantage over the normal, and this doubtless explains why so harmful a gene persists at a high frequency in malarial regions.

In micro-organisms, many studies have been made on inherited biochemical variations. following a principle established in 1941 by G. W. Beadle and E. L. Tatum working with the mould *Neurospora crassa.* This fungus will grow on a minimal medium consisting of water. inorganic salts including sulphate and nitrate. glucose and a trace of biotin. Growth is somewhat better on a complete medium containing, in addition to the minimal medium: yeast extract, malt extract and vitamins. A large number of mutants will grow on the complete medium but not on the minimal medium, since they are unable to synthesize substances present in the former but absent in the latter. By adding to the minimal medium a series of substances it is often possible to discover what synthetic process the mutant is unable to carry out.

For example, mutants may require various amino acids. vitamins or nucleic acid constituents (purines and pyrimidines) to be added to the medium, or they may require reduced sulphur or nitrogen.

Differentorganisms may produce different arrays of auxotrophic (as they are called) mutants; *e.g.,* inositol-requiring mutants are common in some fungi, but have not been found in *Neurospora.* But many organisms produce similar auxotrophic mutants; *e.g.,* arginine-requiring mutants occur in the fungi *Neurospora, Penicillium, Aspergillus* and also in the bacterium *Escherichia coli.*

Examination of a large number of independently arisen auxotrophic mutants in a given organism permits inferences to be drawn regarding certain biochemical steps in intermediary metabolism. For example. in *Neurospora* there are three kinds of mutant which are unable to grow unless the amino acid arginine is added to the medium. In class 1 are mutants which can utilize only arginine; in class 2 are mutants which can utilize not only arginine but also, as an alternative, citrulline; in class 3 are mutants which will grow when any one of the three substances arginine, citrulline or ornithine is added to the medium. It may thus be assumed that the synthetic sequence in the wild-type fungus is ornithine → citrulline → arginine. Mutants of class 1 are unable to achieve the step citrulline → arginine; those of class 2 are unable to achieve the step ornithine → citrulline; and class 3 mutants cannot form ornithine from some precursor.

Such conclusions are open to various objections, however. Blocks in metabolism are often partial, so that growth is not completely stopped but merely slowed down; and it is to be expected that organisms have a number of alternative pathways by which a given end-product may be synthesized.

Another approach to the biochemistry of gene action was made by B. Ephrussi and G. W. Beadle in their eye transplantation experiments with *Drosophila melanogaster.* Two eye-colour mutants, vermilion and cinnabar, differ from the wild type in hating brighter red eyes as a result of the absence of a brown pigment which is present in mild-type eyes. If eyes from a cinnabar or vermilion fly are implanted into the body cavity of a wild-type fly, the eyes containing these mutant genes develop the normal deep red colour of the wild type (with the brown pigment present), because substances synthesized by the wild-type flies diffuse into the mutant eyes. Eyes containing the gene vermilion. when implanted into cinnabar flies. also develop the wild-type pigment; but eyes containing the gene cinnabar, when implanted into vermilion flies, fail to form the wild-type pigment. and develop the cinnabar colour. Biochemical studies have shown that the following synthetic sequence is involved: tryptophan → kynurenine → hydroxykynurenine → brown pigment (with some steps omitted). Vermilion flies are unable to carry out the transformation from tryptophan to kynurenine, while cinnabar flies are unable to carry out the transformation from kynurenine to hydroxykynurenine.

It should be added that *Drosophila* is not able to synthesize tryptophan, which must be added to the food, or no brown pigment will be formed.

Hereditary flower-colour variations were investigated biochemically by M. W. Onslow, R. Scott-Moncrieff and others. For example, in the sweet pea, purple flowers contain an anthocyanin pigment based on delphinidin, red flowers contain an anthocyanin based on cyanidin, and salmon flowers contain pelargonidin. Red sweet peas differ from purples genetically by a single recessive gene, and chemically by having pigments with one fewer hydroxyl group; salmon flowers differ further from reds by another recessive gene and by another hydroxyl group. Similar rules are found to be followed in many other plants. Flower colour variation can be brought about, however. by a number of other biochemical mechanisms. such as variations in copigments, *p*H and so on.

To sum up, genes may act, in biochemical terms. in the following ways: (1) by enabling the organism to carry out a particular synthetic step or a step in the breaking down of a compound derived from the food; (2) by altering the ability of some or all cells to absorb particular substances from the surrounding medium; and (3) by diverting synthesis from one path to another. All these effects may be considered to be brought about through the mediation of enzymes (*q.v.*) formed by the genes. Many of the effects of genes are known to be carried out by enzymes, and sometimes the absence of a particular enzyme in a mutant can be demonstrated. The specificities of enzymes and other macromolecules are thought to be determined by direct gene action in which the genes participate by serving as moulds or templates. Though plausible, however, such a view is not supported by any direct evidence.

HEREDITY AND VARIATION OF INDIVIDUAL CELLS

In higher animals and plants a single individual contains a great variety of cells. It is assumed that the same sets of genes are present in all, and that cellular differentiation is due to variation in some other component, most likely in the cytoplasm. In unicellular organisms also, cells may change their character to a marked degree, and there it can be proved that genic changes need not always be responsible; *e.g.,* in the antigen sysiem of the ciliate protozoon *Paramecium aurelia.* The surface antigens *(see* BACTERIOLOGY) of *Paramecium* vary in different strains and under different conditions. Such antigenic variation is subjected to a dual control of genic and cytoplasmic factors. Thus in every *Paramecium* there are several genes (at different loci) which govern antigenic specificity, but normally only genes at a single locus are able to exert their effect on the phenotype at a given moment

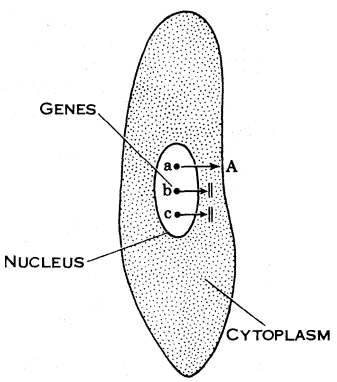


FIG 6 — DIAGRAM OF A PARAMECIUM SHOWING THREE GENES AND THEIR INTERACTION WITH THE CYTOPLASM A IS AN ANTIGEN PRODUCED FROM GENE a

Which gene is thus expressed and which genes are inhibited depend upon the cytoplasm. since the latter can switch from one state to another (and back again), under the influence of various environmental factors such as temperature, salinity of the water and so on. The system is represented diagrammatically in fig. 6. Thus a group of cells, all containing the same array of genes. may nevertheless vary and this *Paramecium* system throws some light on the difficult problem of cellular differentiation in multicellular organisms. The nature of the cytoplasmic components involved is however, unknown.

Another kind of cellular variation is that concerned with adaptation to drugs which has become an important medical problem since the discovery and widespread use of the sulfonamide drugs and antibiotics such as penicillin. It is sometimes found that after an initial period of success in the treatment of a particular bac-

terial infection with a given drug, there may be a relapse, resulting from the development of drug-resistant forms of bacteria. *Gonococci* which are resistant to sulfonamide, *Staphylococci* which are resistant to penicillin and tubercle bacilli which are resistant to streptomycin are particularly common, especially in the vicinity of hospital wards. Drug-resistant strains of bacteria may arise in two ways: (1) by the chance occurrence of a tiny minority of spontaneous mutants, which are selected out in the presence of the drug; and (2) by direct adaptation to the drug, by some process not involving gene mutation. There is controversy as to which mechanism is the more important. It is known. however, that the "mutation and selection" mechanism operates to produce strains of E. *coli* and of *Salmonella typhimurium* resistant to streptomycin and of *Pneumococci* resistant to penicillin. Most commonly, a high degree of drug resistance is reached only after a series of mutations (*e.g.*, with resistance to penicillin), though occasionally full resistance is gained in a single step, as with streptomycin resistance in E. *coli*.

Direct adaptation has been demonstrated in cultures of *Bacillus cereus* initially sensitive to penicillin. If treated with minute amounts of the drug for a short period, such cultures will subsequently produce cells containing the enzyme penicillinase which inactivates penicillin. Growth is then possible in the presence of penicillin. In general, induced adaptations are found in those situations where the cells possess the necessary genes to synthesize certain enzymes. but do not in fact form the enzymes unless stimulated to do so by specific inducing substances in the medium. Such enzyme adaptation or induced enzyme synthesis is commonly met with in bacteria and yeasts, especially in connection with the fermentation of various sugars.

These phenomena illustrate a fundamental property oi cells, namely that of being able to exist in a number of alternative forms, with different enzymatic, antigenic or drug-resistant properties. Since the varied forms may contain identical sets of genes, there is no need to abandon the basic genetic principle of the stability of the genotype under varying environments. When a direct effect of the environment is iound, it may be assumed to operate on some comparatively unstable component of the cytoplasm and not on the genes.

CYTOPLASMIC HEREDITY

Mendel found that hybrids, and their progeny in later generations, did not vary according to which of the original strains of peas had been used as female and which as male parent. Reciprocal crosses yielded essentially the same results, and this has been iound to be so generally, except for sex-linked characters. It is therefore concluded that there is usually no appreciable transmission of hereditary determinants through the cytoplasm, since female gametes contain a large amount of cytoplasm and male gamates very little. Moreover, in species such as *Drosophila melanogaster, Zea mais* and *Neurospora crassa,* where extensive chromosome mapping has been done, the great majority of hereditary characters have been shown to be under the control of genes situated in particular linkage groups.

Nevertheless, the literature contains a considerable number of references to traits which do not coniorm with the above rule. Reciprocal crosses yield divergent progeny when certain species or wild races oi various plants (*e.g., Epilobium*) are crossed. Commonly the viability of the pollen is affected differentially. By the method oi repeated backcrossing it is possible to obtain a plant containing eubstantially all its genes from one race and cytoplasm irom another. Such plants may differ from the original paternal parent and give evidence that some.cytoplasmic factors have been autonomously reproduced in the cytoplasm for generation after generation. In animals behaviour of this kind is rarer, but in the mosquito *Culex pipiens* H. Laven found that the eggs of some geographical races, when fertilized by sperm of certain other races, produced inviable offspring, though the reciprocal matings were quite successful. Even after *14* generations of backcrossing the cytoplasm of the race used as female parent retained its characteristic properties. The precise nature of the cytoplasmic iactors concerned in the above-described examples is obscure.

Characters connected with the green chloroplasts in plants may or may not be determined by hereditary factors in the plastids or in the cytoplasm. In maize and other plants many mutations result in a failure to synthesize chlorophyll, but in most of these mutants the deficient plastids are under strict genic control. In *Mirabilis jalapa,* the seed borne by white parts of variegated plants gives rise to nothing but white-leaveti (and therefore inviable) seedlings, no matter what plant supplies the pollen. In other variegated plants, such as *Pelargonium* and *Oenothera,* a few deficient plastids may be transmitted through the pollen, but not so many as through the embryo sac. Hence there may be some autonomous determinants within the plastids.

Hereditary conditions controlled by cytoplasmic factors are also known in yeasts, *Neurospora, Chlamydomonas* and other organisms. *Paramecium,* because of its possession of the process of conjugation, by which there is a mutual exchange of nuclei between two individuals, usually without any passage of cytoplasm, is especially suitable for the study of the role of the cytoplasm in heredity. In 1938 T. M. Sonneborn discovered the "killer" races of *Paramecium,* which excrete into the water a toxic substance lethal to other races: The "killers" are distinguished from the normal by their content of several hundreds of *kappa* particles in the cytoplasm. The kappa particles are about the size of a small bacterium (1.5–2.5μ in length), contain DNA and vary in a number of ways. Factors external to the kappa particles, such as the conditions in the external medium, or certain genes in the nuclei of the *Paramecia,* may determine whether kappa particles can be maintained in the *Paramecia* and the number of particles which can be maintained; but the hereditary qualities of the kappa particles are due to iactors within the particles themselves. Moreover, kappa particles are produced in a *Paramecium* only if at least one particle is already present or is introduced from outside by cytoplasmic transfer or iniection via the medium. When they were first described, it was thought that the kappa particles were to be considered as cytoplasmically located hereditary determinants, or *plasmagenes;* but later results made it seem more reasonable to consider the kappa particles as separate organisms (though of unknown affinities) living parasitically in the cytoplasm of *Paramecium*.

A rather similar condition is known in *Drosophila nzelanogaster,* certain strains of which are sensitive to killing by carbon dioxide, and contain a cytoplasmic factor called *sigma*.

The two factors—kappa in *Paramecium* and sigma in *Drosophila*—may be considered as borderline units, resembling both hereditary determinants or genes on the one hand and parasitic or symbiotic organisms on the other.

HEREDITY IN BACTERIA AND VIRUSES

Bacteria were at one time considered to be simple types of cells not exhibiting any forms of sexual phenomena and even lacking nuclei. More recent grnetic work has shown without doubt that some at least of these organisms possess a complex hereditary apparatus, consisting of at least one group of linked genes, and that recombination of genes irom different strains and species may be achieved by a number of remarkable processes, some of which resemble the sexual iusions of gametes in higher organisms, while others involve a transfer of genelike material irom cell to cell via the exterior: a process which has not yet been successiully accomplished in any higher organism.

In 1946 J. Lederberg and E. L. Tatum demonstrated a recombination of hereditary factors in *Escherichin coli,* utilizing a number oi biochemical mutants. If very large numbers of bacteria of two different kinds, the one unable to grow in the absence of one substance, the second unable to grow in the absence of a different substance, are mixed together in a liquid medium, and the mixture plated out on agar containing only the minimal medium, a very small proportion of recombinant types of cell is iormed. These are "prototrophs" (*i.e.,* able to grow on the minimal medium) and are selected out. since neither of the parental types could grow there. Further work established the existence of many genes in *E. coli* concerned with various biochemical, antigenic and morphological characters, arranged linearly in a single linkage group. Recombination involves some process analogous to crossing over, but the details are not understood. Nor have cytological studies revealed the chromosome in microscopic preparations. The nature of the sexual process in E. *coli* is not clear, but there is some evidence of a one-way transfer of genetic material, and actual contact of donor and recipient cells of the required type is necessary.

Transfer of genetic material from cell to cell via the exterior has been accomplished by two methods. In the first, nonliving extracts of *Pneumococci* are prepared, and may be purified till they consist almost entirely of DNA. These extracts (containing the so-called transforming principles) are then applied, under certain special conditions, to a different strain of *Pneumococcus*. If a selective technique is available whereby all non-recombinant bacteria are eliminated, and recombinants grow, a small proportion of bacteria can be obtained having certain characters from both strains oi *Pneumococcus* used. Many different hereditary traits can be transferred in this way; *e.g.,* antigenic characters, resistance to drugs and ability to synthesize particular enzymes. Usually only a single factor is transierred at a time, but double characters (*e.g.,* capacity to ferment the sugar mannitol and resistance to streptomycin), due to pairs of closely linked genes, can occasionally be transferred simultaneously. Transformations oi this kind have been demonstrated in bacteria other than *Pneumococcus;* for example, in *Hemophilus influenzae* and *Meningococcus*.

The second method is known as *transduction* and was first used by N. D. Zinder and J. Lederberg. It is similar to that used in the *Pneumococcus* transformations described above, except that in place of the chemical extract a phage lysate is used (*see* below). The method has been demonstrated with *Salmonella typhimurium, E. coli* and *Shigella dysenteriae*. It is believed that when lysis of a bacterium occurs as a result of phage activity, small fragments of the bacterial chromosomes may he incorporated in the phage particles, and when the latter infect a new bacterium the fragments become incorporated in the chromosomes of the newly infected bacterium. If the latter is not lysed, it may develop characters derived from the donor bacterium, though

many details are obscure. As with "transformations" of the *Pneumococcus* type, phage-induced transduction involves single bacterial genes, but occasionally pairs of linked genes are simultaneously transduced.

Exchange of genetic material has been demonstrated even in viruses. Most of this work has been done with the T series of bacteriophages, which are intracellular parasites of the bacterium *Escherichia coli*. When outside the bacteria, phage consists of minute particles containing a core of D A and a coat of protein. Under appropriate conditions the DNA part enters a bacterium leaving the protein outside, and after a short period the bacterium bursts, liberating possibly several hundred phage particles. If two types of phage (*e.g.*, differing in host range and in size of plaques formed by lysis of bacteria on solid media) enter a single bacterium, the resulting lysate may contain not only the two parental types of phage but also the two recombinant types. It is even possible to infect a bacterium with three different phages and to obtain phage particles with characters derived from all three, apparently as the result of two successive matings inside the bacterium. Linkage has been demonstrated in phage genetics, but the exact mechanism by which recombination occurs is unknown. Similar recombination studies have been made with other viruses, including those causing influenza. Hybridization of viruses may be extremely important in giving rise to virulent strains, such as that causing the pandemic of 1918.

Some viruses do not normally destroy their host bacteria but establish a stable symbiotic relationship with them. These viruses are called "temperate" as opposed to "lytic." When a temperate phage enters a bacterium it may give rise to a particle called by A. Lwoff "prophage," which is situated at a particular locus on the bacterial chromosome and is regularly duplicated in the same manner as the bacterial genes. The system may be disturbed by ultra-violet irradiation or other stimulus, active phage is produced, and lysis then occurs. In this system the phage appears to be behaving at one stage as a distinct infectious organism, at another as a bacterial gene. On the other hand, the DNA of phage is chemically distinct from that of bacteria or any other organism, in certain respects.

HETEROCARYOSIS AND SOMATIC CROSSING OVER IN FUNGI

In earlier sections, the various mechanisms concerned with recombination of genetic factors have been described. In higher organisms, the recombination of genes located on different chromosomes takes place as a consequence of the independent assortment of the paternal and maternal homologous chromosomes at meiosis, while recombination of genes in the same linkage group is a consequence of crossing over. In bacteria, recombination may sometimes take place in other ways, such as by transduction. In asexual iungi, still other mechanisms for bringing about recombination are known.

In many iungi the hyphae may contain two or more different kinds of nuclei, and such cultures are known as *heterocaryons*. They arise from fusions of hyphae from different strains, not followed by fusions of nuclei. Just as in diploid organisms heterozygotes are often more vigorous than homozygotes, so in fungi heterocaryons may be more vigorous than the hoinocaryons from which the two kinds of nuclei are derived. For example, one mutant strain of *Neurospora* may be unable to grow on a medium lacking adenine, another may be unable to grow on a medium lacking tryptophan. But a heterocaryon derived from the two strains can grow on a medium lacking both substances. Heterocaryons can give rise to homocaryons by spore formation, since some spores contain only a single nucleus. Thus a kind of rough segregation may occur, but this is a segregation of whole genotypes and not of individual genes. Heterocaryons are very common in nature.

G. Pontecorvo and colleagues produced from heterocaryons diploid strains of some sexual species of fungi (normally only haploid), and with the aid of certain selective techniques were able to show in these diploid strains a low rate of genic recombination due to crossing over in the somatic cells. In sexually reproducing fungi, such as *Aspergillus nidulans,* linkage maps constructed with the aid of somatic crossing over showed the same order of genes as maps made in the usual way, though the numerical values varied.

Somatic crossing over is a valuable technique for obtaining gene recombination—and hence for breeding improved strains—in organisms which cannot be mated in the usual way; *e.g.,* in a number of fungi used in industry, such as *Penicillium chrysogenum*.

SOVIET GENETICS

The theory of heredity as set out in this article is not accepted by T. D. Lysenko and his school. In the years 1935–48 there was a violent controversy in the Soviet Union between adherents of western genetics (called by the Soviet scientists "Mendelism-Weismannism-Morganism") and the Lysenko group, who based their conception of heredity on the writings of the Russian horticulturalist I. V Michurin (1855–1935). This controversy culminated in complete victory for Lysenko in 1948, when he was able to announce that his views had been approved by the Soviet government and the Communist party.

The basis of the antagonism between Soviet and western geneticists mas partly theoretical, partly practical. (The political aspect will be ignored here.) The theoretical objections were concerned with the concept of the gene as an autonomous unit governing the hereditary characters but not modified specifically by the environment. This was considered to be inconsistent with Communist materialist philosophy, which required that every material must be formed in response to the conditions in the surrounding medium. The gene was an "idealist," "metaphysical" concept, according to Lysenko. In place of the gene, Lysenko supposed that heredity is somehow diffused throughout the entire organism and is susceptible to every kind of environmental influence. The Soviet objections on practical grounds were concerned with the fact that western geneticists are unable to change, deliberately, the heredity of an organism in a desired direction, hut must make use of such mutations as may occur by chance. Practical application of Mendelism to breeding is therefore slow, while Lysenko himself claimed the ability to change heredity predictably.

The methods used by the Soviet, or "Michurinist," workers for changing heredity were three: (1) by the effect of the environment; (2) by grafting, or vegetative hybridization; and (3) by sexual hybridization, especially of remotely related forms. By sexual hybridization, however, is here understood something more than a union of two gamete nuclei, for the Soviet workers believe that beneficial results accrue from the fertilization of an egg by not one but a large assortment of spermatozoa; and again, that the heredity of the embryo is controlled not only by the uniting gametes but also by the surrounding maternal tissues.

In 1952 Lysenko proposed a new theory of evolution, based on sudden changes from one species to another due to the action of certain environmental conditions unfavourable to the first species. Thus it was claimed that wheat suddenly produced grains of rye. But this conception, and the evidence on which it was based, was attacked even in the Soviet Union itself.

None of the Lysenkoist views is taken seriously by western geneticists. A few attempts at repeating some of the Soviet experiments were made in western countries (*e.g.,* on the alleged hereditary changes following grafting of plants), but only negative results were obtained.

After 1952 the influence of Lysenko began to wane, and in 1956 it was announced that he had been dismissed from his principal position. This did not, however, at once lead to a revival of Mendelian genetics in the U.S.S.R.

HUMAN HEREDITY

Man is an exceptionally variable species. His hereditary variations may he arbitrarily classified in the following manner: (1) the blood groups; (2) sharply distinct but rare defects showing Mendelian heredity; (3) quantitative variations in stature, degree of pigmentation, etc.; (4) hereditary resistance to disease; and (5) mental and emotional characters. Because of the impossibility of conducting deliberate breeding experiments, resort must be had to the examination of pedigrees, and special mathematical methods have to be adopted. The value of twins in evaluating the relative importance of heredity and environment in human traits may be noted. Identical (or monozygous) twins have identical genotypes, and hence any differences which may exist between pairs must be due to the environment, either postnatally or *in utero*. Pairs of fraternal (or dizygous) twins, on the other hand, differ genetically but in some respects are subjected to an unusually uniform environment, and may therefore show the existence of environmental effects not otherwise noticeable. Proof that a given pair of twins is monozygous or dizygous is most certain if the blood groups are determined.

The blood group antigens are controlled in a very straightforward manner by certain genes, and blood group variations occur in practically all human populations. These traits make it possible to settle most cases of disputed parentage, and they can also be of the greatest value in other fields, such as anthropology and medicine. There are at least 12 different blood group systems in man, of which three only—the ABO, MN and Rh systems—will be considered here.

In the ABO system, which is very important in blood transfusion, there are four classes of individual, O, A, B and AB, the grouping being based on certain agglutination reactions (*see* BACTERIOLOGY; BLOOD TRANSFUSION). The genetic basis consists of a series of three allelic genes—I^O, I^A and I^B—as shown in Table III.

TABLE 111.—Heredity of ABO System of Blood Groups

Blood group	Genotype	Blood group	Genotype
O	I^OI^O	B	I^BI^O or I^BI^B
A	I^AI^O or I^AI^A	AB	I^AI^B

In England, the proportions of the four groups in the population are as follows: O 47%, A 43%, B 7% and AB 3%; and the proportions of the three alleles are estimated as I^O 68%, I^A 26% and I^B 6%. Moving from west to east Europe and into Asia, the frequency of the allele I^B gradually rises. Most human populations contain an assortment of all three alleles, though in characteristic proportions. American Indians have a very high content of the gene I^O.

In the MN system, individuals are distinguished according to the reaction of their red blood cells to certain antisera obtained by injecting human blood into rabbits. The population is classified into three groups, M, MN and N, according to the reaction of the blood to two kinds of antibody, anti-M and anti-N. Individuals of types M and N differ in respect of a single pair of alleles, MN being the

heterozygote. Work in the 1950s indicated the existence of other antigens (called S and s) associated with this locus.

In the Rh system, which is important in connection with haemolytic disease of the newborn, individuals are classified as Rh+ and Rh—. In Great Britain and in the white population of the United States about 85% of the people are Rh+ and 15% Rh—. Rh— persons contain a recessive gene and may be denoted *dd*, while Rh+ persons are DD or *Dd*. Haemolytic disease may arise when an Rh— mother bears an Rh+ child, as a result of formation of anti-D antibodies in the mother's serum, and their action on the child's blood. Hence the condition is likely to arise, though it does not inevitably do so, following a mating between an Rh+ man and an Rh— woman. Fortunately, it is usually only during later pregnancies that a mother develops enough antibody to cause trouble to the child, and the frequency of infant deaths irom haemolytic disease is therefore lower than would be expected on a basis of random combination of Rh+ and Rh— persons.

The genetic situation is complicated by the existence of a number of other genes, which are considered by some workers to form a single series of multiple *(Rh)* alleles and by others as clusters of tightly linked genes (denoted *CDE*). Some of these alleles are rare, and in any case the pair referred to above as *Dd* is the most important from the clinical point of view.

A number of examples of rare human defects controlled by specific genes were mentioned above in the section *Heredity of Biochenzical Characters.* Many other such defects are known. Here may be added a note about the concept of *penetrance.* Study of human pedigrees shows that traits inherited as if due to dominant genes may occasionally fail to appear in a person who, judged by his offspring, is carrying such a gene. An example is polydactyly. It is assumed that the variable penetrance of genes of this type is due to environmental and genetic modifying factors which may vary from individual to individual. Again, it may happen that a hereditary .defect may not make its appearance until comparatively late in life, as is the case for example with Huntington's chorea, caused by a dominant autosomal gene, or with some forms of diabetes. Persons bearing genes for these conditions may have children and die before reaching an age at which the diseases would appear. These facts sometimes confuse the interpretation of pedigrees.

Turning now to human characters showing continuous variation, it may be recalled that stature was one of the first traits to be studied statistically in man, notably by F. Galton and K. Pearson. The range oi variation is readily explained as being due to the cumulative action of a number of genes, together with some effect of the environment. Pearson and A. Lee in 1903 collected data on the heights of 1,078 fathers and their sons, and found a correlation coefficient of 0.51, indicating a high degree of heritability. Moreover, studies of twins reared apart show that the correlation is not significantly different from that of twins kept together. But it must not be forgotten that the environment may be similar for relatives because of cultural and economic reasons, and thus be responsible for some of the correlation found. The degree of pigmentation is also controlled by several genes, acting cumulatively. Studies by C. B. Davenport on Negro-white crosses in the West Indies showed that in the F_1's the pigmentation was intermediate between that of the two parents, and in the F_2 families a more or less continuous range of gradations between Negro and white was found. (Albinism, however, is a totally different phenomenon, controlled by a single autosomal recessive gene.) The inheritance of pigmentation in the eye is not fully understood, though there is some evidence for a dominant gene in brown-eyed and a recessive allele in blue-eyed persons in western Europe; but other genes are also concerned.

Twinning itself has a hereditary basis, as is evident from the fact that twin births are clustered in certain families, but it is not due to a single gene. Moreover, environment plays an important part in the determination of twinning, since the frequency of identical twins increases steadily with maternal age, and for young mothers of a given age, often increases with birth order. Twins have been used to show the existence of a hereditary factor in disease resistance. It is found, for example, that identical twins are more frequently alike in their susceptibility to various diseases than are fraternal twins. This applies to the common infectious diseases of childhood and also to poliomyelitis, leprosy and tuberculosis. A hereditary factor concerning a tendency to develop particular forms of cancer is also evident from studies of twins, as well as from studies on close relatives of patients suffering from cancer. It should be stressed however that there is rarely a direct hereditary determination of any of these diseases, but merely a slight alteration in susceptibility to them.

Finally, regarding the ill-defined quality of intelligence, twin studies show the great importance of the environment. H. H. Newman and colleagues did intelligence tests on pairs of identical twins, some of which had been reared apart and others together. They found pronounced differences; *e.g.,* for identical twins reared apart the correlation coefficient was 0.67, for those reared together it was 0.88. Nevertheless, there is undoubtedly a genetic component as well; *e.g.,* the above-mentioned workers found that none of the identical twins differed by more than 24 points as measured by the tests, whereas 17% of siblings differ by this amount. *(See* also EUGENICS.)

HEREFORD, a city, municipal borough and county town in the Hereford parliamentary division of Herefordshire. Eng., on the Wye, 28 mi. N.W. of Gloucester by road. Pop. (1951) 32,501. Area 7.9 sq.mi. Hereford was founded, after the crossing of the Severn by the West Saxons early in the 7th century, as a settlement near the Welsh march. Probably founded by Earl Harold, afterward Harold II, the castle was taken by Stephen and was the prison of Prince Edward during the Barons' Wars. The pacification of Wales deprived Hereford of military significance until the Civil War, when it changed hands several times between the parliamentarians and the king and the Scots. In 1086 the town included fees of the bishop, the dean and chapter and the Knights Hospitallers, but was otherwise royal demesne. Incorporation dates from 1189, when Richard I sold the town to the citizens at a fee farm rent. The charter was confirmed several times. Hereford, the site of a provincial mint in 1086, later had a grant of an exclusive merchant guilt in 1215–16. The wool trade was important in 1202, but declined in the 16th century.

The Cathedral. — The Cathedral Church of the Blessed Virgin Mary and St. Ethelbert exemplifies all styles from Norman to Perpendicular. The see was detached from Lichfield in 676, Putta being its first bishop. The removal of murdered Aethelbert's body from Marden to Hereford led to the foundation of a superior church, reconstructed by Bishop Athelstane between 1012 and 1052 and burned by the Welsh in 1053. Begun again in 1079 by Bishop Robert de Losinga, it was carried on by Bishop Reynelm (or Reinhelm) and completed in 1148 by Bishop R. de Betun. In 1786 the western tower fell and carried with it the west front and the first bay of the nave. The west front of modern times was completed in 1904–08. The total length of the cathedral outside is 342 ft. and inside 327 ft. 3 in. The principal features are the central tower (165 ft.), of Decorated work, and the north porch, rich Perpendicular with parvis. The Bishop's cloister: of which only two walks remain, is Perpendicular, of curious design, with heavy tracery

in the bays. Within, the nave has Norman arcades, and there is a Late Norman font. The south transept is Norman and Perpendicular; the north transept was rebuilt about 1260 and contains the beautiful Early English shrine of Bishop St. Thomas de Cantilupe where many miracles were reported. The dark choir is Norman in the arcades and the stage above, with Early English clerestory and vaulting. At the east end is a Norman arch. blocked until 1841 by a Grecian screen erected in 1717. The choir stalls are largely Decorated. The organ contains original work by Renatus Harris and was presented by Charles II. The Lady or "Ladye" chapel, dated about 1220, shows elaborate Early English work, and on its south side opens the little Perpendicular chantry of Bishop Audley (1492–1502). In the north choir aisle is the fan-vaulted chantry of Bishop Stanbury (*c.* 1470), and on the wall is the 13th-century *Mappa Mundi,* a vellum world map by a Lincolnshire monk, Richard of Haldingham. The crypt is Early English. There is a large "chained library" and the cathedral has a collection of rare manuscripts, early printed books and relics.

Other Buildings. — From the southeast transept of the cathedral a cloister leads to the quadrangular college of the Vicars Choral, a Perpendicular building. On this side of the cathedral, too, the bishop's palace, originally a Norman hall, lies near the Castle green, the site of the historic castle, now utterly effaced. The church of All Saints with its tall twisted spire is Early English and Decorated and has a chained library. One only of the six gates and a few fragments of the old walls survived in modem times. On the Brecon road, the White cross. erected in 1347, commemorates the departure of the Black Death. The "Old Guild house," a half-timbered building in the wide commercial street called High Town, dates from 1621 and was made a Jacobean museum. In Widemarsh is the Coningsby hospital (almshouses), built in 1614. whose gardens are the 12th-century chapel of the Knights Hospitallers and the ruins of the 14th-century Blackfriars monastery. Old-established schools are the Cathedral school (1384) and the Blue Coat school (1710). Hereford has an art gallery and a museum and was the birthplace of David Garrick and the home of the Kembles.

The Three Choirs festival of Hereford, Gloucester and Worcester is held annually in rotation at these cities. Trade is chiefly agricultural, with sales of Hereford cattle and the making of cider and jam, fruit canning and brewing. There are industries making furniture, glass, leather, nickel alloys, bricks, etc.

HEREFORDSHIRE, an inland county of England on the south Welsh border, bounded north by Shropshire. east by Worcestershire, south by Monmouthshire and Gloucestershire, west by Radnorshire and Breconshire. Pop. (1951) 127,159. The area is 842.1 sq.mi.

Physical Features and Geology. — The surface rocks of the greater part of the county are Old Red Sandstone, the more resistant series of which form high ground (from 500 to 800 ft.) between the various valleys and the Black mountains in the southwest, while on the eastern boundary rise the Malvern hills, with Worcestershire beacon (1,395 ft.) and Herefordshire beacon (1,114 ft.). The Malvern hills form an inlier of Pre-Cambrian gneisses and volcanic rocks along the western edge of which occur Cambrian and Silurian rocks, the limestone bands of the latter forming wooded scarp faces. There is also a similar topography in the Woolhope region: where there is an oval-shaped inlier of Silurian rocks. Smaller patches crop out at Westhide east of Hereford and May hill, but the most important form the hills between Presteigne and Ludlow in the north of the county. The Breconshire boundary is formed by the Black mountains, which! formed of Old Red Sandstone, exceed 2,000 ft. On its sbutheastern margin the county just reaches the Carboniferous Limestone cliffs of the Wye valley below Ross-on-Wye, the scenery of uhich is famous. Glacial deposits, chiefly sand and gravel, are found in the lower ground along the river courses, while caves in the Carboniferous Limestone have yielded remains of the hyena, cave lion, rhinoceros, mammoth and reindeer.

The county is almost wholly drained by the Wye and its tributaries, but on the north and east includes a small portion of the Severn basin. The Wye enters Herefordshire from Wales at Hay, and with a sinuous and beautiful course crosses the southwestern part of the county, leaving it above the town of Monmouth. Of its tributaries, the Lugg enters near Presteigne and flows east to Leominster. where it turns south, receives the Arrow from the west and joins the Wye 6 mi. below Hereford. the Frome flowing in from the east immediately above the junction. The Monnow, rising in the mountains of Breconshire, forms the boundary between Herefordshire and Monmouthshire over one-half its course (about 20 mi.) and joins the main river at Monmouth. Its principal tributary in Herefordshire is the Dore. The Wye is celebrated for its salmon fishing, which is carefully preserved. while the Lugg, Arrow and Frome abound in trout and grayling, as does the Teme, a tributary of the Severn, which forms parts of the northern and eastern boundary. The Leddon, also flowing to the Severn, rises in the county and leaves it in the southeast, passing the town of Ledbury.

History. — The prehistoric period in Herefordshire does not seem to have been important, and the county was probably then heavily forested. The camp on the Herefordshire beacon (Malvern hills) is a noted earthwork and believed to date from the late La Tene A period. During the 7th century the West Saxons pushed across the Severn and established themselves between Wales and Mercia, with which kingdom they soon became incorporated. The district. now Herefordshire, was occupied by a tribe, the Hecanas, who congregated chiefly about Hereford and in the mining districts round Ross-on-Wye. In the 8th century Offa extended the Mercian frontier to the Wye, securing it by the earthwork known as Offa's dike, portions of which are visible at Moorhampton and near Kington. The district was the scene of constant border warfare with the Welsh under Gruffydd ap Llewelyn. king of Gwynedd, and Harold Godwinson, whose earldom included this county, only restored order in 1063 when he overcame the Welsh, caused them to assassinate Gruffydd and added to the county the country on the Welsh side of the Wye, Stradel and Archenfield.

Richard's castle in the north of the county and Ewyas Harold in the southwest were the first Norman fortresses erected on English soil. and Wigmore, Clifford, Weobley, Hereford and Kilpeck were all sites of Norman strongholds. Hereford and Weobley castles were held against Stephen by Milo, earl of Hereford, but were captured in 1138. Edward, afterward Edward I, was imprisoned in Hereford castle and made his famous escape thence to join the Mortimers in 1265. In 1326 after the deposition of Edward II the parliament assembled at Hereford and proclaimed his son as Edward III. In Herefordshire the influence of John Wycliffe's teaching was widely felt, and at the end of the 14th century and at the beginning of the 15th Lollardry was widespread. During the Wars of the Roses the county supported the Yorkist cause, and Edward, earl of March, afterward Edward IV, raised 23,000 men in the neighbourhood. The battle of Mortimer's Cross was fought in 1461 near Wigmore. During the civil war of the 17th century the county was royalist, and Hereford, the centre of, activity, changed hands several times. Brampton Brian castle, the home of Sir Robert Harley, a noted parliamentarian. was the scene of one of the most famous sieges of the war. Lady Harley, who commanded the castle in the absence of her husband, withstood the siege which lasted from July 23 until Sept. 6, 1643.

The earldom of Hereford was granted by William I to William FitzOsbern about 1067, but the title lapsed until conferred on Henry de Bohun in 1200. It remained in the possession of his family until the death of Humphrey de Bohun in 1373. In 1397 Henry, afterward King Henry IV. who had married Mary de Bohun, was created duke of Hereford. Edward VI created Walter Devereux, a descendant of the De Bohun family, Viscount Hereford in 1550, the title being the premier viscounty of England.

Herefordshire probably originated as a shire in the time of Aethelstan, and is mentioned in the ***Saxon*** *Chronicle* in 1051. *In* the Domesday survey parts of Radnorshire and Gloucestershire are assessed under Herefordshire, and the western and southern borders remained debatable ground until with the incorporation of the Welsh marches in 1535 considerable territory was restored to Herefordshire. At the time of the Domesday survey the divisions of the county were very unsettled. As many as 19 hundreds are

mentioned, but these were of varying extent, some containing only one manor, some from 20 to 30. Of the 12 modern hundreds only Greytree, Radlow, Stretford. Wolphy and Wormelow retain Domesday names. Herefordshire has been included in the diocese of Hereford since its foundation in 676. It was governed by a sheriff as early as the reign of Edward the Confessor. the shire court meeting at Hereford where later the assizes and quarter sessions were also held In 1606 an act was passed declaring Hereford free from the jurisdiction of the council of Wales, but the county was not finally relieved from the interference of the lords marchers until the reign of William and Mary.

Herefordshire has always been a rich agricultural area, manufactures being unimportant, with the sole exception of the woollen and the cloth trade which flourished soon after the Conquest. Iron was norked in Wormelow hundred in Roman times, and the Domesday survey mentions iron workers in Marcle. At the time of Henry VIII the towns had become much impoverished. Hops were grown soon after their introduction into England in 1524. In 1580 and again in 1637 the county was severely visited by the plague, but in the 17th century it had a flourishing timber trade and was noted for its orchards and cider.

Herefordshire was first represented in parliament in 1295, when it returned two members, the boroughs of Ledbury, Hereford, Leominster and Weobley being also represented. Hereford was again represented in 1299, and Bromyard and Ross in 1304, but the boroughs made very irregular returns, and from 1306 until Weobley regained representation in 1627, only Hereford and Leominster were represented. Under the act of 1832 the county returned three members and Weobley was disfranchised The art of 1868 deprived Leominster of one member, and in 1885 that town was disfranchised and Hereford lost one member. By the act of 1918 Hereford ceased to be a parliamentary borough.

Antiquities. — There are remains of several of the strongholds which Herefordshire possessed as a march county, some of which were maintained and enlarged, after the settlement of the border, to serve in later wars. To the south of Ross are those of Wilton and Goodrich, commanding the Wye. Of the several castles in the valleys of the boundary river Monnow and its tributaries, those in this county include Pembridge, Kilpeck and Longtown. In the north the finest example is Wigmore.

In addition to the cathedral of Hereford and the fine churches of Ledbury, Leominster and Ross-on-Wye, described under separate headings, the county contains some churches of almost unique interest. In that of Kilpeck the work of the Herefordshire school of Romanesque sculpture is seen. It consists of nave, choir and chancel divided by ornate arches. the chancel ending in an apse, with a beautiful and elaborate west end and south doorway. A similar plan is seen in Moccas church, above Hereford. The church at Bromyard exhibits Norman details. At Abbey Dore, the Cistercian abbey church, still in use, is a large and beautiful specimen of Early English work. At Madley, south of the Wye, 5 mi. W. of Hereford. is a fine Decorated church (with earlier portions), with the rare feature of a Decorated apsidal chancel over an octagonal crypt. Of the churches in mixed styles, those in the larger towns are the most noteworthy, together with that of Weobley.

The half-timbered style of domestic architecture beautifies many of the towns and villages. Among country houses, that of Treago, 9 mi. W. of Ross, is a remarkable example of a fortified mansion, parts of which may date back to the 13th century; Hellens, at Much Marele j mi. S.W. of Ledbury, is a mediaeval manor dating from 1292. Rudhall, near Ross-on-Wye, is a good specimen of 15th-century work. and portions of Hampton court, 8 mi. N. of Hereford, are of the same period. Holme Lacy, j mi. S.E. of Hereford, was built in the latter part of the 17th century. Downton castle possesses historical interest in having been designed in 1774 in a strange mixture of Gothic and Greek styles by Richard Payne Knight (1750–1824), a scholar and numismatist; while Eaton hall, now a farm, was the seat of the family of the famous geographer Richard Hakluyt.

Agriculture and Industries. — The soil is generally marl and clay, but in various parts contains calcareous earth in mixed proportions. Westward the soil is tenacious and retentive of water; on the east it is a stiff and often reddish clay. In the south is found a light sandy loam. More than four-fifths of the total area of the county is under cultivation, and less than half of this is in permanent pasture. The county is more heavily wooded than most of the other western counties, with about 8% of its total area under woodland. It is famous for its pear and apple orchards, about half of which produce fruit for the cider industry. Cider at one time was the staple beverage, and the trade in cider and perry is still large. Hops are another staple of the county. The hopyards occupy about 5,000 ac , mainly in the east, and their hop production is second only to that of Kent. Herefordshire has also given its name to a world-famous breed of beef cattle. The Hereford is characterized by its rich red body aith white face. crest and underline which gives a striking appearance of uniformity to the breed. These colour markings, being a dominant factor, type-mark the calves, no matter with what breed of cow the Hereford bull is crossed. Natural aptitude to fatten and early maturity are perhaps the predorriinant characteristics of the breed. Herefordshire's small, white-faced, hornless, symmetrical breed of sheep known as the Ryelands, originally from the district around Ross-on-Wye, made the county famous. From its original form the breed has been improved in stamina by crossing with the Leicester. The chief breeds of sheep on Herefordshire farms in the mid-20th century were Kerry, Clun, Ryeland, Shropshire and Radnor.

Manufacturing enterprise is of growing significance. In support of the county's major industry, agriculture, there are factories for agricultural implements, quarrying, fruit canning, jam making and milk processing. The cider industry is also concerned with the extraction of pectin New industries are coming into the county and, centred principally around Hereford itself, offer alternative employment for its growing number of citizens.

Communications. — Hereford is the railway centre of the county. The Worcester and Cardiff line (Western Region), entering on the east, runs to Hereford by Ledbury and then southwestward to south Wales. Another line runs north from Hereford by Leominster, proceeding to Shrewsbury, Crewe and Chester. None of the rivers is commercially navigable.

Population and Administration. — The area of the administrative county is 842.1 sq.mi., with a population (1951) of 127,159. The county contains 12 hundreds. It is divided into two parliamentary divisions, Leominster and Hereford, each returning one member. There are two municipal boroughs, Hereford (pop., 1951, 32,501) and Leominster (6,290). The urban districts are Bromyard, Kington, Ledbury and Ross-on-Wye. There are eight rural districts. The county is in the Oxford circuit and assizes are held at Hereford. It has one court of quarter sessions and is divided into ten petty sessional divisions. The borough of Hereford has a separate commission of the peace and a separate court of quarter sessions. The county is almost entirely in the diocese of Hereford, with small parts in those of Gloucester, Worcester and Llandaff. The National trust owned about 2,400 ac. in the county by the latter 1950s.

HERERO, a Bantu-speaking people (pop. c. 50,000) inhabiting the central parts of South-West 'Africa and the northwestern districts of the Bechuanaland Protectorate. Predominantly a pastoral people, they live in small household groups scattered about irregularly. They have a double clan system, one set (*oruzo*) with patrilineal descent, the other (eanda) with matrilineal. The former is associated with religious observances, including the cult of the sacred fire, the latter with economic life and inheritance of property. Kinship terms are classificatory, and cross-cousin marriage is preferred. The dominant form of religion is ancestor worship.

See I. Irle, Die Herero (Giitersloh, 1906); H. Vedder, *South* West Africa in Early Times, tr. and ed. by C. G. Hall (London, 1938). (I. S.)

HERESY, in its primary meaning signifies an act of choice, whether good or bad (cf. LXX in Gen. xlix, j; Lev. xxii, 18, 21;

Neh. xii. 40; 1 Macc. viii. 30); it is the English equivalent of the Greek αἵρεσις. From this arose its later meaning of personal choice of an opinion or belief, or personal adhesion to a group or party advocating certain principles of belief; from this again it was used of the group or party as such, as a school or "sect." In Eusebius (*Hist.* x. 5) the Christian Church itself is described as the "most sacred heresy." But in the N.T. we see the word, acquiring the implication of disparagement or condemnation. It is applied to the Pharisees and Sadducees (Acts v. 17, xv. 5, xxvi. 5) and to Christianity itself by opponents (Acts xxiv. 14, xxviii. 22), with implied censure of a factious spirit. Specially noteworthy is its application to "divisions" due, not to matters of opinion, but to breaches of the law of love (Rom. xvi. 17; Gal. v. 20; 1 Cor. i. 10; iii. 3, 4; xi. 19). In one of the latest books of the N.T. the word is used of doctrinal errors and their advocates (2 Peter ii. 1, and Jude, 4, "false teachers," "sects of perdition"). In general, the apostolic writings show a vehement antagonism towards all teaching opposed to the gospel, whether the word "heresy" is used or not. This is explained by the character of the teachings or movements so attacked. They involved such a blending of the gospel with Jewish and Pagan elements as would have destroyed everything distinctive of it. Before illustrating the theological and ecclesiastical use of the word heresy in the history of Christianity, we must briefly examine its more general significance.

Heresy in Science.—It is evident that the normal conduct of human relations implies a general similarity in the constitution of the human mind, and demands some common ground of belief or (in this sense) an "orthodoxy." Within certain wide limits, all education presupposes the necessity of furnishing to mankind some common measure for the interpretation of the facts of life. Each generation hands on to its successor a common body of knowledge and belief about the facts of the past and the present. The acceptance of a large body of "orthodoxy"—that is, of beliefs commonly held as a basis of thought and conduct—is essential to the effective and coherent action of any organized society. Heresy as to the multiplication table is not allowed. In the life of the average man, the mental forces which are his own in the sense of originality or dissent or deviation from the norm are extremely small in their extent as compared with those due to education, sympathy, imitation and similar social influences. Even in science, the discovering mind has and must have a background or basis of knowledge and belief accepted without analysis or criticism. Science has its orthodoxy as well as religion. There are things which a scientific man may not believe, and other things which he may not disbelieve without treason to the brotherhood of his craft.

From this point of view a "heresy" may be compared to a "paradox," in the sense of a proposition contrary to the body of belief on a given subject held in a particular country or a particular age, or even by most men, always and everywhere. And this fact serves to call attention to the other side of the case which we have stated. Such a proposition is not necessarily false because of its paradoxical or heretical character. Many times in the history of human thought a belief once heretical has become a universally accepted truth, "sometimes a paradox, but now the time gives it proof" (Hamlet, iii., i. 115): so Hobbes described a paradox as "an opinion not yet generally received" (English Works, edit. Molesworth, v. 304). In every age of the world there have been established systems opposed from time to time by isolated and dissentient reformers (cf. De Morgan, Budget of Paradoxes, 1872, p. 4, *sqq*). Such an established system has sometimes fallen slowly and gradually, upset by the rising influence of some one man or undermined by gradual change of opinion in the many. It must be admitted that an opinion being "generally received" implies a preoccupation of the ground which must hold good until sufficient reason is adduced against it. To this extent there is a presumption against anything "heretical"; the burden of proof lies with him who maintains it. Nevertheless, the history of science is partly the history of paradoxes becoming commonplaces and heresies becoming orthodoxies, *e.g.*, the motion of the earth, the possibility of the antipodes, the pressure of the atmosphere (as against the dogma "Nature abhors a vacuum"), the circulation of the blood, the facts of hypnotism, the electrical phenomena produced by Galvani's experiments—to mention only a few of the cases now utterly beyond the reach of controversy. Contemporary science is enlarging indefinitely its conception of natural possibility; and hitherto unknown and unsuspected facts have emerged in regions of enquiry which might have been supposed exhaustively explored, *e.g.*, the constituent gases of the atmosphere. "Such experiences indicate the need of a spirit of caution in those who may be tempted to condemn avenues of scientific enquiry as bound in advance to be unfruitful. Yet it does not follow that the march of science is impeded by such premature judgments. Rather they may be regarded as sheep-dogs, which keep the scientific flock together in its progress to those fields of thought which for the moment offer the richest pasture" (H. A. L. Fisher, Orthodoxy, p. 37, 1922).

Heresy in Religion.—In the history of religion, and above all in the history of Christianity, "heresy" implies "orthodoxy." It is beyond dispute that the system of dogma, the essentials of which are formulated in the Apostles', Nicene, and Athanasian, creeds, emerged gradually in a development which can be historically traced (see the standard Histories of Dogma, especially Seeberg, Harnack and Loofs). This developing orthodoxy forms the *main* stream in the history of Christian thought; and the various heresies which emerged during the first four centuries were dealt with as "heresies" because in every case they endeavoured to open up a more or less dangerous divergence from the main stream. The significance of heresy reached its height when the Church was regarded as the divinely ordained depository of saving truth (cf. Cyprian, De *Unitate Ecclesiae*, sec. 3; Augustine, Epistle 185, and many other passages). The simple primitive creed which can be traced in the N.T.—"Jesus Christ is Lord (κύριος)"—was found insufficient as the movement spread; and even before systematic theology (with the aid of contemporary philosophic speculation) began to take shape, a "Rule of Faith" established itself, bringing together those elements (στοιχεῖα) of Christian faith which were accounted essential. The Rule of Faith (κήρυγμα ἀποστολικόν, or παράδοσις ἀποστολική) was not directly derived from the Scriptures, but was from the apostolic tradition current in the congregations which looked to apostles as their founders. Growing at first by oral tradition, it afterwards appeared in written forms, varying in statement rather than substance, and can be traced in the early fathers (cf. A. E. Burn, Introduction to the Creeds, 1899, and The Apostles' Creed, 1912). The final form of this early Rule of Faith is found in what is now known as the Apostles' Creed. The acceptance of the Rule of Faith explains the ancient conception of heresy. Every serious departure from this Rule was attacked as heresy, with much argument and often with much abuse (cf. Bethune-Baker, Zntroduction to *the* Early History *of Christian* Doctrine, 1903, pp. 2, seq.). The heretical movements emerging in the 1st and 2nd centuries constituted a serious danger to the Christian movement. If the main stream had been diverted into any one of these channels, it would have lost itself and historical Christianity (so far as we can see) would have disappeared. In the 1st century the Jewish-Christian tendency formed such a channel. The primitive Christian communities in Palestine were Jewish Christians because they had not realized the universal character of the gospel. The historic Jewish Christian tendency was left behind and survived for a period in the form of heretical sects (see EBIONITES). In the 2nd century another channel, deeper and more dangerous, was opened up by the Gnostic schools (see GNOSTICISM; MARCION; MARCIONITES; DOCETISM). The controversy with the Gnostics largely created the Rule of Faith. The appeal to Scripture was not sufficient (apart from the fact that the N.T. Canon was only in process of formation); because the heretics had their own methods of interpreting Scripture. Hence the fathers stepped back from the written word to tradition. Another group of important heretical movements arose within the Church itself in the same century. Some theologians (especially in Rome) found insuperable difficulties in the current trinitarian terminology and

were led to surrender either one or the other of the two factors which the leaders of the Church were determined to hold together —the human and the divine in Christ (see ADOPTIONISM; MONARCHIANISM). And at the end of the century we find an enthusiastic reaction against the Church as an organized institution, with authoritative doctrine, ritual and officials appearing to enter into alliance with the world (see MONTANISM). A kindred movement afterward appeared in the time of Augustine in a different form (see DONATISTS).

The influence of these controversies continued in the 3rd century, when new divergent tendencies emerged. A revised Adoptionism, embodied in a more elaborate theology, was taught by Paul of Samosata and by Lucian at Antioch (see PAULICIANS). It spread widely, and Arius was influenced by it. During the latter part of the 3rd and part of the 4th century, the movement said to have been founded by Mani, the Mesopotamian (see MANICHAEISM), at first sight looking like a revived Gnosticism, invaded the Church; Augustine adopted it for a time, and its influence is probably found in some of the enthusiastic movements characteristic of the early mediaeval period (see below). Manichaeism, however, was not a serious danger to the Church; and the controversies characteristic of the 4th century were those arising from the Adoptionist Christology as it spread in the east through Paul of Samosata and through Origen's doctrine of the subordination of Christ to the Father (see ORIGEN). The doctrinal struggle came to a head in the contest between the followers of Arius and their opponents, afterward led by Athanasius, at the Council of Nicaea in 325 (see ARIUS; ATHANASIUS, SAINT). Arianism became a heresy, but it found defenders down to modern times. The Nicene council is a turning point in the history of heresy. The earlier heresies (as indicated above) threatened to mingle with the gospel Jewish or pagan elements fatal to its essence; while many of the later heresies were differences in the interpretation of Christian truth which did not in the same way threaten the essence of Christianity. No vital interest of Christian truth justified the extravagant denunciations in which theological partisanship so recklessly and ruthlessly indulged. Again, in the ante-Nicene period only ecclesiastical penalties. such as reproof. deposition or excommunication. could be imposed; but in the post-Nicene the union of Church and state transformed theological error into legal offense. This greatly embittered the Christological controversies which sprang from the Council of Nicaea (see MONOPHYSITES; MONOTHELITES; NESTORIANS). From the end of the 4th century the emperors accepted the view that they were bound to use their secular power against heretics for the maintenance of orthodox doctrine.

The heresies of the middle ages were not matters of doctrine merely (however important), but were symptoms of spiritual movements, common to people of many lands, and in one way or another threatening the foundations of the Roman Catholic system (see BOGOMILS; CATHARI; WALDENSES). Such movements led to active ecclesiastical legislation against heresy, and several councils in the 12th and 13th centuries declared that the secular arm was bound to punish heretics. But it was maintained that heretics must in the first instance be brought before ecclesiastical courts, and this led to the erection of special Church courts with a procedure of their own *(see* INQUISITION). In evangelical Protestantism the older attitude survived in some of the earlier Protestant constitutions, where heresy is regarded as a crime punishable by the state. Logically, evangelical Protestantism, which declines to force the consciences of its members and appeals only to Scripture for the confirmation of its doctrines, can only denounce erroneous doctrine as erroneous and deal with them by persuasion and argument, although this consideration does not prevent or invalidate disciplinary action in reference to ministers or lay members who defy the official standards of the organized Church to which they claini to belong.

J. von Dollinger, *Beiträge zur Sektengeschichte des Mittelalters;* and the standard histories of dogma and of the Church. (S. H. M.)

HEREWARD, now sometimes called THE WAKE (though this style has no contemporary warrant and probably arose from a supposed connection with the Wake family, lords of Bourne, Lincolnshire), was originally a vassal of Peterborough abbey with property in several villages in the extreme south of Lincolnshire bordering on the fens. In 1070, expecting a Danish conquest of England, he and some followers joined a Danish force that had come to Ely. Together they sacked Peterborough abbey (June 2) at Hereward's instigation; he apparently felt that the Danes might as well have Peterborough's treasures as the Norman abbot then on his way to take up his appointment. Very soon after this raid the Danes returned to Denmark; Hereward maintained himself on the island of Ely, countenanced by Thurstan, abbot of Ely (appointed by King Harold). In 1071 Ely attracted several important fugitives, notably Earl Morcar, who had a connection with Hereward's part of Lincolnshire. A methodical assault by King William won the island, but Hereward, who had distinguished himself in its defense, made a bold escape with a few men. Marvellous tales of Hereward were popular among Normans and English by the middle of the 12th century. His end is, and probably was, obscure. Contemporary and nearly contemporary writers say nothing of his career after 1071, and its legendary endings, beyond suggesting that he survived for a time as an outlaw, command little confidence. His lands were held by others in 1086.

See J. H. Round, *Feudal England* (London, 1909); *The Peterborough Chronicle of Hugh Candidus,* ed. by *W.* T. Mellows (London, 1949), with Eng. trans. (Peterborough, 1941). (ER. S.)

HERFORD, a town in North Rhine-Westphalia. Ger., situated at the confluence of the Werre and Aa, on the Minden and Cologne railway, g mi. N.E. of Bielefeld, and at the junction of the railroad to Detmold. Pop. (1959 est.) 55,236. It owes its origin to a Benedictine nunnery. said to have been founded in 832, and confirmed by the emperor Louis the Pious in 839. From the emperor Frederick I the abbess obtained princely rank and a seat in the imperial diet. The foundation was secularized in 1803. Herford was a member of the Hanseatic league, and in 1631 it became a free imperial town, but in 1647 it was subjugated by the elector of' Brandenburg. It came into the possession of Westphalia in 1807 and in 1813 into that of Prussia.

Herford possesses a Gymnasium founded in 1540, while its churches include the Münsterkirche, a Romanesque building with a Gothic apse of the 15th century and the Marienkirche, in the Gothic style. The industries include cotton and flax spinning and the manufacture of linen cloth, carpets, furniture, machinery, sugar, chocolate, tobacco and margarine.

HERGENROTHER, JOSEPH VON (1824–1890), German Catholic theologian, was born at Wiirzburg, Bavaria, on Sept. 15, 1824. He studied at Wurzburg, at Rome and at Munich, where he became instructor in theology. In 1852 he was recalled to Wurzburg as professor of ecclesiastical law and history. He was one of the most learned theologians on the ultramontane side of the infallibility question, and in 1868 was sent to Rome to arrange the proceedings of the Vatican council. In 1870 he wrote *Anti*-Janus, an answer to The Pope and the Council by Janus (Döllinger and J. Friedrich), which made a great sensation at the time. In 1877 he was made prelate of the papal household, in 1879 cardinal deacon, and afterward curator of the Vatican archives. He died in Rome on Oct. 3, 1890.

His works include *Photius, Patriarch von Constantinopel. Sein Leben, seine Schriften und das griechische Schisma, 3* vol. (Regensburg, 1867–69), and an additional volume, *Monumenta Graeca ad Photium . . . pertinentia* (1869).

HERGESHEIMER, JOSEPH (1880–1954), U.S. author, whose novels are typically concerned with the decadent and sophisticated milieu of the very wealthy, was born in Philadelphia, Pa., Feb. 15, 1880, and was educated at a Quaker school and at the Pennsylvania Academy of Fine Arts. Beginning with The Lay Anthony (1914), he established himself as a popular and prolific

writer of novels, short stories, biography, history and criticism. His work is distinguished for the baroque lushness of its descriptive passages and its often penetrating psychological insights. He went into complete retirement in 1940 and died April 25, 1954, at Sea Isle City. N.J.

His publications include: *Mountain Blood* (1915); ***The*** *Three Black Pennys* (1917); *Gold and Iron* (1918); *Java Head* (1919); *Cytherea* (1922); *The Bright Shawl* (1922); *Balisand* (1924); and *The Foolscap Rose* (1934). *See* G. Hicks, *The Great Tradition* (1933), pp. 207–56.

HERING, EWALD (1834–1918), German physiologist and psychologist, was born at Alt-Gersdorf, Saxony, on Aug. 5, 1834. In 1862 he became lecturer in physiology at the university of Leipzig. He was professor of physiology at the medico-surgical Josephs-Akademie in Vienna (1865–70); at Prague (1870–95) and then again at Leipzig.

Hering's chief work was in physiological optics and more especially the perception of colour. He gave the four-colour theory authoritative form by making it a theory of antagonistic colour-pairs (black and white, blue and yellow. red and green); and formulated the logical conclusion of the principle of the nativistic theory of the visual perception of space against the "empiristic" doctrine of Helmholtz.

See O. Klemm, *A History of Psychology* (1914); F. Hillebrand, *E. Hering* (1918); G. S. Brett, *A History of Psychology* (vol. 3, 1921).

HERIOT, originally the arms and equipment (*O.* E. *geatwa*) of a soldier or army (here). The lord of a fee provided his tenant with arms and a horse, either as a gift or loan, which he was to use in the military service paid by him. On the death of the tenant the lord claimed the return of the equipment. When by the 10th century land was being given instead of arms, the heriot was still paid, but more in the nature of a "relief."

By the 13th century the payment mas made either in money or in kind by the handing over of the best beast or of the best other chattel of the tenant (see Pollock and Maitland, History *of* English Law). For the manorial law relating to heriots, see COPYHOLD.

HERISAU, the largest town in the Swiss canton of Appenzell, built on the Glatt torrent, and by rail 7 mi. S.W. of St. Gall or 13½ mi. N.W. of Appenzell. Pop. (1960) 14,361. The lower portion of the tower of the parish church dates from the 11th century or even earlier.

About ½ mi. to the southeast is Hundwil, where the *Landsgemeinde* of Ausser Rhoden meets in the odd years (in other years at Trogen) on the last Sunday in April. Some of the finest embroideries are manufactured in Herisau.

HERITABLE JURISDICTIONS, in the law of Scotland, grants of jurisdiction made to a man and his heirs. They included civil and criminal jurisdictions, and were a usual accompaniment of feudal tenures.

The power which they conferred on great families was recognized as a source of danger to the state, and led to frequent attempts being made by statute to restrict them, both before and after the union.

They were abolished in 1746, in consequence of the rising of 1745.

HERKOMER, SIR HUBERT VON (1849–1914), a popular British painter of Victorian and Edwardian times, was born at Waal, Bavaria, on May 26, 1849, the son of a woodcarver. In 1857 he was brought to Southampton, where he began his art training. In 1866 he entered the South Kensington schools and established his reputation with "The Last Muster" (Royal Academy, 1875). He was elected an associate of the Royal Academy in 1879, a member in 1890 and was appointed Slade professor at Oxford in 1885. He worked in enamel, practised engraving and illustrating, and widely influenced art education through the Herkomer school (founded 1883) at Bushey. His pictures "Found" (1885) and "The Council of the Royal Academy, 1907" are in the Tate gallery, London. He was knighted in 1907. He died at Budleigh Salterton on March 31, 1914.

See J. Saxon Mills, *Life and Letters of Sir H. Herkomer* (1923); Sir H. Herkomer, *My School and My Gospel* (1908). (D. L. FR)

HERLIN (HERLEN), **FRIEDRICH** (d. 1491), German artist, the most distinguished member of a family of painters of the Swabian school, in the 15th century. His name occurs in the archives of Nordlingen from 1461 until his death in 1491. In 146; he was made citizen and town painter at Nördlingen, "because of his acquaintance with Flemish methods of painting." One of the first of his acknowledged productions is a shrine on one of the altars of the church of Rothenburg on the Tauber, the wings of which were finished in 1466, with seven scenes from the lives of Christ and the Virgin Mary. In the townhall of Rothenburg is a Madonna and St. Catherine of 1467. In the church of Bopfingen portions of an altarpiece of 1472 representing the "Nativity" and the "Adoration of the Magi" and "Scenes From the Life of St. Blasius"; and in the town hall of Nordlingen a triptych of 1488, representing the "Nativity" and "Christ Amidst the Doctors," at the side of a votive Madonna attended by St. Luke and St. Margaret as patrons of the painter's family. In each of these works the painter's name certifies the picture. and the manner is that of a pupil of Rogier van der Weyden. Herlin's epitaph states that he died on Oct. 12, 1491. He was buried at Nordlingen.

HERMAE, properly the plural of the name Hermes (*q.v.*). The adoration ot baetyli (*q.v.*) was and continued to be a fairly common feature of Greek cult, particularly in the more backward districts, such as Laconia. where, for instance, a meteoric stone received worship as Zeus *Kappotas* (Zeus the Descender, *i.e.*, Thunderbolt). Not dissimilar objects were the posts. pillars or heaps of rough stones set up along roads or to mark boundaries. These, like the Latin Terminus. were sacred things, and connected with the cult of Hermes; indeed, some go so far as to derive his name from *herma* (stone, rock, piece of ballast).

With the development of artistic taste and the conception of the gods as having human form (anthropomorphism). these somewhat unsightly objects tended to be replaced, often by statues, frequently also by pillars, generally square and tapering towards the bottom, so as to suggest the human figure. These were surmounted by a head, usually that of Hermes (hence the name), and had a phallus in front, half-way up. They were used, not only as cult-objects, but for all manner of purposes, as mile-stones, boundary-marks, and so forth. But that most if not all of them were regarded with respect, if not actually worshipped, is clear from the famous mutilation of the Hermae. Just before the ill-fated expedition to Sicily sailed from Athens (415 B.C.), "all the stone Hermae in the city of Athens . . . or most of them, had their faces smashed" (Thucydides vi, 27, 1). The whole city was in an uproar of superstitious panic at this impiety, and numerous trials for sacrilege resulted.

Herms are not infrequent in Roman sculpture, for example with heads of Silvanus or Iuppiter Terminus. In later times, all manner of fanciful herms were made and used as ornaments; these are commonly known by compound names, as Hermathena, Hermanubis,-and the like; but it is not clear whether this means a herm with the head of Athena, Anubis, etc., instead of that of Hermes, or a double herm having the heads of both deities, Janus fashion.

Certainly both types of herms existed, and the heads were by no means always those of gods.

See the classical dictionaries, and especially P. Paris in Daremberg-Saglio (*s.v.*). For the mutilation of the Hermae, *see* the histories of Greece; for stone-heaps, J. G. Frazer, *Golden Bough,* (3rd ed.), ix, chap. 1.

HERMANDAD, a Castilian word meaning, strictly speaking, a brotherhood. In the Romance language spoken on the east coast of Spain in Catalonia it is written germandat or *germania* (Lat. germanus, full brother). In the form *germania* it has acquired the significance of "thieves' Latin" or "thieves' cant." and is applied to any jargon supposed to be understood only by the initiated. But the typical "germania" is a mixture of slang and of the gypsy language. The hermandades have played a conspicuous part in the history of Spain. The first recorded case of the formation of an hermandad occurred in the 12th century when the towns and the peasantry of the north united to police the pilgrim road to Santiago in Calicia, and protect the pilgrims against robber knights. Throughout the mid-

dle ages such alliances were frequently formed by combinations of towns to protect the roads connecting them, and were occasionally extended to political purposes. They acted to some extent like the Fehmic courts of Germany. The Catholic sovereigns, Ferdinand and Isabella, adapted an existing hermandad to the purpose of a general police acting under officials appointed by themselves endowed with large powers of summary jurisdiction even in capital cases. In Catalonia and Valencia the germanias were combinations of the peasantry to resist the exactions of the feudal lords.

HERMAN DE VALENCIENNES, 12th-century French poet, was born at Valenciennes, of good parentage. He became a priest and wrote the *Histoire de la Bible,* which includes a separate poem on the Assumption of the Virgin. The work is generally knon-n as *Le Roman de sapience,* the name arising from a copyist's error in the first line of the poem, the first word *Comens* being miswritten in one manuscript *Romens,* and in another *Romanz.* Indeed, the work has the form of an ordinary romance, and cannot be regarded as a translation. He selects Biblicai stories to suit his purpose, and adds freely from legendary sources, displaying considerable art in the use of his materials. This scriptural poem, very popular in its day, mentions Henry II of England as already dead, and must therefore be posterior to 1189.

See *Notices et extraits des manuscrits* (vol. 34), and J. Bonnard, *Les Traductions de la Bible en vers français au nzoyen âge* (1884).

HERMANN I (d. 1217), landgrave of Thuringia and count palatine of Saxony, was the second son of Louis II the Hard, landgrave of Thuringia, and Judith of Hohenstaufen, sister of the emperor Frederick I. About 1180 he received from his brother Louis the Saxon palatinate, and married Sophia, sister of a former count palatine. In 1190 Louis died and Hermann frustrated the attempt of the emperor Henry VI to seize Thuringia as a vacant fief of the empire, and established himself as landgrave. In 1197 he went on crusade. When Henry VI died in **1198** Hermann's support was purchased by the late emperor's brother Philip, duke of Swabia, but as soon as Philip's cause appeared to be weakening he transferred his allegiance to Otto of Brunswick, afterwards the emperor Otto IV. Philip accordingly invaded Thuringia in 1204 and compelled Hermann to come to terms by which he surrendered the lands he had obtained in **1198.** After the death of Philip and the recognition of Otto he was among the princes who invited Frederick of Hohenstaufen, afterwards the emperor Frederick II, to come to Germany and assume the crown. The Saxons consequently attacked Thuringia, but the landgrave was saved by Frederick's arrival in Germany in 1212. After the death of his first wife in 1195 Hermann married Sophia, daughter of Otto I, duke of Bavaria. By her he had four sons, two of whom, Louis and Henry Raspe, succeeded their father in turn as landgrave. Hermann died at Gotha on April **25,** 1217. Walther von der Vogelweide and other Minnesingers were welcomed to his castle, and Hermann figures in story and in opera as the promoter of the famous singing contest at the Wartburg.

See E. Winkelmann, *Philipp von Schwaben und Otto IV. von Braunschweig* (1873–78); T. Knochenhauer, *Geschichte Thüringens* (1871); and F. Wachter, *Thiiringische und obersiichsische Geschichte* (1826).

HERMANN, EDUARD (1869–1950), German linguist, who specialized in comparative studies of the Indo-European languages, was born in Coburg on Dec. **19, 1869.** He was professor successively at Kiel. Frankfurt, and Gottingen, and was the author of many articles in professional journals on widely varying linguistic subjects. His *Herkunft unserer Fragefiirworter* (1943) is a useful history of German interrogative pronouns, and his small volume of exhaustive linguistic commentary on certain passages in Homer (*Sprachwissenschaftlicher Kommentar zu ausgewuhlten Stiicken aus Homer,* 1914) is a very nearly perfect example of that kind of exegesis.

Hermann died in Gottingen on Feb. **16,** 1950. (MY. F.)

HERMANN, (JOHANN) GOTTFRIED (JAKOB) (1772–1848), German classical scholar and philologist who was leader of the school that held linguistic studies to be the sole aim of philology, was born at Leipzig on Nov. **28,** 1772. He studied at Leipzig university, and spent his life there as lecturer and professor, dying on Dec. **31, 1848.** Philipp August Boeckh and Karl Otfried Müller, the representatives of the historico-antiquarian school, opposed Hermann's view of philology, regarding it as inadequate and one-sided. His early work was done in grammar and metre, his most important books being *Elementa doctrinae metricae* **(1816)** and *De emendanda ratione Graecae grammaticae* **(1801).**

HERMANN OF REICHENAU (HERIMANNUS AUGIENSIS), commonly distinguished as Hermannus Contractus, *i.e.,* the Lame (1013–1054), German scholar and chronicler, was the son of Count Wolferad of Alshausen, Swabia. Hermann became a monk of the famous abbey of Reichenau and exercised a great personal and intellectual influence on the scholars that gathered round him. He died on Sept. **24,** 1054, at the family castle. Besides the ordinary monastic studies, he devoted himself to mathematics, astronomy and music, and constructed watches and various instruments.

His chief work is a *Chronicon ad annum 1054* (continued down *to* 1066 by his pupil Bertold) which furnishes important original material for the history of the emperor Henry III. The first edition, from a MS. no longer extant, was printed by J. Sichard at Basel in 1529. A critical edition is given in Pertz's *Monumenta Germaniae historica* (vol. v.), and a German translation by K. F. *A.* Nobbe in *Die Geschichtsschreiber der deutschen Vorzeit* (2nd ed., Leipzig, 1893). The separate lives of Conrad II. and Henry III., often ascribed to Hermann, appear to have perished. His *De mensura astrolabii* and *De utilitatibus astrolabii* (to be found, on the authority of Salzburg MSS., in Pez, *Thesaurus anecdotorum novissimus,* iii.) being the first important European contributions to this subject, Hermann was for a time considered the inventor of the astrolabe. A didactic poem by him, *De octo vitiis principalibus,* is printed in Haupt's *Zeitschrift für deutsches Alterthum* (vol. xiii.); and he is sometimes credited with the composition of the Latin hymns *Veni Sancte Spiritus, Salve Regina,* and *Alma Redemptoris. A martyrologium* by Hermann, discovered by E. Diimmler in a MS. at Stuttgart, was published by him in "Das Martyrologium Notkers und seine Venvandten" in *Forschungen zur deutschen Geschichte,* xxv. (Gottingen, 1885).

See H. Hansjakob, *Herimann der Lahme* (Mainz, 1875); Potthast, *Bibliotheca med. aev.;* and *J. R.* Dieterich, *Die Geschichtsschreibung der Abtei Reichenau* (1926).

HERMANN OF WIED (1477–1552), elector and archbishop of Cologne, was the fourth son of Frederick, count of Wied (d. 1487), and was born on Jan. **14,** 1477. He became elector and archbishop of Cologne in 1515. With the aid of his friend John Gropper (1503–1559), he began, about 1536, to institute certain reforms in his own diocese. One step led to another, and as all efforts at union failed the elector invited Martin Bucer to Cologne in 1542. Supported by the estates of the electorate, and relying upon the recess of the diet of Regensburg in 1541, he encouraged Bucer to press on with the work of reform, and in 1543 invited Melanchthon to his assistance. Summoned both before the emperor and the pope, the elector was deposed and excommunicated by Paul III. in **1546.** He resigned his office in 1547, and retired to Wied. Hermann, who was also a bishop of Paderborn from 1532 to 1547, died on Aug. 15, 1552.

See C. Varrentrapp, *Hermann von Wied* (Leipzig, 1878).

HERMANT, ABEL (1862–1950), French author and dramatist, was born in Paris on Feb. **3, 1862.** A brilliant wit and an exquisite stylist, he consistently devoted his talents to describing the lighter side of life. His most characteristic works are those grouped under the general title, *Mémoires pour servir à l'histoire de la sociktk* (20 vol., 1901–37), in which with unfaltering gaiety and a humour saved only by the delicacy of its expression from appearing scabrous, he mocked the aristocracy and wealthy bourgeoisie of France. He excelled in long series of amusing dialogues. *Le Caravanskrail* (1917), a study of rich foreigners plunged into the cosmopolitan circles of Paris, is perhaps his best-known work, but the series of *Scènes de* la *vie des cours et des ambassades,* which includes *La carrière* **(1894)** and *Le sceptre* (1900), no less pungently portrays the complications of diplomacy in a dignified central European court. Among his plays may be noted *La meute* (1896), a comedy of parasites, and *Sylvie, ou* la *curieuse d'amour* (1900), which with infinite grace displays the reactions of a light-headed woman to the successive phases of revolutionary and imperial France. A more ambitious work is the long novel, Le *cycle de lord Chelsea,* 4 vols. (1923).

See Peltier, *Abel Hermant* (1924).

HERMAPHRODITE, after Hermaphroditus (*q.v.*) in Greek mythology, any organism having both male and female reproductive organs. Statues and pictures from the Greco-Roman epoch depicted humans with fully developed female bodies and male sex organs. This extreme combination, being a particularly rare abnormality, is probably the product of artists' imaginations rather than a record of actual observation.

Medicine and comparative biology have adopted the term hermaphroditism to designate conditions of various degrees of mixed male and female sexuality, in contradistinction to gonochorism, the state of separate male and female sexes. Most flowering plants and many invertebrate animals (*e.g.*, earthworms, slugs and snails) are hermaphrodites, some of them reproducing by self-fertilization. Also a few fishes produce eggs as well as sperms. However, the overwhelming number of vertebrate species, particularly reptiles, birds and mammals, are gonochorists. In an evolutionary sense hermaphroditism is the primitive form of sex distribution out of which gonochorism arose by gradual suppression of one sex.

Human hermaphrodites. — Sex expresses itself in a number of characteristics which may be placed in five groups:

1. Every cell of the body carries the sex constitution. This is a combination of male-determining and female-determining hereditary factors (*see* GENE). Each cell type becomes recognizable under the microscope by characteristic chromosomal patterns. In resting cells, female nuclei contain sex-chromatin nucleoli not present in male nuclei (fig. 1). The difference serves as indicator of cytogenetic sex.

2. The ovaries and testes (gonads or sex glands) at maturity release eggs and sperms. The embryologist recognizes sexual differentiation as early as the seventh week of development.

FEMALE (LEFT) AND MALE (RIGHT) CELL NUCLEI FROM HUMAN EMBRYOS
Arrow points to the sex chromatin of the female nucleus

3. The secondary sex characters are gonaducts, external sex organs and puberal features. The first two differentiate during the embryo's development in the uterus. The ducts are either oviducts (tube, uterus, cervix, vagina) or sperm ducts (epididymis, deferent duct, prostate). Puberal sex characters (breasts, pubic hair, beard, change of voice) develop during adolescence.

4. Of adult endocrine organs, the hypophysis, or pituitary gland, releases gonad-stimulating hormones at a constant rate in men, but at 28-day cycles in women. The gonads are influenced to produce steroid hormones: testicular androgens stimulate male secondary sex characters; ovarian gynogens and progestins, affect female secondary sex characters.

5. Many behavioral and mental traits are sex specific in animals. However, at the human level their development is strongly influenced by environmental and social factors.

In the normal individual the characteristics of these five groups show the same direction of differentiation, either male or female. Combinations fall into the hermaphrodite class (see table). Two other special types of sexual abnormalities are: the gynandromorph (*q.v.*), a mosaic individual, composed of female and male cell territories. This type is not known to occur in man but has been reported for birds and insects. The other special type, the transvestite, is entirely of one sex, as far as criteria of groups 1 to 4 are concerned, but is possessed by a yearning to dress and live like the other sex (see also HOMOSEXUALITY).

Since statistical materials about incidence of all types are meagre, estimates of frequency in large populations can only be provisional, pending collection of more reliable data.

1. True hermaphrodites have gonads with ovarial and testicular territories: either ovotestes, or an ovary on one side and a testis on the other. Only about 200 cases have been reported.

2. Pseudomales have the female cell constitution, but male appearance. The testes produce sperm in subnormal quantity or are completely sterile. At adolescence the breasts often enlarge as in women. Usually the beard is sparse.

Hermaphrodites Classified According to Prevailing Combinations of Criteria of Sexual Differentiation

Class	Cytogenetic sex	Sex of gonads	Secondary sex characters	Hormonal type	Frequency estimate
True hermaphrodite	female or male	female and male	female and male	mixed	very rare
Pseudomale	female	male	male	male or mixed	1 out of 2,000
Pseudofemale	male	none	female castrate	castrate	1 out of 2,000
Male pseudohermaphrodite	male	male	female	female	1 out of
Female pseudohermaphrodite	female	female	mixed	male or mixed	1 out of 50,000

3. Pseudofemales have the male cell constitution, but gonaducts and external sex organs of female type. Gonads are absent, and the gonaducts consist of tubes, uterus, cervix and vagina. At puberty, stature and breasts remain infantile; menses do not become established.

4. Male pseudohermaphrodites have the male cell constitution and male gonads; but during embryonic development the testes do not adequately control the development of the secondary sex characters. In the extreme case, female gonaducts are present and the external appearance is that of a girl or woman. The lightest cases are males normal except for incomplete closure of the urethra on the underside of the penis (hypospadias). The testes may either remain in the body cavity or descend into the inguinal canals or the scrotal sacs.

5. Female pseudohermaphrodites have ovaries and are constitutional females. Development of the secondary sex characters starts along the female pattern. However, at some point in fetal or adult life pathogenesis of the adrenal glands or the ovaries causes a production of androgenic hormones, exerting a masculinizing influence. The clitoris is enlarged, so that the newborn baby sometimes is mistaken for a boy; adult women develop hairiness (hirsutism), beards and low voice.

Irregularities have been observed in the chromosome number of some hermaphrodites; their possible relationship to the abnormality of sex expression was being investigated in the early 1960s. It is thought that no human hermaphrodites, and few pseudohermaphrodites, have ever been able to reproduce. Their mental outlook, female or male, is mostly determined by how they are reared. See also SEX.

Segal, "Genetic, Developmental and Hormonal Aspects of Gonadal Dysgenesis and Sex Inversion in Man," *Journal of Clinical Endocrinology and Metabolism*, 17:737-753 (1957). (EL. W.)

HERMAPHRODITUS, in Greek mythology a being, partly male, partly female, of little importance in cult (first named in Theophrastus, *Charact.* 28 [16]); the Superstitious Man garlands the *Hermaphroditi* (see Jebb-Sandys *l.c.*). The conception undoubtedly had its origin in the east, where deities of a similar dual nature frequently occur. Within the Greek area, it is found in Cyprus. Here, according to Macrobius (*Saturnalia*, iii. 8,2) there was a bearded statue of a male Aphrodite, called *Aphroditos* by Aristophanes. The legend is a product of the Hellenistic period. In accordance with this, Hermaphroditus is the son of Hermes and Aphrodite, of whom the nymph of the fountain of Salmacis in Caria became enamoured. When he bathed in her fountain, she entreated the gods that she might be forever united with him. The result was the formation of a being 'half man, half woman. This story is told by Ovid (*Metam.* iv. 285 et *seq.*) to explain the peculiarly enervating qualities of the water of the fountain. Hermaphroditus was a favourite subject in later Greek art.

See articles in Daremberg and Saglio, *Dictionnaire des antiquités*, and Roscher's *Lexikon der Mythologie;* and for art, A. Baumeister, *Denkmäler des klassischen Alterturns* (1884–88).

HERMAS, SHEPHERD OF, one of the works representing the Apostolic Fathers (*q.v.*), a hortatory writing which "holds the mirror up" to the Church in Rome during the 3rd Christian generation. This is the period indicated by the evidence of the Muratorian Canon, which assigns it to the brother of Pius, Roman bishop c. 139–154. Probably it was not the fruit of a single effort of its author. Rather its contents came to him piecemeal and at various stages in his ministry as a Christian "prophet," extending over a period of years.

In its present form it falls under three heads: Visions, Mandates, Similitudes. These titles are somewhat misleading. In the four "Visions" the author appears to be transforming his personal religious history into a type (as Bunyan did in the *Pilgrim's Progress*). He is deeply impressed by the sad state of religion among professing Christians in Rome, and the "Visions" set forth his personal call to a mission of repentance and the awakened conscience. But before Hermas announces his message to the Roman Church, and thence to the churches abroad, there are added two Visions (iii. iv.) tending to heighten its impressiveness. He is shown the "holy church" under the similitude of a tower in building, and the great and final tribulation under that of a devouring beast, which yet is innocuous to undoubting faith.

The personal revelation given in the "Visions" is then elaborated in a fresh series of revelations through an angel in the guise of a Shepherd, who in a preliminary interview announces himself as the Angel of Repentance, sent to administer the special "repentance" which it was Hermas's mission to declare: "I was sent. quoth he. to show thee *again* all that thou sawest before, to wit the sum of the things profitable for thee. First of all write thou my mandates and similitudes; and the rest, as I will show thee, so shalt thou write." This programme is fulfilled in the xii. Mandates and Similitudes i.–viii., while *Simil.* ix. is "the rest" and constitutes a distinct "book"; while Sim. x. is really an epilogue in which Hermas is "delivered" afresh to the Shepherd, for the rest of his days. He is "to continue in this ministry" of proclaiming the Shepherd's teaching, "so that they who have repented or are about to repent may have the same mind with thee," and so receive a good report before God (Sim. x. 2 2–4). Only they must "make haste to do aright," lest while they delay the tower be finished (4. 4), and the new aeon dawn (after the final tribulation: cf. Vis. iv. 3. 5). Hermas sees that mere repentance is not enough to meet the backsliding condition in which so many Christians then were, owing to the recoil of inveterate habits of worldliness entrenched in society around and within. It is, after all, too negative a thing to stand by itself or to satisfy God. "Cease, Hermas," says the Church, "to pray all about thy sins. Ask for righteousness also" (Vis. iii. 1. 6).

Value of the Work.—Here lies a great merit of Hermas's book, his insight into experimental religion and the secret of failure in Christians about him, to many of whom Christianity had come by birth rather than personal conviction. Thus they were divided in soul between spiritual goods and worldly pleasures, and were apt to doubt whether the rewards promised by God to the life of "simplicity" (all Christ meant by the childlike spirit, including generosity in giving and forgiving) and self-restraint, were real or not. For while the expected "end of the age" delayed, persecutions abounded. Such "doubled-souled" persons, like Mr. Facing-both-ways, inclined to say, "The Christian ideal may be glorious, but is it practicable?" It is this most fatal doubt which evokes the Shepherd's sternest rebuke; and, he meets it with the ultimate religious appeal, viz., to "the glory of God." He who made man "to rule over all things under heaven," could He have given behests beyond man's ability? If only a man "hath the Lord in his heart," he "shall know that there is nothing easier nor sweeter nor gentler than these mandates" (Mand. xii. 3–4). So in the forefront of the Mandates stands the secret of all: "First of all believe that there is one God. . . . Believe therefore in Him, and fear Him, and fearing Him have self-mastery. For the fear of the Lord dwelleth in the good desire," and to "put on" this master-desire is to possess power to curb "evil desire" in all its shapes (*Mand.* xii. 1–2). Elsewhere "good desire" is analysed into the "spirits" of the several virtues, which yet are organically related, Faith being mother, and Self-mastery her daughter, and so on (Vis. iii. 8. 3, *seq.*; cf. *Sim.* ix. 15). These are the specific forms of the Holy Spirit power, without whose indwelling the mandates cannot be kept (*Sim.* x. 3; *cf.* ix. 13. 2, 24, 2).

The absence of the historic names, "Jesus" and "Christ," may be due to the form of the book as purporting to quote angelic communications. This would also explain the absence of explicit scriptural citations generally, though knowledge both of the Old Testament and of several New Testament books—including the congenially symbolic Gospel of John—is clear.

Hermas faithfully reflects the Roman Church of the early 2nd century (cf. E. von Dobschiitz, "Christian Life in the Primitive Church," 1904). Indeed the prime value of the Shepherd is the light it casts on Christianity at Rome in the otherwise obscure period *c.* 110–140, when it had as yet hardly felt the influences converging on it from other centres of tradition and thought. Thus Hermas's comparatively mild censures on Gnostic teachers in *Sim.* ix. suggest that the greater systems, like the Valentinian and Marcionite, had not yet made an impression there, as Harnack argues that they must have done by c. 145. This date, then, is a likely lower limit for Hermas's revision of his earlier prophetic memoranda, and their publication in a single homogeneous work. such as the Shepherd appears to be.

BIBLIOGRAPHY.—The chief modern edition is by **O.** von Gebhardt and **A.** Harnack, in Fasc. iii. of their Patr *apost* opera (Leipzig, 1877); it is edited less fully by F. X. Funk, *Patr.* apost. (Tübingen, 1901). **A** convenient edition, with text and translation, is contained in The *Apostolic* Fathers. vol.,ii., bv Kirsopp Lake (Loeb Classical Library). For the wide literature of the subject see the two former editions, also Harnack's Chronologie der altchr. Lit. i. 257 *seq.*, and **O.** Bardenhewer, *Gesch.* der altkirchl. Lit. i. 557, seq.

HERMENEUTICS, the science or art of interpretation or explanation, especially of the Holy Scriptures. (Gr. ἑρμηνευτική sc. τέχνη, Lat. ars hermeneuticn, from ἑρμηνεύειν to interpret, from Hermes, the messenger of the gods.)

KERMES, a Greek god, son of Zeus and Maia, daughter of Atlas, and often identified with Mercury (*q.v.*) and with Casmilus or Cadmilus, one of the Cabeiri (*q.v.*). The derivation of his name and his primitive character are very uncertain. The earliest centre of his cult was probably Arcadia, where Mt. Cyllene was reputed to be his birthplace. Here he was specially worshipped as the god of fertility, and his images were ithyphallic, as also were the "Hermae" (*q.v.*) at Athens. At Cyllene in Elis a mere phallus served as his emblem, and was highly venerated in the time of Pausanias (vi. 26, 3).

Both in literature and cult Hermes was constantly associated with the protection of cattle and sheep; at Tanagra and elsewhere his title was κριοφόρος, the ram-bearer. As a pastoral god he was often closely connected with deities of vegetation, especially Pan and the nymphs. His pastoral character is recognized in the Iliad (xiv. 490) and the later epic hymn to Hermes; and his Homeric titles ἀκάκητα, ἐριούνιος, δώτωρ ἐάων ("gracious," "the ready helper," "giver of good things") probably refer to him as the giver of fertility. In the Odyssey, however, he appears mainly as the messenger of the gods, and the conductor of the dead to Hades. Hence, in later times he is often represented in art and mythology as a herald. The conductor of souls was naturally a chthonian god; at Athens there was a festival in honour of Hermes and the souls of the dead, and Aeschylus (Persae, 628) invokes Hermes, with Earth and Hades, in summoning a spirit from the underworld. With this go his functions as a dream-god; he is called the "conductor of dreams" and the Greeks offered to him the last libation before sleep. As a messenger he may also have become the god of roads and doorways; he was the protector of travellers and his images were used for boundary-marks (see HERMAE). Treasure casually found was the gift of Hermes (ἕρμαιον), and any stroke of good luck was attributed to him; this and his function as a deity of gain, honest or dishonest (κερδῶος) are natural derivatives of his character as god of fertility. The trickery and cunning of Hermes is a prominent theme in literature from Homer downwards, al-

though it is very rarely recognized in official cult. In the hymn to Hermes the god figures as a precocious child (a type familiar in folk-lore), who, when a new-born babe. steals the cows of Apollo. In many respects he was a counterpart of Apollo, less dignified and powerful, but more human than his greater brother. Hermes was a patron of music. like Apollo, and invented the cithara; he presided over the games with Apollo and Heracles, and his statues were common in the stadiums and gymnasiums. He is god of eloquence also; like hpollo he is something of a prophet, though a much inferior one. presiding over some kinds of popular divination. For his oracle at Pharae, *see* ORACLE.

The sacred number of Hermes was 4, and the 4th of the month his birthday. Apart from the Hermae, in archaic art he was portrayed as a full-grown and bearded man, clothed in a long chiton. and often wearing a cap or a broad-brimmed hat and winged boots. Sometimes he was represented in his pastoral character, as when he bears a sheep on his shoulders; at other times he appears as the messenger or herald of the gods with the herald's staff, which is his most frequent attribute. From the latter part of the 5th century his art type was changed in conformity with the general development of Greek sculpture. He became a nude and beardless youth. the type of the young athlete. In the 4th century this type was probably fixed by Praxiteles in his statue of Hermes at Olympia.

HERMES, GEORG (1775–1831), German Roman Catholic theologian, was born on April 22, 177j, at Dreyerwalde, in Westphalia, and was educated at the gymnasium and university of Münster. He was ordained in 1799 and two years after the publication of his *Untersuchungen über die innere Wahrheit des Christenthums* (Münster, 1805), became professor of theology at Münster. There his rationalistic mode of teaching and his disagreements with the Vicar-General von Droste-Vischering did little to smooth the way for his *Einleitung in die clzristkatholische Theologie* (1819–29), a work which shows the influence of Kant and Fichte, though in the first part the author severely criticizes these thinkers, especially for their views on the existence of God and on revelation. In 1820 Hermes was appointed professor of theology at Bonn where he died on May 26. 1831. His *Christkatholische Dogmatik* was published posthumously (3 vols., 1831–34). After his death, the contests between his followers and their opponents grew so bitter that the dispute was referred to Rome. The judgment was adverse, and in 1835 a papal bull condemned the *Einleitung* and the *Dogmatik*. In 1847 the condemnation of 1835 was confirmed by Pius IX.

HERMESIANAX OF COLOPHOX (b. *c.* 320 B.C.), Greek elegiac poet, has importance as an early exponent of the Alexandrian type of poetry. He was a pupil of Philetas of Cos. Athenaeus has preserved 98 lines from Hermesianax' chief work, in three books, named *Leontion* after his mistress. They catalogue with excessive sentimentality the love affairs (most of them quite fictitious) of Greek poets from Homer to Philetas and of the philosophers Pythagoras, Socrates and Aristippus. Other fragments from the *Leontion* are concerned with bucolic themes. A lost poem called *Persica* may have been an epic.

Hermesianax possessed some skill in versification, but his merits have been exaggerated.

BIBLIOGRAPHY.—Fragments in J. U. Powell, *Collectanea Alexandrina,* pp. 96–106 (1925). *See* also A. A. Day, *The Origins of Latin Love-Elegy,* pp. 19–22 (1938); A. H. Couat, *Alexandrian Poetry Under the First Three Ptolemies,* with Eng. trans. by J. Loeb, pp. 82–103 (1931). (E. A. B.)

HERMES TRISMEGISTOS, the Greek name applied to the Egyptian god Thoth (*q.v.*) as the reputed author or source of the "Hermetic" writings, works of revelation on occult subjects and on theology. Thoth was the scribe of the gods, the inventor of writing, and the patron of all the arts dependent on writing. including medicine, astronomy and magic. At least as early as Herodotus, Greeks had identified him with their god Hermes, and by the 3rd century B.C. the identification was official; on the Rosetta stone (196 B.C.) Hermes "the great, the great" is evidently Thoth. The epithet Trismegistos (Gr. "thrice-greatest") occurs only rarely outside of the Hermetic texts. It represents a development from the Egyptian *aa aa* ("great, great," *i.e.*, "greatest") which is found as an epithet of Thoth in late hieroglyphic.

The writings ascribed to Hermes-Thoth fall into two main classes: "popular" Hermetism dealt with astrology and the other occult sciences, "learned" Hermetism with theology and philosophy. From the Renaissance until the end of the 19th century little attention was paid to the popular Hermetic literature. More recent study has shown that its development preceded that of the learned Hermetism, and that it reflects ideas and beliefs which were widely held in the early Roman empire and are therefore significant for the religious and intellectual history of the time.

In the Hellenistic age it was chiefly works on astrology which were ascribed to Hermes; to these were later added treatises on medicine. alchemy, and magic. The concept which underlies astrology. that the Cosmos constitutes a unity and that all parts of it are interdependent, is basic also to the other pseudosciences. To make this principle effective in practice (and Hermetic "science," unlike Aristotelian. was intensely utilitarian) it was necessary to know the laws of sympathy and antipathy by which the parts of the universe were related. But since these assumed affinities did not, in fact. exist, and hence could not be discovered by ordinary scientific methods, recourse was had to divine revelation. There was a growing distrust of traditional Greek rationalism. and a breaking down of the distinction between science and religion. Hermes-Thoth was but one, if perhaps the most important, of the gods and prophets (chiefly oriental) to whom men turned for a divinely revealed wisdom.

The theological writings are represented chiefly by the 17 treatises of the *Corpus Hermeticum,* by extensive fragments in Stobaeus, and by a Latin translation of the *Asclepius,* preserved among the works of Apuleius; they date probably from the first three centuries A.D. All are marked by a sincere, if turgid, piety of a mystical type, but there is no single doctrine which is consistently set forth, and it is unlikely that there was any well-defined Hermetic community or "church." Though the setting is Egyptian the philosophy, like the language, is Greek.

Hermetism was extensively cultivated by the Arabs, and through them reached and influenced such men as Albertus Magnus in the west. There are frequent allusions to Hermes Trismegistos in late medieval and Renaissance literature.

(Paris, 1945–54), the only satisfactory edition of the theological works; Walter Scott, *Hermetica,* 4 vol. (Oxford, 1924–36), valuable chiefly for A. S. Ferguson's commentaries in vol. 4; A. J. Festugière, La *Révélation d'Hermès Trismégiste,* 4 vol., (Paris, 1944–54), with full references to the earlier literature; W. Gundel, *Neue astrologische Texte des Hermes Trismegistos* (München, 1936). (F. R. WN.)

HERMIAS OF ALEXANDRIA (? fl. late 5th century A.D.), Neoplatonist philosopher, was a disciple of Proclus and belongs to the Athenian rather than the Alexandrian school of Neoplatonism, though he spent his later life in his native city and, probably. taught there. His chief works were a treatise on Porphyry's *Isagoge* and a commentary on Plato's *Phaedrus (In Platonis Phaedrum scholia,* ed. by P. Couvreur, Paris, 1901). This latter work shows clearly the Athenian method of interpreting Plato inaugurated by Iamblichus and developed on the largest possible scale by Proclus. (*See* also AMMONIUS HERMIAE.)

(A. H. AG.)

HERMIT, one who withdraws from intercourse with human beings to live a life of religious contemplation. and so distinguished from a "coenobite," one who shares a liie of withdrawal with others in a community.

See ASCETICISM and MONASTICISM.

HERMIT CRAB, a crustacean of the order Decapoda (Section *Anomura*), typically with soft, asymmetrical abdomen, which the hermit in adult life protects by thrusting it into a gasteropod mollusk shell. They are found in all seas, some at considerable depths; others lead a terrestrial existence in tropical and subtropical lands, returning, however, to the sea to spawn their young. Many live under commensal conditions by association with sea anemones, annelid worms, and others animals. (*See* CRAB; CRUSTACEA; MALACOSTRACA; SYMBIOSIS.) (W. L. ST.)

HERMITE, CHARLES (1822–1901), French mathemati-

cian distinguished for the elegance of his algebraic research, was born at Dieuze and died at Paris.

Most of his formal education was obtained at the Lycée Louis-le-Grand (1840–42) in Paris, and the École Polytechnique (1842–43), where he was disqualified for lameness. Although Hermite had great difficulty in his examinations, he was already a creative mathematician at the age of 20. Having barely passed his bachelor of science examination in 1848, he was given a minor teaching position at the Polytechnique, before being appointed at the Collège de France. It was not until he was 47 that Hermite obtained a worthy position. In 1869 he became professor at the École Normale and in 1870 at the Sorbonne.

Hermite was one of the principal developers of the theory of algebraic forms, the arithmetical theory of quadratic forms and the theories of elliptic and abelian functions. Two isolated results testify to his originality and power: he solved the general quintic equation by means of elliptic modular functions; he proved the transcendence of the number *e* (the base of the natural logarithms). Most of his work is of high artistic quality. Of a generous disposition, Hermite encouraged many young mathematicians in their first serious work. (E. T. B.; X.)

HERMOGENES, of Tarsus, Greek rhetorician, surnamed the Polisher, flourished in the reign of Marcus Aurelius (AD. 161–180). His precocity secured him a public appointment as teacher of his art while he was still a boy, but at the age of 25 his faculties gave way. He had. however, composed a series of rhetorical treatises which became popular textbooks and the subject of commentaries. Of his *Art of Speaking* the sections on legal issues, on the invention of arguments, on the various kinds of style, on the method of speaking effectively and rhetorical exercises are still extant.

HERMON, the most imposing if not the highest mountain in Syria, visible far and wide. It is attached to the southern end of Anti-Lebanon. Its snowy top and the beauty of its outline inspired many images of Hebrew poetry. The Sidonians named it Sirion and it was Senir to the Amorites (Deut. iii, 9). According to one view it was the Mount of Transfiguration. To the modern Arab it is Jebel esh-Sheikh ("old man mountain") or Jebel eth-Thelj ("snow mountain"). Conder explained the former name as given because the "sheikh' of the Druses sought retirement there in the 10th century, but the hoary appearance of the mountain itself may have determined the name.

The ridge of Hermon which rises to a sharp peak is 20 mi. long. "The formation of the lower part is Nubian sandstone, that of the upper part is a hard dark-gray crystalline limestone belonging to the Neocomian period, and full of fossils." The view from the summit is very extensive and a summer sunrise over Damascus viewed from that point of vantage is an awe-inspiring sight. Hermon is covered in the spring uith snow which never entirely disappears and in autumn there is always some snow left piled up in great drifts to 20 or 30 ft. in the gullies and ravines on the mountain top. The ravines and gorges of its lower slopes to the west and southwest are fertile and the vegetation is luxuriant.

To a height of 500 ft. oaks, poplars, and brush are met. Foxes, wolves, and Syrian bears still haunt its fastnesses, if in decreasing numbers. The summit splits into three peaks the highest of which is 9,232 ft. above sea level. On the southern are the ruins of a temple dedicated probably to Baal. This peak, too, is enclosed with a wall. On the plateau separating the peaks is a cave about eight yards square. Twelve other small temples, oriented east, are found on the slopes of the mountain. They are dated by archaeologists at *c.* A.D. zoo and from them several Greek inscriptions have been recovered. (E Ro.)

HERMSDORF (Pol. SOBIECIN), a village in Wroclaw province, Poland, formerly in Silesia, near Waldenburg (Walbrzych). Pop. (1946) 12,156. There are coal mines in the vicinity and matches are manufactured. It was formerly known as Niederhermsdorf to distinguish it from other places of the same name. Perhaps the most noteworthy of these was a village in Silesia at the foot of the Riesengebirge, chiefly famous for the ruins of the castle of Kynast. This castle, formerly the seat of the Schaffgotsch family, was destroyed by lightning in 1675. A third Hermsdorf is a village in Thuringia, Ger., where porcelain is made.

HERNÁNDEZ (FERNÁNDEZ), **GREGORIO** (*c.* 1576–1636), Spanish sculptor, famous for his carved altarpieces and religious subjects, all in polychromed wood, was born in Galicia. He was a pupil of Francisco del Rincón at Valladolid. The Passion was his favorite theme, evoked with baroque intensity of expression and dramatic gravity. Attention was concentrated on the head and on the body surface. His work can be seen chiefly at Valiadolid and other cities of northern Spain. The museum at Valladolid contains, among other pieces, a St. Veronica, a Pietà, a relief of the baptism of Christ and a St. Bruno. Two statues of Christ, stretched out on a sheet—an iconographical innovation of the artist—are at Madrid (the monastery of the Sacrament and the monastery of San Plácido), and another is at near-by El Pardo. Hernández died at Valladolid on Jan. 22. 1636.

See Maria Elena Gómez Moreno, *Gregorio Fernández* (1953); George Kubler and Martin S. Soria, *The Art and Architecture of Spain and Portugal and Their American Dominions, 1500–1800* (1959).
(M. S. S.)

HERNÁNDEZ, JOSÉ (1834–1886), Argentine poet, best known for his depiction of the gauchos, was born in the Chacra de Pueyrredón, province of Buenos Aires, on Nov. 10, 1834. At the age of 14, because of illness, he left Buenos Aires to live in the pampas, where he read extensively and learned the ways of the gauchos. From 1853 to 1868 he took part in the political struggle between Buenos Aires and the provinces on the side of the latter. To defend the rights of the gauchos, he founded, in 1869, the newspaper *El Rio de la Plata.* Because of his participation in the unsuccessful revolt against Pres Domingo Sarmiento's government in 1870, he fled to Brazil (Jan. 1871). He later returned to Buenos Aires and published his famous poem *El gaucho Martin Fierro* (1872), depicting the life of a persecuted gaucho. A true American epic, the poem is recognized as the best example of *poesía gauchesca.* In the second part. La *vuelta de Martin Fierro* (1879), the hero is reintegrated into the society he had abandoned.

Hernandez died at Belgrano (a suburb of Buenos Aires) on Oct. 21, 1886.

(L. LL.)

HERNE, JAMES A. (JAMES AHERN), (1840–1901), U.S. playwright, who helped bridge the gap between the 19th-century melodrama and the 20th-century "drama of ideas," was born in Troy, N.Y., Feb. 1, 1840. After several years as a traveling actor, Herne scored an impressive success with his first play, *Hearts* of Oak (1878). Subsequent dramas, *Drifting Apart* (1885), *The Minute Men* (1886) and *Margaret Fleming* (1890), did not achieve its popularity, but in retrospect *Margaret Fleming* seems his major contribution, since it anticipates the later U.S. social drama. Herne's most popular play, *Shore Acres,* was first presented in 1892, and his last two, *The Reverend Griffith Davenport* (1899) and *Sag Harbor* (1900), were both moderately successful. Herne was especially strong in character delineation. (S. W. H.)

HERNE, a town in North Rhine-Westphalia, Ger., 15 mi. N.N.W. of Dortmund by rail. Pop. (1950) 111,591. It has coal mines, boilerworks, ammonia works, etc. Herne was made a town in 1897.

HERNE BAY, a seaside town and urban district in the Canterbury parliamentary division of Kent, Eng., 8 mi. N.E. of Canterbury by road. Pop. (1951) 18,348. It grew up after the coming of the railway in 1833 and now has a sand and shingle coast line of more than 7 mi. and a pier about $\frac{3}{4}$ mi. long. The church of St. Martin, at Herne, $1\frac{3}{4}$ mi. inland, has medieval brasses. The *Te Deum* was first sung there in English when Nicholas Ridley, later martyred, was vicar. At Reculver, 3 mi. E. through Bishopstone glen, is the site of the Roman station of Regulbium. Only traces of the walls remain. In Saxon times it was converted into a palace by Aethelbert, and in 669 a monastery was founded there by Ecgbert. Parts of the Early English church, taken down about 1805 because of the encroachment of the sea, were incorporated in St. Mary's, but its twin towers, known as the Sisters,

were preserved by Trinity house as a conspicuous landmark. The council owns caravan sites near the towers.

Catering for tourists and agriculture are the area's principal industries.

HERNIA, in surgery, the protrusion of a part from its normal cavity; thus. *hernia cerebri* is a protrusion of brain-substance, *hernia pulmonum*, a protrusion of a portion of lung. and *hernia iridis*, a protrusion of some of the iris through an aperture in the cornea, As a result of X-ray examinations herniae of abdominal viscera into the thorax through a defect in the diaphragm have been recognized. But, used by itself. hernia implies. in common language, a rupture. A rupture may occur at any weak point in the abdominal wall. The common situations are the groin (inguinal). the upper part of the thigh (femoral). and the navel (umbilical). The hernia may contain intestine alone. omentum alone. or both. The predisposing cause of rupture is abnormal length of the mesentery or of the omentum, together with some weak spot in the abdominal wall. as in an inguinal hernia. which descends along the canal in which the spermatic cord lies in the male and the round ligament of the womb in the female. **A** femoral hernia comes through a weak spot in the abdomen to the inner side of the great femoral vessels; a ventral hernia takes place by the yielding of the scar tissue left after an abdominal operation. The exciting cause of hernia is generally overexertion, as in lifting a heavy weight, jumping off a high wall, straining, constipation or excessive coughing. The pressure of the diaphragm above and the abdominal wall in front acting on the abdominal viscera causes a protrusion at the weakest point.

Rupture is either congenital or acquired. A child may be born with a hernia in the inguinal or umbilical region, owing to defective development in those parts; or the rupture may first appear, perhaps, in adult life as the result of a strain or hurt. Men suffer more often than women. because of their physical labours and greater liability to accidents, and because the canal for the spermatic cord out of the abdomen is wider than that for the round ligament of the womb.

At first a rupture is small but it gradually increases in bulk. It varies in size from a marble to a child's head. The swelling consists of three parts — the coverings, sac and contents. The coverings are the structures which form the abdominal wall at the part where the rupture occurs, thinned and matted together as the result of pressure or thickened from repeated attacks of inflammation. The sac is composed of the peritoneum or membrane lining the abdominal cavity; in some rare cases the sac is wanting. The neck of the sac is the narrowed portion where the peritoneum forming the sac becomes continuous with the general peritoneal cavity. The neck of the sac is often thickened, indurated and adherent to surrounding parts, the result of chronic inflammation. The contents are bowel, omental fat, or, in children, an ovary.

The hernia may be reducible, irreducible, or strangulated. A reducible hernia is one in which the contents can be pushed back into the abdomen. In some cases reduction is easy. in others, a matter of great difficulty. At any moment a reducible hernia may become irreducible, perhaps from inflammatory adhesions in and around the fatty contents. or from extra fullness of the bowel in the sac. **A** strangulated hernia is one in which the circulation of blood through the hernial contents is impeded by the pinching at the narrowest part of the passage. The interference is at first slight, but quickly becomes pronounced; the pinched bowel in the hernial sac swells as a finger does when a string is tightly wound round its base. Congestion is followed by inflammation, infection by microorganisms and gangrene. The rapidity with which these changes take place depends on the tightness of the constriction. As a rule, the more rapidly a hernia forms the greater the rapidity of serious change in the conditions of the bowel or omentum, and the more urgent are the symptoms. The constricting band may be one of the structures which form the boundaries of the openings through which the hernia has travelled, or it may be the neck of the sac, which has become thickened in consequence of inflammation—especially is this the case in an inguinal hernia.

Reducible **Hernia.**—With a reducible hernia there is a soft compressible tumour (elastic when it contains intestine, doughy when it contains omentum), its size increasing in the erect. and diminishing in the horizontal posture. As a rule. it causes no trouble during the night. It gives an impulse on coughing, and when the intestinal contents are pushed back into the abdomen a gurgling sensation is perceptible by the fingers. Such a tumour may be met with in any part of the abdominal wall. but the chief situations are as already given. Inguinal hernia is commoner in men, femoral. in women. As an inguinal hernia increases in size it passes into the scrotum in the male. into the labium in the female; while a femoral hernia gradually pushes upward to the abdomen.

The palliative treatment of a reducible hernia consists in pushing back the contents of the tumour into the abdomen and applying a truss or elastic bandage to prevent their again escaping. The younger the patient the more chance there is of the truss acting as a curative agent. The truss may generally be left off at night, but it should be put on in the morning before the patient leaves his bed. If. after the hernia has been once returned. it is not allowed again to come down, there is a probability of an actual cure taking place; but if it is allowed to come don·n occasionally, as it may do, even during the night, in consequence of a cough, or from the patient turning suddenly in bed, the weak spot is again opened out, and the improvement which might have been going on for weeks is undone. It is sometimes found impossible to keep up a hernia by means of a truss. and an operation becomes necessary. The principles involved in the operation are the emptying of the sac and its entire removal, and the closure of the opening into the abdomen by strong sutures: and, in this way, great advance has been made by modern surgery. In some cases tantalum screen mesh may be inserted to strengthen the ciosure. Experience has shown that few ruptures are unsuited for treatment by operation.

Irreducible Hernia. — The main symptom is a swelling in one of the situations already referred to, of long standing and perhaps of large size, in which the contents of the tumour. in whole or in part, cannot be pushed back into the abdomen. The irreducibility is the result of its large size or of changes which have taken place by indurations or adhesions. Such a hernia is a constant source of danger; its contents are liable to injury from external violence; it may at any time become strangulated. or the contents may inflame, and strangulation may occur secondarily to the inflammation. It gives rise to dragging sensations (referred to the abdomen), colic, dyspepsia and constipation. which may lead to stoppage of the passage of the contents through that portion of the intestinal canal which lies in the hernia. When an irreducible hernia becomes painful and tender a local peritonitis has occurred, which resembles in many of its symptoms a case of strangulation. and must be regarded with suspicion and anxiety. Indeed. the only safe treatment is by operation.

The treatment of irreducible hernia may be palliative; a "bag truss" may be worn in the hope of preventing the hernia getting larger; the bowels must be kept open. and all irregularities of diet avoided. But it must be repeated that a person with such a hernia is in constant danger, and if possible an operation should be performed.

In strangulated hernia the bowel or omentum is being nipped at the neck of the sac. and the flow of blood into and from the delicate tissues is stopped. The symptoms are nausea, vomiting of bilious matter, and, after a time. of faecal-smelling matter; a twisting. burning pain generally referred to the region of the navel, intestinal obstruction; a quick. wiry pulse and pain on pressure over the tumour; the expression grows anxious. the abdomen becomes tense and drumlike, and there is no impulse in the tumour on coughing, because its contents are practically pinched off from the general abdominal cavity. Sometimes there is complete absence of pain and tenderness in the hernia itself, and in an aged person all the symptoms may be slight. Sooner or later, from eight hours to eight days. if the strangulation is unrelieved, the tumour becomes livid. crackling uith gas. gangrene of the bowel at the neck of the sac takes place, followed by extravasation of the intestinal contents into the abdominal cavity; the patient has hiccough; he goes into shock and dies.

The treatment of a strangulated hernia admits of no delay; it must be operated on at once. There should be no attempt at treatment by hot bath or ice bag: operation is urgently needed. An anaesthetic should be administered, and perhaps one gentle attempt to return the contents by pressure may be made, but no prolonged attempts are justifiable, because the condition of the hernial contents may be such that they cannot bear the pressure of the fingers.

Attempts at replacement to be successful should be made in a direction opposite to the one in which the hernia has come down. The inguinal hernia should be pressed upward, outward and backward, the femoral hernia downward, backward and upward. The larger the hernia the greater is the chance of success, and the smaller the hernia the greater the risk of its being injured by manipulation and delay. In every case the handling must be absolutely gentle. If it does not succeed the surgeon must at once cut down on the swelling, carefully dividing the different coverings until he reaches the sac. The sac is then opened, the constriction divided, care being taken not to injure the bowel. The bowel must be examined before it is returned into the abdomen, and if its lustreless appearance, its dusky colour, or its smell, suggests that it is gangrenous, or is on the point of becoming gangrenous, it must not be put back or perforation would give rise to septic peritonitis, which probably would have a fatal ending. In such a case the damaged piece of bowel must be resected and the healthy ends of the bowel joined together by fine suturing. Matted or diseased omentum must be tied off and removed.

Modern pre- and postoperative care and the improvement in anaesthesia have almost eliminated the mortality from hernia operations. However, a few deaths still occur usually as a result of pulmonary embolism (a blood clot going to the lungs from the veins near the operative site or in the legs). Early ambulation tends to prevent these accidents.

HERNICI, an ancient people of Italy, whose territory was in Latium between the Fucine lake and the Trerus, bounded by the Volsci on the south, and by the Aequi and the Marsi on the north. In 486 B.C. they were still strong enough to conclude an equal treaty with the Romans (Dion. Hal., viii, 64 and 68). They broke away from Rome in 362–358 (Livy, vii, 6 ff.) and in 306 (Livy, iv, 42), when their chief town Anagnia (*q.v.*) was taken and reduced to a praefecture, and their league was broken up, though Ferentinum, Aletrium and Verulae, which had not rebelled, were allowed to remain free municipia. By 225 B.C. their territory was not distinguished from Latium generally, and it seems probable that they had then received the full Roman citizenship. The oldest Latin inscriptions of the district (from Ferentinum; *Corpus inscriptionum latinarum,* x, 5837–40) are earlier than the Social War.

HERNOSAND (HARNOSAND), a seaport of Sweden, chief town of the district (*lan*) of Vasternorrland, on the Gulf of Bothnia. Pop. (1950) 15,407. Hernosand was founded in 1584 and received its first town privileges from John III in 1587. It stands on the island of Harno (which is connected with the mainland by bridges) near the mouth of the Angerman river, 423 mi. N. of Stockholm by rail. It is the seat of a bishop and possesses a cathedral. There are engine works, timberyards and sawmills. The harbour is good, but generally icebound from mid-January to May. Timber, cellulose and wood pulp are exported.

HERO, a Greek word (ἥρως) of varying meaning whose etymology is unknown.

(1) **In Homer:** a complimentary term (roughly="gentleman," "noble"), applied to the chief characters of the poems, or even to persons of lower rank, or the free warriors generally. Hence in Hellenistic Greek, a great or noble man, a hero; sometimes also a great classical writer.

(2) **Hero-Cult.** After Homer we hear of what had probably existed before him, the cult of the distinguished dead (*see* ANCESTOR WORSHIP). The heroes, as the objects of this cult are called, are not disembodied spirits, nor demi-gods; their position is not intermediate between gods and men, but by the side of these they exist as a separate class, though minor divine figures are often confused with them. Even in Homer, traces of an earlier ancestor-worship appear; *e.g.,* in funeral games in honour of Patroclus and other heroes, while the Hesiodic account of the five ages of man is a reminiscence of the belief in the continued existence of souls in a higher life. This agrees with the clear traces in Mycenaean graves of a cult of the dead. This pre-historic worship and belief, for a time obscured, were subsequently revived. According to Porphyry (De abstinentia, iv. 22), Draco ordered the inhabitants of Attica to honour the gods and heroes of their country "in accordance with the usage of their fathers" with offerings of first fruits and sacrificial cakes every year, thereby clearly pointing to a custom of high antiquity. Heroic honours were bestowed upon the founders of a colony or city, and the ancestors of families; if their name was not known, one was adopted from legend, or invented, as the supposed ancestors of the noble and priestly families of Attica and elsewhere. Again, side by side with gods of superior rank, certain heroes were worshipped as protecting spirits of the country or state; such were the Aeacidae amongst the Aeginetans, Ajax son of Oileus amongst the Epizephyrian Locrians and Hector at Thebes.

Neglect of the worship of these heroes was held to be responsible for pestilence, bad crops, and other misfortunes, while, on the other hand, if duly honoured, their influence was equally beneficent. This belief was supported by the Delphic oracle, which was largely instrumental in promoting hero-worship and keeping alive its due observance. Special importance was attached to the grave of the hero and to his bodily remains. The grave was regarded as his place of abode, from which he could be absent only for a brief period; hence his bones were fetched from abroad (*e.g.,* Cimon brought those of Theseus from Scyros), or if they could not be procured, at least a cenotaph was erected in his honour. Their relics, the house of Cadmus at Thebes, the hut of Orestes at Tegea, the stone on which Telamon had sat at Salamis (in Cyprus) also were carefully preserved. Special shrines (ἡρῷα) were also erected in their honour, usually over their graves. Like the gods, the cult heroes were supposed to exercise an influence on human affairs, though not to the same extent, their sphere of action being confined to their own localities. Among the earliest known historical examples of the elevation of the dead to the ranks of heroes are Timesius, the founder of Abdera, Miltiades, son of Cypselus, Harmodius and Aristogeiton and Brasidas, the victor of Amphipolis, who ousted the local Athenian hero Hagnon. In course of time admission to the rank of a hero became far more common, and was even accorded to the living, such as Lysimachus in Samothrace and the tyrant Nicias of Cos. This is one of the sources of the Hellenistic and Roman cult of kings and emperors. In addition to persons of high rank, poets, legendary and others, legislators and physicians, the patrons of various trades or handicrafts, the heads of philosophical schools received the honours of a cult. Finally, hero sank into a mere complimentary term for any dead man.

The cult of the heroes exhibits points of resemblance with that of the chthonian divinities, but differs from that of the ordinary gods. Normally, sacrifice was offered at night, on a hearth (ἐσχάρα), not an altar: the blood of the victim, which was black and sacrificed with its head turned earthwards, was allowed to trickle on the ground or into a trench or tube leading to the grave to appease the departed; the technical expression for the sacrifice was not *thuein,* but *enagizein* (less commonly entemnein) and generally the flesh was not eaten but burned. The chthonian aspect of the hero is further shown by his attribute the snake, and in many cases he appears under that form himself. On special occasions a sacrificial meal of cooked food was set out for the heroes, of which they were solemnly invited to partake. The fullest description of such a festival is the account given by Plutarch (*Aristides,* 21) of the festival celebrated by the Plataeans in honour of their countrymen who had fallen at the battle of Plataea. Later theologians (see Plutarch, de defectu *oraculorum,* 10, 415B) arranged an ascending scale of heroes (beatified human souls), daimones and gods, and held that promotion from one grade to another was possible.

Teutonic Legend.—Many of the chief characteristics of the ancient Greek heroes are reproduced in those of the Teutonic North. Superhuman qualities and powers are commonly ascribed to both, an important difference being that whatever worship may have been paid to the Teutonic heroes never crystallized into a cult. This applies equally to those who have a recognized historical origin and to those who are regarded as purely mythical.

During the 19th century the "degraded gods" theory was applied not only to such conspicuous heroes as Siegfried, Dietrich and Beowulf, but to a host of minor characters. (See also Henri de Tourville, *Histoire* de la formation *particulariste,* 1903.) It is now, however, admitted that, whatever influence the one may have from time to time exercised on the other, Teutonic myth and Teutonic heroic legend were developed independently. The Teutonic heroes are, in the main, historical personages; though, like the Greek heroes, they are sometimes endowed with semi-divine attributes or interpreted as symbolical representations of natural forces.

The origin of Teutonic heroic saga, which includes that of the Germans, Goths, Anglo-Saxons and Scandinavians, is to be looked for in the traditions connected with the period of the so-called migration of nations (A.D. 350–650), the earliest traces of which are found in the works of historical writers such as Ammianus Marcellinus and Cassiodorus. It consequently rests upon a distinct basis of fact, the saga being the oldest form of historical tradition. (See also Tacitus, Annals, ii. 88.) The next step in the development of epic narrative was the single lay of an episodic character, sung by a single individual, who was frequently a member of a distinguished family, not merely a professional minstrel. Then, as different stories grew up round the person of a particular hero, they formed a connected cycle of legend, the centre of which was the person of the hero (*e.g.,* Dietrich of Bern). The most important figures of these cycles are the following.

(1) Beowulf, king of the Geatas (Jutland), whose story is an amalgamation of the myth of Beowa, the slayer of the water-demon and the dragon, with the historical legend of Beowulf, nephew and successor of Hygelac (Cochilaicus), king of the Geatas, who was defeated and slain (c. 520) while ravaging the Frisian coast. Beowulf is the hero of spring and light who, after overcoming the spirit of the raging waters, finally succumbs to the dragon of approaching winter. Others regard him as a wind-hero, who disperses the pestilential vapours of the fens. Beowulf is also a culture-hero, indicating the blessings of a fixed habitation, secured against the attacks of the sea. (2) Hildebrand, the hero of the oldest German epic. He follows his master Theodoric to the court of Attila. After 30 years' absence, he returns to his home in Italy; his son Hadubrand, believing his father to be dead, suspects treachery, and a fight takes place, in which the son is slain by the father. (3) Ermanaric, the king of the East Goths, who according to Ammianus Marcellinus slew himself (c. 375) in terror at the invasion of the Huns. With him is connected the old German Dioscuri myth of the Hartungen. (4) Dietrich of Bern (Verona), the legendary name of Theodoric the Great. Attempts have been made to identify him as a kind of Donar or god of thunder. (5) Siegfried (M.H. Ger. Sivrit), the hero of the Nibelungenlied, the Sigurd of the related northern sagas, is usually regarded as a purely mythical figure, a hero of light who is ultimately overcome by the powers of darkness, the mist-people (Nibelungen). He is, however, closely associated with historical characters and events, *e.g.,* with the Burgundian king Gundahari (Gunther, Gunnar) and the overthrow of his house and nation by the Huns. Theodor Abeling (Das Nibelungenlied, Leipzig, 1907) traces the Nibelung sagas to three groups of Burgundian legends, each based on fact. (See also the article NIBELUNGENLIED.) (6) Hugdietrich, Wolfdietrich and Ortnit, whose legend. like that of Siegfried, is of Frankish origin. It is preserved in four versions, the best of which is the oldest, and has an historical foundation. Hugdietrich is the "Frankish Dietrich" (=Hugo Theodoric) king of Austrasia (d. 534), who was illegitimate, and had to fight for his inheritance with his relatives. As the myth of the Hartungen is connected with Ermanaric, so another Dioscuri myth (of the Hartungen) is combined with the Ortnit-Wolfdietrich legend. The Hartungen are probably identical with the divine youths (mentioned in Tacitus as worshipped by the Vandal Naharvali or Nahanarvali), from whom the Vandal royal family, the Asdingi, claimed descent. Asdingi would be represented in Gothic by Hazdiggos "men with women's hair" (cf. muliebri ornatu in Tacitus), and in Middle High German by Hartungen. (7) Rother, king of Lombardy. Desiring to wed the daughter of Constantine, king of Constantinople, he sends envoys to ask her in marriage. They are thrown into prison by the king. Rother, who appears under the name of Dietrich, sets out with an army, liberates the envoys and carries off the princess. The slaying of a tame lion by one of the followers of Rother is founded in an incident which actually took place at the court of Alexius during the crusade of 1101 under Duke Welf of Bavaria, while King *Rother* was composed about 1160 by a Rhenish minstrel. Rother may be the Lombard king, Rothari (636–650), transferred to the period of the Crusades. (8) Walther of Aquitaine, chiefly known from the Latin poem *Waltharius,* written by Ekkehard of St. Gall at the beginning of the 10th century, and fragments of an 8th century Anglo-Saxon epic Waldere. Walther is not an historical figure. (9) Wieland (Volundr), Wayland the Smith, the only Teutonic hero (his original home was Lower Saxony) who firmly established himself in England. He typifies the advance from the stone age to a higher stage of civilization (working in metals). (10) Hogni (Hagen) and Hedin (Hetel), whose personalities are overshadowed by the heroines Hilde and Gudrun (Kudrun, Kutrun). In one version occurs the incident of the never-ending battle between the forces of Hagen and Hedin. The battle represents the eternal conflict between light and darkness, the alternation of day and night. The historical background is the raids of the Teutonic maritime tribes on the coasts of England and Ireland. Famous heroes who are specially connected with England are Alfred the Great, Richard Coeur-de-Lion. King Horn, Havelok the Dane, Guy of Warwick, Sir Bevis of Hampton (or Southampton), Robin Hood and his companions.

Celtic Heroes.—The Celtic heroic saga in the British islands may be divided into the two principal groups of Gaelic (Irish) and Brython (Welsh), the first, excluding the purely mythological, into the Ultonian (connected with Ulster) and the Ossianic The Ultonian is grouped round the names of King Conchobar and the hero Cuchulainn, the defender of Ulster against all Ireland, regarded by some as a solar hero. The second cycle contains the epics of Finn (Fionn Fingal) mac Cumhail and his son Oisin (Ossian) the bard and warrior (See IRISH LITERATURE; SCOTTISH LITERATURE. WELSH LITERATURE)

Of Brython origin is the cycle of King Arthur (Artus), the adopted national hero of the mixed nationalities of whom the "English" people was composed. The original Welsh legend was spread by British refugees in Brittany, and was thus celebrated by both English and French Celts. From a literary point of view, however, it is chiefly French and forms "the matter of Brittany." Arthur, the leader (comes Britanniae *dux bellorum*) of the Siluri or Dumnonii against the Saxons, flourished at the beginning of the 6th century. He is first spoken of in Nenniu's History of the Britons (9th century), and at greater length in Geoffrey of Monmouth's History of the Kings of Britain (12th century), at the end of which the French Breton cycle attained its fullest development in the poems of Chrétien de Troyes and others.

Speaking generally, the Celtic heroes are differentiated from the Teutonic by the extreme exaggeration of their superhuman, or rather extra-human, qualities. Take, for instance, the description of some of Arthur's knights in the Welsh tale of *Kilhwch* and Olwen (in the Mabinogion); Sgilti Yscandroed, whose tread was so light that no blade of grass bent beneath his weight; Sol who could stand all day upon one leg; Sugyn who was so "broad-chested" that he could suck up the sea on which were 300

ships and leave nothing but dry land. Such figures as these make no human impression, and criticism has busied itself in tracing them to one or other of the shadowy divinities of the Celtic pantheon. Remnants of their primitive superhuman qualities cling to the Celtic heroes long after they have been transfigured, under the influence of Christianity and chivalry, into the heroes of the mediaeval Arthurian romance; while memories of early myths live on, strangely disguised, in certain of the episodes repeated uncritically by the mediaeval poets. So Merlin preserves his diabolic origin; Arthur his mystic coming and his mystic passmg.

The chief heroes of the mediaeval Arthurian romances are Arthur himself, who tends however to become completely overshadowed by his knights; Merlin (Myrddin) the famous wizard, bard and warrior, first introduced by Geoffrey of Monmouth, originally called Ambrose from the British leader, Ambrosius Aurelianus, under whom he is said to have first served; Perceval (Parzival, Parsifal), the Welsh Peredur, the most intimately connected with the quest of the Grail (*q.v.*); Tristan (Tristram), the ideal lover of the middle ages, whose name is inseparably associated with that of Iseult; Lancelot, son of Ban, king of Brittany, known chiefly from his amour with Guinevere; Gawain (Welwain, Welsh Gwalchmai), Arthur's nephew, the type of knightly courage and chivalry. Among less important figures may be mentioned Kay (Kai of the Mabinogion), Arthur's foster-brother and seneschal, the type of the bluff and boastful warrior, and Bedivere (Bedwyr), the type of brave knight and faithful retainer, who alone is with Arthur at his passing, and afterwards becomes "a hermit and a holy man." (See ARTHUR, MERLIN, PERCEVAL, TRISTAN, LANCELOT, GAWAIN.)

Heroes of Romance. — Another series of heroes, forming the central figures of stories variously derived but developed in Europe by the Latin-speaking peoples, may be conveniently grouped under the heading of "romance." Of these the most important are Alexander of Macedon and Charlemagne. Alexander's name, in the form of Iskander, is familiar in legend and story all over the East to this day; to the West he was introduced through a Latin translation of the original Greek romance (by the pseudo-Callisthenes) to which the innumerable oriental versions are likewise traceable. (See ALEXANDER ROMANCES.)

More important in the West, however, was the cycle of legends gathering round the figure of Charlemagne, forming what was known as "the matter of France." The romances of this cycle, of Germanic (Frankish) origin and developed probably in the north of France by the French, contain reminiscences of the heroes of the Merovingian period, and were influenced later by the Arthurian cycle.

Charlemagne is chiefly venerated as the champion of Christianity against the heathen and the Saracens. (See CHARLEMAGNE LEGENDS.) .

The most famous heroes who are associated with him are Roland, praefect of the marches of Brittany, the Orlando of Ariosto, slain at Roncevaux (Roncesvalles) in 'the Pyrenees and his friend, and rival, Oliver (Olivier); Ogier the Dane, the Holger Danske of Hans Andersen, and Huon of Bordeaux, probably both introduced from the Arthurian cycle; Renaud (Rinaldo) of Montauban, one of the four sons of Aymon; the traitor, Doon of Mayence; Gamelon, responsible for the treachery that led to the death of Roland; Archbishop Turpin, a typical specihen of muscular Christianity; William Fierabras, William au court nez, William of Toulouse and William of Orange (all probably identical), and Vivien, the nephew of the latter and the hero of Aliscans. The late Charlemagne romances originated the legends in English form, of *Sowdone* of Babylone, Sir Otnel, *Sir* Firumbras and Huon of Bordeaux.

The chief remains of the Spanish heroic epic are some poems on the Cid, on the seven Infantes of Lara and on Fernán Gonzales, count of Castile. The legend of Charlemagne, as told in the *Crónica* general of Alfonso X., created the desire for a national hero distinguished for his exploits against the Moors, and Roland was thus supplanted by Bernardo del Carpio. Another hero of a 14th century cycle of romance was Amadis of Gaul; its earliest form is Spanish, although the Portuguese have claimed it as a translation from their own language. There is no trace of a French original.

Slavonic Heroes. — The Slavonic heroic saga of Russia centres round Vladimir of Kiev (980–1015), the first Christian ruler of that country, whose personality is eclipsed by that of Ilya (Elias) of Mourom, the son of a peasant, who was said to have saved the empire from the Tatars. It is not known whether he was an historical personage. A much-discussed work is the Tale *of Igor,* the oldest of the Russian mediaeval epics. Mention may here be made of Wainamoinen, the great magician and hero of the Finnish epic *Kalevala.* The popular hero of the Serbians and Bulgarians is Marko Kralyevich, son of Vukashin, characterized by Goethe as a counterpart of the Greek Heracles. For the Persian, Indian, etc., heroes see the articles on the literature and religions of the various countries.

HERO AND LEANDER, two lovers celebrated in Greek legend. Hero, virgin priestess of Aphrodite at Sestos, was seen at a festival by Leander of Abydos; they fell in love with each other, and he swam the Hellespont at night to visit her clandestinely, guided by a light from her tower. One stormy night the light was extinguished, and Leander was drowned; Hero, seeing his body, drowned herself likewise.

The story is preserved in Ovid (Heroides 18 and 10; authorship of both disputed), Musaeus (5th century A.D.), and in references elsewhere, none earlier than Virgil. It was also adapted by such later poets as Christopher Marlowe (Hero and Leander, completed by George Chapman) and alluded to by Lord Byron (*The* Bride of Abydos).

HEROD, the name borne by the princes of a dynasty which reigned in Judaea from 40 B.C.

HEROD THE GREAT (*c.* 73 B.C.–4 B.C.), the son of Antipater and king of Judaea (40–4 B.C.), was descended from a family of Idumaean origin. When he was 2j, his father, who had served in Caesar's campaign against Egypt, appointed him ruler of Galilee. He at once arrested Hezekiah the arch-brigand, who had overrun the Syrian border, and put him to death. For this he was cited in the name of Hyrcanus to appear before the Sanhedrin, whose prerogative he had usurped in executing Hezekiah. He appeared with a bodyguard, and the Sanhedrin was overawed. Only Sameas, a Pharisee, dared to insist upon the legal verdict of condemnation. But the governor of Syria had sent a demand for Herod's acquittal, and so Hyrcanus adjourned the trial and persuaded the accused to abscond. Herod returned with an army, but his father dissuaded him from wreaking vengeance upon his enemies.

About this time (47–46 B.C.) he was created strategus of Coelesyria by the provincial governor. In 43 B.C. Antipater was poisoned at the instigation of one Malichus, who was perhaps a Jewish patriot. Herod, with the connivance of Cassius, who was in Syria to collect war-tax, had Malichus assassinated. The country was now in a state of anarchy, owing to the extortions of Cassius and the encroachments of neighbouring powers. Antony, who became master of the East after Philippi, was ready to support the

sons of his friend Antipater; but he was absent in Egypt when the Parthians invaded Palestine to restore Antigonus to the throne of his father Aristobulus (40 B.C.). Herod escaped to Rome, where Antony, who had made him tetrarch, now persuaded the Senate to declare him king of Judaea.

In 39 B.C. Herod returned to Palestine and, when the presence of Antony put the reluctant Roman troops entirely at his disposal, he was able to lay siege to Jerusalem two years later. Secure of the support of Rome he endeavoured to legitimize his position in the eyes of the Jews by taking the Hasmonaean princess Mariamne to be his second wife. Jerusalem was taken by storm; the Roman troops withdrew to behead Antigonus the usurper at Antioch. In 37 B.C. Herod was king of Judaea, being the client of Antony and the husband of Mariamne.

The Pharisees, who dominated the bulk of the Jews, were content to accept Herod's rule as a judgment of God. Hyrcanus returned from his prison, and though his mutilation prevented him from holding office as high priest, he was able to exercise an influence favourable to the new dynasty. On the other hand, Herod's marriage with Mariamne brought some of his enemies into his own household He had scotched the faction of Hasmonaean sympathizers by killing 45 members of the Sanhedrin and confiscating their possessions. But so long as there were representatives of the family alive, there was always a possible pretender to the throne which he occupied. Mariamne's mother used her position to further the overthrow of her son-in-law; and she found an ally in Cleopatra of Egypt, who was unwilling to be spurned by him

The events of Herod's reign indicate the temporary triumphs of his different adversaries. His high-priest. a Babylonian, was deposed in order that Aristobulus III., Mariamne's brother, might hold the place to which he had some ancestral right. But the enthusiasm with which the people received him at the Feast of Tabernacles convinced Herod of the danger, and the youth was drowned by his order at Jericho. Cleopatra had obtained from Antony a grant of territory adjacent to Herod's domain and even part of it. She required Herod to collect arrears of tribute. So it fell out that, when Octavian and the Senate declared war against Antcny and Cleopatra, Herod, preoccupied in obedience to her commands, was prevented from fighting against the future emperor of Rome.

After the battle of Actium (31 B.C.) Herod executed Hyrcanus. He took in hand to deal with the Hasmonaeans, and in 25 B.C. the old intriguers, their victims like Mariamne, and all pretenders were dead. From this time onwards Herod was free to govern Palestine as a client-prince of the Roman empire should govern his kingdom. To put down the brigands and to check the raids of the Arabs on the frontier. he built or rebuilt fortresses, which were of assistance to the Jews in the great revolt against Rome He restored the temple at Jerusalem, erected magnificent buildings, founded cities. and established games in honour of the emperor, who recognized his successful government by putting the districts of Ulatha and Panias under him in 20 B.C.

But Herod found new enemies in his household His brother Pheroras and sister Salome plotted for their own advantage and against the two sons of Mariamne. The people still cherished a loyalty to the Hasmonaean lineage, although the young princes were also the sons of Herod The enthusiasm with which they were received aroused suspicion in their father's mind, and they were strangled at Sebaste On his deathbed Herod discovered that his eldest son, Antipater, had been plotting against him. He accused him before the governor of Syria and obtained leave from Augustus to put him to death. The father died five days after his son in 4 B.C He had done much for the Jews, thanks to the favour he had won from the successive heads of the Roman State; and he had observed the Law publicly.

See Josephus, *Ant.* xv., xvi., xvii. 1–8, B J i 18–33; Schiirer, ***Gesch.*** **d** iud *Völk* (4th ed., 1901–09) i., and bibliography in Herzog's *Realencyklopädie.*

HEROD ANTIPAS, son of Herod the Great by the Samaritan Malthace, and full brother of Archelaus, received as his share of his father's dominions the provinces of Galilee and Peraea, with the title of tetrarch. He fortified Sepphoris in Galilee and Betharamptha in Peraea, and founded the important town of Tiberias on the west shore of the Sea of Galilee. He reigned 4 B.C.–A.D. 39. In the gospels he is mentioned as Herod, and he it was who was called a "fox" by Christ (Luke xiii. 32). He is erroneously spoken of as a king in Mark vi. 14. It was to him that Jesus was sent by Pilate to be tried. But it is in connection with his wife Herodias that he is best known. He was married first to a daughter of Aretas, the Arabian king; but, making the acquaintance of Herodias, the wife of his brother Philip (not the tetrarch), during a visit to Rome, he arranged to marry her. Meantime his Arabian wife discovered the plan and escaped to her father, who completely defeated Herod's army. John the Baptist condemned his marriage with Herodias, and in consequence was put to death. Encouraged by his wife, Herod went to Rome to crave a crown from the emperor. Agrippa, his brother-in-law! influenced Caligula against him, and he was deprived of his dominions and banished to Lugdunum (Lyons. or Saint-Bertrand-de-Comminges), Herodias voluntarily sharing his exile.

HEROD PHILIP, son of Herod the Great by Cleopatra of Jerusalem, received the tetrarchate of Ituraea and other districts east and north-east of the Lake of Galilee. His subjects were mainly Greeks or Syrians. He is described as an excellent ruler, who loved peace and was careful to maintain justice, and spent his time in his own territories. The cities he built include Caesarea Philippi and Bethsaida, which he called Julias. He died after a reign of 37 years (4 B.C.–A.D. 34).

HEROD AGRIPPA I (10 B.C.–A.D. 44), king of Judaea A.D. 41–44, was the son of Aristobulus (Herod the Great's son by his second wife, Mariamne), who had married his cousin Berenice. His original name was Marcus Julius Agrippa (Julius because Julius Caesar had made his great-grandfather a Roman citizen; Agrippa because M. Vipsanius Agrippa had been a close friend of Herod the Great). When. in 7 B.C., Aristobulus was executed, Agrippa was sent by Herod the Great to Rome, where he grew up in the imperial court. enjoying the favour of Antonia, mother of the future emperor Claudius, and the friendship of Drusus Caesar, her nephew. So long as his mother was alive, his love of display mas kept within bounds, but after her death he soon became bankrupt. Returning to Judaea, he was rescued from utter poverty by his sister Herodias, who induced her husband Herod Antipas to give Agrippa a post as overseer of the market in his new capital, Tiberias. The two quarreled, however, and Agrippa was a wanderer once more. Eluding arrest in' Palestine for his debts to the imperial treasury and raising a loan in Alexandria, he returned to Rome in A.D. 36. There, thanks to Antonia. Tiberius appointed him tutor to his grandson Tiberius Gemellus. Agrippa also ingratiated himself with Gaius (Caligula), Tiberius' heir. An indiscreet remark that he made to Caligula, to the effect that it was high time Caligula became emperor, was repeated to Tiberius who imprisoned Agrippa (Sept. A.D. 36). Six months later, Tiberius was dead and Agrippa in favour with the new emperor. Caligula. He received the tetrarchy of Batanaea and Trachonitis, to the east of the Sea of Galilee, formerly held by his uncle Philip. Herod Antipas and Herodias tried to discredit him with the emperor, but only brought about their own banishment, Antipas' tetrarchy passing in A.D. 39 to Agrippa. Agrippa was in Rome when Caligula was assassinated in 41 and played a leading part in the elevation of Claudius, who rewarded him with the government of Judaea (which since the banishment of Archelaus had been ruled by Roman procurators) and made his brother (usually called Herod of Chalcis) king of Chalcis in southern Lebanon.

Agrippa was now king of all the territories formerly ruled by his grandfather. He showed himself a zealous champion of Jewry and Judaism (he had already used his influence with Caligula to prevent the erection of a statue of him in the temple in Jerusalem). He was therefore popular with his subjects, and his brief reign marked the peak of their material felicity. He did all in his power to crush the nascent Christian church, and after executing James, the son of Zebedee, he arrested Peter, who escaped from prison (*Acts* xii). Agrippa also started to build a third wall on the north of Jerusalem, to enclose the New City which the secu-

rity of the previous 50 years had brought into being. His sudden death in A.D. 44 from an internal disease at Caesarea during games in honour of Claudius was a disaster for Jewry, because with all his faults of sycophancy and ostentation he had successfully kept the balance between Rome and the Jews and shown that the two could co-exist to the advantage of both.

See A. H. M. Jones, *The Herods of Judaea* (1938) ; S. H. Perowne, *The Later Herods* (1958). (S. H. P.)

HEROD AGRIPPA II (A.D. 27–*c.* 100), king of Chalcis in southern Lebanon from AD. 48 and tetrarch of Batanaea and Trachonitis from A.D. 52, was the son of Herod Agrippa I (*q.v.*). Like his father, he was brought up at the Roman court. As he was only 17 when his father died in A.D. 44, the emperor Claudius re-established procuratorial government in place of the kingdom of Judaea, but Nero added Tiberias and other places to Agrippa's tetrarchy. As spiritual head of the Jews, with power to appoint the high priests, Agrippa II played a prominent role in the events which led up to the Jewish War (A.D. 66–73) and in the war itself. He was an ardent collaborator with Rome and did all in his power to prevent the rupture between Rome and Jewry, but in vain. He was known to have had incestuous relations with his sister Berenice, and this, combined with his "romanizing" views, deprived him of any real authority over his people. With his death (c. 100), the family of the Herods, of which he was the last representative, sank back into the obscurity from which his ancestor Antipater, father of Herod the Great, had raised it. It was before Agrippa that St. Paul appeared at Caesarea (Acts xxvi), and it was he who supplied Josephus with much of the material for his history of the Jewish War.

See works cited under HEROD AGRIPPA I. (S. H. P.)

HERODAS (HERONDAS) (3rd century B.C.), Greek poet, probably of Cos, was the author of mimiambi, short dramatic scenes in verse, which, apart from their intrinsic merit, are interesting in the history of Greek literature as being a new species illustrating Alexandrian methods. Mimes, of which Sophron was a leading exponent, were the Dorian product of southern Italy and Sicily—scenes of popular life written in the language of the people. They were adapted by Herodas in his mimiambi under strict conditions of technique. He used the scazon ("lame") iambic (with a dragging spondee at the end), but although he wrote in the old Ionic dialect with which that metre is associated, the structure of the sentences is close-knit Attic. The grumbling metre and quaint language suit the tone of common life which Herodas aims at realizing. His characters talk in vehement exclamations and emphatic turns of speech, with proverbs and occasionally the most naked coarseness of expression.

In mime I the old nurse calls on Metriche, whose husband is away in Egypt, and tries to interest her in a young man who is in love with her. Metriche declines with dignity, but consoles the old woman with a glass of wine. Mime II is a monologue by a tvhoremonger prosecuting a merchant for breaking into his establishment at night and attempting to remove one of the inmates, who is produced in court. The whole oration is a burlesque of an Attic speech at law. In III a desperate mother brings to the schoolmaster a truant urchin. In a stream of interminable sentences she narrates his misdeeds and begs the schoolmaster to flog him. Hoisted on another's back the boy is flogged, but his spirit does not seem to be subdued.

Mime IV is a visit of two women with an offering to the temple of Asclepius at Cos. While the cock is being sacrificed they admire the works of art, among them a highly praised procession by Apelles "the Ephesian." In V a jealous woman accuses her favourite slave of infidelity, has him bound and sent to receive 2,000 lashes. The only pleasing person in the piece is the maid-servant, who suggests to her mistress an excuse for postponing execution of the threat. A private conversation is related in VI; the subject is an ugly one, but the dialogue is clever. Interest centres on Cerdon, an artistic shoemaker who appears again in VII.

In VIII Herodas, posing as a farmer, narrates his dream of how a goat belonging to him was torn in pieces by goatherds, votaries of Dionysus, thus symbolizing contemporary criticism of his poems, and of how he afterward won a prize for leaping on greased skins, thus representing his recognition as the true successor to Hipponax, the premier choliambic poet. Of IX, "The Women at Breakfast," only a few lines survive. A few other short fragments are preserved by Athenaeus and Stobaeus.

Within the limits of 100 lines or fewer Herodas portrays an entertaining scene and characters clearly drawn. Some of these had been perfected no doubt upon the Attic stage, where the tendency in the 4th century had been to evolve accepted types. The execution has the qualities of first-rate Alexandrian work in miniature, and these little pictures bear the test of all artistic work; they do not lose their freshness with familiarity but gain in interest with increased appreciation of their subtler points.

BIBLIOGRAPHY.—The papyrus containing Mimiambi I–IX was first published by F. G. Kenyon (1891). For editions *see* J. A. Nairn, *The Mimes of Herodas* (1904); *W*. Headlam and *A*. D. Knox, *Herodas: the Mimes and Fragments,* with Eng. trans. (1922); A. D. Knox, in Loeb series, with Eng. trans (1929). For verse translation *see* H. Sharpley, *A Realist of the Aegean* (1906). (E. A. B.)

HERODIANS (Herodianoi) mentioned in the Gospels as taking up a hostile attitude to Jesus (once in Galilee and again in Jerusalem); cf. Mark iii, 6, xii, 13; Matt. xxii, 16; cf. also Mark viii, 15. In every case they are coupled with the Pharisees. The formation of the word (*cf*. "Caesariani" and "Pompeiani") favours the view that what is meant is a party among the Jews who favoured the Herodian dynasty, and were its political partisans.

Another view is that they represented a religious party known in Rabbinical literature as "Boethusians" *i.e.,* adherents of the family of Boethus, whose daughter Mariamne was one of the wives of Herod the Great, and whose sons were raised by him to the high priesthood.

HERODIANUS, Greek historian, flourished during the 3rd century A.D. He is supposed to have been a Syrian Greek. In 203 he was in Rome, where he held some minor posts; the statement that he was imperial procurator and legate of the Sicilian provinces rests upon conjecture only. His historical work (Rhodianou tes *meta Markon* Basileias historion *biblia* okto) deals with the years between the death of Marcus Aurelius and the proclamation of Gordianus III (180–238). His work supplements Dion Cassius and has the value that attaches to a contemporary record written with candour and independence of view. But while he gives a lively account of external events—such as the death of Commodus and the assassination of Pertinax—the barbarian invasions, the spread of Christianity, the extension of the franchise by Caracalla are unnoticed. The dates are often wrong, and little attention is paid to geographical details, which makes the narrative of military expeditions beyond the borders of the empire difficult to understand.

Extensive use has been made of Herodianus by later chroniclers, especially the "Scriptores historiae Augustae" and John of Antioch. His history was first translated into Latin at the end of the 15th century by Politian. The most complete edition is by G. W. Irmisch (1789–1805), with elaborate indices, but the notes are diffuse; critical editions by I. Bekker (1855), L. Mendelssohn (1883) and K. Stavenhagen (Teubner, 1922).

HERODIANUS, AELIUS, called o technikos Alexandrian grammarian. He settled at Rome, under the patronage of Marcus Aurelius (161–180), to whom he dedicated his treatise on prosody (Καθολική προσῳδία) in 21 books. Several epitomes of this work have been preserved.

His Ἐπιμερισμοί dealt with difficult words and peculiar forms in Homer. Of his many grammatical treatises, only one has come down to us in a complete form (Περὶ μονήρους λέξεως), on exceptional or anomalous words.

The best edition is by A. Lentz, *Herodiani Technici* reliquiae (1867–70); a supplementary volume is included in Uhling's *Corpus grammaticorum Graecorum.*

See W. Christ, *Geschichte der griechischen Literatur* (1898).

HERODOTUS (5th century B.C.), Greek author of a history of the Persian Wars, was born at Halicarnassus, a Greek city in southwest Asia Minor at that time under Persian rule. The precise dates of his birth and death are alike uncertain. There was

an ancient tradition that he was born in 484, but this may mean no more than that he "must have been in his prime, *i.e.,* 40 years old, in 444," when he was thought to have been in Athens and met Sophocles, and to have left for Thurii. The latest event alluded to in his History belongs to 430, but how soon after or where he died is not known. There is good reason to believe that he was in Athens, or at least in central Greece, in the early years of the Peloponnesian War, from 431; and that his work was published and known there before 425. He had been in the west for some time before this and perhaps became a citizen of Thurii (founded in 444–443).

Nor is there any means of dating his travels, which were very wide. His journey in the west indeed may well have been, as suggested, later than 443. His longer wandering covered a large part of the Persian empire: he went to Egypt, at least as far south as Elephantine (Aswan), and his visit there, or one of his visits, was after 460; to Libya; Syria; Babylonia; Susa in Elam; Lydia; Phrygia; up the Hellespont to Byzantium; to Thrace and Macedonia; by land or sea or both, northward to beyond the Danube; and to Scythia eastward along the northern shores of the Black sea as far as the Don and some way inland. These travels would have taken many years. If he were born in 484, he could hardly have started them before 450, for his mind mas already mature; he knew what he wanted to search for. But 484 is an uncertain date; he may well have been older.

Structure and Scope of the History.—Herodotus' theme in his History is the war between Greece and Persia and its preliminaries. As it has survived, it is divided into nine hooks (the division is not Herodotus' own): books i–v describe the background to the Graeco-Persian Wars (*q.v.*); books vi–ix contain the history of the wars, culminating in an account of Xerxes' invasion of Greece (book vii) and the great Greek victories of 480–479 B.C. "I am giving," he says in his opening words, "the results of my enquiries (*historiai*), so that the memory of what men have done shall not perish from the world nor their achievements, whether of Greeks or of foreigner. go unsung: they form my theme, and the cause why they went to war." Then after a brief, lighthearted narrative of mythical "aggressions" by one side or the other, culminating in the Trojan War, with different versions of them by the two sides, he goes on: "However I am not concerned with these stories: what 1 am going to narrate is the first known aggression against Greek states, and from it I shall proceed onward, mentioning many cities of men, great and small (for many that were once great are now small, and many now great were small before—human prosperity is a fragile thing). Croesus was a Lydian by birth . . ." and so the great narrative begins. But this, though not at all inconsistent with the form of the History as it was published, yet is not at all a full introduction to it; for, though they are wonderfully well combined into an organic unity, there are two parts in the History, one the systematic narrative of the war of 480–479 mith its preliminaries from 499 onward (including the Ionic revolt and the battle of Marathon, books vi–ix), the other the story of the growth and organization of the Persian empire and a description of its geography, social structure and history.

There has been much debate among modern scholars whether Herodotus from the first had this arrangement in mind or had begun with a scheme for only one part, a description of Persia, or a history of the war, and if so, with which; and the consideration which the problem has received is worthwhile even though no positive answer can be given. so skillfully has Herodotus combined all into one. The view put forward by A. Bauer in Germany, and most persuasively in England by R. W. Macan (see Bibliography) is the most probable, that he began with a plan for the history of the war, and that later he decided on a description of the empire when the question forced itself on his inquiring mind. For a man iike Herodotus was bound to ask himself. "Yes, but what do we mean when we say the Persian (or often the Mede) invaded Greece?" "How did it happen that Xerxes included in his army Scythians and Cappadocians, Lpdians, Lycians, Bactrians and Indians, besides his own Persians and Medes, and relied for his fleet on ships manned by Phoenicians and Egyptians and by some Greeks?" For Herodotus was deeply impressed not only by the great size of the Persian empire compared with all the little Greek states together, but also by the varied and polyglot nature of its army, which was yet united in a single command, in complete contrast to the Greek forces with their political divisions and disputatious commanders, although the Greeks shared a common language, religion and way of thought and the same feeling about what they were fighting for. This difference, and the meaning of "the Persian," had to be explained to his readers, and to this end he describes the empire.

A logical link between the two main sections is to be found in the account (book vii) of the march of the immense army—as on parade and as if on a parade ground—from Sardis to the Hellespont (nearly 200 mi.) on the way to the crossing by the bridge of boats into Europe. First comes a story of Xerxes' arrogance and petulance, followed by another of his savage and autocratic cruelty, then the parade—the baggage train in the van, then half the fighting force, all nations together, then a gap, for none of them came near the king; then 1,000 select Persian cavalry and 1,000 select spearmen, 10 sacred horses called Nisaean, richly caparisoned, the chariot sacred to Zeus drawn by 8 white horses with the driver walking, reins in hand (no man might ride in it), then Xerxes himself standing in his chariot drawn by Nisaean horses with his driver, a noble Persian, standing beside him. So Xerxes rode out from Sardis and, when he so minded, he would change to his carriage. Behind him were another 1,000 spearmen and select cavalry, followed by 10,000 chosen infantry and 10,000 cavalry; then a gap of two furlongs, then the rest of the army, the nations all together. With this account and with the detailed enumeration of all the national and racial elements in the force, naval and military, at the subsequent muster in Thrace, Herodotus has completed one thing that he set out to do—to explain the meaning of Xerxes' "Persian" invasion, as well as of the preliminary events of the previous 20 years; all woven into one intricate pattern.

One detail of arrangement supports this view of the development of Herodotus' theme. His method in the account of the empire is to describe each division of it not in a geographical order, but as each was conquered by Persia—by Cyrus, Cambyses and Darius; thus a picture is given of the formation of the whole, The one exception to this arrangement is Lydia which is treated at the very beginning of the history not because it was first conquered, but because it was the first foreign country to attack and overcome the Greek cities of Asia Minor; and was also of course their nearest neighbour, with whom they were already well acquainted. It would be pedantic to suggest that Herodotus would not have started in this fashion if his earliest project had been the description of the Persian empire; but for all that the form of the first section of book i fits very well with the other hypothesis and with the wording of his preface.

The first section. the history and description of Lydia and its conquest, is followed by the story of Cyrus himself, his defeat of the Medes and a description of Persia proper, his attack on the Massagetae (in the northeast, toward the Caspian) and his death. Book ii contains the succession of Cambyses, Cyrus' son, his plan to attack Egypt. and the immensely long account of that unique land and its history. This account is too long for the proportions of the whole book and is Herodotus' one failure as artist; but his zeal as historian and inquirer would not let him make it shorter. Book iii describes the conquest of Egypt. the failure of invasions to the south (Ethiopia) and west; the madness and death of Cambyses; the struggles over the succession in Persia, ending with the choice of Darius; the organization of the new vast empire by him. mith some account of the most distant provinces as far east as Bactria and northwest India; and the internal revolts suppressed by Darius. Book iv begins with the description and history of the Scythian peoples. from the Danube to the Don. whom Darius proposed to attack by crossing the Bosporus. and of their land and of the Black sea.

Then follows the story of the invasion of Scythia, which carried with it the submission of more Greek cities, such as Byzantium; of the simultaneous attack from Egypt on Libya, which had been

colonized by Greeks; and the description of the country and its colonization. Book v describes further Persian advances into Europe from the Hellespont and the submission of Thrace and Macedonia and many more Greek cities; then the beginning of the revolt of the Greek cities of Ionia against Persia, and so to the main subject of the whole work.

Method of Narration. — This bald account of the first half of Herodotus' History not only conceals its infinite variety, but is positively misleading in so far as it suggests a straightforward geographical, sociological and historical description of a varied empire. The History is more complex than that, and Herodotus' method of narration has also to be described. **A** more detailed account of the first section of the whole (Lydia), which is typical, will help to make clear the many sides of his problem.

First, he had, of course, no need to explain Greek geography, customs or political system, to his Greek readers; but he did wish to describe the political situation at the relevant times of the many Greek cities later involved in the war. This he does by means of digressions skillfully worked into his main narrative. Croesus, the king of Lydia, wishing to act before Cyrus, aho had just conquered Astyages the Mede, consulted many oracles of which that at Delphi seemed to him the truest when it appeared to encourage him in his purpose and advised him to seek Greek allies. He found that Athens and Sparta were then the most powerful of Greek cities, the one Ionian, the other Dorian (a digression on the past history of Ionians and Dorians explains the division in Greece). Athens, however, was at the time (546 B.C.) prevented from action by the struggle between Peisistratus, who was trying to confirm his position as tyrant, and the nobles; but Sparta had only a generation before established its own hegemony in the Peloponnese, and was ready to help (but was too late, Cyrus acting far more quickly than Croesus and his allies had thought possible). Similarly, much further on in the history the story is told of how Aristagoras from Miletus asked for help from Sparta and Athens for the Ionians in revolt (c. 500 B.C.), but was rebuffed at Sparta because he was too truthful about the size of the Persian empire and especially the length of the royal road from Ephesus to Susa, the Persian capital (with its regular stations and security posts and postal system — something quite unknown in Greece). However, he uas welcomed at Athens which had recently freed itself from tyranny and was full of energy and optimism. This carries with it the story of the overthrow of the tyranny, in which Sparta played a double part, which itself connects with the 6th-century history of tyranny at Corinth and Sicyon as well. Later again there is an account of fighting between Athens and Aegina, and of the heavy defeat of Argos by Sparta. All of this, and much besides, some of it only included because of Herodotus' personal interest, helps to explain the positions of these Greek states in 490 (battle of Marathon) and 480 (invasion of Xerxes).

Gift as a Storyteller. — There is a feature of Herodotus' History which is of the first importance and among the most remarkable — his love of and gift for storytelling: that is to say, his love of narrating history in the storyteller's manner (which is not unlike Homer's). For this he uses (besides narrative) dialogue and speech in the words of the speaker, which he can do because the storyteller knows what his own characters said as well as what they did. In the first chapters of his History, Herodotus begins with a story told in this manner of the accession to the throne of Lydia of Gyges, the first of the dynasty of kings of which Croesus was the fifth and last. This is followed by further stories: of Solon and Croesus; of Croesus and Adrastus (a tragic short story, told by a master of the art); of Croesus, now a captive; and of Cyrus. Such stories occur throughout the History, and are in every mood: the boyhood of Cyrus; Rampsinitus and the clever thief (an Arabian Nights sort of tale which Herodotus heard in Egypt); the comedy of the birth of Cypselus who became first tyrant of Corinth. and the grim tale of his son Periander (another masterpiece) and the latter's son Lycophron; the humorous little story uhich Herodotus himself does not believe but cannot refrain from telling, of Xerxes' narrow escape from shipwreck when he was returning from Greece. But this method of narration is not confined to the more or less separate "short story" told in digression, nor to the distant past; it is employed in the very core of the history, for instance, Miltiades' exhortation to Callimachus on the field of Marathon, Artabanus' warnings to Xerxes of the difficulties and risks of the invasion, the debates between the Greek leaders before the battle of Salamis. There is no need to doubt that Miltiades made such an exhortation, though not on the battlefield but to the assembly or council in Athens before the army moved out; and was, though not commander, the moral author of the victory; nor that such warnings as those of Artabanus were given to Xerxes; the strife between the Greek leaders and the tireless insistence of Themistocles is, without doubt, historically true. But these things are the more easily credible because of the convincing reality of Herodotus' writing, much of it in the storyteller's rather than the historian's manner.

Outlook on Life. — The story of Croesus in book i gives Herodotus the occasion to foreshadow, as it were, in Croesus' talk with Solon (a conversation chronologically impossible, but not of course invented by Herodotus), the generalized meaning of the story of the Persian Wars, and so of his whole History — that great prosperity is "a slippery thing," and may lead to a fall; more particularly if it is accompanied by arrogance and folly as in Xerxes, but not only then. Croesus is throughout a sympathetic figure, kindly, generous in the extreme to one in misfortune, only childishly pleased with his great wealth and confident that nothing can go wrong — so he laughs at Solon's warning that no man can be called happy before the end of his life, until tragedy comes to him, the death of his son; then he recovers, and lightheartedly, without due thought, undertakes the attack on Cyrus "before Persia grows too strong" — and total disaster follows. The main story — Xerxes' invasion of Greece — is an even clearer case: a war, which by all human reasoning should have been won, was irretrievably lost. This does not mean that Herodotus, any more than his older contemporary, the poet Aeschylus, simply accepted the old moral "pride goes before a fall"; it was a matter of common observation and proved overwhelmingly true by the greatest event of his time.

In this connection another point must be made. It is often asserted that for Herodotus (and for Aeschylus and others) men are but puppets of an all-powerful fate and that in consequence his story of "pride and fall, sin and retribution, has for him no ultimate moral significance." (J. E. Powell: introduction to his translation of Herodotus, p. xxi, published by Clarendon Press, Oxford; see Bibliography.) This is thought to be confirmed by the story of Croesus, who had been such a generous giver to Apollo's shrine at Delphi only to be rewarded at the end by the deceiving oracle "that if he should attack Cyrus he would destroy a great empire"; then, when after his fall he upbraided the oracle and asked if it were the Greek gods' habit to be ungrateful, he received the reply: "it was caused by the wrongdoing of Gyges your ancestor, in seizing the throne, a sin which fate decreed should be atoned in the fifth generation after, and not even the gods can override fate." But Herodotus has related as clearly as he can that Gyges had the choice whether to commit a crime or die rather than commit it, and "he chose to live"; and Croesus himself, when Delphi reminded him that in so grave a matter he should have inquired more fully into the meaning of a dubious oracle, admitted his responsibility. The story of Glaucus the Spartan who sought, with Delphic aid, to defraud a Milesian of his money, has a similar structure. Herodotus was not an analytic philosopher, but he knew the meaning of a man's responsibility for his actions.

Qualities as a Historian. — Herodotus was a great traveler, with an eye for detail and for the whole, a good geographer, and a man with an indefatigable interest in the customs and past history of his fellow men, and of the widest tolerance, with no bias in favour of Greek and against the barbarian. He was neither naïve nor easily credulous. It is this which makes the first half of his work not only so readable but of such historical importance. In the second half he is largely, but by no means only, writing military history; and it can easily be shown that he knew little of military matters: he moves immensely large armies from place to place as though they were single travelers and problems

of supply hardly existed; his detailed battle pieces are scarcely ever acceptable or even consistent. Yet he understood at least one essential of the strategy of Xerxes' invasion, the Persians' dependence on the fleet though they came by land, and therefore the decisive importance of the sea battle of Salamis (*q.v.*). Similarly in the political story: he is commonly content with a personal motive of a trivial (though psychologically revealing) kind —the contrast with Thucydides is as wide as can be. Yet here again he understood certain essentials: that the political meaning of the struggle between the great territorial empire of Persia and the small Greek states was not independence only. but the rule of law as the Greeks understood it; and that the political importance of the battle of Marathon for the Greek world was that it foreshadowed the rise of Athens (confirmed by Salamis) to a position of equality and rivalry with Sparta and the end of the long-accepted primacy of the latter. He knew that war was not only a question of victory or defeat, glorious as the Greek victory was, but brought its own consequences in its train, no matter who won. "The ships which Athens sent to help the Ionians in their revolt (499 B.C.) were the beginning of suffering for Greeks and non-Greeks" (v. 97). There was an earthquake at Delos in 490, when the Persian armament had just passed on its may to Marathon, which was unique and a portent of the evils which were to fall on Greece, "for during the next three generations more evil befell than during the 20 before, partly caused by Persia, partly by the leading Greek states themselves quarreling for power." Not, it will be noted, simply a portent of the glorious victory of Greek over barbarian.

Was the History Finished? — It has been questioned whether Herodotus died before his work was finished, on two grounds. He makes a couple of promises which he has not fulfilled, one of them, the account of Assyria, leaving a notable gap in the whole; but it is impossible now to be sure of the reason for this. Others have thought that he could not have intended to end where he does with the Greek capture of Sestos on the Hellespont in 479 B.C., for the war went on for another 30 years and did not formally cease until 449. Herodotus' main theme. however, was the invasion of 480–479 and with the revolt of the Ionians and the fall of Sestos the Persians practically ceased to be on Greek soil. Aeschylus' framework for his tragedy was the same and Thucydides agreed in this, as in so many other things, with Herodotus.

Conclusion. — Herodotus had had his predecessors in prose writing (whose works are now lost), especially Hecataeus of Miletus (*q.v.*), a great traveler whom Herodotus mentions more than once—to criticize for inaccuracy in his book and to praise as a practical statesman. But they, for all their charm: says Dionysius, also of Halicarnassus, wrote either chronicles of local events. of one city or another, covering a great length of time, or comprehensive accounts of travel over a large part of the known world. none of them creating a unity, an organic whole. In the sense that he created a work that is an organic whole Herodotus was not only the first of Greek, and so of European, historians; he was also the first European writer of prose. His true predecessor. Homer. wrote in verse; and Aristotle's praise of Homer by contrast with other poets of epic—who thought that 'if they had a single title of a city or a hero, *Thebais* or *Heracleias,* they had achieved artistic unity—is analogous to Dionysius' just estimate of Herodotus.

Herodotus' work is not only an artistic masterpiece; for all his mistakes (and for all his fantasies) he remains the leading authority not only for Greek history of the particular period with which he is concerned, but for much of that of western Asia and of Egypt.

BIBLIOGRAPHY.—Many early editions and commentaries remain valuable, despite later archaeological discoveries in the middle east. Among them are: H. Stein, *Herodoti Historiae* (1869–71); A. H. Sayce, *Ancient Empires of the East, Herodotus I–III* (1883); R. W. Macan, *Herodotus IV–VI* (1895), *Herodotus VII–IX* (1908); C. Hude, *Historia,* Oxiord classical texts: 2 rol., 3rd ed. (1927); W. W. How and J. Wells, *Commentary on Herodotus,* rev. ed. (1928). The Budé edition, with French trans. is by P. E. Legrand, 9 vol. (1932–54). Eng. trans. by J. E. Powell, Oxiord Library of Translations, 2 vol. (1949), a scholarly work. but in quaint English with a biblical flavour: the preface summarizes his views on the composition of the *History* and contains an account of all previous translations into English. *See* also J. E. Powell, *Lexicon to Herodotus* (1938) and *History of Herodotus* (1939) which gives a view of its composition contrary to that argued in this article; G. B. Grundy, *The Great Persian War* (1901); T. R. Glover, *Herodotus* (1924); J. L. Myres, *Herodotus: Father of History* (1953); P. E. (A. W. GE.)

HEROET, ANTOINE, surnamed La MAISON-NEUVE (d. 1568), French poet, bishop of Digne, was born in Paris of a family connected with the chancellor Olivier. His poetry belongs to his early years, for after he had taken orders he ceased to write profane poetry. His chief work is *La Parfaicte Amye* (Lyons, 1542) in which he developed the idea of a purely spiritual love, based chiefly on the reading of the Italian Neo-Platonists. The book aroused great controversy. La Borderie replied in *L'Amye de cour* with a description of a very much more human woman, and Charles Fontaine contributed a *Contr' amye de cour* to the dispute. Héroet, in addition to some translations from the classics, wrote the *Complainte d'une dame nouvellement surprise d'amour,* an *Epistre a François Ier,* and some pieces included in the now very rare *Opuscules d'amour par He'roet, La Borderie et autres divins poetes* (Lyons, 1547). Héroet belongs to the Lyonnese school of which Maurice Scève may be regarded as the leader.

See H. F. Cary, *The Early French Poets* (1846).

HEROIC ROMANCES, the name of a class of imaginative literature which flourished in the 17th century, principally in France. The beginnings of fiction in that country took a pseudo-bucolic form with the celebrated *Astrée* (1610) of Honoré d'Urfé (1568–1625); but this ingenious and diffuse production was the source of a vast literature, which took many and diverse forms. Although its action was, in the main, languid and sentimental, there was a side of the *Astrée* which encouraged that extravagant love of glory, that spirit of "panache," uhich was now rising to its height in France. That spirit it was which animated Marin le Roy, sieur de Gomberville (1600–74), the inventor of the Heroic Romances. In these there was experienced a violent recrudescence of the mediaeval elements of romance. the impossible valour devoted to a pursuit of the impossible beauty, but the whole clothed in the language and feeling and atmosphere of a later age. In the *Carithée* of Gomberville (1621) we have a pastoral which is already beginning to be a heroic romance, and a book in which, under a travesty of Roman history, an appeal is made to an extravagantly chivalrous enthusiasm. A further development was seen in the *Polyxène* (1623) of François de Molière, and the *Endymion* (1624) of Gombauld; in the latter the elderly queen, Marie de' Medici, was celebrated under the disguise of Diana, for whom a beautiful shepherd of Caria nourishes a hopeless passion. The earliest of the Heroic Romances, pure and simple, is, however, the celebrated *Polexandre* (1629) of Gomberville. The author began by intending his hero to represent Louis XIII, but he changed his mind, and drew a portrait of Cardinal Richelieu. The story deals with the adventures of a hero who visits all the seacoasts of the world, the most remote as well as the most fabulous, in search of an ineffable princess, Alcidiane. This absurd, yet very original piece of invention enjoyed an immense success. There was an equal amount of geography and more of ancient history in the *Ariane* (1632) of Desmarets de Saint-Sorlin (1595–1676), which has been greeted by Paul Morillot as the most readable of all the Heroic Romances.

Calprenède and Scudéry.—The type of that class of literature, however, has always been found in the highly elaborate writings of Gauthier de Coste de la Calprenède (1609–63), which enjoyed for a time a prodigious celebrity. His *Cassandre,* which appeared in ten volumes between 1642 and 1645, is perhaps the most characteristic of all the Heroic Romances. It deals with the decline of the empire of Alexander the Great. It must not be supposed, however, that la Calprenhde makes the smallest effort to deal with the subject accurately or realistically. The figures are seigneurs and great ladies of the court of Louis XIII., masquerading in Macedonian raiment. The passion of love is dominant, and it is treated in the most exalted and hyperbolical spirit. La

Calprenede followed up the success of his *Cassandre* with a *Cléopâtre* (1647) in 12 volumes, and a *Faramond* (1661) which he did not live to finish. It should be said that la Calprenkde objected to his books being styled romances, and insisted that they were specimens of "history embellished with certain inventions." He may, in opposition to his wishes, claim the doubtful praise of being, in reality, the creator of the modern historical novel.

The vogue of the historical romance was carried to its height by a brother and a sister, Georges de Scudéry (1601–67) and Madeleine de Scudkry (1608–1701), whose elephantine romances remain as portents in the history of literature. These novels—there are five of them—were signed by Georges de Scudkry, but it is believed that all were in the main written by Madeleine. The earliest was *Ibrahim, ou l'Illustre Bassa* (1641); it was followed by *Le Grand Cyrus* (1648–53) and the final, and most preposterous member of the series was *Clélie* (1649–54). The romances of Mlle. de Scudkry (for to her we may safely attribute them) are much inferior in style to those of la Calprenkde. They are pretentious, affected and sickly. The author abuses the element of analysis. and pushes a psychology, which was beyond the age in penetration, to a wearisome and excessive extent.

Vogue in England.— In England the Heroic Romance had a period of flourishing popularity. All the principal French examples were translated, and "he was not to be admitted into the academy of wit who had not read *Astrea* and *The Grand Cyrus.*" The vogue of these books in England lasted from about 164j to 1660, and led to the composition of original works in imitation of the French The most remarkable of these was *Parthenissa,* published in 1654 by Roger Boyle, Lord Broghill and afterwards earl of Orrery (1621–79). Addison speaks in the *Spectator* of the popularity of all these huge books, "the *Grand Cyrus,* with a pin stuck in one of the middle leaves, *Clélie,* which opened of itself in the place that describes two lovers in a bower." M. Jusserand has analysed what may be considered the very latest of the race, *Pandion and Amphigenia,* published in 1665 by the dramatist, John Crowne.

See G. de Percel, *De l'usage des romans* (1734); J. J. Jusserand, *Le Roman anglais au XVII^e siècle* (1888); André Le Breton, *Le Roman au XVII^e siècle* (1890); P. Morillot, *Le Roman en France depuis 1610* (1894). (E. G.; X.)

HEROIC VERSE, a term exclusively used in English to indicate the rhymed iambic line or HEROIC COUPLET. In ancient literature the heroic verse was the hexameter. It was in this measure that the *Iliad* and *Odyssey* and the *Aeneid* were written. In English, however, it is not enough to designate a single iambic line of five beats as heroic verse because it is necessary to distinguish blank verse from the distich, consisting of two rhymed lines, each of ten syllables. In French the Alexandrine has always been regarded as the heroic measure of that language. The current form of English heroic verse appears to be the invention of Chaucer. who used it in his *Legend of Good Women,* and afterwards, with still greater freedom, in the *Canterbury Tales.* He was followed nearly a century later by the Scottish poet, called Blind Harry (*c.* 1475), whose *Wallace* holds an important place in the history of versification as having passed on the tradition of the heroic couplet. Another Scottish poet, Gavin Douglas, selected heroic verse for his translation of the *Aeneid* (1513) and displayed, in such examples as the following, a skill which left little room for improvement at the hands of later poets:—

> "One sang, 'The ship sails over the salt foam,
> Will bring the merchants and my leman home';
> Some other sings, 'I will be blithe and light,
> Mine heart is leant upon so goodly wight.'"

The verse so successfully mastered was, however, not very generally used for heroic purposes in Tudor literature. The early poets of the revival, and Spenser and Shakespeare after them, greatly preferred stanzaic forms. For dramatic purposes blank verse was almost exclusively used, although the French had adopted the rhymed Alexandrine for their plays. In Elizabethan England heroic verse was often put to somewhat unheroic purposes, mainly in prologues and epilogues, or other short poems of occasion; but it was nobly redeemed by Marlowe in his *Hero and Leander* and respectably by Browne in his *Britannia's Pastorals.* It is to be noted, however, that those Elizabethans who, like Chapman and Drayton, aimed at producing a warlike and Homeric effect, did so in shambling 14-syllable couplets. The one heroic poem of that age written at considerable length in the appropriate national metre is the *Bosworth Field* of Sir John Beaumont (1582–1628). Since the middle of the 17th century, when heroic verse became the typical and for a while almost the solitary form in which serious English poetry was written, its history has known many vicissitudes. After having been the principal instrument of Dryden and Pope it was almost entirely rejected by Wordsworth and Coleridge, but revised, with various modifications, by Byron, Shelley (in *Julian and Maddalo),* and Keats (in *Lamia).* In the second half of the 19th century its prestige was restored by the brilliant work of Swinburne in *Tristram* and elsewhere. Alfred Noyes, in *Drake,* and G. *K.* Chesterton, in *Lepanto,* varied the rhythm and increased the sonority of the line.

HEROIN, a derivative of morphine (diacetylmorphine) having a similar action. As an analgesic it is from four to eight times more powerful than morphine, but it also produces more undesirable side effects in the form of respiratory depression. Heroin was introduced as a substitute for morphine to minimize the danger of addiction, but subsequent experience showed it to be even more dangerous in this respect. It makes addicts more easily than morphine does, and the addiction is harder to cure. Its most important use in medicine is to relieve cough, but any advantages are more than offset by the addiction liability. Its manufacture and importation are forbidden in the United States, and it was deleted from the British pharmacopoeia in 1953. Heroin represents a major addiction problem, contributing a large portion of the total illicit traffic in narcotics. It has been estimated that 75% of drug addicts on the eastern seaboard of the United States are users of heroin. *See* also DRUG ADDICTION; MORPHINE.

(V. E.)

HÉROLD, LOUIS JOSEPH FERDINAND (1791–1833), French composer of early romantic operas, was born in Paris Jan. 28, 1791. He was a pupil of Charles Simon Catel and Joseph Méhul, winning the Prix de Rome in 1812. His first opera *La Gioventù di Enrico V* (the overture to which became known under its French title, *La Jeunesse de Henri V*) was produced in 1815 at Naples where Hérold was court pianist. On his return to Paris he collaborated with François de Boieldieu in the opera *Charles de France* (1816); he produced 12 light operas at the Opéra-Comique between 1817 and 1830. In 1823 he collaborated with Auber in *Vendôme en Espagne,* produced at the Paris Opéra where four of his ballets were given between 1827 and 1829, including the four-act *La Belle au bois dormant.*

In 1831 his *Zampa* and, the following year, *Le Pré aux clercs* were produced at the Opéra-Comique. Though these operas were later to be known only by their overtures, they revealed a novel use of instrumental colour deriving from Weber, and also a subtle sense of characterization. His last opera *Ludovic* was completed by Fromental Halévy. Like Auber and Boieldieu, Hérold brought the *opéra-comique* to the borders of romantic opera, and anticipated in his later works the style of Berlioz. Hérold was also a prolific composer of piano and chamber music, which includes four piano concertos and works for unusual combinations of wind instruments. He died in Paris, Jan. 19, 1833.

BIBLIOGRAPHY.—F. Hérold, "Souvenirs inédits," *La Revue de la Societe Internationale de Musique* (1910); H. Berlioz, *Les Musiciens et la Musique* (1903); A. Pougin, *Hérold* (1906). (E. LR.)

HERON, any long-legged, long-necked wading bird of the suborder Ardeae. order Ciconiiformes. The boat-billed heron (*Cochlearius cochlearius),* ranging from Mexico to Brazil, constitutes the family Cochleariidae. About 30 genera and about 60 species, widely distributed over the world but commonest in the tropics, form the family Ardeidae. They have broad wings; long, straight, sharp-pointed bill; the feet have comb-edged middle claws, probably used for grooming. Egrets (*q.v.*) develop lacy nuptial plumes over the back. Bitterns (*q.v.*) are smaller, stouter, browner herons with shorter necks.

Herons perch hunched in trees, stand quietly in shallows or wade

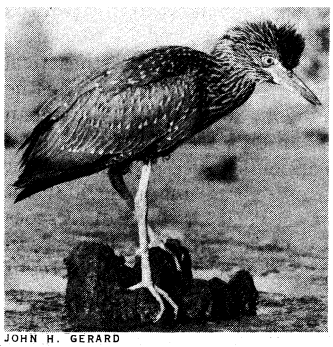
slowly for fish, frogs or other small animals, which they capture with a quick thrust of their daggerlike bill. They fly low over water, or high with leisurely flapping wings, head folded against body and legs trailing loosely. The nests are usually grouped in colonies called heronries. Each nest consists of a rough platform of sticks constructed in a tree or bush near water. Three to five pale, dull-blue eggs are usually laid. Helpless downy young grasp the parents' bill and receive partly-digested food.

ALLAN D. CRUICKSHANK FROM NATIONAL AUDUBON SOCIETY

GREAT BLUE HERON (ARDEA HERODIAS)

Some herons are insect feeders and land dwellers. Among these is the cattle egret *(Bubulcus ibis)* of Africa. Asia and southern Europe. It is often seen perched on the backs of water buffalo who transport the bird and serve as a source of ticks. During the period from about the 1940s to the 1960s, this species invaded the Americas where it has spread rapidly and has nested in numbers, especially in Florida and the tropics. It has been reported from Newfoundland to Bolivia.

The blue-gray heron *(Ardea cinerea),* 36 in. long, of Europe, Asia, Madagascar and Africa, mas once hunted with falcons. The great blue heron *(A. herodias),* 50 in. long, ranges from Alaska and Nova Scotia to southern Mexico and the Galapagos Islands. Other large dull herons live in South America, Africa, southern Asia, the Philippines and Australia. Africa is the home of the giant or goliath heron (A. *goliath)* which stands *j* ft. tall. The great white heron *(A. occidentalis)* breeds in southern Florida, Cuba, Jamaica and Yucatán.



JOHN H. GERARD

YELLOW-CROWNED NIGHT HERON (NYCTINASSA VIOLACEA)

The medium-sized purple heron (A, *purpurea)* is common over most of the old world. The little green heron *(Butorides virescens),* 18 in. long, is common from southern Ontario and Oregon to Panamá; a close relative *(B. striatus)* ranges over South America, Africa. southern and eastern Asia. Australia and nearby islands. The little blue heron *(Florzda coerulea),* 22 in. long, white when young, occurs from Delanare and the gulf states to Argentina; the white-bellied Louisiana heron *(Hydranassa tricolor),* 26 in. long, occurs in the Carolinas and gulf states to northern South America.

Night herons have thicker bills, shorter legs and are more active in the twilight hours and at night. The black-crowned night heron (*Nycticorax nycticorax)* ranges over the Americas. Europe, Africa and Asia; N. *caledonicus* in Australia, New Caledonia and the Philippines; yellow-crowned night heron *(Nyctinassa violacea)* from New Jersey and Indiana to southern Brazil.

(G. F. Ss.; Ht. Fn.)

HERO (Heros) OF ALEXANDRIA, Greek geometer and writer on mechanical and physical subjects. Hero's reference in his *Dioptra* to a lunar eclipse, visible in Alexandria in A D 62, shows that he lived in the 1st century A D

Of Hero's mechanical norks, the *Pneumatica, Automatopoietice, Belopoeica* and *Cheiroballzstra* survive in Greek. The *Pneumatica,* in tno books. describes many interesting contrivances such as siphons, "Heron's fountain," "penny-in-the-slot" machines, a fire engine, a water organ and arrangements employing the force of steam. The *Belopoeica* (on engines of war) purports by its title to be based on a work by Ctesibius, who lived about 250 B.C. in Alexandria. Hero's *Mechanics,* in three books, is extant in Arabic, though not in its original form. This work is cited by Pappus, as is also the *Barulcus,* "weight-lifter," probably the same treatise under a different name. Book ii of the *Mechanics* deals with the five mechanical powers and mechanical problems of daily life. and Book iii with the construction of engines of all sorts. Both the *Belopoeica* and the *Mechanics* contain Hero's solution of the problem of the two mean proportionals.

The geometrical works attributed to Hero that survive in Greek bear the titles *Metrica, Definitiones, Geometria, Geodaesia, Stereometrica* (i. ii), *Mensurae* and *Liber Geeponicus.* The *Metrica* was discovered as recently as 1896 by R. Schone in a manuscript at Constantinople. It is by far the most important, as it is the most genuine, of the geometrical works of Hero, and proves him to have been an accomplished mathematician. The other works containing. like the *Metrica,* problems of mensuration are not Hero's in their present form. A good part of their contents is based on geometrical rules developed in Mesopotamia in the second millennium B.C. and was commonly known in the Hellenistic period. A remarkable feature is the statement of a variety of close approximations to the square roots of numbers that are not complete squares; the *Metrica* describes a general method of finding successive approximations to the values of such surds. as well as a method of approximating the cube root of a noncube number; the former throws light on similar approximations to surds stated in Archimedes and in astronomical works; *e.g.,* Ptolemy's *Almagest.* Book i of the *Metrica* includes the mensuration of triangles, quadrilaterals, regular polygons from the equilateral triangle to the regular dodecagon, circles and segments thereof, an ellipse, a parabolic segment, and of the surfaces of cylinders, right cones, spheres and segments thereof. Book ii shows how to measure the content of solid figures, including cones, pyramids, frusta of such solids, a sphere and a segment thereof, the five regular solids, besides the two remarkable solid figures measured by Archimedes in his *Method* (a solid like a hoof cut off by a plane from the end of the cylinder, and a solid made up of eight such "hoofs"). Book iii gives some problems of the same type as those in Euclid's treatise *On Divisions* (of figures). Akin to the geometrical works is that *On the Dioptra,* a remarkable book on land surveying. so called from the instrument described in it, which was used for the same purposes as the modern theodolite; this treatise contains also an astronomical chapter which describes a graphical method for the determination of the distance between Alexandria and Rome by means of the difference of local time in the simultaneous observation of a lunar eclipse. Chapter 30 gives the proof of "Heron's .formula" for the area of a triangle in terms of its sides,

$$\Delta = \sqrt{\{s(s-a)(s-b)(s-c)\}}$$

This formula is, however, older than Hero; al-Biruni (d. 1048) quotes Archimedes for it.

Hero also wrote *Catoptrica* (on reflecting surfaces); and it seems certain that this is extant in a Latin translation by William of Moerbeke of a work which was formerly thought to be a fragment of Ptolemy's *Optics.* Hero explains the rectilinear propagation of light as well as the law of reflection by the principle of minimal distance. Of other treatises by Hero only fragments remain. One on water clocks in four books is referred to by Pappus and Proclus. Another was a commentary on Euclid's *Elements,* quotations from which are found in the extant Arabian commentary by An-Nairizi.

Bibliography.—The "geometrical" works (other than the *Metrica),* in Greek only, were edited by F. Hultsch (*Heronis Alexandrini geometricorum et stereometricorum reliquiae,* 1864). Except for the treatises on *Engines of War* (also edited by C. Wescher, *Polyorrttique des Grecs,* 1867), the authoritative edition is *Heronis Alexandrini opera quae supersunt omnia,* included in Teubner's series; vol. i and supplement (by W. Schmidt) contains the *Pneumatica* and *Automata,* the fragment on water clocks, etc.; vol. ii, pt. i (L. Nix and W. Schmidt), the *Mechanics, Catoptrica,* etc.; vol. iii (H. Schone), the *Metrica* and *Dioptra;* vol. iv and v (J. L. Heiberg), geometrical works. The *Belopoiica* were edited by H. Diels and E. Schramm in *Abh. preuss. Akad.*

Wiss. (1918). For accounts of Hero's works *see* Tittel in *A.* Pauly and G. Wissowa, *Real-Encyclopädie,* 8, 1, 992–1080 (1912); Sir T. L. Heath, *History of Greek Mathematics,* vol. ii, pp. 298–354; A. G. Drachmann, *Ktesibios, Philon, and Heron, a Study in Ancient Pneumatics* (1948). (T. L. H.; O. E. N.)

HEROPHILUS (*fl.* 300 B.C.), Alexandrian anatomist, was born at Chaludon, and was one of the founders of a school of anatomy at Alexandria.

Being one of the first to perform post-mortem examinations, he studied the eye and cataract, traced the sinuses of the dura mater to their meeting point, still called the torcular herophili, and described the ventricles of the brain, an organ which he regarded as the centre of the nervous system. The nerve trunks he distinguished into sensory and motor branches. He also gave careful accounts of the liver, salivary glands. pancreas and the genital tracts of both sexes, and emphasized the curative powers of drugs, dietetics and gymnastics. Herophilus wrote commentaries on the works of Hippocrates, a book for midwives and a treatise on the causes of sudden death.

HERPES is a term for skin eruptions of different origin in which grouped vesicles appear on a reddened base. Such eruptions are herpes simplex *(see* COLD SORE). herpes zoster *(see* SHINGLES), herpes gestationis, herpes tonsurans, etc.

HERPETOLOGY, the study of amphibians and reptiles (*qq.v.*).

HERR, HERBERT THACKER (1876–1933), U.S. engineer, made significant contributions to the field of steam turbine power by conibining the highly efficient reaction element of the Parsons system with the lighter weight impulse elements of the Curtis-Ratcau system *(see* TURBINE: STEAM) Herr covered this development in a paper published in 1913 entitled, "Recent Developments in Steam Turbines," for which he was awarded the Edward Longstreth medal of the Franklin institute, Philadelphia.

Herr also pioneered in production of "floating frame" reduction gearing. under Melville-McAlpine patents, for propulsion of merchant marine and naval vessels..

Born in Denver, Colo., March 19, 1876, he graduated from Yale university in 1899 with a degree in mechanical engineering. Herr became vice-president and general manager of the Westinghouse Machine company in 1908 and of the Westinghouse Electric and Manufacturing company in 1915. During World War I he served as advisory engineer to the Emergency Fleet corporation of the U.S. Shipping board. Herr died Dec. 19, 1933.

(PL. H.)

HERRERA, FERNANDO DE (called EL DIVINO) (1534–1597), Spanish lyric poet, a leading member of a group of humanists who constituted an informal academy under the count of Gelves. was born in Seville and spent all his life there. He was a conscientious man of letters, ever seeking to elevate the tone of his writings in accordance with Renaissance theory and his own idealistic temperament, both illustrated in his meticulous and extensive *Anotaciones a las obras de Garcilaso de la Vega* (1580), which aroused the anger of certain critics. His sonnets and elegies, of delicate workmanship! on Petrarchan models, express his platonic love for "Luz," the countess of Gelves, but his finest work consists of patriotic odes, rich in Old Testament rhetoric, and melodious eclogues; all show an important advance in style over the previous generation. Herrera also composed two prose treatises on historical subjects.

See A. Coster, *Fernando de Herrera (El Divino)* (1908).

(C. C. SH.)

HERRERA, FRANCISCO DE (EL VIEJO) (*c.* 1576–1656/57), Spanish painter and engraver, was born in Seville. He is said to have studied under Francisco Pacheco and to have been for a short time the master of Velázquez, and he has been claimed as the originator of a neu national style that culminated in the achievements of Velázquez. It seems, however, that Herrera was a follower rather than a forerunner of the new style. His earliest known works, an engraving of St. Ignatius Loyola (1610) and a painting of the "Pentecost" (1617; Toledo, Greco museum), are in the Mannerist tradition. far removed from the simple Caravaggesque naturalism of Velázquez' earliest works of about 1617. Later compositions, such as "The Apotheosis of St. Hermenegild" (c. 1624; Seville museum), echo the Venetian manner of Juan de las Roelas. A marked development in the direction of naturalism first appears in three scenes from the life of St. Bonaventura (Prado; Villandry) commissioned in 1627 by the Franciscan convent in Seville; and this may be attributed to the influence of Francisco de Zurbarán, who contributed four paintings to the series. Naturalism in Herrera is accompanied by a broad technique, akin to José (Giuseppe) Ribera's; but in later works, like the "St. Basil" (1637; Louvre), his brushwork becomes so coarse that it distorts the forms.

Some time after 1638, when he is Iast documented in Seville, Herrera moved to Madrid, where he probably remained for the rest of his life. He seems to have been unaffected by the later development of Velázquez or by other court painters. But the elongated forms and elaborate draperies of "St. Joseph" (1648; Madrid, Lázaro museum), his last documented work. suggest that he may have been influenced by the style of Van Dyck.

Herrera appears to have acquired considerable fame in Seville in his own time and though he can have played no part in the formation of Velázquez' style, he does, with Roelas, mark the transition from Mannerism to Baroque and had some influence on the later development of the school of Seville. "The Miracle of the Loaves and Fishes" (Madrid, archiepiscopal palace), for instance. was the model for Bartolomé Murillo's painting of this subject in the Hospital de la Caridad, Seville.

See J. S. Thacher, "The Paintings of Francisco Herrera, the Elder," *The Chicago Art Bulletin,* 19 (Sept. 1937). (E. Hs.)

HERRERA, FRANCISCO DE (EL MOZO) (1622–1685), Spanish painter and architect. born in Seville, was the son and pupil of Francisco Herrera *el viejo.* After fleeing from his father (who was noted for his bad temper), Herrera the Younger is said to have continued his studies in Rome, where he became famous for his paintings of still life with fish and was known as *lo spagnuolo degli pesci.* But as a painter he is now known only for a few religious compositions. "The Adoration of the Blessed Sacrament" (1656) and "The Ecstasy of St. Francis" (1657), painted on his return from Italy for Seville cathedral, reflect the latest developments of Roman baroque (violent movement, theatrical effect, etc.), nhich he probably introduced into Seville. Thus he may have influenced the development of Bartolomé Esteban Murillo and, more particularly, of Juan de Valdés Leal.

In 1660 Herrera the Younger was appointed vice-president under Murillo of the nenly founded Academy of Painting in Seville; but he soon left for Madrid where he was active as a painter of frescoes and altarpieces and as an architect and designer of retables. In 1672 he mas appointed painter to the king and in 1677 surveyor general As an architect he is said to have been the first to introduce the style of Francesco Borromini into Spain; and his design for the high altar of the church of Montserrat, Madrid, has been claimed as a model for José Churriguera. He died in Madrid, Aug. 25. 1685. (E. Hs.; X.)

HERRERA a province in southern Panamá, on the Gulf of Panama, is the smallest province of the country, and has the highest population density. Pop. (1950) 50,095; Area 907 sq.mi. The province consists mostly of level to rolling plains and is especially important in the production of corn. rice, sugar, and a variety of vegetables and fruits. It also ranks high in the number of beef and dairy cattle, swine and poultry. It ships quantities of these products by boat and truck to the Canal Zone, only about 100 mi. east. (C. F. J.)

HERRERA Y TORDESILEAS, ANTONIO DE (1559–1625), Spanish historian, secretary to Vespasian Gonxago and first historiographer of the Indies. His *Historia general* de *los hechos de los Castellanos en las islas y tierra firme del Mar Oceano* (1601) is borrowed largely from other manuscripts, especially those of Bartolomé de Las Casas and Cervantes de Salazar.

The nork is, on the whole, accurate and unprejudiced, though confused. It was translated into English in 1740.

HERRICK, MYRON T. (1854–1929), U.S. diplomat, was born at Huntington, O., on Oct. 9, 1854. He studied law in Cleveland and was admitted to the bar in 1878. He practised in Cleveland from 1878 to 1886 and then turned his attention to

banking and manufacturing. He also became interested in politics and held many local and state offices in the Republican organizations, serving six times as delegate to the Republican national convention and once (1892) as presidential elector from Ohio. From 1903–06 he was governor of Ohio, having been elected by the largest majority that had been given to an Ohio governor up to that time. He was forced by his business interests to decline appointments as secretary of the treasury under McKinley and again under Taft, but in 1912 accepted the latter's appointment as ambassador to France. He continued to serve under Wilson, and at the outbreak of World War I also assumed charge of the German and Austrian embassies and later those of Turkey and minor nations. During the Marne offensive of 1914 when the French government moved to Bordeaux, Herrick maintained headquarters in Paris. He formed the American committee, which gave help to Americans and others traveling in Europe at the outbreak of the war. With Mrs. Herrick he established the American Ambulance hospital at Neuilly, staffed and managed by Americans. After his return to America in Dec. 1914, he continued to devote much of his time to war relief activities, and in recognition of his services, France conferred upon him the cross of the Legion of Honour. Herrick was one of the initiators of the rural credit movement in the United States; he published *Rural Credits* (1914). In April 1921 he was again appointed ambassador to France and served in this post until his death in Paris on March 31, 1929.

See T. Bentley Mott, *Myron T. Herrick* (1929).

HERRICK, ROBERT (1591–1674), English poet in whom the spirit of the ancient classical lyric was born again, was the seventh child of Nicholas Herrick, of Cheapside, London, and was baptized there on Aug. 24, 1591. Nicholas died in 1592 under suspicion of suicide; his children inherited a few hundred pounds each. In 1607 Robert was apprenticed to his uncle, Sir William Herrick, one of the most prosperous and influential of London goldsmiths; and Robert doubtless took advantage of the situation to cultivate the society of the London wits. In 1613 he went to St. John's college, Cambridge, where he seems to have had a lively circle of friends. Apparently his money was still held in trust by Sir William, who had often to be reminded (in letters still extant) that the next instalment was due. Partly to reduce his expenditure he moved to Trinity hall and graduated from there in 1617, taking his M.A. in 1620. He was ordained in 1623. His reputation as a poet seems to have been highest about 1620–30, and he probably then lived in London again for a time, in touch with court society and enlarging his acquaintance with writers and musicians. In 1627 he went as a chaplain to the duke of Buckingham on the expedition to the Île de Ré. Two years later he was presented to the living of Dean Prior, Devonshire, where he lived, unmarried, for the rest of his life, except that in 1646, because of his Royalist sympathies, he was removed from his living and did not return to it until after the Restoration. He was buried at Dean Prior, Oct. 15, 1674. The only book he published was *Hesperides* with *His Noble Numbers* (1648), containing about 1,400 poems, mostly very short. From these and from other evidence it appears that he was sensible, affectionate and friendly, "much beloved by the Gentry for his florid and witty Discourse," occasionally bored in Devonshire, but appreciating the advantages of seclusion and simple living, the beauty of nature and the daily interest provided by the behaviour of ordinary men and women. And always there was the delight of composing and revising his poems and the faith that they would eventually make him famous.

The appeal of Herrick's poetry lies in its truth to perennial human sentiments and its perfection of form and style. Frequently light, worldly and hedonistic, and making few pretensions to passion or profundity, it yet covers a wide range of fancy and feeling, including moments of serious reflection and poignant sadness. It owes debts to ancient classical literature, especially to Anacreon, Horace, Ovid and Martial; to classical myths and English folklore; to English lyrics and Italian madrigals. It is also influenced by the Bible and patristic literature, the source of many doctrinal aphorisms in *His Noble Numbers;* and by contemporary English writers, notably Ben Jonson and Robert Burton. Variously intended and shaped, it includes elegies, epigrams, satires, love songs, marriage songs, complimentary verse to friends and patrons, celebrations of rustic and ecclesiastical festivals, and evocations of the superstitious beliefs and ceremonies of the countryside, the elves at their feasts and devotions, the night hag riding the storm, the charms to keep evil spirits at bay. Yet Herrick reveals himself less clearly in his poetry than a first reading may suggest. He had a dramatic bent and could easily slip into a fictitious character or an imaginary situation. One poem is addressed to "his supposed wife" and probably his numerous "mistresses," Julia, Anthea and the rest, were no more tangible. He believed, with reason, that he would be remembered as a poet of love; but he is remembered still more for poetry that tells of evanescence, of the rosebuds we are to gather while we may, the daffodils that fade too soon and the joyful meadows left desolate in autumn. "The Argument of his Book," prefixed to *Hesperides,* beginning

> I sing of Brooks, of Blossoms, Birds and Bowers,
> Of April, May, of June, and July-Flowers,

emphasizes his lighter subject matter, and does too little justice to his versatility.

But to Herrick, with his overruling concern for art, themes and occasions would be of smaller account than the poems that they help to create, the address to Julia more important than Julia herself. Sense or thread there must be, but often there is not much and attention fixes on the articulation, fluency and harmony of the phrasing. Often the effects are aural rather than visual or intellectual, and Herrick excels in the kind of poetry that comes nearest to music, by its "concord of sweet sounds," by its precision of outline, and by asking to be accepted more for what it is than for what it conveys. Hence it is rewarding to study his workmanship in detail, the interplay of thought, imagery and rhythm, the metrical accomplishment, the tensions and relaxations, the "sweet disorder" and the "wild civility." Such technical mastery can seldom be long sustained and nearly all Herrick's best things are little things. But no one of his time, not even Milton, sought perfection more devotedly, and because of this he has taken his place among the most accomplished, if not among the greatest, lyrical poets.

Herrick's reputation has varied considerably. The esteem in which he was held for a time is shown by the number of manuscript commonplace-books (dating *c.* 1620–40) that contain poems by him. Few were published before 1648. Of printed miscellanies in which he is represented, *Witts Recreations* (1650) has the largest number (75). Some were printed in songbooks, from 1652 onward. Otherwise his poetry went largely unnoticed until about 1800, after which a great revival set in. The first of many 19th- and 20th-century selections appeared in 1810 edited by J. Nott, the first complete reprint in 1823 edited by T. Maitland.

HERRICK, ROBERT (1868–1938), U.S. writer and novelist, was born in Cambridge, Mass., April 26, 1868. After graduating from Harvard in 1890, he taught composition at Massachusetts Institute of Technology for three years. He left in 1893 to teach in the English department of The University of Chicago, remaining on the staff until 1923. He spent much of World War I in Europe, where he wrote signed articles for the *Chicago Tribune.* In 1935 he was appointed secretary to the governor of the Virgin Islands. He died there Dec. 23, 1938.

Almost all Herrick's stories are set in Chicago. He classified them as "idealistic" or "realistic." The idealistic group includes *The Real World* (1901), *A Life for a Life* (1910), *The Healer* (1911) and *Clark's Field* (1914). His three most important novels, however, were realistic: *The Common Lot* (1904), *The Memoirs of an American Citizen* (1905) and *Together* (1908). Herrick also wrote short stories, critical essays and textbooks.

HERRIES, JOHN MAXWELL, 4TH LORD (*c.* 1512–1583), Scottish politician, was the second son of Robert Maxwell, 4th Lord Maxwell (d. 1546). In 1547 he married Agnes (d. 1594), daughter of William Herries, 3rd Lord Herries (d. 1543), and in

1567 he obtained the title of Lord Herries. Maxweil had become prominent among the men who rallied round Mary queen of Scots, although during the earlier part of his public life he had been associated with the religious reformers and had been imprisoned by the regent, Mary of Lorraine. From March 1566, when Maxwell joined Mary at Dunbar after the murder of David Rizzio and her escape from Holyrood, he remained one of her stauchest friends, although he disliked her marriage with Bothwell. He led her cavalry at Langside, and after this battle she committed herself to his care.

Herries rode with the queen into England in May 1568, and he and John Lesley, bishop of Ross, were her chief commissioners at the conferences at York. After returning to Scotland, Herries was imprisoned by the regent Murray. He was among the supporters of the regent Lennox until his death on Jan. 20, 1583. His son William, 5th Lord Herries (d. 1604), was warden of the west marches.

HERRIN, a city of Williamson county, Ill., U.S., is 45 mi. N. of the Ohio river, about 55 mi. N.N.E. of Cairo. It is strategically located within a cluster of coal belt towns, and although no longer dependent on coal, abandoned mines and their lonely chimneys still linger. First settled in the early 19th century, the city was incorporated in 1900.

Though generally a quiet, conservative community, Herrin was the scene of a tragic labour dispute known as the "Herrin massacre" in 1922. In that year, when the nation's coal fields were closed by strikes and lockouts, a mining company attempted to operate a strip mine with nonunion labour. On June 22 several hundred striking union miners forced the nonunion workers at the mine to surrender and promised them safe conduct. After being marched to a point near Herrin the captives were ordered to run for their lives under fire; more than 20 were killed and others were wounded. A grand jury returned 214 indictments for murder and other offenses. After several acquittals by trial juries the remaining indictments were dismissed.

Soon after World War II, Herrin's citizens raised $900,000 to attract new industries. The effort was successful and local factories now make washing machines, neon signs, upholstery, dresses and staple machines. By the 1960s Herrin's economy was stabilized. Nearby Crab Orchard lake provides adequate water supply and a variety of recreational facilities. For comparative population figures *see* table in ILLINOIS: *Population.* (D. A. PR.)

HERRING, a fish, probably the world's most plentiful, belonging to the genus *Clupea,* more specifically, the Atlantic herring (C. *harengus*) and the Pacific herring *(C. pallasi*). These two species are circumpolar in distribution and may be merely geographical varieties of the same species. They are beautifully coloured fish with silvery, iridescent sides and deep blue, metallic backs.

In the Atlantic ocean herring are caught from the Bay of Biscay northward to the White sea and in the Baltic. They extend westward and northward to Spitsbergen, Iceland, Greenland and along the North American coast from Labrador to Long Island. In the Pacific ocean they are caught from the United States-Mexican border north to Golovin bay, near Nome, Alaska, across the Aleutian chain, and along the Siberian coast south to Vladivostok and among the islands of Japan.

About eight other species of the genus *Clupea* are recognized, including the sprat (*q.v.*) or brisling *(C. sprattus)* of western Europe and the Mediterranean sea, *C. antipodum* and *C. muelleri* of New Zealand, *C. fuegensis* of the Strait of Magellan and the Falkland Islands, *C. bentincki* of Chile, *C. bassensis* of southern Australia and New Zealand, *C. arcuata* extending from Uruguay to northern Patagonia, and *C. melanostoma* of the Río de la Plata.

The family Clupeidae, to which the herring belongs, embraces small species of fishes throughout the world. The subfamily Clupeinae, includes about 18 closely related genera, of which the most important are the sardines or pilchards *(Sardina* and *Sardinops*), the menhaden *(Brevoovtza),* the shad *(Alosa)* and the alewife *(Pomolobus). (See* SARDINE; PILCHARD; MENHADEN; SHAD; ALEWIFE.)

Herring move in vast schools and are caught with seines, gill nets, otter trawls and weirs or pound nets.

In Europe the majority of the catch is salted, pickled in barrels or cured by smoking as kippers or bloaters. In eastern Canada and northeastern United States most of the herring utilized are young fish taken in inshore weirs or seines, which are canned as sardines. The bulk of the herring taken in the Pacific ocean is used in the manufacture of fish oil and meal. and smaller quantities are pickled and smoked.

Herring usually move shoreward to spawn; the female extrudes the eggs as she swims about on her side and rubs her body against clean seaweed, rocks or kelp, to which the adhesive eggs cling tightly. The male fish swims closely behind the female fertilizing the eggs as they are deposited. When a large school of herring is spawning, the sea water takes on a milky appearance from the white milt extruded by the males.

In the Pacific, herring have only one spawning season in each locality, which varies with the latitude and local temperature conditions. The season commences in December in California and becomes progressively later to the northward. Herring were observed spawning in June at St. Michael, near Nome. The majority of the herring in the Atlantic ocean also spawn as water temperatures become suitable in the spring, but certain populations of herring in western Europe south of Norway spawn in late summer and autumn; they are called autumn spawners to distinguish them from the spring spawners in the same localities.

The Atlantic herring usually spawns in water from a few fathoms to more than 100 fathoms deep, and may spawn on gravelly banks many miles from land. The Pacific herring, on the other hand, spawns chiefly on the seaweeds and kelp along the shore, and in many localities a large portion of the deposited spawn is exposed at each ebb tide. Each female deposits from 10,000 to 60,000 eggs per spawning, depending on her size and age. The eggs hatch in two to three weeks or longer depending on the temperature. The larval herring at first drift with the current, but they soon become free swimming, as indicated by the small areas occupied by local races of herring, even in localities such as southeastern Alaska with a strong residual current.

The growth rate of herring varies tremendously with the locality —usually it is slow in enclosed waters or waters of low salinity, as the Baltic, where mature herrings as small as four inches are found. Thus, slow-growing herring are found in the Baltic, the White sea. the Lyseforden (west Norway), the Zuider Zee, the east coast of Sweden, San Francisco bay and the interior waters of southeastern Alaska (Stephens passage). Herring in some of the fiords on the Baltic coast of Sweden are slower growing than those of the main Baltic. Fast-growing herring are found in the western North sea, the Atlantic ocean, around Iceland, the outside waters of Norway, around Kodiak Island and along the Aleutian Islands. Herring from Dutch Harbor in the Aleutians may exceed 1 lb. in weight and 1 j in. in length.

Herring feed on a great variety of the smaller marine forms, such as decapod larvae, copepods and pteropods, and occasionally even feast on small fish. Herring mature chiefly at four years of age, but do not reach a suitable size for pickling until about five to eight years old, depending on the locality. They are normally long-lived and a study of the annual marks on their scales formed by the seasonal rhythm in growth shows that some may attain 20 years of age. Most herring, however, are either eaten by predators or caught before they are 10 years of age.

Different areas are inhabited by different races or populations of herring, as shown by studies of the number of vertebrae and other structural characters and by tagging. North American investigators devised means of tagging these small fish by inserting small steel or nickel tags inside the body cavity. After the liberated fish are recaptured, the tags are recovered either by an electronic device as the herring pass along a conveyer during unloading or from the fish meal as it passes over an electromagnet during continuous process manufacture.

After spawning, the schools of mature herring disperse, but the herring later gather in large schools on the feeding grounds. Different races may feed on the same grounds, but they return to their own localities for spawning. The herring fisheries are subject

to great fluctuations, since the survival of the young varies widely from year to year. A fishery may thus for several years be largely dependent on the progeny from a single spawning. This circumstance also causes a change in the size of the herring taken each year in the same locality, as the herring of the single year class increase in size. Variations in spawning success are keenly felt in the Maine sardine fisheries, which depend chiefly on the young immature herring for their supply. (G. A. RL.)

HERRINGBONE, in masonry construction, the use of courses or rows in which the individual bricks or stones are set at an angle of approximately 45° to the horizontal and with alternate courses at right angles to each other. Herringbone work is occasionally found in late Roman brick construction, and was common in Romanesque architecture (*q.v.*), sometimes decoratively, as in much of the brickwork of north Italy, sometimes structurally, with the apparent idea that long, thin stones could be more efficently used in this manner than if laid horizontally. In modern construction, the herringbone is almost entirely restricted to decorative brickwork and paving. A similar pattern is often used in hardwood floors.

HERRIOT, EDOUARD (1872–1957), French statesman and man of letters who personified in his time the Radical-Liberal tradition in French life and politics, was born at Troyes on July j, 1872, the son of an army officer. Educated at the Paris Lycée Louis-le-Grand and at the École Normale Supérieure, he graduated with high honours in 1894. His book on the Jewish school of Alexandria, *Philon le Juif* (1897), was crowned by the Academy of Moral and Political Sciences. He taught at the *lycée* of Nantes and then at Lyons, where he won a high reputation as a scholar of distinction and a teacher of eminence. This reputation was enhanced by his study of *Madame Récamier et ses amis* (1904) and by the powers of acute literary criticism shown in his *Précis de l'histoire des lettres françaises* (1905). He also engaged in journalism and popular lecturing.

Like many French statesmen, Herriot entered politics through local government. He became a municipal councilor of Lyons in 1904, and mayor in 1905. He remained mayor of the city for the rest of his life with only one brief interruption during World War II. Cnder his guidance that growing industrial city developed every sort of municipal amenity and his local prestige became unshakeable. In 1910 he became a member of the *conseil général* and in 1912 senator for the *département* of Rhbne. He belonged throughout his career to the Radical party, consistent in his liberalism and his faith in republican democracy.

He first held ministerial office during World War I, from Dec. 1916 to March 1917, as minister of public works, transport and supplies in Aristide Briand's cabinet. He showed political acumen and administrative ability in his reorganization of the essential services of supplies and transport in wartime. Before the war ended he was turning his attention to problems of reconstruction. In 1916 he organized the Lyons fair and in the crisis of 1917 published *Agir,* pleading for continued faith in the culture and civilization of France as the path to national victory. In 1919. when victory had come. he published *Crier,* a program of reconstruction dedicated to the youth of France.

Herriot gave up his seat as senator in Nov. 1919 and was elected a member of the chamber of deputies for the *département* of Rhône. There he became leader of the Radical party. He owed his rapid rise in parliament to his powers of oratory and persuasion, and the genial warmth of his personality. He showed himself adept as a politician, skillful in managing committees and in the eloquent presentation of his arguments.

He led the opposition to the postwar *Bloc national.* When the *Cartel des gauches,* a left-wing coalition of Radicals and Socialists. was formed to fight the parliamentary elections of May 1924, it was led by Herriot. and its electoral triumph enabled him to form his first ministry in June 1924. He also took the ministry of foreign affairs. He forced the resignation of Alexandre Millerand, president of the republic, who had openly electioneered on behalf of the right. He extended *de jure* recognition of the U.S.S.R. which he had visited two years before. He arranged with the British prime minister. Ramsay MacDonald. to hold conierences in London on the subject of reparations, wherein France accepted the Dawes plan and agreed to evacuate from the Ruhr the troops which Raymond Poincaré had sent in to enforce payment of reparations by Germany. The following autumn the two premiers prepared the so-called Geneva protocol, *i.e.,* a treaty of collective security. Although rejected by MacDonald's successor the protocol inaugurated the era of Locarno. of improved relations between France, Great Britain and Germany. In April 1925 Herriot's ministry fell, and in July 1926 his second ministry lasted only three days. He then joined the great Poincaré cabinet of national union in which he was minister of education (1926–28). It was June 1932 before another electoral swing to the left brought him back to power as premier and foreign minister. He fell six months later when the chamber refused to pay the December installment of France's war debts to the United States. He served as vice-premier under Gaston Doumergue in 1934 and again under Pierre-Etienne Flandin in 1934–35. In June 1936 he was elected president of the chamber of deputies, an office which he filled with dignity and trust until France's capitulation in June 1940 during World War II.

Though criticized by some for his acquiescent attitude during German occupation (he abstained from voting when on July 10, 1940, at Vichy, the national assembly accorded full powers to Marshal Philippe Pétain) and for having refused to leave France to help in resistance, he suffered no taint of collaboration with the invaders. When Pétain in Aug. 1942 dissolved the permanent bureaus of the chamber and senate, Herriot joined with Jules Jeanneney, president of the senate, in lodging a joint protest. For this he was arrested and was later deported to Germany. In April 1945 he was freed from his internment at Wannsee, near Berlin, by Russian troops. Having meanwhile been re-elected mayor of Lyons, he returned there to resume his duties. He also resumed his place as president of the Radical party, and was elected to both the constituent assemblies of 1945 and 1946. In 1946, too, he was elected a member of the Académie Française. The following year he was elected president of the new national assembly of the Fourth Republic, retaining this office until his retirement in Jan. 1954.

He took part from 1948 onward in the body which became the Council of Europe, an advisory body urging a federal solution to European problems. In 1952–54, however, he opposed the European Defense community because its consequence would be the rearmament of Germany. In June 1955 he was presented with the Soviet peace prize (the former Stalin prize). He died in Lyons on March 26, 1957. Herriot clung throughout his life to liberal ideals of international co-operation, and because of his intellectual gifts and honesty inspired respect and affection, though he lacked great powers of leadership.

BIBLIOGRAPHY.—In addition to Herriot's books quoted above, a few others are worth mentioning: *La Russie nouvelle* (Paris, 1922); *Impressions d'Amérique* (Lyons, 1923); *The United States of Europe* (London, 1930); *Eastward from Paris* (London, 1934), being mainly an account of a second visit to the U.S.S.R.; *The Wellsprings of Liberty* (London, 1940); *Jadis* (Paris, vol. 1, 1948; vol. 2, 1952). *See* also: P. Grosclaude, *Edouard Herriot, écrivain et homme d'ttat* (Paris, 1932) and J. Rivet, *Edouavd Herriot, ou le discrtdit lyonnais* (Paris. 1933).

(D. **Ts.**)

HERRNHUT, a town of Germany, in the district of Dresden, 18 mi. S.E. of Bautzen. and situated on the Löbau-Zittau railway. Pop. (1950) 2.025. It is the principal seat of the Moravian or Bohemian brotherhood, the members of which are called *Herrnhuter.* A colony of these people, fleeing from persecution in Moravia, settled at Herrnhut in 1722 on a site presented by Count Zinzendorf. The buildings of the society include a church, a school and houses for the brethren. the sisters and the widowed of both sexes. The town is remarkable for its ordered, regular life and its scrupulous cleanliness. Linen and various minor articles are manufactured.

Berthelsdorf, a village about a mile distant, has been the seat of the directorate of the community since about 1789.

HERSCHEL, CAROLINE LUCRETIA (1750–1848). English astronomer, whose assistance was invaluable to her brother Sir William Herschel in his astronomical researches, was born at

Hanover, Ger., on March 16, 1750. She assisted her mother in the management of the household until 1772, when her brother took her to Bath, Eng., where he had established himself as a teacher of music.

When her brother accepted the private office of court astronomer to George III in 1782, she executed the laborious calculations that were connected with his observations. During her leisure hours she swept the heavens with a small Newtonian reflector and by this means she detected three nebulae in 1783, and eight comets between 1786–97.

In 1798 she presented to the Royal society an Index to Flamsteed's observations, together with a catalogue of 560 stars omitted from the *British Catalogzte,* and a list of the errata in that publication. She returned to Hanover in 1822, and in 1828 completed the cataloguing of 2,500 nebulae and many star clusters discovered by her brother. Caroline Herschel received the gold medal of the Astronomical society in 1828. and the gold medal for science from the king of Prussia in 1846. She died at Hanover on Jan. 9, 1848.

See Mrs. John Herschel, *Memoir and Correspondence of Caroline Herschel* (1876). (O. J. E.)

HERSCHEL, SIR JOHN FREDERICK WILLIAM, BART. (1792–1871), English astronomer and able successor to his father, Sir William, in the field of nebular observation and discovery. Born in Slough, Bucks, on March 7, 1792, he was educated for a short time at Eton, then by a private tutor and then at St. John's, Cambridge, where he graduated as senior wrangler in 1813. During his undergraduateship he and two of his fellow students who subsequently attained to very high eminence. George Peacock and Charles Babbage, entered into a compact that they would "do their best to leave the world wiser than they found it"—a compact loyally and successfully carried out by all three to the end. As a commencement of this laudable attempt Herschel associated with these two friends in the production of a work on the differential calculus, and on cognate branches of mathematical science, which changed the style and aspect of mathematical learning in England, and brought it up to the level of the continental methods. Two or three memoirs communicated to the Royal society on new applications of mathematical analysis at once placed him in the front rank of the cultivators of this branch of knowledge. Of these his father had the gratification of introducing the first, but the others were presented in his own right as a fellow.

With the intention of being called to the bar, he entered his name at Lincoln's Inn on Jan. 24, 1814, and placed himself under the guidance of an eminent special pleader. Probably this temporary choice of a profession was inspired by the extraordinary success in legal pursuits which had attended the efforts of some noted Cambridge mathematicians. Be that as it may, an early acquaintance with W. H. Wollaston in London soon changed the direction of his studies.

He took up astronomy in 1816; and in 1820, assisted by his father, he completed for a reflecting telescope a mirror of 18-in. diameter and 20-ft. focal length. This, subsequently improved by his own hands, became the instrument that enabled him to effect the astronomical observations forming the chief basis of his fame. In 1821–23 he was associated with Sir James South in the re-examination of his father's double stars. For this work he was presented in 1826 with the Astronomical society's gold medal; and with the Lalande medal of the French institute in 1825; while the Royal society had in 1821 bestowed upon him the Copley medal for his mathematical contributions to their *Transactions.* In 1831 the honour of knighthood was conferred on him by William IV, and two years later he again received the recognition of the Royal society by the auard of one of their medals for his memoir "On the Investigation of the Orbits of Revolving Double Stars."

Before the end of the year 1833, Sir John Herschel had re-examined all his father's double stars and nebulae, and had added many similar bodies to his own lists; thus accomplishing, under the conditions then prevailing, the full work of a lifetime. For it should be remembered that astronomers were not as yet provided with those valuable automatic contrivances that at present materially abridge the labour and increase the accuracy of their determinations. John Herschel then determined to explore the southern, besides re-exploring northern, skies. "I resolved," he said, "to attempt the completion of a survey of the whole surface of the heavens; and for this purpose to transport into the other hemisphere the same instrument which had been employed in this, so as to give a unity to the results of both portions of the survey, and to render them comparable with each other" So, he and his family embarked for the Cape of Good Hope on Nov. 13, 1833; they arrived in Table bay on Jan. 15, 1834; and he began regular observations on March 4.

To give an adequate description of the vast mass of labour completed during the next four busy years of his life at Feldhausen would require the transcription of a considerable portion of the *Cape Observations* (published in 1847, nine years after the author's return to England), for the cogent reason that, as he said, "The whole of the observations, as well as the entire work of reducing, arranging and preparing them for the press, have been executed by myself." It contains catalogues and charts of southern nebulae and star clusters, a catalogue of the relative positions and magnitudes of southern double stars and his observations on the varying and relative brightness of the stars. Herschel returned to his English home in 1838, and was welcomed with an enthusiastic greeting. He was created a baronet by Queen Victoria at her coronation.

Herschel was a highly accomplished chemist. His discovery in 1819 of the solvent power of hyposulfite of soda on the otherwise insoluble salts of silver was the prelude to its use as a fixing agent in photography; and he invented in 1839, independently of Fox Talbot, the process of photography on sensitized paper. He was the first person to apply the now well-known terms "positive" and "negative" to photographic images, and to imprint them upon glass prepared by the deposit of a sensitive film. Perhaps no man can become a truly great mathematician or philosopher if devoid of imaginative power. John Herschel possessed this endowment to a large extent; and he solaced his declining years with the translation of the *Iliad* into verse.

But the main work of his later life was the collection of all his father's catalogues of nebulae and double stars combined with his own observations and those of other astronomers into a single volume. A complete list of his contributions to learned societies will be found in the Royal society's great catalogue, and from them may be gathered most of the records of his busy scientific life. Sir John Herschel met with an amount of public recognition that was unusual in the time of his illustrious father. He was a member of almost every important learned sdciety in both hemispheres. For five years he held the same office of master of the mint, which a century before had belonged to Sir Isaac Newton.

He died on May 11, 1871, and was buried in Westminster abbey close to the grave of Sir Isaac Newton.

Besides the laborious *Cape Observations,* Sir John Herschel was the author of several books, one of which at least, *On the Study of Natural Philosophy* (1830), possesses an interest that no future advances of the subjects on which he wrote can obliterate. In 1849 came the *Outlines of Astronomy,* a volume still replete with charm and instruction. His articles, "Meteorology," "Physical Geography" and "Telescope," contributed to the 8th edition of the *Encyclopædia Britannica,* were afterward published separately. Less known are his volumes, *Familiar Lectures on Scientific Subjects* (1866) and *Collected Addresses* (1857), in which he is seen in his happiest and most instructive mood.

(A. Po.)

HERSCHEL, SIR WILLIAM (originally FRIEDRICH WILHELM) (1738–1822), English astronomer, called the founder of sidereal astronomy for his systematic observations of the heavens, was born in Hanover, Ger., on Nov. 15, 1738. His father was a

musician in the Hanoverian guard. and in 1757 Herschel was sent to England to earn his living as a musician.

Beginnings.—In 1766 he worked as organist in Bath. During the next five or six years he became the leading musical authority. In 1772 he revisited Hanover to bring to England his sister Caroline Lucretia Herschel (*q.v.*), whose services he much needed, as he was already studying astronomy in the time he could spare from his musical engagements. She thus describes her brother's life soon after her arrival: "He used to retire to bed with a bason of milk or a glass of water. with Smith's *Harmonics* and Ferguson's *Astrononty*, etc., and so nent to sleep buried under his favourite authors; and his first thoughts on waking were how to obtain instruments for viewing those objects himself of which he had been reading." It was in this way that he was introduced to the writings of Ferguson and Keill, and subsequently to those of Lalande, uhereby he educated himself to become an astronomer of undying fame.

In those days telescopes were rare, very expensive and not very efficient, and Herschel used a small Gregorian reflector of about two-inch aperture. Finding it impossible to obtain a reflector of larger dimensions, he decided to construct his own and, in 1774, had the satisfaction of viewing the heavens with a Newtonian telescope of six-foot focal length made by his own hands. He had from the very first conceived the gigantic project of surveying the entire heavens, and, if possible, of ascertaining the plan of their general strucrure. For this he required adequate instruments, and he, his brother and his sister toiled at the grinding and polishing of hundreds of specula After 1774 every available hour of the night was devoted to the long-hoped-for scrutiny of the skies. In May 1780 his first two papers on the variable star Mira Ceti and the mountains of the moon were communicated to the Royal society.

Rotation of the Planets.—In 1781 he communicated to the Royal society the first of a series of papers on the rotation of the planets and of their several satellites. These inquiries occupy the greater part of seven memoirs (1781–97). While engaged on them he noticed the curious appearance of a white spot near to each of the poles of the planet Mars. On investigating the inclination of its axis to the plane of its orbit, and finding that it differed little from that of the earth, he concluded that its changes of climate also would resemble our own, and that these white patches were probably polar snow. He also discovered that the times of the rotations of the various satellites round their axes conform to the analogy of our moon by equalling the times of their revolution round their primaries.

In the same year (1781) Herschel made a discovery that completely altered the character of his professionai life. In the course of a methodical review of the heavens he lighted on an object that averred itself to be a new planet, moving outside the orbit of Saturn. He assigned to it the name Georgium Sidus. but this was later changed to Uranus. The object was detected with a 7-ft. reflector having an aperture of 6½ in. Seven memoirs on the subject were communicated by him to the Royal society (1781–1815).

For the discovery of the planet he was awarded the Copley medal of the Royal society, elected a fellow, and in the following year (1782) he accepted George III's offer to give up music and become his private astronomer. So Herschel and his sister moved first to Datchet and in 1786 to Slough. There he resumed his astronomical pursuits with extraordinary vigour, although for a time he had to supplement his income by making and selling telescopes. The necessity for this interruption in his observations was overcome in 1788 when he married the wealthy widow of a London merchant.

Double Stars.—A material part of the task that Herschel had set himself embraced the determination of the relative distances of the stars from our sun and from each other. This resulted in a most important series of observations. He had observed many stars in apparently very close contiguity, but often differing greatly in relative brightness. He concluded that. on the average, the brighter star would be the nearer to us, the fainter enormously more distant.

In the hope, therefore, of detecting an annual parallactic displacement of one star with respect to another, he mapped down the places and aspects of all the double stars that he met with, and communicated in 1782 and 1785 very extensive catalogues of the results. His last scientific memoir, sent to the Royal Astronomical society in 1822, when he was its first president and already in his 84th year, related to these investigations. In the memoir of 1782 he threw out the hint that these apparently contiguous stars might be genuine pairs in mutual revolution. Eleven years afterward (1793), he remeasured the relative positions of many such couples and his prediction was verified, for he ascertained that some of these stars revolved round each other, after the manner required by the laws of gravitation. This discovery, announced in 1802, would of itself suffice to immortalize his memory.

In 1783 he wrote his first memorable paper on the "Motion of the Solar System in Space"—a sublime speculation, yet through his genius realized by considerations of the utmost simplicity. He returned to the same subject with fuller details in 1805. In a series of papers (1784–1818), he used his method of star gauging and concluded that our sun was a star situated not far from the bifurcation of the Milky Way, and that all the stars visible to us lie more or less in clusters scattered throughout a comparatively thin but immensely extended stratum. On either side of this assemblage of stars, Herschel discovered a canopy of discrete nebulous masses, such as those from the condensation of which he supposed the whole stellar universe to have been formed.

Hitherto there has been nothing said about his construction of the great reflecting telescope, of 40 ft. focal length and 4 ft. aperture. On the day that it was finished (Aug. 28, 1789) Herschel saw at the first view, in a grandeur not witnessed before, the Saturnian system with six satellites, five of which had been discovered long before, while the sixth he had glimpsed two years before, in his exquisite little telescope of 6½-in. aperture, but now saw in unmistakable brightness. On Sept. 17 he discovered a seventh, which proved to be the nearest to the globe of Saturn.

Herschel died at Slough on Aug. 25, 1822, a description of him given a few years before by Campbell being: "A great, simple, good old man. His simplicity, his kindness, his anecdotes, his readiness to explain his own sublime conceptions of the universe, are indescribably charming."

Holden and C. S. Hastings, *Synopsis of the Scientific Writings of Sir William Herschel* (1881); J. Sime, *William Herschel and His Work* (1900). Herschel's photometric Star Catalogues were discussed and reduced by E. C. Pickering in *Harvard Annals*, vol. xiv, p. 345, xxiii and xxiv. *See* also J. B. Sidgwick, *William Herschel, Explorer of the Heavens* (1953). (A. Po.)

HERSCHELL, FARRER HERSCHELL, 1ST BARON (1837–1899), English lord chancellor noteworthy for his quickness of apprehension, his common sense and his broad treatment of constitutional and social questions. He was born at Brampton, Huntingdonshire, on Nov. 2, 1837, the son of the Rev. Ridley Haim Herschell, a dissenting minister converted from Judaism. Farrer Herschell, being excluded by dissent from Oxford and Cambridge, was educated at University college, London. He entered Lincoln's Inn in 1858, and became a pupil of Thomas Chitty. In 1860 he was called to the bar, and joined the still undivided northern circuit, where at first he did not find much work. His prospects improved in 1866 when J. R. Quain, for whom he devilled (*i.e.*, worked and understudied), took silk.

In 1872 Herschel1 himself was made a queen's counsel. He had all the necessary qualifications for a leader—a clear voice; a calm, logical mind; a sound knowledge of legal principles; and an abundance of common sense. His only weak point was cross-examination.

Herschell entered parliament for Durham city as a liberal in 1874 In 1880 he was appointed solicitor general by Gladstone, and knighted. Herschell's public services from 1880 to 1885 were of great value, particularly in dealing with the "cases for opinion" submitted by the foreign office and other departments. He helped controversial government measures through the house, notably the

Irish land act, 1881. In 1886 he accepted Gladstone's offer of the lord chancellorship, and was created Baron Herschell Losing office on the fall of Gladstone in Aug. 1886, he was again lord chancellor in 1892–95. His public services outside his judicial work included the chancellorship of the University of London (1894) and the chairmanship of the Imperial institute. which he held from its foundation (1892).

In 1898 Herschell was appointed. jointly with Lord Justice Collins, to represent Great Britain on the Venezuela Boundary commission. which assembled in Paris in the spring of 1899 He also sai, as president, on the joint high commission appointed to adjust certain boundary and other questions pending between Great Britain and Canada on the one hand and the United States on the other.

Herschell died in Washington, D.C., on March 1. 1899. as the result of an accident. (W. T Ws)

MERSFELD, a town of Germany, in the Land of Hesse, situated at the confluence of the Geis and Haun with the Fulda, on the railway from Frankfurt am Main to Bebra, 24 mi. N.N.E. of Fulda. Population (1950) 21.285. Some of the old fortifications of the town remain. The principal buildings are the Stadt Kirche, a beautiful Gothic building, erected about 1320 and restored in 1899; the old town hall (Rathaus) and the ruins of the abbey church. This church was erected on the site of the cathedral in the beginning of the 12th century; it was built in the Byzantine style and was burnt down by the French in 1761. Outside the town are the Frauenberg and the Johannesberg, on both of which are monastic ruins. The town has important manufactures of cloth, leather, machinery, vast-line and cordage; it has also dye-works. The Benedictine abbey of Hersfeld was founded by Lullus, afterwards archbishop of Mainz, about 769. It was richly endowed by Charlemagne and became an ecclesiastical principality in the 12th century, passing under the protection of the landgraves of Hesse in 1423. It was secularized in 1648. Hersfeld became a town in the 12th century and in 1370 the burghers, having shaken off the abbot's authority, placed themselves under the protection of the landgraves of Hesse. Hersfeld, with electoral Hesse, was united with Prussia in 1866.

HERSHEY, MILTON SNAVELY (1857–1945), **U.S.** confectioner and philanthropist, was born in Derry Township, Dauphin county, Pa., on Sept. 13, 1857. He attended the local schools and then served for a time as a printer's devil on the *Lancaster Farmer.* After a brief period in that capacity, he turned to the manufacture of candy and at 21 years of age had his own shop in Philadelphia. He later removed to New York city. There success crowned his efforts, and within 25 years he sold his business for $1,000,000. Returning to his native home in Pennsylvania, he again began the manufacture of chocolate bars, converting the scene of his early struggles into the model industrial town of Hershey, Pa., and developing his business along lines most beneficial to his employees. About 1903 he and his wife, Mrs. Catherine S. Hershey (d. 191j), determined to found an industrial school and home for orphan boys, the school receiving its first pupils in 1910. It is open to male orphans: (1) born in Dauphin, Lebanon and Lancaster counties; (2) born elsewhere in Pennsylvania (3) born elsewhere in the United States. Boys are accepted at four or five years of age and may remain until they reach the age of 18 years. Freedom in the selection of trades is permitted, but it is required that each boy learn to be self-supporting. In 1918 Hershey transferred his entire wealth, estimated at $60,000,000, to the Hershey Trust company for maintenance of the Hershey Industrial school, making it probably the second richest school of its kind in the United States. In 1944 he resigned as president of the Hershey Industrial school, the Hershey corporation and the Hershey Trust company. He remained, however, as chairman of the board of directors of the Hershey Chocolate corporation. He died on Oct. 13, 1945, at Hershey, Pa.

HERSTAL or HERISTAL, a town of Belgium, less than 2 m. N. of Liége and practically one of its suburbs. The second Pippin was born here. His grandson, Pippin the Short, died at Herstal in A.D. 768, and it disputes with Aix-la-Chapelle the honour of being the birthplace of Charlemagne. It is now a very active centre of iron and steel manufactures. The Belgian national small arms factory and cannon foundry are here. Pop. (1955 est.) 28,-32j. The name may come from *Heerstelle* (permanent camp).

HERTFORD, EARLS AND MARQUESSES OF. The English earldom of Hertford was held by members of the powerful family of Clare from about 1138, when Gilbert de Clare was created earl of Hertford, to 1314 when another earl Gilbert was killed at Bannockburn. In 1537 EDWARD SEYMOUR, viscount Beauchamp, a brother of Henry VIII.'s queen, Jane Seymour, was created earl of Hertford, being advanced ten years later to the dignity of duke of Somerset and becoming protector of England. His son EDWARD (c. 1540–1621) was styled earl of Hertford from 1547 until the protector's attainder and death in January 1552, when the title was forfeited; in 1559, however, he was created earl of Hertford. In 1560 he was secretly married to Lady Catherine Grey (c. 1538–1568), daughter of Henry Grey, duke of Suffolk, and a descendant of Henry VII. Queen Elizabeth greatly disliked this union, and both husband and wife were imprisoned, while the validity of their marriage was questioned. Catherine died on Jan. 27, 1568 and Hertford on April 6, 1621. Their son Edward, Lord Beauchamp (1561–1612), who inherited his mother's title to the English throne, predeceased his father; and the latter was succeeded in the earldom by his grandson WILLIAM SEYMOUR (1588–1660), who was created marquess of Hertford in 1640 and was restored to his ancestor's dukedom of Somerset in 1660. The title of marquess of Hertford became extinct when JOHN, 4th duke of Somerset, died in 1675, and the earldom when ALGERNON, the 7th duke, died in February 1750.

In August 1750 FRANCIS SEYMOUR CONWAY, 2nd baron Conway (1718–1794), a direct descendant of the protector Somerset, was created earl of Hertford. Hertford was ambassador to France from 1763 to 1765; was lord-lieutenant of Ireland in 1765 and 1766; and lord chamberlain of the household from 1766 to 1782. In 1793 he became earl of Yarmouth and marquess of Hertford, and died on June 14, 1794. His son FRANCIS INGRAM SEYMOUR CONWAY (1743–1822), known during his father's lifetime as Lord Beauchamp, was sent as ambassador to Berlin and Vienna in 1793 and from 1812 to 1821 he was lord chamberlain. His son FRANCIS CHARLES, the 3rd marquess (1777–1842), an intimate friend of the prince regent, afterwards George IV., is the original of the "Marquis of Steyne" in Thackeray's *Vanity Fair* and of "Lord Monmouth" in Disraeli's Coningsby. The 4th marquess was his son, RICHARD (1800–1870), whose mother was the great heiress, Maria Emily Fagniani, and whose brother was Lord Henry Seymour (1805–1859), the founder of the Jockey Club at Paris. When Richard died unmarried in Paris in August 1870 his title passed to his kinsman, FRANCIS HUGH GEORGE SEYMOUR (1812–1884), a descendant of the 1st marquess, whose son, HUGH DE GREY (1843–1912) became 6th marquess in 1884. The 4th marquess left his great wealth and his priceless collection of art treasures to Sir Richard Wallace (1818–1890), his reputed half-brother, and Wallace's widow, who died in 1897, bequeathed the collection to the British nation. It is now in Hertford House, formerly the London residence of the marquesses of Hertford.

HERTFORD, a market town! municipal borough and the county town of Hertfordshire. Eng.. in the Hertford parliamentary division. 22 mi. N. of St. Paul's cathedral. London by road. Pop. (1951) 13.884. Area 6.1 sq.mi. The Mimram, Beane and Lea flow through the town. Hertford was possibly the scene of a synod in 673. Its communication with London by way of the Lea and the Thames gave it strategic importance during the Danish occupation of East Anglia. In 1066 and later it was a royal garrison and burgh; it was incorporated in 1554. Fairs, now discontinued. were granted from the 13th century, but there are still corn and cattle markets. Hertford's economy is mainly residential and agricultural with a few industries such as gloving, motor engineering, brewing and the making of toothbrushes. stationery and leather goods. The castle, used as municipal offices, retains the wall and part of a tower of the Norman period. Other buildings include the Shire hall by James Adam; the County hall (1939); Hale's grammar school (17th-century); Hertford Grammar school for boys (1930); Christ's Hospital school for girls, moved from

London in 1683 (buildings date from 1695 to 1953). There are many old timber houses in Hertford. Bengeo. in the north of the borough, has a Norman church which is little altered. Two miles S.E. of the town is Haileybury and Imperial Service college, the former founded in 1862 and the latter in 1912. They were amalgamated in 1942 at Haileybury, occupying the buildings formerly used by the East India company.

HERTFORDSHPRE, a county of England, bounded on the northeast by Cambridgeshire, northwest by Bedfordshire. east by Essex, south by Middlesex and southwest by Buckinghamshire. Pop. (1951) 609,775. Area 632.1 sq.mi. The northwest of the county is on the chalk ridge, an extension of the Chilterns; the hills there rarely exceed 600 ft. and sink gradually toward the northeast. Much of the chalk is covered with glacial drift of clays, gravels and loams, the scarp faces northwestward and there is a gentle dip to the southeast until, south of Hertford and St. Albans, it disappears beneath the Eocene Reading beds of yellow clays and sands and London clay. The many small rivers have cut deep valleys and the whole county is undulating and well wooded. The Lea river rising near Luton, Beds.. flows southeastward to Hatfield, eastward to Ware, then southward to the Thames; with its tributary the Stort, it forms part of the boundary with Essex; lesser tributaries, the Ash, Rib, Beane and Mimram are known for their parklike valleys. In the west the Colne and its tributaries flow past Watford to join the Thames at Staines. The New river (1613). to augument London's water supply, was cut from Amwell and Chadwell near Ware to the Lea at Broxbourne and south to the reservoirs at Hornsey and Stoke Newington.

History **and** Antiquities — Thechalk and gravel soils yielded Palaeolithic flints; Mesolithic flints were found along the banks of the Lea; long and round barrows are on the hills above Therfield and a beaker barrow was found in a gravel working at Ware. The Icknield way along the chalk ridge was one of the main prehistoric trackways and scattered finds suggest the county was completely, if sparsely, occupied during the Bronze Age. The few Iron Age camps are small and unimpressive, but the county was a centre of Belgic power, with Cassivelaunus' *oppidum* at Wheathampstead, which Caesar took in 54 B.C., and towns at Braughing. Prae Wood and Welwyn; numbers of Belgic coins have been found. The Roman occupation was thorough; with Ermine street to York, Watling street to Chester, Stane street, linking Verulamium to Colchester, and the replanned Icknield way, as the major roads. A municipium was at Verulamium (partly excavated in the latter 1950s, with a good museum and a Romano-British theatre); a walled town at Braughing; and posting stations at 10-mi. intervals along the roads, of which traces have been found at Cheshunt, Ware, Baldock, Welwyn and Elstree. Villas or farms are common, but in a stoneless country they leave few structural traces beyond the barrows of their former owners.

Saxon settlement was early; pagan burials occur along the line of the Icknield way., and Ermine street appears to have been the boundary of the East Saxon kingdom and later of the diocese of London. Hertford was possibly the scene of a synod in 673 and Hatfield of a witenagemot in 67j. In 793 Offa of Mercia founded the abbey of St. Albans and endowed it with estates in western Hertfordshire, which became both an independent liberty and archdeaconry, maintaining these statuses until 1874 and 1845 respectively. By Alfred's treaty of Wedmore the county east of the Lea was included in the Danelagh; he defeated the Danish fleet in the Lea valley and Edward the Elder built a burgh at Hertford about 913.

William I reached Berkhamsted in 1066 in the course of encircling London and there received the submission of the Saxon leaders. He built castles there and at Hertford. The king confiscated at least 13 rnanors while the abbey of St. Albans retained the 15 manors with which it had previously been endowed. The archbishop, the bishops of London, Winchester. Bayeux, Lisieux and Chester, and the abbots of Ely and Westminster, each had their holdings. Count Eustace of Boulogne, the chief lay tenant, held a fief in the northeast of the county. At the time of the Domesday survey the boundaries were approximately those of the present day. Of the nine Domesday hundreds, Danais and Tring were

consolidated in about 1200 under the name of Dacorum: the modern hundred of Cashio, held by the abbots of St. Albans. was known as Albaneston, while the remaining six hundreds correspond with those of the present day.

Hertfordshire was originally in the dioceses of London and Lincoln; but the abbot of St. Albans was exempt from all control except that of the pope. The bishopric of London embraced the area of the deanery of Braughing and of the archdeaconry of Middlesex. The deaneries of Berkhamsted, Hitchin. Hertford and Baldock were under the jurisdiction of the bishop of Lincoln. After the dissolution, the archdeaconry of St. Albans was placed under the bishop of London. In 184j the whole county was formed into the archdeaconry of St. Albans and placed within the diocese of Rochester until 1877 when a new diocese of St. Albans was formed with jurisdiction over Hertfordshire, Bedfordshire and Essex; Essex later became an independent diocese.

Hertfordshire has always been a battleground for the London area. The Danes. Maud, Stephen and John all fought for the possession of Hertford. while Berkhamsted has seen sieges, especially that of Louis, the dauphin, in the Barons' wars. During the Peasants' Revolt in 1381. there was much rioting between the peasants and the servants of the abbot of St. Albans. In the Wars of the Roses. the county witnessed two battles at St. Albans (1455 and 1461), and the battle of Barnet in 1471. The civil wars in the 17th century found Hertfordshire predominantly puritan, and no major battles were fought in the county.

Architecture. — The churches generally have been heavily, though well: restored and the county has many pleasant. if few remarkable, buildings; St. Albans abbey with its Norman brickwork and mediaeval tombs and watching chamber stands out; Reed has some 11th-century work; Bengeo (Hertford) has a Norman apsidal church. with wall paintings; and good Norman work can be found in Hemel Hempstead, Weston and Abbot's Langley. Baldock and Royston are churches of new towns of the 13th century, created by the Knights Templars and Augustinian canons, respectively, and Ashwell and Wheathampstead are of the 13th and 14th centuries; the town churches of Ware and Hitchin and innumerable village churches have attractive Perpendicular work. Buntingford's Carolean brick, Offley's Georgian Gothic chancel and Ayot's classical St. Lawrence's are examples of work rare in Hertfordshire. Brasses. Jacobean and Georgian monuments form a remarkably fine series.

Fragments of Hertfordshire's many priories survive. often in-

corporated in later houses; the domestic buildings of Ware's friary are complete. as is much of its priory.

Castles at Berkhamsted (Norman earthwork), Hertford (13th-century walls and 16th-century gatehouse), Bennington (Norman keep), are not remarkable. Rye house (1445) is the earliest of a series of brick buildings of great interest which include Hatfield Old palace (c. 1480–go), Berkhamsted school, Standon Lordship (1546), Little Hadham hall (1570); Hatfield house (1608–12); and Knebworth house (one wing of the original Tudor house remains). Hertfordshire is a county of many lesser houses in timber and plaster, often mediaeval. and there are admirable Georgian country houses in fine parks of the period. A tablet in a field at Standon near Ware marks the spot where Vincent Lunardi landed in his balloon in 1784. The National Trust owned 3,946 ac. in 1955, mainly at Ashridge, and 110 ac. were under its protection. In the same year the Tring reservoirs were established as a nature reserve; they are visited by waterfowl and other birds on migration and many species nest there.

Agriculture and Industries.—Hertfordshire has always been a corn-growing county and even at the time of Domesdap Book the shire on its eastern side was noticeably free from wasteland; its corn markets were famous in the 16th century and malting and brewing of local barley were important from an early date.

In 1955 the total acreage farmed was 275,596 ac., of this 199,722 ac.. was arable; grain covered 118,020 ac.; potatoes 5,266 ac.; and there were substantial areas under root crops. Permanent pasture was 75,874 ac. and temporary pasture 43.938 ac. The northern part of the county is chiefly arable. The southern part, particularly on the London clay, has mixed farms carrying pedigree dairy stock. The southeast of Kertfordshire includes the Lea valley nursery and glasshouse district supplying salad vegetables and flowers to London. Watercress is widely grown, and roses, farm and garden seeds are other crops. The Rothamsted Experimental station (*q.v.*) at Harpenden, the first agricultural research station, was founded in 1833. and in 1949 the John Innes Horticultural institution moved to Bayfordbury.

Although agriculture retains the lead, other industries increased vastly during the first half of the 20th century. Papermaking and printing, developed experimentally at Hertford and St. Albans in the early 16th century, centre on the Watford district and Hertford. Agricultural and general engineering, coachbuilding and aircraft, food processing and drugs. chemicals and light industries of all types continue to develop particularly in the south and in the new towns. This made it necessary for the county council to expand its educational facilities at an unprecedented rate. There are many public, grammar and preparatory schools, some of ancient foundation, within the county.

Communications.—Many railways pass through Hertfordshire including the London-Cambridge line. the London-York line, the London-Leicester line. and the London-Birmingham line. all with branches. Electric services of London transport serve the Watford, Rickmansworth and Barnet areas.

Three great highways from London traverse the county; the Great North road—the trunk road to Edinburgh—enters the county north of Mill Hill. bypassing Barnet by means of a road that supersedes the old Great North road to Hatfield; thence it follows the old route leaving the county north of Baldock. The Holyhead road follows the route of the old Roman road. Watling street, entering the county at Elstree and passing through St. Albans, Redbourn and Markyate. The road to Carlisle and Glasgow branches off the Great North road at South Rlimms to pass through St. Albans and Harpenden. Another well-known road is that to Cambridge, the Old North road, along the Lea valley to Ware whence it follows Ermine street, to Royston.

Communications by river and canal from Hertford, Ware and Bishop's Stortford, southward to the Thames dockland by the Lea and Stort navigation, and the Grand Junction canal from London to the northwest. which traverses the southwest of the county by Rickmansworth and Tring, were little used in the 1950s.

Administration and Population.—From the time of the Conquest and up to the year 1567 the county shared a sheriff with Essex. The possessions of the abbot of St. Albans were formed into a liberty, over which he had wide jurisdiction and his own jail. A separate commission of the peace was granted to the liberty which held its own separate quarter sessions until 1874. The county sent two members to parliament in 1290. Before 1375 members were sent by Hertford? St. Albans, Bishop's Stortford and Berkhamsted, but this representation lapsed in the time of Henry V. St. Albans regained its franchise in 1553, but was deprived of it for malpractices in 1852. From 1623 Hertford had two members, reduced to one in 1868 and abolished in 1885.

For parliamentary purposes the county is divided into seven county divisions and Watford borough.

The population of the administrative county in 1951 was 609,775. To Letchworth, the pioneer garden city (1910), Welwyn Garden city was added in 1923 and Hatfield was linked with the latter; Hemel Hempstead and Stevenage, new towns, were developed after World War II to accommodate industry and population from London, and the London county council built major housing estates at Boreham Wood and Oxhey. Watford (pop., 1951, 73,130), St. Albans city (44,098). Hertford (13,884) and Hemel Hempstead (23,437) are municipal boroughs, and there are 19 urban districts and 11 rural districts and the New Town corporations.

The county is in the southeastern circuit and assizes are held at Hertford, which is the administrative centre. There are two quarter sessions and 13 petty sessional divisions. The southern part of the county is in the metropolitan police district and a wider area is in the London postal district.

BIBLIOGRAPHY.—There are county histories by H. Chauncy (London, 1700); N. Salmon (London, 1728); R. Clutterbuck, 3 vol. (London. 1815–27); J. E. Cussans, 3 vol. (Hertford, 1870–84). *See* also *The Victoria County History of Hertjordshire* (London, 1902–1923); *Land Utilisation Survey,* Pt. 80 (London, 1941); N. HERTHA or **NERTHUS,** in Teutonic mythology, the goddess of fertility, "Mother Earth," stated by Tacitus to be worshipped with orgies and mysterious rites at night by Teutonic tribes. Her veiled statue was moved from place to place by sacred cows. After the rites the image, vestments and vehicle were bathed in a lake.

HERTLING, GEORG, COUNT VON (1843–1919), German statesman, was born in Darmstadt on Aug. 31, 1843. He was appointed professor of philosophy at Bonn (1880), and at Munich (1882). From 1875 to 1890 and again from 1896 to 1912 he was a member of the *reichstag,* from 1909 being for a short time the leader of the Centre (Catholic) party. In 1912 he was appointed president of the Bavarian ministry and minister for foreign affairs. and in 1914 was elevated to the rank of count by King Ludwig III. On Nov. 1, 1917, he accepted the chancellorship of the reich, and for 12 months he strove against the encroachments of the military authorities upon the political affairs of the

empire. The failure of the German offensives in 1918 finally destroyed his hopes of being able to negotiate with the Allies on anything like equal terms and he resigned on Sept. 30. 1918. He returned to his home at Ruhpolding in Upper Bavaria, where he died on Jan. 4, 1919.

In philosophy. Hertling was a Neo-Thomist. Starting from a teleological conception of the world. he elaborated a political and social philosophy, and declared the conscious furthering of the divine world plan to be a duty for man. With Baeumker. he collaborated in the production of the invaluable series. *Beiträge zur Gesch. der Phil. des Mittelalters,* himself contributing the volume? *Albertus Magnus, Beiträge zu seiner Würdigung* (1914). Hertling's other works include: *Über d. Grenzen d, mechan. Naturerklarung* (1875); *Naturrecht u. Sozialpolitik* (1893); *Kleine Schriften zur Zeitgesch. u. Politik* (1897); *Recht, Staat u. Gesellschaft* (1906); and *Erinnerungen aus meinem Leben,* 2 vol. (1919).

HERTWIG, the name of two eminent German biologists, who were brothers.

(Wilhelm August) Oskar Hertwig (1849–1922) was renowned for his work in the fields of embryology and cytology. He was born on April 21, 1849, in Friedberg, Hessen, attended school in Mülhausen, Thuringia, Ger., and then studied medicine and zoology in Jena, Zurich and Bonn. He obtained a lectureship in anatomy at the University of Jena in 1875 and was elected to the professorship in 1881. From 1888 to 1921 he was professor of anatomy and evolutionary history at the University of Berlin and director of the Anatomisch-Biologischen Instituts. He died in Berlin on Oct. 25, 1922.

Richard (Carl Wilhelm Theodor) von Hertwig (1850–1937) was particularly noted for his development of the germ-layer theory and for his contributions to the study of Protozoa. Born on Sept. 23, 1850 at Friedberg, he shared his brother's education. He became lecturer in zoology at Jena in 1875, professor of zoology at the universities of Konigsberg in 1881, Bonn in 1883 and Munich from 188j to 1925. He died in Munich on Oct. 3, 1937.

Work of the **Hertwig** Brothers.— The brothers were influenced by the works of Ernst Haeckel (*q.v.*) (theory of evolution)., Karl Gegenbauer (comparative morphology) and Max Schultze (cytology). Jointly they worked on Haeckel's "gastraea" theory of coelom formation and the germ-layer theory. Oskar was the first to recognize the fusion of ovum and sperm nuclei as the essential factor in fertilization; he was also the first to compare ovum and sperm maturation in *Ascaris* and to recognize the significance of reduction division (meiosis). Other fields of study were: nuclear transmittal of hereditary characters (the idioplasm theory of K. W. von Nägeli; *q.v.*); biogenetic theory; and the effect of radium rays on somatic and germ cells. He was also concerned with the importance of biology in relation to social problems.

Richard Hertwig was the first to describe the artificially stimulated development of sea urchins (parthenogenesis; *q.v.*) He then turned to research on Protozoa, and interpreted the changes in the nucleus during the conjugation of paramecia as reduction and fertilization processes. He studied the nucleoplasmic ratio in association with cell division and sexuality problems, originated the chromidia theory and experimented in the determination of sex in Amphibia.

Prominent among their numerous publications are: Oskar and Richard: *Die Colomtheorie* (1881) and *Entwicklung des mittleren Keimblattes der Wirbeltiere* (1883); Oskar only: *Lehrbuch der Entwicklungsgeschichte des Menschen und der Wirbeltiere* (1886; 10th ed., 1915; Eng. trans., 1892); *Die Zelle und die Gewebe* (1893–98; Eng. trans., 2nd ed., 1909); *Allgemeine Biologie* (1905; 7th ed. with Günther Hertwig, 1923); *Der Kampf um Kernfragen der Entwicklungs- und Vererbungslehre* (1909); *Das Werden der Organismen* (1916); *Der Staat als Organismus* (1920); Richard only: *Der Organismus der Radiolarien* (1879); *Die Aktinien der Challenger-Expedition* (1882); *Über die Konjugation der Infusorien* (1889); *Über die Entwickelung des Unbefruchteten Seeigeleies* (1896); *Lehrbuch der Zoologie* (1891–92; 15th ed., 1931); *Die Protozoen und die Zelltheorie* (1902); *Abstammungslehre und neuere Biologie* (1927). (P. Hg.)

HERTZ, GUSTAV (1887– **j,** German physicist, was awarded the Nobel prize for physics jointly with James Franck in 192j for work on the laws of impact between an electron and an atom. Hertz was born on July 22, 1887, at Hamburg, and studied in the universities of Gottingen, Munich and Berlin, in the last of which he was appointed in 1913 an assistant in physics. After service in World War I. in which he was severely wounded, he returned to Berlin as *Privatdozent* (official but unpaid lecturer) in 1917. From 1920 to 1925 he worked in the physics laboratory of the Philips organization (lamp manufacturers) at Eindhoven, Neth. In 192j he was appointed professor of physics in the University of Halle. and in 1928 he became professor of physics at the Technische Hochschule in Berlin-Charlottenburg. He resigned on political grounds in 1934 and soon afterward became director of one of the research laboratories of the Siemens company.

Hertz was in Berlin in 1945 when the Russian forces entered the city and, while it was not known what happened to him. there had been a report that he survived and that he continued his researches for the U.S.S.R. The experiments of Hertz and Franck on the electron-atom collision showed that for ionization of the atom the electron must possess a certain minimum energy. measured in volts as "ionization potential." which varied for different gases; and the measurements made showed quantitatively that a series of spectral lines so obtained corresponded to a series of stationary states in the internal energy of the atom. as demanded by Siels Bohr's theory of the structure of the atom, which included the application of Max Planck's quantum theory. according to which energy could be taken up by the atom only in discrete quantities. Hertz succeeded in devising a method of separating the isotopes of neon by means of diffusion. (D. McK.)

HERTZ, HEINRICH RUDOLF (1857–1894), German physicist. was the first to demonstrate the production and reception of radio waves. He was born at Hamburg on Feb. 22. 18j7. On leaving school he studied engineering. but abandoned it in favour of physics. Hertz went to Berlin. where he studied under Hermann von Helmholtz. In 1883 he went to Kiel. becoming *Privatdozent* (official but unpaid lecturer). and there he began the studies in Maxwell's electromagnetic theory which a few years later resulted in the discoveries that rendered his name famous. These were actually made between 1885 and 1889, when he was professor of physics in the Karlsruhe Polytechnic. Helmholtz drew Hertz's attention to a prize offered by the Berlin Academy of Sciences for the experimental establishment of a relation between electromagnetic actions and the polarization of a dielectric, and promised him the assistance of the institute if he decided to work on the subject. Hertz did not take it up seriously at that time because he could not think of any procedure'likely to prove effective. Later he was able to discover the progressive propagation of electromagnetic action through space. to measure the length and velocity of electromagnetic waves and to show that in the transverse nature of their vibration and their susceptibility to reflection, refraction and polarization they are in complete correspondence with the waves of light and heat. The result was to establish beyond doubt the electromagnetic nature of light. In 1889 Hertz was appointed to succeed R. J. E. Clausius as ordinary professor of physics in the University of Bonn. There he continued his researches on the discharge of electricity in rarefied gases, only just missing the discovery of the X-rays described by W. C. Rontgen a few years later, and produced his treatise on the *Principles of Mechanics.*

This was his last work, for after a long illness he died at Bonn on Jan. 1, 1894 By his premature death science lost one of its most promising disciples.

See also Electricity : *Hertz's Experiments.*

Hertz's scientific papers were translated into English by D. E. Jones and published in three volumes: *Electric Waves* (1893), *Miscellaneous Papers* (1896) and *Principles of Mechanics* (1899).

HERTZ, HENRIK (originally Heyman) (1797 or 1798–1870), Danish author who, like his friend, J. L. Heiberg (*q.v.*), opposed the late romantic tendency to formlessness both in his critical writings and in his poems, plays and ballad operas. Born in Copenhagen of Jewish parents, probably on Aug. 25, 1797 or

1798, he received the first name Heyman, but took the name Henrik at his baptism in 1832. He graduated in law but never practised, instead devoting himself to belles-lettres. His first play, *Herr Burchardt og hans Familie,* a comedy in the line of direct descent from Holberg, appeared in 1827 and was followed by *Kærlighed og Politi* ("Love and the Police"), a vaudeville or ballad opera inspired by those of Heiberg. He greatly admired Heiberg with whom he allied himself, notably in *Gengangerbreve* ("Letters of a Ghost," 1830), in a campaign against the lack of form and intellectual content in Adam Öhlenschläger's mature romanticism. As a poet, Hertz was prolific, versatile and always distinguished, whether in lyric, narrative or didactic vein, but he has been overshadowed by his outstanding contemporaries, Ludwig Bødtcher, Christian Winther and Frederick Paludan-Miiller. None the less, his carefully wrought and eminently actable plays, which continued to appear until 1869, are among the best of his time. They include *Amors Genistreger* ("Cupid's Pranks," 1830), a rhymed comedy, the charm and deftness of which are comparable to those of Alfred de Musset; *Debatten i Politivennen* ("The Debate in 'The Friend of the Police'," 1836) and other entertaining vaudevilles; *Sparekassen* ("The Savings Bank," 1836), a prose comedy; *Svend Dyrings Hus* (1837), a "ballad-tragedy"; and *Kong René's Datter,* a lyric drama anonymously produced in 1845 and soon translated (English by T. Martin, 1850) and acted in many European languages.

Hertz died in Copenhagen, Feb. 25, 1870. His collected poems, *Digte,* appeared in 4 vol. (1851–62); his *Dramatiske Vaerker,* in 18 vol. (1854–73).

See H Kyrre, *Henrik Hertz, Liv og Digtning* (1916); *M.* Brøndsted, *Henrik Herizes Teater* (1946). (B. W. D.)

HERTZ, JOSEPH HERMAN (1872–1946), chief rabbi of the United Hebrew Congregations of the British Empire, was born in Rebrény, Hung.. on Sept. 25, 1872. Emigrating to the Gnited States 'as a child he was educated at New York City college, Columbia university, where he took the degree of Ph.D., and at the Jewish Theological Seminary of America. He was a rabbi in Johannesburg, South Africa, from 1898 to 1911 and, during the Boer War, was expelled by Pres. Paul Kruger for pro-British sympathies and for advocating the removal of religious disabilities from Jews and Catholics. From 1906 to 1908 he was professor of philosophy at Transvaal University college. Hertz was elected to the chief rabbinate in succession to Hermann Adler in 1913. In 1920–21 he undertook an extensive pastoral tour, visiting the Jewish communities in South Africa, Australia, New Zealand and Canada. In 1925 he was made a governor of the University of Jerusalem. His *A Book of Jewish Thoughts* went through numerous editions, and his commentaries in English on the Pentateuch and the Standard Prayer Book are widely accepted and used by orthodox and conservative Jews. Hertz died in London on Jan. 14, 1946.

HERTZBERG, EWALD FRIEDRICH, GRAF VON (1725–1795), Prussian statesman, was born at Lottin, Pomerania, on Sept. 2, 1725. He studied law at Halle, and entered the Prussian government service, rising rapidly until he became chief minister in 1763. For more than 40 years Hertzberg played an active part in the Prussian foreign office. In this capacity he had a decisive influence on Prussian policy, both under Frederick the Great and Frederick William II. At the beginning of the Seven Years' War (1756) he took part as a political writer in the Hohenzollern-Habsburg quarrel. After the defeat at Kolin (1757) he organized the national defense in Pomerania and collected the necessary troops for the protection of the fortresses of Stettin and Colberg. In the same year he conducted the peace negotiations with Sweden, and helped to bring about the peace of Hubertusburg (1763).

In 1772, in a memoir based upon comprehensive historical studies, he defended the Prussian claims to certain provinces of Poland. He also supported by his writings the negotiations on the Bavarian succession (1778) and the peace of Teschen (1779). But in 1780 he failed to uphold Prussian interests at the election of the bishop of Münster. In 1784 appeared Hertzberg's memoir containing a thorough study of the Fürstenbund. He championed this creation of Frederick the Great's mainly with a view to an energetic reform of the empire, though the idea of German unity was naturally still far from his mind. Though the Fiirstenbund failed to effect a reform of the empire, it at any rate prevented the fulfillment of Joseph II's old desire for the incorporation of Bavaria with Austria. The last act of state in which Hertzberg took part under Frederick the Great was the commercial treaty concluded in 1785 between Prussia and the U.S.

Under Frederick William II Hertzberg was raised to the rank of count in 1786. His political system remained on the whole the same as it had been under Frederick, mainly characterized by opposition to the house of Habsburg and by a desire to win for Prussia the support of England. His diplomacy was directed also against Austria's old ally, France, and it was chiefly owing to him that in 1787 Prussia intervened in Holland in support of the stadholder William V against the democratic French party. The success of this intervention marks the culminating point in his career. The opposition between him and the new king became marked when Hertzberg, relying upon the triple alliance (Holland, England, Prussia), sought to take advantage of the entanglement of Austria with Russia in the war with Turkey to secure for Prussia an extension of territory by diplomatic intervention. According to his plan, Prussia was to offer her mediation at the proper moment, and in the territorial readjustments that the peace would bring, was to receive Danzig and Thorn as her portion. Beyond this he aimed at preventing the restoration of the hegemony of Austria in the empire, and secretly cherished the hope of restoring Frederick the Great's Russian Alliance.

Deep-rooted differences between him and the king were revealed during these diplomatic campaigns. Hertzberg wished to effect everything by peaceful means, while Frederick William II was for a time determined on war with Austria. On Polish and British policy, too, their ideas came into conflict. At the conferences at Reichenbach in the summer of 1790, this opposition became more and more acute, and Hertzberg was only with difficulty persuaded to come to an agreement merely on the basis of the *status quo,* as demanded by Pitt. The king's renunciation of any extension of territory was in Hertzberg's eyes impolitic, and this view of his was later endorsed by Bismarck. A letter which came to the eyes of the king, in which Hertzberg severely criticized the king's foreign policy, led to his dismissal on July j, 1791. The king showed himself more and more personally hostile to the ex-minister, and in later years pursued Hertzberg, now quite embittered, with every kind of petty persecution.

Wilhelm von Humboldt excepted, Hertzberg was the most learned of all the Prussian ministers. As a member of the Berlin Academy especially, and, from 1786 onward, as its curator, Hertzberg was active in the world of learning. His yearly reports dealt with history, statistics and political science. The most interesting is that of 1784: *Sur la forme des gouvernements, et quelle est la meilleure.* This is directed exclusively against the absolute system (following Montesquieu), upholds a limited monarchy and is in favour of extending to the peasants the right to be represented in the diet. He spoke for the last time in 1793 on Frederick the Great and the advantages of monarchy. After 1783 these discourses caused a great sensation, since Hertzberg introduced into them a review of the financial situation, which in the days of absolutism seemed an unprecedented innovation. Hertzberg exerted himself as an academician to change the strongly French character of the Academy and make it into a truly German institution. He showed a keen interest in the old German language and literature. He also stood in very close relations with many of the German poets of the time, and in 1780 he boldly took up the defense of German literature, which had been disparaged by Frederick the Great in his famous writing *De la littérature allemande.* He died in Berlin on May 27, 1795.

BIBLIOGRAPHY.—The *Mémoires de l'Académie* from 1780 on contain Hertzberg's discourses. An "Autobiographical Sketch" was published by Höpke in Schmidt's *Zeitschrift für Geschichtswissenschaft,* vol. i (1843). *See* also P. F. Weddigen, *Hertzbergs Leben* (1797); E. L. Posselt, *Hertzbergs Leben* (1798); *Allgemeine deutsche Biographie* (1880); G. Dressler, *Friedrich II und Hertzberg in ihrer Stellung zu den holländischen Wirren* (1882); K. Krauel, *Hertzberg als Minister Friedrich Wilhelms II* (1899); A. T. Preuss, *Ewald Friedrich, Graf von Hertzberg* (1909).

HERTZOG, JAMES BARRY MUNNIK (1866–1942), South African politician, was born at Wellington, Cape Colony, April 3, 1866. Educated at Victoria College, Stellenbosch and Amsterdam university, he became a judge in the Orange Free State in 1895, and served through the South African War of 1899–02. He voted against peace at Vereeniging and, frankly hostile to the British connection, he helped to keep alive this anti-British feeling after the war. On the grant of responsible government in 1907, he became attorney general and minister of education in Fischer's ministry, and forthwith began to undo the work of the Crown Colony Administration. He tried to force upon the schools in the Orange River State a system of compulsory bilingualism — Dutch and English — which was crude and impracticable. The director of education resigned, and one of the three inspectors, dismissed without enquiry, won an action for libel against Hertzog in a *cause célèbre*.

In the first Union Cabinet, in 1910, Hertzog became minister of justice under Botha, but his attitude made the position untenable. Hertzog derided Botha's work at the Imperial Conference in London, and repudiated all suggestions of state-aided immigration and of a naval contribution, which Botha was suspected to have favoured. Botha resigned in 1912, took office again, reconstructed his cabinet and left Hertzog out. Hertzog then (Dec. 1913) formed an opposition party with complete independence of Britain as its goal, and his perfervid nationalism made him a power among the old Republican Boers. He made full use of the racial appeal, and fought unremittingly against the Botha-Smuts policy of South African development within the British Empire. His original five supporters in the South African parliament were increased by 1924 to 63, and a working alliance with the Labour party gave Hertzog a majority. Smuts fell, and the Coalition came to power with Hertzog as prime minister, which office he held for 15 years. In 1933 he formed, in coalition with Gen. Smuts, a National party which was returned to power. When World War II broke out, Hertzog opposed a South African declaration of war against Germany, declaring that such action was a '(crime"; he was defeated in the assembly, however, by a vote of 80 to 6 and resigned forthwith. He was succeeded by Gen. Smuts. Thereafter Hertzog continued to urge a separate peace with the nazis. He resigned from parliament in Dec. 1940 and died Nov. 21, 1942 at Cape Town.

HERTZSPRUNG, EJNAR (1873–), Danish astronomer, was born at Frederiksberg, near Copenhagen; on Oct. 8, 1873 He was educated in technological colleges in Denmark and became a chemical engineer. After several years in this profession he was called to Gottingen, Ger., in 1909 as professor of astronomy and later moved to Potsdam, Ger. He was appointed assistant director of the university observatory at Leyden, Netherlands, in 1919 and became director in 1935; he resigned in 1945.

There is hardly a phase of modern stellar astronomy not affected by Hertzsprung's work. In papers published in 1905 and 1907, he showed that there is a relationship between the colours of the stars and their true or absolute brightness. The great majority lie along a sequence ranging from the blue and white stars (the Orion group, Sirius, and Vega) through the yellow (Procyon, α Centauri, and the sun) to the orange (61 Cygni) and red. Along this sequence the true brightness decreases smoothly and rapidly; the blue and white stars are larger and much more luminous than, the sun; the orange and red stars are smaller and fainter. In addition to this main sequence, Hertzsprung called attention to a number of yellow, orange and red giants (Xrcturus. Pollux. Aldebaran and Betelgeuse); these are far less numerous in space than the main sequence stars of the same colour, and they were described as "whales among the fishes.!'

This description of stellar types was refined by the later work of Hertzsprung and H. N. Russell. and culminated in the "Hertzsprung-Russell diagram" — perhaps the fundamental diagram of stellar astronomy.

Later work indicated that there are faint white stars (the so-called white dwarfs), but the over-all picture suggested by Hertzsprung was completely confirmed. He also noted that the great majority of stars in our region of space are smaller and absolutely fainter than the sun.

One of the most important fields in contemporary astronomy originated in Hertzsprung's discovery, that there is a relationship between the strength of certain features in the spectrum of a star and its true brightness. This furnishes a means of estimating the true brightness — that is, the absolute magnitude — simply from the appearance of a stellar spectrum. (W. W. **M.**)

HERULI, a Teutonic tribe belonging either to the northern or the southern portion of the Jutish peninsula. In the reign of Gallienus (A.D. 26—68), they were with the Goths ravaging the coasts of the Black Sea and the Aegean. Soon afterwards, in AD. 289, they appeared in the region about the mouth of the Rhine. During the 4th century they frequently served together with the Batavi in the Roman armies. In the 5th century the Heruli made piratical incursions in the western seas. At the same time they had a kingdom in central Europe, in or around the basin of the Elbe.

About the beginning of the 6th century they were completely overthrown in war by the Langobardi. Part of them migrated to Sweden, while others crossed the Danube and entered the Roman service, where they were frequently recorded later in connexion with the Gothic wars. In English, Frankish and Scandinavian works they are never mentioned, and there can be little doubt that they were known among the western Teutonic peoples by some other name. Probably they were identical either with the North Suabi or with the Iuti. The name Heruli itself is identified by many with the AS. *Eorlas* (nobles).

The Heruli remained heathen until the overthrow of their kingdom, and retained many striking primitive customs. When threatened with death by disease or old age, they were required to call in an executioner, who stabbed them on the pyre. Suttee was also customary Entirely devoted to warfare, they served not only in the Roman armies, but also in those of all the surrounding nations. They disdained the use of helmets and coats of mail, and protected themselves only with shields.

HERVEY OF ICKWORTH, JOHN HERVEY, BARON (1696–1743), English statesman and writer, eldest son of John, 1st earl of Bristol, by his second marriage, was educated at Westminster school and at Clare Hall, Cambridge. In 1716 his father sent him to Paris, and thence to Hanover to pay his court to George I. He was a frequent visitor at the court of the prince and princess of Wales at Richmond, and in 1720 he married Mary Lepell, who was one of the princess's ladies-in-waiting, and a great court beauty. In 1723 he received the courtesy title of Lord Hervey on the death of his half-brother Carr, and in 1725 he was elected M.P. for Bury St. Edmunds. In 1730 he attached himself to Walpole. He was assumed by William Pulteney to be the author of *Sedition and Defamation display'd with a Dedication to the patrons of The Craftsman* (1731). Pulteney replied, and the quarrel resulted in a duel from which Hervey narrowly escaped with his life. Hervey's influence with the queen enabled him to render valuable service to Walpole. He was vice-chamberlain in the royal household and a member of the privy council. In 1733 he was called to the House of Lords by writ in virtue of his father's barony. He was lord privy seal when the fall of Walpole drove him from his office (July 1742). He predeceased his father, but three of his sons became successively earls of Bristol.

Hervey wrote detailed and brutally frank memoirs of the court of George II. from 1727 to 1737. He gave a most unflattering account of the king, and of Frederick, prince of Wales, and their family squabbles. For the queen and her daughter, Princess Caroline, he had a genuine respect and attachment, and the princess's affection for him was commonly said to be the reason for the close retirement in which she lived after his death. The ms. of Hervey's memoirs was preserved by the family, and published in 1848 under the editorship of J. W. Croker. The ms. had already been subjected to a certain amount of mutilation, and Croker himself softened in some cases the plainspokenness of the original.

HERVIEU, PAUL (1857–1915), French dramatist and nov-

elist, was born at Neuilly (Seine) on Nov. 2, 1857. He was called to the bar in 1877, and, after serving some time in the office of the president of the council, qualified for the diplomatic service, but resigned on his nomination in 1881 to a secretaryship in the French legation in Mexico. He contributed novels, tales and essays to the chief Parisian papers and reviews, and published a series of clever novels, of which the most famous are *Peints par eux-mêmes* (1893), an ironical study written in the form of letters and *L'Armature* (1895), dramatized in 1905 by Eugene Brieux. But his most important work consists of a series of plays: *Les Paroles restent* (Vaudeville, Nov. 17, 1892); *Les Tenailles* (Théâtre Franqais, Sept. 28, 1895); La *Loi de l'homme* (Théâtre Franqais, Feb. 15, 1897); *La Course du flambeau* (Vaudeville, April 17, 1901); *Point de lendemain* (Odéon, Oct. 18, 1901), a dramatic version of a story by Vivaut Denon; *L'Enigme* (Théâtre Franqais, Nov. 5, 1901); *Théroigne de Méricourt* (Théâtre Sarah Bernhardt, Sept. 23, 1902); *Le Dédale* (Théâtre Français, Dec. 19, 1903); and *Le Réveil* (Théâtre Français, Dec. 18, 1905). These plays, which are nearly all *pièces à thèse,* are built upon a severely logical method, the mechanism of which is sometimes so evident as to destroy the necessary sense of illusion. The closing words of *La Course du flambeau*—*"Pour ma fille, j'ai tue ma mère"*—illuminate the Hervieu method. The riddle in *L'Enigme* (staged at Wyndham's Theatre, London, March 1, 1902, as *Caesar's Wife)* is, however, worked out with great art, and *Le Dédale,* dealing with the obstacles to the remarriage of a divorced woman, is reckoned among the masterpieces of the modern French stage. His last play was *Le Destin est Maître* (1914). He was elected to the French Academy in 1900, and died in Paris on Oct. 25, 1915.

See A. Binet, *in L'Année psychologique,* vol. x.; and *Portrait psychologique de Paul Hervieu* (1914); *H.* Burckhardt, *Studien zu Paul Hervieu* (1917).

HERWEGH, GEORG (1817–1875), German revolutionary poet, was born at Stuttgart on May 31, 1817. Expelled from the theological college at Tiibingen, he became a journalist. He was called up for military service, but committed an act of insubordination and fled to Switzerland. There he published *Gedichte eines Lebendigen* (1841), political poems expressing the aspirations of German youth. Although the book was confiscated, it ran through several editions. Herwegh returned to Germany in 1842, greeted by demonstrations showing popular sympathy; Frederick William IV received him in Berlin with the memorable words: *"Ich liebe eine gesinnungsvolle Opposition" ("I* admire an opposition, when dictated by principle"). In 1844 the second volume of *Gedichte eines Lebendigen* was published in Paris, where Herwegh was living, and was also confiscated. At the head of a column of German workingmen, recruited in Paris, Herwegh took part in a south German rising in 1848, but was defeated on April 27 at Schopfheim, Baden. He escaped to Switzerland, but was permitted (1866) to return to Germany, and died at Lichtental, Baden, on April 7, 1875. *Neue Gedichte* appeared in 1877. Herwegh also translated the works of Alphonse de Lamartine.

BIBLIOGRAPHY.—**Herwegh's** works were ed. by H. Tardel, 3 vol. (1909); his correspondence was published in 1896; his *Briefen an seine Braut* in 1906 and his correspondence with Marie d'Agoult in M. Herwegh, *Au printemps des dieux* (1929). *See* also Victor Fleury, *Le Poète Georges Herwegh* (1911); *E.* Baldinger, *Georg Herwegh: Die Gedankenwelt der "Gedichte eines Lebendigen"* (1917); B. Kaiser, *Der Freiheit eine Gasse* (1947). (A. Gs.)

HERZBERG, a town in the *Land* of Lower Saxony, situated under the south-western declivity of the Harz, on the Sieber, 25 mi. N.W. from Nordhausen by the railway to Osterode-Hildesheim. Pop. (1950) 9,606. It has manufactures of machinery and art silk and weaving and dyeing works. On a hill southwest of the town lies the castle of Herzberg, which in 1157 came into the possession of Henry the Lion, duke of Saxony, and was one of the residences of a branch of the house of Brunswick.

HERZBERG, a town in Germany, in the district of Cottbus, on the Schwarze Elster, 25 mi. S. from Jiiterbog by the railway Berlin-Roderau-Dresden. It has a church (Evangelical) dating from the 13th century and a medieval town hall. Its industries include the founding and turning of metal, agricultural machinery and furniture. Pop. (1950) 7,415.

HERZEN, ALEXANDER IVANOVICH (1812–1870). Russian author, was born in Moscow on March 25, 1812, the illegitimate son of Ivan Yakovlev, a noble. A year later the family returned to Moscow, where Herzen attended the university In 1834 he was arrested with other youths suspected of revolutionary tendencies, and in 1835 he was exiled to Viatka and worked as a clerk in the civil service. There he remained for seven years, at the end of which he was allowed to exchange to Vladimir, where he edited the official gazette. In 1840 he was allowed to return to Moscow, where he became one of the leaders of the westerners, but he was again arrested, and sent to serve in the Government offices at Nóvgorod until his retirement in 1842. In 1846 his father died, leaving him by his will a very large property. Early in 1847 he left Russia, never to return. From Italy, on hearing of the revolution of 1848, he hastened to Paris, whence he afterwards went to Switzerland. In 1852 he quitted Geneva for London, where he settled for some years, and established a Russian press for the publication of works which could not be printed in Russia. In 1864 he returned to Geneva, and after some time went to Paris, where he died on Jan. 9, 1870.

In 1847 appeared his novel *Kto Vinovat?* (Whose Fault?), and about the same time were published in Russian periodicals the stories which were afterwards collected and printed in London in 1854, under the title of *Prervannuie Razskazui* (Interrupted Tales). In 1850 two works appeared, translated from the Russian manuscript, *Vom anderen Ufer* (From another Shore) and *Lettres de France et d'Italie. Vom anderen Ufer* is perhaps his greatest work. It is the bitter fruit of disillusion after the failure of the revolution of 1848; in it he seeks to destroy the romanticism of the revolutionaries and to replace it by the will to revolution. In French appeared also his essay *Du Développement des idées révolutionnaires en Russie,* and his *Memoirs.* Herzen's *Memoirs* are indispensable in the history of the revolution in Europe for the portraits of the revolutionary leaders; and they give a true and vivid picture of his own personality and upbringing. From his "Free Russian Press" in London he issued a great number of Russian works, all levelled against the system of government prevailing in Russia. Some of these were essays, such as his *Baptized Property,* an attack on serfdom; others were periodical publications, the *Polyarnaya Zvyezda* (or Polar Star), the *Kolokol* (or Bell), and the *Golosa iz Rossii* (or Voices from Russia). The *Kolokol* soon obtained an immense circulation, and exercised an extraordinary influence. For three years, it is true, the founders of the "Free Press" went on printing, "not only without selling a single copy, but scarcely being able to get a single copy introduced into Russia"; but after the death of the emperor Nicholas in 1855 Herzen's writings, and the journals he edited, were smuggled wholesale into Russia, and their words resounded throughout that country, as well as all over Europe. For some years his influence in Russia was a living force; the circulation of his writings was a vocation zealously pursued. When the Polish insurrection of 1863 broke out, and he pleaded the insurgents' cause, his reputation in Russia received its death-blow. From that time it was only with the revolutionary party that he was in full accord.

In 1873 a collection of his works in French was commenced in Paris. A volume of posthumous works, in Russian, was published at Geneva in 1870. His *Memoirs* (Eng. trans. by C. Garnett, 6 vols., 1924–27, and by J. D. Duff, Yale, 1923), supply the principal information about his life, a sketch of which appears also in A. von Wurzbach's *Zeitgenossen,* pt. 7 (Vienna, 1871). *See* also the *Revue des deux mondes* for July 15 and Sept. 1, 1854. *Kto Vinovat?* has been translated into German under the title of *Wer ist schuld? in* Wolffsohn's *Russlands Novellendichter,* vol. iii.

HERZL, THEODOR (1860–1904), founder of modem political Zionism (*q.v.*), was born in Budapest on May 2, 1860, and died at Edlach on July 3, 1904. He received a legal education at Vienna, where he afterwards acquired high repute as a literary journalist and a dramatist. All his other claims to renown, however, sink into insignificance when compared with his work as the reviver of Jewish hopes for a restoration to political autonomy. The new nationalism of 1848 did not deprive the Jews of political rights, but it denied them both the amenities of friendly

intercourse and the opportunity of distinction in the university, the army and the professions. Many Jews refused to see in the new anti-Semitism (*q.v.*) which spread over Europe in 1881 any more than a temporary reaction against the cosmopolitanism of the French Revolution. In 1896 Herzl published his famous pamphlet "Der Judenstaat." Holding that the only alternatives for the Jews were complete merging by intermarriage or self-preservation by a national reunion, he boldly advocated the second course. He did not at first insist on Palestine as the new Jewish home, nor did he attach himself to religious sentiment; his solution was economic and political.

Herzl rallied the masses with sensational success, and unexpectedly gained the accession of many Jews by race who were indifferent to the religious aspect of Judaism, but he failed to convince the leaders of Jewish thought, who (with such conspicuous exceptions as Max Nordau and Israel Zangwill) remained deaf to his pleading. He assembled several congresses at Basle, Switz. (beginning in 1897). where remarkable scenes of enthusiasm for his ideal of "establishing for the Jewish people a publicly and legally assured home in Palestine" were enacted. Diplomatic interviews. exhausting journeys, impressive mass meetings, brilliant literary propaganda—all these methods were employed by him to the utmost limit of self-denial. In 1901 he was received by the Turkish sultan; the pope and many European rulers and statesmen gave him audiences. In 1903 the British government offered land for an autonomous settlement in east Africa, but an extra-Palestinian site for the Jewish state was strongly opposed by many Zionists. This somewhat embittered "territorial" controversy told on Herzl's failing health, and he died in the summer of 1904. His remains were removed, to the Holy Land, in accordance with his wish, and were buried in Jerusalem in 1949.

See *Theodor Herzls Tagebücher 1895–1904,* 3 vol. (Berlin, 1922–23); *A.* Friedemann, *Das Leben Theodor Herzls,* 2nd ed. (Berlin, 1919); B. Hagani, *Le Sionisme politique et son fondateur T. Herzl* (Paris, 1917); *A.* Bein, *Theodor Herzl, a Biography* (Philadelphia, 1941).

HERZOG, HANS (1819–1894), Swiss general, was born, and died, at Aarau. In 1870 he was commander-in-chief of the Swiss army, which guarded the Swiss frontier, in the Jura, during the Franco-German War, and in February 1871, as such, concluded the Convention of Verrières with General Clinchant for the disarming and the interning of the remains of Bourbaki's army, when it took refuge in Switzerland. In 1873 he became the commander-in-chief of the Swiss artillery.

HERZOG, JOHANN JAKOB (1805–1882), German Protestant theologian, was born at Basle on Sept. 12, 1805. He died on Sept. 30, 1882, at Erlangen, where he had been professor of church history from 1854 to 1877. He prepared the *Realencyklopädie für protestantische Theologie und Kirche* (1853–68, 22 vols.), of which he undertook a new edition with G. L. Plitt (1836–80) in 1877, and after Plitt's death with Albert Hauck (b. 1845). Hauck began the publication of the third edition in 1896 (completed in 22 vols., 1909).

His other works include *Joh. Calvin* (1843), *Leben Ökolampads* (1843), *Die romanischen Waldenser* (1853), *Abriss des gesamten Kirchengeschichte* (3 vols., 1876–82, 2nd ed., 1890–92).

HERZOGENBERG, HEINRICH VON (1843-goo), Austrian musician and friend of Brahms, was born at Graz, Styria, on June 10, 1843, and studied at the Vienna conservatoire. He settled in Leipzig in 1872, and from 1875 to 1885 was conductor of the Bach *Verein.* He was later professor at the Berlin Hochschule, and at Kiel, retiring in 1888. He wrote much chamber music and scholarly church and orchestral works, all of which bear the impress of his intimacy with Brahms.

See J. Kalbeck, *Brahms, in Briefwechsel mit Heinrich und Elisabeth Herzogenberg* (a vols., 1907).

HESILRIGE (or **HESELRIG**), **SIR ARTHUR,** 2ND BART. (d. 1661), English parliamentarian, was the eldest son of Sir Thomas Hesilrige, 1st baronet (c. 1622), of Noseley, Leicestershire. He sat for Leicestershire in the Short and Long Parliaments in 1640, and took a principal part in Strafford's attainder, the Root and Branch Bill and the Militia Bill of Dec. 7, 1641, and was one of the five members impeached on Jan. 3, 1642. He raised a troop of horse for Essex, fought at Edgehill, commanded in the West under Waller, being nicknamed his *fidus Achates,* and distinguished himself at the head of his cuirassiers, "The Lobsters," at Lansdown on July 5, 1643, at Roundway Down on July 13, at both of which battles he was wounded, and at Cheriton, March 29, 1644. On the occasion of the breach between the army and the parliament, Hesilrige supported the army, took Cromwell's part in his dispute with Manchester and Essex, and on the passing of the Self-denying Ordinance gave up his commission and became one of the leaders of the Independent party in parliament. On Dec. 30, 1647 he was appointed governor of Newcastle, which he successfully defended; he defeated the Royalists on July 2, 1648 and regained Tynemouth. In October he accompanied Cromwell to Scotland, and gave him valuable support in the Scottish expedition in 1650. Hesilrige, though he approved of the king's execution, had declined to act as judge on his trial. Cromwell's expulsion of the Long Parliament threw him into antagonism, and he opposed the Protectorate and refused to pay taxes. He was returned for Leicester to the parliaments of 1654, 1656 and 1659, but was excluded from the two former. He succeeded in again obtaining admission to the Commons in January 1658. On Cromwell's death Hesilrige refused support to Richard; after Richard's downfall he attempted to maintain a republican parliamentary administration, "to keep the sword subservient to the civil magistrate," and when Lambert expelled the parliament, Hesilrige turned to Monk for support, and helped him by securing Portsmouth on Dec. 3, 1659. He marched to London, was appointed one of the council of state, and on Feb. 11 became a commissioner for the army. He was completely outwitted by Monk, and trusting to his assurance of fidelity to "the good old cause" consented to the retirement of his regiment from London. At the Restoration his life was saved by Monk's intervention, but he died in the Tower on Jan. 7, 1661.

See article on Hesilrige by *C.* H. Firth in the *Dict. of Nat. Biography,* and authorities there quoted.

HESIOD, the father of Greek didactic poetry, probably flourished during the 8th century B.C. His father had migrated from the Aeolic Cyme in Asia Minor to Boeotia; and Hesiod and his brother Perses were born at Ascra, near Mount Helicon (*Works and Days,* 635). Here, as he fed his father's flocks, he received his commission from the Muses to be their prophet and poet, a commission which he recognized by dedicating to them a tripod—still in existence at Helicon in the age of Pausanias *(see Tkeogony,* 2—34, *W. and D.* 656; Pausanias ix. 38.3)—won by him in a contest of song *(see* below) at some funeral games at Chalcis in Euboea. After the death of his father Hesiod is said to have left his native land in disgust at the result of a law-suit with his brother and to have migrated to Naupactus. There was a tradition that he was murdered by the sons of his host in the sacred enclosure of the Nemean Zeus at Oeneon in Locris (Thucydides iii. 96; Pausanias ix. 31); his remains were removed for burial by command of the Delphic oracle to Orchomenus in Boeotia, where the Ascraeans settled after the destruction of their town by the Thespians, and where, according to Pausanias, his grave was to be seen.

Hesiod's earliest poem, the famous *Works and Days,* and according to Boeotian testimony the only genuine one, embodies the experiences of his daily life and work, and, interwoven with episodes of fable, allegory, and personal history, forms a sort of Boeotian shepherd's calendar. The first portion is an ethical enforcement of honest labour and dissuasive of strife and idleness (1–383); the second consists of hints and rules as to husbandry (384–764); and the third is a religious calendar of the months, with remarks on the days most lucky or the contrary for rural or nautical employments. The connecting link of the whole poem is the author's advice to his brother, who appears to have bribed the corrupt judges to deprive Hesiod of his inheritance. In the *Works and Days* the episodes which rise above an even didactic level are the "Creation and Equipment of Pandora," the "Five Ages of the World" and the much-admired "Description of Winter" (by some critics judged post-Hesiodic). The poem also contains the earliest known fable in Greek literature, that of "The Hawk and the Nightingale." It is in the *Works and Days* especially that we glean indications of Hesiod's rank and condition in

life, that of a stay-at-home farmer of the lower class, whose sole experience of the sea was a single voyage of 40 yards across the Euripus, and an old-fashioned bachelor whose misogynic views and prejudice against matrimony have been conjecturally traced to his brother Perses having a wife as extravagant as himself.

The other poem attributed to Hesiod or his school which has come down in great part to modern times is the *Theogony,* a work of grander scope, inspired alike by older traditions and abundant local associations. It is an attempt to work into system, as none had essayed to do before, the floating legends of the gods and goddesses and their offspring. This task Herodotus (ii, 53) attributes to Hesiod, and he is quoted by Plato in the *Symposium* (178 B) as the author of th'e *Theogony.* The first to question his claim to this distinction was Pausanias, the geographer (A.D. 200). The Alexandrian grammarians had no doubt on the subject; and indications of the hand that wrote the *Works and Days* may be found in the severe strictures on women, in the high esteem for the wealth-giver Plutus and in coincidences of verbal expression. Although, no doubt, of Hesiodic origin, in its present form it is composed of different recensions and numerous later additions and interpolations. The *Theogony* consists of three divisions: (1) a cosmogony, or creation; (2) a theogony proper, recounting the history of the dynasties of Zeus and Cronus; and (3) a brief and abruptly terminated heroogony, the starting-point not improbably of the supplementary poem, the *κατάλογος* or "List of Women" who wedded immortals, of which all but a few fragments are lost.[1] The proem (1–116) addressed to the Heliconian and Pierian muses, is considered to have been variously enlarged, altered and arranged by successive rhapsodists. The poet has interwoven several episodes of rare merit, such as the contest of Zeus and the Olympian gods with the Titans, and the description of the prison-house in which the vanquished Titans are confined, with the Giants for keepers and Day and Night for janitors (735 *sqq.)*

The only other poem which has come down to us under Hesiod's name is the *Shield of Heracles,* the opening verses of which are attributed by a nameless grammarian to the fourth book of *Eoiai.* The theme of the piece is the expedition of Heracles and Iolaus against the robber Cycnus; but its main object apparently is to describe the shield of Heracles (141–317). It is clearly an imitation of the Homeric account of the shield of Achilles *(Iliad,* xviii, 479) and is now generally considered spurious. Titles and fragments of other lost poems of Hesiod have come down to us: didactic, as the *Maxims of Cheiron;* genealogical, as the *Aegimius,* describing the contest of that mythical ancestor of the Dorians with the Lapithae; and mythical, as the *Marriage of Ceyx* and the *Descent of Theseus to Hades.*

Recent editions of Hesiod include the 'Aybv *Ὁμήρου κα Ἡσιόδου,* the *Contest* (of song) *between Homer and Hesiod,* at the funeral games held in honour of King Amphidamas at Chalcis. This little tract belongs to the time of Hadrian, who is actually mentioned as having been present during its recitation, but is founded on an earlier account by the sophist Alcidamas (*q.v.*). Quotations (old and new) are made from the works of both poets, and, in spite of the sympathies of the audience, the judge decided in favour of Hesiod. Certain biographical details of Homer and Hesiod are also given.

A strong characteristic of Hesiod's style is his sententious and proverbial philosophy (as in *Works and Days,* 24–25, 40, 218, 345, 371). There is naturally less of this in the *Theogony,* yet there, too, not a few sentiments take the form of the saw or adage. He has undying fame as the first of didactic poets, the accredited systematizer of Greek mythology and the rough but not unpoetical sketcher of the lines on which Virgil wrought out his exquisitely finished *Georgics.*

BIBLIOGRAPHY.—Complete works: *Editio princeps* (Milan, 1493); Gottling-Flach (1878), with full bibliography up to date of publication; C. Sittl (1889), with introduction and critical and explanatory notes in Greek; F. A. Paley (1883); A. Rzach (1902), including the fragments. Separate works: *Works and Days*—*Vad* Lennep (1847); A. Steitz, *Die Werke und Tage des Hesiodos* (1869), dealing chiefly with the composition and arrangement of the poem; G. Wlastoff, *Promtthte, Pandore, et la légende des siècles* (1883); A. Kirchhoff (1889); *Theogony*—*Van* Lennep (1843); F. G. Welcker (1865), valuable edition; G. F. Schomann (1868), with text, critical notes and exhaustive commentary; H. Flach, *Die Hesiodische Theogonie* (1873), with prolegomena dealing chiefly with the digamma in Hesiod, *System der Hesiodischen Kosmogonie* (1874) and *Glossen und Scholien zur Theogonie* (1876); Meyer, *De compositione Theogoniae* (1887). *Shield of Heracles:* Wolf-Ranke (1840); Van Lennep-Hullemann (1854); F. Stegemann, *De Scuti Herculis Hesiodei poeta Homeri carminum imitatore* (1904); the fragments were published by W. Marckscheffel in 1840; for the *Ἀγὼν Ὁμήρου* (ed. A. Rzach, 1908) *see* F. Nietzsche in *Rheinisches Museum* (new series), xxv, p. 528. For papyrus fragments of the "Catalogue," some 50 lines on the wooing of Helen, and a shorter fragment in praise of Peleus, *see* Wilamowitz-Mollendorff in *Sitzungsber. der konigl. preuss. Akad. der Wissenschafter,* July 26, 1900; for fragments relating to Meleager and the suitors of Helen, *Berliner Klassikertexte* (1907) v; of the *Theogony, Oxyrh. Pap.* vi (1908).

On the subject generally, consult *G.* F. Schomann, *Opuscula* (1857) ii; *H.* Flach, *Die Hesiodischen Gedichte* (1874); A. Rzach, *Der Dialekt des Hesiodes* (1876); *O.* Friedel, Die Sage vom Tode Hesiods (1879), from *Jahrbiicher für classische Philologie* (10th suppl. Band, 1879); P. O. Gruppe, *Die griechischen Kulte und Mythen,* i (1887); *J.* Adam, *Religious Teachers of Greece* (1908). There is a full bibliography of the publications relating to Hesiod (1884–98) by A. Rzach in Bursian's *Jahresbericht iiber die Fortschritte der klassischen Alter-tumswissenschaft* (1900) xxvii.

There are translations of the Hesiodic poems in English by Cooke (1728), C. A. Elton (1815), J. Banks (1856) and specially by A. W. Mair, with introduction and appendices (Oxford Library of Translations; 1908); in German (metrical version) with valuable introductions and notes by R. Peppmiiller (1896) and in other modern languages.

On the date of Hesiod *see* T. W. Allen in *J. H. S.* (1915), xxxv, who would place his *floruit,* on astronomical and other grounds, *c.* 800 B.C.

(J. DA.; J. H. F.)

[1] Part of the poem was called Eoiai, because the description of each heroine began with *ἢ οἵη,* "or like as." *(See* BIBLIOGRAPHY.)

HESPERIDES, "daughters of evening," in Greek mythology, clear-voiced maidens who guarded the tree bearing golden apples which Earth gave Hera on the occasion of her marriage to Zeus. According to Hesiod *(Theogony,* 215) they were the daughters of Erebus and Night; in later accounts, their parents were Atlas, the scene of whose toil was nearby *(Theogony,* 517), and Hesperis, or Phorcys and Ceto. They were usually supposed to be three in number—Aegle, Erytheia, Hesperis (or Hesperethusa)—but according to some there were four, or even seven. They lived far away in the west beyond the Ocean stream, where the sun sets. Hence the sun sails in the golden bowl made by Hephaestus from the abode of the Hesperides to the land where he rises again. According to other accounts their home was among the Hyperboreans. The golden apples were guarded by Ladon, the ever-watchful dragon, offspring of Phorcys and Ceto. As Ladon is the name of an Arcadian river, Arcadia is possibly the original site of the garden. Heracles *(see* HERCULES) slew the dragon or put it to sleep and stole the apples, or else had Atlas get them for him. The golden apples, the gift of Aphrodite to Hippomenes before his race with Atalanta, were plucked from the garden of the Hesperides.

See H. J. Rose, *A Handbook of Greek Mythology* (1928).

(G. E. DK.)

HESPERORNIS, a genus of extinct birds known from the upper Cretaceous deposits of the Great Plains area of the United States (Kansas, South Dakota and Montana), classified in the order Hesperornithiformes. The first specimen, part of a tibio-tarsus, was found by Othniel C. Marsh in Dec. 1870, in fossil beds near the Smoky Hill river in western Kansas. Bitterly cold weather and the presence nearby of hostile Indians prevented further work at the time, but the following June Marsh's party, under strong military escort, excavated a nearly complete skeleton, the type of *Hesperornis regalis.* This was a highly specialized aquatic bird, a diver in habit, about 5 ft. in length.

The head was long, with 14 teeth on the maxilla and 33 on the mandible on either side, placed in a continuous groove. The bare premaxilla seems to point to the beginning of the toothless condition of living birds. The brain appears to have been similar to that of modern birds. The body was elongate and compressed, with the wings functionless and reduced so that the humerus, the only wing bone known, was slender and curved, with so slight an articulation with the scapular arch as to indicate that it had little power. The remaining wing elements, the forearm and hand, were either missing or so rudimentary that they have not been preserved in

the specimens found. The sternum was flat and without a keel, another indication that the wing had no function. The pelvis on the other hand was long and strong, the legs were heavy boned, and the toes strong. The first attempts to reconstruct the skeleton placed the bird in an upright attitude like an auk. But further study revealed that the head of the femur was articulated with the pelvis at such an angle that the leg stood out at the side: and on land the bird must have remained prostrate on the breast. That the leg muscles were extraordinarily strong is indicated by the conformation of the processes for muscular attachment. The patella in particular was especially long and well developed.

Because of the primitive condition of the skull and the flat sternum, Marsh was led to believe that *Hesperornis* was ancestral to the Struthioniformes (an order of flightless ratite birds including the ostrich) so that he referred to it as a "carnivorous, swimming ostrich." On further investigation it developed that characters of the fossil which seemed to ally it with the ratites are rather those marking it as a primitive type, as these fossil species belong in a group apart.

Parts of more than 60 individuals of the *Hesperornis* group had been found, including two additional species of the type genus, *Hesperornis crassipes* of Kansas, larger than *H. regalis,* and *H. montana* named by Robert W. Shufeldt from a vertebra found in Montana. *Hesperornis gracilis* and *Coniornis altus* are additional species of the family Hesperornithidae, which with the family Baptornithidae (for *Baptornis advenus)* form the order Hesperornithiformes.

(A. WT.)

HESPERUS, the evening star, son or brother of Atlas [Gr. *Esperos;* Lat. Vesper]. Although as a mythological personality he is regarded as distinct from Phosphoros or Heosphoros (Lat. Lucifer), the morning star or bringer of light, the son of Astraeus (or Cephalus) and Eos, the two stars were early identified by the Greeks.

HESS, MYRA (1890–), British pianist known for her interpretations of Bach, Mozart, Beethoven and Schumann. Born in London, Feb. 25, 1890, she studied at the Guildhall School of Music, and from 1902 to 1907 at the Royal Academy of Music under Tobias Matthay, whose theories of touch, related to the weight of the arm and muscular relaxation, she illustrated in her playing. She first appeared in London in 1907 and in the U.S. in 1922. From 1939 to 1946 she organized a series of daily midday concerts at the National gallery, London, which were of great service to both music and the public during World War II and for which, in 1941, she was made a dame of the British empire. In her earlier years she cultivated an intimate chamber music style, and it was in this sensitive manner that she gave her memorable performances of the concerto of Schumann. The more powerful style of her later years became evident in her performances of the concertos of Beethoven and Brahms.

HESS, VICTOR FRANCIS (1883–). Austrian physicist, shared the 1936 Nobel prize for physics with C. D. Anderson (*q.v.*) for his discovery of cosmic radiation. Born at Schloss Waldstein. Aus., on June 24. 1883, he was educated at Graz and Vienna. From 1910 to 1920 he was 'assistant at the Institute for Radium Research of the Vienna Academy of Sciences and lectured on physics at the Vienna Veterinary college. Appointed associate professor at Graz in 1920, in 1921 he became director of the research laboratory of the U.S. Radium corporation and consulting physicist to the U.S. department of the interior (bureau of mines). He returned to Graz in 1923 and became professor of physics in 1925 and professor and head of the new Institute for Radiation Research at Innsbruck in 1931. In 1938 he became professor of physics at Fordham university, New York, and was naturalized in 1944.

Hess's researches dealt mainly with radioactivity and atmospheric electricity. As early as 1911 he studied the electrical conductivity of the atmosphere during balloon ascents and on high mountains. and found that ionization increased rapidly with altitude. His experiments proved what had long been suspected; *i.e.,* that an extremely penetrating radiation enters the earth's atmosphere from outer space. Further investigation of the radiation, which was given the name of cosmic rays by R. A. Millikan in 1925, led to discovery of the positron, or positively charged electron, by Anderson, and opened up new fields of research in modern physics. (W. J. BP.)

HESS, WALTER RUDOLF (1881–), Swiss physiologist, shared with Antonio Egas Moniz (*q.v.*) the 1949 Nobel prize for medicine "for his discovery of the functional organization of the interbrain as a coordinator of the activities of the internal organs." Hess was born at Frauenfeld, Switz., on March 17, 1881. After studying medicine at several Swiss and German universities he obtained his M.D. at Zurich in 1906 and practised for six years as an ophthalmologist. In 1911 he devised the Hess screen which is widely used in the investigation of squint. From 1912 he devoted himself to the study of physiology and in 1917 was appointed director of the physiological institute in Zürich. During advanced study in England he came under the influence of J. N. Langley, Sir C. S. Sherrington and other pioneer neurophysiologists. His own researches dealt with the viscosity of the blood, the dynamics of blood pressure, the physiology of respiration and finally with the central control of the internal organs in general through the vegetative or autonomic nervous system. He studied cerebral localization by the application of fine electrodes which permitted of strictly local stimulation or destruction of brain tissue. By these means he was able to prove that the cerebral centre for the control of blood pressure lies in a group of cells in the medulla and diencephalon. His work is complementary to that of C. Heymans (*q.v.*) on the peripheral mechanisms involved in the regulation of blood pressure. (W. J. BP.)

HESSE, HERMANN (1877–), German-born Swiss writer and poet, was born at Calw on July 2, 1877. He wrote a long series of novels, Indian travel sketches and other works. His collected poems appeared in 1942. Four years later he received the Nobel prize for literature.

HESSE, a *Land* of Germany. Hesse, as constituted at the end of World War II, has an area of 8,147 sq.mi. and a population (1950) of 4,323,801. The *Land* lies between the Rhine plateau and the Thuringer Wald and consists mainly of richly wooded hill land, cut by two fault troughs, the west and east Hesse depressions, which have been since earliest times important corridors and along which most of the main towns were founded in the middle ages. The Vogelsberg, a great basaltic mass, and the Rhon, rising to the Wasserkuppe (3,117 ft.), Hesse's highest mountain, dominate the area. The Spessart and the Odenwald (*qq.v.*) both belong in part to Hessian territory. Hesse is drained by the Rhine and its tributaries the Main and the Lahn, by the Weser, and by the Werra and Fulda. Towns of more than 50,000 people in 1950 were: Frankfurt am Main (532,037); Wiesbaden. the capital (220,741); Cassel (Kassel), capital of the former Prussian province of Hesse-Nassau (162,132); Darmstadt (94,788); and Offenbach (89,030). There are two universities, Frankfurt and Marburg. Legislative power (in spheres where this rests with the *Liinder)* is vested in the *Landtag,* according to the constitution of Dec. 1, 1946. The minister president is elected by the *Landtag.* Hesse is divided administratively into Wiesbaden, Cassel and Darmstadt. Cattle is an important type of farming and in the Rhine and Main valleys vegetables and fruit, including vines, are grown.

Hesse is noted for its mineral springs. Many minerals are mined, notably copper and brown coal. The copper deposits, around Sontra, are the only ones in west Germany. Iron is also mined and petroleum and natural gas are found.

Hesse's geographical position, situated as it is at the centre of German lines of communication, has greatly furthered its industrial development. The Rhine-Main area is the industrial centre, with Frankfurt, Cassel, Offenbach, Wiesbaden and Darmstadt all great

manufacturing towns. Vehicles, machinery, chemicals, iron, tin, electrical goods, scientific instruments and textiles are among the products of these and other towns. New industries grew up after World War II, stimulated by the refugees, among them glass, toys and musical instruments.

HISTORY

The country of Hesse has had different boundaries at different times. The earliest inhabitants of the area were the Chatti, a Frankish tribe whom Tacitus describes and with whom the Hessi may be identified. The Hessians were converted to Christianity after the fall of the Roman empire, mainly through the efforts of St. Boniface. Their land was included in the archbishopric of Mainz, and religion and culture were alike kept alive among them largely by the Benedictine abbeys of Fulda and Hersfeld.

As part of the Carolingian empire, Hesse contributed also to the movement against the imperial power which followed the death of Charlemagne. The Hessian Conrad of the Franks was elected as Conrad I in 911, but on his death the crown passed out of Frankish hands to Henry of Saxony. From 1130 to 1247 Hesse formed part of Thuringia. But on the death, childless, of the Thuringian ruler Henry Raspe in 1247 a conflict about the succession broke out; and Hesse was won by Sophie of Brabant for her son, Henry, the Child of Brabant. It thereupon became an independent landgraviate. In 1292 Henry was raised to the rank of prince of the empire. The landgraves were constantly at variance with the archbishop-electors of Mainz, who had possessions in Hesse. In the 15th century the country was twice divided among members of the ruling family, but no lasting division took place before the Reformation.

From 1509 to 1567, the difficult Reformation years, Philip the Magnanimous (*q.v.*), the most famous of all Hessian rulers, was landgrave. A reformer in both senses of the word, he promoted the Protestant faith and cared for the education and general welfare of his country; in 1527 he founded the Protestant University of Marburg. On his death in 1567 Hesse was divided among his four sons into Hesse-Cassel, Hesse-Marburg, Hesse-Rheinfels and Hesse-Darmstadt.

Hesse-Cassel.—Hesse-Cassel (later known also as Electoral Hesse) consisted of about half the former country and was apportioned to Philip's eldest son, William IV. A later ruler, Charles (1670–1730), is notable for being the first to adopt the system of hiring out his soldiers as mercenaries to help the national finances. As many as 22,000 Hessian troops later fought on the English side in the American Revolution. Charles also improved the prosperity of his land by bringing in the Huguenots.

The reign of William IX (1785–1821) was important for Hesse-Cassel As compensation for the loss of lands on the left bank of the Rhine (ceded to France in 1801 by the peace of Lunéville) he was in 1803 granted some of the former French territory around Mainz and was raised to the dignity of an elector as William I William refused alike to join the Confederation of the Rhine and an alliance proposed by Prussia; and in 1806 Napoleon recognized his neutrality. But the French emperor suspected William's designs and after the battle of Jena expelled him, adding Hesse-Cassel to his brother Jerome's kingdom of Westphalia. A rising in 1809 under Fritz von Dörnberg came to nothing, but after the battle of Leipzig (1813) the French were driven out and the elector returned in triumph.

The Restoration, however, brought reaction rather than progless The estates, indeed, were summoned in 1815 but an attempt to agree on a constitution broke down and they were dissolved in May 1816. The constitutional crisis came to a head under William TI, who succeeded his father in 1821. Disturbances folloned the Paris July revolutiori, the elector was forced to summon the estates and on Jan 5, 1831, a constitution was signed. But a year later the strongly conservative Hans Daniel Hassenpflug became minister, and nith him the struggle against the constitution gained new force In 1852 the constitution was formally repealed, after the defeat of the revolutionary movements of 1848–49; Bavarian and Austrian troops had intervened to make this possible, after an appeal by Hassenpflug to the *Bundestag*. After considerable unrest the constitution was restored in 1862. But four years later, at the end of the Austrian-Prussian war, in which Hesse-Cassel fought for Austria, the country was annexed by Prussia. In 1868 it was formed (except for some small districts) into the province of Hesse-Nassau with lands accruing to Prussia as a result of the war: part of the former duchy of Nassau, the free city of Frankfurt and some other territories. In 1944 the territory was split into two provinces, Nassau and Electoral Hesse. On Sept. 9, 1945, both provinces (except for a small area, which was joined to Rhineland-Palatinate) were united with the part of Hesse-Darmstadt right of the Rhine to form Great Hesse, later called simply Hesse.

Hesse-Marburg.— This was formed in 1567 for the second of Philip's sons, Louis. The line died out in 1604 and the land was eventually divided between Hesse-Cassel and Hesse-Darmstadt after disputes lasting until 1648.

Hesse-Rheinfels.—Formed in 1567 for Philip's third son, Philip, Hesse-Rheinfels was short-lived. On Philip's death in 1583 the land passed to the other lines.

Hesse-Darmstadt.—Philip's fourth son, George, received what was at first only the small territory of Upper Katzenelnbogen with Darmstadt, but additions were later made to it. Hesse-Darmstadt sided with the Habsburgs in the Thirty Years' War, during which it suffered severely from the ravages of the Swedes. In this struggle Hesse-Cassel took the other side, and the rivalry between the two landgraviates was increased by the dispute over Hesse-Marburg.

During the 18th century the War of the Austrian Succession and the Seven Years' War dealt heavy blows at the prosperity of the landgraviate, which was always loyal to the house of Austria. Louis IX (1768–90), who served in the Prussian army under Frederick the Great, was the husband of Henrietta Caroline, "the great Landgravine," who counted Goethe, J. G. von Herder and Jacob Grimm among her friends and who was described by Frederick the Great as *femina sexu, ingenio vir* ("a woman in sex, in wisdom a man").

In April 1790, just after the outbreak of the French Revolution, Louis X, an educated prince who shared the tastes and friendships of his mother, became landgrave. Re supported Napoleon with troops from 1805 to 1813, but after the hattle of Leipzig he joined the allies. In 1815 Louis secured again a district on the left bank of the Rhine, including the city of Worms and, in 1816, Mainz, but he made cessions of territory to Prussia and to Bavaria and he recognized the independence of Hesse-Homburg *(see* below). His title of grand duke, taken in 1806 when he entered the Confederation of the Rhine, was confirmed, and he entered the Germanic federation. Soon the desire for liberty made itself felt in Hesse, and in 1820 Louis gave a constitution to the land; some reforms were carried through; and in 1828 Hesse-Darmstadt joined the Prussian *Zollverein.* Many concessions were made to the popular will by Louis III in the revolutionary year 1848, but during the subsequent reaction these were withdrawn, and the period between 1850 and 1871, when Karl Friedrich Rheinhard, Freiherr von Dalwigk, was chiefly responsible for the government, was mainly one of repression. During the war of 1866 the grand duke fought on the Austrian side, the result being that he was compelled to pay a heavy indemnity and to cede certain districts to Prussia. In 1871 Hesse-Darmstadt became one of the states of the new German empire.

Many reforms were introduced, and, in general, the grand duchy may be said to have passed largely under the influence of Prussia. After its annexation by Prussia in 1866 the grand duchy was known simply as Hesse. The ruling house lost its power at the same time as the rest of the German princes in 1918. In 1945 the part of Hesse-Darmstadt on the right of the Rhine (which belonged to the U.S. occupation zone) was united in one *Land* with Electoral Hesse (see *Hesse-Cassel* above), while that portion left of the river became part of the French-occupied *Land* of Rhineland-Palatinate.

Hesse-Homburg.— Formed in 1622. Hesse-Homburg belonged to a younger line of the Hesse-Darmstadt family and its rulers had only limited sovereignty. It was separated from Hesse-Darmstadt in 1768. From 1806–15 it was again included in the larger state, but its independence was restored in 1815 by the congress of Vienna and Meisenheim was then added to it. On the death of the landgrave (childless) in 1866, however, Meisenheim passed to Prussia and the rest to Hesse-Darmstadt; but this latter part was also ceded to Prussia later in the same year and became part of Hesse-Nassau (see *Hesse-Cassel* above).

HESSIAN: see BURLAP.

HESSIAN FLY (Phytophaga destructor), a small fly native to Asia, transported into Europe and later intd North America in hay or straw. It is especially destructive to wheat crops, particularly in the United States and Canada. It is dark in colour and lays its eggs on the leaves of wheat, barley and rye, the whitish larvae feeding on the stem. The winter is passed in the "flaxseed" stage (puparium) in the axils of the leaves. There are from one to three generations annually. Eggs laid on the first and second leaves rarely develop to adults, so late spring seeding aids in control. Some varieties of wheat are resistant. Deep fall plowing prevents emergence of the flies. The common name is derived from the fact that the fly is supposed to have been introduced into America in straw bedding by Hessian troops during the Revolutionary War. (See DIPTERA; ENTOMOLOGY.) (C. H. CN.)

HESSUS, HELIUS EOBANUS (1488–1540), German scholar! considered the foremost Latin poet of his age, was born at Halgehausen in Hesse-Cassel, on Jan. 6, 1488. His family name is said to have been Koch. He entered the University of Erfurt in 1504 and became professor of Latin there in 1517. He took part in the political, religious and literary quarrels of the period, finally declaring in favour of Luther and the Reformation. Through the influence of Camerarius and Melanchthon, he obtained a post at Niirnberg (1526). He again went back to Erfurt (1533), but found the university deserted. In 1536 the landgrave of Hesse made him professor of poetry and history at Marburg, where he died on Oct. 5, 1540. Described as "brilliant but bibulous." Hessus was a facile versemaker but not a true poet. He wrote local, historical and military poems, idylls, epigrams and occasional pieces. collected under the title of Sylvae (1539). His most popular works were translations of the Psalms into Latin distichs (1538), which reached 40 editions, and of the Iliad into hexameters (1540). His most original poem was the *Heroïdes* Christianae (1514–1532) in imitation of Ovid, consisting of letters from holy women.

BIBLIOGRAPHY.—His *Epistolae* were edited by his friend Camerarius, who also wrote his life (1553). There are later accounts of him by M. Hertz (1860), G. Schwertzell (1874) and C. Krause (1879).

HESTIA, in Greek mythology the hearth goddess (see VESTA), daughter of Cronus and Rhea. She is not mentioned as a goddess in Homer, but the hearth is recognized as a place of refuge for suppliants. In post-Homeric religion she is one. of the 12 Olympian deities. When Apollo and Poseidon became suitors for her hand she swore to remain a maiden forever, whereupon Zeus bestowed upon her the honour of presiding over all sacrifices. She was worshiped chiefly as goddess of the family hearth; but. as the city union was only the family union on a large scale. she had also. at least in some states, a public cult at the civic hearth in the *prytaneion* or town hall. where the common hearthfire round which the magistrates met was ever burning. From this fire, as the representative of the life of the city, intending colonists took the fire that was to be kindled on the hearth of the new colony. In later philosophy Hestia became the hearth goddess of the universe—the personification of the earth as the centre of the universe, identified with Cybele and Demeter (*q.v.*). She is seldom represented in works of art and plays no important part in legend.

HESTON AND ISLEWORTH, a municipal borough and parliamentary division. except for two wards in the Feltham division, of Middlesex, Eng., on the north bank of the Thames, 10 mi. W.S.W. of Hyde Park corner, London, by road. Pop. (1961) 102,897. The Great West road, opened in 1925, crosses the Bath road within the borough which was created in 1932, Heston and Isleworth parishes having been united since 1875. Cranford was added in 1934. Hounslow, in the centre, contains the council offices and to the southwest is Hounslow heath. Syon monastery, founded in 1415, was pulled down in the 16th century by the duke of Somerset who built Syon house on the site. This was remodeled and redecorated by Robert Adam who did the same to the Elizabethan Osterley house. By the latter 1950s there were about 200 industrial undertakings in the borough.

HESYCHASM, a type of Eastern Christian monastic life, uhose purpose is to achieve divine quietness (Gr. hesychia) through the contemplation of God in uninterrupted prayer. Such prayer, involving the entire human being, soul, mind and body, is often called "pure" or "intellectual" prayer. or the "Jesus prayer." St. John Climacus (*q.v.*), one of the greatest writers of the hesychast tradition, writes, "Let the remembrance of Jesus be present with each breath, and then you will know the value of the hesychia." In the late 13th century, St. Nicephorus the Hesychast produced an even more precise "method of prayer," advising novices to fix their eyes during prayer on the "middle of the body," in order to achieve a more total attention. and to "attach the prayer to their breathing." This practice was violently attacked in the first half of the 14th century by Barlaam the Calabrian, who called the hesychasts *omphalopsychoi* (*i.e.*, people having their souls in their navels).

St. Gregory Palamas (*q.v.*), a monk of Mount Athos and later archbishop of Thessalonica, defended the hesychast monks. In his view, the human body. sanctified by the sacraments of the church, is able to participate in the prayer, and human eyes may become able to see the uncreated light which once appeared on Mt. Tabor on the day of Transfiguration. The teachings of Palamas were confirmed by the Orthodox Church in a series of councils held in Constantinople. Hesychast spirituality is still practised by Eastern Christians and gained wide popularity in Russia.

BIBLIOGRAPHY.—The main collection of hesychast spiritual texts is the *Philocalia* (1782); partial English trans. by E. Kadloubovsky and G. E. H. Palmer (1951–53). The main work of Palamas is *For the Defense of the Holy Hesychasts* (Gr. text and Fr. trans.), 2 vol. (1959). *See* also J. Meyendorff, *St. Grégoire Palamas et la mystique orthodoxe* (1959), *A Study on Gregory Palamas* (1963). (J ME.)

HESYCHIUS, grammarian of Alexandria, probably flourished in the 5th century A.D. He was probably a pagan; and the explanations of words from Gregory of Nazianzus and other Christian writers are later interpolations. He has left a Greek dictionary, explaining peculiar words, forms and phrases, often with a reference to the author who used them or to the district of Greece where they were current. Hence the book is of great value for the study of the Greek dialects: and in the restoration of the text of classical authors, and particularly of such writers as Aeschylus and Theocritus, who used many unusual words. Many of the explanations give important facts about the religion and social life of the ancients. Hesychius says that his lexicon is based on that of Diogenianus (itself extracted from an earlier work by Pamphilus), but that he has also used similar works by Aristarchus, Apion, Heliodorus and others.

The best edition is by M. Schmidt (1858–68); in a smaller edition (1867) he attempts to distinguish the additions made by Hesychius to the work of Diogenianus.

HESYCHIUS OF MILETUS, Greek chronicler and biographer, surnamed *Illustrius,* son of an advocate, flourished at Constantinople in the 5th century A.D. during the reign of Justinian. According to Photius, who considered him a truthful historian (cod. 69), he was the author of three important works. (1) *A Compendium* of Universal History in six books, from Belus, the reputed founder of the Assyrian empire, to Anastasius I (d. 518). A considerable fragment has been preserved from the sixth book, a history of Byzantium from its earliest beginnings till the time of Constantine the Great. (2) *A* Biographical Dictionary (Ὀνοματόλογος or Πίναξ) of Learned Men, the chief sources of which were Herennius Philo and the Μουσικὴ ἱστορία of Aeluis Dionysius. Suidas incorporated much of it in his lexicon but his words leave us uncertain whether he himself epitomized Hesychius, or used an already existing epitome. The second view is more generally held, and the epitome referred to, which substituted alphabetical order for arrangement by classes, and included articles on Christian writers, is assigned from internal indications to the years 829–837. Both it and the original work are lost, with the exception of the excerpts in Photius and Suidas. A smaller compilation, chiefly from Diogenes Laertius and Suidas, with a similar title, is the work of an unknown author of the 11th or 12th

century. (3) A *History* of the reign of Justin I (518–527) and the early years of Justinian, completely lost.

Editions: J. C. Orelli (1820) and J. Flach (1882); fragments in C. W. Miiller, *Frag. Hist. Graec.* iv, 143 and in T. Preger's *Scriptores originis Constantinopolitanae,* i (1901); *Pseudo-Hesychius,* by J. Flach (1880); *see* generally C. Krumbacher, *Geschickte der byzantinischen Literatur* (1897).

HETERODYNE RECEPTION is the process of receiving radio waves by combining the received current with locally generated alternating current. The locally generated frequency is commonly different from the frequency of the received current, thus producing beats. This is then called beat reception.

HETEROGAMY, a condition in which the gametes are unlike *(see* ISOGAMY). The term is commonly used to designate differences of both size and structure, implying a differentiation into male and female sex cells.

Usage has tended, however, toward a separation of heterogamy into two categories: namely, anisogamy, in which the uniting gametes appear to differ only in size; and oogamy, in which they differ in both size and structure. In all cases of gametic union it is probable that the pairing gametes are differentiated physiologically whether they appear alike or unlike. The term is also used for the bearing of two different kinds of flowers on the same plant, as in certain sedges, or in many Compositae (*q.v.*) where the discoid florets are perfect and the radiate florets are neutral or pistillate. In zoology, heterogamy is used for a type *of* alternation of parthenogenetic generations with a sexual generation, as in certain aphids. (J. M. Bl.)

HETERONOMY, the state of being under the rule of another person. In ethics the term is specially used as the antithesis of "autonomy," which, especially in Kantian terminology, treats of the true self as will, determining itself by its own law, the moral law "Heteronomy" is therefore applied by Kant to all other ethical systems, inasmuch as they place the individual in subjection to external laws of conduct.

HETMAN, a military title formerly in use in Poland; the *hetman wielki,* or great hetman, was the chief of the armed forces of the nation, and commanded in the field, except when the king was present in person. The office was abolished in 1792. From Poland the word was introduced into Russia in the form *ataman,* and was adopted by the Cossacks as a title for their head, who was practically an independent prince, when under the suzerainty of Poland. After the acceptance of Russian rule by the Cossacks in 1654, the post was shorn of its power. "Ataman" or "hetman" was also the name of the elected elder of the *stanitsa,* the unit of Cossack administration. *See* COSSACKS.

HETTSTEDT, a town of Germany, in the district of Halle, on the Wipper, and at the junction of the railways Magdeburg-Eisleben and Hettstedt-Halle, 23 mi. N.W. of the last town. Pop. (1950) 16,316. Hettstedt is mentioned as early as 1046; in 1220 it possessed a castle; and in 1380 it received civic privileges. When the countship of Mansfeld was sequestrated, Hettstedt came into the possession of Saxony, passing to Prussia in 1815. It manufactures pianofortes and cigars. In the neighbourhood are mines of argentiferous copper. Silver, sulfuric acid, nickel and gold are also found in small quantities.

HETZER (HAETZER), **LUDWIG** (d. 1529), Swiss Anabaptist, was born at Bischofzell, Switzerland, and studied at Freiburg-im-Breisgau. In 1j23 he published *Judicium Dei,* a small tract against the religious use of images. In 1524 he brought out a tract on the conversion of the Jews, and published a German version of Johann Bugenhagen's brief exposition of the epistles of St. Paul (Ephesians to Hebrews). He was expelled from Augsburg in the autumn of 1525, and made his way through Constance to Basel, where Oecolampadius received him kindly, and then to Ziirich. He had gone to the length of rejecting all sacraments, and his relations with Zwingli were difficult; he returned to Basel, and then went to Strasbourg, where, in 1526, he fell in with Hans Dengk or Denck, who collaborated with him in the production of his *opus magnum,* the translation of the Hebrew prophets, *Alle Propheten nack hebraischer Sprach verdeutscht* (Worms, 1527; Augsburg, 1527 and 1528). It was the first Protestant version of the prophets in German, preceding Luther's by five years. Hetzer was arrested in Constance in the summer of 1528 and beheaded on Feb. 4, 1529. Hetzer's papers included an unpublished treatise against the essential deity of Christ, which was suppressed by Zwingli; the only extant evidence of his anti-trinitarian views being contained in eight quaint lines of German verse preserved in Sebastian Frank's *Chronica.*

See Breitinger, "Anecdota quaedam de L. H." in *Museum Helveticum,* parts 21 and 23 (1746); Wallace, *Antitrinitarian Biography* (1850); *Dutch Martyrology* (Hanserd Knollys society) (1856); Th. Keim, in Hauck's *Realencyklopadie* (1899).

I-IEUGLIN, THEODOR VON (1824–1876), German traveler in northeast Africa, was born on March 20, 1824, at Hirschlanden, Wurttemberg. In 1850 he went to Egypt where he learned Arabic, afterward visiting Arabia Petraea. In 1853 he was appointed Austrian consul at Khartoum. He traveled in Abyssinia and Kordofan, making a collection of natural history specimens. He died at Stuttgart, on Nov. 5, 1876. It is principally by his ornithological labours that Heuglin has taken rank as an independent authority.

His chief works are *Systematische Ubersicht* der *Vogel Nordost-Afrikas* (1855); *Reisen in Nordost-Afrika, 1852–53* (1857); *Syst. Übersicht der Säugetiere Nordost-Afrikas* (1867); *Reise nach Abessinien, den Gala-Landern,* etc., *1861–62* (1868); *Reise in das Gebiet des Weissen Nil,* etc *1862–64* (1869); *Reisen nach dem Nordpolarnzeer, 1870–71* (1872–74); *Ornithologie von Nordost-Afrika* (1869–7j); *Reise in Nordost-Afrika,* 2 vol. (1877).

HEULANDITE, mineral of the zeolite family consisting of hydrous calcium and aluminum silicate, and the name of a group of zeolites including brewsterite and epistilbite. Crystals are monoclinic, and have a characteristic coffin-shaped habit. They have a perfect cleavage parallel to the plane of symmetry on which the lustre is markedly pearly; on other faces the lustre is vitreous. The mineral is usually colourless or white, sometimes brick-red. The hardness is 3.5–4, and the specific gravity 2.2. It closely resembles stilbite (*q.v.*) in appearance, and differs from it chemically only in containing rather less water of crystallization.

Heulandite occurs with stilbite and other zeolites in cavities of basaltic volcanic rocks, and occasionally in gneiss and metalliferous veins. The best specimens are from the basalts of Berufjord in Iceland and the Faeroe Islands, and the Deccan traps near Bombay, India. Crystals of a brick-red colour are from Campsie Fells in Stirlingshire, Scot., and the Fassathal in the Tirol. Heulandite also is found near Paterson, N.J., and in Nova Scotia.

For discussion of composition, origin and characteristics *see* ZEOLITE.

HEVELIUS (HEWEL or HÖWELCKE), **JOHANNES** (1611–1687), German astronomer whose careful charting of the lunar surface entitles him to be called the founder of lunar topography, was born at Danzig on Jan. 28, 1611. In 1641 he built an observatory in his house, provided with excellent equipment. Besides composing his *Selenographia* (1647), he catalogued 1.j64 stars, made observations of sunspots, discovered four comets, and suggested the revolution of such bodies in parabolic paths about the sun. He published two books on comets, *Prodromus cometicus* (1665) and *Cometographia* (1668). Hevelius died at Danzig on Jan. 28, 1687. His wife, Elizabeth, had collaborated in his study of the surface of the moon, his catalogue of the stars and his work on comets. After his death she edited and published his *Prodromus Astronomiae* (1690). (0. J. E.)

HEVESY, GEORGE CHARLES DE (188j–), Hungarian chemist who became a Swedish subject, codiscoverer of the element hafnium and pioneer in the use of radioactive isotopes, received the Nobel prize for chemistry in 1943. He was born on Aug. 1, 1885, in Budapest, Hung., and educated there and in the Technische Hochschule at Berlin and at Freiburg. He was elected professor in Budapest in 1918, left there to work in the institute of theoretical physics in Copenhagen, where he became professor in 1920, and then returned to Freiburg as professor of physical chemistry in 1926. In 1943, a refugee from Germany, he became professor in the institute of organic chemistry in Stockholm university. In Copenhagen in 1923 he discovered,

with D. Coster, a new element, named hafnium; on his return to Freiburg he applied a method based on the fluorescent radiations excited by X-rays to calculate the relative abundance of the different chemical elements. In 1934, after the preparation of a radioactive isotope of phosphorus, he used this discovery to study various physiological processes by means of such "labeled" radioactive isotopes to trace the course of particular substances in the body. Thence he showed the dynamic state of the constituents of the body; for this and similar work he received the Nobel prize. (D. McK.)

HEWART, GORDON HEWART, 1ST VISCOUNT, OF BURY (1870–1943), British lord chief justice remembered for the independence of his views, was born on Jan. 7, 1870, at Bury, Lancashire. A scholar of University college, Oxford, he was called to the bar at the Inner Temple in 1902 and practised on the northern circuit. After an unsuccessful contest in northwest Manchester in 1912, in which year he took silk, he was elected as a liberal for Leicester in 1913, and later represented the eastern division of that city. In Dec. 1916 he was appointed solicitor general in Lloyd George's coalition government. He was made attorney general in Jan. 1919, and was admitted to the cabinet in 1921. He played, as law officer. a leading part in a great deal of litigation arising under the Defence of the Realm acts; while in the house of commons he proved himself a powerful debater. He took an active part in the final phase of the negotiations with Sinn Feiners. He acted as president of the War Compensation court from 1922. Hewart was knighted in 1916; on Jan. 16, 1918, he was sworn in as a member of the privy council, and on March 24, 1922, mas appointed lord chief justice; at the same time he was created Baron Hewart of Bury. He resigned as chief justice in 1940 and in that year was created Viscount Hewart of Bury. As a judge, Hewart was prone to reach a decision too soon and on insufficient material, and so seemed to take sides. His book The *New* Despotism (1929) was a powerful but not always temperate or just indictment of the quasijudicial powers granted to the executive and of the use made of them. He died on May 5, 1943, in Totteridge, Hertfordshire. (W. T. Ws.)

HEWITT, ABRAM STEVENS (1822–1903j, U.S. manufacturer and political leader, was born in Haverstram, N.Y., July 31, 1822. His father John, a Staffordshire man, was one of a party of four mechanics who were sent by Boulton and Watt to Philadelphia about 1790 to set up a steam engine for the city waterworks and who in 1793–94 built at Belleville, S.J., the first steam engine constructed wholly in America. He graduated at Columbia college in 1842, and taught mathematics at Columbia. With Edward Cooper, son of Peter Cooper, he went into the manufacture of iron girders and beams under the firm name of Cooper, Hewitt and Co. His study of the making of gun-barrel iron in England enabled him to be of great assistance to the U.S. government during the Civil War, when he refused any profit on such orders. The men in his works never struck—indeed irom 1873 to 1878 his plant was run at an annual loss of $100,000. In 1871 he was prominent in the reorganization of Tammany after the fall of the "Tweed ring"; from 1875 until the end of 1886 (except in 1879–81) he was a representative in congress; he was one of the house members of the joint committee which drew up the famous Electoral Count act providing for the electoral commission. In 1886 he was elected mayor of New York city over Henry George and Theodore Roosevelt. He broke with Tammany, was not renominated, ran independently for re-election and was defeated. He died in New York city on Jan. 18, 1903. He gave liberally to Cooper union, of which he was trustee and secretary.

HEWITT, HENRY KENT (1887–), U.S. naval officer, was born at Hackensack, N.J., Feb. 11, 1887, and graduated from the Cnited States Naval academy, Annapolis, Nd., in 1906. Hewitt commanded amphibious forces in a series of successful landings during World War II: in Morocco, Nov. 1942; the U.S. forces in Sicily, July 1943; the Allied forces at Salerno, Sept. 1943; and in southern France. Xug. 1944. He became commander of the U.S. naval forces in Europe on Aug. 16, 1945, retaining this post until Sept. 1946. He subsequently served as U.S. naval representative on the military staff committee of the United Nations from 1947 until his retirement as admiral in 1949. (J. B. HN.)

HEWLETT, MAURICE HENRY (1861–1923), English novelist, was born on Jan. 22, 1861, the eldest son of Henry Gay Hewlett, of Shaw hall, Addington, Kent. He was educated at the London International college, Spring Grove, Isleworth, and was calked to the bar in the year 1891. He published in 1895 two books on Italy, *Earthwork Out of Tuscany,* and (in verse) *The Masque of Dead Florentines. Songs and Meditations* followed in 1897, and in 1898 he won an immediate reputation by his *Forest Lovers,* a romance of medieval England. In the same year he printed the pastoral and pagan drama of *Pan and the Young Shepherd,* produced at the Court theatre in March 1905, when it was followed by the *Youngest of the Angels,* dramatized irom a chapter in his *Fool Errant.* In *Little Novels of Italy* (1899), a collection of brilliant short stories, he showed a close knowledge of medieval Italy. The new and vivid portraits of Richard Coeur de Lion in his *Richard Yea-ad-Nay* (rgoo), and of Mary, queen of Scots, in *The Queen's Quair* (1904), showed real historical sense. *The New Canterbury Tales* (1901) was another volume of stories of English life, but he returned to Italian subjects with *The Road in Tuscany* (1904); in *Fond Adventures, Tales of the Youth of the World* (1905), two are Italian tales, and *The Fool Errant* (1905) purports to be the memoirs of Francis Antony Stretley, citizen of Lucca. Other novels followed, but his main interest was directed to verse. *The Song of the Plow* (1916) is one of the most considerable English narrative poems of the new century; it describes the fortunes of the English farm labourers from the earliest times down to the present, and contains many fine passages. Other poems were *The Village Wife's Lament* (1918) and *The* Lore of *Proserpine* (1913). The popularity of his earlier fiction perhaps accounts for the limited appreciation of the real strength and originality of his later work. He died on June 15, 1923, at Broad-Chalke, near Salisbury.

HEXACHORD, in music, the scale of six degrees attributed to Guido d'Arezzo (11th century) and introduced as an improvement on the Greek scale system based on tetrachords or groups of four notes. The six notes making up each hexachord received the names *ut,* re, *mi,* fa, sol, la from the initial syllables of the lines of a certain hymn to St. John, the melody of which happened to be such that each line began on successive degrees of the hexachordal scale. As, however, the hexachords could begin on either C, F or G the syllabic names of the notes associated with the alphabetical names were not always the same. Thus in the scale of C the note G was sol, or G sol, whereas in the scale of F it was re and was therefore called G re, while in the scale of G itself it became naturally G *ut.* Hence in the complete gamut (a word derived from the note just named, *gamma-ut*) each alphabetical note was given a compound name according to the different syllabic names which coincided with it, *e.g.,* G sol re *ut, A* la mi re, and so on. These names remained in use for centuries until the whole system was superseded with the adoption of the octave as the standard group unit and recognition of the modern principles of key-relationship. But the same syllables—*ut,* re, mi, etc.—are still retained, with the addition of si for the seventh note, in the musical nomenclature of France and Italy as the names for the notes of the existing diatonic scale of C major.

See GUIDO OF AREZZO; MUSICAL NOTATION.

HEXAMETER, the earliest known form of classical verse in dactylic rhythm. The word indicates that each line contains six feet of measures of which the last is always a spondee (– –) or a trochee (– ⏑). When the last foot is a trochee, the pause at the end of the line makes up for the short syllable. The fifth foot is usually a dactyl (– ⏑ ⏑); the rest indifferently dactyls or spondees.

In Latin and Greek hexameter is the invariable metre of epic and didactic poetry; in Latin it is also the metre of satire irom the period of Horace onward. In modern languages. Longfellow, Charles Kingsley, Arthur Clough and several German poets have written hexameters of a sort, substituting accent for quantity. The English verses are usually unsatisfactory, owing to the lack of any real equivalent for a spondee; and the German are much worse, on-ing to the scarcity of really short syllables. Accent alone cannot give the true effect of either spondee or dactyl. Even the classic Greek poets made many variations in their treatment of the hexameter.

In 1898 William J. Stone defined the rules of the hexameter in On *the* Use *of* Classical *Metres in* English Verse, and Robert Bridges attempted to apply them in his experiments with quantitative verse. Though he followed the rules closely, his hexameters sound artificial, and he had even more difficulty than Longfellow in finding true spondees:

Now in | wintry de | lights, and | long fire | side medi | tation.
'Twixt studies | and rou | tine pay | ing due | court to the | Muses, . . .
(Epistle I from Robert Bridges, *Poems in Classical Prosody,* by permission of the Clarendon Press, Oxford.)

Richmond Lattimore's translation of the Iliad into English hexameters retains the swift pace and vigour of the original, but he is forced to take some liberties with the meter because of the great number of unstressed syllables in English, as the following lines indicate:

Nine days | up and | down the | host ranged | the god's | arrows,
but on the | tenth A | chilleus | called the | people to as | sembly;
a thing put | into his | mind by the | goddess of the | white arms, |
Hera, . . .

(I, 53–55)

(Richmond Lattimore, *Thr Iliad of Homer,* Chicago: The University of Chicago Press, p. 60 © 1951 by The University of Chicago.)

It will be noticed, however, that the extra syllables are extremely light and do not interfere with the basic rhythm. *See* METRE; VERSE.

BIBLIOGRAPHY.—Robert Bridges, *Milton's Prosody* (1901), which includes William J. Stone's On *the Use of Classical Metres in English Verse* (mentioned above); and Max Kaluza, *A Short History of English Versification* (1911). (G. W. A.)

HEXAPLA, the term for an edition of the Bible in six versions. and especially the edition of the Old Testament compiled by Origen.

HEXAPODA, an alternative name for insects (*q.v.*), having reference to their three pairs of walking legs.

HEXATEUCH, the name given to the first six books of the Old Testament (the Pentateuch and Joshua) to mark the fact that these form one literary whole, describing the early traditional history of the Israelites from the creation of the world to the conquest of Palestine. See BIBLE: *Old Testament;* DEUTERONOMY; EXODUS; GENESIS; JOSHUA, BOOK OF; LEVITICUS; NUMBERS.

HEXHAM, a market town and urban district in the Hexham parliamentary division of Northumberland, Eng., 20 mi. W. of Newcastle upon Tyne by road and on the Tyne river. Pop. (1961) 9,897. Its great abbey church of St. Andrew, standing by the market place, is a fine monument of Early English work. It was largely built of stone from Roman *Covstopitum* near Corbridge, 4 mi. E. of Hexham, and was reconstructed about 1112; the nave was rebuilt in 1907–08. There are also fragments of the monastic buildings remaining, and west of the churchyard is the monks' park, known as the Seal. In the town are two castellated 14th-century towers known as the Moot hall (*c.* 1100–1178), which now houses the Brough library, and the Manor office, which was built as a prison in the 14th century. Aydon castle near Corbridge is a fortified house of the 14th century; and Dilston or Dyvilston is a typical border fortress dating from Norman times. There is an Elizabethan grammar school.

Hexham (in 685 *Hagustaldes ham,* "the estate of the hagusteald," or squire) and its abbey were the victims of many raids from Danes, Scots and English. In 1464 at the battle of Hexham the Lancastrians under the duke of Somerset were defeated. In 1536 the last prior was hanged for being concerned in the Pilgrimage of Grace. In 1761 many people were killed in a riot over enlistment. The church and monastery were founded about 673 by Wilfrid, archbishop of York. The church in 678 became the head of the new see of Bernicia, united to that of Lindisfarne about 821 and restored to the archbishop of York by Henry II. In 1545 the archbishop exchanged Hexhamshire with the king for other property. Hexham was a borough by prescription from 1276 until 1853. Many fairs and markets were granted from the 13th century onward. In the neighbourhood are market gardens. especially on the rich alluvium near Haugh lane. The chief industries are agricultural, including the marketing of cattle and other livestock, the making of agricultural implements and the buying and sorting of wool.

HEYDEN, JAN VAN DER (1637–1712), Dutch painter, was born at Gorinchem. Neth. In 1650 he moved with his parents to Amsterdam, where he lived for the rest of his life, and where he died on March 28, 1712. There are recurrent subjects in his paintings which afford evidence of a journey southward to Brussels. Cologne and perhaps even farther. It is probable that he had already made this journey by the time of his marriage in 1661. There is the possibility also of a later journey to London, for according to an early authority he painted the royal exchange and Sir Christopher Wren's monument commemorating the fire of London, which was not completed until 1677. Although in his late years Van der Heyden painted landscapes and also produced some still-life subjects at the beginning and end of his career. his reputation rests entirely, and rightly, upon his architectural subjects! the town views which he painted in early maturity. In this department of Dutch 17th-century art he has no rival, for he succeeded in combining breadth and truth of general effect with an astonishing attention to the minutest details. In particular, his manner of separately realizing every individual brick of his houses has never ceased to amaze as a technical tour de force. His pictures are well composed and harmoniously coloured. especially where he exploits the contrast of mellow brick with the foliage of the trees which line the canals in his Dutch townscapes. Although they carry the conviction of a factual record. they are by no means all topographically accurate. Van der Heyden took liberties with actuality in the interests of design. sometimes even fusing elements of different towns into a single composition. His *Brandspuitenboek* ("fire engine book"), published in 1690, contains etched illustrations of high quality. (R. E. W. J.j

HEYMANS, CORNEILLE JEAN FRANÇOIS (1892–), Belgian physiologist, was awarded the 1938 Nobel prize for medicine and physiology "for his discovery of the role played by the sinus and aortic mechanisms in the regulation of respiration." He was born at Ghent, Belg., on March 28, 1892. After taking his M.D. degree at Ghent in 1920 he studied physiology in Paris, Lausanne. Vienna, London and the United States. In 1930 he succeeded his father, J. F. Heymans (1859–1932), as professor of pharmacology in the University of Ghent. His researches, which were begun in collaboration with his father, were mainly concerned with the physiology of the respiratory and circulatory systems.

The work for which he received the Nobel prize dealt with the part played by the carotid sinus, the carotid body and the aortic arch structures situated at the bifurcation of the common carotid artery in the neck—in regulating blood pressure and respiration, by their response to pressure stimuli and to changes in the oxygen tension of the blood. Heymans travelled and lectured extensively and is probably the best known modern Belgian medical scientist. (W. J. BP.)

HEYNE, CHRISTIAN GOTTLOB (1729–1812), German classical scholar. was born on Sept. 25, 1729, at Chemnitz, Saxony. In 1748 he entered the University of Leipzig. In 1752 he went to Dresden on the invitation of Count von Brühl, the prime minister, from whom, however, he obtained only a post as clerk in the count's library. He published his first edition of *Tibullus* in 1755, and in 1756 his *Epictetus.* In the latter year the Seven Years' War broke out, and Heyne was compelled to support himself by tutoring. The bombardment of Dresden on July 18, 1760. destroyed all his possessions. including an almost finished edition of Lucian. based on a valuable codex of the Dresden library. In 1763 he obtained a professorship at Göttingen, where he died on July 14, 1812. He was the lirst to attempt a scientific study of Greek mythology.

Of Heyne's numerous writings, the following may be mentioned. Editions. with copious commentaries. of Tibullus (1755–98), Virgil (1775–89), Pindar (1744–98j, Apollodorus, *Bibliotheca Graeca* (1803), Homer, *Iliad* (1802–04); *Opuscula academica* (1785–1812), dissertations of which the most valuable are those relating to the colonies of Greece and the antiquities of Etruscan art and history. His *Antiquarische Aufsätze* (1778–79) is a valuable collection of essays connected with the history of ancient art.

See biography by A. H. Heeren (1813) which forms the basis of the interesting essay by Carlyle (*Misc. Essays,* ii); J. E. Sandys, *Hist. Class Schol.,* 3rd ed., vol. 3 (1921); A. Hessel, *Heyne als Bibliothekar* (1928).

HEYROVSKY, JAROSLAV (1890–), Czech chemist awarded the 1959 Nobel prize for chemistry "for his discovery and development of polarography" (*q.v.*), was born in Prague on

Dec. 14, 1890.

He was educated at the Charles University of Prague and at University college, London, where he worked under Sir William Ramsay and F. G. Donnan and, in 1913, held the post of demonstrator in the chemistry department. Returning to the University of Prague he was in turn assistant in the chemistry department (1920), lecturer (1922), assistant professor (1924) and professor of physical chemistry and director of the Institute of Physical Chemistry (1926–54). Heyrovsky then became director of the institute of polarography of the Czechoslovak Academy of Sciences. The work which led eventually to the discovery of polarography was begun during his student days in London, when he investigated the electrode potential of aluminum at the suggestion of Donnan.

The polarograph is an instrument for measuring the current which flows when a predetermined potential is applied to two electrodes immersed in the solution being analyzed. The first polarographic apparatus was made and described in 1925, but the method did not come into common use until some ten years later. Polarography permits of some determinations which are difficult or impossible to carry out by other means and the method finds increasing applications in both qualitative and quantitative chemical analysis. Heyrovsky's monograph *Polarographie* appeared in 1941.

In Nov. 1955 he revisited London to deliver his presidential address to the Polarographic society.

See J. Heyrovsky, "The Development of Polarography," *Nature*, 177:266–267 (1956); G. W. C. Milner, *Principles and Applications of Polarography and Other Electroanalytical Processes* (1957). (W. J. Bp.)

HEYSE, PAUL JOHANN LUDWIG VON (1830–1914), German novelist, dramatist, poet, and Nobel laureate was born at Berlin on March 15, 1830, the son of the philologist K. W. L. Heyse (1797–1855). He studied classics, and then the Romance languages, and after a year's stay in Italy, he was summoned, early in 1854, by King Maximilian II to Munich.

Heyse was a master of the short story. He published at Munich in 1855 four in one volume. one of which, *L'Arrabbiata,* showed his genius. Many other volumes of stories appeared in due course and in these his most characteristic work is to be found. Heyse worked on his stories in the spirit of a sculptor; he depicted piquant problems and strong passions in a highly polished style. He also wrote several novels, the more important being *Kinder der Welt* (1873, Eng. trans. 1894) and *Im Paradiese* (1875)—the one dealing with the religious and social problems of its time, the other with artist life in Munich. He was a prolific dramatist, but met with little success, being out of sympathy with the realistic trend of his time.

There are masterly translations by him of G. Leopardi, G. Giusti and other Italian poets *(Italienische Dichter seit der Mitte des 18ten Jahrhundert,* 4 vol., 1889–90). Some of the translations of Shakespeare in the Bodenstedt edition are by him. His collected works contain also original lyrics and verse tales. Heyse received the Nobel prize for literature in 1910.

He died at Munich on April 2, 1914.

HEYWARD, (EDWIN) DUBOSE (1885–1940), U.S. novelist, dramatist and poet, whose first novel, *Porgy,* was also a highly successful play, opera and motion picture.

Born in Charleston, S.C., on Aug. 31, 1885, he was educated in private and public schools there. At the age of 17 he worked on the waterfront, where he observed the Negro life that was to bulk large in his work.

The novel *Porgy* (1925) was set in Catfish Row, a Charleston tenement. Heyward and his wife Dorothy dramatized it (1927) and in 1935 the opera *Porgy and Bess* was produced, the libretto and words being by Heyward and Ira Gershwin and the music by George Gershwin. A motion picture version appeared in 1959. Other plays include *Brass Ankle* (1931), about miscegnation, and *Mamba's Daughters,* also dramatized by him and his wife from the novel (1929).

Heyward's first published work was poetry, *Carolina Chansons* (1922) being a joint publication with Hervey Allen; other volumes include *Skylines and Horizons* (1924) and *Jasbo Brown and Selected Poems* (1931).

Other novels include *Angel* (1926), about mountain people in North Carolina; *Peter Ashley* (1932), about pre-Civil War Charleston; and *Star Spangled Virgin* (1939), about the Virgin islands during the New Deal.

He died at Tryon, N.C., on June 16, 1940.

See Frank Durham, *DuBose Heyward* (1954).

HEYWOOD, JASPER (1535–1598), English priest and poet whose translations of Seneca had some importance in the development of English drama, was born in London in 1535, the son of John Heywood (*q.v.*). Educated at Merton college, Oxford, he entered the Jesuit society in Rome (1562) and became professor in 1564 at the Jesuit college at Dillingen, Ger. In 1581 Heywood replaced Robert Parsons as head of the Jesuit mission to England, and was imprisoned from Dec. 1583 to Jan. 1585, when he was exiled.

Heywood died in Naples, on Jan. 9, 1598.

His English translations of the *Troas* (1559), the *Thyestes* (1560) and the *Hercules Furens* (1561) of Seneca were issued, with other translations, as *Seneca his tenne Tragedies, translated* (1581).

HEYWOOD, JOHN (b. 1497), English dramatist, known to his contemporaries as "merry John Heywood," was probably the son of William Heywood, who was coroner of Coventry in 1505–06.

In 1519 John Heywood was in receipt of a quarterly payment in the king's music book as "player of the virginals," and later he appears as a "singer." In 1528 he was granted a pension of £10 a year; from time to time he received emoluments and grants which show that he was in high favour at court under Edward VI and Mary. As early as 1538 he "played an interlude with his children" before the princess Mary. He may have owed his introduction to her to Sir Thomas More, for he evidently belonged to the More circle; two at any rate of the pieces commonly attributed to him show strong evidence of More's influence. Moreover, his wife, Joan Rastell, was a daughter of the printer John Rastell, who was More's brother-in-law. He was attached to the old religion, and in 1564, when a commission was appointed by Elizabeth I to enforce the Act of Uniformity, he left England and took refuge at Malines. From there he wrote in 1575 to Lord Burghley, saying that he was an old man of 78, and asking that his daughter might collect his rents. The date of his death is unknown.

Heywood's name was actually attached to four interludes: *The Playe Called the Foure PP; A Newe and a Very Mery Interlude of a Palmer, a Pardoner, a Potycary, a Pedler* (not dated) is a contest in lying, easily won by the palmer, who said he had never known a woman out of patience. *The Play of the Wether, a New and a Very Mery Interlude of all Maner of Wethers* (printed 1533) describes the chaotic results of Jupiter's attempts to suit the weather to the desires of a number of different people. *The Play of Love* (printed 1533) is an extreme instance of the author's love of wiredrawn argument. *The Dialogue of Wit and Folly* is more of an academic dispute than a play. But two pieces usually assigned to Heywood, though printed by Rastell without any author's name, are *The Mery Play Betwen the Pardoner and the Frere, the Curate and Neybour Pratte* (printed 1533, but probably written much earlier), and the *Mery Play Betwene Johan Johan the Husbande, Tyb the Wyfe, and Syr Jhan the Preest* (printed 1533). These two pieces show the strong influence of Sir Thomas More, but there does not seem to be any ground for excluding them from the list of Heywood's plays.

Heywood's other works are a collection of proverbs and epi-

grams, the earliest edition of which now extant is dated 1562.

HEYWOOD, THOMAS (1574?–1641), English playwright and miscellanist who excelled in dramas of domestic sentiment, was born in Lincolnshire, probably in 1574. Cambridge was apparently his university and Emmanuel his college. Though his stay from 1591 may have been cut short, he left with some classical scholarship, acquiring later several modern languages. Philip Henslowe first mentioned a "bocke" by him in Oct. 1596. Thereafter he was active as playwright and player until the late 1630s, claiming in 1633 to have had "either an entire hand, or at the least a maine finger" in 220 plays. Twenty-four surviving plays are generally accepted as by Heywood in whole or in part; and cases have been made out for shares in about 12 more.

His voluminousness. facility in collaboration and readiness to throw any material into a play made him, along with Thomas Dekker. the best representative of the journeymen-playwrights who wrote primarily for immediate effect. He took more care in his middle and later years, as the appeal of the theatre to the *bourgeoisie* diminished. But "the prose Shakespeare," as Charles Lamb called him. remained a practical purveyor of theatrical fare, making no high claims for his plays as literature and explaining that he was not anxious to usher them, "into the world in Volumes, to beare the title of Workes." like Ben Jonson. If he was sometimes complacent. it was at his stage successes; as when *If you know not me, You know nobody* (1605) so filled the cockpit that the printers pirated the play from shorthand notes; or when the *Ages* were acted by two companies concurrently; or when Charles I and his queen saw *Love's Mistress* three times in eight days. Heywood's plays are theatrical *mélanges,* his recipe being two or more contrasted plots with little integration and a lacing of clowning.

In one prologue he boasts of the variety of plots on the English stage. He dabbled in every field; but he made that of domestic sentiment his own. It is the chief ingredient of his masterpiece. *A Woman killed with Kindness* (1607), with its main plot of the erring wife and the forgiving husband. *The English Traveller* (1633) is a variant on the same theme; and so are the Jane Shore episodes of *Edward IV*, pts. 1 and 2 (1 599), and the Generous story in *The late Lancashire Witches* (1634, with Richard Brome). Other plays with a domestic emphasis are *How a man may choose a good Wife from a bad* (1602), *The Rape of Lucrece* (1608), *The Wise-woman Of Hogsdon* (1638) and *If you know not me,* pt. 2 (1606).

Part 1 of the last-named play, with some scenes in part 2. is a chronicle-history of Elizabeth as princess and queen. Other chroniclcs, based on pseudo-history, are *Nobody and Somebody* (1606) and *The Royall King, and the Loyall Subject* (1637). Adventure plays include the naive *Foure Prentises of London* (1615), *The Fair Maid of the West* (1 631) and *Fortune by Land and Sea* (with William Rowley, 16jj). The five *Ages* (*Golden, Silver, Brazen* and, in two pts., *Iron*) are a mythological cycle dramatizing much of Heywood's *Troia Britanica,* Lucian. Homer, Vergil and Ovid. *Love's Mistress* (1636) is a charming masque play also based on mythology. Still another group of plays are essays in Fletcherian romance: *The Captives, A Maidenhead well lost* (163j) and A *Challenge for Beauty* (1636).

Heywood also wrote many books and pamphlets in prose, verse, or a mixture of both. The verse is mostly included in *Troia Britannica* (1609), an engaging version of William Caxton's *Recuyel of the Histories of Troy* with two further cantos of universal history; *Tlze Hierarchy of the Blessed Angels* (1635), a folio of angelology and diabolology with copious notes; *Pleasant Dialogues and Dramas* (1637). consisting of dialogues and miscellanea; and seven lord mayor's pageants between 1631 and 1639. His celebrity as a symbolist in the pageants probably secured him his commission to devise the carving for the "Sovereign of the Seas." launched in 1637. He published *A True Description of His Majesties Royal Ship* in the same year. Other prose works are a translation of Sallust (1608) from the French; *An Apology for Actors* (1612); *Gynaikeion: or, Nine Books of Various History. Concerning Women* (1624); *Englands Elizabeth* (1631); *The Exemplary Lives . . . of nine of the most worthy Women of the World* (1640); and *Tlze Life of Merlin* (1641). From 163s on Heywood turned out 12 or more pamphlets coining down, not altogether surprisingly, on the anti-Laudian and Parliamentary side.

Heywood was married. perhaps twice. and had several children. He was buried in Clerkenwell, London. where he had lived for many years. on Aug. 16,1641.

HEYWOOD, a municipal borough (1881) in the Heywood and Royton parliamentary division of Lancashire., Eng., 9 mi. N. of Manchester by road. Pop. (1951) 25,201. Area 13.3 sq.mi. It owes its rise to the grandfather of the statesman Sir Robert Peel, who first introduced cotton manufacturing to the town. It is still a big cotton centre. Other industries include tanning and engineering. Behind Heywood hall (1611), which belongs to the town, is Queen's park, opened in 1879 and covering 43 ac. There is an air force maintenance unit on the outskirts. and in the town are an art gallery and museum attached to the technical school.

HEZEKIAH, son and successor of Ahaz, one of the greatest of the kings of Judah, flourished at the end of the 8th and the beginning of the 7th century B.C. in critical times. There are difficulties about the chronology of his reign, the one fixed point being 701 B.C. when Judah was invaded by Sennacherib. Whether he came to the throne before or after the fall of Samaria (722–721 B.C.) is disputed. Shortly before 701 B.C. the whole of western Asia was in a ferment; Sargon had died and Sennacherib had come to the throne (in 705); vassal kings plotted to recover their independence and Assyrian puppets were removed by their opponents. Judah was in touch with a general rising in southwest Palestine, in which Ekron, Lachish, Ascalon (Ashkelon) and other towns of the Philistines were supported by the kings of Musri and Meluhha. Sennacherib completely routed them at Eltekeh (a Danite city), and thence turned against Hezekiah. In this invasion Sennacherib claims entire success; 46 towns of Judah were captured, 200,150 men and many herds of cattle were carried off among the spoil, and Jerusalem itself was closely invested. Hezekiah was imprisoned.

The briei account in II Kings xviii, 14–16, supplements the Assyrian record by the statement that Sennacherib besieged Lachish, a fact which is confirmed by a bas-reliei (now in the British museum) depicting the king in the act of besieging the town. This historical iragment is followed in II Kings by two narratives which tell how the king sent an official from Lachish to demand the submission of Hezekiah and concludes %-ith the unexpected deliverance of Jerusalem. Both these stories appcsr to belong to a biography of Isaiah, and are open to the suspicion that historical iacts have been subordinated to idealize the work of the prophet (cf. the similar accounts about Elijah and Elisha). (*See* KINGS, FIRST AND SECOND ROOKS OF.)

The narratives are (1) II Kings xviii, 13, 17–xix, 8; *cf.* Isa. xxxvi, i–xxxvii, 8. and (2) xix, 9b–35; *cf.* Isa. xxxvii, 9–36 (II Chron. xxxii, 9 *et seq.* is based on both). Jerusalem's deliverance is attributed to a certain rumour (xix, 7), to the advance of Tirhakah, king of Ethiopia, and to a remarkable pestilence which finds an echo in a famous story related, not without some confusion of essential facts, by Herodotus (ii, 141). It has been widely assumed that the two narratives are duplicates, but it is much more probable that they refer to different events. Sennacherib really made two expeditions against Judah. In the first of these, 701 B.C., the Assyrian monarch was bought off by payment of a heavy tribute (*cf.* II Kings xviii, 14–16) and deprived Judah of a good deal of territory. In the second expedition, which took place aiter the accession of Tirhakah, king of Egypt, 691 or 688 B.C., occurred the disaster described in II Kings xix, 9–35; cf. Herotlotus ii, 141. An attractive solution of the chronological difficulty would be to reckon the 15 years, extension to Hezekiah from 705, in which case his reign would have been prolonged to 690.

The reforms mentioned in II Kings xviii, 1–8, cannot have been carried out until after 701 when the prestige of the Prophet and the Temple had been enormously enhanced by the deliverance of Jerusalem. The most striking of the reforms was the destruction of the brazen serpent, the cult oi which was traced back to the time of Moses (Num. xxi, 9).

According to Prov. xxv, I, Hezekiah was a patron of literature. The hymn which is ascribed to the king is of postexilic origin but is further proof oi the manner in which the Judaean king mas idealized in subsequent ages, partly, perhaps, in the belief that the deliverance of Jerusalem mas the reward for his piety. (S. A. C.; G. H. B.)

HIALEAH, a city of Florida, U.S., in Dade county and part of greater Miami, is widely known for the Hialeah racecourse, maintained as a public park, which annually attracts many visitors, exclusive of the racing season, to the exquisitely landscaped grounds, Hundreds of flamingos live on islands in the enclosed lake of the course, and are "paraded" annually on Flamingo day around a part of the infield turf. The birds were originally imported from Cuba, but most of the present flock was raised at Hialeah, where they were successfully propagated outside their native habitat. Their wings are clipped to keep them in the park.

Founded as a suburb of Miami in 1922 by James Bright, pioneer stockman, and Glenn Curtiss, aviation promoter, the city was incorporated in 1925. Hialeah developed as a distribution and manufacturing centre for processed foods, bricks, fibre glass, steel and concrete products, furniture and fabricated homes; areas that were vacant land in the 1940s are covered with warehouses and factories. With a navigable canal, two railroads, several federal and state highways, the city has solicited commercial enterprises for its industrial parks. More than 10,000 residents of Hialeah are employed in the airline shops and offices at the nearby Miami International airport.

Points of interest include the Fire Engine museum with its collection of fire fighting equipment, two automobile race tracks, the nearby *jai alai frontón* and Miami-Battle Creek sanitarium.

Hialeah grew slowly with a population of 3,958 by 1940 and participated in the phenomenal growth of the city of Miami and of Dade county after World War II. By 1950 the population had reached 19,676; in the special census of 1955, 43,135; and 66,972 in 1960. For comparative population figures see table in FLORIDA: *Population* (J. E. D.)

HIAWATHA ("he makes rivers"), a legendary chief (*c.* 1450) of the Onondaga tribe of North American Indians. The formation of the League of Six Nations, known as the Iroquois, is attributed to him by Indian tradition. In his miraculous character, Hiawatha is the incarnation of human progress and civilization. He teaches agriculture, navigation, medicine and the arts, conquering by his magic all the powers of nature which war against man. He was adopted as the hero of the well-known poem by Longfellow.

HIBBING, a village of St. Louis county, Minn., U.S., 76 mi. N.W. of Duluth, centrally located on the Mesabi range 1,527 ft. above sea level. Organized as a lumbering centre and named after Frank Hibbing, a timber cruiser, it was platted and incorporated in 1893. Digging a well to secure drinking water resulted in the discovery of iron ore. The finding of rich deposits under the village streets in 1919 caused the entire village to be moved one mile south. Old Hibbing became the site of one of the world's largest open-pit mines, 400 ft. deep and covering 1,300 ac. Wealth derived from the mines is evidenced by a combined high school-junior college erected in 1921 costing $3,800,000. Mining over 121,000,000 tons of ore during World War II exhausted the rich deposits and the village, again relocated by 1950, turned to the processing of nonmagnetic taconite and the promotion of a strong retail trade. The original Northland-Greyhound bus line was established near Hibbing in 1926 by Carl E. Wickman and Andrew G. Anderson. For comparative population figures see table in MINNESOTA: *Population.* (E. F. GR.)

HIBERNATION AND ESTIVATION, broadly speaking, are states of dormancy in which bodily functions and activities of certain animals are greatly reduced. During hibernation, commonly known as winter sleep, certain animals endure prolonged periods of cold. Estivation or summer torpidity is a comparable state of suspended animation entered into by some animals in periods of heat or drought. Both hibernation and estivation permit survival during periods when food supply is short. While cold is usually considered as the most important stimulus for hibernation, other environmental factors as well as internal seasonal rhythms must be recognized as playing some part in bringing on the sleep.

There is a fascination for man in those warm-blooded animals which can hibernate, partly because man cannot do it and partly because of the hope that man might prolong his own life if he learned how to survive near-freezing body temperatures. By mid-20th century lowered body temperature (hypothermia) had been used in surgical anesthesia.

Many living cells, such as sperm for artificial insemination and red blood cells for transfusion, can be stored frozen, and some simple very small animals can be repeatedly frozen and thawed without apparent damage. The harm of freezing comes from the slow formation of ice crystals. Some living tissues can be cooled rapidly in liquid air to a vitrified state and later rewarmed rapidly without harm. In slow freezing there are changes in the distribution of water and salts that kill cells. For living cells to endure storage in a frozen state, they must undergo preliminary dehydration and salt dilution by some nonaqueous solvent. As freezing proceeds, only free water crystallizes at first into ice, then water which has been bound to organic and other molecules becomes frozen.

Probably no animal can withstand freezing of all its body water and still recover afterward but a few mammals have been frozen experimentally to the extent of becoming rigid for a few minutes and have recovered. Although the outer tissues of fish can be frozen, reports of complete freezing of fish appear fallacious.

Many insects are frozen for long winter periods. In these insects there is some dehydration during gradual winter-hardening and their body fluids become supercooled by many degrees; *i.e.*, the temperature falls below the freezing point, yet the body fluids remain liquid; but if an ice crystal forms, the temperature rises to the freezing point. Some animals can remain in a supercooled condition for long periods; certain fish in deep fiords live in this state permanently.

Hibernation **by Mammals and Birds.**—Warm-blooded (homoiothermic) animals are distinguished from cold-blooded (poikilothermic) ones in having higher metabolism, hence greater heat production; in being protected against heat loss by insulation of fur, feathers and subcutaneous fat; by being able to divert warm blood away from the body surface; but most of all by having a temperature-regulating centre ("thermoregulator") in the brain. When the temperature centre is stimulated, either by nerve impulses from skin cold receptors or by direct cooling of the blood, various protective mechanisms are called into action and body heat is conserved. The first protective responses against cold are by diverting blood from the skin to the interior of the body, by improving insulation by erection of fur or feathers and then by shivering and increasing heat production. A set of responses in the opposite direction serves to increase heat dissipation when the temperature centre is activated by high temperatures. Hormonal responses occur to each temperature stress.

All mammals and birds show fluctuations in body temperature characteristic of the time of day or night. Night prowlers or flyers have their sleep period of low body temperature in the daytime, In some bats heat regulation lapses during rest and they enter a coma; during each day's sleep they go into a condition similar to winter dormancy, with their body temperature dropping to near air temperature. Similar cessation of activity, slowdown of heart and breathing and fall in body temperature, occurs in sleeping hummingbirds, some swifts and poorwills. This cooling during sleep conserves body reserves but it delays the animal's becoming active on awakening. Primitive mammals such as the Monotremata (*q.v.*; platypus, spiny anteater), Marsupialia (*q.v.*; kangaroo, opossum) and Edentata (*q.v.*; sloth, armadillo) tend to have lower temperatures normally than other mammals. Seasonal hibernators are found among the Monotremata, the Insectivora (shrews and hedgehogs) and bats (the insect-eating ones). Best-known hibernators are rodents of temperate and arctic latitudes; *i.e.*, ground squirrels, woodchucks, marmots, hamsters, dormice (*qq.v.*).

The warm-blooded animals that can hibernate are able to turn down the setting of their thermoregulators, so to speak, so that over a wide range of temperature they are essentially cold-blooded. They then enter a sleep in which their body temperature fluctuates with the temperature of the air around them. Some animals pass abruptly into the hibernation state; others require much preparation. Some, such as ground squirrels, gain much fat prior to hibernation and their body fats change to a less saturated form.

Others, for example, hamsters, store up much food and delay entrance into hibernation.

Most hibernating mammals seek a sheltered hiding place, or burrow into the ground. The temperature in the den is usually several degrees warmer than outside, 59°–63° F. when it is 46°–50° F. outdoors. The burrow usually extends below the frost line; the alpine marmot burrows 9 ft. into the ground, the steppe marmot as much as 30 ft. and closes the entrance with stones and hay. Cold temperature is normally the stimulus for hibernation, but it may be hastened by lack of food, shortened days and other factors. As an animal enters hibernation, its temperature regulation becomes poor; when its body temperature falls, it fails to respond in the usual manner by fluffing fur, shivering and increasing metabolism. The body temperature falls to conform with that of the air and may go down to a few degrees above freezing (39°–41° F.). Breathing becomes slow and irregular, the heart beats only periodically and slowly (7 to 10 times per minute, compared with the 300 per minute normal in the ground squirrel), metabolism is reduced by 30 to 100 times. Various nervous reflexes cease to function when the body temperature falls to 64°–77° F.; and electrical activity of the brain is no longer detected at below 52°–66° F. The exact limiting temperature can be different for each animal species. The breathing centre remains sensitive to carbon dioxide, however. During the sleep, body fats are slowly used up; a brown bat may lose 35% of its weight and a fattened ground squirrel 80% during a winter.

If the air temperature drops to freezing (32° F.), many hibernators begin to breathe faster; they raise their heat production and maintain their body temperature at about 39" F.; some awaken. Those that fail to respond to the freezing air die as a result of the extreme cold. Many hibernators awaken periodically during the winter, some of them to feed and drink. Bats apparently are not stimulated to awaken by extreme cold but they usually hibernate in comparatively warm moist caves and move about occasionally. The energy expended by a ground squirrel in awakening every 11th day has been calculated to be more than that used during the entire 10 intervening days of dormancy.

Arousal from hibernation is a dramatic process. It can be elicited experimentally by a rise in temperature, by mechanical, sound and other stimulation. The body temperature may rise by as much as 86° F. during three or four hours. The warming process of a hibernating mammal uses self-produced heat in contrast to the warming of a cold-blooded animal which absorbs heat from outside. The heart begins to beat regularly, breaths come more frequently, heat is produced by heart and chest muscles. and the anterior half of the body warms before the hind part. The region of the brain concerned with autonomic function is active before higher centres. As the animal warms, its oxygen consumption overshoots the normal level, and muscular activity begins irregularly.

Many body functions in hibernators are different from those in nonhibernators, but the most important seems to be the setting down of the thermoregulator to a little above freezing temperature. The net effect is to permit the animal to remain alive without additional food during the period when temperatures are low and food is scarce.

Many mammals sleep a great deal during the winter but do not hibernate, that is, their body temperature remains high. Bears, skunks, pocket gophers, chipmunks and opossums take long winter sleeps. Brown and black bears enter protected dens; the anus becomes plugged with a tappen composed partly of pine needles, and they do not defecate until spring. However, the young are born during the winter.

No birds are able to enter a state of prolonged hibernation. Those that lack sufficient insulation to survive long cold winter nights without eating migrate to warmer climates. (See MIGRATION, BIRD.)

Hibernation and Estivation by Cold-Blooded Vertebrates. — In ninter many of the Amphibia become inactive in a protected niche. At low temperatures aquatic amphibians, such as frogs, burrow into bottom mud. Reptiles also spend the winter in a torpid state. A few fish spend long periods resting on the lake or river bottom or in mud when their activity is limited by temperature. Most fish, however, continue to be active in winter.

Many reptiles, amphibians and fish undergo estivation brought on not so much by heat as by drought. Crocodiles, alligators and water turtles may remain buried in mud until water reappears. Frogs have frequently been dug out of clay near the edges of dried-up ponds and streams. The bladder may retain water and Australian aborigines are said to use such frogs as a source of water. The best-known of estivating fish are the dipnoans or lungfish (*q.v.*). The African lungfish *Protopterus* burrows deep into the mud when its swamp stream starts to dry. The gills become useless, but it breathes by means of its gas bladder and in its torpid state uses fat reserves slowly. Its bladder accumulates quantities of urea but when the fish is released by the rains it reverts to .the excretion of ammonia.

Invertebrates. — Many fresh-water Protozoa form cysts under such adverse conditions as cold, heat, drying or fouling of the water in which they live. Encystment is entered by some protozoans in the normal process of reproduction and dispersal. The protozoan secretes a protective cyst wall, which may be either carbohydrate or keratinous in nature. and a transparent inner membrane. Reorganization of cell contents occurs. Encysted protozoans may survive high heat, subfreezing (liquid air) temperatures and drying. There are reports of revival of soil flagellates and amoebae from cysts which had been dried for more than 40 years. Cysts of ciliates attached to grass survive long periods of drought. In suitable surroundings and temperature excystment occurs in a few minutes.

Fresh-water sponges form resistant gcmmules, and bryozoans (*see* POLYZOA) form statoblasts as part of their normal liie cycles. Both gemmules and statoblasts are surrounded by a hardened, resistant double membrane and may survive repeated freezing and drying. Some of the fresh-water Copepoda and Tardigrada (*qq.v.*) form resistant cysts in unfavourable conditions, either winter or summer. Land snails protect themselves for either hibernation or estivation by closing the shell mouth with a resistant, sometimes calcareous, membrane. Slugs burrow into the soil and protect themselves with a mucous mantle. Desert snails may survive several years without food or water in a state of estivation.

Insects winter in several ways, many as nymphs or pupae in a state of diapause or rest. Diapause can be brought on by cold or lack of food and water; some species, such as meal moths and blowflies, breed continuously in favourable conditions, but enter diapause in unfavourable conditions. In other species, particularly certain moths and butterflies, pupal diapause is a necessary stage of the life cycle, and the butterfly or moth cannot emerge until diapause is broken by exposure to cold. Other insects, for example mosquitoes, spend the winter as resistant eggs, and many spend it as larvae or adults. These may seek locations protected from freezing, or a place where only their outer layers may freeze. In preparation for wintering they become somewhat dehydrated, and may contain more bound and less free water than previously. They may become supercooled by about 41°–68° F., and thus they do not freeze. Experiments indicate that when invertebrates do freeze only slightly more than half of their body water is frozen.

Various animals suspend vital activities in different ways during periods of prolonged cold and drought. Cold, especially gradually decreasing temperatures, is only one stimulus, perhaps the most important, for hibernation. And drought is only one of the stimuli for estivation. Investigations of the processes of hibernation and estivation may aid in bringing about an understanding not only of the limits of vital function but also of the preservation of tissues in a state of suspended animation. *See* also ANIMAL *HEAT*.

See C. P. Lyman and P. O. Chatfield, "Physiology of Hibernation in Mammals," Physiol. **Rev.,** 35:403 (1955). (C. L. PR.)

HIBERNIA, in ancient geography, one of the names by which Ireland was known to Greek and Roman writers. Other names were Ierne. Iouernia. Iberio. All these are adaptations of a stem from which also Erin is descended. The island was well known to the Romans through the reports of traders, so far at least as its coasts, but it never became part of the Roman empire.

Agricola (*c.* A.D. 80) planned its conquest but the Roman government forbade it. *See* IRELAND: *History.*

HIBISCUS, a genus of plants of the mallow family (Malvaceae), one of which is popularly known as rose mallow. The genus comprises about 150 or more Species of herbs, shrubs and trees, native to temperate and tropical regions but most abundant in the latter. They bear palmately veined, lobed or parted leaves and mostly bell-shaped, frequently very large, scarlet, pink, yellow or white flowers, with the parts, except the numerous stamens, usually in fives. A few species yield food and fibre products, but in Great Britain they are grown chiefly, and in the U.S. frequently, for ornament. Representative economic species are *H. esculentus* (okra or gumbo); *H. tiliaceus,* the mahoe, a tropical plant which yields a fibre; and *H. sabdariffa,* the roselle, the cooked calyx of which has a cranberrylike flavour and is used in the southern United States. Among the best-known ornamental species are *H. syriacus* (rose of Sharon or shrubby althea); H. *rosa-sinensis* (rose of China or shoeblack plant, widely cultivated in many handsome varieties); and *H. trionum* (flower of an hour). The North American *H. moscheutos,* the rose mallow, is native to salt or brackish marshes near the coast from Massachusetts to Florida and occurs sparingly, westward to Indiana and Missouri, in fresh marshes. It is the source of many fine garden forms cultivated for ornament. These varieties, which are treated as annuals or perennials, require deep, rich, moist soil. They may be grown from seed or roots; most are hardy late summer and fall bloomers in temperate regions, but they may benefit from a mulch during the winter. *See* FIBRES; GUMBO; MALVACEAE. (N. TR.; X.)

THE NORTH AMERICAN HIBISCUS (HIBISCUS MOSCHEUTOS)

HICHENS, ROBERT SMYTHE (1864–1950), English novelist, mas born at Speldhurst, Kent, on Nov. 14, 1864. He was educated at Tunbridge Wells and Clifton college, and then became a student at the Royal College of Music, London. He first attracted serious attention as a writer with *The Green Carnation* (18943, but his best-known work in fiction was a series of novels with an eastern setting, beginning with *The Garden of Allah* (1905) and including *The Call of the Blood* (1906) and *Bella Donna* (1909). *The Dweller on the Threshold* (1911) is a good example of his tales of the supernatural. Of his dramatized novels, *Bella Donna,* produced in 1911–12, and *The Garden of Allah,* produced first in New York and (1920) at Drury Lane, were the most successful. *The Paradine Case* (1933) was filmed and released in the U.S. in 1948. He died at Zürich, Switz., on July 20, 1950.

HICKES, GEORGE (1642–1715), English clergyman and scholar, was born in Yorkshire on June 20, 1642. He was appointed rector of St. Ebbe's, Oxford (1675), vicar of All Hallows, Barking, London (1680), chaplain to the king (1681) and dean of Worcester (1683). He opposed both James II's declaration of indulgence and Monmouth's rising, and he tried in vain to save from death his nonconformist brother John. At the revolution Hickes, as a nonjuror, was first suspended and afterward deprived of his deanery. After remaining some time in concealment in London, he was sent by Sancroft and the other nonjurors to James II in France to discuss episcopal succession; upon his return in 1694 he was consecrated suffragan bishop of Thetford. He died on Dec. 13, 1715. A posthumous publication of his *The Constitution of the Catholick Church and the Nature and Consequences of Schism* (1716) gave rise to the celebrated Bangorian controversy *(see* HOADLY, BENJAMIN).

His chief writings are the *Institutiones Grammaticae Anglo-Saxonicae et Moeso-Gothicae* (1689) and *Linguarum veterum Septcntrionalium Thesaurus grammatico-criticus et archaeologicus* (1705), a work of great learning. His two treatises, one *Of the Christian Priesthood* and the other *Of the Dignity of the Episcopal Order* (1707), were reprinted in the *Library of Anglo-Catholic Theology* (1847).

See J. H. Overton, ***The Nonjurors*** (1902).

HICKOK, JAMES BUTLER ("WILD BILL") (1837–1876), U.S. marshal, soldier and scout, was born May 27. 1837, at Troy Grove, Ill. Early in life he became recognized as an excellent pistol shot. In 1855 he went west where for a time he drove a stage over the Santa Fe and Oregon trails. He had many violent encounters. Once he was almost fatally injured from an attack by a cinnamon bear which he killed with a knife. In 1861 he fought singlehandedly the McCanles outlaw gang at Rock Creek Station in Jefferson county, Neb., killing McCanles and two of his men. During the American Civil War he served as a scout in the Union army. His career as an Indian fighter and as a U.S. marshal at Hays City and Abilene, Kan., led to numerous combats with thieves and outlaws. For a brief period of time he was an unsuccessful member of one of William ("Buffalo Bill") Cody's famed Wild West shows. When not otherwise employed, Hickok liked to gamble at cards, and it was while playing in a poker game at Deadwood City. Dakota Terr., that he was fatally shot from behind by Jack McCall, Aug. 2, 1876.

See William E. Connelley, ***Wild Bill*** and ***His Era*** (1933); Richard O'Connor, *Wild* ***Bill Hickok*** (1959). (O. W.)

HICKORY, the common name for the genus *Carya,* one of the most valuable timber and nut-producing groups of hardy trees indigenous to eastern North America. The recognized American species are native to the eastern U.S., westward to Texas and Nebraska, with a few species extending into southeastern Canada and northern Mexico. These are pecan, *C. illinoensis;* and the following hickories: bitternut, C. *cordiformis;* black, *C. texana;* Carolina, *C.* carolinae-septentrionalis; Fernow, *C. fernowiana;* hammock, *C. ashei;* mockernut, *C. tomentosa;* nutmeg, *C. myristicaeformis;* pignut, *C. glabra;* red, *C. ovalis;* sand, *C. pallida;* scrub, *C. floridana;* shagbark, *C. ovata;* shellbark, *C. laciniosa;* swamp, *C. leiodermis;* and water, *C. aquatica.* A few hickory species, including C. *cathayensis, C. poileana* and *C. tonkinensis,* are found in southeast Asia, along with the closely related trees of the genera *Annamocarya* and *Rhamphocarya.* Fossil forms referred to *Carya* have been found over wider regions, including western U.S. (including Alaska), Greenland, Iceland, Europe and a considerable part of China.

JOHN H. GERARD

TRUNK OF THE SHAGBARK HICKORY (CARYA OVATA)

All hickories are nut bearers; the pecan, shagbark, shellbark, Carolina hickory and their hybrids are of particular value on this account. Bitternut and water hickory are inedible because of tannin in the skin covering their convoluted kernels, but a few pecan-bitternut and shagbark-bitternut hybrids are cultivated for their nuts and are among the most vigorous trees of the genus. Many hickories have special ornamental value, since the foliage is rich green in summer and may become bright yellow in fall. The wood of all hickories is valuable as fuel, and that of shagbark, shellbark, Carolina, mockernut, pignut and red is much prized as material in making tool handles.

Although cultivated to a limited extent, the shagbark, shellbark and hybrid hickories are propagated in numerous varieties which yield high-quality nuts farther northward than the pecan. Among the pomological varieties are the shagbarks Harold, Etter

No. 54, Anthony, Bernath, Davis, Fox, Grainger, Neilson, Schinnerling, Shaul, Weschcke and Wilcox; the shellbarks Scholl. Ross Etter NO. g and Wagner; and the hybrids De Acers, Fairbanks and Stratford. The first two shagbarks and the last three hybrids are among the few that appear permanently compatible when grafted on stock of the bitternut species. Shagbark, shellbark, pecan and hybrids between them make more useful stocks in nurseries. Grafting is by bark, modified cleft or plate budding methods.

J. HORACE MCFARLAND COMPANY

FRUIT AND LEAVES OF THE SHAGBARK HICKORY (CARYA OVATA)

Pleas is the only pecan-bitternut hybrid with good-flavoured nuts. *See* also NUT; *PECAN.*

(J. C. McD.)

HICKS, ELIAS (1748-1830), U.S. Quaker liberal, influential in the early days of the abolition movement, was born on the Hempstead plain, Long Island, N.Y., on March 19, 1748. A carpenter's apprentice, he married Jemima Seaman in 1771 and settled on the Seaman farm at Jericho, L.I. Recorded a minister in 1778, he repeatedly passed through the British and American lines during the Revolutionary War. On horseback or by gig he journeyed 40,000 mi. in the ministry, from Canada to North Carolina and as far west as Richmond, Ind. Walt Whitman wrote of the "pleading, tender, nearly agonizing conviction" of Hicks's speech. Hicks urged Friends to establish local schools and helped found an important boarding school. After assisting in freeing the Society of Friends of slavery, he worked for general abolition. He urged a boycott on the products of slave labour and advocated the establishment of an area in the southwest as a home for freed slaves. Several editions of his *Observations on the Slavery of the Africans and Their Descendants* (1811) were published. He helped secure legislation bringing slavery to an end in New York state. Hicks's sermons dwelt much on simplicity, temperance and peace. He combined the Quaker teaching of God's individual guidance with the use of human reason, and was one of the first teachers of the doctrine of progressive revelation. He successfully opposed the adoption by the Baltimore yearly meeting in 1817 of a set creed. Called a heretic for opposing the rising evangelical movement among Friends, he was unjustly held responsible for the Quaker schism in America of 1827–28. His followers, who called themselves the Liberal branch, were termed Hicksites by the orthodox party, which in the beginning they outnumbered. (*See* FRIENDS, SOCIETY OF.) Hicks died at Jericho on Feb. 27, 1830.

Hicks's *A Series of Extemporaneous Discourses* was published in 1825, his *Journal* in 1832 and his *Letters* in 1834.

See B. Forbush, *Elias Hicks: Quaker Liberal (1956).* (B. FH.)

HICKS, THOMAS HOLLIDAY (1798–1865), U.S. politician, governor of Maryland at the outbreak of the Civil War, was born on a farm in Dorchester county, Md., Sept. 2, 1798. He became a constable when 21 years old and was elected sheriff when 26. In 1830 he was elected to the state legislature; in 1836 he was made a member of the electoral college and returned to the legislature; and in 1838 he was appointed register of wills in his home county, a position he held for almost 17 years. He was elected governor of Maryland in 1857.

The state was divided on the question of secession. The southern and eastern parts generally favoured the cause of the seceding states; the northern and western counties did not. In 1860–61 Hicks resisted great political pressure to call a special session of the state legislature, avoiding any official action on secession. This and the fact that the state lay north of Washington and quickly came under control of the federal government at the outbreak of the war kept Maryland from joining the Confederacy. Hicks represented the state in the U.S. senate from 1862 to 1865. He died at Washington, D.C., on Feb. 13, 1865.

HIDALGO (*hijo de algo*, "son of something"; *cf.* Port. *fidalgo*) a Spanish term originally used to describe a member of the louest grade of nobility entitled to the style of "don." It is now generally used to denote a man of gentle birth.

See M. J. Gounon-Loubens, *Essais sur l'admiuistration de la Castille au XVIe siècle (1860).*

HIDALGO, an inland central plateau state of Mexico. Pop. (1960) 983,161. Area 8,058 sq.mi. It is bounded on the north by San Luis Potosí and Veracruz, on the east by Puebla, on the south by the states of México and Tlaxcala and on the west by Querktaro. Hidalgo was part of the state of México until 1869 when it was established as a separate state in honour of the revolutionary patriot Miguel Hidalgo y Costilla (*q.v.*), the priest who began the struggle which ended in Mexico's independence from Spain in the early 19th century. Its northern and eastern parts are among the most mountainous in Mexico. The peak at Navajas reaches 10,538 ft. and is near the spot where the Aztecs obtained obsidian for their knives. The south and west of the state is relatively flat and semiarid elevated tableland, sloping off into tropical lowlands. In the plains area is Lake Metztitlán and the valley of Tulancingo, centre of textile industries.

Hidalgo has a number of natural thermal baths, such as those at Ixmiquilpan. With cool to temperate climates and considerable ranges of moisture, a variety of agricultural products are cultivated including rice, cereals, coffee, maguey (American aloe) for pulque, peppers, tobacco, fibres and woods. Hidalgo is one of the most highly mineralized states of Mexico. The first mines were founded in 1534 in Pachuca, and the government-owned Cia. del Real del Monte y Pachuca is one of the most extensive properties in the world. Much of the silver carried to Spain by the famous "silver fleet" came from the rich mines of Hidalgo. Silver, gold, mercury, copper, iron, lead, zinc and antimony as well as sulfur, jasper, opals and a little coal are produced. Although fairly well urbanized, Hidalgo still has numerous indigenous groups, such as the Otomi, living in primitive but picturesque agricultural villages and settlements such as Tenango de Doria and Metepec. Tula, 40 mi. W. of Pachuca (*q.v.*), the state capital, was once the capital of the Toltecs and is an archaeological site. Tulancingo (pop., 1950, 18,543) and Huejutla de Reyes (30,331) are important commercial centres. (H. R. HY.)

HIDALGO Y COSTILLA, MIGUEL (1753–1811), "father of hlexicnn independence" was born May 8, 1753, at Corralejo, a farm near Guanajuato. He was educated for the priesthood at Valladolid (now Morelia, Michoacán) and was ordained in 1789. His early career was uneventful, though his interest in the economic advancement of his parishioners in Dolores, through the introduction of newer methods of agriculture, made him suspect by the Spanish authorities. He was thought to be too much under the influence of the Enlightenment (*q.v.*).

In 1808 Spain was invaded by French troops and Napoleon forced the abdication of Ferdinand VII in favour of his brother Joseph Ilonaparte. Though Spanish officials in Mexico mere loath to oppose the new king, many Mexicans formed secret societies, some in support of Ferdinand, others of independence from Spain. Father Hidalgo belonged to such a group in San Miguel, near Dolores. When the plot was betrayed to the Spanish, several members were arrested. Warned to flee, Hidalgo decided instead to act promptly. On Sept. 16, 1810, he rang the church bell in Dolores to call his parishioners, announcing a revolution against the Spanish. But what had begun in San Miguel as a movement for independence under white leadership became a social and economic war of the masses against the upper classes. Thousands of Indians and mestizos flocked to Hidalgo's banner of the Virgin of Guadalupe. The hosts rolled over Guanajuato and other major cities west of Mexico City. Soon Hidalgo was at the gates of the capital. Yet he tarried, and the opportunity was lost. His followers melted away. The responsible elements in Mexico were frightened by the prospect of social upheaval. In the end Hidalgo fled north, hoping to escape into the United States. He was captured, degraded from the priesthood and shot as a rebel in Chihuahua on July 31, 1811. Though he accomplished little, Father Hidalgo's name became the symbol of the independence movement for most Mexicans and Sept. 16, the anniversary of *grito de Dolores* ("cry of Dolores"), is celebrated as hlexico's Independence day. (R. E. Q.)

HIDATSA. A native American people of Siouan family,

one of three agricultural "village tribes" on the upper Missouri, the others being the Mandan (*q.v.*) and Arikara (*q.v.*); the surrounding groups were buffalo-hunting nomads of the plains. Culturally the Hidatsa resembled the Mandan; in speech, the Crow (*q.v.*). They are also known as Minitari and Gros Ventre of the River.

HIDDENITE: *see* SPODUMENE.

HIDE. This word can most accurately be rendered by the phrase "family land"!; originally it denoted the amount of land necessary for the support of a free peasant family. The actual amount of land covered by this term is still and is long likely to be a matter under discussion. In the 12th and 13th centuries, when records are first abundant, the hide commonly appears as 120 ac. of arable, with the meadow and the pasture-rights locally considered appurtenant to such a tenement. But the scanty evidence which comes from an earlier time suggests that, at least in Wessex, the hide had once been much smaller than this, and there are facts which point to a pre-Conquest southern hide of 48 ac. The large hide of 120 ac. is best recorded in the eastern midlands, and its appearance there may in part be due to the influence of the large Scandinavian tenements introduced into the neighbouring country by the Danish settlements of the 9th century. In any case, throughout England, the hide underlay the whole local organization of early English society. It was the basis of the earliest taxation, the contributions made by different districts to the support of kings and ealdormen, and it seems to have formed also the basis according to which the primitive English militia, the *fyrd*, was raised. By the end of the old English period it had become unusual for a single peasant to hold an entire hide. The quarter hide, or yardland (Lat. virgata) had become. and long continued to be, the normal peasant tenement. Long after the Norman Conquest, however, the hide was the unit according to which assessment to national taxation, such as danegeld (*q.v.*), was expressed. The Norman administration maintained the old English system by which most villages in the midlands and the south and west of England were assessed at some round number of hides, such as j, 10 or 25, an arrangement which undoubtedly descends from the time when the hide was the essential unit of agrarian economy.

(F. M. S.)

BIBLIOGRAPHY.—The voluminous literature relating to the hide may conveniently be approached through J. H. Round, *Feudal England* (1895); *F. W.* Maitland, *Domesday Book and Beyond* (1897); F. Liebermann, "Hufe" in *Die Gesetze der Angelsachsen* (1898–1916); *P.* Vinogradoff, *English Society in the Eleventh Century* (1908). The system of assessment based on the hide will be found explained in any of the articles on Domesday survey contributed by Round in the *Victoria History of the Counties of England,* ed., *H. A.* Doubleday (1900).

HIDE. This term is generally used to describe the pelts taken from cows, steers and bulls of the bovine species and also the pelts from horses. The pelts of other animals are commonly called skins. viz., sheepskins. goatskins, calfskins. etc. Hides are almost entirely a by-product of the meat industry. the supply being determined by the demand for beef. For the preservation and tanning of hides see LEATHER. (E. L. D.; X.)

HIDEYOSWI, TOYOTQMI (1536–1598), one of the generals who brought about the reunification of Japan in the 16th century. Although of humble birth, he rose to become one of the most powerful barons in the service of Oda Nobunaga. After Nobunaga's death in 1582, Hideyoshi utilized his military power to defeat rival barons. At first he patronized the European missionaries and traders whose imports of firearms had helped make his victories possible, but in 1587 he turned against the Jesuits and ordered them to leave. although the orders were not immediately enforced. Measures designed to restore the stratiication of feudal society followed.

In 1592 Hideyoshi's ambitions turned toward the mainland. An expedition sent to Korea withdrew after Korean ships threatened its supply lines. A second expedition to Korea followed in 1597, but Hideyoshi died before it was withdrawn. (M. B. J.)

HIERAPOLIS, the name of two ancient cities, one in Syria, the other in Asia Minor.

Syrian Hierapolis.— This is now a ruin, the site of which is partly occupied by modern Membij (Manbij), about 50 mi. N.E. of Aleppo in the Aleppo *mohafazet* (district) of Syria. The place first appears in Greek as Bambyce. but Pliny (*Natural* History, v, 23) states that its Syrian name was Mabog. It was doubtless an ancient Commagenian sanctuary. The Seleucids made it the chief station on their main road between Antioch and Seleucia-on-Tigris. As a centre of the worship of the Syrian nature-goddess Atargatis (*q.v.*), it became known to the Greeks as the Holy City (Hierapolis). Lucian (or some anonymous writer) in the tract De Dea *Syria* has described the orgiastic luxury of the shrine. The warship was of a phallic character, votaries offering little male figures of wood and bronze. Huge phalli were also set up before the temple and were climbed once a pear, with certain ceremonies, and decorated. For the rest the temple was Ionic.

The temple was sacked by Crassus on his way to meet the Parthians (53 B.C.). In the 3rd century of the empire Hierapolis was the capital of the Euphratensian province and one of the great cities of Syria. It was in ruins, however, when Julian collected his troops there. and Khosrau I held it to ransom after Justinian had failed to put it in a state of defense. Harun al-Rashid restored it at the end of the 8th century and it became a subject of dispute among Byzantines. Arabs and Turks. The crusaders captured it from the Seljuks in the 12th century, but Saladin retook it (1175) and later it became the headquarters of Hulagu and his Mongols, who completed its ruin. A colony of Circassians was settled there in 1879 after the Russo-Turkish War.

The remains are extensive, but almost wholly of late date, as is to be expected in the case of a city that survived into Muslim times. A sacred lake survives.

Phrygian Hierapolis.— This is an ancient city in the Denizli *il* (province) of Turkey, situated, at a height of 1.200 ft., on the Coruh Su, a tributary of the Buyuk Menderes (Maeander) river, about 6 mi. N. of the ruins of Laodicea (*q.v.*). There, at an early date, a religious establishment (hieronj existed, and the town that grew round it became one of the greatest centres of Phrygian native life but of nonpolitical importance. The chief religious festival was the Letoia, named after the goddess Leto, a local variant of the Great Mother of the Gods! who was honoured with orgiastic rites. There was also a worship of Apollo Lairbenos.

Hierapolis was the seat of an early Christian church (Col. iv, 13), with which tradition closely connects the apostle Philip.

The ruins of Hierapolis are remarkable, particularly for a long avenue of tombs in the west of the city and for a very perfect, partly excavated theatre.

HIERO I, the brother of Gelo, and tyrant of Syracuse from 478 to 467 B.C. During his reign he greatly increased the power of Syracuse. He removed the inhabitants of Naxos and Catana to Leontini, peopled Catana (which he renamed Aetna) with Dorians, concluded an alliance with Acragas (Agrigentum), and espoused the cause of the Locrians against Anaxilaus, tyrant of Rhegium. His most important achievement was the defeat of the Etruscans at Cumae (474), by which he saved the Greeks of Campania. A bronze helmet (now in the British Museum). with an inscription commemorating the event, was dedicated at Olympia. Though despotic in his rule, Hiero was a liberal patron of literature. He died at Catana in 467.

See Diod. Sic. xi. 38–67; Xenophon, **Hiero,** *6. 2*; E. Liibbert, *Syrakus zur Zeit des Gelon und. Hieron* (1875); for his coins see NUMISMATICS: *Greek Coins:* Italy and Sicily.

HIERO II, tyrant of Syracuse from 270 to 216 B.C., was the illegitimate son of a Syracusan noble, Hierocles, who claimed descent from Gelo. On the departure of Pyrrhus from Sicily (27j) the Syracusan army and citizens appointed him commander of the troops. He materially strengthened his position by marrying the daughter *of* Leptines, the leading citizen. In the meantime, the Mamertines, a body of Campanian mercenaries who had been employed by Agathocles, had seized the stronghold of Messana, whence they harassed the Syracusans. They were finally defeated in a pitched battle near Mylae by Hiero, uho was only prevented from capturing Messana by Carthaginian interference. His grateful countrymen then chose him king (270). In 264 he again returned to the attack, and the Mamertines called in the aid of Rome. Hiero at once joined the Punic leader Hanno, who had

recently landed in Sicily; but being defeated by the consul Appius Claudius, he withdrew to Syracuse. Pressed by the Roman forces, in 263 he was compelled to conclude a treaty with Rome, by which he was to rule over the southeast of Sicily and the eastern coast as far as Tauromenium (Polybius i, 8–16; Zonaras viii, 9). From this time till his death in 216 he remained loyal to the Romans, and frequently assisted them with men and provisions during the Punic wars (Livy xxi, 49–51; xxii, 37; xxiii, 21). He kept up a powerful fleet for defensive purposes, and employed his famous kinsman Archimedes in the construction of those engines that, at a later date, played so important a part during the siege of Syracuse by the Romans.

A picture of the prosperity of Syracuse during his rule is given in the 16th idyll of Theocritus, his favourite poet. *See* Diod. Sic, xxii, 24; xxvi, 24; Polyhius i, 8; vii, 7; Justin xxiii, 4.

HIEROCLES (fl. *c.* A.D. 535), Byzantine grammarian, whose *Synekdemos* (a list of eparchies and cities under Justinian I) is fundamental for the study of the political geography of the Byzantine empire. It was a source for George of Cyprus and for Constantine VII Porphyrogenitus' book on the themes.

See edition by *E.* Honigman with introduction and notes (1939).

HIEROCLES OF ALEXANDRIA (fl. *c.* A.D. 430), Alexandrian Neoplatonist who, after studying under Plutarch of Athens and visiting Constantinople, spent the rest of his life in Alexandria, where he won a reputation as a teacher of philosophy. His commentary on the *Chrysa Epe* ("Golden Words," 71 hexameters ascribed to Pythagoras) is written with sincerity in a clear and simple style. His other work, *Peri Pronoias* ("On Providence"), is known only from the summary and fragments in Photius' *Bibliotheca,* 214, 251.

He rejected the multiplicity of entities introduced by the Athenian school of Keoplatonism. His teaching on morals and psychology is a mixture of Platonic, Aristotelian and Stoic elements. His theory of creation seems to show Christian influence.

This Hierocles should not be confused with the Stoic Hierocles of Alexandria who lived in the 1st/2nd century A.D.

BIBLIOGRAPHY.—The commentary is cd. by F. W. Mullach, *Fragmenta philosophorum Graecorum,* vol. 1, pp. 416–484 (1860); word index (together with Longinus and Eunapius) by R. Robinson (1772); Eng. trans. by N. Rowe (1756). *See* bibliography to NEOPLATONISM. *See* also K. Praechter in Pauly-Wissowa, *Real-Encyclopädie der classischen Altertumswissenschaft,* vol. 8, col. 1479–87 (1913); K. Pracchter, "Christlich-neoplatonische Bezichungen," *Byzantinische Zeitschrijt,* 21:1–27 *(1921).*

HIEROGLYPHS, a term broadly used to denote any system of writing composed of pictures. Hieroglyph, "sacred carving," is a Greek translation of the Egyptian "the god's words." which was used at the time of the early Greek contacts with Egypt to distinguish the older hieroglyphs from the handwriting of the day (demotic). Modern usage has extended the term to other writing systems, such as Hieroglyphic Hittite, Mayan hieroglyphs and early Cretan. There is no connection between Egyptian hieroglyphs and these other scripts, the only certain derivative from the Egyptian writing being that used for Meroitic.

Egyptian hieroglyphic writing was composed entirely of pictures, though the object depicted cannot be identified in every instance. The earliest examples which can be read show the hieroglyphs used as actual writing, that is, with phonetic values, and not as picture writing such as that of the Eskimos or American Indians. The origins of the script are not known. It apparently arose in the late predynastic period (just before 3100 B.C.). There were contacts between Egypt and Mesopotamia at this time, and it has been thought that the concept of writing was borrowed from the Sumerians. This is certainly possible, but even if this was the case, the two systems were so different in their use of signs that it is clear that they developed independently.

Except for names and a few titles, the oldest inscriptions cannot be read. In many cases individual hieroglyphs were used which are familiar from later periods, but the meaning of the inscription as a whole is obscure. It is apparent that this writing did not represent the sounds as completely as was the case later. This fact may be illustrated by personal names of this period and by formulas from later times which still reflected the usage of this period. The royal name Wedymuw was written simply*, that is, with (later read d) for *wdy* and for "water," read *mw* (the vowels were not written). Later writing was fuller, indicating the *w* and perhaps also the *y* of *wdy*, and used three wavy lines for *mw*, reserving the single one for the consonant n. The formula "(may he) live, be prosperous and healthy!" constantly used throughout later times after royal names, was written with the sign for "live" , which represented all the consonants in the word ('nx—the' was the equivalent of Arabic ayin) at all periods, the sign for *ǧ*? (? was a glottal stop), which stood for *wǧ*? "prosper," and the sign for *s*, which stood for the word *snb* "be healthy." The abbreviated nature of these writings shows that early hieroglyphic had not developed a consistent representation of the sounds. It was as much an aid to memory as it was a system of writing.

Nevertheless, even in the oldest period the basic principles of hieroglyphic writing were in operation.

1. A hieroglyph could be used to represent the original object or action pictured. might be "sun"; a man with his hand to his mouth might be "eat."

2. A hieroglyph might be used to represent another word suggested by the picture. might be "day" or the sun-god Re (Ra); might be used for "be silent," as if the man were putting his hand on his mouth to keep himself from saying anything.

3. A hieroglyph might be used phonetically to represent a word or part of a word having the same (or nearly the same) consonants. The consonants must be in the same order. "mace," which had the consonants *ḥǧ*, could also be used for hg "be bright"; *pr* "house" might represent *pry* "go out."

By the 3rd dynasty (about 2700 B.C.) these principles had been elaborated into a more regular representation of the language, and a system of writing was established which remained in use for approximately 3.000 years. While there must have been some conscious direction of the process, there was no absolutely consistent, logical system introduced into the spelling. Usage brought about general agreement on how signs might be used. Middle Egyptian spelling was the most consistent, and the following description is based primarily on this period. In general it also reflects Old Egyptian. *See* EGYPTIAN LANGUAGE.

Egyptian, like Semitic, mas a language in which the roots were usually composed of consonants, which might combine with any number of different vowel patterns, as well as suffixes and prefixes. The word for "face" was something like * *ḥar* but "his face" more like * *ḥrif*. Since only the consonants remained the same in different usages of the same root, the hieroglyph for that root came to be associated with just the consonants. "face" represented only the two consonants *hr*. When the sign was used for a similar sounding word, only the consonants were taken into consideration. The sign for house could be used for *par, pur, pir, pra, pru, pri* or for *pr* with no vowel. The result was that Egyptian hieroglyphic writing did not have any way of indicating vowels. (Modern scholars have a conventional way of pronouncing Egyptian which has nothing to do with ancient Egyptian pronunciation.)

In any example of Egyptian writing most of the signs represented consonants, not ideas. A small number of signs came to represent single consonants. A horned viper was f, a hand was d, a loaf of bread *t*, an owl *m*, and so on. In a few cases there were several signs for the same consonant, as or for *w*. As there was at least one sign for each of the 24 consonants, the Egyptians had in these signs a potential alphabet (*q.v.*), equal to that later developed by the Canaanites. They never took advantage of this fact but continued to write in the complex manner outlined here as long as hieroglyphs were used.

Within the system, however, many words were written out with these signs and so spelled alphabetically (as far as the consonants were concerned).

The use of signs representing single consonants arose in several ways. In some cases the first letter of the word was taken, as f from *ỉt* "horned viper," *r* from *r*ʾ "mouth." On the other hand the cobra, originally *ʾǧyt,* was used for *ǧ*. In this, as in many other things. there was no absolute consistency. Some scribe used for *ǧ,* and others followed suit. The phonetic principle of hieroglyphic writing did not demand complete identity of consonants in this early period. This is further illustrated by some of the signs which came to represent two or three consonants. There does seem to be a pattern: however, in what consonants might be ignored. Only the glottal stop (ʾ), y, w and the suffix-t (a feminine ending) might be dropped.

About 78 hieroglyphs came into general use as representing two consonants each. The house stood for *pr,* an eye for *yr* (from *yrt* "eye," with the *-t* dropped). In a few cases a sign stood for more than one combination, as for both *bḥ* and ***hw,*** or several signs for the same sounds, as both and for *mr*. In all about 76 different combinations, out of a possible 576, could be written with commonly used phonetic signs.

A hieroglyph representing all the consonants in a word might stand for up to three or even more consonants. "Head" was *tp* or *ǧʾǧʾ* (*tp* was more frequent in Middle Egyptian); "day" was *hrw;* "build" was *qd*. Only a few signs came to be used as general phonetic signs ior three consonants. The most common of these was *tyw* (used only as a phonetic sign); another was *xpr* (from *xprw* "dung beetle"), used in *xpr* "become" and other words.

Egyptian spelling combined all of the above elements in a manner which was usually clear but was often clumsy. Words were ordinarily nritten with a combination of signs. some representing the general idea or even picturing the object or action, others giving the sound. Since a given sign might have several different sound values, other signs were added to make sure that the reader knew which was meant. For example, an animal ear might be *msǧr* "ear" or *sǧm* "hear." *Msǧr* might be written or . In the single stroke was added to show that the hieroglyph was to be read as the object pictured, that is as *msǧr* "ear." This was not a foolproof system, however, and it was usually considered better to add at least some phonetic signs. In the word was written out in phonetic signs in addition to the ear. is *ms;* is *ǧr*. Each of these had another consonant added, which repeated the last consonant of the preceding sign (*s* and r). There could have been no ambiguity here, as the signs and regularly stood ior *ms* and *gr,* but the addition oi the other two signs was typical of Egyptian writing. The nord was actually spelled *ms-s-ǧr-r* (ear). Such multiple nriting has been of considerable help to scholars in determining the sounds of each word. The other value of the ear noted above, *sǧm* "hear," was usually written , the ear being followed by an *m* ( ) to show that it was to be read *sǧm,* not *msǧr* or some other word.

Just as a limited number of hieroglyphs came to have regular phonetic value, others came to be regularly used to designate words belonging to a certain type or class. These are known as determinatives. The seated man (originally *z* "man") came to be used after many words designating persons, often as engaged in a profession or trade: *smr* "courtier," *smdt* "subordinates, staff." The seated man with hand to mouth used as a determinative in large numbers of words suggested by this gesture, such as those for "call," "lamentation," "complaint," "thirst," "message," "mourn," "interpreter," "boasting," "swallow," "bite," "answer," "denounce." The sparrow never represented the bird itself. It rather became a symbol of that which was restricting, bad or defective and was used as a determinative in words such as *šw* "empty," *mr* "sick," *ʾq* "to perish." The papyrus roll tied with a string came to be associated not only with writing but also with abstract concepts, so that it was used as a determinative in *rx* "know," hrt "contentment" and many others. Very frequently several determinatives were used in the same word: *nmḥ* "waif, orphan" (written *n-nm-m-ḥ* [child with hand to mouth] [sparrow]).

There were a number of ways of writing noun plurals. One of these was to repeat the word or the word sign three times: *rnw* "names" (rn "name"), *prw* "houses." Another way was to add three strokes: *prw* "houses" (the stroke beside showed that it was to be read as what it pictured, not as *pry* "go out" or some other word). The ending could also be written out phonetically, but it was customary to add the plural strokes to such a spelling. Since the plural ending was *w,* the plural strokes were often added to a word ending in *w,* even though no plural was intended, as *nfrw* "shortage" (note the use of the "bad bird"). The triple writing might be used in the same way: *nfrw* "beauty." (These two words had the same consonants. They undoubtedly had different vowel patterns. but these are unknown. They illustrate the fact that Egyptian writing was clearer than purely alphabetic writing of only the consonants would have been.) The plural strokes might also be used as a determinative in words indicating quantity, as *ʿš*ʾ "many," or mass. as , *ʿd* "fat."

Many other examples of this type oi derived value, based on the associations of a hieroglyph in the spelling system, might be given. For example, the exclamation "oh!" was written , with the appropriate determinative. This group of signs was then used to represent the same consonant (a glottal stop) elsewhere, in words in which the determinative has no bearing, as in , a late Middle Egyptian nriting ior *ʾnn* "we" (note plural strokes).

On the basis of the uses noted here, hieroglyphs have been classified into logograms (also called ideograms or nord signs; more accurately described as representing morphemes), determinatives and phonograms (phonetic signs). This classification is convenient. but it is often impossible to determine which classification fits a hieroglyph in a particular word. The inexactness is due to the nature of Egyptian writing, which does not lend itself to modern analysis into set categories.

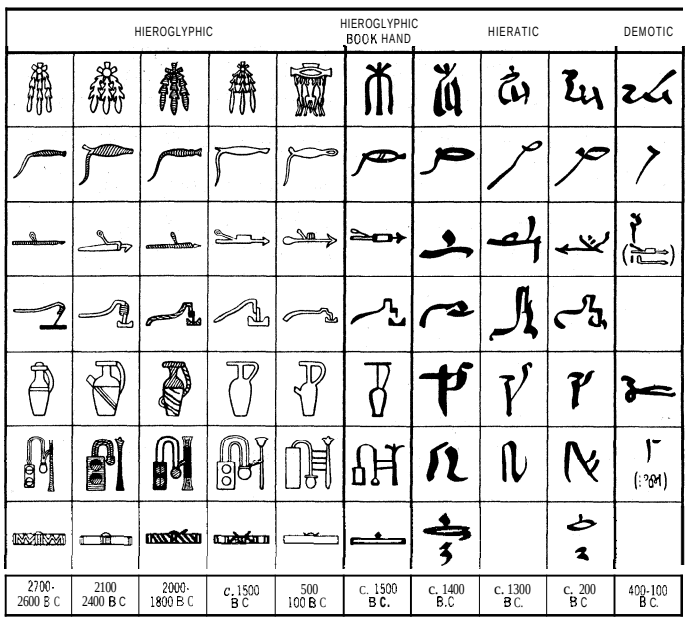
The Egyptian oiten looked upon the writing of a word as a unit, and the old phonetic spelling was usually kept even after sound

change had altered the consonants. When the word  swr "drink" (written *s-wr-r* [water] [man with hand to mouth]) became swy through the change of *r* to y, the y () was simply added to the spelling:  . There was a minimum of this kind of writing in Old and Middle Egyptian, but Late Egyptian spelling abounded in signs added, sometimes erroneously, to try to compensate for linguistic change. For example, in Late Egyptian "his beginning" was written  , that is, *ḥ³t-t* (stroke) t-w-f, where Middle Egyptian wrote only  *ḥ³t-t* (stroke) f. The word *ḥ³t* "beginning" had become something like *ha by Late Egyptian times, so that the writing  represented a word which, standing alone, had in current pronunciation no *t* at the end. The word still had the *t* before suffixes such as f "his," and the signs  (t-w, to be read simply *t*) were added to show this. The whole spelling represented only the consonants h t f.

It is readily seen from these examples that while there was a basic core of uniformity, there was also a large area of permissible variation in hieroglyphic spelling. In addition to the regular system, several special types of spelling arose. The most important of these was "group writing," in which each consonant was aritten with a sign or group of signs which normally indicated tno consonants. No texts were written in this spelling. but it was used occasionally for individual words from Old Egyptian times onward. In Late Egyptian it was primarily used to write foreign names and other loan words. The word "chariot," borrowed from Semitic (probably Canaanite **markabtu*), was written  . This would normally have been transcribed *m-y-r³-k-³-b-w-ty-y-t* ("wood"), but in group writing it represented only m-r-k-b-t. Attempts have been made to demonstrate that such writing was syllabic and so indicated the vowels. This has not been proved. It is possible that it was an Egyptian way of spelling out words using the names of hieroglyphs, like the English pronunciation of abbreviations such as NBC, some of the names having different vowel associates. There would, then, be a partial correspondence of the signs to the vowels of the word. There were also cryptographic scripts, such as the secret writing used for certain religious inscriptions in the 19th and 20th dynasties.

Order of Signs.—Hieroglyphs could be written either right to left or left to right. the lines being either vertical (reading down) or horizontal (reading across). The hieroglyphic figures always faced the beginning of the line. In an inscription which read right to left the signs faced the right. They were reversed for one reading left to right. Hieroglyphs were chosen and arranged so as to fill the space neatly and symmetrically. The word  *rmč* "people" was regularly written as here, *r-č* (man) (woman) (plural strokes). The writing  was very rare, as the *m* (the owl) made the group untidy. In other instances neatness caused the order of the consonants to be changed in the writing; for example,  may be t-w as it is written, or w-t. Signs were transposed for honorific reasons also. Phrases containing words such as "god," "king" or the names of deities (including the king, who was considered to be divine) often had these words first, out of deference. The name  "Menkheperre" ("enduring is the becoming of the sun-god Re") was written *r'-mn-xpr*, though it must be read mn-xpr-r'. Hm *nčr* "servant of god" (a type of priest) was written *nčr-ḥm:* .

Hieroglyphs and Religious Beliefs.—A number of hieroglyphs were used as amulets. The signs for "life"  , "stability"  and "protection"  were among those frequently reproduced as charms or included in dress or jewelry designs. The sacred eye of the god Horus  , according to legend scratched from its socket and torn into pieces by the wicked god Seth and later restored by the good god Thoth, was a talisman signifying wholeness and soundness. (The individual parts of the eye also served to indicate the fractions of a standard grain measure, the eyebrow being one-eighth, the pupil and iris one-fourth. etc.) As used in the tombs. hieroglyphs were not considered as mere writing. The portrayal of a person, animal or object, either as a picture on the wall or as a hieroglyph, was believed to be as effective as the original. The drawings of food in an offering list were therefore not just pictures; they were symbols which could become real food for the deceased Since hieroglyphs also depicted persons and animals which could harm the occupant of the tomb or deprive him of his food by eating it themselves, measures were sometimes taken to prevent this. In the Pyramid texts hieroglyphs representing human beings or animals who might eat the food needed by the deceased were usually incompletely drawn. The head, shoulders and arms (enough to show which sign was meant) would be used instead of a seated or standing man. An animal, such as a lion, would be shown cut in two pieces. A snake, on the other hand, was left nhole. since it would not be interested in man's food. In funerary texts of the Middle Kingdom fear is also shown of snakes, as well as other animals, by such incomplete drawing.



BY COURTESY OF THE ORIENTAL INSTITUTE

EGYPTIAN HIEROGLYPHS AND THEIR CURSIVE EQUIVALENTS

The hieroglyphs depict: (1) three foxskins tied together; (2) a whip; (3) a single-barbed harpoon; (4) an adz at work on a block of wood; (5) a stone jug with handle; (6) a scribe's outfit; (7) a roll of papyrus tied with a cord

Hieroglyphs as Art.—At all periods the hieroglyphs were part of the artistic expression of ancient Egypt As noted above, the very choice and order of signs was influenced by considerations of symmetry. The actual execution of the signs was the business of sculptors and painters. Kina M Davies has listed seven ways in which the hieroglyphs were made on walls and like surfaces: (1) carved in low relief; (2) carved and then touched up with different colours; (3) modeled on plaster which had been applied to the surface and then painted; (4) carved into the surface (incised) and the interior of the sign painted a solid blue or green; (5) incised deeply and the details carved on the sunken surface (a feature of the New Kingdom and later); (6) in silhouette (painted solid in blue or black); (7) painted directly on the surface in different colours. Although most inscriptions were done as a matter of routine and many were quite poorly executed, there were

also many of fine artistic quality with exquisite detail. The colours applied sometimes corresponded to those in nature but as often did not. The pastel shades of many painted hieroglyphs as seen today are the result of fading. The original colours were bright and contrastive.

Handwriting.— The scribes wrote with fine reed pens, using red ink for rubrics and black ink elsewhere. The hieroglyph for "scribe" shows the palette. with the two depressions for red and black ink, a bag to hold the powdered pigments and a holder for the reed pens:  . Examples of handwriting are known from very early times, though they are rare from the first few dynasties. The signs were written with thick strokes. giving the characteristic features of the hieroglyph in broad outline. This cursive script is known as hieratic, three types of which came into use: a book hand, used for literary works and official documents; a business hand. also used for private letters; and a religious book hand, which was a closer approximation to hieroglyphic than the other two. Some hieratic forms reflect hieroglyphs which were not used in contemporary inscriptions, such as  , which goes back to a hieroglyph of a falcon on a standard  . There were also spelling conventions for hieratic which werk slightly different from those used for hieroglyphic.

Hieratic became more and more cursive in the course of time. The changes were gradual but distinct enough to afford a good basis for dating manuscripts on paleographic grounds alone. Late Egyptian hieratic was considerably different from the older stages, as a result not only of the changes in the shape of the characters but also of the new spellings introduced. About 650 B.C. a new cursive, demotic, replaced hieratic. Demotic was a development from hieratic and retained all the features of the hieroglyphic system, including word signs, determinatives and phonetic signs. However, the script became so cursive that it is far more difficult to read. Seven demotic signs were borrowed to suppiement the Greek letters used to write Coptic when the ancient Egyptian hieroglyphic system was finally abandoned.

The latest known use of hieroglyphs was at Philae about A.D. 394. The latest use of demotic was about A.D. 470. After this, knowledge of hieroglyphs was completely lost until they were deciphered in the early 19th century (see also EGYPTIAN LANGUAGE).

Decipherment.— Attempts made before 1800 to decipher the hieroglyphic inscriptions were completely unsuccessful. as the picture was believed to be composed of mystic symbols. This medieval concept was slow to die out even after the discovery, in 1799, of an inscription. the Rosetta stone (*q.v.*), in three languages, hieroglyphic Egyptian, demotic and Greek. In 1802 the French scholar A. I. Silvestre de Sacy and the Swedish diplomat Jean David Xkerblad identified a number of proper names in the demotic text by comparing it with the Greek. Akerblad also correctly assigned phonetic values to a few of the demotic signs.

Several 13th-century scholars had believed that the ovals. or cartouches, found in the inscriptions contained proper names. There were six cartouches on the Rosetta stone, but they all contained the same name, which was quickly identified as Ptolemy. The English physicist Thomas Young made a study of this and cartouches found on other inscriptions. Five of the phonetic values he assigned to hieroglyphs were correct (*p*, *t*, i, *n* and *f*). He completed his paper in 1819 and it was published by the *Encyclopædia Britannica* in 1824.

The first person who was actually able to read not merely proper names and a few isolated words but longer passages and connected texts was the French scholar Jean François Champollion. He made an exhaustive study of the Rosetta stone, comparing the different versions sign by sign and preparing lists of equivalents. He recognized that demotic writing was developed from hieratic (which he knew from other documents) and hieratic from hieroglyphic. On identifying the name Cleopatra in demotic. he transcribed it back into hieratic and then into hieroglyphs. He later obtained a copy of an obelisk inscription written in both Greek and hieroglyphs in which he found Cleopatra written almost as he had reconstructed it. Comparing the names Ptolemy and Cleopatra, which had the sounds *p*, *t*, *o*, *l* and *e* in common, he was able to identify not only the hieroglyphs for these letters (including two for *t*) but also the others used in these two cartouches. Not all of the values he assigned to the hieroglyphs were exact from the point of view of present knowledge, but they were close enough to provide a firm basis for further work.

Champollion was still not convinced that hieroglyphs were regularly used in a phonetic way to write the ancient Egyptian language, since the names which had been deciphered were foreign (Greek and Roman). In Sept. 1822 he received copies of inscriptions from older periods, which included cartouches with the names Rameses and Tuthmosis. Working from his meagre alphabet and skillfully applying his knowledge of Coptic and of the Rosetta stone, he successfully deciphered them. He then knew that he had the key to the ancient language itself. The phonetic values found in the proper names could now be used to read the Egyptian texts. He announced this in his letter to M. Dacier of Sept. 22, 1822.

See Alan Gardiner, *Egyptian Grammar*, 3rd ed rev. (1957); Nina M. Davirs, *Pirture Writing in Ancient Egypt* (1958). (C. T. HE.)

HIGDEN (HIGDON), **RANULF** (d. 1364), Benedictine monk and chronicler. famous as the author of the *Polychronicon*, a universal history, entered the monastery of St. Werburgh at Chester in 1299. The *Polychronicon* was written in Latin but translated into English by John de Trevisa in 1387 and again in the 15th century. It enjoyed very great popularity, and well over 100 manuscripts survive. Beginning with the creation and ending originally in 1327, the chronicle was continued in a later recension to 1352, and Higden's autograph manuscript is in the Huntington library, San Marino, Calif. The *Polychronicon* is of less value for English history than its numerous continuations, the best known of which is that of John of Malvern. It belongs rather to literature and throws light on the general historical, geographical and scientific culture of the age. It was printed by William Caxton (1482), by Wynkyn de Worde (1495) and Peter Treveris (1527). Higden also wrote a number of theological works, such as his *Speculum curatorum* (1340), some of which survive. It has been believed, but is unlikely, that he was the author or translator from French into English of the Chester mystery plays. He died at the abbey of St. Werburgh, Chester, on March 12. 1364.

See C. Babington and J. Lumby (eds.), *Polychronicon Ranulphi Higden*, 9 vol. (1865–86); V. H. Galbraith, "An Autograph MS of Ranulph Higden's *Polychronicon*," *Huntington Library Quarterly*, vol. xxiii (i) (1959). (V. H. G.)

HIGGINS, ALEXANDER PEARCE (1865–1935), British international lawyer remembered primarily as an expert in maritime international law, was born at R'0rcester on April 24, 1865. He was educated at Worcester Cathedral (King's) school and at Downing college. Cambridge, and was called to the bar in 1908. He taught international law for many years at Cambridge, at the London School of Economics and at the Royal Naval War and Staff colleges. He published his principal work, *The Hague Peace Conferences*, in 1909. containing the texts of the Hague conventions of 1899 and 1907, together with some kindred instruments and valuable detailed commentaries. During World War I his special knowledge enabled him to render great service as adviser in international law and prize law to the procurator-general and treasury solicitor. In 1920 he succeeded L. F. L. Oppenheim as Whewell professor of international law at Cambridge. Pearce Higgins was a member of the Permanent Court of Arbitration at The Hague (1930) and president of the Institut de Droit International (1929–31). He died on April 2, 1935. His published work includes contributions to basic textbooks on international and maritime law, as well as studies in international law and in history. (McN.)

HIGGINSON, THOMAS WENTWORTH STORROW (1823–1911), U.S. reformer, soldier and author, was born at Cambridge, Mass., on Dec. 22, 1823. He entered Harvard college at the age of 13 and graduated in 1841. He spent two years in teaching. thought for a time that he might become a poet, and then entered the Harvard divinity school, where he graduated in 1847.

Although still a bit uncertain as to his calling he was ordained in Sept 1847, married his cousin Mary Channing a few weeks later and accepted the pastorate of the Religious Society of Newburyport. During the next two years he set the pattern he was to follow for the remainder of his life. He preached a social gospel that was too liberal even for Unitarians. He organized an evening school for workers; wrote editorials for newspapers; ran for congress on the Free Soil ticket; and took such extreme positions on temperance, women's rights, labour and slavery that, as he said, he literally "preached himself out of his pulpit."

The loss of his pulpit intensified his reforming zeal. On the passage of the Fugitive Slave act in 1850, he joined the Boston Vigilance committee to aid escaping slaves, advocated breaking up the Union and denounced those who refused to use force against slavery. In May 1854 he took a leading part in the liberation of the fugitive slave Anthony Burns in Boston. It was Higginson who purchased the axes and helped break down the door of the courthouse. For his part in the affair, he was arrested but never brought to trial. Next he turned his efforts to sending settlers and supplies to Kansas. He visited the territory twice and supported John Brown both in Kansas and in the raid on Harpers Ferry. Later he sponsored a move to rescue by force Brown's men still held in prison.

With the outbreak of the Civil War in 1861 Higginson helped to raise and drill troops in his own community. In 1862 he resigned his commission as captain in a newly organized Massachusetts company to accept appointment as colonel of the first Negro regiment in the Union army.

After the war, Higginson spent his time writing and gained ready access to the *Atlantic, Scribner's, Harper's* and the *North American Review*. Many of his articles were later gathered into books. He wrote a *Young Folks' History* of *the United States* (1875), a *Larger History of the United States* (1885) and the lives of Margaret Fuller Ossoli, Henry Wadsworth Longfellow, John Greenleaf Whittier and Francis Higginson. first minister of the Massachusetts Bay Colony, for a popular biographical series of the day His only novel. *Malbone,* never won the recognition given his magazine articles. He died in Cambridge on May 9. 1911.

(AY. CN.)

HIGHAM FERRERS, an ancient market town and municipal borough in the Wellingborough parliamentary division of Northamptonshire, Eng , 15 mi. E N.E. of Northampton by road. Pop. (1961) 3,756. Area 3 sq.mi. It stands high above the river Nene. The fine church of St. Mary is mainly Early English and Decorated; close by stand the beautiful Perpendicular schoolhouse and the bedehouse, both founded by Archbishop Chichele (*q.v.*); in the town are remains of Chichele's college. The local industries are leather dressing and shoemaking.

Higham (Hecham, Heccam, Hegham Ferrers) was evidently a large village before the Domesday survey, when it was held by William Peverel of the king. It was granted in 1199 to William Ferrers, earl of Derby, who gave the first charter (confirmed 1251); after passing through various hands it went to Henry, earl of Lancaster; it subsequently formed part of the duchy of Lancaster and so remains. The castle, mentioned in 1322, no longer existed by 1540. A mayor was elected from about 1343; a town hall is mentioned in 1395. The borough, incorporated in 1556, returned one member until 1832.

HIGH COMMISSION, COURT OF. The Act of Supremacy (1534) recognized Henry VIII as "Supreme Head in earth of the Church of England" and assigned to the crown the power of ecclesiastical visitation. This was given practical effect in 1535 when Thomas Cromwell was appointed vice-gerent, invested with the plenitude of royal authority in ecclesiastical affairs and directed to delegate part of it from time to time to such persons as he thought fit. The first general commission to a number of men was issued by Edward VI in 1549. The royal powers were confirmed by the Elizabethan Act of Supremacy (1559), which declared the queen to be "Supreme Governor of this realm . . . as well in all spiritual or ecclesiastical things or causes as temporal" and authorized the crown to nominate by letters patent persons to exercise on its behalf "all manner of jurisdictions . . . touching . . . any spiritual or ecclesiastical jurisdiction . . . and to visit, reform, redress, order, correct and amend all . . . errors, heresies, schisms, abuses, offences, contempts and enormities whatsoever."

The device of an ecclesiastical commission was thus adopted in the first place as a means whereby the crown could effectively enforce the laws of the Reformation settlement and exercise control over the church. The existing archiepiscopal and subordinate church courts were inadequate for this purpose. The men in charge of them were often unreliable; their organization was incapable of dealing with the increased business consequent upon the Reformation; and their coercive powers were insufficient to ensure obedience to orders given, secularism breeding increasing disrespect for ecclesiastical censures. By the high commission the authority of the church was to be at once controlled and supplemented by that of the state.

Until 1565 the work performed by the commissioners was mainly visitatorial, and their authority was regarded as temporary. But the continued difficulties experienced in enforcing the settlement, the development of additional administrative functions by the commission itself and the increasing delegation to it of ecclesiastical or semiecclesiastical business from the privy council gave the commissioners a sufficiently permanent tenure to enable them to establish traditions and judicial forms which, in time, transformed a temporary device into a permanent, regularized prerogative court. These developments were reflected in the appearance of the term "high commission" by 1570 and the title of "court" about ten years later.

That these developments took place in the 1570s was due to the fact that during that decade the position of the established church became most critical in face of growing opposition by Romanists and Puritans alike. The crown was forced to adopt firmer measures to protect the settlement. The intrinsic authority of the bishops and their courts was still declining, and in consequence an increasing burden was thrust upon the commissioners. It was also found necessary in the early 1570s to set up local ecclesiastical commissions, offshoots of the parent body in London, to deal with particularly disordered parts of the country.

Composition and Jurisdiction.— The total membership of the commission varied between 24 in 1549 and 108 in 1633; but of these any three were normally empowered to act, provided one of them was "of the quorum" (which numbered 11 in 1549, 68 in 1633). The effective nucleus of the commission appears to have consisted of a group of canon lawyers, who were joined by bishops or other men of superior standing as the importance of the business or quality of the offenders before the court might determine. The commission (as its visitatorial duties demanded) originally sat anywhere in the province of Canterbury, but came later, as its form and procedure hardened, to sit only in London on certain fixed days and to keep the law terms. Its jurisdiction, best summarized in connection with the other ecclesiastical courts as concurrent, appellate and equitable, though vague, was by no means unlimited. It could assume jurisdiction only *in personam* in criminal matters (though here the interpretation was rather loose); and it could not initiate cases of party and party. In matters of discipline its procedure was normally based upon the administration of the oath ex officio; *i.e.,* an oath imposed by the judge in virtue of his office. .This device was borrowed from the procedure of the ordinary church courts, being naturally employed by canon lawyers on the commission as the form most familiar to them. On the other hand, the penalties inflicted were generally secular in character: fine and imprisonment. The commission did not employ torture or inflict the death penalty.

That the commission's appellate jurisdiction in cases of party and party was popular is evident from the numbers who applied to it even in its last years. As an instrument for the maintenance of ecclesiastical discipline it seems to have been generally successful except in cases where it was concerned to coerce those whose opposition to the church settlement was dictated by sincere religious conviction. Secular penalties were of no more avail in such circumstances than the excommunication of a despised church: rather, indeed, they served to strengthen the sects by

providing them with a martyrology.

Opposition and Suppression. — The opposition which eventually destroyed the commission derived principally from the Puritans, the common lawyers and the common-law judges. The Puritans resented the commission's enforcement of orders relating to the conduct of services which they regarded as idoiatrous; and they complained that the use of the ex officio oath compelled a man to convict himself. The common lawyers' opposition to the commission stemmed from the traditional hostility between the lay and ecclesiastical courts. Though in part actuated by jealousy and self-interest, by a desire to extend their jurisdiction and hence enlarge their income irom fees, they could also claim with some justification that the commission's activities bred jurisdictional confusion. Recusancy, for instance, was a secular as well as an ecclesiastical offense.

Under James I the common-law judges first attempted. by prohibitions and pronouncements, to limit the commission's activities; and then, encouraged by the support of the parliamentary opponents of the royal prerogative, they embarked upon a vigorous attack upon its jurisdiction and procedure in general. The Supremacy act of 1559 had purported merely to restore to the crown the "ancient jurisdictions" allegedly "usurped" by the bishop of Rome; and the crown claimed accordingly that its power to exercise ecclesiastical jurisdiction through commissioners rested on its own inherent, ancient rights, not on any authority specifically conferred by parliament. The common-law judges had accepted this point of view as late as 1591 (Cawdrey's case); but now, under the Stuarts, they began to insist that the commissioners' jurisdiction was based on statutory permission, not prerogative right, and to interpret the terms of the act of 1559 in an indefensibly narrow fashion. They took exception to the use of fine and imprisonment because these were not strictly ecclesiastical penalties; and they challenged the legality of the ex officio oath as being contrary to common-law practice.

As the constitutional struggle developed between the Stuart kings and their parliaments the legal opposition to the commission became merged into the general political conflict. Abortive bills on the subject of the commission were introduced in the parliaments of 1607 and 1609–10; and in 1610 a petition of the commons denounced the act of 1559 as "inconvenient and of dangerous extent."

In 1641, when Charles I had to give way to parliament, the clause of the act of 1559 that gave the crown power to exercise its supremacy through commissioners was repealed, the court was abolished and it was provided that no similar court should again be set up. The commissioners were accused of having, "to the great and insufferable wrong and oppression of the King's subjects, used to fine and imprison them, and to exercise other authority not belonging to ecclesiastical jurisdiction restored by that Act." At the Restoration, when the other ecclesiastical courts were revived, the prohibition upon the use of a high commission was retained. It was nevertheless re-established by James II in 1686, only to be condemned finally by the Bill of Rights in 1689 as "illegal and pernicious."

See R. G. Usher, *The Rise and Fall* of *the* ***High*** *Commission* (1913); W. S. Holdsworth, History of *English* ***Law,*** vol. i and vi, rev. ed. (1922–24). (F. D. PE.)

HIGH COURT OF JUSTICE, one of the two major divisions of the English supreme court of judicature (*q.v.*), the other being the court of appeal (*see* COURT OF APPEAL [BRITISH]), was created by the Judicature act, 1873. This measure, among other changes, abolished the historic courts with their separate jurisdictions, such as the courts of chancery, queen's (or king's) bench, common pleas, admiralty and so on, and substituted a high court of justice sitting in three divisions: the chancery division; the queen's (or king's) bench division; and the probate, divorce and admiralty division. Each division has certain classes of work assigned exclusively to it, but apart from these any division may deal with any matter and the remedies available in one division are available in another, so that, *e.g.,* the chancery division may award damages and the queen's bench grant an injunction. *See* COURT: *England;* JUDICIARY AND COURT OFFICERS: *English Judicial System.* (W. *T.* WS.)

HIGHER EDUCATION. During most of the 19th century higher education was understood as referring to the training provided in established colleges and universities; and this was essentially a nontechnical and nonprofessional liberal arts education. In the 20th century the term has come to be applied to a great variety of postsecondary institutions of learning, including not only universities and colleges, but also large numbers of professional schools, separate from the universities, which provide preparation in such fields as law, theology, music and art and, in addition, separately organized teacher-training schools, junior colleges (a peculiarly American institution) and various kinds of institutes of technology.

This article reviews the growth in curriculum offerings in the traditional institutions and the development of new institutions of higher education accompanying the increasing specialization of knowledge and of technology and the expanding number of students seeking higher education. For details on traditional educational institutions *see* COLLEGE; UNIVERSITIES; UNIVERSITY COLLEGES; LAND-GRANT COLLEGES AND UNIVERSITIES. *See* also EDUCATION, HISTORY OF. For institutions 01 higher education in particular countries, *see* education sections of separate articles on those countries.

EXPANSION OF THE CURRICULUM

Historical Background. — In spite of the fact that the 19th century witnessed a steady expansion of scientific knowledge, the curriculum of the established higher educational institutions was virtually untouched. Higher education followed a single dimension. This was the century of Faraday, Von Helmholtz, Joule, Darwin, Lister, Wundt, Pasteur and Koch. Yet, until the end of the century, most of the significant research was done outside the walls of higher educational institutions. In Great Britain it was the Royal society and other such societies that fostered advanced studies and encouraged research. In 1828 Yale college issued what was, in effect, a manifesto, proclaiming that a single prescribed course of study, nontechnical and nonprofessional, was the only proper course for a higher educational institution. When, in 1847, Abbott La rence notified the president and fellows of Harvard college that he was prepared to give $50,000 for the support of scientific education, the college organized a separate school, the Lawrence scientific school. The basic curriculum of Harvard college remained intact. Cardinal Newman, lecturing in Dublin on "The Idea of a University" in 1852, stated that the task of the university was to prepare young men "to fill any post with credit, and to master any subject with facility." Higher education was for the gentleman.

The German University. — While Newman's words epitomized the views held in most colleges and universities in the United States, Great Britain and continental Europe, the end of the 19th century saw the beginnings of the expansion of the entire enterprise. Earlier, in 1807, J. G. Fichte (*q.v.*) drew up a plan for the proposed new university of Berlin, of which he became rector (1810–12) and which mas dedicated to the scientific approach to knowledge. By the third quarter of the 19th century the influence of German *Lernfreiheit* (freedom of the student to choose his own program) and *Lehrfreiheit* (freedom of the professor to develop the subject and to engage in research) was being felt throughout the academic world. When Charles W. Eliot was named president of Harvard in 1869, he advocated greater flexibility in the college curriculum. By 1900 Eliot's free elective system had been widely adopted by U.S. colleges and universities.

The German conviction that investigation and research were the primary functions and responsibilities of institutions of higher education was embodied in the new Johns Hopkins university, founded in 1876, the first U.S. institution of higher education organized along modern university lines. It was followed by Clark university. Worcester, Mass., in 1887 and The University of Chicago in 1891. The polytechnic (*q.v.*) idea caught on in Great Britain in the 1890s. The first civic universities in England came into existence at the turn of the century — Birmingham was chartered March 24, 1900. Higher education was expanding.

20th-Century Expansions. — In the 20th century the unfolding scientific revolution, the growth of a technological society, the expansion of the cities, the changes in the intellectual and social climate brought new demands upon the formal educational program. The whole world of organized knowledge exploded as new areas of study emerged and old areas expanded beyond recognition. Auguste Comte (1798–1857) is called the father of the "social sciences" — sociology, anthropology, economics and political science — but it is the 20th century that has seen their development. Psychology as a field of study is essentially a 20th-century phenomenon. The pioneers, Wilhelm Wundt (1832–1920), William James (1842–1910), G. Stanley Hall (1846–1924), Sigmund Freud (1856–1939), bridged the 19th and 20th centuries. The physical sciences began the exploration of the atom, and the biological sciences expanded in new directions.

At the beginning of the second half of the 20th century higher educational institutions still accepted as their proper role the transmission of the cultural heritage; but they also stood at the forefront of research — much of the original work on the use of atomic energy was done in the laboratories of the universities of Chicago and California. The curriculum had expanded. and at some of the large state universities in the United States it was possible to study everything from atomic physics to television repairing and driver training.

Teacher Training. — This expansion of the functions of institutions of higher education is illustrated by the developments in teacher training and technical education in the United States and Great Britain. During the first part of the 20th century US. teacher training was a limited type of postsecondary training carried on in normal schools. It was not until the second and third decades that there was a move toward collegiate-level programs. By the 1960s, however, a national program of accreditation had been set up and many of the normal schools had extended their offerings to include functions other than teacher training — though this remained their primary role — and had dropped the word "normal" or "teachers" from their titles. (See also TEACHERS, TRAINING OF.)

The United States had established a system of tax-supported secondary education much earlier than had Great Britain, and it was only after the British Education act of 1944 completely revised secondary schooling in England and Wales that British teacher training was thoroughly reorganized. Prior to the act of 1944 teacher training was carried on in schools having little status and operating under great diversity of form and sponsorship. By 1949, however, the responsibility for training teachers, as had been proposed in the McNair report of 1943, had been taken over by 16 area training organizations, for 13 of nhich the universities and university colleges had accepted administrative responsibility.

Thus, by the middle of the 20th century. the training of elementary- and secondary-school teachers, training for specific vocations, had come to be considered an integral part of higher education in Great Britain and the United States Debate continued about the nature of the training, the courses to be included and the locus of administrative responsibility for the programs in the university, but teacher training had become "higher education."

Technical Education. — Technical education had not proceeded as far in gaining status as had teacher training, but it too was more frequently being included under the general category of "higher" education. As an applied science, engineering in all of its branches had gained acceptance into the university curriculum during the first part of the 20th century, largely because of the strong emphasis engineering programs placed upon theory and general principles. The expanding technology, however demanded for every graduate engineer a score of persons with less training in theory but with basic insights into technical applications In the United States tno- and three-year technical institutes experienced a spectacular growth in enrollment following World War II. During the 1950s some of these technical programs found their way into the curriculums of established higher educational institutions, and regional accrediting agencies adopted new policies for the recognition of qualified, separately organized technical institutes as higher educational institutions.

In Great Britain the universities strongly opposed the offering of degrees by technical colleges, a prerogative the technical colleges sought with equal fervour. The Percy committee in 1945 recommended the establishment of regional advisory councils on which the universities and technical colleges would be represented with industrial and local authorities. In 1948 the ministry of education established a national advisory council on education for industry and commerce to co-ordinate the work of the regional councils and advise on matters of national policy. Various national technical schools were established, such as the National College of Rubber Technology (Northern Polytechnic, London, 1948). Technical colleges strengthened their programs and increased their emphasis on research.

Advanced programs in separately organized art and music schools also gained status, and in the United States many were classified by the office of education as higher educational institutions. (A. O. P.)

Points of View. — Though welcomed by many, and accepted by most. the horizontal expansion of higher education was not without opponents. Dissenters insisted that, whatever else they might be, courses in beauty culture, manipulation of the adding machine and preparation of an evening meal were not valid parts of higher education. They damned the uncontrolled impetus toward specialized fragmentation and the introduction of triviality into the college curriculum and called for a re-examination and reorientation of educational theory. Advanced training in academic areas and preparation for "successful" careers, these people asserted. are not proper objectives of undergraduate college curriculums

From the debate which followed, a debate largely forced on the educational world by the articulate voices of the dissenters. emerged the concept of general education. As used in its most common currency, the term was understood to embrace the broad views of those who sought to preserve certain common elements of liberal education in the college curriculum and to restore the unity of purpose that had characterized the best colleges of the 18th and 19th centuries. Despite a number of specific successes, the supporters of general education would be the last to assert the victory of their position and many of them would, indeed, insist that the situation may have become worse than when the debate began; that, like a large cafeteria, the college program seems designed to offer the largest number of students the widest variety of insubstantial snacks to be eaten with the least amount of effort.

Most hopeful — and. perhaps. most enduring — of the many experiments sponsored by the supporters of general education were various efforts to plan education around a standardized program of reading in what came generally to be called Great Books The idea that true education begins best with the reading of great works by great minds, rather than in the analysis of what later textbook authors have written about those works, was not new. It may have been implicit in the Bibliotheca *curiosa,* a formal eclectic reading list prepared by Johann Hallervord of Königsberg in 1676, or in the reading-discussion program of Benjamin Franklin's Junto association of the 18th century, in Sir John Lubbock's list of the *Hundred* Best Books (1891) or in any of the many bound home-library collections of "classics" published throughout the late 19th and early 20th centuries

In 1916 John Erskine at Columbia university made what is believed to have been the first attempt to persuade a major U.S. college to offer a credit course based on the reading and discussion of great books. He was not to succeed in his plan until the end of World War I, when he first offered his general honours course in great writings from Homer to William James. Fifteen students were enrolled in the initial course; they read a book a week and met once a week in the evening for a two- or three-hour discussion of the material covered Unlike later offerings of the same type. the Erskine course did not constitute the entire curriculum followed by the students enrolled in it, and the 53 works on the reading list were drawn entirely from the humanities. The goal of Erskine and his assistant instructor, Mark Van Doren, was relatively modest — to repair the failure of contemporary scholarship to reward effort with "either pleasure or wisdom."

The general honours course continued in existence at Columbia

until 1932, when it was replaced by a colloquium, or seminar, limited to selected members of the junior and senior classes.

Early in the 1930s Robert M. Hutchins, then president of The University of Chicago, with Mortimer Adler, who had been an Erskine student in the first year of the course at Columbia. offered a great books class for 25–30 selected freshmen at the university. Convinced that the great books approach offered a sound corrective to the educational trends of his day, trends which "confused science with information, ideas with facts and knowledge with miscellaneous data," and determined that the primary obligation of the college student was "to think," Hutchins in 1936 established at Chicago a committee on the liberal arts. The committee, whose members included Stringfellow Barr and Scott Buchanan, was directed to study the whole concept of a liberal education. Hutchins in 1937 dropped high school credits as a basis for admission to the college and instituted a four-year liberal arts program starting in what would have been the junior year of high school. In 1942 the university decided to award the bachelor's degree for the program. Three years earlier. in 1939, the university college had begun a great books curriculum, which by 1944 had become firmly established.

Meanwhile, in 1937, St. John's college in Annapolis, Md., reinstituted the liberal arts program that it had earlier abandoned. Under the direction of Barr as president and Buchanan as dean, it became the first U.S. college to offer a full four-year liberal arts program consisting of the study of great books. Like The University of Chicago list before it. the St. John's course was based on a modified version of the Erskine reading list with science as a notable addition. Seventy-five authors were represented on the list which formed the nucleus of a program consisting of four years of seminars on the books, one lecture each week on the great ideas, special tutorials in Greek. Latin, French, German and mathematics, and laboratory work in science. The course has remained without substantial revision.

Significantly, the great books program has perhaps been more influential in the field of adult, nonformal education than it has in academic collegiate studies. In New York. under the influence of the Columbia program, Adler. Buchanan and Everett Dean Martin in 1927 began a series of adult courses with the support of the Carnegie Corporation of New York. Similar courses had been offered two years earlier by the New York Public library and the Peoples' institute and were to be offered later by Alexander Meiklejohn's School of Social Studies in San Francisco, Calif. (1933); the Chicago Public library (1945) and the District of Columbia Public library (1945) ; and by adult education programs in Annapolis, Washington. D.C.. and Baltimore, Md., beginning in 1938 and 1939. In 1945–46 The University of Chicago accepted an incitation to conduct what is believed to have been the first course in classical readings for industrial employees in the United States. and in the same period offered a similar program for supervisory personnel of the Marshall-Field department store in Chicago.

By 1947 the movement had resulted in the creation of the Great Books foundation to promote "reading and discussion of Great Books as a program of free, universal adult liberal education." The foundation assisted in the organization of groups, the training of group leaders and the publication of editions of the works to be read. Discussion groups were conducted in the manner of Platonic dialogues. Growth of the movement was spectacular. In 1948 there were 36.000 enrollees in groups in 222 cities throughout the United States; in 1949 the number had grown to 60,000 and by the beginning of the 1960s, organized groups were active in well over 1.000 communities.

Perhaps the most spectacular manifestation of the movement was recorded in 1952 when, after seven years of preparation, a 54-volume set of the "Great Books of the Western World" was published by Encyclopædia Rritannica. Inc , under the direction of William Benton and the editorship of Hutchins. Included in the 54 volumes were 32.000 pages and 25.000.000 words comprising 443 full works by 74 authors. A feature of the set was the *Syntopicon,* edited by Adler, which indexed the entire set in relation to 102 great ideas and 3,000 subordinate ones. Within a decade, the set had become, despite the early skepticism of many, a publishing success which attested to the vigour of the great books idea as a method of liberal education. (W. E. Pr.)

GROWTH IN ENROLLMENTS

Not only was the curriculum of higher education expanding, but enrollments also increased. Follo ing World War II the "G.I. Bill of Rights" (public law 346, 78th congress) in the United States and the Further Education and Training scheme in Great Britain released a flood of students upon the educational institutions in both countries. The effect was not only to fill the gaps created by the war years but also to give new impetus to the demand for higher education on the part of persons who othernise would not have considered applying for work beyond the secondary-school level. What happened can be illustrated by the experience in the United States. In 1946, when higher education first felt the full impact of World War II veterans, the enrollment climbed to 2,078,000. The highest enrollment ever before reached was in 1939, when 1,365.000 students were registered. By the late 1950s enrollments exceeded 3,000 000 In 1930 just over 21% of U.S. youth aged 18 to 21 attended higher educational institutions. By the second half of the 20th century the ratio between persons aged 18 to 21 years and persons enrolled in higher educational institutions had climbed beyond 32%. Similar advances were recorded in Great Britain.

Calibre **of** Students. — In the midst of these exploding enrollments, questions were raised about the intellectual calibre of the young people entering colleges. Some persons were convinced that opening the doors to more and more students could only result in the progressive deterioration of higher education. On the other hand. the United States president's commission on higher education in 1946 argued that only a portion of those qualified for higher education were actually enrolled. The commission said that 49% of the population had the mental ability to complete 14 years of schooling with a curriculum of general and vocational studies and that 32% had the ability to complete advanced liberal or specialized professional education.

In Great Britain the Barlow committee earlier concluded, on the basis of an analysis of test experiments, that only about one in five of the boys and girls with intelligence equal to that of the best half of the university students actually reached the university. The committee stated that it would be possible to double enrollments in British higher educational institutions while still raising standards. In both the U S. and Great Britain the respective reports met with mixed reactions They were as roundly condemned as they were loudly applauded, but conclusive evidence either substantiating or repudiating their conclusions was lacking.

Faculties. — Increased enrollments were accompanied by problems in staffing and financing Among U S colleges and universities one of the most persistent concerns was how to obtain and hold competent teachers in the numbers needed to serve the steadily expanding enrollment A study conducted by the research division of the National Education association showed that over a four-year span holders of the doctor's degree comprised a steadily decreasing per cent of the successive groups of newly employed full-time college teachers. The decrease appeared to be only in small part due to the short supply of qualified personnel. To fill the gaps institutions were turning to new instructional methods and. among other things, some introduced closed-circuit television in various ways.

Among British institutions, the expanding enrollments also brought significant changes. The traditional residential college pattern was disrupted by the tremendous growth in enrollments in the nonresidential "red-brick" or civic universities.

Finance. — The financing of higher education in the United States represents a complex balance of eight different sources of income: student fees. government grants (federal. state. local), endowment earnings. private gifts. sales and services, auxiliary enterprises scholarships and a general catchall category labeled "other." The proportion of income from each of these sources varies nith the institution and with the type of institution. The most striking variation is between public and private institutions.

Private institutions in the second half of the 20th century derived over 30% of total income from student fees, while public institutions received about 10% from the same source. (In the United States "public" institutions are tax-supported institutions.) Private institutions received about 15%–17% of their total income from government sources, while public institutions received over 60% of their income from these sources.

Private colleges and universities earlier depended heavily upon endowment income. In the 1960s endowment funds produced less than 10% of the income. These institutions became more dependent upon student fees and private gifts. The most significant development in the financing of private higher education was the growth in contributions from industry. In 1960 business and industry gave an estimated $100.000.000 to higher education in the United States. This was an increase of $60.000.000 over 1950. In large part the funds went to private institutions. Public higher educational institutions. enrolling almost 60% of. the resident students, depended for their major income upon tax monies from state governments. State governments contributed more than 40% of the total income for these institutions. Education had become one of the major items in state budgets.

In Great Britain. except for the University of London, none of the institutions had an endowment comparable with Oxford or Cambridge; but even those relatively wealthy universities were becoming more and more dependent upon government grants. Endowment was unable to carry the burdens imposed by postwar expansion, rising costs and new facilities. In the 1950s government grants constituted 70% of the total income for British higher educational institutions. See also ADULT EDUCATION; TECHNICAL EDUCATION; UNIVERSITY EXTENSION.

HIGH-FIDELITY SOUND SYSTEMS. The reproduction of music in the home has been of sufficient importance that two large industries are built upon it—recording and radio broadcasting. With the popularization of alternating-current–operated amplifiers in the late 1920s, it became possible to provide enough power to approximate the acoustic volume of the original performance with loud-speakers, which have been improved continuously ever since. High fidelity became a hobby of thousands of music lovers. and many developments in the art appeared during the succeeding 30 years. The introduction of the long-playing phonograph record in 1948 made it possible to widen the over-all frequency range of recorded music so that a reasonable facsimile of the original could finally be attained. Improvements in broadcasting equipment and the introduction of frequency-modulation (FM) broadcasting provided still higher quality, and by the early 1950s the general public began to develop an interest in high fidelity.

The term high fidelity, in its original meaning, referred to an assembly of equipment—more often than not built by the hobbyist himself—designed for reproduction of music with as great a faithfulness to the original as possible. In general, a high-fidelity or "hi-fi" system contains a source of music, an amplifier and a loud-speaker. The source may be any means for reproducing phonograph records, a radio tuner or a tape recorder; the sound signals from a television set may also be used. The signals produced by any of these devices are fed into the amplifier where they are increased in strength so that they have enough energy to actuate one or more loud-speakers, a combination of several mounted in an enclosure commonly being known as a loud-speaker system. Early systems usually consisted of loud-speakers originally intended for use in motion-picture theatres, since speakers of good quality were rarely used in conventional radio receivers. Amplifiers designed for public-address systems were adapted for home use, but in many ways early systems were makeshift. Sufficient demand was recognized by 1950 to warrant the production of amplifiers, record-playing equipment and high-quality loud-speakers intended for home use. Within five years the industry had some zoo manufacturers engaged in building components.

With no industry standards of quality and no restrictions on what could be called high fidelity, it was not long before the term was applied to any and all equipment that would reproduce a sound. While the original concept of high fidelity referred exclusively to an assembly of individual components—each being produced by a specialist in that particular equipment—by 1954 many complete systems, already housed in a cabinet by the manufacturer, appeared on the market. Economies of manufacture resulted in more impressive equipment at lower cost, but complete packaged hi-fi systems seldom compared in reproduction quality with those assembled from components, even though the latter might have been assembled by a dealer and sold as a complete unit. In general, sound quality is better when the loud-speaker is in a separate cabinet, particularly if a record player or turntable is part of the system.

Sound Sources.—The source of sound for the usual hi-fi system is the phonograph record, although many listeners find adequate programing from radio broadcasts. Record-playing equipment chosen for such a system is most often of highest quality, especially in the case of the serious music lover, who is likely to use a transcription turntable, a less-expensive. modification of the extremely fine machines used in broadcasting stations and recording studios. This type of turntable produces a minimum of flutter and wow, and the lowest possible rumble. "Wow" is the name given to low-frequency variation in rotational speed of the record which causes a sound well described by the name. "Flutter" refers to speed variations of higher frequency, and while not so readily detected by the untrained ear, it is usually manifested by a roughness in violin and soprano voice tones. "Rumble" is a continuous low frequency which is fairly constant and which interferes with good reproduction of bass tones; intentional reduction of low-frequency response of the amplifier and loud-speaker equipment reduces the effect of rumble but sacrifices bass.

The phonograph pickup is the device which converts the mechanical vibrations caused by variations in the record groove into an electrical signal. Two general types are in use, with the magnetic group—including variable-reluctance, moving-coil and moving-magnet constructions—favoured for best quality. Piezoelectric types. which include crystal and ceramic pickups, are less expensive and require less critical amplifier circuits, hut their output is not as uniform for all frequencies nor do they cover as wide a frequency range. Output signals from the magnetic types range from 1 or 2 mv. up to about 50 mv. for average recorded volume; ceramic and crystal types have outputs in the vicinity of 0.j v. Stereophonic pickups of either type are actuated simultaneously by variations in both walls of the record groove and provide the two separate signals necessary for stereophonic reproduction. (See also PHONOGRAPH.)

Another source of program material is the tape recorder, which came into common use in the early 1950s. These machines record on narrow bands of thin plastic upon which a coating of magnetic oxide has been deposited. The recording process is simple and necessitates little skill. reproduction quality being dependent almost entirely on the quality of the recorder itself. Program material may be recorded from broadcasts or from live performances. and prerecorded tapes have been introduced that offer a wide selection of music. (See TAPE RECORDING, MAGNETIC.)

For reception of radio broadcasts, the tuner is employed. The

hi-fi tuner is simply a refined version of a radio receiver, but without audio amplifier or loud-speaker. Best reproduction comes from frequency-modulation stations, but since the range of FM signals is limited to about 50 mi. for reliable reception, amplitude-modulated (AM) stations can provide a usable signal for greater distances. The usual tuner for hi-fi use combines both AM and FM in the same unit, with circuitry often being arranged to permit reception of both types of signal at the same time for stereophonic reproduction. Frequency response of FM tuners meets highest broadcasting standards. and reception is almost entirely free from atmospheric or man-made static or noise.

FM stations are inherently capable of transmitting two or more programs over one channel at the same time by a process known as multiplexing, and thus can transmit both portions of a stereo program at once. FM stations also can provide additional program services by multiplex without the knowledge of listeners who are receiving the main channel only; such transmissions are usually subscribed for by hotels, restaurants and the like for background music entertainment.

The sound portion of TV programs is often fed into a high-fidelity system for improved reproduction. In most TV sets, the amplifier and speaker offer minimal sound quality, although the transmitted sound is almost equal to the best of FM quality. In built-in hi-fi systems, careful placement of TV picture tube and loud-speaker can give increased realism and greater enjoyment.

Amplifiers. — Since the output signals from phonograph pick-ups may be as low as 0.000001 v. during quiet passages, amplifiers are required to build these minute signals up to the volt or so necessary to actuate a loud-speaker. Controls are necessary to adjust frequency response to suit the listener's desires, the acoustic environment in the home and deficiencies in equipment or recordings. Phonograph records are not cut with a uniform frequency response because at low frequencies a loud signal would require a aide groove spacing which would reduce playing time. Noise and "needle scratch" can be reduced by accenting the high frequencies during recording and attenuating them during playback. Beginning at 500 cycles per second (c.p.s.), about one octave above middle C, the recording level is reduced progressively as frequency is lowered, decreasing in strength by one-half for each octave. High frequencies are increased or pre-emphasized beginning at 2,120 c.p.s., doubling in strength with each octave. To play back properly, a complementary correction must be introduced in the amplifier so that the resultant output is uniform over the entire frequency range. The frequency at which the lows begin to be reduced is known as the turnover, and was standardized in 1954 by the Record Industry Association of America (R.I.A.A.) at 500 c.p.s. for long-playing records. Prior to that time various other turnover points were used, resulting in lack of uniformity of records and necessitating greater complication in the amplifier. Similarly, the amount of pre-emphasis was standardized at 13.75 decibels (db.) at 10,000 c.p.s., which requires the complementary "roll-off" in the amplifier. For records made after 1954, only the one compensating characteristic, known as the R.I.A.A. curve, is required, but for records made prior to that date a number of compensations must be provided in the amplifier. These compensations, along nith bass and treble tone controls, volume and loudness controls and source selector switches, form the preamplifier section, which may or may not be a separate unit. Tone controls must be arranged to provide boosts and attenuations of approximately 1 j db. at both the bass and treble ends of the sound spectrum, with the reference frequencies usually specified as 50 c.p.s. in the bass and 10,000 c.p.s. in the treble. Loudness controls (sometimes designated "contour") are intended to compensate for reduced sensitivity of the human ear to low tones at volumes lower than the original performance. As the loudness control is turned so as to reduce volume, it reduces middle and high frequencies more rapidly than it reduces lows, giving the effect of increasing bass. Preamplifiers for stereophonic reproduction are equipped with two complete sets of controls, usually arranged so that one knob will control the same function in both amplifiers simultaneously.

The preamplifier may be combined with the basic or power amplifier, which furnishes sufficient electrical energy to drive the loud-speaker to room volume, although separate units for both give greater flexibility in use as well as in physical placement. When each component of a system is a separate unit, improvements in any one do not make the entire system obsolete, since the outdated'unit may be replaced independently of the remainder of the equipment.

Amplifiers for home use should be capable of furnishing at least 10 w. of power to the speaker. Two separate amplifiers are required for stereophonic reproduction, and each should be rated at not less than 10 w. Distortion in high-fidelity amplifiers should not exceed 2% at rated output, and many amplifiers are even better. Certain types of loud-speakers are of low efficiency and consequently require 30 w. of power or more to perform satisfactorily, and it is not unusual for home systems to employ 60-, 70- or 80-w. amplifiers. Because of their greater physical size, it is not usual for these high-power amplifiers to be built on the same chassis with the preamplifiers. Lower-powered amplifiers are usually combined with the preamplifier sections, and in many instances with a radio tuner, making a complete system in one unit. (*See* also AMPLIFIER, ELECTRONIC.)

Loud-speakers and Speaker Systems. — For use in the home, loud-speakers must be housed in cabinets which combine proper acoustic design with aesthetically compatible appearance. By the late 1930s, the dynamic or moving-coil loud-speaker was established as the most efficient form of reproducer, and more powerful magnets and design improvements subsequently brought it to a high degree of performance. The typical high-fidelity loud-speaker is basically a modification of heavy-duty theatre types, and different sizes — each intended for optimum performance over a limited range of frequencies — are often combined into a loud-speaker system. The larger models of direct-radiator cone speakers are generally employed for low frequencies because of the need to move large volumes of air for good performance. Middle frequencies may be reproduced well by eight-inch cones, but some designers prefer small driver units coupled to horns for the intermediate range. Still smaller cones or horn-type loud-speakers are preferred for the very high frequencies. Reasonably uniform sound pressures may be created by such complete systems from as low as 25 or 30 c.p s. up to about 18,000 c p.s.

Electrostatic loud-speakers met with some acceptance, particularly for handling the upper frequency range, and some even were offered as "full-range" models. Most types have exceptionally good tone quality, but for acceptable reproduction down to 50 c.p.s. or below, the electrostatic speaker must be made excessively large, usually with an area of at least 12 sq.ft. Smaller units designed especially for high frequencies were favoured by some listeners, but not universally.

The performance of a loud-speaker depends more upon the enclosure than upon the mechanism itself, and a aide variety of enclosure designs appeared. each with its own claims to superior performance. Since all loud-speakers are presumed to possess the best sound-reproducing characteristics their designers can build into them, and since all do not sound alike by any means, the potential buyer should listen to the products of several reputable manufacturers and then choose the one that sounds best to him. (*See* also LOUD-SPEAKER)

Public-Address Systems. — Sound coverage of large groups of people comprises two classifications: public-address systems, in which the principal requirement is to provide intelligible speech over large areas, usually outdoors; and sound reinforcement systems. which must reproduce both speech and music with sufficient faithfulness that the sound system is unobtrusive. The latter are generally employed indoors, and aim for greatest realism. Equipment differs considerably between the two types, and the acoustic problems are entirely dissimilar.

For large outdoor gatherings. directional horns are usually employed to concentrate the sound over the occupied areas, thus utilizing the available power most efficiently. Since low frequencies contribute little to intelligibility of speech, response is decreased below about 300 c.p.s., and the upper limit is around 5,000 c.p.s. This permits the use of sturdy driver units and horns of reasonable

sizes.

These units, used with directional horns, have high efficiencies—of the order of 40%–50%—and about 2 w. of electrical power will be required for each 1,000 sq.ft. of floor or seating area for a suitable sound level of 20 dynes per square centimetre, uhich is 100 db. above the threshold of audibility. Reflections from adjacent structures, such as buildings, grandstands and high fences, may reduce the required power, but such reflections may result in echoes which decrease rather than increase intelligibility, and their effect must be considered carefully. Amplifiers must be duplicated sufficiently so that failure of any one will not put the entire system out of commission, and output lines should feed the loud-speakers alternately so that partial coverage will be possible even in the event of some equipment failure.

Because of the high powers required, loud-speaker lines should be fed from a 70.7-ohm distribution system to reduce losses in the wiring, rather than at the lower impedances of the speaker units. This also permits ease of adjustment of the power consumed by each speaker to equalize sound distribution over the affected area. Switching of loud-speakers and sound sources and control of volume should be concentrated at one point so that a single operator can control the system.

Sound reinforcement systems for indoor use require less acoustic power because of reflections from walls and ceiling, but since wide-range loud-speakers are less efficient than directional horn units. a minimum of 50 w. should be provided for seating capacities up to 500, with an additional 50 w. being necessary for each additional 500 seats. The entire system must be capable of a wide frequency range for high-fidelity reproduction of music. It is important that the operator be stationed not in a separate control studio but uhere he can hear the sound in the auditorium if he is to maintain levels that are not too loud for realism, yet still adequate to override audience noises.

Theatrical performances are best reinforced by groups of loud-speakers at the sides and above the proscenium, but in many other applications the use of a "low-level" system which employs numerous small speakers at low volume is more satisfactory. Acoustic treatment to avoid undesirable echoes or reflections is likely to be required in most auditoriums, and the use of nonparallel surfaces often simplifies the sound reinforcement problem. See also ACOUSTICS OF BUILDINGS.

(C. G. McP.)

HIGH-FREQUENCY HEATING is that form of industrial heating which derives its energy source from an alternating electric field. The field may be magnetic. as in induction heating. or electric, as in dielectric heating. In both cases, the energy transfer as heat into the material being processed increases with the frequency of the alternating polarity. Therefore, frequencies greater than those normally encountered in electrical energy supplies are generally used. These heating methods are sometimes misleadingly referred to as "r-f" (radio-frequency) heating or "electronic" heating.

Induction heating is applicable to materials that are nominally electrical conductors, usually metals. The required magnetic field is produced by circulating high-frequency current through a work coil, or inductor, that acts as the primary winding of a simple transformer in which the work to be heated may be thought of as a single-turn secondary or susceptor. By shaping the coil properly, the heat can be localized or spread throughout the work as required, and heat distribution patterns can be obtained which are not possible using conventional forms of heating. The work coil may consist of a single turn or of many turns, depending upon the desired heat pattern.

Appreciable heat losses occur in the work coil from the relatively high currents and the high effective resistance due to the increased frequency. Because of these losses, the work coil is generally water-cooled.

Induction heating has a number of salient features. For example, it is possible to localize the heat at the surface of the work, resulting in surface hardening. such as is required for bearings. This phenomenon becomes more pronounced at higher frequencies.

With induction heating it also is practical to localize the heat longitudinally on the work within the confines of the work coil. Many desirable heat-treating and metal-joining applications are made possible by this feature.

No electrical connections are made to the work to accomplish the heating. and the surrounding atmosphere remains cool. Induction heating has no temperature limitations, since the heat energy is generated within the work itself, and as long as the energy input is in excess of the heat losses the work temperature will increase. With proper thermal insulation, extremely high temperatures can be attained, an especially important factor in the metallurgy of the refractory metals. In addition, heat energy can be introduced into the work at extremely rapid rates. many times those possible by conventional means.

Combination of one or more of these features makes induction heating a widely accepted metal-working tool. It is used for metal melting and refining. sintering, surface hardening, annealing, soldering, brazing. welding, and in vacuum furnace operations. In broad terms, induction heating finds application in practically any metal-working process requiring heat. It has been utilized in the processing of nuclear fuels and components, and also has been used in specialized heating applications for materials that are electrically conducting though nonmetallic; ionized solutions, glass at elevated temperature and molten salts are examples.

Three types of frequency conversion equipment are used as energy sources for induction heating. The motor-generator set is the most common. and standard units of this type supply frequencies of 960, 1.920, 3,000 and 9,600 cycles per second (c.p.s.) at power ratings of 7.5 to 1.500 kw. Since the power factor of the work coil is very low, large banks of capacitors are used to bring the load circuit power factor to unity or slightly leading, thus permitting optimum utilization of the generator.

Spark-gap convertors are also used for induction heating, employing both the mercury-vapour gap and the air gap principle. These units are inherently of low output, not exceeding 40 kw., and their frequency is limited to the 40 kc. to 300 kc. range. Vacuum-tube oscillators are employed where the higher frequencies at higher output power ratings are desired, and equipment of this type is available at frequencies of 300 kc. and higher at power outputs of 200 kw. or greater in single units.

The choice of frequency in induction heating depends upon the particular application. In many cases, it is not critical, and any frequency may suffice. The degree to uhich the induced current, and in turn the heat losses. penetrate the work is an inverse function of the frequency. Therefore. for deep-heating applications, such as forging, melting, brazing and through-hardening, the lower frequency range of 1,000 to 10,000 c.p.s. finds application. For case hardening, or any other surface heating application, the higher frequencies of 10,000 to 500,000 c.p.s. are used. Diameter of the work being heated also affects the choice of frequency, since the smaller diameters require higher frequencies for a given rate of energy transfer. As a rule. it can be said that the range of frequencies for induction heating is from 1,000 to 500,000 c.p.s., with very few applications requiring higher frequencies. Large melting installations and low-temperature heating of large masses employ 60-cycle energy for induction heating, and the principles of operation are the same as those which apply to high-frequency induction heating.

The induction heating effect also is dependent upon the magnetic properties of the material being heated. and in general magnetic materials heat more readily than nonmagnetic. However, all magnetic materials lose their magnetic properties at the Curie point (1,330° F. for iron). Since most metallurgical operations on steel require temperatures in excess of this value, the problems of heating must be considered as those of nonmagnetic materials. Since induction heating can be considered as resistance heating, the resistivity of the material directly affects its reaction to the induction-heating field. Hence, good electrical conductors, such as copper, silver and aluminum, heat less readily than poorer conductors such as nickel, iron, steel and the refractory metals.

Dielectric heating is the counterpart in the field of industrial

heating of electrical nonconductors to induction heating in the metal-working field. Materials that are poor electrical conductors because of their molecular behaviour are also poor thermal conductors, and when they are heated by conventional means the transfer of heat through the surface to the inner sections of the mass is difficult and time-consuming. Since a large proportion of these materials are subject to damage at elevated temperatures, the rate of heating conventionally is sloaed considerably by the damage temperature. which cannot be exceeded.

Dielectric heating is achieved by placing the material to be processed in the influence of a high-frequency electric field It is a voltage phenomenon, whereas induction heating is a current phenomenon. but it is also directly affected by the frequency of the alternating field. The electrodes which produce the heating field are. in industrial practice, flat plates separated so that the work can be placed between them. Since one side of the output circuit can be operated at ground potential. the electrode assembly reduces itself to a single high-voltage electrode. suspended on electrical insulators above the grounded platen of the work-handling equipment. Other electrode configurations are employed, such as cylindrical, finger and cuff shapes.

If a mass of material relatively uniform and homogeneous in cross section is placed in a high-frequency electric field, each unit mass of that material absorbs energy. The rate of energy absorption is proportional to (1) the square of the voltage gradient across the unit mass; (2) the frequency of the alternating field; (3) the dielectric constant of the material at the operating frequency and (4) the power factor of the material at the operating frequency. The latter two factors are often combined and their product referred to as the loss factor of the material. Consequently, for maximum heating rate, the frequency and voltage should be as high as can be practically attained. In general, dielectric-heating electrodes are energized at potentials of the order of 5,000 to 15,000 v.. and the frequency ranges from 5 to 50 mc. For many materials. the specific frequency is relatively unimportant, and effective heating can be accomplished anywhere within the above limits. Other materials show radical change in their loss factor at different frequencies, and the frequency for such materials must be chosen to give the maximum loss factor.

Since dielectric heating is a voltage phenomenon, the currents involved in the electrode circuit are relatively small and no water cooling is required. On the other hand, the high voltages encountered impose a severe electrical insulation problem.

Dielectric heating finds application in practically all fields where heat must be introduced uniformly throughout electrically nonconducting materials. Moisture removal is one of its most important functions, since much of the industrial heating done on such materials is for this purpose. Water heats much more rapidly than any other material nhen exposed to the dielectric-heating field, since it has a dielectric constant of 80 over practically the entire frequency range, whereas other materials have dielectric constants from 1.0 to 8.0. Typical examples of dielectric heating as applied to moisture removal are the heating of packages of yarn, the baking of foundry cores and the curing of wood and tobacco. Other curing operations do not involve the removal of moisture but are truly molecular transformations brought about by heat. Thermosetting plastics are typical examples and dielectric heating is used extensively in processing them. The heat may be applied to a thermosetting glue in the woodnorking field, or to plastic for heating prior to molding. Foundry cores. already mentioned as an application for moisture removal, are also an example of plastic processing since a thermosetting binder is used in aqueous solution Other fields of application of dielectric heating include the production of pharmaceuticals, food processing and sterilization.

The great advantage of dielectric heating is speed. For example, foundry cores that previously required 8 to 12 hr. in an oven can be baked in 90 sec., and textile packages which formerly required 72 hr. in heated, circulated air for proper drying can be dried dielectrically in 15 min. The vacuum-tube oscillator provides the high-frequency electrical energy source for dielectric heating, since it is the only type of apparatus which will produce sizable amounts of electrical energy in the high-frequency ranges. Terminal output voltages range from 5,000 v. on small equipment to 15,000 and even 20,000 v. on large units. Power output ratings range from a fraction of a kilowatt to 200 kw. Although the large majority of units operate in the frequency range from 1 to 50 mc., some equipment is built which has an output frequency of the order of 2,500 mc. These units are self-contained equipment of the resonant cavity type, with the oscillator and heating section mounted adjacent to each other in the same cabinet. They have found application in cooking and defrosting foods.

See J. Wesley Cable, *Induction and Dielectric Heating* (1954).

(J. WY. CE.)

HIGHGATE, a district in northern London and Middlesex, England, in the boroughs of St. Pancras, Islington and Hornsey (Middlesex). Area 1.2 sq.mi. Pop. (1951) 14,994. The Great North road passes through Highgate and leaves it at the top of the hill (413 ft.) where a tollgate was erected by the bishop of London in the 14th century. Highgate school was founded by Sir Roger Cholmley in 1565. In the Grove S. T. Coleridge died after living there for 18 years. There too, in Arundel house (now Old hall), Bacon died in 1626. On the other side of the hill lies Waterlow park (26 ac.) containing Lauderdale house, the seat of the duke of Lauderdale, one of the "Cabal" of Charles II. To the west lies Parliament Hill fields (containing Highgate ponds) and Ken wood, (see ST. PANCRAS) and in the north are Highgate woods.

HIGHLAND PARK, a residential city of Lake county, Ill., U.S., 23 mi. N.N.W. of Chicago, situated on a bluff 100 ft. above Lake Michigan. Originally the site of two Potawatomi villages, white settlement began in 1834 with a tavern, Green Bay house, on the Chicago-Milwaukee post road. For a short time it served as a small lake port (Port Clinton), and was named Highland Park by the Chicago and Northwestern railroad in 1854 when it became a station. The town was incorporated in 1867, became a popular wealthy residential and health resort area in the late 19th century, and owes its growth to its proximity to Chicago. It adopted a city-manager form of government in 1955. Ravinia park within the city is one of the oldest outdoor summer music and cultural centres in the United States; the U.S. army's Fort Sheridan adjoins Highland Park on the north. For comparative population figures see table in ILLINOIS: *Population.* (RI. S. H.)

HIGHLAND PARK, a city in Wayne county: Mich., U.S., is a residential and industrial suburb surrounded by the city of Detroit (*q.v.*). The site, originally the English settlement of Nabors, was renamed Whitewood after the American Civil War.

Judge Augustus B. Woodward in 1824, purchased 320 ac. in what is now the centre of the city and laid plans for developing a village which he named Woodwardville. Three years later the Judge died and his property was sold.

In the early 1880s Capt. William Stevens settled in Whitewood, which by 1889 was incorporated as a village. A ridge or highland (at Highland and Woodward avenues) leveled to make way for the electric railway became the namesake of the community. City status was attained in 1918.

Henry Ford purchased the old race track along Woodward avenue and opened his automobile plant Jan. 1, 1910. Three years later he introduced the system of mass production. After the Model T was discontinued in 1927, the Ford assembly operations moved to Dearborn. In 1959 the famous Ford stacks mere torn down to make way for a modernization program, completed the following year. Paints, chemicals. interior trim sets for cars and tractors are manufactured in the Highland Park Ford plant. Another major industrial establishment is the Chrysler corporation plant with its institute of engineering.

The school district of Highland Park, established in 1889, offers an educational program from kindergarten through junior college to all residents. For comparative population figures see table in MICHIGAN: *Population.* (E. C. HA.)

HIGHLAND PARK, an independent town within the city of Dallas. Tex., U.S. was one of the first planned residential towns in the southwestern United States. In 1889 a Philadelphia syndicate acquired the wooded, creekside site north of Dallas for an exclusive residential section, but the panic of 1893 killed the project. In 1906 John S. Armstrong. a retired packer. bought the land. The town was incorporated in 1913. He and his son-in-law, Hugh E. Prather, went to California to see the town of Beverly Hills laid out by a planning expert and brought him to Texas

to design Highland Park. With its sister suburb, University Park (*q.v.*) at its north boundary, Highland Park shares one of the better public school systems of the nation. Of its high school graduates 98% go to college. For comparative population figures *see* table in TEXAS: *Population.* (E. P. CR.)

HIGHLANDS, THE, that part of Scotland northwest of a line drawn from Dumbarton to Stonehaven, sometimes including the Inner and Outer Hebrides and the county of Bute, but excluding the Orkneys and Shetlands, Caithness, the flat coastal land of the shires of Nairn, Elgin and Banff, and all east Aberdeenshire (*see* SCOTLAND). The town of Inverness is usually regarded as the capital of the Highlands.

HIGHMORE, JOSEPH (1692–1780), English portrait painter, was born in London, June 13, 1692. About 1714 he entered Sir Godfrey Kneller's academy where he was influenced, according to George Vertue, by the French painter Louis Cheron. In Highmore's early work, he adapted Kneller's style to a more unvarnished if less masterful rendering. Observation of individual resemblance and a discreet grace are evident in later portraits.

Although Highmore visited France and the Low Countries in 1732 and again in 1734, his style was perhaps affected more by French Rococo artists such as Philippe Mercier and Hubert Gravelot, who were established in London during the 1730s and 1740s. But their influence is traceable less in Highmore's portraits than in his genre illustrations. In 1744 he painted a series of 12 for Richardson's *Pamela,* which suggest comparison with William Hogarth's "Marriage *à la* mode." Highmore is less boisterous, less satirical and more refined, although his juxtaposition of characters is quite vivacious, as in the British museum drawing called "The Enraged Husband." But Highmore's genre belongs to a larger context which includes John Vanderbank's illustrations for *Don Quixote* and Francis Hayman's compositions for Vauxhall. Highmore retired from practice in 1761 and moved to Cambridge in 1762. (F. H. D.)

HIGH PLACE is the usual translation of the Hebrew *bamah,* a word of uncertain etymology, meaning "height." The rendering of "high place" is, however, accurate enough, as appears from the poetical use of the plural, but in prose *bamah* is always a place of worship. It has been surmised that it acquired this meaning because places of worship were originally upon hilltops, or that the *bamah* was an artificial platform or mound, but neither view is historically demonstrable. The word was probably adopted from the Canaanites, along with some of the holy places themselves.

In old Israel every town and village had its own place of sacrifice, often on the hill above the town as at Ramah (I Sam. ix, 12–14). On the *bamah* stood a stone altar on which offerings were burned; and near the altar there was a cistern for water, and perhaps low stone tables for dressing the victims; sometimes also a hall (*lishkah*) for the sacrificial feasts. At times there was also a stele (*massebah*) marking the place as sacred, and a wooden post or pole (*asherah*) which, among the Canaanites, was itself an object of worship. Around these places the religion of the ancient Israelite centred; at festival seasons, or to make or fulfill a vow, he might journey to more famous sanctuaries, but ordinarily the offerings were paid at the *bamah* of his own town. While the *massebah* and *asherah* were condemned from an early date, the use of the banzah was permissible as long as there was no central sanctuary in existence; yet the practice had been of such long-standing that it continued even after the building of Solomon's temple.

The religious reformers of the 8th century assailed the worship at "high places" because of their heathenish associations, though they equally condemned the worship at the temple in Jerusalem when divorced from inner piety and moral conduct. (I. E.)

HIGH POINT, an industrial city of Guilford county, in north central North Carolina. U.S., in the Piedmont region, 18 mi. S.W. of Greensboro, 99 mi. N.W. of Raleigh. The area was originally settled by Quakers about 1750, but the town was not laid out until 1853 when it was so named because it was the highest point between Goldsboro and Charlotte on the state built North Carolina railroad. Incorporated in 1859, it developed from a small trading centre in the 1880s into a modern, sprawling industrial city. Furniture manufacturers, attracted by the abundance of hardwood timber, caused it to become "the Grand Rapids" of the south. The Southern Furniture exposition is held every January and July in a block-size building where national manufacturers bring their new lines for inspection and sale. More recently the hosiery industry outstripped the furniture business in volume. Other manufactures include paint, chemicals and machinery.

High Point college, a Methodist, coeducational institution, chartered in 1920 and opened in 1924, has about 1,000 students, one half of whom are day students.

The city adopted a commission-manager form of government in 1916. The population, which almost trebled between 1900 and 1920, was 62.063 in 1960. (B. P. R.)

HIGH SCHOOL: see SECONDARY EDUCATION.

HIGH SEAS, also known as the open seas, consist of all parts of the mass of salt water surrounding the globe which are not territorial waters and which are accessible by navigable salt-water lanes open to the shipping of all countries. For a period of several hundred years beginning in the middle ages attempts were made by a number of states with varying degrees of success to assert claims of sovereignty over certain areas of the high seas. The importance of free communication and commerce brought realization that such claims were untenable. (P. W. T.)

HIGH-SPEED STEEL, a tungsten-chromium-vanadium tool steel, so called because of its ability to machine metals at speeds many times those possible with carbon tool steels.

It was developed almost simultaneously by European and U.S. metallurgists during the latter years of the 19th century. The research of F. W. Taylor and Maunsel White on proper heat-treating methods led to the full realization of the unusual qualities of these high-alloy steels. The Taylor-White heat treatment, which applies substantially to all high-speed steels, consists of two essential parts: heating the tool to a temperature just below its melting point, usually in the range of 2,200°–2,350° F. (1,204°–1,288° C.), the exact temperature depending upon the type of high-speed steel, and quenching in oil, molten salt or a blast of air; reheating to approximately 1,050° F. (565° C.) and cooling in air. Subsequent research showed that a second reheating (tempering treatment) at 1,050° F. develops the optimum in hardness, resistance to wear and toughness which are essential for good cutting tools. Such a treatment induces the quality of red-hardness in these alloys, whereby the tool retains its useful hardness even when cutting so fast that the tip is heated red-hot by friction with the chip. The presence of numerous small particles of tungsten and vanadium carbides in the steel plays a significant role in attaining these properties. The most important feature of the Taylor-White treatment is the unusually high quenching temperature to which the steel is heated. Ordinarily carbon or low-alloy steels would be seriously damaged by heat treating at such temperatures.

Up to 5% cobalt has been usefully added to high-speed steel to improve its hardness and wear resistance for special machining requirements. Other innovations include an increase in the vanadium content to 2%–3%, which permits higher carbon contents and provides greater wear resistance without decreasing the toughness. A more important innovation consists of replacing half or more of the tungsten with molybdenum, an element analogous chemically, but cheaper and much more readily available. However, the molybdenum-type steels are more prone to suffer a loss of carbon from their surface because of reaction with oxygen of the air at the high heating temperatures, thus decreasing the cutting efficiency of the tools. Coating the tools with borax or copper paint or using neutral molten salt baths for a heating medium successfully combats this problem.

The varieties of high-speed steel can be reduced to the three important classes indicated in the table. Three additional classes are made possible by the addition of cobalt to each of these types.

Approximate Analysis of High-Speed Steel

Metal		High tungsten	Molybdenum	Tungsten-molybdenum
Carbon	per cent	0.50–0.80	0.75	0.80–1.20
Tungsten	per cent	18.0	1.5	5.75
Chromium	per cent	4.0	4.0	4.0
Vanadium	per cent	1.0	1.0	1.0–4.0
Molybdenum	per cent	—	8.5	4.5

HIGH WYCOMBE, a municipal borough in the Wycombe parliamentary division of Buckinghamshire, Eng., 29 mi. N.W. of London by road, on the edge of the Chiltern hills. Pop. (1951) 40,702. Area 11.1 sq.mi. The town stretches for more than 4 mi. along the narrow valley of the Wye stream (the Wye combe of the name) and it also spreads over the steep hills on either side. The valley is one of the main passes of the Chilterns and through it run the railway and the London-Oxford road. High Wycombe has long been noted for furniture, especially Windsor chairs, manufactured from the beeches that grow on the Chiltern hills; to the sheer woodwork have been added ancillary industries in metal, etc., and the manufacture of precision instruments. During World War II a number of clothing factories were opened. There are also paper mills and

printing works. Wycombe appears to have been settled from early times. There are various British remains, including an encampment, and many indications of an important Roman settlement. In Domesday the manor only is mentioned, but the borough existed in the time of Henry II, though it was not chartered until 1558.

All Saints' church replaced in 1273 a church dedicated in 1070 to All Hallows. It was in great part rebuilt in the 16th century. Wycombe abbey, now a public school for girls, is a modern rebuilding. In and around the main street are other interesting buildings, including the 18th-century Market house and guildhall and the Red Lion hotel with its memories of Benjamin Disraeli. Hughenden manor, where Disracli lived and where he was buried, lies on the northern outskirts oi the town. Since 1947 it has been national property—a rebuilt Tudor house in a fine park and a rebuilt church incorporating 14th-century ieatures.

West Wycombe is a beautiful 15th- to 18th-century village lining the main road west of Hish Wycombe. Threatened with destruction. it was bought by the Royal Societv of Arts in 1929 and transferred to the National Trust in 1934.

The Trust also owns West Wycombe park (300 ac. and an 18th-century mansion) and the hill above the village. This is crowned by an extraordinary church and mausoleum erected in 1763 by the eccentric Sir Francis Dashwood, who also built West Wycombe park and founded the so-called "Hell Fire club."

HILARIUS (HILARUS, HILARY). **SAINT** (d. 468). pope from 461 to 468, succeeded Leo **I.** He was of Sardinian origin. As legate to the "robber" synod of Ephesus in 449 he opposed the condemnation of Flavian, patriarch of Constantinople, whose dying appeal to Rome he brought to Leo. His letters as pope show him as a wise and zealous administrator, correcting abuses and solving disputes submitted to him from southern Gaul and Spain His synod of 46 j is the oldest Roman synod of which the acts survive. He died on Feb 29. 468, and his feast day is Feb. 28/9.

See his letters in A Thiel, *Epistolae Romanorum pontificum genuinae,* vol i (1868); *see* also *E.* Caspar, *Geschichte des Papsttums,* vol ii (1933) (ME. BT.)

HILARIUS (fl. A.D. 1125), medieval poet and wandering scholar, was a pupil of Abelard and seems to have been associated with Angers, France. He wrote light verse of great charm in Latin, including a poem addressed to Abelard and several dedicated to English persons—which has led to the otherwise unsupported theory that he was English himself. His fame rests on his three Latin religious plays, two of which. like two of his poems, have French refrains. Those on the raising of Lazarus and on Daniel were written to be performed at matins or vespers. Both follow the biblical narrative fairly closely. In the latter, surprising elaboration of décor is required for a performance within the liturgy. The third play, nhich bears no trace of liturgical performance, is on a non-biblical subject: the legend of the image of St Nicholas. All three plays show variety of metre, great liveliness and dramatic power. The French refrains (lacking in the play on Daniel), nhich are a lyrical addition, not an interpretation of the Latin. give an impression of directness and freshness.

See editions of his norks by J.-J. Champollion-Figeac (1838) and J. B. Fuller (1929). The plays are quoted in full in K. Young, *The Dranza of the Medieval Church,* vol 1 (1933).

HILARY (HILARIUS). **SAINT** (c. 315–367), bishop of Poitiers. his native city. was a champion of orthodoxy who. after the Arianizing councils of Ariminum and Seleucia (j59), resisted almost alone both imperial pressure and the maneuvers or unintelligent subservience of his fellow bishops, and then consolidated the faith of his colleagues in Gaul, thus earning the title of "Athanasius of the west" He was exiled from his see by the emperor Constantius to Phrygia (356–360), where his contact with the Greek mind enabled him to discern the real issues of the Trinitarian controversies. There he wrote De tvinitate, the first work in Latin to deal with them comprehensively. In De *synodis seu* de *fide orientalium* he explained the history of the controversy to his Gallic colleagues, and convincingly showed the easterns that those who held the Son to be like the Father in substance and those who held him to be consubstantial should rally against those who called him unlike the Father. His appeals to the emperor were in vain, and he was turned out of the east as a trouble maker. Returning to Poitiers he spent his last years in confirming the faith in Gaul and in writing his commentary on the Psalms and *Tractatus mysteriorum* on typology. In these too he served as channel for Greek thought to the west, writing in a very personal style, which is difficult but free from ambiguity or uncertainty of thought. Besides minor works he also wrote hymns and (before his exile) a commentary on St. Matthew. His feast day is Jan. 14. He was declared a doctor of the church in 1851.

Migne, *Patrologia Latina,* vol. ix–x (1844–45); *Tractatus super Psalmos* ed. by *A.* Zingerle in *Corpus scriptorum ecclesiasticorum Latinorum,* vol. xxii (1891); *Tractatus mysteriorum* and minor works ed. by A. Feder in the same series, vol. lxv (1916); *Tractatus mysteriorum,* ed. by *J.* P. Brisson with French trans., in the *Sources chrétiennes* series (1947); Eng. trans. of *De trinitate* and *De synodis* by *E.* W. Watson in *Nicene and Post-Nicene Fathers,* vol. ix (1899). *See* also P. Smulders, S.J., *La Doctrine trinitaire de S. Hilaire de Poitiers* (1944). (ME. BT.)

HILARY (HILARIUS), **SAINT** (c. 400–449), bishop of Arles, is often regarded as having provided the occasion for an extension of papal authority in Gaul. Born probably in northern Gaul, in early youth he entered the abbey of Lérins, presided over by his kinsman Honoratus, who became bishop of Arles in 426. In 429 Hilary succeeded him and vigorously promoted reforms through several local councils. But his zeal led him to interfere with provinces outside his metropolitan jurisdiction and to overstep even the personal privileges bestowed on Patroclus, one of his predecessors, by Pope Zosimus in 417. He deposed Chelidonius, bishop of Besançon, and replaced another bishop (Projectus) regardless of canonical procedure. An appeal was made to Rome (444), and Pope Leo I quashed Hilary's irregular appointments, but while depriving him of all metropolitan rights he did not remove him from his see. These measures, to which Hilary submitted, were endorsed by an imperial decree of Valentinian III reinforcing Gratian's recognition of papal authority in 378. Besides minor works, Hilary wrote a memorial sermon on St. Honoratus. His feast day is bfay 5.

HILBERSEIMER, LUDWIG (188 j–), German-American city planner, was born at Karlsruhe, Ger., on Sept. 14, 1885. In Germany he devoted as much time to architecture as to planning and in 1930 founded the department of city planning at the Bauhaus. Dessau. An original and logical thinker, his first project for a new city was, to some extent, two cities on top of one another, dwelling houses for workers being vertically above the offices and workshops. Later he developed a linear form of city with housing and industrial units related horizontally.

In 1938 Hilberseimer came to the United States as professor of city planning at the Illinois Institute of Technology, Chicago, and there demonstrated further the implications of the decentralization of cities with a plan for Chicago and in regional planning studies showing the possibilities for integrating agriculture, industry and transportation.

His writings include *The New City* (1944); *The New Regional Pattern* (1952); *The Nature of Cities* (1956). (R. F. MN.)

HILBERT, DAVID (1862–1943), German mathematician who exerted a great influence on modern mathematics. He was born on Jan. 23, 1862, in Konigsberg, where he studied under H. Weber and F. Lindemann. receiving his Ph.D. in 1885. During this period began the close personal and scientific ties with H. Minkowski and A. Hurwitz that had a lasting effect on his mathematical interests. He taught in Konigsberg as *Privatdozent* (1886–92) and professor (1893) until he became professor at Gottingen (1895), a post he held to his retirement in 1930. He died in Göttingen on Feb. 14, 1943.

Hilbert became a member of the academy at Gottingen in 1895, editor of the *Mathematische Annalen* in 1902, and later received many honours. His lectures were rich in ideas and stimulated his students who came from all parts of the world.

His main achievements, all of great importance, included work on the theory of algebraic invariants (1885–92); the theory of algebraic numbers (1893–99); the foundations of geometry, initiating his work in axiomatics (1898–99); a new approach to Dirichlet's problem and other contributions to the calculus of variations (1900–05); integral equations and the theory of infinitely many variables including spectral theory and the concept of

Hilbert space (1901–12). Then followed his work in mathematical physics with contributions in such fields as the kinetic theory of gases, the theory of relativity, etc., and, finally, his critical studies on the foundations of mathematical logic.

He helped establish many modern trends with his famous "mathematical problems" formulated at the International Mathematical congress in Paris (1900). Noteworthy among his extensive accomplishments is his proof, in 1909, of the famous conjecture of E. Waring (1782) on the representation of integers as sums of powers.

Hilbert's work, and in particular his collaboration with H. Minkowski and F. Klein, was most fruitful and led to a new vigour within the field of mathematics in Gottingen and all over Germany, interrupted only by the unhappy political developments of the 1930s. *See* also MATHEMATICS, HISTORY OF: *19th* and *20th Centuries*.

See the collection of his papers, 3 vol., with a warm and accurate biography by O. Blumenthal, one of his first pupils, *Gesammelte Abhandlungen* (1933–35). (*G*. So.)

HILDA, ST., strictly HILD (614–680), was the daughter of Hereric, a nephew of Edwin, king of Northumbria. She was converted to Christianity before 633 by Paulinus. About 650 she became abbess of Hartlepool, where she remained several years. From Hartlepool Hilda moved to Whitby, and in 657 founded the famous double monastery which in her time included among its members five future bishops, Bosa, Aetta, Oftfor, John and Wilfrid II, as well as the poet Caedmon. Hilda exercised great influence in Northumbria, and ecclesiastics from all over England and from Strathclyde and Dalriada visited her monastery. In 6j5 after the battle of Winwaed, Oswio, king of Northumbria, entrusted his daughter Aelfled to Hilda, with whom she went to Whitby. At the synod of Whitby in 664 Hilda sided with Colman and Cedd against Wilfrid, and in spite of the defeat of the Celtic party, remained hostile to Wilfrid until about 679. Hilda died in 680.

See Bede, *Hist. eccl.,* ed. by *C*. Plummer (1869) ; Eddius, *Vita Wilfridi* in Raine's *Historians of Church of York,* Rolls series, vol. i, c. liv. (1879).

HILDEBRAND, ADOLF VON (1847–1921), German sculptor, who was a powerful exponent of classical Greek principles in modern sculpture, was born in Marburg on Oct. 6, 1847. He studied in Nurnberg, Munich, Berlin and Rome, and in 1874 settled in the neighbourhood of Florence. In 1897 he built himself a house in Munich, where he died on Jan. 1, 1921.

Hildebrand's work combined lifelike realism with classic conception of form. He modeled many portrait busts, among which may be mentioned those of Clara Schumann, Hermann von Helmholtz, Max von Pettenkofer, Wilhelm von Bode and Henriette Hertz. For the market place in Jena he designed the Bismarck fountain (1894); for Munich the Wittelsbach fountain (1895) and the Hubertus fountain (1907); for Strasbourg a fountain with the bronze figure of Father Rhine (1903), the architectural part of which was destroyed in 1919 and the figure placed in a park; for Meiningen a monument of Brahms (1898) and one of the poet Otto Ludwig (1898); for Bremen a monument of Bismarck (1910); and for Nurnberg a monument of Schiller (1911). His small book entitled *Das Problem der Form* (1893), in which he analyzed the optical laws underlying the artistic representation of form, exercised a revolutionary influence on art criticism. It was widely read, and many theorists in art founded their writings on it.

HILDEGARD, SAINT (1098–1179), German abbess and mystic, called the "Sibyl of the Rhine," was born of noble parents at Bockelheim, near Spanheim, and was educated at the Benedictine cloister of Disibodenberg by Jutta, sister of the count of Spanheim, whom she succeeded as prioress in 1136. From childhood she experienced visions, and in her 43rd year she consulted her confessor, who in turn consulted the abbot and the archbishop of Mainz, who gave a favourable verdict. He appointed a monk, Volmar, to aid in preparing a manuscript record of Hildegard's visions, and the principal writing, *Scivias,* was taken down in the years 1141–50. This consists of 26 visions, prophetic, apocalyptic, symbolic in form. About 1147 she went with 18 of her nuns to a new convent on the Rupertsberg near Bingen, where she continued to exercise the gift of prophecy and to record her visions in writing. She died on Sept. 17, 1179, and though she has never been canonized, her name is in the Roman martyrology. Her feast day, Sept. 17, is observed in a number of German dioceses.

In addition to the *Scivias* there is an extensive correspondence, in which are to be found further prophecies and allegorical treatises. Those addressed range from popes and emperors to simple nuns and laymen. There are also two treatises dealing with medicine and science, reflecting a quality of scientific observation rare at that period.

See *Butler's Lives of the Saints,* ed. *by* H. Thurston, S.J., and D. Attwater (1956). (Fs. P. C.)

HILDEN, a town in North Rhine-Westphalia on the Itter, 9 mi. S.E. of Dusseldorf by rail. Pop. (1950) 27,304. Its manufactures include silks, calico-printing, tanning, machinery and brickmaking.

HILDESHEIM, a town and episcopal see in Lower Saxony, Germany, at the north foot of the Harz mountains, on the right bank of the Innerste, 18 mi. S.E. of Hanover by railway, and on the main line from Berlin, via Magdeburg, to Cologne. Pop. (1950) 72,292.

Hildesheim owes its rise and prosperity to the fact that in 822 it was made the seat of the bishopric which Charlemagne had founded at Elze a few years before. St. Bernward, bishop from 993 to 1022, walled the town, and stimulated the art of working in metals. In the 13th century Hildesheim became a free city of the empire; in 1249 it received municipal rights and about the same time it joined the Hanseatic league. Its bishops gradually became practically independent, and carried on wars with neighbouring princes, especially with the house of Brunswick-Liineburg, under' whose protection Hildesheim placed itself several times. The extent of their lands depended on the fortune of war, but at the beginning of the 19th century the extent of the prince bishopric was 682 sq.mi. In 1801 the bishopric was secularized and in 1813 it was transferred to Hanover. In 1866, along with Hanover, it was annexed by Prussia. In 1803 a new bishopric of Hildesheim, a spiritual organization only, was established, and this had jurisdiction over all the Roman Catholic churches in the centre of north Germany.

The town consists of an old and a new part, and is surrounded by ramparts. Its streets contain many old houses with overhanging upper stories and adorned wooden facades. The Roman Catholic cathedral (mid-11th century) occupies the site of a building of the early 9th century. The Romanesque church of St. Godehard was built in the 12th century and restored in the 19th. The church of St. Michael, founded by Bishop Bernward early in the 11th century and restored after damage by fire in 1186, contains a unique painted ceiling of the 12th century, the sarcophagus and monument of Bishop Bernward and a bronze font; it is now a Protestant parish church, but the crypt is used by the Roman Catholics. The church of the Magdalene possesses two candelabra, a gold cross and various other works in metal by Bishop Bernward; and the Lutheran church of St. Andrew has a choir dating from 1389. In the suburb of Moritzberg there is an abbey church founded in 1040, the only pure columnar basilica in north Germany.

The chief secular buildings are the town hall (Rathaus), which dates from the 1 jth century and was restored in 1883–92, adorned with frescoes illustrating the history of the city; the Tempelherrenhaus, in Late Gothic, erroneously said to have been built by the Knights Templars; the Knochenhaueramthaus, formerly the guildhouse of the butchers, restored after a fire in 1884 and probably the finest specimen of a wooden building in Germany; the Michaelis monastery, used as a lunatic asylum; and the old Carthusian monastery. The buildings of Trinity hospital, partly dating from the 14th century, became a factory; and the Wedekindhaus (1598) became a savings bank. Hildesheim is the seat of considerable industry. Its chief productions are sugar, tobacco and cigars, stoves, machines, vehicles, rubber and gutta percha, paper. oil, agricultural implements and bricks. Other trades are brewing and tanning.

HILFERDING, RUDOLF (1877–1941), German statesman, was born on Aug. 10, 1877, at Vienna. He took his degree in

medicine in Vienna university. In 1907 he joined the staff of *Vorwarts* in Berlin as political director, and became one of the most important publicists of the Social Democratic party. Opposing his party's majority decision to vote war credits in 1914, after the outbreak of World War I, he conducted pacifist propaganda and joined the group that formed the Independent Social Democratic party in 1917. At the end of the war he acquired German (instead of Austrian) citizenship and was editor of *Freiheit* (1918–22), the organ of the Independents. He resisted Communism, however, and when the left wing of the Independents split off as "New Communists," he led the other to reunion with the Majority Socialists (1922). He was one of the German experts at the Genoa conference (April–May **1922**) and from August to October 1923 finance minister in the Stresemann cabinet. In **1928** he was given the same portfolio in the Mueller cabinet. He fled to France in 1933 when Hitler became chancellor and was arrested by German military police during the invasion of France in 1940. Berlin dispatches of Sept. **17,** 1941, reported that he had committed suicide in his prison cell. Hilferding's principal work was *Das Finanzkapital* (1910, 2nd ed. 1920).

HILL, AARON (1685–1750), English miscellaneous writer, whose adaptations of Voltaire's plays *Zaïre (Zara)* **(1736)** and *Mérope* (1749) enjoyed considerable success, was born in London on Feb. 10, **1685.** On leaving Westminster school he traveled in the near east, and published *A Full Account of the Present State of the Ottoman Empire* (1709). He was an optimistic speculator and, though kindly, bored his friends and irritated them with gratuitous advice. He married an heiress, produced Handel's *Rinaldo* at the Haymarket theatre (having himself translated the Italian libretto) and engaged in various ambitious commercial ventures, all without success. Peter the Great acknowledged his poem *The Northern Star* **(1718)** by ordering a gold medal for him which, however, never arrived. In 1730 he wrote *The Progress of Wit* as a retort to Pope who had satirized him in *The Dunciad.* He also published periodical essays, and his letters to Pope and others were published in 1751. Hill died in London on Feb. **8,** 1750, and was buried in Westminster abbey.

See H. Ludwig, *The Life and Works of Aaron Hill* (1911); *D.* **Brewster,** *Aaron Hill, Poet, Dramatist, Projector* (1913).

HILL, AMBROSE POWELL (1825–1865), American Confederate soldier, was born in Culpeper county, Va., on Nov. **9, 1825.** and graduated at West Point in **1847,** being appointed to the 1st U.S. artillery. He served in the Mexican and Seminole Wars, was promoted first lieutenant in Sept. **1851,** and in 1855–**1860** was employed on the U.S. coast survey. In March **1861.** just before the outbreak of the Civil War, he resigned his commission. and when his State seceded he was made colonel of a Virginian infantry regiment, winning promotion to the rank of brigadier general on the field of Bull Run. In the Peninsular campaign of **1862** he gained further promotion. and as a major general was one of the most prominent and successful divisional commanders of Lee's army in the Seven Days', Second Bull Run, Antietam and Fredericksburg campaigns. His division formed part of "Stonewall" Jackson's corps. and he was severely wounded in the flank attack of Chancellorsville in May **1863.** After Jackson's death Hill was made a lieutenant general and placed in command of a corps of Lee's army, which he led in the Gettysburg campaign of **1863,** the autumn campaign of the same year and the Wilderness and Petersburg operations of 1864–65. He was killed in front of the Petersburg lines on April 2, 1865. His reputation as a troop leader in battle was one of the highest among the generals of both sides.

HILL, ARCHIBALD VIVIAN (1886-), British physiologist, was awarded the **1922** Nobel prize for medicine and physiology jointly with Otto Meyerhof "for his discovery relating to the production of heat in muscles." Born at Bristol on Sept. **26, 1886,** he was educated at Blundell's school and at Trinity college, Cambridge, where he distinguished himself as a mathematician, being third wrangler in 1907 and a fellow of his college from 1910 to **1916.** He became a physiologist at the suggestion of Sir Walter Fletcher. one of his teachers. and his researches on the physiology of muscular activity were undertaken at the suggestion of J. N. Langley. After study in Germany in 1910–11, he continued to work at Cambridge until the outbreak of World War I, in which he served from 1914 to 1919. In **1920** he was appointed Brackenbury professor of physiology at Manchester university, and from 1923 to 1925 he was Jodrell professor of physiology at University college. London. Hill was elected fellow of the Royal society in **1918** and he was the society's Foulerton research professor (1926–51), secretary (1935–45), foreign secretary (1945-46) and Copley medalist **(1948).** As an Independent Conservative he represented Cambridge university in parliament from 1940 to 1945. During World War II he served on many commissions and committees concerned with defense problems and with scientific research. He was awarded the Order of the British Empire in **1918** and was made a Companion of Honour in **1946.**

In addition to his work on muscular activity, Hill studied heat production in nerves following their stimulation. These researches involved the use of apparatus capable of measuring rises of temperature of not more than 0.003° C. during only a few hundredths of a second. Hill's principal researches are summarized in his books *Muscular Activity* (1926), and *Muscular Movement in Man* (1927). (W. J. Bp.)

HILL, DANIEL HARVEY (1821–1889), U.S. Confederate soldier, was born in York district. South Carolina. July **12. 1821.** He graduated at the United States military academy in **1842** and became a major in the Mexican War. From **1849** until the outbreak of the Civil War he was professor of mathematics at Washington college (Washington and Lee university), at Davidson college, North Carolina. and superintendent of the North Carolina military institute. As colonel of a Confederate infantry regiment he won the action of Big Bethel. June 10, **1561.** As major general he led a division with great distinction in the battle of Fair Oaks and the Seven Days. in the second Bull Run campaign. In the Antietam campaign the resistance of his division enabled Lee to concentrate for battle. It was conspicuous in the battles of the Antietam and Fredericksburg. In **1863** he commanded one of Bragg's corps in the victory of Chickamauga. In 1866–69 he edited *The Land We Love,* at Charlotte (N.C.). He became president of the University of Arkansas in 1877 and in 1885 of the Military and Agricultural College of Georgia. He died at Charlotte on Sept. **24, 1889.**

HILL, DAVID JAYNE (1850–1932), U.S. diplomat, was born at Plainfield, N.J., on June 10, 1850. After graduating in **1874** from the Cniversity of Lewisburg, Pa.—later known as Bucknell university—he became instructor in Greek and Latin there and from **1877** professor of rhetoric. In **1879** he was elected president of Bucknell, and in **1888** of the University of Rochester. In **1896** he resigned and went abroad to study public law. In 1898 he was appointed assistant secretary of state by President McKinley. While in Washington he was also professor of European diplomacy in the school of comparative jurisprudence and diplomacy. In 1903 he was appointed minister to Switzerland and in 1905 was transferred to Holland. He was a delegate to the Second Peace conference at The Hague in 1907. From 1908–11 he was ambassador to Germany.

Hill's best-known work is his *History of Diplomacy in the International Development of Europe,* embracing *The Struggle for Universal Empire* (1905), *The Establishment of Territorial Sovereignty* **(1906)** and *The Diplomacy of the Age of Absolutism* (1914).

HILL, GEORGE BIRKBECK NORMAN (1835–1903), English author. editor of Boswell and commentator on Samuel Johnson, was born at Tottenham. Middlesex. the son of Arthur Hill. head master of Bruce Castle school. He was educated in his father's school and at Pembroke college. Oxford. In 1858 he began to teach at Bruce Castle school and from **1868** to **1877** was head master. In **1869** he became a regular contributor to the *Saturday Review.* He settled at Oxford in 1887, but from **1891** onwards his winters were usually spent abroad He died at Hampstead. London, on Feb 27, 1903. His works include: *Dr. Johnson, his Friends and his Critics* **(1878);** an edition of Boswell's *Correspondence* **(1879);** a laborious edition of *Boswell's Life of Johnson, including Boswell's Journal of a Tour to the Hebrides, and Johnson's Diary of a Journey into North Wales* **(6** vols , 1887);

Wit and Wisdom of Samuel Johnson (1888); *Select Essays of Dr. Johnson* (1889); *Footsteps of Dr. Johnson in Scotland* (1890); *Letters of Johnson* (1892); *Johnsonian Miscellanies* (2 vol., 1897); an edition (1900) of Edward Gibbon's *Autobiography;* Johnson's *Lives of the Poets* (3 vol., 1905); and other works on the 18th-century topics. Dr. Birkbeck Hill's elaborate edition of Boswell's *Life* is a monumental work, invaluable to the student.

HILL, JAMES JEROME (1838–1916), U.S. capitalist and one of the great U.S. railroad magnates, was born near Guelph, Ont., Can., Sept. 16, 1838. After settling in St. Paul, Minn.. about 1870 he established transportation lines on the Mississippi and Red rivers and effected a traffic arrangement with the St. Paul and Pacific railroad. When the railway failed in 1873 Hill interested Canadian capitalists in the road, reorganized it as the St. Paul, Minneapolis and Manitoba Railway Co., and in 1882 became its president, becoming president of the Great Northern railway, which absorbed the St. Paul line in 1890 (1893–1907), and board chairman (1907–1912). The Hill interests obtained control of the Northern Pacific and the Chicago, Burlington and Quincy railroads. Hill was president of the Northern Securities Co., which in 1904 mas declared to be in conflict with the Sherman Anti-Trust law. In 1912, he secured control of and merged the First and Second National banks of St. Paul. He wrote *Highways of Progress* (1910).

Hill died in St. Paul, Minn., May 29, 1916. (W. H. D.)

HILL, JOHN (*c.* 1716–1775), English miscellaneous writer and botanist who compiled from his wide firsthand knowledge the earliest British flora to use Linnaean nomenclature. Born, possibly in Peterborough, about 1716, he opened an apothecary's shop in Westminster. He studied botany and was employed by the Duke of Richmond and Lord Petre to arrange their botanical specimens, traveling all over the country to collect rare plants for them. A versatile man, of pugnacious temperament and extravagant tastes, he attempted to make money in a variety of ways: writing plays, novels and treatises on acting, natural history, medicine, astronomy and geology; editing the monthly *British Magazine* (1746–50) and contributing a daily letter of society gossip to the *London Advertiser and Literary Gazette* (1751–53); selling herbal medicines and practising medicine, in which he had a diploma from St. Andrews. He was involved in many literary quarrels: his scurrilous attack on Christopher Smart provoked Smart's mock epic, *The Hilliad* (1752), and his failure to persuade John Rich and David Garrick to produce his plays led to fierce denunciation of them, and to Garrick's epigram.

> For physic and farces, his equal there scarce is,
> His farces are physic, his physic a farce is.

Hill's most lasting work was as a botanist. Although critical of Linnaeus' work on classification, he accepted and used his system of binomial nomenclature and thus made it more widely known. In 1756 he published a *British Herbal* and between 1759 and 1775, under the patronage of Lord Bute, produced *The Vegetable System,* in 26 folio volumes with 1,600 copperplate engravings of 26,000 plants. For this, his most important work, he received the order of Vasa from the king of Sweden and thereafter called himself "Sir" John Hill. He died on Nov. 21. 1775, in London.

HILL, MATTHEW DAVENPORT (1792–1872), English lawyer and penologist and the originator of the *Penny Magazine,* was born on Aug. 6, 1792, at Birmingham. He was a brother of Sir Rowland Hill. In 1819 he was called to the bar by Lincoln's inn. In 1832 he was elected one of the Liberal members for Hull, but he lost his seat at the next election in 1835. He took silk in 1834, and was recorder of Birmingham from its incorporation in 1839 until 1865. He was also commissioner in bankruptcy for the Bristol district from 1851 until 1869. In his charges to the grand juries, as well as in special pamphlets, he advocated many important reforms in the methods of dealing with crime. He was supported by his brother Frederic Hill (1803–96), whose *Crime: its Amount, Causes, and Remedies,* the result of his experience as inspector of prisons for Scotland, marked an era in the methods of prison discipline. Hill mas a promoter of the Society for the Diffusion of Useful Knowledge. He died at Stapleton, near Bristol, on June 7, 1872.

His principal works are *Practical Suggestions to the Founders of Reformatory Schools* (1855); *Suggestions for the Repression of Crinze* (1857), consisting of charges addressed to the grand juries of Birmingham; *Mettray* (1855); *Papers on the Penal Servitude Acts* (1864); *Journal of a Third Visit to the Convict Gaols, Refuges and Reformatories of Dublin* (1865). See *The Recorder of Birmingham: Memoir of M. D. H.* by his daughters R. and F. Hill (1878).

HILL, OCTAVIA (1838–1912), English housing reformer, whose work led to the founding of the Society of Women Housing Managers in England and of similar societies in Europe and in the United States, was also a pioneer of the open space movement, one of the principal founders of the National Trust and organizer of the first cadet corps for lads. Eighth daughter of James Hill, a merchant and banker, and maternal granddaughter of Thomas Southwood Smith (1788–1861), pioneer of sanitary reform, she was born at Wisbech, Cambridgeshire, on Dec. 3, 1838. John Ruskin greatly influenced her. He offered to teach her drawing, and out of her visits to his home grew the first of her housing projects in a slum court in Marylebone, London (1864). Ruskin lent the money; Octavia managed the property. The novelty of her system was the substitution of a personal visitor for a slum rent collector; its success depended on the property's paying its way. The experiment succeeded and the scope of her work spread widely. In 1884 she was entrusted by the Ecclesiastical Commissioners with the management of their property in Southwark, London; she trained other women managers and her work became known abroad.

Knowledge of the life of the town poor led her to a crusade for open spaces, which resulted in the foundation of the National Trust (1895). and the preservation of such open spaces as Parliament hill in London. She died in London on Aug. 13, 1912.

Biog.; E.* Moberley Bell, *Octavia Hill: a Biography* (1942); William Thomson Hill, *Octavia Hill, Pioneer of the National Trust and Housing Reformer* (1956). (W. T. H.)

HILL, ROWLAND (1744–1833), English preacher, sixth son of Sir Rowland Hill, Bart. (d. 1783), was born at Hawkstone, Shropshire, on Aug. 23, 1744. He was educated at Shrewsbury, Eton and St. John's college, Cambridge. Having inherited considerable property, he built for his own use Surrey chapel, in the Blackfriars road, London (1783). Hill conducted his services in accordance with the forms of the Church of England, in whose communion he always remained. Both at Surrey chapel and in his provincial "gospel tours" he had great success. He possessed a voice of great power, and according to Southey "his manner" was "that of a performer as great in his own line as Kean or Kemble." He helped to found the Religious Tract society, the British and Foreign Bible society and the London Missionary society, and was a stout advocate of vaccination. His best-known work is the *Village Dialogues,* which first appeared in 1810. He died on April 11, 1833.

HILL, SIR ROWLAND (1795–1879), English administrator and educator, originator of the penny postage system, was principally known for his development of the modem postal service subsequently adopted throughout the world *(see* POSTAL SERVICES: *Great Britain: History).* Born Dec. 3, 1795, at Kidderminster, the son of an English schoolmaster, he early turned his attention to problems of teaching, developing the Hazelwood system of instruction with emphasis on student democracy, rigid self-discipline and intensive teaching methods. Hill possessed wide-ranging interests, exploring the fields of printing, astronomy, mathematics and transportation. An analysis of taxation led him to the conclusion that those levies mere best the productiveness of which kept pace with the growing prosperity of the nation. The postal revenues of his time were, he felt, an example of the failure to meet that requirement. His proposals for reform were based on the following: a lower rate would increase the revenues of the state by increasing the volume of mail: all postage rates should be the same without regard to distance; and all mail should be prepaid. In connection nith the last principle he suggested a device which subsequently became known as a postage stamp. He managed to put his program into effect in 1840 in spite of the opposition of an

entrenched bureaucracy.

He died at Hampstead on Aug. 27, 1879, and was buried in Westminster abbey.

See G. **Birkbeck Hill,** *Life of Sir Rowland Hill* (1880). (L. N.)

HILL, ROWLAND HILL, 1ST VISCOUNT (1772–1842), British general, one of the best of the duke of Wellington's officers, was born on Aug. 11, 1772, the second son of Sir John Hill. of Hawkstone. Shropshire. Entering the army in 1790, he took a course at Strasbourg military school, did well at Toulon (1793) and was secured by Thomas Graham (his future colleague in Spain, later Baron Lynedoch) as major of the 90th foot. Wounded in the first fight in Egypt (1801), he was promoted brigadier in 1803 and won credit in Ireland. A brigade command in Portugal (1808) brought him to Vimieiro, Corunna and Oporto; he led a division at Talavera. In 1810 Hill covered the southern flank with a corps and stood out as Wellington's ablest general, entirely trustworthy in a wing command and respected by his men. His absence on sick leave in 1811 was deeply felt at La Albuera; he came back a week later and faced J. B. Drouet d'Erlon in Estremadura; in October a well-calculated march and surprise broke J. B. Girard's division near Arroyomolinos de Montánchez. He was along the Tagus during the siege of Badajoz and led Wellington's right wing with prudence, enterprise and success for the rest of the war. He stormed the works of Almaraz at the Tagus bridge May 19, 1812, advanced to Madrid after Salamanca, was the pivot at Vitoria, invested Pamplona, drove Drouet d'Erlon from the Pyrenees, broke the lines on the Nive river and, at Bayonne on Dec. 13, 1813, defeated Marshal Soult before Wellington could join him. Orthez and Toulouse added to his renown. (See PENINSULAR WAR.)

Knight of the Bath and member of parliament for Shrewsbury in 1812, he was created Baron Hill of Almaraz and Hawkstone Salop, May 17, 1814. In 1815 he commanded one of Wellington's two corps. On the right at Waterloo he led the charge of Sir Frederick Adam's brigade against the imperial guard; his horse was shot down and for a time he was lost in the confusion. When Wellington became prime minister in 1828, Hill replaced him as general commander in chief.

Hill resigned in 1842 and was created a viscount, but died on Dec. 10, 1842.

See E. Sidney, *Life of Lord Hill, G.C.B.* (1845). (I. D. E.)

HILLAH, a town in Iraq, about 60 mi. S. of Baghdad, in 32° 28' N. and 44° 48' E. It lies on the Hillah branch of the Euphrates, 11 mi. below the fork at Hindieh. Population (1957) 54,005, mostly Shicah Arabs, but including a number of Jews. The town lies on the Baghdad-Basra railway line, and on the land routds along the river. There is also a certain amount of river traffic. There is a telegraph and post office and a small garrison. Saddlery and similar industries are carried on in the town but the principal trade is in grain—wheat, barley and rice—and there are a large number of grain stores. The two halves of the town are connected by a bridge of boats. Along the river there are flourishing palm groves although these have been threatened by periodic bursting of the Hindieh barrage and the drying up of the channel.

The country around Hillah, which is essentially agricultural, improved in production after renovation of the ancient canals. To the north lie the ruins of Babylon, which have been looted to build the town, while 14 mi. E. is Tell Oheimer, the ancient Rish. The bazaars of Hillah are large.

HILLARY, SIR EDMUND PERCIVAL (1919–), New Zealand mountaineer and explorer, was the first man, with Tenzing Norgay, to reach the summit of Everest (29.028 ft.). He was also the first man after Captain R. F. Scott to reach the south pole overland. Born on July 20, 1919, at Auckland, and by profession an apiarist, Hillary started climbing in the New Zealand Alps. In 1951 he joined a New Zealand party to the central Himalaya, and went on to take part in Eric Shipton's successful reconnaissance of a route up the southern flank of Everest. During the British Everest expedition of 1953 his outstanding qualities were persistence and boundless energy, as well as great strength on ice. He and Tenzing Norgay formed the second summit pair, and on May 29, from a tent at 27,900 ft., reached the summit at 11:30 a m. This and his earlier journeys he described in *High Adventure* (1955).

He was appointed leader of the New Zealand section of the British Commonwealth Transantarctic expedition. With the "Theron" party he reconnoitred the Weddell sea base (Nov. 1955–March 1956). During the main crossing by Vivian (later Sir Vivian) Fuchs's party (Nov. 1957–March 1958), his job was to support from the Ross sea and establish Depot 700. He reached the pole himself in a Weasel tractor on Jan. 4, 1958, and was flown out from the American South Pole station. (C. W. F. N.)

HILLEBRAND, KARL (1829–1884), German author, born at Giessen on Sept 17, 1829, was a student at Heidelberg when he was caught in the revolutionary movement in Baden and had to leave Germany. He was for some months secretary to Heine in Paris. and finally settled in Florence, where he died on Oct. 19, 1884. He wrote in English and French, as well as German, and was a good cosmopolitan critic of European literature. His best known work is *Zeiten, Völker und Menschen* (7 vol., 1874–85), being collections of essays on different subjects.

See H **Homberger,** *Karl Hillebrand* (1884).

HILLEGOM, a toun of the Netherlands, 5 mi. S. of Haarlem. Pop. (1957 est.) 14,362 (mun.). It is the centre of the bulb-growing activities in Holland.

HILLEL (c. 70 B.C.–*c.* AD. 10), Jewish rabbi, was of Babylonian origin and descended from the family of David. When about 40, he went to study at Jerusalem. There he became numbered among the leaders of the Pharisaic scribes, and tradition assigns him the highest dignity of the Sanhedrin, under the title of nasi ("prince"), about 30 B.C. Hillel is said to have laid down seven rules for the interpretation of the scriptures, which became the foundation of rabbinical hermeneutics. He founded a more lenient school in opposition to that of his colleague Shammai (*q.v.*), and introduced the well-known institution of the Prosbol, which was intended to avert the evil consequences of the scriptural law of release in the seventh year (see Deut. xv, I).

Hillel lived in the memory of posterity as the great teacher who enjoined and practised the virtues of charity, humility, patience and true piety.

Of the sayings ascribed to him, many of which bear a remarkable resemblance to the teaching of Jesus, the following are typical: "My abasement is my exaltation"; "What is unpleasant to thyself that do not to thy neighbour; this is the whole Law. all else is but its exposition"; "If I am not for myself, nho is for me? And if I am for myself alone, what then am I? And if not now, then when?" "Separate not thyself from the congregation"; "Judge not thy neighbour until thou art in his place"; "He who wishes to make a name for himself loses his name; he who does not increase [his knowledge] decreases it; he who does not learn is worthy of death; he who works for the sake of a crown is lost"; "He who has acquired the words of doctrine has acquired the life of the world to come."

It is noteworthy that no miraculous legends are connected with Hillel's life. A scholastic tradition, however, tells of a voice from heaven which made itself heard when the wise men had assembled in Jericho, saying: "Among those here present is one who would have deserved the Holy Spirit to rest upon him, if his time had been worthy of it." And all eyes turned toward Hillel. He was lamented after his death as "the humble, the pious, the disciple of Ezra."

HILLEL II, one of the patriarchs belonging to the family of Hillel I, lived in Tiberias about the middle of the 4th century, and introduced the arrangement of the calendar through which the Jews of the Diaspora became independent of Palestine in the uniform fixation of the new moons and feasts.

The Rabbi HILLEL, who in the 4th century made the remarkable declaration that Israel need not expect a Messiah, because the promise of a Messiah had already been fulfilled in the days of King Hezekiah, is probably Hillel, the son of Samuel ben Nahman, a well-known expounder of the scriptures.

The university student clubs established by the B'nai B'rith (*q.v.*) order were named after Hillel, the ideal student and sage.

HILLER, FERDINAND (1811–1885), German composer, was born at Frankfort-on-blain, on Oct. 24, 1811, and studied first under Aloys Schmitt and then under Johann Hummel in Weimar. There he devoted himself to composition, among his work being the entr'actes to *Maria Stuart*, through which he made Johann Goethe's acquaintance. With Hummel he went in 1827 to Vienna, where he met Ludwig van Beethoven and produced his pianoforte quartet. Later he went to Paris where he spent seven years and did much to make the works of Beethoven and Johann Sebastian Bach known in French musical circles. Subsequently he joined his friend Jakob Ludwig Mendelssohn-Bartholdy in Leipzig. where in 1843–1844 he conducted a number of the Gewandhaus concerts and produced his oratorio. *Die Zerstörung Jerusalems*, one of his best works. Later at Cologne he was conductor of the Gürzenich concerts and head of the conservatory. He retired in 1884, and died May 12, 1885.

Hiller frequently visited England. He composed a work for the opening of the Royal Albert hall, his *Nala and Damayanti* was performed at Birmingham, and he gave a series of pianoforte recitals of his own compositions at the Hanover Square Rooms in 1871. His compositions, numbering about 200, include six operas. two oratorios, six or seven cantatas, much chamber music and a once-popular pianoforte concerto.

HILLER, JOHANN ADAM (1728–1804), German composer. n-as born near Görlitz,' in Silesia, on Dec. 25. 1728. He studied law at Leipzig. but adopted music as a profession. In 1789 he became cantor of the Thomasschule, and died at Leipzig, where the most of his life was spent. on June 16, 1804. Hiller played an important part in the German musical life of his day. To him was due the foundation of the famous Gewandhaus concerts in Leipzig. He had much to do with the re-establishment in favour of the *Singspiel* and the general popularization and development of light opera. while he helped materially also in the cultivation and development of the German *Lied* as against the Italian operatic aria. He did propagandist work for Handel also. and the *Messiah* was first given in Berlin (more than 40 years after it was composed) under his bâton. He was a prolific author as well as a copious composer, his literary works including an autobiography.

HILLIARD, LAWRENCE (1582?–1640), English miniaturist, was baptized on March 5, 1582, in St. Vedast's, Foster Lane, London. He was a pupil of his father, Nicholas Hilliard (*q.v.*), whose profession he followed. In 1606 he was working for James I and the queen, in limning and medals; in 1608 he was granted a patent as king's limner, to take effect at his father's death. He succeeded his father in 1619, and in 1624 was paid for five pictures, presumably painted for the king. Lawrence Hilliard is reputed to have had three sons, and one daughter named Laurence. His portraits, signed L. H. in roman capitals, are rare. His style is stiffer than his father's; two examples in the Beauchamp collection, signed and dated 1636 and 1638, bear florid inscriptions. like those found in Nicholas' work.

The colour scheme adopted by Lawrence is fuller and more varied than his father's, and to some extent his light and shade and modeling were influenced by the oil painters of the early Stuart period. (C. H. C. B.)

HILLIARD, NICHOLAS (1547–1619), the first true English miniature painter, is said to have been the son of Richard Hilliard of Exeter. He was appointed goldsmith, carver and portrait painter to Elizabeth I, and engraved the Great Seal of England in 1586. He was in high favour with James I as well as with Elizabeth, and from the king received a patent of appointment (May 5, 1617), which granted him a sole licence for the royal work for 12 years.

Hilliard is believed to have been the author of an important treatise on miniature painting, preserved in the Bodleian library, but it seems more probable that the author of that treatise was John de Critz. It is probable, however, that the treatise was taken down from the instructions of Hilliard, for the benefit of one of his pupils, perhaps Isaac Oliver.

John Donne, in a poem called "The Storm" (1597), praises Hilliard's work. He painted a self portrait at the age of 13, and is. said to have executed one of Mary, queen of Scots, when he was 18. He died Jan. 7, 1619, and was buried in St. Martin's-in-the-Fields, Westminster.

It seems to be fairly certain that he visited France, and that he is the artist alluded to in the papers of the duc d'Alençon under the name of "Nicholas Belliart, peintre anglois" who was painter to this prince in 1577.

HILLMAN, SIDNEY (1887–1946), U.S. labour leadernoted for his aggressive organization of industrial workers and extension of union functions to include social services and political action. He was born March 23, 1887, at Zagare, Lithuania, and received a rabbinical education. At the age of 19, while employed in a chemical laboratory in Kovno, he was jailed by the government for advocating labour reforms. Released, he went to England and then in 1907 to the United States where he soon became active in labour unions.

In 1914 he became president of the Amalgamated Clothing Workers of America, a position he held for the rest of his life. Under his leadership the union increased its membership and provided two banks, a housing development and unemployment insurance for its members. With John L. Lewis (*q.v.*) and others, Hillman formed the Congress of Industrial Organizations in the 1935–38 period and broke away from the American Federation of Labor. (See AMERICAN FEDERATION OF LABOR-CONGRESS OF INDUSTRIAL ORGANIZATIONS.)

Pres. Franklin D. Roosevelt appointed him to several labour advisory posts and in 1541 made him associate director-general of the Office of Production Management and in 1942 director of the labour division of the War Production Board.

Hillman left his government positions in 1943 to become chairman of the C.I.O. political action committee! which played an active role in the election of 1544. After World War II he attended labour union meetings in Europe and served as vice-president of the World Federation of Trade unions.

Hillman died at Point Lookout, N.Y., July 10, 1946.

See Matthew Josephson, *Sidney Hillman: Statesman* of *American Labor* (1952). (B. MI.)

HILL TIPPERA: *see* TRIPURA.

HILTON, JOHN (1804–1878), British surgeon, was born at Castle Hedingham, in Essex, in 1804. He entered Guy's hospital in 1824, and was connected with the hospital all his life. In 1867 he was president of the Royal College of Surgeons. As Arris and Gale professor (1859–62) he delivered a course of lectures on "Rest and Pain" (published 1863, with several revised editions later), which became classics. He was surgeon-extraordinary to Queen Victoria.

His anatomical knowledge is indicated by the method for opening deep abscesses which is known by his name, and he was the first to reduce a case of obturator hernia by abdominal section, and one of the first to practise lumbar colostomy. He died at Clapham on Sept. 14, 1878.

HILVERSUM, a town in the province of North Holland, Neth., 18 mi. by rail S.E. of Amsterdam. Pop. (1957 est.) 97,312 (mun.). It is in the middle of the Gooi, a stretch of hilly country extending from the IJsselmeer (Zuider Zee) to about 5 mi. south of Hilversum.

Hilversum is a summer resort and manufactures large quantities of carpets and is the centre of the Dutch radio activities. The A.V.R.O. and the V.A.R.A. stations are in this town. Two miles from Hilversum is the village of 's Graveland (the count's country), seat of a number of 17th century Dutch Renaissance country homes, most famous of these being the Trompenberg.

HIMACHAL PRADESH, a former constituent state of India, now a Union Territory. It was formed on April 15, 1948, of the 21 former Punjab Hill princely states and their 9 tributaries. Bilaspur (*q.v.*) was merged into it on July 1, 1954. Area of Himachal Pradesh 10,922 sq.mi.; pop. (1951) 1,109,466. The capital is Simla (*q.v.*). Himachal Pradesh was administered under part C of the first schedule of the Indian constitution of 1950; *i.e.*, it mas the direct responsibility of the central government in New Delhi, which controlled it through a lieutenant governor (equivalent to a chief commissioner in other part C states). There was, how-

ever. a state legislature with powers somewhat more limited than those of governors' and rajpramukhs' states, and a ministry comprising a chief minister and two others. The former state was composed of five districts, four of which, Sirmoor, Mahasu, Mandi and Bilaspur formed a continuous tract while the fiith, Chamba, to the northwest, was separated by a wedge of Punjab state.

Potatoes and fruit (apples, peaches, pomegranates, etc.) are the main products; almonds and other nuts are cultivated. There are considerable salt deposits, and forests yield coniferous timber? firewood and charcoal. Wool of good quality is available and the shawls woven there are exported to all parts of the country. There is a large hydro-electric plant at Jogindarnagar and a rosin and turpentine iactory at Nahan (pop. 9,431).

The forests. besides being the main source of revenue for the Gnion Territory (about Rs. 6,000,000 a year), ensure the safety of the catchment areas oi the Jumna, Sutlej, Beas, Ravi and Chenab rivers. The steady and constant flow of water in these rivers and the success of irrigation and engineering yrojects in the plains depend on the proper protection of these catchment areas. (S. GL.)

HIMALAYA, that portion of the mountain region between India and Tibet enclosed within the arms of the Indus and the Brahmaputra, having, therefore, a length of 1,500 mi., and a width from 100 to 150 miles. North-west of the Indus the region of mountain ranges which stretches to a junction with the Hindu Kush, south of the Pamirs, is usually known as Trans-Himalaya. Thus the Himalaya represents the southern face of the great central elevated region — the plateau of Tibet — the northern face of which is buttressed by the huen Lun.

Geographical Classification of the Himalaya. — For this purpose the Himalayan mountain system is divided into three parallel longitudinal zones which have marked differences in orographical features.

(1) *The* Great *Himalaya.*—The main ranges, which lie in the north, rise above the snow line and have an average elevation of 20.000 ft. above the sea. Here occur the highest peaks, *e.g.,* Everest, K_2 (Godwin-Austen). hanchenjunga, etc.

(2) *The* Lesser *Himalaya.*—The middle ranges, which are closely related to and lie south of the Great Himalaya. They form an intricate mountain system, with an average height of 12.000 to 15,000 ft. above the sea.

(3) *The Outer Himalaya.*—These comprise the Siwalik ranges, lie between the Lesser Himalaya and the plains, and have an average height of 3,000 to 4,000 ft. above the sea.

The Great Northern Watershed. — On the north and north-west of Kashmir, the great water-divide which separates the Indus drainage area from that of the Yarkand and other rivers of Chinese Turkestan, is the Mustagh range which, with the Karakoram, trends south-eastwards. forming a continuous mountain barrier and the true water-divide west of the Tibetan plateau. Shutting off the sources of the Indus affluents from those of the Central Asian system of hydrography, this great water-parting is distinguished by a group of peaks of which the altitude is hardly less than that of the Eastern Himalaya. Mount Godwin-Austen (K_2) (28,250 ft. high), only 778 ft. lower than Everest, affords an excellent example of a dominating. peak-crowned water-parting or divide. From Kailas on the far west to the extreme north-eastern sources of the Brahmaputra, little is known of the great northern water-parting of the Indo-Tibetan highlands. For some 500 or 600 mi. E. of Kailas it appears to he lost in the mazes of the minor ranges and ridges of the Tibetan plateau. Nor can it be said to be well defined to the east of Lhasa.

Eastern Tibet. — The Tibetan plateau, or Chang, breaks up about the meridian of 92° E., to the east of which the affluents of the Tsanpo (the same river as the Dihang and subsequently as the Brahmaputra) drain no longer from the elevated plateau, but from wild, rugged mountain slopes. In this region are hidden the sources of all the great rivers of Burma and China. Neither immediately beyond the great bend of the Brahmaputra nor in the Himalayan regions lying north of Assam and east of Bhutan, have scientific investigations yet been systematically carried out; but it is known that the largest of the Himalayan affluents of the Brahmaputra west of the bend derive their sources from the Tibetan plateau. and break down through the containing bands of hills, carrying deposits of gold from their sources to the plains, as do ail the rivers of Tibet.

Although the northern limits of the Tsanpo basin are not sufficiently well knonn to locate the Indo-Tibetan watershed even approximately, there exists some evidence of the nature of that strip of Northern Himalaya on the Tibeto-Nepalese border which lies between the line of greatest elevation and the trough of the Tsanpo. Recent investigations show that all the chief rivers of Nepal flowing southwards to the Tarai take their rise north of the line of highest crests, the "Great Himalaya." and that some of them drain long lateral high-level valleys enclosed between minor ridges nhose trend is parallel to that of the Himalaya and, occasionally, almost at right angles to the course of the main drainage channels breaking down to the plains. This formation brings the southern edge of the Tsanpo basin to the immediate neighbourhood of the banks of that river, which runs at its foot like a drain flanking a wall. North of Bhutan, between the Himalayan crest and Lhasa, this formation is approximately maintained; farther east, although the same natural forces first resulted in the same effect of extensive curves of ridge and furrow, the abundant rainfall and the totally distinct climatic conditions which govern the processes of denudation subsequently led to the erosion of deeper valleys enclosed between forest-covered ranges which rise steeply from the river banks.

Height of Himalayan Peaks. — It is now proved that Mount Everest, which appears from the Tibetan plateau as a single dominating peak, has no rival amongst Himalayan altitudes. The main features of Nepalese topography are now fairly well defined. So much controversy has been aroused on the subject of Himalayan altitudes that the present position of scientific analysis in relation to them may be shortly stated. The heights of peaks determined by exact processes of trigonometrical observation are bound to be more or less in error for at least three reasons: (1) the extraordinary geoidal deformation of the level surface at the observing stations in submontane regions; (2) ignorance of the laws of refraction when rays traverse rarefied air in snow-covered regions; (3) ignorance of the variations in the actual height of peaks due to the increase, or decrease, of snow.

Geology. — The Himalaya have been formed by violent crumpling of the earth's crust along the southern margin of the great tableland of Central Asia. Outside the arc of the mountain chain no sign of this crumpling is to be detected except in the Salt Range; and the Peninsula of India has been entirely free from folding of any importance since early Palaeozoic times, if not since the Archaean period itself. But the contrast between the Himalaya and the Peninsula is not confined to their structure: the difference in the rocks themselves is equally striking. In the Himalaya the geological sequence (Cambrian to Eocene) is almost entirely marine; there are occasional breaks in the series, but during nesrly the whole of this long period the Himalayan region, or at least its northern part, must have been beneath the sea — the Central Mediterranean Sea of Neumayr or Tethys of Suess. In the peninsula, however, no marine fossils have yet been found of earlier date than Jurassic and Cretaceous, and these are confined to the neighbourhood of the coast; there can be no doubt that; at least since the Carboniferous period. nearly the whole of the peninsula has been land. Between the folded marine beds of the Himalaya and the nearly horizontal strata of the peninsula lies the Indo-Gangetic plain: covered by an enormous thickness of alluvial and wind-blown deposits of recent date. Deep borings here have failed to reach the rocky bottom, or even to indicate the approach of the base of the alluvium. It is clear. then, that in front of the Himalaya there is a great depression, but there is no indication that this depression was ever beneath the sea.

Geologically, the Himalaya may be divided into three zones. The northern (Tibetan zone), in which fossiliferous beds of the Palaeozoic and Mesozoic age are largely developed — excepting in the north- vest, no such rocks are known on the southern flanks. The second (Himalayan zone) comprises most of the Lesser and Great Himalaya, and is composed chiefly of crystalline and metamorphic rocks, together with unfossiliferous sedimentary beds supposed to be of Palaeozoic age. The southern (*sub*-Himalayan zone) consists entirely of Tertiary beds, and especially of the Upper Tertiaries. The oldest beds which have yielded

fossils occur in the Spiti valley and belong to the Cambrian system (the "Haimanta" system). These are underlain by Archaean gneisses. There appears to be no break in the Lower Palaeozoic beds in the Spiti region but in other parts of the Central Himalayas the conglomerate at the base of the Permian rests unconformably upon older formations. This conglomerate forms an important datum line. From the Permian to the Lias the sequence in the central Himalaya shows no sign of a break. The Spiti shales follow, and although they contain Middle and Upper Jurassic fossils no break has yet been proved at their base. The Spiti shales are succeeded conformably by Cretaceous beds (Giumal sandstone below and Chikkim limestone above), and these are followed without a break by h'ummulitic beds of Eocene age. The beginning of the Tertiary period was marked by violent igneous activity, in which intrusion and extrusion occurred. The next succeeding deposit is a sandstone, often highly inclined, which rests unconformably upon the Nummulitic beds and resembles the Lower Siwaliks of the sub-Himalaya (Pliocene) but which as yet has yielded no fossils of any kind. The whole is overlaid unconformably by the younger Tertiaries of Hundes, which are perfectly horizontal and have been folded.

It is evident that in the northern part of the Himalayan belt, at least in the Spiti area, there can have been no post-Archaean folding of any magnitude until after the deposition of the Nummulitic beds, and that the folding was completed before the later Tertiaries of Hundes were laid down. It was, therefore, during the Miocene period that the elevation of this part of the chain began, while the disturbance of the Siwalik-like sandstone indicates that the folding continued into the Pliocene period. Along the southern flanks of the Himalaya the history of the chain is still more clearly shown. The sub-Himalaya are formed of Tertiary beds, chiefly Siwalik or Upper Tertiary, while the Lower Himalaya proper consist mainly of pre-Tertiary rocks without fossils. Throughout the whole length of the chain, wherever the junction of the Siwaliks with the pre-Tertiary rocks has been seen, it is a great reversed fault (the "Main Boundary Fault"). The hade of the fault is constantly inwards, towards the centre of the chain, and the older rocks, which form the Himalaya proper, have been pushed forward over the younger beds of the sub-Himalaya. Moreover, nearly everywhere the fault formed the northern boundary of deposition of the Siwalik beds, and only in a few instances do any of these deposits extend even to a short distance beyond it. The fault, in fact, was being formed by the deposition of the Siwalik beds, and as they were laid down, the Himalaya were pushed forward over them, so that they were folded and upturned during the process. The Siwaliks are fluviatile and torrential deposits similar to those which are now being formed at the foot of the mountains in the Indo-Gangetic plain. The "Main Boundary Fault" is really one of a series of approximately parallel faults, all of which formed the northern boundary of deposition of the deposits immediately south of them. The Himalaya grew southwards in a series of stages. A reversed fault was formed at the foot of the chain, and upon this fault the mountains were pushed forward over the beds deposited at their base, crumpling and folding them in the process, and forming a sub-Himalayan ridge in front of the main chain. This process was repeated several times and the earthquakes of to-day in this region can be traced to the fault lines and show that crustal equilibrium has not yet been reached.

Topographical Results sf Evolution. — The uplift of the Himalayas was a gradual process protracted over a very long period and the process had a very marked effect upon the scenery, the topography and the river system. The latter is not consequent upon the structure, but the principal rivers were of an age anterior to the Tertiary earth-movements and the drainage is spoken of as "antecedent." During the slow process of uplift, folding and faulting the rivers were able to keep, for the most part, to their original courses, although their erosive power was increased owing to increased gradients. Thus we find the rivers cutting through the main chains in deep transverse gorges after flowing for long distances parallel to the trend of the chain. Examples of this are the Indus and the Brahmaputra.

In the outer valleys of the Himalaya the sides are generally steep, so steep that landslides frequently occur, whilst the streams are still cutting down the river beds and have not yet reached their base level. Here and there a valley has become filled with alluvium, owing to some local obstruction, and when this occurs there is usually to be found a fertile and productive field for agriculture. The straits of the Jhelum, below Baramula, probably account for the lovely vale of Kashmir, which is in form (if not in principles of construction) a repetition on a grand scale of the Maidan of the Afridi Tirah, where the drainage from the slopes of a great amphitheatre of hills is collected and then arrested by the gorge which marks the outlet to the Bara.

Other rivers besides the Indus and the Brahmaputra begin by draining a considerable area north of the snowy range — the Sutlej, the Kosi, the Gandak and the Subansiri, for example. All these rivers break through the main snowy range ere they twist their way through the southern hills to the plains of India. Here the "antecedent" theory will not suffice, for there is no sufficient catchment area north of the snows to support it. Their formation is explained by a process of "cutting back," by which the heads of these streams are gradually eating their way northwards owing to the greater rainfall on the southern than on the northern slopes. The result of this process is well exhibited in the relative steepness of slope on the Indian and Tibetan sides of the passes to the Indus plateau. On the southern or Indian side the routes to Tibet and Ladakh follow the levels of Himalayan valleys with no remarkably steep gradients till they near the approach to the water-divide. The slope then steepens with the ascending curve to the summit of the pass, from which point it falls with a comparatively gentle gradient to the general level of the plateau. The Zoji La, the Kashmir water-divide between the Jhelum and the Indus, is a prominent case in point, and all the passes from the Kumaon and Garhwal hills into Tibet exhibit this formation. Taking the average elevation of the central axial line of snowy peaks as 19,000 ft., the average height of the passes is not more than 10,000 owing to this process of cutting down by erosion and gradual encroachment into the northern basin. (See also TIBET; LEH.)

Climate. — Independently of the enormous variety of topography the vast altitude of the mountains alone is sufficient to cause very great modifications of climate. One-half of the total mass of the atmosphere and three-fourths of the water suspended in it in the form of vapour lie below the average altitude of the Himalaya; and of the residue, one-half of the air and virtually almost all the vapour come within the influence of the highest peaks. The mean winter temperature at 7,000 ft. (which is about the average height of Himalayan "hill stations") is 44° F and the summer mean about 65" F, but in the valleys a temperature of go to 100° F may be felt during the day in May and June. At 9,000 ft. the mean temperature of the coldest month is 32" F. At 12,000 ft. the thermometer remains above freezing-point from the end of May to the middle of October, but at 15,000 ft. is seldom above that point even in the height of summer. It should be noted that the thermometrical conditions of Tibet vary considerably from those of the Himalaya. At 12,000 ft. in Tibet the mean of the hottest month is about 60° F and of the coldest about 10° F, while at 15,000 ft. the frost is only permanent from Nov. 1 to May 1. In Tibet the daily range may be 60" and often reaches 50°. The temperature of the sandy surface varies even more and records of 2° and 96" have been taken within 24 hours by the Everest expedition. The soil beneath the surface is far more constant in temperature. The difference of temperature between forest-clad ranges and the Indian plains is twice as much in April and May as in December or January; and the difference between the temperature of a well-wooded hill top and the open valley below may vary from 9° to 24° within twenty-four hours. The general relations of temperature to altitude as determined by Himalayan observations are as follows: (1) The decrease of temperature with altitude is most rapid in summer. (2) The annual range diminishes with the elevation. (3) The diurnal range diminishes with the elevation.

Rainfall is chiefly related to the monsoonal rainfall of India of which the Himalayas catch a large portion. There is more

rain, and rain for a longer season, in the east than in the west. The east may have 50 to 80 in. of rain against southward hill slopes and in certain spots even higher totals are reached, for example Darjeeling gets 120 inches. The rainfall diminishes westward to 40 inches near the place where the Ganges leaves the mountains and falls to 30 towards the emergence of the Indus from the mountains, while in places in a rain-shadow the fall may be only 15 in. though they are in a zone that on the whole averages 30 or more. In the arid zone protected from the rainy winds the rainfall goes below 15 in. and in Tibet for the most part well below 10 inches.

In Tibet the rapid heating of the plains by the morning sun brings a fierce wind down daily from the eternal snows and some air may thus drift through such partial gaps as there are in the great range from India to the Tibetan table-land.

In the eastern Himalaya the ordinary winter limit of snow is 6,000 ft. and it never lies for many days even at 7,000 ft. In Kumaon, on the west, it usually reaches down to the 5,000 ft. level and occasionally to 2,500 feet. Snow has been known to fall at Peshawar. At Leh, in western Tibet, hardly 2 ft. of snow are usually registered and the fall on the passes between 17,000 and 19,000 ft. is not generally more than 3 ft., but on the Himalayan passes farther east the falls are much heavier. Even in September these passes may be quite blocked and they are not usually open till the middle of June. The snow-line, or the level to which snow recedes in the course of the year, ranges from 15,000 to 16,000 ft. on the southern exposures of the Himalaya that carry perpetual snow, along all that part of the system that lies between Sikkim and the Indus. It is not till December that the snow begins to descend for the winter, although after September light falls occur which cover the mountain sides down to 12,000 ft., but these soon disappear. On the snowy range the snow-line is not lower than 18,500 ft. and on the summit of the table-land it reaches to 20,000 ft. On all the passes into Tibet vegetation reaches to about 17,500 ft., and in August they may be crossed in ordinary years up to 18,400 ft. without finding any snow upon them; and it is as impossible to find snow in the summer in Tibet at 15,500 ft. above the sea as on the plains of India.

The glaciers of the Himalayas seem to be in retreat. On the north side of Everest the Rongbuk glacier ends at about 16,500 ft. and the Kyetrak glacier at 15,400 feet. In the Kinchinjunga group the glaciers may come down to 13,000 ft. while in Kumaon they reach 12,000 ft. and in Kashmir, in special situations, they may come as low as 8,000 feet. The level reached is, as in Europe, 3,000–5,000 ft. below the limit of perpetual snow. The air temperatures at the ends of the glaciers are about as in Europe, namely, nearly 60° in July and diminishing slowly until the end of September. Several glaciers are 11–16 m. long, the higher figure being attained in the Kinchinjunga series. Italian geologists have investigated the moraines of the Karakoram Mts. and have given evidence of the great ice sheets of the Pleistocene glaciation, ice sheets which may have been one continuous mass over the whole of central Asia. They have further shown that there is evidence of phases of variation during the Pleistocene Ice Age which seem to correspond with those observed in Europe.

Plants. — A valuable study of the ecology of the Himalayan forests of Osmaston (*Journ.* Ecology, Cambridge, England, 1922, vol. x., p. 129), and the observations taken by the Everest expeditions have added considerably to knowledge of the plants of this region.

The European flora of the Mediterranean reaches the Himalaya, but very few of its members attain the eastern end of the chain. Some Japano-Chinese forms such as *Aucuba, Helwingia, Skimmia,* Adamia, *Goughia* reach the east of the chain, but do not spread far to the west. It is naturally at fairly high levels that the European forms are found, but *Tilia, Fagus,* Arbutus, Erica, Azalea and the *Cistaceae* are absent. An African element is claimed to reach the western Himalayas.

The eastern section is very warm and damp and intertropical plants live even at 7,000 ft. above sea, while the forest reaches up to nearly 13,000 ft. in places. In the west the corresponding levels are 5,000 and under 12,000 ft., the dry season being more marked and the variation of temperature greater.

Using Osmaston's general classification of the forests we have: (1) The Shorea (-Sal) *Anogeissus-Pinus* formation in the warm moist valleys, and up to about 6,500 ft. in places. The warm temperature implies heavy evaporation and rapid decomposition of humus. This forest may be called warm subtropical, the trees form an open canopy and belong to species that either shed their leaves in the warm weather before the rains, or are needle-leaved conifers. *Pinus* longifolia is specially able to survive fires and Anogeissus has special powers of coppicing so that it survives grazing and lopping. *Anogeissus* lives up to a 4,000-ft. level in large groups and reaches west as far as the neighbourhood of Srinagar (Kashmir). (2) The Quercus-Abies formation on the moist hill sides from 5,000 ft. to 11,500 ft., where the rainfall is typically 50–80 in. per annum, and some of it is snow. The parts which face south are apt to get dry in November and December and from April to June and in the latter season there are often forest fires. The heat and rainfall prevent accumulation of much humus on the south side except under special circumstances, but the north side has humus, and there forest fires are rare. The general covering is dense on the north, but less so on the south; evergreen oaks are the commonest trees, epiphytic ferns abound and on higher levels mosses and lichens encrust the tree-trunks. (3) The *Pinus-Cedrus* formation on the drier mountain flanks from 9,000 ft. to 12,000 ft. with a rainfall of 10 to 40 in., but in winter the precipitation is mainly snowfall and the temperature is low. Slopes facing the sun are apt to be very dry and suffer from fires. Trees and grass often occur together, both giving place to shrubs in some areas with long dry periods. *Cedrus* itself reaches the 8,000-ft. level in the moist zone, but the 10,000-ft. level in the dry one, it grades into cypress below and blue-pine above. The cypress suffers specially from fires and perhaps for this reason is rarely found near grassland in the Himalayas; it favours rather the steep rocky hill sides. (4) The *Betula-Rhododendron* formation has a general distribution between the 9,000- and the 13,500-ft. contours with vegetative activity chiefly during the monsoon rains. The cold soil makes absorption by the roots slow even if there be abundant moisture, as there is in some parts. The rainfall varies very much and a large proportion is really snowfall, and the formation generally occurs where insolation is low because of a north aspect, or cloudiness. The formation makes a dense covering, but there are no large trees and the branches often bend down and are flexible. It is sometimes quite absent in the moist zone in which oak forest may be succeeded above by grass; much has to be allowed in this matter for the depredations of grazing animals. Sometimes one finds a Rhododendron-Lonicera shrubby group, sometimes a *Betula-Abies* tree-group, but it is difficult to distinguish different conditions for them. Lonicera oboaata is restricted to the higher part of the zone. (5) The Caragana-Lonicera-Artemisia formation in the arid Tibetan zone 9,000 ft. to 15,000 ft. above sea with extremely dry conditions during the short period in which vegetative activity is possible. The sun is strong and the dry atmosphere gives it unusual power. The strong daily wind down from the peaks transports sand and dust. Trees and shallow rooted grasses are almost absent, shrubs have branches bent down and very flexible and the leaves are deciduous. *Salix* and *Myricaria* form associations related to No. 5, but choosing moister spots near streams. Only a few plants, save willows and junipers, grow taller than 2 ft. or so. The small amount of grass, and shoots of shrubs are a precious resource to yaks and other animals of the heights and water weeds of the cold lakes are also useful to them. The mouse-hares lay up stores of seeds in their burrows for the winter and perhaps on the whole help in this way to maintain some species of plants.

Animals. — On the outer fringes the Himalayan fauna grades into that of the surrounding regions. Towards India, for example, the langur (Semnopithecus sp., a monkey) elephant, rhinoceros, tiger, leopard, civet, mongoose (*Herpestes*), toddy cat (Paradoxurus), cat-bear (*Aelurus*), *Helictis* (an aberrant badger), linsang (an aberrant civet), the last two of Malayan affinities, and the bamboo-rat (Rhizomys) of the base of eastern Himalayas. The Himalayan fauna in the stricter sense, especially on the Tibetan

side, is, however, mainly northern in its affinities. The fossils of the Siwalik beds include remains of 84 species of mammals akin to those of Miocene and Pliocene Europe. The langur reaches as high as the 12,000-ft. level and bears, martens and related forms and several cats are features of the forests, while moles abound, though they are unknown in India; foxes and wolves are unknown in the forest area, but both, and also the lynx, ounce, marten, ermine and wild ass occur on the Tibetan side, also musk-deer, antelope (2 species) and sheep. The wild dog (Cuon) is found in the forest area, so is the wild pig, a form of which reaches very high levels, but the gaur or wild ox is confined to the lower lands; two species of the scaly anteater (*Manis*) reach the eastern Himalayas, but the chevrotain, another southeast Asiatic form, is absent. Goat-like animals called the serow (Nemorhaedus), goral (*Cemas*), and tahr (Hemitragus) are found, and the tahr ranges up to great heights. The yak and other animals of the great altitudes will be discussed below.

The bird life of the Himalayas is wonderfully rich. Eagles, vultures and many birds of prey soar to great heights. Gorgeous colouring occurs among sun-birds, trogons, kingfishers, etc., but of the parrot family only parrakeets and a small lory are known. The peacock occurs in the forests borderin'g the plains on the Indian side, and pheasants and partridges include varieties adapted to life on the snow at great altitudes. Waders and waterfowl are not very important features.

Among the snakes the python is found on the Indian side and the cobra penetrates as high as some 8,000 ft. above sea. Lizards and frogs abound and reach remarkable elevations, the lizard, Phrynocephalus, and a frog being found even in Tibet. Of the fishes only two Acanthopterygii enter the mountains, most of the fish of the region belonging either to the catfish family (*Siluridae*) or the carp family (*Cyprinidae*), a few of the former and a number of the latter live in Tibetan waters. Most of the fishes of high mountain-torrents have suckers with which to hold on to rocks. The salmon family is absent from the region.

The butterflies are renowned for their magnificence and include among others Papilionidae, *Nymphalidae, Morphidae,* and *Danaidae*. Insect life of all kinds is very rich and locust-swarms are carried up by the winds even to the perpetual snow.

Major Hingston of the Indian Medical Service has given valuable accounts of the natural history of animals at great altitudes in the Himalayas. Protective colouring, usually in browns and greys akin to those of the desert-like surface of Tibet, is almost universal. The mouse-hare (Ochotona) is common and even the sheep and gazelles are coloured like the soil. Most of the birds are protectively coloured, though some show bright colours when on the wing. Unlike the large mammals, the large birds are not protected in colour, and the eagles, kites, ravens and choughs abound. It is said that the birds living among the villages are not protectively coloured. That type of coloration is common among insects, spiders, etc.

The intense cold of the great heights is made still more trying by the fierce winds that rush down from the snows to the plateau as the latter warms up in the morning sun. As a protection most mammals have thick hair and the dogs have wool as well; even the pig is thickly covered with hair. The yak has a coat of wool over which is the long hair that forms a protective skirt under the belly, while the tail may be described as a unique windscreen. The hair under the belly is thought by Major Hingston to keep the animal's legs warm when it is resting. The yak stands with its hindquarters to the wind. The smaller animals and the birds mostly shelter among the rocks and stones when the wind becomes strong, but many of them illustrate its power of damaging fur and feathers. The birds generally face the wind and the great vultures are able to some extent to make use of it. The butterflies may protect themselves by pressing their wings against a stone in as sheltered a nook as can be found. Major Hingston found *Parnassius* sp. as high as 17,000 ft. above sea-level.

The sharp changes of temperature within a few hours, known in all mountain regions, are accentuated here and may be very trying in winter. Many animals of the high mountains are protected from this by the habit of hibernation in burrows where, a little beneath the snow and the surface soil, the temperature is much more uniform. The mouse-hare was seen by Major Hingston as high as 17,000 ft. above sea and he thinks it may reach 20,000 ft. as a stray. Several birds go up to 20,000 ft. and more on the mountain side, and choughs followed the Everest climbers as high as 27,000 ft.; they seem least incommoded by the great heights. The habits of mammals and birds have been noticed to change on the great heights; thus birds which elsewhere are of the wild, live there on and around the villagers' houses, while communities (even some of birds and mammals) are a characteristic development with mutual aid in view.

HIMERA, an ancient city on the north coast of Sicily, on a hill above the west bank of the Himeras Septentrionalis, south of the present railway station of Buonforello 6 mi. east of Termini Imerese. It was founded c. 649 B.C. by Chalcidian inhabitants of Zancle and Syracusan exiles. Early in the 5th century the tyrant Terillus, son-in-law of Anaxilas of Rhegium and Zancle, appealed to the Carthaginians, who came to his assistance, but were utterly defeated by Gelon of Syracuse in 480 B.C., on the same day, it is said, as the battle of Salamis. Thrasydaeus, son of Theron of Agrigentum, seems to have ruled the city oppressively, but an appeal made to Hieron of Syracuse, Gelon's brother, was betrayed by him to Theron; the latter massacred all his enemies and in the following year resettled the town. In 408 Hannibal, after capturing Selinus, destroyed Himera, founding a new town close to the hot springs (Thermae Himeraeae), 8 m. to the west, which, however, soon became a Greek city. The only relic of the ancient town now visible above ground is a small portion (four columns, lower diameter 7 ft.) of a Doric temple, the date of which (whether before or after 480 B.C.) is uncertain.

HIMERIUS (c. A.D. 315–386), Greek sophist and rhetorician, was born at Prusa in Bithynia. He completed his education at Athens, whence he was summoned to Antioch in 362 by the emperor Julian to act as his private secretary. After the death of Julian in the following year Himerius returned to Athens, where he established a school of rhetoric, to which pupils came from all over the world; among them were Gregory of Nazianzus and Basil the Great, bishop of Caesarea; in his later years he became blind and he died of epilepsy. Although a heathen, who had been initiated into the mysteries of Mithra by Julian, he shows no prejudice against the Christians. Himerius is a typical representative of the later rhetorical schools. Photius (cod. 165, 243 Bekker) had read 71 speeches by him, of 36 of which he has given an epitome; 24 have come down to us complete and fragments of 10 or 12 others. They consist of epideictic or "display" speeches after the style of Aristides, the majority of them having been delivered on special occasions, such as the arrival of a new governor, visits to different cities (Thessalonica, Constantinople), or the death of friends or well-known personages.

The *Polemarchicus* is a panegyric of those who had given their lives for their country. Other declamations, only known from the excerpts in Photius, were imaginary orations put into the mouth of famous persons — Demosthenes advocating the recall of Aeschines from banishment, or Themistocles inveighing against the king of Persia. Himerius is more of a poet than a rhetorician, and his declamations are valuable as giving prose versions or even the actual words of lost poems by Greek lyric writers. The prose poem on the marriage of Severus and his greeting to Basil at the beginning of spring are quite in the spirit of the old lyric. Himerius possesses vigour of language and descriptive powers, though his productions are spoilt by too frequent use of imagery, allegorical and metaphorical obscurities, mannerism and ostentatious learning But they are valuable for the history and social conditions of the time, although lacking the sincerity characteristic of Libanius.

See Eunapius, *Vitae sophistarum;* Suidas, *s.v.:* editions by G. Wernsdorf (1790), with valuable introduction and commentaries, and by F. Dübner (1849) in the Didot series; C. Teuber, *Quaestiones Himerianae* (Breslau, 1882); on the style, E. Norden, *Die antike Kunstprosa* (1898)

HIMLY, LOUIS-AUGUSTE (1823–1906), French historian and geographer, was born at Strasbourg on March 28, 1823. After studying in his native town and taking the university course in Berlin, 1842–43, he went to Paris, and passed first in the examination for fellowship *(agre'gation)* of the lycées (1845), first in the examinations on leaving the École des Chartes and first in the examination for fellowship of the faculties (1849).

In 1849 he took the degree of doctor of letters with two theses, one of which, *Wala et Louis le Débonnaire* (Paris, 1849), placed him in the front rank of French scholars in Carolingian history. Soon, however, he turned his attention to the study of geography. In 1858 he obtained an appointment as teacher of geography at the Sorbonne, and henceforth devoted himself to that subject. In 1876 he published, in two volumes, his *Histoire de la formation territoriale des états de l'Europe centrale,* in which he discussed the reciprocal influence exerted by geography and history. The work was written in the form of a student's manual, but it was based on original research.

Himly was head of the Faculté des lettres de Paris, 1881–98, and became a member of the Institute (Académie des sciences morales et politiques).

HIMMEL, FREDERICK HENRY (1765–1814), German composer, was born on Nov. 20, 1765, at Treuenbrietzen, Brandenburg.

During a temporary stay at Potsdam, he had an opportunity to show his self-acquired skill as a pianist before King Frederick William II, who made him a yearly allowance to enable him to complete his musical studies. He studied under Johann Gottlieb Naumann, a German composer of the Italian school, and Himmel adopted the style of that school in his serious operas. The first of these, a pastoral opera, *Il Primo Navigatore,* was produced at Venice in 1794 with great success.

The production of his oratorio *Isaaco* (1792) procured his appointment as court Kapellmeister to the king of Prussia. His Italian operas, successively composed for Stockholm, St. Petersburg and Berlin, were all received with great favour in their day. Of greater importance than these, however, is an operetta to German words by Kotzebue, called *Fanchon,* a good specimen of the German *Singspiel.* Himmel's gift of melody is shown in the still popular anthem "Incline thine ear." He died in Berlin on June 8, 1814.

HIMMLER, HEINRICH (1900–1945), German police official, was born Nov. 7, 1900, at Munich. He studied agriculture at the University of Munich and later became a member of the Academy of German Law.

In 1927 he became deputy leader of the *Schutzstaffel* (known as the S.S., Black Shirt or Elite Guard troops), and he was appointed leader in 1929. Himmler was reich director of propaganda, 1926–30, a member of the *Reichstag* and Prussian state council, 1933, commander of the united German police forces, 1936, and deputy head of the reich administration, 1939. He was empowered by Adolf Hitler to suppress antinazi resistance at home and in the occupied countries, and his methods were brutal and ruthless.

Hitler made Himmler interior minister on Aug. 24, 1943, and by Nov. 1944 it appeared that the gestapo chieftain had assumed executive control over Germany, replacing Hermann Goering as the second nazi. After the Karl Doenitz government was formed on May 1, 1945, following Hitler's death, Himmler went into hiding. He adopted a disguise which might have proved effective, but his identity papers, made out in the name of Hitzinger, aroused suspicion of British soldiers at Bremervoerde, and Himmler was arrested on May 21. He revealed his identity and was placed under strict custody. On May 23, 1945, the gestapo chief was able, however, to swallow a vial of poison carried under his tongue, and he died within a few minutes.

HIMYARITES: *see* ARABIA: *History.*

HINCKLEY, a market town and urban district in the Bosworth parliamentary division of Leicestershire, Eng., 13 mi. S.W. of Leicester by road. Pop. (1951) 39,094. Area 18.6 sq.mi. The ditch of a castle erected in the time of William Rufus is still to be traced; the site is a garden of remembrance. In the 19th century Hinckley was a spa and health resort. A weekly market has been held since 1311; the grammar school dates from the 16th century and there is a technical college. Hinckley's main and oldest industry is that of hosiery, footwear is made and there are dye and engineering works. The battle site of Bosworth field (*q.v.*) is 5 mi. N.

HINCKS, EDWARD (1792–1866), British Assyriologist, was born at Cork, Ire., and educated at Trinity college, Dublin. He took orders in the Protestant Church of Ireland and was rector of Killyleagh, Down, from 1825 till his death on Dec. 3, 1866. Hincks devoted his spare time to the study of hieroglyphics and to the deciphering of the cuneiform script, working out contemporaneously with and independently of Sir Henry Creswicke Rawlinson the ancient Persian vowel system. He published a number of papers on Assyriological questions, chiefly in the *Transactions* of the Royal Irish academy.

HINCKS, SIR FRANCIS (1807–1885), Canadian statesman, was born at Cork, Ire., and migrated to Canada, where he settled in business at Toronto. After ten years of political life he became premier of Canada (1851–54), and co-operated with Lord Elgin in negotiating the reciprocity treaty of 1854 with the United States. In 1855 he was chosen governor of Barbados and the Windward Islands, and subsequently governor of British Guiana. He was finance minister (1869–73) in the cabinet of Sir John Macdonald. In 1879 the failure of the Consolidated Bank of Canada, of which he was president, led to his being tried for issuing false statements. Though found guilty on a technicality (see *Journal* of the Canadian Bankers' Association, April 1906), judgment was suspended and his personal credit remained unimpaired. He died on Aug. 18, 1885.

His writings include: *The Political History* of *Canada between 1840 and 1855* (1877); *The Political Destiny of Canada* (1878), and his *Reminiscences* (1884).

HINCMAR (c. 805–882), archbishop of Reims, was born of noble parents and received his education at St. Denis under the direction of abbot Hilduin who brought him in 822 to the court of the emperor Louis the Pious. When Hilduin was disgraced in 830 for supporting Lothair, Hincmar accompanied him into exile at Corvey, but returned with him when the abbot was reconciled with the emperor. Through the influence of Charles the Bald, he received the abbacies of Notre Dame at Compiègne and St. Germer de Fly, and in 845, the archbishopric of Reims. Archbishop Ebbo had been deposed in 835 at the synod of Thionville (Diedenhofen) for having broken his oath of fidelity to the emperor Louis, but on the death of Louis, he regained possession of his see for some years (840–844), until in 844 Pope Sergius II confirmed his deposition.

From the beginning of his episcopate Hincmar was in conflict with the clerks who had been ordained by Ebbo during his reappearance. His view that their ordination was invalid was confirmed in 853 at the council of Soissons, and in 855 by Pope Benedict III. This conflict, however, bred an antagonism of which Hincmar was later to feel the effects. During the next 30 years the archbishop of Reims played a very prominent part in political and religious affairs. In the latter sphere, his first encounter was with Gottschalk (*q.v.*), whose predestinarian doctrines were claimed to be drawn from St. Augustine. Hincmar secured the condemnation of these doctrines at Quierzy (853) and Valence (855), and the decisions of these two synods were confirmed at the synods of Langres and Savonnières, near Toul (859). To refute the predestinarian heresy he composed his *De praedestinatione Dei et libero arbitrio,* and against certain propositions advanced by Gottschalk on the Trinity he wrote his *De una et non trina deitate.* The question of the divorce of Lothair II, king of Lorraine, who had repudiated his wife Theutberga to marry his concubine Waldrada, engaged Hincmar's literary activities in another direction.

In the middle of the 9th century there appeared in Gaul the

collection of false decretals known as the Pseudo-Isidorian Decretals. Rothad, bishop of Soissons, one of those who favoured the pseudo-Isidorian theories, came into collision with his archbishop. Deposed in 863 at the council of Soissons, presided over by Hincmar, Rothad appealed to Rome. Pope Nicholas I supported him, and in 865, in spite of the protests of the archbishop of Reims, Arsenius, bishop of Orta and legate of the Holy See, was instructed to restore Rothad to his episcopal see. Hincmar experienced another check when he endeavoured to prevent Wulfad, one of the clerks deposed with Ebbo, from obtaining the archbishopric of Bourges. Nicholas I pronounced in favour of the deposed clerks, and Hincmar had to submit. He was more successful in his contest with his nephew Hincmar, bishop of Laon. who refused to recognize the authority of his metropolitan. Hincmar exposed his errors in a treatise *Opusculum* LV. *capitulorum,* and procured his deposition at the synod of Douzy (871). A more serious conflict arose between Hincmar on the one side and Charles and the pope on the other in 876, when Pope John VIII, at the king's request, entrusted Ansegisus, archbishop of Sens, with the primacy of the Gauls and of Germany, and created him vicar apostolic. Hincmar regarded this as an encroachment on the jurisdiction of the archbishops, and published his *De jure metropolitanorum.* At the same time he wrote a life of St. Remigius to prove the supremacy of the church of Reims over the other churches. Charles the Bald, however, upheld the rights of Ansegisus at the synod of Ponthion. On Charles's death, he helped to secure the submission of the nobles to Louis the Stammerer, whom he crowned at Compiègne (Dec. 8, 877).

To Carloman, on his accession in 882, Hincmar addressed his *De ordine palatii,* partly based on a treatise (now lost) by Adalard, abbot of Corbie *(c.* 814), in which he set forth his system of government and his opinion of the duties of a sovereign, a subject he had already touched in his *De regis persona et regio ministerio,* and in his *Instructio ad Ludovicum regem.* In 882 an irruption of the Normans forced him to take refuge at Epemay, where he died on Dec. 21, 882.

Hincmar's works, which besides the above include many theological tracts and a continuation from 861 of the *Annales Bertiniani,* written by Prudentius, bishop of Troyes, were printed in Paris (1645) and in Migne, *Patrol. Latina,* vol. cxxv and cxxvi. *See* J. C. Prichard, *Life of Hincmar* (1849); *C.* von Noorden, *Hinknzar, Erzbischof von Reims* (Bonn, 1863); H Schrors, *Hinkmar, Erzbischof von Reims* (Freiburg-i-B., 1884); Abbé Lesne, *La Hiérarchie épiscopale en Gaule et en Germanie* (1905); Hefele, *Konziliengeschichte IV* (Freiburg-i-B., 1879).

HIND, the female of the red deer, usually taken as being three years old and over, the male being known as a "hart." It is sometimes applied to the female of other deer.

In Scotland the hind is a farm servant, with a cottage on the farm, and duties and responsibilities that make him superior to the rest of the labourers. Similarly hind is used in certain parts of northern England as equivalent to bailiff.

HINDEMITH, PAUL (1895–), German composer, was born at Hanau on Nov. 16, 1895, and studied at the Hoch conservatorium in Frankfurt. For eight years (1915–23) he was first leader and then conductor of the opera there. In 1923 he joined the Amar quartet as viola player. Among much which is frankly experimental he produced a good deal also which secured the genuine approbation of even conservatively inclined musicians. His works include the operas *Cardillac* (1926), *Neues vom Tage* (1929) and *Mathis der Maler* (1934); the puppet-play *Das Nusch-Nuschi* (1921); one symphony, songs and choral music and much chamber music including works for chamber orchestra with one solo instrument.

His works were banned by the nazis in 1933. He emigrated to the U.S. in 1939 and joined the faculty of the Yale university school of music in 1941.

See F. Wilms, "Paul Hindemith," in *Von neuer Musik* (1925); Heinrich Strobel, *Paul Hindentith* (1928).

HINDENBURG, PAUL VON (1847–1934), German soldier, second president of the German reich. Paul Ludwig Hans von Beneckendorf und von Hindenburg was born in Posen Oct. 2, 1847, the son of a Prussian officer whose family traced its military record to the 13th century. In 1858 he entered the cadet school at Wahlstatt in Silesia, later joining the chief cadet academy in Berlin. He entered the 3rd foot guards at Danzig as a second lieutenant in 1866. At the battle of Koniggratz, he was wounded while storming an Austrian battery for which he received the order of the Red Eagle. In the Franco-German war of 1870–71, he received the Iron cross for bravery at St. Privat, and was chosen to represent his regiment at the proclamation of the German empire at Versailles.

During the next 40 years Hindenburg rose from captain to general, being promoted not for outstanding achievement but in the regular advancement of a conscientious officer. In 1903 he was appointed to command the 4th army corps at Magdeburg, and in this capacity participated in the imperial manoeuvres of 1908, when he committed the mistake of allowing the corps commanded by the kaiser to lose the battle. In 1911, he was allowed to retire at his own request, because "there was no prospect of a war." He settled down in Hanover, where he was able to indulge his passion for shooting. He had married the daughter of a general, and his son Oskar was a second lieutenant in his old regiment.

When war broke out on Aug. 1, 1914, Hindenburg chafed in a fever of inactivity. On Aug. 22 he received a telegram appointing him to command the 8th army in East Prussia and at 3:00 A.M. on the 23rd boarded a train at Hanover on which he found Major Gen. Erich Ludendorff, an officer who had distinguished himself at the siege of Liège and had now been made chief of staff to Hindenburg. Ten days later Hindenburg leaped from obscurity into world-wide fame as the victor of Tannenberg.

Legend long had it that Hindenburg had been appointed because of his familiarity with the region of the Masurian lakes (a brother lived at Neudeck, the family home) and that he had worked out plans for a battle years before; but he himself declared that he had never seen the battlefield until Aug. 24, 1914. Two Russian armies, under Gen. Alexander Samsonov and Gen. Paul Rennenkampf, were advancing into East Prussia and driving back the numerically inferior Germans whose commander, Gen. Max von Prittwitz, became somewhat panicky. By the time Hindenburg and Ludendorff arrived on the scene, the chief of staff,Lt. Col. Max Hoffmann,had devised a plan for stopping the Russians, which was to beat Samsonov first and then turn on Rennenkampf. The two generals agreed. On Aug. 26, Ludendorff, upset by a hitch, wished to modify the plan, but was overruled by Hindenburg, who remained calm and resolute. By Aug. 31, Samsonov's army had been surrounded and beaten, 100,000 being killed, including Samsonov, and an equal number taken prisoner. In the following week, Rennenkampf's army was dispersed and defeated and East Prussia was cleared of enemy troops. It was Hoffmann's idea to report the victory from Tannenberg, where the Teutonic Knights had been defeated by the Poles in 1410, and thus even the score in the struggle of *Germanentum* and *Slaventum,* which was a leitmotiv of the war. Because of his official position, however, Hindenburg could and did claim credit for the victory, and he almost immediately became the most popular man in Germany; he himself gradually realized this and cultivated his position until he became a legend, against which all other factors in the state, including the emperor, were powerless. A monster wooden statue of Hindenburg was erected in Berlin, into which his admirers drove thousands of nails.

For the next four years Hindenburg and Ludendorff were inseparable. Hindenburg later described their relations as those prevailing in "a happy marriage." Ludendorff, with the assistance of Hoffmann and others, formulated plans for the conduct of operations and submitted them to his chief, who "invariably" (says Ludendorff) approved them. Hindenburg's tranquillity enabled him to restrain the impetuous Ludendorff—"no one ever saw Hindenburg out of temper and nobody ever saw Ludendorff laugh," remarks one biographer. There is no doubt that the pair functioned together admirably, and as the war advenced they became the practical rulers of Germany.

Hindenburg was unable to follow up his victories in East Prussia by advancing across the lower Narev, for the Austro-Hungarian armies had been badly defeated in Galicia and German forces had

to be sent to their assistance. The Germans in southern Poland then advanced toward the Vistula and the Austrians toward the San. The Russians counterattacked from Warsaw. Much confused fighting followed, in the course of which Hindenburg regrouped his forces on a line from Posen to Thorn and then moved against Lodz. He captured the city on Dec. 6, but did not have enough troops to crush the Russians, who retired behind the Bzura and Rawka rivers.

Meanwhile Hindenburg had been promoted to field marshal and appointed commander in chief of all German forces in the east. Since the German armies in the west had not been too successful and trench warfare had in fact been introduced, Hindenburg and Ludendorff clamoured for huge reinforcements with which to follow up their victories against the Russians, but Gen. Erich von Falkenhayn, who had succeeded Gen. Helmuth von Moltke as chief of the general staff after the defeat at the Marne, refused, for he believed that the war had to be won in the west. Hindenburg appealed to the emperor, who was thus forced to choose between his chief of staff and his most popular and successful general. A compromise was reached by which an offensive in the east was approved, but only with the troops already available; the Austro-Hungarian armies were to strike in the south, and it was hoped to catch the Russians in a vast encircling movement. Hindenburg opened his attack in Masuria on Feb. 7, 1915, but was unable to cross the Narev to Bialystok. When the general eastern campaign, directed by Falkenhayn, began with the break-through at Gorlice on May 2, Hindenburg's armies, stretching from the upper Vistula to Courland, remained stationary, except for local offensives. The Russians withdrew steadily, but their armies were not destroyed. Hindenburg was convinced that victory for the Central Powers depended upon the destruction of the Russian colossus and proposed a super-Tannenberg, an outflanking movement to cut off the Russians behind Warsaw, by striking towards Kovno and Vilna. Falkenhayn, on the other hand, held that it would be sufficient by means of a "campaign with limited objectives" to keep the Russian army at bay and thus cripple its offensive power; the chief of staff, being responsible for the western front as well, could not bring himself to take the troops from France necessary for the execution of Hindenburg's plan. With the support of the emperor, he rejected the large strategy in favour of an advance across the lower Narev, which was to be carried out in conjunction with an attack by Gen. August von Mackensen and the Austrians in the south. The relations between Hindenburg and Falkenhayn became very cool.

At first Falkenhayn's scheme seemed to work out well, for the Russians withdrew from Warsaw on Aug. 5, from Kovno on Aug. 17, and from the fortress of Novo-Georgievsk on Aug. 18. Nevertheless their armies under the grand duke Nicholas escaped annihilation. So Hindenburg and Ludendorff once more pressed their idea by proposing to surround the Russian centre at the Pripet marshes, and once more Falkenhayn refused. In September he ostensibly gave way, but without placing at Hindenburg's disposal the necessary forces, and an attack on Vilna petered out. At the end of the campaign, Hindenburg celebrated the 50th anniversary of his entry into the Prussian army.

From the autumn of 1915, Falkenhayn treated the Russian front as subsidiary and in Feb. 1916 launched a mighty attack on Verdun, in the hope of putting France out of the war. In spite of a sharp protest, Hindenburg had been forced to surrender divisions, and could not do more than defeat a Russian offensive on the Narev in March 1916. In June and July the Russians under Brussilov broke through the Austro-Hungarian front at Luck and created such havoc that Hindenburg had to be placed in command of the entire eastern front from Riga to Galicia, with headquarters at Brest-Litovsk. He was able to stabilize the new line and restore order. Meanwhile, Falkenhayn's offensive against Verdun had obviously failed, the British and French were pushing ahead on the Somme, the Italians captured Gorizia, and on Aug. 27, Rumania declared war against the Central Powers. This last event sealed Falkenhayn's fate. Hindenburg was appointed chief of staff, with Ludendorff as first quartermaster general, and they repaired to Pless, the German headquarters.

Thanks to the Hindenburg myth, his appointment restored German morale, at least for a time, and a supreme war command was established which the field marshal exercised in the name of the emperor. But more than ever Ludendorff became the directing spirit, especially in the negotiations with the government and the *Reichstag*. Thus it was Ludendorff who insisted on the proclamation of the kingdom of Poland in Nov. 1916 and on the resumption of submarine warfare in Jan. 1917, which was to involve the United States in the war; Hjndenburg's role was to lend the support of his prestige to the proposals of his nominal subordinate. Likewise the tightening-up of the economic effort, the so-called "Hindenburg program," was inspired by the first quartermaster general.

From a military point of view, Hindenburg's visit to the western front made him for the first time conscious of the danger there. So the offensive against Verdun was abandoned, and in March 1917 the German lines were withdrawn somewhat to the east, being re-established from Arras through St. Quentin to Vailly-sur-Aisnes on what was officially called the *Siegfried-Stellung* but is known to history as the "Hindenburg line." Against this the Allied offensive organized by Gen. Robert Georges Nivelle spent itself in vain, and for the rest of 1917 the Germans were not seriously disturbed, for the Passchendaele "push" cost the British more than it did the Germans.

So secure did Hindenburg and Ludendorff feel that in July 1917 they brought about the resignation of the chancellor, Theobald von Bethmann Hollweg, whom they regarded almost as a defeatist, and imposed on William II an unknown politician named Georg Michaelis, who could be counted on to do their bidding. The new chancellor soon repudiated a peace resolution adopted by the *Reichstag* on July 19 which asked for peace without annexation or indemnities on either side. Henceforth the supreme command exercised dictatorial power. It rebuffed a suggestion for peace negotiations made by Pope Benedict XV by refusing to make a declaration concerning the restoration of Belgium, and it took its own line in dealing with the Russian situation.

Shortly after the Russian revolution broke out, Ludendorff—without the knowledge of Hindenburg—arranged for the passage through Germany of Lenin, the Bolshevist agitator, then living in Switzerland, but anxious to return to Russia. Lenin reached Petrograd in April and at once launched a campaign for peace. The morale of the Russian armies was rapidly affected, and although Alexander Kerensky, the minister of war, was able to restore it sufficiently for an offensive in July, its fighting spirit was definitely broken. When the Bolshevists mounted to power in November, they promptly proposed an armistice, and the Central Powers accepted. In the peace negotiations Hindenburg stood out for the establishment of a "protective belt" on the Prussian front—whereas Hoffmann, usually in full agreement with his superiors, objected to the inclusion of more Poles in Germany. Hindenburg and Ludendorff protested strongly against Hoffmann's intrusion, and the emperor yielded. The two generals then formulated harsh terms and forced them on Russia by threatening to resume military operations. The treaty of Brest-Litovsk of March 3, 1918, was one of the severest in history, for it took from Russia 301,000 sq.mi. of territory and 56,000,000 inhabitants. A supplementary and severe treaty with Rumania followed in May 1918.

Hindenburg's greatest task, however, remained: to defeat Great Britain and France before the United States could intervene in force, for Ludendorff had decided, and Hindenburg had accepted his view, that the favourable military situation in the east was not to be used for offering peace on reasonable terms in the west. Hindenburg forced this policy on the unhappy William II by the threat that he and Ludendorff would resign. Later the two generals brought about the resignation of the chief of the emperor's civil cabinet, Rudolf von Valentini, who favoured a negotiated peace. It was Ludendorff, rather than Hindenburg, who decided that the German attack should be directed primarily against the British, near their junction with the French, in order to drive a wedge between the two armies.

The battle which opened on March 21, 1918, the "Kaiser's battle," and lasted till Nov. 11, was the greatest in history (up to that

time). From a tactical point of view the first blow in the direction of Amiens was a brilliant success, for the British front reeled badly — without, however, breaking. A second attack on the Lys had the same result. Nevertheless, Hindenburg clung to his resolve to deal the decisive blow against the British in Flanders. In order, however, to divert the French reserves, he attacked along the Chemin-des-Dames and threw the French back to the Marne, where, for the first time. German troops came into real contact with the U.S. army. Despite large gains of territory, the Germans failed to break through the Allied lines at any point, and men like Prince Max of Baden and the crown prince of Bavaria urged the necessity of trying to obtain peace. But when Richard von Kuhlmann. the foreign minister, spoke in the *Reichstag* in this sense, the generals forced the emperor to dismiss him on July 8. A week later, they opened the last German offensive at Rheims.

This was the beginning of the end, for not only were the Germans stopped with frightful losses but Marshal Ferdinand Foch immediately replied with an Allied counteroffensive from Villers-Cotterêts, in which U.S. troops assumed a large role. Henceforth the initiative rested with the Allies. On Aug. 8, which Ludendorff called "the black day of the German army," the British struck east of Amiens so savagely that the Germans were unable to counterattack and large numbers of them were captured. From that time until November the German armies were forced from one position to another, although they fought bravely and stubbornly.

At a conference of the highest military and civilian officials held under the presidency of William on Aug. 14. Ludendorff let his opinion be known that the war could no longer be won by military operations. Hindenburg, on the other hand, assured the emperor that it would be possible to "maintain our troops on French territory and thereby in the end to enforce our will on the enemy." Chancellor Georg von Hertling passed these assurances on to the *Reichstag* and the political leaders. and no negotiations for peace were started. By the end of September, however, Bulgaria had withdrawn from the war and the Hindenburg line in the west had been pierced, while discontent was seething at home. On Sept. 28 Ludendorff. losing his nerve, concluded that an immediate armistice was imperative and communicated this to Hindenburg, and the next day the two generals informed the emperor, who accepted the situation calmly and announced the establishment of a parliamentary regime in Germany, with Prince Max of Baden as chancellor. In spite of Max's protests, the generals insisted on an armistice, and he appealed to Pres. Woodrow Wilson on Oct. 4.

As the month passed. the military situation of the German army was found to be less desperate than had been supposed, but the negotiations for an armistice could no longer be halted. On Oct. 24 Hindenburg telegraphed to all army group commanders denouncing the terms demanded by Wilson and ordering a fight to a finish. Such an act could not be tolerated by the new government, and Prince Max protested. This time the emperor yielded, not to the supreme command, but to the civilian chancellor, and Ludendorff resigned—while Hindenburg stayed, although it was he who had signed the telegram. Gen. Wilhelm Groener was appointed to succeed Ludendorff. By this time Austria-Hungary and Turkey were also ready to withdraw from the war. Also, the negotiations with Wilson had raised the question of the emperor's abdication. The emperor, incidentally, had left Berlin and gone to general headquarters at Spa, where he was out of touch with political realities. The chancellor urged William to abdicate in favour of his grandson, but in vain. The emperor wished to place himself at the head of troops and march against the revolution, but Groener was forced by Hindenburg to tell him that the army would not follow him. William then proposed to abdicate as emperor but remain king of Prussia. On Nov. 9 the revolution occurred in Berlin by which a republic was proclaimed and Friedrich Ebert, the Social Democratic leader, named chancellor. Hindenburg had then to advise the emperor to abdicate and to proceed to Holland, adding "Would to God, Sire, it were otherwise." William II never forgave Hindenburg for his exile.

With the signing of the armistice on Nov. 11, Hindenburg's role changed completely. He was no longer a victorious general but a beaten commander who had to lead his armies home as best he could. Thanks to his reputation, the armies marched back with good discipline. Hindenburg deeply resented the terms of the Versailles treaty, but when asked by the government if there was any chance of successful resistance, he evaded the issue and once more forced Groener to take the responsibility for the decision. The field marshal then retired for the second time to Hanover.

Hindenburg offered to place himself at the disposal of the Allies, in place of William II, who was accused in the treaty of Versailles of "a supreme offense against international morality and the sanctity of treaties," but no reply came. He then prepared his memoirs, *Out* of My *Life* (1920), in which he declared that the German army had not been truly beaten but had been betrayed by the revolution, thus creating the legend of the "stab in the back." He also appeared before a committee of the national assembly which was investigating the causes of the war and of the German defeat; he treated it with scant respect and made it look ridiculous. In 1923 Frau von Hindenburg died. Seemingly the old marshal having rounded out his second life, had nothing more to live for.

When President Ebert died in Feb. 1925, the Nationalists remembered Hindenburg and persuaded him to accept a nomination for the presidency. On April 26, 1925, he was elected by 14,600,000 votes, as against 13,800,000 for Wilhelm Marx, the candidate of the Catholics, Liberals and Socialists, and thus began a third life, this time in a civilian capacity. Though a monarchist by tradition and conviction, Hindenburg made no effort to restore the Hohenzollerns and allowed the republican regime to function without much interference. Perhaps his chief service was to restore the confidence of the German people in themselves. He was much influenced by Otto Meissner, secretary of state to the president, who had risen to power under Ebert, and by a camarilla of generals and conservative politicians which gradually formed around him.

In 1930 he appointed as chancellor the Catholic leader Heinrich Bruening, to whom he took a great liking. In order to deal with the economic difficulties which were becoming increasingly serious, the president, practically violating his oath, allowed the chancellor to rule more and more by decree under article 48 of the constitution. In the confused state of German politics and the multiplicity of parties, this sabotaging of the *Reichstag* seemed to have its advantages; but in 1932 Hindenburg was persuaded that Bruening was planning legislation to the disadvantage of the *junker* landlords of East Prussia and dismissed him out of hand—and the chancellor could not defend himself by appealing to the *Reichstag*. Inasmuch as Hindenburg had been re-elected president only two months before, defeating Adolf Hitler, largely through Bruening's efforts, the treachery was hardly deserved.

As successor to Bruening, the president appointed Franz von Papen, a close friend but a deep intriguer. Papen was succeeded by General von Schleicher, another favourite, only to be in turn ousted in Jan. 1933. Adolf Hitler's National Socialists were now the strongest party in Germany, and Hitler had made a bid for power in the summer of 1932. Hindenburg refused to appoint "that Bohemian corporal," but in Jan. 1933 he was persuaded to do so by Papen, who thought that he and the other experienced politicians of the right could manipulate the upstart Viennese paperhanger. It should be said that the old marshal had become somewhat senile and in all probability did not understand the machinations of those around him, including his own son Oskar, who had allowed the estate of Neudeck, East Prussia, presented to Hindenburg by admiring *junkers*, to be registered in his own name in order to escape the payment of inheritance taxes when his father should die. The calculations of Papen were quickly and completely frustrated by Hitler, who was soon able to possess himself of complete power. Hindenburg's career was now practically ended, although Hitler treated him with marked respect, and he spent more and more time at Neudeck. When Hitler carried through his purge on June 30, 1934, a telegram was sent from Neudeck congratulating him on having "nipped treason in the bud and saved the German nation from serious danger." It bore Hindenburg's signature; whether it was actually signed by him

remains uncertain. On Aug. 2, 1934, he died at Neudeck. In 1935 his body was moved to Tannenberg.

Hindenburg was Germany's greatest hero of World War I, and even in other countries he was long regarded as one who had served the state honestly and well. After his death opinion became more critical. Certainly he took credit for much which others did, while he tried to evade responsibility at critical moments, and it was a misfortune that he continued to hold the highest office in Germany after his faculties had begun to fail. Perhaps the best description of this massive personality is in the title of an English biography, "Wooden Titan."

HINDENBURG (ZABRZE), a town of Germany. in the extreme southeast of Prussian Silesia, on the railway between Gleiwitz and Konigshiitte. Pop. (1939) 126.402. Like other towns in this region, it is an important manufacturing centre, having coal mines, iron, wire, glass, chemical works, breweries, etc.

HPNDENBURG LINE, BATTLES OF 1918. On Aug. 26, 1918. began the third stage of the series of offensive operations which formed the British share of the Allied advance to victory. This stage culminated on Oct. 5 in the capture of the last and strongest system of German defence, known as the Hindenburg Line. The first stage had been the attack by Rawlinson's IV. Army, assisted by the French I. Army under Debeney, eastwards and southeastwards from Amiens with the object of freeing the Paris-Amiens railway. In the second phase the British III. Army under Byng had extended the front of the attack northwards by a successful thrust towards Bapaume. The British I. Army under Horne was now to broaden the front of attack by driving eastwards from Arras with the object of turning the German positions on the Somme battlefields.

Hindenburg Line Described.—The Hindenburg Line consisted of a heavily wired system of trenches which ran northwards from St. Quentin to the village of Bantouzelle approximately parallel to the Schelde Canal. This portion was known to the Germans as the Siegfried Line. From Bantouzelle the main line of trenches ran northwest to Havrincourt, whence it turned north and followed the line of the Canal du Nord to Moeuvres. From Moeuvres it ran northwest past Quéant and Bullecourt to the original German front line east of Arras. Within this northern bend in the system, and covering the approaches to Cambrai, lay several snitch lines and defensive positions, the most formidable of which were the Drocourt-Quéant Line, which ran in a northerly direction from the Hindenburg Line at Quéant, and the Canal du Nord, which passed by Moeuvres to the Sensée.

On the night of Aug. 25–6 the British line extended from a point northwest of Chaulnes, where the right of the British IV. Army joined the left of the French I. Army, east of Bray, nest of Bapaume to Croisilles, and thence northwest to the old British line, southeast of Arras. The IV. Army had the Australian and III. Corps in line; the III. Army, which extended northwards from a point east of Albert, had the V., IV., VI. and XVII. Corps. The I. Army front was held by the Canadian Corps and the VIII. and I. Corps, of which only the Canadian Corps, astride the Scarpe, was involved in the operations to be described. The German troops who were to bear the brunt of the impending blow were the left wing of Bulow's XVII. Army, the II. Army under Marwitz and the right wing of Hutier's XVIII. Army.

The Offensive Launched.——At 3:00 A.M. on Aug 26 the Canadian Corps under Sir A. Currie attacked the German positions astride the Scarpe on a front of 53 miles. The attack was carried out by the 2nd and 3rd Canadian Divs. and the 51st Highland Div. supported by 45 tanks and some 600 guns. The XYII. Corps of the III. Army co-operated on the right. The attack was a complete success. The Bavarian II. Corps and Bavarian I. Res. Corps were driven back through Wancourt. Guémappe, Monchy and Roeux. and by evening, in spite of strong counter-attacks, the Canadian Corps had established itself well to the east of those villages. On Aug. 27 the attack was continued by the same divisions, and Chérisy, Vis-en-Artois and Gavrelle fell into their hands. On the following day the Canadian 3rd Div. made further progress, and that night both divisions were relieved, the Canadian 2nd Div. by the Canadian 1st. while the British 4th Div. relieved the Canadian 3rd. During the next few days considerable progress was made. This advance brought the British to within assaulting distance of the formidable trench system known to the Allies as the Drocourt-Quéant Line, and to the Germans as the Wotan Line. The capture of this system, would, it was anticipated, turn the whole of the German organized positions for some distance southwards. Preparations were put in hand to launch the attack on Sept. 2. The XXII. Corps took over the front north of the Scarpe held by the 51st Div. and relieved that division by the 11th.

The Drocourt-Quéant Line Attacked.—By the evening of Sept. 1 all preparations for the attack of the Drocourt-Quéant Line were complete. The main attack was to be carried out by the Canadian Corps, whose principal task was to break through the defences between Hendecourt and Sailly. The XXII. Corps, also of the I. Army astride the Scarpe, mas to secure the Canadian left, while the XVII. Corps of the III. Army, advancing on the right of the Canadians, was to capture the maze of trenches at the junction of the Drocourt-Quéant and Hindenburg lines, and turn the last named defensive position from the north. The XVII. and Canadian Corps were then to push on up to and if possible beyond the Canal du Nord.

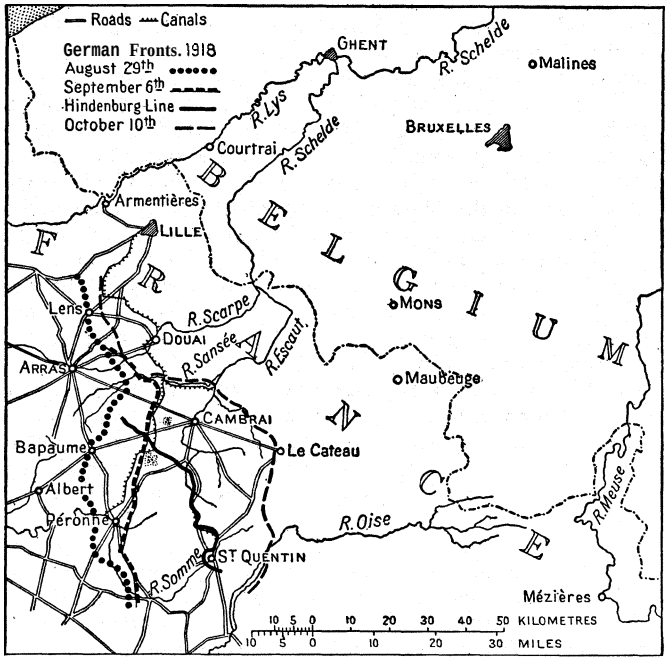
The attack of the Canadian Corps was launched at 5:00 A.M. by the Canadian 1st and 4th and the British 4th Divs., supported by some 500 guns and 40 tanks, on a front of $4\frac{1}{2}$ miles. All resistance on the first objective was speedily overcome, and by 9:15 A.M. the whole system of trenches on the front of the Canadian Corps was in the hands of the assaulting troops. On the XVII. Corps front, the attack was launched at the same hour and met with equal success. The 52nd Div. stormed the network of trenches at the junction of the two systems, and after heavy fighting succeeded in overcoming all resistance. The 57th Div., attacking north of the 52nd, pressed forward south of the Canadians, and by nightfall had swung round to the right and were threatening the villages of Quéant and Pronville from the north. The 63rd Div. had heavy fighting during the afternoon, but by dark had reached the railway east of Quéant.

During the afternoon the Canadian Corps met with increased opposition, particularly from machine guns on the British 4th Div. front, but by the evening an advance of some 3 mi. had been made and British troops had captured Cagnicourt, Villers and Dury, and were approaching the outskirts of Buissy. Eight thousand prisoners and many guns were captured, bringing the total captures on the I. Army front alone since Aug. 26 to 16.000 prisoners and 200 guns. In eight days the 10 British and Canadian divisions employed by the I. Army had defeated 13 German divisions and driven them back 10 mi., out of all their organized positions in front of Cambrai. Troops of the III. and IV. Armies prolonged the attack southward on Sept. 2, and substantial progress was made, though the fighting was severe.

The results of this most successful operation became obvious at once, as on the night of Sept. 2–3 the Germans fell back to the line of the Canal du Nord from Pkronne to Hermies. The following day they commenced to withdraw from the Somme, south of Péronne, and by the night of Sept. 8 they were back on a line Yermand (6 mi. west of St. Quentin)-Epehy-Havrincourt and thence along the east bank of the Canal du Nord to the Sensée.

Preparatory Operations Continued.—The Canal du Nord. behind which the German forces facing the I. Army and left of the III. Army had now established themselves, was far too

strong a natural position to warrant attack without very careful preparation. The next three weeks were therefore devoted by the British forces on this front to the organization of an operation which eventually took place on Sept. 27. South of Havrincourt the German main line of resistance was the Hindenburg Line, but strong forces were still occupying advanced positions in the trenches which formed the old British and German lines



MAP SHOWING SUCCESSIVE GERMAN FRONTS BETWEEN AUG 29 TO OCT. 10, 1918 AND THE GENERAL TREND OF THE HINDENBURG LINE

prior to the German offensive in March 1918. These had to be captured before the Hindenburg Line itself could be assaulted, and to this end operations were undertaken by the British III. and IV. Armies.

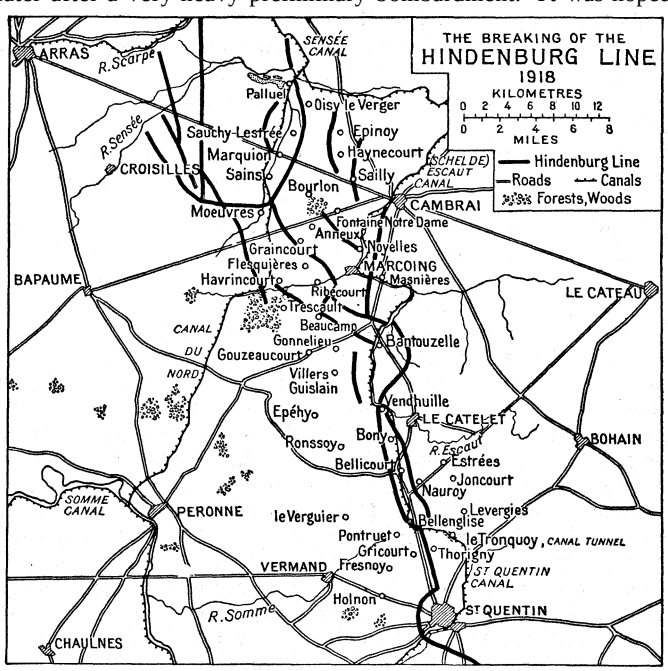
On Sept. 12 the III. Army attacked with the IV. Corps and the VI. Corps on a 5m. front in the neighbourhood of Havrincourt Wood. A considerable advance was made and the villages of Trescault and Havrincourt were captured. Meantime the IV. Army had continued to press the German withdrawal, and between Sept. 11 and 17 the line had been pushed forward at several points. On Sept. 18 a much more extensive operation was undertaken, in which the IV. Army in conjunction with the III. Army attacked the German forces on a 17m. front from Holnon to Gouzeaucourt. The French I. Army co-operated on the right. The final objective of the main attack was the old British outpost line running past Pont Ruet, west of Bellicourt, Bony and Vendhuille. It was not intended that this final objective must necessarily be reached on the first day—and in fact it was not reached until after several days of very severe fighting.

At 7:00 A.M. on Sept. 18 the IV. and III. Armies attacked in heavy rain. The attack was supported by 23 tanks and 978 guns, and in some sectors dummy tanks were used with considerable success. The IX. Corps advanced on the right with the 6th and 1st Divisions. The first objectives were taken at 9:00 A.M., but the 6th Div. was checked at Holnon and west of Fresnoy. The 1st Div. was more successful, but was unable to reach Pont Ruet, and both divisions suffered severe casualties. The Australian Corps had very heavy fighting, particularly in and about Le Verguier, and was held up in front of its final objective till dusk. During the night a successful attack was made which completed the operation on the Australian front.

North of the Australians the III. Corps attacked with the 74th, 18th, 12th and 58th Divs., and met with very stubborn resistance. Ronssoy was captured by the 18th Div. and Epéhy by the 12th and 58th Divs., but little progress was made beyond these places. The V. Corps of the III. Army continued the front of attack to the north and all divisions made considerable progress, though it was not found possible to take Gouzeaucourt on this day. Minor operations were undertaken during the succeeding week, which resulted in the capture of Gricourt and Pontruet by the IX. Corps, and by Sept. 26 the British line had been advanced to a position from which the attack on the main Hindenburg system could be launched. In this last series of operations 15 divisions of the British III. and IV. Armies had driven back 29 divisions of the German II. and XVII. Armies into the Hindenburg defences, and inflicted on them a loss of 12,000 prisoners and 100 guns.

The Storming of the Hindenburg Line.—All was now ready for the great effort to break through the Hindenburg Line. The strategic plan decided on by Marshal Foch and the Allied Commanders-in-Chief involved the launching of four convergent and practically simultaneous offensive operations. The Americans were to attack west of the Meuse in the direction of Mézières. The French offensive, also against Mézières, was to be launched west of the Argonne. The British were to break through the Hindenburg Line between St. Quentin and the river Sensée and advance on Maubeuge, while an Allied force (British, French and Belgian) under the King of the Belgians, was to attack in Flanders in the direction of Ghent. The results to be obtained from these offensive operations depended in no small degree on the success of the British attack in the centre, where a threat to the German vital systems of lateral communication would re-act on their defences elsewhere. It was here, too, that the German system of defence was most highly organized.

In accordance with the above general strategic plan the French and Americans attacked on Sept. 26; the British offensive commenced on the 27th, and the Allied attack in Flanders was launched on the 28th. Haig's plan was to strike first with his left wing in the direction of Cambrai, while the right wing, which was faced by the more formidable defences, was to attack later after a very heavy preliminary bombardment. It was hoped



DETAIL MAP SHOWING THE HINDENBURG LINE. WHICH WAS A SERIES OF STRONGLY FORTIFIED WORKS—NOT A SINGLE OR CONTINUOUS LINE

that any success obtained by the left wing would draw off the German reserves, and deceive their higher command as to the point where the main blow was to fall.

A very heavy bombardment was opened on the night of Sept. 26–27 on the front of the British I., III. and IV. Armies, and at 5:20 A.M. on the 27th four corps-attacked on a front of 13m. from Gouzeaucourt to the neighbourhood of Sauchy Lestrée. On the northern flank the Canal du Nord was too formidable an obstacle to be carried in face of opposition, and consequently the plan was conceived of crossing on a comparatively narrow front,

and then of turning the line of the canal farther north by a divergent attack from the point of crossing. This difficult manoeuvre was most successfully carried out. On the right the 5th and 42nd Divs. of the IV. Corps established and held a strong flank between Beaucamp and Ribecourt. On their left the VI. Corps advanced with the 3rd and Guards Divs., and captured Ribecourt and Flesquieres, while the 62nd and 2nd Divs., passing through, continued the advance in the direction of Marcoing. Farther north the 52nd and 63rd Divs. of the XVII. Corps forced the passage of the canal and, after heavy fighting, established themselves in Graincourt, and the 57th Div., in close co-operation with the Canadians, reached Anneux.

On the I. Army front the Canadian Corps attacked with the Canadian 4th and 1st Divs., and in the half light of dawn stormed the canal on the line Moeuvres-Sains-Marquion. With irresistible impetus the Canadian 4th Div. pushed on to Bourlon village and wood where the Canadian 3rd Div., taking up the attack, advanced towards Fontaine Notre Dame and Sailly. On the left the Canadian 1st Div. was equally successful, and, having captured Sains and Marquion, advanced rapidly towards Haynecourt and Sauchy Lestrée, while the British 11th Div. passed through and captured Epinoy and Oisy-le-Verger. Meanwhile the 56th Div. of the XXII. Corps crossed the canal, west of Sauchy Lestrée, cleared that village and advanced on Palleul. By the evening of Sept. 27 over 10,000 prisoners and 200 guns had been taken. As soon as the crossings of the canal were secured the British and Canadian engineers began to construct the necessary bridges, and in spite of heavy artillery fire completed their task with remarkable speed, and contributed in no small degree to the success of the operation.

On Sept. 28 the advance was continued and Gouzeaucourt, Marçoing, Noyelles, Fontaine Notre Dame, Sailly and Palleul were taken, and a footing was obtained on the east bank of the Schelde Canal at Marcoing. At 5:50 A.M. on the morning of Sept. 29, after a preliminary bombardment lasting over two days, in which some 1,600 guns were employed, the British IV. Army advanced to the attack, covered by an intense artillery barrage. The front of attack extended from Holnon to Vendhuile, a distance of about 12 miles. On the right the IX. Corps met with complete success. The 1st Div., advancing south of the bend in the canal at Bellenglise, established a flank facing southeast from Gricourt to the Le Tronquoy tunnel. The 46th Div., which was faced by a most formidable task, advanced with the greatest gallantry, and with the assistance of rafts, mats and even life-belts, stormed the canal at and north of Bellenglise and rushed the German trench system west of the canal. The German defences here faced south, and the British troops swung to the right and took them in flank and rear, capturing many prisoners and guns. By 3:00 P.M. the 46th Div. had broken through the Hindenburg Line to a depth of 3 miles, routed four German divisions, and taken over 4,000 prisoners and 70 guns at the small cost of 800 casualties. The 32nd Div., passing through, completed the capture of the Hindenburg Reserve Line, and by nightfall had taken 800 more prisoners and 20 guns.

Work **of** the American **Corps.**—On the left of the IX. Corps the American II. Corps had been superimposed on the Australian Corps. The task of the American troops was to break through the Hindenburg Line at and north of Bellicourt, where the St. Quentin Canal passes through a tunnel. The Australian 5th and 3rd Divs. were then to take up the attack and advance on more distant objectives. The Americans advanced with the greatest gallantry, but owing to the uncertain issue of a preliminary attack that had been made to secure a good starting line, their left division (the 27th) started half a mile behind the barrage—which the Army Command were reluctant to bring back. Without this protection its attack was quickly shattered with great loss. The Australian 3rd Div., following it up, could make but little headway and was finally checked in front of Bony. The American 30th Div. on the right was more successful, but also suffered heavily from German reserves who came up from their shelter in the tunnel, and it was only after very heavy fighting that the Australian 5th Div., passing through, finally succeeded in reaching the Hindenburg Reserve Line about Nauroy.

On the left the III. Corps carried out their task of securing the left flank of the IV. Army. On the same day the III. Army achieved an important success by securing the canal crossings at Masnières and northward as far as Cambrai, while the I. Army front was advanced northwest of that town. On Sept. 30 the break in the Hindenburg system was widened by the capture by the IX. Corps of Thorigny and Le Tronquoy, and on the same day the Germans abandoned Villers Guislain and Gonnelieu. On Oct. 1, in co-operation with the French I. Army who occupied St. Quentin, the IX. Corps took Levergies and the Australians captured Joncourt, Estrées and Bony. The III. and I. Armies also achieved important successes. During the first week in Oct. the XIII. Corps relieved the III. Corps north of the Australians and a series of successful minor operations were carried out on the fronts of all three armies, and by Oct. 5 the whole of the rearward lines of the Hindenburg system were in British hands.

Results **of** the Offensive.—During this nine days' battle 30 British and two American divisions had broken through the last and most powerfully organized system of German defences, had overwhelmed 39 German divisions and captured 36,000 prisoners and 380 guns. The effect of the British victory was decisive on the subsequent course of the campaign, and though there was still to be hard and bitter fighting before the termination of hostilities on Nov. 11, only natural obstacles such as woods, rivers and villages now lay between the British Armies and their objective at Maubeuge.

HINDĪ is the national language of India. The 1951 census of India failed to ascertain the number of people using Hindi as their mother tongue; instead it computed returns from, Hindi, Urdū and Hindustani. Of the total 149,944,311, over 90,500,000 gave Hindi and 13,500,000 Urdū as their mother tongues; the remainder gave Hindustani (*q.v.*), the lingua franca of northern India.

Hindi or High Hindi developed as a standard language through the language program offered to British civil servants at the College of Fort William, Calcutta, in the 19th century. It was fashioned on a vernacular spoken near Delhi and in the upper Gangetic Doab, and spread as the language used by government officials. Later it was used for literary purposes and eventually it became the vehicle of prose composition—previously rare in any of the modern Indo-Aryan languages (*q.v.*). (For a sketch of Western Hindi see *Linguistic Survey* of *India,* vol. ix, pt. i, pp. 50–57, 1916.)

The term "Hindi" is applied to two groups of dialects, viz. Western and Eastern. Western Hindi, *i.e.*, the Indo-Aryan dialects of the middle and upper Gangetic Doab, and the country to the north and south, has as one of its standard dialects Braj Bhāshā (Braj Bhāṣā or Braj Bhākhā), spoken near Muttra (Mathura), with extensive literature directed to the worship of Krishna. Another is Hindustani, from which High Hindi was derived. Western Hindi represents the language of the Madhyadēśa (Midland), as distinct from the Intermediate and Outer Indo-Aryan languages in the classification devised by Sir George A. Grierson. Western Hindi has four main dialects: Bundēlī of Bundelkhand, Braj Bhasha, Kanauji of the central Doab and the country north and vernacular Hindustani of Delhi and the upper Doab. West of the upper Doab, across the Jumna, is another dialect, Bāngarū. Kanauji is closely related to Braj Bhāshā, and these two were with Awadhi the great literary vehicles of northern India until about 1850. Nearly all the classical literature of India is religious, Braj Bhāshā being concerned with Krishna, Awadhi with the Rāma cult and associated epic poetry.

Eastern Hindi, an Intermediate Indo-Aryan language spoken in Oudh, Baghelkhand and Chattisgarh, has a large and important literature. Its most famous writer is Tulsi Dās, poet and reformer,

who died early in the 17th century; since his time it has been the north-Indian language of epic poetry. Eastern Hindi has Bihārī to its east and Marāthī to the south, both being Outer languages. Awadhi (Avadhi), spoken in Oudh, is the most important dialect of Eastern Hindi. The other dialects, Chattisgarhi and Baghēlī, have little recorded literature. (For a sketch of Eastern Hindi see vol. vi of the *Linguistic* Survey *of India,* 1904.)

Modern Hindi literature: like other Indian literatures under British influence in the early 19th century, developed away from the conventions and themes of indigenous verse, and towards a standard language suitable for western prose forms—the novel, short story, essay, newspaper article, biography, history, literary criticism, tragedy and the one-act play. New themes reflect dynamic changes—social, political, intellectual and material—which entered the Indian social structure through contact with the west. Secular and popular themes were preferred to religious and esoteric themes; *e.g.,* daily life, society in transition, the need for social reform.

Of the first two great Hindi writers, Bharatendu Harischandra (1850–1883) and Mahavirprasad Dwivedi (1868–1938), the latter is considered the founder of modern Hindi prose through his influence as editor of the monthly *Saraswati* (first quarter of the 20th century). The period roughly from 1920 to 1937 was characterized by two movements. Limited to poetry, the first, the Chāyāvāda, was romanticist with a strongly theistic undercurrent. Its pioneers were the poets "Nirala" (Suryakant Tripathi, 1896–) and Sumitranandan Pant (1900–). The second movement, Pragativāda ("Progressivism"), was a blend of late romanticism and Marxian dialectic. At first it had common interests with the progressive-liberal outlook found in the most distinguished of Hindi writers, Prem Chand (1880–1936), but later it identified itself with the doctrinaire communist movement. These movements gave way in the post World War II period to the Nayī Kavitā ("New Poetry") or Prayogavāda ("Experimentalism") and, in prose, to the search for authenticity which has interested some writers in special segments of society and produced a regional fiction.

(ET. B.)

HINDI AND URDU LITERATURE. The literatures of Hindi and Urdu are here grouped together because they are two forms of what is basically a single language, possessing a common grammatical structure and a largely common vocabulary of those words which relate to the elementary needs of daily life (see HINDUSTANI LANGUAGE). At the literary level they are widely divergent and constitute for all practical purposes two separate languages. Hindi is written in the Devanagari script, draws upon Sanskrit for its literary vocabulary, and exhibits in many works the influence of Sanskrit literary traditions. Urdu is written in the Persian script, draws upon Persian and Arabic for its literary vocabulary, and is influenced by Persian literature. (RH. R.)

HINDI LITERATURE

Of the different forms of Hindi the most important from a literary point of view are Braj Bhasha and Kanauji and Eastern Hindi (see HINDI). High Hindi is a modern literary development of that dialect of Western Hindi originally spoken about Delhi and northward to the Himalayas.

The Rajasthani dialects of Marwari and Jaipuri, west of the main Hindi areas, and Bihari, to the east, are now not customarily classed as Hindi tongues. But their literary importance is mentioned here because of their contribution to the formation of the literature of central north India between the upper Jumna and eastern Rohilkhand that may securely be labelled "Hindi." (See BIHARI LANGUAGE; RAJASTHANI LANGUAGE.)

Hindi as a literary language intruded upon the ground occupied by Sanskrit and represents mainly a revolt against Brahmin monopoly of Sanskrit. During the early period (approximately A.D. 1100–1500) the language was being fashioned as a literary medium out of the ancient Prakrits *(see* PRAKRIT LANGUAGES).

Early Hindi **Literature.**—Knowledge of the ancient metrical chronicles of Rajasthan is still imperfect and is chiefly derived from James Tod's *Annals and Antiquities of Rajasthan* (1829–32), which is founded on them. It is in the nature of compositions of this character—products of the family bards of the dynasties whose fortunes they record—that they should be constantly added to and their languages modified. Around a historical nucleus legends accumulate; later redactors try to systematize and to assign dates. but the mass has the character of ballad literature. The materials used by Tod are nearly all still unprinted. and his important manuscripts are in the library of the Royal Asiatic society. London.

The first known chronicle of this bardic era is the *Khumman Raso* of the 10th century. This relates the deeds of the rulers of Chitor. In 1016 was first written the *Bisaldev Raso,* in four cantos, about a ruler of Ajmer. But the earliest author of whose works any part had been published in the original text by the mid-20th century is Chand Bardai, court poet of Prithvi-raj, the last Hindu sovereign of Delhi. His poem, *Prithi-Raj Raso,* is a vast chronicle in 69 cantos, comprising a general history of his period. Of this a small part has been printed by the Asiatic Society of Bengal; but the difficult nature of the task prevented much progress. A fresh critical edition of the text was completed in 1913 under the auspices of the Nagari Pracharini Sabha (Banaras). Chand was a native of Lahore, which for nearly 170 years (since 1023) had been under Moslem rule when he flourished. and the poem contains many Persian words. In its present form the work is a redaction made by Amar Singh of Mewar (early 17th century), more than 400 years after Chand's death. The detailed dates contained in the c ronicle are in every case about go years astray: and the Mongols (Book XV) are brought on to the stage more than 30 years before they actually set foot in India and are said to have been vanquished by the redoubtable Prithviraj. But undoubtedly the chronicle contains in it much of Chand's original composition. "We have certainly in his writings some of the oldest known specimens of Gaudian literature, abounding in pure Xpabhramsa Sauraseni Prakrit forms" (Grierson, see *Bibliography*).

It is difficult to form a just estimate of the poem as literature. The language, essentially transitional in character, consists largely of obsolete and obscure words. Chand appears to exhibit the merits and defects of ballad chroniclers. There is much that is spirited in his descriptions of the battles, marriages and hunting expeditions of Prithivi Raj; and the characters of the Rajput warriors are often sketched with skill and animation. But the poem is too long and tends to be tedious.

Chand may be taken as a representative of a long line of successors. still continued in Rajasthan. Many of their compositions are still popular as ballad literature but are known only in the oral versions of professional singers. One of the most famous is the *Alha-khand,* reputed to be the work of a contemporary of Chand called Jagnik or Jagnayak, of Mahoba in Bundelkhand, who sang the praises of Raja-Parmal, a ruler whose wars with Prithviraj are recorded in the "Mahoba-Khand" section of Chand's work. Alha and Udal, the heroes of the poem, are famous warriors in popular legend. and the stories connected with them exist in an eastern recension current in Bihar, as well as in the Bundelkhandi or western form which is best known. Another celebrated bard was Sarangdhar of Rantambhor, who flourished about 1363, and sang the praises of Hammir Deo, the Chauhan chief of Rantambhor, who fell in a heroic struggle against Sultan Alauddin Khilji in 1300. He wrote the *Hammir Kavya* and *Hammir Raso,* of which an account is given by Tod. The *Hammir Raso* is the last epic of the bardic era. A much later work is the long chroni-

cle, *Chattra-Prakas*, or the history of Raja Chattarsal, the Bundela raja of Panna, who was killed fighting for Prince Dara-Shukoh in the battle of Dholpur won by Aurangzeb in 1658. The author, Lal Kabi, has given in this work a history of the valiant Bundela nation.

Mention may be made here of a remarkable composition, a poem entitled the *Padmawat* (1540), the materials of which are likewise derived from the heroic legends of Rajasthan. The author, Malik Mahomed of Ja'is in Oudh, was a Moslem devotee to whom the Hindu raja of Amethi was greatly attached. The poem is composed in pure vernacular Awadhi, with no admixture of traditional Hindu learning, and is generally found written in the Persian character, though the metres and language are thoroughly Indian. It professes to tell the tale of Padmawati or Padmini, a princess celebrated for her beauty, who was the wife of the Chauhan raja of Chitor in Mewar, Rajasthan. The story turns upon the attempts of Alauddin Khilji to gain possession of her person. Malik Mahomed takes great liberties with the history, and explains at the end of the poem that all is an allegory.

With the dispersal of scholars and destruction of temples which followed the Moslem invasions the Hindus of the north were driven back on their religion. The literature of the *bhagats* or Vaishnava saints who propagated the doctrine of *bhakti* or faith in Vishnu has exercised a powerful influence upon the national speech and poetic literature. Nearly the whole of subsequent Hindi poetry is impressed with Vaishnava doctrine. This Vaishnava revival in the north had its source in the south, in the teachings of Ramanuja, a Brahmin born about the end of the 11th century at Perambur near the modern Madras. His works, which are in Sanskrit and consist of commentaries on the *Vedanta Sutras,* are devoted to establishing "the personal existence of a Supreme Deity, possessing every gracious attribute, full of love and pity for the sinful beings who adore him, and granting the released soul a home of eternal bliss near him." The Hindus regard the Deity as having become incarnate on several occasions for the benefit of mankind; but of these incarnations two, Ramachandra, the prince of Ayodhya, and Krishna, the chief of the Yadava clan, are pre-eminently the objects of *bhakti*. The cult of Kama is founded on the virtues of family life, while that of Krishna employs the language of erotic passion to express the longings of the soul for God.

Because Ramanuja's doctrine was too abstruse, and in Sanskrit, it did not reach the people. But it appears to have been set forth in the vernacular about 1250 by Jaideo, a Brahmin of Bengal, author of the Sanskrit *Gita Govinda,* and about 1300 by Namdeo, or Nama, a tailor of blaharashtra, of both of whom verses are preserved in the *Adi Granth,* the sacred book of the Sikh gurus or fathers. But it was not until the 15th century that the Brahmin Ramanand, a follower of Ramanuja, wandered in the north as an itinerant preacher and made Vaishnavism the popular faith of Hindustan. One short Hindi poem by him is contained in the *Adi Granth* and Sir George Grierson collected hymns (bhajans) attributed to him and still current in Mithila or Tirhut.

Among Ramanand's 12 disciples was a Moslem weaver, the celebrated Kabir. Sixty-one works, containing about 20,000 verses, are ascribed to him, but of these at least four were the works of his disciples. Though he described his dialect as Awadhi, it was in fact an amalgam. His style makes up in power what it lacks in polish, and it is suffused by mysticism. Both Ramanand and Kabir were devoted to the cult of Rama; a contemporary of Ramanand. Yidyapati Thakur, is celebrated as the author of numerous lyrics in the Maithili dialect of Bihari, expressive of the other side of Vaishnavism, Krishna worship. Vidyapati's stanzas afterward inspired the Vaishnava literature of Bengal, whose most celebrated exponent was Chaitanya (b. 1484). Mira Bai, "the one great poetess of northern India" (Grierson), was the daughter of Raja Katiya Rana, a Rathor of Merta in Rajasthan, and was married in 1413 to Raja Kumbhkaran of Mewar. She was devoted to Krishna, and her songs have a wide currency in India.

An important compilation of the utterances of the early Vaishnava *bhagats* is contained in the Sikh *Adi Grunth*. Nanak (1469–1538), the founder of Sikhism, took his doctrine from the *bhagats;* and each of the 31 *rags,* forming the body of the *Granth,* is followed by texts from the utterances of Vaishnava saints, chiefly of Kabir, while the book's *bhag* or conclusion contains more verses by the same authors. These extracts are a precious store of the work of authors some of whom have left no other record.

Middle Hindi Literature. — The second period, that of middle Hindi, begins with the reign of the emperor Akbar; and it is not improbable that his sympathy with his Hindi subjects, and the peace which his organization of the empire secured had an important effect on the great development of Hindi poetry which then set in. Akbar's court was itself a centre of poetical composition. Akbar's favourite minister and companion, Raja Birbal, was a musician and a poet, and held the title of *kabi-ray* or poet laureate; his verses and witty sayings are still popular.

By this time worship of Krishna as the lover of Radha (*Radhavallabh*) had been systematized, with its chief habitation at Gokul, near Muttra, by Vallabhacharya, a Brahmin from Madras. Born in 1478, he chose Braj as his headquarters in 1497, thence making missionary tours throughout India. He wrote chiefly in Sanskrit; but among his immediate followers, and those of his son Bitthalnath (who succeeded him in 1530), were some of the most eminent poets in Hindi. Four disciples of Vallabhacharya and four of Bitthalnath, who flourished between 15jo and 15jo, are known as the Asht Chhap, or "Eight Seals," and are the acknowledged masters of the literature of Braj Bhasha. Their names are Krishna Das Pay-ahari, Sur Das (the Bhat), Parmanand Das, Kumbhan Das, Chaturbhuj Das, Chhit Swami, Nand Das and Gobind Das. Of these the most celebrated is Sur Das, who was descended, as he claimed, from the bard Chand Bardai. The traditional dates of his birth (1483) and death (1573) seem to be placed too early. His many hymns to Krishna have been collected in the *Sur Sugar,* said to contain 60,000 verses. This work is considered the high-water mark of Braj devotional poetry. The great glory of this age (coinciding with the Elizabethan age of English literature) is Tulsi Das (*q.v.*). He and Sur Das between them are held to have exhausted the possibilities of poetic art.

A period of artifice and reflection followed, when many works were composed dealing with the rules of poetry and the analysis and the appropriate language of sentiment. Especially famous is Kesab Das, a Brahmin of Bundelkhand. who flourished in the reigns of Akbar and Jahangir. His works are the *Rasik-priya,* on composition (1591), the *Kuvipriya,* on the laws of poetry (1601), the *Ramachandrika,* dealing with the history of Rama (1610), and the *Vigyan-gita* (1610). This elaboration of the poetic art reached its highest point in Bihari Lal, whose *Sat-sai,* or "seven centuries" (1662), is the most remarkable example in Hindi of the rhetorical style in poetry.

Side by side with this literary cultivation of the themes of Rama and Krishna, there grew up a class of composition dealing with the lives of the holy men who guided the development of the popular religion. The most famous is the *Bhakta-mala,* or "Roll of the Bhagats," by Naryan Das. Nabha Das, or Nabhaji, a member of the menial Dom tribe of the Deccan, who had in his youth seen Tulsi Das. His work consists of 108 stanzas, each setting forth the characteristics of some holy personage. and expressed in a brief and obscure style. Its date falls between 1j8j and 1623. The book was furnished with an *ika* (supplement or gloss) in a different metre by Priya Das in 1713, gathering up in an allusive and disjointed fashion the stories related of each saint. This again was expanded about a century later by Lachhman into a work called the *Bhakta-sindhu.* From these nearly all our knowledge of the lives of the Vaishnava authors is derived, and much of it is of a dubious character. Another work. dated 1j51, named the *Chaurasi Varta,* is devoted to stories of the followers of Vallabhacharya. It is attributed to Gokulnath, grandson of Vallabhacharya.

The themes of the many authors who succeeded the great period of Hindi poetical composition which extended through the reigns of Akbar. Jahangir and Shah Jahan exhibit no novelty. (*See* list of Hindi authors by Sir George Grierson, in *J. Asiatic Soc.* of *Bengal,* 1889.) The courts of Chhatar Sal, raja of Panna, who died in 1658, and of several rajas of Bandho were famous for their

patronage of poets; and the Mogul court itself kept up the office of poet laureate even during the fanatical reign of Aurangzeb.

Modern Period.—At the beginning of the 19th century John Gilchrist was head of the Fort William college at Calcutta and he gathered together the leading vernacular scholars to prepare suitable books in their languages. Under Gilchrist's guidance Lallu Lal created "High Hindi" as a literary language. His Prem *Sagar* and Rajniti—the former a version in pure Hindi of the 10th chapter of the Bhagavata Purana, detailing the history of Krishna, and founded on a previous Braj Bhasha version by Chaturbhuj Mise; and the latter an adaptation in Braj Bhasha prose of the *Hitopadesa* and part of the Pancha-tantra—are unquestionably the most important works in Hindi prose. The Prem *Sagar*, begun in 1804 and completed in 1810, enjoys immense popularity in northern India. The *Rajniti* (1809) is much admired for its sententious brevity and the purity of its language. Lallu Lal was also the author of a collection of 100 anecdotes in Hindi and Urdu entitled *Lataif-i-Hindi*, an anthology of Hindi verse called the *Sabhabilas*, a *Sat-sai* in the style of Bihari Lal called *Saptasatika* and several other works.

The most noticeable authors in Hindi after the middle of the 19th century were Babu Harishchandra and Raja Siva Prasad, both of Benares. The former (1850–85) was an enthusiastic cultivator of the old (dialect) poetic art. He published the *Sundari* Tiiak, an anthology of Hindi poetry, and a quantity of old texts, with much added matter. He also wrote biographies and critical studies. In history especially he cleared up many problems. In his Kashmir *Kusum*, or history of Kashmir, a list is given of about a hundred works by him. He was also the real founder of the modern Hindi drama. Raja Siva Prasad (1823–95) published many educational works which greatly contributed to the formation of a form of Hindi not excessively Sanskritized, and not rejecting current Persian forms. The first novel in Hindi, Rani Ketaki *Ki Kahani*, had been written about 1800 by Insha Allah, a Kashmiri Moslem settled in Lucknow; but thereafter there was no creative prose writing till Deoki Nandan (1861–1913) wrote a series of fantasies. His contemporary Gopal Ram Gahamari introduced some realism into fiction, while Kishori Lal Goswami (1865–1932) drew inspiration from the Bengali novel. But the greatest Hindi novelist was Prem Chand (1880–1936). His plots were thin and his characters somewhat unreal; but he had a vigorous style and a keen sense of description. Hindi drama, however, went through a lean period after Harishchandra.

Hindi poetry after the mid-19th century was inspired by nationalism and the desire for social reform. The most outstanding poet, Mithili Saran Gupta (b. 1886) voiced these sentiments while standing squarely in the classical tradition. (C. J. L.; S. GL.)

URDU LITERATURE

Notwithstanding that the earliest Urdu works date from the 14th century, that a work of Urdu prose so outstanding as Mulla Vajhi's allegory *Sab* Ras was written in 1634 and that a school of poetry flourished in the Deccan in the 17th century—reaching the height of its development with Vali (?1667–?1741)—it was about 1730 in Delhi, the imperial capital, that some of the greatest Urdu poets began to establish their name. From then until the early years of the 19th century three great names dominate the scene. Sauda (1713–80), Mir (1724–1810) and Mir Hasan (1727–86).

The first great age of Urdu poetry is also the age of the rapid dissolution of the Mogul empire, when the faithlessness, cruelty, corruption and general moral depravity of the ruling nobility became notorious. On this nobility the poets depended for their livelihood; but it should not be thought either that their poetry reached only a limited court circle or that it expressed the decadent values of their patrons. The people of Delhi were accustomed to hear the great poets reciting their verses in public gatherings known as mushairas, and poetry of considerable refinement and subtlety was widely understood and appreciated. Mir indeed explicitly avowed that it was for the ordinary people that his poetry was primarily intended. That the poets did not flatter the nobility the example of Sauda clearly shows. He is pre-eminent as a satirist, and his work is a fuil-blooded attack on the decadence of his age. A stranger to the modern conventions of literary polemic, he assails the objects of his wrath, as did Aristophanes and Milton, with every weapon at hand. The emperor himself is attacked for his spinelessness, his armies for their cowardice and inefficiency, the nobles for their incompetence in state affairs, administrators and officials for their corruption, and scholars for their failure to master and develop their heritage of learning. A healthy, boisterous humour pervades his work, which not only, reveals a remarkable invective power, but also an astonishing mastery of the whole range of learning of his day. Like that of all great satirists, his indignation arises from a deep and genuine sorrow, and he sincerely laments the decline of Delhi, which only a generation or so earlier had been the largest and most famous city between Constantinople and Canton.

This same deep sorrow for the fall of Delhi and the misfortune of its people finds frequent and poignant expression in the poetry of Mir. Mir, however, is primarily a love poet, unsurpassed in the beautiful and moving portrayal of all the situations of love as it manifests itself in Indian Moslem society, where love and marriage are two wholly separate phenomena, where purdah ensures the complete segregation of the sexes from an early age, where all love is therefore illicit love, persecuted as dangerous to society, and when in consequence almost all love affairs end in tragedy. Mir's poetry is the finest expression of the values which to a greater or less extent are those of all the great writers of the *ghazal*, or lyric. For him it is fidelity to the ideals of love in the face of all adversity which makes a man a real man, and love in a much wider sense than that of the love of man for woman (though comprehending that also) is the force which should govern all human relationships. In his poetry the love of man as man, without regard to social status, religious creed or nationality, is particularly prominent.

Mir Hasan's fame rests mainly upon a single work, his masnavi (verse romance) of the love of Badr-i-Munir and Benazir. Its popularity is still unrivalled. Within the conventional framework already established for the masnavi before his day, he describes with great delicacy and beauty the first meetings of the lovers, the subsequent grief of separation and their final happy reunion. The story is set amid scenes of splendour which, vividly and with realistic detail, recall Mogul India at the height of its glory. The characterization is masterly and the language of crystal and overwhelmingly effective simplicity.

Of the same age is Nazir Akbarabadi (1740–1830), but he differs significantly from his contemporaries in that he alone turned his back on the courts and passed his life among the ordinary people. His poetry reflects this fact: for the most part he abandons the strict classical forms for those which allow him more freedom, uses metres more varied and closer to folk rhythms, and employs without any refinement the language of popular speech. Most significant of all, however, are his themes. These describe the revelry of popular festivals, both Moslem and Hindu, the seasons, various animals and their young, everyday recreations and scenes, and many other subjects which had not hitherto been made the central themes of independent poems. A zest for the material pleasures of life, including sexual pleasures, finds frank expression in his poetry. He is a great poet, though not of the greatest. Of all Urdu poets he is perhaps the one who makes the most immediate appeal to the western reader.

No long period of time divides Ghalib (1797–1869) from the age of Mir and Sauda, but his outlook is radically different from theirs. He is unmistakably the first of the moderns, living in the present, and seeking the solution to the ills of the time not, as they did, in the re-establishment of the best values of the old society, hut in the development of the potentialities of his own age. A shrewd, humorous and deep observer of men and their institutions, sceptical about religion, jealous fo'r his honour and self-respect, un-

failing in fortitude and humour, able to look at himself, as it were, through others' eyes, critical both of the old order and of the new, and unwilling to fall down and worship the values of either—such is the picture of him which emerges from his works. It is significant that his popularity rapidly increased in the 20th century.

Anis (1802–74), though younger than Ghalib, belongs spiritually to the old world. He is the undisputed master of the *marsia*, or elegy. a long poem composed for recitation in assemblies gathered to mourn the martyrdom of Husain and his 71 companions at Karbala; and it is his complete mastery of this particular form which singles Xnis out from the other great poets. who in depth of feeling and skill in composition are not inferior to him. What the *marsia* particularly demands is that the poet never lose the sense of what will make it effective in recitation, and in all Anis's prolific work this sense rarely seems to desert him.

Urdu Prose.—In 1800 the Fort William college was established and within a few years a number of romances in simple. colloquial Urdu made their appearance. Commissioned as test books for the instruction of British officials in Urdu. many of them nevertheless possess considerable literary merit. Their atmosphere is that of the *Arabian Nights.* Outstanding among them is Mir Amman's *Bagh o Bahar,* which is still widely read. There is an English translation by D. Forbes (London. 1862). Others available in English include Sayyid Haidar Bakhsh's *Tota Kahani* (tr. G. Small. London. 1875) and Ikram Xli's *Ikhvan us Safa* (tr. J. T. Platts, London, 1875). These works did much to weaken the hold of the traditional style of Urdu prose. ornate and abounding in elaborate verbal artifices. which had hitherto alone been considered a fit vehicle for literary work. It continued to dispute the field, however. until it received its death blow at the hands of Ghalib. The graceful. easy. almost conversational style of his letters. collections of which were published during his lifetime, set a new standard which completely superseded the old.

After the 1857 mutiny new trends developed in Urdu literature. The first of these was the fruit of the life work of Sir Sayyid Ahmad Khan (1817–98), who strove to convince the Indian Moslems that they must identify themselves with the aims of British rule, and worked indefatigably for the introduction of western education and western ideas as the most potent means of achieving this end. His movement. the "Aligarh movement." is so called because it centred around the Aligarh Mohammedan Anglo-Oriental college founded by him in 187;. His own voluminous writings are less important than those of the younger men associated with him. Noteworthy among these are Zaka Ullah (1832–1910), who performed single-handed an enormous task in preparing more than 100 instructional books in Urdu. Nazir Ahmad (1831–1912), one of the best of all Urdu prose stylists and ,a writer of great. realistic power and, above all. Hali (1837–1914). As a poet. Hali is best known as the author of the *Musaddas,* a long poem contrasting the past glories of Islam with the present fallen state of the Indian Moslems and calling on them to work for national regeneration. It evoked a truly overwhelming response. His best poetry, however. is to be found in his *ghazals.* As a biographer his most voluminous work is his life of Sir Sayyid. his best that of Ghalib. As a critic. his major work is *Poetry and Poetics,* in which he discusses the nature of poetry and then proceeds to a comprehensive survey of the main branches of Urdu poetry in the light of the conclusions reached. The work reveals all the limitations of a narrowly Victorian outlook. but also shows a wide knowledge and deep appreciation of classical Urdu poetry.

In a sense complementary to Hali's work is *Ab i Hayat,* by Muhammad Husain Xzad (1827–1910), the first considerable work on the history of Urdu poetry. It is most valuable for the largely traditional stories of the great poets. which Xzad tells extremely well and which often bring into relief significant aspects of their character of which Xzad himself seems unaware.

The opposition to Sir Sayyid was centred in Lucknow. but not all Lucknow writers were hostile. With Aligarh in spirit were Sarshar (1846–1902), whose enormous book *The Adventures of Azad* is full of vivid pictures of the Lucknow of his day, and Rusva (1858–1931), the setting of whose *Cmrao Jan Ada,* technically the most perfect novel in Urdu, is Oudh in the middle decades of the 19th century.

The organ of the opposition was the humorous journal *Oudh Punch* (1877–1913), and its most effective weapon the witty satirical verse of Akbar (1846–1921). *Oudh Punch* did not share Aligarh's enthusiasm for British rule. and assailed it for trying to turn Indians into Englishmen. While not opposed to modern education as such. it insisted on the need to preserve and take a pride in the traditions of Indian cultural and social life. including the tradition of Hindu-Moslem unity. and was from the outset sympathetic to the Indian national congress.

Shibii (1857–1914) is the author of many works on Islamic history. Originally a partisan of Sir Sayyid, he later became increasingly sympathetic to pan-Islamism and to Indian nationalism, and a tendency to idealize the past impairs the value of his historical work. It is as a critic that he excels. His monumental *Sher ul Ajam* is an excellent study of the whole range of Persian poetry. and his *Comparison of Anis and Dabir* was in the mid-century still the best study of the Urdu *marsia.*

Literature of the 20th century.—The main political ideas of the age—nationalism. pan-Islainism, Moslem communalism and finally. after 1917, Socialism and Communism—all influenced Grdu literature. which after 1goo, and more especially 1918, enormously extended its range. From 1y18 to about 193j poetry. both in the classical and in the more modern forms. and prose of every kind—journalism. essays. criticism. history. biography, travel writing, short stories. novels, humorous writing—all developed on a scale which renders an adequate survey impossible. Among the *ghazal* writers the major names are those of Hasrat. Fani. Asghar, Yas-Yagana, Riaz and Firaq. Those writing mainly in other forms include Iqbal. Josh and Akhtar Shirani. In journalism. which developed particularly rapidly in the years which culminated in the first non-co-operation movement and the allied *khilafat* movement, some of the great names are those of Abul Kalam Xzad, Muhammad Ali. Zafar Ali Khan. and finally Qazi Abdul Ghaffar. also a novelist and biographer. In criticism. Abdul Haq is the leading figure; in the essay. which in the 1920s was the most developed form in Crdu prose. Hasan Nizami. Mahdi Ifadi. Sajjad Xnsari and Sajjad Haidar Yaldaram; in the short story. Prem Chand and Sudarshan; in the novel. Prem Chand again; in humorous writing, Farhat Ullah Beg. Azim Beg Chughtai, and Patras. Space allows detailed mention of only two—Iqbal and Prem Chand.

No poet of this period exercised so wide an influence as Sir Muhammad Iqbal (1875–1938), for nationalists. Moslem communalists and communists all derive inspiration from his poems. Iqbal stresses the need for man to develop to the full all the latent powers within him, so that he may become "the vice-regent of God on earth" and set out to make his own future. guided not only by reason but also by a passionate and all-consuming zeal for the realization of his ideals. He believes that this doctrine constitutes the essence of true Islam. and conversely that only he who is inspired by sincere devotion to Islam can hope to achieve the tasks which Iqbal sets before mankind. *Poems from Iqbal* (translated by Victor Kiernan, London. 19jj) gives an excellent translation of some of his main poems. *The Ardent Pilgrim,* by Iqbal Singh (London. 1951), is a good short study.

The work of Prem Chand (d. 1936), who wrote both in Urdu and Hindi, mainly depicts the life and struggles of the Indian peasants of his own day. Prem Chand knew his subject intimately; he deeply loved the peasants, and from the outset strove to use his art in their service and to inspire in his readers the same indignant anger that he himself felt for their oppressors—the landlords. moneylenders. capitalists and officials of the foreign government. His numerous short stories contain his artistically most perfect work, and his novels would be equally good were it not for faults in construction and for the negative influence of Gandhian preconceptions which in parts impair their essential realism. A steady weakening of this influence is evident as his work matures, and his last novel *Gaodan* (1936) is his best, *A Handful* of *Wheat* (Delhi, 19jj) gives a good selection of his stories in English.

After 1935 the major trend to develop was that represented by the Progressive Writers' association, founded in 1936, in which writers of socialist and communist sympathies came to predomi-

nate. In fiction its forerunner was Prem Chand, who indeed actively associated himself with the new movement. In poetry. many of its writers continued the trend established by Josh (1894–), the "poet of revolution," an accomplished and versatile poet who had already made his name in the 1920s. Noteworthy among writers who were associated with this trend are the poets Ali Sardar Jafri, Majaz, Jazbi, Makhdum and Faiz; the critics Majnun, Ihtisham Husain. Firaq and Ale Ahmad Sarur; and the short story writers Krishan Chandar. Minto, Bedi. Hayat Ullah Ansari and Ismat Chughtai. The further perfection of the short story was the progressives' main achievement. Some of Krishan Chandar's appear in English (Flame and the Flower, Bombay, 1951).

BIBLIOGRAPHY.—There are no satisfactory general histories. The most readable is R: B. Saxena's *History of Urdu Literature* (Allahabad, 1927); *see* also *T*. HINDLEY, an urban district (1894) in the Westhoughton parliamentary division of Lancashire, Eng., 18 mi. W.N.W. of Manchester by road. Pop. (1961) 19,395. The first grammar school was built in 1632 and the church in 1641. Now purely industrial, cotton milling, light engineering and the making of asbestos, paints and clothing are the chief works.

HINDOSTAN is a Persian word. and in modern Persian is pronounced "Hindūstān." It means the country of the Hindūs. In mediaeval Persian the word was "Hindōstān," with an 6, but in the modern language the distinctions between *ē* and i and between 6 and *ū* have been lost. Indian languages borrowed Persian words in their mediaeval form. The word "Hindu" is in mediaeval Persian "Hindō," representing the ancient Avesta *hendava* (Sanskrit, *saindhava*), a dweller on the *Sindhu* or Indus. Because of the influence of scholars in modern Persian the word "Hindū" is now established in English and, through English, in the Indian literary languages; but "Hindo" is also often heard in India. "Hindostan" with o is much more common both in English and in Indian languages, although "Hindustan" is also employed. Up to the days of Persian supremacy inaugurated in Calcutta by John B. Gilchrist and his friends, every traveller in India spoke of "Indostan" or some such word, thus bearing the testimony to the current pronunciation. Gilchrist introduced "Hindoostan." which became "Hindustan" in modern spelling. The word is not an Indian one, and both pronunciations, with *ō* and with *ū*, are current in India at the present day. but that with *ō* is unquestionably the one demanded by the history of the word and of the form which other Persian words take on Indian soil. On the other hand, "Hindu" is firmly established in English. The word "Hindi" has another derivation, being formed from the Persian Hind, India (Avesta *hindu*, Sanskrit *sindhu*, the Indus). "Hindi" means "of or belonging to India," while "Hindu" now means "a person of the Hindu religion." See Sir Charles James Lyall, *A* Sketch of the Hindustani Language, p. 1. (1880).

HINDUISM. A precise definition of Hinduism is hard to formulate since the beliefs and practices of the Hindus vary widely both regionally and, within a given region, from class to class. It is a favourite dictum that Hinduism is not a religion but a whole way of life, whose precepts cover a vast range of human activity outside the scope of most modern religions. A distinction must be drawn, however, between the orthodox Hindu and the modern educated Indian of Hindu origin who still respects much of his ancient religion and calls himself a Hindu but breaks so many of the ancient precepts that, strictly, he can scarcely be classed as such. In its traditional form the chief distinguishing features of Hinduism are the doctrine of the transmigration of souls, with its corollary that all living beings are the same in essence; a complex polytheism, subsumed in a fundamental monotheism by the doctrine that all lesser divinities are subsidiary aspects of the one God; a deep-rooted tendency to mysticism and monistic philosophy; a stratified system of social classes, generally called castes, which is given religious sanction; and a propensity to assimilate rather than to exclude. This last feature divides Hinduism sharply from the religions of the west, based on Judaism. The latter, at least in their earlier forms, generally reject as false all other religious beliefs and practices; Hinduism, on the other hand, concedes some validity to them all. The western attitude is expressed by the words of Yahweh on Sinai, "You shall have no other gods before me" (Ex. xx, 3); in the Bhagavad Gita, the incarnate god Krishna says, "Whatever god a man worships, it is I who answer the prayer."

Hinduism as it is known today has developed slowly from the synthesis of sacrificial cults brought in by the Aryan invaders of c. 1500 B.C. with the religions of the various indigenous peoples they conquered. These included the highly civilized peoples of the Harappa culture of the Indus valley and the nameless savage tribes of the hillier parts of the hinterland of India. There are thus distinctive differences in the Hinduism of every main region of India, partly due to the local genius and partly to the survival of prehistoric chthonic cults and practices. To these must be added external factors. Zoroastrianism, Islam, Christianity, the tribal religions of central Asian nomads and perhaps even Chinese Taoism have all influenced the complex of religious belief, custom and practice.

HISTORY AND LITERATURE

Vedic Period. — The earliest phase of Hinduism is rooted in the religion of the Vedas — four collections (*samhita*) of hymns, incantations and sacrificial formulas, known as the Rigveda, the Samaveda, the Yajurveda and the Atharvaveda. Of the four, the Rigveda is the earliest and most important, being probably composed over a period of several centuries and collected in its present form early in the 1st millennium B.C. To each Veda is attached a body of prose writings of later date called Brahmanas (c. 800–600 B C), intended to explain the ceremonial application of the texts and the origin and import of the sacrificial rites for which they were supposed to have been composed. Further appendixes, the Aranyakas (c. 600 B.C.) and Upanishads (c. 600–300 B.C.), respectively expound the symbolism of the more recondite rites and speculate on the nature of the universe and man's relation to it. (See also VEDIC RELIGION; SANSKRIT LANGUAGE AND LITERATURE.) When Vedic religion gradually evolved into Hinduism between the 6th and 2nd centuries B.C., these texts taken collectively became the most sacred literature of Hinduism. They were known as shruti (that which was "heard" or divinely revealed to ancient sages), as opposed to the later strata of religious literature, known as smriti (that which is "remembered," or is traditional). But in modern Hinduism the shruti, with the exception of a few hymns of the Rigveda and the more important Upanishads, is little known, while some of the *smriti* texts, notably the Bhagavad Gita, are extremely influential.

The Rigveda reflects in general a polytheistic sacrificial religion very different from that of later India. It involved the worship of numerous divinities, most of whom were conceived of as male, and were connected with the sky and natural phenomena. The complex ceremonial, for which the hymns were composed, centred in sacrifice connected with the ritual slaughter of animals and the pressing and drinking of a sacred inebriating liquor called Soma, and it was afterward abandoned in favour of rituals of a different kind.

In some of the more recent hymns of the Rigveda, however, there are speculations on the source and fundamental nature of the cosmos, and already its origin is attributed to a single being or principle. It is suggested that the world is the product of a creator god, to whom various names, such as Prajapati (Lord of Creatures) and Vishvakarman (All-worker), are given. In one very important hymn (x, 90) creation takes place after the gods have offered a primeval being, identified with Prajapati, as a sacrifice to himself. From his body the whole universe is created, including the four great classes of Indian society, each being made from a different member of the victim. Alternatively it was suggested that the universe developed out of a watery chaos, or from an impersonal entity such as the Hiranyagarbha or Golden Embryo (Rigveda x, 121). These speculative tendencies, coupled with the development of asceticism, led to the mysticism and monism which have been always characteristic of Hinduism.

C. 600 **B.C.–A.D.** 650. — The Aryans who composed the Rigveda

do not appear to have believed in transmigration or the reincarnation of the soul; apparently they thought that the righteous dead passed to a heaven resembling the Valhalla of the Nordic peoples. while sinners were relegated to a dark and shadowy land similar to the Semitic Sheol. By perhaps 600 B.C., the new doctrine of the continual process of reincarnation (samsara) was known to comparatively small circles of ascetics and was coupled with the idea of karma (*q.v.*), the fundamental law of cause and effect by which the evildoer is reborn in unhappy conditions It spread very rapidly, and seems to have been accepted almost universally in the time of the Buddha (6th century B.C.). Its origin and rapid diffusion are not yet satisfactorily explained, but it may have been derived from cruder doctrines of metempsychosis held by some of the indigenous non-Aryan inhabitants of the Ganges valley. It was accompanied by a desire to escape from the round of birth and death, and this urge produced the splendid mystical literature of the Upanishads and led to the emergence of a number of heterodox sects, some of which, notably Buddhism and Jainism, became distinct religions.

Thereafter Hinduism. at least in its higher manifestations was concerned not with propitiating the gods but with obtaining release from *samsara.* This mas the main aim of the philosophical schools which arose between about 300 B.C. and A.D. 300. Sacrifices were by this time less frequently performed, partly because of a strong feeling against the unnecessary destruction of life but largely because it was felt that they were ineffectual as a means to salvation Morality and religious observance were thought to be conducive to favourable rebirths on the lower stages of spiritual progress. but for complete emancipation asceticism and mystical gnosis were necessary.

Also in the second half of the 1st millennium B.C., the older gods of the Rigveda began to lose ground before Vishnu and Shiva, the first a minor divinity in earlier times, the second a fertility god. perhaps inherited from the pre-Vedic Harappa culture with whom the Vedic god Rudra was identified. Local divinities in the areas gradually occupied by Aryan culture were assimilated to one or other of these, and the doctrine of *avataras* or divine incarnations made it possible for theriomorphic gods (gods worshiped in the form of a beast) and divinized heroes to become incarnations of Vishnu. The religion of this period is reflected in the two great epics, the Mahabharata and the Ramayana, and in the texts on law and human conduct generally called Dharma Sutras and Dharma Shastras. The religious attitude usually known in Indian contexts as *bhakti,* or devotion to a personal deity. also developed The new gods were normally worshiped with prayer, offerings of flowers and food, incense or music; the rite of worship (*puja*) had replaced that of sacrifice (*yajna*). The most important text of early *bhakti* is the Bhagavad Gita, inserted into the Mahabharata epic as a discourse addressed to the hero Arjuna by the incarnate god Krishna.

Until just before the beginning of the Christian era it seems that the Indians generally worshiped without the aid of images. The oldest extant icons, other than those of the Harappa culture, are large figures of yakshas, or local chthonic divinities. not much more than 2.000 years old. This indicates that iconolatry began among lower levels of the people devoted to deities not fully assimilated into the Hinduism of the time. Similarly, there are no remains of Vedic temples; sacrifices normally took place in the open air. though small shrines housing sacred objects may have existed. Sacred places (*chaityas*), usually groves or mounds, were the centres of popular religion, but they were outside the ambit of orthodoxy. By the Gupta period (*c.* A.D. 300–650) the worship of images in stone temples was fully established, possibly through the influence of the successive invaders of northwestern India about the beginning of the Christian era.

By A D 650 a new feature of later Hinduism. the worship of feminine divinities, was also fully established. The Mother Goddess. in various forms and under various names. became an important object of reverence and though the Tantras, the sacred texts of the cult of the Mother. are of later composition, it is evident from inscriptions that her temples existed from the 5th century A.D. onward. Animal and sometimes even human sacrifices were revived. and certain other barbaric practices, such as sati burning and religious suicide, seem to have increased in prevalence. This marked the close of the formative period of Hinduism.

Period of the Later Hindu Dynasties. — The 9th–12th centuries saw the work of great philosophers and theologians, such as Shankara (*q.v.*), Ramanuja and Madhva (*q.v.*). Later, an enormous quantity of religious literature was composed in the regional languages, chiefly devotional hymns whose various authors today command respect and reverence second only to that accorded to the great gods themselves. The earliest collections are in Tamil, the songs of the Nayanars or devotees of Shiva. and the Alvars, the devotees of Vishnu, which were written from the 7th century onward. The composition of such hymns in the Indo-Aryan languages began only some centuries later. Among the most important hymnodists are Kabir (*q.v.*) in the 15th century and Tulsi Das (*q.v.*) in the 16th century, who both wrote in Hindi; various singers of the school of Chaitanya (15th–16th century) in Bengali; and Namdev (13th century) and Tukaram (17th century) in Marathi. Noteworthy also is Mira Bai, the 16th-century poetess of Rajasthan. These teachers, and many others like them in all parts of India, encouraged simple faith and devotion to a personal deity: disparaged exaggerated ritualism and caste pretensions and stressed brotherly love and fellowship. Though all these elements can be found in the early Tamil devotional poetry it is generally thought that Islamic ideas, mediated by *sufi* preachers, had some influence on this development. Kabir knew something of Islam, and according to tradition he was brought up as a Muslim. Nanak owes his insistence on the unity of God and his opposition to iconolatry to Islam, and the religion of Sikhism which he founded is clearly syncretistic.

By the end of the 17th century the inspiration of the devotional hymnodists had ceased and there was no advance in Hindu thought or practice during the 18th century. The first European rulers of India found a sterile religion whose chief aim was the preservation of a rigid social order by means of a very complex system of ritual observances and tabus. It was widely expected that India would soon become Christian, but contact with the west tended instead to revitalize Hinduism through the work of a number of reformers (see *Modern* Developments below).

COSMOLOGY

Indian religion contrasts sharply with the religions of the west in its conception of the size and duration of the universe. In place of the comparatively small, transient cosmos of traditional Judaism, Christianity and Islam. Hinduism postulates a universe immense in size and immensely long in duration. passing through a continuous process of development and decline. The fundamental cosmic cycle is the "day of Brahma." a period of 4 320,000,000 years known as a kalpa. At the beginning of this day Vishnu lies asleep upon the cobra Shesha, symbolizing endless time. who in turn floats on the cosmic ocean, the primeval chaos. From Vishnu's navel there grows a lotus. and from its bud is born the god Brahma who creates the universe on behalf of Vishnu, who then awakes and controls the cosmos throughout the day. At its end the world is destroyed, according to some accounts by Shiva. and is once more absorbed into Vishnu's body. The god sleeps for a further kalpa, the "night of Brahma," after which the process is repeated more or less indefinitely.

According to some sources. Vishnu has a life of 100 "years of Brahma," each of which consists of 360 days of Brahma. He is now 50 years old, and when he reaches his 100th year his personality will be lost in the one real and eternal impersonal entity, the Brahman. After a tremendously long period when nothing but the one Absolute World Spirit exists, a new Vishnu will appear and the process will begin once more This scheme is to be found with modifications in various early texts. such as the Puranas, long collections of legendary and mythological stories which date from the 4th century A.D. It is evidently an attempt to find room for devotional theism in a scheme which is essentially idealist and monist.

The later devotional sects insist on the fundamental nature of Vishnu, who will always retain his character of a personal god in

whom and through whom universes have their being and are again destroyed. The Shaivites have different legends. In south India some maintain that Shiva created the universe by a process analogous to dancing, preserves it by his divine ascesis and destroys it at the end of time by a similar process. This myth has produced one of the most beautiful figures of Hindu iconography, the image of the Dancing Shiva (Nataraja). The Shaktas hold that the Mother Goddess gave birth to the universe after a sort of cosmic coitus with her transcendent spouse, Shiva, who plays little or no direct part in the universal process. The educated Hindu believes that all these legends bear some symbolic relationship to the actual evolution of the cosmos, but prefers the version maintained by his own sect.

Within the *kalpa* are 1.000 smaller cycles, the *maha* yugas or "great aeons." These are divided into four *yugas,* or aeons, each of which is progressively shorter and less blissful than that which preceded it. The world is at present in the fourth aeon, the kali yuga, which began in 3102 B.C. and will continue for over 400,000 years, until Vishnu in the form of the Kalki destroys its evil elements and a new age of gold begins.

PHILOSOPHICAL AND THEOLOGICAL SCHOOLS

Philosophical Schools.—The traditional account of the immense duration of the universe led to a general vie that life is essentially unsatisfactory, since man is enmeshed in this universal scheme by the process of samsara, continued reincarnation. In theory, the Hindu finds existence a vale of tears, and his long-term aim is to achieve salvation or "release" (*mukti*, moksha) from the round of birth, death and rebirth. Its achievement may involve a series of many lives and demands a long course of spiritual discipline, meditation and devotion. All the six philosophical schools, the Nyaya, the Vaisheshika, the Samkhya, the Yoga, the Purva Mimamsa and the Vedanta, are theoretically directed to this end, though different schools emphasize varying factors as the chief means of attaining it (see INDIAN PHILOSOPHY).

Theological Schools.—The theological schools, most of which are branches of the Vedanta school of philosophy, are differentiated by the degree of ultimate reality which they concede to personality, and the degree of identity which they admit between the naked soul of the individual and the Absolute. The school of strict monism (advaita) maintains that the ultimate reality is the impersonal world spirit, Brahman, and that the inmost soul of the individual is mystically identical with it. The phenomenal universe, including the gods themselves and all individualized beings, evolves from this Absolute and is fundamentally illusory.

This concept of Brahman is based on the gnosis of the Upanishads, where the term is sometimes used to describe the world spirit. with which the individual soul is essentially one. Originally, in the Rigveda, Brahman implied supernatural power—the magical force. inherent in impressive beings or objects, widely believed in by primitive peoples and known to anthropologists as mana. In later Hindu literature Brahman is always used with a mystical but impersonal connotation. It is grammatically neuter, and must not be confused with the Brahman priest (brahmana, literally the possessor of brahman in its primitive sense), or the male god Brahma. Brahman, according to the school of strict monism, is characterized by the three attributes of being, consciousness and bliss (*sachchidananda*).

The advaita school, looking back to the great 9th-century philosopher Shankara (*q.v.*), has perhaps been the most influential in forming the character of intellectual Hinduism. But it is possible that the school of qualified monism (*vishishtadvaita*), based on the teaching of Ramanuja, has had greater effect on the religion of the masses. This school maintains that the ultimate reality has in some sense a personality, and is in fact a God; moreover the soul, though essentially a part of God and intimately joined to him in the state of salvation, never completely loses its sense of individuality. The school of qualified monism holds that the soul can reach salvation more easily through sincere devotion (bhakti) to God. and by patiently awaiting his grace in the attitude of mind known as *prapatti* (passive surrender), than through meditation. The way of devotion (Bhakti Marga) has probably at all times been more popular than the way of knowledge (Jnana Marga). Though most Hindus honour Shankara and pay theoretical respect to his teachings, in its practical manifestations Hinduism is a theistic religion demanding deep devotion of its adherents and, as all who have visited Hindu temples and attended festivals will realize, its main expression is simple piety.

GODS

Most of the great gods of the Rigveda, such as Indra, Agni and Varuna, are of secondary importance in later Hinduism, and have yielded pride of place to other divinities who either play a minor part in Vedic religion or are not mentioned in the Vedas at all. Another god who has lost a great deal of his importance is Brahma (masculine, not to be confused with the neuter Brahman). This name seems to have evolved as an epithet applied to the creator god of the later Vedas, Prajapati, which eclipsed the latter name in popularity. At the time of the Buddha, Brahma was looked on as the high god in eastern India, and he is often referred to in the older parts of the Mahabharata as the creator of all things. But in the Vaishnava cosmology he becomes a mere demiurge. Some attempt to rehabilitate Brahma was made in the medieval doctrine of the trimurti or Trinity, postulating three gods of equal importance as the primary manifestations of the ultimate reality—Brahma, the creator; Vishnu, the preserver; and Shiva, the destroyer. This syncretistic system, however, was at no time important and plays a much bigger part in some older textbooks on Hinduism written in Europe than in any ancient Hindu text. At present Brahma is little regarded, and it is said that only one temple of Brahma (at Lake Pushkar, near Ajmer) exists in the whole of India.

Shiva, Vishnu and the Mother Goddess.—Classical Hinduism is centred in these three great divinities and, though many other deities are worshiped, nearly all Hindus look on one or other of the triad as the ultimate being. the disposer of human destiny and of the destiny of the cosmos itself. Thus with few exceptions Hindus may be broadly divided into followers of Shiva, Vishnu or Shakti ("Power," godhead in its active feminine form), whichever is by family tradition their main object of worship. Each group, while reverencing the Vedas, has its own scriptures. In general each has respected the faiths of the other two, though occasional cases of mild religious persecution have been attested, especially on the part of the Shaivites of south India. Certain scriptures. such as the Bhagavad Gita, which is Vaishnava in origin and glorifies Vishnu as the chief god and Krishna as his incarnation, are highly respected by all sects. A man may occasionally worship in a temple, or take part in a festival, connected with a divinity other than his own, since behind the superficial polytheism of Hinduism is a general realization that the various gods severally worshiped are essentially one.

Vishnu, who probably receives rather more widespread worship than Shiva, is generally reverenced in the form of one of his incarnations, of which at present only two, Rama and Krishna, are given much attention. The cult of Rama is comparatively recent; though he was known as a great hero much earlier, he appears not to have been generally worshiped as a god until medieval times. He is depicted as the ideal ruler, the embodiment of grace and justice toward men, and significantly is chiefly honoured in those parts of India which came earliest and most completely under Muslim domination. His spouse Sita is the ideal of Hindu womanhood, the perfect wife and mother, entirely devoted to her lord. The cult of Rama is particularly strong in Uttar Pradesh and Bihar, and has been wholly beneficent. Ramaite literature, especially the beautiful Hindi Ramayan of Tulsi Das, which is virtually the bible of millions of simple Hindus of northern India, has very high ethical value.

Krishna (*q.v.*) is a more complex figure, and his worship is even more widespread than that of Rama. Long and involved legends show him to be a combination of disparate elements. He appears in such archetypal forms as the wonder-working child, the divine lover, the charismatic leader and the dying god. Some Rrishnaite religious literature contains rich erotic imagery, notably Jayadeva's mellifluous Gita-Govinda; probably he is worshiped most widely

as the divine flute player, luring the wives and daughters of the cowherds of Vrindavana (Brindaban) to dance with him in the moonlight, a symbol of God calling the human soul. He appears as the teacher in the Bhagavad Gita.

Shiva, unlike Vishnu, is not believed to incarnate himself for the salvation of the world, but only to afford occasional theophanies to his more devout worshipers. Thus he is a rather remoter figure than Vishnu, and more calculated to excite awe. He sits on the peak of Mt. Kailas in the Himalayas, in a state of perpetual meditation, generating an immense spiritual force which maintains the cosmos. He is most commonly worshiped in the form of the *linga*, an upright rounded post usually of stone, which is a formalized phallic emblem. This proves his origin as a fertility god, an element of his character which has largely vanished, for he is generally thought of by his worshipers as a very austere divinity. His cult is strongest in the south, but it is also prevalent among Kashmiri Hindus, and he has numerous devotees all over India. The millions of Hindu ascetics are mostly his followers.

The Mother Goddess is an ambivalent divinity. The gentler aspects of her character appear in her manifestations as Parvati, Uma or Annapurna, the bestower of blessings. the personification of a beneficent nature, in which form she is depicted as a beautiful woman in early middle age. In her fierce form as Kali, Chandi, Durga or Chamunda she is usually thought of as a terrible giantess with black skin, an enormous blood-red tongue and fierce tusks protruding from her mouth, an assortment of weapons in her many hands and a garland of skulls or human heads round her neck. Thus the Mother Goddess stands for nature in all its aspects, and her worship is in part designed to avert evil. Frequent animal sacrifices are still performed in her honour, kids being offered throughout the year and buffaloes at the Dasahra festival (see below, Festivals). Her cult is most prevalent in Bengal and Assam. The Shaktas, who look on the Mother as the chief object of worship, have produced their great teachers; Ramakrishna Paramahamsa, who did so much for the regeneration of Hinduism, began his career as a devotee of Kali in the famous Shakta temple of Dakshineshvari, outside Calcutta. Nevertheless the cult of the Mother has obtained a rather bad reputation on account of some sects of Shaktas whose initiates, in certain ceremonies, partake of the pancha-makara, ritually breaking some of the major tabus of orthodoxy, eating meat, drinking alcoholic liquor and having illicit sexual intercourse. These Tantric sects (so called from the Tantras, their sacred texts) evolved a theory that salvation was to be obtained most easily not by knowledge, meditation or devotion but by the utterance of mystical syllables, words and phrases (mantras), and by ritual acts of a magical character, among which the pancha-makara rite was included. Both animal sacrifice and the practice of pancha-makara are repugnant to the trend of modern Hinduism, and both practices are disappearing, though animals are still sacrificed by the uneducated and semieducated, especially at certain famous Shakta temples; such as Kalighat in Calcutta and Kamakhya, near Gauhati, Assam.

As well as the three great gods there are many others who have considerable importance and who are worshiped on special occasions. Of these the best known is probably Ganesha, the elephant-headed son of Shiva and Parvati, petitioned for success before all enterprises. Skanda or Karttikeya, the war god, also the son of Shiva and Parvati, is of 'some importance in south India; Lakshmi. the spouse of Vishnu, is the patroness of wealth and fortune; Sarasvati, the beautiful goddess of learning and the arts, is worshiped annually at festivals throughout India, especially by students; Hanuman, the monkey god associated with the exploits of the divine hero Rama, appears as a personification of the active power of God upon earth, and is a popular object of worship especially in the north and west; in Bengal and Assam, Manasa, the goddess of snakes, is much worshiped by peasants, not only to prevent snake bite but also for general prosperity; another divinity revered in order to propitiate her is Sitala, the goddess of smallpox.

Many animals, plants and natural objects are sacred in varying degrees, the most noteworthy being the cow. The bull is specially sacred because of his connection with the god Shiva, but the cow is divine in her own right and is generally revered as the representative of Mother Earth. Thus all cattle are inviolate and even among those castes where vegetarianism is not the rule. beef is never eaten. Among other sacred animals are monkeys and Indian tree squirrels (*gileri*), especially associated with Rama, and snakes, associated with Shiva. The many-rooted banyan and the pipal, two of the largest trees of India, are sacred; also the tulsi, a wild basil sacred to Vishnu, which is grown on a pedestal in the courtyard of the orthodox Vaishnava home. All rivers and hills are more or less divine, and the extreme holiness of the Ganges, believed to flow from the head of Shiva, needs no emphasis.

A qualified or limited divinity inheres in other beings and objects also. Thus parents are divinities to their children and should be treated as such; similarly a husband is for his wife a divine incarnation, and texts can be found giving the same position to a wife in respect of her husband, though this is not stressed in a predominantly masculine civilization. Teachers are gods on earth to their students. All Brahmans and earnest ascetics possess a degree of divinity, as do very aged people. At regular festivals a workman will worship the godhead inherent in his tools, and it is even laid down that a man's food is a god and he should worship it before he eats it. The evident animistic origin of Hinduism does not detract from its value, and much of the dignity of Hindu culture may be attributed to this belief in the immanence of divinity.

SOCIAL AND ETHICAL ASPECTS OF HINDUISM

For nearly 3,000 years Hinduism has believed in a stratified social system as a divinely ordained feature of the cosmos, and its teachers have given full religious sanction to the four classes (varna) and the innumerable castes (jati). The doctrine of the four classes goes back to the hymn of the Rigveda describing the primeval sacrifice from which the world was created. From the head of the primeval man appeared the Brahman, from his arms the warrior (Kshatriya), from his trunk the class of merchants and craftsmen (Vaishya) and from his feet the menial (Shudra). Thus the fourfold society is an essential part of the structure of the world, and it must be preserved in order that as many people as possible may achieve salvation.

As there is a fourfold order of society, so there are four stages in the life of each man in the three higher classes who has undergone the ceremony of initiation (upanayanu). After initiation, which takes place at or just before puberty, he should become a celibate student (*brahmachari*); next he is a householder (grihastha). producing sons and fulfilling his family duties; in later middle age, when he has seen his children's children, he retires as a vanuprastha, ideally to a hut in the forest, and devotes his life to the things of the spirit; finally as an old man he becomes a homeless religious beggar (sannyasi) giving up all earthly ties. This scheme of the four *ashramas*, though laid down in many texts, could obviously never be enforced by law as was possible to some extent in the case of the segregation of the four classes. Though it was never taken literally by more than a comparatively small fraction of the Hindu population, it formed an ideal which set the pattern of Hindu life.

The two fourfold systems, of class and stage of life, are often referred to together as *varnashrama;* the dharma or system of conduct appropriate to each class and stage, taken collectively, is known as *varnashrama-dharma,* a term which recurs again and again in earlier religious literature as the fundamental principle of social ethics. It was said that in the earlier stages of the world's development, when men were closer to perfection, *varnashrama*-dharma was practised more or less automatically. With the decline of the cosmos the rules were increasingly broken, and men suffered at one another's hands in a state of terrible anarchy; so Vishnu appointed a divine king to enforce dharma by coercion. The state is thus subordinate to society and exists to preserve it.

Within each of the four orders are numerous castes (jati) and clans or families (kula), and each of these units has its own dharma, or standard norm of conduct. Each must be preserved intact, its traditions and way of life unvitiated by miicegenation or innovations. Thus the traditional Hindu social system is thor-

oughly conservative in principle, although in fact at all times old practices have lapsed into disuse and new ones have been adopted. The change has never been more rapid than in the 20th century. (See also CASTE [INDIAN].)

Second only to the preservation of the social order as a whole, Hindu ethics aim at the preservation of the family. The traditional family is a joint one. the paterfamilias being the steward of the family property. Solidarity is maintained by the rite of shraddha at which offerings are made for the welfare of the ancestors, who are believed to enter into spiritual communion with the surviving kinsfolk. The utmost respect for the elder members of the family is inculcated and the paterfamilias has authority over the younger members, even when they are full grown. Marriage is indissoluble, even before consummation. and widows may not remarry. The practice of the immolation of the widow on her husband's funeral pyre, wrongly called sati (a word meaning a "true wife"), which aroused so much disapprobation and was ultimately forbidden by law in 1829, was. however, never obligatory from the point of view of the sacred texts, though in many families it became virtually so in practice. Polygamy is permitted but not looked on with favour in most castes, except when the first marriage does not produce living male children. Successive Indian governments have modified traditional Hindu marriage law by legislation, forbidding the marriage of children, legitimizing widow remarriage and even, in 1955, forbidding polygamy and allowing divorce. However, feeling against some of these innovations remains strong in many Hindu families, and divorce and widow remarriage are rare.

Personal ethics are not neglected in the Hindu texts and there is much sacred literature of high ethical value. notably the Bhagavad Gita, the Tamil *Kural* and many of the poems of the medieval hymnodists. For the layman the norm of personal conduct was contained in the traditional formulation of the three aims of man (*purushartha*): righteousness or religious merit (*dharma*), profit and material advantage (*artha*) and pleasure (kama). All three were regarded as worthy of pursuit, but the claims of the first overrode those of the second, and those of the second overrode those of the third. All three aims were theoretically subservient to the fourth long-term aim of salvation (moksha), which was only pursued directly by ascetics. Thus the traditional ideal of the layman's life was one of a balanced via media. Modern Hindu teachers, however, appear to have largely forgotten the doctrine of the three aims, and the layman is often told to follow the ascetic's way of life as far as possible.

Everyday Religious Life.—Religious activity is chiefly centred in the home. Every orthodox home has at least one sacred image, picture or emblem, before which *puja* in the form of prayers, hymn singing, the offering of flowers and the burning of incense is performed, especially by the women of the house. In richer houses there is usually a family shrine room or chapel. Every meal is a religious rite and daily rituals. of a sacrificial character but not involving the killing of animals. surviving almost without change from the Vedic period, are still performed by some of the more orthodox Brahmans. Much time is spent in listening to religious literature, read aloud or recited. Rites requiring the help of a trained brahman are performed by a *purohita,* or chaplain, serving a family or group of families.

The personal ceremonies begin from the conception of the child; rites are performed with the participation of the pregnant mother, to ensure the safe arrival of a male child. The birth ceremony (*jatakarma*) should take place before the cutting of the umbilical cord. Ten days after birth the ritual impurity of mother and child is removed and the child is named. L7arious minor rites take place in infancy; more important is the rite of upanayana, originally performed among the three higher classes but now largely confined to Brahmans, celebrated about the time of puberty. At this ceremony a boy is invested with the sacred thread (*upavita* or *yajnopavita*), which he should wear throughout his life over his right shoulder. He is taught the *Savitri* or Gayatri verse of the Rigveda, which is repeated at all religious rites and ceremonies, and he is then qualified to study the Vedas, and has the status of an Aryan. With this the stage of the *brahmachari* commences.

The Hindu marriage ceremony is lengthy and complicated. The kernel of the rite is the threefold circumamhulation of the sacred domestic fire by the couple, and their taking seven steps with their garments knotted together. Hindu funerals normally involve cremation. The corpse is burned as soon as possible after death, and the bones are thrown into a river, preferably the Ganges (Ganga) or another sacred stream. For ten or more days the family is ritually impure, and the relatives, with shaven heads, confine themselves as far as possible to the family home, performing antyeshti ceremonies for the welfare of the soul of the dead man; without these rites it will find it impossible to achieve a rebirth. They consist of pouring libations of water and offering rice balls (*pinda*) and milk to the departed spirit. On the tenth day the soul acquires a subtle body and reaps the fruits of its former deeds, whether good or evil. The shraddha ceremonies, repeated at periodic intervals for the continued welfare of the dead man and for the welfare of other dead members of the family, are of similar character.

Congregational worship hardly exists, though it has been introduced by some reformed sects, such as the Arya Samaj. The temple is the house of the god, as the palace is the house of the king. It is a meritorious act to do him homage, and thus Hindus visit the temple alone or in small family groups, reverence the image of the deity and depart. Although regular *pujas* or ceremonies of worship are performed by trained ministrants at intervals throughout the day in the larger temples, devoutly watched by the laity, there is no real parallel to the Christian religious service or the Muslim khutba. The larger temples, however, are centres of religious instruction, where sacred literature is read publicly, and at one time many of them also ran schools.

FESTIVALS

At least once a year each temple of any importance holds its festival. In south India these are marked by the procession of the god round the city or village, either in a very large cart with a towering superstructure (*ratha*), usually pulled by devotees, or on the back of an elephant. Dancing, singing and the recitation of religious stories take place in the temple. Even festivals in quite small villages attract worshipers from nearby and pilgrims come from all over India to the great festivals of such temples as that of Puri in Orissa, where the annual procession of the god Jagannath (a form of Vishnu) is famous throughout the world. The seven sacred cities of Hinduism and the chief centres of pilgrimage are: Varanasi (Benares). Hardwar. Ayodhya. Dwarka, Mathura, Kancheepuram and Ujjain. To these must be added hladurai, one of the most important centres of Dravidian Shaivism; Gaya, equally a centre of Buddhist pilgrimage; and Prayaga (Allahabad), where the religious fair (*mela*) at the confluence of the Jumna and Ganges attracts hundreds of thousands.

Pilgrims and visitors to temples often assume the so-called caste mark. This symbol. painted on the wearer's forehead and sometimes on other parts of his body, really indicates his sectarian affiliations Vaishnavas wear a mark ∪ and Shaivites wear three horizontal lines ≡. Variations of these marks indicate sects within the two main traditions. These and other religious emblems are often worn painted, tattooed or branded on various parts of the body by ascetics and extreme devotees.

All festivals are fixed according to the Hindu lunisolar calendar, and their occurrence according to the western calendar varies from year to year within a month, as does the Christian Easter. General days of festival are numerous. but lesser festivals and fasts are little regarded except by the more devout Hindus. Probably the most widely maintained are those occurring in the autumn. The first ten days of Ashvina (September–October) are particularly sacred to the Mother Goddess. For nine days she is worshiped in her fiercer forms, animals being sacrificed to her on the ninth day by Shaktas and some Shaivites. The tenth day (dasahra) is one of processions and merrymaking, celebrated even by Vaishnavas. Divali or *dipavali,* at the beginning of Karttika (October–November) is by origin a New Year festival, at which lamps are ceremonially lit, housefronts are illuminated and presents are exchanged. *Holi* is a spring festival, occurring at the

full moon of Phalguna (February–March); it is a sort of Hindu saturnalia, theoretically connected with the god Krishna but evidently originally a fertility ceremony; for townspeople at any rate it has now lost much of its original religious significance. *Vasanta-panchami,* usually falling in February, is the festival of Sarasvati, the patroness of art and learning; the goddess is worshiped in specially erected shrines and concerts are held in her honour. In the Tamil country the most famous festival is *Taipongal,* occurring in January or February, when newly cooked rice is offered to various divinities and domestic cattle are honoured to the accompaniment of many festivities. There are many other festivals of varying importance, and all Hindus, whatever their sectarian affiliations, are usually ready to take part in them. (See also FEAST AND FESTIVAL: *Hinduism.)*

ASCETICISM

Among westerners Hinduism is especially associated with asceticism, perhaps unjustly, because for the lay Hindu it is not essentially an ascetic religion. The practice of asceticism seems to have begun in a sort of shamanism, the performance of austerities in order to achieve supernatural powers. hints of which are to be found in the Rigveda. With the growth of the doctrine of transmigration it was thought that full release from the round of birth and death *(samsara)* could be gained only by giving up worldly life and concentrating on achieving mystical gnosis, and this has been the ostensible motive for a Hindu's taking to the life of asceticism down to the present day. The doctrine of the four *ashramas* put forward the ideal that every man should end his days in asceticism, but in fact many have not done so, while many others have taken to asceticism in youth.

The ascetic, on "leaving the world," attaches himself to a master *(guru),* who initiates him and trains him in his early career. The sincere ascetic usually learns the technique of breath control and control of the bodily functions known as Hatha Yoga, and from this goes on to rapt meditation, until he feels that he has fully realized the identity of his soul (Atman) with the Absolute (Brahman). He should own nothing, or only the barest necessities, and should depend on food offered to him by laymen.

Many ascetics at all times have achieved great respect, and some have been very powerful spiritual forces in the molding of Hinduism On the other hand there are innumerable men of a more dubious character who live very comfortably on the donations of credulous laymen. Others, of a psychopathic character, subject themselves to self-tortures — which are not, as some apologists assert, a feature of the degenerate Hinduism of recent times but are fully attested in the earliest Buddhist scriptures, and must have been practised centuries before the Christian era.

The organization of ascetics into disciplined fraternities probably began with the heterodox sects such as Buddhism and Jainism, but orthodox ascetic schools existed from around the beginning of the Christian era. A form of Hindu monasticism, probably owing much to Buddhist precedent, was established by the great teacher Shankara. and the foundation of similar monastic orders is attributed to Ramanuja and other medieval teachers. These ascetic foundations still survive. In the 19th and 20th centuries the celibate order of the *swamis* of the Ramakrishna Mission were and are one of the most vital forces of Hinduism. The many schools of Indian asceticism are distinguished by varying sectarian marks, uniforms and practices.

MODERN DEVELOPMENTS

The system of belief and conduct described above has prevailed in Hindu India for many centuries. In the 19th and 20th centuries the system has altered considerably, at least in the cities among literate people, because of the influence of western ideas, changing social conditions and the work of numerous reformers. The earliest of these was the Bengali brahman Ram Mohan Roy who founded a reformed Hindu church, the Brahmo Samaj (*q.v.*), which, though it is now almost extinct, had much influence in the 19th century and campaigned against many of the more objectionable aspects of Hinduism, such as widow-burning, child marriage and polygamy. The Arya Samaj (*q.v.*), founded by Dayananda Sarasvati in 1875. is more nationalist and is still an important force in Uttar Pradesh and the Punjab. The claim of its founder that all wisdom was to be found in the Vedas was accompanied by an attack on the worship of idols, an insistence on monotheism and social equality and much educational activity. The Theosophical society. originally gnostic or cabalistic in character, became virtually a reformed sect of Hinduism when its founder, Madame Blavatsky, moved her headquarters to India in 1879 (see THEOSOPHY). At the very end of the century the Ramakrishna Mission was founded, inspired by the teachings of the saintly Begali mystic Ramakrishna Paramahamsa. Its founder. the *swami* Vivekananda (*q.v.*) campaigned energetically in favour of Hinduism in Europe and America and was successful in making a number of western converts to his reformed Hindu movement. In the mid-20th century the west was also showing increasing interest in Yoga.

India's achievement of independence, and the significant part played by the Indian republic in international affairs, have added to the importance of Hinduism. Undoubtedly the greatest contribution has been that of Mahatma Gandhi (*q.v.*), whose unique synthesis of religion and politics provided an ideology for the civil disobedience movement which was instrumental in gaining India's independence. Appreciably influenced by Christian ideas, which he assimilated to the Hindu outlook, Gandhi gave a new sense of purpose to many Hindus of all classes and taught them to respect their traditional beliefs and practices but to adapt them to the needs of the times. Continuing the work of early reformers he encouraged the emancipation of Hinduism from the system of class and caste, and fostered a spirit of social service. His work has been continued in the agrarian reform movement led by Acharya Vinoba Bhave (*q.v.*) and in many smaller movements.

The great majority of Indians still support their traditional religion, but the educated among them may have their reservations, and unbelief in the form of agnosticism, humanism and materialism has made many inroads on the citadels of the faith. Though the development of industrialization, education and democracy will almost certainly condemn many traditional elements, the lack in Hinduism of an over-all organization, which superficially may seem a source of weakness, may prove a source of strength. Its continuance depends not on popes or high priests but on a multitude of independent brahmans who perform the domestic ceremonies of the laity, and on thousands of ascetics, of varying degrees of intelligence and saintliness, who give the layman spiritual help and advice and need no organization to carry on their work. See ASCETICISM; see also references under "Hinduism" in the Index volume.

HINDU **KUSH,** a range of mountains in Central Asia. Throughout 500 mi. of its length, from the Pamir region to the Koh-i-Baba, west of Kabul, it forms the water divide between the Kabul and the Oxus basins, and, for the first 200 mi. is the

southern boundary of Afghanistan. Probably it branches from the head of the Taghdumbash Pamir, where it unites with the Sarikol stretching northward, and the impressive mountain barrier of Muztagh. the northern base of which separates China from Kanjut. The Wakhjir pass. crossing the head of the Taghdumbash Parnir into the river Hunza, almost marks the trijunction of the three great chains. As the Hindu Kush strikes westward. after first rounding the head of an Oxus tributary (the Ab-i-Panja), it closely overlooks the trough of that glacier-fed stream under its northern spurs, its crest at the nearest point being separated from the river by a distance of about 10 mi. As the river is here the northern boundary of Afghanistan, and the crest of the Hindu Kush the southern boundary, this distance represents the width of the Afghan kingdom at that point.

Physiography.— For the first roo mi. the Hindu Rush is a comparatively wide flat-backed range with small lakes on the crest, and possessing no considerable peaks. It is crossed by many passes, varying in height from 12,500 ft. to 17,500 ft., the lowest and the easiest being the group about Baroghil. As the Hindu Kush gradually recedes from the Ab-i-Panja and turns southwestward it pains in altitude. and prominent peaks rise to more than 24.000 ft. above sea level. The main central water divide is not the line of highest peaks. which is farther south, where Tirach Mir dominates Chitral from a southern spur. For some 40 or 50 mi. of this southwesterly bend, the crest is intersected by many passes, of which the most important is the Durah group (including the Minjan and the Mandal), which rise to about 15,000 ft.. and which are practicable links between the Oxus and Chitral basins.

From the Durah to the Khamak group of passes (11,000 and 12,000 ft. in altitude), the water divide overlooks Kafiristan and Badakshan. There, its exact position uncertain, it lies amid a wild, inaccessible region of snowbound crests: and is nowhere less than 15,000 it. above sea level. The Khawak, at the head of the Panjshir river, leading straight from Badakshan to Charikar and the city of Kabul: is now an excellent kafila route, and is available for traffic throughout the year. From the Khawak to the head of the Ghorband (a river which meets the Panjshir near Charikar), the Hindu Kush is interjected by passes at intervals. *e.g.,* the Kaoshan (the "Hindu Kush" pass *par excellence*), 14,340 ft.; the Chahardar (13.900 ft.), on the Afghanistan high road to Turkistan; and the Shibar (9,800 ft.).. There the southern extremity of the Hindu Kush commences the Koh-i-Baba system into which the Hindu Kush is merged.

The general structure of the Hindu Kush south of the Khawak, no less than such evidence as at present exists to the north. points to similar conditions of uplift and subsequent denudation as in the western Himalaya and the whole of the trans-lndus borderland. The uplift was later than the Himalayas and was marked by the overthrusting of Cretaceous limestones upon Recent shales and clays as on the Baluch frontier. The Hindu Kush is, in fact, but the face of a great plateau lying north of it. just as the Himalaya forms the southern face of the tableland of Tibet. and its general physiography, exhibiting long, narrow. lateral valleys and transverse lines of "antecedent" drainage. is similar. There are few passes across the southern section of the Hindu Kush which have not to surmount a succession of crests or ridges as they cross from Afghan Turkistan to Afghanistan. The exceptions are notable, and have played an important part in the military history of Asia. From a little icebound lake called Gaz Kul. which lies on the crest of the Hindu Kush near the Taghdumbash Pamir. two very important river systems (those of Chitral and Hunza') are believed to originate. The lake really lies on the watershed and is probably a glacial relic. Its contribution to either stream appears to depend on the blocking of ice masses towards one or other end. It marks the commencement of the water divide which separates the Gilgit basin from that of the Yashkun, and subsequently divides the drainage of Swat, and Bajour from that of the Chitral (or Kunar). The Yashkun-Chitral-Kunar river is the longest affluent of the Kabul, and it is in many respects a more important river than the Kabul. It is closely flanked on its left hank by this main water divide. It is this range. crowned by peaks of 22.000 ft. and of an average height of 10,000 it. throughout its length of 250 mi., that is the real barrier of the north—not the Hindu Kush itself. Across it are glacial passes (Darkot) which lead to the foot of the Baroghil. Those passes (the Kilik and Mintaka. both above 15,000 ft.) from the Pamir. which lead into the gorges of the upper affluents of the Hunza, east of Darkot, belong rather to the Muztagh system. Other passes are the Shandur (12,250 ft.), between Gilgit and Mastuj; the Lowarai (10,230 ft.), between the Panjkora and Chitral valleys; and farther south certain lower crossings, which formed part of the great highway between Kabul and India.

Facing Chitral, on the right bank of the river, and extending for 70 mi., is the lofty snowclad spur of the Hindu Kush known as Shawal, across which one or two difficult passes lead into the Bashgol valley of Kafiristan. This spur carries the boundary of Afghanistan. South of Arnamai the Kunar valley becomes a part of Afghanistan *(see* KUNAR). The Durah pass leads into the Chitral valley from the Oxus, as also the Mandal pass, a few miles south, is the connecting link between the Oxus and the Bashgol valley of Kafiristan; and the Bashgol valley leads directly to the Chitral valley at Arnawai, about 50 mi. below Chitral. Nor must we overlook the connection between north and south afforded by the long narrow valley of the Chitral (or Yashkun) itself, leading up to the Baroghil pass. This route was once used by the Chinese for purposes of pilgrimage, if not for invasion.

Access to Chitral from the north is therefore but a matter of practicable tracks; or passes, in two or three directions, and the measure of practicability under any given conditions can best be reckoned from Chitral itself.

Historical.— Hindu Kush is the Caucasus of Alexander's historians. It is also included in the Paropamisus, though the latter term embraces more. Caucasus being apparently used only when the alpine barrier is in question. It was no doubt regarded (and perhaps not altogether untruly) as a part of a great alpine zone believed to traverse Asia from west to east. whether called Taurus. Caucasus or Imaus. Arrian himself applies Caucasus distinctly to the Himalaya also. The application of the name Tanais to the Syr seems to indicate a real confusion with Colchian Caucasus.

Alexander. after building an Alexandria at its foot (probably at Hupian near Charikar), crossed into Bactria, first reaching Drapsaca, or Adrapsa. This has been interpreted as Anderab, in which case he probably crossed the Khawak pass. but the identity is uncertain. The ancient Zend name is, according to Rawlinson, Paresina, the essential part of Paropamisus; this accounts for the great Asiatic *Parnassus* of Aristotle, and the *Pho-lo-sin-a* of Hsiian Tsang.

The Hindu Kush. formidable as it seems, and often as it has been the limit between petty states, has hardly ever been the boundary of a considerable power. Greeks, White Huns, Samanidae of Bukhara. Ghaznevides, Mongols, Timur and Timuridae, down to Saddozais and Barakzais, have ruled both sides of this great alpine chain.

HINDUR (modern official NALAGARH), a town and *tehsil* in the Patiala district of Punjab, India. The town (pop. in 1951, 2.517) is 25 mi. W. of Simla.

NALAGARH TEHSIL (272 sq.mi.; pop. in 1951. 52,042) was formerly one of the Punjab Hill states. It was merged with Pepsu on July 15, 1948.

HINDUSTANI LANGUAGE. Hindustani is the name used in English to refer to the lingua franca of modern India before its partition in 1947. Hindustani, like Bengali, Marathi, Gujarati and most other Indian languages except those of the

southeastern part of the peninsula. has its ancient origins in the Prakrits or "vernaculars" associated with Sanskrit. The widespread common language Hindustani is closely associated with two specialized literary languages, Hindi and Urdu.

Hindi, written from left to right in the Devanagari or Sanskrit script, borrows largely from Sanskrit. Urdu, written from right to left in an adapted form of the Perso-Arabic script brought by the Moslem invaders from over the northwest frontier, is naturally full of loan words from Persian and Arabic. Still, Urdu and Hindi are "of one language" mith Hindustani and the other Sanskritic languages of India. Through the well-known relationship of Sanskrit, Persian. Greek and Latin. they belong. with most of the languages of Europe, to the great linguistic family usually called Indo-European.

The everyday speech of well over 50,000,000 persons of all communities in the north of India and in West Pakistan is the expression of a common language. Hindustani. This language is shared at different levels and in varying degrees by about 50,000,000 more in the north, in Hyderabad (Deccan) and in all parts of India. This vast language community of close on 100,000,000 persons is the third largest in the world, coming next after Chinese and English. The basic common language of many millions of Indians and Pakistanis is a form of Khari Boli (*i.e.*, "standing" or current language).

There is convincing evidence of the existence and development of Khari Boli from the 13th century. The use of what can be recognized as Khari Boli in certain early writings indicates that it was being employed also as a spoken language. Hindustani, in this sense, was the natural language of the people in the wide neighbourhood of Delhi and ultimately became the lingua franca of the Mogul camp and was carried everywhere in India by the lieutenants of the empire, long before the publications issuing from Fort William. It has several recognized varieties. Dakhini, Urdu, Rekhta and Hindi. Dakhini is the name usually employed for Hindustani in south India. and was the first to be employed for literature. It contains many archaic expressions now extinct in the standard dialect. Urdu or Urdu zaban, "the language of the camp," is, with Bengali, the official language of Pakistan and the standard form of speech of the Moslems of India.

All the early Hindustani literature was in poetry, and this literary form of speech was named "Rekhta" or "scattered," from the way in nhich the words borrowed from Persian were scattered through it. The name was applied to the dialect used in poetry, Urdu being the dialect of prose and of conversation. The introduction of these borrowed words, which has been carried to an even greater extent in Urdu, was facilitated by the fact that Persian was the official language of the Mogul court. In this way, Persian (and, with Persian, Arabic) words came into current use and, though the language remained Indo-Aryan in its grammar and essential characteristics, it soon became unintelligible. in its elegant form, to anyone nho had not at least a moderate acquaintance with the vocabulary and literature of Iran. This extreme Persianization of Urdu in the earlier days m s probably the work of Hindu officials employed by the Mogul administration and acquainted with Persian, rather than by the Moslem elite who normally would prefer the Persian language itself. It is clear that in the days of the Mogul empire, Urdu began to develop and its use as a literary language followed a natural course. It exercised a strong influence on the development of spoken Hindustani, contributing a measure of standardization.

Hindi scholars are inclined to nullify the effects of Urdu upon the formation of Hindi through their labours on Sanskritization to replace Persian elements. Up to the 19th century, the only literary forms which arose from colloquial Khari Boli, and gave it some stability and prestige, must be described as Urdu.

The epoch of Akbar was the period of the formation of the language. But its final consolidation did not take place until the reign of Shah Jahan. Changes were comparatively immaterial until the time when European sources began to mingle mith those of the east. Like the greater part of those from Arabic and Persian, the contributions from these sources were chiefly in vocabulary.

The development of Hindustani as the lingua franca, with publication in it as well as in Persianized Urdu and Sanskritized Hindi, owes an enormous debt to Fort William college and the labours of John B. Gilchrist and his assistants, both Hindu and Moslem. Gilchrist was appointed head of the college upon its foundation in 1800. From the Hindustanee Press in Bengal there had already come his large *Grammar of the Hindoostanee Language* (1796). He had also written *A Dictionary, English and Hindoostanee* (1787–90) and is described by John Elphinstone as the "founder of Hindee philology."

Among those who worked with Gilchrist in the "Hindoostanee" department were William Hunter, Lallu Ji Lal and Sadal Misra. Gilchrist's early references to Khari Boli are of great interest. He described it as the "sterling tongue of India" . . . "distinguished by the general observance of Hindoostanee grammar and nearly a total exclusion of Arabic and Persian."

Inspired by Gilchrist, Lallu Ji Lal wrote the *Prem Sagar* in a form of Khari Boli. "the grand object" being to teach "our scholars the Hindoostanee in its most extended sense, and with proper advantages among the grand Hindoo mass of the people at large in British India."

People who speak what is called Khari Boli may read and write Grdu in the adapted Persian character or Hindi in the Devanagari, or both. To the cultural specialization of the two languages have now been added national and political forces since the separation of Pakistan from India. Since partition, Hindi has been declared the national language of India while Urdu is associated with Pakistan and, in particular, West Pakistan. Nevertheless Urdu remains one of the languages of India, which is its origin and home. It is interesting to note that after the conquest of the Punjab, the British government introduced not only hundreds of junior officials. referred to in the newly conquered province as "Hindostanees," from what is now Uttar Pradesh, but also their language, Urdu.

The Moslem gentry of the Punjab petitioned the government of India in favour of Persian, rejecting Urdu. Pakistan owes its Urdu to British policy in the early formative years after the annexation of the Punjab.

To sum up, Urdu may be described as the Persianized Hindustani of educated hfoslems, while Hindi is the Sanskritized Hindustani of educated Hindus. Hindustani is the great lingua franca of peninsular India understood both by Hindus and Moslems alike.

(J. R. FH.; ET. B.)

HINES, JOHN LEONARD (1868–), U.S. soldier, was born at White Sulphur Springs, W. Va., on May 21, 1868. After graduating from the U.S. military academy in 1891 he was stationed for five years at Fort Omaha, Neb. He served as acting quartermaster in Cuba during the Spanish-American War, and afterward in the Philippines, 1900–01, 1903–05, 1911–12. He was assistant chief quartermaster 1908–09 in the department of Missouri and 1910–11 in Japan. In 1916–17 he served as adjutant of the punitive expedition into Mexico, and in June 1917 was sent to France as assistant adjutant-general of the American expeditionary forces.

In May 1918, he was appointed to the command of the 1st brigade of infantry, 1st division, A.E.F., which he commanded during the Cantigny operations and in the Montdidier and Aisne-Marne defensives. In August he was transferred to the 4th division. which he commanded at the Battle of St. Mihiel and in the earlier stages of the Meuse-Argonne offensive. He was appointed commander of the 3rd army corps Oct. 11, 1918 with a temporary

commission as major-general. He was made a major-general of the regular army on March 5, 1921, and in Dec. 1922, became deputy chief of staff.

Upon the retirement of Gen. John J. Pershing on Sept. 13. 1924, Hines succeeded as chief of staff. He retired from active service in 1932.

HPNES, WALKER DOWNER (1870–1934), U.S. lawyer, was born at Russellville, Ky., Feb. 2, 1870. He was educated at Ogden college and the University of Virginia. From 1893 to 1904 he was with the Louisville and Nashville railroad in the legal department and, after 1901, as first vice-president. He practised law in Louisville. Ky., 1904–06 and in New York city 1906–16. In 1906 he became general counsel for the Atchison, Topeka and Santa Fe railroad, later becoming chairman of the board of directors.

In Feb. 1918, after the U.S. government had assumed control of the railways as a war measure. Hines was appointed assistant director general. and in January of the following year director general. In May 1920 he was designated by Pres. Woodrow Wilson as arbitrator in the distribution of German, Austrian and Hungarian inland shipping under the peace treaties. In 1925 he made an investigation and report of navigation on the Rhine and Danube for the League of Nations. He wrote *The War History of the American Railroads* (1928).

HINNY, a hybrid between a horse and an ass in which the latter is the female parent. *See* MULE.

HINRICHS, HERMANN FRIEDRICH WILHELM (1794–1861), German Hegelian philosopher, was born on April 22, 1794, at Oldenburg.

He studied theology at Strassburg and philosophy at Heidelberg under Hegel, who wrote a preface to his *Religion im innern Verhältniss zur Wissenschaft* (1822) directed against Schleiermacher. Hinrichs held professorships at Breslau (1822) and at Halle (1824j. Among his philosophical works were *Grundlinien der Philosophie der logik* (1826) and *Genesis des Wissens* (1835). His writings on esthetics include *Vorlesungen über Goethes Faust* (1825); *Das Wesen der antiken Tragodie* (1827), and *Schillers Dichtungen* (1837); His *Geschichte der Rechts- und Staatsprinzipien seit der Reformation* (1848–52) and *Die Könige* (1832) were historical works.

Hinrichs died on Sept. 17, 1861.

HINSCHIUS, PAUL (1835–1898), German jurist, the son of Franz Sales August Hinschius (1807–77), was born in Berlin on Dec. 2j, 1835. His father was not only a scientific jurist. hut also a lawyer with a large practice in Berlin. After working under his father, Hinschius in 1852 began to study jurisprudence at Heidelberg and Berlin, the teacher who had most influence upon him being Aemilius Ludwig Richter (1808–64). to whom he afterward ascribed the great revival of the study of ecclesiastical law in Germany. In 185j Hinschius took the degree of *doctor utriusque iuris,* and in 1859 was admitted to the juridical faculty of Berlin. He lectured at Halle. Berlin and Kiel universities, and in 1870–71 represented Kiel in the I'russian upper house (1870–71). In 1872 he was appointed professor ordinarius of ecclesiastical law at Berlin. He took part in the conferences of the ministry of ecclesiastical affairs. which issued in the famous "Falk laws." In connection with the developments of the *Kulturkampf* which resulted from the "Falk laws." he wrote several important treatises. He sat in the *reichstag* as a National Liberal from 1872 to 1878, and again in 1881 and 1882, and from 1889 onward he represented the University of Berlin in the Prussian upper house. He died on Dec. 13, 1898. The two great works by which Hinschius established his fame are the *Decretales Pseudo-Isidorianae et capitula Angilramni* (2 parts, Leipzig, 1863) and *Das Kirchenrecht der Katholiken und Protestanten in Deutschland,* vol. i–vi (1869–77). The first of these, for which during 1860 and 1861 he had gathered materials in Italy. Spain. France. England, Scotland. Ireland. the Netherlands and Belgium. was the first critical edition of the False Decretals. The *Kirchenrecht* is an exhaustive historical and analytical study of the Roman Catholic hierarchy and its government of the church.

HINSHELWOOD, SIR CYRIL NORMAN (1897–), English chemist. was awarded, with Nikolai Semenov (*q.v.*), the 1956 Nobel prize for chemistry, for his work on chemical kinetics. Hinshelwood was horn in London on June 19, 1897. He was educated at Westminster City school and at Oxford university. where he held in succession fellowships at Balliol. Trinity and Exeter colleges. In 1937 he was elected Dr. Lee's professor of chemistry at Oxford. From the Royal society, of which he was elected a fellow in 1929 at the early age of 31, he received the Davy medal in 1943 and a Royal medal in 1947, and he was elected president in 1955. During 1946–48 he was president of the Chemical society. His early studies dealt with molecular kinetics and later he investigated chemical changes in the bacterial cell with physico-chemical explanations of the biological responses of bacteria to changes in environment. He claimed that changes. more or less permanent, in resistance to a drug could be induced in bacterial cells by prolonged exposure to the drug. as a result of a change in the enzyme patterns of the cell impressed on them by the drug, a conclusion of great significance with regard to the development of "resistance" in bacteria subjected to the action of chemotherapeutic agents and antibiotics. Hinshelwood was knighted in 1948. His publications include *The Kinetics of Chemical Change* (1926; 4th ed.. 1940) and *Tlze Chemical Kinetics of the Bacterial Cell* (1946). (*D.* McK.)

HINSLEY, ARTHUR (1865–1943), English cardinal. was born at Carlton. Selby, Yorkshire. Eng.. on Aug. 2j. 1865. Educated at Ushaw, near Durham, and at the English college in Rome, he was ordained at Rome in 1893. He was professor at Ushaw (1893–97), assistant priest at Keighley. Yorkshire. in 1898. and headmaster of St. Bede's grammar school. Bradford. Yorkshire (1899–1904). He was pastor of' Sutton Park. Surrey, from 1904 to 1911 and of Sydenham. Devonshire, from 1911 to 1917, when he returned to academic life as rector of the English college at Rome, a position he held until 1928. In 1926 he was consecrated titular bishop of Sebastopolis, and in 1930 titular archbishop of Sardis. He was Visitor Apostolic in Africa in 1927. He was Apostolic delegate in Africa from 1930 to 1934, and while there contracted paratyphoid. which seriously affected his hearing and vision. He was canon of the Patriarchal Basilica of St. Peter's in Rome during 1934–35, after which he retired.

The death of Francis Cardinal Bourne, archbishop of Westminster. on Jan. 1. 193j. left English Catholics without a ruling prelate for the jubilee of George V. and consequently Hinsley was called out of retirement and made archbishop of Westminster on March 25, 1935. On Dec. 13, 1937, he was made cardinal.

Outspoken on political matters, he had criticized the negative stand of Pope Pius XI at the time of the Ethiopian invasion in 1935. His experience in Africa had confirmed him as a staunch advocate of English imperialism. Though he had been long out of England, he became famous before and in the early years of World War II, not only to English Catholics but to the English people generally, for his forthright stands against totalitarianism. He despised Germany's national socialism. denounced the Hitler party as "pagan upstarts" and, although no friend of communism, paid frequent tribute to the Russian people for their defense against Germany.

Cardinal Hinsley died at Buntingford. Hertfordshire, on March 17, 1943.

HINTERLAND, the region lying behind a littoral country yet regarded as a part of it geographically and perhaps economically. The term, which may be translated as "hack country," is German in origin. first coming into prominence in 1883–85, when Germany insisted on the right to exercise jurisdiction in the territory behind those parts of the African coast that it had occupied. The doctrine of the hinterland was a revival of the U.S. theory of continuity and contiguity. set forth by secretaries of state John C. Calhoun and Daniel Webster. which had held that a state occupying a certain territory should have the right of preference in the future disposition of territory contiguous to it. Extensive regions in Africa were claimed after 1895 by Great Britain. Germany, France and Portugal on the basis of the hinterland doctrine. Neither the U.S. theory of contiguity nor the doctrine of the hinterland ever obtained wide support.

The weakness common to both of them was the lack of effective occupation and control over the areas claimed.

See M. F. Lindley, *The Acquisition and Government of Backward Territory in International Law (1926).* (N. L. HL.)

HINTON, SIR CHRISTOPHER (1901–), British engineer who played a leading part in developing the atomic industry in Great Britain, was born at Tisbury, Wilts., on May 12, 1901, and served an engineering apprenticeship in the Great Western railway shops at Swindon before going up to Cambridge to read for the mechanical sciences tripos. In 1926 Hinton joined the research department of Brunner Monds, which became the Alkali division of Imperial Chemical Industries Ltd. By 1931 he was chief engineer at I.C.I., Northwich. On the outbreak of World War II, Hinton went to the ministry of supply, being deputy director general of filling factories from 1942 to 1946. After the war he became director of the production division of the department of atomic energy, and subsequently a member of the Atomic Energy authority. 1956 saw the commissioning of the Calder Hall power station, the first in the British program for the peaceful development of nuclear power. In 1958 Hinton became chairman of the central electricity generating board. He was knighted in 1951 and was made a knight of the British empire in 1957. In 1954 he was elected a fellow of the Royal society and in 1957 an honorary fellow of Trinity college, Cambridge. (J. F. BR.)

HINTON, JAMES (1822–1875), English surgeon and author, son of John Howard Hinton (1791–1873), Baptist minister and author, was born at Reading in 1822. He was educated at his grandfather's school near Oxford, and at the Nonconformist school at Harpenden, and in 1838 was apprenticed to a woollen-draper in Whitechapel. After a year in this occupation he became a clerk in an insurance office, spending his evenings in intense study, and this, combined with his over-zealous interest in moral problems, endangered his health in his 19th year. On the advice of a physician he was then sent to St. Bartholomew's hospital to study for the medical profession. After receiving his diploma in 1847, he was for some time assistant surgeon at Newport, Essex, but the same year he went to Sierra Leone to take medical charge of free labourers on their voyage to Jamaica. He returned to England in 1850 and practised as a surgeon in London, where he became interested in aural surgery and physiology. He first appeared as an author in 1856 when he contributed papers on physiological and ethical subjects to the *Christian Spectator;* and in 1859 he published *Man and his Dwellingplace.* A series of papers entitled "Physiological Riddles," in the *Cornhill Magazine,* and another series entitled *Thoughts* on *Health* (1871), proved his aptitude for popular scientific exposition. He was appointed aural surgeon of Guy's hospital in 1863, and rapidly acquired a reputation as the most skilful aural surgeon of his day, which was fully borne out by his works, *An Atlas of Diseases of the membrana tympani* (1874) and *Questions of Aural Surgery* (1874). He gave up his practice in 1874 when his health broke down; and he died in the Azores on Dec. 16, 1875. Other works by him include *The Mystery of Pain* (1866) and *The Place of the Physician* (1874). His *Life and Letters,* with an introduction by Sir W. W. Gull, appeared in 1878.

HINTZE, PAUL VON (1864–1941), German admiral and diplomatist, was born at Schwedt-on-the-Oder on Feb. 13. 1864. He entered the navy. and became (1908) military plenipotentiary at the Russian court. where he was said to enjoy the tsar's confidence. From 1911–14 he was ambassador in Mexico, but was recalled at the end of 1914, was sent to Peking and accomplished the journey in spite of the vigilance of the Allies. Transferred to Christiania (Oslo) in 1915 he again succeeded in eluding the blockade. From July 9 to Oct. 3, 1918, he was state secretary at the foreign office in succession to Kiihlmann, representing it at German headquarters in the months preceding the Armistice in 1918. Tirpitz said in his *Erinnerungen* (1919) that war with Russia might have been averted in 1914 if the emperor had sent Hintze on a mission to the tsar. Hintze died Aug. 23, 1941.

HIP, the projecting part of the body formed by the top of the thighbone and the side of the pelvis, in quadrupeds generally known as the haunch. The hip joint is the connecting joint between the thighbone (femur) and the pelvis. *See* JOINTS AND LIGAMENTS; SKELETON, VERTEBRATE.

HIPPARCHUS (fl. 146–127 B.C.), was the greatest astronomical observer of antiquity and an able mathematician. He was born at Nicaea in Bithynia, which lies east of the sea of Marmara. The dates of his birth and death and the place of his death are not known. He carried out his observations in Bithynia, at Rhodes, where he spent much time, and also, it seems, at Alexandria. The year 127 B.C. is usually quoted as the latest date known for his actual work, and the French astronomer J. B. J. Delambre (1749–1822) clearly showed how some observations of Hipparchus on the star η Canis Majoris seem likely to have been carried out in that year.

Most of our knowledge of Hipparchus is contained in the writings of Strabo of Amasya (fl. A.D. 20) and in that great astronomical compendium, the *Almagest* of Ptolemy (fl. A.D. 127–151). Ptolemy often quotes Hipparchus verbally, and it is obvious that he thought very highly of him; indeed, as a result of the slow progress of early science, he speaks of him with the respect due to a distinguished contemporary, although almost three centuries separated the work of the two men. It is difficult always to determine to which of them credit is due.

It is certain, however, that in all his work Hipparchus showed a clear mind and a dislike for unnecessarily complex hypotheses. He rejected not only all astrological teaching, as might be expected, but also the heliocentric views of the universe which seem to have been proposed, according to Archimedes (287–212 B.C.), by Aristarchus of Samos (fl. c. 270 B.C.) and which were resuscitated by Seleucus the Babylonian, a contemporary of Hipparchus. It must be remembered that strong arguments had been advanced against the motion of the earth, and the general climate of opinion had never been favourable to following up the lead given by Aristarchus. Moreover, the movable eccentric and the epicyclic systems accounted well for most of the irregularities observed in the motions of the sun, the moon and the planets, and it was not until the 15th century A.D. that regular observations over very long periods showed the geocentric hypothesis to be too complex to be acceptable. It was, of course, the Ptolemaic geocentric system which was handed down to western European science, but it must be remembered that the views of Hipparchus had a profound influence on Ptolemy, as he himself acknowledged.

Few details are known of the instruments which Hipparchus used. However, it seems likely that he observed with the usual devices current in his day, although Ptolemy credits him with the invention of an improved type of theodolite. In all his instruments Hipparchus would, of course, have used open sights.

Precession of the Equinoxes and Length of the Year.— Hipparchus is best known for his discovery of the precession of the equinoxes; *i.e.,* of the alterations of the measured positions of the stars resulting from the movement of the points of intersection of the ecliptic and of the celestial equator. It appears that he had written a work bearing "precession of the equinoxes" in the title, and this term is still in current use although the phenomenon is more usually referred to merely as "precession." This notable discovery was the result of painstaking observations worked upon by an acute mind. Hipparchus observed the positions of the stars and then compared his results with those of Timocharis of Alexandria 150 years before. and with even earlier observations made in Babylonia. He discovered that the celestial longitudes were different, and that this difference was of a magnitude exceeding that attributable to errors of observation. Hipparchus therefore proposed precession to account for this, and gave a value of 45″ or 46" for the annual changes.

This is very close to the figure of 50″.26 accepted nowadays, and is a value much superior to the 36" which Ptolemy obtained. It strongly confirms the reputation of Hipparchus as an observer of outstanding precision.

His discovery of precession enabled Hipparchus to obtain more nearly correct values for the tropical year (the period of the sun's apparent rotation from an equinox to the same equinox again) and also for the sidereal year (the period of the sun's apparent rotation from a fixed star to the same fixed star). Again he was ex-

tremely accurate, so that his value for the tropical year was too great only by 63 minutes.

Star Catalogue. — Observations of star positions, measured in terms of celestial latitude and longitude. as was customary in antiquity, were carried out by Hipparchus and entered in a catalogue — the first star catalogue ever to be completed. Hipparchus measured the stellar positions with greater accuracy than any observer before him, and his observations were of use to Ptolemy and later to Edmund Halley. To catalogue the stars was thought by some of Hipparchus' contemporaries to be an impiety. but he persevered. He had been stimulated in 134 B.C. by observing a "new star" and. concluding that such a phenomenon indicated a lack of permanency in the number of "fixed" stars, he determined to catalogue them, and no criticism was able to deflect him from his purpose.

Hipparchus' catalogue was completed in 129 B.C. and listed about 850 stars (not 1,080 as is often stated), the apparent brightnesses of uhich were specified by a system of six magnitudes similar to that used today. For its period, this catalogue was a monumental achievement.

Lunar and Solar Work. — In his work on the sun and moon Hipparchus used the observations of others as well as his own. He showed that the movable eccentric and the deferent and epicycle systems were equivalent in the motions they gave for the sun and moon and, indeed, for the planets. Both methods gave the position of the sun correct to within 1', and Hipparchus rejected the peculiar notion, prevalent in his day. that the sun moved in an orbit inclined to the ecliptic. He also redetermined the inclination of the ecliptic and obtained a value correct to within 5' of the modern figure.

The motion of the moon is more complex than that of the sun, owing to the perturbations which the moon suffers from both earth and sun; in consequence, there are more irregularities to be taken into consideration. Hipparchus satisfactorily accounted for that inequality of the moon's motion which is due to the elliptical form of its orbit; he utilized circular motions but inclined the deferent at an angle of 5° to the ecliptic. His theory gave reasonably satisfactory results for the motion at full and new moon. Hipparchus was dissatisfied however, for, as he appreciated, the errors at quadrature were too great. He concluded that there was some further inequality in the moon's motion. but he uas unable to discover any means of solving this problem. With his scientific approach, he stated that he left the solution of this question to his successors.

Hipparchus also attacked the problem of the relative size and distance of the sun and moon. It had long been appreciated. of course, that the apparent diameter of each was the same, and various astronomers had attempted to measure the ratio of size and distance of the two bodies. Eudoxus obtained a value of 9:1; Phidias (father of Archimedes) 12:1; Archimedes himself 30:1, while Aristarchus believed 20:1 to be correct. The present-day value is, approximately, 393:1. Hipparchus followed the method used by Aristarchus, a procedure which depends upon measuring the breadth of the earth's shadow at the distance of the moon (the measurement being made by timing the transit of the shadow across the moon's disk during a lunar eclipse). This method really gives the parallax, and thus the distance, of the moon, the parallax for the sun being too small to give a significant result; moreover the accuracy obtainable for the distance even of the moon is poor. Hipparchus was dissatisfied with his results, so he attempted to find the limits within which the solar parallax must lie for observations and calculations of a solar eclipse to agree; he also hoped that differences betueen solar and lunar parallax might thus be revealed. He obtained no satisfactory result from his efforts. however, and concluded that the solar parallax was probably negligible. At least, then. he appreciated that the distance of the sun was very great indeed. But it must be mentioned that Cleomedes (fl. 2nd century A.D.) claimed that Hipparchus gave the sun's volume as 1,050 times that of the earth (modern value= 1,300,000); and Theon of Smyrna (fl. 2nd century A.D.) made him give it as 1,880 times.

Planetary Studies. — Hipparchus was unsuccessful in forming a satisfactory planetary theory, and, as has already been remarked, he was true scientist enough to avoid building hypotheses on insufficient evidence. Theon claims that Hipparchus preferred the mathematical device of the epicycle to that of the movable eccentric, but it seems clear that he looked upon such devices purely as mathematical conveniences, and was not concerned with the reality or otherwise of these combinations of circular motion. Ptolemy went further in his description of the planetary work of Hipparchus and wrote: "It was, I believe, for these reasons and especially because he had not received from his predecessors as many accurate observations as he has left to us, that Hipparchus, who loved truth above everything. only investigated the hypotheses of the sun and moon, proving that it was possible to account perfectly for their revolutions by combinations of circular and uniform motion, while for the five planets, at least in the writings which he has left, he has not even commenced the theory, and has contented himself nith collecting systematically the observations and showing that they did not agree with the hypotheses of the mathematicians of his time. He explained in fact not only that each planet has two kinds of inequalities but also that the retrogradations of each are variable in extent, while other mathematicians had only demonstrated geometrically a single inequality and a single arc of retrograde motion; and he believed that these phenomena could not be represented by eccentric circles nor by epicycles carried on concentric circles, but that, by Jove. it would be necessary to combine the two hypotheses." (J. L. E. Dreyer, *History of the Planetary Systems From Thales to Kepler,* Cambridge University Press, 1906.)

Those who studied this problem before the time of Hipparchus had but one main aim, to explain the irregularities which occurred when a planet was in opposition. No notice mas taken of those irregularities which occurred when a planet was in other parts of its orbit, doubtless because of the habit of observing only around times of opposition. Hipparchus advocated more frequent observing for longer periods, and he carried out such work himself with an accuracy unsurpassed in his time. The need for accurate and frequent observations made over a long period may be appreciated when it is recollected that Jupiter takes almost 12 years to complete an orbit round the sun and Saturn nearly 30 years, and that such sidereal periods must be carefully observed before any law can be formulated. Ptolemy used the older observations which Hipparchus had sifted and those which Hipparchus himself had made as well as his own, before he formulated the planetary views enshrined in the *Almagest.* In his own planetary work Hipparchus adopted the generally accepted order for the sun, moon and planets, namely (in order from the earth) the moon, Mercury, Venus. the sun, Mars, Jupiter and Saturn.

Mathematics. — It is to be expected that the astronomical work of Hipparchus should lead him to develop certain departments of mathematics. He made an early formulation of trigonometry and tabulated a table of chords (chord $\alpha = 2 \sin [\alpha/2]$); he is known to have had a method of solving spherical triangles. It is also generally agreed that the theorem in plane geometry known as "Ptolemy's theorem" was originally due to Hipparchus, and was later copied by Ptolemy. This theorem has implicit in it the trigonometrical addition formulas for $\sin (A \pm B)$ and $\cos (A \pm B)$, and Lazare Carnot (1753–1823) showed how the whole of plane trigonometry can be deduced from these formulas.

Hipparchus criticized severely the geographical work of Eratosthenes (*c.* 273–192 B.C.) and himself did some work in this field. His main contribution was to apply rigorous mathematical principles to the determination of places on the earth's surface, and he was the first to do so by specifying their longitude and latitude — the method used today. Hipparchus was, no doubt, led to this method by his work on the trigonometry of the sphere. He tried to measure latitude by utilizing the ratio of the longest to the shortest day at a particular place instead of following the customary method, due to the Babylonians, of measuring the difference in length of day as one travels northward. Hipparchus also divided the then known inhabited world into climatic zones, and suggested that the longitude of places could be determined by observing. from these places, the moments when a solar eclipse began and ended; but this bold scheme, while theoretically satis-

factory for a small area of the earth's surface, was not a practical proposition in his day.

HIPPARION, an extinct horse that arose in North America and spread over Europe, Asia and Africa in the early Pliocene. Like its allies *Neohipparion* and *Nannippus,* which are known only from North America. *Hipparion* was persistently three-toed and was not ancestral to the modern horse *(Equus)* but was a lateral off-shoot derived from *Merychippus. (See* EQUIDAE.) (G. G. SI.)

HIPPASUS OF METAPONTUM (fl. *c.* 500 B.C.), Pythagorean philosopher. was probably of the first generation after Pythagoras. Tradition said that he was drowned after revealing a mathematical secret of the brotherhood. He may also have published a *mystikos logos* or work on the mysteries which for some reason was resented. He held the Heraclitean fire-doctrine. whereas the Pythagoreans maintained that number is the first principle, and seems to have regarded the soul as composed of igneous matter; so he approximates Pythagorean dualism of light and dark to the theories of Heraclitus.

See H. Diels and W. Kranz, *Fragmente der Vorsokratiker,* i, 7th ed. (Berlin, 1954). (A. C. LD.)

HIPPEASTRUM, formerly a genus of the Amaryllidaceae, now placed in the genus *Amaryllis* (*q.v.*).

HIPPED ROOF, in architecture, a roof which starts on all sides on the same level at the eaves and slopes up toward a ridge or point in the centre.. Hipped roofs were apparently common in the domestic work of the Mediterranean countries from the time of Greece, and are still the most common form for informal buildings throughout the near east and in Italy. southern France and Spain. With the coming of the Renaissance into northern Europe the hipped roof tended to supersede the gable, owing to the emphasis on the horizontal line of the cornice. Thus most of the Renaissance *châteaux* of France and many of the earlier Georgian manors of England have hipped roofs. A remarkable development of hipped roof design was made by the Chinese, particularly .in the north. where many of the great temple and palace halls have widely projecting and gently curved hipped roofs in which the hips (the intersections of the slopes) and the ridges are richly decorated with molded tiles and terminated by fantastic dragons or grotesque beasts. *See* ROOF.

HIPPEL, THEODOR GOTTLIEB VON (1741–1796), German satirical and humorous writer, was born on Jan. 31, 1741, at Cerdauen, East Prussia. the son of a schoolmaster. In 1770 he was appointed chief burgomaster in Konigsberg, and in 1786 president of the town. He died at Konigsberg on April 23, 1796. *Lebensläufe nach aufsteigender Linie* (1778–81) is an autobiography, in which persons well known to him are introduced, together with a mass of heterogeneous reflections on life and philosophy. *Kreuz- und Querzüge des Rifters A bis Z* (1793–94) is a satire levelled against the follies of the age—ancestral pride and the thirst for orders, decoration and the like. Hippel has some resemblance to Jean Paul Richter in his constant digressions and in the interweaving of scientific matter in his narrative. Like Richter he was strongly influenced by Laurence Sterne.

In 1827–38 a collected edition of Hippel's works in 14 vols., was issued at Berlin. *Über die Ehe* has been edited by E. Brenning (Leipzip, 1872), and the *Lebrnslaufe nach aufsteigender Linie* has in a modernized edition by A. von Öttingen (1878) gone through several editions. *See* J. Czerny, *Sterne, Hippel und Jean Paul* (Berlin, 1904).

HIPPIAS OF ELIS, Greek sophist who claimed to be at home in all the learning of his day. He was born before the middle of the 5th century B.C. and was alive in 399 B.C. He is depicted in Plato's *Protagoras* and in the *Hippias Major* and *Hippias Minor.* Hippias acquired great wealth and fame as a teacher throughout the Creek world. His vast literary output included elegies and tragedies as well as technical treatises in prose. He propounded an ideal of individual self-sufficiency and appealed from convention to nature. He was perhaps the first to preach cosmopolitanism. He made a significant contribution to mathematics by discovering the *quadratrix (see* CURVES, SPECIAL); and he developed a system of mnemonics (*q.v.*). His historical compilations and investigations, such as the list of Olympic victors, were used by later writers. His influence on contemporary thinkers was certainly considerable but cannot now be traced in detail.

For fragments and textimonia *see* H. Diels and W. Kranz, *Fragmente der Vorsokratiker,* ii. 7th ed. (Berlin, 1954). (G. B. KD.)

HIPPIUS, ZINAIDA (1869–1945), Russian poet and prose writer, was born on Nov. 8. 1869. at Belev. in the Tula province. She married Dmitri Merezhkovsky (*q.v.*) in 1889 and went to St. Petersburg (Leningrad). Later she settled in Paris. Hippius was one of the leading poets of the Russian symbolist movement of the '90s and her poetry bears the usual character of the movement: the cult of beauty. mysticism and individualism. The influence of Nietzsche's philosophy is also apparent as in the famous line "I love myself as I love God." which became the slogan of the Russian "decadents." Her later poetry shows the influence of the neo-Christian theories of Merezhkovsky. but at the same time reveals deep individual and emotional power. Her prose works were much inferior to her poetry, but under the pseudonym of "Anton Krainy" she was known as a trenchant literary critic. Among her works are *Revolution and Violence* (French trans.. 1907); *The Green Ring* (Eng. trans. *by* S. S. Koteliansky. 1920); *My Journal under the Terror* (French trans., 1921).

HIPPO (fl. *c.* 450 B.C.), Greek philosopher who revived the belief of Thales that the world originates from water or moisture, was born either in Samos or at Rhegium in southern Italy. He held that fire first originates from water and that these two, operating as contrary forces, produce the physical cosmos. But he was more especially concerned with problems of medicine and physiology: disease and death were due to the drying up of the natural moisture in the body. He was a critic of Empedocles. and his physiology resembled that of the Pythagoreans. He must have been well-known at Athens, either personally or through his writings, since Cratinus in a comedy attacked him as an "atheist:" and he was often so designated.

See E. Zeller, *Die Philosophie der Griechen,* rev. ed., vol. i (Leipzig, 1920); K. Freeman, *Companion to the Presocratic Philosophers* (Oxford, 1946; Cambridge, Mass., 1947). (U. J. A.)

HIPPOCRATES AND THE HIPPOCRATIC COLLECTION. The attitude of scholars toward Hippocrates and the Hippocratic problem has altered greatly since the beginning of the 20th century. Serious investigators now agree that we know next to nothing of the man and that few, if any, of the works to which his name is attached can be by him.

According to Soranus (fl. 2nd century A.D.), Hippocrates, the "Father of Medicine" was born on the island of Cos off the coast of Asia Minor at a date corresponding to 460 B.C. Both Soranus and Plato speak of him as a member of the sect, family, guild or society known as the Asclepiadae (*i.e.,* sons of Asclepios). Unfortunately we know nothing of the rights, duties or functions of these Asclepiadae, though highly conjectural statements about them have become current. It is said that Hippocrates was descended from Asclepios on his father's side and from Heracles on his mother's. Since Asclepios is a historical figure—being mentioned as a physician in the Iliad—the former is at least possible. It is said that Hippocrates prosecuted his early medical studies in the famous temple of Xsclepios at Cos, but neither the results of the excavations on that island nor the description by Herondas (fl. 3rd century B.C.) of the conduct of the place suggest any affinity with the spirit of the *Hippocratic Collection.* We shall: therefore, not occupy space with the mass of Hippocratic legend, centred on Cos and spreading also to other sites. It is said, and it is likely, that Hippocrates traveled widely. He is stated to have taught and practised in Thrace, Thessaly. Delos. Athens and elsewhere. He is said to have died at Larissa, at an age given variously, the extremes being 8 j and 110. His "floruit" may be safely placed about 400 B.C. Biographies of him were written by Soranus of Ephesus in the 2nd century A.D., by Suidas the lexicographer in the 11th and by Tzetzes the historian in the 12th centuries. None of them contains much concerning him.

The character and abilities of Hippocrates as a physician have been held in almost universal veneration by medical men in the ages which have followed. Nevertheless, early references to him are very scanty He is mentioned twice by Plato with respect (in the dialogues *Protagoras* and *Phaedrus*). When we reflect that Plato was his younger contemporary, it is surprising that he does not mention Hippocrates more often—especially in the *Timaeus*, which deals with physiological subjects. There are some passages in the Platonic dialogues which have been influenced by works now included in the *Hippocratic Collection.* Aristotle mentions the name of Hippocrates once only (in his *Politics)* but a number of parallels can be discovered between works of the Hippocratic *Collection* and those of Aristotle. These are most frequent in Aristotle's *Historia Animalium*. On the other hand, Hippocrates has had few detractors. Among them were the physician Andreas, who practised in Egypt at the end of the 3rd century B.C., and Asclepiades of Bithynia, who practised in Rome in the 1st century B.C. The works neither of Andreas nor of Asclepiades have survived. We shall make no attempt to entertain the reader by inventing a life of Hippocrates, but pass straight to the so-called *Hippocratic Collection.*

THE HIPPOCRATIC COLLECTION

Early in the history of the Alexandrian medical school—probably not long after 300 B.C.—there began to circulate a group of medical works that has become known as the *Hippocratic Collection.* The name of Hippocrates was already at that date held in high veneration. and into this collection was put everything that could be claimed as of Hippocratic origin. The genuineness of some of these works was suspected from an early date. Ancient scholars applied themselves to their critical study. Notable among these students was Galen (*q.v.*) who was working about 600 years after Hippocrates and wrote commentaries on a number of works of the *Collection.* But dubious in its origin as was the *Collection,* it had not remained intact even between the time when first put together and the time of Galen. On the contrary, during that interval it had suffered considerable alteration—both by accretion and by loss—to say nothing of confusion and error due to the mistakes, dishonesty, haste and ignorance of booksellers, scribes and editors. Further, the deterioration continued after Galen. Our earliest manuscript of the *Collection* is of the 9th century A.D.; our earliest manuscript of a translation is of the 7th century and is a Latin version of the obviously spurious *Dynamidia;* while the earliest documents of any part of the *Collection* are papyrus fragments, of the 3rd or 4th century. of the no less spurious *Epistolae.* Thus the *Hippocratic Collection* provides an ideal battleground for textual criticism and for the discussion of genuineness. The literature on it is vast. Here, we shall give only conclusions.

The works which make up the *Hippocratic Collection* are variously numbered and divided and can be regarded, according to taste, as between about 70 and about 100. Where and when were they written? Of later works, some of the more recent. dating from the time of the Roman empire. were probably mostly written in Rome and may be as late as the 3rd century A.D. The main interest of the *Collection* is, however, concentrated on the earlier works. Of these the earliest were composed in the 5th century B.C. and came from the shores of Asia Minor, one or two possibly from Sicily. In Asia Minor two schools of medicine were early organized. The older was associated with the peninsula of Cnidus. The younger has always been associated with the opposite island of Cos. though it would be safer to link it with Coan physicians rather than with Coan soil. in view of what is known of Cos itself. It is with the Coan school that the name of Hippocrates will he forever linked. The Coan and the Cnidian schools represented divergent views, and their differences affected the medical world of the 5th and 4th centuries B.C. The main differences between the two were that the Coan school was more concerned with disease in general and the Cnidian with particular manifestations of disease. There is also some evidence that the Cnidians paid more attention to gynecology.

The great merit of Hippocrates, however, is that it was he, as the encyclopaedist **A.** Cornelius Celsus (1st century A.D.) tells us, "who first separated medicine from philosophy"; *i.e.*, in the language of modern times, he observed and inferred without allowing his judgment to be biased by preconceived ideas. Now there is a small group of treatises in the *Collection* (books i and iii of the *Epidemics* being perhaps the most striking of the group) of which this can fairly be said. Is this the residuum of works by "the Father of Medicine" himself? We may say so, if we will, but in doing so we have no test of authenticity save excellence. If we examine even these "authentic" works closely we shall find them by no means as free from preconceived ideas as many have considered. Scientific thinkers of the 5th century B.C. were indeed much like those of the 20th century A.D., for all their work was conditioned and controlled by their past.

To speak of a "Hippocratic canon" would be misleading: the contents of the various manuscripts differ. and the date, style, length and subject matter of the treatises also vary greatly, though most of them exhibit the doctrines of the Coan school. Some treatises appear to be textbooks for the use of medical men, some are books intended for use by the nonmedical layman; some are collections of material, either the results of research or matter intended for use in research; some are lectures or essays, sometimes with a polemical or apologetic purpose; in others the chief interest is philosophical. A few treatises are collections of aphorisms. Thus nearly every treatise in the *Coblection* requires separate and individual discussion from the point of view of style, authorship, philosophical associations, language, sources, doctrines and interpretation. The works of the *Collection* can no more be treated in common than can the books of the Old Testament, which cover a comparable area of time. We may. however, make one general negative statement. The works of the *Collection* contain practically nothing of superstition. They are sometimes wearisomely sophistic; they are frequently ludicrously wrong; they often advance absurd hypotheses; they are not seldom obscure. But the attitude of their authors to the supernatural is the same throughout and none swerves in his loyalty to the idea of natural law. There is a work on *The Sacred Disease* (*i.e.*, epilepsy) which puts the point for us:

> As for this disease called divine, surely it too has its nature and causes whence it originates, just like other diseases, and is curable by means comparable to their cure. It arises—like other diseases—from things which enter and quit the body, such as cold, the sun and the winds, things which are ever changing and never at rest. Such things are divine or not—as you will, for the distinction matters not—and there is no need to make such division anywhere in nature, for all are alike divine or all are alike human. All have their antecedent causes which can be found by those who seek them. (Slightly paraphrased.)

Another work in the *Collection,* the *Airs, Waters, Places,* is perhaps by the same author, but there are few instances in the *Collection* in which several works can be ascribed to one hand.

Other treatises belonging to the chief medical section of the *Collection* are the *Epidemics,* of which books i and iii are the most famous, containing 42 clinical histories, with descriptions of climatic and other circumstances for each particular case; the scientific character of these is striking.

Among the surgical treatises may be mentioned *Wounds in the Head,* one of the greatest of the Hippocratic treatises, dating probably from the end of the jth century B.C. It contains a remarkable description of the method of trephining (perforating the skull) and discusses when this operation should be attempted. Another interesting treatise is *In the Surgery,* from which the following passages may be quoted:

> Operative requisites in the surgery; the patient, the operator, assistants, instruments, the light, where and how placed; the patient's person and apparatus. The operator, whether seated or standing, should be placed conveniently to the part being operated upon, and to the light. Each of the two kinds of light, ordinary and artificial, may be used in two ways, direct or oblique . . .
>
> The nails [of the operator] neither to exceed nor to come short of the finger tips. Practice using the finger ends . . . Practice all the operations with each hand and with both together, your object being to attain ability, grace, speed, painlessness, elegance and readiness . . .
>
> Let those who look after the patient present the part for operation as you want it and hold fast the rest of the body so as to be all steady, keeping silence and obeying their superior.

Among the more philosophical treatises is *Ancient Medicine,* in

which the approach to medicine by way of arbitrary hypotheses or postulates (as was done for instance by Empedocles) is condemned, and the traditional method of observation and research is defended and commended. This treatise is interesting also for its strong emphasis upon regimen (an emphasis not uncommon in Hippocratic times, because of the defective development of drugs) and for its acceptance of the doctrine of an immense number of constituents (called *dynameis,* "strong substances") both of the human body and of its foods, the "blend" *(kraszs,* whence ultimately "temper," "temperament," etc.) of which substances was necessary for health. In *The Nature of Man* a theory of four humours is adopted.

In *Airs, Waters, Places* (which. as stated above, may well be by the same author as *The Sacred Disease),* climate is treated as an important factor in prognosis. and the effect of climate upon human character is discussed—an early essay in topographical anthropology.

Regimen, a treatise in four books, is based on the theory that the human body, its foods and its activities can all be reduced to the terminology of fire and water and prescribes foods and exercises for maintaining and restoring health; in book iv the medical significance of certain kinds of dreams is dealt nith.

A few treatises are written in the so-called aphoristic style, in which conclusions of wide general import are compressed into short and easily remembered sentences; the best-known is the admirable treatise which bears the title *Aphorisms* and opens with the most famous sentence of the whole *Collection,* "Art is long and life is short."

As a rule common style is an argument for common authorship, but in the case of aphorisms imitation is so easy that confidence as to authorship is almost impossible.

Perhaps the most famous of all the treatises in the *Collection* is the so-called *Hippocratic Oath,* which is really an indenture to be executed between master and pupil, perhaps upon the latter's completion of his period of apprenticeship. *(See* also MEDICINE, HISTORY OF. *Ancient Medicine: The Hippocratic Oath.)* It has been cogently argued by Ludwig Edelstein that the *Oath* embodies Pythagorean beliefs and did not at the time of its composition express the views generally accepted in Greece. Edelstein dates it to the 4th century B.C.

A Christian adaptation of the *Oath* is found in some manuscripts.

BIBLIOGRAPHY.—For a critical edition of the texts of the *Collection* see the *Corpus medicorum graecorum* (Leipzig, 1927–). E. Littré (ed.), *Oeuvres complètes d'Hippocrate,* 10 vol. (Paris, 1839–61), gives a complete French translation. For the text of the more important works with Eng. trans., see *Hippocrates,* ed. by *W.* H. S. Jones and E. T. Withington, 4 vol. (London and New York, 1923–31). On the manuscripts, *see* H. Diels, *Die Handschriften der antike Aercte,* 3 vol. (Berlin, 1905–08). (C. SI.; A L. PK.)

HIPPOCRATES OF CHIOS *(c.* 460 B.C.), famous Greek geometer known for compiling a book of the elements of mathematics, thus being a precursor of Euclid (c. 300 B.C.); for finding the areas of certain lunes. *i.e.,* plane figures bounded by arcs of circles; and for reducing the problem of doubling the cube to that of finding two mean proportionals between two given numbers.

Tradition saps that Hippocrates was a merchant whose goods had been captured by pirates.

He went to Athens to prosecute them, stayed in that city for a long time, attended lectures on mathematics and added to his income by teaching that subject.

Aristotle's account of the story was that Hippocratcs had been cheated by customs officers in Byzantium. and that though he was a good geometer, he was a poor businessman.

The book of the elements of mathematics compiled by Hippocrates is said to have been the first of his achievements. It is known only through references in the work of later commentators, especially Proclus *(c.* 450) and Simplicius *(c.* 530). Hippocrates' quadratures of lunes were based upon the theorem that the areas of two circles have the same ratio as the squares on their diameters. A summary of these quadratures. written by Eudemus, with elaborate proofs, has been preserved by Simplicius.

The third of the achievements attributed to Hippocrates was the discovery that if two mean proportionals be inserted between a number and its double, the first of these mean proportionals is the edge of a cube whose volume is double that of the cube that has the first of the numbers as its edge *(see* CUBE).

HIPPOCRATIC OATH, still taken at some universities by graduates in medicine, whereby they undertake not to divulge confidential information. For the text of the Hippocratic oath, *see* MEDICINE, HISTORY OF; *see* also HIPPOCRATES AND THE HIPPOCRATIC COLLECTION.

HIPPOCRENE, "the fountain of the horse," the spring on Mt. Helicon. in Boeotia, which like the other spring there. Aganippe, was sacred to the Muses and Apollo, and hence taken as the source of poetic inspiration. The spring, surrounded by an ancient wall, is now known as *Kryopegadi* or the cold spring.

According to the legend, it was produced by the stamping of the hoof of Pegasus. The same story accounts for the Hippocrene in Troezen and the spring Peirene at Corinth.

HIPPODAMUS of Miletus, Greek architect of the 5th century B.C., who introduced a tonn-planning system of a series of broad straight streets intersecting at right angles. He planned the harbour town of Athens. Piraeus, about the middle of the century, under Pericles, and was architect to the colony at Thurii in Italy in 443 B.C. His alleged superintendence of the building of the nen city of Rhodes in 408 B.C. is probably a fiction.

See R. *E* Wycherley, *How the Greeks Built Cities* (1949).

HIPPODROME, a Greek building for horse and chariot races, corresponding to the Roman *circus.* It was usually placed on a hill slope, so that the excavated material from one side could serve for an embankment for the other. One end was semicircular and the other square. The seats ran continuously around the semicircle and the two long sides, in rising tiers, and down the centre was a division. Because as many as ten chariots raced at a time, a width of about 400 ft. was necessary. The usual length varied from 600 to 700 ft. In the hippodrome at Constantinople much of the area was supported on tiers of great vaults instead of the more usual embankment. On the centre division, between an Egyptian obelisk and a memorial column, was placed the famous bronze serpent tripod from the oracle at Delphi.

Begun by Severus in 203, and completed by Constantine in 330, it was both the largest and the most splendid hippodrome of the ancient world. Among its decorations were the four Greek bronze horses that now stand on the facade of St. Mark's at Venice.

HIPPOLYTUS (d. *c.* 230), a writer of the early church, whose personality was enveloped in mystery before the discovery in 1851 of his chief nork. the *Philosophumena.* Assuming the

authenticity of this work, and correlating it with tradition, we get a tolerably clear picture. Hippolytus was born in the second half of the 2nd century, probably in Rome. He was learned and eloquent, and under Bishop Zephyrinus (199–217) was presbyter of the church at Rome. He accused Zephyrinus's successor, Calixtus I (*q.v.*), of favouring the Christological heresies of the Monarchians, and of subverting discipline by receiving back into the Church those guilty of gross offenses. The result was a schism, and for some ten years Hippolytus stood as bishop at the head of a separate church. During the persecution under Maximinus the Thracian, Hippolytus and Pontius, who was then bishop, were transported in 235 to Sardinia, where it would seem that both of them died, the former having been reconciled with the church.

Hippolytus's voluminous writings, some of which are listed in Eusebius, *Hist. Eccl.* vi and in Jerome, *De Viris Ill.* lxi, exist chiefly in fragments. They embrace the spheres of exegesis, apologetics and polemic, chronography and ecclesiastical law. Of his exegetical works the best preserved are the *Commentary on the Prophet Daniel* and the *Commentary on the Song of Songs*, both distinguished by sobriety and sense of proportion. Of his polemical treatises the chief is the *Refutation of all Heresies*, or *Philosophumena. Ek.* i was for a long time printed among the work of Origen; bks. iv–x were found in 1842 by the Greek Minoides Mynas, without the name of the author, in a ms. at Mount Athos, but it is now accepted as a work of Hippolytus; books ii and iii are lost. The work has been much over-rated, the exposition of the Gnostic system in particular being untrustworthy. Of the dogmatic works, that on *Christ and Antichrist* which survives in a complete state, gives a vivid account of the events of the beginning of the 3rd century. The chronicle of the world, from the creation to 234, formed a basis for many chronographical works both in the east and west. In the great compilations of ecclesiastical law which arose in the east after the 4th century *(see* CONSTITUTIONS, APOSTOLIC) much material was taken from Hippolytus.

BIBLIOGRAPHY.—The edition by J. A. Fabricius (2 vols., Hamburg, 1716–18, reprinted in Gallandi, *Bibliotheca veterum patrum* (vol. ii, 1766) and Migne, *patrol. graeca*, x) is out of date. The *Commentaries on Daniel* and on the *Song of Songs*, the treatise on *Antichrist*, and the *Lesser Exegetical* and *Homiletic Works* were edited by N. Bonwetsch and H. Achelis in 1897. The *Chronicle* has been published by A. Bauer (Leipzig, 1905) and the *Refutation* by Miller (Oxford, 1851), Duncker and Schneidewin (Göttingen, 1859) and Cruice (Paris, 1860). The *Philosophurnena* has been translated by F. Legge (1921).

See Bunsen, *Hippolytus and his Age* (1852, 2nd ed., 1854); Dollinger, *Hippolytus und Kallistus* (Regensb. 1853; Eng. transl., 1876); G. Ficker, *Studien zur Hippolytfrage* (Leipzig, 1893); H. Achelis, *Hippolytstudien* (Leipzig, 1897); K. J. Neumann, *Hippolytus von Rom in seiner Stellung zu Staat und Welt*, part i (Leipzig, 1902); Adhémar d'Alès, *La Théologie de Saint Hippolyte* (1906).

HIPPOLYTUS, in Greek legend, son of Theseus and Hippolyte, oueen of the Amazons (or of her sister Antiope), a famous hunter and charioteer and favourite of Artemis. His stepmother Phaedra became enamoured of him, but, finding her advances rejected, she hanged herself, leaving a letter in which she accused Hippolytus of an attempt upon her virtue. Theseus, to whom his father Poseidon had given three wishes, then prayed for the destruction of Hippolytus and banished him. While Hippolytus was driving along the shore at Troezen (the scene of the *Hippolytus* of Euripides), a sea-monster sent by Poseidon frightened his horses; Hippolytus was thrown out of the chariot, and was dragged along, entangled in the reins, until he died. According to a tradition of Epidaurus, Asclepius restored him to life at the request of Artemis; later, he was represented as having been removed to Aricia *(see* DIANA). At Troezen he had a cult, and girls used to dedicate a lock of hair to him before marriage (Eurip. Hipp. 1423; Paus. ii, 32, 1); a local cult-legend said he was not dead, but turned into the constellation Auriga (Paus. *ibid.*). Well-known classical parallels to the main theme are Bellerophon and Anrea (or Stheneboea) and Peleus and Astydamia. The story was the subject of two plays by Euripides (the later of which is extant), and a tragedy by Seneca. Trace of it has survived in the legendary death of the apocryphal martyr Hippolytus, a Roman officer who was torn to pieces by wild horses as a convert to Christianity.

See Roscher's *Lexikon*, art. "Hippolytus"; *L.* R. Farnell, *Greek Hero-Cults* (1921).

HIPPOLYTUS, THE CANONS OF. This book stands at the head of a series of church orders, which contains instructions in regard to the choice and ordination of Christian ministers, and regulations for baptism, the Eucharist, fasts and other observances. We possess the *Canons of Hippolytus* only in an Arabic version, itself made from a Coptic version of the original Greek. It was only in 1870 that it was edited by Haneberg, who added a Latin translation, and so made it generally accessible. In 1900 a German translation was made by H. Riedel, based on fresh mss. These showed that the book, as hitherto edited, had been thrown into disorder by the displacement of two pages near the end; they also removed other difficulties upon which the theory of interpolation had been based.

Contents **of the** Canons. — The book is attributed to "Hippolytus, the chief of the bishops of Rome," and is divided into 38 canons, to which short headings are prefixed. This division is certainly not original, but it is convenient for purposes of reference. Canon 1 is prefatory; it contains a brief confession of faith in the Trinity, and especially in the Word, the Son of God; and it speaks of the expulsion of heretics from the church. Canons 2–5 give regulations for the selection and ordination of bishops, presbyters and deacons. The bishop is chosen by the whole congregation: "one of the bishops and presbyters" is to lay hands upon him and say a prayer which follows (3); he is at once to proceed with "the offering," taking up the eucharistic service at the point where the *sursum corda* comes in. A presbyter (4) is to be ordained with the same prayer as a bishop, "with the exception of the word bishop"; but he is given no power of ordination (this appears to be inconsistent with c. 2). The duties of a deacon are described, and the prayer of his ordination follows (5). Canons 6–9 deal with various classes in the church. One who has suffered punishment for the faith (6) is to be counted a presbyter without ordination: "his confession is his ordination." Readers and subdeacons (7) are given the Gospel, but are not ordained by laying-on of hands. A claim to ordination on the ground of gifts of healing (8) is to be admitted, if the facts are clear and the healing is from God. Widows are not ordained (9): "ordination is for men only." Canons 10–15 describe conditions for the admission of converts. Certain occupations are incompatible with Christian life; only under compulsion may a Christian be a soldier. Canons 16–18 deal chiefly with regulations concerning women.

Canon 19 is a long one dealing with catechumens, preparation for baptism, administration of that sacrament and of the eucharist for the newly baptized. The candidate is twice anointed: first, with the oil of exorcism, after he has said, with his face westward, "I renounce thee, O devil, and all thy following"; and, again, immediately after the baptism. As he stands in the water, he declares his faith in response to an interrogatory creed; and after each of the three clauses he is immersed. After the second anointing the bishop gives thanks "for that Thou hast made them worthy that they should be born again, and hast poured out Thy Holy Ghost upon them, so that they may belong, each one of them, to the body of the Church"; he signs them with the cross on their foreheads, and kisses them. The eucharist then proceeds: "the bishop gives them of the body of Christ and says, This is the body of Christ, and they answer Amen": and similarly for the cup. Milk and honey are then given to them as being "born a second time as little children." A warning is added against eating anything before communicating. Canons 20–22 deal with fast-days, daily services in church and the fast of the passover-week. Canon 23 seems as if it closed the series, speaking, as it does, of "our brethren the bishops" who in their cities have made regulations "according to the commands of our fathers the apostles": "let none of our successors alter them; because it saith that the teaching is greater than the sea, and hath no end." We pass on, however, to regulations about the sick (24) who are to be visited by the bishop, "because it is a great thing for the sick that the high-priest should visit them (for the shadow of Peter

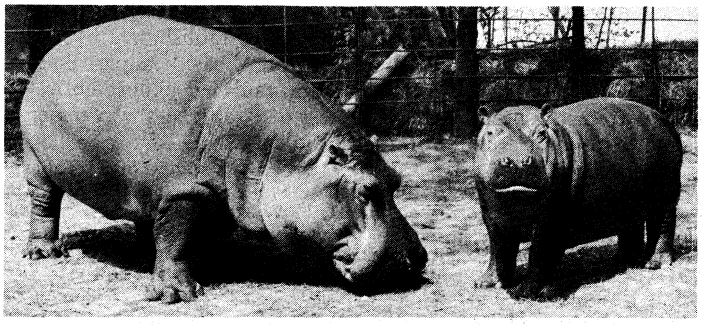
healed the sick)."

Canons 25–27 deal again with prayers and church-services. The "seven hours" are specified, with reasons for their observance (25); attendance at sermons is urged (26), "for the Lord is in the place where his lordship is proclaimed" (comp. *Didachè* 4, part of the Two Ways). When there are no prayers in church, reading at home is enjoined (27); "let the sun each morning see the book upon thy knees" (cornp. Ath. *Ad* virg., § 12, "Let the sun when he ariseth see the book in thy hands"). Prayer must be preceded by the washing of the hands. "No believer must take food before communicating, especially on fast-days"; only believers may communicate (28). The sacred elements must be guarded, "lest anything fall into the cup, and it be a sin unto death for the presbyters." No crumb must be dropped, "lest an evil spirit get possession of it." Canons 30–35 contain various rules, and specially deal with suppers for the poor (i.e., agapae) and memorial feasts. Then we have a prayer for the offering of first-fruits (36); a direction that ministers shall wear fair garments at "the mysteries" (37); and a command to watch during the night of the resurrection (38). The last canon hereupon passes into a general exhortation to right living, which forms a sixth part of the whole book. In Riedel's translation we read this for the first time as a connected whole. It falls into two parts, and describes, first, the true life of ordinary Christians, warning them' against an empty profession, and laying down many precepts of morality; and then it addresses itself to the "ascete" who "wishes to belong to the rank of the angels," and who lives a life of solitude and poverty. He is encouraged by an exposition, on somewhat strange lines, of the temptations of our Lord, and is specially warned against spiritual pride and contempt of other men. The book closes with an appeal for love and mutual service, based on the parables in St. Matthew xxv.

Authenticity of Authorship. — The Puritan severity of the canons well accords with the temper of the writer to whom the Arabic title attributes them; and it is to be noted that the exhortation at the close contains a quotation from 2 Peter actually attributed to the apostle, and Hippolytus is perhaps the earliest author who can with certainty be said to have used this epistle. But the general style of Hippolytus, which is simple. straightforward and strong, is in marked contrast with that of the closing passage of the canons; moreover, his mind, as presented to us in his extant writings, appears to be a much larger one than that of the writer of these canons; it is as difficult to think of Hippolytus as it would be to think of Origen in such a connection. How, then, are we to account for the attribution? There is evidence to show that Hippolytus was highly reverenced throughout the east; his writings, which were in Greek, were known, but his history was entirely unknown. He was supposed to be "a pupil (γνώριμος) of apostles" (Palladius, 4th century), and the Arabic title calls him "chief of the bishops of Rome," *i.e.,* archbishop of Rome. A whole group of books on church orders bears the name of Clement of Rome; and the attribution of our canons to Hippolytus may be only an example of the same tendency. The fact that Hippolytus wrote a treatise Concerning Spiritual Gifts, and that some such treatise is not only referred to in the Latin preface to the Egyptian Church order, but is actually found at the beginning of book viii of the Apostolic Constitutions, introduces an interesting complication. Dom Morin's ingenious attribution of the canons to Dionysius of Alexandria (on the ground of Eusebius, H.E. vi, 46, 5) cannot be accepted in view of the broader church policy which that writer represents.

HIPPONAX, of Ephesus, Greek iambic poet. Expelled from Ephesus in 540 B.C. by the tyrant Athenagoras, he took refuge in Clazomenae, where he spent the rest of his life in poverty. He was caricatured by the Chian sculptors Bupalus and Xthenis, upon whom he revenged himself by a series of satires. His coarseness, his rude vocabulary and his numerous allusions to local matters prevented his becoming a favourite in Attica. He was considered the inventor of parody and of a peculiar metre. the *scazon* or *choliambus,* which substitutes a spondee for the final iambus of an iambic senarius.

HIPPOPOTAMUS, the largest living nonruminating even-toed mammal (*see* ARTIODACTYLA).



W. SUSCHITZKY

FEMALE HIPPOPOTAMUS (HIPPOPOTAMUS AMPHIBIUS) **AND YOUNG**

The common hippopotamus (H. *amphibius*) inhabits the large rivers of Africa, though its range has non become much restricted. It is the type of the family Hippopotomidae, whose nearest relatives are the pigs.

In form the hippopotamus is huge and unnieldy, reaching a iength of 14 ft , a height of 3 ft. 10 in. at the shoulder and a weight of at least 3 tons. The ears are small but flexible, the body thick, the legs short. The eyes and nostrils protrude so as to be out of water when the animal is floating; the gape is enormous and the upper lip thick and bulging. Both canines and incisors are of continuous gronth and very large. The skin. which is two inches thick in places, is almost destitute of hair. Hippopotamuses live in herds of 20 to 40 on the banks and in the beds of rivers, feeding mainly at night and on aquatic plants groning in the nater. but they also come on shore to feed, frequently doing immense damage to crops.

Of a mild and inoffensive disposition, the hippopotamus can exhibit great ferocity nhen wounded or defending its young; its immense strength and agility, despite its unwieldy bulk, render it a formidable antagonist. As among elephants. old bulls may become "rogues" and will attack without provocation.

In the Pleistocene epoch, a hippopotamus inseparable from the living species inhabited the greater part of Europe, while dwarf species were found in Crete. Malta, Sicily, India, Burma and northern Africa. More recently a small species, H. *lemerlei,* lived in Madagascar.

The pygmy hippopotamus (Choeropsis liberiensis), the size of a pig, lives in the rain forest of west Africa. It is more primitive and less aquatic in habit than its large cousin.

HIRA, a ruined city, south of Kufa in Iraq. which played an important role in the history of the Arabs before Islam. As the word itself indicates (Syriac herta, "camp"), the town was originally a military encampment.

It was under the Lakhmids, the Arab vassals of Persia, that Hira attained its fame and importance. As their capital. it became, for at least two centuries before Islam, a centre of diplomatic, political and military activities nhich involved Persia. Byzantium and the Arabian peninsula. The Lakhmids adorned the town and its environs with palaces and castles, but twice during the 6th century A.D. it experienced the ravages of war at the hands of the Ghassanid Arabs, the vassals of Byzantium.

It is. however, in the history of Arab culture before Islam that Hira is most important. Various aspects of material culture flourished in it, and the Arabic script (according to tradition) was developed there. Especially significant was Hira's role in the development of Arabic poetry and Arab Christianity. Toward the Lakhmid court gravitated some of the best-known poets in pre-Islamic Arabia (*e.g.,* 'Abid, Tarafah and al-Nabighah), while in Hira itself flourished the famous poet 'Adi ibn Zayd. Even more significant was its role in the spread of Christianity. As the seat of a Nestorian bishopric, Hira exercised a strong influence over the religious life of the east, and through this influence Christian monotheism penetrated the Arabian peninsula.

Its fortunes closely linked to those of its Lakhmid rulers, Hira began to decline in the first decade of the 7th century after the Persians had brought the Lakhmid dynasty to an inglorious end.

In A.D. 633 the town capitulated to Moslem arms and agreed to pay tribute. Its decline was accelerated by the establishment of Kufa, which eclipsed it, and by the fact that the Abbasid caliphs did not make it their residence. Finally Hira vanished almost entirely, except from the literary consciousness of Arab poets who remembered it to point a moral or adorn a tale.

BIBLIOGRAPHY.—For Arabic sources *see* the *Annales* of al-Tabari, vol. i and iii, ed. by M. J. de Goeje (1879–1901), and the *Mu'jam al-Buldan* of Yaqut, vol. ii, ed. by H. F. Wiistenfeld (1866–73). *See* further G. Rothstein, *Die Dynastie der Lahmiden in al-Hira* (1899); *D.* Talbot Rice, "The Oxford Excavations at Hira, 1931," *Antiquity* (1932); *R. A.* Nicholson, *A Literary History* of *the Arabs* (1907; reprinted 1953). (I. A. K.)

HIRADO-SHIMA, an island lying off the west coast of Kyushu in Nagasaki prefecture, Japan. Area 66 sq.mi.; pop. (1955) 43,302. The town of Hirado was the first port open to foreign trade and is celebrated as the site of the original Dutch factory and the "English House" (17th century). It was frequented by Chinese ships, and during the period of Christian persecutions the port towns of Hirado and Nagasaki (*q.v.*) were the only ones open to foreign trade. It is the place where one of the finest blue and white porcelains of Japan (Hiradoyaki) was produced in the 17th and 18th centuries. (R. B. H.)

HIRE PURCHASE: see INSTALLMENT CREDIT.

HIRING, in law, a contract by which one man grants the use of a thing to another in return for a certain price. It corresponds to the locatio-conductio of Roman law. That contract was either a letting of a thing (locatio-conductio rei) or of labour (locatio operarum). The distinguishing feature of the contract was the price. In modern English law the term can scarcely be said to be used in a strictly technical sense. The contracts which the Roman law grouped together under the head of locatio-conductio —such as those of landlord and tenant, master and servant, etc.— are not in English law treated as cases of hiring but as independent varieties of contract, but hiring is generally applied to contracts in which the services of a man or the use of a thing are engaged for a short time.

Hiring fairs or statute fairs, still held in Wales and some parts of England, were formerly an annual fixture in every important country town. The men and maids seeking work stood in ro s, the males together and the females together, while masters and mistresses walked down the lines and selected those who suited them. Originally these hiring fairs were always held on Martinmas day (Nov. 11). Now they are held on different dates in different towns, usually in October or November. In Cumberland the men seeking work stood with straws in their mouths.. In Lincolnshire the bargain between employer and employee was closed by the giving of the "fasten-penny." the earnest money, usually a shilling, which "fastened" the contract for a twelvemonth. A few days after the statute fair it was customary to hold a second called a mop fair or runaway mop. "Mop" meant in Old English a tuft or tassel, and the fair was so called, it is suggested, in allusion to tufts or badges worn by those seeking employment. Thus the carter wore whipcord on his hat, the cowherd, a tuft of cow's hair, and so on. See EXHIBITIONS AND TRADE FAIRS; LABOUR LAW; MASTER AND SERVANT; WAGES.

HIROHITO (1901–), emperor of japan, was born on April 29, 1901, the son of the emperor Yoshihito (Taishō) (*q.v.*). After being educated at the Peers' school he .visited Europe in 1921, becoming the first crown prince to go abroad. Upon his return, he was named prince regent when his father retired because of mental illness. His marriage in 1924 to Princess Nagako stirred up controversy because the princess came from the Shimazu family instead of the Fujiwara family as decreed by tradition. The emperor and empress had two sons and four daughters; a fifth daughter died in 1928. The eldest son, Akihito, was born in 1933. Hirohito became emperor Dec. 25, 1926, and his reign, although designated Shōwa or "bright peace," was characterized by internal unrest and an aggressive foreign policy culminating in World War II. It appears that the emperor had grave misgivings about militarism and foreign expansion and tried to restrain the militarists. but in vain. In 1945, when Japan was near defeat, Hirohito threw his influence against the army and on the side of those favouring peace. He broke precedent on Aug. 15, 1945, when he spoke on the radio to announce Japan's surrender. When surrendering, the Japanese government sought a pledge from the Allies that the emperor would be retained; the U.S. reply was noncommittal, but eventually a policy of supporting a modified imperial system was adopted. To bring the throne closer to the people, Hirohito publicly repudiated the doctrine of the emperor's divinity in Jan. 1946; he later made numerous public appearances and permitted pictures and stories about his personal and family life to be published. The campaign to "humanize" the emperor increased his popularity and reduced the effect of Communist agitation to abolish the imperial system. When in 1959 he permitted Crown Prince Akihito to marry a commoner, Shoda Michiko, he again broke with tradition. (N. I.)

HIROSAKI, a town in Aomori prefecture in north Japan. Pop. (1955) 138,953. The fine isolated cone of Iwaki-yama, a mountain of pilgrimage, rises to the west. Hirosaki developed as a castle town, many traces of which are found in the old buildings and street names. It has failed to' develop modern industry. Local products include a distinctive green lacquer ware (*Tsugaru-nuri*), apples and processed apple products such as cider, jam and juice. (R. B. H.)

HIROSHIGE, ANDŌ (1797–1858), Japanese artist, was one of the last great masters of the Ukiyo-e or popular school of painting in Japan, a school which specialized in the making of colour prints. He was adopted into the And6 family but received his art name, Utagawa Hiroshige, from his tedcher Utagawa Toyohiro. Even as a child Hiroshige had shown considerable artistic promise, but it was not until he accompanied an embassy from the shogun in Edo (now Tokyo) to the emperor in Kyōto and traveled along the Tōkaidō road in 1832 that his great talent developed. On this trip Hiroshige stayed at the 53 overnight stations along the way and he made numerous sketches of everything he saw. Upon his return to Edo, he published in 1832 a series of 55 prints entitled the "Fifty-three Stages of the Tōkaidō"—one for each station plus the beginning of the highway and the arrival in Kyōto. The success of this series was immediate and made Hiroshige one of the most popular Ukiyo-e artists of all time.

Later Hiroshige made many other journeys within Japan and issued series of prints depicting the famous "Sixty-nine Stages of the Kisokaido," "Views of Edo," "Lake Biwa" and "Famous Places in Kyoto." Repeatedly new designs were executed of the 53 Tōkaidō views wherein he employed his unused sketches of previous years. He also designed some lovely bird and flower prints which are an interesting contrast to his landscapes. Hiroshige's work declined toward the end of his life, largely because of the demands of his publisher for new subjects and the artist's need for money. Various sources have estimated that Hiroshige created over 5,000 prints and that as many as 10,000 copies were made from some of his wood blocks. Hiroshige had assistants but not one of his pupils ever approached the talent of his master, although the names Hiroshige II and III were given to two of his successors. Possessing the ability to reduce the pictured scene to a few simple elements of a highly decorative character, Hiroshige captured the very essence of what he saw and turned it into a strikingly effective composition. Snow, rain, mist and moonlight scenes compose some of his most poetic masterpieces. These are the prints that so influenced the French painters of the late 19th century.

See Arthur Davidson Ficke, *Chats on Japanese Prints* (1915); James *A.* Michener, *The Floating World* (1954). (M. O. Gs.)

HIROSHIMA, a prefecture (ken) in southwest Honshu, Japan. with an area, including offshore islands, of 3,235 sq.mi. and a population (1955) of 2,149,044. The Chūgoku mountains run along the northern boundary, and delta plains are extensively developed along the Inland sea coast in the south. Agriculture supports most of the population, followed by manufacturing industry and retail trade. Important products are rice, oranges, rush (material for mats), cattle, oysters and salt. The majority of the factories are on the traditional small scale but large modern factories produce textile goods. There are shipyards at Kure, Innoshima. Onomichi and Hiroshima city, the prefectural capital. (R. B. H.)

HIROSHIMA, a seaport, capital of Hiroshima prefecture, in southwestern Japan. Population (1960) 431,336. The town of Hiroshima grew up on the delta of the Ota river, where the Mori clan built a castle in 1591 which survived until 1945. From the Meiji era (1868–1912) to World War II, the city was a military centre. On Aug. 6, 1945, Hiroshima was the first city to be struck by an atomic bomb dropped by the United States air force. The greater part of the city was destroyed, and about 200,000 people were killed. Reconstruction was commenced immediately after the end of the war. New permanent buildings were begun about 1950 under a city-planning scheme. Bridges are important as the city is split into five islets by the river delta, and recovery began with the rebuilding of the Inaribashi bridge. A wide road traversing the centre of Hiroshima from east to west is expected to become the main thoroughfare with the completion of the bridges. Being the largest city in the Chūgoku and Shikoku districts, Hiroshima has many administrative offices and public-utility centres. The chief modern industries include the Matsuda truck factory, the Mitsubishi shipbuilding and machinery factories and the Kirin brewery. The city produces 80% of the needles used in Japan.

From ancient days, Hiroshima was famous for its association with the neighbouring islet of Itsuku-shima which is dedicated to the goddess Benten; but now Hiroshima is thought of as a city dedicated to world peace. The Atomic Bomb Casualty commission was established there in 1947 to conduct long-range medical and biological research and to investigate the effects of radiation upon man. There are five public hospitals including the "A-Bomb hospital" and 40 private clinics which give free treatment to A-bomb sufferers. (R. B. H.)

HIRPINI, from an Oscan or Sabine stem hirpo-, "wolf." An inland Samnite tribe in the south of Italy, whose territory was bounded by that of the Lucani on the south, the Campani on the southwest, the Xppuli (Apuli) and Frentani on the east and northeast. On the north they were, politically speaking, identified with the Pentri and Caraceni, and with them constituted the Samnite alliance in the wars of the 4th century B.C. (See SAMNITES.) The Roman policy of separation cut them off from these allies by the foundation of Beneventum in 268 B.C., and henceforward they were a separate unit. They joined Hannibal in 216 B.C., and retained their independence until, after joining in the Social War (see ROME: The Republic: The Social War), which in their part of Italy could hardly be said to have ceased till the final defeat of the Samnites by Sulla in 83 B.C., they received the Roman franchise. Of their Oscan speech, besides the evidence of their place names, only a few fragments survive.

In the ethnology of Italy, the Hirpini appear from one point of view as the purest type of Safine stock, namely, that in which the proportion of names formed with the suffix *-ni-* is highest, 33 out of 36 tribal or municipal epithets being formed thereby (*e.g., Caudini, Compsani*) and only one with the suffix *-ti-* (*Abellinates*), where it is clearly secondary.

HIRSAU (formerly HIRSCHAU), a village of Germany, in Baden-Württemberg, 2 mi. N. of Calw. Pop. (1950) 1,576. Hirsau owes its origin and historical interest to its former Benedictine monastery, Monasterium Hirsaugiense, at one period one of the most famous in Europe. It was founded about 830 by Count Erlafried of Calw, at the instigation of his son, who enriched it with the body of St. Aurelius. Its first occupants (838) were a colony of 15 monks from Fulda, disciples of Hrabanus Maurus and Walafrid Strabo, headed by the abbot Liudebert. During about a century and a half, under the fostering care of the counts of Calw, it enjoyed great prosperity, and became an important seat of learning; but toward the end of the 10th century the ravages of the pestilence combined with the rapacity of its patrons and the selfishness and immorality of its inmates to bring it to the lowest ebb. After it had been desolate and in ruins for more than 60 years it was rebuilt in 1059, and under Abbot William —Wilhelm von Hirsau (abbot from 1069 to 1091)—it more than regained its former splendour. By his *Constitutiones* Hirsaugienses, a new religious order, the *Ordo* Hirsaugiensis, was formed, the rule of which was afterward adopted by many monastic establishments throughout Germany.

The friend and correspondent of Pope Gregory VII and of Anselm of Canterbury, Abbot William took active part in the politico-ecclesiastical controversies of his time; while a treatise from his pen, De *musica* et *tonis*, as well as the Philosophicarum et *astronomicarum institutionum libri* iii, bear witness to his interest in science and philosophy. About the end of the 12th century the material and moral welfare of Hirsau was again very perceptibly on the decline, and it never afterward rose into importance. It was secularized in 1558; in 1693 it was laid in ruins by the French. The *Chronicon* Hirsaugiense or, as it is called in the later edition, *Annales* Hirsaugienses of Abbot Trithemius (1559) is, although containing much that is merely legendary, an important source of information, both in the affairs of the monastery and on the early history of Germany. The Codex Hirsaugiensis, edited by A. F. Gfrorer, was printed in 1843.

HIRSCH, MAURICE, BARON DE (BARON MORITZ VON HIRSCH AUF GEREUTH) (1831–1896), German capitalist and philanthropist, was born at Munich on Dec. 9, 1831. His grandfather, the first Jewish landowner in Bavaria, was ennobled in 1818, and his father, who was banker to the Bavarian king, was created a baron in 1869. The family for generations occupied a prominent position in the German-Jewish community. At the age of 13 young Hirsch was sent to Brussels to school, but when 17 years old he went into business. In 1855 he became associated with the banking house of Bischoffsheim & Goldschmidt, of Brussels, London and Paris. He amassed a fortune, which he increased by purchasing and working railway concessions in Austria, Turkey and the Balkans and by speculations in sugar and copper.

While living in splendour, he devoted much time to schemes for the relief of his persecuted coreligionists, and took a deep interest in the educational work of the Alliance Israélite Universelle, on two occasions presenting the society with 1,000,000 fr. For several years he regularly paid the deficits of the alliance, amounting to several thousand pounds a year. In 1889 he capitalized his donations and presented the society with securities producing an annual income of £16,000.

On the 40th anniversary of Emperor Francis Joseph's accession to the Austrian throne Hirsch gave £500,000 for the establishment of schools in Galicia and the Bukovina. His greatest charitable enterprise was in connection with the persecution of the Jews in Russia. He gave £10,000 for the repatriation of the refugees in 1882 and offered the Russian government £2,000,000 for the endowment of a system of secular education in the Jewish pale of settlement. The Russian government, while willing to accept, declined to allow any foreigner to be concerned in its administration. Thereupon Baron de Hirsch devoted the money to a colonization scheme which should enable persecuted Jews to establish themselves in agricultural colonies outside Russia. He founded the Jewish Colonization association as an English society, with a capital of £2,000,000, and in 1892 presented to it a further £7,000,000. On the death of his wife, *née* Clara Bischoffsheim, in 1899 the capital was increased to £11,000,000, of which £1,250,000 went to the treasury in death duties. This fund became one of the largest charitable trusts in the world. The association, prohibited from working for profit, came to possess large colonies in South America. Canada and Asia Minor and adopted as its purpose the alleviation of Jewish distress, including emigration and distributing agencies, technical schools, co-operative factories, savings and loan banks and model dwellings in the congested Russian ghettos.

Hirsch also founded in 1891 the Baron de Hirsch fund in the Cnited States for the benefit of Jeaish immigrants, endowing it with £493,000. The activities of the trust involved helping newly arrived Jewish immigrants. educating them for U.S. citizenship, aiding them to move from the cities to smaller tonns and operating a trade school for Jewish boys, to name only a few. By mid-20th century the fund supported the Jewish Agricultural society. which aided farmers by means of loans and also helped to settle displaced persons on farms in the U.S. Baron de Hirsch's minor charities were on a princely scale. While in London he distributed over £100.000 among the local hospitals. In this manner he disposed of the whole gross proceeds derived from his successes on

the English turf. Baron de Hirsch died on April 21, 1896.
(L. W.; X.)

HIRSCH, SAMSON RAPHAEL (1808–1888), Jewish religious thinker, founder of Trennungs-Orthodoxie ("separatist Orthodoxy"). was born in Hamburg on June 20, 1808. He studied rabbinics at Mannheim and philosophy at Bonn university, and was rabbi in Oldenburg, Emden and Nikolsburg before being called to Frankfurt am Main (1851). There he became the leading spirit in the establishment of a modernized Orthodox Jewish congregation and school system which could withstand the challenge of enlightenment without abandoning the best in European civilization. "Torah combined with worldly wisdom" became the slogan of the growing "neo-Orthodox" group. Due to the efforts of Eduard Lasker (*q.v.*), Prussia adopted a law (July 28, 1876) permitting Jews to secede from the general Jewish community and establish separate religious societies. Thereupon, Hirsch led his congregation out of the community, which in his view was unfaithful to the Law. Hirsch wrote *Nineteen* Letters (1836; Eng. trans., 1899), Horeb (1837), commentaries on the Pentateuch (1867–78), Psalms (1882), the Hebrew prayer book (1890), and edited the monthly Jeshurun. Six volumes of his essays were published (1902–12). He died at Frankfurt on Dec. 31, 1888.

Hirsch presents Judaism as a community based on faith, aiming at the sanctification of life, the spiritualization of man and the attainment of an awareness of divine presence on earth. While searching for the symbolic meaning of the ritual and ceremonial laws, he steered clear of mysticism. In opposition to Abraham Geiger (*q.v.*) he rejected biblical criticism and the application of scientific methods to the study of Judaism. Though limited to a segment of Jewry, Hirsch's influence has been lasting and deep.

See I. Grunfeld (ed.), *S. R. Hirsch:* ***Judaism*** *Eternal* (1957).
(N. N. G.)

HIRT, HERMANN (1865–1936), German philologist, who was in his generation the most distinguished follower of Karl Brugmann and the neogrammarians (Junggrammatiker), was born at Magdeburg on Dec. 19, 1865. He was educated at Leipzig and Freiburg, and appointed professor of Indo-European philology and Sanskrit at the University of Giessen in 1912. His most original research was on accent and vowel gradation, published in Der indogermanische *Akzent* (1895), Der indogermanische Ablaut (1900) and many articles. From these studies he went on to a comprehensive *Indogermanische Grammatik* (7 vol., 1921–37), which no subsequent scholar has undertaken to revise or supersede. Hirt had less knowledge of ancient texts than Brugmann but he profited from the general advances in learning, particularly in the Celtic and Slavic fields, and he worked continually on the Germanic languages. He was intensely concerned with prehistory, not only of language but also of the Indo-European people and their culture, which he treated in Die Indogermanen (2 vol., 1905–07). He died on Sept. 12, 1936, at Giessen. (S. LN.)

HIRTIUS, AULUS (*c.* 90–43 B.C.), Roman historian and statesman. He was with Julius Caesar as legate in Gaul, but after the civil war broke out in 49 he seems to have remained in Rome to protect Caesar's interests. He was also a personal friend of Cicero. He was nominated with C. Vibius Pansa by Caesar for the consulship of 43; and after the dictator's assassination in March 44, he and his colleague supported the senatorial party against M. Antonius, with whom Hirtius had at first sided. The consuls set out for Mutina, where Antonius was besieging Decimus Brutus. On April 15 Pansa was attacked by Antonius at Forum Gallorum, about 8 mi. from Mutina, and killed. Hirtius, however, compelled Antonius to retire on Mutina, where another battle took place on April 21 (or 27) in which Hirtius was slain. Of the continuations of Caesar's Commentaries—the eighth book of the Gallic war, the history of the Alexandrian, African and Spanish wars—the first is generally allowed to be by Hirtius; the Alexandrian war is perhaps by him (or Oppius); the last two were supposedly written at his request by persons taking part in the events described, with a view to subsequent revision and incorporation in his proposed work on military commanders.

HIRUDINEA: see LEECH.

HIRUNDINIDAE: see SWALLOW; MARTIN.

HIS, WILHEEM (1831–1904), Swiss-German anatomist, one of the leading embryologists of his time and an authority in the embryology and anatomy of the brain, was born in Basel on July 9, 1831. As a medical student in Berlin. His received lasting impressions from the great anatomist and physiologist Johannes Peter Müller (*q.v.*) and from the embryologist Robert Remak. Afterward he studied in Wiirzburg under Rudolf Virchow and the histologist R. A. von Kölliker (*qq.v.*). Before taking his M.D. in Basel he visited Prague, Vienna and Paris and returned a few years later to Paris to attend the lectures of the neurologist C. E. Brown-Séquard. This background, and publications on the histology of the cornea of the eye and the lymphatic organs, gained him the professorship of anatomy and physiology in Basel at the age of 26. Fifteen years later he was called to Leipzig, where he established a new institute of anatomy, and where he remained until his death, on March 1, 1904. He and the physiologist Karl Ludwig were mainly responsible for the eminence of the Leipzig medical school in the late 19th century.

His's work in embryology covered the entire development from the early stages to the definite form of the organs, especially of the brain, and of the body as a whole. His discovery that the individual nerve fibre originates from a single nerve cell became the cornerstone of the neuron theory of the nervous system. Stressing mechanical factors as immediate causes of developmental changes, he stimulated later work in experimental embryology. His method of enlarged plastic reconstruction of embryonic organs from serial microscopic sections played an important part in the advancement of embryology. Asked for his opinion about the identity of a skeleton that was supposed to be that of Johann Sebastian Bach, he developed an anthropological method which has since been used repeatedly for the identification of a skull as that of a historical person.

His's son, also WILHELM HIS (1863–1934), professor of medicine in Berlin, is known for his contributions to the physiology and pathology of the heart and as the discoverer of the bundle of specific muscle fibres (bundle of His) in the septum of the heart which transmits the nervous impulse from the atria to the ventricles. (F. WN.)

HISHAM IBN AL-KALBI (ABU-AL-MUNDHIR HISHAM IBN MOHAMMED IBN AL-SA'IB AL-KALBI) (d. c. 819), Arab historian, who wrote a valuable account of the genealogies of the ancient pre-Islamic Arabs. He was born in Kufa but spent much of his life in Baghdad. Like his father. who was also his teacher, he devoted his energies to collecting information about the history and descent of the Arabs. He died in Kufa about 819. He is said to have written 140 works, most of which are lost. His account of the genealogies of the Arabs, which is continually quoted by Abu-al-Faraj (*q.v.*) in his Kitab al-Aghani, has been preserved only in part; one of his works has survived intact, Kitab al-Asnam (Eng. trans., The Book of Idols, with introduction and notes by N. A. Faris. 1952).

HISPANIOLA, the second largest island of the West Indies (*q.v.*), divided politically into the Republic of Haiti (République d'Haïti) and the Dominican Republic (República Dominicana). The island has been known by various names. Christopher Columbus, discoverer of the island in 1492, named it La Isla Espafiola, supposedly from which it was anglicized to Hispaniola. During Spanish colonial times it was commonly called Santo Domingo, after the capital city, and this name is still sometimes used. In English-speaking countries the form became San Domingo. The entire island has also been referred to as Haiti, supposed by some to be the precolonial name used by native aboriginal Indians (Arawaks) who also called it Quisqueya. Hispaniola is the name given to the island by the United States government.

The shape of the island can be described as resembling a lobster's claw with the western pincers open as though ready to grasp the island of Gonâve. Several large peninsulas extend from the main body of Hispaniola. The southwestern peninsula of Haiti reaches more than 120 mi, and the northwestern peninsula extends about 50 mi. The greatest length is nearly 400 mi. and the greatest width is 150 mi. The area is 29.296 sq.mi., of which nearly two-thirds (18,640 sq.mi.) is in the Dominican Republic and the re-

maining, western section (10,656 sq.mi.) is in Haiti.

Hispaniola's location is tropical. between latitude 17° 36' (Cape Beata) and 20° 04′ N. (Tortuga Island) and from longitude 68° 20′ (Cape Engaño) to 74° 29′ W. (Cape Irois). This location on the northern flank of the Caribbean sea furnished an excellent position for control of Spanish expansion to Cuba, Mexico, Panamb and South America during the early colonial period.

The rest of this article deals with the geography of the island. For its history, people, administration, social conditions and economy see DOMINICAN REPUBLIC and HAITI.

Geology and Structure. — The general structure of Hispaniola is geanticlinal, with the oldest rocks exposed in a broad belt through the centre of the island and the younger rocks flanking each side. The foundation is composed of igneous and metamorphic rocks, such as granite, schist and serpentine, of pre-Cretaceous age. The strata that were folded in Late Cretaceous time were also intruded by diorites. The ruggedness and irregularity of Hispaniola, however, are not primarily the result of folding, but of intense faulting. The Cordillera Central is much deformed, being faulted along several different axes. Faulting, accompanied by some folding, began in the Late Oligocene and continued during the Miocene and much of the Pliocene. The Late Cenozoic uplift resulted in the Cordillera Central being lifted considerably higher than it stands now and in the uplift of the Cordillera Septentrional. The Pliocene orogeny also probably produced the great faulted valleys of the Cibao and San Juan rivers and Lake Enriquillo, along with the Artibonite river, after which they received the deposition of great quantities of sediments from the mountains. Crustal movements are still in progress.

The alignment of features is dominantly east-west in the southern part, toward Jamaica, and in the eastern part, toward Puerto Rico. Northwest-southeast trends are predominant in the central, northern and northwestern sections of the island.

Physiography. — Hispaniola consists of alternate series of mountain ranges and long valleys and plains, with the mountains predominant. More than one-third of the island lies above 1,500 ft. elevation. The orientation of such land forms causes contrasts in climatic conditions and poses problems of transportation across the country from north to south.

Hispaniola has the highest relief of the West Indies, reaching to more than 10,400 ft. elevation in the Cordillera Central in the Dominican Republic with Monte Tina and Pico Trujillo as the loftiest peaks. The highest elevation in the northern cordillera is 3,992 ft. and in the southern mountains 5,350 ft. The southwestern peninsula is the most elevated part of Haiti, rising to 8,793 ft. about 15 mi. W. of the Dominican border. The island is unusual because the basin of Lake Enriquillo in southwestern Dominican Republic has land below sea level, the surface of the lake being about 150 ft. below sea level.

The main rivers draining Hispaniola are the Yaque del Norte (248 mi. in length) and the Camú in northern Dominican Republic and the Yaque del Sur in the south, and the Artibonite in Haiti. Hispaniola's coast line, though much indented, has relatively few deepwater, protected anchorages.

Climate. — The climate of Hispaniola can be described as modified tropical, resulting from the location of the island near the outer margin of the tropics and the somewhat complex mountain and valley structure. The influence of the steady trade winds, which blow from the northeast in winter and from the east and southeast in summer, is felt in both temperature and moisture conditions, which vary according to exposure and elevation.

Temperatures are constantly high near sea level, but freezing temperatures occur occasionally at moderate elevations near the centre of the island. Average temperatures range from 72° F. in January and February to 83° in July and August. Average extreme temperatures rarely go above 95° or below 50°.

Rainfall is abundant in much of the island, averaging about 55 in. annually over-all. Seasonal rainfall is highest in the southern sections during the months of May to November with a definite dry season. In the north the seasonal emphasis is reversed, with the wettest season occurring from December to April, though the summer is less rainy rather than really dry. The driest sections are the leeward plains, such as the lower Yaque del Norte and the basin of Enriquillo, where rainfall is less than 30 in. annually.

Hurricanes occasionally strike the island. sometimes causing serious damage. They may occur between August and November and generally cross from south to north.

Vegetation. — More than 60% of Hispaniola is covered by forests and woods and an additional 15% is classed as pasture land. The Dominican Republic has a higher proportion of its land still in forests than does Haiti. in part because of the lower density of population. Large tracts of land in the eastern plains of the Dominican Republic are still covered by forests, whereas much of even the steep mountain slopes of Haiti has been deforested because of the great population pressure for cultivated land.

The humid slopes of the mountains facing the trade winds are still clothed in dense forests. On the leeward, slopes and where the rainfall is distinctly seasonal are more open stands. In the higher elevations of the Cordillera Central and in the highest mountains of southeastern Haiti are extensive stands of pine. On the driest plains, as in western Dominican Republic and the Artibonite plain of Haiti, forests give way to scrubby growth and even desertic plants, except along the river courses. Scattered tree growth occurs in semiarid savanna grasslands. The stately royal palm (Roystonea *regia*) is widely distributed and is an extremely useful tree. Other than the valuable pine stands, the chief timber resources are mahogany, cedar, lignum vitae (*Guajacum officinale*) and logwood (Haematoxylon *campechianum*).

Mangrove swamps are common along the coast where tidal mud flats are formed. The largest areas are the head of Samanb bay, the northern coast east of Cap-Haitien and around Gonâve bay.

Animal Life. — There is a great variety and number of insects, but aside from some domestic animals which have been introduced, larger animal species are lacking. Before the arrival of the Spaniards land mammals were rare except for rodents and the mute dogs, which are now extinct. There is a great variety of birds and marine fishes, as well as mollusks, which are typical of the West Indian region. There are a few nonpoisonous snakes. Scorpions, centipedes and some large spiders are poisonous, but their bites are not usually fatal.

Land Use. — The major geographical features of Hispaniola are arranged in nearly parallel systems of mountains alternating with plains. Because of the existence of several distinct mountain systems and related plains. a large number of major regions could be delineated. In general, the mountains are forested and sparsely populated. Coffee growing is the chief agricultural activity and this enterprise is spread through most of the mountainous regions of Hispaniola in the humid areas.

The most populous plains region is the long and highly productive plain extending from Samaná bay northwestward to the northern coast of Haiti. In the humid eastern section, called the Vega Real (Royal plain), many crops are grown, the chief commercial one being cacao. Tobacco is dominant in the upper Yayue plain and irrigated rice in the semiarid lower plains, while sugar cane dominates the Plaine-du-Nord of Haiti. The southern plains of Hispaniola are also productive, though irrigation is necessary in many areas because of deficient rainfall. Sugar cane is by far the main crop and livestock grazing is also very signihcant. On the Haitian plains, cotton is also an important commercial crop and food crops assume great significance. (D. R. D.)

HISSAR. (1) A town in the Tadzhik S.S.R. of the U.S.S.R., in lat. 38" 30' N., long. 68° 39' E., at a strategic point at the head of the defile carved out by the Kafirnigan river, a tributary of the Amu-Darya. It is the ancient capital of a once independent region where principalities rose and fell, finally incorporated with the former emirate of Bukhara. The town was at one time famous for its damascene swords and silk goods. Before the revolution it was the winter residence of the beg of Hissar. The moist and oppressive heat leads to an abundance of reeds. (2) The Hissar mountains 7,000 to 13,000 ft. also in the Tadzhik S.S.R. form the snow-capped southern arm of the bifurcation in long. 67" 45′ E. of the Alai range, a western extension of the Tien-Shan. The Turkistan range forms its northern arm, and a long spur, the Zarafshan range branches off west of the Pakshif pass, from which

point the Hissar range turns off in a slightly southwest direction, with two deep curves on its northern slopes, and numerous spurs thrusting into the plain on the south. The valleys here are well wooded on their lower slopes, with clumps of poplar, ash, birch, willow, maple, juniper, pear, hawthorn and walnut interspersed with currant bushes and shrubs. From these southern slopes the Surkhan and Kafirnigan flow into the Amu-Darya. In the narrow parallel valley between the Turkistan range and the Zarafshan range the glacier-fed Zarafshan river flows westward, while between the Zarafshan range and the Hissar range, its tributary, the Yagnob, flows parallel to it.

See W. *R.* Rickmers, *The Duab of Turkestan* (1913).

HISSAR, a municipality and district in the Ambala division of Punjab, India. The town is on the Western Jumna canal, 97 mi. W.N.W. of Delhi. Pop. (1951) 35,297. It was founded in 1356 by the emperor Feroz Shah, who constructed a canal to supply it with water; but this fell into decay during the 18th century because of the constant inroads of marauders. Hissar was almost completely depopulated during the famine of 1783, but was afterward occupied by the Irish adventurer George Thomas, who built a fort and repopulated it. It is now chiefly known for its government cattle farm.

HISSAR DISTRICT comprises an area of 5,274 sq.mi. It lies along the northeastern border of the great Bikaner desert, and consists for the most part of sandy plains dotted with shrub and brushwood, and broken toward the south by undulations, which rise into hills of rock jutting up like islands out of a sea of sand. The Ghaggar is its only river, and its supply is uncertain. The Western Jumna canal crosses the district from east to west via Hansi and Hissar, irrigating many villages. Hissar produces a breed of large milk-white oxen, which are in great demand. The district's population is (1951) 877,945. The climate is very dry, hot westerly winds blowing from the middle of March till July. Cotton weaving, ginning and pressing are carried on. The chief trading centres are Bhiwani (pop. 52,183), Hansi (25,837), and Sirsa (24,980). Hansi was the capital of the Hariana tract and was also George Thomas' headquarters.

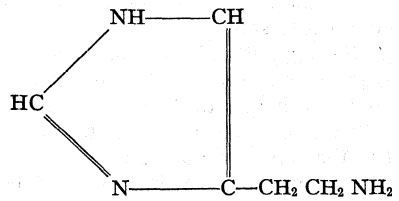
Before the Mohammedan conquest, the semidesert tract of which Hissar district forms a part was the retreat of Chauhan Rajputs. Toward the end of the 18th century the Bhattis of Bhattiana gained ascendancy after bloody struggles. Hissar passed nominally to the British in 1803, but they could not enforce order till 1810. Early in the mutiny of 1857 Hissar was wholly lost for a time to British rule, and all Europeans were either murdered or compelled to flee. The Bhattis rose under their hereditary chiefs, and the majority of the Mohammedan population followed their example. Before Delhi had been recovered, however, the rebels were utterly routed. Panjab university has a training college, a veterinary school and two general undergraduate colleges at Hissar and a training college and a textiles institute at Bhiwani.

HISTAMINE, a substance with varied and dramatic pharmacological effects, is found in extracts of all living cells, both animal and plant. Identified in 1910 by G. Barger and H. H. Dale, the compound itself, or a substance very similar to it, has been incriminated in certain types of headache, and in initiating the chain of events called triple response, reddening, flare and wheal, which is producible by heavy stroking of the skin. It is one of the irritating ingredients present in wasp venom, bee stings, heads of gnats and also in nettles. Above all, it is alleged to be the substance which is responsible for some of the symptoms of allergic and anaphylactic reactions such as asthma, hay fever, urticaria or hives (similar to the triple response) and serum sickness. Histamine is presumably always present in body tissues, but in an inactive, bound form which may be converted to the free, active compound in response to various stimulants. If all the histamine bound in the tissues of a human being were released at one time, the amount would be lethal. A quantity sufficient to kill an animal on injection is quite ineffective when given by mouth, however, since it is rapidly destroyed or inactivated in the intestine.

Histamine causes a contraction of the smooth musculature of some structures such as the lungs and the uterus. In asthma, the bronchioles of the lung are acutely obstructed because of exudate formation and muscular spasm caused by histamine. it also brings about capillary dilatation associated with an increased capillary permeability that leads to concentration of the blood. Intravenous injection in man of as little as 0.5 to 1 mg. produces headache, a marked dilatation of capillaries and arterioles, associated with the appearance of "blushing" and a lowering of blood pressure. These and still other responses may vary quantitatively and even qualitatively with different species of animals. The uterus responds to histamine (at term or immediately post partum) by contracting, but this action on the uterus is not employed clinically because of the many other and undesirable effects.

Some of the actions of histamine are put to practical use. Thus this remarkably versatile agent is the most potent known stimulant of the secretion of gastric juice, especially gastric hydrochloric acid. The doses which elicit this effect are smaller than those required to produce any of the other actions. Hence histamine is an important diagnostic tool in gastric function tests. Absence of an acid-secreting response may be associated with gastric carcinoma. Furthermore, observation of the separate components of the triple response produced on intradermal injection of histamine is used to ascertain the presence of a normal local arterial blood circulation and a functioning local peripheral nervous system.

Although a great deal of information has been uncovered concerning the responses to histamine, its precise role under normal physiological conditions and the exact mechanisms whereby it produces its various effects were, even 50 years after its discovery, only incompletely understood. It appears certain, however, that histamine is formed in the body from the amino acid histidine, a harmless and indeed essential component of dietary protein, by removal of carbon dioxide in an enzymatically catalyzed decarboxylation reaction. Histamine is destroyed in the body by oxidative deamination in the presence of the enzyme histaminase, or it may be inactivated by enzymatic acetylation. In solid form, histamine can be obtained as white deliquescent needles. It has the following chemical structure:



The ring component is known as imidazole, and histamine may be called β-aminoethyl imidazole.

The ill favour accorded to the word histamine is evidenced by the wide use made of the term antihistamine or antihistaminic. This denotes a group of substances that have a remote structural resemblance to histamine and block it in many but not all of its actions. The antihistaminics have been used with success clinically to give temporary relief in many allergic conditions.

HISTIAEUS (d. 494 B.C.), tyrant of Miletus under the Persian king Darius Hystaspis. According to Herodotus he rendered great service to Darius while he was campaigning in Scythia by persuading his fellow despots not to destroy the bridge over the Danube by which the Persians must return. Choosing his own reward for this service, he became possessor of territory near Myrcinus (afterward Amphipolis), rich in timber and minerals. The success of his enterprise led to his being recalled to Susa, where in the midst of every kind of honour he was virtually a prisoner of Darius, who had reason to fear his growing power in Ionia. During this period the Greek cities were left under native despots supported by Persia, Aristagoras, son-in-law of Histiaeus, being ruler of Miletus in his stead. This prince, having failed against Naxos in a joint expedition with the satrap Artaphernes,

began to stir up the Ionians to revolt, and this result was brought to pass, according to Herodotus, by a secret message from Histiaeus. The revolt assumed a formidable character and Histiaeus persuaded Darius that he alone could quell it. He was allowed to leave Susa, but on his arrival at the coast found himself suspected hy the satrap, and was ultimately driven to establish himself (Herodotus says as a pirate, more probably in charge of the Bosporus route) at Byzantium. After the total failure of the revolt at the battle of Lade, he made various attempts to re-establish himself, but was captured by the Persian Harpagus and crucified by Artaphernes at Sardis. His head was embalmed and sent to Darius, who gave it honourable burial. The theory of Herodotus that the Ionian revolt was caused by the single message of Histiaeus is incredible; there is evidence to show that the Ionians had been meditating after about 512 a patriotic revolt against the Persian domination and the tyrants on whom it rested.

See *Cambridge Ancient History,* vol. iv (London, 1924); article IONIA; also S. Heinlein in *Klio,* pp. 341–351 (1909).

HISTOLOGY, the science or study of the tissues, is that branch of biology which deals with the microscopic structure of plants and animals in normal and abnormal states. This implies that histology is also concerned with those functions of living organisms which must be studied with the microscope. In the many-celled animals and plants, accumulations of cells of a common origin are grouped into the four major tissues. These in turn are grouped in various combinations to form the different organs. The distinction sometimes made between histology, which deals with the tissues, and microscopic anatomy, which deals with the organs, is falling into disuse. The major tissues are epithelium, connective tissue, muscular tissue and nervous tissue; they are considered below.

The histological constitution of the various organs is considered in the appropriate sections.

History.—As the history of the subject will be taken up under other headings, it will not be discussed here (see BIOLOGY: History; SWAMMERDAM, JAN; LEEUWENHOEK, ANTHONY VAN; MALPIGHI, MARCELLO; SCHWANN, THEODOR; VIRCHOW, RUDOLF.)

The Tissues.—The elementary tissues of the body may be more or less arbitrarily subdivided into: (1) epithelial (of various types and including such modifications as hair, nails, tooth enamel, glands, etc.); (2) nervous tissue; (3) connective tissue (including fibrous and elastic tissue, fat, tendon, bone, cartilage, dentine, blood and blood-forming tissues); (4) muscular tissue (voluntary, involuntary and cardiac).

These elementary tissues are derived from the three primary blastodermic layers of the embryo (with trifling exceptions) as follows: (1) from ectoderm, mesoderm or entoderm; (2) from ectoderm; and (3) and (4) from the mesoderm.

Tissues are composed of cells (see CYTOLOGY) and intercellular substances, the latter in most cases formed through cellular activity. In epithelial tissues there is a meagre "cement substance," the origin and nature of which is but poorly understood. In connective tissue, the intercellular substances (amorphous ground substance with its contained collagenous and elastic fibres) constitute the bulk of the material and the same is true of the cartilage matrix and the fibrous and calcareous substance of bone. In the nervous system, the glia fibres of the supporting neuroglia bear the same relation to the glia cells as the fibres of connective tissue to its cells.

Epithelial tissue serves chiefly as a protective covering and for absorption, secretion and excretion. According to shape, epithelial cells are called: flat or squamous (covering skin, adjacent mucous membranes, some kidney tubules, etc.); or columnar (lining the digestive tract, the ducts of glands, uterus and oviducts, forming the secreting cells of glands). They may occur in single (simple) layers or in many layers (stratified), and various modified forms are found, such as ciliated (bronchi, etc.), and greatly modified for special uses (as in the retina, ear, taste buds). The single-layered flat cells lining the vascular system and the large enclosed body spaces (pleura, etc.) are called endothelial and mesothelial cells respectively.

Connective *tissue* is found in such forms as the embryonal jelly of the umbilical cord, reticular, loose fibro-elastic or areolar, dense fibrous, elastic tissue, cartilage and bone (for details, see appropriate sections). It contains a variety of cells such as fibroblasts, macrophages and a few lymphocytes, plasma cells, eosinophiles, mast cells and pigment cells.

Muscle tissue (*i.e.,* a form of protoplasm in which the property of contractility predominates) is of three main types: (1) smooth or involuntary; (2) striated or voluntary; (3) cardiac. Some striped muscle, such as oesophagus and diaphragm, is only partly voluntary. Smooth muscle, consisting of elongated pointed cells with central oval nuclei, is found in the following systems: alimentary, respiratory, genito-urinary, vascular, and in glandular ducts, the capsule of the spleen, the skin and some eye muscles. Voluntary muscle, distinguished by definite longitudinal and cross striae, a complex system of lines and cross disks, and peripheral nuclei, is of obvious distribution through the body. Cardiac muscle (which also has characteristic cross striations) forms a close meshwork with loss of the original cell boundaries, and centrally placed nuclei. Its physiological properties differ somewhat from those of ordinary voluntary muscle.

Nervous tissue, receiving, originating and conducting nerve impulses, is made up of the neuron (or nerve cell in its broadest sense) and the supporting neuroglia. While details are to be found in the entry NERVOUS SYSTEM, a few examples of the many kinds of nerve cells may be given. The giant pyramidal cell of Betz in the cerebral cortex, the lesser ganglion cells of wide distribution (unipolar, bipolar and multipolar), the characteristic Purkinje cells of the cerebellum, the various types of Golgi cells, the ependymal cells and the various types of glial cells, will indicate the great variation of structure to be found, though unfortunately there is still a tremendous lack of correlation with function. While tigroid bodies, axone, dendrites, medullated sheath, neurolemma and terminal arborizations are common properties of most nerve cells, their infinite variety adds still further to the complexity of this subject. (*See* EPITHELIUM; ENDOTHELIUM; NERVOUS SYSTEM; CONNECTIVE AND SUPPORTING TISSUES, CYTOLOGY.)

Organs are formed from combinations of the various units of these tissues, sometimes of two units, usually of several. The separate subjects are to be found further described under appropriate headings.

Histological Methods.—The ideals of histological technique are to examine the tissues directly in the living condition and to compare them with methods which provide a minimum deviation from the condition in the living state and yet with a differentiation permitting a maximum recognition and study of the various component elements. Since neither of these desiderata has yet been attained, new methods are frequently being invented.

Among the many means of attack on histological problems are a variety of chemical procedures, including microincineration, and certain physical methods, such as the use of fluorescent dyes, polarized light and the electron microscope. These techniques form one of the bases of histochemistry.

Examination of **Living** Tissues under Normal Conditions.—Because of the thickness of most tissues arid organs it is difficult to examine them directly under the microscope in the living condition. There are a few exceptions to this by which it is possible to place thin living membranes under the microscope. The classic studies of Julius Cohnheim of the phenomena of inflammation in the living mesentery or tongue of the frog at once come to mind. Improved methods permit the examination of the tail of the tadpole for days and weeks and permanent transparent chambers have been inserted in the ears of rabbits. Normal growth or reaction to various tests or injuries may be thus studied in a way hitherto impossible. Many important problems, as the functions of the kidney, spleen, lung and liver may be studied in the living animal with the aid of modern methods of illumination.

Tissue Cultures.—The cell being the important unit of animal tissue, methods are constantly being sought by histologists to study it uader relatively normal conditions. The discovery by Ross Harrison in 1907 that nerve cells would survive, function and reproduce in suitable media outside the body ('(tissue cul-

ture" or "tissue growth in vitro") has been applied to practically every cell in the body. By this method Alexis Carrel kept strains of chicken cells alive for more than 20 years, far beyond the natural term of life. suggesting the potential immortality of animal tissue. Though this method can subject cells to microscopic examination while still alive. they exist under conditions that are far from normal. (See AKIMAL CELL [TISSUE] CULTURE.)

Smears or Spreads. — The cellular contents of the blood and various body fluids may be spread in thin films and examined either fresh or after fixation with a great variety of stains, designed to bring out diverse properties or pathological changes.

Vital Stains. — Methods of intra-, supra- and post-vital staining have developed a considerable technique for the study of living cells and tissues. Here dyes are used which enter but do not kill the cell. They usually select certain parts of the cell (vacuoles, mitochondria, etc.), and the cell only becomes diffusely stained after it has died. Such dyes may be injected in the living organism and the cells which have selected the stain studied, or may be applied to cells withdrawn from the body but still alive. Such procedures are comparatively free from the objection that death of the tissue may introduce artefacts in the form of the cell or tissue and also have the advantage of permitting the study of the differentiated components under varying experimental living conditions. It must be recognized, however, that even such stains are toxic to a greater or less degree, so that the cells being studied are to a corresponding degree abnormal.

Fixed Tissues. — For proper examination with the modern microscope (magnifying up to 1,500 diameters), tissues must be cut so thin that after appropriate staining they can be accurately examined by transmitted light and without the confusion of several superposed layers of cells. The vast majority of histological materials are prepared for microscopic examination by preliminary fixation, hardening, sectioning, staining and mounting. The purpose of the fixing fluid is to penetrate and kill the tissues quickly, so that the various tissue elements are preserved as life-like and undegenerated as possible. As hardening fluids, formalin and alcohol are preferred.

To get sufficiently even and thin sections (*e.g.*, 1/1000 mm.) with the microtome (introduced by J. E. Purkinje and W. His), the tissue must by gradual transitions be imbedded in paraffin wax or celloidin, the former having the advantage that ribbons of serial sections can be more easily obtained. The sections may be stained and counterstained in the greatest variety of ways (see EHRLICH, PAUL). The celloidin technique, used especially in the examination of the nervous system, is simpler yet more time-consuming, although yielding better results.

Morbid Histology. — The microscopic study of the structural changes produced in the tissues by disease is a subject of great importance (see PATHOLOGY). It will suffice here to say that the microscopic study of tissues removed at autopsy or at surgical operations not only serves to confirm the gross anatomical diagnosis or to give the necessary information where a gross diagnosis was impossible, but also gives an accurate picture of the condition at the time the organs were examined. An evaluation of the morbid process is thus constructed, which would otherwise be impossible. Morbid histology also performs a great practical service in the examination and diagnosis of "biopsy" material, *i.e.*, tissue removed from the living body (*e.g.*, in suspected neoplasms) in order to make a diagnosis.

HISTORICAL ARTICLES. Under this head we give a general guide to the arrangement of these articles in the Encyclopedia *Britannica.*

ANCIENT HISTORY

In addition to the guide here given, see ARCHAEOLOGY (ARTICLES ox); PHILOSOPHY (ARTICLES ON); and RELIGION (AND THEOLOGY), ARTICLES ON.

Non-classical History. — For this see the articles BABYLONIA AND ASSYRIA, MESOPOTAMIA, EGYPT, PHOEKICIA, PALESTINE, PERSIA: and smaller articles such as PERSIS, MEDIA, PARTHIA, ELAM and EDESSA See also AEGEAN CIVILIZATION, CRETE and MYCENAE; ETRUSCANS and HITTITES; SCYTHIA; and the ancient history sections of such articles as GERMANY, IRELAND or WALES.

Greek History. — The main account of Greek history will be found under GREECE: History, Ancient. But this should be supplemented by reference to the special articles on constitutional and State questions, of which the chief are ARCHON, AREOPAGUS, BOULE, CONSTITUTION OF ATHENS, ECCLESIA. ORACLE. STRATEGUS, GREEK LAW. There are also articles on the most important towns, leagues. etc., such as ACHAEAN LEAGUE, AEGINA, ATHENS. BYZANTIUM, CORINTH, DELIAN LEAGUE, SICILY, SPARTA, SYRACUSE, THEBES, and tribes such as AMAZON, ACHAEANS, DORIANS, IONIANS and PELASGIANS.

HERODOTUS, ARISTOPHANES, DEMOSTHENES, THUCYDIDES, and all other ancient Greeks of importance have their biographies, nhich should be consulted; the history of the latest period of Greece should be also studied under the headings HELLENISM, MACEDONIAN EMPIRE and such biographies as that of ALEXANDER III THE GREAT.

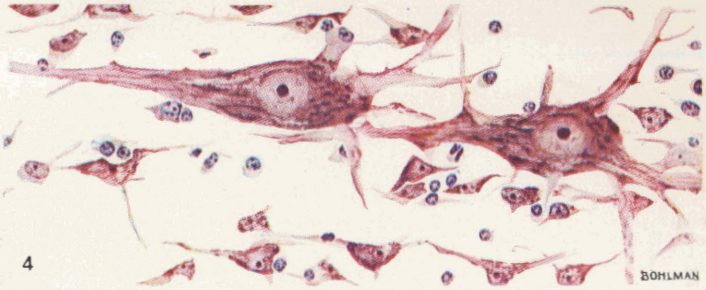
Roman History. — In Roman history the chief article is to be found under ROME. Under ITALY will be found pre-Roman history. All figures in Roman history or legend of any importance have biographical articles, from ROMULUS to ROMULUS AUGUSTULUS. The organization of the Roman State is systematically explored under the heads AERARIUM, CENSOR, COMITIA, CONSUL, EQUITES, MUNICIPIUM, PATRICIANS, PRAETOR, PREFECT (ROMAN), PROVINCE, QUAESTOR, SENATE, TRIBUNE, etc. There are other minor headings and the article ROMAN LAW should be consulted.

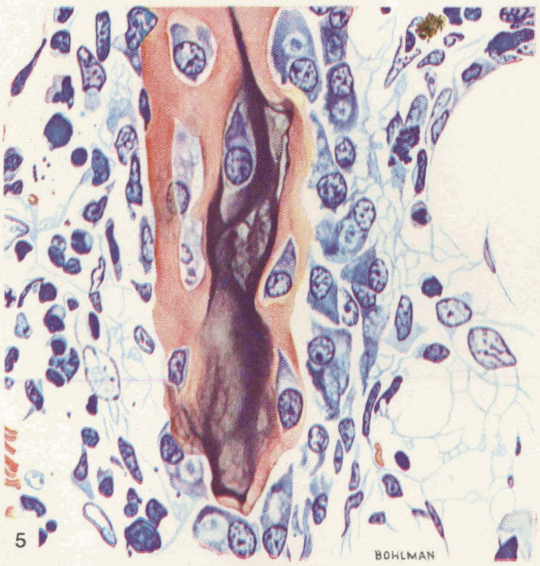
The chief tribes of the Roman world have each a separate article. We may mention HELVETII, HUNS and VOLSCI. Every province, etc., of the republic or empire has a separate article, in particular, AFRICA, ROMAN PROVINCE OF; BITHYNIA; BRITAIN: Roman Britain; CAPPADOCIA; CILICIA; DACIA; GALATIA; GAUL; ILLYRIA; LIMES GERMANICUS; LYCIA; LYDIA; MAURETANIA; PALMYRA; PANNONIA; PHRYGIA; PONTUS; SPAIN; SYRIA; THRACE; see also CARTHAGE.

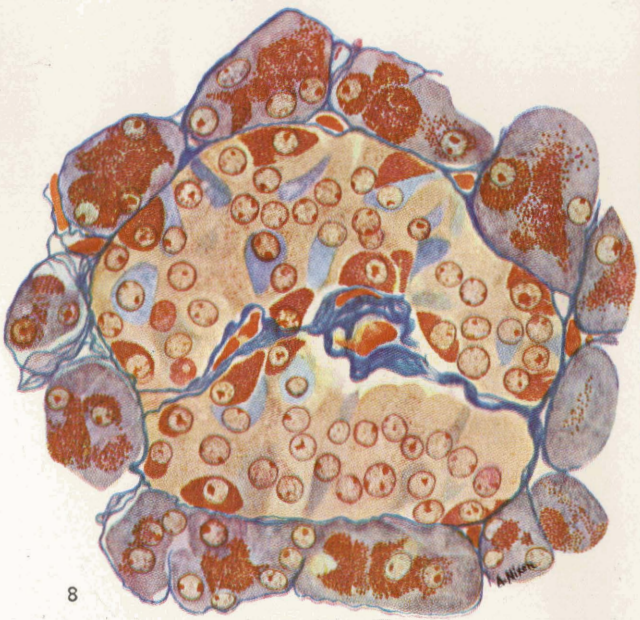
Military History. — The military history of the ancient world is dealt with in articles which, on the one hand, cover the outstanding military organizations and, on the other, the chief campaigns and battles. In the first class come the articles MACEDONIA-ARMY and ROMAN ARMY. The second class enables the reader not merely to study the course of the great conflicts but to trace the evolution of warfare and its methods. Beginning with the GRAECO-PERSIAN WARS, the thread passes through the PELOPONNESIAN WAR. then through such illustrative battles as CUNAXA, LEUCTRA, MANTINEA, and on by Alexander's battles, GRANICUS, ISSUS, GAUGAMELA and HYDASPES, as well as the biographical article on ALEXANDER III THE GREAT. The system of Alexander then declined, and the next stage is reached with the PUNIC WARS (see also HANNIBAL and SCIPIO). TRASIMENUS and CANNAE show Hannibal's art, as ILIPA and ZAMA show Scipio's. Thereafter come Caesar's battles and sieges. among them ALESIA, ILERDA, PHARSALUS and THAPSUS. and as CARRHAE reveals a weakness in the Roman legionary organization, so EDIRNE marks its fall from military supremacy.

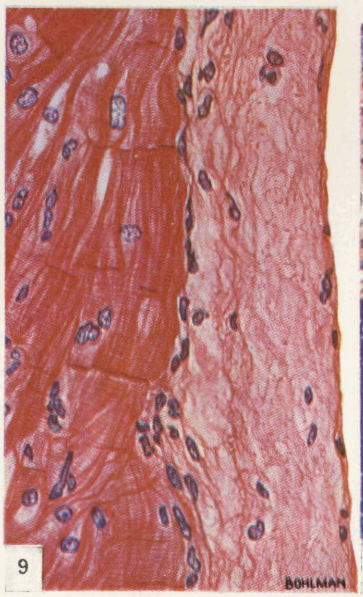
MEDIEVAL HISTORY

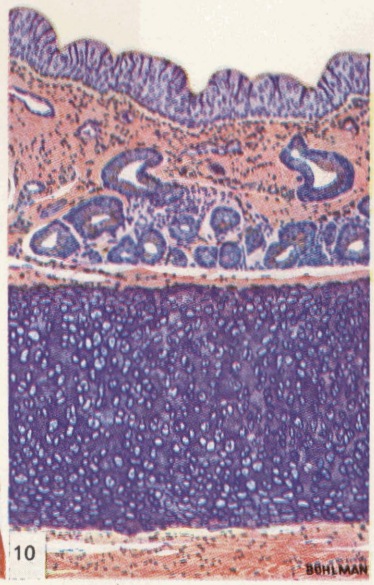
In addition to the guide here given reference should also be made to articles under the various biographical articles and to the headings connected with Archaeology, Church History, Economics, Law and Literature.











BY COURTESY OF W. BLOOM AND (8) W. BLOOM IN "THE ANATOMICAL RECORD," VOL. 49, PUBLISHED BY THE WISTAR INSTITUTE OF ANATOMY AND BIOLOGY AND (1-5, 7, 9) W. B. SAUNDERS COMPANY, FROM MAXIMOW AND BLOOM'S "TEXTBOOK OF HISTOLOGY" (4TH ED., 1942); ALL DRAWN BY ESTHER BOHLMAN, EXCEPT 8 BY AGNES NIXON

A VARIETY OF TISSUES AS THEY APPEAR IN ROUTINE MICROSCOPIC PREPARATIONS

1-3. Intestinal epithelial cells of guinea pig (magnification, **1440X**): **1,** living, unstained; 2, stained **supravitally** to show **mitochondria;** 3, sectioned and stained with **haematoxylin-eosin** (as in **4,** 6, 7, 9, **10**)

4. Nerve **cells** — large, several smaller — from monkey Brain **(about 275X)**

5. Bone **(pink** and purple), surface layer of bone-forming **cells** (blue) and bone marrow cells; stained, **haematoxylin-eosin-azure II** (710X)

6. Small intestine of man, composed of mucous membrane **with epithelium** (above), smooth **muscle** (light blue) and **connective** tissue (pink, below) **(27X)**

7. Thyroid gland of man, cuboidal epithelium surrounding masses of **colloid (pink)** containing vacuoles **(640X)**

8. **Pancreas** *of* man: glandular cells whioh **secrete** pancreatic juice border an islet of Langerhans **(orange-stained** cells are believed the **source** of insulin); stained, **Mallory-azan** method **(605X)**

9. Heart in man: cross-striated cardiac **muscle** (red) **with** darker **intercalated disks, connective** tissue (pink) and lining layer of **endothelium** (right) **(190X)**

10. Trachea **of** man, **lined** with ciliated epithelium (above), then a layer of **connective** tissue with glands, a thick **band of** cartilage (dark **purple)** and connective tissue **(pink) (27X)**

For Europe *see* DARK AGES; MIDDLE AGES; EUROPE. For articles on Europe generally, *see* also COMMUNE (MEDIEVAL); COMMUNE (OF PARIS, 1871); CRUSADES; FEUDALISM; GOTHS; GUILDS; LOMBARDS; PAPACY; BYZANTINE EMPIRE; SERFDOM; VANDALS; VIKING; VILLAGE COMMUNITIES; VILLEINAGE. For histories of individual countries and peoples of Medieval Europe, *see* articles under names of countries except England, which is under ENGLISH HISTORY.

For England, in addition to ENGLISH HISTORY, *see* ANGLO-SAXONS; BRITAIN; DANELAW; EAST ANGLIA; ESSEX; HWICCE; JUTES; KENT; NORTHUMBRIA; SUSSEX; STRATHCLYDE; WESSEX, etc. And also articles on constitutional problems and particular subjects, for example: BAYEUX TAPESTRY; CHURL; CLARENDON, CONSTITUTIONS OF; DOMESDAY BOOK; FRANKPLEDGE; FYRD; HIDE; JUSTICIAR; LOLLARDS; MAGNA CARTA; NORTHAMPTON, ASSIZE OF; OXFORD, PROVISIONS OF; PIPE ROLLS; PURVEYANCE; RAPE; SCUTAGE; TALLAGE; WAPENTAKE; WITAN; VASSAL.

In addition to article FRANCE, *see* articles on chief divisions of Medieval France, *e.g.,* ARTOIS; BRITTANY. *See* also ANTRUSTION; CAGOT; DAUPHIN; JACQUERIE, THE; CHATELAIN; PARLEMENT; PRAGUERIE; FRENCH LAW AND INSTITUTIONS; FRANKS; MAYOR OF THE PALACE; MEROVINGIANS; MISSI DOMINICI.

In addition to article GERMANY, *see* articles on EMPIRE; AULIC COUNCIL; DIET; FEHMIC COURTS; IMPERIAL CHAMBER; GOLDEN BULL; HANSEATIC LEAGUE; HUSSITES; SWABIAN LEAGUE; and articles on the principal divisions of GERMANY.

In addition to the article Italy, *see* CARROCCIO; GUELPHS AND GHIBELLINES: LOMBARD LEAGUE; FLORENCE; RAVENNA, EXARCHATE OF; ROME; PAPACY; VENICE; SICILY; VESPERS, SICILIAN.

In addition to articles SPAIN and PORTUGAL, see articles on the medieval divisions of Spain.

For Flanders (*q.v.*) *see* also BRABANT, DUCHY OF; FRISIANS; GELDERLAND; HAINAUT; HOLLAND, COUNTY AND PROVINCE OF; JOYEUSE ENTREE; NETHERLANDS.

For the Scandinavian countries, in addition to DENMARK, NORWAY, SWEDEN, *see* articles VIKING; VINLAND.

For the Near East, *see* AUSTRIA, EMPIRE OF; BULGARIA; CUMANS; PECHENEG; PERSIA; SLAVS; VLACHS, GREECE; TURKEY; ISLAM; ISLAMIC LAW; ISLAMIC INSTITUTIONS.

For the Jews, *see* EXILARCH, GHETTO, JEWS, RITUAL MURDER.

The development of the methods and means of warfare in Medievai history is covered in the historical parts of such general articles as ARMY; CAVALRY; FORTIFICATION; SMALL ARMS, MILITARY; INFANTRY; MILITIA; and TACTICS. For special light on certain periods and on certain military organizations which markedly influenced the course of medieval history *see* MONGOL CAMPAIGNS; HUNDRED YEARS' WAR; etc. The thread of evolution is also traced through the separate narrations of the more famous battles of each period, such as TRICAMERON; TAGINAE; MANZIKERT; COURTRAI; ACRE; ARSUF; BOUVINES, BATTLE OF; TAGLIACOZZO; BANNOCKBURN; DUPPLIN, BATTLE OF; HALIDON HILL; CRECY, BATTLE OF; POITIERS; AGINCOURT, BATTLE OF; ORLEANS; RAVENNA; and MARIGNAN.

More isolated but immortal incidents, for example the battles of Chalons, Tours and Hastings, also receive individual treatment in separate articles.

MODERN HISTORY

The history of the various countries will be found under their respective names with the following exceptions: the history of England is under the title ENGLISH HISTORY; the history of Ireland is to be found under IRELAND until the date 1921, but afterwards under IRELAND, NORTHERN, and IRELAND, REPUBLIC OF; the post-war history of "Iraq" is given under that title: for earlier history *see* MESOPOTAMIA. There is also a comprehensive article under the title of each continent. There are separate articles on all the British colonies and dominions as well as a long general article COMMONWEALTH OF NATIONS. The article SOUTH AFRICA, UNION OF, contains the complete history of the territory embraced by the republic; but there are also separate articles on its component parts, *e.g.,* CAPE OF GOOD HOPE, NATAL, TRANSVAAL, etc. The officially recognized names Nyasaland and French Equatorial Africa, are used in this edition in place of the older names British Central Africa and French Congo.

The events of World War I and its consequent problems are dealt with in such articles as SERBIA and DIMITRIJEVIC, DRAGUTIN, which discuss the Serajevo murder; WORLD WAR I; EUROPE, PARIS, CONFERENCE OF; VERSAILLES, TREATY OF; LEAGUE OF NATIONS; FOURTEEN POINTS; DISARMAMENT; REPARATIONS: MINORITIES; SAAR; RUHR; SANCTIONS AND GUARANTEES; LOCARNO, PACT OF, etc.

A great number of articles deal with questions of government and administration, *e.g.,* CABINET; PRIVY COUNCIL; PRIME MINISTER. BRITISH; STAR CHAMBER; GOVERNMENT; GOVERNMENT DEPARTMENTS; MINISTRY, GOVERNMENT; SPEAKER; ELECTORAL SYSTEMS; WOMEN'S SUFFRAGE.

Most important treaties, political documents, and congresses have entries of their own, *e.g.,* BERLIN, CONGRESS OF; BILL OF RIGHTS; NANTES, EDICT OF, etc. Political parties, etc., are dealt with under such headings as COMMUNISM; SOCIALISM; CHARTISM; FASCISM; MAFIA; CARBONARI; CONSERVATIVE PARTY (BRITISH); LIBERAL PARTY; LABOUR PARTY, THE (BRITISH); and under the titles of the principal parties of the French Revolution. Movements of historic importance have special articles of their own. *e.g.,* REFORMATION; RENAISSANCE; FRENCH REVOLUTION; REFORM MOVEMENT; EASTERN QUESTION; SCHLESWIG-HOLSTEIN QUESTION; PAN-GERMANISM; PANSLAVISM; CHURCH AND STATE. The Czech National Movement in Bohemia. Moravia, Silesia, and Slovakia, is included in the article BOHEMIA. There are also various articles on special subjects related to history such as DIPLOMACY; DIPLOMATIC; TRADE ROUTES.

The history of the Church will be found under PAPACY; ROMAN CATHOLIC CHURCH; INQUISITION, etc., and under the separate headings of denominations, *e.g.,* UNITARIANISM; BAPTISTS. etc., where the rise and development of each movement is traced. In some isolated articles, *e g ,* MONGOLS, a sketch of history is given as an essential indication of the influence of such peoples on surrounding nations. The Muslim religious world is treated in the article ISLAM, the history of Muslim Law is found under ISLAMIC LAW and the articles ISLAMIC INSTITUTIONS and CALIPHATE, give an indication of Mohammedan influence on Europe. The religious history of Further Asia is treated under BUDDHISM: SHINTO; TAOISM; HINDUISM; etc., and the individual biographical articles, *e.g.,* CONFUCIUS.

All the principal historical characters have their own biographical articles. There are also general family articles, *e.g.,* BOURBON; HABSBURG; HOHENZOLLERN DYNASTY; ROMANOV.

The great wars of modern history are all fully described and arranged in articles under their own headings—THIRTY YEARS' WAR; CIVIL WAR. ENGLISH; DUTCH WARS; GRAND ALLIANCE; SPANISH SUCCESSION; AUSTRIAN SUCCESSION; SEVEN YEARS' WAR; AMERICAN REVOLUTION; FRENCH REVOLUTIONARY WARS; NAPOLEONIC CAMPAIGNS; PENINSULAR WAR; WATERLOO CAMPAIGN, 1815; ITALIAN WARS; CRIMEAN WAR; AMERICAN CIVIL WAR; SEVEN WEEKS' WAR; FRANCO-GERMAN WAR; RUSSO-TURKISH WARS; RUSSO-JAPANESE WAR; BALKAN WARS; WORLD WAR I; WORLD WAR II.

The military history of Great Britain's overseas expansion and defense of her territories may be traced in such articles as QUEBEC; SIKH WARS; INDIAN MUTINY; EGYPT; and SOUTH AFRICAN WAR, 1899–1902.

Chief battles of these wars have special articles, which rise in scale as we approach the determinating military events of recent history. Thus ATLANTA, BATTLES AROUND; BULL RUN; FREDERICKSBURG; GETTYSBURG; the SEVEN DAYS and VICKSBURG, in the American Civil War have extensive treatment, as also such particular phases as the PETERSBURG, SHENANDOAH VALLEY, and WILDERNESS campaigns. Similarly with METZ and SEDAN in 1870. The events of World War I have been brought into historical perspective. the main battles of the Western, Eastern and Italian fronts, in particular MARNE, YPRES, SOMME, VERDUN, CAPORETTO, CAMBRAI, ST. QUENTIN, AMIENS and HINDENBURG LINE, having separate articles, in

which fresh light is shed on their origin and course, and their conduct is examined with frank and impartial regard for historical truth which documentary and personal evidence has made possible and the lapse of time has made suitable. The course of events in subsidiary theatres is described in such articles as DARDANELLES; PALESTINE; SALONIKA, and SERBIAN campaigns.

For more detailed information on the development of the instruments and methods of warfare during modern history, consult such articles as AIR WARFARE; AMMUNITION, ARTILLERY; ARMY; ARTILLERY; BRIDGING. MILITARY; CAMOUFLAGE; CHEMICAL WARFARE; CONSCRIPTION; FORTIFICATION; GUERRILLA WARFARE; INFANTRY; LOGISTICS; MEDICAL SERVICES, MILITARY; TRANSPORT, MILITARY; MOUNTAIN WARFARE; ORDNANCE; SMALL ARMS. MILITARY, SIGNAL COMMUNICATION; SMOKE: IN WARFARE; STAFF, MILITARY; STRATEGY; SUPPLY AND TRANSPORT, MILITARY; TACTICS; TANK; WAR.

HISTORY. The word history is used in two senses. It may mean either the record of events or events themselves. Originally limited to inquiry and statement, it was only in comparatively modern times that the meaning of the word was extended to include the phenomena which form or might form their subject. It was perhaps by a somewhat careless transference of ideas that this extension was brought about. Now indeed it is the commoner meaning. The "history of England" is used without reference to any literary narrative. Kings and statesmen are termed the "makers of history" and sometimes it is said that the historian only records the history which they make. History in this connection is obviously not the record, but the thing to be recorded.

History in the wider sense is all that has happened. not merely all the phenomena of human life, but those of the natural world as well. It includes everything that undergoes change; and as modern science has shown that there is nothing absolutely static, therefore the whole universe and every part of it has its history. This idea of universal activity has in a sense made physics itself a branch of history.

But the tendency to look at things historically is not merely the attitude of men of science. The present outlook upon life differs in just this particular from that of preceding ages. The unstable nature of our whole social fabric is recognized, and it is therefore more and more capable of being transformed. In short. the historical spirit of the age has invaded every field. The world picture presented in the *Encyclopedia Britannica* is that of a dynamic universe, of phenomena in process of ceaseless change. Because of this insistent change all things which happen. or seem to happen, are history in the broader sense of the word. The *Encyclopedia Britannica* itself is a history of them in the stricter sense—the description and record of this universal process. This narrower meaning is the subject of the rest of this article.

The earliest prose origins of history are the inscriptions. Their permanence, however, depends not upon their importance. but upon the durability of the substance on which they are inscribed; and as few know how to read them, they lie forgotten for centuries while oral tradition flourishes. Next to the inscriptions (sometimes identical with them) are the early chronicles frequently preserved in temples. These were of various kinds: simple religious annals. votive tablets recording miracles accomplished at a shrine, lists of priests and priestesses, accounts of benefactions. of prodigies and portents. In some cases. as in Rome, the pontiffs kept a kind of register of important political events; down to the time of the Gracchi (131 B.C.) the pontifex maximus inscribed the year's events upon annual tablets of wood which were preserved in his official residence and thus came to be a sort of civic history.

The first historians were the logographers of Ionian cities; men who carried their inquiry (*istorie*) beyond both written record and oral tradition to a study of the world around them. Their "saying" *(logos)* was gathered mostly from contemporaries; they made prose transcripts from folk memory, studying in particular the rise of Persia and the countermeasures of the Greek cities. They were the forerunners of the "father of history." Herodotus (*q.v.*). It is easy for the student now to show the inadequacy of his sources, yet the work of Herodotus remains a scientific achievement as remarkable for its approximation to truth as for its vastness of scope. It was his chief glory to have joined to this scientific spirit an artistic sense which enabled him to cast the material into the truest literary form. In Thucydides a higher art than Herodotus' was combined with a higher science. He scorned the storyteller "nho seeks to please the ear rather than to speak the truth." and yet his rhetoric is the culmination of Greek historical prose. He withdrew from vulgar applause. conscious that his narrative would be considered "disappointing to the ear." yet he recast the materials out of which he constructed it in order to lift that narrative into the realm of pure literature. Speeches, letters and documents are reworded to be in tone with the rest of the story. It was his art, in fact, which really created the Peloponnesian War out of its separate parts. And yet this art was merely the language of a scientist. His "laborious task" was that of consulting all possible evidence and weighing conflicting accounts. It is this which makes his rhetoric worthwhile, "an everlasting possession. not a prize competition which is heard and forgotten."

From the sublimity of Thucydides and Xenophon's straightforward story, history passed with Theopompus and Ephorus into the field of rhetoric. A revival of the scientific instinct of investigation is discernible in Timaeus the Sicilian at the end of the 4th century, but his attack upon his predecessors provoked a crushing counterattack by Polybius, who declares him lacking in critical insight and biased by passion. Polybius' comments upon Timaeus reach the dignity of a treatise upon history. He protests against its use for controversial pamphlets which distort the truth. "Directly a man assumes the moral attitude of an historian he ought to forget all considerations, such as love of one's friends. hatred of one's enemies. . . . He must sometimes praise enemies and blame friends. For, as a living creature is rendered useless if deprived of its eyes, so, if you take truth from History, what is left but an improfitable tale" (bk. xii, 14). Unfortunately Polybius. like most modern scientific historians, was no artist. His style is often only clear in the light of inscriptions, so closely does it keep to the sources; it thus found no imitator. and history passed from Greece to Rome in the guise of rhetoric. In Dionysius of Halicarnassus the rhetoric was combined with an extensive study of the sources. but the influence of the Greek rhetoricians upon Roman prose was deplorable from the standpoint of science. Cicero, although he said that the duty of the historian was to conceal nothing true, to say nothing false. would in practice have written the kind of history Polybius denounced. History for him was the mine from which to draw argument in oratory and example in education, not the subject of a scientific curiosity.

History writing in Rome (except for the Greek writers resident there) was until the first half of the 1st century B.C. in the form of annals. Then came rhetorical ornamentation—and the Ciceronian era. The first Roman historian who rose to the conception of a science and art combined was Sallust. the student of Thucydides. The Xugustan age produced in Livy a great popular historian and natural artist and a trained rhetorician (in the speeches). From Livy to Tacitus the gulf is greater than from Herodotus to Thucydides. Tacitus is at least a consummate artist. His style ranges from the brilliancy of his youth to the sternness and sombre gravity of age, passing almost to poetic expression in its epigrammatic terseness. Yet in spite of his searching study of authorities, his keen judgment of men and his perception of underlying principles of moral law, his view was warped by the heat of faction, which glows beneath his external objectivity. After him Roman history writing speedily degenerated. Suetonius' *Lives of the Caesars* is but a superior kind of journalism. But his gossip of the court became the model for historians, whose works, now lost. furnish the main source for the *Historia Augusta.* The importance of this uncritical collection of biographies is sufficient comment on the decline of history writing in the latter empire. though classical models could still inspire writers at the Byzantine court as late as Procopius in the 6th century. Finally, from the 4th century the epitomes of Eutropius and Festus served to satisfy the lessening curiosityin the past and became the handbooks for the middle ages. Ammianus Marcellinus stands out alone in this age like a belated disciple of Tacitus. But the world was

changing from antique to Christian ideals just as he was writing.

Early Christian History.— The 4th and 5th centuries saw a great revolution in the history of history. The pagan past slipped out of mind, and in its place was set, by the genius of Eusebius. the story of the world force which had superseded it, Christianity. and of that small fraction of antiquity from which it sprang — the Jews. Christianity from the first had forced thinking men to reconstruct their philosophy of history, but it was only after the church's triumph that its point of view became dominant in historiography. Three centuries more passed before the pagan models were quite lost to sight. But from the 7th century to the 17th (from Isidore of Seville and Bede for 1,000 years) mankind was to look back along the line of Jewish priests and kings to the Creation. Egypt was of interest only as it came into Israelite history, Babylon and Nineveh were to illustrate the judgments of Yahweh, Tyre and Sidon to reflect the glory of Solomon.

Christian history begins with the triumph of the church. With Eusebius of Caesarea the apologetic pamphlets of the age of persecutions gave way to a calm review of three centuries of Christian progress. Eusebius' biography of Constantine shows what distortion of fact the father of church history permitted himself, but the *Ecclesiastical History* was fortunately written for those who wanted to know what really happened and still remains an invaluable repository of Christian antiquities. With the continuations of Socrates, Sozomen and Theodoret and the Latin manual which Cassiodorus had woven from them (the *Historia tripartita*), it formed the body of church history during all the middle ages. An even greater influence, however, was exercised by Eusebius' *Chronica*. Through Jerome's translation and additions, the scheme of this world's chronology became the basis for all medieval world chronicles. It settled until modern times the succession of years from the Creation to the birth of Christ, fitting the Old Testament story into that of ancient history. Henceforth the Jewish past (that one path hack to the beginning of the world) mas marked by the absolute laws of mathematics and revelation.

From the first. Christianity had a philosophy of history. Its earliest apologists sought to show how the world had followed a divine plan in its long preparation for the life of Christ. From this central fact of all history, mankind should continue through war and suffering until the divine plan was completed at the judgment day. This idea received its classic statement in St. Augustine's *City of God*. The terrestrial city, whose eternity had been the theme of pagan history, had just fallen before Xlaric's Goths. Augustine's explanation of its fall not only passes in review the calamities of Roman history but carries the survey back to the origin of evil at the Creation. The Roman empire (the last general form of the earthly city) must at last yield to the heavenly. This is the main thread of Augustine's philosophy of history. The historical demonstration of its truth was left to his disciple Paulus Orosius. whose *Seven Books of Histories Against the Pagans*, written as a supplement to the *City of God*, was the first attempt at a Christian "world history."

Medieval and Renaissance History.— The commonest form of medieval historical writing was the chronicle. Often beginning merely as a series of memoranda of current events inserted in Easter tables, the chronicle might develop, either as a general history of Christendom or as a localized account of a monastic house—the individual historian was frequently a religious who wrote history from the standpoint of his own convent. Behind it might lie oral tradition, documentary collections and the testimony of contemporaries. If the monastic chronicle at times lacks perspective and tends to relate marvels, it is by no means uncritical. Among the English medieval chroniclers, William of Malmesbury and William of lieu-burgh were both men of remarkable ability, the one a stylist with a high sense of accuracy, the other an acute and penetrating intellect. The St. Albans school: from Roger of Wendover to Thomas Walsingham, showed itself keenly alive to the whole contemporary scene and began what might be termed a "Whig tradition" in historical writing through its support of and admiration for the baronial opposition to the crown. At the end of the middle ages, the development of vernacular chronicles, particularly town chronicles, prepared the way for the breakdown of general histories written to the medieval theological pattern.

The Renaissance marked the first great gain, in the historic sense, in the efforts of the humanists to realize the spirit of the antique world. If an Italian humanist in the 15th century had been asked to justify his writing of history, he might have replied that it was a form of literature highly regarded by the ancients and presenting admirable opportunities for the exercise of style; that it had great value for its inculcation of moral and political lessons; and finally that the history written by his contemporaries (*cf.* that of Leonardo Bruni) celebrated the past and present glories oi their native land or the city-state whose story they related. The political point of view and the patriotic purpose led to a new periodization of history into "ancient" (Creek and Roman) and "modern" (irom the age of Constantine onward). Some humanists, such as Petrarrh, regarded the modern age with disgust; but later Italians, such as Bruni and Flavio Biondo, found elements of hope in the emergence of the city-states from the commune; and Nicolaus Cusanus recognized the existence and the value of a middle age between classical times and the modern world. Nonetheless history had become the servant to literature, an adjunct to the classics. Rut if the literary side of humanism has been a barrier to the progress of scientific history, the discovery and elucidation of texts first made that progress possible. Laurentius Valla's brilliant attack on the "Donation of Constantine" (1440) and Ulrich von Hutten's rehabilitation of Henry IV from monastic tales mark the rise of the new science. For a while it remained but a phase of humanism. It mas north oi the .%lps that it parted company with the grammarians. Classical antiquity was an Italian past, the German scholars turned back to the sources of their national history. Aeneas Sylvius Piccolomini (Pius II) had discovered Otto of Freising and Jordanes. Maximilian I encouraged the search for manuscripts, and Vienna became a great humanistic centre. Conrad Celtes left his *Germania illustrata* unfinished, but he had found the works of Hrosvitha. Conrad Peutinger gathered all sorts of chronicles: publishing among them those of Gregory of Tours.

Influence of the Refowmation.— The Reformation. with its heated controversies, seems a strange starling point for science. yet it, even more than the Renaissance. brought out scientific methods of historical investigation. It not only sobered the humanist tendency to sacrifice truth for aesthetic effect. it called for the documents of the church and subjected them to the most hostile criticism. Martin Luther himself challenged them. Then in the *Magdeburg Centuries* (1559–74) Protestantism tried to make good its attack on the medieval church by a great collection of sources accompanied with much destructive criticism. This gigantic work is the first monument of modern historical research. The reply of Cardinal Baronius (*Annales ecclesiastici*, 1588–1607) was a still greater collection, drawn from archives which until then had not been used for scientific history.

The movement back to the sources in Germany until the Thirty Years' War was a notable one. Collections were made by Simon Schard (1535–73), Johannes Pistorius (1576–1608), Marquard Freher (1565–1614), Melchior Goldast (1576–1635) and others.

Leibniz began a new epoch, both by his philosophy, uith its lair. of continuity in phenomena, and by his systematic attempt to collect sources through an association (1670). His plan to have documents printed as they were, instead of "correcting" them, was a notable advance. But from Leibniz until the 19th century German national historiography made little progress—although church historians such as J. L. von Mosheim and J. A. W. Neander stand out among the greater historians of their country.

The 17th and 18th Centuries.— France had not paralleled the activity of Maximilian's Renaissance historians. The father of modern French history, or at least of historical research, was André Duchesne (1584–1640), whose splendid collections of sources are still in use. Jean Bodin wrote the first treatise on scientific history (*Methodus ad facilem historiarum cognitionem*, 1566), but he did not apply his own principles of criticism, and it was left for the Benedictine monks of the Congregation of St. Maur to establish definitely the new science. The place of this school in the history of history is entirely without a parallel. When Luc d'Achery turned irom exegetics to patristics anti the lives of the saints. as a sort of Christian humanist, he led the may to that vast work of collection and comparison oi texts which developed through Jean Mabillon, Bernard de Montfaucon. Thierry Ruinart, Edmond Martène, Martin Bouquet and their associates, into the indispensable implements of modern historians. Here, as in the Reformation, controversy called out the richest product. Mabillon's treatise! *De re diplomatica* (1681), was due to the criticisms of that group of Belgian Jesuits whose *Acta Sanctorum quotquot toto orbe coluntur* (1643, *et seq., see* BOLLANDISTS) was destined to grow into the greatest repository oi legend and biography the world has seen. In reply to D. Papebroch's criticisms of the chronicle of St. Denis, Mabillon prepared this manual ior the testing of medieval documents. Its canons are the basis, indeed, almost the whole, of the science of diplomatic (*q.v.*), the touchstone of truth for medieval research. Henceforth even the mediocre scholar had a body of technical rules by which to sort out the vast mass of apocrypha in medieval documentary sources. Scientific history depends upon implements. Without manuals. dictionaries or easy access to tests, the modern historian would go as far astray as any medieval chronicler. The France oi the Maurists supplied the most essential of these instruments. The great "glossary" of Charles du Fresne du Cange is still in enlarged editions the indispensable encyclopaedia of the middle ages. Chronology and paleography were placed on a new iooting by Montfaucon's *Palaeographia graeca* (1708), the monumental *Art de vérifier les dotes* (3rd ed., in 38 vol., 1818–31) and the *Nouveau Traité de diplomatique* (1750–65) of R. P.

Tassin and C. F. Toustain. The collections of texts which the Maurists published are too many to be enumerated here (see C. Langlois, *Manuel de bibliographie historique,* pp. 293 ff.). Bouquet's *Historiens* de la *Gaule* et de la France—the national repertory for French historians—is but one of a dozen tasks of similar magnitude. During the 18th century this deep underwork of scientific history continued to advance, though for the most part unseen by the brilliant writers whose untrustworthy generalities passed for history in the salons. Interrupted by the Revolution, it revived in the 19th century, and the roll of honour of the French École des Chartes has almost rivaled that of St. Germain-des-Prés.

The father of critical history in Italy was L. A. Muratori (1672–1750). His vast collection of sources (Rerunz *Italicarum scriptores*), prepared amid every discouragement, remains the national monument of Italian history; and it is but one of his collections. His output is perhaps the greatest of any isolated worker in the whole history of historiography. The same haste, but much less care, marked the work of J. D. Mansi (d. 1769), the compiler of the fullest collection of the councils. Spain, stifled by the Inquisition. produced no national collection of sources during the 17th and 18th centuries, although Nicolas Antonio (1617–84) produced a national literary history of the first rank.

England in the 16th century kept pace with continental historiography. Henry VIII's chaplain, John Leland, is the father of English antiquaries. Three of the most precious collections of medieval manuscripts still in existence were then begun by Thomas Bodley (the Bodleian, Oxford), Archbishop Matthew Parker (Corpus Christi, Cambridge) and Robert Cotton (the Cottonian collection, British museum). The end of Elizabeth's reign saw English historical scholarship concentrated on topographical description and upon the investigation of the beginnings of parliamentary and local government. In the first half of the 17th century a serious effort was made to study and exploit the national records which, until the end of the 18th century, were scattered in no less than 15 repositories. The characteristic English interest in local history and in family origins had now started; ecclesiastical and administrative history had begun to claim attention; and in the 17th and 18th centuries English scholarship was enriched by such monuments oi research as William Dugdale's *Monasticon,* Thomas Madox's History *of* the Exchequer, David Wilkins' *Concilia* and Thomas Rymer's Foedera. But these works, important as they were, gave but little idea of the wealth of historical sources which the 19th century was to reveal in England as a result of the concentration of English governmental records in the Public Record office (after 1838) and of the investigations undertaken by the Historical Manuscripts commission from 1870 onward. The picture was to be extended after World War II by the creation of the National Register of Archives (1947).

MODERN PRACTICE

History as a Science.—In the 19th century the science of history underwent a revolution. The machinery of research was periected. Groups of scholars grew into national or international associations, producing from archives collections of material to be worked up into the artistic form of history. These faithful workers, cataloguing, publishing and indexing make it possible for the student to master in a few hours sources which baffled the long years of research of a Martène or a Rymer.

Every science which deals with human phenomena is in a s-ay an implement in this great factory system in which the past is welded together again. But the real auxiliary sciences to history are those which deal with those traces of the past that still exist, the sciences of language (philology), of writing 'paleography), of documents (diplomatic), of seals (sphragistics), of coins (numismatics) and of weights and measures and archaeology in the widest sense of the word. These sciences underlie the whole development of scientific history. Dictionaries and manuals are the instruments of this industrial revolution. Without them the literary remains of the race would still be as useless as Egyptian inscriptions to the fellaheen. .Archaeology remained but a minor branch of art until the machinery was perfected which enabled it to classify and interpret the remains of the "prehistoric" age.

This is the most remarkable chapter in the whole history of history—the recovery of that past which had already been lost when our literary history began. The old "providential" scheme of history disintegrates before a new interest in the "gentile" nations to whose high culture Hebrew sources bore unwilling testimony. The scientific historian of antiquity works on the hills of Crete or in the uplands of Asia Minor rather than in the quiet of a library. His discoveries, co-ordinated and arranged in vast bodies of inscriptions, stand now beside Herodotus or Livy, furnishing a basis for their criticism.

The immense increase in available sources, archaeological and literary, has remade historical criticism. Leopold von Ranke's application of the principles of "higher criticism" to works written since the invention of printing (Rritik neuerer *Geschichtsschreiber*) was an epoch-making challenge of narrative sources. Now they are everywhere checked by contemporary evidence, and a clearer sense of what constitutes a primary source has discredited much of what had been currently accepted as true. Hardly an "old master" remains an authoritative book of reference. Old landmarks drop out of sight—*e.g.,* the fall of the western empire in 476, the coming of the Creeks to Italy in 1453, dates which once enclosed the middle ages. The perspective changes: humanism stretches back into the middle ages and the gap between the Renaissance and the middle ages dwindles; the Protestant Revolution becomes a complex of economics and politics and religion, the French Revolution a vast social reform, in which the Terror was an incident. The result has been a complete transformation of history since the middle of the 19th century. The history of the human spirit has also introduced itself as a new category, largely as a result of the work of Jakob Burckhardt. the Swiss historian of the Renaissance, who showed that the movement affected the whole life of man in society and was to the individual a revelation of a new world instead of being a mere phase in artistic and literary achievement. On the other hand such auxiliaries of history as psychological biography, local genealogy and social (*e.g.,* class) analysis have given new factual and environmental interpretations to movements of thought and opinion and have explained the development of institutions by exploring their local and personal origins. The tendency has been to break down the dichotomy of history into the history of facts and the history of ideas.

Theories of History.—The Augustinian scheme of world history received its last classic statement in J. B. Bossuet's *Histoire universelle.* Voltaire's reply to it in the 18th century (Essai *sur les* moeurs) attacked its limitations on the basis of deism and its miraculous procedure on that of science. But while there are foreshadowings of the evolutionary theory in this work, neither the *philosophe* historians nor David Hume nor Edward Gibbon arrived at a constructive principle in history which could take the place of the Providence that they rejected. Religion, though false, might be a real historic force. History became the tragic spectacle of a game oi dupes—the real movers being priests, kings or warriors. The pawns slowly acquired reason and then were able to regulate the moves themselves. But all this failed to give a satisfactory explanation of the laws which determine the direction of this evolution. Giovanni Battista Vico (1668–1744) was the first to ask why there is no science of human history. But his lonely life and unrecognized labours leit him apart from the main movement until his works were discovered again in the 19th century. The first half of the 19th century (apart from the scientific activity of G. H. Pertz, the statesman Guizot, etc.) was largely dominated by the romanticists, with their exaggeration of the individual. Thomas Carlyle's "great-man theory of history" lent itself to magnificent dramatic creations; but it explained nothing. Hegel got no closer to realities. His idealistic scheme of history, which makes religion the keynote of progress and describes the function of each (Judaism to typify duty, Confucianism order, Mohammedanism justice, Buddhism patience and Christianity love) does not account for the facts of the history enacted by the devotees. It characterizes, not the real process of evolution, but an ideal which history has not realized. More attractive to 19th-century optimism was the interpretation of history given by the Positivists under Auguste Comte, to whom man's history had been a history of his opinions: "the whole social mechanism is ultimately based on opinion." After passing through what he called the "theological" and "metaphysical" stages, man was presently, Comte believed, to enter upon the "positive" stage, when society would be organized in accordance with the views of scientific sociology.

Against the intellectualist interpretations of history, two men in particular were to protest. H. T. Buckle, in his History of Civilization *in England* (1857–61), was to work out the influences of the material world-upon history, developing through a wealth of illustration the importance of food, soil and the general aspect of nature upon the formation of society. Meanwhile, however, the economists had themselves taken up the problem. Karl Marx was led to the conclusion that the evolution of society is conditioned by the economic circumstances of its existence; from Hegel, moreover, he got the idea of a dialectical process in history whereby one stage of development (the thesis) is challenged by its opposite (the antithesis), and the conflict between the two gives place to the third stage (the synthesis). In his *Misère* de la philosophie (1847) Marx lays down the principle that social relationships largely depend upon modes of production, and therefore the principles, ideas and categories thus evolved are no more eternal than the relations that they express, but are historical and transitory products. In the famous *Manifesto* of the *Communist* Party (1848), the theory was applied to demonstrate how the Industrial Revolution had replaced feudal with modern conditions. In *Das* Kapital, Marx showed how the social developments of modern times depend on capital: the essence of modern history is the rise, culmination and final breakdown of capitalism and its replacement by communism. This is, of course, the phenomenon which, according to Marx, the historian should he engaged in portraying. Since the third volume of Das *Kapital,* published in 1894, a controversy over his views has been continual. It is an exaggeration of the theory which makes it an explanation of all human life; but the whole science of dynamic sociology rests upon the postulate of Marx. Without him it is unlikely that such un-Marxian historians as Mas Weber and Maro Bloch could have written their widely influential works: the former to explain the relations between religion and capitalism, the latter to demonstrate the place of economic considerations in the study of any historic society.

The content oi history reflects the interests of the age in which it is written. Modern historians began with politics; but as the complex nature of society became more evident in the age of democracy they came to appreciate that no one branch of history is more than a single glimpse at a vast complex of phenomena, most of which lie forever

beyond the range of our knowledge.

This expansion of interest has intensified specialization. Each historian chooses his epoch or century and his subject and spends his life mastering such traces of it as he can find. He can thus judge the methods of his fellows, but his own work remains restricted by the very wealth of material at his disposal. Thus the great modern enterprises are co-operative — the *Allgemeine Geschiclzte in Einzeldarstellungen,* edited by W. Oncken (qj vol., 1879–93), the *Cambridge* histories (1902 *et seq.; Modern, Medieval* and *Ancient),* the *Historie générale,* edited by E. Lavisse and A. Rambaud (12 vol., 1893–1901), the *Histoire de France,* edited by E. Lavisse (two series, 19 vol., 1908–22) and the *Oxford History of England,* edited by Sir George Clark (12 vol., 1934 *et seq.).*

In contrast with these specialist tendencies, however, from the beginning of the 20th century certain of the more philosophical minds among historians and sociologists have been engaged in the exacting task of reinterpretation. The two leading efforts have been the work oi the German school represented by the philosophers Wilhelm Dilthey, Heinrich Rickert and Ernst Troeltsch and by the historian Friedrich Meinecke; and that of a single British historian, Arnold Toynbee. It is mainly with the problem of evaluation that the Germans have been concerned: how to measure the values of a civilization when the valuer himself is borne along upon the stream of history. Only, it is concluded, in the moment and the act of creative self-consciousness can the solution be found. This school lays stress on social and religious rather than political iactors. The historian's business lies less with the causes of historical events than with their meaning. Troeltsch found the significance of history to rest in the development of social groups and movements of thought and culture, each of which has its own unique inherent value and cannot be explained by historical antecedents alone. The importance of Toynbee (*A Study of History,* 10 vol., 1934–54) lies less in the conclusions that he reaches on the decline and fall of civilizations than in the units that he selects for study and the inclusiveness of the field, looking as he does to humanity in all lands and all ages.

The notion that it is possible to discover patterns or regularly recurring phenomena in the process oi history has been iashionable at various periods. especially during the 4th, the 18th and parts of the 19th and oi the 20th centuries of the Christian era. In face of these alleged uniiormities, the power of the individual to modify his environment seriously or to alter the course oi events has been called in question, and the exceptional person, where he occurs, has been presented as the projection or incarnation of a mass movement rather than as a creative force in himself. To the impersonal school of historians, neither the individuals nor the masses can ultimately be thought responsible for historical change, since the behaviour of men is largely determined by factors of race, culture, national custom and sentiment or class. A more cautious view avoids such universals to hold that every event of human life is an element in a necessary pattern. All men, according to this theory, have iunctions and pursue purposes. These may be governed by divine ordaining or providence, or may, as in the Aristotelian scheme, be part of their nature, by fulfilling which they reach their best or "truest'! realization. Thus. whether oi supernatural direction or as the result of innate forces, human action in historic time must be regarded as planned or determined and in that sense inevitable. The historian's function, then, is to understand and to explain this planning and how people and events are affected by it. Such a view. it need not be said, is strongly a priorist. At the other estreme is the scepticism which not only refuses to pass moral judgments on historical characters but also doubts the possibility of ever fully knowing the causes of historical events and, in suspending judgment, escapes irom the historian's plain duty to seek, as conscientiously as he can, the derivation of movements and events and not to evade the issue of right and wrong. The diversity of moral judgments should not be invoked as an excuse for such abnegation, and the existence of bias and wrongheadedness in writers of history is no solid reason for condemning the whole class of historians to narrative or description alone.

HIT, a town in Iraq on the right (western) bank of the Euphrates, on which it iorms the limit of navigation, in 34° N. and 43° E.. about 70 mi. N.W. of Baghdad. The importance of the region lies in its oil. The town is of great antiquity and was the chief source of bitumen which was used in ancient times for binding the courses of brick buildings. There are bitter springs and lakes and abundant suriace indications of oil. A pipeline was built, 1932–34, to the Mediterranean ports of Haifa and Tripoli. Population (1953 est.) 19.619.

HITCHCOCK, THOMAS, JR. (1900–1944), generally regarded as polo's greatest player, was born in Aiken, S.C., Feb. 11, 1900.

A brilliant defender in international play against Great Britain for the Westchester cup. Hitchcock got his 10-goal rating in 1922 and dominated polo for the next two decades. Commander of a Mustang fighter group in World War II. Lieutenant Colonel Hitchcock crashed to his death in England. April 19, 1944. See also POLO: *United States.* (J. D. McC.)

HITCHIN, a market town and urban district in the Hitchin parliamentary division of Hertfordshire. Eng.. on the small Hiz river (the name of the town in Domesday). 16 mi. N.W. of Hertford by road. Pop. (1951) 19.963. Area 6.0 sq.mi. An ancient town in an agricultural area. Hitchin has many timber-iramed and gabled houses, and the church of St. Mary (12th to 15th century) has a fine porch. Hitchin priory is a mansion on the site of a Carmelite ioundation of c. 1318 and portions of a 14th-century Gilbertine nunnery appear in an almshouse known as the Biggin. Medicinal distilling, rose growing, and the casting of pipe joints and fittings are some of the chief industries. In 1936 the council obtained one of the few grants of arms issued during the reign of Edward VIII.

HITLER. ADOLF (1889–1935), Austrian-born politician, who became 'dictator of Germany in 1933, was born on April 20, 1889, at Braunau-am-Inn. on the border of Austria-Hungary. His father, Alois (b. 1837), was illegitimate. and for a time bore his mother's name, Schicklgruber. but by 1876 he had established his claim to the surname Hitler. Adolf never used any other name, and the name Schicklgruber was only revived by his political opponents in Vienna in the 1930s.

Adolf Hitler spent most of his childhood in the neighbourhood of Linz. the capital of Upper Austria. after his father's retirement from the Habsburg customs service. His father. Alois Hitler, died in 1903, but left an adequate pension and savings to support his wife and children. Adolf received a secondary education and. although he had a poor record at school and failed to secure the usual certificate, did not leave until he was 16 (1905). There followed two idle years in Linz, when he indulged in grandiose dreams oi becoming an artist without taking any steps to prepare for earning his living. His mother was overindulgent to her willful son and even after her death at the end of 1907 he continued to draw a small allowance with which he maintained himself at first in Vienna. His ambition was to become an art student but he twice failed to secure entry to the Academy of Fine Arts. Thereafter he lived a lonely and isolated life, earning a precarious livelihood by painting postcards and advertisements and drifting from one municipal lodging house to the next.

Hitler already showed traits that characterized his maturity: inability to establish ordinary human relationships; intolerance

and hatred both of the established bourgeois world and of non-German peoples, especially the Jews; a tendency to passionate, denunciatory outbursts; readiness to live in a world of fantasy and so escape from his poverty and failure.

In 1913 he moved to Munich, thereby evading military service in the Habsburg empire. He volunteered, however, on the outbreak of war in 1914, joining a German regiment, the 16th Bavarian reserve infantry ("List") regiment. He served throughout the war, was wounded in Oct. 1916 and gassed two years later. He was still hospitalized when the war ended. Except when hospitalized, he was continuously in the front line as a headquarters runner; his bravery in action was rewarded with the Iron Cross, second class, in Dec. 1914, and the Iron Cross, first class (a rare decoration for a corporal), in Aug. 1918.

He greeted the war with enthusiasm, as a great relief from the frustration and aimlessness of his civilian life. He found comradeship, discipline and participation in conflict intensely satisfying; and was confirmed in his belief in authoritarianism, inequality and the heroic virtues of war.

Rise to Power.— Discharged from the hospital in the atmosphere of confusion that followed the German defeat. Hitler determined to take up political work in order to destroy a peace settlement which he denounced as intolerable. He remained on the strength of his regiment until April 1920 and as an army political agent joined the tiny German Workers' party in Munich (Sept. 1919). In 1920 he was put in charge of the party's propaganda and left the army to devote his time to building up the party which in August was renamed the Nationalsozialistisch Deutsche Arbeiterpartei (of which "Nazi" was an abbreviation). Conditions were ripe for the development of such a party. Resentment toward the victorious powers and economic chaos brought general discontent. This was sharpened in Bavaria (*q.v.*), where Hitler lived throughout the 1920s, by traditional separatism and dislike of the republican government in Berlin. In March 1920 a coup d'état by the army established a strong right-wing government. Munich became the gathering place for dissatisfied ex-servicemen and members of the Freikorps which had been organized in 1918–19 from units of the German army unwilling to return to civilian life, and for political plotters against the republic. Many of these joined the Nazi party. Foremost among them was Ernst Roehm, a member of the staff of the district army command, who had actually joined the German Workers' party before Hitler and who was of great help in furthering his schemes for developing it into an instrument of power. It was he who recruited the "strong-arm" squads used by Hitler to protect party meetings, to attack Socialists and Communists and to exploit violence for the impression of strength it gave. In 1921 these were formally organized under Roehm into a private party army, the SA. (*Sturmabteilung*). Roehm was also able to ensure the protection of the Bavarian government which depended on the local army command for the maintenance of order, and which tacitly accepted his breaches of law and policy of intimidation.

Although conditions were thus favourable to the growth of the party, only Hitler was sufficiently astute to take full advantage of them. When he joined the party he found it small, ineffective, committed to a program of nationalist and socialist principles, but uncertain of its aims and divided in its leadership. He accepted its program, but regarded it only as a means to an end—political power. His propaganda methods and his personal arrogance caused friction with the other members of the committee, resolved when Hitler countered their attempts to curb his freedom by offering his resignation. Aware that the future of the party depended on his power to organize publicity and to acquire funds, they were forced to give in and in July 1921 he became president with unlimited pow-er. From the first he set out to create a mass movement, whose mystique and force would be sufficient to bind its members in loyalty to him. He engaged in unrelenting propaganda through the party newspaper, the Volkischer *Beobachter* (acquired in Aug. 1920), and through a succession of meetings, rapidly growing from audiences of a handful to thousands, where he developed his unique talent for magnetism and mass leadership. At the same time he gathered round him several of the Nazi leaders who later became infamous—Alfred Rosenberg, Rudolf Hess, Hermann Goring and Julius Streicher.

The climax in this rapid growth of the Nazi party in Bavaria came in an attempt to seize power in the Munich Putsch of Nov. 1923 (see BAVARIA), when Hitler and Gen. Erich Ludendorff took advantage of the prevailing lawlessness and opposition to the Weimar republic to force the leaders of the Land government and the local Reichswehr commander to proclaim a national revolution. When released, however, they rescinded the proclamation. When placed on trial, Hitler, although his part in the *Putsch* had been far from glorious, characteristically took advantage of the immense publicity afforded to him. He also drew a vital lesson from the Putsch—that the movement must achieve power by legal means. He was sentenced to prison for five years, but served only nine months, and that in comfort at Landsberg. He used that time to prepare the first volume of *Mein Kampf*.

Hitler's ideas included little that cannot be traced to earlier writers or to the commonly accepted shibboleths of Viennese radicalism in his youth. He regarded inequality between races and individuals as part of an unchangeable natural order, and exalted the "Aryan race" as the sole creative element of mankind. The natural unit of mankind was the Volk, of which the German was the greatest; and the state only existed to serve the Volk—a mission which the Weimar republic betrayed. All morality and truth was judged by this criterion: whether it was in accordance with the interest and preservation of the Volk. For this reason democratic government stood doubly condemned. It assumed an equality within the Volk which did not in fact exist; and it supposed that what was in the interests of the Volk could he decided by discussion and voting. In fact the unity of the Volk found its incarnation in the fuehrer, endowed with absolute authority. Below the fuehrer the party (which Hitler often called the "movement," to distinguish it from democratic parties) was drawn from the best elements of the Volk and was in turn its safeguard.

The greatest enemy of Naziism was not, in Hitler's view, liberal democracy which was already on the verge of collapse. It was rather the rival Weltanschauung, Marxism (which for him embraced Social Democracy as well as Communism), with its insistence on internationalism and class conflict. Behind Marxism he saw the greatest enemy of all, the Jew, who was for Hitler the very incarnation of evil, a mythical figure into which he projected all that he feared and hated.

During Hitler's absence in prison, the Nazi party disintegrated through internal dissension. In the task of reconstruction after his release he faced difficulties that had not existed before 1923. Economic stability had been achieved by currency reform and the Dawes plan; the republic had become more respectable. Hitler was forbidden to make speeches, first in Bavaria, then in many other German states (these prohibitions remained in force until 1927–28). Nevertheless the party grew slowly in numbers, and in Feb. 1926 Hitler successfully established his position against Gregor Strasser, who had built up a rival Kazi movement in north Germany.

The slump of 1929 opened a new period of economic and political instability. Hitler made an alliance with the Nationalist Alfred Hugenberg in a campaign against the Young plan. Through it Hitler was able for the first time to reach a nation-wide audience with the help of Hugenberg's Nationalist party organization and the newspapers it controlled. It also enabled him to commend himself as a gifted agitator to the magnates of business and industry who controlled political funds and were anxious to use them to establish a strong right-wing, antiworking-class government. The subsidies he received from the industrialists placed his party on a secure financial footing and enabled him to make effective his emotional appeal to the lower middle class and the unemployed, based on his proclamation of his faith that Germany would awaken from its sufferings to reassert its natural greatness. Like his later intrigues with the conservatives, Hitler's dealings with the Nationalists and the industrialists provide a striking example of his skill in using those who sought to use him.

Mass agitation and unremitting propaganda, set against the failure of the government to achieve any success in internal or external affairs, produced a steadily mounting electoral strength for the Nazis, who became the second biggest party in the country with more than 6,000,000 votes at the 1930 election. Hitler opposed Hindenburg in the presidential election of 1932, capturing 36.7% of the votes on the second ballot (see GERMANY: History).

Placed in a very strong position by his unprecedented mass following, he took part in a series of intrigues ior the support of the aging president, in which the other principal participants were Franz von Papen, Gen. Kurt von Schleicher, Otto Meissner and Oskar Hindenburg (see GERMANY: History). In spite of a decline in the party's votes in Nov. 1932, he held to the chancellorship as the only office he would accept, and this by constitutional not revolutionary methods. Throughout, he showed a unique ability to exploit conditions favourable to success. He created the Hitler myth; he propagated it by every device of mass agitation, and with an actor's ability to be absorbed in the role which he created for himself. Yet all the time he remained a shrewd and calculating politician, aware of the weaknesses of his own position, perceiving more quickly than anyone else how a situation could best be turned to his own advantage. In Jan. 1933, he reaped his reward when Hindcnburg invited him to be chancellor of Germany, and he took office with the support of Papen and Hugcnberg, and with Field Marshal Werner von Blomberg as minister of defense.

Hitler's personal life grew more relaxed and stable with the added comfort that accompanied the success of the party. After his release from prison he went to live on the Obersalzberg, near Berchtesgaden. His income at this time was derived in a haphazard manner from party funds and from writing in nationalist newspapers. When he became chancellor he accepted the material comforts that followed, but remained independent of them. He was indifferent to clothes and food, never smoking or drinking tea or coffee, far less alcohol. He continued, even as fuehrer, to rebel against routine or regular work—a characteristic which he ascribed to his own artistic temperament.

When he went to live at Berchtesgaden his half sister Angela Raubal and her two daughters accompanied him. Hitler became devoted to one of them, Geli, but his possessive jealousy drove her to suicide in Sept. 1931. For weeks Hitler was inconsolable. Later Eva Braun, a shop assistant from Munich, became his mistress. Hitler rarely allowed her to come to Berlin or appear in public with him; and would not consider marriage on the grounds that it would hamper his career. Eva was a warmhearted girl with no intellectual ability. Her great virtue in Hitler's eyes was her unquestioning loyalty and in recognition of this he made her his legal wife at the end of his life.

Dictator: 1933–39.—Once in power, Hitler proceeded to establish an absolute dictatorship. He secured the president's assent for new elections on the grounds that a majority in the *Reichstag* could not after all be obtained. The *Rrichstag* fire, on the night of Feb. 27, 1933, engineered by the Nazis but attributed by them to a Communist ,plot, provided an excuse for a decree overriding all guarantees of freedom, and for an intensified campaign of violence. In these conditions, the Nazis polled 43.9% of the votes. In March the *Reichstag* assembled in the Potsdam garrison church, a theatrical gathering designed by Hitler to show the unity of his own movement with the old conservative Germany, represented by Hindenburg. Two days later an enabling bill, giving full powers to Hitler, was passed in the *Reichstag,* by the combined votes of Nazi, Nationalist and Centre party deputies.

Thus far successful, Hitler had no desire to inaugurate a radical revolution. Conciliation was still necessary if he was to succeed to the presidency and retain the support of the army; nor had he ever intended to disappropriate the leaders of industry, provided they served the interests of the Nazi state. Ernst Roehm was the chief protagonist of the "continuing revolution"; he was also, as head of the SA., greatly distrusted by the army. Hitler tried first to secure Roehm's support for his policies by persuasion and by giving him government office, but failed to win him over. Goring and Heinrich Himmler were eager to remove Roehm hut Hitler hesitated until the last moment. Finally, on June 29, 1934, he reached his decision. Roehm and his lieutenant Edmund Heines were executed without trial, together with Gregor Strasser, Schleicher and a variety oi other victims. The army leaders, satisfied at seeing the SA. broken up, approved Hitler's actions. When Hindenburg died, on Aug. 2, they, together with Papen, assented to the merging of the chancellorship and the presidency—with which went the supreme command of the armed forces of the reich—and officers and men took an oath of allegiance to Hitler personally. Economic recovery and a reduction in unemployment (coincident with world recovery, but for which Hitler took credit) made the regime more acceptable, and a combination of tyranny and success brought the support of 90% of the voters in a plebiscite.

In power, Hitler devoted little attention to the organization and running oi the domestic affairs of the Nazi state. Responsible for the broad lines of policy, as well as for the system of terror which upheld the state, he left detailed administration to his subordinates. Each of these exercised arbitrary power in his own sphere, but by deliberately creating offices and organizations with overlapping authority Hitler effectively prevented any one of these private empires from ever becoming sufficiently strong to challenge his own absolute authority.

Foreign policy claimed his greater interest. His objectives were laid down in *Mein Kampf,* and Hitler worked toward them with consummate skill. He had early admired the pan-Germanism of the Austrian Georg von Schonerer, and the reunion of the German peoples was hjs first ambition. Beyond that, the natural field of expansion lay eastward, in Poland, the Ukraine and the Soviet Union—expansion which would necessarily involve renewal of Germany's historic conflict with the Slav peoples, who would be subordinate in the new order to the Teutonic master race. He regarded Fascist Italy as a natural ally in this crusade against bolshevism, provided their rivalry in central Europe could be overcome, and was ready to abandon the Germans of the Tirol to this end. Britain was a possible ally provided it abandoned its traditional policy of maintaining the balance of power in Europe and limited itself to its interests overseas. France alone in the west was the natural enemy of Germany, and must therefore be subdued to make possible expansion eastward.

Before such expansion was possible it was necessary to remove the restrictions placed on Germany by the treaty of Versailles. Hitler used all the arts of propaganda to allay the suspicions of the other powers. He posed as the champion of Europe against the scourge of bolshevism and insisted that he was a man of peace who wished only to remove the inequalities of the Versailles treaty. Germany withdrew from the disarmament conference and from the League of Nations (Oct. 1933), but Hitler hastened to sign a nonaggression treaty with Poland (Jan. 1934). Every repudiation of the treaty was followed by an offer to negotiate a fresh agreement and insistence on the limited nature of Germany-'s ambitions. Only once did he overreach himself, when the Austrian Nazis, with the connivance of the German embassy, murdered Chancellor Engelbert Dollfuss of Austria, and attempted a coup d'état (July 1934). The attempt failed, and as Mussolini moved troops to the frontier Hitler disclaimed all responsibility, and sacrificed those who had acted with his sanction. In Jan. 1935 a plebiscite in the Saar returned that territory to Germany, and Hitler took the opportunity to renounce any further claims on France. In March of the same year, he announced the introduction of conscription, and although this provoked the united opposition of Britain, France and Italy at the Stresa conference of the League of Nations, his peace propaganda was sufficiently successful to permit the negotiation of a naval treaty (June 1935) with England, involving the abandonment of the Versailles treaty. His greatest stroke came in March 1936, when he used the excuse of a pact between France and the Soviet Union to remilitarize the Rhineland—a decision which he took against the advice of his own general staff. Meanwhile the alliance with Italy, foreseen in *Mein Kampf,* rapidly became a reality, as a result of the sanctions imposed by Britain and France against Italy; in Oct. 1936 the Rome-Berlin axis was established; shortly aiteru-ard came an anti-Comintern pact with Japan, and these two were linked a year later.

By 1937–38 a new stage had been reached. In Nov. 1937 Hitler outlined his plans of iuture conquest (beginning with Austria and Czechoslovakia) to a secret meeting of his military leaders. He no dispensed with the services of those who were not wholehearted in their acceptance of Nazi dynamism—Hjalmar Schacht, who declared Germany's further rearmament a danger to its economy, Blomberg and Gen. Werner Freiherr von Fritsch, representative of the caution of the professional soldiers, and Ronstantin von Neurath, Hindenburg's appointment at the foreign office.

In Feb. 1938 Hitler invited the Austrian chancellor, Kurt von Schuschnigg, to Berchtesgaden and forced him to sign an agreement giving the Austrian Nazis virtually a free hand. When Schuschnigg attempted to repudiate the agreement and announced a plebiscite on the question of an *Anschluss* with Germany, Hitler immediately ordered the occupation of Austria by German troops. The enthusiastic reception which Hitler himself received decided him to settle the future of Austria by outright annexation. He returned in triumph to Vienna, the scene of his youthful humiliations and hardships. No resistance was encountered from Britain and France. Hitler had taken special care to secure the support of Italy, and when this was forthcoming proclaimed his undying gratitude to Mussolini.

Having given assurances that the *Anschluss* would not affect Germany's relations with Czechoslovakia, Hitler proceeded at once with his plans against that country. Konrad Henlein, leader of the German minority in Czechoslovakia, was instructed to agitate ior impossible demands on the part oi the Sudeten Germans, thereby enabling Hitler to justify the annexation of Czechoslovakia. But the willingness of Britain and France to compel the Czech government to cede the Sudeten areas to Germany presented Hitler with the choice between substantial gains by peaceful agreement, and even greater acquisitions by a spectacular war against Czechoslovakia. Mussolini's intervention appears to have decided him, and he accepted the Munich agreement on Sept. 30—only to ieel resentment immediately afterward at being cheated out of an impressive military conquest.

It was to be expected therefore that Hitler would waste no time in provoking an occasion for occupying the whole of Czechoslovakia. This he did by fostering Slovak discontent. On hlarch 16, 1939, from the Hradcany castle in Prague, he proclaimed the dissolution of the state whose existence he, as an Austrian, had always regarded as unnatural. Immediately afterward, the Lithuanian government was forced to cede Memel, on the northern frontier of East Prussia, to Germany.

Hitler was now ready to advance toward the ultimate objective of *Lebensraum* in the east. Confronted by an uncompromising Poland, guaranteed by Britain and France, he strengthened the alliance with Italy (the "pact oi steel," May 1939) and negotiated a nonaggression pact with the Soviet Union signed on Aug. 23—just within the deadline set for an attack on Poland before the winter. He still disclaimed any quarrel with Britain, but to no avail, and the invasion of Poland (Sept. 1) was follow-ed two days later by a British and French declaration of war.

Throughout these years Hitler had pursued unwaveringly the objectives of his ioreign policy as they had been laid down in *Mein Kampf.* He showed astonishing skill in judging the mood of the democracies and exploiting their weaknesses—in spite of the fact that he had scarcely set foot outside Austria and Germany and spoke no foreign language. Up to this point every move had been successful—even his anxiety over British and French entry into the war was dispelled by the rapid success of the war in Poland. The result was to convince him more and more of his own infallibility, and to induce him to push ahead still faster with his plans for conquest.

World War II.—Hitler irom the first had assumed direction of the major strategy of the war. When the success of the campaign in Poland failed to lead to the peace negotiations with Britain for which he had hoped, he ordered the army to prepare for an immediate offensive in the west. Bad weather, however, provided the reluctant generals with the opportunity to postpone the western offensive and this in turn led to two major changes in planning. The first, on the suggestion of Adm. Erich Raeder, commander in chief of the navy, was Hitler's order to occupy Denmark and Norway in April 1940. Hitler took a close personal interest in the operation, and irom this time his intervention in the detail of military operations was to grow steadily greater.

The second was the adoption of Gen. Erich von Manstein's plan for an attack through the Ardennes (opened May 10) instead of through the Low Countries. Against his generals' advice Hitler held back Guderian's tanks south of Dunkirk, so enabling the British to organize the evacuation from Dunkirk. But the campaign as a whole was a brilliant success and Hitler could claim the major credit ior its over-all

planning. On June 10 Mussolini entered the war on the side of Germany, and at the end of June Hitler avenged the treaty of Versailles by signing an armistice with France on the site of the Armistice of 1918.

The next step was the subjugation of Britain by aerial bombardment, followed by invasion. But in the summer of 1940 long-term preparations were begun for the invasion of the Soviet Union, and as the expected surrender of Britain still failed to materialize, the eastern campaign quickly came to dominate Hitler's conception of the grand strategy of the war, to the exclusion of everything else. The Soviet Union had occupied eastern Poland and Bessarabia, and Hitler sought to counter any further moves by forcing the governments of Hungary and Rumania to accept an agreement which he dictated, and by urging the abandonment of Mussolini's plans for the invasion of Greece. Mussolini, however, piqued at being kept in ignorance of Hitler's intentions, invaded Greece; and the lack of success of the Italian armies made it necessary for German forces to come to their aid in the Balkans and north Africa. Hitler's plans were further disrupted by a coup d'état in Yugoslavia in March 1941, overthrowing the government which had made an agreement with Germany. Regarding this as an insult to Germany and himself, Hitler immediately ordered his armies to subdue Yugoslavia. The campaigns in the Mediterranean theatre, although successful, remained subordinate to the eastern offensive, with which Hitler was so preoccupied that he lost the opportunism and flexibility which he had shown in political affairs. Even when Raeder and Erwin Rommel urged Hitler to destroy the whole British middle east position by a final blow at Suez, he would spare no more forces from Operation "Barbarossa."

The attack against the U.S.S.R. was launched on June 22, 1941, with Hitler so confident of success that he refused to provide winter clothing and equipment for his troops: The German army advanced swiftly into the Soviet Union, but failed to destroy its Russian opponent. Hitler became completely overbearing toward his generals. He disagreed with them about the object of the main attack, and he wasted time and strength by failing to concentrate on a single objective, by frequently reversing his own decisions. In Dec. 1941 an unexpected Russian counterattack made it clear that Hitler's hopes of a single campaign would not he realized.

The next day came the Japanese attack on Pearl Harbor. Hitler precipitately declared war on the United States—although the pact with Japan was purely defensive and he had not been informed of the Japanese intentions. Misled by an essentially central European view of world politics he apparently took no account of the force which a mobilized United States could bring to bear in Europe.

Hitler's conduct throughout 1942 was marked by further errors of judgment—he paid insufficient attention to the Mediterranean and the Atlantic at a time when a relatively small additional effort in those theatres might have been decisive. In the Soviet Union his continued unreadiness to concentrate on a single objective probably forfeited the opportunity to capture Stalingrad while it was still lightly defended.

Meanwhile he directed Himmler to prepare the ground for the "new order" in Europe. The concentration camps were expanded, and there were added to them extermination camps such as Auschwitz and Mauthausen, as well as *mobile* extermination squads. The Jews of Germany, Poland and the Soviet Union were most numerous among the victims; in German-occupied Europe between 4,500,000 and 5,500,000 had been killed by the end of the war as the only solution in Hitler's view to the Jewish "problem." (This approximate total is a compromise betw-een the 6,000,000 quoted during the Nuremberg trials and the 4,500,000 later admitted by German sources.) The sufferings of other races were only less when measured in numbers killed. Such barbarism was indiscriminate, even where, as in the Ukraine, Hitler might have encouraged nationalist feeling to his own advantage.

At the end of 1942, defeat at El Alamein and at Stalingrad brought the turning point in the war and Hitler's character and way of life began to change. Hitherto the success which he had imagined had been largely realized, but to preserve the world of fantasy from defeat and failure he isolated himself more and more from reality. Directing operations from his headquarters in the east, he refused to visit bombed cities or to read reports of setbacks; those close to him, especially Martin Bormann, his secretary, took care that only pleasing information reached him; and he became increasingly dependent on his physician, Theodor Morell, and the injections which he supplied. Even so, he had not yet lost the power to react vigorously in the face of misfortune. Following the arrest of Mussolini in July 1943 and the Italian armistice, he not only directed the occupation of all important positions held by the Italian army, but ordered the kidnapping of Mussolini, with the intention that he should head a new Fascist government. On the eastern front, however, the refusal to withdraw led only to greater losses, without any possibility of holding up the Soviet advance. Inevitably, relations with his army commanders grew increasingly strained, the more so with the growing importance given to the SS. divisions, directly responsible to Hitler. Meanwhile the failure of the U-boat campaign and the bombing of Germany made more evident how reduced were the chances of victory.

All these factors made more desperate the few soldiers and civilians who were ready to remove Hitler and negotiate a peace. Several attempts were planned in 1943–44; the most nearly successful was made on July 20, 1944, when Col. Graf Claus von Stauffenberg exploded a bomb at a conference at Hitler's headquarters in East Prussia. But Hitler escaped, with superficial injuries, and with few exceptions those implicated in the plot were executed. The destruction of the army's independence was now made complete, and National Socialist political officers appointed to all military headquarters.

Thereafter Hitler was increasingly ill and fatigued; but he did not relax or lose control over the Nazi party or the army, and he continued to exercise an almost hypnotic power over his close subordinates, none of whom was able to wield any independent authority. In Dec. 1944 he moved his headquarters to the west, to direct an offensive in the Ardennes for uhich the last reserves of manpower were mobilized. When it failed, his hopes for victory became ever more visionary, based on the use of new weapons, or on the breakup of the grand alliance, especially after the death of Roosevelt. Far from trying to save what could be rescued from defeat, he ordered mass material destruction, and condemned his armies to death by refusing to allow surrender.

From Jan. 1945 he never left the chancellery in Berlin, or its bunker, abandoning a plan to lead a final resistance in the south as the Russians closed in on Berlin. In a state of extreme nervous exhaustion, prematurely senile if not insane, he at last accepted the inevitability of defeat, and thereupon prepared to take his own life, leaving to its fate the country over which he had taken absolute command. Before this, two further acts remained In the small hours of April 29 he married Eva Braun, the ceremony being performed by one of Goebbels' staff. Immediately afterward he dictated his political testament, justifying his career and appointing Karl Dönitz as head of the state and Josef Goebbels as chancellor.

On April 30 he said farewell to Goebbels, Martin Bormann and the few others remaining, then retired to his suite and shot himself, while Eva took poison. In accordance with his instructions, their bodies were burned, and no remains were discovered.

Summary.— Hitler's success must be attributed to the susceptibility of postwar Germany to his own unique talents as a political leader. His rise to power was not inevitable, and any change in a complex conjunction of circumstances might have relegated him to the obscurity and failure of his youth; yet there was no one who equaled his ability to exploit and shape events to his own ends. The power which he wielded was unprecedented, both in its scope and in the technical resources at its command; but he made no permanent contribution, moral or material, to mankind. His originality and distinctiveness lay in his methods rather than his ideas and purpose, which were shared in whole or in part by millions of people, in Germany and elsewhere. By the time he was defeated he had broken down the whole structure of the world in which he lived, and inaugurated a new era with even greater potentialities of power and destruction.

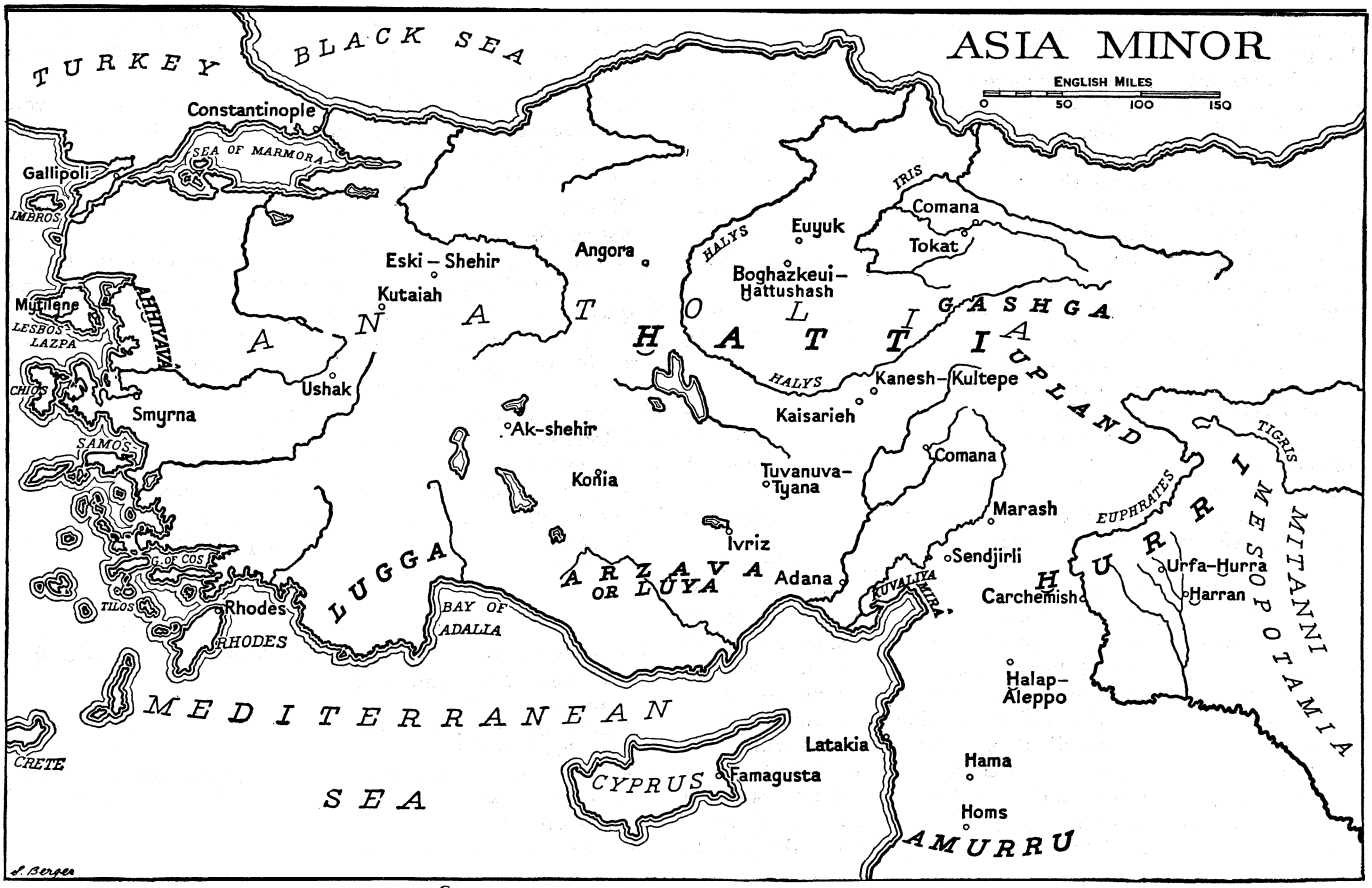
HITTITES, THE. This ancient Oriental people ruled over a great part of Asia Minor and Syria between the years 2000 and 1200 before the birth of Christ. and imposed their own high degree of civilization upon those regions. Rivals of the old Egyptians and Assyro-Babylonians. in comparison with both these nations, the Hittites rank third in importance among the peoples of the ancient east.

Modern research has proved that the ruling people of the Hittite kingdom spoke a language which is related to modern European languages.

The Old Testament, Egyptian and Assyro-Babylonian Knowledge of the Hittites.— The Hittite race, "the sons of Heth" (Hebr. *Hittîm, Benê Hêth*) was known to the writers of the Old Testament. In Gen. x, 15 Heth was a son of Canaan; in Gen. xxiii "the sons of Heth" abode in Hebron, where Abraham traded with them for a grave for his wife Sarah; in Num. xiii, 29, the Hittites occupied the mountains of Canaan; in Gen. xxvi, 34, Esau married the Hittite women, Judith and Basemath. Also Uriah, whose wife David had appropriated (II Sam. xi), is called a Hittite. In I Kings ix, 20, the Hittites, in conjunction with the Amorites, Hivites, etc., were an important element in the population of Canaan. Yet according to the testimony of the Old Testament, Syria was the real home of the Hittites. In Joshua I, 4, the land of the Hittites reached to the Euphrates. In North Palestine, in the time of Solomon, the powerful kings of the Hittites ruled as sovereigns over separate Hittite states, besides



CHIEF HITTITE TOWNS, AND NEIGHBOURING DISTRICTS

the "kings of Arameans" (I Kings x. 29). From there King Solomon obviously brought his Hittite women (I Kings, xi. 1).

In confirmation and amplification of these Old Testament accounts, Egyptian evidence shows that in the time of the 18th to the 20th dynasties, between the years 1500–1190 **B.C.**, a powerful northern kingdom *Kheta* sought perpetually to obtain political influence over Syria and therefore often fought with Egypt. Already the Pharaoh Thutmosis III. (1501–1447), who had conquered Syria as far as the Upper Euphrates, received presents from the prince of Kheta. Under the succezding rulers of the 18th dynasty the Hittites established themselves in Syria. Bitter struggles took place between them and, especially, the Pharaohs of the 19th dynasty, Seti I. (c. 1313–1292) and Ramses II. (*c.* 1292–122 5). About the year 1288 **B.C.** a great battle took place between the two hostile powers near Kadesh on the Orontes; after further combats, about the year 1272 Ramses II. established an alliance with the Hittite king Khattushilish III. and married, about the year 1259, one of his daughters; on this occasion the Hittite king visited Egypt in person. About the year 1190, the Hittite kingdom succumbed to the attacks of the so-called "sea nations."

The Cuneiform inscriptions also know a powerful kingdom and people *Khatti* who gave much trouble to the Babylonians, Assyrians and Egyptians during the II. and I. millenniums B.C. According to a Babylonian chronicle. about the year 1758 B.C. the *Khatti* people overwhelmed Akkad-Babylonia under the rule of King Samsuditana, and made an end of the Khammurabi dynasty. The increasing influence of the Khatti kingdom in Syria about 1400 B.C. is shown by the Amarna inscriptions. After the destruction of the Hittite empire in the 12th century B C. the name Khatti is applied especially, according to the evidence of the inscriptions of the Assyrian kings, after Tiglath Pileser (*cir.* 1110 B.C), to the kingdom of Carchemish on the upper Euphrates, but it also denotes the whole of Syria. Sargon II., it is true, made an end of the Khatti kingdom of Carchemish in 717 B.C., yet the New-Babylonian king, Nebuchadnezer II. (604–562), still used the name Khatti for Syria,

Hittite Monuments and Hieroglyphic **Inscriptions.**—The quoted information pointed to Syria and probably also to the adjoining regions of Asia Minor as the home of the Hittites. When during the 19th century, monuments of unusual style and inscriptions written in an unknown hieroglyphic script, were found in Syria and Commagene, as for example, at Hamah on the Orontes, at Aleppo, at Jerablus on the Euphrates, at Marash and Malatia, further in Cappadocia, as at Boghazkeui and Euyuk, as well as in the Taurus mountains, at Bor, Ivriz and Bulgarmaden, and finally also in western Asia Minor, at Sipylos near hfagnesia, it was very natural to attribute them to the Hittites. The native monuments, together with the Egyptian reliefs representing Hittites, showed the physical characteristics of the Hittite race; in particular, the great curved nose and backward sloping forehead, which proved beysnd any dispute that the Hittites were not Semites or Indo-Europeans. The hieroglyphic writing of the Hittites has nothing to do with the Egyptian hieroglyphic script. It is a pictographic script; but the original meaning of many of the signs is still obscure. In the course of time many signs developed a cursive form. The inscriptions are written *boustrophedon;* after a line written from right to left (or the reverse) there follows one from left to right (or the reverse), so that the figures and heads always face towards the beginning of the line. So far about 200 of the signs of this writing are known. In regard to the age of this writing, the Hittite Archives of Boghazkeui, for example a clay bulls bearing the seal of King Shuppiluliumash (about 1385 B.C), the legend being written both in cuneiform and in hieroglyphics, proves that the latter was used as early as the 14th cent. B.C. Indeed this script may be much older, as is shown by its use in the very old Hittite sanctuary Yasili Kaya, not far from the chief Hittite city Khattushash-Boghazkeui. The invention of this writing may, therefore, be placed in the first half of the second millennium B.C. This script was employed by the Hittites on their rock and stone monuments especially, and upon seals made of stone and metal. It is their monumental writing; for their daily needs and especially for library and archive purposes, as the

archives of Boghazkeui show, they used cuneiform writing and clay tablets.

Much ingenuity has been employed in deciphering the Hittite hieroglyphics. Systems of deciphering were published by F. E. Peiser, A. H. Sayce, P. Jensen, A. Gleye, R. C. Thompson, A. E. Cowley and C. Frank, yet none of them was accepted by the scientific world. It seems that from all these systems only the interpretation of very few signs will prove true. The task is, in fact, very difficult, since bilingual inscriptions are still too few; those that have been discovered so far give but little help in decipherment owing to their brevity, obscurity or damaged condition. They are these: the silver seal of a king Tarkutimme-Tarkondemos of Metan (?), the seal cylinder of one Indilimma, which is, possibly, not bilingual, and the seal impressions of the Kings Shuppiluliumash and Arnuvantash IV.

The Hittite Royal Archives of **Boghazkeui.**—The discoveries of the 19th century failed to solve the very important problem of the affinities of the language of the Hittite people. A firm position was first reached, when in the course of his epoch-making excavations, 145 km. east of Angora, Hugo Winckler, the Berlin Assyriologist, found in the ruins of Boghazkeui a great mass of Hittite clay tablets inscribed with cuneiform characters. Winckler dug there in 1906–07 and in 1911–12, and found about 10,000 broken and whole cuneiform tablets which belonged to the archives of the kings of Khatti, and proved that the capital of the Hittite empire had been at Boghazkeui. Only a relatively small number of the clay tablets discovered in Boghazkeui are written in Babylonian cuneiform script and in Babylonian language. These are state treaties which the Khatti kingdom concluded with other ancient oriental states, and diplomatic letters of the Hittite kings. Babylonian, as the Tell-el-Amarna letters have shown, was the language of eastern diplomats, the ancient oriental French, in the second millennium B.C. The greatest number of the Boghazkeui clay tablets are written, it is true, in Babylonian cuneiform writing, but in the Hittite language. A closer examination of these Hittite documents soon showed the identity of the Hittite language with that of Arzawa (probably Cilicia Tracheia, Isauria and Southeast Lycaonia), which was already known through two letters from the cuneiform collection of Tell-el-Amarna in Egypt. (For the contents of the Hittite archives of Boghazkeui, now for the most part in the museum at Constantinople, some being in Berlin, *see* below)

The Decipherment of Hittite.— After the premature death of Hugo Winckler in 1913, the German Oriental Society, under whose aegis the excavations at Roghazkeui had been carried out, entrusted the publication of the Hittite archives to a group of Assyriologists, one of whom. Professor Bedrich Hrozný, of the Czech University at Prague (but then at the University of Vienna), succeeded in solving the riddle of the Hittite language, in writing the first Hittite grammar and establishing the Indo-European character of the structure of this language. About the same time E. F. Weidner declared the Hittite to be undoubtedly a Caucasian language. Hrozný's decipherment was founded upon the unilingual clay tablets of Boghazkeui: these inscriptions had to be interpreted only on their own content. For this task sentences containing proper names afforded valuable help, as well as those in which Sumero-Babylonian ideograms (word signs) occurred. The Sumrro-Babylonian cuneiform writing *(see* CUNEIFORM) in which the Boghazkeui texts are written was indeed originally a picture-writing, from which later on a syllabic script was developed; but even in the later, more phonetic stage the cuneiform signs were used sometimes as word-signs (for example, the cuneiform sign  , originally the picture of a fish  , as the sign for the word "fish"). Even the Hittites employed these so-called ideograms'in their cuneiform script so that these signs in a Hittite text were intelligible even without knowledge of the Hittite language. Moreover the Hittites also occasionally employed phonetically written Babylonian words as ideograms. Thus, in the middle of an unintelligible Hittite text the Babylonian word *a-bu*, "father" is found: this Babylonian word was naturally read by the Hittites (as we now know) *attash*, but, by its Babylonian form, known to us, it helped us eventually, even without knowledge of the Hittite reading, to penetrate at least in some degree into the sense of the Hittite sentence. A help was derived also from the method of combination which, progressing from the known to the unknown, by means of analogy, parallelism, resemblance of words, etc., endeavours to elucidate the unknown words. In this way, later on, Hittite sentences could be treated which were written only phonetically in Hittite.

Hittite — an Indo-European **Language.**—Hrozný, in the course of his researches, succeeded in identifying most forms of the Hittite language. On the basis of the structure of the language thus established he built his thesis that Hittite is an Indo-European language. He got this idea at first when he established that Hittite has a present participle, which in Nom. Sing. Masc. ends in *-anza*, in other cases in the Masc. in *-ant-* and *-and-*, thus resembling the Indo-European participle in *-nt-* (Lat. *ferens, ferentis*, Gr. *φέρων, φέροντος*). The idea of a relationship between Hittite and Indo-European languages soon took a stronger hold when, having established a complete paradigm of the Hittite participle in *-ant-*, as of other Hittite nouns, he discovered that almost all the case-endings have more or less precise counterparts in Indo-European languages. Thus the Hittite participle *khûmanza* "all" is declined:

	Singular:	
	Masc.-Fem.	Neuter
Nom.	*khûmanza* (compare Lat. *ferens*)	*khdman* (compare *φέρον*)
Gen.	*khûmandash* (compare *ferentis*, *φέροντος*)	
Dat.-Loc.	*khûmanti, -î* (compare *ferenti*, *φέροντι*)	
Xccus.	*khûmandan* (compare *ferentem*, *χρόνον*)	*khûman* (compare *φέρον*)
Abl.	*khûmandaz(a)*[1]	
Instr.	*khûmantet* (compare osk. Abl. *praesentid?*)[1]	
	Plural:	
Nom.	*khûmanteš* (compare *ferentes* *φέροντες*)	*khûmanda* (compare *φέροντα*)
Gen.	*khûmandâsh*[2]	
Dat.-Loc.	*khûmandâsh*[2]	
Accus.	*khdmandush* (compare *lupos*, *λύκους*)	*khdmanda* (compare *φέροντα*)

The Hittite word for "Father" *attash* for example is declined in the same way:

Sing.: Nom. *attash*, Gen. *attash*, Dat.-Loc. *atti*, Acc. *attan*, Abl. *atfaza*, Instr. not yet found would be *attit*;
Plural: Nom. *attêsh*, Gen. and Dat.-Loc. *attâsh*, Accus. *attush*.

Very important was the discovery of a declension which is especially characteristic of Indo-European languages. It is the declension of the Hittite word *vâdar* "water" whose meaning Hrozný succeeded in establishing with the help of the sentence: *nu NINDA-an ezzatteni vâdar-ma ekutteni*. In this sentence the meaning of the Sumero-Babylonian ideogram *NINDA* "bread" was all that was known. The following Hittite ending *-an* has been established as the termination of the Acc. Sing. from examples in other places. In one sentence speaking of bread also the word for "to eat" might possibly (though not necessarily) be expected, and as this meaning fitted for the Hittite root *ezza-* everywhere, Hrozný identified the Hittite *ezza-* and also *ad-* (*adanzi* "they eat") with the Latin *edo*, old High German *ezzan* "to eat," etc. Other passages showed him that *-teni* is the ending of the second Pers.

[1]The ablative (not the locative as was originally assumed by Hrozný) in *-az (a)* is perhaps of the same origin as the Hittite instrum. in *-et, -it*. Compare *kallarit uddanaz* (*Keilschriftt. aus Bogh.* IV. 7, 60) "from the disastrous thing," *ishar-hhuvantazshet* "from its belly" (Code Hittite par. 90), *KAP-laz-tet* "from thy left side" (KBo. 2482 II. 6) etc. Both the Hittite endings *-az(a)* and *-et, -it* are derived from the Indo-European ablative ending *-ōd, -ēd;* before the particle *-a* (from *-e*) the *d* is changed into *z* in Hittite. Thus two forms arise, *-az(a)* and *-et, -it*, which differ also in use: the first, as a rule, is used as the ending of the ablative, the second, chiefly as that of the instrumental.

[2]The origin of the ending *-âsh* is still obscure.

Pl. *Pres.*: ***ezzateni*** *means consequently: "you eat, you will eat." As the sentence:* ***vâdarma*** *ekutteni was clearly in parallelism with the* first *one (NINDA-an ezzatteni), it seemed possible to see in* ***vâdar,*** *which is parallel with "bread," also a simple victual. A* meaning *as "water" was here very convenient and also other passages confirmed this interpretation. A surprising comparison with the English water, old Saxon watar "water," etc., offered itself and proved true. Then ekutteni that is parallel to ezzatteni "you will eat" must signify: "you will drink"; and for the Hittite root eku-, aku- "to drink" and the cognate Hittite word* ***akuvanna*** *"drinking, drink" offered itself as a comparison with the Latin aqua "water." The Hittite sentence above thus runs when translated: "Now you will cat bread, further you will drink water."*

Astonishing as was the discovery of a word for "water" similar to the English one in an ancient oriental language of the middle of the second millennium B.C. *the discovery soon after of the declension of this Hittite word was still more so: Sing. Nom.* ***vâdar,*** *Gen.* ***vedenash,*** Dat.-Loc. ***vedeni,*** *Accus. vddar,* Abl. ***vedenaz,*** *Instr.* ***vedenit;*** *Plural* Nom. *and Accus.* ***vidâr.*** *The Gen. Sing. of* ***vâdar*** *is not, as we might expect,* ***vâdarash,*** *but* ***vedenash,*** *with an alteration in the suffix (n for the r, used in the Nominative). The same very remarkable declension shows however also the quoted Indo-European word for "water" (Old Saxon* ***watar,*** *etc.)*: Gr. Nom. ὕδωρ, Gen. ὕδατος *from* ὑδν-τος. *(Cf. Lat. femur, Gen. feminis.)*

The Hittite pronouns, as established by Prof. Hrozný, *also bear marked resemblance to Indo-European forms as shown in the following list in which the Hittite forms are set in italics at the beginning of each line or paragraph:*

uga, ug "I", compare Lat. ego.
ammug, ammuga "to me, me," compare Gr. ἐμέγε.
ammêl "of me, my," which is similarly related, is connected through the Genitive ending -êl with the languages of Asia Minor and with Etruscan.
zig, ziga "thou," compare Gr. σύγε *or better perhaps according to* Marstrander, *the Accus.* σέγε.
tug, tuga "to thee, thee," compare Goth. thuk.
tuêl "of thee, thy" with the Genitive ending -êl, is also connected.
vêsh "we," compare *Goth. weis.*
anzâsh "us," compare old High German uns.
anzel "our," compare Goth. unsara.
shumêsh, shumâsh "you," compare Gr. ὑμεῖς.
-mu "to me, me," -ta, -du "to thee, thee," compare Gr. μοι, μέ, τοι, *etc.*
-mish "my," -tish "thy," compare Lat. meus, tuus.
enish, annish (compare uni) "that," compare old High German ener *"that," old Slav.* onŭ.
kâsh "this," compare Oscan *e-kas "these"* (fem.)
shash "this," compare Sanskrit sá.
kuish "who, which," *cf. Lat. quis.*
kuit neuter "what, which," *cf. Lat. quid.*
kuvabi "where, whither," cf. Lat. ubi, ne-cubi.
kuish kuish "whoever," neuter kuit kuit, cf. Lat. quisquis, quidquid.
kuishki, neuter kuitki, "somebody, something," cf. Lat. quisque, quidque.
kuvatka, "something, perhaps," cf. Lat. quodque.
kuvabikki "somewhere," *cf. Lat. ubique, etc.*

On the other hand, the Hittite pronoun ***apâsh*** *"that" is connected with the languages of Asia Minor (see* ANATOLIAN LANGUAGES); *cf.* Lycian *ebe "this," Lydian bis "he."*

Hrozný *likewise proved that also the Hittite verb is essentially Indo-European. The present tense of the Hittite verb jami "I make" runs:*

	Hittite	*Sanskrit*	*Greek*
Sing. 1.	*jami "I make"*	*yâmi "I go"*	τίθημι
2.	*jashi*	*yâsi*	τίθης
3.	*jazi*	*yâti*	τίθησι, τίθητι (Dor.)
Plur. 1.	*javeni (javani, jauni)*	*yâmah, cf.* 1. pers. dual *yâvah*	τίθεμεν
2.	*jatteni (jattani)*	*yâtha, yâthana*	τίθετε
3.	*janzi*	*yânti*	τιθέασι, τίθεντι (Dor)

(The forms enclosed in brackets are found, but from another verb — not yet from jami.)

The Hittite verb ***dâkhkhe*** *"I take" for example presents a somewhat different paradigm for the present tense:*

Sing. 1. ***ddkhkhe, dâkhkhi*** *"I take" (cornp.* Lat. *fero? The Hittite kh or h is, perhaps, as elsewhere frequently, secondary).*
2. ***datti*** *(cornp.* 2. *Pers. pret.* ***dâtta*****).**
3. ***dâi*** *(comp.* οἶδε*?).*
Plur. 1. *(dâveni), dâvvani.*
2. *datteni, (dattani).*
3. ***dânzi.***

The Imperative Pres. Active runs:

	Hittite
Sing. 1.	***jallu*** (KUB *xiv. 27,* 19); *also (jallut,* ***jallit*****)?** *Comp. eshlut,* ***eshlit*** *I will do.*

Comp. for ***jal-*** *old ecclesiastical Slav. Part. Pret. Act.* 11. ***neslŭ,*** *umbr. Fut. ex.* ***apelust,*** *Armenian Part. Pres.* ***berol?*** ***-u*** *is an Imperative ending, which is found also in* Indo-Iranian.

The ***-t*** *in eshlut, eshlit is perhaps of medial origin; see below especially the Preterite of the Hittite* Medio-passive.

		Sanskrit
2.	***ja*** *"make"*	*ydhi "go"*
3.	***jaddu***	*yâtu*
Plur. 2.	***jatten***	*yâta, yâtana*
3.	***jandu***	*yântu.*

The Preterite Active runs:

Sing. 1.	***janun*** *"I made" (cornp.* ἔφερον*)*	***ddkhkhun*** *"I took" (Hittite kh is perhaps secondary);* ***tabarkha*** *"I reigned" (cornp.* οἶδα*?).*
2.	***jat*** (comp. ***dâtta*** *2. Pers. sing. and* ***jat*** *3. p. sing.)*	***ddtta*** (comp. οἶσθα), ***dâsh*** *(from* ***dâsh*** *+ sh?).*
3.	***jat*** (comp. *Sanskrit* ***ádhāt*****)**	***dâtta*** *(? Comp.* ***jat*** *3. pers. and* ***ddtta*** *2. Pers. sing. ?)* ***dâsh*** *(from* ***dâsh*** *+ t?).*
Plur. 1.	*javen*	***dâven***
2.	*jatten*	*(datten)*
3.	***jêr*** (comp. Lat. *fuēre*).	***dâir;*** *also* ***dalugnula*** *"they have made long" (cornp. for ex. Czech nesli?).*

Very important is the proof of the existence of a Hittite Medio-passive *form which frequently has an* ***-r*** *ending as exhibiting resemblance to the Latin verbal forms such as amatur, amantur and similar forms in Italo-Celtic and Tocharish. Besides -r, a medial -ti, -t is found as ending in the Hittite Medio-passive in other forms, especially in the Preterite; the forms with -ti are in the old Hittite more frequent than those with -t.*

The present of the Hittite medial verb jakkkhari, "I go" runs:

Sing. 1. *jakhkhari (cornp. Lat. feror? Hittite kh is secondary?), (jakhakhari) "I go." See also* Kuryłowicz *in Symbola grammatica in honor. Rozwadowski,* p. 95–104.
2. *(jatta old Hittite), jattati (cornp.* οἶσθα *and 3. Pers. sing. jatta?) Also eštari "thou* sittest *down," v.* Götze, *Madduwattaš, p. 104, n. 12.*
3. *jatta (cornp.* φέρεται, ἐφέρετο*), jattari, jattâri (cornp. Lat. amatur), also esha, eshari, "he sits down" (cornp. Umbrian ferar).*

Plur. 1. *(javashta, javashtat, javashtati) (cornp. Act. javeni, [javani,] the pronoun vêsh "we" and* 1. *Pers. dual Sansk. svás?)*
2. *jadduma (jatumari old Hittite) (cornp. Sanskrit abharadhvam, old Avestic mazdazdûm).*
3. *janta, (cornp.* φέρονται, ἐφέροντο*), jantari (cornp.* Lat. *amantur).*

The medio-passive imperative of Hittite, whose endings for the most part show the imperative ending -u, already known to US, *runs:*

Sing. 1. *(jakhkharu, jakhakharu) "I will go."*
2. *jakhkhut, (jakhkhuti) (stem with a secondary kh + -u of the Imperative + -t, -ti of the medium?)*
3. *jattaru, also esharu.*

Plur. 2. *jaddumat, (jaddumati)* (comp. 2. *Pers. Plur. Pres. and Preterite.)*
3. *jantaru.*

The Preterite of the Hittite medio-passive runs:

Sing. 1. *(jakhati), jakhkhat, jakhkhakhat "I went" (cornp.* 1. *pers. Sing. present).*
2. *(jattati, jattat) (cornp.* 2nd *pers. sing. Pres. and* 3rd *sing. Pret.), also* ***kîshat*** *(cornp.* ***kîshat,*** *eshat 3rd Sing.?) "thou becamest," besides* ***kîshtat.***

3. *(jatta?), (jattati), jattat* (comp. 3. Sing. pres.), also *eshati, eshat* (= 3rd Sing. pres. *esha*+medial *-ti, -t?*), "he sat down," besides *eshtat.*

Plur. 1. *(javashtati),* (comp. 1. Plur. Pres.)
2. *(jadumat), kîshdumat,* "you became" (comp. 2. Plur. Pres.)
3. *(jantati), jantat* (comp. 3. Plur. Pres.).

(Both Friedrich and Götze have been successful in the interpretation of some medio-passive forms of Hittite. However the paradigms cited above are given on the basis of independent researches of Hroznji with the only exception of the forms *javashta* and *javashtat[i]*, whose identification must be referred to Friedrich. Hrozný found also the form of the 1. Pers. sing. Imp. Act. independently of Friedrich.) Among others, Hittite had also verb stems in *-shk-*, as for example *dashkishi,* "thou takest" (to the simple stem *dâ-* "to take"), as also verb stems in *-nu,* as for example *arnumi* "I send for," to the simple stem *ar-* "come"; comp. Lat *posco,* Greek ὄρνυμι, etc.

That all this correspondence of Hittite with Indo-European languages shows that in its construction Hittite is an Indo-European tongue, is the substance of Hrozný's decipherment of the Hittite language: of his preliminary report Die *Lösung des hethitischen Problems*—"The solution of the Hittite Problem" in the Transactions of the German Oriental Society (*Mitteilungen der deutschen* Orientgesellschaft), No. 56 (1915) and especially of his Hittite grammar Die *Sprache* der Hethiter, *ihr Bau und ihre Zugehörigkeit zum indogermanischen Sprachstamm*—"The Language of the Hittites, its structure and its membership of the Indo-Germanic stock" (Leipzig, 1916–17). Within the Indo-European group of languages the Hittite, which treats the gutturals like the West Indo-European languages, the so-called Kentum group (see INDO-EUROPEANS: Language *Classification*), appears to be related chiefly in respect of its medio-passive endings, such as *-tari,* with the Italo-Celtic languages and Tocharish. (In 1902 Knudtzon published the view that the Arzava language which, as we now know, is identical with Hittite. is an Indo-European language. But his opinion met with such severe and universal opposition from the Indo-European philologists that he withdrew it.)

Foreign Influences. — In the Hittite language, the remains of which date from the second millennium B.C., and which therefore is one of the oldest Indo-European languages, there can be observed a strange extensive simplification and attrition of the language, in spite of the survival of certain ancient features. Further at the present time only a small proportion of the Hittite vocabulary can be traced to Indo-European roots. This, it is true, is perhaps in some extent due to the fact that the cuneiform script invented by the Sumerians is poorly adapted for rendering an Indo-European language. For this reason it is very difficult to set up a complete system of Hittite phonology. In Hittite words such as *khameshkhanza* "spring," antukhshash, *antuvakhkhash* "man." *idâlush* "evil," *karmalashai* "remains crippled," etc., are very numerous, for which a clearly defined Indo-European etymology is—at least at the present time—wanting. All these strange facts are best explained by the supposition that Hittite was largely influenced by other, non-Indo-European, languages. We find in Hittite words, borrowed from Assyro-Babylonian as, for example, the verb *khabalashaizi* "he smashes," which is borrowed from the Assyro-Babylonian verb khabrilu "to destroy." The Hittite word for house *pir* has its origin perhaps in the old Egyptian word per "house," which is found also in the word Pharaoh, properly "great house, palace." For the far greatest number of such non-Indo-European words Hittite is however most probably indebted to the indigenous languages of Asia Minor, with which it was in close association for about 1,000 years. It is even possible that Hittite derives a not unimportant part of its foreign words from non-Indo-European tribes with whom the nation was in contact when it occupied its earliest Indo-European home. As the Hittites belong to the oldest Indo-European peoples, those uho first left their earliest Indo-European home in the north, it must be supposed that they belonged to the borderland tribes of the earliest Indo-European home and, therefore, had already there come into contact with foreign peoples. Later, probably in the second half of the third millennium B.C., when the Hittites, as a conquering apparently not very numerous people, forced their way over the Caucasus, or (less probably) across the Bosporus, into Asia Minor, and overthrew the native inhabitants, also, the languages of the latter exercised considerable influence on the language of the Indo-European conquerors. At the Same time the Hittites came into contact with the Assyro-Babylonian colonies in Asia Minor, from whom they took over cuneiform writing, many religious and cultural goods, and, naturally, many words of their language.

Hrozný's Decipherment and the **Experts.**—Relying chiefly on these foreign influences in Hittite, the philological experts (*e.g.,* Bartholomae, Bork) in the beginning opposed and refused to accept both Hroznji's decipherment and his theory of the Indo-European character of Hittite. They even sometimes doubted the accuracy of his readings which were held to be tendencious. Hrozný himself provided a measure of support to these unfavourable criticisms since, while working out the Indo-European affinity of this language, he sometimes overshot the mark in his first public announcement. Scepticism as to Hrozný's decipherment was carried very far especially in England. But further investigations of Hittite material which achieved notable success, especially in Germany, demonstrated the futility of this criticism and thus obtained a complete victory for Hroznji's position. The first to maintain Hroznji's theory were the Assyriologist Holma (1916), the Indo-Germanist, Marstrander (1919) and the Assyriologist, Forrer (1919). Also the Indo-Germanist, F. Sommer, who learned cuneiform writing on account of Hittite, and thus convinced himself of the exactness of Hroznji's readings, "after long doubt" declared (1920) Hittite "to be by its flexional structure an Indo-Germanic language," and in 1921 the lndo-Germanists, Herbig and Debrunner joined him. The Indo-Germanic (Indo-European) theory won a very warm adherent in the Hittitologist J. Friedrich of Leipzig, an expert in Assyriology and Indo-Germanic learning. Also the assent of both the eminent Indo-Germanists, P. Kretschmer and H. Pedersen (1925–26) to the theory of the Indo-European character of Hittite is very important. Thus in 1924 Friedrich was able to assert that almost all serious students adhere to the theory that Hittite is a newly discovered Indo-Germanic language (Ebert, *Reallexikon* der *Vorgeschichte, s.v.* "Altkleinasiatische Sprachen").

OTHER HITTITE LANGUAGES

Khattish.—Not only the mixed character of the Hittite language, but also the physical characters of the "Hittite" race, its hyperbrachycephalous skull, the large hooked nose and sloping forehead, suggested the hypothesis that here an Indo-European nation is mingled with a non-Indo-European race. At the turn of the year 1919–20 this conjecture was confirmed by the independent and surprising discovery of Hrozný and Forrer that in the State archives of the Hittite kings had been preserved remains of one language which is totally different from the Indo-European Hittite and which these documents call khattili, that is, khattish. According to a collection of instructions an employe shall come out from the Palace and call "khattish" the word trikhaja, whereby the word *tâkhaja* is said to be the "khattish" word for shaver. Also according to another text the doorkeeper calls the employes of the Palace by their "khattish" designations, and this same text gives also the Indo-European-Hittite versions of these titles. Sometimes the rituals composed in the Indo-European Hittite comprise litanies, prayers, exorcisms, etc , "in the Khattish language," "in the language of the town Khatti" (khattili); songs also were very frequently sung by the singers in the Khattish language during religious services. Khattish appears to have played an important rôle, especially in the religion of the Khatti land. The Khattish litanies were left sometimes without translation into the Indo-European-Hittite language, but they sometimes appear there also translated into Indo-European Hittite; in the latter case we have to do with true Khattish-Hittite bilingual texts. The population of the Khatti country therefore. in regard to physical and linguistic characteristics, was mixed and not pure, as was also the case in ancient Babylonia with its Sumerian and Baby-

lonian peoples, and Sumerian used as the ecclesiastical language. We must assume that when the Indo-European Hittites invaded Asia Minor they found there an older population which they subdued, but were in return strongly influenced by them, both in blood and language. The long-nosed type already mentioned, and called "Hittite," also "Armenoid," especially described by the anthropologist von Luschan—so far as Eastern Asia Minor is concerned—goes indeed back to these original inhabitants of Eastern Asia Minor called "khattish" by the Boghazkeui texts. The same type is found also in Syro-Palestine, Mesopotamia, Armenia and Persia. In consequence of mixtures of peoples this large nosed race now speaks (as in antiquity) widely different languages, Indo-European languages, such as Armenian and Persian, and Semitic Hebrew (in antiquity the Semitic Assyrian also). (The so-called "Jewish" type belongs also to this ancient race.) According to the Hittite Boghazkeui texts, to the Khattish race element in the Hittite empire belonged especially, though not exclusively, the lower class of the towns, the minor officials and the craftsmen in temple and palace, a great part of the priesthood and probably also a part of the country people.

The Khattish (by Forrer called proto-khattish) language differs fundamentally from all others of the Khatti kingdom in its construction. It employs almost exclusively prefixes in its inflections and not suffixes; for example, the word *binu,* child, forms its plural *lê-binu.* Knowledge of this language with its astonishing abundance of curious prefixes, which is known to us only through texts of slight extent, is still in its infancy. It is as yet uncertain whether we should regard it, with Forrer, as related to the north east Caucasian tongues, which also make use of prefixes. (Bleichsteiner *[Ber. d. Forsch.-Inst. f. Osten u. Orient, 3,* p. 102 and foll.] believes, on the contrary, that some analogies between Khattish and West Caucasian languages can be established. This also is uncertain.)

Contact between Indo-European Hittite and Khattish can also be established in the words borrowed from the latter tongue. As characteristic of Khattish we may mention the Khatti words *kâtte* "king," *nimkhutun* probably "woman" (Bo. 2039), *vindukkaram* "cup-bearer," in which the Minor Asiatic word *vin* "wine," occurs, *shakhtarîl* (with the suffix *1)* "exorcist," *khantipshuvâ* "cook," and deal with the following Khattish fragment: *imâkhashâil ugga varvh shugga varvashkhap ziptipâil kâtti kurkuvenna bîdush kâbarvun vashkhavûn liggarân varûshemu kurkubenna,* etc.

It proves therefore that the Hittites themselves designated as the speech of the capital city, and probably also that of the country Khatti—K h a t t i s h—the non-Indo-European language just described, that of the original inhabitants of their country. This language should therefore be called "Hittite," because the name "Hittite" goes back to the name Khatti through the Old Testament Heth. So far a name for the Indo-European Hittite, for the official language of the Hittite state, has not been discovered in the Boghazkeui texts; once only is the Hittite state language called *nâshili* which, however, according to Hrozný's interpretation, means no more than "our (language)"—comp. Lat. *nos* "us." In the Hittite religious services, according to the Hittite ritual texts, sometimes Khattish, sometimes Khurrish *(see* below), sometimes Lûish *(see* below) singers took part, sometimes also singers from the city *Kanesh, Kanish,* in Asia Minor. Because these last singers probably used the Indo-European state language, Forrer would call this language the "Kanish language." But nothing else supports the supposition that the Indo-European Hittites called themselves "Kaneshites"; further so far, the expression *Kaneshili*="in Kaneshite (language)" never occurs. We must therefore continue the make-shift of designating the non-Indo-European speech as "Khattish" and the Indo-European, as hitherto, as "Hittite."

Lûish.—Another very important language of the Khatti kingdom is LQish which Hrozný has also shown to be essentially Indo-European. Forrer, who falsely calls this language "Lûvish," regarded it at first as a Finno-ugrian language, but adopted later Hrozný's view that it, too, must be considered as Indo-European. Of this opinion are also, for example, Friedrich, Kretschmer, Ungnad and others. Lûish is closely related to Hittite as is demonstrated by the following passage, written in LQish and Hittite:

Hittite: *Marduk .Innaravantash...eshkhanuvanta kuêsh veshshanta Lûlakhijashshan*
Lûish: *Shantash...Annarummenzi...ashkhanuvanta kuinzi vashantari Lûlakhinzashtar*
English: *Shantash* (and) the *Innaravantash*-deities who put on mantles *and* the *Ldlakhi-deities*
Hittite: *khuprush kuêsh ishkhijantish*
Liiish: *khupparaza kuinzi khishkhijanti*
English: who have tied on their pilgrim bottles(?).

Sentences such as *kuinzi vashantari* (medio-passive; comp. *amantur)*=Hitt. *kuêsh veshshanta* leave no doubt as to the Indo-European character of LQish and its relationship to Hittite. Certainly in this example (and still more perhaps in others) LQish appears to have been already more thoroughly transformed through the autochthonous languages of Asia Minor than Hittite. Unfortunately, LQish passages in the Boghazkeui texts occur but so seldom that a thorough investigation of this language is beset with difficulties.

The name LQish (Hittite *Lûili*) is derived from that of the country *Lhya,* which was also called *Arzava* and which may be possibly sought in West Cilicia, Isauria and South Lycaonia. Besides for Lûya itself the LQish language is also attested for the capital Hittite city *Khatti* or *Kattushash* and for the State of Kizvatna, commonly identified with Pontus on the Black sea. Gotze and Smith look for it on the Gulf of Issos, though with meagre justification. Thus, in the second millennium B.C., the Lûites were dispersed, though probably unequally, throughout the whole of Eastern Asia Minor, but because of their name, we must certainly seek the centre of their distribution in Lûya-Arzava, therefore southerly from the Khatti country. They are the Indo-Europeans who made the furthest advance into the South of Asia Minor in the second millennium B.C. They must—as the earliest Indo-European wave—have reached Asia Minor earlier than the Indo-European Hittites (about 3000 B.C.?). The language of this vanguard of the later Hittites was destroyed to a greater degree by the influence of the autochthonous tongues of Asia Minor than was the case with that of the true Hittites. On the contrary these Indo-European languages have also influenced the autochthonous tongues of Asia Minor, as is shown by the Indo-European elements in Lycian, Lydian, Etruscan, etc. LQish appears to have been spoken in the Khatti kingdom—so far indeed as they did not use Khattish—by the peasants; their language was accounted barbaric by the Hittites. (It is also interesting that the employees, priests and workmen of the royal palace in Khatti-Khattushash were Khattish, its fire-men however LQish.)

Khurrish.—Besides the Hittite, Khattish and LQish, still another language has been revealed by the inscriptions at Boghazkeui—Khurrish (Hittite *khurlili),* which is thus named after a people, empire and, apparently, also a city *Khurri.* The country *Khurri* (which properly means "hollows, caverns"), must be looked for in North Mesopotamia and the bordering Armenian mountains. The name both of this country and its people was formerly read as Kharri which, graphically, was also possible. The Mitanni country, the later Mygdonia on the rivers Djaghdjagh and Khabur in North Mesopotamia, formed one part of the Khurri country. Because the Aryan deities Mitra, Varuna, Indra and Nâsatya are named in the political treaties of Mitanni, Winckler associated the name Kharri with that of the Aryans. However, Hrozný has shown that the character *khar, khur* in the name *Khar-ri* can only be read *khur,* and this name itself therefore only *Khur-ri;* this is proved by the place-name *Bàd-Khu-u-ur-lu-ush-sha* (in the inscription Bo. 434), that is "The fortress of the *Khurri* people," where only the reading with *u* is possible. (Compare also the proper name *Ḫu-u-ur-lu-u* [*i.e.,* "the Khurrite"] in the inscription *Transact. of the Amer. Phil. Assoc. 58,* p. 24, 2. Hrozný regards the North Mesopotamian town Urfa, Gr. Orrhoe, Edessa, as the centre of the empire of *Khurri.* The name of this town and country in Aramaic is *Urhôi,* אדהי, in Arabic *ar-Ruhd'u;* compare also the Arabes Orrhoei or Orroei of Pliny [n.h. V. 85, VI. 25, 117, 129]. In the letter of Tushratta

composed in Mittanish the Khurri country is called Khurvûkhe or Khurrûkhe, *i.e.*, the Khurrish. To a Hurriihe, which may have been spoken with a weak *h*, can easily be traced *Urhôi, Orrhob* [country *Orrhoëne*, later changed into *Osroëne*]; comp. *Khabur*, Gr. *Khaboras* and also *Aborras*. In Assyrian Urfa seems to be called *Khurra* [in an inscription of Adadnarâri I.]. As the name probably means "cavern[s]," it is perhaps possible to suppose that *Khurra-Urfa* received this name on account of the numerous caverns in the Nimrûd Dâgh of the surrounding country.)

As Hrozný has shown, the Khurrish language is not related to Aryan tongues, but to the entirely non-Aryan and non-Indo-European speech of Mitanni, which is represented by a long letter of the king Tushratta of Mitanni from Tell el-Amarna. The two languages are probably distinguished only by very slight dialectical differences. When, in Khurri-Mitanni the nom. sing. ends in *-sh* (as well as in *-l*), and the accus. in *-n*, the influence of the Aryan speech of the *Khurri-Mitanni* country *(see* below), can be perceived in it and, in some degree perhaps also that of Hittite. The genitive endings *-ve* and *-khe*, and the plural ending *-na* are, on the contrary, native to the language. When a genitive is dependent on a substantive, it receives also the ending of that substantive: *ilâni-na Shamûkhakhi-na*, "the gods of the city *Shamûkha*." This phenomenon occurs also in some Caucasian languages, especially in Old Georgian and Cakhurish (Bork). But no definite conclusion can be based as yet upon this isolated phenomenon. Wholly non-Indo-European also is the Khurrish-Mitannish verb which Messerschmidt, Bork. Forrer and Ungnad have studied carefully. In any case Khurrish and Khattish are not related. The following are chosen as examples of Khurrish-Mitannish words: *shena*, brother; *ashte*, wife; *tivi*, word; *katiu*, I will proclaim (Cngnad). The following specimen of the language may be quoted: *Teshubbutte shîlallukhi shâla abkijâve annûn mirzi annûnmân irâne annûn gaggari*, etc.

Khurrish litanies and prayers occur in the Hittite rituals but, unfortunately. without Hittite translations, and Khurrish singers (singers of the city Khurri) also sang in the religious services. This is the case especially in the eastern Khatti provinces, in Kizvatna and in the city Shamûkha, situated somewhere in Commagene or Melitene. But also in Shamûkha were found Hittites and Khatti.

A mixed population of Hittite, Khatti and Khurri was distributed throughout Syria, while in Khurri (Orrhoëne and South Armenia) and Mitanni (Mygdonia) the Khurrish-Mitannish were the preponderating race. Occasionally Khurri is synonymous with Syria generally. The country *Kharu*, more exactly *Khôr* of the Egyptian inscriptions, as also the Old Testament people, the Khorites (until now usually considered to be "dwellers in the caverns") who, according to Gen. xiv. 6, Deut. ii. 12 and 22, inhabited the land of Edom before the Edomites, is identical with this *Khurri*. The Khurri-Khorites also belong, like the Khatti, to the large-nosed Armenoid race which has influenced, physically, the later Semitic (Assyrian, Hebrew, etc.) and Indo-European (Armenian) population of these countries. Not a little literature must have been written in Khurrish, as the fragments of the Gilgamesh epic and also other poetical texts in the same tongue, found in Boghazkeui, testify. Ungnad suggests the name Subarian for Mitannish (and Khurrish), derived from the geographical term Subartu used for the countries lying north and north-west of Babylonia.

In the Boghazkeui inscriptions a language of the country *Palâ* (*palâumnili*) is mentioned occasionally. This must be sought, perhaps, somewhere in Syria (?). Unfortunately, no sure records of this language have, so far, come to light. Two insignificant fragments, published by Forrer, if really written in Pall, suggest perhaps a Lûish-Khattish mixed language.

If. as suggested above. Hittite. Khattish. Liiish and Khurrish were spoken in the Hittite area. and if the cuneiform writing was used for all these languages, it is likely to suppose that also in the monumental writing of the Hittites—that is, in the Hittite hieroglyphs—several languages. presumably Hittite. Khattish and Khurrish. occur. If so, the decipherment of this script becomes still more difficult. since the language in which any given inscription is written must first be determined.

Aryans (Earliest Indians) in Syria and Mesopotamia.—The Boghazkeui inscriptions show that, besides the Hittites and the Liiish, there was also in the second millennium B.C. another Indo-European people within the Hittite area: an Aryan conquering people which formed the governing class in the kingdoms of Khurri and Mitanni and—probably in consequence of a former expansion of the Khurri kingdom in Syria-Palestine—not seldom supplied Syrian and Palestinian cities with their Dynasties. In the treaty of the Hittite king Shuppiluliumash *(cir.* 1380 B.C.) with the king of Mitanni, Mattivaza, among the gods of Mitanni, also the gods *Mitrashshil* (Mitra gods), *Arunashshil* (Aruna gods), *Indara* and *Nashattijannu* are invoked as witnesses of the oath, which are surely identical with the Indian gods *Mitra, Varuna, Indra* and *Nāsatya*. In the Boghazkeui archives four tablets (originally there were still more) have also been discovered of a manual written in Hittite on the management of horses and chariot races of which a certain Kikkuli from Mitanni was the author, and in which expressions used in chariot racing in Indian language occur: *aikavartanna* "in one turning," *teravartannu* "in three turnings," *panzavartanna* "in five turnings," *shattavartanna* "in seven turnings," etc. (comp. old Indian *dka-h*, one, *tráy-ah*, three, *pañca*, five, *saptá*, seven, *vártanam*, the turning). In addition the inscriptions mention a class of military nobility, the so-called *marianni* who play an important rôle in Syria and Khurri-Mitanni, and whose name is derived from the old Indian *márya*="young man, hero." Finally, in the inscriptions of Tell el-Amarna and Boghazkeui, names of Palestinian, Syrian and Mesopotamian kings and princes, of Aryan character, are preserved as, for example, the names of the kings of Khurri and Mitanni, *Artatama* (probably old Indian *Rta-tama*, "the most pious"), *Tushratta, Mattivaza*, the name of the Palestinian prince *Shubandu* (old-Indian *su-bandhu*= "who has good kinsmen"), and others.

It is to be supposed, that in the course of theirwanderingto India the earliest Indians, or, at least, a part of them, touched Mesopotamia and Syria, where the Khurri-Mitanni kingdom was their centre, in the second and even the third millennium B.C. At the present time, Kretschmer pleads for a longer sojourn of all Indians in Near Asia particularly on the ground of his hypothesis that the Indians borrowed the deities *Varuna* and *Indra* from the Hittites; cf. the Hittite *arunash*, sea, and the Hittite god *Inar, Inarash*. (That the Hittites had a god of the sea *Arunash*, whose name was in the cuneiform writing written with the determinative for gods, is now shown—[which could not have been known to Prof. Kretschmer]—by the text *Keilschr.-Urk. aus Bogh. XX.*, 1, 32 and 2, 5, and also by Bo. 3206, II. 16.) On the other hand the Hittite god *Aknish* or *Agnish*, discovered by Hrozný *(Rev. d'assyr.* 1921) may perhaps have been derived from the old Indian god of fire *Agni*. Iranians also may have taken part in this immigration of Aryan stock in the Near Asia. Forrer's proposal to name the Aryan language of Khurri-Mitanni as Mandaean is impossible, for even if the name 'Wanda-people, Manda-warriors" of the paragraph 54 of the Hittite Codex of Laws really denoted the Aryans of Khurri-Mitanni, the Assyrian-Babylonian collective expression *Ummân-Manda* "troops of peoples" for the hostile, mostly—as it is to be supposed—Indo-European north peoples obviously could not be employed to designate the speech only of one of these peoples. It is also doubtful if the name of the country Mitanni (also Metan?) has anything to do with the Medes. On the other hand it is sure that the horse which appears in Near Asia somewhere about 2000 B.C., was there introduced by the Aryans now in question.

HISTORY OF THE HITTITES

The earliest information concerning Asia Minor relates to the first half of the third millennium B.C. Eastern Asia Minor was already inhabited by the non-Indo-European Khatti. The rich natural resources of the country attracted the Sumero-Babylonians and Assyrians, who founded colonies and kingdoms there. About 263j B.C. the powerful ruler, Sargon of Akkad, undertook a campaign against the city *Purushkhanda*, in Asia Minor, governed by a king with the Accadian name *Nûr-Dagan*. According to text

HITTITES

BY COURTESY OF THE TRUSTEES OF THE BRITISH MUSEUM

HITTITE RELIEFS AND HIEROGLYPHIC INSCRIPTIONS FROM CARCHEMISH

1. Hittite-Khurri sculpture of a warrior, one figure on a series of reliefs discovered at Carchemish, the modern Jerablus, on the west bank of the Euphrates.
2. Two men killing a lion. Another relief on basalt found at Carchemish. Head dress, beard and hair, as well as the turned-UP toes, are characteristic of Hittite sculpture
3. Hittite inscription, found on a monument at Carchemish. The hieroglyphic writing of the Hittites is a pictographic script which has not yet been deciphered
4. Hittite-Khurri sculpture cf bird-headed demons

of uncertain historical value the most powerful of the successors of Sargon of Akkad, King Narâmsin (25th century B.C), fought a victorious battle against a coalition of 17 kings which included Pamba, king of Khatti (now Roghazkeui), *Zipani,* king of Kanesh (now Kara Euyuk and Kultepe near Caesarea), and *Khuvâruvash,* king of Amurru in Southern Syria. It is not certain whether it is permitted to infer from the name *Khuvâruvash,* of wholly Hittite character, that the invasion of Asia Minor, even of Syria, by the first Indo-Europeans, the Lûites (in part also the true Hittites?) took place as early as the first centuries of the third millennium B.C. Narbmsin had also to defend his empire against the attack of the *Ummân-Manda* "troops of peoples" which came from the North, and in which then, as later, are to be seen in the first line Indo-European, Aryan peoples. One of these peoples may have been the later Aryans of Khurri-Mitanni.

Further light on the most ancient history of Asia Minor is thrown by the old Assyrian (also called Cappadocian), cuneiform tablets of Kultepe-Kanesh, which date from the 21st century and which were discovered partly by the secret diggings of natives, and partly by the official excavations of Hrozný in 1925. The original stock of the population is Khatti; the native prince of Purushkhanda? (or Khatti) is called Labarsha, in an inscription found by Hrozný's expedition. This name is Khattish (cf. the later Khatti-Hittite royal name and kingly title *Labarna-Tabarna.*) Meanwhile the Assyrian empire had become very powerful; Eastern Asia Minor was subject to it. In the cities resided rich Assyrian merchants who were organized in *gâru*'s "Bazaars" and carried on a flourishing trade in the products of Asia Minor. The Indo-European Hittites had already invaded this territory as is shown by distinctly Indo-European names, such as *Inar* (cf. *ἀνήρ* "man"), also *Inarava, Khalkiashu* (cf. Indo-Eur.-Hittite khalkish "corn") and others. While the political centre of the Khatti was the city Khatti and the first Indo-Europeans, the Lûites, were concentrated in the South, in Arzava-Lûya, it may be that the Indo-European Hittites, at first (probably however after 2000 B.C.), had settled mainly around the cities Kanesh and Kushar. Inscriptions do not state that the city Kanesh was once also a political centre of the Indo-European Hittites. Probably the invasion of the Indo-European Hittites in the 20th century B.C. made an end of the Assyrian rule in Cappadocia. Eastern Asia Minor was subdivided again, as for example in the time of the kings of Akkad, into a number of small mutually hostile states, over which the Indo-European conquering people, called by us Hittites, now attempt to rule. One of the important rulers, of this time, the great king *Anittash,* of *Kushshar,* about the beginning of the 19th century B.C. vanquished *Pijushtish,* then king of the town Khatti (himself, possibly, also a Hittite), then the king of *Nêshash,* the king of the city *Zalpuva* (*Zalpa*), situated apparently somewhere in the coastal region, and rulers of *Purushkhanda* and *Shalativara.*

Some generations later, about 1800 B.C., there ruled in Kushshar the great conqueror *Tlabarnash,* whose name is written *Tabarnash* or Labarnash, and who extended his kingdom as far as to the sea. His successes are so great that his name and that of his wife, Tlabarnash and *Tavannannash,* were used as titles of honour by the later Hittite kings and queens. The kingdom, thus greatly enlarged, later on undertook military expeditions beyond Asia Minor. In Mesopotamia, Syria and South Armenia, in the first half of the second millennium B.C., the effect of the invasion of the East Indo-European peoples—of the Aryans of Khurri-Mitanni—becomes more evident. A series of Aryan-Khurrish states arose here: among which the most notable are Khanigalbat (=Khurri-Mitanni) in Mesopotamia and the great kingdom Khalap (now Aleppo) in Syria. The great king Khattushilish I., a son of Tlabarnash, who lived in Kushshar, but apparently also in Khattushash-Boghazkeui fought against Khalap successfully. His successor Murshilish I. who transferred the seat of the Hittite Dynasty to Khattushash, succeeded about the year 1758 B.C. in vanquishing not only Khalap and the Khurri, but even Babylon itself, and overthrew the Khammurabi dynasty in Babylonia. During the remainder of the 18th and the 17th–15th centuries B.C. the Hittites were engaged in internal disorders and external campaigns, especially against the Khurri. From the Syrian Khurri, who were strongly mingled with Khatti, Hittite and Semite elements, went out the people, known as the Hyksos, who took possession of Egypt about 1685 B.C. (The Hyksos names are probably partly of Semitic and partly of Syrian-Asianic origin. Only the name of the Hyksos king, *Khendder* or Khenddel, may be here mentioned, which is of linguistic interest as recalling the name of the Hittite king *Khantilish,* the successor of Murshilish I.) The great king *Telepinush* attempted, about 1600 B.C., to reorganize the shattered kingdom. The Hittite rulers of the 15th century B.C. may still be reckoned as belonging to the Old Empire, though the forerunners of the New one. *Tudkhalijash II.* succeeded in reuniting the kingdom and breaking the power of the confederate kingdoms of Khanigalbat (Khurri-Mitanni) and Khalap; but still some time after this, Khattushilish *II.* fought successfully against Khalap and Mitanni.

The New Empire which begins about 1385 B.C. with the brilliant Hittite king Shuppiluliumash, son of Tudkhalijesh *III.,* embraced the last two centuries of the Hittite kingdom. During this time the Khatti kingdom exercised the most profound influence on the destiny of the Near East. It may certainly be considered as, for some time, the first military and political power of the East at that epoch. The united Hittite kingdom sought to extend its sphere of influence in all directions, by means of wars, alliances and treaties with vassals, as well as by dynastic marriages. A powerful confederation of States came into existence, which, however, composed of very dissimilar elements, could not be of long duration. The resurrection of the Indo-European Hittite empire was facilitated by the decay of the Khurri kingdom, ruled over by an Aryan dominant class which took place in the 14th century B.C. The Khurri kingdom, Khanigalbat dissolved into two enemy states, Khurri and Mitanni (with the capital *Vashshugganni*), which we may seek perhaps in Râs el-Ain in North Mesopotamia; cf. Opitz in Zeitschr. *f. Assyr.* 1927, 299 et seq.), against which Shuppiluliumash was able to fight. The king Tushratta ruled in Mitanni at this time. Shuppiluliumash established his power almost over the whole of Syria, where he successfully checked the Egyptian influence. His armies advanced thence as far as the territory of Lebanon. He also subdued the people of Gashga between the Euphrates and the Halys, and by means of alliances and marriages, bound Khajasha on the Upper Euphrates and Arzava in southern Asia Minor to the Hittite empire, with which Kizvatna-Pontos was also very closely allied. After the death of the Pharaoh Bibkhururiash (=Tutankhamen?) his widow sought to marry one of the sons of Shuppiluliumash, but the Hittite prince was murdered by Egyptians on his way to Egypt. The political and military activities of the Hittite kingdom were conducted on the same lines with many vicissitudes, in the reign of the successors of Shuppiluliumash which however can not be described here in detail. His son and second successor *Murshilish II.* (about 1340 B.C.) belongs to the most enterprising and warlike rulers not only of the Hittite kingdom, but even of the ancient East as a whole. This great king also took special interest in Western Asia Minor, where he came into touch with the Greeks as Forrer was the first to point out, though his views as Friedrich specially has shown, are in many instances untenable. The city and the country Akhkhiyavd, which now appear in the Hittite inscriptions and which are there named together with *Lazpash,* perhaps = Lesbos, can be probably connected with Gr. Ἀχαιρᾶ and the Achaeans (*q.v.*), which are for the rest mentioned in an inscription of Pharaoh Menneptah (*c.* 1240 B.C.). It is, however, impossible (with Forrer) to seek this Akhkhiyavd in Greece. It is probably a country situated on the coast of Western Asia Minor near the island Lesbos. Further both on linguistic and real grounds, it is not possible to identify Tavagalavash, who at the time of Murshilish was perhaps a vassal of Akhkhiyavd, and who wished to become a vassal of the Hittites, with the mythical king Eteokles (Ἐτεϝοκλεϝης) of Orchomenos in Boeotia. To identify Antaravash, mentioned in an oracle text, which names also *Akhkhiyavâ* and Lazpash, with *Andreus,* the father of Eteokles of Orchomenos, is also very risky. Again, Forrer has failed to prove that the king *Attarishshijash* of Akhkhiyd (probably = Akhkhi-

yavâ), an opponent of the Hittite king *Tudkhaliyash IV.* (*cir.* 1240 B.C.) is the same as *Atreus,* king of Mycenae and father of Agamemnon. Forrer's opinion that the Hittite word *ajavalash* means Aeolian and that Troy might be recognized in Hittite inscriptions in the name Taruiska, which Forrer reads *Troisa,* which however should be read Tarvisha, is also erroneous.

At the present time we may reasonably admit only the existence of an Achaian state in Asia Minor, represented by Akhkhiyavd and Lazpa (probably not to be identified with Zalpa), and await further information from the future. (Kretschmer [Glotta 12] compares the king *Alakshandush* [*cir.* 1300 B.C.] of Vilusha-Elaiussa with the Homeric Alexandros-Paris.) On the relations between the Hittites and the Greeks, *see* also below the chapter on the Hittite myths.

Other powerful Hittite rulers of this age were the sons of *Murshîlish* II., *Muvattallish* (Muttallish) about 1300 B.C., who vanquished at Kadesh the Egyptian Pharaoh Rameses II. (see above), and *Khattushilish III.,* who concluded an alliance with the same Pharaoh about the year 1272 B.C. (See also above.) Tudkhalijash *IV.* (*cir.* 1240 B.C.), son of Khattushilish III., apparently still extended his kingdom westwards by successful wars. But already about the year 1190 B.C. under his second successor Tudkhalijash V., the Hittite kingdom fell under the attack of the so-called sea peoples and that of the Indo-European Thracians, Phrygians and Armenians, who followed in their train and forced their way into Asia Minor. Shortly before this the Mitanni kingdom was conquered by the Assyrians. Subsequently small Hittite-Khurrish states arose in Syria, such as Carchemish and Kunulua. Yet these too were gradually overthrown by the Assyrians; Carchemish itself fell under the attack of Sargon II. in 717 B.C.

HITTITE CIVILIZATION

Generalities. Law.—The cuneiform inscriptions of Boghazkeui show that Hittite civilization had reached a high level. In this civilization the cuneiform script and many other elements were borrowed from Babylon, yet the invention of a native hieroglyphic script, the rich and original Hittite cuneiform literature, the art monuments and other manifestations of Hittite culture, all prove that in spite of all borrowings, due to their comparatively late entry into the civilization of Asia, the Hittites are in no way inferior to the Babylonians and Egyptians.

In the state archives of Boghazkeui, there was found a series of so-called vocabularies, a kind of lexicon, with Sumerian in the first column, Babylonian in the second and Hittite in the third; tor example: Sumerian *gú* = Babylonian *rêshu* "head" = Hittite *khalanta* (cf. Latin *calva,* Armenian *xalam* "skull"). If we add Khattish, Lûish and Khurrish to these three languages, we perceive that there were writers and scholars in the Hittite kingdom, who were masters of six languages.

The historical literature of the Hittites is rich and varied. There exist extremely important State treaties of the great Hittite kings with their vassals, and other powers abroad, diplomatic correspondence; annals of the Hittite kings, their proclamations, which treat the problems of politics and administration (for instance: the succession of the throne, disputes between individual cities, etc.), deeds of royal gifts and so on.

The strict military and political organization of the new Hittite kingdom is clearly portrayed in these documents. The same picture of an administration, ordered and regulated to the smallest details, is presented to us by the preserved prescriptions for different palace and temple employes. A well organized kingdom must also have its code of laws. The Hittite code (published by Hrozný) in two parts, containing about 200 paragraphs, gives us a deep insight into Hittite justice. In regard to punishment it is much milder than that of Khammurabi, Assyria or the Israelites. Mutilations and the death penalty were only seldom imposed in the Hittite kingdom; the Hittite code was very indulgent to certain sexual crimes which throws a not very favourable light on the sexual morality of this nation. A longer section of the Hittite code of laws, regulating prices in the Hittite kingdom is in the economic regard very important. Partly from this, partly from other texts, we learn that the Hittites, like other nations of the ancient East, cultivated especially barley, *Triticum dicoccum* (a kind of spelt) and wheat; that they brewed beer from barley malt after the manner of the Babylonians, and that wine also played an important part among them. The whole economic position of the Hittite kingdom was founded on agriculture and the raising of cattle; beekeeping was zealously cultivated. Silver pieces, which were weighed according to the Babylonian system (*manû,* etc.) were used as circulating medium. In the domain of material civilization, the Babylonians were in many things the teachers of the Hittites who arrived in Asia much later than they.

The Hittite Pantheon.—The numerous religious texts in the archives of Boghazkeui familiarize us with the religion of the Hittites. The Hittite Pantheon, which is known also to us from the State treaties, where all possible gods, "a thousand gods" are summoned as witnesses and in support of the treaty, and which may be here assembled for the first time in its principal divinities, is very mixed. Sumerian-Babylonian, Assyrian, Khurrish, Indo-European-Hittite, Lûish and Indian elements are here bewilderingly blended together. The Weather god and the Sun goddess are the chief divinities. We do not know the names they bore in the proper Khatti territory; in the Khurrish-Mitannish country they were called *Teshup* and *Khepit* (Khepa). The weather gods of Nerig and *Zippalanda* are the sons of the weather god of Khattushash and the sun goddess of the city Arinna (= Euyuk [?]); this is also the case with the god of the fields, *Telepinush,* to whom can be traced back the hero *Telephos,* specially honoured in Mysia and Lycia; the goddess *Mezzullash* is daughter to this divine pair, the goddess *Zentukhîsh* or *Zindukhijash* is the grandchild. The exact position of the goddess Lelvanish in this family circle is uncertain. (By this analysis of the Hittite Pantheon the chief Hittite gods on the rock reliefs at Yasili-Kaya can now be successfully identified. From left to right they are: the Storm-god, Sun-goddess, Telepinush, *Mezzullash* and *Zentukhîsh* [or Lelvanish ?]. The hieroglyphs which accompany the names of these gods can be now adequately interpreted). The wife of Telepinush is called Khatepinush. The sacred bulls of the weather god of Khattushash are called Sherish and *Khurrish.* Of secondary origin in this circle is the goddess Khepit. The very important god of male virtues, *Inar* or *Inarash,* is certainly of Indo-European origin (of period Skt. NARA, Gr. ἀνήρ, "man"); according to a conjecture of Kretschmer he was borrowed by the early Indians (cf. Indara-Indra) from the Hittites. The Hittite god Indra, Indara, may be found—as may here be established for the first time—also in the Egyptian Rameses treaty in the form 'ntrtj which, according to Lexa, is probably the Egyptian word for "goddess," Coptic NTWPE. Apparently the Egyptians simply identified the name of the god Indara, which was unknown to them, with this Egyptian word. Possibly all the divinities of this kind are comprehended in the name *Innaravantash* (probably Plur.; Sing. *innaravanza,* Keilschr.-Urk. aus Bogh. 17, Nr. 20, 11.3), Lûish *Annarummenzi.* For the other Hittite deities, who are also adored by the Indians *Arunash* "Sea" (cf. Ind. *Varuna*) and Agnish (cf. Ind. Agni) see also above. Besides the "Great Sea" which also plays an important part in the Hittite myths, the Hittites worshipped also the Heavens, the Earth, mountains, rivers, wells, winds and clouds. A deity of field fruits is apparently Khalkish, sometimes named with Telepinush and probably of Indo-European origin. Another god who bears probably an Indo-European name, is Vashdulashshish whose name is derived from the Hittite *vashdul* = "transgression, sin." (Cf. Lat. vasto.)

Another Hittite divinity is the father of the gods, *Kumarpish,* who may have been borrowed from the Khurrish Kumarve, and who plays also an important part in the Hittite mythology. He is sometimes identified with the Babylonian Earth god *Enlil,* but is also worshipped beside him. His messenger is called *Mukishanush* (of Babylonian origin?). Related to the god *Inarash* are probably the gods *Âlash* (who must not be confounded with the goddess *Alâsh*), *Zitkharijash,* whose cult arose in the city *Zitkhara, Karzish,* Khapanfalijash or Khapatalijash, and perhaps also the god *Pirinkir* or Pirikar. According to a text the god *Inarash* was worshipped under no less than 112 forms. Others are the

deities *Birvash* (comp. the Syrian deity *Biruva,* Rawl. III. 66, Rev. I. 19), *Mâlijash,* "the mother" *Kamrushepash* or *Kammarushepash,* who appears in Hittite myths, and the goddess (or god?) *Ashkashepash.* The goddesses *Nenattash* or *Ninattash* and *Kulittash* may be regarded as connected to a certain degree with the goddesses *Ishtar* and *Ishkhara; Ninattash* is probably borrowed from the Sumerian-Babylonian goddess *Nina,* while again, *Kulittash* can be traced back to the Sumerian-Babylonian goddess *Gula,* the "great lady doctor"; instead of *Kulittash,* also *Gulittash* may be read. (Comp. the Syrian goddesses *Ninitum* and *Kulittum,* Rawl. III. 66, Rev. I, 27. 28.) Of great importance are the Hittite tutelar deities of the house and of the grave, *Kulshêsh* or *Kulashshêsh* and *MAḪ-nêsh.* From the first name are probably derived the names of the Etruscan deities *Culśanś,* who was the protector of the gates, and of *Culśu,* the goddess of the nether world. (For the relations of the Etruscans to the Hittites *see* Hrozný in *Zeitschrift für Assyriologie,* 1928.) To the Hittite tutelar deities belong also *Zukkish* (or *Zunkish*) and *Anzilish.* The following deities may also be named here: *Khullash, Jarrish, Zappanash* (*Zampanash, Zapnash*), *Khashammilish* or *Khashmilish, Khîlashshish, Târavash, Jajash, Pentarukhshish, Nârash* (originally a Babylonian river god?), *Namsharash* or *Napsharash* (of Sumerian-Babylonian origin? Comp. the Sumerian-Babylonian primeval gods *Ninshar, Enmeshara, Ninmeshara?*), *Minkish* or *Munkish, Ammu(n)kish, Tukhushish* or *Tushshish* (related to the Hittite word *antukhshish,* "man"?), *Ammezadush, Alalush* (of Sumerian-Babylonian origin), and *Apantum* (originally Babylonian??).

Other aboriginal Sumerian-Babylonian divinities in the Hittite Pantheon are: the Heaven god *Anush* and his wife *Antum,* the Earth god *Enlil* and his wife *Ninlil,* the Sea god *Êa* and his wife *Damkina* and his son *Marduk,* the Moon god *Sin* and his wife *Ningal, Nikkal,* the god of the underworld *Nergal* and his wife *Ereshkigal* or *Allatum,* the goddesses *Ishtar* and *Ishkhara,* the war god *Zababa,* and others. Many of the Babylonian divinities were included in the Hittite Pantheon only because the Hittite priests diligently studied the religious literature of the Babylonians: their existence in the realm of the Hittite gods, is therefore somewhat theoretical. On the other hand not a few of the Babylonian names of divinities in Hittite inscriptions may in reality be only ideograms, expressing the names of Hittite native gods. The influence of Babylonia upon the religion of the Hittites, though certainly great, may therefore have been much less than seems to be the case, on the first glance, on the basis of the graphical impression of the names of deities.

Among the numerous local Hittite gods whose names are of interest, the following may be mentioned: *Khantidashshush* of the city *Khurma, Katakhkhash,* also *Khatakhkhash* or *Khataggash* of *Ankuva,* the goddess *Shartijash,* the "queen" (Babylonian in origin; but *cf.* also Hittite *shardijash* "helper"?) of *Katapa, Mammash* or *Ammammash* of *Takhurpa, Khallarash* of *Dunna, Gazbâja* (Babylonian in origin?) and *Khuvashshannash* of *Khûbishna, Tapishuva* of *Ishkhupitta, Bîlat* or *Bêlti* (Babylonian) and *Kunijavannish* of *Lânda* (cf. *Laranda*), *Zashkhabûnâsh* or *Zakhabunash* or *Zakhbunash* of *Kashtama, Khâshigashnavanza* (comp. the name of the city *Khashshiḳḳashanavanta*) and *Mullijarash* of *Lavvazantija* (cf. *Lauzados*), the goddesses *Alâsh* of *Karakhna, Zûlimash* of *Shugazzija, Tashimish* of *Likhshina, Lushitish* of *Nenashsha, Shakhkhashsharash* of *Tuvanuva* (=Tyana), *Shuvanzipash* of *Shuvanzana, Navatijalash* of *Zarvisha, Vashkhalijash* of *Kharziuna, Zanduza* of *Shallapa, Ammamash of Khakhana, Katakhkhash* of *Tavinija, Karmakhish* of *Kalimuna, Karunash* of *Kariuna, Tamishshijash* of *Tabiḳḳa* (*cf.* the modern Dâbik in Syria), *Bishanukhish* of *Kumanni* (Comana) and *Apârash* of *Shamûkha* in the so-called "Upper Land."

Notice also these names of Hittite gods: *Kharishtashshish, Kattishkhapish* (Khattish), *Tashimmet* (Khattish? or comp. Babylonian *Tashmêtu?*), *Vašezzel* (Khattish), *Valizilish* or *Valizalish* (Khattish), *Teteshkhapish* (Khattish), *Shullinkattish* (Khattish), *Âpish, Aduntarish, Zulkish, Irbitigash, Karmakhilish, Zilibûrish, Negmish, Menkishurish, Zibarvâ* or *Zabarvâ* (in *Palâ*) etc.

The worship of the gods *Shantash* (cf. *Sandon*) and *Tarkhunza* (cf. *Tarku*) was characteristic of *Lûya-Arzava* especially; for *Annarumenzi.* In Arzava was also the deity *Ulilijashshish,* in the apparently Lûish city *Ishtanuva* or *Ashtanuva* among other divinities also *Shuvashunash, Vandush, Jashallashshish* or *Vashalla* worshipped. *Teshup* and *Khepit* (*Khepa*) were worshipped in Khurri-Mitanni. For the Aryan gods of these countries and for *Kumarve* see above. Among the other gods of these countries were the goddess *Shaushgash,* further *Shimegi, Êasharri* (Babylonian), *Shâlush* (Babylonian), *Lellûrish,* etc. The Pantheon of Shamûkha is also closely related. Hittite-Khattish, Lûish, Khurrish and Babylonian elements are mingled in the Pantheon of Kizvatna.

Hittite Mythology.—Among the numerous, though mostly badly preserved Hittite mythological texts, the first to be mentioned may be that of the disappearance of the offended god of vegetation *Telepinush,* who brings bad growth, sterility and famine in his train, and of his reappearance, which produces a new fruitfulness. The connection of this myth with the ancient oriental myths of Tammuz, Adonis, Attis, etc. is plainly evident. It is interesting, that the gods have *Telepinush* sought among others also by an eagle and even a bee. Another myth relates to the struggle between the weather god and the serpent *Illujankash,* and still another relates to the sea (?) serpent *Khedammush* (Sumerian-Babylonian? *cf. Khedimme-azag,* the daughter of the Ocean, resp. Êas) and the goddess *Ishtar.* Another myth, though not completely preserved, is that of the goddess *Ashertush,* identical with the west-Semitic goddess *Ashirtu-Ashera,* who attempts to seduce the weather god. On his refusal *Ashertush* contrives that the refusal should appear to be on her side; evidently a parallel to the Old Testament story of Potiphar's wife! The storm-god then betakes himself to *Elkunirshash,* husband of *Ashertush,* and relates what has happened. Another badly preserved myth is that related of *Gurpa-Aranzakhush,* probably king of a city *Ailanuva,* situated, evidently in Asia Minor, who married *Tatizulish,* the daughter of King *Impa-akrush* of *Accad* in Babylonia, and who resides at the court at *Accad,* and is there sought for by the river-god *Aranzakhash,* the personification of the water from the weather god's head. This myth may be a feeble reflection of some historical event. Another myth relates the story of a rich man, *Abbush* (is the name Babylonian?), who lives in the *Lulluvaja* country in the city of *Shudul,* situated on the sea-shore, to whom nothing is wanting (Heth. *vaḳḳari; cf.* Lat. *vaco!*) but a son and a daughter. In his trouble he seeks the help of the sun-goddess. *Abbush,* apparently, then has two sons, one good and one bad, who later on divide the paternal inheritance and separate; but this text also is very incompletely preserved.

In Hittite countries the Babylonian myth of *Gilgamesh* was much in favour. Fragments of the *Gilgamesh* Epos have been discovered in Boghazkeui, written in Babylonian, Hittite and Khurrish. There existed also indigenous adaptations of this grateful material, inasmuch as *Khuvavaish-Khumbaba* of the *Gilgamesh* Epos, who dwells in the cedar wood, appears to have belonged originally to Khurri-Syria. Not less than 15 (possibly still more) tablets in Khurrish existed of the "Songs of *Keshshesh,*" *i.e.,* of *Gilgamesh* (called in Khurrish also *Galgamishul*). The myth of *Gilgamesh* was related and songs of this hero were sung over the whole of Asia Minor. The Greeks of Asia Minor also were certainly familiar with the *Gilgamesh* epic, traces of which may be found in the Odyssey. It is not impossible that the name of Odysseus or Olysseus, Lat. Ulixes (as Gemser suggests in the Archiv f. Orientforschung III. 184) may be traced back to the Hittite name *Ullush* (from the Babylonian *Ullû, i.e.,* "carried away, distant") of the hero of the deluge story who dwelt apparently in the city *Idlash* (at the mouth of the rivers?). Khattish has a *tl*-sound, which is sometimes represented by *t,* at others by *l* (*see* above, the king's name *Tlabarnash*).

Religious Worship, Exorcisms, Omens.—We can learn much concerning the Hittite forms of worship, sacrifices, religious festivals, etc., from the archives of Boghazkeui. Rituals for various temple feasts and other occasions of the public and private

life, which request the intervention of the priest, recorded by priests and priestesses who are named by their names, have been preserved. Purifications, sacrifices, prayers and oaths are the chief features of Hittite worship, whereby many connections with and borrowings from Babylonia can be established. Illnesses and epidemics, famines, evil demons, domestic quarrels, etc., are banished from believers by the exorcists and sacrificial priests. Before every considerable undertaking the future and the will of the gods were ascertained by consulting them; the liver of the sacrificial animals was examined; the flight of birds was observed, a prophetess was questioned, etc. Here the influence of Babylon is unmistakable. Clay models of livers used in hepatoscopy have been discovered in Boghazkeui, bearing Hittite or Babylonian inscriptions. The will of the gods was also revealed to men by appearances in the heavens, and all kinds of unusual occurrences on earth. All these signs and omens were interpreted by competent priests. The manuals used by these priests in the interpretation of omens are mostly of Babylonian origin. The Babylonian influence and origin are disclosed by the astronomical-astrological inscriptions of the Hittites, and by their medical treatises, written in both Hittite and Babylonian, which have been discovered at Boghazkeui. Here it may be remarked that also deeds of landed property and clay tablet catalogues have been found in Boghazkeui.

Hittite Art.—It is certain that, like the script documents, the artistic monuments, generally attributed to the Hittites, which have been discovered in the country between Smyma and Tell Halaf on Khabur in Mesopotamia, are the work of not one, but of the several peoples described above. In the West the monuments are essentially Khatti-Hittite, in the East, Khurri-Mitanni; in Syria both spheres met and later on also Aramaic influence can be stated there.

In the first centuries of the first millennium B.C. Assyrian influence was felt in the East, while late Assyrian art was not a little influenced by the Hittite-Khurrish. That this Hittite-Khurrish art in its beginning was dependent to a wide extent on Sumerian-Babylonian art, is obvious. Egyptian influence was added in the second millennium B.C. But in spite of all these external influences, Hittite-Khurrish art has its independent nature, which is of value for the history of art. Hittite-Khurrish artistic remains can never be confused with those of either Egypt or Babylonia.

If Hittite-Khurrish monuments give a more naïve and awkward impression than either the Egyptian or Babylonian, this can be explained chiefly by the relatively short duration of Hittite-Khurrish civilization, which rendered impossible the attainment of a higher perfection. Hittite art motifs are also found in Greek art.

The application of whole series of reliefs to gates, accesses and bases of palace walls, as well as the use of wooden columns on stone bases are characteristic of Hittite-Khurrite building and architecture.

HITTORF, JOHANN WILHELM (1824–1914), German physicist, best known for his work on the migration of ions during electrolysis, was born at Bonn on March 27, 1824. He studied at Bonn and Berlin, and became Privatdozent (official but unpaid lecturer) in the academy of Munster. When this institution became the University of Miinster, Hittorf became professor of physics and chemistry; in 1879 the physics and chemistry departments were separated, and he became director of the physical laboratories. Hittorf retained this post until 1889 when he had to resign because of ill-health. After a rest his health improved, and he continued his research work. He died at Miinster on Nov. 28, 1914.

Hittorf's early investigations were on the allotropy of selenium and phosphorus. His most important work on ion migration during electrolysis appeared in the *Annalen* der *Physik* between 1853 and 1859. He investigated the changes in concentration in the electrolyte and from this worked out the "transport numbers" for the migrating ions. With his teacher Plucker, Hittorf made investigations on the spectra of gases and vapours. He made a number of investigations on the passage of electricity through gases, he discovered a number of properties of cathode rays and observed the Crookes dark space. Other investigations were on the passivity of metals.

HITTORFF, JACQUES IGNACE (1792–1867), French architect and archaeologist, was born at Cologne on Aug. 20, 1792, and died in Paris on March 25, 1867. After apprenticeship to a mason in Cologne, he went in 1810 to Paris to study at the Academy of Fine Arts under Bélanger, the government architect, whom Hittorff succeeded in his post in 1818. Thereafter he designed many important buildings. both public and private, in Paris and the south of France. His principal work is the basilica of St. Vincent de Paul (1830–44). His books are. *Architecture antique de la Sicile* (1826–30 and 1866–67); *Architecture moderne* de *la Sicile* (1826–35); *Architecture polychrome chez les Grecs* (1830): *Restitution du temple d'Empédocle à Sélinunte* (1851).

HITZIG, FERDINAND (1807–1875), German biblical critic. was born on June 23, 1807, at Hauingen, Baden, and studied theology at Heidelberg, Halle and Göttingen. Returning to Heidelberg he became *Privatdozent* in theology in 1829, and in 1831 published his *Begriff der Kritik am Alten Testamente praktisch erortert*, in which he explained the critical principles of the grammatico-historical school. and his *Des Propheten Jonas Orakel über Moab*, an exposition of chapters 15 and 16 of Isaiah attributed by him to the prophet Jonah mentioned in 2 Kings xiv. 25. In 1833 he went to Ziirich as professor of theology. and in 1861 to Heidelberg, where he died on June 22, 1875. As a Hebrew philologist Hitzig holds high rank; and as a constructive critic he is remarkable for acuteness and sagacity. As a historian, a number of his speculations have been considered fanciful.

His chief works include commentaries on Isaiah (1833), on the Psalms (1835, 2nd ed, 1863–65); on the minor prophets (1838, 3rd ed, 1863). on Jeremiah (1841, 2nd ed., 1866); archaeological monographs, the *Gesch. des Volkes Israel* (1869), *Zur Kritik paulinischer Brirfe* (1870) and *Sprache u. Sprachen Assyriens* (1871).

HIUNG-NU, HIONG-NU, HEUNG-NU, a people who about the end of the 3rd century B.C. formed, according to Chinese records, a powerful empire from the Great Wall of China to the Caspian. A theory which seems plausible is that which assumes them to have been a heterogeneous collection of Mongol, Tungus, Turki and perhaps even Finnish hordes under a Mongol military caste. though the Mongolo-Tungus element probably predominated. Toward the close of the 1st century of the Christian era the Hiung-nu empire broke up. Their subsequent history is obscure. De Guiques suggests that they were the ancestors of the Huns, and many ethnologists hold that the Hiung-nu were the ancestors of the modern Turks.

HIVES (URTICARIA, NETTLERASH) is a common skin eruption consisting of transitory, circumscribed swellings known as wheals (urticas) which vary from about one centimetre in diameter to very large areas. They are surrounded by redness, last from one to many hours and leave no visible skin changes.

Localized whealing in the skin is produced by certain chemical and physical stimuli. Some of these obligatorily produce a wheal at the site of introduction in every person's skin (*e.g.*, products of nettles and insects; histamine, morphine, etc.). Allergens elicit wheals only in the skin of persons who have become allergically sensitized to them.

In the common variety of hives wheals appear spontaneously in many body areas, usually without any relationship to the site of introduction of the stimulus. They may last from a few hours or days (acute urticaria) to many weeks, months or even years (chronic urticaria). They are often caused by drugs (*e.g.*, penicillin, aspirin) and foods (*e.g.*, shellfish, strawberries) and less frequently by infectious microorganisms, intestinal parasites, inhalants and body-own products. Other manifestations of hives may be swelling of the mucous membranes of the mouth and throat and in the joints and internal organs. Large swellings of the hands, lips, eyelids, etc. (angioneurotic edema) result from involvement of the deeper skin tissue. Cholinogenic urticaria, an uncommon variety of hives, consisting of many minute wheals with large surrounding red zones, is elicited by heat and physical and emotional stress. Hives engendered by contact allergens (*e.g.*, wool, silk) and physical agents (light, cold, trauma) usually remain localized to the site of exposure to the causal agent and last only for a few hours.

The cause of acute hives often can be ascertained from the history and observation of the clinical course, but the cause of chronic hives is found by this method in only a small percentage of cases. Skin tests are generally of no value in finding causal agents in acute or chronic cases Treatment consists of avoiding and eliminating causal factors whenever possible, plus administration of ephinephrine, antihistamines or cortisone type drugs which often help to suppress the lesions of hives.

See also ALLERGY AND ANAPHYLAXIS. (R. L. BR.)

HJÖRRING, an ancient town of Denmark, in the northern insular part of the peninsula of Jutland. Pop. (1955) 14,591. It lies 7 mi. inland from Jammer bay, a stretch of coast notoriously dangerous to shipping. The church of St. Catherine dates from 1300, St. Hans from 1600 and St. Olai from 1200. The principal products include textiles, bricks, tiles and tobacco.

HO, the administrative centre of the Volta region of Ghana and of the Ho district council, is situated 45 mi. N.E. of Akuse on the Volta river. Pop. (1948) 5,852.

The town is surrounded by hilly country, mainly forest to the north and savannah to the south. The people, the majority of whom are of the Ewe tribe, are for the most part engaged in farming, trade and government service. It is an important market centre, mainly for agricultural produce, fish and meat. Palm oil, cotton and cacao are produced. Apart from government offices, the principal buildings are Mawuli secondary school and the sports stadium. Ho is the centre of a network of roads. which link it with Accra, all parts of the Volta region and with the Republic of Togo. The divisional chief of Ho, whose authority also extends over the area to the east of the town, has his seat in Dome. a subdivision of Ho. (A. H. B.)

HOADLY, BENJAMIN (1676–1761), an English bishop, who was born at Westerham. Kent. on the 14th of November, 1676. In 1691 he entered Catharine Hall. Cambridge, where he graduated M.A. and was for two years tutor. after which he held from 1701 to 1711 the lectureship of St. Mildred in the Poultry, and along with it from 1704 the rectory of St. Peter-le-Poor, London. His first important appearance as a controversialist was against Edmund Calamy "the younger" in reference to conformity (1703–1707), and after this he came into conflict with Francis Atterbury, first on the interpretation of certain texts and then on the whole Anglican doctrine of non-resistance. His principal treatises advocating civil and religious liberty were the *.Measures of Submission to the Civil Magistrate* and *The Origin and Institution of Civil Government discussed.* In 1710 he was presented by a private patron to the rectory of Streatham in Surrey. In 1715 he was appointed chaplain to the king, and the same year he obtained the bishopric of Bangor. He held the see for six years, but never visited the diocese. In 1716, in reply to George Hickes (*q v*), he published a *Preservative against the Principles and Practices of Nonjurors in Church and State*, and in the following year preached before the king his famous sermon on the text, "My Kingdom is not of this tvorld," in which he maintained that Christ had not delegated his powers to any ecclesiastical authorities. The sermon was immediately published by royal command. The bishops at once resolved to proceed against him in convocation. The king therefore prorogued the assembly. a step which had vital consequences on the history of the Church of England. since from that period Convocation ceased to transact business of a more than formal nature.

As Convocation was thus debarred from taking action against Hoadly, the dispute took the form of a war of pamphlets known as the Bangorian Controversy, in which the main issues of the dispute were concealed almost beyond the possibility of discovery. But however vague and uncertain might be the meaning of Hoadly in regard to some of the questions around which he aroused discussion, he was explicit in denying the power of the Church over the conscience, and its right to determine the conditions of grace. His own most important contribution to the controversy was his *Reply to Representation of Convocation.* William Law was his ablest opponent; others were Andrew Snape, provost of Eton. and Thomas Sherlock, dean of Chichester. In July 1717 as many as seventy-four "Bangorian" tracts appeared. Hoadly, heing not unskilled in the art of flattery, was translated

in 1721 to the see of Hereford, in 1723 to Salisbury and in 1734 to Winchester. He died at his palace at Chelsea on April 17, 1761. His controversial writings are vigorous if prolix and his theological essays have little merit.

The works of Benjamin Hoadly were collected and published by his son John in 3 vols. (1773). To the first volume was prefixed the article "Hoadly" from the supplement to the *Biographia Britannica.* *See* also *L.* Stephen, *English Thought in the 18th Century.*

HOAR, SAMUEL (1778–1856), American lawyer, was born in Lincoln (Mass.), on May 18, 1778. He graduated at Harvard in 1802, was admitted to the Massachusetts bar in 1805, and began practice at Concord. His success was immediate, and for half a century he was one of the leading lawyers of Massachusetts. He was in early life a Federalist, later an ardent Whig. He was a member of the State Senate in 1825, 1832, and 1833 and of the U.S. House of Representatives in 1835–37, during which time he made a notable speech in favour of the constitutional right of Congress to abolish slavery in the District of Columbia.

In November 1844 he went to Charleston (S.C.) to test in the courts of South Carolina the constitutionality of the State law which provided that "it shall not be lawful for any free negro, or person of colour, to come into this State on board any vessel, as a cook, steward, or mariner, or in any other employment," and that such free negroes should be seized and locked up until the vessels on which they had come were ready for sea, when they should be returned to such vessels. His visit aroused great excitement; he was threatened with personal injury; the State legislature passed resolutions calling for his expulsion, and he was compelled to leave early in December. In 1848 he was prominent in the Free Soil movement and assisted in the organization of the Republican Party. In 1850 he served in the Massachusetts house of representatives. He died at Concord (Mass.), on Nov. 2, 1856.

See a memoir by his son, G. F. Hoar, in *Memorial Biographies of the New England Historic Genealogical Society,* vol. iii. (1883); the estimate by R. W. Emerson in *Lectures and Biographical Sketches* (1903); and "Samuel Hoar's Expulsion from Charleston," Old *South Leaflets,* vol. vi. No. 140.

His son, EBENEZER ROCKWOOD HOAR (1816–1895), was born at Concord (Mass.), on Feb. 21, 1816. He graduated at Harvard in 1835 and at the Harvard Law school in 1839, and was admitted to the Massachusetts bar in 1840. From 1849 to 1855 he was a judge of the Massachusetts court of common pleas, from 1859 to 1869 a judge of the State supreme court, and in 1869–70 as attorney-general in the cabinet of President Grant, fought unmerited "machine" appointments to offices in the civil service until, at the pressure of the "machine," Grant asked for his resignation. In 1871 he was a member of the joint high commission which drew up the Treaty of Washington. In 1872 he was a presidential elector on the Republican ticket, and in 1873–75 was a representative in Congress. He died at Concord on Jan. 31, 1895.

Another son, GEORGE FRISBIE HOAR (1826–1904), was born in Concord (Mass.), on Aug. 29, 1826. He graduated at Harvard in 1846 and at the Harvard Law school in 1849. He settled in the practice of law in Worcester (Mass.), and became a partner of Emory Washburn (1800–77). In 1852 he was elected as a Free Soiler to the Massachusetts house of representatives, and subsequently thereto became the leader of his party. He was active in the organization of the Republican Party in Massachusetts and in 1857 was elected to the State Senate. During 1856–57 he worked for the Free State cause in Kansas. He was a member of the U.S. House of Representatives, 1869–77. A defender of the Freedman's Bureau, he took a leading part in later reconstruction legislation and in the investigation of the Crédit Mobilier scandal, and in 1876 was one of the House managers of the impeachment of Gen. W. W. Belknap, Grant's secretary for war.

In 1877 he was a member of the electoral commission which settled the disputed Hayes-Tilden election. From 1877 until his death he was a leader of the Republican Party in the U.S. Senate. From 1882 until his death he sat on the important judiciary committee, of which he was chairman in 1891–93 and in 1895–1904.

His most important piece of legislation was the Presidential Succession Act of 1886. He was a delegate to every Republican national convention from 1876 to 1904 and presided over that at Chicago in 1880. He was a Conservative, and although he did not leave his party he disagreed with its policy in regard to the Philippines and spoke and voted against the ratification of the Spanish treaty.

He died at Worcester, Mass., on Sept. 30, 1904. A memorial statue has been erected there.

See his *Recollections of Seventy Years* (1903).

HOARFROST is ice deposited when the water vapour in the atmosphere solidifies without passing through the liquid state. It has a crystalline appearance, and takes a variety of interesting forms which are particularly striking on windowpanes. Hoarfrost is a hydrometeor (*q.v.*). See FROST.

HOATZIN, a tropical South American bird, *Opisthocomus hoazin,* remarkable for the keel, only developed on the posterior part of the sternum, and for a very capacious crop resembling a gizzard. It constitutes the family Opisthocomidae and suborder Opisthocomi in the order Galliformes.

Appearing about the size of a small pheasant, though actually much smaller, the hoatzin has a strong, curiously denticulated beak; prominent eyelashes set in a bare space round the eye; a long pendant crest of yellow feathers; and an olive body above, varied with white; below it is dull bay. The wings are short, the tail long and tipped with yellow. The legs are short, the claws long.

The hoatzin lives in bands, feeding on leaves and fruits. Because of its strong smell, it is called the "stinkbird" in British Guiana. The nest is built of sticks in a tree and contains three or four yellowish-white eggs, blotched with red. The young have well-developed claws on the first and second fingers of the wing, with which they can climb; they can also swim.

See H. W. Bates, *Naturalist on the River Amazon* (1910); C. W. Beebe, *Naturalist in Guiana.*

HOBART, GARRET AUGUSTUS (1844–1899), vice-president of the United States 1897–99, was born at Long Branch, N.J., on June 3, 1844. He graduated at Rutgers college in 1863, was admitted to the bar in 1869, practised law at Paterson, N.J., and rose to prominence in the state. He was long conspicuous in the state republican organization. was chairman of the N.J. state republican committee from 1880–90, became a member in 1884 of the Republican National committee, and was the delegate-at-large from New Jersey to five successive Republican national nominating conventions. He served in the N.J. assembly in 1873–74, and in the N.J. senate in 1877–82, and was speaker of the assembly in 1874 and president of the senate in 1881 and 1882. He was also prominent in business. He accepted the nomination as vice-president in 1896 on the ticket with President McKinley, and was elected; but while still in office he died at Paterson, N.J., on Nov. 21, 1899.

See the *Life* (1910) by David Magie.

HOBART, the capital of Tasmania. Pop. (1954), 54,887, including suburbs, 95,206. It was founded in 1804, taking its name from Lord Hobart. then Great Britain's secretary of state for the colonies. It was proclaimed a city in 1842, and the first municipal council was established by an act passed in 1852. Situated on the Derwent river about 12 mi. from the sea, it occupies a site of extreme beauty. standing on a series of low hills at the foot of Mt Wellington (4,166 ft.) which is snow clad for part of the year. The harbour is easy of access, well sheltered and deep. with wharf accommodation for the largest vessels afloat. It is the seat of the Anglican bishop of Tasmania and the Roman Catholic archbishop of Hobart. It is connected with its eastern suburbs by a floating concrete bridge. The great development in recent years owes much to the hydroelectric power generated in the central highlands Hobart is the centre of a large fruit-growing and mixed farming district and the Derwent valley produces 90% of the hops grown in Australia. The only mills in the world manufacturing newsprint from Australian hardwoods are at Boyer. At Risdon are large works for zinc smelting and associated industries, at Electrona calcium carbide is produced on a large scale, while at Claremont are factories producing cocoa, chocolate and confectionery Other industries are jam making and fruit processing. flour milling, motor and omnibus body building, tanning, manufacture of furni-

ture, joinery, ale, beer and cordials. As a contrast with fine hospitals and other modern buildings many of the churches, public schools and other older buildings possess an old-fashioned charm. Among them may be mentioned the houses of parliament; government house; the treasury buildings; St. David's cathedral; the town hall, of Tasmanian freestone; the museum and art gallery; the general post office, with its clock tower and chimes; the University of Tasmania, established in 1890. Among the parks are Queen's Domain, Mt. Wellington park and Knocklofty reserve. Franklin square. named after the explorer and former governor, Sir John Franklin, St. David's park and Long Beach reserve. The Royal Hobart regatta caters for all classes of aquatic competition and is probably unique. (H. J. R. C.)

HOBART PASHA, AUGUSTUS CHARLES HOBART-HAMPDEN (1822–1886), English naval captain and Turkish admiral, 3rd son of the 6th earl of Buckinghamshire, was born in Leicestershire on April 1, 1822. He entered the navy in 1835, and served with distinction until 1862. when he retired with the rank of post-captain. His first engagement was against slave traders off Brazil in 1835. During the American Civil War, he took command of a blockade-runner. He ran the blockade 18 times, conveying war material to Charleston and returning with a cargo of cotton. In 1867 Hobart entered the Turkish service, and was immediately nominated to the command of the fleet. with the rank of "Bahrie Limassi" (rear-admiral). He helped to suppress the insurrection in Crete, and was rewarded by the Sultan with the title of Pasha (1869).

In 1874 Hobart. whose name had, on representations made by Greece. been removed from the British Navy list, was reinstated; his restoration did not. however, last long, for on the outbreak of the Russo-Turkish War he again entered Turkish service. In command of the Turkish squadron he completely dominated the Black sea, blockading the ports of south Russia and the mouths of the Danube. and paralysing the action of the Russian fleet. In 1881 he was appointed Mushir, or marshal, being the first Christian to hold that office.

He died at Milan on June 19, 1886.

See his *Sketches of My* Life (1886), which must, however, be used with caution, since it contains many proved inaccuracies.

HOBBEMA, MEINDERT (1638–1709), one of the foremost Dutch landscape painters of his day. was born at Amsterdam on Oct. 31. 1633. lived there all his life and died there on Dec. 7. 1709. He was a friend, and probably pupil! of Jacob van Ruisdael. The two made sketching tours together and often painted the same views. Thus Ruisdael's "Water Mill" at Amsterdam and Hobbema's "Water Mill" in Washington, D.C.; Ruisdael's "Ruins of the Castle of Brederode," formerly in the Northbrook collection. and Hobbema's on the same subject in the Wallace collection. London, and Frick collection, New York. These were painted from 1661 to 1663.

In Oct. 1668 Hobbema married the cook of the burgomaster of Amsterdam. This marriage marked the end of his artistic career. for through the position and influence of his wife he received a municipal appointment.

He was. however, not able to amass a fortune, for when his wife died in 1704 she was buried as a pauper, and Hobbema was buried in Dec. 1709 in the pauper section of the Westerkerk cemetery at Amsterdam.

Unlike Ruisdael. who liked to paint the sea, the mountain torrent and rocky landscape. Hobbema's favourite motif is the countryside. thickly studded with trees, houses, churches and ruined castles. A peaceful stream with a water mill may enliven the scene, as in "Landscape With Water Mill" (Institute of Art. Minneapolis. Minn.).

His masterpiece is "The Avenue. Middelharnis," in the National gallery. London. "The Avenue" is unique in style among Hobbema's works, and its fine composition bears no resemblance to the somewhat tame and repetitive designs he produced earlier. Hobbema's other masterpieces were painted between 1663 and 1669. Among them are "a wooded landscape with two cows," in which the cons are painted by Adrian van de Velde. "The Mill" is in the Louvre. and there are examples in most European galleries and in many private collections. From 180 to 200 works by the master are extant. (R. E. W. J.; X.)

HOBBES, THOMAS (1588–1679), English philosopher, perhaps the greatest political thinker of his nation, was born at Westport (now part of Malmesbury), Wiltshire, on April 5, 1588, the second son of Thomas Hobbes, vicar of Westport and Charlton. Reports of the Spanish Armada were filling England with alarm at the time of his birth, and Hobbes afterward attributed his own love of peace to the fact that fear and he were twins. His father was "a choleric man": in Hobbes's early years he caused a scandal by engaging in a brawl at the church door, and disappeared, leaving his three children to be brought up by his brother, a well-to-do glover in Malmesbury. At the age of four Hobbes was sent to the church school at Westport; then to a private school kept by Robert Latimer; and finally, at 15, to Magdalen hall, Oxford. He took little interest in the scholastic philosophy taught there and devoted most of his time to books of travel and the study of maps and charts.

Studies and Travels, 1608–36.—On graduating (Feb. 5, 1608), Hobbes became private tutor to William Cavendish, afterward 2nd earl of Devonshire. and began a connection with the Cavendish family which lasted, with interruptions during the Great Rebellion, until the end of his life. He grew very fond of his pupil. who was only a little younger than himself, and in 1610 accompanied him on a tour in Europe. Finding that the philosophy taught at Oxford was held in contempt there. he determined to make himself a scholar and. on his return to England, devoted himself to classical studies. At some time between 1621 and 162 j he came into contact with Francis Bacon: John Aubrey relates that he occasionally acted as Bacon's amanuensis and helped him to render a few of his *Essays* into Latin. But the chief fruit of Hobbes's classical studies was his translation of Thucydides *(English Works,* viii–ix). Its publication in 1629 was inspired by the troubles of the time, for Hobbes saw in the fate of ancient Athens a salutary warning against democracy.

After the death of the 2nd earl of Devonshire (1628) Hobbes remained for a short time in the Cavendish household, but in 1629 he went abroad again as traveling companion to the son of Sir Gervase Clifton. In 1630 he was recalled from Paris to teach the young earl of Devonshire. William Cavendish (1617–84), son of his late patron. He took his pupil to France and Italy in 1634. These last two excursions stimulated Hobbes's interest in science and philosophy by bringing him into contact with the leaders of the new thought in Europe. The turning point in his intellectual history, his discovery of geometry, is described by Aubrey as follows: "Being in a gentleman's library in . . . , Euclid's *Elements* lay open, and 'tmas the 47 El. libri I. He read the proposition. 'By G—', said he (he would now and then swear by way of emphasis). 'this is impossible!' So he reads the demonstration of it. which referred him back to such a proposition; which proposition he read. That referred him back to another. which he also read. *Et sic deinceps,* that at last he was demonstratively convinced of that truth. This made him in love with geometry." In his prose autobiography *(Latin Works,* i) Hobbes himself relates how he was in a gathering of learned men when the question was asked. "What is sense?" On consideration it occurred to him that if material things and all their parts were always at rest or in uniform motion there could be no distinction of anything and consequently no perception, and he concluded that the cause of all things must be sought in diversity of motion. He was therefore driven to geometry to gain insight into the principles of motion. Hobbes's awakening to physical science seems to have taken place during his second European journey in 1629–30; on his third journey the new interest became an overpowering passion, and he was able to discuss his ideas with Marin Nersenne's circle in Paris and with Galileo. whom he visited at Florence in 1636. He now determined to embody his doctrines in a philosophical trilogy: *De corpore* was to show that physical phenomena were explicable in terms of motion; De *homine* was to show what specific bodily motions were involved in human cognition and appetition; and *De cive* was to expound the proper organization of men in society.

Political Interests, 1637–40.—But when Hobbes returned

home in **1637** he was quickly diverted from abstract speculation about body and motion. Finding the peace of his native land endangered by attacks on the royal prerogative, he set to work to prove that the powers and rights called in question were inseparably annexed to sovereignty, which at that time was admitted to reside in the king; and by **1640** his treatise on *The Elements of Law, Natural and Politic* was being circulated in manuscript.

It already embodies Hobbes's characteristic doctrine that social peace requires the existence of an absolute and undivided sovereign power *(see* ABSOLUTISM, **POLITICAL)**; but it differs from his *Leviathan (see* below) by stressing that primary democracy is the first form of commonwealth by institution, monarchy and aristocracy arising when the democratic sovereign created by the social contract between individuals annihilates itself by transferring its power absolutely to one man or a few. Hobbes's views antagonized both parties in the constitutional struggle: the believers in the divine right of kings were irritated by his attempt to base sovereignty on a social contract, the parliamentarians by his advocacy of absolute monarchy.

Exile in **Paris,** 1640–51.—When strife became acute in **1640** with the impeachment of the earl of Strafford and of Archbishop Laud, Hobbes thought he was a marked man and fled to Paris. Probably his fears were exaggerated. In any case the next 11 years were spent in exile, chiefly in Paris, where he was soon in contact with later fugitives from England. He rejoined the Mersenne circle. and Mersenne showed him the unpublished *Meditations* of Descartes. Hobbes put in writing certain objections to the *Meditations* and also to the *Dioptrique (Latin Works,* v); but the self-confident dogmatism of these communications exasperated Descartes, who finally refused to have anything more to do with "the Englishman." In **1642** *De cive (Latin Works,* ii) appeared at Paris, but so few copies were issued that according to Pierre Gassendi they excited rather than satisfied thirst. This work expanded the argument of the second part of *The Elements of Law* and concluded with a section on religion which dealt more fully than the earlier treatise with the relation between church and state. A Christian church and a Christian state were one and the same body; of that body the sovereign was the head; the sovereign had therefore the right to interpret Scripture, to decide religious disputes and to determine the form of public rvorship. Such, in brief, was Hobbes's remedy for the sectarian controversies then disrupting the peace of so many European states.

Having published the third part of his trilogy first in the hope of averting civil war, Hobbes spent the next four years working on *De corpore;* but in **1646** the young prince of Wales, later to become Charles II, sought refuge in Paris, and Hobbes accepted an invitation to instruct him in mathematics. Contact with exiles from England made it increasingly difficult to concentrate on natural philosophy, and he turned once more to political theory. In 1647 a second edition of *De cive,* augmented by explanatory notes and a "Preface to the Reader," appeared at Amsterdam. In **1650** the manuscript of *The Elements of Law* was published as two separate works, the first entitled *Human Nature,* the second *De corpore politico (English Works,* iv).

In 1651 there appeared an English version of *De cive (English Works,* ii); and this was followed in the same year by Hobbes's masterpiece, *Leviathan, or the Matter, Form, and Power of a Commonwealth, Ecclesiastical and Civil (English Works,* iii). In the first two parts, "Of Man" and "Of Commonwealth," he re-covered the ground already traversed in the earlier treatises; in the last two, "Of a Christian Commonwealth" and "Of the Kingdom of Darkness," he embarked upon a discussion of Scripture and made a vigorous attack on the attempts of papists and presbyterian~to challenge the right of the sovereign.

By 1651 Charles I was dead and the royalist cause seemed hopelessly lost; accordingly, in the "Review and Conclusion" at the end of *Leviathan* Hobbes attempted to define the circumstances under which submission to a new sovereign became legitimate. He had always maintained that a subject had the right to abandon a ruler who could no longer protect him and to transfer his allegiance to one who could; but the statement of this view in his "Review and Conclusion" naturally gave serious offense to Prince Charles's advisers, who concluded that Hobbes was trying to curry favour with the new regime in England in order to facilitate his own return. So little was Hobbes himself conscious of any disloyalty that he presented the prince, newly returned to Paris after the defeat at Worcester, with a manuscript copy of *Leviathan,* "engrossed in vellum in a marvellous fair hand" (probably the copy in the British museum, *Egerton Mss. 1910).* Barred from the exiled court and suspected by the French authorities for his attack on the papacy, Hobbes found his position in Paris becoming daily more intolerable and, at the end of **1651,** returned to England. His patron, the earl of Devonshire, had submitted to parliament in **1646** to save the family estates, and now Hobbes too made his peace with the new regime. Instead of joining his patron in the country he settled in London, where he could enjoy the society of men like William Harvey and John Selden.

Later Life and Controversies.—Hobbes was now 63 years of age, but was to retain his vigour for another quarter of a century. For a time he worked quietly on *De corpore,* but in 1654 he became involved in one of the controversies which were to play so large a part in his later life. In **1646** he had discussed the problem of free will with John Bramhall, bishop of Londonderry, at the house of the marquis of Newcastle in Paris. After the discussion Bramhall had put his arguments in writing and sent them to Newcastle; Hobbes had replied; Bramhall had made a rejoinder; and the controversy had then closed. Since Hobbes had requested Newcastle to keep his contribution private the whole correspondence had remained unpublished. But one of the philosopher's admirers had seen and made a copy of Hobbes's answer; and this he now published, without Hobbes's knowledge, under the title *Of Liberty and Necessity (English Works,* iv). The publication of this work, under Hobbes's name and with an offensive prefatory epistle, incensed Bramhall, who in 1655 proceeded to issue the whole correspondence, including his own replies to Hobbes, in a work entitled *A Defence of True Liberty From Antecedent and Extrinsical Necessity.* In the following year Hobbes retorted with *The Questions Concerning Liberty, Necessity, and Chance (English Works,* v), where he reprinted the correspondence with animadversions on the bishop's replies. In **1658** Bramhall returned to the fray with *Castigations of Mr. Hobbes His Last Animadversions,* which contained for good measure an appendix entitled *The Catching of Leviathan or the Great Whale.* Hobbes took no notice of the *Castigations;* but to the charge of atheism made in *The Catching of Leviathan* he replied ten years later in a work which was not published until **1682,** some three years after his death *(English Works,* iv).

Hobbes's argument with Bramhall over free will is still interesting and important; but the same cannot be said of the other controversy which occupied Hobbes's later years. He had made enemies at Oxford by the publication of *Leviathan,* which attacked the university system as being founded originally for the support of the papal against the civil authority and as still working social mischief by adherence to the old learning. Oxford was therefore quick to avail itself of the opportunities for criticism offered by *De corpore (Latin Works,* i), which was published at last in **1655.** Hobbes's main antagonists were Seth Ward. Savilian professor of astronomy, and John Wallis, author of the great treatise *Arithmetica infinitorum,* both of them much abler mathematicians than Hobbes. He replied to their attacks in Six *Lessons to the Professors of Mathematics in the University of Oxford (English Works,* vii), which appeared in **1656** as an appendix to the English translation of *De corpore (English Works,* i). After more rough thrusts on both sides Hobbes retired to complete his *De homine* (1658; *Latin Works,* ii). It consisted for the most part of an elaborate theory of vision, and although it contained a brief account of human psychology, it did little to bridge the gap between *De corpore* and *De cive.*

As soon as *De homine* was through the press Hobbes prepared to join battle again. In the spring of 1660 he published an onslaught on the newfangled methods of mathematical analysis in six dialogues entitled *Examinatio et emendatzo mathematicae hodiernae qualis explicatur in libris Johannis Wallisii (Latin Works,* iv). In *Dialogus physicus, sive De Natura aeris* (1661; *Latin Works,*

iv) he fulminated against Robert Boyle and other friends of Wallis who were then forming themselves into a society (incorporated as the Royal society in 1662) for experimental research, in opposition to the deductive method of physical inquiry advocated in *De corpore*. Wallis, retorted in the scathing satire *Hobbius heautontimorumenos* (1662). Professing to be roused by the attack on his friend Boyle, when he had scorned to lift a finger in defense of himself against the earlier dialogues. he tore them all to shreds with consummate skill, accusing Hobbes, quite unjustly, of having written *Leviathan* in support of Oliver Cromwell's title and of having deserted his royal master in distress. Hobbes answered these charges in a letter about himself in the third person addressed to Wallis in 1662, under the title *Mr. Hobbes Considered in His Loyalty, Religion, Reputation, and Manners (English Works,* iv). In this piece, which is of great biographical value, he told his own and Wallis' "little stories during the time of the late rebellion" so effectively that Wallis wisely attempted no reply.

After a time Hobbes began a third period of controversial activity, which did not end on his side till his 90th year. *De principiis et ratiocinatione geometrarum* (1666; *Latin Works,* iv) was designed to humble the pride of professors of geometry by showing that their works contained as much uncertainty and error as those of writers on physics or ethics. *Quadratura circuli, Cubatio sphaerae, Duplicatio cubi* (1669; *Latin Works,* iv) gave Hobbes's solutions to these famous problems; and although they were promptly refuted by Wallis he worked them up again in later publications. In 1674, at the age of 86, he published *Principia et problemata aliquot geometrica, ante desperata, nunc breviter explicata et demonstrata (Latin Works,* v); and in 1678 appeared his last piece of all, *Decameron physiologicum (English Works,* vii), a new set of dialogues on physical questions. By this time Wallis had given up the vain attempt to cure him of his mathematical aberrations.

These controversial writings on mathematics and physics represent only part of Hobbes's activity after the age of 70. From the time of the Restoration he acquired a new prominence. Two or three days after Charles II's arrival in London, Hobbes attracted the notice of his old pupil in the street and was at once received into favour. The king relished his wit (he used to say, "Here comes the bear to be baited!"), and did not like the old man the less because his presence at court scandalized the bishops and the prim virtue of the chancellor Edward Hyde (1st earl of Clarendon). He even granted Hobbes a pension of £100 a year (not always fully or regularly paid) and had his portrait hung in the royal closet. But "Hobbism" was frequently identified with freethinking and even with atheism, for Hobbes's attack on the church was regarded as subversive of all religion. His enemies were many and powerful. His eagerness to defend himself against Wallis' imputation of disloyalty and his apologetic dedication of *Problemata physica (Latin Works,* iv) to the king are evidence of the hostility with which he was being pressed by the church party as early as 1662; but it was not till 1666 that he felt himself in serious danger. In that year the house of commons embodied the superstitious fear arising from the calamities of the plague and the Great Fire of London in a bill against atheism and profaneness; and the committee to which the bill was referred was instructed to investigate *Leviathan*. Hobbes, then verging upon 80, burned such of his papers as he thought might compromise him and set himself to inquire into the state of the law of heresy.

The results of his investigations appeared in the three short dialogues which in the Latin version of *Leviathan* (1668; *Latin Works,* iii) replaced the old "Review and Conclusion." In these dialogues, as in the tract entitled *An Historical Narration Concerning Heresy and the Punishment Thereof* (published posthumously in 1680; *English Works,* iv), he maintained that since the abolition of the high court of commission there was no court of heresy to which he was amenable and that in any case nothing was to be declared heresy but what was at variance with the Nicene creed, as the doctrine of *Leviathan* was not.

Although parliament dropped the bill on atheism Hobbes could never afterward get permission to print anything on subjects relating to human conduct. In 1668 his Latin works (2 vol.) came out at Amsterdam, because he could not obtain the censor's licence for their publication in England. Some of his other writings were not printed until after his death—the king apparently having made it the price of his protection that no fresh provocation should be offered to popular sentiment. The most important of the works thus withheld from publication was the spirited dialogue *Behemoth, the History of the Causes of the Civil Wars of England* (*English Works,* vi). This was kept back at the king's express desire, but an unauthorized edition was brought out in 1679, while Hobbes was still alive. *Behemoth* was composed about 1668; to the same period probably belongs the unfinished *Dialogue Between a Philosopher and a Student of the Common Laws of England* (published in 1681; *English Works,* vi), a trenchant criticism of the constitutional theory of English government as upheld by Edward Coke. The Latin elegiacs exposing the methods by which ecclesiastics encroached upon the civil power may also date from this period; they were first published in 1688 under the title *Historia ecclesiastica (Latin Works,* v).

For some time, then, Hobbes was not allowed to publish a word in his own defense, and his enemies took every opportunity to discredit him. But no Englishman of the day stood in such high repute abroad, and distinguished foreigners who visited England were always eager to pay their respects to the old man, whose vigour and freshness of intellect no passage of the years seemed able to quench. Among these was the grand duke of Tuscany (Ferdinand 11), who took away some works and a portrait to adorn the Medicean library.

In his last years Hobbes amused himself by returning to the classical studies of his youth. The autobiography in Latin verse *(Latin R'orks,* i), with its playful humour, occasional pathos and sublime self-complacency, was thrown off at the age of 84. In 1673 he produced *The Travels of Ulysses,* a translation of books ix–xii of the *Odyssey* in rugged English rhymes; finding this favourably received, he published in 1675 a rendering of the whole epic, with a lively preface "Concerning the Virtues of an Heroic Poem." A translation of the *Iliad* appeared in the following year *(English Works,* x). As late as Aug. 1679 he was promising his publisher "somewhat to print in English." He died at Hardwick hall in Derbyshire on Dec. 4 of that year and was buried in the neighbouring church of Hault Hucknall.

Personal Character.—Hobbes was tall and erect in figure. Believing that "a beard did not make a philosopher," he had himself shaved close except for a little tuft under his lip. He lived a temperate life. He used to say that he had been drunk about 100 times in all; and after the age of 60 he drank no wine and ate little meat. His favourite sport was tennis, which he still played occasionally even at 75.

Socially he was genial and courteous, though in argument he sometimes lost his temper. Cautious in practical matters, but intellectually bold in the extreme, he claimed to have read little and boasted that he would have known as little as other men if he had read as much. He is said to have had an illegitimate daughter for whom he made generous provision. There is a portrait of him by J. M. Wright in the National Portrait gallery, London, and two others are in the possession of the Royal society.

Hobbes's Place in **Philosophy.**—Hobbes was so impressed by Galileo's achievements in mechanics that he sought to explain all phenomena, and indeed sense itself, in terms of the motion of bodies. His a priori mathematical approach to natural philosophy separated him decisively from Francis Bacon, who had advocated an experimental inductive method; and the laborious investigations which John Locke was later to make into the powers of the human understanding were alien to his dogmatic and self-confident temper.

Yet Hobbes was not only the architect of a grand metaphysical design: he was also a critical philosopher with a lively interest in language and a keen eye for the snares which it spread for the unwary. Indeed, his account of the sources of absurdity, which provided him with a potent weapon against the scholastics, gives him some title to be regarded as a forerunner of modern logical analysis.

But Hobbes's reputation as a thinker rests mainly on his contributions to the philosophy of man. His egoistic psychology was

taken over and elaborated by Spinoza; and in Great Britain it stimulated such thinkers as the 3rd earl of Shaftesbury, Joseph Butler and Francis Hutcheson to seek a more respectable account of human motivation. His contribution to the free-will problem in his controversy with Bramhall had an influence which can be traced not only in Spinoza, Locke, Anthony Collins, David Hume and Jonathan Edwards, but even in modern writers like Moritz Schlick and G. E. Moore. In moral theory he is generally regarded as a pioneer of the utilitarian school. He justified obedience to moral rules as the means to "peaceable, social, and comfortable living"; and, since he was hostile to the political pretensions of ecclesiastics, it obviously suited him to give such rules a purely secular basis. Yet he also said that the laws of nature were God's commands: and it was left to Spinoza to deny that God was a king who laid down laws which men could break. *(See* ETHICS, HISTORY OF: *Modern Ethics.)*

In his political theory he departed from the accepted tradition by making natural right rather than natural law his fundamental concept. The right of nature is essentially a right to self-preservation, and Hobbes maintains that a man has no obligation to act in accordance with the law of nature, and indeed cannot do so, if he thinks such conduct inimical to his own security. Yet peace and its blessings cannot be achieved unless the law of nature is generally observed.

Hobbes's solution is to give everyone a guarantee of the good behaviour of his fellows by creating a power sufficient to keep them in awe. This power will be created if each individual promises every other individual that he will carry out whatever commands some selected person—either one man or an assembly, but preferably one man—shall consider necessary for the peace and defense of all. Such covenants. by convincing each individual that the others will obey the person agreed upon, will inspire him with a belief in the sovereign's power; and a sovereign so established may survive even if all the subjects desire to depose it, provided that they do not communicate their desire to one another. This condition will be satisfied in Hobbes's commonrvealth, whose subjects have no source of unity but the sovereign.

The sovereign's right will be as absolute as its power. Insofar as it is responsible at all, it is responsible only to God. It cannot be unjust to its subjects, since these have authorized its actions, and consent precludes violation (*injuria non fit volenti*). Nor is it bound by any covenant with the people, for there is no people apart from the sovereign.

In essence Hobbes's argument is very simple. He first analyzes the conditions necessary for peace and security and then, in his version of the social contract. provides a recipe for constructing an ideal state in which these conditions will be satisfied. Later thinkers, stimulated and influenced though they were by his doctrine. were critical both of his account of the ends of the state and of the means which he advocated to achieve them. Spinoza maintained that peace was not mere absence of war but voluntary co-operation; Locke and Jean Jacques Rousseau rudely compared the peace of Hobbes's state with the peace of a dungeon. As for the means, Spinoza argued that absolute sovereignty was seldom. if ever, possible in practice and explored the limitations which the intractable nature of man imposed upon those in authority; Locke, denying that security could be attained by submission to an absolute ruler "corrupted by flattery and armed with power." recommended that legislative power and executive power should be placed in different hands and that the former should be vested in an assembly whose members would be subject to the laws which they collectively made; and Rousseau. while accepting absolute sovereignty. equated sovereignty with the legislative power which he vested in the people as a whole (he too found some safeguard against oppressive legislation in the fact that the lawmakers were to be subject *qua* individuals to their own laws).

Hobbes's reputation was soon overshadowed by that of Locke; and when the theory of the social contract went out of fashion he suffered a period of neglect in Great Britain. But in the 19th century interest in him was revived by the followers of Jeremy Benthnm and in particular by John Austin, who made a modified version of Hobbes's doctrine of sovereignty and law the basis of his jurisprudence; and since Austin's day Hobbes has gradually won recognition as one of the greatest of English political thinkers.

BIBLIOGRAPHY.—The standard edition of Hobbes's complete works is that by Sir William Molesworth, comprising *English Works,* 11 vol. (London, 1839–45), and *Latin Works,* 5 vol. (London, 1839–45); the *Latin Works* include the autobiographies in prose and verse and a supplement entitled *Vitae Hobbianae Auctarium.* Among the numerous modern editions of *Leviathan* that by M. Oakeshott (Oxford, 1946; New York, 1947) is noteworthy for its controversial introduction (*cf.* articles in *Political Studies,* i, pp. 53–63, 216–227, and ii, pp. 168–172 [Oxford, 1953]). Other modern editions of separate works include *The Elements of Law* and *Behemoth,* ed. from early manuscripts by F. Tonnies (London, 1889); *Of Liberty and Necessity,* ed. by Baron Cay von Brockdorff (Kiel, 1938); and the English version of *De cive,* ed. by S. P. Lamprecht (New York, 1949). For details of original editions *see* H. Macdonald and M. Hargreaves, *Thomas Hobbes: a Bibliography* (London, 1952).

John Aubrey's account of Hobbes (in *Brief Lives,* ed. by A. Clark, vol. i, pp. 321–403 [Oxford, 1898]) gives intimate anecdotes. For further studies *see:* G. C. Robertson, *Hobbes* (London, 1886); F. Tonnies, *Hobbes der Mann und der Denker* (Leipzig, 1912); Sir Leslie Stephen, *Hobbes* (London, 1904); R. HOBHOUSE, LEONARD TRELAWNEY (1864–1929), British philosopher and sociologist. was born Sept. 8, 1864, at St. Ive, near Liskeard. Educated at Oxford, he taught at Merton and Corpus Christi colleges until 1897. An active Liberal, he served on the editorial staff of the *Manchester Guardian* until 1902, was secretary of the Free Trade union until 1905 and published several political works, notably *The Labour Movement* (1893; 2nd ed., 1898). *Democracy and Reaction* (1904) and *Liberalism* (1911), showing strong sympathy with collectivism which he maintained was consistent with Liberalism. In 1907 he was appointed professor of sociology in the University of London, a position he retained until his death at Alençon, France, on June 21, 1929. His concept of sociology, not as a specialty, nor a synthesis of specialties but as the interpretation of social life as a whole, helps explain the many fields such as philosophy, biology and psychology into which he ventured and made his own.

His principal works are *The Theory of Knowledge* (3rd ed., 1921); *Mind in Evolution* (2nd ed.. 1915); *Morals in Evolution* (rev. ed., 1915); *Development and Purpose* (rev. ed.. 1927); *Social Evolution and Political Theory* (1911); and, in collaboration with G. C. Wheeler and M. Ginsberg, *The Material Culture and Social Institutions of the Simpler People* (1915). Four works constitute his sociological system and together they are entitled *The Principles of Sociology* (1918–24). The first, *The Metaphysical Tlzeory of the State* (1918), criticizes the Hegelian theory of the state; the second, *The Rational Good* (1921), develops a social philosophy based on individual development and the common good; the third, *Elements of Social Justice* (1922), applies this philosophy to concrete economic and political problems; the final volume, *Social Development* (1924), examines the actual conditions underlying the life of societies and their bearing on the fulfilment of rational purpose.

See Hugh Seiver Carter, *The Social Theories of L. T. Hobhouse* (1927); M. Ginsberg and J. A. Hobson, *L. T. Hobhouse: His Life and Work* (1931); J. A. Nicholson, *Some Aspects oj the Philosophy of L. T. Hobhouse* (1928).

(J. RY.)

HOBOKEN, town of Belgium on the right bank of the Scheldt about 4 mi. above Antwerp. It is an important industrial centre. Many wealthy Antwerp merchants have villas there, and it is the headquarters of several of the leading rowing clubs on the Scheldt. Pop. (1955 est.) 30.867.

HOBOKEN, a city of Hudson county, in northeastern New

Jersey, U.S., adjoining Jersey City and Union City (*qq.v.*), is located on the Hudson river opposite Manhattan Island, with which it is connected by ferry, tunnel and subway.

In 1630 the Dutch, led by Michael Pauw, purchased the site from the Leni-Lenape Indians, who smoked carved stone pipes and named it Hobocan after *Hobocan Hackingh* (land of the tobacco pipe). In 1784 John Stevens (*q.v.*), the locomotive inventor, after whom the Stevens Institute of Technology is named, bought the site and laid out the town more formally.

During the large-scale migrations to the U.S., around the middle of the 19th century, Germans and Irish came to Hoboken and German traditions dominated. The first brewery in America (1642) was built there by a Dutchman. Aert T. van Putten, and beer (which is no longer produced) was later brewed in great quantities by the Germans, who established many beer halls and gardens. The New York Knickerbockers, early baseball team, made the Elysian Fields their home field for the 1846 season *(see* BASEBALL: *History of Baseball).*

During World War I Hoboken was the main port of embarkation of U.S. forces to continental Europe. Under the terms of a 1952 agreement the Port of New York authority leased Port Hoboken for operation as an integral part of the Port of New York. Hoboken's industries include shipbuilding, processing machinery, textiles, food processing, chemicals, furniture, electronic equipment, paints and precision instruments. The modern type ferry slip and the application of steam power to ships and locomotives is closely associated with Hoboken through Stevens' inventions and their later development. For comparative population figures *see* table in NEW JERSEY: *Population.* (D. N. A.; M. P. M.)

HOBSON'S CHOICE, *i.e.,* "this or nothing," an expression that arose from the refusal of the Cambridge-London carrier, Thomas Hobson (1544?–1631), when letting his horses on hire, to allow any animal to leave the stable out of its turn. Among bequests made by Hobson, whose death was commemorated by Milton. was a conduit for the Cambridge market place.

HOBY, SIR THOMAS (1530–1566), English diplomat and translator of Castiglione's *Cortegiano,* was born in 1530. He entered St. John's college, Cambridge, in 1545, but in 1547 went to Strasbourg. Thereafter he traveled extensively on the continent, spending a short time at Augsburg with his half brother, Sir Philip Hoby (1505–58), then ambassador at the emperor's court. By 1552 Thomas was engaged on his translation, *The Courtyer of Count Baldesser Castilio,* printed in 1561. The *Cortegiano,* which Samuel Johnson called "the best book that ever was written upon good breeding." exercised an immense influence on the standards of manners throughout Europe and was the recognized authority for the education of a nobleman. Hoby was knighted by Elizabeth I in 1566, and was sent to France as English ambassador. He died in Paris on July 13 of the same year. His other works include a translation of a Latin work by Martin Bucer as *Gratulation ... Unto the Church of England* and an autobiography, *A Booke of the Travaile and Lief of Me, Thomas Hoby,* edited by *E.* Powell for the Camden Miscellany, vol. x (1902).

HOCHE, LAZARE (1768–1797), French general, was born near Versailles on June 24, 1768. He enlisted in the *Gardes françaises* and soon obtained promotion. When the *Gardes françaises* were broken up in 1789 he served in various line regiments up to the time of his receiving a commission in 1792. He served with credit in the operations of 1792–1793 on the northern frontier of France. When Dumouriez deserted to the Austrians, Hoche, with le Veneur and others, fell under suspicion of treason; but after being kept under arrest for some months he took part in the defence of Dunkirk, and in the same year (1793) he was promoted successively *chef de brigade,* general of brigade, and general of division. During his command in Lorraine he was defeated by the Prussians at Kaiserslautern (Nov. 28, 30, 1793), but the Committee of Public Safety valued his services enough to leave him in command; in December, after he had stormed the lines of Fröschweiler the army of the Rhine was also put under him, and he pursued his success, sweeping the enemy before him to the middle Rhine in four days. Before the following campaign opened, he married Anne Adelaïde Dechaux at Thionville (March 11, 1794). Ten days later he was suddenly arrested, on charges of treason preferred by Pichegru, the displaced commander of the army of the Rhine. Hoche escaped execution, though imprisoned in Paris until the fall of Robespierre. On Aug. 21, 1794 he was appointed to command against the Vendéans and made the peace of Jaunaye (Feb. 15, 1795) when the war was renewed by the royalists. Hoche inflicted a crushing blow on the royalist cause by capturing de Sombreuil's expedition at Quiberon and Penthibvre (July 16–21, 1795). Before the summer of 1796 he had pacified the whole of the west, which had for more than three years been the scene of a pitiless civil war. In December 1796 he was appointed to organize the invasion of Ireland, but the expedition was driven back by bad weather. Hoche was at once transferred to the Rhine frontier, where he defeated the Austrians at Neuwied (April), though operations were soon afterwards brought to an end by the Preliminaries of Leoben. Later in 1797 he was minister of war for a short period, but, finding himself the dupe of Barras and technically guilty of violating the constitution, he returned to his command on the Rhine frontier. But his health grew rapidly worse. and he died at Wetzlar on Sept. 19, 1797.

HO CHI MIMH (originally NGUYEN TAT TAN) (1890–), founder and first president of the Democratic Republic of Viet-, nam (northern Vietnam), was born on May 19, 1890, in a village of Annam. After participating in Tongkingese revolutionary activities, he went to France in 1919 as a dock hand, changing his original name to Nguyen Xi Quoc ("Friend of the People") and, in 1920, joining the French Communist party. He then went to Moscow (1924), whence in 1925 he was sent to Canton to join the staff of Borodin (Mikhail Markovich Grusenberg). the Soviet consul there. Arrested by the Chinese government in 1927 but soon released, he returned for a time to Moscow but was next sent to Thailand to prepare an insurrection in French Indochina. His Vietnam Workers' party (Dan Lao Dong Viet Nam) was banned by the French after riots in Tongking (1931). Moving to Hong Kong. Ho continued to organize Communist activity in Tongking and Thailand from there. In 1941, with the new name of Ho Chi Minh ("Brilliant One"), he appeared in the southern Chinese province of Yunnan as leader of the Vietnam League for Independence (Viet Nam Doc Lap Dong Minh Hoi). After the Japanese surrender at the end of World War II he proclaimed the People's Republic of Vietnam at Hué on Sept. 2, 1945, with himself as president. Invited to Paris by the French government for negotiations, he signed the Fontainebleau agreement of Sept. 1946 to make Vietnam an independent unit in an Indochinese federation, but fighting broke out between the French and his forces in the folloning December. The ensuing war continued until the Geneva armistice of July 1954, which partitioned Vietnam between a northern Communist state and a southern national one. *See* also VIETNAM.

HOCK, a name probably corrupted from Hochheim on the Main, is used to designate nhite table uines produced in the Rhine valley. Elsewhere it is also applied, as is the more frequently encountered term Rhine wine, to any thoroughly dry, tart, light-bodied table wine of straw colour or slightly greenish hue. In at least some portions of the Rhine valley grape vines were started by the Romans, and Charlemagne found them flourishing around 800 A.D. Three celebrated vineyards of the Rhine were founded by monks early in the 12th century.

The finest Rhenish hocks are from the Rhinegau vineyards, situated along the Rhine's right bank from Rudesheim to the juncture with the Main. Here the highly developed Riesling grapes thrive, imparting to the best wines a fresh briskness combined with soft fullness and a distinctive bouquet. Sylvaner grapes are grown also, and at Rudesheim the use of Green Orleans gives local wines a darker colour and a more fruity flavour.

On the Rhine's left bank, from Bingen to Mayence, and then on to Worms are the more extensive vineyards of the Rhinehesse. There the wines, though sweet and full, are less celebrated.

Further up the Rhine, south of Worms, the Rhinepfalz or Bavarian Palatinate favours mixed plantings of Riesling, Gutedel, Traminer and Sylvaner for early-maturing wines usually slighter than those of the Rhinegau or Rhinehesse.

There are other hocks, notably the Stein wines grown in lower Franconia, to the east of Hochheim, which are distinctive and in good years fine. They appear in squat, flasklike *bocksbeutels* instead of the slender bottles commonly used for Rhine wines.

Throughout the Rhine area viticulture is difficult. The soil is forbidding, the vineyards rise on slopes often so steep that even animals may not be employed to till the soil, and the seasons are sometimes too harsh to permit full ripening of all the grapes. Grapes from the same vineyard are gathered at various stages of ripeness, and if possible of over-ripeness, to produce various qualities of wine. In other viticultural areas of the world wines of hock or Rhine-wine type are produced largely from Rhine grape varieties. While in the eastern United States native grapes or crossbreeds are employed in the absence of Rhine varieties, in California the Johannisberger Riesling, Sylvaner, Traminer and Gutedel are favoured. *(See* WINE.)

HOCKEY, an outdoor game played on a grass or hard dirt surface nith a ball by two opposing teams of 11 players on each side. using hooked or bent sticks with which each side attempts to drive the ball into the other's goal. The game is also called field hockey to distinguish it from ice hockey (q v).

A crude form of a stick game was played by the ancient Persians, from whom it was acquired by the Greeks. who in turn passed it on to the Romans. A discovery made at Athens in 1922 gives reason to believe that a form of stick game came from the east. This was a bas-relief found in the wall built by Themistocles (c. 514–449 B C), which depicts six youths taking part in a game resembling hockey. and shows what is termed a bully in the modern game, but with the hooked sticks pointing downward instead of upward. Traces of a sort of stick game have also been found in America, as played by the Aztec Indians, and evidence shows that probably most of the Indian tribes in America played a rough stick game for several thousand years But neither these nor the "London Balle Playe" mentioned by William Fitzstephen in 1175 bear much general resemblance to modern hockey.

Modern Hockey. — About 1875 a game resembling modern hockey began to be played in England. No goal could be scored if hit from a distance of more than 15 yd. from the nearest goal post. but players did not for a time realize the need of a definite marked-out circle A landmark in the progress of the game was the formation of the famous Wimbledon club in 1883. The members at first used a string ball and light ash sticks. A few more clubs soon came into being in the London area and the game spread to the midlands, west and north of England. The real birthday of modern hockey was. however, Jan. 18. 1886. the date of the formation of the Hockey association and of the adoption of the striking circle In 1895 the first international match was played between England and Ireland, resulting in a win for the former by 5 goals to nil. About 1900 the need for an international committee to frame and amend the rules of the game was realized. and the governing bodies of Ireland and Wales were each asked to send two representatives to meet three from the Hockey association. Later this body was called the International Hockey board, its membership being increased by two on the formation of the Scottish Hockey association in 1902. The game grew rapidly throughout the British Isles and is played there by hundreds of clubs as well as by schools and universities and the various armed services.

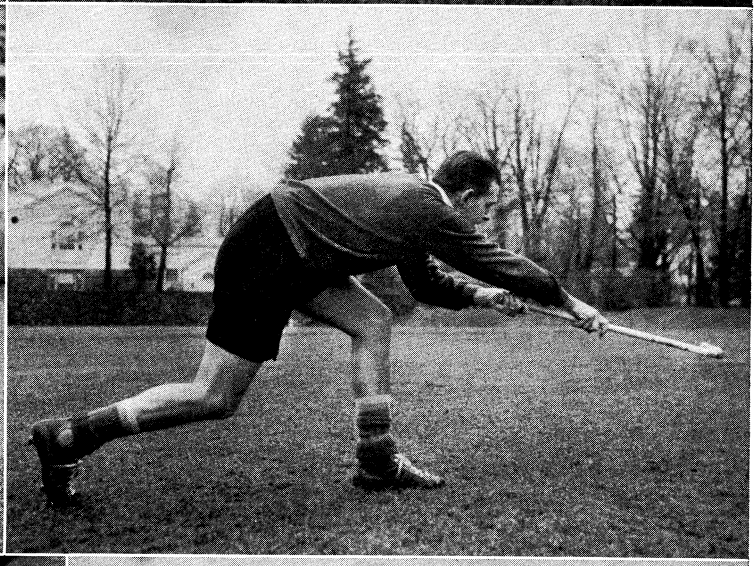
The Game Throughout the World. — Although not played to the same extent as football (soccer), the game is now popular in many countries throughout the world. The national associations of these countries, including those making up the rest of the British commonwealth and also the United States, did not become members of the International Hockey board but of the Fédération Internationale de Hockey. From 1908 hockey was included in the program of the Olympic games. England, after an absence of several years. competed in the Olympic games held in London in 1948. and a close working arrangement was instituted at that time between the International Hockey board and the Fédération Internationale de Hockey whereby the observance thereafter of the same playing rules by all countries was assured. The leading countries *in* this sport in the 1950s were India, the Netherlands, England. Germany and Pakistan. Along with cricket. hockey gained the distinction of being the national game of India. which dominated Olympic competition. Sports writers covering the games of 1932 at Los Angeles. Calif.. voted the performance of the Indian team the outstanding exhibition of skill in any sport. The Indian type of play features short. controlled passes as opposed to the European type. in which the tendency is to hit the ball about the field more. Furthermore, the players in India and Pakistan use sticks with a short toe. By using these sticks and employing a left-handed grip well behind the stick they are able to reverse the stick without changing the grip and thus attain remarkable ball control. The conventional long-toed stick will strike the ground and fail to contact the ball properly if it is reversed in this manner. European players were gradually adopting the short-toed stick in the early 1950s. United States Olympic players attempted to follow the Indian type of play as closely as possible, although they also used some of the European technique.

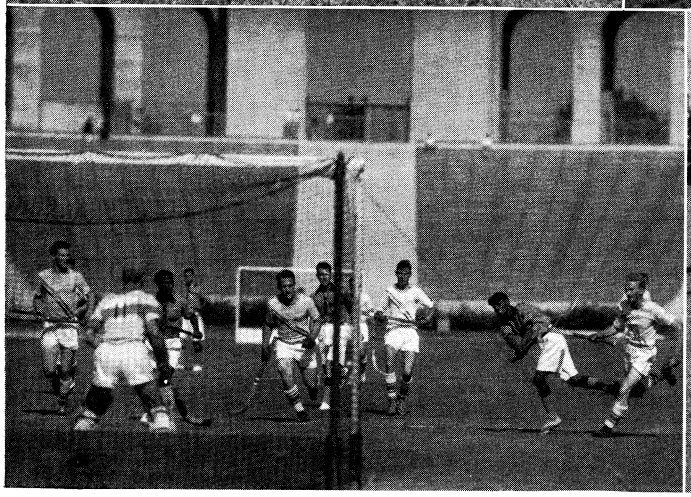
A version of the game to be played indoors was devised. utilizing special rules and a limited number of players.

The Game. — The game is played by two teams of 11 players on a rectangular ground. 100 yd. long and not more than 60 yd. nor less than 55 yd. wide, marked with white lines: the longer boundary lines are the side lines. the others the goal lines. Inside the ground. at a distance of 7 yd. and running parallel with the side lines, a dotted line is marked. called the 7-yd. line. The goals are 12 ft. wide and 7 it. high. In front of each goal there is drawn a white line. 12 ft. long. parallel to and 16 yd. from the goal line. This line is continued each way to meet the goal line by quarter circles having the goal posts as centres. The space thus enclosed is called the striking circle. For a goal (which counts 1 point) to be scored the ball must pass over the goal line between the goal posts and under the crossbar. and while within the striking circle must have been touched by the stick of an attacker. The ball originally was a cricket ball (similar to a baseball) but plastic balls now are also approved. It weighs $5\frac{1}{2}$ to $5\frac{3}{4}$ oz. and is $8\frac{13}{16}$ to $9\frac{1}{4}$ in. in circumference. The average stick is 36 to 38 in. long and weighs 18 to 22 oz. The diameter must not exceed 2 in. nor the weight 28 oz. To prevent stinging the handle is laminated and is attached to the solid head by glue and binding. The striking surface is flat on the left side only and only the flat surface may be used. The usual composition of a team is five forwards, three halfbacks, two fullbacks and a goalkeeper. Two halves of 3j minutes each are played and no subsfitutions are allowed. even for injury. Time out is permitted only in case of injury. Generally speaking. strategy in field hockey is similar to soccer football. However, one big difference is that no obstruction is allowed—that is. it is forbidden to place one's body between the opponent and the ball. The reason for this rule and for the one-sided stick rule is that the sticks are relatively heavy and are used for hard striking. Consequently, if it were permitted to defend the ball with the body the game would become quite dangerous. The goalkeeper wears heavy pads and while in the striking circle is allowed to kick the ball or stop it with the foot or body. All other players, however, may stop the ball with the hand or stick only.

The game is started and restarted after each goal by a bully in the centre of the field. A bully occurs when two players stand at opposite sides of the ball and tap the ground and each other's sticks alternately three times before putting the ball in play. All players must be on side during a bully. If the ball is hit over the goal line by the attackers without a goal being scored or accidentally hit over the goal line by a defender from beyond the 25-yd. line. the game is restarted by a bully on the nearer 25-yd. line. If the ball is hit over the goal line accidentally by the defense from within the 2j-yd. line. a corner is taken, the defenders all being behind the goal line and the attackers being outside the striking circle until the ball is hit in by one of the attackers from the corner of the field scores to which the ball went out. If the defenders hit the ball over the goal line intentionally or commit a foul within the

HOCKEY





BY COURTESY OF (TOP LEFT, TOP RIGHT, CENTRE LEFT, CENTRE RIGHT) HENRY KIRK GREER, (BOTTOM LEFT, BOTTOM RIGHT) UNITED STATES FIELD HOCKEY ASSOCIATION

Top left: The face-off or bully. Player at left is in correct position: the other player is not standing "square" and not using the flat of stick

Top right: Dribble and left lunge. Player with ball is employing grip with left hand well behind the stick, enabling him to reverse stick and control the bail by twisting left wrist forward. The left lunge enables other piayer to tackle from same level or rear. Both players are using the short-toed stick introduced by India and Pakistan

Centre left: Start of flick stroke. The head of the stick is laid back slightly, the ball at its heel. The player has left foot forward, knees bent and weight low

Centre right: Finish of flick stroke. As the stick is pushed ahead the ball rolls toward the toe and is thrown forward, rising slightly

Bottom *left:* Action between Olympic teams of India and the United States at a practice match

Bottom right: Action during a U.S. women's national tournament

circle or a deliberate foul inside the 2j-yd. line. a penalty corner is taken. the only difference being that the attacker hits the ball out from a point on the goal line 10 yd. from either goal post. In the case of a deliberate foul by the defense inside the striking circle or any foul within the circle which prevents a goal being scored. a penalty bully is awarded. This is taken j yd. in front of the goal by the offending player and any player from the attacking team. All other players must remain out of play. In the case of other fouls a free hit is awarded the team opposed to the offender on the spot where the infraction occurred. No other players may stand within 5 yd. of those taking a bully or the one taking a free hit. When the ball goes over the side line it is rolled in by hand by a player of the team opposed to the player who last touched it. all other players remaining back of the 7-yd. line. The stick must not be raised above the shoulder when playing the ball and undercutting the ball and hooking sticks is not allowed. The offside rule is similar to that in soccer except that three opponents are required to place a player on side if he is ahead of the ball and in the attacking half of the field. An important point is that the umpire refrains from enforcing a penalty where he believes that to enforce it would give an advantage to the offending team. There is one umpire for each half of the field. The playing surface is usually grass covered, but in India most of the grounds are of hard dirt. In England and most of continental Europe the game is played through the fall. winter and spring, but in the Cnited States weather conditions usually permit play only in the fall and spring. The *Rules and Official Notes* covering the game were redrafted generally in 1952.

Women's Hockey.—The foregoing comments apply particularly to the game as played by men. Hockey is also played extensively in many countries by women. Although women do not compete in this sport in the Olympic games. they do engage in international competition. The international governing body, the International Federation of Women's Hockey Associations. was formed in 1927. Teams representing England dominated international competition. The game was introduced in the United States in 1901 by Constance M. K. Applebee, a member of the British College of Physical Education. and thereafter became the most popular outdoor team sport among women in the United States. It is played in schools and colleges and sectional and national tournaments are held.

The rules used by women are similar to those used by men, the following being the more important exceptions: the striking wide measurement is 15 yd.; the dotted lines are j yd. from the side lines; the foot may be used to stop the ball provided there be no rebound; on corners the members of the forward line of the defenders are stationed on the 2j-yd. line (United States innovation being gradually adopted); and playing time does not exceed two 30-minute halves.

HODDESDON, a market town and urban district in the East Hertfordshire parliamentary division. Eng.. in the Lea valley, 18 mi. N. of St. Paul's cathedral, London, by road. Pop. (1951) 13,736. Area 6.9 sq.mi. It was a Great North road coaching station but of its old inns lining the High street many are now private houses; there. too, are St. Monica's priory, once Rawdon house (1622). and the Clock tower which dominates the market place —in use since 1253. By the New river is Rye house generating station (1954). Hoddesdon. well known to anglers in the Lea, is mentioned by Izaak Walton. Though residential, about 320 ac. are covered with glasshouses for tomatoes and flowers and there are sand and gravel pits. In the greater London plan the area, with Broxbourne woods, is a beauty spot and part of the "green. belt."

HODEIDA (HODEDA, HADEDA, HUDAIDA), chief seaport of Yemen, on the Arabian coast of the Red sea, lies on a beach of muddy sand exposed to south and west winds. Steamers anchor more than a mile from shore, and goods are lightered. Its population is estimated at 30.000. In Turkish times, Hodeida contained Indian. African and Greek traders, but after World War I prosperity declined. Coffee, skins and hides are the chief exports. After World War I Hodeida, occupied by British troops, was handed over to the Idrisi ruler of Asir, but in 1921 Imam Yahya of Yemen had no difficulty in wresting the town and district from his son Saiyid Ali ibn-Mohammed. By the Italian treaty with the imam. Hodeida was formally recognized as forming part of Yemen.

HODGE, CHARLES (1797–1878), U.S. Presbyterian theologian, the major figure in the "Princeton school" of Reformed (Calvinist) orthodoxy, was born Dec. 27, 1797, in Philadelphia, Pa.. but moved at age 14 to Princeton, N.J., his home for 68 years. He graduated from Princeton college, then from the seminary, where, in 1822 he became professor of biblical literature. Traveling abroad (1826–28), he met leading continental theologians in Paris, Halle and Berlin, but firmly resisted all the newer trends of thought, significantly forming a lasting friendship with the learned and conservative Friedrich August Tholuck of Halle. Adding systematic theology to exegetical work, Hodge became. after 1840, professor of exegetical, didactic and polemic theology until his retirement in 1877, thereby contributing to the training of about 3.000 ministers. Active as a churchman, he was moderator of the "Old School" Presbyterian Church in 1846. Having founded the *Biblical Repertory and Princeton Review* in 1825, he remained an editor for 46 years, contributing nearly 150 articles. Among his books are biblical commentaries on the Roman, Ephesian and Corinthian epistles; a rejection of "nonteleological" science called *What is Darwinism?* (1874); and his magnum opus, the influential *Systematic Theology,* 3 vol. (1871–73).

Hodge emphasized exegesis of a verbally infallible Bible as the base of all theology and recognized as his intellectual antecedents the church confessions and scholastic systems of 17th-century Calvinism, pre-eminently the thought of François Turretin (d. 1687) of Geneva. He adopted a method described by himself simply as induction and deduction from biblical "facts." By defending his tradition with learned and detailed reference to the history of theology, to Roman Catholic teaching and to the contemporary streams of religious: scientific and philosophic thought: he mediated to United States religious life both a broad learning and an unruffled resistance to innovation.

He was much revered for learning and piety, a pleasant wit and an irenic manner even in polemic. Hodge died June 19, 1878.

See A. A. Hodge, *The Life of Charles Hodge* (1880). (E. **A. Dy.)**

HODGES, COURTNEY HICKS (1887–), U.S. army officer, was born at Perry, Ga., Jan. 5, 1887. Enlisting in the U.S. army in 1906, he was commissioned second lieutenant of infantry three years later, serving in Mexico (1916–17) and France (1918). He headed the infantry school (1940–41) and was chief of infantry from 1941 to 1942. In 1942 he commanded the 10th corps and, in 1943, the 3rd army. He assumed command of the 1st army in Normandy in Aug. 1944, after serving as deputy commander during the invasion. His forces swept through France, Belgium, and Luxembourg and were the first into Germany. They bore the brunt of the Ardennes counterattack and were the first to cross the Rhine and to meet the Russians. Hodges was transferred to the far east in the summer of 1945. He returned after the war to command the 1st army at Governor's Island until his retirement, as full general, in 1949. (F. C. PE.)

HODGKIN, THOMAS (1831–1913), English banker, best remembered for his historical writings, was born in London. July 29, 1831. He was educated as a member of the Society of Friends and at University college, London. In 1859 he became a partner in the banking house of Hodgkin, Barnett & Co., at Newcastle upon Tyne. Hodgkin was a scholar by inclination and devoted much time to historical study. His reputation rests on *Italy and Her Invaders,* 8 vol. (1880–99) and a *History of England from*

the Earliest Times to the Norman Conquest (1906). Although both are dated, the first covered the same ground as Gibbon but with much greater insight into and sympathy toward the Teutonic invaders; the second was the first work on the historical origins of Great Britain considered from a Northumbrian point of view. Hodgkin died at Falmouth, March 2, 1913.

See L. Creighton, *Life and Letters of Thomas Hodgkin* (1917); E. E. Taylor, *Dr. Thomas Hodgkin* (1935).

HODGKIN'S DISEASE is a rare disease of man, of unknown cause, resembling both inflammation and cancer, usually causing at first enlarged lymph nodes in some region, external or internal. Tending to spread eventually to other nodes, it may affect any living tissue of the body, directly or indirectly. Among many synonyms are LYMPHOGRANULOMATOSIS, LYMPHADENOMA and MALIGNANT GRANULOMA. Thomas Hodgkin of London described in 1832 seven fatal cases, of which three fit modern criteria for Hodgkin's disease.

Although most commonly found in the third to fourth decades of life, Hodgkin's disease may occur at any age. Its rarity is indicated by the fact that there are about 16 new cases annually per 1,000,000 population. The true incidence computed according to number of persons living at various ages tends to increase with age. Male to female ratio is about 1.7 to 1 over-all, but in children it is nearer 5 to 1. Although often less aggressive in menstruating women, its course may be worsened by pregnancy. The cause is unknown, despite extensive research. Noncontagious and of extremely slight hereditability, nevertheless it has about 1% familial incidence.

Apparent modes of onset vary greatly. Painless enlargement of lymph nodes in the neck is a common first indication. Routine chest X-rays in some cases disclose enlarged nodes in front between the lungs, before symptoms appear. Low-grade febrile illness without localized symptoms, or a stormy course with high fever and obscure findings, should be suspect. Common symptoms as Hodgkin's disease progresses are fever, sweating, anemia, wasting, itching and pain. Fortunately usually some feature such as enlarged nodes in neck, armpit or groin permits early diagnosis by biopsy (removal of specimen of diseased tissue). showing microscopically a complex of cells including the characteristic Sternberg-Reed cell.

No blood test, chemical test or X-ray examination proves Hodgkin's disease. Common mimicry of or by other serious diseases makes diagnostic proof imperative to permit selection of proper treatment.

Occasionally early biopsies may not be diagnostic. In such cases repetition should be permitted. In most cases experienced pathologists can make the diagnosis if given representative tissue.

The total duration may be from a few weeks or months to 30 years or more. In the course of advancing Hodgkin's disease, skin, lungs. gastrointestinal tract, liver spleen, kidneys. adrenals, spinal cord, brain or bones can be invaded or affected. With the multiplicity of parts that may be affected. and the frequency of bacterial, fungal or viral infections in those debilitated by the disease, recurring diagnostic problems of complications often arise.

Although no treatment is assuredly curative, and no features permit foretelling the outlook, it seems theoretically possible that some early cases may be curable. Surgical removal of a single early localized lesion may be justifiable in selected cases. The treatment of greatest over-all usefulness is irradiation applied externally to various lesions, as by X-rays or gamma rays of cobalt 60. The so-called polyfunctional alkylating chemicals, such as nitrogen mustard, triethylene melamine and chlorambucil, are valuable palliative agents. In certain advanced cases appropriate hormones (adrenal corticosteroids or ACTH) may produce symptomatic benefits. Anemia may necessitate blood transfusions. Judicious treatment may cause more or less complete remissions, sometimes with great prolongation of life, or distinctly worthwhile palliation.

Five-year survivals run from about 25% for all cases to 50% or even 75% for favourable cases.

See also LYMPH AND LYMPHATIC SYSTEM: *Diseases of the Lymphatic System*. (L. F. CR.)

HODGSON, BRIAN HOUGHTON (1800–1894), English administrator, ethnologist and naturalist, was born at Lower Beech, Cheshire, on Feb. 1, 1800. In 1816 he obtained an East Indian writership, went out to India in 1818 and in 1820 was appointed assistant to the resident at Katmandu. In 1833 he became resident in Nepal, and succeeded in concluding a satisfactory treaty in 1839 with the court to which he was accredited; but in 1842 his imperious policy toward the native government was upset by the interference of Lord Ellenborough. Hodgson disobeyed the latter's instructions; he was continued in office for a time, but was recalled in 1843. He died at Alderley Grange in the Cotswold hills, on May 23, 1894.

Hodgson did much to throw light on Buddhism as it exists in Nepal. He presented his collection of Sanskrit manuscripts to the East India office. He also became the greatest authority on the flora of the Himalayas. His principal work, *Illustrations of the Literature and Religion of Buddhists* (1841), was republished with other writings in 1872–80.

HODLER, FERDINAND (1853–1918), Swiss painter and sculptor whose work is transitional between Expressionism and Symbolism, was born on March 14, 1853, at Berne. He studied first at Thun under F. Sommer, who painted landscapes for tourists, but after 1872 he worked in a more congenial atmosphere under B. Menn at Geneva. In 1878 he visited Madrid, but his study of Velazquez was already apparent in works like "Der Student" (1874). By 1879, when Hodler settled in Geneva, he was producing massive, simplified portraits owing something to Courbet and landscapes showing an Impressionist tonal key ("Landschaft bei Madrid," 1879). By the mid-1880s, however, a tendency to self-conscious linear stylization is visible in his subject pictures, which deal increasingly with the symbolism of youth and age, solitude and contemplation (*e.g.*, "Die Reformatoren," Geneva, 1889). From this time his work can be divided between the naturalistic and the symbolic, the latter being the mood of his murals in the town hall at Hanover and at Jena university.

Hodler died at Geneva on May 20, 1918.

See A. Loosli, *Ferdinand Hodler*, 5 vol. (1918–21); H. Mühlestein, *Ferdinand Hodler* (1942). (D. C. T. T.)

HODMEZOVASARHELY, a Hungarian town in the county of Csongrad. Lying near the right bank of the Tisa and protected from normal floods by a large dike, the town is on the edge of a very fertile alluvial plain and is essentially the centre of extensive agriculture and stock rearing, being particularly noted for grapes and melons and the fine breeds of horned cattle and horses. Much of the surrounding plain (294 sq.mi.) is owned by the municipality, Pop. (1957 est.) 54,000 (mun.).

HODOGRAPH. If from any point O a vector OP be drawn representing at any instant in magnitude and direction the velocity of a particle P, which is moving in any manner whatever, the locus of P is the hodograph of the path of P. (Cf. the definition of radial curve under CURVES, SPECIAL.) A fundamental property of this curve is that the velocity of any point P of the hodograph is equal to the acceleration of the corresponding point P'; also that the direction of motion of P is that of the direction of acceleration of P. The hodograph of the orbit of a planet or a comet, considered as in a Newtonian field, is always a circle, whatever may be the form and dimensions of the orbit. The pole O is inside, on, or outside the circle, according as the orbit is an ellipse, a parabola or a hyperbola. The idea of the hodograph originated with Mobius (1843) and, independently, with Sir William Rowan Hamilton (1846) to whom the name and certain original developments of the theory are due. If a particle describes a logarithmic spiral about the pole as a centre of force, the hodograph is also a logarithmic spiral; the same result holds true for sinusoidal spirals (Schouten). If a particle starts from rest at the vertex of a perfectly smooth inverted cycloid and oscillates under the action of gravity, the hodograph of the motion is a circle through the pole, described with constant velocity. An important improvement in nautical charts by A. Smith (*Proc. Roy. Soc.*, vol. xv., 1867) introduced a curve which has been called a tidal hodograph (Thomson and Tait).

HODSON, WILLIAM STEPHEN RAIKES (1821–1858), British leader of light cavalry during the Indian Mutiny, was born on March 19, 1821 at Maisemore Court, near Gloucester. He was educated at Rugby and Cambridge, and became a cadet in the Indian army at 23.

In 1855 he was charged with having arbitrarily imprisoned a Pathan chief named Khadar Khan, on suspicion of being concerned in the murder of Colonel Mackeson. The man was acquitted. and Dalhousie removed Hodson from his civil functions and remanded him to his regiment. He was also accused of malversation in the funds of his regiment. Hodson's career seemed ruined when the Indian Mutiny broke out. At the outset of the campaign he made his name by riding with dispatches through a country swarming with the rebel cavalry. He then raised a regiment of 2,000 irregular horse. famous as Hodson's Horse, and was placed at the head of the intelligence department.

After the fall of Delhi, Hodson obtained from General Wilson permission to ride out with 50 horsemen to Humayun's tomb, 6 mi. out of Delhi, and bring in Bahadur Shah, the last of the, Moguls. This he did with safety in the face of a large and threatening crowd. Next day with 100 horsemen he went out to the same tomb and obtained the unconditional surrender of the three princes, who had been left behind on the previous occasion. A crowd of 6,000 persons gathered. and Hodson ordered them to disarm, which they proceeded to do. He sent the princes on with an escort of 10 men, while with the remaining 90 he collected the arms of the crowd. On galloping after the princes he found the crowd once more threatening an attack; and fearing that he would be unable to bring his prisoners into Delhi he shot them with his own hand. He gave the king a safe conduct, which was afterward seen by Sir Donald Stewart, before he left the palace. Hodson was killed on March 11, 1858, at Lucknow.

HOE, RICHARD MARCH (1812–1886), U.S. inventor of the rotary printing press, was born in New York city, Sept. 12, 1812. He was the son of Robert Hoe (1784–1833), an English-born U.S. mechanic, who with his brothers-in-law Peter and Mathew Smith had established in New York city a manufactory of printing presses. Educated in public schools, Richard entered Robert Hoe and Co. in 1827 and on his father's death became head. He had considerable inventive genius and the application of his ideas revolutionized printing processes. He discarded the old flat-bed press. placing the type on a revolving cylinder. a model later developed into the Hoe rotary or "lightning" press, patented in 1346, and first used by the Philadelphia *Public Ledger* in 1847. It was further improved under the name of the Hoe web perfecting press. His press enabled publishers to satisfy the increasing circulation demands of the rapidly growing U.S. population.

Hoe died in Florence. Italy, June 7, 1886.

See Robert Hoe, *Short History of the Printing Press* (1902). (R. P. P.)

HOEFNAGEL, JORIS (GEORG HUFNAGEL) (1542–1600), Dutch painter and illustrator, noted for his miniatures, was born at Antwerp. He mas a pupil of Jan Bol. He traveled abroad often in the company of the famous geographer Abraham Ortelius, studying and making dranings of the people, their costumes and customs in France. Spain, England and Italy. He was afternard patronized by the elector of Bavaria at Munich. where he stayed eight years, and by the emperor Rudolph II at Prague. He is famous for his miniature work, especially on a missal in the Imperial library at Vienna; he painted animals and plants to illustrate works on natural history; and his illustrations (especially for Braun's *Civitates orbis terrarum,* 1572), give him a place among early topographical draftsmen.

HOF, town of Germany, in the Land of Bavaria, situated on the Saale, on the northeastern spurs of the Fichtelgebirge, 103 mi. S.W. of Leipzig. Pop. (1950) 61,033. Hof, originally called Regnitzhof, built about 1080, was sold by the dukes of Meran in 1373 to the burgraves of Nuremberg. Cloth manufacture introduced in the 1jth century, and the manufacture of veils begun in the 16th century, greatly helped it. but it suffered severely in various wars. In 1810 it was incorporated with Bavaria. In 1823 the greater part of the town was destroyed by fire. It has a town hall of 1563, and a hospital founded in 1262. It is the seat of woolen and cotton spinning, and manufactures cotton and half-woolen fabrics. It has also dye works, flourmills, sawmills, breweries: ironworks and manufactures of machinery, iron and tin wares, chemicals and sugar. In the neighbourhood there are large marble quarries and extensive iron mines.

HOFBAUER, SAINT CLEMENT MARY (KLEMENS MARIA) (1751–1820), Roman Catholic priest, the "Apostle of Vienna," was born on Dec. 26, 1751, in the Moravian village of Tassmitz, of a poor family. He ardently desired to become a priest, but encountered many obstacles, particularly the anti-Catholic spirit prevalent in the educational institutions of Austria. In 1784, while on a pilgrimage to Rome, he entered the Congregation of the Most Holy Redeemer (the Redemptorists). He was ordained to the priesthood in 1785, and authorized by his superiors to establish Redemptorist monasteries in northern Europe. In 1788 he took up residence in Warsaw, and for 20 years exercised a zealous apostolate and at the same time recruited a large number of members for his congregation. In 1808, by the order of Napoleon, the Redemptorist community at Warsaw was disbanded and the members exiled. Hofbauer spent the remainder of his life in Vienna, where he exerted a wide influence on the intellectuals and contributed much toward the revival of Catholic life. He was particularly popular with the students of the University of Vienna. He continued to seek governmental approbation for Redemptorist monasteries, which was granted shortly after his death (March 1j, 1820). He was canonized by Pope Pius X in 1909, and his feast day is March 15.

HOFER, ANDREAS (1767–1810), Tirolese patriot, was born Nov. 22, 1767, at St. Leonhard. By the treaty of Pressburg (1805) Tirol was transferred from Austria to Bavaria and Hofer became a leader of the agitation against Bavarian rule. In 1808 with others he visited Vienna at the invitation of Archduke John to concert a rising in 1809. Hofer defeated the Bavarians, enabling the Austrians to re-occupy Innsbruck temporarily; a month later won two further victories on the Iselberg, drove back the Bavarians. who had advanced again, and entered Innsbruck in triumph. Emperor Francis assured him that no peace would be concluded by which Tirol would again be separated from Austria and Hofer returned home.

By the armistice of Znaim (July 12). however, Austria unconditionally surrendered Tirol and Vorarlberg. French and Bavarian troops again invaded the country, which rose once more. Hofer placed himself at the head of the movement,. After defeating the French on the Iselberg, he again entered Innsbruck. Hofer was elected *Oberkommandant* of Tirol and for two months ruled the country in the emperor's name. On Sept. 29 the emperor encouraged Hofer in the belief that Austria did not intend again to desert him; but the treaty of Schonbrunn (Oct. 14) again ceded Tirol to Bavaria. The French re-entered the country, and. an amnesty having been stipulated, Hofer and his companions submitted to France, though not to Bavaria. On Nov. 12, deceived by false reports of Austrian victories?Hofer attempted to renew the revolt; the regular forces proved too strong and Hofer took refuge, but was betrayed. On Jan. 27, 1810, he was captured by Italian troops, sent to Mantua, and was shot.

HÖFFDING, HARALD (1843–1931), Danish philosopher who is remembered chiefly as a historian of philosophy, was born in Copenhagen on March 11, 1843. He was professor of philosophy there from 1883 to 1915. He died on July 2, 1931, in the same city. Höffding's major work is *Den nyere Filosofis Historie,* 2 vol. (Copenhagen, 1894–95; Eng. trans., *A History of Modern Philosophy,* London, 1900). His own philosophy is notable for his psychological voluntarism and for his view of religion, which he held to be the reaction of mind to the sense of value and which he made the basis of his ethical system.

His writings include, *Den engelske Philosophi i vor Tid* (1874); *Psykologi i Omrids paa Grundlag af Erfaring* (1882); *Etik* (1887); *Kontinuiteten i Kants filosofiske Udviklingsgang* (1893); *Rousseau og hans Filosofi* (1896; Eng. trans., *Jean Jacques Rousseau and His Philosophy,* 1930); *Det psykologiske Grundlag for logiske Domme* (1899); *Mindre Arbejder* (1899); *Religionsfilosofi* (1901; Eng. trans., 1906); *Udvalgte Skrifter,* 7 vol. (1902–09); *Moderne Filosofer* (1904; Eng. trans., 1915); *Danske Filosofer* (1909); *Oplevelse og Tydning* (1918); *Spinoza's Ethica* (1918); *Begrebet Analogi* (1923); and *Erkendelsesteori og Livsopfattelse* (1925).

HOFFMAN, MALVINA (1887–), U.S. sculptor, most famous for her bronze representations of ethnic types, was born in New York city on June 15, 1887. She studied in New York with Herbert Adams and Gutzon Borglum. In 1910 Miss Hoffman went to Paris, where until World War I she worked intermittently under Auguste Rodin. On his advice she studied anatomical drawing and dissecting at the College of Physicians and Surgeons, New York. Rodin's sculpture influenced her work in many ways—in erotic subject matter ("Offrande," 1919), in impressionistic technique ("Lovers' Prayer," 1923), in fleeting movement ("Bacchanale," 1917), and in vivid realism ("The Coal Man," 1928). In 1930 the Field museum (later Chicago Natural History museum) commissioned her to execute a series portraying the various "Races of Man." To make studies for the 101 bronzes, which bear such titles as "Blackfoot American Indian," "Hawaiian Surf-board Rider," and "Family Group of South African Kalahari Bushmen," she traveled around the world.

She also did a number of portraits, marked by unaffected characterization. Among these are three heads of Paderewski, showing him as the Friend, the Statesman, and the Artist (1920), and a bust of Wendell L. Willkie (1944). A war memorial, entitled "The Sacrifice" (1920), in Memorial chapel, Harvard university, is considered the finest of her ideal compositions. After 1911, when her "Russian Bacchanale" won first prize at the Paris Salon, Miss Hoffman received many awards and honorary degrees.

Her autobiography, *Heads and Tales,* appeared in 1936 and *Sculpture Inside and Out* in 1939. (M. I. B.)

HOFFMAN (HOFMANN), **MELCHIOR** (c. 1495–1543/4), German Anabaptist, was born at Schwäbisch-Hall. He was a furrier by trade, and worked as a Lutheran lay missionary in Livonia, Sweden and Lower Germany. Frederick I of Denmark appointed him a preacher at Kiel, in Holstein. The Zwinglian view of the Eucharist that he developed alarmed Martin Luther, and after the colloquy in Flensburg (1529), when he disputed with J. Bugenhagen, Hoffman was banished from Denmark. He went to Strasbourg, where he was converted to Anabaptism (*see* ANABAPTISTS) and became a proponent of the doctrine of the celestial flesh of Christ. Journeying to East Frisia (1530), he became the apostle of Anabaptism in the Netherlands, where his followers were known as Melchiorites. Elaborating his eschatological convictions, he returned in 1533 to Strasbourg, which was to be the seat of the New Jerusalem to await the Last Day. He was arrested there, and imprisoned. The last notice of his continued imprisonment is Nov. 19, 1543. Some of his ideas survived among the Mennonites.

HOFFMANN, AUGUST HEINRICH (1798–1874), known as HOFFMANN VON FALLERSLEBEN, German patriotic poet, philologist, literary historian, whose "Deutschland über alles" was adopted as the German national anthem after World War I, was born at Fallersleben, near Brunswick, April 2, 1798. Having studied at the universities of Göttingen and Bonn, he was custodian of the university library at Breslau (1823–38), became extraordinary professor of German language and literature there in 1830 and ordinary professor in 1835. Removed by the Prussian authorities in 1842 for his *Unpolitische Lieder* (1840–41), he was allowed to return after the revolution of 1848. In 1860 he was appointed librarian to the duke of Ratibor at Corvey castle, where he died on Jan. 19, 1874.

Hoffmann was among the earliest and most effective of the poets who prepared the way for the revolutionary movement of 1848. He also composed political melodies for many of his songs, which were sung throughout Germany. His "Deutschland über alles," written in 1841, is typical in its expression of popular feeling—the wish for national unity felt by German liberals of the period. In the first line the word "Deutschland" was repeated to fit Haydn's tune, adopted from the Austrian national hymn. As a student of ancient Teutonic literature Hoffmann ranks among the most persevering and cultivated of German scholars. *Die deutsche Philologie im Grundriss* (1836) valuably contributed to philological research, and *Geschichte des deutschen Kirchenlieds bis auf Luthers Zeit* (1832; 3rd ed., 1861), *Unsere Volkstümlichen Lieder* (3rd ed., 1869) and *Die deutschen Gesellschaftslieder des 16 und 17 Jahrh.* (2nd ed., 1860) were also important.

BIBLIOGRAPHY.—Hoffmann's 6-vol. autobiography, *Mein Leben. Aufzeichnungen und Erinnerungen* (1868–70) was abbreviated in 2 vol. (1894); *Gesammelte Werke* were ed. by H. Gerstenberg, 8 vol. (1890–93). *See* also H. Gerstenberg, *Deutschland, Deutschland über alles! Ein Lebensbild des Dichters Hoffmann von Fallersleben* (1916); W. Marquardt, *Heinrich Hoffmann von Fallersleben* (1941). (A. Gs.)

HOFFMANN, ERNST THEODOR WILHELM (1776–1822), German romance writer, composer, conductor, caricaturist, theatrical manager, lawyer and many other things, was born at Königsberg on Jan. 24, 1776. For the name Wilhelm he himself substituted Amadeus in homage to Mozart. He studied law at Königsberg, and began to practise in the town in 1795. He then moved to Glogau, in 1798 to Berlin, and in 1800 received an official legal appointment at Posen, which he lost through offending the authorities by his caricatures. He was sent to a little country town, Plozk, into virtual banishment. There he spent his leisure in musical composition, which was, throughout his life, his chief delight. In 1804 he received an appointment at Warsaw, where, through Zacharias Werner, he became acquainted with the work of Novalis, Ludwig Tieck, W. H. Wackenroder and other Romanticists. He was happy in Warsaw, where he wrote the music to Brentano's *Lustige Musikanten* and Werner's *Kreuz an der Ostsee;* also an opera, *Liebe und Eifersucht,* based on Calderón's drama *La Banda y la flor.* The French invasion (1806) put an end to this peaceful existence, and Hoffmann lived an uncertain and troubled life until 1814. He was for a short time musical director of a theatre at Bamberg, then at Dresden, and wrote sketches in the *Allgemeine Musikalische Zeitung,* ultimately included in the *Phantasiestücke in Callots Manier* (4 vol., 1814–15).

In 1814 he resumed his legal profession in Berlin, and two years later he was appointed councillor of the court of appeal. Hoffmann had the reputation of being an excellent jurist and a conscientious official; he had leisure for literary pursuits and belonged to the circle of Romantic poets and novelists who gathered around Fouqué, Chamisso and his old friend J. E. Hitzig. He had a great musical success with his opera *Undine* (1816; libretto by F. de la M. Fouqué) and, under the name of "Johannes Kreisler, Kapellmeister," he wrote the excellent musical criticism on J. S. Bach—at that time almost forgotten—Beethoven and others, which inspired Schumann's *Kreisleriana.* To his Berlin period belong the great series of tales which have placed Hoffmann in the short list of great storytellers of the strange and grotesque. Unfortunately habits of intemperance grew on him, and his health became speedily undermined. He died on June 25, 1822.

The *Phantasiestücke,* with a preface by Jean Paul (J. P. F. Richter), were followed by the gruesome novel—to some extent inspired by M. G. Lewis' *Monk—Die Elixiere des Teufels* (1816), and the even more gruesome stories which make up the *Nachtstücke* (1817). The full range of Hoffmann's powers is first

clearly displayed in the collection of stories *Die Serapionsbrüder* (1819–21), this being the name of a small club of Hoffmann's more intimate literary friends. *Die Serapionsbriider* includes not merely stories in which Hoffmann's love for the mysterious and the supernatural is to be seen but novels in which he draws on his own early reminiscences *(Rat Krespel, Fermate),* finely outlined pictures of old German life *(Der Artushoj, Meister Martin der Küfner und seine Gesellen)*, the fairy-tale *Nussknacker* and *Mausekönig* (which inspired Tschaikovsky) and vivid and picturesque incidents from Italian and French history, *Doge und Dogaresse,* the story of Marino Faliero, and *Das Fräulein con Scudéri.* The last-mentioned story is usually regarded as Hoffmann's masterpiece. *Klein Zaches, genannt Zinnober* (1819) and *Lebensansichten des Katers Murr, nebst fragmentarischer Biographie des Kapellmeisters Johannes Kreisler* (1821–22) are good examples of his powers as a humorist.

Hoffmann is one of the master storytellers of the Romantic movement in Germany. He possessed a humour that is reminiscent of Jean Paul, but he was supreme in the almost clairvoyant powers of his imagination. His work abounds in grotesque and gruesome scenes; the morbid and supernatural, animal magnetism, the *Doppelgänger,* the automaton were made famous by him in literature. But this was only one outlet for Hoffmann's genius, and even here the secret of his power lay not in his choice of subjects but in the wonderfully vivid and realistic presentation of them. Every line he wrote leaves the impression that it expresses something felt or experienced. Himself ugly and ridiculous to the eye, he combined detached common sense with ecstatic, alcoholically induced exaltation. This realism, in the best sense of the word, made him the great artist he was, and gave him so extraordinary a power over his contemporaries. His influence in France and in England and America (on Musset, Gautier, Baudelaire, Carlyle. Scott. Poe. Wilde and others) was, in fact, as great as in his own country; it was felt also in Denmark (by, for example, Hans Christian Xndersen). Sweden, Russia and Poland.

With respect to his work as a composer, his *Cndine* was a minor classic of its period. though he will probably be longest remembered by musicians in having provided the inspiration and the book for Offenbach's *Les Contes d'Hoffmann* ("Tales of Hoffmann"), based on three of his fantastic stories.

BIBLIOGRAPHY.—The first collected edition of Hoffmann's works appeared in 15 vol. (Berlin and Stuttgart, 1827–39); it comprised *Ausgewählte Schriften,* 10 vol. (1827–28) and 5 vol. added by Hoffmann's widow (1839), including the 3rd ed. of J. E. Hitzig's *Aus Hoffmann's Leben und Nachlass* (1823). There are good modern editions by K. G. Maassen (Munich and Leipzig, 1908–), G. Ellinger, 15 vol., 2nd ed. (Berlin, 1927) and others. Of many selections that by M. Hurlimann (Zurich, 1946–) may be mentioned. Hofmann's writings on music were edited by E. Istel (Stuttgart, 1907); his musical compositions by G. Becking, 3 vol. (Leipzig, 1922–27); his letters by Hans von Muller in *E. T. A. Hoffmann im persönlichen und brieflichen Verkehr,* 2 vol. (Berlin, 1912); his diaries by H. von Müller (Berlin, 1915). English translations of Hoffmann's works include: *The Devil's Elixir* (Edinburgh, 1824); *The Golden Pot,* tr. *by T.* Carlyle in *German Romance,* 4 vol. (Edinburgh, 1827); The Serapion Brethren, tr. by A. Ewing (London; 1886–92); J. M. Cohen (ed.), *Tales from Hoffmann* (London and New York, 1951). For Hoffmann's popularity in France *see* G. Thurau. *Hofmanns Erzählungen in Frankreich* (Königsberg, 1896). For bibliographies *see* K. Gocdeke, *Grundriss zur Geschichte der deutschen Dichtung,* 2nd ed., vol. viii (Dresden, 1905) and G. Salomon. E. *T. A. Hoffmann, Bibliographie,* 2nd ed. (Weimar, 1927). For biography and criticism *see* G. Ellinger, *E. T. A. Hoffmann* (Hamburg and Leipzig, 1894); W. Harich, E. *T. A. Hoffmann. Hewett-Thayer, *Hoffmann: Author of the Tales* (Princeton, N.J., and London. 1948); J. Mistler, *Hoffmann le fantastique* (Paris. 1950).

HOFFMANN, MAX (1869–1927), German general, was born at Homburg on Jan. 25, 1869. He spent many years in Russia, and was sometime general staff officer in the provinces of Posen and East Prussia. In 1914 he was general staff officer to the VIII army, was present at Tannenberg, became quartermaster-general of the eastern command and in 1916 succeeded Ludendorff as chief of the general staff in the east, under Prince Leopold of Bavaria. From that time he was mainly responsible for the operations on the eastern front. In Dec. 1917 he conducted, on the German side, the negotiations with the Russians at Brest-Litovsk, and in February signed the treaty with the Ukraine. After World War I he engaged in a lively controversy with Ludendorff. The rift seems to have dated from Jan. 1918, when Hoffmann read to the emperor, William II, a memorandum condemning Ludendorff's scheme of Polish annexations. He sharply criticized the German high command in his book (1923), *Der Krieg der versäumten Gelegenheiten* (the War of Lost Opportunities), which, in spite of the evident animus against Hindenburg, Ludendorff and Falkenhayn, is a document of considerable importance to the student of the war. In *Tannenberg wie es wirklich war* (1927) he impugned the official account of the victory of Tannenberg, which was, he says, due to strategic orders drawn up before Hindenburg and Ludendorff arrived, and to the tactics of Gen. François, who commanded the I corps, and went his own way in defiance of Ludendorff's orders. Gen. Hoffmann is credited with a scheme for military intervention in Russia in 1922, and he wrote a book against Bolshevism, entitled *An allen Enden Moskau* (1925). He died on July 8, 1927.

HOFMANN, AUGUST WILHELM VON (1818–1892), German chemist whose research on aniline, with that of Sir William H. Perkin (*q.v.*), helped lay the basis of the aniline dye industry, was born at Giessen in western Germany on April 8, 1818. He first read law and philosophy at Giessen and then studied chemistry under Justus von Liebig. He acted for a short time as *Privatdozent* ("official but unpaid lecturer") at Bonn and then, in 1845, accepted the invitation, made at the suggestion of Prince Albert, to become the first director of the new Royal College of Chemistry, London. Many of the leaders of British chemistry were trained there under him. In 1864 he returned to Bonn, but before he moved into the laboratory there, which had been built under his direction, he succeeded (1865) Eilhardt Mitscherlich as professor of chemistry and director of the laboratory in the University of Berlin. He continued his excellent work there as teacher and researcher until his unexpected death on May 5, 1892. In 1868 Hofmann founded the German Chemical society and he was for many years its president. Its home in Berlin was opened in 1900, and was named the Hofmann Haus in his memory. He also served as president of the British Chemical society. He was ennobled on his 70th birthday.

Hofmann's work covered a wide range of organic chemistry. His first research, carried out in Liebig's laboratory at Giessen, was on coal tar, and his investigation of organic bases established the nature of aniline. In 1845 he developed a method of preparing aniline from benzene. His perception of the analogy between it and ammonia led to his famous work on the amines and organic ammonium bases and the allied phosphorus compounds, while his researches on rosaniline, which he first prepared in 1858, formed the first of a series of investigations on colouring matters which culminated in the discovery of quinoline red in 1887. Hofmann is also known for his discovery of allyl alcohol (with Auguste Cahours), of formaldehyde, hydrazobenzene and the isonitriles. He discovered a method of converting an amide into an amine containing one carbon atom less, and this important reaction is now known by his name. Hofmann's method for determining molecular weight of liquids by means of vapour densities was an important contribution to chemistry.

In addition to the investigations for which he was responsible, he exercised considerable influence on chemical progress through the valuable work of his pupils, among whom were Perkin, discoverer of mauve, Peter Griess, the discoverer of diazo compounds, and Sir William Crookes. Almost 1,000 papers came from his laboratory and nearly 300 of these represent his own work. Among his scientific publications were *Handbook of Organic Analysis* (1853) and *Einleitung in die moderne Chemie* (6th ed., 1877). After Liebig's death (1873) he succeeded to the editorship of the *Annalen der Chemie.* He was the possessor of a clear and graceful, if somewhat florid, style which showed to special advantage in his numerous obituary notices or encomiums (collected and published in three volumes, *Zur Erinnerung an vorangegangene Freunde,* 1888). He delivered speeches in four languages. His other historical works were *Berliner Alchemisten und Chemiker: Ein Jahrhundert chemischen Forschung unter dem Schirm der Hohenzol-*

lern. The two volumes of the letters of Liebig and Friedrich Wohler (1888) were issued under his guidance.

As a teacher, besides the power of accurately gauging the character and capabilities of those who studied under him. he had the faculty of infecting them with his own enthusiasm and thus of stimulating them to put forward their best efforts. In the lecture room he laid great stress on the importance of experimental demonstrations, paying particular attention to their selection and arrangement, though since he himself was a somewhat clumsy manipulator, their actual exhibition was generally entrusted to his assistants. Many of the standard lecture demonstrations were invented by Hofmann.

BIBLIOGRAPHY.—J. Volhard and E. Fischer, *August Wilhelm von Hofmann* (1902); *B.* Lepsius, essay in jubilee issue of *Ber. dtsch. Chem. Ges.* (1902) and essay in G. Bugge's Das *Buch der grossen Chemiker* (1930); Hofmann memorial lecture, J. *Chenz. Soc.* (1896).

(R. E. O.; X.)

HOFMANN, JOSEF CASIMIR (1876–1957), pianist and composer, was born at Cracow, Pol., Jan. 20, 1876. At seven he attracted Rubinstein's attention, becoming his pupil. Touring Europe at nine, he went to the United States two years Iater, giving 52 concerts, but mas compelled to stop by the Society for Prevention of Cruelty to Children. He returned to Europe, studied further under Rubinstein, Urban and Moszkovski, and resumed public performances in 1894. When the Curtis Institute of Music, Philadelphia, was endowed in 1924, he was invited to head the piano department. He became the director in May 1927, not long after his naturalization as a U.S. citizen, and served until 1938. His compositions include a symphony, much piano music. an orchestral suite. *Mignonettes,* four *Old Dutch Songs, Trois Impressions* and *Valse Caprice.* He was the author of *Piano Playing* (1898). Hofmann died in Los Angeles, Calif., on Feb. 16, 1957.

HOFMANNSTHAL, HUGO VON (1874–1929), Austrian poet, was born in Vienna on Feb. 1, 1874. He took the degree of Ph.D. at the University of Vienna and when still a schoolboy originated the romantic school in Austria by his lyric and semidramatic poetry, which aroused much controversy at the time. He was not uninfluenced by Stefan Georg's example and Hermann Bahr's criticism, but the melody and colour of his language, and the art with which he gave poetic expression to complicated spiritual moods were new. He had genius for appreciating bygone cultures and a sensitive understanding of the beautiful in art and in nature.

Hofmannsthal is little indebted to contemporary realism, but his almost too susceptible personality is tinged by innumerable literary influences from the Attic tragedians down to Victor Hugo, Swinburne, Browning and D'Annunzio. This is especially noticeable in his dramatic poems, not a few of which are simply old plays of Sophocles, of Calderon, Molière and Otway cloaked in modern form and spirit. Nevertheless he has an abiding place in the history of literature as founder of the whole German neo-romantic drama. Some of his dramas became known outside Austria and Germany through the music of his friend Richard Strauss, others through Reinhardt's Festival plays at Salzburg. His collected poems appeared in 1911, his collected prose began to appear in 1907. In later years he turned his attention to society comedy. The most characteristic of his original dramas are: *Gestern* (1891); *Der Tod des Tizian* (1892); *Der Tor und der Tod* (1893); *Der Abenteurer und die Sängerin* (1899); *Oedipus und die Sphinx* (1906); *Cristinas Heimkehr* (1910); and his libretti: *Elektra* (1903); *Der Rosenkavalier* (1911); *Ariadne auf Naxos* (1912); *Die Frau ohne Schatten* (1919); and *Der Unbestechliche* (1923). He died on July 15, 1929.

HOFMEISTER, WILHELM (FRIEDRICH BENEDICT) (1824–1877), German botanist and pioneer investigator of the comparative embryology of plants who greatly influenced botanical research, was born at Leipzig on May 18, 1824. He entered his father's publishing and bookselling business in 1841. Meanwhile his interest in botany was developing. Entirely self-taught, he published his first paper, on investigations concerning the process of fertilization of *Oenothera,* in 1847. His next studies concerned sexuality and origin of the embryo of phanerogams (seed plants). His short hut epoch-making paper, "Embryology of Flowering Plants" (1849), settled the question of the origin of the embryo from an ovum, as against the prevalent pollen-tube theory of M. J. Schleiden. Hofmeister's study of the embryology of Bryophytes and Pteridophytes led to his accounts of the germination of the spores and fertilization in *Pilularin, Salvinia, Selaginella.* His important work, *On the Germination, Development and Fructification of the Higher Cryptogamia* (1851; Eng. trans., 1862) demonstrated the life story of liverworts, mosses, ferns. equiseta. rhizocarps. lycopodiaceae and even gymnosperms, and the analogy between these higher cryptogams and the conifers. He clearly established that there is an alternation of generations in plants as had recently been shown in animals.

Hofmeister remained in business until 1863, then was appointed professor of botany and director of the botanical garden at Heidelberg. He became professor at Tübingen in 1871. He died at Lindenau, near Leipzig. on Jan. 12, 18; 7.

See K. E. von Goebel, *Wilhelm Hofmeister* (1924, Eng. trans., 1926).

HOFMEYR, JAN HENDRIK (1845–1909), South African statesman, for many years leader of the Afrikander Bond in the Cape Colony, was born in Cape Town on July 4, 1845, and educated at the South African college. He entered public life through journalism, as editor of the *Volksvriend* (1861–71) and of the united *Zuid Afrikaan* and *Volksvriend* (1871–83). He also founded a literary periodical, *Zuid Afrikaansche Tijdschrift,* in 1878. Though an admirer of English culture, "Onze Jan," as he later came to be called, worked successfully to revive the waning Dutch culture of the Cape. more especially the Dutch language (which he always preferred to the spoken Afrikaans); and his efforts, with the help of many others, led by the end of the century to the recognition of Dutch as an official language for most purposes.

The son of a wine farmer. Hofmeyr established a Boeren Beschermings Vereeniging (Farmers' Protection association) in 1878, with the long-term object of making the Afrikaner Boer as politically conscious as his English-speaking counterpart. In 1879 he entered parliament as member for Stellenbosch at the head of a small, loosely knit party. The establishment of the Afrikander Bond in 1879 faced Hofmeyr with a difficult problem, for he did not share the hostility toward things English which this rival political movement then manifested. By astute maneuvering, however. he secured the amalgamation of the Bond and his own association in 1883, retaining the parliamentary leadership of the united body; he strengthened his hold still more in 1889, when he became chairman of the organization's new disciplinary committee, Commissie van Toezicht op Electies.

As leader of the only organized party in the Cape parliament. Hofmepr commanded enough votes to make and unmake ministries and secure the passage of measures agreeable to the Bondsmen. His refusal to form a government was a constant theme of attack by his opponents, though it may be doubted if it mas ever in fact possible for him to form a stable administration. He held cabinet rank only for a few unhappy months in 1881, and retired from parliament in 1895, though his political influence was hardly diminished thereby. To some extent, Hofmeyr was affected by the anti-imperial spirit of the early 1880s, opposing the restoration of British rule in Basutoland or its establishment in Bechuanaland. Native policy, he considered, was a matter not for the British, but for South African governments working in co-operation. He was slow to grasp the need for South African economic federation until after the discovery of gold on the Rand (1886), and even then continued to back for a while the isolationist railway policy of the Transvaal. By degrees, however, his political horizon broadened, as shown by the constructive part he played in the imperial conferences of 1887 and 1894. By 1890 he had moved far enough to support Cecil Rhodes's schemes for the opening up of the north as a Cape colonial venture.

His alliance with Rhodes during the latter's premiership (1890–95) was of advantage to both parties. Rhodes obtained a secure basis of power in the colony; the Bondsmen obtained agricultural. labour and railway policies to their liking, and their membership rose markedly. The Jameson raid, however. led to a complete breach between Hofmeyr and Rhodes, and the dark night of Hofmeyr's political career began. His masterly statesmanship during

the raid crisis, designed not only to expose the guilty but also to reconcile the imperial and Transvaal authorities, was matched by his responsible handling of the 1899 crisis. But his efforts to maintain peace were ineffective. partly because, though he persuaded Paul Kruger to give a little ground, he was not correspondingly successful with Sir Alfred Milner. He retired to Europe during. the South African War. a sick and disillusioned man.

Returning to the Cape in 1902. Hofmeyr resumed effective leadership of the Bond. which supported a policy of reconciliation between Boer and Briton. In the movement tonard union, he was a lively supporter of Dutch language rights and of the Cape nonwhite franchise and, unlike most leaders outside Satal. advocated a federal rather than a unitary constitution. He went to London, however, in the delegation which presented the draft Act of Cnion to the British government. and died there on Odt. 16. 1009.

See J. H. Hoimcyr, *The Life of Jan Hendrik Hofmeyr (1913).*

HOFSTADTER, ROBERT (1915–), U.S. physicist awarded the 1961 Nobel prize for physics, jointly with Rudolph Mössbauer. for his investigations of the structure .of atomic nuclei and nucleons, was born in New York city on Feb. 5. 1915. He received his undergraduate education at City College of New York and attended Princeton university. where he obtained the degree of doctor of philosophy in 1938. During World War II he worked on military equipment at the national bureau of standards and the Norden Corp.. returning to Princeton in 1916. Up to the time he left there to join the faculty of Stanford university in 1950, his principal scientific work dealt with infrared spectroscopy. photoconductivity? and crystal and scintillation counters. At Stanford, he first used the high-voltage linear electron accelerator to explore the structure of atomic nuclei by means of electron scattering. Using the same equipment, he also made quantitative measurements of the sizes and shapes of nucleons (protons and neutrons), the basic building blocks of nuclei. (L. I. S.)

HOGARTH, DAVID GEORGE (1862–1927), English archaeologist, was born on May 23, 1862, at Barton-on-Humber, Lincs, the son of a clergyman, and died at Oxford on Nov. 6, 1927. He had been president of the Royal Geographical Society since 192j and keeper of the Ashmolean museum since 1909. He was not only one of the greatest scholars of his time but also a man of action who left his mark on the middle east through the magnificent work which he did as director of the Arab Bureau at Cairo during the World War.

Hogarth was educated at Winchester and Magdalen college, Oxford, of which he became a fellow in 1886. In 1893 he was elected a research fellow to carry out archaeological investigations in the Levant. He conducted explorations in Cyprus, Egypt, Ephesus, Carchemish and Crete (1887–1907). He was for a time director of the British school at Athens and in 1899 became director of the Cretan exploration fund.

In 191j he was sent to Cairo by the director of naval intelligence with the temporary rank of lieutenant-commander to take charge of the communications with the Xrab leaders which were intended to lead to the Arab revolt against Turkish rule. Sext year he began to build up at Cairo that Xrab Bureau which drew into its service Gertrude Bell. Mark Sykes, T. E. Lawrence and other brilliant servants. He then returned to London to work there on Arab and middle-eastern problems. returning to Cairo in the last year of the war. In 1919 he was British commissioner at the Middle-East Commission of the Paris Peace Conference.

His works include *A Wandering Scholar in the Levant* (1896), which at once won for him the love of many readers: *Philip and Alexander of Macedon* (1897); *The Nearer East* (1902); The *Penetration* of *Arabia* (1904); *Carchemish* I. (1914); *The Wandering Scholar* (1925); *Kings oj the Hittites* (1926); etc. etc.

HOGARTH, WILLIAM (1697–1764), the first great English-born painter and engraver, who uas especially popular on account of his moral and satirical paintings. was born in the City of London on Sov. 10. 1697. His father was Kichard Hogarth, a schoolmaster who had come to London from Westmorland to obtain literary work, but failed to make more than a meagre living. The son was from childhood fond of drawing and this interest led to his being apprenticed to an engraver of arms on silver plate near Leicester Fields, nhere he came in touch with the Huguenot community who brought over prints from France 'The end of his apprenticeship, together nith the death of his father in 1718, left Hogarth free to follow his own devices. Heraldry did not appeal to him and by 1720 he had set up for himself in the same neighbourhood as an engraver on copper. Beginning with shop hills, he proceeded in 1723 to book illustrations. the best of which are those for Samuel Butler's *Hudibras* (1726) He also designed satiric prints on the fashions of the day. such as "Masquerades and Operas" (1724) These had a brief popularity, but were soon pirated

In 1720 Hogarth had become a not very diligent student at Cheron and Vanderbank's academy in St Martin's lane in order to study from the model, and he may also have attended the free school opened by Sir James Thornhill However, he disapproved of copying as an exercise and preferred to rely on his own method of training the memory by close observation of persons and scenes noticed in the course of his amusements until he could reproduce their characteristics. He took naturally to the use of oils. a fluid medium which lent itself to the free expression of his ideas. In 1727, he painted a design called "The Element of Earth" for a tapestry maker. who rejected it on the grounds that he had since learned that Hogarth was an engraver and not a painter: but in the ensuing litigation Hogarth was able to produce evidence of his ability and won his suit. The following year he produced his first painting of a scene from The *Beggar's Opera* then running in London. and this proved so popular that he was called upon for repetitions (one in the Tate gallery. London).

In 1729 Hogarth eloped with Sir James Thornhill's daughter Jane. an event which affected the subsequent course of his work. Being now under an obligation to provide for a family. he took to painting small portrait groups of the type known as conversation pieces. Those done during the next three years include "The Wedding" (New York), "The Assembly at Wanstead House" (Philadelphia,), "The Wollaston Family." "The Conquest of Mexico," "The Cholmondeley Family." and two unfinished sketches of the royal family (one at Dublin). Some of these have great charm and vivacity. which has made them among the most popular of his works. In fact, though it was only a short time since he had been dependent on his engravings. Hogarth was now at the height of his fame as a painter, and George Vertue could write of him in 1729, "happy are they who can get a picture of his painting." Unfortunately the labour was immense in relation to the remuneration (in one instance the number of likenesses to be included were 25), so that this only proved another form of drudgery.

Meanwhile. Hogarth had been following his natural bent for social satire in such works as "The Denunciation" (Dublin). By 1731, he had completed the six pictures entitled "A Harlot's Progress" (destroyed by fire in 1755), the first of the great sets of works arranged like acts in a play, on which his fame as an original artist most securely rests. "Subjects." he wrote. "I considered as writers do. My picture was my stage and men and women my actors who were by means of certain actions and expressions to exhibit a dumb show." He engraved the "Harlot's Progress" himself. and when the prints were published the next year they had an instantaneous success. which was enhanced by the fact that gossip could identify some of the figures with well-known people. So many were sold that Hogarth could henceforth look upon the proceeds of his printing press as the revenues of ,an estate, and in 1733 he bought himself a large house in Leicester square. which he occupied for the rest of his life. The eight pictures of "A Rake's Progress" (Sir John Soane's museum. London) soon followed; but he still suffered from piracy and publication of the engravings was held up until 1735, when he secured the passing of a statute, still known as "Hogarth's act." to protect the copyright of original artists in their own designs. Other popular prints from paintings appearing during 1733–38 were "A Midnight Modern Conversation." "Sarah Malcolm." "South\\-ark Fair." "The Distressed Poet," "Four Times of the Day," and "Strolling Actresses Dressing in a

"HEADS OF SIX OF HOGARTH'S SERVANTS" BY WILLIAM HOGARTH. IN THE NATIONAL GALLERY, LONDON

Barn"; but these had no such moral purpose as the "progresses," being intended simply for entertainment.

Thus assured of a regular income. Hogarth could afford to divert his energies to less remunerative work. A major influence on his determination to become an artist had been Thornhill's frescoes for St. Paul's cathedral, and "history painting," as it was then called, was regarded as the highest form of art. In 1733, having been elected a governor of St. Bartholomew's hospital, he announced his intention of adorning the staircase with large mural paintings at his own expense and carried out his offer in the next year or so with "The Pool of Bethesda" and "The Good Samaritan," the first of his scriptural subjects. The experiment, however, met nith little response.

On Thornhill's death in 1734 his art school in St. Martin's lane had passed to Hogarth, who turned it into a sort of club, where many of the leading artists came to study and hold lively debates on the state of British art, still overshadowed by that of the continent. Hogarth refused to accept the defeatist attitude of his colleagues, and the opening in 1739 of the Foundling hospital, London, in which he was actively interested, gave him a chance of displaying his own prowess by presenting it with a large portrait of the founder, his friend Capt. Thomas Coram. Ambitious to succeed in the most profitable branch of his profession, he painted a number of portraits during the next few years, notably "The Graham Children" in 1742 and "Mrs. Salter" in 1744 (both in the Tate gallery, London). But his reputation as a satirist was against him and though he had a few staunch supporters and received the highest fee yet paid in England for his "Garrick as Richard III" (Liverpool), he did not meet with the success for which he had hoped.

In 1743 he announced the forthcoming publication of his most famous set of works, "Marriage a la Mode" (Tate gallery), in which the disastrous results of a union contrived from mercenary motives are displayed. Having no high opinion of his own powers as an engraver where fine work was required, he decided to have the paintings engraved by other hands, and his visit to Paris in the same year may have been for this purpose. The six plates appeared in 1745 and added to his laurels in this field. His reputation as a painter, however, was falling in inverse proportion to the popularity of his prints. As a result of a feud with the art dealers, whom he held responsible for foisting bogus old masters on the public, he conducted a sale by auction of his best-known pictures in 1745. The prices bid were ridiculously low and the originals of "Marriage à la Mode" remained on his hands? to be sold six years later for 20 guineas apiece. This may explain why the series of paintings to be known as "The Happy Marriage" remained unfinished, though "The Dance" (Camberwell, London). with its effect of flickering light, ranks among his finest efforts, along with other oil sketches, such as "The Shrimp Girl" (National gallery, London).

In 1746 Hogarth renewed his attempt to encourage British artists by organizing a permanent exhibition of their works at the Foundling hospital, the first exhibition of its kind in England, his own contribution being "Moses Brought to Pharaoh's Daughter." The so-called "March to Finchley" (Foundling hospital), a return to satirical subjects, is of the same period. The didactic prints of "Industry and Idleness." done from drawings, came out in 1747, to be followed four years later by "The Four Stages of Cruelty," "Gin Lane" and "Beer Street," which were intended to reform rather than amuse. In 1748 Hogarth painted "Paul before Felix" for Lincoln's Inn and went over to France again, only to be turned back at Calais on suspicion of spying while sketching the fortifications, as seen in "Calais Gate" (Tate gallery).

Having acquired a summer villa at Chiswick in 1749, and discouraged by the reception of his paintings, Hogarth went into seclusion for the next few years to compose his *Analysis of Beauty*, "written with a view to fixing the fluctuating Ideas of Taste" and published in 1753. The notion had long been simmering in his mind and the serpentine "Line of Beauty," shown on the palette in his self-portrait of 1745 (Tate gallery), had raised enquiries as to its meaning, which he now sought to satisfy by demonstrating that it was the underlying principle of enjoyment of beauty in life as well as in art. The line, it should be noted, was three-dimensional, his doctrine being based on seeing things in the round. The book had some success abroad, but only served to harden opinion against him in England as an arrogant ignoramus.

He returned to painting with the "Election" series of 1754 (Soane's museum), a large altarpiece for Bristol in 1756, and a few more portraits. In spite of his appointment as serjeant-painter to the king in 1757, in the closing years of his life Hogarth was frustrated and unhappy. After painting "The Lady's Last Stake" (Fine Arts academy, Buffalo, N.Y.) in 1759 by way of a farewell to his brush, he was persuaded to take it up once more and produced his ambitious "Sigismonda" (Tate gallery), which provoked a storm of ridicule. As the result of a political quarrel in 1762, when he was in ill health, he was savagely attacked by John Wilkes and his friend Charles Churchill and retaliated with biting caricatures of both men. He died suddenly at his house in Leicester square on Oct. 26, 1764, and was buried at Chiswick.

Although he was the first English-born artist of international status and innumerable feeble imitations of his prints were made, Hogarth can hardly be said to have had any great influence on the art of his time, except possibly through his conversation pieces. His prints passed rapidly abroad and it is impossible to estimate the effect of his works on later generations of artists. The incisive quality of his engravings was well suited to their purpose of inculcating a moral, while his merits as a painter have come to be more and more appreciated since the first exhibition of his paintings in 1814. He played an important part in the emancipation of British art by means of his own academy and exhibitions of contemporary works.

BIBLIOGRAPHY.—Hogarth's own autobiographical notes will be found in J. Burke's edition of his *Analysis of Beauty* (1955). *See* also P. Quennell, *Hogarth's Progress* (1955). The best collection of the prints is in the British museum, catalogued by F. G. Stephens. For drawings *see* A. P. Oppé, *The Drawings of William Hogarth (1948)*. HOGG, JAMES (1770–1835), Scottish poet, known as "the Ettrick shepherd," was baptized at Ettrick, Selkirkshire, on Dec. 9, 1770. His ancestors had been shepherds for generations, and he himself was a shepherd from 1790 to 1799 at Yarrow. On the recommendation of Sir Walter Scott. Constable published his miscellaneous poems *(The Mountain Bard)* in 1807. The proceeds of this book and of another on the treatment of sheep were invested by Hogg in a ruinous farming enterprise in Dumfrieshire,

and the poet went to Edinburgh to make his living by writing. In 161; he was provided by the duke of Buccleuch with a small farm at Altrive, Yarrow, and in 1820 he married Margaret Phillips. He died on Nov. 21, 1S3j. and was buried at his native place. Hogg is familiar to many readers as the "Shepherd" of Wilson's *Noctes Ambrosianae*. Hogg's most important volumes are: *Scattish Pastorals* !1801), *The Mountain Bard* (1807), *The Queen's Wake* (1813), *Evening Tales* (1820), *The Shepherd's Calendar* (1829) and *Lay Sermons* (1834).

See Hogg's "Memoir of the Author's Life, written by himseli." prefixed to the 3rd ed. (1821) of *The Mountain Bard;* also *Memorials of James Hogg, the Ettrick Shepherd,* ed. by his daughter, Mrs. M. G. Garden (enlarged ed. with preface by Veitch, 1903), and Sir G. B. S. Douglas; *James Hogg,* "Famous Scots Series" (1899); also *Poems of James Hogg,* selected by William Wallace (1903). *See* also Mrs Oliphant. *Annals of a Publishing House,* vol. i., chap. vii., and G. Gilfillan, *First Gallery of Literary Portraits.*

HOGG, QUINTIN (1845–1903), English philanthropist and originator of the Polytechnic. was born in London Feb. 14. 1845, and educated at Eton. He chose mercantile n-ork in London and became associated n-ith Lord Kinnaird and his philanthropic "ragged schools." intended to educate destitute children and "save them from vagrancy and crime." Hogg's interest in education began with a reading lesson given to a couple of crossing sweepers. He opened a ragged school in "Of Alley," no!~Cork place. Charing Cross. and in 1868 it was moved to Castle street. Ten years later a Working Lads' institute was set up at Long Acre and in 1881 Hogg acquired the building known as the Polytechnic in Regent street. This had previously been a place of popular entertainment. Hogg carried on the work of the Polytechnic without the aid of public funds until 1889, when it received money through a redistribution of the city parochial charities and came under the supervision of the London County council. The Polytechnic developed a large number of activities. social, recreational and educational. and the parent institution gave rise to similar education centres elsewhere (*see* POLYTECHNIC). Hogg died in London on Jan. 17, 1903.

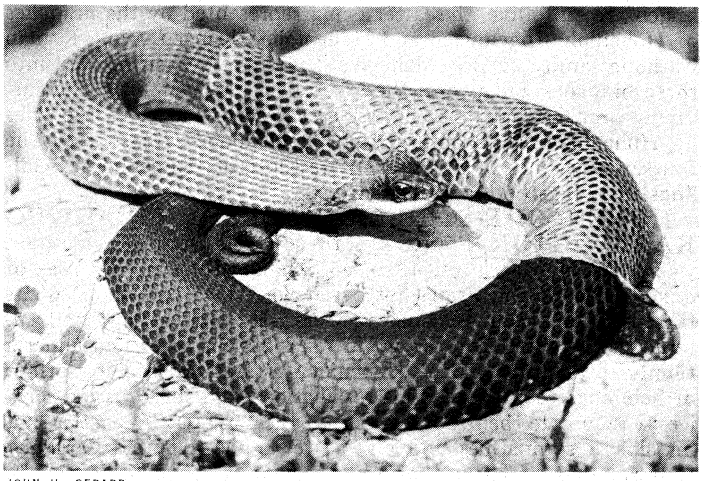
Hogg's remarkable success with boys sprang from his understanding of them, his sincerity and his convinced belief in Christianity, which he put into practice.

See E. M. Hogg (afterward Wood), *The Polytechnic and Its Founder, Quintin Hogg* (1932). (S. J. C.)

HOGG, THOMAS JEFFERSON (1792–1862), English man of letters, was born in Norton. Durham. He was educated at Durham grammar school and at University college. Oxford. where he became the friend of Shelley. with whom in 1811 he nas expelled from the university for refusing to disclaim connection with the authorship of the pamphlet *The Necessity for Atheism.* He then studied law at Tork for six months. Hogg's behaviour to Harriet Shelley interrupted his relations with her husband for some time. but in 1813 the friendship was renewed in London. In 1817 Hogg was called to the bar, and became later a revising barrister. In 1844 he inherited £2.000 under Shelley's will; and in 1855, in accordance with the wishes of the poet's family, began to write Shelley's biography. The first two volumes were published in 1858, but they proved to be more autobiography than biography, and Shelley's representatives refused Hogg further access to the materials necessary for its completion,

HOGMANAY, the name in Scotland and parts of the north of England for New Year's Eve, as also ior the dole of bread. cake or sweets then given to the children that go from house to house soliciting it with traditional rhymes, one of n-hich concludes with "Rise up and gie's our Hogmanay." On this evening also it is traditional for parties of masked children or young men to visit houses as guisers or mummers. Of local customs formerly observed at Hogmanay. the "burning of the clavie" (a bonfire of split casks, in which a nail plays a part) still flourishes at Burghead in Moray. The derivation of the term is doubtful. For \-arious theories *see* R. Chambers (ed.). *The Book of Days* (1864; reprinted 1914). (J. F. OF K.)

HOGNOSE SNAKE, the name applied to the North American snakes of the genus *Heterodon.* The name is due to the sharp angular snout, used in burrowing. The commonest species.



JOHN H. GERARD

HOGNOSE SNAKE SHEDDING ITS SKIN

H. platyrhinos, may reach a length of 3 ft. All species are harmless. feeding especially on toads. Eggs. laid in midsummer. hatch in autumn. Although the several species of hognose are harmless. they have an aggressive, bluffing defense—all spread the neck and inflate the lungs when molested, the front half of the body being puffed up to twice its normal diameter; if this fails to repel an enemy. they "play dead." (K. P. S.; X.)

HOHENLIMBURG, German town, on the Lenne. in the *Land* of North Rhine-Westphalia, 30 mi. S. of Dortmund. Pop. (1950) 23.862. Iron and metal and textile industries are carried on. It is the chief town of the *Kreis* of Limburg. Hohenlimburg castle overlooks the town.

HOHENLINDEN, BATTLE OF. In this battle on Dec. 3, 1800, Moreau turned the tables on the Austrians, who had planned his encirclement, and, destroying them by an able countermaneuver. struck the decisive blow of the campaign in Germany. The result. combined n-ith Napoleon's victory at Marengo in Italy, led to the peace oi Lunéville which ended the war of the Second Coalition. *See* FRENCH REVOLUTIONARY WARS.

HOHENLOHE, a German princely family which took its name from the district of Hohenlohe in Franconia. At first a countship. its two branches were raised to the rank of principalities of the empire in 1744 and 1764 respectively. In 1806 they lost their independence and their lands became part of the kingdoms of Bavaria and oi Württemberg. At the time of the mediatization the area of Hohenlohe was 680 sq.mi. and its estimated population 108.000. The family is first mentioned in the 12th century as possessing the castle of Hohenloch or Hohenlohe, near Uffenheim, and its influence was soon perceptible in several of the Franconian valleys. including those of the Kocher, the Jagst and the Tauber. Henry I id. 1183) was the first to take the title of count of Hohenlohe. and in 1230 his grandsons Gottfried and Conrad. supporters of the emperor Frederick II, founded the lines of Hohenlohe—Hohenlohe and Hohenlohe-Brauneck. The latter became extinct in 1390, while the former was divided into several branches. only two of which, Hohenlohe-Weikersheim and Hohenlohe-Uffenheim-Speckfeld (extinct in 1412), need be mentioned here. Hohenlohe-Weikersheim, descended from Count Kraft I (d. 1313), also underwent several divisions, that which took place after the deaths of Count Albert and Count George in 1j51 being specially important. In 1j51 the lines of Hohenlohe-Neuenstein and Hohenlohe-Waldenburg were founded by the sons of Count George, from which are descended the existing branches of the Hohenlohe family.

The former of these became Protestant. while the latter remained Catholic. Of the family of Hohenlohe-Neuenstein, which underwent several partitions and inherited Gleichen in 1631, the senior line became extinct in 1805, while in 1701 the junior line divided itself into three branches, those of Langenburg. Ingelfingen and Kirchberg. Kirchberg died out in 1861. Members of the families of Hohenlohe-Langenburg and Hohenlohe-Ingel-

fingen are still alive. the latter being represented by the branches of Hohenlohe-Ingelfingen and Hohenlohe-Öhringen. The Roman Catholic family of Hohenlohe-Waldenburg was soon divided into three branches. but two of these had died out by 1729. The surviving branch, that of Schillingsfiirst, was divided into the lines of Hohenlohe-Schillingsfürst and Hohenlohe-Bartenstein. The four existing lines of this branch are those of Waldenburg, Schillingsfiirst, Jagstberg and Bartenstein.

HOHENLOHE-SCHILLINGSFURST, CHLODWIG KARL VICTOR, PRINCE OF (1819–1901), German chancellor, was born on March 31, 1819, at Schillingsfürst in Bavaria, of mixed Catholic and Protestant parentage, which perhaps accounts for his tolerance in religious matters. He studied law, and entered the Prussian civil service in 1844, but his accession, under a family distribution of the Hohenlohe estates, as reigning prince of Schillingsfurst, entailed his resignation from the Prussian service in 1846. He then took his seat in the Bavarian Reichsrat, but his liberal sympathies and his desire to see a united Germany compromised his chances of advancement at the Bavarian court. Prince Hohenlohe married, in 1847, a Russian heiress, the Princess Marie of Sayn-Wittgenstein-Berleburg. He spent much time at various European courts, and was in touch with important people in Vienna, St. Petersburg (now Leningrad), and London.

It was Wagner, apparently, who persuaded the Bavarian king to place Hohenlohe at the head of his Government (*Denkwürdigkeiten*, i. 178, 211), and on Dec. 31, 1866, the prince was duly appointed minister of the royal house and of foreign affairs and president of the council of ministers.

As head of the Bavarian Government Hohenlohe's principal task was to discover some basis for an effective union of the South German States with the North German Confederation, and during the three critical years of his tenure of office he was, next to Bismarck, the most important statesman in Germany. He reorganized the Bavarian army on the Prussian model, brought about the military union of the southern States, and took a leading share in the creation of the customs parliament (*Zollparlament*), of which on April 28, 1868, he was elected a vice-president. On the question of the Vatican council Hohenlohe took up an attitude of strong opposition to the ultramontane position. He believed that the policy of Pius IX. of setting the Church in opposition to the modern State would prove ruinous to both, and that the definition of the dogma of papal infallibility, by raising the pronouncements of the Syllabus of 1864 into articles of faith, would commit the Church to this policy irrevocably. This view he embodied into a circular note to the Catholic powers (April 9, 1869) drawn up by Döllinger, inviting them to exercise the right of sending ambassadors to the council and to combine to prevent the definition of the dogma. The only practical outcome of Hohenlohe's action was that in Bavaria the powerful ultramontane party combined against him with the Bavarian "patriots" who accused him of bartering away Bavarian independence to Prussia. The combination was too strong for him; a bill which he brought in for curbing the influence of the Church over education was defeated, the elections of 1869 went against him, and in spite of the continued support of the king he was forced to resign (March 7, 1870).

Though out of office, his personal influence continued very great both at Munich and Berlin, and had not a little to do with favourable terms of the treaty of the North German Confederation with Bavaria, which embodied his views, and with its acceptance by the Bavarian parliament. Elected a member of the German reichstag, he was, on March 23, 1871, chosen one of its vice-presidents, and was one of the founders of the Liberal Imperial Party (Liberale *Reichspartei*), the objects of which were to support the new empire, to secure its internal development on Liberal lines, and to oppose clerical aggression as represented by the Catholic Centre. Hohenlohe strenuously supported Bismarck's anti-papal policy, the main lines of which (prohibition of the Society of Jesus, etc.) he himself suggested.

In 1873 Bismarck chose Prince Hohenlohe to succeed Count Harry Arnim as ambassador in Paris. In 1878 he attended the Congress of Berlin as third German representative, and in 1880, on the death of von Bulow (Oct. 20), secretary of State for foreign affairs, he was called to Berlin as temporary head of the Foreign Office and representative of Bismarck during his absence through illness. In 1885 he was chosen to succeed Manteuffel as governor of Alsace-Lorraine. In this capacity he had to carry out the coercive measures introduced by the chancellor in 1887–88, though he largely disapproved of them; his conciliatory disposition, however, did much to reconcile the Alsace-Lorrainers to German rule. He remained at Strasbourg till Oct. 1894, when, at the urgent request of the emperor, he consented, in spite of his age, to accept the chancellorship in succession of Caprivi. The events of his chancellorship belong to the general history of Germany. In general, during his term of office, the personality of the chancellor was less conspicuous in public affairs than in the case of either of his predecessors. His appearances in the Prussian and German parliaments were rare, and great independence was left to the secretaries of State. What influence the tact and experience of Hohenlohe exercised behind the scenes on the masterful will and impulsive character of the emperor cannot as yet be generally known.

Prince Hohenlohe resigned the chancellorship on Oct. 17, 1900, and died at Ragaz on July 6, 1901.

Prince Hohenlohe's *Denkwürdigkeiten* (2 vols., Stuttgart and Leipzig, 1906) are singularly full and outspoken, the latter quality causing no little scandal in Germany and bringing down on his son, Prince Alexander, who was responsible for their publication, the disfavour of the emperor.

For the Hohenlohes generally *see* A. F. Fischer, *Geschichte des Hauses Hohenlohe* (1866–71); K. Weller, *Hohenlohisches Urkundenbuch, 1153–1350* (Stuttgart, 1899–1901), and *Geschichte des Hauses Hohenlohe* (Stuttgart, 1904). *See* also Prinz Alex. Hohenlohe, *Aus meinen Leben* (edit. G. Anhauser. 1925).

HOHENSTAUFEN, a German princely family which derived its name from a village and ruined castle near Lorsch in Swabia, now in Württemberg. Its members were emperors or German kings from 1138 to 1208, and again from 1214 to 1254. The earliest known ancestor was Frederick, count of Biiren (d. 1094), whose son Frederick built a castle at Staufen, or Hohenstaufen, and called himself by this name. He supported the emperor Henry IV., who granted him the dukedom of Swabia in 1079, and gave him his daughter Agnes in marriage. In 1081 he remained in Germany as Henry's representative, but only secured possession of Swabia after a struggle lasting twenty years. In 1105 Frederick was succeeded by his son Frederick II., called the One-eyed, who, together with his brother Conrad, afterwards the German king Conrad III., held south-west Germany for their uncle the emperor Henry V. Frederick inherited the estates of Henry V. in 1125, but failed to secure the throne. He opposed the new emperor, Lothair the Saxon, who claimed some of the estates of the late emperor as crown property. A war broke out and ended in the complete submission of Frederick at Bamberg. In 1138 Conrad of Hohenstaufen was elected German king, and was succeeded in 1152, not by his son but by his nephew Frederick Barbarossa, son of his brother Frederick (d. 1147). Conrad's son Frederick inherited the duchy of Franconia which his father had received in 1115, and this was retained by the Hohenstaufen until the death of Duke Conrad II. in 1196. In 1152 Frederick received the duchy of Swabia from his cousin the German king Frederick I., and on his death in 1167 it passed successively to Frederick's three sons Frederick, Conrad and Philip. The second Hohenstaufen emperot was Frederick Barbarossa's son, Henry VI., after whose death a struggle for the throne took place between Henry's brother Philip, duke of Swabia, and Otto of Brunswick, afterwards the emperor Otto IV. Regained for the Hohenstaufen by Henry's son, Frederick II., in 1214, the German kingdom passed to his son, Conrad IV, and when Conrad's son Conradin was beheaded in Italy in 1268, the male line of the Hohenstaufen became extinct

Daughters of Philip of Swabia married Ferdinand III., king of Castile and Leon, and Henry II. duke of Brabant.

HOHENSTEIN (Hohenstein-Ernstthal), town of Germany,

in the district of Karl-Marx-Stadt, on the railway Zwickau-Karl-Marx-Stadt (Chemnitz), 12 mi. N.E. of the former. Pop, (1950) 18.015.

The city has textile industries, and there are copper and arsenic mines in the neighbourhood. Hohenstein was united to the town of Ernstthal in 1898. Hohenstein was founded by the Teutonic Order in 1359.

HOHENZOLLERN DYNASTY. The Hohenzollerns were a German family of counts, who in the 11th century were living in comparative obscurity in the south-eastern corner of the empire, in the 12th received a Burgrafdom in Franconia, thanks to the friendship of one emperor, in the 1 jth were invested by another emperor with the electorate of Brandenburg, in the 17th acquired by marriage Prussia in the north-eastern corner of Germany. and at the same time fragments on the Rhine and the Ruhr, on its western frontier, in the 18th rounded off and enlarged their centrifugal possessions by conquest and also assumed the title of king. in the 19th outstripped the other German states by means of victorious wars, united them and thereby won the title of German emperors, and in the 20th, after an unsuccessful war, lost empire, kingdom, and markgravate at a blow and abandoned their defeated country to its fate.

When they entered the German empire, it was a very shadowy entity. Up to the 19th century they were never interested in the empire, much less in a position to consolidate it. They remained immersed in the factions of rival German dynasties, until at last they achieved the hegemony in a whole so solid that their disappearance left it unshaken. For exactly five centuries they extended and increased their rule over northern Germany. seldom lost territory, and then only for short times, and gradually consolidated a State that was only a patchwork of scattered fragments, with no organic connection.

Thus their State could only be held together from above, by an army of soldiers and an army of officials, by severity, police and punctuality; it was often found necessary to suppress by force the centrifugal forces of certain parts which had been accustomed to other dynasties or other forms of State, and always felt themselves rather German than Prussian. The basic principle of this dynasty thus came to be absolutism, which survived here longer and more vigorously than in most parts of Europe, looked on its citizens to the last as subjects, was opposed to any democratic movement, and sought to impress obedience as the chief virtue In the place of national sentiment there arose a spirit of caste, and interest in the State went no further than the wish to belong to the upper caste. On top of this came a militaristic system, rnore prominent in domestic than in foreign affairs; for the Hohenzollerns were by no means more warlike than the majority of ruling houses. and their subjects cared less for the pursuit of the laurel than many another nation It was the necessity of unifying their scattered subject peoples that gained the Hohenzollerns their bellicose reputation; and this is how the sober and peaceable Prussian nation has acquired a name for brawling.

The fortuitous character of the origin of this State, the lack of a great guiding line of development, is reflected and in part influenced by the personal characters of the dynasty. Of the 20 rulers who reigned in Brandenburg and Prussia for five centuries, from the first elector to the last emperor-king, there were not more than eight who ruled with efficiency, industry and talent, while the rest were weak and vain, and squandered the money and success accumulated by their fathers; and these two types followed one another in almost regular alternation, grandfather often resembling grandson, while their country flourished or decayed alternately, according to the personal characters of these almost unrestricted autocrats

As these princes were generally long-lived (their reigns averaged 25 years each) the shocks of abrupt changes of character were mitigated. Moreover, the two greatest rulers had each nearly half a century to impress his nature on the people These two rulers, the Great Elector and Frederick the Great, mere able, thanks only to their very long reigns, to draw the tatters of the land together into a real State. These two, with Frederick William I. and William I., incorporated the best characteristics of the family: economy, industry, honesty, courage. Of them all, Frederick the Great alone showed any traces of genius.

Origins.—The name Hohenzollern, first borne by a certain Wezel of Zolorin, is derived from the word "Söller," a watch tower or castle. The family demesne in Swabia extends from the upper Neckar to the Lake of Constance. In the 12th century one of these counts was invested by the emperor, whose friend he was, with the Burggravate of Nürnberg. His successors acquired further lands in the neighbourhood through purchase or marriage, and in the 14th century one of them was raised to the rank of prince of the empire. His son. the Burggraf Frederick, saved the life of the Emperor Sigmund, king of Hungary, in battle, and was appointed by him Imperial Governor in Brandenburg The family thus divided, a secondogeniture was formed in Franconia, which ruled there from 1486 to 1791, when the territories in question became Bavarian. The original Swabian line, meanwhile, survived from 1251 to 1850 This line played a part in the outbreak of the war of 1870, one of its princes having come forward as candidate for the throne of Spain, a suggestion which France vetoed. His younger brother Charles (1839–1914) also aspired to a foreign throne, and became Prince and afterwards king of Rumania. His nephew and successor, Ferdinand of Rumania, the son of the prince intended for Spain, fought in the World War against Germany. The head of the Swabian line in 1919 was Prince William (b. 1867).

The Margraf Frederick, who became hereditary elector of Brandenburg in 141 j, a brave and able man, was despised and opposed by the native, half-Slav nobles as a petty foreign prince. and felt so out of place that after ten years he returned home, leaving his son to rule in the desolate North. His successor, Frederick II. (1440–70) met with equally violent resistance from the nobles, and also from the towns, until, disregarding their ancient rights, he appeared with 600 horsemen before the gates of the young city of Berlin, took the city, built a castle on the Spree to overawe it, and made this new place in the middle of the sandy waste into his capital. He destroyed all old privileges, turned the citizens into subjects, deprived them of their courts, and in 1443, forced them to swear fealty to him, an oath which the people of Berlin kept until their first rebellion, 400 years later This iron right hand of his knew not what his pious left hand was doing, for at the same time he founded an Order of holy living for noblemen; but at last, like his father, he abdicated in disgust—not before his reason had half given way.

Albert Achilles (1470–86), called by his contemporaries the "German Fox," and twice excommunicated by the pope, established a brilliant court. enslaved burgess and peasant (whose part consisted only of paying and serving), involved the country in unprofitable disputes—only to desert it in the end, like his two predecessors. All three, and their successors, the weak John (1486–99), who died young, and the brilliant, crafty Joachim I. (1499–1535) were hated in the land, which was still strange to them, although the family had now been ruling there for 100 years. Joachim, a strong opponent of Luther, was also the first to show a mystic side. He dabbled in astrology, pursued and encouraged education, founded the first university, in Frankfurt on the Oder, but also passed many cruel sentences and once had 38 innocent Jeus burned in the centre of Berlin.

More unbridled still was the life of Joachim II. (1535–71), who during his long reign built churches and castles with a lavishness that verged on madness. sought to outshine all other princes, squandered the burgesses' gold on favourites, mistresses and the chase, forbidding them the while to wear trunk-hose or to hold rich wedding feasts, but forcing them five times to pay his debts, which ran into millions.

His son and opposite. John George (1571–98), an Evangelical Protestant, as his father had been before him. economical, pious, father of more than 20 children, tried to make up the 2 joo ooo thalers of debts aith nhich his predecessors had saddled the country, lived quietly and respectably, and managed, by clever marriages for his relatives, to secure important heritages. His successor, Joachim Frederick (1598–1608) lived staidly also, and was wise enough to fashion himself a staff for all questions

of government by empanelling nine learned men on his privy council — the actual beginning of the Prussian bureaucratic State.

After him, John Sigismund (1608–19) reaped the fruits of the marriage arranged by his grandfather, and for the first time enlarged the land very considerably through his wife's heritage; he became duke in Prussia, and at the same time lord of rich and storied lands on the Ruhr, the Maas and the right bank of the Rhine, for the sake of which he turned Calvinist. Thus, without merit of his own, but also without war, he extended the land "from the Maas to the Memel," as the song said; yet had no pleasure of these strange lands, but sat disgruntled in the middle of a long chain of provinces, linked together by nothing but a dynasty that was still feeble. Under his successor it all went to pieces; this George William (1619–40), another of the frivolous, showy sort, the hunters and carousers, had none of the qualities needed to weather the storms of the Thirty Years' War, for, as Gustavus Adolphus said, "a new livery, a handsome horse or a pair of greyhounds drove everything else out of his mind." He remained neutral in the war, which nevertheless brought famine and misery into his lands. Thereupon he left Berlin, and went to Prussia, the duchy in the far north-east, where there was better fare and sport, leaving everything in ruin behind him, and bequeathing to his son a hopelessly disorganized country.

The **Great** Elector. — This twenty-year old youth, Frederick William (1640–88), rightly called the Great Elector, began by repairing all the damage his father had done. In the confusion of the war, the end of which was still far away, he built up a solid army, and played the rival combatants off skilfully against each other until he had a trained force of 8.000 men; all in great secrecy, for he was a master of dissimulation although also personally brave. Thus playing the double game which the times forced upon him, and which was also native to his character, he won the trick every time, through the power of his ever-growing army, which he employed now for, now against his neighbours. First he allied himself with Sweden, then ten months later broke this alliance and joined Sweden's mortal enemies, the Poles. Nor had he any compunction in signing a secret treaty with the "Roi Soleil," promising the German Imperial crown for the Dauphin if he himself only got back Pomerania. When Louis XIV. failed to pay the promised subsidies, the elector forthwith joined the league against him.

An excellent general, he never spared himself in the fight, fought in person among his men at the great victory over the Swedes at Fehrbellin in 1675, and generally developed gifts and qualities possessed by none of his forefathers, and not more than one of his successors. It was only blended slyness and courage that enabled him to assert his authority in Prussia, after an involved struggle to rid himself of Poland's suzerainty, and thus become master in his own house. But scarcely had he overcome the enemy abroad, when he turned in the same absolutist spirit against the enemy within, and as his ancestor had subdued Berlin, two centuries before, so he forced Konigsberg to submit to him, in the teeth of the constitution, compelled the recalcitrant towns and nobles to do him homage, cancelled the privileges of the Estates where they inconvenienced him, and threw into prison the leader of the burgesses. against his pledged knightly word.

On the other hand, after a reign of nearly 50 years, he left behind him a unity, created by violence, but surpassed in Germany only by the house of Habsburg, hundreds of villages new-built, new canals, dykes and roads, the State revenue increased five-fold, a first-class army 30,000 strong, and the general awe of his neighbours. Shortly before his death, by one of his cleverest inspirations, he had invited into his country the Protestants expelled from France. Only now and then, and of special purpose, did he make a brave outer show; his nature was simple; he loved to water the flowers himself in his palace garden, in which, and afterwards in the country, he planted the pioneer potatoes, went himself to the market and bought singing birds, enjoyed unsophisticated pleasures, and in an age which despised burgess and peasant, was yet a fairly just ruler.

His son and successor was his opposite: a weak, vain and silly man, who tried to hide his hump back under a huge wig; affected, greedy and ungrateful. Frederick III. (1688–1713) had only one passion: he wanted to be king. At the age of ten he founded his first Order, and went on playing to the day of his death with feasts, processions and problems of etiquette. Seeking to embellish the ever-growing castle on the Spree, he discovered a great artist, Andreas Schliiter. When he founded the Academy of Arts, its first and also its second task was: the coronation of the king.

His wife, Sophie Charlotte, an enlightened princess from Hanover, who laid out the castle and town of Charlottenburg outside the gates of Berlin, unluckily meddled in politics, which were in the excellent keeping, not of the king, but of his tutor and adviser, the grave and indefatigable Danckelman. She hated this man's honesty and not only hunted him out of his offices, after he had ruled the land with success for a decade, but set the law against him, threw him into prison, and only released him ten years later. His place was taken by thieving adventurers. The work of the Great Elector was ruined.

Meanwhile Frederick took umbrage at the glory in which his cousins of Orange and Saxony were sunning themselves as kings of England and Poland, negotiated for several years with the emperor, and at last, by great promise of military help for Spain, extorted from him the concession that he would raise no objection to his coronation as king. This took place on Jan. 18, 1701 in Konigsberg, with unexampled pomp, and cost 4,000,000 thaler, or two years revenue. The elector, who placed the crown on his own head, called himself henceforward Frederick **I.,** king in Prussia.

Now he began to play at Versailles, founded dozens of grades among the courtiers, and kept a mistress, although he neither needed her nor liked her, for the sole purpose of taking her out publicly, at regular hours, like the king of France. At the same time, as price for kingly rank, he sent a part of his subjects to the emperor, and the emperor sent them to Spain, to death. The rest groaned under the most fantastic taxes, including a tax on wigs, or had to hand in the bristles of the swine they slaughtered, the king proposing to start a trade in bristles. The peasant had to spare the wild swine which trod down his field for the new king to shoot, and antelopes and aurochs were imported into Prussia.

It was fortunate that the son was once more of the economic, efficient type. Frederick William **I.** (1713–40), unfairly overshadowed by the figure of his son, was one of the best. rulers in Prussia. Short, fat, sound and active, pious, moral and thick-skulled, looking like a peasant whenever he laid uniform and pigtail aside, he stood four-square in life and in the State, asking none, always commanding, but usually commanding the right thing. His first act was to clear away all the paternal luxury, to send the favourites packing, to order simplicity in all things; for he had only one idea — economy. Simple in manner, more of a burgess than a king, he liked thick soups, drank thin beer, smoked moderate shag in his pipe, and only now and then let his ministers invite him to delicacies on which he would fall half in mockery, half in enjoyment. His idea of his post was that of a father of a family — a despotic one, of course. He interfered in everything, took account of no laws, clapped his bad ministers of State into jail, woke up the porters who kept people waiting, forced the rich burgesses of Berlin to build houses, forced his generals to buy the bad portraits of them that he insisted on painting in the evenings; ran, rode and drove about from five in the morning to six in the evening, inspecting, giving orders, and always finding fault.

All the same, he was usually just, and was popular, did everything for the country, nothing for himself and little for the upper classes. Out of the nobles, in particular, he squeezed so many taxes that they complained to the imperial council in Vienna, and won their appeal. Yet the king went on threatening them: "I will stabilize the sovereignty and set the crown as fast as a rock of bronze! I am king and lord. and will do what I wish! Holiness is God's, but all else must be mine!" But his severity grew milder as it reached the lower classes, worthy burgesses might rise to high posts, bad counts were thrown out, the peasant prospered again throughout the land. Tax-farmers and officials were punished for abuses, sometimes even hanged for them. When ravaged districts were to be restored, the king gave the money himself, rewarded every man who built a new house there with a post,

enlarged Berlin. made his residence in Potsdam, cut out all the sinecures at court, founded the Kammergericht, a treasury department to check expenditure and most important of all, the State Exchequer.

It was iron discipline; but the land prospered and got back much of the power and solidity which the Great Elector had given it. Compulsory military service was introduced in 1726—although only for burgesses and peasants. This compulsion was hated most by the educated classes in the towns, especially as the rules of the service were pedantic. The Great Elector created the Prussian military, but his grandson must answer for the militarism, for then it was that the barrack-yard tone spread like a pestilence through the people. whom the endless years of service spoiled for any more genial regime, so that they tortured themselves and the rest with rudeness and exactitude.

The king had a weakness for "tall fellows," whom he mistakenly held to be the best soldiers. He had the tallest men pressed in all Europe, paid fantastic prices, up to £3,700 a man, for them, spent 12,000,000 thaler on this toy, sold offices for it, broke the law, had giants stolen and carried away from abroad, started a sort of slave traffic, came to the edge of wars—all over the passion which this short, fat man entertained for the tall and slender. Here his piety and his economy broke down.

As he looked after the state like a *pater-familias,* so in his house he played the king, and with the best will in the world, he would have broken up any family life. Aghast, he saw his children go over into inevitable opposition, the daughters reading French books, the son playing the flute in a silk dressing-gown, instead of practising musket-drill as he should have done, having been born, as it were, in uniform. Finding in the crown prince the weaknesses and vanities of his own father renewed, he saw that they must be destroyed, and thrusting a cruel hand into the tangled woof of a complex young soul, driving a young man to desperation, by that very act he saved just what his nature held of genius. But for the horrors endured in his youth, Frederick II. would never have become "the Great." His father served Prussia well in many respects, and not least in saving his son for the State and for history.

Frederick **the** Great.—For Frederick II. (1740–86) was decidedly what his father called him, an "effeminate fellow." Things came to a crisis over a marriage which the young prince was to have concluded with the daughter of the king of England, but his father spoiled it. Even before this, at 16, when on a visit to the court at Dresden, he had made the acquaintance of another world, and thereafter shunned military service, accumulated debts and scandals, till his father, in a rage, beat him in the presence of strangers and once came near running him through. Then the prince tried to escape over the frontier, at some manoeuvring in the west, was hailed back, thrown into jail, with a friend who had helped him was sentenced to be shot as a deserter, was pardoned, but forced to see Katte, his friend, beheaded before his eyes, and finally came out of this affair, after a time of complete spiritual collapse. a changed man. He had become a cynic.

At first he began to study the country only to please his father, but he learned to value a fruitful activity and when the king, in his last years, saw the prince busy about his future task, he relaxed the military fetters, allowed him, when his work was done, to occupy himself, generally far from his unloved wife, with the teachings of Voltaire, with giving concerts in his country palace; for the king looked on all this only as a sort of recreation, like his own, which he mostly took in a room full of tobacco smoke, among doxies and bawdy stories. So it came that when he died, he called himself fortunate to have left such a son behind.

The young king had no love for the people, whom he called the *canaille,* but still less for the nobles. He loved nothing at all, in fact, except wit and his dogs, and perhaps his sister and a few old soldiers. But he applied that great tolerance which he had learned from Voltaire and from the ideas of Locke, called himself and felt himself the first servant of the State, allowed complete freedom of the press, had a caricature of himself hung lower down in the window. so that the people might see it better, and proclaimed at once that his people were free to be happy in their own fashion.

He abolished the tall fellows at once, but strengthened and enlarged the army, and put a stop to pedantry and brutality. He saved up, and spent little when he built himself a solitary, one-storied country house, the Sanssouci, where the best wits, not, indeed, out of Prussia, but mostly out of France, foregathered at his table; for the king was fond of speaking French, which he did as badly as he did German.

As crown prince, mostly out of boredom, he had written a thesis against Macchiavelli's "Prince," based on misunderstandings, but containing some principles which he afterwards followed: "The Prince is not lord, but servant of the people, his power rests in the last end only on the people's choice. No man has the right to allow himself unlimited sway over his fellow-men. Only the tyranny of government brings the peoples to rebellion." These principles of domestic policy accorded with the age and his own ideas; in foreign policy Frederick behaved exactly like Macchiavelli, denying any morality in affairs of State, or any valid consideration except personal interest. Thus, scarcely had he begun to reign, when he provoked a war to conquer Silesia, on which he had no claim. "My age, the fire of my passion" he wrote to a friend, "the thirst for glory, even curiosity, to tell you the whole truth, in short, a secret instinct has torn me out of pleasant ease and the satisfaction of reading my name in the gazettes and the history-books has seduced me." In the first and second Silesian Wars he was able, with the help of his father's army, to conquer this land from Maria Theresa and retain it.

In the decade of peace that followed he lived as a man of the world, not a philosophical one by any means, adorned himself with Voltaire's presence, dabbled in the arts and sciences, kept up the best opera in Europe, was generous towards artists, and wrote his own history so quickly that in 1746 he was already dictating the events of 1745. But when he was half-way through the forties, the consequences of his youthful ambitions rose up before him like black shadows. He saw the revenge of the empress of Austria join hands with the disfavour of the tsarina, the hate of the king of Saxony and the pride of the king of France allied with them, and all at once half Europe stood united against him, to destroy this young kingdom, become too strong.

Frederick went into the Seven Years' War (1756–63) with about 200,000 men against twice the number. This third war, which he had provoked through the conquest of Silesia, brought the enemy as far as Berlin and Sanssouci, and Frederick himself to the verge of despair. In this war a million men fell to no purpose, for it ended on approximately the status quo ante. Half of this million were Prussians. Some 30 years after those candid words on thirst of glory and curiosity, Frederick wrote: "Glory is vain. Have men ever deserved praise? They have only been praised because they made a stir." At the Peace of Hubertusburg, Frederick gained nothing, but also lost not so much as a village, although his enemies had meant to break the new great Power into pieces. This result, shattering in both ways, must have shattered the king as well, like the conflict with his father when he was crown prince. For the second time he returned home a changed man.

Although only 52 years of age, he looked an old man; although an old man, he had 23 years before him still. Now he became great. The work of reconstruction to which his conscience, his experience, his age, his loneliness alike urged him, showed him the father of his fatherland; all for the peasant and the poor, all, where possible, against the noble, all always against the idle. He quarrelled with Voltaire and most of the other Frenchmen; his sister was dead, his oldest friends were ageing around him, the circle fell silent, dust lay on the flute; only the greyhounds loved him, lay in his chairs, in his bed, and when they died, he set up marble memorials to them. In his will he wrote that he wanted to be buried beside them. He could still be interested in the French spirit, but the German was foreign and unsympathetic to him. That Kant, a Prussian professor, was building up a new world, that Herder and Klopstock, Lessing and Wieland were writing quite near him, he was unaware, or else disliked it; he wrote a sneering pamphlet against Goethe's *Götz* von *Berlichingen*; the fact was, he was neither philosopher nor poet, only a dilettante, and not even a good one.

On the other hand, he worked harder than any man in his State, harder, too, than any Hohenzollern before or after him. He drained morasses, planted woods, made roads, built countless houses, went on tours of inspection among his people, distrusted his officers, backed up the peasant against the count, even when he was in the wrong, and now lived truly in the heart of his people. At 70 he wrote, in the true spirit of Voltaire and the old Faust: "He who improves his land, makes waste land fruitful, and who drains swamps, he wins victories over barbarism."

Weak Monarchs. — His successor was one more of the bad sort. Frederick's nephew, Frederick William II. (1786–97), lazy and sensual, vacillating and romantic, managed in the single decade of his reign to squander on favourites, male and female, half of what his predecessors had spent seven decades in accumulating, and what chance brought him through a partition of Poland and a heritage in his own family was never assimilated and soon lost. The army soon became undisciplined, and when it was sent to fight the French revolution, it dared not even attack it. The day of Valmy, no victory for the French, yet made the deepest impression, for all Europe said that the army of Frederick the Great had ceased to fight.

The next one, too, was weak and without talent, although his life was simple, sober and respectable. Frederick William III. (1797–1840) imitated his ancestors' policy in the Thirty Years' War, and tried to preserve neutrality through the tempests of the Napoleonic Wars. He watched his neighbours' lands occupied, unperturbed, al ays spoke of "soothing" (which was not very appropriate) Napoleon, refused to listen to his wife, the talented and ambitious Queen Luise, and then suddenly found himself forced into war, after all, and at the Battle of Jena (1806) lost the fame of Frederick's army, and in the Peace of Tilsit lost more than half of his possessions-everything, in fact, west of the Elbe. He failed to recognize the natural saviour who offered himself to him, the Freiherr vom Stein, one of Prussia's two great statesmen, and when Stein made his entry into the Government conditional on the dismissal of the intriguing privy council, the king wrote to him: "You are a recalcitrant, stubborn, obstinate and disobedient servant of the State, full of your own genius and talents, and instead of looking to the good of the State, led only by caprices, swayed by passions and personal animosity."

All the administrative reforms which Stein and Hardenberg effected, were done in the king's despite; he was drawn into the Wars of Liberation and the alliance with Russia in 1813 against his will, he took no personal part in any battle, but entered conquered Paris in state. For all that, the popular struggle against France evoked the first democratic movement in Prussia. The towns got back the self-government filched from them 300 years before, in another form, the term of general military service was fixed at three years, the conduct of the State was concentrated in the hands of a ministry, which, however, was only empowered to debate, and not to decide. The grant of a constitution now could have bound together the disunited nations of the State, one third of which, into the bargain, were Catholics — a further point of difference. The king promised, indeed, in 181 j, just before the last war against Napoleon, the rudiments of a constitution, which involved no losses for him, as the Estates envisaged were also only to have an advisory voice.

When the people had driven out the conquerors, it was quickly forgotten. The reaction, led by part of the Prussian nobility, fed by Metternich in Vienna, conquered in Prussia also; the Holy Alliance testified that kings were appointed by God, the fall of the Corsican willed by God, and the princes, therefore, infallible in their way. The king threw himself against the popular movement, dissolved athletic and students' associations, suppressed dangerous books and papers, dismissed professors, threw the most popular leaders into prison, punished every request for fulfilment of his promise as treasonable, filled the country with police and spies, or at least, was glad to let his servants do so.

The son was exactly snch a failure as his father: Frederick William IV. (1840–61), a man of decided talent, but weak, confused, romantic; in person short-sighted, slovenly, thin-haired, he never dared do what he would, and only took a definite decision to abandon it as soon as taken. Liberal, like all crown princes, before his accession, he soon disappointed the people. The guiding idea of the day, citizenship, the contract between prince and people, he dismissed as nonsense, the sovereignty of the people he described as the principle of evil in the world, and tried vainly to gloss over his hostility to the people by smooth phrases.

It was only seven years later that he began to notice the gathering storms, and under the pressure of public opinion, convoked, in the shape of the "united diet" (1847) the first parliament that Prussia had seen, graded on the caste system, but yet empowered to reject State loans or taxes. In his very first speech, however, the king took everything back, declaring it to be God's will that he should reign — he was always adept at hiding his own fear of the people under a mystic light. The diet was closed again immediately, with nothing accomplished; but the February revolution in Paris soon after strengthened the people's forces in Berlin. When revolution broke out there in March.1848, when the people of Berlin broke their oath of loyalty exactly 400 years after they had sworn it, the king hesitated, characteristically, assembled troops, but immediately afterwards, in his mortal fear, issued a Patent promising a Liberal Constitution, which he proclaimed in person from the balcony of his palace.

Those first shots which can never be prevented in any riot, were fired by the military. Two hours later, 200 barricades had been erected in Berlin. The troops had the upper hand in the fighting, but the next day the king issued a proclamation "to my dear Berlin," begging the people to disperse quietly, and withdrew his own troops. He sat in his palace, irresolute, listened to all councils, approved a citizens' defence corps, proclaimed an amnesty, ordered a new ministry, till the beaten bourgeoisie were turned into victors by the Crown's timidity. Three days later there appeared an unintelligible proclamation, saying "Prussia was to be absorbed in Germany" and the king would take his place at the head of Germany. Elections were held for a parliament for Prussia and one for Germany. When the latter, sitting in Frankfurt, elected the king German emperor, on April 3, 1849, those who were nearest to him did not know whether he would accept or refuse the crown. Up to the last moment his chief intimates believed that he would accept. Suddenly he refused.

Out of fear of a coalition which threatened to form against him under Austria's leadership, he dropped all plans for uniting Germany, but took the oath to the new Prussian Constitution before the two Chambers. This reproduced the principles of the modern constitutions of other countries; but the ministers were still responsible to the king alone, who enjoyed the sole right of appointing them, and also the sole right of concluding treaties with foreign powers, and declaring war or concluding peace at discretion. Only the spirit of an absolutism 400 years old was capable of burdening itself with this two-fold responsibility which the king of Prussia received, and indeed, really assumed for the first time before the whole people, without himself being responsible to anyone but God. At the same time, these two most dangerous clauses cut the people off from any attempt to educate themselves politically, and gave the citizens an excuse for living on as subjects. Only so can it be explained how these provisions lived on into the 20th century. The next decade passed in Prussia amid the growing discontent of the Liberals, and the growing irritability of the sick king, till the king, too late, was declared of unsound mind and his brother became regent, and afterwards successor to the throne.

The German Empire. — William I. (1861–88) ascended the throne as a man of almost 64 years of age, and no one could have anticipated that he would retain it till his 91st year. He was suspect to all Liberals on account of his attitude in the days of the revolution, when he had had to escape out of the country, and sealed his unpopularity when, in Sept. 1862, he could find no other way out of the internal impasse than to appoint the notorious Junker, Otto von Bismarck-Schonhausen, his minister. That he kept, on the whole, on friendly terms with this man for 26 years without a break, in spite of many conflicts of opinion, and although he was convinced that he ruled by Divine Grace and at heart felt no greater inclination towards intimacy with a Junker

than with any other mortal, cannot be explained only by the successes of his minister. It is also a proof that this truly honest and chivalrous old gentleman admitted to himself the superiority of his servant, who, indeed, treated him like a master, and sometimes too, being nearly 20 years the junior, like a son. Besides, William was past the vagaries of youth and the ambition of manhood, and would have liked best to yield to old age's need of rest, had not his minister's uncanny energy led him ever onward on the path of daring.

For the King began by objecting to all the three wars which Bismarck had decided to wage, to put Prussia at the head of Germany, and thus to solve the German question without and against Austria. In 1864, 1866 and 1870 he swore not to draw the sword, yet in the end his adviser wrung his consent from him. Before the Schleswig-Holstein war he said that he really had no rights at all to these two duchies; before the war against Austria, that he would never shed German blood; before the war against France he gave way to Napoleon's and Grammont's arrogant demands to the limit of what was possible. But when he was swimming on the full tide of victory, it was only with great difficulty that he could be restrained by Bismarck's foresight from impolitic immoderation. He neither understood nor liked Bismarck's consistent purpose, for if Bismarck cared more for Prussia's greatness than for Germany's unity, the king cared even less for Germany, and he refused for weeks to assume the imperial title, which he thought looked "like a major's title," while clinging to the insignia of Prussia, like his brother before him, who had also refused to become emperor.

None of the important steps in the king's career were due to his own initiative; in fact, at the decisive moments at Nikolsburg, Gastein and Versailles, Bismarck had always had to employ threats of resignation, nervous breakdowns and outbursts of tears, before he got his way. "I carried him on my shoulders on to the imperial throne," he said afterwards, and it was true. In the end the king was so angry with him over the whole emperor business, that when he descended from his throne in the Hall of Mirrors at Versailles, on Jan. 18, 1871, he walked past Bismarck without a word, when he went to thank his generals.

The old monarch long remained strange to his people, and it was only through the surprising elevation of his position, and especially through his more than patriarchal age, that he achieved a gradual and tardy popularity. He always remained simple and very economical, as he had been brought up to be in Prussia's lean years; slept and died in his iron camp bed, but left over 20,000,000 marks. But he had a really warm and tactful heart, and like a true king, always managed to leave his chancellor a free hand and all possible glory, without losing any of his own natural dignity. This, and the loyalty with which he stood by his chief minister, although the great nobles tried very hard for years, and his wife for decades, to separate them, the gratitude with which he heaped honours and riches on the founder of his empire—this combination of qualities was not to be found in any of his ancestors. For all his unsophisticated mind. for all his narrow upbringing, William I., with his courage, his piety and his kingly nature was always a true nobleman.

His son, who mounted the throne a dying man, and ruled only 100 days, as Frrderick III., had won by his share in famous battles, his good looks, and above all, his sorrows, a popularity which he bore with exemplary patience. In character he belonged rather to the romantic type of the family; when the empire was being founded, he proposed that the other princes should be compelled to do homage; he adored old thrones and brilliant pageants, and only betrayed his domineering instincts so seldom as he did because the superior intelligence of his wife, Victoria of England, primed him with democratic demands or catch-words.

The Ambitions of William II.—William II. (1888–1918) inherited both his mother's great gifts and her dilettantism, with his father's love of display; together with other ancestral qualities which Bismarck, in his character-sketch of the last emperor, summed up as follows: "From Frederick I. he inherited love of display, vanity and an autocratic nature; from Frederick William I. only the taste for tall fellows; from Frederick the Great only the love of interfering in his officials' business; from Frederick William II. a mystic turn and strong sexual impulses, from Frederick William IV. the desire to talk a lot.'

The dangerous mixture of weaknesses and talents, in both of which William II. was rich, of vanity and timidity, both of which were equally strongly developed in him, is only partly to be explained by the withered arm which all his life he hid from the world and tried to overcome in his own soul by an exaggeratedly manly and military manner. An over-strict upbringing, keenly resented because of his physical defect, gave him, too, an unhappy youth reminiscent of the repression suffered by Frederick the Great. In this case, however, there was no instruction to mature the prince, no restraint to moderate him. On the contrary, fate willed it that at 29, suddenly and almost unprepared, he should inherit an empire which had grown steadily in power as he grew from boyhood to manhood. Could it be wondered at that the young monarch, impelled by the will to please, bemused with ideas of God's peculiar grace, inspired with the rise of his house, too long repressed, too suddenly master, began to follow the promptings of his vanity rather than of his duty? And how was a State whose constitution was still practically the same as in 1850, whose citizens had no political experience and in which the higher officials and officers had for centuries been drawn almost exclusively from the nobility—how was such a State suddenly to produce men with the courage to turn their backs on the throne, or even to warn the king? The empire was at its zenith. What could happen to it with the strongest army in the world, and an officialdom which ran as smoothly and as incorruptibly as a machine?

When the young emperor overthrew the old chancellor in March 1890, after 28 years' service, in the same brutal way as Frederick I. of old had cast aside his minister Danckelman and as William had suggested in talk among his friends, nothing hindered him from making himself supreme except lack of Frederick the Great's genius. He did not, indeed, like Frederick, unleash a war, for all his life, in natural and explicable fear he dreaded nothing so much as the danger of battle and war; but he dissolved the treaty with Russia on which Bismarck had bound the security of the empire. Almost at the same moment as William dismissed Bismarck, he cut the wire which linked Berlin to Petersburg, and so cleared away the obstacle which had kept the tsar aloof from a French *rapprochement;* and thus William opened the door for that war on two fronts which Bismarck, with an eye to Germany's unfavourable situation, had managed for three decades to prevent.

From now onward, the encirclement of Germany proceeded the more inevitably, as William, out of personal hatred of his uncle, Edward VII. of England, rejected every advance from England, even the offer of an alliance from Chamberlain, and instead of this aspired to colonies and began to build a great fleet—two things that Bismarck had avoided on the principle that Germany's dangerous situation forbade her from engaging in any adventures abroad. All these enterprises were accompanied by a flood of high-flown and even provocative speeches, the echoes of which made the cabinets of Europe, and the peoples too, uneasy for 25 years. To shout down his weakness, the emperor in these hundreds of public speeches proclaimed again and again his phrases of the shining armour, of the victorious German sword, of the mailed fist, Nibeiungen loyalty and Neptune's trident, until the world he addressed held him for a warlike conqueror, only waiting for the moment to fall upon his neighbours.

In reality he was pushed on by the little military circle, that, in Prussia as everywhere else, was urging new wars after a generation of peace, called him a coward in secret, and thought out machinations how to bring him from words to deeds, from threats to mobilization. The middle classes listened with ironic smiles, paid less and less attention to these speeches every year, and buried themselves in business, which was flourishing everywhere. Only the workmen and Socialists, in their press, brochures and speeches uttered warnings, year after year, against the dangers of the ever-increasing boasting and court display. When the consequences of the imperial speeches became a national danger, in Kov. 1908, over an incautious interview in the Daily Telegraph, and all Germany arose and demanded a remedy, it was not the

Socialists, but members of the highest nobility who debated whether the emperor should not be put under control, as of unsound mind.

The murder of the Austrian heir to the throne in July 1914 was a personal blow to William, because the victim was his friend. and a prince by God's grace as well; his mind, too, appears at the time to have been in a state of maniac excitement, so that he encouraged the bellicose cabinet of Vienna with violent words, letters and marginal notes, and promised them help. Three weeks later, when all was lost, and his mind was passing through a state of less exaltation, his anger burned out, he shrank away from the threatening spectre of war, which he, oftenest of all men, had evoked, and sought at the last moment to avoid it. When the first signs of unrest began among a starving, bleeding people, he thought it could be crushed by force, as in peace. It mas only when the general collapse began, in Oct. 1918, that in a memorable scene he sanctioned the new constitution, even as Frederick William IV. had not promised his till the first shots were heard in Berlin; and thus in the last weeks of his reign, against his declared will, yet founded that new democratic Germany in which ministers rule instead of kings, and are nominated by a people's parliament.

In vain first Wilson in America, then a section of public opinion in Germany, appealed to him to abdicate, to ease the situation of his country. He remained, until in the first days of November, the people rose in different cities and ports, and demanded his abdication. Even on Nov. 8, when his cousin and chancellor, Prince Max of Baden, himself proposed his abdication as a means of saving the monarchy, which could easily have been carried on by his grandson, a minor, the emperor refused. and in the end, when at last the capital itself rose, declared that he would abdicate as emperor, that is, from the empty title, but not from his place of real power as king of Prussia. But on the morning of the 10th, fear of sharing the fate of the tsar, and the advice of his Field-marshal Hindenburg sent him fleeing out of his country over the frontier into Holland.

Thus ended the dynasty of the Hohenzollerns. The deeds of the best Hohenzollerns were not entirely in vain. however. It was only through their work and energy in welding the land together out of so many different parts that Germany was able to survive the fall of the dynasty without dissolving into its component parts, and only because Bismarck had united the many German states into one state could the *Reich* continue to survive until its defeat under Hitler. (E. LED.)

HOHOKAM. Hohokam is the name of an American Indian tribe which lived long ago in the semiarid region of central and southern Arizona. The word Hohokam is of Pima Indian origin and means "the people who have gone." It has been adopted as the name of this old tribe whose accomplishments have been brought to light through archaeology.

No one knows exactly when the Hohokam's history began or what their origin was, but there are reasons for believing that they were descendants of early hunters and food gatherers who lived in the southwestern United States before the time of Christ. A village way of life was firmly established by the beginning of the Christian era. From this time on for at least 1,500 years the history of the tribe has been painstakingly traced and pieced together through excavations in its villages.

Hohokam history was sharply influenced by the desert environment in which it developed The heartland. along the broad flat valleys of the Gila and Salt rivers. was hot and low in rainfall, but the ground was incredibly fertile and the rivers ran permanently, fed by mountain water from the east. The combination of living water in shallow stream channels, nearby flat and rich lands and an enterprising people resulted in the development of agriculture by canal irrigation. It was this achievement in large-scale systematic irrigation, unsurpassed in North America, that brought fame to the Hohokam as engineers and farmers.

By about A D 700 canal systems were in use, and before AD. 1400 the netnork of canals reached their greatest extent In the Salt river valley aggregate canal length was probably in excess of 150 mi. Ditch nidths were 30 ft. or more and depths to 10 ft. have been noted. These nere dug by hand because the Hohokam had no mechanical earth movers or beasts of burden. This was truly a monumental accomplishment in planning and execution, and it hints that these Indians nere strongly organized politically to create what may be regarded as an intervillage public waterworks program long before the arrival of Europeans.

The principal crops were corn, beans, squash and cotton. These foodstuffs, produced in abundance and supplemented by game, blessed the Hohokam during most of their history with comparative economic security. Through the centuries their villages grew in size. their material arts flourished and Hohokam influence among neighbouring tribes increased.

The archaeological record reveals that the Hohokam developed their unique achievements slowly through many centuries of time. Scholars have divided the history of this people into four stages—the pioneer, colonial. sedentary and classic periods—which broadly express, by the names applied the transitions through which the society passed. Although from the beginning the Hohokam nere living in pit houses, making pottery and groning corn, it was not until about A.D. 1000 that the culture reached its pinnacle. It was then that the tribe's greatest artistic expression is seen in the weaving of cotton cloth. the carving of stone, shell and bone and the making of pottery. At that time too. and for several centuries thereafter, the Hohokam developed their greatest ability to extract a livelihood from the soil and were strongest socially and politically. After about 1400 Hohokam society declined, the large populous centres broke up and the record becomes dim. No one knows certainly nhy this happened.

Hohokam architecture consisted of flimsy structures of wood, brush and clay built over a shallow pit dug into the ground. These are known as pit houses. Each house was an independent unit, probably sheltering a single family, and because the buildings were widely scattered, Hohokam villages were rambling and exhibited little or no plan. Changes in the shape of the floor and in the method of roofing through the centuries have been determined, but the principle of lowering the floors below ground level was adhered to throughout Hohokam prehistory. Formal religious architecture evidently did not exist.

The dead were cremated, and the ashes of the deceased were placed in pits in the ground or in jars which were buried. Mortuary offerings of pottery, ornately carved stone objects and shell jewelry often accompanied the ashes. This custom of burning the dead destroyed most of the evidence needed to determine the physical appearance of the Hohokam An exceptional discovery of Hohokam mummies in Ventana cave in Arizona revealed that they closely resembled the modern Papago and Pima Indians.

An interesting and significant sidelight of the Hohokam is the fact that they were in communication nith the Indians far to the south in the Mexican highlands. This resulted in the direct importation of objects. such as copper bells and mosaic plaques or mirrors. and in the borrowing of ideas, such as a ball game played in a large oval court with earth embankments. A ball of native rubber. possibly used in this game, dating from about 1100, was found in Arizona. The time of strong Mexican influence broadly coincides with the peak of Hohokam achievement.

They left no written records and had no system of noting the passage of time—at least not any which has survived. For these reasons the dating of their remains has to be done by the standard

archaeological procedures of stratigraphy, comparison with other cultures of known age and through the presence of trade goods. also of known age. The most famous village was Snaketown, on the Gila river southeast of Phoenix, Ariz., in which more than 1,000 years of Hohokam history has been recovered.

Not all of the Hohokam lived in the fortunate surroundings provided by the fertile and well-watered valleys of the Gila and Salt rivers. There were some who settled in the harsher environment of what is now the Papago Indian reservation west of Tucson, Ariz. Little surface water and arable land forced them to depend more heavily upon natural plant foods than on the yield of cultivated products. and as a consequence there were no large villages or concentrations of population. In most respects the level of cultural attainment was below that of their river kinsmen because of the rigours of the environment.

What happened to the Hohokam has long puzzled archaeologists. The answer that best fits the facts known about them is that the Pima and Papago Indians, who inhabit southern Arizona, are the living descendants of this famous culture.

HŌJŌ, the name of an illustrious family of medieval Japan. established by Tokimasa (1138–1211) of the Taira clan. In the 12th century he adopted the new family name of Hōjō, derived from his domain in eastern Japan. The Hōjō political career was launched when Yoritomo Minamoto was arrested by the Taira and placed under the guardianship of Tokimasa. But an alliance of the Hōjō and Minamoto, achieved through the marriage of Yoritomo and Tokimasa's daughter. laid the basis for a successful revolt against Taira power (1180–8j). The Hōjō then assisted Yoritomo in setting up the Kamakura *bakufu,* or military government. In 120j Tokimasa assumed the position of regent for the shogun, an office which was held until 1333 by nine successive members of the Hōjō family. The descendants of Tokimasa, by dominating the military regime at Kamakura. were also able thereby to control the imperial government and court at Kyōto for more than a century. The Hōjō regents were usually able administrators and contributed greatly to the extension of feudal power in 13th-century Japan. Though the Hōjō ascendancy was finally destroyed, together with the Kamakura *bakufu,* in 1333, the family endured as a leading military house for several centuries afterward. *See* also JAPAN: *History: The Development of Feudalism.* (HN. HOKAN. This term unites as genetically related a number of North American Indian linguistic stocks, scattered over a large area and previously considered distinct.' Dixon and Kroeber in 1913 (*Amer. Anthrop.,* vol. xv) coined the name from the word for "two" in some north Californian dialects, including in the family Shasta. Achomawi. Karok. Chimariko. Pomo (*q.v.*), Yana, Esselen, Yuman (*q.v.*) and subsequently Salinan. Chumash and Washo, all in or near California. Seri (*q.v.*) in Sonora, and Tequistlatecan in southern Mexico. Sapir *(Intern. Journ. Amer. Linguistics,* vol. i, 1920) added Coahuiltecan. Karankawa, Tonkawa and, in 1925 (*Amer. Anthrop.,* vol. xxvii), Subtiaba in Nicaragua, suggesting further that Siouan, Muskogian, Caddo and Iroquois would ultimately prove to be related to Hokan-Coahuiltecan. The historic significance of these linguistic determinations. if confirmed, is considerable, but some authorities (Boas. Goddard, Michelson, Uhlenbeck) remain unconvinced of the validity even of the narrower Hokan family in California, though others (Rivet W. Schmidt) accept the full findings. (A. L. K.)

HOKE, MICHAEL (1874–1944), U.S. orthopedic surgeon. was born at Lincolnton, N.C., on June 28. 1874. He took his medical degree from the University of Virginia. Charlottesville, in 1895, and practised at Atlanta, Ga., after 1897. Hoke soon became one of the leading orthopedic surgeons in the world: among his contributions being new operative methods of straightening twisted bones. He was one of the founders of the Shriners' hospitals and was chief surgeon of the Scottish Rite hospital in Atlanta from its foundation in 1915. He became chief surgeon at the Warm Springs, Ga.. Infantile Paralysis foundation in 1931, serving there five years before he resigned to resume private practice. He retired in 1937. Much of Hoke's outstanding work in orthopedic surgery was done without charge for thousands of crippled children throughout the United States. He died at Beaufort, S.C., on Sept. 24, 1944.

HOKKAIDO, the name of a group of islands (one large island and a few small adjacent islands) in northern Japan. Hokkaido constitutes an autonomous administrative division (do), with an area of 30.312 sq.mi., comprising 21% of Japan's land territory. The population of 5,039.206 (1960) was but 5.4% of the national total. The administrative centre is Sapporo (*q.v.*). Hokkaido is characterized by a microthermal climate and recent land settlement. Long the domain of the Ainu (*q.v.*), except for fishing populations on the southern coasts, serious Japanese settlement did not begin until 1869, when the division. then called Yezo, was renamed Hokkaido. Prior to 1945 the Hokkaido government administered some of the Kuril Islands (*q.v.*), which were ceded to the U.S.S.R. under the terms of the Yalta agreement.

The present economic development includes agriculture, mining and fisheries. The agrarian population accounts for 40% of the total. Rice is the first crop. Soy and kidney beans. oats. barley. hay and white potatoes are important. Thirty per cent of Japan's coal is mined there. *See* JAPAN. (R. B. H.)

HOKUSAI, KATSUSHIKA (1760–1849), Japanese painter, one of the greatest masters of the popular school *(Ukiyo-e),* was born in Edo (Tokyo). He was adopted into an artisan family and apprenticed at an early age to a wood engraver. At 18 he entered the studio of Katsukawa Shunshti. considered one of the foremost artists of the day, to learn the art of designing woodcuts. He was given the art name of Katsukawa Shunrō. but Hokusai was an eccentric, and a quarrel with his master resulted in his changing his name and launching out on a career for himself. Then began a period of intensive study, for Hokusai, a man of great vitality and a terrific worker with an insatiable curiosity, allowed nothing to escape his searching eyes: no scene was too small or too sublime to escape his brush. He lived in poverty most of his life, and in his later years proudly called himself the "peasant of Katsushika."

During his lifetime Hokusai used more than 30 different names and is said to have lived in more than 90 houses, moving only when the place was too dirty to clean or the landlord would no longer extend credit.

Hokusai illustrated large numbers of books, and his famous *Manga,* sketches and caricatures from life. appeared in 15 volumes during the years from 1812 to 1875. Outstanding among his colour prints. the "Thirty-six Views of Fuji" is generally considered the culmination of Hokusai's art. The set contains 46 prints in all and was published between 1823 and 1829. Other series issued around this time were "Views of Famous Bridges," "Waterfalls of the Provinces" and "Pictures of Flowers and Birds." A set, designed in upright format, commonly called the "Imagery of the Poets" is among his masterpieces. These designs are executed in the great landscape tradition and are full of a poignant beauty. Hokusai also designed some superb large sheets published separately. and his *surimono* (greeting card) prints are unequaled for delicacy. When Hokusai was in his 70s his finest book, the *Hundred Views oj Fuji,* was published in monochrome; the designs are full of extraordinary originality.

Hokusai possessed great powers of observation and characterization. a singular technical skill and untiring industry. He was an eager student to the end of his life and at the age of 7j wrote *Once Hokusai, Today the Old Man Mad About Drawing.*

HOLBACH, PAUL HENWI THIRY, BARON D' (1723–1789). French philosopher and man of letters, celebrated for his outspoken atheism and materialism, was born at Edesheim, near

Landau in the Palatinate, in Dec. 1723, and baptized as a Roman Catholic. His family. German in origin, was French in its loyalties. and his uncle F. A. d'Holbach, to whom he owed his fortune and whose surname he added to that of Thiry, was a naturalized French subject. After spending some time in Paris. Paul Henri completed his education at the University of Leiden, where he made the acquaintance of Mark Akenside and John Wilkes. He returned to France and was naturalized in 1749. His intellectual interests nere first displayed in the field of geology, mineralogy and metallurgy. For Diderot's *Encyclopédie,* starting with the second volume, published early in 1752, D'Holbach wrote articles on diverse scientific subjects. eventually publishing 376 in all. He became a prominent figure in French intellectual society. facilitated in this by his considerable fortune, which enabled him to make his table a meeting place of the philosophes, notably of Diderot. D'Alembert, Helvétius, Raynal. Grimm, Buffon, Marmontel and, for a time. J J. Rousseau. He became before long the most advanced and outspoken of their number. In 1761 he published, under the name of his then deceased friend Nicolas Antoine Boulanger, *Le* Christianisme *dévoilé* (reprinted 1766 and 1767), an open and sustained attack on Christianity as contrary to reason and nature. Nine years later, over the name of J. B. Mirabaud (the late secretary of the Académie Française), he published his *Système* de la nature (1770), the most celebrated 18th-century exposition of atheism, materialism and determinism. Here he unambiguously asserts doctrines which his predecessors had hinted at: all causal relationships are simply relationships of motion; man is entirely a machine; the soul is a false notion; free will is nonexistent; the arguments for the existence of God whether proposed by Christians or deists, are totally false: religion is harmful as well as untrue. The aise man's course is to accept necessity and to follow nature. The non sequiturs and inconsistencies which abound in the work did not prevent it from being sensational in its impact on public opinion. It provoked replies and challenges. notably from Voltaire, whose deistic position now appeared conservative, and had a great influence on Goethe and later on Shelley. Of D'Holbach's other works the most significant is his *Système* social (1773), in which he outlines principles of morality and politics on a utilitarian basis.

(RT. S.)

HOLBEIN, HANS, THE ELDER (*c.* 1465–1524), was the senior member of a family of painters that included also his brother Sigismund and his sons Xmbrosius (c. 1494–1519/20) and the famous Hans Holbein the Younger (*q.v.*). Nothing is known of his early life and training, but he was married and established as a painter in his native Augsburg by about 1493. His early works, which include the Weingarten altar (1493, Augsburg cathedral). the St. Afra altar (1495. parts in the bishop's palace at Eichstatt and in the Basel museum). the picture called the "Basilica of St. Mary" (1499, Augsburg) and a Passion series in 12 scenes (Donaueschingeni, are characterized by deep, rich colouring and by balanced compositions of figures moving slowly and deliberately on a narrow stage. They show a knowledge of the art of Rogier van der Weyden which has led some authorities to suppose that Holbein had visited the Netherlands, but ignorance of his Augsburg predecessors precludes any real evaluation of the immediate sources of his style.

A visit in 1501 to Frankfurt am Main, where, with the assistance of Sigismund Holbein and Leonhard Beck, he painted the high altar of the Dominican monastery (Frankfurt, Stadelsches Institut), initiated a new stylistic phase which includes also the Kaisheim altar (1502, Munich) and the "Basilica of St. Paul" (1502, Augsburg). These paintings have much greater depth than before. with a freer grouping of highly individualized figures — often portraits — in rather lively movement. It has been suggested that this new manner was perhaps inspired by a contact with the early work of Matthias Griinewald in Frankfurt.

In a third and last phase, after 1510, including the St. Catherine altar (1512, Augsburgj, the St. Sebastian altar (1516, Munich) and the "Fountain of Life" (1519, Lisbon), Holbein began to use Italianate ornament and evolved a compromise between the late Gothic and Renaissance styles similar to that of Gerard David in Bruges. But he then found himself overshadowed by masters whose grasp of the Italian idiom was sounder than his own. In 1517, having fallen into financial difficulties, he withdrew from Augsburg to Isenheim. where he died.

Holbein's honesty and insight as a portraitist are best seen in his many silverpoint drawings (Basel, Berlin; self-portrait in this medium at Chantilly); it is clear that the incomparable portraiture of his more famous son must have owed much to his teaching. He also made designs for glass painting, and windows were designed by him in Eichstatt cathedral (1502) and in the churches of St. Ulrich at Augsburg and St. James at Straubing.

See C. Glaser, *Hans Holbein der Altere (1908).* (D. Kc.)

HOLBEIN, HANS, THE YOUNGER (1497?–1543), German painter and designer for printers and craftsmen, best known for his portraits and historical scenes, was born at Augsburg in 1497 or 1498. He was the son of the painter Hans Holbein the elder, the nephew of the painter Sigismund Holbein and the younger brother of the painter Ambrosius Holbein.

Holbein the elder sent both his sons on their travels about 1513–14 and their first stopping place is thought to have been Constance. In 1515, Hans Holbein the younger was in Basel and there both brothers entered the workshop of the painter Hans Herbster.

In the spring of 1j17, commissions from the magistrate Jacob von Hertenstein took Hans Holbein to Lucerne. His first journey to Italy (Lombardy) for study purposes was taken about 1518–19. He was evidently influenced there not only by works by Mantegna and other north Italian engravers but also by Lombard building styles and by the paintings of Leonardo da Vinci and his circle.

In Sept. 1519, the young artist was received as master into the painters' guild in Basel, and a year later he became a citizen of the town and married the widow Elsbeth Schmid. In 1522 he worked for the municipality of Solothurn. In Sept. 1523 he spent some time around Lake Constance; and in the early summer of 1524 went to Lyons and probably also Avignon, in France.

ONE OF THE WOODCUTS DESIGNED BY HANS HOLBEIN, THE YOUNGER, FOR THE "DANCE OF DEATH"

Furnished with letters of recommendation from Erasmus, Holbein wandered. in the autumn of 1526, through the Netherlands and visited Antwerp. In October he crossed to England. where he found a friendly patron in Sir Thomas More, who took him into his home in Chelsea.

In the summer of 1528, Holbein returned to Basel and acquired a house in St. Johann. In 1528–29 he experienced the fury of the iconoclasts. About 1529, Holbein was apparently in Milan for the second time. In 1531 the artist bought another house in Basel.

A payment was made to Holbein in Basel in Oct. 1531, but the next document. dated Sept. 1532, shows him to have been once more in London, where he first worked chiefly for the German merchants of the Steelyard. About 1536, he seems to have entered court service. In March 1538, he was in Brussels, on a commission from Henry VIII; in June he was in Le Havre and in August in Nancy and Joinville. He spent September to October of that year in Basel, where the city council offered him a pension. The same autumn, however, he returned to London by way of Paris. In July and Aug. 1539, he was once more on the continent and, commissioned by Henry VIII, painted a portrait of Anne of Cleves at Schloss Duren, near Aachen.

Between Oct. 7 and Nov. 29, 1543, Holbein died in London during a plague epidemic He left two illegitimate children there. His legitimate sons Jacob and Philipp were both goldsmiths. Descendants called Holbein, mostly goldsmiths, were long to be found in

England, France, Italy and Portugal.

One would expect to find the artistic influence of his father in Holbein's early work. and this is in fact present in a small Madonna with a Mantegnesque frame of *putti* (children) in Basel (1514) and in the portrait of the painter H. Herbster. which is also in Basel (1516). It is disputed, however, whether these two pictures are the work of Hans the Younger or his brother Ambrosius. It is with the imaginatively painted table for Hans Baer in Zurich (1515) and the free marginal drawings in a copy of Erasmus's *Laus Stultitiae* (151j, Basel) that Holbein the younger first appears as a definite artistic personality. A "Christ Carrying the Cross" (hitherto ascribed to Herbster) with a "Crowning With Thorns" on the back (1515, Basel) and the 1j16 portrait of the Burgomaster Meyer and his wife (Basel) show the young artist as a disciple of the conventional early Renaissance. At the same time, he had naturalistic tendencies, these showing themselves most freely in the two genre scenes on a double-sided schoolmaster's sign (1516, Basel). About 1516–17 he also began to work in woodcut for book decoration and to design paintings on glass.

GIRAUDON

"ERASMUS" BY HANS HOLBEIN. THE YOUNGER. IN THE LOUVRE, PARIS

Toward the end of the second decade of the century. Holbein was drawn into the international mannerist stream. This is already suggested in a small "Fall of Alan" of 1517 (Basel). The five dramatically impetuous scenes of a Basel Passion altarpiece and the 1519 sketch for a "Christ Crucified" (Berlin) are extreme examples of this mannerist tendency. The two leaves of the Oberried altarpiece (Freiburg) also incline in this direction. The 1517 portrait of the youthful Benedikt von Hertenstein (New York) Indicates that this extreme mannerism was overcome. Only fragments and copies remain of the façade paintings for the Hertenstein house in Lucerne. There Holbein returned to a quieter and more constrained composition and style, under the influence of Mantegna ("Triumph of Caesar"). The eight scenes of another Basel Passion altarpiece represent a classicism in which reminiscences of Mantegna and Dürer combine with Holbein's own striving toward simplicity and 'breadth of style. Leonardo's "Last Supper" inspired Holbein to a picture on the same subject, pared down, in Basel. Holbein was preserved from the dangers of eclecticism at that time by the clearsighted realism that is illustrated in the "Christ in the Tomb" of 1521 (Basel).

The portrait of Johannes Xilotectus of 1j20 (Nürnberg), that of Bonifacius Xmerbach of 1519 (Basel) and the full-face portrait of Erasmus of 1 ja.3 (Longford castle. Wiltshire) are shot through with the humanistic spirit and are connected in style with the Hertenstein portrait of 1517. In the contemporary profiles of Erasmus. Holbein goes back to the simplest portrait type of the early Italian Renaissance. The "Solothurn Madonna" (1522) and the "Burgomaster Meyer's Madonna" in Darmstadt, Ger., (preliminary sketch in Basel, repetition in Dresden) are classical compositions of almost symmetrical balance. Two half-length pictures in Basel dating from 1526, the "Venus" and the "Lais of Corinth," again show reminiscences of Leonardo. Connected with them in conception and style is the portrait of a musician in Berlin.

Between 1519 and 1526, Holbein gave more time to book and craft design. At this period he was probably already busy with plans for the two series of woodcuts. the "Dance of Death" (41 pictures) and the Old Testament illustrations (92 pictures), neither of which were brought out until 1538, by K. and M. Trechsel in Lyons. In addition, he designed numerous title pages, initials. etc., for Basel printers.

Two types are to be distinguished, at this period, in Holbein's decorative painting for buildings. In the ornament of the wall decorations for the house "Zum Tanz" (Basel, 1520–22; destroyed) Holbein, remembering Lombard prototypes in antique style. exploited all the possibilities of a playful fantastic illusionism. which breaks up the architectural planes with rich imagination. On the other hand, in the interior frescoes for the walls of the great council chamber in Basel (first payment made in June 1522). Holbein concentrated on the serene. closely organized design of classical fresco; some original fragments. sketches and numerous copies still bear witness to the work. The painting on the organ in Basel cathedral (1523–24) shows similar characteristics.

During his first stay in England (1526–28), Holbein painted a number of portraits which follow the severely objective lines of the Erasmus pictures, but which show a greater degree of detachment and calm. Outstanding examples of this new style of portraiture are the half-length Thomas More (New York city), William Warham (London; variant in Paris) and Henry Guildford with his wife (Windsor castle; copy in New York), all from the year 1527. There are coloured drawings for most of these and for the portraits enumerated below (largest collection in Windsor castle), marvelous in the soft distinctness of their contours, the economy of their modeling and their passionate objectivity.

In the portrait of the astronomer Niklas Kratzer (1528; Paris), Holbein attempts a certain "interior" mood by including the scholar's study and his instruments, the intention being to bring out the characteristic features of the subject. The double portrait of Thomas Godsalve and his son (1528; Dresden) displays an expressive kind of rhythmical grouping.

Everything which Holbein there tried out separately is brought together in the Thomas More family group, which consists of ten figures in an interior. Unfortunately, it exists no longer, but an outline drawing (1527 or 1528; Basel), seven portrait studies (Windsor) and several copies still give an idea of its appearance. In 1527 Holbein was in charge of the festal decoration of a hall in Greenwich; London, and also painted a battle scene.

To the beginning of Holbein's third stay in Basel belong portraits of a more intimate, private character: the "Holbein Family" (copies in Glarus. Switz., and Lille, Fr.), which is broadly painted on paper, the unfinished half-length picture of a woman with her hair loose (Basel) and the portrait of a burgher's wife (copy? The Hague). Some miniaturesand various craftsmen's designs may be assigned to the same period; the most important of them is the glass design with ten scenes from the Passion (before 1528). Holbein's chief concern, however, was the completion of the frescoes in the great council chamber, Basel.

The portrait of Georg Gisze, (1532; Berlin) must have been painted soon after Holbein's return to England. This is allied in style to the 1528 interior portrait of the astroiiomer, and he extended the method to the double portrait in the monumental interior of the ".Ambassadors" (1j33; London). He also painted a great number of half-length portraits, which show a constant advance in simplicity and objectivity: Hans von Antwerpen (1532; Windsor), Dietrich Born (1533; Windsor), two members of the Wedigh family (1532, Chicago; 1533, Berlin). Robert Cheseman (1533; The Hague), Charles de Solier (Dresden), Cyriacus Kale (1533; Brunswick), Dirk Berck (1536; New York city), and Richard Southwell (1536; Florence). Many of Holbein's most beautiful drawings and miniatures are among his portraits.

For the Steelyard. Holbein did frescoes and decorative work. The two *grisaille* frescoes, "The Triumphs of Wealth and Poverty," are lost. but they have come down to us through a preliminary sketch in the Louvre and later copies by Federico Zuccaro and others. There, Holbein apparently turned to account reminiscences of hlantegna's "Triumphal Procession of Caesar" and Dürer's "Triumphal Car of Maximilian." For the entry of Anne Boleyn, Holbein ornamented the Steelyard with a figurative festal decoration representing the Parnassus (preliminary drawing of 1533 in Berlin). His most mature religious work. the Venetian-inspired "Noli me tangere," in Hampton court, Eng., probably dates from the same period.

Most of Holbein's last works were commissioned by Henry VIII. Half-length court portraits predominate, and for these the artist

had developed a formula of great vitality: Jane Seymour (1536, Vienna), Henry VIII (1537, Althorp), Thomas Howard (Windsor), Anton the Good of Lorraine (Berlin), Anne of Cleves (1539, Paris), Henry VIII (Rome), John Chambers (Vienna).

A number of miniatures (the king's wives, Charles and Henry Brandon, etc., in London, Windsor, Munich, etc.) also date from about 1540. Besides these official portraits, there are others of a more intimate character: Simon George of Quocoute (Frankfurt am Main), the prince of Wales (New York city, Basel) and the full-length Christine of Denmark (1538, London).

In this last period, Holbein also created monumental group pictures — besides a rather dry mass scene, "Henry VIII Confers a Charter on the London Barber Surgeons' Guild" (1541?; London, Barbers' hall; much damaged), and the lost group portrait of Henry VIII with Jane Seymour and his parents, which was one of the wall paintings commissioned for the palace of Whitehall (part of 1537 sketch at Chatsworth, and copies).

HOLBERG, LUDVIG HOLBERG, BARON (1684–1754), Scandinavian writer, has been called the founder of Danish literature. He was born at Bergen, Nor.. on Dec. 3. 1684. Both of Holberg's parents died in his childhood. his father first. leaving considerable property; and at the age of 11 he lost his mother also. Beiore the latter event. however, the family had been seriously impoverished by a great fire which destroyed several valuable buildings; notwithstanding this. the mother left to each of her six children some little fortune.

In 1695 the boy Holberg was taken into the house of his uncle, Peder Lem, nho sent him to the Latin school and prepared him for the profession of a soldier, but soon after this he was adopted by his cousin Otto klunthe. and went to him up in the mountains. His great desire for instruction. however, at last induced his family to send him back to Bergen to his uncle. There he remained, eagerly studying. until the destruction of that city by fire in 1702, when he was sent to the University of Copenhagen.

But he soon exhausted his resources and. having nothing to live upon. was glad to hurry back to Norway, where he accepted the position of tutor in the house of a rural dean at Voss. He soon returned to Copenhagen where, in 1704, he took his degree. and worked hard at French, English and Italian. But he had to earn his living, and accordingly he accepted the post of tutor once more, this time in the house of the vice-bishop of Bergen. The vice-bishop had travelled much. and the reading of his itineraries and notebooks awakened such a longing for travel in the young Holberg that at last. at the close of 1704, having scraped together 60 thaler, he went on board a ship bound for Holland. He proceeded as far as Aachen, where he fell ill. He suffered much from weakness and poverty and had to make his way back to Norway on foot.

Ashamed to be seen so soon in Bergen, he stopped at Christianssand, where he lived through the winter, supporting himself by giving lessons in French. In the spring of 1706 he travelled. in company with a student named Brix, through London to Oxford, where he studied for two years, gaining his livelihood by giving lessons on the violin and flute. He mentions. with gratitude. the valuable libraries of Oxford, and said it was while he was there that it first occurred to him "how splendid and glorious a thing it would be to take a place among the authors."

Through London and Elsinore he reached Copenhagen a third time, and began to lecture at the university; his lectures were attended but he received no money. He was asked in 1 jog to conduct a rich young gentleman to Dresden, and on his return journey he lectured at Leipzig, Halle and Hamburg.

Once more in Copenhagen, he undertook to teach the children of Admiral Gedde. Weary with that work, he took a post at Borch college in 1710, where he wrote, and published in 1711, his first work, *An Introduction to the History of the Nations of Europe,* and was permitted to present to King Frederick IV two manuscript essays on Christian IV and Frederick III.

The king soon after presented him with the title of professor and with the Rosenkrantz grant, the holder of which was expected to travel. Holberg accordingly started in 1714, and visited. chiefly on foot, a great portion of Europe. From Amsterdam he walked through Rotterdam to Antwerp, took a boat to Brussels and on foot again reached Paris. Walking and skating, he proceeded in the depth of winter to Marseilles, and on by sea to Genoa. On the last mentioned voyage he fell ill. and nearly died in that city. On his recovery, he pushed on to Civitavecchia and Rome. When the spring had come, being still poor and in feeble health. he started homeward on foot by Florence, across the Xpennines. through Bologna, Parma, Piacenza, Turin, over the Alps, through Savoy and Dauphiné to Lyons, and finally to Paris, where he arrived in excellent health.

After spending a month in Paris, he walked on to Amsterdam, took sail to Hamburg and so went to Denmark in 1716. He spent the next two years in extreme poverty. and published his *Introduction to Natural and Popular Law.* At last, in 1718. his talents were recognized by his appointment as professor of metaphysics at the University of Copenhagen, and in 1720 he was promoted to the lucrative chair of public eloquence. which gave him a seat in the consisiory. His pecuniary troubles were now at an end.

Hitherto he had written only on law, history and philology, although in a Latin controversy with the jurist Xndreas Hojer of Flensborg his satirical genius had flashed out. But now. and until 1728, he created an entirely new class of humorous literature under the pseudonym of Hans Mikkelsen. The seriocomic epic of *Peder Paars*, the earliest of the great classics of the Danish language, appeared in 1719. This poem was a brilliant satire on contemporary manners and enjoyed an extraordinary success. But the author had offended in it several powerful persons who threatened his life. and, if Count Danneskjold had not personally interested the king in him, Holberg's career might have had an untimely close. During the next two years he published five shorter satires. In 1721 Holberg became director of the first Danish theatre in Grönnegade, Copenhagen. where, in Sept. 1722, a Danish translation of *L'Avare* was produced. Until this time no plays had been acted in Denmark except in French and German, but Holberg now determined to use his talent in writing Danish comedy. The first of his original pieces performed was *Den politiske Kundestiiber* ("The Pewterer Turned Politician"); and before the end of 1722 he produced *Den Vaegelsindede* ("The Waverer"), *Jean de France, Jeppe paa Bjerget* and *Gert the Westphalian.* Of these five plays, four are masterpieces. Holberg took no rest, and before the end of 1723 the comedies of *Barselstuen* ("The Lying-in Room"), *The Eleventh of July, Jakob von Thyboe, Den Sundeslöse* ("The Fidget"), *Erasmus Montanus, Don Ranudo, Ulysses of Ithaca, Without Head or Tail, Witchcraft* and *Melampe* had all been written, and some of them acted. In 1724 the most famous comedy that Holberg produced was *Henrik and Pernille.* But in spite of this unprecedented blaze of dramatic genius the theatre had to be closed for lack of money, Holberg composing for the last night's performance, in Feb. 1727, a *Funeral of Danish Comedy.*

This excessive labour for the stage had undermined the poet's health. and in 1725 he had determined to take the baths at Xachen; but instead of going thither he wandered through Belgium to Paris, and spent the winter in that city. In the spring he returned to Copenhagen with recovered health and spirits, and worked quietly at his protean literary labours until the great fire of 1728.

In the period of national poverty and depression that followed this event. a puritanical spirit. which was little in sympathy with Holberg's dramatic or satiric genius, predominated. He there-

fore closed his career as a dramatic poet by publishing in 1731 his acted comedies, with the addition sf five which he had no opportunity of putting on the stage. He adopted the serious tone of the new age and busied himself for the next 20 years with historical, philosophical and statistical writings. During this period he published his poetical satire called *Metamorphosis* (1726) and his *Epistolae ad virum perillustrem* (1727), his *Description of Denmark and Norway* (1729), *History of Denmark, Universal Church History, Biographies of Famous Men, Moral Reflections, Description of Bergen* (1737), *A History of the Jews* and other learned and laborious compilations. The only poem he published at this time was the famous *Nicolai Klimii iter subterrancum* (1741), afterward translated into Danish by Baggesen.

When Christian VI died in 1747, pietism lost its sway; the theatre was reopened and Holberg was appointed director, but he soon resigned this arduous post. The six comedies he wrote in his old age did not add to his reputation. His last published work was his *Epistles,* in five volumes, the last of them posthumous (1754). In 1747 he was created by the new king Baron of Holberg. He died at Copenhagen on Jan. 28, 1754, at 70 years of age. He was buried at Soro, in Zealand. He had never married, and he bequeathed all his property, which was considerable, to Soro college.

Holberg was not only a great Danish author, but he was, with the exception of Voltaire, the first writer in Europe during his own generation. Neither Pope nor Swift, who perhaps excelled him in particular branches of literary production, approached him in range of genius or in encyclopaedic versatility. Holberg found Denmark provided with no books, and he wrote a library for it. When he arrived in the country, the Danish language was never heard in a gentleman's house. Polite Danes were wont to say that a man wrote Latin to his friends, talked French to the ladies, called his dogs in German and only used Danish to swear at his servants. The single genius of Holberg revolutionized this system.

He wrote poems of all kinds in a language hitherto employed only for ballads and hymns; he instituted a theatre, and composed a rich collection of comedies for it; he filled the shelves of the citizens with works in their own tongue on history, law, politics, science, philology and philosophy, all written in a true and manly style and representing the extreme attainment of European culture at the moment.

Perhaps no author who ever lived had so vast an influence over his countrymen, an influence that was still at work after two centuries.

The editions of Holberg's works are legion. Complete editions of the *Comedies* are too numerous to be quoted; the best is that brought out in 3 vol. by F. L. Lichtenberg (1870). Of *Peder Paars* there exist *more* than 20 editions, besides translations in Dutch, German and Swedish. The *Iter subterraneum* was translated into Danish, German, Swedish, Dutch, English, French, Russian and Hungarian. The life of Holberg was written by Welhaven in 1858 and by Georg Brandes in 1884. Among other works may be mentioned those by Robert Prutz (1857) and A. Legrelle (1864).

HOLBORN, a metropolitan (1900) and parliamentary borough of London. Eng.. bounded northwest by St. Pancras, northeast by Finsbury, southeast by the City of London. southwest by the City of Westminster and west by St. Marylebone. Pop. (1951) 24,810, the day population being about 250,000. It is the smallest borough in London (0.6 sq.mi.). It is a legal centre containing two of the four Inns of Court—Gray's Inn and Lincoln's Inn—and a concentration of solicitors as well as insurance firms. architects, auctioneers: estate agents, engineers, office equipment suppliers and government offices. Near the patent office are many patent and trade-mark agents.

The origin of the name is found in *Holebourne,* "the stream in the hollow." in allusion to the Fleet. The fall and rise of the road across the valley before the construction of the viaduct (1869) was abrupt and inconvenient. The site of Holborn bars. where tolls were levied at the entrance to the City. is $\frac{1}{4}$ mi. W. of the viaduct. The residential district is mainly within the parish of St. George. Bloomsbury (derived from William Blemund, a lord of the manor in the 13th century). though many of its 18th-century houses. built round squares. are used as offices. Succeeding the nobility in Bloomsbury came the medical profession followed in the 19th century by writers. From the 17th century until the building of New Oxford street in 1847 the district of St. Giles. which includes Seven Dials, was notorious as a home of crime and poverty, and in the Rookery of St. Giles were some of the most dangerous of London's alleys. Many of Charles Dickens' characters lived and moved there and in other parts of Holborn: Hatton Garden, leading north from Holborn circus, is a centre of the diamond. gold and silver trades.

Ely place takes its name from a palace of the bishops of Ely. The property was acquired by Sir Christopher Hatton, lord chancellor under Elizabeth I. The chapel of St. Etheldreda (Roman Catholic) is the only remnant of the palace and was built in the 13th century with a vaulted crypt. The parish church of St. Giles-in-the-Fields, between Shaftesbury avenue and New Oxford street, dates from 1734 and is the successor to the chapel of a lepers' hospital founded there in 1101 by Matilda, wife of Henry I. St. George's church (1720–31), Bloomsbury way, by North Hawksmoor. has a statue of George I on a stepped spire. The Tudor gateway of Lincoln's Inn opens (east) upon Chancery lane while west lies the square called Lincoln's Inn Fields, with the Sir John Soane's museum. Gray's Inn is between High Holborn and Theobald's road. Of the former Inns of Chancery attached to these Inns of Court the most noteworthy building remaining in Holborn is Staple Inn, with its unique timbered and gabled Elizabethan front, in High Holborn, once attached to Gray's Inn.

The British Museum stands north of New Oxford street, and also in Bloomsbury are the Senate house and library of the University of London, Birkbeck college and other institutions belonging to the university and the Royal Academy of Dramatic Art. Holborn also contains the Hospital for Sick Children in Great Ormond street, Moorfield's Eye hospital and other hospitals: the Central School of Arts and Crafts, the City Literary institute; the London Central Y.M.C.A.. the Y.W.C.A. central club and the headquarters of the T.U.C. (1956). all in Great Russell street; the Freemasons' hall, Africa house, the Winter Garden and six other theatres. From 1950 onward many great blocks of offices were built on areas bombed in World War II.

HOLBROOKE, JOSEPH (JOSEF) **CHARLES** (1878–1958), English composer whose works were popular at the beginning of the 20th century. He was born at Croydon. Surrey. July 5, 1878, and became a pupil of Frederick Corder at the Royal Academy of Music, London. His symphonic poem *The Raven,* inspired by the poem by Edgar Allan Poe, was performed in 1900, and uas followed by a series of over 20 orchestral and chamber works also based on Poe, including *Ulalume, The Bells,* a dramatic choral symphony, and *The Masque of the Red Death.* His operas, which were of Wagnerian proportions, include the trilogy *The Cauldron of Annwyn,* based on Welsh legends and consisting of *The Children of Don* (1912), *Dylan* (1914) and *Bronwen* (1929). A prolific composer, Holbrooke wrote in all forms. His orchestral variations "Three Blind Mice" best succeeded in retaining a hold on the public. He died in London, Aug. 5, 1958.

HOLCROFT, THOMAS (1745–1809), English dramatist whose melodrama *The Road to Ruin* (1791) has often been revived, was born in London, Dec. 10, 1745. His father, a cobbler who turned peddler, was so poor that Thomas had sometimes to beg his bread; but he taught him the uncompromising honesty which won admiration later. His life was a struggle against adversity. After working as a Newmarket stableboy. a cobbler and a teacher, meanwhile teaching himself languages and music, he secured in 1778 a minor position at Drury Lane theatre, where his first play. *The Crisis,* had one performance. *Duplicity* (1781) was more successful. While in Paris as *Morning Herald* correspondent in 1782 he saw Beaumarchais' *Le Mariage de Figaro* every night until he knew it by heart. and his translation, *The Follies of a Day* (1784), enjoyed great success. He himself acted Figaro. Meanwhile he was writing novels, verse, translations and articles. Holcroft supported the French Revolution and joined the Society for Constitutional Information: in 1794 he was indicted for high treason and imprisoned, but was released two months later. He then tried to found a journal in Hamburg; later. after two years in Paris, he started a printing-press in London (1803) which failed dismally.

He died there on March 23. 1809.

Holcroft's friends included Coleridge, Lamb, William Godwin and William Hazlitt. who in 1816 edited his *Memoirs, Written by Himself and Continued Down to the Time of His Death, From His Diary, Notes and Other Papers.* This vivid autobiography shows the gentleness and humour of a man who often appeared harsh. It was re-edited by E. Colby (1925), who also published a bibliography of Holcroft's works (1922).

HOLD, a nautical term applied to the interior or cargo-containing part of a ship, below the deck or lower deck. The term hold beam applies to beams crossing the ship above the hold.

The derivation is not from the same root as the verb "to hold," but from the Dutch *hol,* a "hole" or "cavity."

HOLDEN, SIR EDWARD HOPKINSON, 1ST BART. (1848–1919), English banker, was born on May 11, 1848, at Tottington. Lancashire. He became managing director (1898) and eventually chairman (1908) of the Birmingham and Midland bank. He devoted himself to the development of the amalgamating policy of his bank, which ultimately became the London Joint City and Midland bank *(see* BANKING: *Great Britain and the Commonwealth).* From 1898 he interested himself in international banking, and became as great an expert on foreign exchange questions as on home finance. He was the first of the larger London joint-stock bankers to open a foreign exchange department.

In 1906 Holden was elected Liberal M.P. for the Heywood division of Lancashire and in 1909 received a baronetcy. In 1915 he went with Lord Reading to the United States on behalf of the government and arranged there the Anglo-French loan. He died on July 23, 1919.

HOLDEN, SIR ISAAC, BART. (1807–1897), English inventor and manufacturer, was the son of Isaac Holden, a native of Cumberland, and was born at Hurlet, near Paisley, on May 7, 1807.

His early life was passed in straitened circumstances, but his father spared no pains to give him as much elementary education as possible. At the age of ten he began to work as weaver's drawboy, and afterward was employed in a cotton mill.

Meanwhile his education was continued at night school, and from time to time, as funds allowed. he was taken from work and sent to the grammar school, to which he at last went regularly for a year or two until he was 15, when his father moved to Paisley and apprenticed him to an uncle, a shawl weaver there.

In 1828 he was appointed mathematical teacher in the Queen's Square academy, Leeds. After six months he transferred to Lingard's grammar school, near Huddersfield, and shortly afterward to Castle Street academy. Reading.

It was there that he developed a lucifer match by adopting sulphur as the medium between the explosive material and the wood, but he refused to patent the invention. In 1830, when his health failed. he returned to Scotland, where a Glasgow friend offered to set up a school for him. However, he was recommended for the post of bookkeeper to the firm of Townend Brothers, worsted manufacturers, of Cullingworth, Yorkshire. His interest in machinery soon led to his transfer from the countinghouse to the mill.

His experiments led him to the invention of his square-motion wool comber and of a process for making genappe yarns, a patent for which was taken out by him in conjunction with S. C. Lister (Lord Masham) in 1847.

The firm of Lister and Holden, which established a factory near Paris in 1848, carried on a successful business, and in 1859. when Lister retired. was succeeded by Isaac Holden and Sons, which became the largest wool-combing business in the world, employing more than 4,000 workpeople.

In 1865 Holden, who was advised by his physicians to make a complete change of occupation, entered parliament as Liberal member for Knaresborough. From 1868 to 1882 he was without a seat, but in the latter year he was elected for the northern division of the West Riding and in 1885 for Keighley.

He was created a baronet in 1893. He died suddenly at Oakworth house, near Keighley, on Aug. 13, 1897.

HOLDER, ALFRED THEOPHIL (1840–1916), Austrian philologist of astonishing productivity in the fields of ancient and medieval Latin, Germanic and Celtic, was born in Vienna on April 4, 1840. After an interlude as schoolmaster, in 1867 he joined, and in 1870 became chief librarian of, the Court and National library at Karlsruhe, Ger., where he died on Jan. 12, 1916.

Holder's work, almost entirely in the form of text editions and manuscript catalogues, embraced four main fields: (1) the editions of Horace (1864–69, in collaboration with Otto Keller) and of the ancient commentaries on Horace (1894), of Tacitus (1882), Caesar (1882, 1898), Avienus (1887) and of works by Cicero, Cato, Seneca and later Latin writers; (2) the extensive study of medieval Latin from which resulted his catalogue *Die Reichenauer Handschriften* (3 vol., 1906–18); (3) in the field of Germanic antiquities, besides producing part 2 of his teacher Holtzmann's *Altdeutsche Grammatik* (1870–75) and *Germanische Alterthümer* (1873), he edited texts of Ekkehardus (1874), *Beowulf* (1882–84), Bede (1890), Einhardus, Nithardus and Jordanes (1882), Saxo Grammaticus (1886) and a Dutch Passion (1877); (4) his *Alt-celtischer Sprachschatz* (1891–1913), a monumental compilation of Celtic names culled from antiquity.

See K. Preisendanz, *Biographisches Jahrbuch* fur *Altertumskunde* (Bursian's *Jahresbericht)* 47:54–93 (1927). (E. P. H.)

HÖLDERLIN, JOHANN CHRISTIAN FRIEDRICH (1770–1843), one of the greatest German poets, was born on March 20, 1770, at Lauffen on the Neckar. He was destined for the church and studied theology at Tiibingen. He was already writing poetry and had begun to sketch his novel *Hyperion* when he was introduced to Schiller, who published some of his early writings in his periodicals *Die neue Thalia* and *Die Horen.* Schiller also obtained for Holderlin the post of tutor to the son of Charlotte von Kalb. A year later Holderlin moved to Jena to attend J. G. Fichte's lectures and to be near Schiller; but in 1796 he was forced by poverty to accept another post as tutor to the family of the banker J. F. Gontard in Frankfurt-on-Main. He fell deeply in love with Susette, Gontard's beautiful and gifted wife, the "Diotima" of *Hyperion* and some of the poems, and she returned his affection. Gontard's jealousy was aroused and the poet was obliged to leave Frankfurt. Physically and mentally shaken, he nevertheless completed the second volume of *Hyperion,* which appeared in 1799, the first having been published in 1797. He also began a tragedy, *Der Tod des Empedokles,* of which the first version was nearly completed; a magnificent fragment written for a second version has survived. Symptoms of great nervous irritability alarmed his family and friends, who persuaded him to go to S itzerland as tutor to a family in Hauptwyl. He wrote several fine poems during this period, among them "Der blinde Sanger," "An die Hoffnung" and "Dichtermut." His employer, however, found himself obliged to make other arrangements and Holderlin returned home in 1801. After vainly attempting to obtain a lectureship in Greek literature at Jena through the influence of Schiller, who ignored his appeal, he once more accepted a post as tutor, at Bordeaux. Susette Gontard died a year later in June, and the news is supposed to have reached Holderlin shortly afterward; for in the following month he suddenly left Bordeaux and traveled homeward on foot through France, arriving at Niirtingen completely destitute and mentally deranged, in an advanced stage of schizophrenia. He seemed to recover somewhat as a result of the kind and gentle treatment he received at home; and in his lucid intervals he continued to write magnificent poetry, most of it published by friends after he had lost his reason. He also completed verse translations of Sophocles' *Antigorte* and *Oedipus Tyrannus,* published in 1804. In this year Hölderlin's devoted friend Isaac von Sinclair obtained for him the sinecure post of librarian to the landgrave Frederick V of Hesse-Homburg. Sinclair provided the modest emoluments himself, and Holderlin improved noticeably under his care and companionship. But unfortunately Sinclair (who refused to believe that Holderlin was insane) was shortly afterward arrested on a charge of high treason and imprisoned for many months. By the time he was released, Holderlin had succumbed irretrievably, and, after a spell in a clinic in Tiibingen, was moved to a carpenter's house in that town, where he died on

June 7, 1843.

Holderlin ranks as one of the greatest of German poets. Strongly influenced by Friedrich Klopstock and Schiller in his early youth, he was emancipated from the latter's overpowering personality by the inspiration of "Diotima," and abandoned rhymed metres for classical hexameters and free rhythms. His ardent love of ancient Greece and its deities fused with his pantheistic conception of nature into a prophetic and visionary whole which forms the background of his work. *Hyperion, oder der Eremit in Griechenland* (1797–99), in spite of the beauty of the language and the inspiring enthusiasm for Greece, cannot compare with the great hymns and odes of Holderlin's latter period in which the classical inspiration met and mingled with Christian conceptions and the worship of Christ. Among these *Der Archipelagus, Brot und Wein, Der Rhein,* "Germanien," "Der Einzige" and "Patmos" are perhaps the most famous; *Der Tod des Empedokles* and the fragmentary *Empedokles auf dem Aetna* have an almost Aeschylean grandeur. and the translations from Sophocles are unparalleled in any language.

Holderlin is to all intents and purposes a discovery of the 20th century, largely because of Torbert von Hellingrath's beautiful edition. which caught the eye of such poets as Rainer Maria Rilke and Stefan George and established his reputation in Europe. The definitive edition of his collected works was edited by F. Beissner (1943). Previous collected editions were those by N. von Hellingrath, F. Seebass and L. von Pigenot, 6 vol., 2nd ed. (1923); by F. Zinkernagel, 5 vol. (1914–26); and by W. R. Bohm, 5 vol., 4th ed. (1924). *Selected Poems* were translated by J. B. Leishman (1944). The collected letters were edited by E. Bertram (1936).

HOLDERNESSE, EARL OF, an English title borne by Sir John Ramsay and later by the family of Darcy. John Ramsay (*c.* 1580–1626), a member of the Scottish family of Ramsay of Dalhousie, was knighted for his share in rescuing James VI from the hands of John Ruthven, earl of Gowrie. in Aug. 1600. In 1606 the king created him Viscount Haddington and Lord Ramsay of Barns, and in 1621 made him an English peer as earl of Holdernesse. Ramsay died in Feb. 1626, at which time his titles became extinct.

In 1644 Charles I created his nephew, Prince Rupert, earl of Holdernesse, but when the prince died unmarried in Nov. 1682 the earldom again became extinct. Conyers Darcy (1599–1689), who was made earl of Holdernesse in 1682, only a few days after the death of Rupert, was the son and heir of Conyers Darcy, Lord Darcy and Conyers (*c.* 1571–1654). Robert Darcy, 4th and last earl of Holdernesse, died in 1778.

HOLDHEIM, SAMUEL (1806–1860), Jewish rabbi, a founder and leader of Reform Judaism in Germany, was born in Posen. He officiated at Frankfurt-on-Oder (1836–40), Mecklenburg-Schwerin (1840–46) and Berlin (1847–60). Holdheim was one of the dominant personalities in the rabbinical conferences of 1844–46, which elaborated the ideology of Reform. He advocated changing the language of prayer in the synagogue from Hebrew to the vernacular. In general he favoured the elimination of all nationalistic elements, particularly the hope for the return to Zion, from the prayer book. In his later years he advocated the observance of Sunday as the Sabbath. Holdheim died at Berlin on Aug. 22, 1860.

Holdheim's writings form part of the classical literature of Reform, though his ideas are not generally accepted within the movement. They include, besides numerous contributions to periodicals and essays, *Gottesdienstliche Vortrage* (1839); *Geschichte der Entstehung und Entwicklung der jiidischen Reformgemeinde in Berlin* (1857); and three volumes of sermons.

See E. G. Hirsch, "Holdheim!' in *The Jewish Encyclopedia,* vol. vi.

HOLGUÍN, a city in Oriente province, Cuba, about 65 mi. N.W. of Santiago de Cuba. It is located on the rolling northeastern plains of the island and is the most important communication and trading centre of northern Oriente. Due to excellent climate and surrounding fertile soils, the city has grown rapidly (pop. [1953] 57,573). Sugar cane and tobacco are the chief products of the region, though cattle are important. The city is on the Central highway and is served by railroads and airlines. Its port, Gibara, is 19 mi. north.

Holguin was founded in the first half of the 16th century by a group of families under Garcia Holguin, a veteran of the Spanish conquest of Mexico. The town was an insurgent centre and suffered intensely the effects of the Ten Years' War (1868–78) and the 1895–98 revolution for Cuban independence. (D. R. D.)

HOLIDAY, originally "holy day," a festival in honour of some sacred event or person. When the Psalmist spoke of going to the house of God "with a multitude that kept holyday" (Ps. xlii, 4), the word he used for holyday also meant "dancing in a circle," thus suggesting that some aspects of the festival were joyful and carefree

In the course of time, holidays came to include rest or recreation days not necessarily connected with religion. It is significant that the idea of dancing, a primitive mode of expressing joy, persisted for centuries; even in 1577 we find an English poet. Barnabe Googe, saying. "Do you not knom that it is a holiday, a day to dance in?"; and days of celebration were traditionally days for dancing in the streets

Secular holidays were usually weekdays on which work was suspended. Shakespeare makes this clear when in the opening scene of *Julius Caesar* he has Flavius rebuke a group of workingmen: "Hence, home, you idle creatures . . . Is this a holiday?" and the cobbler explains, "We make holiday to see Caesar and to rejoice in his triumph."

How Holidays Became Vacations. — In olden times the common people did little travelling. They worked hard and earned little; furthermore, the highways were poor and unsafe. Holidays, usually of one-day duration, were celebrated close to home, often on the traditional village green. As economic conditions improved, especially as the result of the Industrial Revolution, people began to be able to absent tbemselves from work for more than a day, and even visit other towns. The term "holiday" began to be expanded to include recreation periods of a week or more, sometimes called vacations. When this happened, some of the one-day "festival" holidays became less important. When "holiday" began to mean "vacation" it was a sign that the people had more leisure. It was a symbol of more freedom. mental as well as physical. For a few brief days they could be away from the watchful eye of inquisitive neighbours, free from the limiting surveillance of paternalistic employers.

The new type of holiday enabled a man to fulfil some of his hitherto suppressed desires. One who had longed to go fishing could betake himself to a river and devote his whole free period to the felicities of angling Another could spend a few days in the big city. and perhaps find out if the city folk were really smarter than their rustic brethren. At the same time city people were getting their first glimpses of country life, discovering a new world of nature. Holidays of this type uere symptoms of motion, of circulation, of groning national vitality. Even when, as often happened, a man would use his "time off' to study some aspect of his own trade, it was the purest kind of recreation; on "the busman's holiday." riding on another driver's bus, he was no longer a drudge but an eager amateur, able to sit back and study the operations of his dally job with complete detachment.

Expanding Holidays. — A simple example of how a church holiday can expand into a vacation is seen at Eastertide, in the three-day period from Good Friday to Easter Monday This is sometimes lengthened to four days by adding Easter Monday (in England a bank holiday). It is five days long in Denmark, where the vacation includes the Thursday before Easter. The tendency to "take off" an extra day or so is seen also when Christmas falls near the beginning or end of a week, leaving only one workday between the holiday and Sunday.

Independence Days.— Holidays celebrating national independence occur largely in the period from July through September. Examples are Argentina, July 9; Belgium, July 21; Bolivia. Aug. 6; Brazil, Sept. 7; Chile, Sept. 18; Colombia, July 20; Costa Rica, Sept. 15; Ecuador, Aug. 10; France, July 14; Guatemala, Sept. 15; Honduras, Sept. 15; Liberia. July 26; Mexico. Sept. 16: Nicaragua. Sept. 15; Peru, July 28; Republic of the Philippines, July 4; El Salvador, Sept. 1j; United States. July 4; Uruguay, Aug. 25; Venezuela. July 5.

The nations celebrating their independence on Sept. 1j were members of a confederation of Central American states which lasted from 1824 to 1839 Sept. 1j, 1821. is the date of their independence from Spain.

Dates of some other independence days are: Cuba. June 17; Dominican Republic. Feb. 27; Finland, Dec. 6: Greece, March 2j; Haiti. Jan. 1; Iceland, June 17; Lebanon, Nov. 22; Panamá, Nov. 3.

The Republic of Israel may be said to have two independence days, the ancient Passover, commemorating deliverance from Egypt, and the modern Proclamation of the Jenish State, nhich took place on May 14. 1948 (5th day of Iyar in the Jewish year 5708). Because the Jenish calendar is a lunar one, both of these feasts are movable. the Passover falling in March or April, and the modern festival in April or May. Also a movable feast is the Irish independence day (often so called). It recalls the rising of Irish Republican volunteers in Dublin. on Easter Monday, April 24. 1916, and is celebrated on Easter Monday. regardless of the date.

Independence days mark the trend auay from monarchy and from colonialism. Much may be learned by comparing the character and behaviour of a nation before and after its day of independence; the study of such national holidays is full of dramatic revelations.

Akin to independence days are days honouring the defenders of a nation. In the United States are two of these, Memorial (Decoration) day. on May 30, a full holiday, and Veterans' (formerly Armistice) day, Nov. 11, the latter for living as well as dead veterans.

Holidays of **Limited** Observance.—In the United States, certain anniversaries are celebrated on days devoted to "business as usual." When there is cessation or curtailment of postal and banking services on such days. it causes inconvenience to the public. Examples are Feb. 22 and Nov. 11, respectively George Washington's birthday and Veterans' day. Such days, honoured by appropriate exercises in schools and elsewhere, though sometimes called holidays. are not such in the full sense of the word; perhaps they should be classed as patriotic anniversaries.

Thanksgiving.— Days or periods of thanksgiving have been known in many lands from ancient times. In the United States, from early colonial times onward, days for thanksgiving have been appointed for various reasons, and in at least eight different months. Sometimes the thanks was for food and shelter. sometimes for victory over Indians, or for peace with the Indians; sometimes for other reasons. Early Thanksgivings in Plymouth Colony were held in September, July and February. In Revolutionary times the continental congress appointed several thanksgiving days. which fell in May, July and December. In 1789 the *Book of Common Prayer* of the Protestant Episcopal Church in America directed that Thanksgiving be observed on the first Thursday of November, "unless another day be appointed by the civil authorities."

On Oct. 3. 1789, Pres. George Washington appointed Thursday, Nov. 26 (which happened to be the fourth Thursday in the month). a day of general thanksgiving throughout the union. Because this was the first festival of its kind proclaimed by a president of the United States. it is considered the first national Thanksgiving day. In Washington's diary he wrote "Thursday, 26th: Being the day appointed for a thanksgiving. I went to St. Paul's Chapel. though it was most inclement and stormy—but few people at Church."

In Oct. 1863 Pres. Abraham Lincoln "invited" citizens of the United States "to set apart and observe the last Thursday of November next as a day of Thanksgiving." He did the same in 1864. It is understood that he was following a suggestion of Sarah Josepha Hale. editor of *Godey's Lady's Book*. Most of the states had already held the festival on such a day, and Mrs. Hale sought to achieve national unity.

In 186j Pres. Andrew Johnson named the first Thursday in December the Thanksgiving festival, and in 1869 Pres. Ulysses Grant chose the third Thursday in November. Otherwise Lincoln's "last Thursday in November" was the accepted date for many years. In 1939 businessmen. who wished to create a longer shopping period between Thanksgiving and Christmas, petitioned Pres. Franklin Roosevelt to move Thanksgiving back one week. He complied, in 1939 specifying the fourth Thursday and in 1940 and 1941 the third Thursday in November. In 1941 congress rejected both "third" and "last," and decreed that Thanksgiving henceforth be on the fourth Thursday in November.

Labour **Day,** in the United States the first Monday in September, was first celebrated in New York city in 1882. Then often referred to as a holiday for workmen. it gained in importance and in general participation. As early as 1884, readers of the *New York Heruld* were told that "This . . . is a day that should be honored above all others. It is in honor of the greatest of saints—St. Labor." After various developments *(see* LABOUR DAY) it became one of the country's principal holidays.

Changing Status of Holidays.— Under modern conditions, holidays as such tend to lose their importance. They provide opportunities for leisure and recreation to a public already largely enjoying those advantages. With a reduced work week and vastly improved means of transportation. workers by the millions are able to turn every week-end into a holiday. In some countries, notably in the United States. a holiday became an opportunity to stay at home, free from the rigours of the crowded highway. One of the by-products of such holidays at home was the rise of the "do-it-yourself" movement, and work-away-from-work became a hobby. There still continued to be, nevertheless, a strong appeal in a day that is special and set apart; and while that appeal lasts there will always be men and women and children who find some magic in a holiday.

(Religious and secular holidays and holiday customs in Europe, the Unittd States and other parts of the world are discussed at some length in articles such as: ARBOR DAY; ARMISTICE DAY; BANK HOLIDAYS; BOXING DAY; CARNIVAL; CHRISTMAS; EASTER; FEAST ASD FESTIVAL; GOOD FRIDAY; HALLOWEEN; INDEPENDENCE DAY; LABOUR DAY; LUPERCALIA; MEMORIAL DAY; MISRULE, LORD OF; NEW YEAR'S DAY; PASSOVER; SATURN; SUNDAY; THANKSGIVING DAY; WAKE.) (A. McQ.)

HOLINSHED, RAPHAEL (d. *c.* 1580), English chronicler, is remembered chiefly because his *Chronicles* enjoyed great popularity and became a quarry for many Elizabethan dramatists, especially Shakespeare, who found in the second edition material for *Macbeth, King Lear, Cymbeline* and many of his historical plays. Holinshed probably belonged to a Cheshire family and may possibly be identified with the Holinshed who matriculated from Christ's college, Cambridge, in 1544; he was in London from about 1560. His will, dated Oct. 1, 1578, describes him as steward to Thomas Burdet, of Bramcote, Warwickshire, and was proved, April 24, 1582.

In London he was employed as a translator by Reginald Wolfe, who was preparing a universal history; but after Wolfe's death (1573), the scope of the work was abridged and it appeared, with many illustrations, as the *Chronicles of England, Scotland, and Ireland* (2 vol.; dated 1577). although not licensed for publication until July 1578. Holinshed received valuable assistance from William Harrison (*q.v.*) and others, and from John Leland's manuscripts. The part dealing with the history of Scotland is mainly a translation from Hector Boece's *Scotorum historiae* (1527).

The *Chronicles* is a work of largely uncritical compilation from many sources of varying degrees of .trustworthiness. The texts of the first and second (1587) editions were expurgated by order of the privy council, and the excisions from the second edition were published separately in 1723. An edition of the complete text of 1587 was published in six volumes (1807–08). A selection, *Holinshed's Chronicle as used in Shakespeare's Plays*, was edited by A. and J. Nicoll (1927).

HOLKAR, the family name of the Maratha ruler of Indore (*q.v.*), which was adopted as a dynastic title. The termination *-kar* implies that the founder of the family came from the village of Hol near Poona.

HOLL, FRANK (1845–1888), English painter. was born in London on July 4. 1845. and was educated chiefly at University College school. He was a grandson of William Holl, an engraver of note, and the son of Francis Holl. A.R.X. Entering the Royal academy schools as a probationer in painting in 1860, he exhibited at the academy in 1864 "A Portrait" and "Turned out of Church," a subject picture. "A Fern Gatherer" (1865); "The Ordeal" (1866); "Convalescent" (the somewhat grim pathos of which attracted much attention) and "Faces in the Fire" (1867) succeeded.

Holl gained the travelling studentship in 1868; the successful work was characteristic of the young painter's mood, being "The Lord Gave. and the Lord Hath Taken Away." Holl was much below Millais in portraiture. The range of his studies and the manner of his painting were narrower than those of Josef Israels. with whom. except as a portrait painter, he may better be compared than with Millais.

In 1878 he was elected A.R.A., and exhibited "The Gifts of the Fairies." "The Daughter of the House," "Absconded" and a very fine portrait of Samuel Cousins now in the National gallery. London. This last canvas is a masterpiece. Holl was elected R.A. in 1883 and in 1886 he produced a portrait of Millais as his diploma work, but his health rapidly declined and he died at Hampstead, on July 31. 1888.

HOLL, KARL (1866–1926), German theologian, remembered chiefly for his historic contribution to the interpretation of Luther, was born at Tubingen, May 1j, 1866. He studied at Tubingen, Berlin. Giessen and Marburg, becoming professor of church history at Tiibingen in 1900 and at Berlin in 1906. He died at Charlottenburg, Berlin, May 23, 1926.

Holl's interests ranged. from the early church to urgent contemporary problems, but his chief work was divided between the Greek Church and the Reformation. He was a paleographer, a textual critic and a conscientious scholar, and these gifts find expression in such works as *Die Sacra Parallela des Johannes Damascenus* (1897), *Enthusiasmus und Bussgewalt beim griechischen Monchtum* (1898) and *Amphilochius in seinem Verhältnis zu den grossen Kappadozien* (1904), which contains a history of the doctrine of the Trinity in the 4th century.

His highly erudite study of Luther's doctrine, forming vol. i of his *Gesammelte Aufsätze zur Kirchengeschichte* (3 vol., 1923–28; 7th ed. of vol. i, 1948), was the fruit of his passionate interest in theology as the study of man's meeting with God and shows his profound knowledge of his period. The work's remarkable impact, ho ever, was due mainly to Holl's insight into Luther's personality, and to his understanding of Luther's experience of God and the confrontation of God and the conscience. With this, and his handling of the doctrine of justification, Holl made his most telling contribution to Luther studies. The book's effect was all the greater for being published in the period of uncertainty and moral crisis after World War I. It gave a new direction to Luther interpretation and remains a classic work on the subject.

See A. von Harnack and H. Lietzmann, *Karl Holl. Zwei Gedachtnisreden (1926)*; and H. Bornkamm "Karl Holl" in *Evangelisches Kirchenlexicon* (1958).

HOLLAND, CLIFFORD MILBURN (1883–1924), U.S. engineer, directed the design and construction of the Hudson river tunnel connecting New York and Jersey City. officially named the Holland tunnel in his honour. He was born at Somerset, Mass., on March 13, 1883.

He graduated from Harvard university in 1906 and was soon appointed assistant engineer of the Battery-Joralemon street tunnel, New York city. On the completion of this work in 1908, he was in charge of a portion of the Fourth avenue subway in Brooklyn. In 1914 he took direct charge of the Old Slip-Clark street and Whitehall-Montague street tunnels and, later, of the Willoughby, 14th and 60th street tunnels in New York city, all, like the Battery-Joralemon street tunnel, connecting Manhattan and Long Island.

On July 1. 1919, he became chief engineer of the New York and New Jersey interstate bridge and tunnel commissions for the construction of a vehicular tunnel under the Hudson river. He died on Oct. 27, 1924, at Battle Creek. Mich., before the project was completed.

HOLLAND, SIR (THOMAS) ERSKINE (1835–1926), English international jurist and outstanding professor of international law and diplomacy at Oxford, was born at Brighton, Sussex, on July 17. 1835. He was educated at Brighton college and Balliol and Magdalen colleges, Oxford. He studied Greek philosophy and in 1859 was elected fellow of Exeter college. In 1875 he was elected fellow of All Souls.

In 1863 he was called to the bar by Lincoln's Inn, and joined the home circuit. In 1874 he was appointed Vinerian reader in English law at Oxford and later in the same year, on the resignation of M. Bernard. Chichele professor of international law and diplomacy. a post which he held for 36 years.

In 1875 Holland became associate (and later member) of the Institut de Droit International, which held a meeting in Oxford on his invitation in 1880. The Naval Prize act, 1894, was drafted by him, and also the Admiralty Manual of Naval Prize law (1888). He was particularly interested in law in its scientific and literary aspects, and in 1894 gained the Swiney prize for his *Elements of Jurisprudence,* which went through numerous editions. The war office made use of his services in drafting orders for troops in the field; these were subsequently co-ordinated and published under the title of *Laws of War on Land* (1904). In 1903–05 Holland served on the Royal Commission on the Supply of Food and Raw Material in Time of War and attended the Geneva conference (1906) as plenipotentiary. In 1917 he was knighted. He died at Oxford on May 24, 1926.

Sir Robert Erskine Holland (1873–), the distinguished civil servant, was his son.

HOLLAND, SIR HENRY, BART. (1788–1873), English physician and author, was born at Knutsford, Cheshire, on Oct. 27, 1788. His maternal grandmother was the sister of the potter Josiah Wedgwood, whose grandson was Charles Darwin; and his paternal aunt was the mother of Elizabeth Gaskell, the novelist and biographer. After spending several years at a private school at Knutsford, he was sent to a school at Newcastle upon Tyne, whence after four years he was transferred to J. P. Estlin's school near Bristol. There he at once took the position of head boy, in succession to John Cam Hobhouse, afterward Lord Broughton, an honour which required to be maintained by physical prowess.

On leaving school he became articled clerk to a mercantile firm in Liverpool, but, as the privilege was reserved to him of passing two sessions at Glasgow university, he at the close of his second session sought relief from his articles. In 1806 he began the study of medicine in the University of Edinburgh. where he was graduated in 1811.

After several years spent in foreign travel. he began practice in 1816 as a physician in London—according to his own statement, "with a fair augury of success speedily and completely fulfilled." This "success," he added, "was materially aided by visits for four successive years to Spa, at the close of that which is called the London season." It must also, however, be in a great degree attributed to his happy temperament and his gifts as a conversationalist--qualities the influence of which. in many cases belonging to his class of practice, were often of more importance than direct medical treatment.

In 1816 he was elected F.R.S. and in 1828 F.R.C.S. He became physician in ordinary to Prince Albert in 1840. and was appointed in 1852, physician in ordinary to the queen. In April 1853 he was created a baronet. He was also a D.C.L. of Oxford and a member of the principal learned societies of Europe.

He was married twice, his second wife being a daughter of Sydney Smith. She had considerable literary talent and published a biography of her father.

Sir Henry Holland at an early period of his practice resolved to devote to his professional duties no more of his time than was

necessary to secure an income of £5,000 a year, and also to spend two months of every year solely in foreign travel. By the former resolution he secured leisure for a wide acquaintance with general literature and for a more than superficial cultivation of several branches of science. The latter enabled him, beside visiting. "and most of them repeatedly. every country of Europe," to make extensive tours in the other three continents, journeying often to places little frequented by European travellers.

He procured, moreover, an introduction to nearly all the eminent persons in his line of travel and knew many of them in his capacity of physician.

The *London Medical Record,* in noticing his death, which took place on his 85th birthday, Oct, 27, 1873, remarked that it "had occurred under circumstances highly characteristic of his remarkable career." On his return from a journey in Russia he was present, on Friday. Oct. 24, at the trial of Marshal A. F. Bazaine in Paris. dining with some of the judges in the evening. He reached London on Saturday, took ill the following day and died quietly on Monday afternoon.

HOLLAND, HENRY (1745–1806). British architect, who designed the original Brighton pavilion, was born on July 20, 1745. He became the assistant and, later, partner of the well-known landscape gardener, Lancelot Brown. Holland carried out extensive alterations and additions at Carlton house, the London home of the Prince of Wales; he was also architect of the Brighton Marine pavilion, which was later buried under the "Hindu" accretions of John Nash. His principal surviving works are Brooks's club in London, Althorp in Northamptonshire, parts of Woburn abbey in Bedfordshire and Southill in the same county. All show a quality of restrained elegance that was felt by contemporaries to be a welcome change after the more lavish interiors of Robert Adam. The last three also show a large degree of French influence, which had first appeared in Carlton house. He died on June 17, 1806, in Chelsea.

See Dorothy Stroud, *Henry Holland* (1951); *Capability Brown* (1951). *(Ms. W.)*

HOLLAND, HENRY FOX, 1ST BARON (1705–1774), English politician, notable chiefly for the success with which he exploited public office for private gain, second son of Sir Stephen Fox. was born on Sept. 28, 1705. Inheriting a large share of the riches which his father had accumulated. he squandered it soon after attaining his majority and went to the continent to escape from his creditors. He contracted a wealthy marriage which enabled him to enter parliament in 1735 as member for Hindon, Wiltshire. He became the favourite pupil and devoted supporter of Sir Robert Walpole. He was surveyor general of works from 1737 to 1742, was member for Windsor from 1741 to 1761, lord of the treasury in 1743. secretary at war and member of the privy council in 1746 and became leader of the house of commons and secretary of state under the duke of Newcastle in 1755. In 1757. in the rearrangements of the government, Fox was ultimately excluded from the cabinet and became paymaster of the forces.

During the Seven Years' War Fox devoted himself mainly to accumulating a vast fortune. He again became leader of the house, with a seat in the cabinet. under the earl of Bute in 1762 and exercised his skill in cajolery and corruption to induce the house of commons to countenance the treaty of Paris of 1763; as a recompense. he was raised to the house of lords with the title of Baron Holland of Foxley, Wiltshire.

In 1765 he was forced to resign the paymaster generalship, and four years later a petition of the livery of the City of London against the ministers referred to him as "the public defaulter of unaccounted millions." The proceedings brought against him in the court of exchequer were stayed by a royal warrant and he justified the delays by appealing to custom. He died at Holland house, Kensington, on July 1, 1774. One of his four sons was the Whig leader Charles James Fox (*q.v.*).

HOLLAND, HENRY RICH, 1ST EARL OF (1590–1649), second son of Robert, 1st earl of Warwick, and of Penelope. Sir Philip Sidney's "Stella," daughter of Walter Devereux. 1st earl of Essex, was baptized on Xug. 19. 1590, educated at Emmanuel college. Cambridge, knighted in 1610 and returned to parliament for Leicester in 1610 and 1614. In 1610 he was present at the siege of Juliers. Favours were showered upon him by James I. He was made gentleman of the bedchamber to Charles. prince of Wales. and captain of the yeomen of the guard; and in 1623 he was raised to the peerage as Baron Kensington. In 1624 he was sent to Paris to negotiate the marriage treaty between Charles and Henrietta Maria.

In September he was created earl of Holland, and in 1625 was sent on two further missions, first to Paris to arrange a treaty between Louis XIII and the Huguenots, and later to the Netherlands with Buckingham. He held various places under Charles I. but deserted his cause in 1641. He was chosen by the parliament in March and July 1642 to communicate its votes to Charles, who received him with studied coldness.

He was appointed one of the committee of safety in July, and joined Essex' army at Twickenham. where. it is said, he persuaded him to avoid a battle. In 1643 he appeared as a peacemaker! and after failing to bring over Essex, he returned to the king. His reception. however, was not a cordial one, and after the first battle of Newbury he once more returned to the parliament. Once again he renewed his allegiance to the king's cause; and after endeavouring to promote the negotiations for peace in 1645 and 1647 he took up arms in the second Civil War, received a commission as general and put himself at the head of 600 men at Kingston. He was defeated on July 7, 1647, captured at St. Neots shortly afterward. and imprisoned at Warwick castle. He was sentenced to death. and was executed together with Hamilton and Capel on March 9, 1649.

HOLLAND, HENRY RICHARD VASSALL FOX, 3RD BARON (1773–1840), one of the leading members of the Whig party'as refounded by Charles Grey, and a disciple of Charles James Fox, was the son of Stephen Fox (1745–74), 2nd Lord Holland, and Lady Mary Fitzpatrick. daughter of John, earl of Upper Osaory. He was born at Winterslow house. Wiltshire, on Nov. 21. 1773. and was soon orphaned. his father dying in 1774, his mother in 1778. While in Italy in 1796 he fell in love with the young wife of Sir Godfrey Webster, who divorced her in 1797 after she had given birth to a son by her lover. Lord Holland then married her. and she bore him four legitimate children.

After the death of his uncle, Charles James Fox, in Sept. 1806, Holland became lord privy seal in the Grenville ministry, with a seat in the cabinet of the ministry of "all the talents," until it was dismissed in March 1807. Lord Grey in vain urged him to take over the leadership of the Whig opposition in 1812. As Fox's nephew he would have been particularly acceptable to Fox's friends, and the prince regent had no dislike for him as he had for Grey: an important consideration whenever there was a possibility of forming a Whig administration. The Whigs who joined the Canning and Goderich ministries in 1827 would have liked to strengthen their own position by securing the foreign secretaryship for Holland. hut George IV could not stomach a further infusion of Whiggism into the cabinet. Holland therefore remained out of office from 1807 to Nov. 1830 when he was appointed chancellor of the duchy of Lancaster in Lord Grey's reform ministry (1830–34), after refusing an offer of the foreign secretaryship as too arduous a post, since he had for years suffered from gout. This cabinet office Holland retained under Lord Melbourne from 1834 (except for the brief interlude of the Peel ministry. Dec. 1834–April 1835) until his death on Oct. 22. 1840. In the house of lords he was the recognized exponent of the political ideas of his uncle; Lady Holland made their London home. Holland house. the most celebrated of the Whig *salons.* His *Memoirs of the Whig Party,* 2 vol., ed. by the 4th Lord Holland (1852), and *Further Memoirs of the Whig Party, 1807–1821,* ed. by Lord Stavordale (1905). enshrine the Whig creed and vividly portray the contemporary literary and social world.

HOLLAND, HENRY SCOTT (1847–1918), English divine, was born at Ledbury, Hereford, on Jan. 27 1847. He was edu-

cated at Eton and at Balliol college. Oxford; in **1872** he was ordained, becoming the same year a tutor at Christ Church. In **1882** he was senior proctor of the university, and the same year was made a canon of Truro and examining chaplain to its bishop. He was appointed a canon of St. Paul's in 1884, and in **1886** precentor.

He refused the offer of the see of Norwich in **1893,** but in 1910 was appointed regius professor of divinity at Oxford. He died at Oxford on March 17, 1918. Scott Holland was closely associated with the Christian Social union for many years. He was a successful tutor and a popular professor; but it is as a preacher that he is most vividly remembered.

See his *Life,* by Stephen Paget (1921).

HOLLAND, JOHN PHILIP (1841–1914), U.S. inventor and developer of the modern submarine, designed and built the first submarine accepted by the U.S. navy.

Holland was born at Liscannor, County Clare, Ireland, on Feb. 24, 1841, and received his primary education at Limerick. His real interest was in ships, but because of his poor eyesight, he decided to become a schoolteacher. He taught in Ireland until **1872,** then went to the United States, where he taught in Paterson, N.J., until **1879.**

He drew plans of submarines and, in 1879, with funds from Irish associates, built a small submarine which operated submerged successfully. He formed a company in 1895 and was awarded a contract to build a submarine for the U.S. navy. His first boat was a failure but his second, the "Holland," passed navy tests. This boat had a gasoline engine for surface propulsion and an electric motor fed by storage batteries for power when submerged. The arrangement of tanks to be flooded to submerge this boat was similar to that in modern submarines. It was purchased by the navy on April **18,** 1900.

Holland died at Newark, N.J., on Aug. 12, 1914. (M. **R. D.**)

HOLLAND, JOSIAH GILBERT (pen name **TIMOTHY** TITCOMB) (1819–1881), U.S. journalist and editor: wrote a number of sentimental, didactic books which were popular during his lifetime. He was born in Belchertown, Mass., on July 24, **1819,** into a family of straitened circumstances. He worked at various occupations and for a brief period attended secondary school. After graduation from a medical college at Pittsfield, Mass., he practised medicine in Massachusetts from **1844** and made an unsuccessful attempt with Charles Robinson (1818–94), later first governor of the state of Kansas, to establish a hospital for women. He abandoned medicine, however, and in **1848** was superintendent of schools in Vicksburg, Miss. He also taught for a short period of time in Richmond, Va.

In **1849** he returned to Massachusetts, where he became assistant editor under Samuel Bowles, and later one of the owners, of the *Springfield Republican.* Under Holland. who contributed items of human interest, and Bowles, who was primarily responsible for news of public affairs. the newspaper prospered and earned a high reputation. Holland first won prominence with a series of "letters" in the paper satirically pointing up differences between life in urban and rural areas.

In 1870, in New York city, he helped establish and became editor of *Scribner's Monthly.* The title was changed in **1881** to *The Century.* He remained editor of the magazine until his death on Oct. 12, 1881.

His writings fall into four classes: **(1)** history and biography, represented by a *History of Western Massachusetts* (1855) and a *Life of Abraham Lincoln* **(1866)**; **(2)** fiction, of which *Miss Gilbert's Career* (1860) and *Sevenoaks* (1875) were pictures of village life in the eastern United States; **(3)** poetry, of which *Bitter-Sweet* **(1859)** and *Kathrina, Her Life and Mine* (1867) were widely read; and (4) a series of homely essays on the art of living, of which the most characteristic were *Titcomb's Letters to Young People, Single and Married* (1858), *Gold Foil, Hammered From Popular Proverbs* **(1859)**, *Letters to the Joneses* **(1863)** and *Every-Day Topics* (two series, **1876** and **1882**).

See Harry Houston Peckham, *Josiah Gilbert Holland in Relation to His Times* (1940).

HOLLAND, PHILEMON (1552–1637), English scholar called by Thomas Fuller "the translator general in his age," was born at Chelmsford, Essex, in 1552. He studied under John Whitgift at Trinity college, Cambridge, 1566–74, was elected fellow in 1573, and became an M.D. in 1597. He had been incorporated M.A. at Oxford in 1585. About 1595 he settled at Coventry, Warwickshire. practising medicine and teaching, but his main work was translating. He died there on Feb. 9, **1637.**

Holland's version of Livy appeared in **1600.** His translation of Pliny's *Natural History* was finished in **1601,** and was followed by Plutarch's *Morals* (1603), Suetonius (1606), Ammianus Marcellinus **(1609)** and Xenophon's *Cyropaedia* **(1632).** In 1610 he completed an English version (with additions) of his friend William Camden's *Brztannia.*

Holland translated not so many books as big books. His prose is marked by clarity and colloquial ease. His Suetonius (probably his masterpiece) is spirited. and more accurate than any other English translation.

BIBLIOGRAPHY.—Holland's *Suetonius, History of Twelve Caesars,* was ed. by C. Whibley (1899). *See* also H. *B.* Lathrop. *Translations from the Classics into English, 1477–1620* (1933); *F.* O. Matthiessen, *Translation: an Elizabethan Art* (1931). (H. H. Ds.)

HOLLAND, RICHARD, or RICHARD DE HOLANDE (*fl.* 1450), Scottish writer, author of the *Buke of the Howlat,* was secretary or chaplain to the earl of Moray **(1450)** and rector of Halkirk, near Thurso. He was afterward rector of Abbreochy, Loch Ness. He was an ardent partisan of the Douglases, and on their overthrow retired to Orkney and later to Shetland. He was employed by Edward IV in his attempt to rouse the Western Isles through Douglas agency, and in **1482** was excluded from the general pardon granted by James III to those who would renounce their fealty to the Douglases.

The poem, entitled the *Buke of the Howlat,* written about 1450, shows his devotion to the house of Douglas:

> On ilk beugh till embrace
> Writtin in a bill was
> O Dowglass, O Dowglass
> Tender and trewe!
>
> **(ii, 400–403)**

and is dedicated to the wife of a Douglas:

> Thus for ane Dow of Dunbar drew I this Dyte,
> Dowit with ane Dowglass, and boith war thei dowis,

but all theories of its being a political allegory in favour of that house may be discarded. The poem, which extends to 1,001 lines written in the irregular alliterative rhymed stanza. is a bird allegory. of the type familiar in the *Parlement of Foules.*

The text of the poem is preserved in the Asloan and Bannatyne manuscripts. Fragments of an early 16th-century black-letter edition, discovered by D. Laing, are reproduced in the *Adversaria* of the Bannatyne club.

See F. J. Amours in *Scottish Alliterative Poems,* pp. 47–81, also Introduction, pp. xx–xxxiv (1897).

HOLLAND, SIR SIDNEY GEORGE (1893–1961). prime minister of New Zealand from **1949** to **1957,** was born at Greendale. N.Z., on Oct. **18, 1893.** and educated at West Christchurch high school. He started work at **18** in a hardware store. but at 19 joined his father's rural haulage and mobile threshing firm. After service in World War I he founded with his brother a successful engineering firm in Christchurch. and at the age of **42** succeeded to his father's seat in parliament. Party maneuvering made him leader of the National party in **1940.** and stout opposition to Labour policy at every opportunity strengthened his hold on his followers through the war years and after. The **1949** election made him prime minister, when he set out to remove controls over the country's economy and to adopt a "strong" policy toward industrial unrest, at that time concentrated in water-front work. He broke a serious strike **(1951).** capitalizing on this with a snap election. which gave him an increased majority. Holland combined great force as leader of a cabinet with a certain naïveté in his, pronouncements on matters of both internal and external concern to the country; his popularity waned and his government was defeated in **1957.** Bad health had already forced him to resign the premiership earlier in the pear, and he did not stand again

for parliament. On ceasing to be premier he was knighted. He died at Wellington, N.Z., on Aug. 5, 1961. (J. C. BE.)

HOLLAND is a maritime country of northwestern Europe, whose official title is the Netherlands. It extends from lat. 53° 33' (the island of Rottum off the northeastern coast) to lat. 50° 46' N. (Slenaken in southern Limburg) and from long. 3° 22' (St. Anna ter Muiden, near Sluis in Zeeland) to 7° 13' long. E. (Nieuwe-Schans in east Groningen). The Netherlands' maximum length from north to south is thus 190 mi.; its breadth, which varies considerably, is greatest on its southwest-to-northeast axis (160 mi.).

The country is bounded on the east by Germany. In 1949, after World War II, certain minor rectifications were made on the German frontier (thenceforth 304 mi. in length); these resulted in the inclusion within the Netherlands of the districts around Elten and Tuddern, together with smaller areas at various scattered points along the eastern boundary. The total area of these acquisitions was about 23 sq.mi. (60 sq.km.).

To the south of the Netherlands lies Belgium (frontier 246 mi.), and on the west and north the country is bounded by the North sea. The extent of coast line, including estuaries but not the Zuider Zee (IJsselmeer) coast line, is about 429 mi. This length is increased by about 647 mi. if the coasts of close-lying islands are included, making a total of 1,076 mi.

The area of the country has shown a continual variation. It has been decreased by coastal erosion and flooding by the sea; on the other hand this has often been compensated by extensive silting up, by withdrawal of the sea and also by such artificinl land reclamation as diking and impoldering. The total land area of the Netherlands was estimated to be 12.616 sq.mi. by 1957, as compared with 12.482 sq.mi. in 1947. The increase. which was continuing at mid-century. was largely the result of extensive poldering in the IJsselmeer area.

Much of the country (approximately two-fifths) lies below sea level and is protected from inundation by dunes and dikes. A large part of the remainder is composed of sandy regions and rarely rises above 300 ft. except in south Limburg. Through the centre of the country flow in close proximity and roughly parallel three great rivers, which have formed a wide alluvial plain.

The Netherlands is divided administratively into 11 provinces; its capital is Amsterdam, though The Hague ('s Gravenhage) is the seat of the government and the principal residence of the sovereign.

PHYSICAL FEATURES

The geology of the Netherlands is relatively simple. The surface characteristics are more artificial, probably, than those of any other country; most natural physical features date from the later Tertiary stages (Pleistocene and Holocene periods), and their deposits cover most of the country in considerable depth. Beneath this layer of recent formations lie fresh-water, deltaic and marine Tertiary sediments and earlier Mesozoic rocks. The latter are so deep over most of Holland that they are only met in borings on the east and south of the country and in rare outcrops near Maastricht and in the Enschede and Winterswijk areas of Gelderland. Beneath the Mesozoic rocks lie Carboniferous strata in which coal measures occur widely. Because of the great depth of these Carboniferous layers the coal measures cannot be exploited over much of the country. Productive seams do approach the surface, however, in Limburg and, less closely, in the Peel region (between North Brabant and Limburg) and also along the frontier region of east Overijssel and Gelderland. In Limburg, measures that have been worked since the middle of the 14th century approach to within 300 ft. of the surface; in the Peel district borings have proved that there is coal at depths between 2,000 and 3,000 ft.

Earlier Permian and Triassic rocks, which were the first cover of the "North Sea depression" of which the Netherlands was a southern part, probably underlie the whole country at considerable depths. They contain beds of salt and Triassic salt which are exploited at Boekelo in Gelderland.

During the Pliocene period of the later Tertiary stage, the forerunners of the Rhine, Meuse (Maas) and Scheldt deposited over the area huge quantities of sediment, mostly of sand with a later surface of fluviomarine or deltaic. The area, in the succeeding Pleistocene period, did not experience the first and second glaciation; but ice expansion spread over the northern part during the third (Riss). In the provinces of Drenthe, Friesland and Groningen are large areas of boulder clay with blocks of Scandinavian rock. Another legacy is the existing glacial ridges of Gelderland, Drenthe and Overijssel. which run from north to south. Along the southern margin of the ice expansion are the remnants of terminal moraines, composed of sand and gravel. Further south, the rivers built up terraces of gravel, mostly later submerged under delta deposits.

The postglacial period saw the return of sea level to its approximate modern position. Then followed the initiation and subsequent development of an offshore bar (part of that stretching from the eastern mouth of the English channel along the northwestern European coast to German Friesland). It was breached by the estuaries of the Scheldt, Meuse and Rhine, but swept unbroken from the Hook of Holland to Den Helder and then continued in what are now the Frisian Islands. In time this bar was covered with sand dunes, which represent successive periods of building. Within the bar were created lagoons, in which formed peat areas, or marine clay, where for a time the sea breached the bar.

Through the centre of the area the rivers had created a broad plain of clay alluvium within a sandy region to the south and north. The growth of the Rhine-Meuse delta in the west occurred through a stoppage of an original outlet toward the north, and a consequent shift to the west. A second alluvial plain had also been created by the IJssel now flowing north from the Rhine, through the sands of the eastern area.

Nearly two-fifths of the Netherlands lies below sea level. The rest of the area rarely rises above 150 ft., though in parts of southern Limburg occasional heights of more than 1,000 ft. may be reached. Geologically and physically the country can be roughly divided into four areas. There is the low deep coastal belt, much of which is below sea level and is protected by stretches of dunes and dikes; this belt is flanked in the southwest and northeast by neighbouring islands. A central area comprises the plains of the Rhine and its chief distributaries and the Meuse. To the north of these plains are higher sandy regions, themselves sometimes divided by alluvial plains: the so-called Utrecht-Gelderland ridge and the Veluwe region, and lower-lying eastern Gelderland and Overijssel in the east of the country. To the south along the Belgian border stretches the sandy belt of southern Brabant and of Limburg. The tongue of southern Limburg itself thrusts between Belgium and Germany; it is a relatively high plateau of Cretaceous rocks rising above 300 ft. in large areas and to more than 1,000 ft. at points in the south. In the northeast of the Netherlands stretch the low-lying areas of Drenthe and the interior of Friesland and Groningen, composed of peat and sandy heath.

The **Coastal** Belt.—The coastal belt itself can be divided into several zones. Stretching northeast from the Belgian frontier it is deeply indented by the wide estuaries of the Wester and Ooster Schelde (Scheldt), the Mastgat, the Grevelingen Meuse and the Haringvliet Meuse. These estuaries themselves divide about the large islands of Walcheren, Zuid and Noord Beveland, Schouwen-Duiveland, Tholen and Goeree-Overflakkee. Most of this area (including the islands) is protected by dikes or sand dunes and edged with marshes, mud flats and more rarely by sandy beaches. The land is mostly in polders, as land reclamation has been in progress for many centuries, and the soil, a fertile marine clay, is suitable for arable farming. From the Hook of Holland the coast line runs northward in a continuous sweep to Den Helder at the northern tip of the mainland; all its hinterland, which comprises the provinces of North Holland and much of South Holland, between the North sea and the Zuider Zee can be termed as the coastal belt. It is bisected approximately halfway from IJmuiden (Ymuiden) to Amsterddm by the North Sea canal. The North sea coast line is low and fringed by sandy beaches, and along it land reclamation has proved impossible. The interior of the belt,

which is below sea level, is protected mostly by coastal dunes, It includes much polder land and is traversed, particularly in the south, by large rivers. Much of the surface area is peat, and the land suitable for all types of agriculture.

Stretching from the tip of North Holland in a northeasterly curve are the Frisian Islands. The first three, Texel, Vlieland and Terschelling, low flat areas protected by dunes or dikes. enclose a stretch of shallow tidal sea, the Wadden Zee, which led formerly into the Zuider Zee but is now separated from it by the Afsluitdijk (the IJsselmeer dam). The dam, which connects North Holland with Friesland, is 18½ mi. long and carries both a motor road and railway. The northeastern coastal belt of Friesland and Groningen to the German frontier at Ems is also extensively diked. Land reclamation is made in the more suitable places, and the entire zone is poldered. The area consists largely of heavy clays and less extensive districts of peat. The coast itself is flanked by the more northeasterly Frisian Islands, the smaller of which are uninhabited.

The Alluvial Plains and Valleys.—The broadest alluvial plains stretch through central Netherlands; this area is in effect a delta of the Rhine and its divergent distributaries. The Rhine itself divides shortly on entering Dutch territory into the Waal and a more northerly stream, first called the Pannerdensch canal and later the Neder-Rijn (Lower Rhine). At Arnhem this last-named river throws off an important tributary, the IJssel. It flows northward into the Zuider Zee through a relatively narrow alluvial plain, bordered by the sandy plateau of Veluwe on the west and the lower sandy areas of eastern Gelderland and Overijssel on the east. The Neder-Rijn itself, later named the Lek, winds westward to Rotterdam and the North sea. The more southerly Waal follows an approximately parallel course. A third great river, the Meuse, flowing first north through Limburg, turns westward just below Nijmegen and winds several miles south of the Waal. It gathers in its later course various small tributaries, coming from the higher land which borders the Dutch and Belgian frontier. The rivers are slow moving and meandering and deposit much silt. They are, of course, subject to considerable flooding and are diked along considerable stretches, usually some distance from their summer beds.

A smaller valley, the Geldersche, lies between the Utrecht-Gelderland ridge and the Veluwe region; it is a triangular strip with its basis on the southern coast of the Zuider Zee and its apex on the Seder-Rijn. The region is one of clays in the north, and of peat and outcrops of sand.

The Sand Areas.—A third type of area is the higher sandy regions with which may also be grouped more low-lying and mixed districts in the northeast of the country. The most extensive of these regions is the area stretching to the Dutch-Belgian frontier (the south of Brabant) and northern Limburg. Altitude rarely exceeds 150 ft. Cutting through the area are the alluvial valleys of various streams. Patches of peat bog (notably on the boundary between Brabant and Limburg) occur, but many, which existed formerly, have been reclaimed. A second strip, the Utrecht-Gelderland ridge, comprises a narrow belt of moraine hills running from the Zuider Zee to the Neder-Rijn. The northern part, the hills of Gooiland, rises in places above zoo ft.; east and southeast of Utrecht similar heights are attained. The ridge sinks to the east in the Geldersche valley, but the sandy uplands reappear in the Veluwe, of which the Over Veluwe rises in places to more than 300 ft. This region is surrounded by the chief terminal moraines of the Netherlands, which fall into the valley of the Neder-Rijn on the south and the IJssel on the east. Still further east across the valley of the IJssel lie eastern Gelderland and Overijssel, where the lower sand heaths are frequently interspersed by the alluvial channels of streams. Woodland is extensive, and in the north of the region occur areas of bog, though much reclamation has been carried out.

To the north and northeast of this last district stretch the province of Drenthe and the interior of Friesland and Groningen. Altitude there is seldom above 40 ft., except on the glacial ridges of the Hondsrug, running southeast of Groningen, where altitudes of 100 ft. are reached. Much of the region comprises bog peat, of which large regions have been reclaimed. Extensive areas of sandy heath remain. much of which has been converted into woodland.

The Southern Limburg Plateau.—Finally there is the small plateau in southern Limburg, thrusting for about 20 mi. between Belgium and Germany, with a maximum width of about 20 mi. Except for the plain of the Meuse, this is a plateau of Cretaceous rocks, rising in extensive areas to more than 300 ft. and to more than 1,000 ft. in the south. The plateau is dissected by deep valleys with swift streams. Its surface is covered with a fine soil (loess) which is suited to wheat and sugar beet. Underlying Carboniferous deposits, a continuation of those in the Belgian Kempenland, have led to the industrialization of the area.

Climate.—Climate is practically uniform throughout the Netherlands. The prevailing winds are westerly and southwesterly, with a late spring period of cool northwesterly winds. High winds are fairly frequent in coastal areas. Extreme temperatures are −4° F. on the one hand and 95° on the other, with mean winter temperature around freezing and mean summer temperature about 70°.

Mean average rainfall varies between 22 and 32 in.; the wettest regions are the northeast, the Veluwe area and southern Limburg, with heaviest falls from July to September. Marsh mists and sea fogs are common particularly in winter.

Dikes and Polders.—Protection of the land by sea and river dikes has long been practised by the inhabitants of the Netherlands. The earliest of these people in the north, the Free Frisians, had by the 1st century A.D. built extensive mounds against the tidal rises. These primitive attempts to secure refuge appear to have become more systematic in the 8th and 9th centuries along most of the Dutch coast and were particularly undertaken in the later 12th and 13th centuries, when the steady sinking of the land or rise of the sea became a serious threat. Until the 16th century, however, the sea usually held the upper hand, and losses of land were considerable while gains were few.

The technique of diking slowly improved, and initial constructions such as the Westkapelle dike between Westkapelle and Domburg and the Hondsbossche Zeewering from Kamperduin to near Petten, built in the 15th century, were reconstructed and extended between 1860 and 1884. Later still, several additional dikes were built, and the government has devoted considerabie expenditure to the construction of protective works, a corps of engineers (De Waterstaat) being exclusively occupied with protection and reclamation. The entire coast of the Netherlands, except in the dune belt of the west and small isolated areas sheltered by low cliffs, is protected by dikes. The protected areas are either of low peat and marine clays or land reclaimed from the tidal flats.

Problems of inundation were also created by the large rivers, the Rhine and its various branches, the Meuse and the IJssel, which tended to raise their beds with depository sediment. Their courses, however, were artificially controlled, especially that of the Meuse, which was particularly prone to flooding. The Rhine and its distributaries are diked practically throughout the Netherlands. Dikes are continuous along either the north bank or south bank of the Meuse.

Parallel with the process of soil protection has been one of reclamation, and during the centuries about a quarter of the arable land of the Netherlands has been gained by this device. Reclamation has ranged from small areas of marsh, lake or bog throughout the country to the extensive undertaking of draining a large part of the Zuider Zee. This was first begun in 1923 and progressed by the creation of various polders; for example, the Wieringermeer (75.18 sq.mi.; out of the northwestern corner of the Zuider Zee), the Noord-oost (182.76 sq.mi.; in the east) and one (210.42 sq.mi.) a little farther south near Kampen.

Flora.—The four physiographical divisions, beach land, pasture, dunes and coasts, are characterized by differing flora. Heath, ling, gorse and juniper cover the sandy waste regions in the east. In the more damp meadowlands are marsh trefoil. carex and rush, nith water lilies, reed mace, etc., in the ditches and pools. Dune flora types are usually stunted: a smooth reed grass *(helm)*

is sown to bind the loose sand, as do also the dewberry bramble and buckthorn. Other dune plants are marram and sea lyme grass, thyme, dune rose, fever ort, etc. Certain plants are cultivated to assist in consolidating the mud flats and enlarging the littoral deposits; *e.g.*, sea aster and sea lavender. Except for the pollarded willows along the rivers, nearly all natural woods are found on the sandy gravel soils; they are chiefly copses of elm, poplar, beech and elder. (J. D. L.)

HISTORY

The following section deals with the history of the Netherlands after the confederation of 1579. For the events preceding that year the reader is referred to the article NETHERLANDS.

THE UNITED PROVINCES

William the Silent and **Anjou.**—The Union of Utrecht, by which the northern provinces were confederated, was signed on Jan. 29, 1579. It remained in force until the fall of the Dutch republic in 1795, and its formation may therefore be taken as the starting point of the history of the newly created state; but that state was as yet so far from being fully grown that its leaders did not even consciously desire either republicanism or independence. In this first stage it was a loose federation for defense, finance and other limited purposes. The, states-general were still controlled by the estates of the provinces, in which the work of government had always been shared between the estates and a monarch or his representative. It was eight years before the possibility of a monarch was ruled out, and throughout the whole history of the republic there was never a finally satisfactory adjustment between the powers of the estates, among which the estates of Holland were predominant (see HOLLAND. COUNTY AND PROVINCE OF), and those of the stadholders, the old royal lieutenants, who continued to exercise the executive functions which had been theirs as the overlord's representatives. Collisions between the estates and the stadholders were to lead to constant strife and to five successive revolutions: in 1618, in 1650, in 1672, in 1747 and in 1787. For the first 30 years after the Union of Utrecht the war of independence was being waged, and constitutional developments were dictated by its fortunes. William the Silent, who was supreme in Holland and Zeeland, did not welcome the union, because he still hoped to unite all the 17 provinces against Spain. That proved to be impossible, and the military situation grew alarming. Maastricht, Koevorden, Groningen, Delfszyl, Steenwyk were lost. Philip II felt himself strong enough to pronounce the "ban" against William; that is, to declare him an outlaw whom anyone might lawfully kill. William saw that, without foreign aid, the northern provinces could not maintain themselves. He therefore gained the support of France by the offer of the sovereignty of the Netherlands to Francis, duke of Anjou, brother of Henry III of France. With the reservation of ultimate control in all important matters to the estates, this arrangement was made in the treaty of Plessis-les-Tours, in Sept. 1580. Anjou, who took the field next year, was inaugurated early in 1582 as duke of Brabant and of Gelderland, count of Flanders and lord of Friesland. He did not become count of Holland and Zeeland. In these provinces he was distrusted as a Catholic, and they would have no sovereign except William nimself, who reluctantly yielded to their insistence and had agreed, before his death, to accept the title of count. At the same time the northern provinces solemnly repudiated the sovereignty of Philip and declared themselves absolved from their allegiance to him (July 26, 1581). In 1581 and 1582 military events continued unfavourable: more fortresses were lost, and Anjou was chafing at the limitations imposed on his sovereignty. On Jan. 17, 1583, his troops attempted to obtain possession of the city of Antwerp. By the vigilance of the citizens, this "French fury" was frustrated, and in June the discredited Anjou returned to France, where he died while planning his return. William continued to organize defense from his refuge in Delft, though with little success, for Zutphen fell. He had been severely wounded by one of the gunmen let loose by Philip's ban; on July 10, 1584, another, a fanatical young Catholic from Franche-Comté named Balthazar Gerard, got admission to his house and shot him dead.

The Estates and **Leicester.**—The loss of the "father of his country" made the position of the rebels almost desperate, but their courage did not flag. His eldest son being in the hands of the Spaniards, the second, Maurice of Nassau, was appointed president of the newly constituted council of state and stadholder of Holland and Zeeland: but as he was still only 17 years old, the real leadership passed for the time being to the ablest men of the estates, in particular to Paul Buys, advocate of Holland until 1585, and Johan van Oldenbarneveldt, who was to hold that office from 1586 until 1618. They tried to revive the French policy of William, but Henry III of France was in no position to take risks, and refused their offers of sovereignty in July 1585. Meanwhile the war went from bad to worse. One after another the towns fell before Alexander Farnese: Ypres, Bruges and Ghent in Flanders; Brussels and Malines in Brabant; then Nijmegen and Doesburg in the east. Antwerp itself, the richest and most vitally needed of all, was besieged., While its fate was in the balance ambassadors were pleading for the help of the queen of Protestant England. Elizabeth I, who had allowed her subjects to give unofficial help since 1572, was no friend to rebellion; she did not wish to precipitate open war between herself and Spain, and if it seemed to her interest she would leave her allies in the lurch. It was only after Antwerp had fallen (1585) that she came to terms. Refusing the sovereignty, she promised to send 5,000 foot and 1,000 horse under her favourite, the earl of Leicester; but her expenses were to be guaranteed, and as surety she took the towns of Flushing and Brill and the fort of Rammekens. These pledges were held until the debt was settled in 1616.

Leicester was in Holland from Dec. 1585 and did not finally leave until Dec. 1587, but his rule was an utter failure. Without Elizabeth's authority and against her wishes, he accepted the title of governor general, with greater powers than had been enjoyed by Anjou or even William himself. His influence with the queen had been his greatest asset, but it proved almost useless, and he had little ability either in war or in politics. He saw clearly the defects of the improvised constitution, and tried to remedy them by centralizing the financial and naval organization; but he did not know how to work with the estates of Holland. He alienated them by prohibiting all trading with the enemy, though Holland and Zeeland were growing rich by that means and drawing from it taxes which financed the war. He set himself at the head of democratic and Calvinist extremists. Worst of all, he could not check the victories of Alexander Farnese (since 1586 duke of Parma): Grave, Venlo and Deventer and the siegeworks made for the recovery of Zutphen were lost, the last two reverses being the result of the treachery of English Catholic commanders. Finally Sluys, a port to the south of the Scheldt, surrendered. Made still more unpopular by a peace move which Elizabeth compelled him to take, Leicester attempted a coup d'état but failed.

Maurice and **Oldenbarneveldt.**—This was the lowest ebb of the rebels' fortunes. After 1587 Parma could not press them so hard. The year 1588 was that of the Spanish armada: the shifting of Spain's effort to England and the sea meant that less could be done against Holland. Twice within the next four years, in 1590 and 1592, Philip made Parma, against his better judgment, lead away his forces against Henry of Navarre in the civil wars of France. Such a course might have been justifiable if nothing had changed on the side of the rebels; but Maurice and his older cousin, William Louis, stadholder of Friesland, proved to be soldiers of genius. They reorganized the Dutch army and worked out innovations in discipline, equipment, tactics and transport which gave them the model fighting force of the world. Parma's absence in 1590 was the signal for ending the defensive action which had lasted so many years. Maurice took Breda by surprise and then captured Steenbergen and other places. Next year he got the consent of the states-general to a bolder offensive campaign, and with brilliant results. The recovery of Zutphen and the capture of Deventer gave him the line of the IJssel. He pushed on to take Delfszyl, Hulst and Nijmegen. In 1592 he added Steenwyk and Koevorden, and his troops, successful in so many sieges, won their first victory in open battle since the pacification of Ghent. At the

end of that year Parma died a disappointed man. The prizes of the next two years were Geertruidenberg and Groningen. The latter was the capital of the most northerly province, of which William Louis became stadholder. Practically no Spanish garrisons now remained in the northern provinces. The estates had complete control of the resources and communications within their territories. The war had ceased to have any of the aspects of a civil war and had become a regular war along the frontiers of the new state. The triple alliance concluded in **1596** between the Dutch, the French and the English, though it brought little military help, was significant of the republic's progress: it now took its place as a state of which France and England could make an open ally. The successes of Prince Maurice, though not absolutely unbroken., continued, and this phase of the struggle culminated in 1597, when a considerable battle was won at Turnhout and there was added to the tale of captured towns Rheinberg (lost in 1590), Meurs, Grol, Breedevoort, Enschede, Ootmarsum, Oldenzaal and the fortress of Lingen.

The year **1598** saw important political changes. By the treaty of Vervins, France made peace with Spain, a separate peace in which neither the Dutch nor the English were included. Philip II died in the same year, after arranging a new regime for the southern Netherlands. The cardinal archduke Albert of Austria, who had become governor in **1596,** was to marry his cousin, Philip's daughter, the infanta Isabella, and the two were jointly to rule the Netherlands as an independent sovereignty. If, however, they had no heirs, the sovereignty was to revert to Spain, as it ultimately did in **1633.** In practice, however, the "cession" made little difference to the dependence of the provinces on Spain, and it did nothing toward bringing about a reconciliation with the north. The Spaniards could not bring themselves to concede freedom of worship, and another factor now arose which made it impossible for the Dutch to gain peace except through victory. In 1595–98 came the first Dutch voyage to the East Indies. By **1602,** when the united Dutch East India company was founded (see DUTCH EAST INDIA COMPANY), Dutch ships were trading everywhere in the east and west, and the Spanish colonial empire was endangered. But not until **1609** would the Spaniards recede from their colonial claims. On land the character of the war altered. In **1600** Oldenbarneveldt and the other politicians made the unwilling Maurice undertake a march westward across Flanders to strike at Dunkirk, from which port privateers preyed on the commerce of the channel. Maurice won a spectacular victory at Nieupoort (July 1), but nothing more. The great business of the next three years was the archduke Albert's siege of Ostend, the isolated port which the Dutch were enabled to hold by their command of the sea. While the siege was in progress Maurice took Cadzand, Grave and the port of Sluys, which had been lost by Leicester; but Ostend itself he could not save. It fell on Sept. 20, **1604.** after a resistance of **38** months, to Ambrose Spinola, a member of the great Genoese banking house, who was equally eminent in policy and in arms. In **1604** King James I of England made his peace with Spain, and the Dutch. now without allies, could no longer make such headway as before. Oldenzaal and Lingen were lost, and after them Grol and Rheinberg; but the resources of Spcin had been sapped by the long war and especially by disasters at sea. In **1607** Jacob van Heemskerk sharpened the threat to the Indies by a striking victory off Gibraltar. Soon after that the Spaniards' need for peace led to serious negotiations. These were not easy, and the two stadholders would have been well content to continue the war; but by the mediation of France there was concluded. on April **9, 1609,** a 12 years' truce. It was made with the provinces as free states over which neither Spain nor the archdukes made any claims. The frontiers were to be as they actually stood at the time. Nothing was said about religion or the Indies, but in a secret treaty King Philip III undertook to permit Dutch trading there. So ended gloriously and advantageously the first act of the war of independence.

The interval provided by the truce was marked by little of importance in external relations. The only event that need be named is the intervention of the republic in the dangerous succession dispute in the neighbouring duchies of Jiilich and Cleve (1609–14). With this external calm went growing economic prosperity, but also lamentable strife in domestic politics and religion. Estrangement between Maurice and Oldenbarneveldt had begun as far back as the Nieupoort campaign, had been accentuated in the negotiations for the truce and now became open enmity. A theological professor at Leyden, Jacobus Arminius (*q.v.*), had criticized the orthodox Calvinistic doctrine of predestination. His subtle argument led to a raging controversy in which one of the issues was the right of the estates to control the church. The followers of Arminius addressed a remonstrance, from which they were called Remonstrants, to the estates of Holland. Among the liberal-minded men of affairs who composed that body they had many supporters, including the advocate himself, though not the representatives of Amsterdam, the leading town. The estates tried to preserve unity, first by silencing the controversy and, when that failed, by taking the side of the Remonstrants; but the theological dispute had political implications. A weakening of the anti-Catholic front might make it harder to resume hostilities when the truce came to an end. For this reason among others Maurice and four provinces out of seven in the states-general took the orthodox Calvinist side. The states-general wished to call a national synod or church assembly to settle the disputed questions, but the estates of Holland refused their consent. Exasperated by their failures, they passed a resolution which asserted the principle of provincial independence in such a way as to threaten the unity of the republic; they raised levies of local militia (waardgelders) to enforce their will and instructed the contingents of the regular army paid by Holland that they owed no allegiance to the "generality." The states-general and Maurice, with the army behind him, overawed the opposition and removed its leaders from their positions in the town governments. Oldenbarneveldt, the famous Hugo Grotius and others were arrested. A special tribunal was erected to try, or rather to condemn, them. Meanwhile, the national synod had met at Dordrecht (Dort) on Nov. 13, **1618.** Its decisions were entirely against the Arminians, who were silenced. The synod closed on May **9, 1619,** and four days later Oldenbarneveldt, in spite of long public service, was beheaded.

Frederick Henry. — The 12 years' truce came to a conclusion in **1621,** and, Maurice and his party being supreme, the war with Spain was automatically resumed. Three years earlier the Thirty Years' War had broken out, and the Dutch frontiers were therefore merely one of the theatres of a general conflict. The republic at first failed to adapt its policy to the new conditions, and Maurice had lost his old vigour. After failing to relieve Breda from Spinola's siege, he died on April **23, 1625.** His younger brother Frederick Henry (*q.v.*), now prince of Orange, who succeeded him in all his titles and offices, was an abler politician and a competent soldier. During his stadholdership of more than a quarter of a century the golden age of the republic set in. Political and religious affairs became more harmonious; the stadholder maintained a princely court; learning. literature and painting reached a dazzling brilliance. Commerce flourished ; an eastern empire was acquired, and large, though not lasting, conquests were made in South America. The capture of the Mexican silver fleet by Piet Hein, in **1628,** was the greatest of many naval exploits (see DUTCH WEST INDIA COMPANY).

Financial and other help came from England and France, the latter in exchange for the grant of naval assistance to Cardinal Richelieu for the subjugation of the Huguenots in La Rochelle. This was withdrawn, but the old dreams of international religious solidarity were ending. In **1626** Oldenzaal was recovered, and in **1627** Grol. In **1629** Frederick Henry captured the virgin fortress of 's Hertogenbosch (Bois-le-duc), and the seizure of Wesel interrupted the enemy's communications by the Rhine. Two years later there came the defeat of an invading fleet in the Slaak, and in **1632** the taking of Maastricht, a crossing of the Meuse. After this there were negotiations for peace, which in spite of the growth of a peace party in Holland led to nothing. A treaty of alliance with France in **163j** opened the prospect of a partition of the southern Netherlands between the French and Dutch, but the dissensions of the allies and the good generalship of their new opponent, the cardinal infante Ferdinand (brother of Philip IV),

prevented any notable success until 1637, when Breda was retaken, The grudging grants of supply from the province of Holland were insufficient for ambitious plans in the next two years, and a dash on Antwerp was frustrated; but Spanish sea power received a smashing blow when on Oct. 21, 1639, a great fleet of warships and transports under Antonio de Oquendo was engaged in the Downs by Martin Tromp. This gave umbrage to Charles I of England, a squadron of whose navy had watched this battle in waters where he claimed sovereignty. He and his father had already, in connection with the herring fishery and other matters, tried to assert this sovereignty against the Dutch. Commercial jealousy of the Dutch was becoming strocg in England, and there was a growing tale of grievances against their East India company, of which the "massacre of Amboina" of 1623 was the most sensational. But Charles, far from being able to press these home, was in need of help against the opposition that was soon to break out in civil war. He therefore consented to the marriage of his daughter Mary, the princess royal, to Frederick Henry's 14-year-old son William, who had been recognized as his father's heir in all his offices. This was the first of three marriages of princes of Orange with English princesses, a social promotion which was to bring the republic into the cross currents of dynastic interests. It had no influence on the course of the war.

Two great changes now brought the possibility of a satisfactory peace in sight. Portugal, subject to Spain since 1580, broke away again in 1640, and the Spaniards, besides being weakened in Europe, had no longer much reason for maintaining the colonial quarrel with the Dutch, since it was in the Portuguese spice islands and Brazil, now lost to Spain, that the Dutch had established themselves. The other great change was the rise of France as a military power. At Rocroi, in 1643, the Spaniards were thoroughly beaten by the French. The danger opened out that the southern Netherlands might pass from decadent Spain to the rising power of France. Negotiations were begun in that year and ultimately led to a settlement. While they were in progress, Frederick Henry won his last victories. He captured Sas van Ghent in 1644 and Hulst in 1645, thus gaining a foothold on the southern bank of the Scheldt. The frontier line to which he had pushed forward his armies remained almost unaltered until the end of the republic. He died on March 14, 1647, less than a year before the treaty of Münster (part of the Peace of Westphalia), in which this frontier was confirmed. The Scheldt was closed to trade, as it had been, in fact, since 1572. Dutch independence was finally recognized, and with it all that had been gained in the east and west. The "eighty years' war" was over.

William II of Orange.—The separate peace, however, left France and Spain at war, and that had not been to the liking of the able and ambitious young soldier, William II, who had lately succeeded his father. With the support of Zeeland and Utrecht he had opposed the settlement. For the time being the estates of Holland, with the help of the other provinces, had easily got their way; but the peace meant a renewal of the contest which had arisen after the truce of 1609 between the Organist tendency toward constitutional unity and the decentralizing policy of the pacific oligarchies of the states. The latter had its stronghold in the patriciate of Amsterdam, then the richest trading city of the continent. William entered upon secret negotiations for a renewal of the war in alliance with France, of which the daring purposes were to be a partition of the southern Netherlands and the restoration of his exiled cousin, Charles II of England. The domestic counterpart of this was to be the strengthening of his own powers. Issue was joined over the disbanding of the troops rendered superfluous by the conclusion of peace. The states-general, in which the other six provinces now took the prince's side, wished to retain the cadres of the disbanded regiments, which could thus be quickly raised to a war footing; the estates of Holland objected, and ordered the disbanding of those troops for which they provided the money. There thus arose an intricate legal question similar to that of 1618, and the resources of the constitution were exhausted in the attempt to settle it. On July 31, 1650, six leaders of the estates of Holland were clapped into the castle of Loevestein, from which the estates party was known until long afterward as the Loevestein faction. Troops under the command of William Frederick, stadholder of Friesland, moved against Amsterdam. The gates were manned, but the town council had no heart to fight. It made its submission. William used his success as skilfully as he had won it. The prisoners were released, and he was virtually master of the republic. His triumph ended suddenly; he died of smallpox on Nov. 6.

First "Stadholderless Period."—A week after William's death his widow gave birth to a son, who was to become William III of Orange and of England. This child was now the head of the house of Orange; but the power of that house was only what a strong man could make it. The Loevestein party took its opportunity. A great assembly of the provinces, like the states-general but more numerous and solemn, met at The Hague on Jan. 18, 1651, to regulate the constitution for this first "stadholderless period." Its results were to strengthen the sovereignty of the provinces within their own borders, including the control of the army and religion. This implied the preponderance of Holland, by far the richest and strongest in external and general affairs. None of the provinces, except Friesland and Groningen, which remained faithful to William Frederick, now had a stadholder. This limitation of the central and executive powers aggravated the defects of the constitution: delays, obstructions and disputes were multiplied. But the Dutch were experts in public business, and they worked this cumbrous machine through 20 years of difficulties and dangers until the greatest crisis of their history, for which alone it proved inadequate. Much of the credit for this is due to John de Witt, the son of one of the prisoners of Loevestein, who became *raadpensionaris* (council pensionary or, more properly, stipendiary councillor) of Holland in 1653 (see HOLLAND, COUNTY AND PROVINCE OF). In this office all the business of the estates of Holland passed through his hands. He had no equal in the art of political management and few in that of international diplomacy; but with these he combined higher gifts. His intellectual distinction, his broad and deep political knowledge, entitle him to be called the most scientific statesman of his time. His appointment came during the course of the first English war.

The commercial and colonial rivalry with England had been growing hotter all through the century. In the year 1651 it reached boiling point. The Dutch had declined far-reaching proposals of alliance from the new sister republic, and Orange partisans had insulted the ambassadors of the regicides. The English navy, in stamping out royalist resistance, interfered with Dutch commerce. The celebrated Navigation act inflicted, or rather was meant to inflict, a severe blow on the Dutch carrying trade. The war was fought entirely at sea. It lasted from May 1652 to April 1654, in which time there were 12 fleet actions. This evenly balanced fighting was something new in naval history; the Dutch commanders, Tromp (killed Aug. 10, 1653) and Michel de Ruyter, did wonders, as did the Englishmen Robert Blake and George Monk. Dutch commerce suffered enormously. In the end the English had the upper hand, and the Protestant idealist Oliver Cromwell, now protector, had no wish to continue the war. In the treaty of Westminster (April 5, 1654) the Dutch agreed to pay compensation for the East Indian claims and to make formal acknowledgment of the British sovereignty of the narrow seas by saluting with the flag. Another condition was added, since the states-general refused to accept it, in a secret treaty which the estates of Holland under De Witt's influence made as a separate sovereign state. In this Holland was pledged to the Act of Seclusion, by which the prince of Orange, in despite of popular opinion, was to be excluded from the office of stadholder.

Baltic affairs next gave trouble. The trade there was of great importance to the Dutch and was adversely affected by the war between Sweden and Denmark (1657–60). By a skilful use of force and diplomacy John de Witt, in concert with France and England, imposed a settlement. The expulsion of the Dutch from Brazil had led to war with Portugal in 1657, but this, too, was satisfactorily terminated in 1661. Meanwhile, Charles II had been restored to England, and to conciliate him De Witt secured the repeal of the Act of Seclusion. The dynastic question was, however, subordinate. It was in an alliance not with England but

with France (1662) that the Dutch put their trust. Parliament re-enacted and strengthened the Navigation act. Dutch posts on the west coast of Africa were seized (1664) in time of peace; the colony of New Netherland was seized soon afterward and its capital. New Amsterdam, renamed New York after James, duke of York. The second English war broke out in 1665. This, too, was an obstinately contested sea war. The land operations were insignificant, but it differed from the first war in that it was not a mere duel, the English having as an ally the bishop of Miinster, against whom the Dutch were aided by the French, in accordance with the alliance of 1662. The general result was less favourable to the English, and negotiations were already in progress when the Dutch made their memorable raid on the Medway and burned the English fleet where it had been unwisely laid up in harbour. Naturally they had the better of the treaty. True. New Netherland was handed over in exchange for Surinam and Run; but it may be doubted whether it could have had much future under the Dutch, and the treaty marked the end of effective English rivalry in the East Indies.

In the following year De Witt and Sir William Temple negotiated the triple alliance of England. Holland and Sweden. The purpose of this was to force a peace upon Louis XIV, uho in 1667 had invaded the Spanish Netherlands and now was making dangerous progress. In later days, when England and Holland stood side by side against French ambition, the alliance was famous as an anticipation of their policy; but its immediate consequences were far from splendid. Louis did indeed make peace, for which he had other sufficient reasons, but he kept it for no more than four years and spent those years in preparing the way for a new war of aggression in which the Spanish Netherlands were still the ultimate objective; but the direct enemy was the Dutch republic, which had taken upon itself to be their friend. Louis's diplomacy isolated the Dutch completely. Charles II sold himself cheap by the treaty of Dover (1670); neither to Sweden nor to Spain, nor to any among the German states, could the republic look for support. John de Witt with all his foresight had not done enough. The fleet was strong and well-equipped, but from jealousy of its Orange sympathies the oligarchs had neglected the army. By 1672 Louis was ready. He moved against the eastern frontier in apparently overwhelming force. The English picked a quarrel over the salute to the flag and, before declaring war, attacked a Dutch merchant fleet in the channel.

William III of Orange.— In this extremity it was futile to resist the wave of feeling which demanded that William of Orange should be called to power; he became stadholder of Zeeland, stadholder of Holland, captain general of the union (June 1672). Unable to hold the frontier on the line of the IJssel, he prevailed on his countrymen to save the more westerly territory by opening the dikes and awaiting the enemy behind the inundations of the "Old Holland water line." The French were held up within a day's march of Amsterdam. The insulting peace terms offered by Louis were rejected. Unhappily. those heroic days were stained by a brutal crime. In The Hague an infuriated mob set upon John de Witt and his brother Cornelius and tore them limb from limb.

For the next 40 years Dutch history turned on the struggle against France. William, though not the equal of the French marshals who opposed him, was the most resolute man in Europe. In the field he never admitted defeat and in diplomacy he seldom met it. Before the end of 1673 the direct danger to the existence of the Dutch republic was ended. Brandenburg, the emperor and Spain were induced to declare war against France. William was able to come out and surprise the Rhine fortress of Bonn, thus threatening the enemy's communications. In 1674 the land war made no great headway, but at sea the English, among whom a powerful section was unfriendly to Louis, had had enough. The treaty of Westminster (Feb. 19, new style; 9, old style) provided for the restoration of all conquests.

Before very long Charles found it to be to his advantage to work for a time with the anti-French party, and the improvement in the republic's military and diplomatic situation was signally shown by the marriage (1677) of William to Mary, the elder daughter of Charles's heir presumptive, James, duke of York. The bridegroom had still his war to finish, but the years 1675–77 had been tolerably successful at sea, though not in the principal theatre, and negotiations were already in progress. They terminated by the general settlement of Nijmegen (Aug. 1678), in which, though it marked the greatest extent of Louis's conquests, the Dutch surrendered nothing. Ten years elapsed before the next war between Holland and France and, in contrast with the period before 1672, ended with the almost complete isolation of Louis XIV. England remained an uncertain factor until 1688, when the clumsiness of James and Louis, the generous patriotism of the Dutch regents, including those of Amsterdam, and the genius of William brought about one of the decisive events of modern times. William and Mary became king and queen of England (see FRANCE: History; ENGLISH HISTORY). In Holland this greatly raised William's authority, which in no way suffered from his frequent absences in his kingdom. He still had to contend with the particularism of the regents in Amsterdam and elsewhere, but his mastery of Dutch political devices was equal to that of John de Witt, and he exercised a less restricted power as stadholder of Holland than as king of England. In the War of the Grand Alliance (*q.v.*) he was an undisputed leader. Holland's part was subordinate to England's, and it suffered by sea and by land only less severely than in the earlier wars of the century; but by the Treaty of Ryswyk (1697) it gained, besides the indirect benefit of William's recognition as king, a favourable commercial treaty. Afterward it garrisoned a number of "barrier fortresses" in the Spanish Netherlands. This barrier policy was, however, unsound. The mercantile Dutch did not desire an extension of frontiers but trusted to making themselves safe in the south, as they had already done in the east, by maintaining garrisons which should shore up the resistance of buffer states, strong enough to serve for defense but too weak to be dangerous. In the great War of the Spanish Succession, which began soon after William's death in 1702 and was a continuation, with still greater stakes, of the last war, one weakness of this scheme at once became apparent. Spain was now in alliance with France, and the garrisons could not hold on in what had thus become an unfriendly country.

Second "Stadholderless Period."— After William's death there was no stadholder until 1747. In 1672 the stadholdership in his five provinces had been declared hereditary; but William died childless, and the jealousy of Holland prevented the appointment of his cousin's son, John William Friso, the stadholder of Friesland and Groningen, whom he had named as his heir. The evils of this disunion were, however, mitigated by the statesmanship of Antonius Heinsius (council-pensionary, 1689–1720) and the duke of Marlborough (deputy captain general and British ambassador at The Hague), who carried on the tradition of William III. After the fall of Marlborough, however, a treaty settlement was made (1713–15) which disappointed Dutch expectations. Small patches of territory on the Meuse were gained. In the southern Netherlands, now handed over by Spain to Austria, a barrier was conceded less advantageous than had been promised by the English during the course of the war.

The finances of the republic were exhausted. From this time it was no longer one of the great powers; but its geographical situation and the wars of its great neighbours, England and France, made international politics the ruling factor in its destiny. Economic decline began to set in seriously toward the middle of the 18th century, so that the political influence of the Dutch was further diminished. They supported the Hanoverian dynasty in England by sending troops when it was in danger, but they followed in general a policy of peace and abstention from European complications. In 1723–31 they departed from this in order to obtain the suppression of the East India company that the emperor Charles VI had set up at Ostend in the Austrian Netherlands, a competitor which might have undone much of the advantage gained by the Dutch from the closing of the Scheldt (see OSTEND COMPANY). In exchange for this suppression they guaranteed the Pragmatic Sanction, by which Maria Theresa was to succeed to all the hereditary dominions of her father, Charles VI, and therefore they were unable to avoid joining, in 1743, in the War of the Austrian Succession. They were now, as in 1689–1713,

in alliance with the English and Austrians against the French, but they confined their help to unimportant contingents and subsidies. The French under Maurice, comte de Saxe, made short work of the Austrian Netherlands and the barrier fortresses. After holding back in the hope that the Dutch would be neutral, they marched in 1747 into the defenseless Dutch territory south of the Scheldt, Dutch Flanders.

William IV of Orange.—Then followed a parody of the revolution of 1672. Popular opinion everywhere demanded a stadholder who should save the country as it had been saved by William III. The man marked out by fate was John William Friso's son. William IV of Orange, who was already stadholder of Friesland, Groningen and Gelderland and the son-in-law of George II of England. Some English men-of-war in port in Orangist Zeeland gave the first impulse to a swift and bloodless revolution, by which William became stadholder of the remaining provinces and captain and admiral general of the union. Before long his offices were declared hereditary. He was an eloquent speaker and a believer in constitutional legality, but he lacked all the qualities of the man of action. His high hopes of effective Dutch exertions in the war came to nothing; even in the making of the treaty of Aix-la-Chapelle in 1748 he had no influence. He and still more his adviser, Willem Bentinck van Rhoon, saw the need for reform in the system of taxation and the machinery of government, but they could not overcome the slackness and obstructiveness of the regents. By the time of William's death (Oct. 22, 1751) nothing remained of the dreams of a revived republic strongly led by a stadholder in the old alliance with Austria and England.

William V of Orange.—In the Seven Years' War (1756–63) the republic remained neutral. After the death in 1759 of William's English widow, Anne, the estates were regents for her son, who was declared to be of age in 1766. William V was a man of the feeblest character, ruled by his spirited wife Wilhelmina of Prussia, niece of Frederick the Great. In the American War of Independence he favoured the English; most of the Dutch people sympathized with the rebellious colonists. It was, however, the interference of the British with neutral shipping which brought the Dutch into their fourth English war. By a majority of four provinces to three the states-general decided to join the "armed neutrality," the combination promoted by Catherine II of Russia (1 8) The war which ensued was an unrelieved disaster. Party strife paralyzed every organ of the state, and, though a stout fight was put up in the indecisive naval action of the Dogger bank (1780), the Dutch could not hinder the English from taking possession of all their shipping and all their colonies. In the treaty of Paris (1784), deserted by their allies, they had to give up Negapatam in southern India and grant the English the right of navigating through the Moluccas. The economic effects of the war had been disastrous.

Perhaps undeservedly but not unnaturally it was the stadholder and his party who were blamed for these humiliations, and the strongest element in the republic for the next few years was that of the sbccessors of the old "Estates party." These were the "Patriots," liberals inspired by French philosophical ideas and politically inclined to France. They used their power to hamper and limit that of the stadholder. In 1784 the emperor Joseph II took advantage of these dissensions to announce his intention of opening the Scheldt, and the Dutch had no means of averting this except by the payment of a heavy compensation. But the Patriots went too far, and the opponents of France were determined not to lose their chances of controlling Dutch policy through the house of Orange. Sir James Harris, the British ambassador, had long been preparing a stroke. In 1787 Frederick William II of Prussia, on the pretext of an insult offered to his sister Wilhelmina, princess of Orange, dispatched an army of invasion. Amsterdam capitulated, the Patriots were driven from office and the authority of William V, such as it was, was restored.

The Revolutionary and Napoleonic Wars.—This might have been the prelude to fundamental reforms had not Dutch history been projected into a new era by the French Revolution. In 1792 the French threw open the Scheldt, as Joseph II had threatened to do. They declared war on George III of England in the following year, and they were merely registering the results of 1787 when they included the prince of Orange in the declaration. The course of events in the war and in France protected the Dutch until the winter of 1794–95, when the army of Charles Pichegru swept all before it, even the fleet being captured in the Texel by cavalry which crossed the ice. William V and his family fled to England. All the characteristic institutions of the antiquated republic were done away with, and the French and Patriots together organized the Batavian republic on the French model (1795–98). The Dutch soon found what it was to be a client state of France. The English seized all their colonies, shut up all their shipping and, at Camperdown (1797), destroyed their navy. Constitutions, growing less democratic, followed one another as in France. At the peace of Amiens England restored the Cape of Good Hope and the West Indian colonies, only to occupy them anew when war was resumed in 1803. In 1805 Napoleon imposed a new constitution, and Rutger Jan Schimmelpenninck took the leading place with the title of council-pensionary. In the next year, however, the French emperor sent his brother Louis to Holland to rule it as a king. Louis, particularly in the matter of the continental system, put his subjects' interests before his master's; hence in 1810 he had to abdicate. The country was incorporated in the French empire and had to pay its share of men and money for Napoleon's costly last campaigns. (G. N. C.)

MONARCHY

William I.—When Napoleon was defeated at Leipzig in 1813 the French power in the Netherlands melted away. The prince of Orange, son of William V (who had died in exile, 1806), hastened back and, amid general enthusiasm, accepted at Amsterdam (Dec. 1813) the title of sovereign prince. The drafting of a constitution was begun. Next year the powers victorious over Napoleon decided to set up, as a bulwark against the French, a state uniting all the Netherlands, divided since 1579, together with the bishopric of Liège and the little duchy of Bouillon. At its head was William VI of Orange with the title of William I (*q.v.*), king of the Netherlands. His share in the German inheritance of the Nassau family was exchanged for Luxembourg, of which he became grand duke, thus bringing it into a personal union with his kingdom. When Napoleon returned for the Hundred Days, the king's son and heir, now called prince of Orange, at the head of the Dutch troops, won distinction at Quatre Bras and at Waterloo, where he was wounded. King William's coronation at Brussels on Sept. 27, 1815, inaugurated a new era.

The Belgian Revolution.—The inclusion of the Belgian Netherlands in the new state of William I set Dutch statesmanship a great task. In the conception of the European powers who had promoted the creation of the united Netherlands kingdom (of England in the first place) it was to be a bulwark against the aggression of France. This conception harmonized quite naturally with the heroic traditions of Dutch foreign policy, of which the house of Orange could consider itself to be in a special sense the guardian, but which were regarded as out of date by those who had no further national ambition beyond neutrality. Yet from another point of view the union might have been expected to appeal to Dutch public opinion. The Flemish half of the southern Netherlands had, since the forced separation in the 1580s, become estranged from the northern Netherlands; during the 20 years of annexation to France the upper classes had been deliberately and to a large extent successfully denationalized. The union might well seem a great opportunity to win the people back for Dutch nationality.

The government endeavoured to restore the Dutch language to its natural position in the public life of the Flemish regions and tried to base a new conception of a greater Netherlands nationality on what the king ostentatiously called "the national language." The inclusion of the Walloons in his kingdom was inevitably a hindrance to a policy of this kind. The conflict with the Roman Catholic heirarchy which the king, heedless of the warning example of Joseph II's reign, did not avoid, tended to alienate the sympathies of the Flemings even more than of the

Walloons. Yet when in 1830, under the immediate effect of the July Revolution in France, the rising against Dutch rule began at Brussels, it was the Walloons who, with the Gallicized Bruxellois, assumed the initiative. The Flemish provinces followed only after the first reverses of the government, and, in fact, in the new Belgian kingdom they were destined to play a subordinate part. The Dutch regime had not lasted long enough to weld them and the northern provinces together in a conscious national unity, but it had, by reversing the process of Gallicization and introducing a system of elementary education, saved the Flemish language from extinction and paved the way for the Flemish movement in Belgium.

Dutch public opinion had taken little interest in the great work that had been done in the south for Dutch civilization and was glad that the nnion had come to an end. At the time of the restoration the Dutch people, shaken by the vicissitudes of the "French period" and impoverished by the loss of trade, had entrusted their interests to William of Orange with the confidence of exhaustion. The years of union with Belgium are marked by an absence of interest in public affairs, surprising on the part of a people with the political tradition of the Dutch. When the Belgian opposition began to ask for ministerial responsibility and similar reforms, the Dutch had only supported the government with greater docility. Events after 1831 brought about a change in this attitude.

It had become clear almost at once after the insurrection of the southern provinces that no foreign help was to be expected to coerce the rebels back under the sovereignty of William I. The attention of Russia, Prussia and Austria was soon distracted by an insurrection in Poland, while England, especially after the formation of the Whig cabinet in November, was anxious to settle the whole question in amicable consultation with France. The international conference that met in London at the request of William I to discuss the matter had, on Dec. 20, 1830, pronounced the dissolution of the kingdom. The principles of separation which it laid down a month later were not inacceptable to Dutch opinion, but in June–July 1831 the conference drew up the so-called Eighteen Articles, which differed essentially from the Bases of January and which the Netherlands rejected. When Leopold I accepted them, William I-denounced the armistice, and in the ten days' campaign the Dutch army routed the Belgians and withdrew only when a French army appeared on the scene. The demonstration was not without effect. The conference again altered its verdict, and the Twenty-four Articles (Oct. 1831) were much more favourable to the Netherlands. But it was not until March 1838 that William intimated his readiness to accept them, and more than a year later the definitive treaty of separation between the Netherlands and Belgium was signed at London and guaranteed in a collective treaty by the five powers.

The treaty left to the Netherlands the ancient territory of the Dutch republic with the addition of a strip of land along the Meuse in order to connect the old enclaves of Maastricht and Venlo with the body of the country. The Belgians undertook to share the burden of the public debt of the defunct kingdom. The Scheldt was declared to be free to international navigation and the Netherlands undertook to maintain its navigability. (See also BELGIUM.)

Financial Policy.—The obstinacy with which King William had maintained his "system of persistence" from 1831 to 1838 had greatly embarrassed Dutch finances and had roused Dutch public opinion against the system of irresponsible government which in 1814 had been accepted without a murmur. The government had been able to finance the protracted mobilization only by drawing largely on the colonies. Here the so-called "cultures system" had been introduced by Jan van den Bosch, who had first been governor general then minister of the colonies. This system really meant a return to the principles of the Dutch East India company; under it the Dutch government asserted a monopoly for trading in agricultural articles obtained by forced labour on a large scale. The Netherlands Trading company (1824), in which the king had a considerable personal interest, was drawn into the service of the government cultures, and both through it and directly the state made enormous annual profits, Altogether, these financial transactions evoked much criticism and intensified the demand for a revision of the constitution. A revision undertaken in 1840 brought colonial finance under the competence of the chambers. A few weeks afterward the king abdicated (Oct. 1840).

William II.—Under William I's son, William II. the drastic fiscal measures necessary to avoid a public bankruptcy were forced through by Floris Adrian van Hall, but at the same time it appeared that the revision of 1840 had by no means satisfied liberal opinion, and the agitation for a further strengthening of the power of the states-general continued.

The leader of liberal thought in the country was Jan Rudolf Thorbecke, professor of constitutional law at Leyden and member of the second chamber. When in 1848 the government suddenly moved in his direction, it was impelled by the revolutionary events in France and Germany rather than by any immediate menace in the country itself. Thorbecke's was the ruling mind in the royal commission which elaborated the new constitution, and the largely conservative states-general dared not block the way when the king himself led the forces of progress. In Oct. 1848 the new constitution came into force. under which full ministerial responsibility, complete control by the states-general of public finance and of colonial administration, direct elections and freedom of meeting were introduced.

William III.—King William II died a few months later (March 17, 1849). It was under his son, William III, that the first great lesson in the practice of parliamentary government was taught, when the new king saw himself obliged to entrust Thorbecke, whom he hated, with the formation of a ministry. The lesson had not been taught so completely but that in 1853, when the institution of a new Roman Catholic hierarchy gave rise, in Holland as in England, to an outburst of Protestant feeling, the king at once used the opportunity to get rid of him; nor was it until 1868, after two general elections had been fought on the issue of royal v. parliamentary ministries, that the question was definitely decided in the liberal sense.

Thorbecke's first ministry (he was again at the head of the government from 1862 to 1866 and died shortly after the formation of his third cabinet in 1872) produced a great record of legislative achievements. The liberal state, postulated in the new constitution, was realized by means of organic laws, regulating the electoral system and provincial and municipal administration. A navigation act did away with differential treatment of Dutch shipping, a first step in the direction of complete free trade. The impulse given by Thorbecke lost much of its force after his resignation in 1853. In his second ministry Bosch's cultures system was attacked both because of the hardships that it inflicted on the native populations of the colonies and in the name of liberal economics; "free labour" was advocated in the interests of the Javanese and of Dutch capitalists alike. On this point Thorbecke and his more radical colonial minister, Fransen van de Putte, differed, and it was not until 1870 that the cultures system was abolished; only government cultures of coffee were maintained for a further number of years.

Education Controversy.—During the whole of this period liberalism may be said to have been the only vital force in Dutch political life. The conservatives had no principle of their own to oppose it; they only questioned and retarded. Other parties, however, were in being, the guardians of distinct and positive traditions of their own. If so far they had been powerless or had not cared to exert their power against liberalism, the time had now come when they had begun to oust the colourless conservatism of men like Van Hall and Heemskerk and to plan an increasingly important part in politics.

The Catholics had long supported the Liberal party, to whose political progenitors, the Patriots, they owed possession since 1795 of full citizens' rights and whose victory in 1848 had enabled them to organize their church again. The formation of the kingdom of Italy, Pius IX's challenge of liberal principles and the rise of ultramontanism disturbed these friendly relations. The Catholics were organized in a separate party and, as they numbcrcd about one-third of the total population, this party was bound to be a powerful one. Its views on the education question soon

brought about an alliance with a party that in the past had been its chief enemy.

Calvinism had suffered a long eclipse. In the first decades of the 19th century the prevailing tone in religious life was "liberal" and "enlightened." But among the people the old doctrines lingered on, and in the 1830s there had been a Calvinist secession from the Reformed Church which William I, imbued with Napoleonic *étatisme* and Erastianism, had vainly tried to dragoon back to conformity. At the same time a religious revival, comparable with the evangelical movement in England, had affected a number of men and women in other classes of society. To this group belonged Guillaume Groen van Prinsterer, who stood for the application of orthodox Protestant principles to politics. But it was only after Groen van Prinsterer's death (1876) that, helped by the political awakening and enfranchisement of the lower classes and by pooling forces with the Roman Catholic party, the new leader of his Antirevolutionary party, Abraham Kuyper, could undermine the Liberal ascendancy until, at length, in 1901, it crashed.

It was the education question that made the Calvinist-Catholic coalition possible. The Netherlands had possessed a national elementary school system since 1806. The constitution of 1848 laid down that the government was to see that public elementary instruction was available in all parts of the kingdom. According to an act of 1857, the public elementary school was to educate the child to "all social and Christian virtues," a provision which it was hoped would meet the objection of the orthodox to the neutral or, as they said, the "godless" character of the state schools. It did nothing of the sort, and when in 1878 the Liberals under J. Kappeyne van de Coppello strengthened the act of 1857 without making any concessions to religious scruples the agitation was doubled in intensity. It was urged that to make people pay toward the upkeep of state schools to which conscience forbade their sending their children, so that they had to pay again for the upkeep of private denominational schools, was unfair, and it was proposed that the state should give financial support to private denominational schools as well. This demand was strenuously resisted by the Liberals, and the constitution, by committing public elementary instruction to the government's especial care, undoubtedly made it difficult to go very far in the direction of state support for denominational education. The constitution could be altered only by the two-thirds vote of a specially elected states-general. So the first coalition (Antirevolutionary *cum* Catholic) ministry, 1887–91, could make only a modest beginning with the subsidizing of denominational schools.

The Franchise. — The coalition majority in 1887 was the direct outcome of an extension of the franchise which increased the number of electors from 140,000 to 300,000, in a population of 4,400,000. The Liberal party had failed to adapt itself to the new circumstances. Both radicals and conservatives split off from it to form independent parties. The growth of the Socialist party was at first slow, not only because of internal dissensions, but also because the Netherlands was still a not very strongly industrialized country. Moreover, the bulk of the working-class population was still without the vote, although a new franchise act in 1896 increased the number of voters to 577,000. It was again the constitution that blocked the way to universal suffrage, but the failure of the Liberal party to solve the question in a bold fashion alienated working-class sympathies from it. Yet, shortly before their final fall from power, the Liberals produced 'a cabinet that tackled social legislation firmly. Workmen's insurance against accidents, improvement of housing conditions and compulsory education for children from 6 to 12 were carried by the Hendrik Goeman Borgesius ministry between 1897 and 1901.

Progress. — A very great change had by this time taken place in the economic and intellectual life of the country. The Netherlands had been very slow in recovering from the exhaustion which the interruption of overseas trade during the "French period" had caused. The working-class population of the towns remained poor, capital cautious and unenterprising, the whole tone of society middle class and dull. Great writers such as Everhardus Johannes Potgieter, Conrad Busken-Huet and Edward Douwes Dekker (Multatuli) felt profoundly dissatisfied and they criticized often with an almost despairing bitterness. In the last quarter of the 19th century, however, hope for the future was born afresh. The rapid economic development of Germany and particularly of the industrial districts on the Rhine after 1870 enabled Rotterdam to grow into a port of the first magnitude. Amsterdam was given good access to the sea by the construction of the North Sea canal to IJmuiden (1865–76). Rotterdam, too, got its new waterway (1866–71). Lakes were turned into land, waste grounds were reclaimed. In Twente and North Brabant textile industries grew up, while along the rivers shipbuilding yards increased in numbers. The Dutch merchant fleet began to grow rapidly. Economic development and increasing prosperity reacted on politics. The new vitality of the Socialist movement as well as the democratic tendencies of the Antirevolutionary and Catholic parties were largely attributable to the passing of material stagnation. In literature, although its promise was hardly fulfilled, poetry was permanently enriched by the Nieuwe Gids movement of the 1880s. The revival of scientific studies in the universities was to bear its richest fruit a little later and in the 20th century.

Wilhelmina.—William III died on Nov. 23, 1890, and was succeeded by his ten-year-old daughter Wilhelmina. For the first eight years of the new reign the queen mother, Emma of Waldeck-Pyrmont, was regent.

In 1901 the clerical parties won a decisive victory at the polls, and a cabinet was formed by Abraham Kuyper. This remarkable man, a dissident minister of religion, a powerful writer and a speaker with a gift of arresting statement, had for 25 years already exercised an enormous influence over the orthodox Calvinists. Events, however, took an unexpected turn. A further instalment of educational reform was procured by the act making it possible to found private universities on a denominational basis. This act emancipated the existing Calvinist University of Amsterdam (a different body from the municipal university of that town) and enabled the Catholics to erect a university of their own (Nijmegen, 1924). But the program of social reform, sponsored by Kuyper's colleague A. S. Talma, was slow in materializing. Instead, in 1903, Kuyper got into a very violent conflict with the growing forces of trade unionism and socialism when he used the forces of the state to break a railway strike. From that moment onward, the Socialists derided his professions of democratic sentiment and religious faith. The general election of 1905 resulted in a deadlock. A very weak Liberal government was formed, which was in 1907 replaced by another coalition government. The political situation did not permit Kuyper's strong personality to be included even in 1909 when the general election led to further disaster for the Liberals.

Theodore Heemskerk was the leading member of this government, which was somewhat too moderate in its religious policy for the more fanatical Kuyperians. Talma's scheme for state disability and old-age insurance had not yet been carried into effect when the defeat of the coalition at the polls in 1913 hung it up indefinitely.

The parties of the left proved unable, in 1913, to assume the responsibilities of government. The Socialist party had now won a large proportion of the left, and there was little sympathy between it and the so-called Free Liberals, one of the sections into which the Liberal party had been split. An attempt was made, nevertheless, to form a coalition of the left, under Bos, the Radical leader, on a program that included universal suffrage. The Free Liberals agreed to this program, but the Socialists (although their leader, P. J. Troelstra, was in favour of accepting) refused to cooperate.

In this difficulty an extraparliamentary cabinet was formed by Cort van der Linden, who attempted to find final solutions for both the questions which had long paralyzed Dutch political life. A revision of the conititution (for which purpose a two-thirds majority of the chamber is required) was to be achieved by an agreement of all parties. In it the clerical groups would find the solution of the school problem and the Liberals, Radicals and Socialists the final extension of the suffrage. The dangers arising from World War I quickened the sense of national solidarity, and

in 1917 agreement was reached. Universal suffrage and proportional representation were introduced; at the same time, the principle of absolute equality with regard to the public exchequer of public undenominational education and private denominational education was conceded in full and written in the constitution.

World **War** I.—In the years before the war, more than one acute controversy between the two opposing groups of Eurcpean powers had centred round the position of the Netherlands. The Dutch-Belgian rapprochement so much talked about in those years proceeded not from the Dutch-speaking Flemings but from Francophil circles. A great outcry was raised over the proposal to fortify the mouth of the Scheldt which was submitted by the Dutch government to the chamber in 1910. The contention, however, that the Netherlands was obliged, or even that it had the right, to allow Entente forces to use the Dutch part of that river in case of a German threat to Antwerp was quite untenable. In 1911 and 1912 official visits of Pres. Clement Armand Fallières to The Hague and of Queen Wilhelmina to Brussels and Paris made it plain that there was no ill will between the Netherlands and the Entente.

Probably, indeed, a desire to allow Germany no possible pretext for an attempt to occupy the Dutch ports in case of an Anglo-German conflict had as much to do with the decision to fortify the mouths of the rivers as any idea that the fortifications might ever actually be used against Great Britain. The Netherlands was at the same time remodelling its system of land defense to excellent effect. At least the German general staff thought it necessary to rearrange its plan of operations for the event of a war with France. H. J. L. von Moltke, realizing that the Dutch army was made mobile and would be used to strike, even if only the outlying province of Limburg were violated, decided to respect Dutch neutrality.

The Netherlands' attitude, then, in those crucial years was strictly and impartially neutral. The sympathies of the public could less easily be controlled. The economic prosperity of the country was to a certain extent bound up with the tremendous development of the German hinterland since 1870, but the Dutch people felt oppressed by German militarism-imperialism. On the outbreak of war in 1914, it was the violation of Belgian neutrality and the subsequent acts of repression in the occupied territory that determined the attitude of Dutch public opinion.

The government at once proclaimed strict neutrality. Inevitably there were times when each group of belligerents felt the Netherlands' neutrality, however impartially administered, as a burden. The British enforcement of a blockade gave rise to a good deal of friction. Moreover, the Netherlands' neutrality undoubtedly had the effect of covering Germany's right flank. On the other hand, the closure of the Scheldt, once Antwerp had fallen, was all to the advantage of Great Britain, as Germany was thus prevented from using Antwerp as a submarine base. The efficiency of the Netherlands' defense forces contributed to its neutrality's being respected. The army, 450,000 strong, had been mobilized without a hitch in the last days of July 1914 and was kept on a war footing, at a great cost financially and morally, till 1918.

Unfortunately, frequent cases arose in which the vague principles of international law could be variously interpreted. The sand and gravel dispute, which dragged on throughout 1917 and 1918, was the most acrimonious and at one time endangered the Netherlands' neutrality. The Entente governments protested against the Netherlands' allowing the Germans to use Dutch waterways for the transport of sand and gravel to Belgium for use in the construction of a new kind of ferroconcrete dugouts. Pressed by both sides, the Netherlands at last consented to ration this traffic on the footing of prewar statistics; but in the spring of 1918 Erich Ludendorff wanted this arrangement to be used as a pretext to overrun the Netherlands and was restrained only by the determined intervention of representatives of the German civil power.

The most real difficulties, however, were economic, and these began to be of the most tragic importance to the Dutch people in 1915. Sea-borne trade was gradually extinguished as the war went on. The Germans began by laying mines in front of the English ports. The British retaliated by laying a mine field in the North sea. In order to make their blockade of Germany effective they exercised an ever more stringent control over imports into the adjacent states, regardless of the provisions of the declaration of London. In March 1915 the Entente powers did away with all distinctions between legitimate and contraband trade and prohibited the import into the Netherlands of all goods, whatever their nature, which could be suspected of being destined for transmission to Germany. All goods imported into the Netherlands had to be consigned to an unofficial body (the Netherlands Oversea trust), which possessed the confidence of the Entente authorities and undertook that they should go no further.

The Allies gradually assumed control of the entire economic life of the Netherlands, allowing it the bare necessities of life, withholding anything that could be used to replace goods sent to Germany. Even the Netherlands' trade with its own colonies was subject to this control. As the Netherlands depended on Germany for certain indispensable articles (*e.g.*, coal), it was driven to export food which it really could not do without, in order to obtain them in exchange. Meanwhile, in 1915 Dutch vessels had begun to fall victims to German U-boats. Food scarcity became almost as serious in the Netherlands as in Germany itself, certainly more serious than in England. In the last stages of the war the Netherlands' industrial life was at a complete standstill.

Negotiations with Belgium.—In the first months of the war, when the Germans advanced through Belgium, a stream of Belgian refugees had sought safety on Dutch soil, where they were hospitably received. At one time their number exceeded 1,000,000, and their support, the provision of food and shelter, was an exceedingly heavy charge. In spite of this the Netherlands found itself decidedly unpopular in some of the Allied countries, and the firm refusal of the Dutch government in 1920 to surrender the former emperor William, who had taken refuge there in Nov. 1918, gave rise to excited denunciations of the Netherlands' alleged tenderness for the Hohenzollerns. During the peace conference, then, Belgium declared that the Netherlands' claim to sovereignty over the Scheldt mouth and its action in closing it against the Allied forces had made the defense of Antwerp impossible, while its possession of the province of Limburg had hindered the defense of Belgium's eastern frontier, which ought to have been based on the river Meuse. The Belgian *Comité* de Politique Nationale advocated that Belgium should be given sovereignty over Dutch Flanders, on the left bank of the Scheldt, and over Dutch Limburg, on the ground that the treaties of 1839, guaranteeing the neutrality of Belgium, having lapsed, these territories were now necessary for its protection. The question was eventually referred to direct negotiation between the two countries.

These negotiations on new arrangements for the regime on the Scheldt, on the Ghent-Terneuzen canal, etc., were, however, carried on in a somewhat unfavourable atmosphere. Although the populations of Limburg and Dutch Flanders protested their loyalty to the Dutch fatherland. the annexationist agitation in Belgium went on, and was still supported by the government. Yet the Dutch government was prepared to go far to meet Belgian wishes.

Early in 1920 a treaty in which several Dutch concessions were laid down was ready for signature when a new dispute arose about the sovereignty of the Wielingen channel, which connects the Scheldt estuary with the open sea. Although that channel runs along the Belgian coast within the three-mile limit, the Netherlands had exercised sovereign rights over it since mediaeval times. But, later, when conditions everywhere grew more stable. the treaty of 1920 was signed at The Hague on April 3, 1925, without the Netherlands' having changed its attitude toward the Wielingen question, which was suffered to remain in its original state. Pending ratification, however, the agreement was subjected to lively criticism in the Netherlands. In 1919 and 1920 the Netherlands had been willing to make economic concessions to avoid a threat to its sovereign rights;. but in 1925, when the treaty was at last published in its entirety, the danger that had loomed so large five

years before seemed altogether negligible, and the proposed concessions were scrutinized entirely on their merits, widespread dissatisfaction manifesting itself at the one-sided character of the treaty. When the second chamber on Nov. 11, 1926, nevertheless approved it, agitation redoubled in intensity. with the result that on March 24, 1927, the first chamber, by 33 votes against 17, rejected it.

Internal Politics, 1919–39.—The first elections under the new suffrage law after the revision of the constitution were held while the war was still going on, and resulted in further disaster for the Liberal groups; the Cort van der Linden administration resigned, and another Calvinist-Catholic cabinet was formed (July 1918). J. M. Ruys de Beerenbrouck was the first Catholic premier in Dutch history. This government's mandate was confirmed by the elections of 1921, when the coalition parties got 60 of the 100 seats of the second chamber. At the elections of June–July 1925 they lost some ground but still retained the majority, and when Ruys retired. Hendrik Colijn, leader of the Calvinist Anti-revolutionary party, formed another coalition cabinet. Each of these elections since proportional representation came into force meant a further stage in the disintegration of the Liberal parties, but the Socialists. with 24 members, became the largest party in the chamber after the Catholics, with 30, in 1925.

The years 1919 and 1920 were feverish ones, when a fallacious sense of prosperity stimulated enterprise in business and politics alike. Indeed the zeal for social reform which characterized them may perhaps be connected with a certain nervousness remaining after the "November days" of 1918. But the fictitious prosperity was succeeded by a severe depression. Shipping and shipbuilding particularly felt the effects. and Rotterdam suffered from the occupation of the Ruhr area and from the preference grdnted by France to its own and Belgian commerce. Unemployment remained a drain on Dutch resources. The one really bright spot in the picture was the prosperity of the East Indian cultures. Economy came to be the cry. The building subsidies were cut down, dispensations from the act restricting the hours of labour were freely granted, and it was felt that the multiplication of small state-subsidized schools, resulting from the compromise of 1917, overburdened the taxpayer. Colijn's appointment as minister of finance in 1923 strengthened the government, and he succeeded in balancing the budget in 1925. thanks largely to the improvement in the yield of direct taxation resulting from economic revival. (P. GE)

The coalition government under Colijn lasted only a few months. It had to resign in Nov. 1925, and there ensued a period of crisis in the parliamentary system that lasted until a short time before World War II. The cabinet of D. J. de Geer (1926–29) and that of Ruys de Beerenbrouck (1929–33) and the four Colijn cabinets during the years of 1933–39 were all wholly or partly extraparliamentary. This crisis, partly a result of proportional representation and the consequent formation of splinter parties, was mainly the result of two factors: (1) the circumstance that the political dividing line between "Christian" and "non-Christian" that had obtained since the struggle for the schools no longer corresponded with reality, while the logical division based on the distinction between economically and socially progressive policies on the one hand and conservative ones on the other was not accepted in its place; and (2) disappointment at the inability of democracy and the parliamentary system to solve the burning questions of the day.

These questions were raised especially by the world financial and economic crisis, which affected the Netherlands between 1929 and 1937, leading to continually increasing unemployment and sapping the financial and moral strength of part of the population. Colijn's remedy for the country's plight was retrenchment first and foremost: he thus became the "strong man" for all those who hoped to see the liberal-capitalistic economic system saved from ruin. As against this policy the Socialist or Social Democratic Workers' party (S.D.A.P.), which had continued in opposition all these years, brought forward its proposals for a planned economy and published its *Plan for Labour (Plan van de* Arbeid). The leaders of this party, seeing that their plan could be realized only if Socialists took part in the government, dropped their extreme internationalism; they recognized the rights of the monarchy and repudiated their former slogan for one-sided disarmament.

The economic and social crisis promoted the emergence, there as elsewhere. of extremist parties rejecting the democratic system of government altogether. Such were the Communist party (C.P.N.), which was never of much importance and won 3 seats of 100 in the 1937 elections, and the National Socialist movement (N.S.B.) with its "leader" Anton Mussert. At first the N.S.B. seemed likely to gain considerably by the prevailing discontent. At the provincial elections in 1935 it obtained 8% of the votes, but only two years later at the general election its poll was merely 3.8% (with four seats in the house), a decline which was caused by political developments abroad, particularly in Germany, as well as by improvement in the economic sphere. In opposition to both totalitarian movements a national concentration of democrats, cutting across the traditional political dividing lines. was formed in Eenheid *door Democratie* ("Unity through Democracy"). The only government measure against the extremist parties was an order declaring membership of either of them incompatible with public employment of any description.

That the Social Democrats abandoned their former rigid disarmament line was partly a result of the steady deterioration of the international situation during the 1930s. The country was disappointed in the League of Nations and was the first of the so-called Oslo states to abandon the policy of collective security. From 1936, after the war in Abyssinia, the Dutch government adhered to a policy of strict neutrality and complete independence. At the same time rearmament was taken in hand, at home as well as in the East Indies. Though it was on a modest scale. this nevertheless proved considerable strain on the country's financial resources.

Colijn's retrenchment policy met with increasing opposition. not least from the Catholic party. It was as a result of a Catholic motion that the fifth Colijn cabinet fell on July 25, 1939, only a few days after its formation. The road was now clear for Social Democrats to enter the government, and in the De Geer cabinet of Aug. 1939 two of them were included.

World War II.—A few weeks later World War II began. The Netherlands declared its neutrality, but from the first it seemed obvious that the country's chances to keep out of the war were smaller than they had been during World War I. Indeed Adolf Hitler, despite solemn promises to the contrary, apparently never intended to respect either Dutch or Belgian neutrality once it had become clear that England and France were prepared to fight on after the fall of Poland. During the winter of 1939 there was a series of incidents (among others, the Venlo incident of Nov. 9) as part of a cold war of nervous attrition, clearly showing from which side danger threatened. Nevertheless. the government continued its preparations for defense against attack from either of the belligerent sides and protested with equal force against violations of the country's neutrality by either and against impediments to trade by sea or on land.

On May 10, 1940, German planes and motorized land forces crossed the Dutch frontier, and paratroopers were dropped at strategically important points behind the Dutch defenses, in the west of the country. The Dutch foreign minister. E. N. van Kleffens, indignantly repudiated the German offer of "protection against an impending Alhed attack." The Netherlands considered itself at war with the third reich.

The struggle was of short duration. German troops advanced rapidly through North Brabant (the French 7th army came too late for effective aid), the small Dutch air arm was destroyed almost at once, the IJssel and Grebbe lines of defense were forced On May 13 Queen Wilhelmina and the cabinet embarked for England, whither Princess Juliana had gone the day before with her children. The departure of the queen, for which the public had not been prepared. had a demoralizing effect on both soldiers and civilians. The bombardment of the open town of Rotterdam on May 14 did the rest. On the evening of that day the army capitulated, except for the forces fighting in

Zeeland, where the unequal struggle continued until May 17. The navy joined the Allied fleets. The Netherlands was occupied by the *Wehrmacht.*

Reichskommissar Arthur Seyss-Inquart took office on May *30* and, in his inaugural address, promised the Dutch not to press national socialism on them. At that moment the struggle for the continent had not yet been won by the Germans, and they were out to show moderation. For a year after the capitulation of France it was the German tactic to play the wolf in sheep's clothes. Nevertheless. there were occasional symptoms of their ultimate intention: for example. the ban on listening to Allied broadcasts; the muzzling of the press; the suppression of the S.D.A.P. and of the Socialist trade-union movement: the first anti-Jewish measures; and the maiming of political and intellectual life by the internment in Buchenwald of a number of leading personalities as hostages. Characteristic of these early steps was their gradualness; categories of the population were attacked separately, one after the other, so that many were lulled preliminarily into a mistaken sense of relief and expectation of further respite. This method, moreover, was applied right to the end of the occupation.

In the first year of the occupation the Germans tolerated a certain amount of political activity by the newly formed *Nederlandse Unie,* which was led by a triumvirate of well-meaning but somewhat naïve persons from outside the ranks of regular party politicians. It soon became obvious. however. that this semblance of liberty had to be bought by unworthy pandering to the Nazi ideology. Two signs of awakening resistance were already discernible, though only a small number of people were involved as yet: these were the appearance of illegal newssheets *(Vrij Nederland, Het Parool, Je Maintiendrai)* and the strike in Amsterdam and other towns as a protest against the first open anti-Jenish action (Jews being arrested haphazardly and deported).

BRONZE MONUMENT SCULPTURED BY OSSIP ZADKINE (1890–) COMMEMORATING THE DESTRUCTION OF ROTTERDAM DURING WORLD WAR II. THE STATUE STANDS NEAR THE HARBOUR

After the attack on the Soviet Union the German measures of *Gleichschaltung* became more frequent and far reaching More and more groups of the population were affected (denominational trade unions, artists, journalists, doctors, etc.). The terror, growing fiercer and more barefaced, was especially directed against the Jews and the resistance movement. Toward the end of 1942 the Dutch National Socialists were given a certain measure of authority. But the chance of gaining support for the German cause by alternating benevolence and ruthlessness had dwindled with the belief in a German victory. The broadcasts by the British Broadcasting corporation and Radio-Orange did much to prevent a reawakening of this belief. There had at first been hesitations in Dutch government circles in London. These came to an end when the aging Premier De Geer was replaced by Pieter Sjoerds Gerbrandy, who, strongly supported by the queen, pursued an unnavering policy of no compromise. (De Geer, sent in Sept. 1940 on a mission to Indonesia, broke his trust by returning to the Netherlands instead. For this feat he was brought to trial after the liberation.)

After Stalingrad and the Allied victory in north Africa the German terror set in with full force. while at the same time organized resistance grew The *Arbeitseinsatz* became a mass deportation of labour to Germany and served also to remove Dutchmen from possible temptation in the event of an Allied invasion. It was also the pretext for the calling up of demobilized soldiers for internment (the Germans had already, by deceitful means. got hold of the officers). The announcement of this measure by the German military commander. General Christiansen, on April *29,* 1943, resulted in a spontaneous strike in a large part of the country. The Germans. taken by surprise, immediately proclaimed summary justice and overcame resistance in a few days, with bloody reprisals. If the strike brought no direct gain, at least thousands of people were forced to realize what was at stake, and the resistance movement was greatly strengthened.

The University of Leyden and the technical school at Delft had been closed as early as the autumn of 1940 in response to protests against the dismissal of Jewish staff members. In 1944 academic life as a whole was paralyzed by the closure of the universities when the students refused (March) to sign a declaration of loyalty to the occupying power. The resistance movement answered the terror by the nation-wide organization of hiding out (called "diving") for men and women sought by the Germans, for Jews, for men of the "dangerous age," etc.; by raids on food offices (for ration cards) and on municipal registries (the data stored there were useful to the Germans); and by the "liquidation" of Dutch traitors and *provocateurs.*

The Dutch government in London, which had for a long time been ill informed about the real situation in the Netherlands, now gave a determined lead and forbade all collaboration with the Germans and all compliance with unlawful German orders. The London government's declaration of war on Japan and the Japanese invasion of the Netherlands Indies had already made a profound impression. The battle of the Java sea (Feb. *27–28,* 1942), in which the Dutch fleet sacrificed itself in defense of Australia, aroused feelings of grief and pride.

After the Allied invasion of Normandy. the warfare itself drew close to the Dutch frontier. At the beginning of Sept. 1944 Gen. Bernard Law Montgomery's army entered North Brabant; on Sept. 5 *(Dolle Dinsdag,* "Mad Tuesday." as it was called afterward) Germans and Dutch National Socialists began to pack up and actually to leave. Unfortunately the reports that Allied troops were marching in were premature. Not until Sept. 17 did the drive to cross the rivers begin, and then, although Nijmegen was captured and the Waal river crossed, it was held up on the Rhine at Arnhem. where a German armoured column that happened to be at hand threw the British parachutists back. Meanwhile, however, the Dutch government in London had instructed the railwaymen to strike (for months already trains and railway junctions had been targets for Allied planes), an order carried out promptly and completely.

The loss of the battle of Arnhem meant that, although Torth Brabant and Limburg were now liberated, the rest of the country was to face the worst winter of the war. The Netherlands now lay in the front line of battle, with the German forces stubbornly resisting attack. Walcheren and with it the passage to Antwerp could be won only by the inundation of the island through the bombardment of the dike at Westkapelle, and there were severe civilian losses caused by mistakes made in Allied air attacks on German positions and communications. The struggle between the resistance movement and the occupiers reached its peak; the German terror became more and more ruthless. But worse than the effects of warfare and as horrible as the terror and the renewed deportations involving further thousands of men were the cold and hunger. There was no gas, no electricity, no fuel and no food. In the big towns in the western part of the country the famine nas especially serious: every day thousands of men and women left their cold homes to scavenge for food in the countryside, often for weeks on end. The rationing system virtually ceased to function, and food mas only to be obtained on the black market. Money no longer had any value, and only goods were accepted in exchange for food.

The final great Allied offensive against the third reich in 1945 liberated the Netherlands at last. Canadian forces drove the enemy from the east and north of the country. But still the Germans stood their ground in the west, where they destroyed the harbours of Rotterdam and Amsterdam, threatened to inundate large areas and were apparently prepared to let the population starve to death. Then, toward the end of April, Seyss-lnquart

was prevailed upon by the Committee of Trustees (a body of men recently appointed to represent the government and hitherto not even known to the Germans) to permit food droppings by the Allies. A few days later, on May 5, the German 25th army under Gen. Johannes von Blaskowitz surrendered to the Canadian commander Gen. Charles Foulkes.

Postwar Policies.—The Gerbrandy cabinet had in Jan. 1945 been reformed to include several ministers from the liberated southern provinces. After the liberation of the entire country it resigned and mas replaced by an interim cabinet led by Willem Schermerhorn, leader of a progressive nonparty movement initiated during the occupation, and by Willem Drees, leader of the Socialist party, who had been among the hostages at Buchenwald and had afterward played a part in the resistance. This government announced a progressive program, based on the apparently general desire for renewal that had developed during the war. It soon became clear, however, that the progressive mentality was neither so deeply rooted nor so widespread as the leading group of politicians and intellectuals had been led to think through their association in the resistance movement and the hostage camps. The majority of the electorate seems rather to have desired a speedy restoration of prewar political and economic circumstances, as far as the radical effects of the war allowed. This inclination was shown by the relative failure of the so-called "breakthrough" in the outmoded political dividing line (still largely determined by religion).

A new Labour party (Partij van de Arbeid, P.v.d.A.) was formed by the amalgamation of the old Socialist party. the Radical party (Vrijzinnig Democratische Partij) and a considerable number of progressives of either Catholic or Protestant persuasion and political antecedents, but the resuscitated denominational parties showed at the first genera1 election (May 17, 1946) that they had practically retained their former following. The Labour party, with 29 seats in the house of 100, was no more a national party than any of the others. If it had made gains on the right (the denominational parties included) it had lost as much on the left, nhere the Communists now held ten seats.

This situation remained essentially unchanged after the election of July 7, 1948. The election of June 25, 1952, had shown, however, that the idea of a "breakthrough" gained some ground, Labour increasing from 27 to 30 seats, while the Catholic People's party was reduced from 32 to 30.

After the first postuar election a mainly Catholic-Labour coalition government nas formed by the Catholic Louis Joseph Maria Beel. The governments formed in Aug. 1948 and in March 1951 by Drees were similarly composed. After the 1952 election the Catholic-Labour coalition remained in power, with Drees as premier.

After the liberation the people and government of the Netherlands were faced by an immense task of political, economic, social and moral rehabilitation and by many problems comparable nith those of other western European countries. The housing shortage created by wartime destruction was intensified by the increase of population, nhich continued to exceed that of any other country in western Europe. The catastrophic flood of Jan. 31–Feb. 1, 1953, struck especially the province of Zeeland. causing 1,783 deaths and enormous material damage. In 1954 the Dutch launched a great project for the closing of the sea arms in this area. However, ten years after the end of World War II. prosperity had again reached a high level.

As regards foreign policy, the Netherlands joined the United Nations after World War II. As it became increasingly clear that the traditional policy of neutrality could no longer be maintained against the threat to Europe from military, political and economic aggression. the large majority of the people subsequently supported adherence in 1949 to the North Atlantic Treaty organization. The Netherlands became in April 1951 party to the European Coal and Steel Community and in Oct. 1954 to the Western European union. It was hoped that the Benelux organization, formed in London on Sept. 15, 1944, for closer co-operation between Belgium. the Netherlands and Luxembourg, would show the way toward a greater integration of western Europe. According to the promise given by Queen Wilhelmina on Dec. 7, 1942, the former West Indian colonies. after long-drawn-out discussions, were granted autonomy on June 3, 1954. On Dec. 15, 1954, the new statute of the kingdom came into being. The kingdom includes the Netherlands, Surinam (Dutch Guiana) and the Netherlands Antilles. The two last-named delegate two ministers who decide with The Hague government all matters of common interest.

After the June 1956 election, in which the Labour party became the strongest in the second chamber. Drees remained premier of a coalition of the Labour and denominational parties after the most prolonged cabinet crisis in Dutch parliamentary history.

In Feb. 1957 the government started a policy of restricting investments.

Relations with Indonesia became worse as a consequence of the Indonesian claim on Dutch New Guinea, and led in Dec. 1957 to a crippling of the Dutch share in the Indonesian economy as well as to a large-scale emigration of Dutchmen from Indonesia.

In Dec. 1957 the parliament ratified the treaties on the European common market and on Euratom (European Atomic Energy Community). In Jan. 1958 the final treaty creating the economic union of Belgium, the Netherlands and Luxembourg was signed.

Juliana.—Queen Wilhelmina had returned to her country with the Allied armies in March 1945 but had had to relinquish her royal powers, because of ill-health, from Oct. 14 to Dec. 1, 1947, and from May 14 to Aug. 30, 1948. During these periods her daughter, Princess Juliana, was regent. On Sept. 4, 1948, Wilhelmina abdicated. Two days later Juliana was enthroned as queen of the Netherlands. (C. D. J. B.)

Colonies.—The colonial possessions of the Netherlands included before 1939 both East Indian and West Indian territories. The former, dating back to 1602, consisted of Sumatra, Java, most of Borneo, Celebes and western New Guinea, together with lesser islands.

After World War II, native leaders demanded that these possessions should become a self-governing entity, the United States of the Republic of Indonesia. Fighting between Dutch and native troops continued within the area for several years. In Dec. 1949 a settlement was reached whereby the sovereignty of all the East Indies except Dutch New Guinea was handed over to the nationalists. A Netherlands-Indonesian union was established under the crown of the Netherlands, whereby the two nations entered into a voluntary association as two independent and equal sovereign states. This union was abolished in 1954.

The Rest Indian territories, comprising the Netherlands Antilles and Surinam, date back to 1667. By a statute of Dec. 1954 the territories were given full autonomy in internal affairs.

POPULATION AND SOCIAL CONDITIONS

The population of the Netherlands according to the census of 1947 was 9,625,499 (of whom 4,791,443 were male). According to the Jan 1. 1955 estimate it rose to 10,680,023, the average density being 852 per square mile. This high density was chiefly the result of an intense concentration within the two provinces of North and South Holland (1,920 and 2,337 per square mile). The distribution of this population according to habitat is shown in Table I.

Between the years 1830 (the date of the separation of Belgium from the Netherlands) and 1955, the population of the Netherlands rose by 8,066,725. The greater part of this increase took place during the 20th century, and its rate far exceeded that of any

Total	2,922,842	943,603	3,866,445

As a result of this increasing population (to which should be added immigration figures of 51.756 in 1956) and of accompanying postnar economic difficulties, emigration, which was only moderate before 1939, increased in postwar years (62,737 in 1956) and received official help from the state.

Industrialization began later in the Netherlands than in other western European countries, but during the 20th century there was an increasing drift into urban areas and in 1954 the 81 towns of more than 20.000 inhabitants contained about 55% of the population. The working population in 1954 numbered 4,091,000 or 3,119,000 male and 972,000 female Of these 42% worked in industry, 13% in agriculture and fisheries and 45% in other services.

The total population of the provinces of North and South Holland, and of Utrecht. the area of which is about one-fifth of the whole kingdom, represents half the national population. This concentration is a result of the fact that suitable positions for commercial centres. particularly in transit trade, coincided with the existence of a fertile soil or the opportunity to win such soil by the reclamation of lakes and marshes. There are to be found the largest towns in the Netherlands: Amsterdam, Rotterdam, The Hague, Utrecht, Haarlem. etc. (See Table V.) Most of these,

TABLE V.—*Population of Major Towns, 1912–55*

*1918. Eindhoven became a town in 1920. †Municipal population figure.

with the exception of The Hague, owe their greatness to commerce. but each also developed various industries. Apart from the towns, population varies within this area according to the fertility of the soil. Along the belt of sand dunes from the Hook of Holland to Den Helder, for example. it is thinly scattered, though in the south a strip of older sand dunes, where soil has been improved, supports a very heavy density, mainly relying upon the intensive cultivation of small holdinas. Market gardening. bulb growing and dairy production on the more recent and wetter polders and agricultural production on the older drying ones are the main occupations outside the towns.

A second well-populated area is the interfluvial belt of central Holland, where the population may reach 1,000 per square mile. The largest towns are Arnhem and Nijmegen in the east and Breda in the west. The productive diked lands of this area. more suited to pasture than cereals, concentrate on stock raising and animal fodders. A further relatively high density is to be found in southern Limburg, nhere the fertile loess plateaus and the exploitation of coal mines support a density up to 1 000 per square mile. Maastricht (67,976), Heerlen (35,001) and Kerkrade (18,-602) are chief centres of the mining and other industries. Of the other provinces or regions, Zeeland and its adjacent islands reach occasional densities of 1.000 per square mile, and towns are rarely above 10,000 in population. Arable and mixed farming are the main occupations of the more fertile diked lands.

In North Rrabant and northern Limburg, population varies from less than 130 per square mile in the sandy plains and heath or wooded regions to 1,000 in industrial areas around Eindhoven, Tilburg, 's Hertogenbosch (53 208) and Venlo (26,822). These towns and surrounding districts have numerous industries. Much of the rural area is devoted to cereals for cattle fodder. In Drenthe, Overijssel and Gelderland. where large areas remain infertile, the population rises from less than 130 per square mile to 1,000 in urban centres. Overijssel is one of the most highly industrialized provinces of the Netherlands. with a flourishing textile industry in such towns as Enschede. Zwolle (45,541), Hengelo (43.431) and Almelo (38,266).

Finally, the coastal belts of Friesland and Groningen, form-

ing one of the richest farming regions of the country, support densities up to 500 per square mile. There is little urban development with the exception of Groningen and Leeuwarden (57,923).

Unemployment was particularly severe during the economic depression of the 1930s. First affecting the luxury trades (particularly the diamond), it gradually spread to industries dependent upon foreign and transit trades. A peak was reached in 1936, with a total of 475,000 unemployed. After World War II an increasing population and economic difficulties brought about a little unemployment. In Sept. and Dec. 1956 figures were 20.000 and 43.800. the increase being chiefly due to seasonal fluctuation.

Racial Origins and Language. — The population of the Netherlands is a mixture of several racial elements. Few traces of the original Celtic inhabitants remain. An early Germanic settlement was absorbed by the Romans who. in their turn, were settling in different parts of the country, intermixed to form the basic elements of the modern population In the provinces north of the Rhine, particularly Friesland and Groningen, the physical features of the "Nordic" races predominate. In the southern provinces those of the darker, shorter Alpine type are to be found.

To speak generally, the Dutch are an independent and democratic race, with a tendency to conservatism. They are good businessmen and colonizers, hardworking, reliable and attached to domestic life.

Dutch, officially called Nederlandsch and more popularly *Hollands(ch)*, the standard language, developed from the dialect used in Flanders, Brabant and Holland during the 16th century. By that time it had become a cultured speech in this region and was increasingly used as the written language and the medium of politics, administration and the law.

The standard spoken language which finally evolved differs somewhat from the written. All educated people speak a standard version, but there are fairly numerous dialects, and in these there is also a certain amount of literary activity, particularly in West Frisian, various forms of Low Franconian in Limburg, Brabant and North and South Holland and Low Saxon in the provinces of the northeast.

Religion. — The principle of religious toleration was declared by William of Orange in 1564. It was reaffirmed later in the various constitutions of the country, though that of 1814 stipulated that the sovereign must be a member of the Dutch Reformed Church. In 1848 complete freedom was given to all religious bodies. This long-established liberty of conscience naturally promoted the appearance of many denominations. The chief of these are the various branches of the Calvinist. the most important being the Dutch Reformed Church (2,988,839 members [31.1%] in 1947), which for many years has been closely allied with the state. Various congregations seceded from this body in 1834 over questions of church discipline and doctrine and organized themselves in 1869 into the Christian Reformed Church. Later in the 19th century splinters of both these bodies united to form the Reformed Churches of the Netherlands. The confessional issue in the Netherlands remains a major source of disunity. Roman Catholicism survived the separation of the country from Spain, though it suffered various disabilities until 1798, after which its influence grew steadily. In 1947, with 3,703,572 members (38.5%), it was the largest single denomination. Persons without any acknowledged creed numbered 1,641,214 (17%) in 1947.

Education. — State interest in Dutch education began in 1806 under the French occupation. Legislation in that year aimed at secularizing all teaching, but this principle was resisted by both Protestants and Catholics. During the 19th century, despite the opposition of liberalism, state support was gained for the denominational or private (bijzonder) schools, and in 1889 they secured financial assistance on a considerable scale. By the Education act of 1920 complete equality between state (public) and denominational education was established. The Dutch system thus possesses a dualism in most grades and branches of education, and from 1920 denominational schools outnumbered state schools.

Administration is characterized by a high degree of decentralization. and much is left to local and private initiative. The ministry of education is thus largely concerned with supervision and co-ordination. The minister himself is assisted by an advisory council appointed by the crown. The central authority is also responsible for allotting the public funds voted for education and for keeping a watch on local expenditure. State expenditure naturally increased greatly; it was 35,000,000 guldens in 1913, 142,000,000 guldens in 1938 and 603,200,000 guldens in 1954.

Compulsory education was introduced in 1901 for children between 6 and 13 (later 14). Infant education in kindergarten schools (*bewaarscholen*) may precede this. Kindergarten schools in 1956 numbered 3,706 (mostly private). with 370,222 infants. Primary education can be continued for a further two years. The numbers of the two types of primary schools (public and private) with their attendance are shown in Table VI.

TABLE VI.—*Primary Schools*

Item	1930		1938		1956	
	Public	Private	Public	Private	Public	Private
Schools	3,325	4,114	2,564	4,457	2,523	5,172
Pupils	446,397	736,131	357,675	785,439	425,623	1,065,151

In 1956 there were 421 special primary schools with 43,532 pupils (16,834 girls). The total number of teachers employed in all primary schools was 45,297 (1955–56).

Secondary education is given in various types of schools. As in primary education, schools are both state and. private, and the latter tended to increase at the expense of the former. The older *Gymnasium* (or grammar school) has a more traditional and classical emphasis; the *hogere* burgerschol (or municipal secondary) has an essentially modern and scientific curriculum. A third type. the lyceum. was instituted about 1910 to give a compromise between the two former institutions; it provides an education in which a broad preparatory course is followed by one on the lines of the grammar or municipal secondary school. Most of the establishments are coeducational, but there are a number of girls' secondary schools. In addition, there are a considerable number of special schools, technical, agricultural. commercial, domestic, etc., devoted to vocational training; they are supplemented by part-time (usually evening) institutions. (See Table VII.)

TABLE VII.—*Secondary Schools, 19jj-j6*

Schools	Number	Teachers	Pupils	
			Total	Girls
Day, all types	1,385	14,083	278,352	126,702
Evening	141	1,309*	20,290	8,121
Agricultural	434	2,837†	27,452	138
Other vocational	1,190	13,536*	322,600	162,811

*1951–52. †1950–51.

There were also 87 teachers' training colleges with a teaching staff of 1,152 (1950–51) and 15,374 students including 7,722 women (1955–56).

There are six universities. Three are public: Leyden (founded 157j), Groningen (1614) and Utrecht (1636). Amsterdam has a municipal university (1632) and the Free university (Calvinist, 1880). A Roman Catholic university was also founded in 1923 at Nijmegen. There are two colleges for advanced education in economics, one for agricultural and one for technical training. Teachers are supplied by the universities or by the normal schools (*i.e.*, training colleges); the latter numbered 89, with 10,546 students, in 1950. The numbers attending these universities in 1955–56 were 21,863 (4,946 women). Figures for other institutions of higher education (college of engineering at Delft, agricultural high school at Wageningen and commercial high schools at Rotterdam and Tilburg) in 1955–56 were 7,779 students (206 women). The teaching staff in all institutions of higher education amounted in 1950–51 to 1,095.

Secondary school education has contributed much toward the middle-class culture that attained so high a level and so wide an expansion in the Netherlands, and the academic standard of the

universities is exceptionally high. Illiteracy is practically unknown.

GOVERNMENT AND ADMINISTRATION

The modern constitution of the Netherlands dates from the restoration of the country's independence in 1814. when the first fundamental law was promulgated. This created a monarchy possessed of considerable powers! with an upper house nominated by the king and a lower house elected by a restricted franchise together constituting the legislature, called the states-general. Successive revisions of the constitution, notably in 1848, 1887 and 1917, transformed the state into a parliamentary democracy. Later amendments in 1948 established the new legal status between the Netherlands and its overseas countries and made certain changes in domestic administration.

The sovereignty of 'the Netherlands is vested in the house of Orange-Nassau; succession, in default of a male heir, passes to the female. Queen Juliana succeeded her mother; Queen Wilhelmina, on the latter's voluntary abdication in Sept. 1948.

The executive power resides constitutionally in the monarch, who is unimpeachable. It comprises command of the armed forces; conduct of foreign relations. with the proviso that the assent of the states-general is necessary in making war or peace and in the ratification of treaties; the appointment of ministers (who are, however, responsible to parliament for their own and for the sovereign's actions); and the right to dissolve the two chambers. separately or jointly.

The constitution, which includes within its text provisions for provincial and communal administration, justice, religion, defense, education, etc., as well as central government, can be amended by the consent of both chambers and the crown. The existing legislature first passes the necessary legislation by a simple majority; a new states-general is elected and must endorse the change by a two-thirds majority of each chamber within 30 days of election.

The crown is assisted in its executive capacity by a council of state (raad *van* staat). presided over by the monarch. This is a permanent advisory body. which is consulted on administrative problems and on the introduction of legislation. A second body is the council of ministers (minister-rand). which is in effect the central executive. Its ministers do not remain members of the chambers on taking office. but can speak and attend in a consultative capacity within either. This tendency to divorce the executive from the legislative sometimes results in the formation of cabinets not based upon a majority within the states-general. Ministers are generally the heads of departments, but the appointment of ministers of state is not uncommon.

The states-general comprises a first (upper) and a second (lower) chamber. The first chamber is composed of 50 members elected by the assemblies of the provincial estates. Half of these members retire every third year and are replaced in turn by a group of provinces representing half of the electorate. Members of the first chamber must have attained their 30th birthday.

The second chamber numbers 100 members, all of whom must have attained their 23rd birthday, and is elected by all citizens of 23 and over through a system of proportional representation, voting being compulsory (see Table VIII). Its mandate runs for four years, unless it is dissolved. The second chamber alone, in addition to the sovereign on the advice of the council of state or of the appropriate minister. can initiate legislation. This the first chamber must accept or reject outright. The first chamber may, however. put forward proposals which do not take the form of bills.

TABLE VIII.—*Distribution of* Seats, Second *Chamber*

Party	Year of election								
	1922	1925	1929	1933	1937	1946	1948	1952	1956

Communist	2	1	2	4	3	10	8	6	4
Other	4	1	2	7	8	2	3	4	2

Legislation is in practice usually drafted by a minister or committee of experts, which sends it with an explanatory memorandum to the council of ministers. This body in turn seeks the advice of the council of state. and the measure proceeds by way of the sovereign to the second chamber. There it is studied by committees, which report on it to the minister concerned. The latter replies to their observations, and the chamber discusses the measure in detail and may amend it if it so nishes. It not rejected, the measure then passes to the first chamber, where a similar procedure (without the right of amendment) is pursued. Should it receive approval, it is usually given royal assent and becomes the executive responsibility of the ministry concerned.

Provincial and Local *Government.*—Until 1795 the Dutch republic consisted of seven provinces and an area in Brabant and Flanders governed by the states-general and known as the "Generality Lands." In 1813 the lands in Brabant became the province of North Brabant, while the Flemish districts mere incorporated within the province of Zeeland. 4 third area of Drenthe was also elevated to provincial status. Limburg was created a province in 1839, and the province of Holland was divided into North and South Holland in 1840.

BY COURTESY OF J. G. VAN AGTMAAL

THE BEURSPLEIN OR EXCHANGE SQUARE AT ROTTERDAM. STATUE OF DESIDERIUS ERASMUS (14669–1536). THE GREAT DUTCH HUMANIST, WAS ERECTED IN 1622. THE MAIN OFFICE OF THE ROTTERDAM BANK ASSOCIATION IS IN THE BACKGROUND

Each province possesses a legislative and administrative assembly called the provincial estates. Members are elected for four years to the body, which varies in numbers from province to province according to population (but not strictly in ratio; *i.e.,* South Holland had one member for about 24.000 inhabitants and Drenthe one for 6,000). The Catholic party had (1955), 186 seats of the 590 in provincial states; Labour, 180; the Conservative parties, 132; and the Liberals, 50.

The provincial estates are the highest regional administrative body in the province. Their responsibilities also include the supervision (particularly in financial affairs) of the municipal councils and the upkeep of roads, bridges and dikes. etc.. which are outside municipal or state authority. The executive power and routine administration are vested in a salaried committee of six members (usually), known as the deputed estates (*gedeputeerde staten*). Both the provincial and the deputed estates are presided over by a commissioner of the crown (*commissans* der koningin), and their decisions in certain matters (*e.g.,* provincial taxation) are subject to government control.

The basic unit of local government is the commune (*gemeente*), of which there were 1.015 in 1949, ranging from 624 with fewer than 5,000 inhabitants each (representing 14.6% of the population) to 11 large cities with more than 100,000 (representing

31.4%). They are all, however, administered according to a uniform pattern.

The chief executive officer is the burgemeester, and there is a body of aldermen (methouders) and a communal council (*gemeenteraad*). The latter body, varying in size according to communes. is elected and chooses from its members a number of aldermen. The *burgemeester*, appointed by the crown, holds office for six years and is responsible for public order; with the aldermen he forms a college which has executive authority. The council has legislative, administrative and taxative functions.

Law *and* Police.—The basis of the Dutch legal system is the constitution, and the principles of modern Dutch law are those of the Xapoleonic code. The individual is guaranteed by the constitution such fundamental rights as freedom of religion, education. speech and association. The laws are codified into civil, criminal and commercial, and procedure in civil and criminal cases.

Since 1934 courts of general jurisdiction have been graded into four types: the 62 canton courts (kantongerechten), in which a single magistrate deals with petty civil and criminal cases and from which there is generally right of appeal; the 23 district courts (*arrondissementsrechtbank*), usually presided over by three judges, which may also have juvenile courts presided over usually by a single magistrate; the 5 appeal courts (*gerechtshoven*), with three judges in certain towns appropriately distributed; and the supreme court (*hooge* road van *Nederland*) at The Hague, a final court of appeal which is also a tribunal to try high government officials and to administer special branches of law. No type of court has a jury, and the official prosecutor must present boih sides of the case.

In addition, there exist certain special courts for arbitration in social and economic legislation and courts dealing with taxation each with their courts of appeal.

The ministry of justice supervises the administration of the law, prosecutes through its representatives in criminal cases and controls the state police force. Before 1940 civil police were divided between local forces of the commune (of whom the burge*meester* was the chief) and the state police. In some cases the smaller communes shared forces. After 1945 the majority of the communal police were absorbed within the state police (*rijksveldwacht*). The larger towns, however, such as Amsterdam, retained their forces, which remained under the authority of the burge*meester;* within them were specialized sections (*e.g.,* criminal investigation and motor water police).

Amsterdam's force had in 1949 a strength of around 2,300. The state police, incorporating the forces of most communes, comprises both personnel for routine duties and specialized sections. In addition. there are the *rijksrechercheures,* who specialize in investigation under the instructions of the state prosecutors. Semicivilian organizations undertake frontier protection, customs duties, etc.

Defense.—By an act of 1922, service in the armed forces was made compulsory for males between 20 and 40, inclusive. Conscripts were chosen by lot, and their numbers (an intake of about 19,500 annually) mere supplemented by volunteers for the small regular element of the forces. The training for the conscripts varied from 8 months (navy) to 15 (cavalry) and was often done in stages. There mas in addition a small volunteer reserve.

On mobilization in 1940 the army had about 500.000 men, with trained reserves of 150,000; the navy had 4 cruisers. 8 destroyers and 23 submarines. with various other vessels; and the air force (mostly part of the army) had approximately 300 machines with a total staff of 600 men. In 1938 the Netherlands joined the Brussels treaty powers; in 1949 NATO; and in 1954 Western European union.

Aiter 1949 the armed forces were reorganized as a component element of the North Atlantic Treaty organization. A conscription period of 18 months was introduced, and all fit males of 20 and over were liable. This produces an average of 55,000 recruits a year. Volunteers supplemented the number of conscripts. Conscientious objectors had to serve in noncombatant units or posts or compulsory civilian labour organizations. New men might be distributed, according to their preference and suitability, among the various services: but the majority were directed into the army. About 10% were accepted for the air force, but flying crews had to serve for a minimum of three years. Men previously under arms were also recalled for refresher courses.

By the end of 19j7, land forces consisted of two active divisions with supporting elements (for European defense); the navy had 1 aircraft carrier, 2 cruisers! 24 destroyers and escorts, 6 submarines and 65 mine sweepers, together with auxiliary craft and planes. The air force by the end of 1955 had 9 fighter, 36 fighter-bomber and various reconnaissance and transport squadrons.

Political Parties.—Political parties in the Netherlands have long been numerous. but many of the smaller groups fail to secure representation in the chambers despite the system of proportional representation for elections. The three oldest parties are the Catholic, the Liberal (the party of the professional and commercial classes) and the Antirevolutionary (formed in opposition to the principles of the French Revolution and now mostly composed of Orthodox Calvinists). During the second half of the 19th century administrations were chiefly composed of Liberals or a weak coalition of the two "religious" parties. Toward the end of the 19th century the traditional party divisions under the influence of new political forces were broken by the emergence of splinter groups and factions. The Liberals lost their dominating position, chiefly because of the closer consolidation of the "religious" parties and the advent of socialism. Various schisms occurred within their ranks, which mere divided into radical and conservative factions. until, during the 20th century, liberalism as a cohesive political force ceased to have any significant power. By 1913 the Socialist party, founded in 1881. had secured 16 seats in the second chamber and held there the balance of power, with the Catholics on the whole the largest single group. Communism failed to secure any firm hold.

The division of strength between the parties, which remained remarkably constant, made coalition almost inevitable for the government after 1918. The right wing is composed of the Political Reform party, the Antirevolutionary party and the Christian Historical union; the centre of Liberals and Catholics; the left wing of Socialists, with Communists on the extreme left. Table VIII gives the chief parties' strengths in the second chamber, 1922–56; the political pattern of the first chamber usually follows that of the second very closely.

Trade Unions.—The trade-union movement in the Netherlands sprang from the desire of the working class to make good the lack of social legislation and to improve conditions of employment. In the middle of the 19th century associations of a nonpolitical character were in existence to provide mutual aid against sickness, accident and old age. In later years they had the additional objective of improving the conditions of the working classes through political action. The first national union to be formed was that of the printers in 1866. Aided by legislation in 1872, other crafts rapidly followed their lead. From the beginning the labour movement was influenced by denominational considerations.

Nonreligious unions became federated under the Dutch section of the International Labour secretariat in 1893. They were the more militant section of the Dutch labour movement, and as a reaction against their revolutionary nature the Federation of Labour Trades Unions was established in 1905, ultimately to become the controlling power of Socialist trade unionism. Like all Dutch labour organizations, it was abolished by the Germans in 1940. Renamed the Socalist National Trade union, it numbered (1954) 453.765 members.

Catholic unions tended at first to embrace cultural and spiritual interests as well as industrial. They were not divided according to trades but existed as local and diocesan associations and became federated in 1924. Within this movement developed sections based upon the various trades, which placed more emphasis upon industrial interests. After a period of friction the two elements were finally unified within the Catholic Labour Movement of the Netherlands. This had 346,792 members in 1954.

The creation of the Federation of (Protestant) Christian Unions was largely the result of a reaction against the syndicalist tendencies of the labour unions toward the end of the 19th century.

Its membership is mostly drawn from the Calvinist element of the country. In 1954 this federation had a membership of 191,120.

Other unions (including the Communists) had (1954) 167,000. That of the Communists was constituted by the syndicalist elements of former years on the liberation of the Netherlands in 1945. In addition, there were two fairly large independent trade unions: that of the mineworkers in Limburg, established in late 1944; and that of the transport workers.

The Council of Trade Union Federations was composed of equal numbers of representatives from the Catholic. Christian and Labour federations. Through it the individual federations attempted to integrate a common policy on various industrial problems.

Social Legislation. — Insurance against unemployment was not compulsory before World War II, though it was encouraged by an act of 1916 that introduced a system of state and municipal subsidies to increase the benefits paid out by voluntary associations. An act of 1901 had, however, initiated compulsory insurance against accident, which one of 1919 extended to disablement and old age; the Public Health act of 1930 provided for payment during a certain period (six weeks) in the case of sickness. Under the Sickness Insurance Funds decree of 1941 workers and their families became entitled to free medical treatment. which in 1951 was extended, on payment of a weekly contribution, to aged people. widows and seamen.

Legislation regulating employment was initiated by an act of 1874, which forbade the employment of children under 12 years of age. In 1889 a further act limited working hours for women and children under 16 years of age to 11 hours per day and banned night and Sunday working to them (except in agriculture). The minimum age for child labour was in 1911 raised to 13, the maximum time lowered to 10 hours per day and 58 per week. In 1919 the minimum age was raised to 14, and there was a general restriction on the working day to eight and one-half hours. In 1949 works and industrial councils of employers, norkers and experts were instituted to regulate social and economic affairs.

In July 1955 a bill was introduced into parliament to provide (with effect from Jan. 1. 1957) old-age pensions to all people over 65. Under it a yearly income of 1,338 guldens would be granted to a married couple and 804 guldens to single people. The estimated increased burden on the 1957 budget would be about 722 guldens.

ECONOMICS, ADMINISTRATION AND POLITICS

Agriculture. — The agricultural prosperity of the Netherlands probably owes more to the ingenuity and labours of its engineers and farmers than to the natural fertility of the soil. For centuries land has been reclaimed from the sea or from inland marshes, bogs and heaths; or it has been protected from inundation on the coast and in the river deltas. In addition, numerous devices such as drainage and the use of natural and artificial fertilizers have been employed to increase fertility.

By 1938 the total of farm and horticultural land was 2,322,500 ha.. or approximately 70% of the country's area; in 1953 it was 2,308,000 ha. Of this, 908,000 ha. was plowland, 1,296,000 grassland and 134,000 horticultural area. Reclaimed polder land from 1840 to 1940 amounted to 400,000 ha. (an addition of more than 20% to the total agricultural area). and the draining of the Zuider Zee progressively increased this total. Woodland covered in 1953 246,000 ha. and infertile regions 237,000 ha.

The agricultural area comprises the reclaimed polder lands of the coast from Zeeland to Groningen. Those of the southwest (*i.e.,* Zeeland and its adjacent islands, northwestern North Brabant and the islands of South Holland and along the Frisian and Groningen coast) are composed of heavy marine clays which, after preparation, give a soil that yields good grain and root crops. This area, together with the few colonies of northeastern Groningen and Drenthe is chiefly devoted to the production of cereals.

In the polder lands of North and South Holland arable farming is chiefly found on the surface of drained lakes. In general the rich pasture of reclaimed areas there and in western Utrecht was for many years the centre of the dairy and cattle industry. There is, however, an intensive cultivation, particularly in the south, with an emphasis, because of the proximity to large communal centres. upon market gardening. The polder areas of Friesland rival those of North and South Holland in cattle raising.

The clays of the central river deltas do not offer such good farming land as the marine clays, and the area suffers from infiltration of river water. Large districts are therefore devoted to grazing land, though where conditions are better there is mixed farming and horticulture. The region (especially the Betuwe) is also one of the principal orchard districts of the country.

BY COURTESY OF NETHERLANDS INFORMATION SERVICE

VILLAGE BUILT ON POLDERS IN THE PROVINCE OF SOUTH HOLLAND

The sands and gravels of southern and eastern Netherlands offer a somewhat poor soil. Much of the peat area in the higher districts has been reclaimed. Cultivation, through clearing, drainage and irrigation, has been considerably extended during the 20th century. The southern part of Limburg forms a district apart. Instead of sand, it possesses a high proportion of fertile loams which are roughly half arable and half pasture. The development of the region as an industrial area stimulated dairy farming and market gardening. Fruits and sugar beets are also important crops.

Many of the agricultural holdings are less than one hectare, though these are mostly worked by farm labourers or by people not permanently engaged in agriculture. But the country is on the whole one of small farms. Only about 1% are bigger than 50 ha. (125 ac.). and about two-thirds are less than 10 ha. Arable farming is also nearly always linked with some class of animal farming. Most of the grain is used for fodder, and even then some has to be imported. Bread grain like domestic wheat has to be imported in considerable quantities, as the local variety is not very suitable for flour.

The ratio of the area under pasture to that under cultivation varied little after the middle of the 19th century; pasture amounted to 57.6% of farmland in 1833, 57% in 1930 and 52% in 1953. Of the arable area the proportion devoted to cereals was 47.2% in 1928, 60% in 1938 and 70% in 1953. The principal cereals are wheat, with barley as a subsidiary (Groningen, Zeeland, North and South Holland); rye. grown extensively for cattle fodder (North Brabant. Drenthe. Overijssel and northern Limburg); and oats (over the same areas as rye and in Groningen). Between 1851 and 1890 the area sown to wheat stood around 86,000 ha., but between 1921 and 1930 it declined steadily to an average of 57,000. Within the next decade, however, it nearly doubled. The area under rye increased gradually, from 188,720 ha. (1851–60) to 218,000 ha. in 1934–38, because of

TABLE IX.—*Agricultural Production, 1934–56*

Crop	Area sown (in 000 ha)				Yield per hectare in kilograms				Production (in 000 metric tons)			
	1934–38	1948–52	1955	1956	1934–38	1948–52	1955	1956	1934–38	1948–52	1955	1956
Wheat	142	89	89	86	30.3	36.5	39.3	36.0	430	325		309
Rye	218	176	154	1	22.7	25.9	30.2	28.8	496	455		492
Barley	42	60	70	74	27.9	33.4	37.7	36.9	117	202	350	273
Oats	138	142	171	153	25.5	29.4	34.0	31.6	351	419	465	483
Sugar beet	43	62	67	69	38.1	41.9	44.7	38.0	1,637	2,508	2,984	2,625
Potatoes	144	186	153	144	...	...	...	...	2,823	4,679	4,082	3,462

more animal husbandry. Similarly, the area under oats increased from 84,03j ha. (1851–60) to 138,000 ha. in 1934–38. After World War II the area under wheat decreased, while the area under barley and oats continued to increase. (See Table IX.)

Of the other crops, potatoes are grown both for human consumption and for commercial preparations such as sage, glucose and dextrine. Sugar beets and fodder beets are grown particularly in the southwest. Such crops as madder and rapeseed, hemp and even flax were declining considerably by 1954, being supplanted by caranay, poppy, colza and chicory, though in the decade immediately preceding World War II the area devoted to flax had increased from 6,400 ha. in 1931 to 20,700 ha. in 1938 (*cf.* 6.000 ha. in 1953).

Horticulture.— Horticulture, long an important aspect of Dutch agricultural life, became in the 20th century a principal item in the export trade. The area under horticulture in 1938 was about 61,200 ha , to which should be added approximately 37.600 ha. of pasture orchards. In 19j3 the total area was 130,000 ha. Market gardening flourishes particularly in the southern part of North and South Holland, where it is favoured by a mild climate, suitable soil and ready markets. This area is also devoted to bulb and flower growing.

Cultivation of fruit has been developed considerably throughout the whole country. The pasture or arable orchard predominates in southern Limburg and the new districts of Gelderland. Orchards of apples. pears and plums, among uhich are various bush fruits, are found particularly in the west of North Brabant and in South Holland. The annual value of horticultural produce in 1929 was estimated at about 250,000,000 guldens, of which 145,000,000 guldens were exports, but in the 1930s foreign markets became scarce. In 1952–53 the total value of horticulture was about 611,000,000 guldens.

Animal Husbandry.—With the exception of Switzerland, the Netherlands had more livestock to the acre in the years before World War II than any other European country. Animal husbandry mas formerly devoted to the production of milk and its derivative products. There was also considerable breeding and export of dairy cattle, and beef cattle were fattened for the home markets.

The three principal breeds of cattle are the black-and-white Frisian, the white-faced black Groningen and the red-and-white river cattle; of these, the first named is the most numerous and is especially famous for its milk yield.

The oldest centre of the dairying industry is the pasture polders of North and South Holland and western Utrecht. Much of this area is given over to permanent grass. More important, however. are the small dairy farms of Friesland. whose farmers are, moreover. specialists in breeding and are also occupied in the raising of cattle for beef. The number of head in the Netherlands increased continuously, and the proportion of milch cows and cows in calf

TABLE X.—Livestock, *1939–57*
(in 000 head)

is usually high (more than 50%).

Pigs form an important subsidiary asset in dairy farming. They are of two kinds: the Dutch pork, bred chiefly for the home market, and the bacon pig for export. Their raising is most common in the mixed-farming areas of and North Brabant, in South Holland and to a smaller extent in the eastern and northern areas. Sheep raising declined considerably. Poultry raising, however, has been considerably developed, particularly in areas of poorer soil. (See Table X.)

Co-operative societies for the marketing of dairy produce are common in Friesland, North Holland, Korth Brabant and Drenthe. A proportion of the annual output of milk was devoted to the home market or fed to stock. The balance provided exports in the form of butter, cheese and milk. (See Table XI.)

TABLE *XI.* — *Dairy Produce, 1934–56*
(in 000 metric tons)

Product	1934–38	1948–52	1954	1955	1956
Milk	5,121	5,441	5,863	5,823	5,871
Butter	97	81	164	74	77
Cheese	121	129		158	154
Hens' eggs	127.2	112.7	206.0	217.0	...

Export value of arable crops in 1955 amounted to 1,238,000,000 guldens, that of animal produce to 1,848,000,000 guldens and of horticultural produce to 618,000,000 guldens.

In general in the 1950s Dutch agriculture was failing to keep pace with other sectors of the economy. and there was an increasing shift of labour to industry and commerce.

Fisheries.— Much of the Ketherlands' coast line is particularly suited to coastal fishery and, moreover, is conveniently near the rich fishing grounds of the North sea. From the middle ages herring fishing was a principal occupation of the Dutch. Their fisheries, however, in the face of competition (particularly from the British) and handicapped by wars, suffered many vicissitudes. During the 20th century, chiefly because the country failed to keep its fleet modernized, deep-sea fishery tended to decline; there was more concentration upon the North sea in preference to more distant grounds, so that in the 1940s about 99% of the total catch nas taken in it. Herring constitutes the chief catch. with plaice, sole, cod and mackerel less important. Chief fishing ports are IJmuiden, Scheveningen and Vlaardingen. Coastal fisheries concentrated mostly on mussels, oysters and eels; of the inland catches salmon is the most important.

About 16,000 people were engaged in sea and coastal fishing in 1930 and 12,400 in 1949.

Between 1938 and 1956 the total catch of fish rose from 256,200 to 298,100 metric tons. Landings of herring alone rose during the same period from 118,400 to 138.600 tons, while the catch of molluscs decreased from 69.300 to 60,700 tons. The total value of landings rose between 1938 and 1956 from U.S. $11,480,000 to $26,908,000. The greater part of landings was exported.

Industry.— The industrialization of the Netherlands, though retarded by a lack of native resources such as minerals and by a paucity of coal, grew steadily after the mid-19th century. An increasing population and limited land made imperative the exploitation of economic sources other than commerce and agriculture and the modernization of shipbuilding, textiles, paper production and pottery. As a commercial country, the Netherlands had an abundance of private capital. Moreover, the state was prompt to assist, as in the exploitation of coal, oil and salt deposits. Initially the emphasis was chiefly upon technical improvement of existing industries. Also, the pastoral resources of the Netherlands were adapted to more modern requirements; *i.e.*, by milk processing, margarine manufacture, matchmaking, strawboard production. Later, capital and scientific research were applied to technical industries which required a minimum of raw material, such as electrical and wireless equipment, synthetic fibres and aircraft and component parts.

At the beginning of the 20th century the introduction of heavier basic industries was initiated with the exploitation of the Limburg coal field and, later, of the salt beds in eastern Overijssel and in Gelderland, near Winterswijk and Hengelo. As a result the

coking, chemical and later iron and steel industries were developed. Various emergency industries that came into existence between 1914 and 1918 contributed to the country's industrial development. Postwar depression. however. severely affected most Dutch trades, particularly those of shipping and textiles. The home markets were maintained by heavy tariffs and government subsidies. but overseas markets, which were so vital to the Dutch economic system, were considerably curtailed.

During the German occupation of 1940–45, such industries as shipbuilding, electrical engineering, etc., which possessed a strategic value, were encouraged; others, like leather. paper and textiles, were to some extent starved. and those which depended upon colonial or overseas imports naturally declined considerably. In addition, during the last years of World War II the industrial plant suffered severe damage. By the end of the war 30% of the country's wealth had been lost through hostilities, a heavier loss than that sustained by any of the other Allies.

These disadvantages were aggravated by the virtual loss of Indonesia, by shortages of both dollars and sterling and a consequent restriction on purchases of capital goods and raw materials, and by a lack of skilled labour. Further industrialization of the country (necessary in view of the great increase of population) became more and more dependent upon a close integration of Dutch industry with that of western Europe and a comprehensive liberalization of trade, together with financial support from such schemes as the European Recovery program.

The percentage of population engaged in industry rose steadily from about 33.8% of the working population in 1899 (cf. 29.6% engaged in agriculture) to 38.8% (cf. 20.1%) in 1930, 36% (cf. 21%) in 1938 and 42% (cf. 13%j in 1954. Industrial production rose considerably after World War II and by 1954 stood 70% higher than in 1938. Similarly, labour productivity rose satisfactorily. With the year 1938 taken as 100, figures for the years 1946–53 were as follows: industrial production, 74, 94, 113, 121, 139, 145, 147 and 163; labour productivity, 70, 77, 82, 88, 93, 95, 98 and 107.

In 1954 the numbers employed in the chief industries were as follows (figures based on returns from undertakings employing ten or more): earthenware, glass. chalk, brick. 45,500; diamonds, precious stones, 900; industrial photography. 29,100; chemical industry, 50,800; industrial preparation of wood, cork. straw, 37.800; clothing, 56,900; laundry, 14,000; leather, oilcloth, rubber, 35,700; mining, peat production, 58,500; metals, shipbuilding, etc.. 293,400; paper industry, 27,200; textile industry. 119,600; foodstuffs, tobacco, candy. 134,200.

The Korean war caused a steep rise in prices of the raw materials on which the Netherlands was so dependent. In mid-1951 the country was in debt to the European Payments union for 267,300,000 guldens. Internal consumption was therefore seriously restricted. By the end of 1952 a surplus of 1,800,000,000 guldens was gained. By 1953 the Dutch government could inform the U.S. that it no longer needed economic aid.

Distribution.——The chief industrialized regions are North Brabant, Overijssel and southern Limburg, where approximately half the working population is engaged in various industries. In Brabant textile industries are found chiefly at Tilburg and Goirle (mostly woolens and linen), at Eindhoven (also specializing in electrical and wireless equipment) and at Geldrop, Helmond and Bokstel (cotton and mixed fabrics). Another industrial centre in this province is Breda, which specializes in engineering and synthetic fibres.

In Overijssel, Arnhem is the chief town of the Dutch synthetic fibre industry and possesses in addition engineering and shipbuilding works. Northward along the IJssel are smaller textile, engineering and foundry centres. The Twente region of Overijssel concentrates on textiles; cotton manufacture and the finishing trades are found there in most towns and villages, notably Enschede-Lonneker. Southern Limburg is rich in coal but lacks other workable minerals; the chief towns on the coal field are Heerlen and Kerkrade; Maastricht, the largest town of the province, has big glass, pottery and cement works.

The two other principal industrial areas are North and South Holland. On a central band across North Holland lie Amsterdam, Haarlem and Hilversum, the chief towns of the province. Amsterdam has the largest shipbuilding yards in the country and miscellaneous engineering trades and refining industries. Haarlem is a centre of shipbuilding and engineering, and Hilversum of textiles and wireless equiqment. An important concentration of industries. chiefly timber, rice milling and the refining of vegetable oils, is also found along the Zaan river, from Zaandam northward to Krommenie and Wormerveer. Around IJmuiden and Velsen are blast furnaces, coke ovens and chemical works. In South Holland the chief industries are shipbuilding, engineering and chemicals. Rotterdam is the most important centre. with varied industries; Leyden specializes in the woollen and printing trades and Utrecht in engineering and chemicals.

The basis of industry itself is largely one of medium-sized or small private undertakings. The government has long taken a share in sponsoring industry but tends to restrict its direct control to a relatively small number of large concerns. At the beginning of 1954 industry comprised about 10.400 undertakings (of ten or more workers) with a labour force of 903,600.

Fuel and Power.——Coal, one of the few mineral resources of the Netherlands, was first extensively worked at the beginning of the 20th century in the south of Limburg. Smaller and relatively undeveloped areas also exist in the Peel district of central Limburg, in the southeast of North Brabant and in the Winterswijk area of eastern Gelderland. Both the state and private enterprise share in exploitation, the latter obtaining its property as a concession from the state Technically the industry is well advanced. Output in 1900 totalled about 300,000 tons. In 1920 it was 4,502,000 tons. (See Table XII.)

The refining of petroleum was not very important in the Netherlands before World War II. Of a total oil import of 1,687,000 tons in 1938. about 433,000 tons were crude oil. In post ar years domestic production of this commodity was increased considerably, chiefly from the Schoonebeek oil field in Drenthe. In addition, more than 5,000 000 tons were imported. By 1955 the Netherlands had become the most important exporter, after Great Britain. of petroleum products in Europe. Its refineries produced in that year 2,378,000 metric tons of gasoline, 747,000 tons of kerosene, 7,984,000 tons of fuel oil and 68,000 tons of lubricating oil.

Metallurgy.—Despite the fact that the Netherlands' mineral deposits are negligible, the country built up during the 20th century a considerable metal industry. Between 1930 and 1950 workers rose by 95%. Iron smelting was begun in 1924 at IJmuiden with ore imported chiefly from Spain and Sweden. and steel is produced there and at Utrecht. Steel production nas low and incapable of covering the amount required by the shipbuilding industry; the metal was imported, therefore, from Belgium, Germany and Great Britain.

Of nonferrous industries, tin smelting was the most important in the Netherlands. Before 1939 the country treated one-fifth of the world's output and produced about 35% of European tin. In 1956 smelter production amounted to 28,680 tons. Zinc smelting

and the refining of imports chiefly from Belgium and Luxembourg amounted to 29,040 tons in 1956.

Shipbuilding.—Shipbuilding and repairing has long been one of the Netherlands' chief industries. Numerous shipyards are found along the rivers between Schiedam and Dordrecht in the south-west, at Amsterdam and, to a lesser extent, at Haarlem, Flushing and around Groningen. In 1938 Dutch shipyards launched the fourth largest gross tonnage in the world, 240,000 tons, and gave employment to about 45 000 workers. After World War II the industry recovered rapidly. In 1955 there were about 300 shipyards with a total labour force of about 50,000, and an equal number of ancillary trades. Orders secured up to 1957 and under construction amounted to 1,400,000,000 guldens. The allied trades of repairing and marine engineering were also important.

Engineering.—The Dutch metal industry has been created chiefly as an ancillary to shipbuilding and maintenance of the merchant navy. The later engineering industry specialized particularly in marine engines and in machinery for domestic and colonial industries and for public works, such as oil-well equipment, tin dredges, pumps. pontoons, etc. Rolling stock and heavy electrical and textile machinery were produced only on a restricted scale. as were internal-combustion engines. Lighter electrical and wireless equipment was flourishing before World War II, and by 1939 the Netherlands was the fourth largest exporter of such goods in the world. Chief centres were at Eindhoven and Nijmegen. After the war the aircraft industry, together with the manufacture of component parts and specialized technical equipment, was increasingly developed.

Chemicals.—The Dutch chemical industry developed substantially and was assisted in the supply of some basic minerals by the exploitation of salt deposits at Boekelo (Overijssel) and at Winterswijk (Gelderland). but potash, basic slag and nitrate of soda had to be imported. The industry possessed numerous large chemical plants, some very well equipped. chiefly at Amsterdam. Vlaardingen. Pernis, Utrecht, Sluiskil. IJmuiden and Boekelo. In the field of nitrogenous and phosphate fertilizers, coal derivatives, processing of refinery products, pharmaceuticals, etc., the industry was well established. Other expansion was begun in the extending of the processing chemical industries to paint, pigment and synthetic material manufactures. Fertilizers were the most valuable part of the industry. Sulfuric acid. mostly domestically produced, also went into the making of fertilizers. Value of the Netherlands' chemical output increased from 200,000,000 guldens in 1938 to 2,500,000,000 guldens in 1954. Nearly 30% of production was exported.

Textiles.—The manufacture of woollen cloth, especially at Rotterdam, Haarlem, Leyden and Dordrecht, was the Netherlands' most important mediaeval industry. It benefited from the immigration of skilled workers from Flanders and from France in the 17th century. Later the linen industry was developed in the Twente district of Overijssel. and at the beginning of the 18th century mixed fabrics of linen and cotton were manufactured there. In the same century the industry concentrated subsequently on cotton, and gradually Twente and North Brabant became the chief textile areas. The woollen and linen industries became established chiefly in North Brabant. Other textile trades were rayon, lace and carpets. A ready-made clothing industry existed in many towns, but much clothing was imported.

After World War II the Dutch textile industry aimed at small-scale extensions in specialized fields such as cotton yarns, worsteds, hosiery and rayon fibre. Modernization of much machinery was necessary to ensure that the industry as a whole could hold its ground. By 1930 about 88,000 people were employed in various branches of the industry. This figure had declined to 82,000 in 1939, hut reached 121,000 in 1953.

Other *Industries*.—Leather and foot\\-ear are produced mostly in the towns of North Brabant and also at Nijmegen in Gelderland; production after World War II was roughly adequate to support domestic demands. A timber trade, concentrated chiefly in the towns of North and South Holland, provided pulp and paper industries with a large export trade. This was supplemented by the production of strawboard from cereal straw. The rubber industry expanded after World War II, chiefly in the production of tires and manufactured articles. Food industries were principally concerned with sugar (manufacturing and refining), milk products and vegetable oils.

Foreign Trade.—Early in the 16th century the Dutch had developed a flourishing trade with Scandinavian countries and the Baltic area, which constituted the lifeblood of Amsterdam and even smaller centres. In the last decade of the 16th century, expeditions were dispatched to the East Indies, and in 1602 the Dutch East India company was formed with the official support of the states-general. Twenty years later a similar company was created to trade with the West Indies and America. During the first half of the 17th century the Dutch, in addition to planting numerous trading settlements overseas, had become the chief carriers of Europe.

Overseas expansion was reflected in industrial and commercial development and financial prosperity. The Netherlands developed such business innovations as trusts, joint-stock banks and bills of exchange. Amsterdam supplanted Antwerp as the great stock and money market of Europe. During the 18th century, entanglement in foreign wars. domestic dissension, the usurpation of its carrier trade and the lack of any compensatory industrial development led to a commercial decline.

Yet, after 1814, when most of its colonies were restored, its experience and skill in seafaring and commerce, together with the advent of an era of free trade, put the Netherlands on the way toward recovering its commercial prosperity during the later decades of the 19th century. Its progress, however, suffered a severe setback in M'0rld War I from the rigours of blockade. The subsequent dislocation of world trade was particularly harmful to its economic structure. The Netherlands nas the last European country to abandon the gold standard (Sept. 1936), but after this step its industrial production and trade improved.

After 1945 the Netherlands had to face numerous difficulties: industrial dislocation, lack of foreign currency and a continued adverse balance of payments. To these were added an increasing population and, in 1950, a financial strain from rearmament according to its obligations under the North Atlantic treaty. Attempts to solve its problems included a customs union (Jan. 1, 1948) and development of the economic union with Belgium and Luxembourg; bilateral trading agreements; diversion of production largely into exports and restriction of home markets; and a policy of industrialization, particularly in specialized fields.

Before 1940 the country's volume of foreign trade was the fifth largest in Europe and per capita the fourth largest; its visible exports covered imports by nearly 64% (in 1938 by 73%); and it derived a considerable revenue from foreign and colonial investments and from shipping and other services. Aiter World War II exports revived. to cover imports by 54% (1948), 72% (1949) and 68% (1950); but the value of invisible exports had shrunk considerably. In later years coverage was 75% (1952), 91% (1953) and 85% (1954).

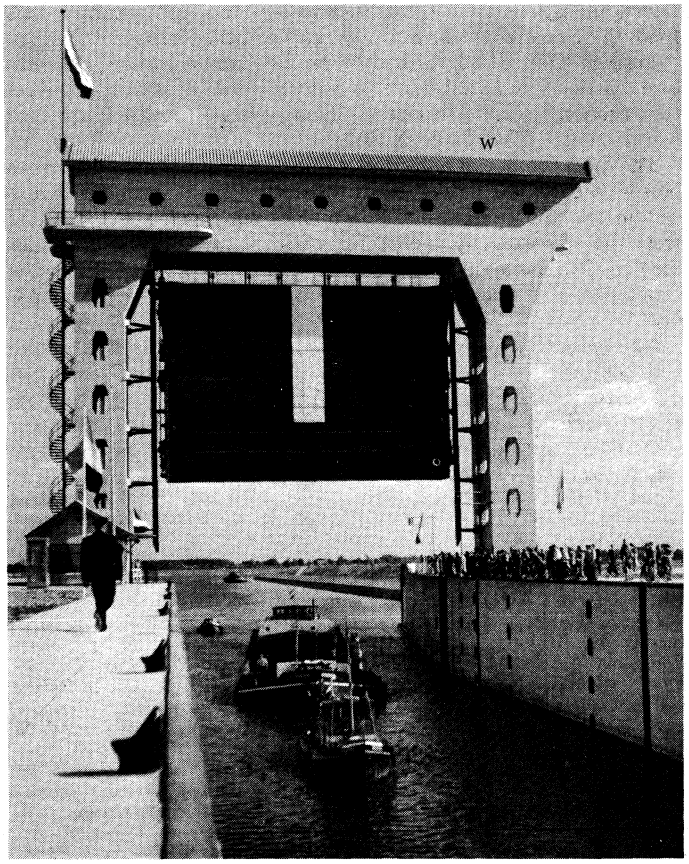
The prewar pattern of foreign trade had, particularly as regards



BY COURTESY OF CAS OORTHUYS

PRINCE BERNHARD LOCK AT TIEL ON THE WAAL RIVER AT THE SOUTHERN END OF THE AMSTERDAM-RHINE CANAL

imports, changed. There was a concentration upon the continental neighbours, France, Belgium, Germany and S itzerland. In 1954 Belgium-Luxembourg. the German Federal Republic, the United States and Britain were in that order the Netherlands' chief suppliers. Its exports went chiefly to west Germany, Belgium-Luxembourg, Britain and the United States. Tables XIII and XIV indicate the general trend and chief direction of trade.

Imports both in prewar and postwar years were largely made up of agricultural raw materials, particularly linseed, peanuts for chemical production, maize for fodder and wheat for human consumption; mineral raw materials and mineral oil and chemical raw materials; hides, raw rubber and rubber produce; wood, chiefly timber for constructional purposes; textiles and clothing; base metals, chiefly iron and steel, and finished machinery and rolling stock. Exports comprised agricultural produce, chiefly dairy products, vegetables, flowers, bacon, stock guts and oils; chemicals, chiefly coke and fertilizers; paper and wood products; tex tiles, chiefly cotton goods and rayon yarns; metal products such as ships, dredgers, instruments, radio and electrical equipment and tin.

Transport and Communications. — The artificial waterways were constructed originally for land drainage rather than for the carriage of goods. Later, with the considerable stretches of navigable rivers, they were found very suitable for carrying both domestic and transit goods. Open rivers and the main shipping canals were mostly state controlled, except in the northeast, where they were administered by the provincial authorities. The total length of trade-carrying waterways in Jan. 1956 was 6,918 km.; the length navigable by barges carrying more than 1,500 tons was 1,259 km.

Of the main systems that of the Rhine and its offshoots is the most important. Its ramifications are extensive, particularly in the west, and can carry barges with a capacity of 4,000 tons. It serves as communication between such large centres as Arnhem and Nijmegen in the east, Tiel, Gouda and Utrecht in the west centre and Rotterdam and Dordrecht in the west. A second system is that of the Meuse, the Juliana canal and the canals of North Brabant, which links central and western Netherlands with southern Limburg and the eastern Belgian system. Amsterdam is connected to the Rhine waterways, and from the capital there are extensions across North Holland to IJmuiden and the northern end of the province. In the eastern provinces are a great number of smaller canals which play an important role in the transport of agricultural goods, etc. These are connected to the eastern extremity of the Rhine system by the IJssel.

In the years immediately before World War II the Dutch inland fleet was the largest of western Europe, with around 20,000 craft (4,454,000-ton capacity). In 1954 it possessed about 17,000 vessels of about 4,328,000 metric tons. The waterways were responsible for more than 50% of the internal traffic of the country. They also played an extremely important part in transit trade. Rhine-borne traffic figures alone were 28,200,000 tons downstream and 27,600,000 tons upstream in 1938, to be compared with 4,900,000 and 3,600,000 in 1947 and 18,000,000 and 32,100,000 in 1955. Traffic originating in or bound for Dutch ports in 1938 and 1955 was approximately three-quarters of the totals.

The Dutch railway network is not so well developed as that of Belgium. Its total length in 1956 was 4,600 km. of which about 1,400 km. were electrified Services were chiefly devoted to passenger traffic, and little bulk freight was handled by rail. Freight traffic was 3,562,000,000 ton-kilometres in 1956.

The development of the road system in the country was handicapped in many areas by the nature of the land surface and by the existence of large rivers and estuaries. In the immediate prewar years considerable progress was made. however, in developing a national network. Roads in 1950 comprised about 2,774 km. of main state highways, 4,334 km. of secondary and 5,240 km. of third-class roads. Minor unclassified ones, many of them little more than tracks, totalled about 15,000 km.

In Dec. 1956 there were 327,466 passenger cars, 122,686 trucks and 7,378 buses registered.

The Dutch have long been a seafaring people, though during the Napoleonic wars their flag practically disappeared from the seas. A revival of their maritime importance began in the latter part of the 19th century, when several shipping lines were established. By 1905 the Dutch mercantile fleet was the ninth largest in the world. It suffered relatively severely but not excessively in comparison with those of other neutrals during World War I. Afterward tonnage reached a maximum of 3,178,000 in 1931, but had fallen to 2,854,287 in Sept. 1939. About half this total was lost during World War II. In postwar years a determined effort was made to re-establish the industry and in July 1956 the mercantile fleet had attained a record size, comprising 1,797 ships of 4,006,000 gross registered tons. Qualitatively the fleet mas not so good as before the war, because of the large percentage of older vessels. The earnings of the Dutch merchant navy were second only to revenue derived from investments abroad.

The chief Dutch ports are those with easy access to the Atlantic ocean; *e.g.*, Rotterdam, Vlaardingen, Hook of Holland, Schiedam (all situated on the estuaries of the Rhine and its branches), Dordrecht (at the junction of four important waterways) and the most important Dutch port of the middle ages, IJmuiden (at the western extremity of the North Sea canal). Amsterdam on the Zuider Zee lost much of its former trade to Rotterdam, but benefited from the cutting of the North Sea canal across the centre of North Holland. Of the remaining ports, Flushing (Vlissingen) on the island of Walcheren in the west, Harlingen and Delfzijl on the northern coast and Groningen several miles inland on the Ems canal were the most important.

In cargo traffic, Rotterdam overshadowed the other ports of the country, its chief rival being rather Antwerp than any Dutch port. Before World War II it handled four-fifths of the total sea-borne cargo and eight times as much as Amsterdam, its nearest Dutch competitor (in 1938 Rotterdam handled 42,300,000 tons, Amsterdam 5,600,000 tons). Through it passed also by far the greater part of transit traffic.

In 1955, 27,890 seagoing ships of 83,710,000 gross tons entered

Dutch ports. Total goods traffic by seagoing ships amounted in the same pear to 56,410,000 metric tons of imports (including 26,855,000 tons in transitj and 23,613,000 tons of exports (11,-270,000 tons in transit), excluding bunker fuel.

The Royal Dutch Airlines (K.L.M.) was founded on Oct. 7, 1919, with government aid as a private enterprise. The company had in 1955 a paid-up capital of 123,000,000 guldens, 95% of which was owned by the government. Its traffic increased rapidly and in 1955 it was the third largest air transport enterprise in Europe. These are the figures for 1955 (1938 in parentheses): kilometres flown 54,247,000 (10,609,000); passenger-kilometres 1,485,448,000 (59,758,000): cargo 50,991.000 (1,207,000) ton-kilometres; mail 9,081,000 (1,813,000) ton-kilometres.

The number of telephones in use on Jan. 1, 1957, amounted to 1,229,174. On Jan. 1, 1956, there were 2,092,459 radio sets. Television receivers totalled 92.867 on Dec. 1. 1956.

Currency and Finance. — The monetary unit, the gulden (*q.v.*) or guilder, also known as the florin, dates from 1798; it is divided into 100 cents. Gold and silver coinage was progressively withdrawn during the 20th century. and currency after World War II comprised solely notes and coins representing varying fractions of the gulden. The Netherlands was the last country to abandon the gold standard: on Sept. 19, 1936. There were 12.107 guldens to the pound sterling in the immediate prewar years, and 10.68 for several years after 1948. The gulden was devalued with the pound in Sept. 1949; its exchange rate in relation to the U.S. dollar fell from 2.65 guldens to 3.80, and in relation to the pound was fixed at 10.64 guldens.

The Netherlands bank. founded in 1814, was for long a private institution. It acted as the government's banker. and the state. in return for its privilege of issuing notes, shared in the profits. The bank was nationalized on Aug. 1, 1948. Note circulation totalled 906,834,000 guldens at the beginning of 1938, 3,052,000,-000 guldens by 1949 and 4,213,000,000 guldens on Dec. 31. 1956. Gold and foreign exchange holdings on Dec. 31, 1956, amounted to U.S. $1,072,000,000.

The Netherlands possessed numerous joint-stock banks, of which the larger were intimately concerned with industrial financing. These larger banks tended to absorb the smaller provincial ones.

The Budget. — Dutch budgets were divided into ordinary and capital services. both on the revenue and expenditure side. Until 1931 budgets usually showed a surplus. As a result of the economic depression of the earlier 1930s this was transformed into a small deficit. With the devaluation of the gulden in 1936, however, revenue began to increase, and in the years iinmediately after World War II a surplus was once more being recorded. In addition to the main budget there were various funds with separate accounts into which special taxes were paid and which also received allocations from the treasury; *e.g.*, the Agricultural Crisis fund: the Unemployment Subsidy fund and the Transport fund.

Postwar Dutch budgets had to provide for increasing expenditure, particularly in subsidies to industry and agriculture, for reconstruction, social services, unemployment and, later, for rearmament. (See Table XV.)

The local provincial and in particular the communal authorities possess a considerable degree of financial autonomy and derive a certain revenue from taxation, which is supplemented by grants from the state and by the profits of local undertakings. Under the constitution, a chief responsibility of these local bodies is the maintenance of roads, etc., public health and education and police.

National Debt. — The national debt steadily increased after the 19th century.

The total national debt was 3,986,000,000 guldens on Dec. 31, 1938. At the end of 1955 the total national debt was 19,689,000,-000 guldens, including 2,013,000,000 guldens of foreign debt.

BIBLIOGRAPHY.—Statistical information on most subjects is contained in the annual *Jaarcijfers voor Nederland* and other official periodicals published by the Centraal Bureau voor de Statistiek (The Hague). Other Dutch ministries publish periodical reports on relevant matters. *See* also E. V. Lucas, *A Wanderer in Holland,* 18th ed. (New York, 1924); H. (*J. D. L.;* X.)

HOLLAND, COUNTY AND PROVINCE OF. The beginnings of the history of the county of Holland are centred in Kennemerland, where a certain Rorik, of Norman origin, became a count in 862. His successor Gerulf, to whom the German king Arnulf in 889 granted some possessions and rights in the region between the Rhine and Swithardeshaga (probably a wood in the neighbourhood of Schoorl). may be considered as the first count of Holland, notwithstanding the doubt that may be felt about his being the father of Dirk I, whom tradition long held to be the first count. This Dirk I (the name is a shortened form of Diederic: German Dietrich, Latin Theodoricus) in 922 obtained from Charles III the Simple of France the church of Egmont in full possession. with all that belonged thereto from Swithardeshaga to Fortrapa (possibly Voortrap, otherwise 's Gravenpolder, on the island of Zuid-Beveland) and Kinnem (possibly a diked-in marsh on the island of Terschelling). His son Dirk II played a part in the troubles in the old duchy of Lorraine after its incorporation into the German kingdom by Henry I and Otto I: we find him, for instance, supporting Duke Giselbert of Lorraine in his revolt against Otto in 939; and later he seems to have supported the claims to Lorraine of King Lothair of France. from whom at any rate he got the wood Wasda (land van *Waes*) in 969. Eventually, however, he was won over to the side of the German kings; Otto III allowed him a considerable extension of territory (Maasland and Texel) in 985 and favoured his sons Arnulf and Egbert, the latter becoming chancellor of the German kingdom and then archbishop of Trier. Dirk II died in 988. Arnulf. Dirk's elder son of his marriage with the daughter of Count Arnulf of Flanders,

was born in Ghent and married to Liutgarde of Luxembourg, whose sister Kunigunde was to be the wife of the emperor Henry II. He was count till 993, when he was slain in battle against the West Frisians and was succeeded by his 1a-year-old son Dirk III. In his minority the boy was despoiled of almost all his possessions, except Kennemerland and Maasland. Afterward he made himself master not only of his ancestral possessions hut also of the district on the Meuse known as the Bushland of Merweda (*forestum* Merweda), hitherto subject to the see of Utrecht. In the midst of this marshy tract, at a point commanding the courses of the Meuse and the Waal, he built a castle (*c.* 1015) and began to levy tolls. Around this castle sprang up the town of Vlaardingen. The possession of this stronghold was so injurious to the commerce of Tiel, Cologne and the Rhenish towns with England that complaints were made by the bishop of Utrecht and the archbishop of Cologne to the emperor, who commissioned Duke Godfrey of Lorraine to chastise the young Frisian count. Godfrey invaded Dirk's lands with a large army, but was totally defeated with heavy loss (July 29, 1018). This victory of 1018 is often regarded as the true starting point of the history of the county of Holland. Having thus established his rule in the south, Dirk next proceeded to subject the Frisians in the north.

His son Dirk IV was one of the most enterprising of his warlike and strenuous race. His reign was marked by a notable victory over an imperial army which had occupied Zeeland (1047). It was in his time that the dispute between the counts of Flanders and Holland for the possession of Zeeland and Walcheren began. In 1049 he was killed in battle near Thuredrech (Dordrecht) against the forces of a coalition headed by the bishops of Utrecht, Liège and Metz. He was succeeded by his brother Floris I, who was murdered in 1061 at Nederhemert. At Floris's death his son Dirk V was still a child and so came under the guardianship of his mother, Gertrude, daughter of Bernard II of Saxony. William, bishop of Utrecht, saw his opportunity here and was in fact made liege lord over the young count by the German king Henry IV in 1064. However, the countess Gertrude married a younger son of Count Baldain V of Flanders, Robert the Frisian, who took his stepson's interests to heart, so that it was only in 1071 and with the help of Godfrey III of Lorraine that William of Utrecht was able to subdue Holland, Robert the Frisian being then occupied in disputes over the succession in Flanders and Hainaut. Even so. after Godfrey of Lorraine's death in 1076, Dirk V, now of age was able with his stepfather's help to recover his county from the bishop and to become the first count of Holland to hold the title officially.

Dirk V died in 1091 and was succeeded by his son Floris II the Fat. This count had a peaceful and prosperous reign of 31 years. After his death (1122) his widow, Petronilla of Saxony, governed in the name of Dirk VI, who was a minor. The accession of her half-brother, Lothair of Saxony. to the imperial throne on the death of Henry V greatly strengthened her position and that of her sons. Dirk VI tried to impose his rule on the West Frisians of the northern part of the later province of Holland, but they chose instead his brother Floris the Black as their count. The emperor Lothair settled his nephews' quarrel, and Floris the Black sought his fortune in Utrecht, where he was murdered.

Floris III (1157–90), Dirk VI's son, managed to subject the whole northen region down to the Vlie. He reversed the traditional policy of his house by allying himself with the Hohenstaufen. He became a devoted adherent and friend of Frederick I Barbarossa, whom he accompanied on the third crusade, in which he was a distinguished leader. He died of pestilence at Antioch in 1190. His son Dirk VII had a stormy but on the whole successful reign. Contests with the Flemings in western Zeeland and with the West Frisians, stirred up to revolt by his brother William, ended in his favour. The brothers were reconciled and William was made count of Friesland. In 1202 a war with the duke of Brabant broke out; Dirk was defeated and taken prisoner and had to purchase peace on humiliating terms. He died in Nov. 1203, leaving as his only issue a daughter Ada, aged 1*j* years. Her succession was challenged by William, count of Friesland, who became undisputed count of Holland after 1205. William I took an active part in the events of his time. He fought by the side of the emperor Otto IV against Philip II Augustus of France in the great battle of Bouvines in 1214 and was taken prisoner. Two years later he accompanied Louis, the eldest son of Philip Augustus, in his expedition against King John of England. William is perhaps best known in history by his part in the crusades He distinguished himself greatly in an expedition to Portugal and to Egypt, especially at the capture of Damietta (1219). and died in 1222. The earliest charters conveying civic privileges in the county of Holland date from his reign—those of Geertruidenberg (1213) and of Dordrecht (1220). His son Floris IV, being a minor, succeeded him under the guardianship of his maternal uncle Gerard III of Gelderland. He maintained in later life close relations of friendship with Gerard and supported him in his quarrel with the bishop of Utrecht (1224–26). Floris was murdered in 1234 at a tournament at Corbie in Picardy by the count of Clermont. Another long minority followed his death, during which his brother Otto, bishop of Utrecht, acted as guardian to his nephew William II (1234–56).

William II became a man of mark. Not only did several towns get their charters during his reign (Haarlem, Delft. Alkmaar, Middelburg), but moreover Pope Innocent IV, having deposed the emperor Frederick II, caused the young count of Holland to be elected king of the Romans (1247) William took Aachen in 1248 and was there crowned king; and after Frederick's death in 1250 he had a considerable party in Germany. He was on the point of proceeding to Rome to be crowned emperor when in an expedition against the West Frisians he perished, going down, horse and armour, through the ice near Hoogwoude (1256). Like so many of his predecessors he left his inheritance to a child.

Floris V (1256–96) was but two years old at his father's death; there were many difficulties with the guardianship before the young count came of age, 12 years old, in 1266. Soon there were other troubles: an expedition against the West Frisians failed, and the peasants in Kennemerland and Waterland rose against their lords and allied themselves to the democrats in the town of Utrecht. Floris overcame this danger by entering into a pact of neutrality with Utrecht and by giving a charter of rights to the Kennemer peasants (the latter act won him the quite undeserved name of der keerlen God, "the God of the common people"). In 1276 Floris restored the power of the bishop-elect John of Nassau in Utrecht. Thenceforth roles were reversed, and the influence of Holland over the bishops of Utrecht became ever greater. In his own county, too, Floris' power was steadily rising. He finally subdued the West Frisians; strongholds such as Alkmaar and Medemblik made revolts impossible for the future.

But his policy mas not limited to his own county and its neighbours. He allied himself closely with Edward I of England and secured great trading advantages for his people; the staple of wool was placed at Dort (Dordrecht) and the Hollanders and Zeelanders got fishing rights on the English coast. So intimate did their relations become that Floris sent his son John to be educated at the court of Edward with a view to his marriage with an English princess. In 1296, however, Floris forsook the alliance of Edward I for that of Philip IV the Fair of France, probably because Edward had given support to Guy of Dampierre, count of Flanders, in his dynastic dispute with John of Avesnes, count of Hainaut. Shortly afterward a conspiracy of disaffected nobles was formed against him, and he a-as murdered in the castle of Muiden (June 27, 1296).

With his son John I (1296–99), husband of Eleanor, daughter of Edward I, the first line of counts ended after a rule of nearly 400 years.

The House of Avesnes.—The first count of the new line, John II of Holland, was the son of John I of Avesnes. count of Hainaut, and Adelaide or Alida, sister of William II of Holland.

This succession brought Holland directly into connection on the one hand with the struggle between the house of Dampierre in Flanders and that of Avesnes in Hainaut and on the other with the war between the count of Flanders and the democratic Flemish towns and their suzerain Philip the Fair, ahose ally John of Avesnes was. One of the consequences was a revival of the old

conflict of Flanders and Holland over Zeeland west of the Scheldt. After the battle of Courtrai (Kortrijk, 1302) a Flemish army invaded Holland, but in the neighbourhood of Haarlem it began to withdraw. Zeeland alone stayed in Fltmish hands till a combined Flemish-French fleet was defeated near Zierikzee in 1304. The protracted conflict between Flanders and Holland over Zeeland west of the Scheldt was definitely settled in the reign of John's successor, William III the Good (1304–37), by the treaty of 1323, which granted full possession of western Zeeland to William, who on his part renounced all claim to imperial Flanders. The Amstelland with its capital Amsterdam, which had hitherto been held as a fief of Utrecht, was by William, on the death of his uncle the bishop Guy of Avesnes, finally annexed to Holland. William III did much to encourage civic life and to develop the resources of the country. He had close relations through marriage with the three principal European dynasties of his time: his wife was Joan of Valois, niece of Philip the Fair'; in 1323 the emperor Louis IV the Bavarian married his daughter Margaret; and in *1328* his third daughter, Philippa of Hainaut, was married to Edward III of England. By their alliance William III occupied a position of much dignity and influence, which he used to further the interests of his hereditary lands. He was succeeded by his son William IV, who was the ally of his brother-in-law Edward III in his French wars but was killed in battle against the Frisians in 1345. He left no children, and the question of the succession now brought on Holland a period of violent civil commotions. William IV's inheritance was claimed by his eldest sister, the empress Margaret, as well as by Philippa of Hainaut — in other words by Edward III of England. Margaret came in person and was duly recognized as countess in Holland, Zeeland and Hainaut but returned to her husband after appointing her second son, Duke William of Bavaria, as stadholder in her place. In 1349 Margaret uas induced to resign her sovereignty, and the stadholder became count with the title of William V. This time saw the formation of the famous parties in Holland, known as Cods *(Kabeljauwen)* and Hooks (*Hoeken*): the former, mostly the burgher party, were the supporters of William; the latter were as a rule the party of the disaffected nobles, who wanted to catch and devour the fat burgher fish. In 1350 the nobles invited Margaret to return to Holland. Edward III came to her aid, winning a sea fight off Veere in 1351; a few weeks later the Hooks and their English allies were defeated by William and the Cods at Vlaardingen — an overthrow that ruined Margaret's cause. Edward III shortly afterward changed sides, and the empress saw herself compelled (1354) to come to an understanding with her son: he was recognized as count of Holland and Zeeland, she as countess of Hainaut. Margaret died two years later, leaving William, who had married Matilda of Lancaster, in possession of the entire Holland-Hainaut inheritance (July 1356). But before the close of 1358 he showed such marked signs of insanity that his wife, with his own consent and the support of both parties, invited Duke Albert of Bavaria, younger brother of William V, to assume the functions of *ruwaert* (regent). William lived in confinement for *31* years. Albert died in 1404, having ruled the land for *46* years, first as *ruwaert,* then, from 1389, as count. During his reign the struggle between the partisans of the Cods and the Hooks was revived once more. He was succeeded by his son William VI in 1404. On his accession to power William upheld the Hooks and secured their ascendancy. His reign was much troubled with civil discords, but he was a brave soldier and was generally successful in his enterprises. He died in 1417, leaving an only child, his daughter Jacqueline (*i.e.,* Jacoba), who had in her early youth been married to John, heir to the throne of France.

The Burgundian Dynasty. — At a gathering held at The Hague (Aug. 15, *1416)* the nobles and representatives of the cities of Holland and Zeeland had promised at William's request to support his daughter's claims to the succession. But John of France died in April 1417 and William VI about a month later, leaving the widowed Jacqueline at 17 years of age face to face with a difficult situation. She was welcomed at first in Holland and Zeeland, but found her claims opposed by her uncle John of Bavaria, who was supported by the Cod party. Every one from whom she might have expected help betrayed her in turn: her second husband John IV of Brabant, her third husband Humphrey of Gloucester, her cousin Philip the Good of Burgundy, all behaved shamefully to her. She long struggled against Philip of Burgundy. whose hand was behind all the difficulties that she encountered, but in *1428* she was compelled to join in the so-called peace offering of Delft, by which treaty Philip became *ruwaert* over all her territories and she retained only a semblance of power. Five years later, after Jacqueline's marriage to Francis of Borselen, Holland, Zeeland and Hainaut were taken over altogether by Burgundy.

Under the Burgundian line of counts Holland's material prosperity increased continually. The herring fishery, rendered more valuable by the curing process discovered or introduced by Beukelszoon, brought increasing wealth, and the county's fishermen were already laying the foundations of its future maritime greatness. During the reign of Philip the Good's son Charles the Bold (1467–77) the Hollanders, like the other subjects of that warlike prince, suffered much from the burden of taxation. They were much aggrieved by the establishment of a high court of justice for the entire Netherlands at Malines (1474) which was regarded as a serious breach of their privileges. The succession of Mary of Burgundy led to the granting to Holland (as to the other provinces of the Netherlands) of the Great Privilege of March 1477, which restored the most important of their ancient rights and liberties *(see* NETHERLANDS). A high court of justice was established for Holland, Zeeland and Friesland, and the use of the native language was made official. (C. D. J. B.)

The Habsburgs and **the** House of Orange. — On the sudden death of Mary in *1482* her possessions. including the county of Holland, passed to her infant son Philip, under the guardianship of his father the archduke Maximilian of Austria. Thus the Burgundian dynasty was succeeded by that of the Habsburgs. During the regency of Maximilian the turbulence of the Hooks caused much strife and unrest in Holland. Their leaders, Francis of Brederode and John of Naaldwijk, seized Rotterdam and other places. Their overthrow finally ended the strife between Hooks and Cods. The "Bread and Cheese War," an uprising of the peasants in northern Holland caused by famine, was proof of the misery caused by civil discords and oppressive taxation. In 1494, Maximilian having been elected emperor, Philip was declared of age. His assumption of the government was greeted with joy in Holland, and in his reign the province enjoyed rest and its fisheries benefited from the commercial treaty concluded with England. The story of Holland during the long reign of his son and successor Charles II *(1506–55),* better known as the emperor Charles V, belongs to the general history of the Netherlands (*q.v.*). On Charles's abdication his son Philip II of Spain became Philip III, count of Holland, the ruler whose arbitrary rule in church and state brought about the revolt of the Netherlands. His appointment of William. prince of Orange, as stadholder of Holland and Zeeland was destined to have momentous results to the future of those provinces *(see* WILLIAM, *1533–84).*

The capture of Brill and of Flushing in 1572 by the Sea Beggars led to the submission of the greater part of Holland and Zeeland to the authority of the prince of Orange, who, as stadholder, summoned the estates of Holland to meet at Dordrecht. This act was the beginning of Dutch independence. From this time forward William made Holland his home. It became the bulwark of the Protestant faith in the Netherlands, the focus of the resistance to Spanish tyranny. The act of federation between Holland and Zeeland brought about by the influence of William was the germ of the larger union of Utrecht in *1579,* which by the fortunes of war was to be confined to the seven northern provinces. But within the larger union the inner and closer union between Holland and Zeeland continued to subsist. When after the solemn abjuration of Philip II as sovereign by the states-general in *1581* the sovereignty was offered to Francis, duke of Anjou. the two maritime provinces tried to safeguard their position by offering the countship to William. The matter was in an advanced state of preparation when William was assassinated *(1584)* and was then left in abeyance. In 1585, when the earl of Leicester had become gov-

ernor over all the provinces not yet reduced to obedience by Spain, William's son Maurice was appointed only to the position of stadholder.

Of these provinces, protected by the barrier of the rivers, Holland was the mainstay. More than half the burden of the charges of the war fell upon this one province; and with Zeeland it furnished the fleets which formed the chief defense of the country. Hence the importance attached to the vote of Holland in the assembly of the states-general. That vote was given by deputies, at the head of whom was the advocate (in later times called the grand pensionary) of Holland, and who were responsible to, and the spokesmen of, the provincial estates. These estates, which met at The Hague in the same building as the states-general, consisted of representatives of the burgher obligarchies (regents) of 18 voting towns, together with the representatives of the nobles, who possessed one vote only. The advocate was the paid minister of the estates; he presided over their meetings, kept their minutes and conducted all correspondence, as well as being their spokesman in the states-general. If, therefore, he was an able man he had opportunities for exercising a very considerable influence, becoming in fact a kind of minister of all affairs. It was this influence as exerted by the successive advocates — Paul Buys and Johan van Oldenbarneveldt — and grand pensionaries of Holland — of whom John de Witt was the greatest — that ensured the hegemony of Holland in the federation; in other words, of the burgher oligarchies who controlled the town corporations of the province and especially Amsterdam. This authority of Holland was. however. counterbalanced by the influence exercised by the stadholder princes of Orange; and the chief crises in the internal history of the Dutch republic are to be found in the struggles for supremacy betueen two, in reality, different principles of government. Whereas, however, the Holland party used to invoke the principle of provincial soxereignty, it would nevertheless be unfair to represent it as primarily and unalterably opposed to a strengthening of the federal government. The provincial principle was invoked as a means of defense against powerful stadholders who, basing themselves on the support of a majority of smaller and often corrupted provinces in the states-general, abused the unitary principle to further their personal foreign policy. Holland's preponderance in reality often served as an alternative factor to infuse some vigour into the all too loosely constructed federal government. In the 1780s the continuing conflict led to a state of latent civil war. The "Patriot" opponents of William V of Orange, originally sprung from the *staatsgezinden* (*i.e.,* the Holland magistracies, led by that of Amsterdam and not without allies in other provinces), came to develop democratic tendencies. When in 1795 the old republic was overthrown they welcomed the French as deliverers, not only in order to do away with stadholderships and the oligarchic system (which had lately become allies), but also to realize that unitary state which neither of the old parties had really been able to conceive. It was on this basis, in 1813, that the modern kingdom under the sovereignty of the house of Orange was founded.

Constitution. — The full title of the estates of Holland in the 17th and 18th centuries was De Edele Groot *Mogende* Heeren Staaten van Holland en *Westfriesland*. After 1608 this assembly consisted of 19 members, 1 representing the nobility (*ridderschap*) and 18 the towns. The "member" (*i.e.,* delegation) for the nobles gave its opinion first, followed by a spokesman for each town in a fixed order of precedence. The grand pensionary, acting as chairman, had in the end to embody the sense of the assembly, as apparent from 19 opinions, in a "resolution." The interests of the country districts (*het platte* land) were the peculiar charge of the member for the nobles. The nobles also retained the right of appointing representatives to sit in the college of deputed councillors, in certain colleges of the admiralty and upon the board of directors of the East India company and to various public offices. Each town (as did also the nobles) sent as many representatives as it pleased, but the 19 "members" had only one vote each. Each town's deputation was headed by its pensionary, who often acted as spokesman on behalf of the representatives. Certain questions such as peace and war, the voting of subsidies, the imposition of taxation, changes in the mode of government, etc., required unanimity of votes. The estates of Holland sat at The Hague in the months of March, July, September and November. During the periods of prorogation the continuous supervision of the business and interests of the province was, however, never neglected. This duty was confided to the college of deputed councillors (het kollegie der gekommitteerde raden), which was itself divided into two sections, one for the southern quarter, another for the northern. The grand pensionary presided over the meetings of the college, which had the general charge of the whole provincial administration, especially finance, the carrying out of the resolutions of the estates, the maintenance of defenses and the upholding of the privileges and liberties of the land. (P. GE.)

HOLLAND, a harbour city on Lake Macatawa, an inlet of Lake Michigan, in Ottawa county, Mich., U.S., 25 mi. S.W. of Grand Rapids. Advantages of the site for water transport attracted Rev. A. C. Van Raalte and his small band of Dutch settlers in 1847. Subsequently, this outpost became the destination of many Dutch immigrants who colonized western Michigan. Shingle making, tanning and woodworking were early industries. The city has industrial diversity including pharmaceuticals, furniture, metal crafts and machinery. It is renowned as a resort centre and is the hub of a fruit-growing, poultry and farming area. Holland State park is nearby, and the annual Tulip festival in May features Dutch provincial costumes, pageantry, wooden-shoe dances, and miles of streets and parks bordered by tulips. The Netherlands museum has exhibits of local history and Dutch folklore. Hope college (1866) and Western Theological seminary (1869) are institutions of the Reformed Church in America. Holland was incorporated in 1867 and the council-manager government, adopted in 1950, operates its own utilities, a community hospital and a civic centre. For comparative population figures see table in MICHIGAN: *Population.* (W. C. W.)

HOLLAND. A cloth so called from the country where it was first made. It was originally a fine plain linen fabric of a brownish colour — unbleached flax. Several varieties are now made: hollands, pale hollands and fine hollands. They are used for casement curtains, aprons, blinds, shirts, blouses and dresses.

HOLLAND AND LINCOLN VEHICULAR TUNNELS. Construction of the Holland tunnel, extending from Canal street in Manhattan, New York city, to Journal square in Jersey City, N.J., was started in 1920 under Clifford M. Holland, who died in 1924. The tunnel was opened to traffic on Nov. 13, 1927. The Holland tunnel consists of two distinct tubes, each having external diameters of 29½ ft., and each accommodating two lines of one-way traffic. The north tube is 9,180 ft. long, and the south tube 9,277 ft. A viaduct, costing $3,200,000, was completed at the New Jersey exit in 1951.

A second tunnel, known as the Lincoln tunnel, and essentially of the same design as the Holland tunnel, was started in 1934. It extends from Times square in Manhattan to Weehawken, N J. The south tube of the Lincoln tunnel was opened to traffic in 1937 and the north tube in 1945. The tubes of the Lincoln tunnel are each 31 ft. wide in outside diameter, or 18 in. wider than those of the Holland tunnel. The total length of the Lincoln tunnel is 3.4 mi.

Both tunnels are ventilated by fresh air forced through the spaces between the roadway and the bottom of the tube and drawn by fans through a similar space at the top. In this way, fresh air is supplied to all points throughout the tunnels and is not affected by the traffic or external wind conditions. The ventilating equipment, communications systems and other operating equipment of both tunnels are similar, with some technical improvements in the newer tunnel, developed as a result of experience. A feature of the Lincoln tunnel is the glass-tiled ceiling which provides improved lighting with less glare.

HOLLANDER, BERNARD (1864–1934), British physician and writer on medical subjects, was born in Vienna in 1864. He went to London in 1883 and was naturalized in 1899. He published in 1899 the results of his first investigation into the localization in the brain of the fundamental psychical functions. He wrote many papers for various learned societies, and was

well known for his studies of abnormal mental conditions and as an exponent of psychotherapy.

His many publications include *The Mental Functions of the Brain* (1902); *Scientific Phrenology* (1902); *Psychotherapeutics of Insanity* (1908); *The Unknown Life and Works of Dr. Francis Joseph Gall* (1909); *The Insanity of Genius* (1913); *In Search of the Soul atzd the Mechanism of Human Thought, Emotion, and Conduct* (1920); *Psychology of Misconduct, Vice and Crime* (1922).

HOLLANDS: *see* GIN.

HOLLAR, WENCESLAUS (WENZEL; in Czech. VÁCLAV HOLAR) (1607–1677), Bohemian etcher. whose work has always had great charm for connoisseurs; for mastery in working directly on the etched plate he had few—if any—peers. He was born in Prague on July 13, 1607. The earliest of his extant works are small plates dated 1625 and **1626.** In **1627** he was working under Matthäus Merian in Frankfurt. later moving to Strasbourg and then to Cologne in 1633. There he attracted the attention of the collector Thomas, earl of Arundel, who was on an embassy to the imperial court; and with him Hollar traveled to Vienna and Prague, arriving at last in 'England in 1637.

Though he lived in the household of the earl of Arundel he seems to have worked not exclusively for him, but to have begun that slavery to the publishers which was the normal condition of his life. During his first years in England he produced his view of Greenwich, nearly a yard long, receiving **30** shillings for the plate. The earl of Arundel left England in **1642** and Hollar passed into the service of the duke of York. With other royalist artists he stood the long siege of Basing house and there are about a hundred plates by him dated during the years **1643** and 1644. Taken prisoner, he escaped or was released and joined the earl of Arundel at Antwerp, remaining eight years, the prime of his working life, and produced the finest of his plates: his noble views, his miraculous muffs and shells. the superb portrait of the duke of York. In **1652** he returned to London and lived for a time with the engraver William Faithorne.

He illustrated many books. among them Sir William Dugdale's *Monasticon* (part i, **1655).** *Warwickshire* **(1656)** and *St. Paul's* (1658). After the Great Fire he produced some of his famous "Views of London" and it may have been the success of these which induced the king to send him to Tangiers in **1668** to draw the town and forts. During his return trip to England occurred the desperate and successful engagement fought by his ship the "Mary Rose" against seven Algerian men-of-war, an affair which Hollar etched for Ogilby's *Africa.*

Hollar lived eight years after his return, still working for the booksellers and retaining to the end his wonderful powers. He died in London on March 28. **1677.** in extreme poverty. his last recorded words being a request to the bailiffs that they would not carry away the bed on which he was dying.

Two catalogues of his etchings have been made, one in 1745 (2nd ed.. 1; 59) by George Vertue and a definitive one **(18**53) by Gustav Parthey.

HOLLES, DENZIL HOLLES, BARON (1599–1680), English statesman and writer. second son of John Holles, 1st earl of Clare (c. 1564–1637), and Anne, daughter of Sir Thomas Stanhope. was born on Oct. **31.** 1599. He was in early youth the playmate and intimate companion of Prince Charles. In **1624** Holles was returned to parliament for Mitchell in Cornwall, and in 1628 for Dorchester.

On March 2. **1629.** when Sir John Finch, the speaker, refused to put Sir John Eliot's Protestations and was about to adjourn the House by the king's command, Holles with another member thrust him back into the chair and swore "he should sit still till it pleased them to rise." Meanwhile Eliot, on the refusal of the speaker to read the Protestations, had himself thrown them into the fire; the usher of the black rod was knocking at the door for admittance, and the king had sent for the guard. But Holles, declaring that he could not render the king or his country better service, put the Protestations to the House from memory, all the members rising to their feet and applauding. He, with others, was arrested and arraigned first in the Star Chamber and subsequently in the King's Bench.

When brought upon his *habeas corpus* before the latter court Holles offered with the rest to give bail, but refused sureties for good behaviour, and argued that the court had no jurisdiction over offences supposed to have been committed in parliament. On his refusal to plead he was sentenced to a fine of 1.000 marks and to imprisonment during the king's pleasure. Holles was confined. first in the Tower of London. and then in the Marshalsea. His resistance to the king's tyranny did not prove so stout as that of some of his comrades in misfortune. Having given the security demanded for his good behaviour, he was liberated early in **1630,** and retired to the country.

Holles nas a member of the Short and Long Parliaments assembled in **1640.** According to Laud he was now "one of the great leading men in the House of Commons." and he sought to find means of preserving his brother-in-law, Strafford, from execution. He was one of the chief movers of the Protestation of May 3, **1641.** He took up the impeachment of Laud to the House of Peers. supported the Londoners' petition for the abolition of episcopacy, and the Root and Branch bill.

Together with Pym, Holles drew up the Grand Remonstrance, and made a vigorous speech in its support on Nov. 22, **1641,** in which he argued for the right of one House to make a declaration, and asserted. "If kings are misled by their counsellors we may, me must, tell them of it."

After the failure of the attempt by the court to gain over Holles and others by offering them posts in the administration, he was one of the "five members" impeached by the king. Holles at once grasped the full significance of the king's action, and after the triumphant return to the House of the five members, on Jan. 11, threw himself into still more pronounced opposition to the king's policy.

On the outbreak of the Civil War *(see* CIVIL WAR, ENGLISH) Holles took a command in the field, fighting at Edgehill and at Brentford. But he soon returned to London, moderated his tone. and advocated peace and a settlement of the disputes by concessions on both sides.

He supported the peace negotiations on Nov. 21 and Dec. 22, **1642,** and his attitude led to a breach with Pym and the more determined party. In June **1643** he was accused of complicity in Waller's plot, but snore to his innocency; and his arrest with others of the peace party was even proposed in August. In November Holles and Whitelocke headed the commission appointed to treat nith the king at Oxford. He endeavoured to convince the royalists of the necessity of yielding in time, before the "new party of hot men" should gain the upper hand.

Holles and Whitelocke had a private meeting, not reported to parliament. with the king. when at Charles's request they drew up the ansner which they advised him to return to the parliament. Holles was also a commissioner at Uxbridge in Jan. 1645. As leader of the moderate (or Presbyterian) party Holles now came into violent antagonism with Cromuell and the army faction, and was one of those who sought to secure Cromwell's impeachment.

On June **16, 1647,** eleven members including Holles were charged by the army with various offences against the state, followed on the 23rd by fresh demands for their impeachment and for their suspension. which were refused. On the 26th, however, the eleven members, in order to avoid violence, asked leave to withdraw. They were recalled, expelled, imprisoned and again recalled.

Holles was one of the commissioners appointed to treat with the king at Newport on Sept. 18, **1648.** and was one of those who stayed behind the rest in order to urge Charles to compliance. On Dec 1 he received the thanks of the House. On the occasion of Prides Purge on Dec. **6** Holles absented himself and escaped to France.

From his retirement there he wrote to Charles II. in 1651, advising him to come to terms with the Scots as the only means of effecting a restoration; but after the alliance he refused Charles's offer of the secretaryship of state. In March **1654** Crom-

well sent Holles a pass "with notable circumstances of kindness and esteem." The date of his return to England is uncertain, but in 1656 Cromwell's resentment was again excited against him as the supposed author of a tract, really written by Clarendon. Holles appears to have been imprisoned, for his release was ordered by the council on Sept. 2, 1659.

Holles took a leading part in the Restoration, was one of the 34 commissioners appointed to try the regicides, and entered the House of Lords as Baron Holles in 1661. He was ambassador to France (1663–66), and an envoy at the peace with Holland at Breda (1667). He became with Halifax and Shaftesbury a leader in the resistance to the domestic and foreign policy of the court, and in 1676 was summarily dismissed from the council. In order to bring about the downfall of Danby (afterwards duke of Leeds) and the disbanding of the army, which he believed to be intended for the suppression of the national liberties, Holles engaged (1677–1679), as did many others, in a dangerous intrigue with Courtin and Barillon, the French envoys, and Louis XIV.; he refused, however, the latter's presents on the ground that he was a member of the council, having been appointed to Sir William Temple's new modelled cabinet in 1679. Barillon described him as at this period in his old age "the man of all England for whom the different cabals have the most consideration," and as firmly opposed to the arbitrary designs of the court. He showed moderation in the Popish Plot, and on the question of the exclusion of James, duke of York, followed Halifax rather than Shaftesbury. He died on Feb. 17, 1680.

The character of Holles has been drawn by Burnet (*Hist.* of His *Own* Times vi. 257, 268), with whom he was on terms of friendship. "Hollis was a man of great courage and of as great pride. . . . He was faithful and firm to his side and never changed through the whole course of his life. . . . He argued well but too vehemently; for he could not bear contradiction. He had the soul of an old stubborn Roman in him. He was a faithful but a rough friend, and a severe but fair enemy. He had a true sense of religion; and was a man of an unblameable course of life and of a sound judgment when it was not biased by passion."

See C. H. Firth in the *Dictionary of National Biography* and authorities there quoted.

HOLLOWAY, THOMAS (1800–1883), English patent-medicine merchant and philanthropist, was born at Devonport on Sept. 22. 1800. He began to sell an ointment in 1837 and it carried his name over the world. He soon added the sale of pills to his business. Advertising played a large part in making his business efiorts successful. He endowed two institutions, a sanatorium for the mentally afflicted of the lower middle class, which was opened in 1885, and a college for women which was opened at Egham in 1886. He attended carefully to the arrangements for establishment of these institutions prior to his death at Tittenhurst on Dec. 26. 1883. (H. J. Sg.)

HOLLOW WARE. Hollow ware is a term which may be used to describe all articles of concave shape employed for domestic, particularly culinary, purposes; but actually. according both to the popular and to the trade usage, it is applied only to those which are made of metal. Even with this limitation the term covers a wide variety of articles. which are produced by several distinct industries. Some account of the development of those industries mill show how the various branches of the manufacture grew up. It is not necessary to look back beyond the middle of the 18th century, since it was not till then that any considerable variety in the types of article in use began to appear. At that time the metal kitchen utensils, such as kettles, pans and ale warmers, were made of sheet copper, brass or, less frequently, iron; cast-bronze skillets, which corresponded to the modern saucepans, and caldrons were very common. Nonferrous-metal vessels of these various types were frequently tinned on the inside. The lighter domestic hollow ware, such as kettles, trays, jugs and cups, was occasionally made of tin plate and sometimes japanned, or coated with baked-on varnish. Articles of this material, besides being produced by tinsmiths in many different parts of Europe, were made in quantity in south Wales and south Staffordshire under the name of Pontypool wares. Further, utensils such as plates, bowls, dishes and cups were often made of pewter, while similar articles of a more expensive kind were of silver or silver plate.

Cast iron was employed only for the heavier and cruder types of hollow ware, *e.g.*, caldrons and mortars, because the charcoal-smelted iron, which was then the only kind available, ran too thick to be cast into light domestic utensils.

During the latter half of the 18th century important changes occurred. The use of coke in the blast furnace resulted in the production of an iron which was suitable for the manufacture of light cast pots and pans, and so foundries began to be established for this purpose in several British industrial centres, particularly in south Staffordshire, at West Bromwich and Wolverhampton. During the same period a process was introduced for coating the interior of cast- and wrought-iron hollow ware with tin. and this, since it obviated the danger of rust, greatly extended the use of iron at the expense of nonferrous articles. Further, a new alloy, known as Britannia metal, of which the constituents were copper, tin and antimony, came to be used for making tea- and coffee-pots, so that by 1800. in addition to the older types of copper. brass, sheet-iron, pewter, silver-plate and tin-plate and japanned hollow ware, there were tinned and "black" cast-iron and Britannia metal articles. Soon after 1800 stove-dried varnish began to be employed as an outside coating for tinned iron kettles and pans.
