Introduction of Enameling and Galvanizing.— Before 1850, in addition to the improvements which were made in finishing processes, several new varieties of hollow ware came into existence. Processes had long been known for the coating of iron with vitreous enamel and, early in the century, they had been applied by continental producers. but it was not until about 1840 that an enameled hollow ware manufacture was established in Great Britain. From then on enameled ware began slowly to supersede tinned articles, chiefly because of the former's resemblance to glazed pottery and the ease with which it could be cleaned. A few years later the makers of wrought-iron utensils adopted a process for covering their goods with zinc, and so the galvanized-iron hollow ware trade came into existence. British producers in this branch of industry benefited greatly by the increased colonial demand which occurred after the middle of the century.

Meanwhile, the electroplating trade had risen to prominence after 1840 and began to produce teapots and similar articles which had before been made of pewter, tin plate, silver plate or Britannia metal. For a time this last material was used as a base metal in the manufacture of electroplate ware; but it was slowly superseded by German or nickel silver! which bore a considerable resemblance to it.

During the 1830s, moreover, the stamp began to come into use in the sheet-metal branches of the industry. particularly in tin-plate ware production in which thin sheets were employed, and, after this time, many articles such as dishes and pans, which had previously been made of separate. pieces of metal brazed together, were stamped out of a single sheet. There were, however, many kinds of tin-plate ware which still had to be made by the older methods; and the stamp was not used to any extent, even in the 1860s, for the production of heavier gauge cooking utensils of wrought iron.

Stamped Steel and Aluminum Ware.––Up to the 1870s, when most of these branches of the industry had come into existence in Europe and North America, only British manufacturers had developed a large export trade, and they then sent their goods to Europe and the U.S., besides supplying most of the hollow ware used in the colonies and filling a large proportion of the African. Indian and South American demands. During the next decade, a new form of wrought hollow ware, made of stamped steel, came into use. The change was associated with the rise of the German steel industry after 1880. Before basic Bessemer and Siemens-Martin steel came into use, most of the manufacturing operations in the wrought branch of the industry had been done by hand, as wrought iron did not lend itself readily to manipulation by presses and stamps. The new mild steel, however, being more

ductile, could be treated in that way, and it was therefore possible to produce machine-made steel articles which were much cheaper than either cast- or wrought-iron wares. Consequently, steel sheets superseded iron sheets as the raw material of the tinned, enameled, galvanized and "black" sections of the wrought trade; and since enameled stamped-steel hollow ware could be produced at a low cost, other branches of the industry began to suffer.

This decline continued up to the outbreak of World War I, and after 1918 the decay of the manufacture of cast-iron and of certain types of tin-plate wares was accelerated by the increasing use of aluminum hollow ware. Aluminum was first employed in this trade during the later 1890s, and up to 1914 the quantity produced was comparatively small. Germany was the first country to develop the manufacture, and most of the aluminum ware used in Great Britain during the years immediately preceding the war came from that source. The supersession of cast iron by enameled stamped steel and aluminum utensils after the beginning of the 20th century was stimulated by'the increasing use of gas and electric stoves for cooking purposes. In consequence of this development the greater strength of cast-iron ware was no longer such an advantage as it once had been; while articles made of that material mere less economical in the use of fuel than the lighter forms of hollow ware.

Manufacture of **Hollow Ware in the 20th** Century. — As may be inferred from the above historical account, the hollow ware in use in the 20th century may be classified into sections. The first group consists of cast-iron utensils which are either enameled, tinned, or "black." The "black" ware usually takes the form of Dutch ovens and large pots. The other wares, which are coated on the inside with enamel or tin and on the outside with stove-dried varnish. consist of frying pans, saucepans, kettles and other utensils employed for cooking. These articles are first cast from a special quality of pig iron and are then annealed. From the annealing ovens they go to be turned and polished on lathes, after which they are enameled or tinned. The handles are usually made of wrought iron and are riveted onto the body of the articles in the mounting shops. Finally, the wares pass to the stoving and varnishing departments.

The lids are usually made of tinned or enameled steel, or are pressed out of tin plate.

The second group covers wrought hollow ware, which is generally formed from mild-steel sheets and which may be either "black," tinned, enameled or galvanized. The first three varieties consist of similar types of articles to those produced by the cast section, but the enameled ware also comprises such things as jugs, colanders. bowls, buckets, cups, baths and plates, and thus covers a very wide range of domestic utensils. Many of these articles are fashioned under the stamp or drawing press, while some, *e.g.*, frying pans, are spun on the lathe. The later processes in this branch of the industry resemble those which have already been briefly described in connection with the various kinds of cast hollow ware. The latter are more durable and less likely to be adversely affected by heat; while the wrought wares have the advantage of being cheaper, lighter and more economical in the use of fuel.

Galvanized ware is more suitable for outdoor purposes or for uses not connected with food preparation, and it comprises such articles as dustbins, watering cans and coal scuttles. It seldom consists of articles similar to those which are enameled, though the two sections overlap at a few points — such things as buckets, bowls and water cans being common to both.

Galvanized ware is, of course, of a lower grade than the enameled variety.

Some of the more ornamental tin-plate and japanned wares, such as tea- and coffeepots, kettles, japanned coal scuttles, trays and traveling trunks, have, as already indicated, been superseded in Great Britain by other types; but a great quantity of hollow ware is still made of this material.

Aluminum hollow ware takes the form of a wide variety of utensils, such as are associated with the enameled and tin-plate ware trades and with the pottery industry, and it ranges from large cast pots for industrial uses to light saucepans, cups and plates.

The handles of aluminum articles are usually made of iron or steel, although sometimes a composition which is a nonconductor of heat is used.

Finally there remains to be mentioned the hollow ware made of brass, copper, electroplate and nickel silver. This is of an ornamental and expensive kind, and although copper and brass articles are produced in fair quantities, these types do not form, in the 20th century, a considerable proportion of what can be strictly regarded as hollow ware.

The term "hollow ware" is seldom used in the U.S. to describe this group of manufactured articles. These objects are referred to as enamelware, aluminumware and by various other names. These are discussed in the articles HOME EQUIPMENT; TIN PLATE AND TERSEPLATE; ALUMINUM; PORCELAIN ENAMELING; and in related subjects. (G. C. A.)

HOLLY (Ilex), a large genus of trees and shrubs of the family Aquifoliaceae, containing about 180 species. The genus finds its chief development in Central and South America: is well developed in Asia, especially the Chinese-Japanese area, but has few species in Europe, Africa and Australia. In Europe, where I. *aquifolium* is the sole surviving species, the genus was richly represented during the Miocene period by forms at first South American and Asiatic, and later North American in type. The leaves are generally leathery and evergreen, and are alternate and stalked; the flowers. commonly dioecious, are in axillary clusters and have a persistent four- to five-lobed calyx, a white, rotate four- or rarely five- or six-cleft corolla, with the four or five stamens adherent to its base in the male, and a two- to six-celled ovary, seldom more; the fruit is a globose, usually red drupe, containing two to eight one-seeded stones.

ROCHE

HOLLY (ILEX AQUIFOLIUM)

In North America about 12 native species occur, found chiefly in the southeastern United States. The American holly (I. *opaca*), very similar in appearance and uses to the European holly, is a slow-growing tree, sometimes 40 or 50 ft. high, with a trunk 3 ft. or more in diameter. It grows in moist woods, mostly near the coast, from Massachusetts to Florida, westward to Texas and northward in the Mississippi valley to Missouri and Indiana. Like the old world holly, it is much used for Christmas decoration. The dahoon holly (I, cassine), a shrub or small tree, sometimes 25 ft. high, with oblong, spineless and mostly toothless evergreen leaves, is found from Virginia to Florida and westward to Arkansas and Texas, and also in Cuba and the Bahamas.

The cassena or emetic holly (I. vomitoria), called also yaupon, Carolina tea and Indian black drink, because of its use by the Indians as an emetic and purgative, has nearly the same geographic range as the dahoon. It usually grows 10 to 15 ft. high and has small, minutely wavy-toothed leaves, about one inch long, and small fruits. Several North American species have deciduous leaves. Of these the best known is the Virginia winterberry or black alder (I. *verticillata*), a shrub, 6 to 15 ft. high, native to swamps from Connecticut to Wisconsin and south to Florida and Missouri. The foliage turns black and falls off in autumn, leaving bright-red persistent fruits which are used for winter decoration. Other deciduous species are the smooth winterberry (I. laevigata), native to swamps from Maine to Pennsylvania and Georgia; the deciduous holly (I. decidua), widely distributed in the southeastern states, and the mountain holly (I. montana) of the Allegheny mountain region.

The common European holly or hulver, I. aquifolium, is an evergreen shrub or low tree, having smooth, ash-coloured bark and wavy, pointed, smooth and glossy leaves, two to three inches

long, uith a spinous margin. The flowers. which appear in May, are ordinarily dioecious. as in all the best of the cultivated varieties in nurseries. Darwin says of the holly: "During several years I have examined many plants, but have never found one that was really hermaphrodite." Shirley Hibberd, however, in 1877 mentioned the occurrence of "flowers bearing globose anthers well furnished with pollen, and also perfect ovaries." The holly occurs in Great Britain, northeast Scotland excepted, and in western and southern Europe, from as high as latitude 62° N. in ~ ~ m to Turkey and the Caucasus and in western Asia. It is found generally in forest glades or in hedges, and does not flourish under the shade of other trees. In England it is usually small. probably on account of its destruction for timber, but it may attain to 60 or 80 ft. in height. Some of the trees on Bleak hill. Shropshire. are said to be 14 ft. in girth at some distance from the ground. The holly is abundant in France, especially in Brittany. It will grow in almost any soil not absolutely wet. but flourishes best in rather dry, sandy loam. The holly is propagated by means of seeds. which do not normally germinate until their second year, by whip grafting and budding and by cuttings from the matured summer shoots. Transplanting should be performed in damp weather. It is rarely injured by frosts in Great Britain. where its foliage and bright red berries in winter render it a valuable ornamental tree. There are numerous holly varieties. Some trees have yellow. and others white or even black berries. In the fruitless variety *laurifolia*, "the most floriferous of all hollies" (Hibberdj. the flowers are highly fragrant; the form known as *femina* is. on the other hand, remarkable for the number of its berries. The leaves in the unarmed varieties *aureo-marginata* and *albo-marginata* are of great beauty, and in *ferox* they are studded with sharp prickles. The holly is of importance as a hedge plant, and is patient of clipping. Evelyn's holly hedge at Say's Court: Deptford, was 400 ft. long, 9 ft. high and j ft. in breadth.

HOLLY (ILEX OPACA)

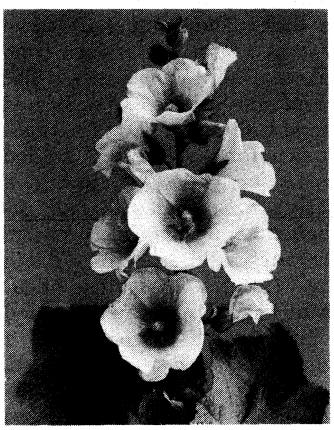
The wood of the holly is even grained and hard, especially when from the heartwood of large trees, and almost as white as ivory, except near the centre of old trunks, where it is brownish. It is employed in inlaying and turning and, since it stains well. in the place of ebony. as for teapot handles. When dry it weighs about 47½ lb. per cubic foot. From the bark of the holly birdlime is manufactured. The leaves are eaten by sheep and deer, and in parts of France serve as a winter fodder for cattle. The berries provoke in man violent vomiting and purging. but are eaten with impunity by birds.

The custom of employing holly and other plants for decorative purposes at Christmas is one of considerable antiquity. and has been regarded as a survival of the usages of the Roman Saturnalia, or of an old Teutonic practice of hanging the interior of dwellings with evergreens as a refuge for sylvan spirits from the inclemency of winter. A Border proverb defines a habitual storyteller as one that "lees never but when the hollen is green." Several popular superstitions exist with respect to holly. In the county of Rutland it is deemed unlucky to introduce it into a house before Christmas Eve. In some English rural districts the prickly and nonprickly kinds are distinguished as "he" and "she" holly; and in Derbyshire the tradition obtains that according as the holly brought at Christmas into a house is smooth or rough, the wife or the husband will be master.

See INKBERRY; MATE; WINTERBERRY.

HOLLYHOCK, *Althaea rosea,* a perennial plant of the Malvaceae. or mallow, family. A native of China, it is widely grown in North America and in Great Britain. The ordinary hollyhock is single blossomed, but the florists' varieties have all double flowers. of white, yellow, rose. purple. violet and other tints, some being almost black. The plant is in its prime in late summer. but by careful management samples may be obtained in blossom from July to autumn.

Hollyhocks are propagated from seed or by division of the root; also single eyes from woodshoots or cuttings from outgrowths of the old stock or of the lateral offsets of the spike may be planted out in rich sandy soil, in a close frame, with a gentle bottom heat. The seed may be sown in autumn under cover. the plants obtained being potted and kept under glass until the following spring. Or, if the seed is late-gathered, it may be planted in the open ground in early summer. the plants being transplanted in the autumn or the following spring. In many gardens. when the plants are not disturbed. self-sown seedlings come up in abundance in late spring. Seedlings may also be raised in February or March by the aid of gentle heat in a light and rich moist soil. They should not be watered till they have made their second leaves and, when large enough for handling. should be pricked off in a cold frame. from which they are subsequently transferred to the flower bed. Hollyhocks thrive best in a well-trenched and manured sandy loam. The plant is susceptible of great modification under cultivation. The forms now grown are the results of the careful selection and crossing of varieties. The most diverse varieties may be raised from plants growing near together.



J. HORACE MCFARLAND CO

HOLLYHOCK (ALTHAEA ROSEA)

The young shoots of the hollyhock are very liable to the attacks of slugs and to a disease called hollyhock rust, caused by a fungus. *Puccinia malvacearum.* P. *malvacearum*, a native of Chile. reached Europe in 1869 and the United States in 1886; it threatened the extermination of the hollyhock. The fungus. which also attacks wild mallows. destroys the soft parts of the leaves, leaving only the veins. It is especially harmful to the plant in dry seasons. The disease appears on the leaves as minute, hard, pale-brown pustules. filled with spores which germinate without a resting period, but which. when produced late in the season. may last as resting spores until the next spring. Sulfur spray is useful in preventing rust. but the disease. once established. is difficult to control. In hot dry seasons. red spider injures the foliage very much. but may be kept at bay by spraying the plants frequently with water. Hollyhock is also susceptible to anthracnose, caused by the fungus *Colletotrichum malvarum.*

HOLLYWOOD, Calif., the principal seat of the U.S. motion-picture and television film industries. is situated about 8 mi. N.W. of the centre of Los Angeles (*q.v.*) to which it was annexed in 1910. Its district boundaries are Hyperion avenue and Riverside drive on the east. Beverly boulevard on the south, the foothills of the Santa Monica mountains on the north and the city of Beverly Hills (*q.v.*) on the west. Spanish annals referred to an unimportant way station on El Camino Real and the Cahuenga pass, the principal route between southern and northern California and back door to modern Hollywood. The first home, an adobe, in the area was built by Don Tomás Urquidez in 1853. It was not until the early farmers or homesteaders settled there in the 1870s that there arose an appreciation of the unique combinations of geography that influenced an unusually pleasant climate. The nearby Pacific ocean conditioned the temperature to a comfortable medium, while the desert stretching to the east helped to keep the atmosphere dry and clear. During the 1880s one of the settlers, Mrs. Horace H. Wilcox from Topeka, Kan.. gave the community the name Hollywood, which n-as derived from the summer residence of a friend in Chicago. By 1903 the colony had developed a pride in local achievements and a desire to control its destiny, and on Nov. 14 voted 88 to 77 to incorporate as the city of Holly-

wood. Because of its arid location! the new city's water supply was inadequate. To solve the problem, Hollywood (pop. then about 4,000) voted in 1910 to become a district of Los Angeles.

The pioneers of the motion-picture industry found southern California extremely well suited to their needs of maximum sunshine, mild temperatures, varied terrain and a labour market. In 1908 one of the first "story" moving pictures. *The Count of Monte Cristo*, begun in Chicago by William N. Selig, was finished in the Hollywood area by Francis Boggs. About this time the Motion Picture Patents company ("Movie trust") was formed in New York by producers licensed by Thomas Alva Edison to use his kinetoscope. A group of independent producers and exhibitors, using French cameras for which patent priority was claimed, threatened the trust's monopoly, resulting in a series of suits, injunctions and even street fights. The independents eventually moved to southern California. The trust companies followed, and studios, independent and trust alike, became centred at Edendale. Resultant overcrowding caused some producers to move a few miles westward into Hollywood. In 1911 David Horsley leased the northwest corner of Gower street and Sunset boulevard for his Nestor film company studio, the first actually in Hollywood. Before the end of the year 15 companies had located close by, to be followed by many others. The trust companies dwindled; the independents eventually dominated the industry.

In 1913 Cecil B. deMille, Jesse Lasky and Samuel Goldwyn combined to produce *The Squaw Man* in a barn just a block from the intersection of Hollywood boulevard and Vine street. The barn was subsequently moved to Paramount Studios and dedicated as a historical monument by the state of California. D. W. Griffith helped give Hollywood a start in the race for supremacy in motion pictures. Early films such as *The Birth of a Nation* (1915) helped set a standard of showmanship. Early stars included Mary Pickford, Douglas Fairbanks, Charlie Chaplin (*qq.v.*), Gloria Swanson, Rudolph Valentino. Harold Lloyd, Francis X. Bushman, William S. Hart, Lillian Gish and Tom Mix. Great studios arose under leaders such as Adolph Zukor, William Fox, Samuel Goldwyn and Louis B. Mayer. The 1920s saw Hollywood as the centre of a movie industry with a world-wide market. Real estate boomed, riches were extravagantly displayed and headline scandals periodically occurred. Censorship bureaus in many cities ordered the suppression of pictures or the deletion of suggestive lines and scenes. The producers responded by forming an organization that became known as the Hays office—a bureau for self-censorship, headed by Will Hays, former postmaster general, under the aegis of the Motion Picture Producers and Distributors of America, Inc.

The advent of the talking picture had a marked effect on the careers of many, Famous stars of the silent screen were forced into retirement. There was a demand for more resourceful directors and screen writers and for technicians with more varied skills to cope with the new sound medium. Film technicians, writers, directors and actors organized into guilds that acquired the status of trade unions.

The effect of television as a competitor to the movie industry began to he felt after the prosperous years of World War II. The Hollywood counteraction was a rash of new techniques involving new lenses, wider screens and stereophonic sound. Nevertheless, thousands of theatres stayed closed and millions of former movie patrons preferred the home television screen. An additional blow was a series of court decisions that the control of theatre chains by major producing companies constituted combinations in restraint of trade, which must be broken up. The major Hollywood studios joined their rival, selling great backlogs of films for televiewing and selling and leasing their facilities for television production requirements. The RKO studio was taken over by television producers. In the early 1960s about 80% of the three main television networks' evening programing originated from Hollywood. The financial structure of movie making underwent a radical change. The old studio giants were largely replaced by a conglomerate alliance of independent producers, profit-sharing stars, bankers, agents and investment counselors. The blocking of foreign currency and capital gains and income tax factors provided incentive for production of an increasing number of films overseas, and the cheap supply of extras and other help encouraged this trend. However, thousands of technically skilled artisans who have made Hollywood and its environs their home have to dome extent been absorbed into the television industry, with an equally vast inventory of equipment. The entertainment industry is so firmly anchored that it will hardly be uprooted. The Central Casting office maintains a file of thousands of bit players and extras.

Radio in Hollywood was a natural outgrowth of its supply of talent, and in pretelevision days Hollywood rivaled New York as radio centre for nation-wide programs. Columbia square, the Mutual Don Lee Broadcasting system studios and the National Broadcasting company studios stand as monuments to radio. The recording of songs written for movies, of radio and television programs and of other popular music is a thriving industry.

In 1919 the Hollywood Bowl, a 50-ac. natural amphitheatre owned by Los Angeles county, became a reality. The pool of artists who moved to the area in the ensuing years made possible the array of talent that attracts record-breaking crowds to the outdoor series of summer concerts known as "Symphonies Under the Stars." Other main points of interest are the outdoor Pilgrimage Play amphitheatre and Greek theatre, the Californian Art club and Barnsdall park.

Hollywood has grown from a country village concerned with the quality of its citrus fruits to a thriving community of more than 200,000, most of whom live in apartments. It has many churches It is known for the manufacture of cosmetics and is among the leaders in the creation of styles in both men's and women's clothes. In the 1960s a redevelopment program was under way.

HOLLYWOOD, a city of Broward county, in southeastern Florida, U.S., on the Atlantic ocean, 18 mi. N. of Miami. Until 1921 it was palmetto jungle with a few pineapple and tomato farms. Joseph W. Young, a developer from California (hence the name Hollywood), starting with 1,700 ac. in the present downtown section, made a geometrically precise layout for the town, which was to be bisected by a broad avenue (Hollywood boulevard) with three circular 10-ac. parks at regular intervals and a hotel at the east end. The city mas incorporated in 1926, but was hit hard by the hurricane and the real estate collapse of that year and grew but little until the 1950s when the population doubled. It shares ownership and benefits of Port Everglades with nearby Dania and Fort Lauderdale. Tourism and some industry. principally electronics, furniture, cement and shipping, with a winter vegetable-growing hinterland make up the economy. It adopted a council-manager form of government in 1926. For comparative population figures *see* table in FLORIDA: *Population*.

(C. W. TE.)

HOLMES, OLIVER WENDELL (1809–1894), **U.S.** physician, poet and humorist, was born in Cambridge. Mass., on Aug. 29, 1809. His father was Abiel Holmes. a minister in Cambridge and author of a creditable historical work. *The Annals of America* (1809). A childless widower upon his settlement in Cambridge, Abiel Holmes had chosen as his second wife Sarah Wendell, daughter of the well-to-do Oliver Wendell. Sarah Holmes was a good-humoured, sociable woman, beloved by her children, to whom she bequeathed the wit that leavened the sobriety of a Calvinist home. She lived to be 93; perhaps it was she who taught her son that "life is a fatal complaint, and an eminently contagious one."

Early Life. — Educated first at local schools, Holmes was sent to Phillips academy (Andover) for a year before entering Harvard in 182j Andover, the seat of a Calvinist theological seminary, was to Holmes a "dove's nest of Puritan faith" and very different from "our heretic college," as he described Harvard, which had become the centre of New England Unitarianism. The battle between the New England Calvinists and Unitarians would soon lead to a skirmish in his father's church. While Holmes, in his junior year, was making a reputation as student, poet and convivial club man. the town of Cambridge became embroiled in the schism in its principal parish. The tao-year battle between the orthodox and liberal groups ended a month before Holmes's graduation with the ousting of his father from the pulpit. For Holmes the blame rested not upon his mild-tempered father nor upon the liberals, but upon the Calvinists who had forced matters to a head. The quarrel left him with an ineradicable impression of "Machiavellian" deacons and contributed greatly to his later compulsion to attack Calvinist doctrines.

Outwardly, young Holmes was unaffected by the quarrel. His talents were recognized by his fellow students, who chose him as class poet, and by the faculty, which awarded him a commencement part. Although his ability was thus acknowledged. Holmes was too sensible to consider a literary career; his choice lay between law and medicine. Acting upon the American conviction

that law was the field for a gifted young man, he enrolled at the Harvard law school but. finding the work dull. he sought relief in writing verses. He was encouraged by five undergraduates who printed his verses in their periodical, *The Collegian* (Feb.–July 1830). These poems, of which the best known is "The Height of the Ridiculous." were reprinted and praised in the newspapers. Having tasted "the intoxicating pleasure of authorship." Holmes later confessed that "there is no form of lead-poisoning which more rapidly and thoroughly pervades the blood and bones and marrow than that which reaches the young author through mental contact with type metal." He was never able to cure the infection, although he tried to when he sought to become established in the profession of his final choice, medicine. Holmes began to study medicine in the fall of 1830, but he published "Old Ironsides" in September; he worked hard under James Jackson, but he published "The Last Leaf" (1831). Following Jackson's cases until he knew more of them than anyone else. he wrote "September Gale" and other well-wrought comic verses. Still scribbling. he nevertheless pursued assiduously the courses at the Harvard medical school and those given by a group of Boston physicians. In these two years he showed what Jackson called the "true zeal" and persuaded his parents that he deserved an additional two years! training in Paris. In France. Holmes forsook poetry and followed the teaching of Charles Pierre Alexandre Louis and others of the school of French clinicians known as therapeutic nihilists for their skepticism about the efficacy of the drugs then employed.

Medical Teacher and Author. — Returning home in Dec. 1833 and taking his medical degree at Harvard. Holmes was qualified to practise medicine, but from the first he desired to secure a professorship. Although he practised medicine for ten years, he also taught. becoming associated in 1838 with other physicians in founding the Tremont Medical School. Holmes's modest practice and two years as professor of anatomy at Dartmouth college, Hanover, N.H., did not interfere with his work at the Tremont school. Practice and teaching provided the income necessary for marriage. and in 1840 Holmes married Amelia Lee Jackson! daughter of Charles Jackson. justice of the supreme judicial court of Massachusetts. The first child, Oliver Wendell Holmes, Jr., who was to become a justice of the supreme court of the United States, was born in 1841; a daughter Amelia (1843) and a son Edward Jackson (1846) completed the family.

The professorship Holmes really sought came his way in 1847 when he became the Parkman professor of anatomy and physiology at Harvard; this post he held until his retirement in 1882. As a teacher he was distinguished for introducing the use of the microscope and for his ability to make his lectures amusing. At Harvard, during his 36 years of service. he was always assigned the one o'clock lecture hour. the last in the students' long morning, because he could keep attention with his. lucidity, wit and delight in the subject. Charles William Eliot. reforming president of Harvard, said of Holmes: "I never heard any mortal man exhibit such enthusiasm over an elegant dissection." Although Holmes did not wholly favour Eliot's reforms of the medical school, he helpfully led the older members of the faculty to accept them. Upon one matter of policy, Holmes was in advance of his colleagues, old or young; he always voted for the admission of women to the medical school.

Although in his medical writings Holmes offered no original discoveries, he employed his talent and knowledge in good causes. In his first medical essay. "Direct Exploration," which won the Boylston medical prize in 1836. he argued for a more frequent use of the stethoscope, which was then not extensively used in America. In the following year he won both Boylston prizes with an essay on neuralgia, competent but not important, and with a study of "Intermittent Fever in New England," described by an authority as the best regional study of malaria. The subject led Holmes into the deserts of Puritan theology. which he described as "more likely to cause a fever than to mention one." With his eyes on a professorship, Holmes published all three essays in 1837. dedicating the volume to C. P. A. Louis, who had taught him the techniques of medical scholarship.

In 1848 Holmes provoked controversy with a *Report on Medical Literature* (prepared for the American Medical association); here he urged his countrymen to produce original work instead of merely annotating English books, not sparing himself from censure for having similarly edited (with Jacob Bigelow) a work by Marshall Hall. Before 1848, however. Holmes had produced his most distinguished medical work, the essay on *The Contagiousness of Puerperal Fever,* 1843. Written at white heat in 21 days. the essay was evoked by discussions in the Boston Society for Medical Improvement. Persuaded by these discussions and by investigation of the literature that the disease was contagious and was transmitted from patient to patient by the obstetricians, Holmes directed all his talents to marshaling the evidence. His article met vigorous opposition from the leading American obstetricians. Although he did not suffer the martyrdom of the Hungarian Ignaz Semmelweiss who published similar conclusions in 1847, Holmes was roundly abused, until in 1855 he was urged to reprint his essay with additional and even more eloquent pleas that the facts be acknowledged, as shortly they were. Holmes's other medical writings, witty and intelligent though less important, show their author as scornful of quackery of all kinds *(Homoeopathy and Its Kindred Delusions,* 1842), insistent upon scientifically tested therapeutic practices (*Currents and Counter-Currents in Medical Science,* 1860), eager to see psychology recognized both in morals and medicine (*Mechanism in Thought and Morals,* 1871) and bold in defense of freedom of investigation (address, *The New Century and the New Building* of *the Harvard Medical School,* 1884). Holmes never devoted himself to pure science; he had not the mind for it: "I like nine-tenths of any matter I study but I do not like to lick the plate. If I did I suppose I should be more a man of science. . . ."

Poet, **Essayist,** Novelist. — His regrets for not having trained himself "to the exhaustive treatment of some limited subject" may be taken with a grain of salt. Distracting him was his delight in the flattering praise his countrymen lavished upon the man of letters, praise they were not disposed to give the labouring scholar. In the same year in which he won the first Boylston prize. Holmes published his first volume of verse *(Poems,* 1836); here he gathered his fugitive early pieces together with "Poetry, a Metrical Essay." In his preface. Holmes bowed himself off the literary stage, and for a time he held with some show of firmness to this "retirement," but he was easily persuaded to make public appearance, poem in hand. for the pleasure of Harvard classmates, fellow citizens, medical colleagues and innumerable visiting celebrities. He early became the unofficial laureate of Boston. As Ralph Waldo Emerson observed: "Holmes is the best example I have seen of a man of as much genius, who had entire control of his powers, so that he could always write or speak *to order:* partly from the abundance of the stream, which can fill indifferently any provided channel."

Holmes was also before the public as a popular lecturer; appearing sporadically on the platform in the 1840s, he became a regular performer in the 1850s. His firecracker wit delighted his audiences, provided he eschewed the slavery question. There his conservative views provoked the wrath of the abolitionists, upon whom he retaliated by diagnosing their complaint as "inflammation of the conscience" and treating them with the corrosive satire of "The Moral Bully." By 1857 Holmes's comic poems and witty lectures had made him famous in his own country and known also to English celebrities like Thackeray, who declared Holmes the best thing he'd seen in America.

In 1857 the literary group in Boston founded a new magazine; James Russell Lowell made his acceptance of the editorship contingent upon the publishers' securing Holmes as a contributor. It was Holmes who gave the magazine its name, *The Atlantic Monthly,* and according to William Dean Howells, its third editor, "he not only named but made it." Page 47 of the first number made the magazine notorious overnight, for it carried Emerson's provoking poem "Brahma" and the tantalizing opening lines of Holmes's *The Autocrat of the Breakfast-Table:* "I was just going to say when I was interrupted." The interruption had occurred 25 years before, when Holmes, after two numbers, abandoned the Autocrat papers published in *The New-England Magazine* (1831, **1832).** *The Atlantic Monthly,* founded in the midst of an economic

depression, owed its survival chiefly to Holmes's essays, and Holmes appears to have been regarded by successive editors as a good-luck piece, for each in his turn anxiously sought assurance that he mould have the doctor's contributions. Many of his poems, all three of the Breakfast-Table books. *Our Hundred Days in Europe, Over the Teacups* and the three novels were there serialized before book publication. *The Autocrat* of 1858 was followed by his alter ego *The Professor* in 1859. The second mas less popular than the first because, under fire from the religious press, Holmes became insistent on attacking Calvinism. His revulsion from Calvinism provided the theme for the novel *Elsie Venner* (1861). Serialized as *The Professor's Story* it brought down upon Holmes's unbowed head the accusation of "moral parricide" and the charge that he was no fit company for Harriet Beecher Stowe. also an *Atlantic* contributor. In writing the novel. Holmes had succumbed to what he astutely recognized as "the flattery of abuse."

A different kind of flattery, that of the *Atlantic's* second editor, James T. Fields, tempted him to try a second novel, *The Guardian Angel* (1867). Somewhat more plausible a story than *Elsie Venner, The Guardian Angel* has the same intention, that of demonstrating the limits of the human will and persuading readers to judge human behaviour from the standpoint of psychology rather than religion. Holmes's third novel, *A Mortal Antipathy* (1885), has a bold psychological theme, but it is ill-conceived and poorly executed; Holmes had undertaken to write it before recovering from the effort of composing a hiography of Emerson (1885). In love with his own planet, Holmes was not prepared to follow Emerson on his metaphysical flights. The best chapter in the biography is that on Emerson's poetry; it particularly pleased readers of the Civil War generation, for it helped them to understand the reverential regard given Emerson before the mar. Holmes's other venture into full-length biography, *John Lothrop Motley* (1879), is more affectionately loyal than informative.

Appraisal. — A mediocre biographer and novelist. Holmes was at his best in the Breakfast-Table chatter, which allowed free play to his wit. As a talker Holmes had his peers in Boston, but no superior. At the monthly meetings of the Saturday club, Holmes delighted in the rapid fire of talk in which his friends Motley and Lowell readily engaged him. According to a less loquacious member of this club of distinguished men, these three wits could all talk at once at high speed without losing the thread of the argument or repeating themselves or each other. While it was said that Holmes talked too much, it was never said that his talk was dull. The conversational form of the Breakfast-Table books, used also in *Over the Teacups*, was for Holmes the ideal medium of expression. Not so sparkling as *The Autocrat* nor so argumentative as *The Professor, The Poet* (1872) is the least pleasing of the four books because it is overweighted with too much serious blank verse instead of being garnished, as the others are, with a variety of poetic forms and moods. *Over the Teacups* (1891), written when Holmes was 80, shows no diminution in wit and no flagging of spirit. In it, the poem "The Broomstick Train" matched "The Deacon's Masterpiece" (in *The Autocrat)* and prompted Lowell to write Holmes that it was "a serious thing to have 'eclipsed the gayety of nations.' " Spontaneous and personal, these four books express Holmes's volatile personality in which, with characteristic candour, he admitted to being "intensely interested." Then too, they provide a record of their author's times, for Holmes's catholic mind touches lightly upon all subjects of current talk, and upon all subjects he flashed the lightning of his wit.

Closely attached to his native ground, Holmes lived all his life in Boston, spending even his summers in Massachusetts, first at Pittsfield and later at Beverly Farms. He contentedly admitted to being as provincial as any Bostonian who contemplated his own reflection in the Frog Pond. He maintained, however, correspondence uith many English friends and was finally. in 1886, persuaded to make his second trip abroad. He spent a triumphant 100 days chiefly in England, where he suffered the delights of a London season; received honorary degrees from Oxford, Cambridge and Edinburgh; and studied with interest Tennyson and Gladstone, who born in 1809 were his exact contemporaries. He managed a flying trip to Paris to make sentimental visits to the cafés he had frequented more than 50 years earlier and to pay a respectful call on Louis Pasteur. The book evoked by the trip is an extended thank-you letter to his hosts.

Surviving all those who had made New England the literary centre of the United States, Holmes fulfilled the expectation of the poem "The Last Leaf." He died on Oct. 7, 1894, and was buried from King's chapel, Boston, in Mt. Auburn cemetery in Cambridge.

BIBLIOGRAPHY.—The best edition of Holmes's works is the Riverside edition, 14 vol. (1891–92). The best edition of his poems is the Cambridge edition of *The Complete Poetical Works*, ed. by H. E. Scudder (1895). *See* also *Representative Selections*, ed. by S. E. Hayakawa and H. M. Jones (1939). The principal biographies are by John *T.* Morse, Jr., *Life and Letters of Oliver Wendell Holmes* (1896), and Eleanor M. Tilton, *Amiable Autocrat* (1947). *See* also *Holmes of the Breakfast-Table*, by M. *A.* DeW. Howe (1939); T. F. Currier's definitive *Bibliography,* ed. by *E.* M. Tilton (1953). (E. M. TN.)

HOLMES, OLIVER WENDELL (1841–1935), justice of the U.S. supreme court, is the only American jurist who competes with John Marshall for the superlative. He was born, a "child of fortune," in Boston, on March 8, 1841. His father was the famed poet-physician, Oliver Wendell Holmes; his mother, the daughter of Justice Charles Jackson of the Massachusetts supreme judicial court. The Olivers, the Wendells, the Jacksons and the Holmeses all played a part in the development of New England, whose intellectual life was being brought to flower during Holmes's youth. He was thus born an aristocrat in the only sense in which the United States has ever had an aristocracy. He was heir. not to great wealth, though he hardly represented the Horatio Alger tradition; nor to distinction. for he had to earn his own place in the firmament; but to an environment of thought in which his mind could be brought to full flower under the most favourable circumstances. His father's intimates included Emerson, Agassiz, Lowell, Longfellow, Prescott, Whittier and Hawthorne. Among his onn companions were Charles Francis, Henry and Brooks Adams and Henry and William James.

Holmes's schooling was that of his time and circumstances: a dame's school. iollowed by a boys' school conducted by a Unitarian minister, then preparation for Harvard college at a Latin school conducted by his future father-in-law, Epes Sargent Dixwell. Harvard college was—in the image of Oxford and Cambridge—a citadel of orthodoxy into which Holmes did not fit. His education was advanced despite his professors, not because of them. Philosophy was his first love and Emerson was his true mentor. Art was a second love. and this appreciation was intuitive; his college essay on Albrecht Durer remains unsurpassed. Writing and good talk were his avocations, and here his father was his master from whom these arts were well learned. Indeed there was a great intellectual debt due from son to father.

Religious orthodoxy, which was then the foundation of Harvard's curriculum, was anathema to Holmes. Dr. Holmes had deserted the strict tenets of his minister-father's Calvinism. His son would not tolerate even the unconfining doctrines of the Unitarian Church. The philosophic skepticism which Holmes developed as a young man and carried through his life was even preceded by a religious skepticism which he apparently got at his mother's knee. For him there were no answers except tentative ones.

The Civil War erupted during Holmes's senior year. Though he was not active in the abolitionist cause—he was never active in any cause—he enlisted immediately. When his battalion was not called up, he returned to Harvard to take his degree. He then secured a commission in the Massachusetts 20th Volunteers, a regiment which participated in the bloodiest battles of the war. Holmes was thrice wounded and three times returned to his regiment, seldom far from the immediate scenes of conflict. He returned to Cambridge when his commission expired before the .end of the war, physically and morally exhausted.

At the Harvard law school, which he attended at his father's instance, Holmes once again met with orthodoxy, this time the orthodoxy of the common law as the perfect legal system. Holmes was less openly rebellious at law school than he had been at college, but no less unwilling to accept the dogmas proffered to him.

After flirting once again with philosophy, he finally determined upon law as a career, but withdrew from law school before completing the course. After a short time in the offices of Robert Morse and John C. Ropes, Holmes set off on the first of many visits to England, which became for him his home away from home.

Europe, and especially England and Scotland, proved most congenial. In England he visited with the great: Gladstone, Roundell Palmer, Lord Houghton, Chancellor Cranworth, Jowett, Mill, Baron Parke, and the duke of Argyll. On this visit as on later visits he made fast and lasting friendships, some of which, as in the case of Frederick Pollock, were recorded in a remarkable series of letters.

When he returned to Boston, Holmes entered the offices of Chandler, Shattuck and Thayer. Of his intellectual debt to Shattuck, one of Boston's great trial lawyers, Holmes said: "I owe more to Mr. Shattuck than I ever owed to anyone else in the world." In Thayer he found a kindred spirit who was to express academically the same doctrines for which Holmes was to become famous as a jurist. Holmes continued to woo philosophy, with Charles Peirce and William James among others, but only as a sideline; he was now fully dedicated to the law. He was admitted to the bar on March 4, 1867, and became a contributor to the *American Law Review* and its co-editor in 1870. In 1869 he undertook the extensive job of producing the 12th edition of Kent's *Commentaries* which was published in 1873. Holmes's official biographer, Mark Howe, has attributed this total immersion in the law to "a Puritan's feeling that no moment should be wasted" (*Justice Oliver Wendell Holmes,* vol. i, Harvard University Press, Cambridge, Mass., 1957). Holmes's less charitable contemporaries regarded the spur as regard for place, for there were in Holmes strong traits of ambition and vanity.

In 1872 he married Fanny Bowditch Dixwell, a marriage which provided a remarkable man with a remarkable wife. Howe has written: "When New England breeds a woman of intelligence and reserve, it occasionally brightens those qualities with a dash of wit, and humor, and ashamed to admit it, softens them with sentiment . . . Cambridge had bred such a girl in Fanny Dixwell. . . ." (*Justice Oliver Wendell Halmes).* When she died, Holmes wrote to Pollock: "We have had our share. For sixty years she made life poetry for me." (Mark De Wolfe Howe [ed.], *Holmes-Pollock Letters,* 2 vol., Harvard University Press, Cambridge, Mass., 1941.)

The early fugitive writings of Holmes were systematized in his most important contribution to legal thinking, *The Common Law,* which was published in 1881 after first being delivered as a series of lectures at the Lowell institute. As Mr. Justice Frankfurter has said: "The book is a classic in the sense that its stock of ideas has been absorbed and become part of common juristic thought. . . . they placed law in a perspective which legal scholarship ever since has merely confirmed." (*Of Luw and Men,* Harcourt, Brace and Co., Inc., New Tork, 1956.) Its opening words set its theme much as do the opening notes of Beethoven's Fifth Symphony: "The life of the law has not been logic; it has been experience." (Little, Brown & Co., Boston, 1938).

The publication of this book led Harvard to offer Holmes the Weld chair at the law school, which he accepted on condition that he be free to take a judicial post were one to be opened to him. For him the ivory tower could only be a second choice: "The final test . . . is battle in some form. . . . It is one thing to utter a happy phrase from a protected cloister; another to think under fire—to think for action upon which great interests depend." (*Mind and Faith of Justice Holnzes,* ed. by Max Lerner, Little, Brown & Co., Boston. 1943.) Less than a year later he was a judge. Holmes served on the supreme judicial court of Massachusetts from 1883 until 1902, the last three years as chief justice.

In 1902 Pres. Theodore Roosevelt, looking for a "liberal" of his own pattern and mistakenly believing he had found him, appointed Holmes to the supreme court of the United States. On the Massachusetts court Holmes had written about 1,300 opinions, most of them resolving controversies between individuals. On the national court he had a different function to perform. But it was in this new arena, which called upon the actors to define the boundaries of governmental power, that Holmes established himself as a peer of Marshall. Unlike Marshall, however. Holmes espoused a doctrine of judicial restraint. And however important his many individual opinions may be, his view of the judicial function is more important: "While the courts must exercise judgment of their own. it by no means is true that every law is void which may seem to the judges who pass upon it excessive, unsuited to its ostensible end. or based upon conceptions of morality with which they disagree. Considerable latitude must be allowed for differences of view as well as for possible peculiar conditions which this court can know but imperfectly. if at all. Otherwise a constitution, instead of embodying only relatively fundamental rules of right, as generally understood by all English-speaking communities, would become the partisan of a particular set of ethical or economical opinions, which by no means are held *semper ubique et ab omnibus."* (*Otis* v. *Parker,* 187 *U.S.* 606, 608 [1903].)

Short of his 92nd year by only a few months, Holmes resigned on Jan. 12, 1932, writing "the time has come and I bow to the inevitable." He died on March 6, 1935, leaving the bulk of his estate to the United States of America. In a message to congress suggesting that these funds be put to an appropriate use, Pres. Franklin Delano Roosevelt said of Holmes that "for him law was an instrument of just relations between man and man. With an insight into its history that no American scholar has surpassed; with a capacity to mold ancient principles to present needs. unique in range and remarkable in prophetic power, nith a grasp of its significance as the basis upon ahich the purposes of men are shaped, Mr. Justice Holrnes sought to make the jurisprudence of the Cnited States fulfill the great ends our nation was eatablished to accomplish." The bequest was ultimately used to finance a history of the supreme court, an appropriate use and a fitting tribute to its great donor.

BIBLIOGRAPHY.—The literature on Holmes is extensive. *See* vol. 1 of his authorized biography by Mark De Wolfe Hocve, *Justice Oliver Wendell Holmes: the Shaping Years, 1841–67* (1957); other biographies are Silas Bent, *Justice Oliver Wendell Holnzes* (1932); Francis Biddle, *Mr. Justice Holmes* (1942); Catherine Drinker Bowen, *Yankee From Olympus* (1943). *See* also Samuel J. Konefsky, *The Legacy of Holmes and Brandeis* (1956); Max Lerner (ed.), *The Mind and Faith of Mr. Justice Holmes* (1943); Felix Frankfurter, Mr. *Justice Holmes and the Supreme Court* (1939), (ed.), *Mr. Justice Holnzes* (1931). HOLMES, WILLIAM HENRY (1846–1933), U.S. anthropologist, was born in Harrison county, O., on Dec. 1, 1846. He graduated in 1870 from McNeely Normal college (Ohio) and in 1872 became an assistant in the U.S. geological survey. He was with the F. V. Halden survey in the Rocky mountain states for eight years, being assistant geologist 1875–80. In 1880 he was appointed geologist and continued his western explorations. From 1888 to 1894 he served as archaeologist with the Bureau of American Ethnology. After a brief period as curator of anthropology at the Field Columbian museum in Chicago (1894–97), he returned to Washington to become head curator of the department of anthropology at the U.S. National museum (1897–1902). After serving as chief of the Bureau of American Ethnology, 1902–10, he again returned to his position as head curator at the National museum, which he held until 1920. During 1908–20 he also served as curator for the National Gallery of Art, and in 1920 gave up his archaeological work to become director of that institution. He mas one of the pioneers in archaeological investigation in the southwest. His researches in aboriginal pottery greatly contributed to knowledge of the habitat and relationships of Indian groups and cultures.

His books include *Art in Shell of the Ancient Americans* (1883); *Ancient Pottery of the Mississippi Valley* (1886); *Pottery of the Ancient Pueblos* (1886); *Ancient Art of the Province of Chirique, Colombia* (1888); *Archaeological Studies Among the Ancient Cities*

of Mexico (1895–97); Aboriginal Pottery of the *Eastern* United States (1903). A complete bibliography of his writings to 1916 is found in *Holmes Anniversary Volume,* Anthropological Studies (1916).

HOLMIUM (symbol Ho, atomic number 67, atomic weight 164.94. stable isotope Ho^{165} [100%]), is one of the least abundant of the metallic elements belonging to the rare-earth group; the name is derived from Holmia, a Latinized form of Stockholm. It was discovered by J. L. Soret in 1878 and independently by P. T. Cleve in 1879. Holmium occurs associated with the other rare earths in the minerals gadolinite, euxenite, xenotime, samarskite, etc. It has usually been purified by the fractional crystallization of the bromates; the yttrium contained in this product is then removed by the fractional crystallization of the double sodium sulfates in a vacuum at 25°–30° C. From 1945 it was separated efficiently by means of ion-exchange columns. After 1953 kilogram quantities of very pure holmium oxide mere separated by this means. Holmium oxide! Ho_2O_3, is yellowish in colour and is generally soluble in acids. It forms orange-yellow salts which are paramagnetic. Solutions show strong absorption spectra. The metal is produced by the calcium reduction of the anhydrous fluoride. It is silvery in colour and becomes ferromagnetic at extremely low temperatures. At slightly higher temperatures it appears to be antiferromagnetic.

The metal crystallizes in the hexagonal close-packed system $a = 3.5773$ Å, $c = 5.6158$ Å, and has a calculated density of 8.799 g. per cubic centimetre. It melts at 1,500° C. and boils in the neighbourhood of 2,600° C. It has an appreciable vapour pressure at the melting point. See RARE EARTHS. (F. H. SP.)

HOLROYD, SIR CHARLES (1861–1917), English artist noted for the technical excellence of his etchings. was born at Leeds on April 9, 1861. It was intended that he should become a mining engineer, but after a false start at the Yorkshire College of Science, Leeds, he received an art education under Alphonse Legros at the Slade school. University college, London.

After obtaining a traveling scholarship he studied for two years (1889–91) in Italy. Except for that interval, he was assistant master at the Slade school from 1885 to 1893. He was an occasional portraitist and landscape painter, and for Aveley church, Essex, he painted a triptych altarpiece.

Holroyd was chiefly distinguished as an etcher possessed of profound technical knowledge. Among the best-known plates are the "Monte Oliveto," "Icarus," "Monte Subasio" and "Eve" series, together with "The Flight Into Egypt," "The Prodigal Son," "A Barn on Tadworth Common" and "The Storm." Holroyd was the first keeper of the National Gallery of British Art (Tate gallery), 1897–1906, and director of the National gallery, 1906–16. He was responsible for the acquisition for the National gallery of the Layard pictures, and for the proper display at the Tate of works by Alfred Stevens and Turner that lay neglected in store. He was knighted in 1903. He died at Weybridge on Nov. 17, 1917.

HOLST, GUSTAV (1874–1934), English composer, was born at Cheltenham on Sept. 21, 1874. His father came of a Swedish family, one branch of which had settled in England early in the century. Holst entered the Royal College of Music, London, in 1893, and was a pupil of Sir Charles Stanford for composition, in which branch he gained a scholarship after two years. He also studied piano, organ and trombone. In 1898 he left the college and for several years played trombone in an orchestra. As a teacher he became associated with the Passmore Edwards settlement (1904), Morley college (1907), Reading college (1909) and St. Paul's Girls' school, London (1905), and after 1919, taught composition at the Royal college. In 1918 he worked among the troops in Salonika, organizing music under the Young Men's Christian association. He visited the University of Michigan, Ann Arbor, in 1923 to conduct a concert of his own works. Holst's international reputation as a composer dates from the appearance of his largest symphonic work, *The* Planets (opus 32), in 1919. Next in importance are the Hymn of *Jesus,* opus 37, no. 1 (1917), for chorus and orchestra; the Choral Symphony, opus 41 (1923); the Vedic Hymns for voice and piano. opus 24, and for chorus and orchestra, opus 26. which, with the opera *Savitri,* opus 28. represent the eastern period in Holst's music; the opera: The Perfect Fool (1923); and the very charming examples of his lighter style —St Paul's Suite for string orchestra (written for St. Paul's Girls' school) and the medieval songs for voice and violin. Holst produced his choral effects with a sureness and ease that tell of long experience. He was particularly successful in writing for female voices. As an instance of his thoroughness it may be noted that he studied Sanskrit for the purpose of making his own translations for his songs, and himself wrote the libretto for *Savitri.* Characteristic of his idiom is the folk-song strain in his melody and the frequent use of unusual time signatures. His other works include Beni *Mora,* opus 29, no. 1, oriental suite for orchestra; suites for military band, opus 28, a, b; Japanese Suite for orchestra. opus 33; part songs for mixed voices, opus 34; choral folk songs, opus 36, no. 2; Ode to Death (Whitman) for chorus and orchestra; fugal overture for orchestra, opus 40, no. 1; fugal concerto for flute, oboe and string accompaniment, opus 40. no. 2.

HOLSTEIN, FRIEDRICH VON (1837–1909), from 1878 to 1906 counselor (Vortragender Rat) in the political department of the German foreign office, was the most important personality, after Bismarck. and equally with William II, in the political history of the German empire. Friedrich August von Holstein was born on April 21, 1837, of an old and noble, but untitled. Mecklenburg family. He attended the Gymnasium and the university in Berlin, and after passing his examinations in law entered the foreign office in 1860 as attaché. His first post was in St. Petersburg, under Bismarck, who was at that time Prussian ambassador. His most important secretarial post was in Paris after the war of 1870–71, first under Generals von Fabrice and von Waldersee, and later, after the re-establishment of the embassy, under the ambassador Count Arnim. He became secretary of legation in 1872, and in 1876. after Arnim's fall, was recalled to the foreign office, where the rest of his career was passed. At the Congress of Berlin in 1878 he accomplished excellent work, which was recognized by Bismarck, and was promoted Vortragender Rat.

After Bismarck's fall he appears at once as the "wirepuller in chief," whose extraordinary influence is known to all the initiated. Holstein was the only man in the foreign office who mastered the complicated principles of German foreign policy, and was able to lay down its course with an assurance which may have been real and in any case was apparent. This situation continued, contrary to expectation, even during Bülow's long years of office. The first time that Biilow acted independently was during the Moroccan crisis of 1905–06. Holstein thereupon tendered his resignation, as the most effective way of gaining his point; it happened, however, that both chancellor and the secretary of state succumbed to strokes in quick succession and the secretary of state's deputy, Tschirschky, submitted Holstein's proffered resignation to the emperor. who accepted it. Even after Holstein's dismissal, Biilow did not despise his advice in later difficulties. A long memorandum by Holstein. for example, exerted a decisive influence on the attitude of the German government in the Bosnian crisis of 1908–09. He died in Berlin on May 8, 1909.

Relations With Bismarck.— Bismarck kept in personal touch with his former attaché, whom he took with him ten years later to headquarters at Versailles, afterward appointing him to the embassy under Freiherr von Arnim. It was there that the first great scandal arose, which is characteristic of Holstein. Soon after Arnim's appointment to the embassy, Bismarck quarreled with him, and employed Holstein to spy on his chief. In the trial in which Bismarck broke the ambassador, Holstein was obliged to come forward as a witness and to admit that he had written letters to the chancellor about his chief, Count Arnim. Bismarck had unmasked the secretary of legation before all the world as an intrigant; and this earned Holstein's undying hatred. He believed that Bismarck had shamed him as a traitor in order to make him a degraded and unresisting tool. The passion of injured pride and vanity with which he reacted against this, the force of hatred, which was to endure nearly 20 years, are no less characteristic of Holstein than his secret collaboration with Bismarck against Arnim.

Prince Philip Eulenburg is the chief authority for the statement that Holstein was mainly instrumental in bringing about Bismarck's fall. But, he says, Holstein's tread was so soft and so

hidden his ways, that he himself failed to detect the secret method of this enemy. It is impossible to say how far Holstein was influenced by his old hatred, how far by boundless ambition, which could not bear even a Bismarck in its path. and how far by political conviction that Bismarck's policy had ceased to be sound. Any of these three motives may have been present.

Diplomatic Decisions. — Whether Bismarck, after the Congress of Berlin, did or did not utter the proud saying, "From now onward I will drive Europe four-in-hand in harness." the foreign office in Berlin was fully convinced that this was Germany's position in Europe, at least up to the Conference of Algeciras, and Holstein developed this conviction into a system. As England would never be able to reconcile its differences either with France or Russia. the triple alliance would always remain the dominating combination, even in the case, which hardly needed to be considered seriously, of Russia's joining France in the war against Germany. That was Holstein's basic idea. He therefore held the task of German statesmanship to be to play off England and Russia against each other, either placing them under an obligation by some service. or coercing them by threats if the counterservice was not rendered. He did not in any case want to start a war. That was to be left to the tao world powers which were described as the bear and the whale. and which, it was thought, must inevitably clash. This clash mould then give Germany its great opportunity.

This was the system on which Holstein based his policy. It began with the nonrenewal in March 1890 of the German-Russian treaty of 1887. It would have been consistent with Holstein's policy to keep the treaty, but the system also allowed him to ignore it. For Holstein did not believe that Russia could form an alliance with France nhich would stand the test of Mediterranean policy. The suggestion that a treaty with Russia, added to one with Austria, was an act of dishonesty toward the latter power, was incorrect. Both treaties nere defensive in their terms, and the aim of the double arrangement was not to let either of the two rivals in the Balkans act against the other and thereby against the peace of Europe. It is true, as Caprivi and others maintained, that this policy was more difficult to conduct than one which dealt uith Austria alone. But Holstein shunned rather than sought simplicity; the only explanation of his decision is therefore his hostility to Bismarck. Bismarck's fall was to be final, his return made impossible. Up to Bismarck's death, Holstein was always tortured by the nightmare of the possible return of the "Bismarcks." The danger of return would. however, have been greater on the renewal of the Russian treaty than at any other time. The following year saw Russia's political understanding with France, and 1892 the drafting of that military convention which was still in force in 1914. If it is remembered that at least up to 1908 Russia did not come into any sort of conflict, even with Austria. much less with Germany, it is clear that the one circumstance nhich drove the tsar into the arms of France was the nonrenewal of the treaty. which was accompanied by ostentatious advances by the emperor William to England, causing the tsar to fear an attack. Thus two days after Bismarck's dismissal, the superiority of the triple alliance. which had hitherto been indubitable. vanished. France emerged from its isolation, and a danger of war betneen the two European systems of alliance arose. The chief responsibility for this must rest on two men: the emperor and Holstein.

In the succeeding period Holstein's political path always led him nearer to Russia than to England. This attitude was largely due to his dislike of Lord Salisbury. The rebuffs experienced by Eismarck in 1887 and 1889 from the British foreign minister seem to have had a strong aftereffecton Holstein. Between 1893 and 1895 came England's refusal to agree to the Italian plan of redrafting the Mediterranean agreement of 1887 more closely and more favourably for Italy. Holstein had supported Italy's wishes, and felt the refusal as a personal rebuff. Again. after the Chinese-Japanese war, Germany joined the Russo-French note, while England refused at the last moment, making Germany's attitude conspicuous. Holstein believed that England had maneuvered him into a false position. Then, in 1895, the British prime minister sounded the powers regarding the partition of Turkey. Here Holstein conceived a fixed idea that British policy was aiming at bringing Germany into opposition with Russia and getting it to pull the chestnuts out of the fire for Great Britain. For Holstein assumed that Salisbury had conceived the whole plan in order to keep Russia quiet in the far east. Later, after the emperor had met Salisbury's suggestions with a sharp refusal, Holstein saw that the plan had accorded with Russia's interests, and altered the foreign office's recommendation, but too late.

Holstein is quite certainly the spiritual father of Germany's attitude toward the advances made by Chamberlain and Lansdowne in 1899–1901. In England itself. Salisbury consented only with reluctance to negotiations for a general understanding betneen England and Germany; and the idea immediately encountered the strongest opposition from Holstein. He feared that Germany was to be driven into a war with Russia and France and dropped at the decisive moment. He rightly saw that England would be unable to allow a fresh victory by Germany over France. But he failed to see that if England were bound to Germany by a general understanding, and the U.S. and Japan also joined this combination, as seemed possible. then Russia and France would never have dared risk a war with Germany, Austria and Italy. On the other hand. Holstein committed the error of considering England's differences uith France and Russia to be insuperable, although Chamberlain made it absolutely clear that England, if rebuffed by Germany, would seek and find a settlement of its differences with Russia and France, which must then necessarily bring it into opposition to Germany. The negotiations were dragged out so long at Holstein's orders, and made so difficult that at last the British government broke them off in Dec. 1901 after concluding the treaty with Japan.

When war threatened to break out between Russia and Japan in 1904, Holstein remained so conspicuously deaf to all warnings, particularly from Freiherr von Eckardstein. the well-informed councilor of embassy in London, that at this point the suspicion arises that financial motives influenced his attitude. During the war he adhered to his former policy of contact with Russia and strained relations dangerously with England by allowing Russian ships of war to take in German coal in the Baltic. If England had now joined Japan in its fight with Russia, and if France had supported its ally Russia against England and Japan, the continental alliance between Russia, France and Germany would have been formed. Without wishing for a war aith England, which would have entailed the sacrifice of Germany's mercantile marine, Holstein envisaged the possibility of this alliance; and there is proof that one of the motives behind the German naval program was the wish to enhance Germany's value to Russia as a potential ally. The emperor, indeed. when he afterward concluded the desired alliance with the downcast tsar at Bjorkoe on July 24, 1905, privately altered the foreign office draft and limited the obligation of active mutual assistance to Europe, evoking thereby Bülow's offer of resignation, which was as unexpected as it was unnelcome to him. Bülow could have nullified the effect of the treaty of Bjorkoe, which the Russian foreign minister. Count Lamsdorff, saw to be impracticable, without resigning; his threat of resignation must be therefore looked on as a successful attempt to curb the emperor's power—a typical Holstein maneuver.

The last time that Holstein determined German policy was over the first Morocco bargain with France. The Anglo-French entente had just been concluded and England had promised to support France in its action. which was irreconcilable with the 1880 Morocco convention of Madrid. Holstein had always declared the Anglo-French entente to be a dream, and wished to seize the opportunity to shatter it. If this artificial neb were only held to the light of the sun, he thought, the natural opposition of the two powers in Morocco must pulverize it. The emperor wanted Germany to remain disinterested in Morocco; but Bülow and Holstein sent him to Tangier against his will. There by a speech, not that drawn up for him by the foreign office, but one of his own—which gave Holstein a nervous shock—he drew on himself public disapproval of his personal interference. The French and British governments would have been glad to find a diploinatic

settlement for the matter. but Holstein insisted on a conference and was not even satisfied by Delcassé's leaving the French cabinet. He wanted to put forward and eniorce such unmistakable and decisive demands as to compromise the Anglo-French entente. As Russia was absolutely out of action at the moment, and the French government was consequently unable to risk an armed conflict; and as Germany also had international law on its side, which must place the British government in an embarrassing light, Holstein's campaign, which he planned with great energy, had every prospect of success. But here for the first time Bülow failed to follow his tyrannical adviser. Fear of possible war with Great Britain, which would annihilate Germany's trade, seems to have been his decisive motive. Holstein in consternation tendered his resignation for the 14th time, and this time, as said above, it was, contrary to expectation, accepted. Thus he relinquished the reins of policy, after holding them since Bismarck's resignation. Only once again, during the Bosnian crisis, had he an opportunity of affecting a great decision by his advice. Holstein believed that the issue of the crisis had been a victory for Germany, which repaired the defeat of 1906. This was a grave error. Far from loosening the entente. Russia's defeat over the Bosnian question in 1908–09 resulted in a reconstruction of the entente on lines of closer diplomatic co-operation, and in a determination to arm.

It was Holstein who by his share in the nonrenewal of the German treaty with Russia took the decisive step in making Germany dependent on Austria-Hungary. In trying to repair this fault by a *rapprochement* with Russia, he missed the hour in which Great Britain could have been won for the triple alliance, without being able to overcome the hostility of Russia, which dated from 1878 and had its roots in its rivalry with Austria in the Balkans. Finally, when England had composed its difficulties with France and Russia. consequent on which Italy also joined this group, Germany was left alone with Austria-Hungary. Possibly Holstein's Morocco policy would have been a more effective way of breaking the increasing menace of encirclement than Austria's war with Serbia in 1914. But it was due to Holstein's policy that the two central powers were isolated at all. (E. Fr.; X.)

HOLSTEIN, formerly a duchy of Germany, later incorporated in Prussia. Until about 1110 the county of Holstein formed part of the duchy of Saxony. and it was made a duchy in 1472. From 1460 to 1864 it was ruled by members of the house of Oldenburg, some oi whom were also kings of Denmark. By the treaty of Vienna (Aug. 1864) which concluded the Danish War. Holstein was ceded to Prussia and Austria jointly, but placed under the administration oi Austria, which. however, was forced to deliver it over to Prussia after the Austro-Prussian War of 1866. *See* SCHLESWIG-HOLSTEIN; SCHLESWIG-HOLSTEIN QUESTION.

HOLSTENIUS, LUCAS, the Latinized name of LUC HOLSTE (1596–1661), German humanist, geographer and theological writer. was born at Hamburg. He studied at Leyden university, where he became intimate with the most famous scholars of the age—J. Meursius. D. Heinsius and P. Cluverius. whom he accompanied on travels in Italy and Sicily. Eventually he went to Paris, and was recommended to Francesco Cardinal Barberini. papal nuncio and the possessor of the most important private library in Rome. He was appointed librarian of the Vatican by Innocent X. and was sent to Innsbruck by Alexander VII to receive Queen Christina's abjuration of Protestantism. He died in Rome on Feb. 2. 1661. Holstenius was the author of notes on Cluvier's *Italia antiqua* (1624); an edition of portions of Porphyrius (1630); notes on Eusebius *Against Hierocles* (1628). on the sayings oi the later Pythagoreans (1638), and the De *diis et mundo* of the neo-Platonist Sallustius (1638); *Notae et castigationes in Stephani Byzantini ethnica* (first published in 1684); and *Codex regularum, Collection of the Early Rules of the Monastic Orders* (1661). His correspondence *(Epistolae ad diversos,* ed. by J. F. Boissonade, 1817) is a valuable source of information on the literary history of his time.

HOLT, SIR JOHN (1642–1710), lord chief justice of England. remembered for the firmness with which he upheld his prerogatives in opposition to the authority of the houses of parliament. was born at Thame. Oxfordshire, on Dec. 30, 1642. He studied at Oriel college, Oxford, and at Gray's Inn, London. He was called to the bar in 1663. An ardent supporter of civil and religious liberty, he defended accused persons in many state trials. In 1685–86 he was appointed recorder of London. He was dismissed from this office about a year later after refusing to pass sentence of death on a soldier for desertion. He doubted whether the soldier's conviction in peacetime was good in law. As a legal assessor to the peers in the convention Holt took a leading part in the Glorious Revolution, and after the accession of William III was appointed lord chief justice of the king's bench. In judicial fairness, legal knowledge and ability, clearness of statement and unbending integrity he had few superiors on the English bench. In 1700 Holt was offered the great seal, but declined it. He died in London on March 5, 1710. (R. G. M. B.)

HOLTEI, KARL VON (1798–1880), German poet, playwright, novelist and actor who achieved success by his "vaudevilles" or ballad operas and by his recitations, was born at Breslau, Jan. 24, 1798. After studying law, in 1821 he married the actress Luise Rogée (1800–25) and was made official poet at the Breslau theatre. He soon went to Berlin where his two popular ballad operas, *Die Wiener in Berlin* and *Die Berliner in Wien,* were produced in 1824, and where he also wrote a number of plays for the Konigsstadter theatre, notably *Lenore* and *Der alte Feldherr* (both 1829). In 1830 he married the actress Julie Holzbecher (1809–39) and with her toured Germany and Austria. In Vienna in 1833 he created a sensation by his brilliant recitations, especially of Shakespeare, and was appointed manager of the Josefstadter theatre, where he remained until 1836. From 1837 to 1839 he was manager of the theatre at Riga, and then led a wandering life until 1847, when he settled at Graz, where he wrote several novels. The last years of his life were spent at Breslau, where he died, Feb. 12, 1880. As a dramatist his chief importance was that he introduced the "vaudeville" into Germany; as a poet. he was particularly successful in the Silesian dialect; as a reciter, he was unequaled, especially in his interpretation of speeches from Shakespeare. His lively autobiography, *Vierzig Jahre,* was published in 6 vol., 1843–50, with two supplementary volumes, *Noch ein Jahr in Schlesien* (1864); his plays appeared in 6 vol. in 1867, and his collected works in 39 vol. (1861–66).

HÖLTY, LUDWIG HEINRICH CHRISTOPH (1748–1776), German poet, the most gifted lyric poet of the Gottingen circle, was born Dec. 21, 1748, at Mariensee, Hanover. In 1769 he went to Gottingen to study theology and became a close friend of J. M. Miller. J. H. Voss, H. Boie, the brothers Stolberg and others, with whom he founded (1772) the *Gottinger Dichterbund* or *Hain,* a group of young poets, mostly of peasant background, whose work drew inspiration from folk song and ballad. His poems appeared in the society's *Musenalmanach* and other collections. He died of tuberculosis at Mariensee. Sept. 1. 1776. His *Gedichte* were published by Friedrich Leopold zu Stolberg and Voss, 2 vol. (1782–84); an enlarged edition by Voss (1815). included a biography. There was a critical edition by W. Michael, 2 vol. (1914–18).

Holty was influenced by J. P. Uz and by Klopstock, but his love for the *Volkslied* and his real delight in nature preserved him from the artificiality of the one and the cloudiness of the other. A strain of natural melancholy, tempered by sincere religious faith, runs through his lyrics. His ballads are the pioneers of the rich ballad literature which, influenced by English models made available by the publication of Percy's *Reliques* (1765), sprang up in Germany in the late 18th century. He also translated from Anacreon. Ariosto, Tasso and the English poets.

See H. Ruete, *Holty, sein Leben und Dichten* (1883); *W.* Kayser, *Geschichte der deutschen Ballade* (1936).

HOLTZMANN, HEINRICH JULIUS (1832–1910), German Protestant theologian, was born on May 17, 1832. at Karlsruhe. He wrote on the Synoptics (1889), the Johannine books (1890) and the Acts of the Apostles (1901) in the series *Handkommentar zum Neuen Testament.*

Other noteworthy works are the *Lehrbuch der histor.-kritischen Einleitung in das Neue Testament* (1885, 3rd ed. 1892), and the *Lehrbuch der neutestamentlichen Theologie* (2 vols., 1896–97; 2nd ed., 1911).

HOLUB, EMIL (1847–1902), Bohemian traveler in south-central Africa, was born at Holitz, eastern Bohemia, on Oct. 7, 1847. In 1872 he went to the Kimberley diamond fields and practised as a surgeon. He undertook expeditions to the northern Transvaal. blashonaland and through Bechuanaland to the Victoria falls, making extensive natural history collections. In June 1886 he crossed the Zambezi west of the Victoria falls and explored the then almost unknown region between that river and its tributary the Kafue.

When the expedition was beyond the Kafue the camp was attacked by the Mashukulumbwe. and Holub had to retreat. He returned to Austria in 1887 with a collection of great scientific interest, of over 13,000 objects, now in various museums. Holub died at Vienna on Feb. 21, 1902.

His principal works are: *Eine Culturskizze des Marutse-Mambundareichs* (1879); *Sieben Jahre in Südafrika,* etc. (2 vol., 1880–81), of which an English translation appeared; *Die Colonisation Afrikas* (1882); and *Von der Kapstadt ins Land der Maschukulumbe* (2 vol., 1888–1890).

HOLY, sacred, devoted or set apart for religious worship or observance. It is a term characteristic of the sublimity and perfection of God, as the object of human reverence, awe and worship; and it is applicable to all that is held sacred or that excites awe, particularly, though not exclusively, to what is worthy of veneration or reverence on the ground of its moral worth; hence the term is transferred to those human. persons, who, either because of their devotion to a spiritual life, or because of their moral perfection, are considered worthy of reverence. *See* RELIGION.

HOLY ALLIANCE, the name given to a 19th-century organization of collective security for Europe after the French Revolutionary and Napoleonic Wars. The outcome not of a comprehensive general agreement but of a series of diplomatic acts and proceedings. it took its name from a treaty between Alexander I of Russia. Francis I of Austria and Frederick William III of Prussia. This treaty was signed in Paris on Sept. 26, 1815, while the members of the Quadruple alliance, namely Russia. Austria, Prussia and Great Britain. were negotiating a new peace treaty with France after the Hundred Days.

This treaty was supposed to inaugurate a community of the Christian nations of the world. without regard to the question of victory or defeat in the preceding wars. Though Great Britain steadfastly refused to accede to it, France was secretly admitted to the Holy alliance on Nov. 19, 1815, just before the signing of the second treaty of Paris between the allies and the restored Bourbon kingdom of France and the public renewal of the Quadruple alliance (Nov. 20). France's accession to the Holy alliance was made public at the congress of Aix-la-Chapelle (*q.v.*) in 1818.

For a long time historians regarded the treaty concluded on Sept. 26. 1815. as a sort of mystical union which the influence of the baroness von Kriidener (*q.v.*) had brought Alexander to sponsor. It seems, however, that Alexander was less preoccupied by evangelical exaltation than by a political design to create an international concert through which Russia could counterbalance the sea power of Great Britain by that of other maritime nations. such as the Netherlands, France. Spain (which all acceded to the treaty! and the United States (which however declined the invitation to accede). Such a concert would indeed have had an effect opposite to that of the Quadruple alliance. through which Viscount Castlereagh hoped to maintain a continental European balance of power favouring British interests. All the powers, however, mere at one in wanting to avoid another war and to continue that system of conferences and congresses which had preserved allied unity in the negotiations with France. Consequently at the congress of Xix-la-Chapelle in 1818 the Austrian minister Metternich was able to achieve some compromise between divergent aspirations of the participant powers. The general system that emerged from the compromise was manifested in the subsequent congresses of Troppau, of Laibach and of Verona (*qq.v.*) in 1820, 1821 and 1822.

Another consequence of the common desire to avoid a major war was that the powers sought to maintain the existing state of affairs. This concern explains the Austrian intervention in Naples and in Piedmont (1821j and the French intervention in Spain (1823); and it also explains to some extent the pressure brought by the other powers to prevent Russian intervention against Turkey over Greece (1821–23).

Castlereagh's diplomacy meanwhile succeeded in excluding from the series of congresses the maritime powers, such as Spain and the United States, which Alexander I would have liked to invite. The result was that the system of the Holy alliance was confined to Europe. Though both France and Russia tried to extend its operation to Latin America, the British minister George Canning and the U.S. president James Monroe together succeeded in limiting it to the North Atlantic seaboard; and France, authorized to intervene in Spain by Russia, Austria and Prussia at the congress of Verona, was deterred from carrying this intervention to South America, where the Spanish colonies were in revolt. Thereafter the French government, in order to protect its economic interests in America, had to seek a *rapprochement* with the liberally disposed nations of the Atlantic world.

With France's virtual secession, the general system fell to pieces. Thenceforward the Holy alliance was nothing more than the coalition of Russia. Austria and Prussia for the maintenance of the existing order in eastern Europe. Among the Atlantic powers the free-trade policy advocated from 1822 by the British board of trade became the basis of peaceful relations.

For further discussion of British foreign policy during this period see the biography of Castlereagh under LONDONDERRY, ROBERT STEWART, 2ND MARQUESS OF. For U.S. policy *see* MONROE DOCTRINE, THE.

HOLY CHILD JESUS, SOCIETY OF THE (S.H.C.J.), a teaching order of women religious founded in England in 1846 by Cornelia Connelly (*q.v.*). The general mother house is at Rome, and members number around 800.

See WOMEN'S RELIGIOUS ORDERS: *Since the French Revolution.*

HOLY CROSS, CONGREGATION OF, (CONGREGATIO A SANCTA CRUCE; C.S.C.), a Roman Catholic institute of religious. was formed in 1837 by Basil Moreau by uniting the Auxiliary Priests (founded by him in 1835) and the Brothers of St. Joseph (founded by James Dujarie in 1820) at Sainte Croix, Le Mans, France. In 1841 the Marianite Sisters of Holy Cross were founded by Moreau. There are a priests' society and a teaching brothers' society. both having nonteaching brothers, the same constitutions and top administration, but each is otherwise autonomous at the provincial level. Approximately 3.000 Holy Cross priests and brothers in 11 provinces are stationed in Haiti, Brazil. Chile, Ireland, France. Spain. Italy. Ghana. Liberia, Uganda. Pakistan, India, Canada and the United States. The generalate is in Rome, Italy. Best known of Holy Cross operations are St. Joseph's shrine. Montreal; the Family Rosary crusade: and the University of Notre Dame. founded in 1842 near South Bend, Ind.. by E. F. Sorin.

HOLY DAYS OF OBLIGATION are religious feast days on which Roman Catholics are bound to attend Mass and refrain from unnecessary work. Although all Sundays are sanctified in this nay, the term "holy days" usually refers to other feasts that must be observed in the same manner as Sunday. The number of such days has varied greatly, since until the 17th century bishops had the right to institute new feasts for their dioceses. At that time Pope Urban VIII limited the number of holy days through-

out the church to 36. In 1918. taking into account the difficulty of observing religious feasts that are not civil holidays, canon law designated ten holy days: Christmas, Circumcision, Epiphany, Ascension. Corpus Christi, Assumption, Sts. Peter and Paul. All Saints, the Immaculate Conception, and St. Joseph. By papal permission this number is reduced in some countries. Thus the Immaculate Conception and St. Joseph are not observed in England and Wales; Epiphany, Corpus Christi, Sts. Peter and Paul and St. Joseph are not kept in the United States. Canada has the same holy days as the United States except that the Epiphany is observed and the Assumption is not. Scotland and Ireland keep all ten holy days, except that Ireland celebrates St. Patrick's day instead of St. Joseph. The various Eastern Catholic churches have their own feasts of obligation; which are generally more numerous than those of the western church. *See* also CHURCH YEAR.

(J. H. ZI.)

HOLY GHOST: *see* HOLY SPIRIT. THE.

HOLY GHOST, CONGREGATION OF THE (CONGREGATIO S. SPIRITUS SUB TUTELA IMMACULATI CORDIS BEATISSIMAE VIRGINIS MARIAE; C.S.Sp.), a Roman Catholic society of men, founded in 1703 in Paris, by a former lawyer, Claude François Poullart des Places. Originally intended only for the training of seminarians. the congregation gradually began to take an active part in missionary work. Suppressed by the French Revolution. it was restored under Napoleon, but recurrent persecution kept it weak until 1848 when the Congregation of the Immaculate Heart of Mary merged with it and Venerable Francis Libermann. a convert from Judaism. became its 11th superior-general. The congregation pioneered in the resumption of African missions in the 19th century. Xlong with missions (of which the African are still most significant) the Holy Ghost Fathers (Spiritans) staff many educational and social works. The general mother house is in Paris and members number about 5.000.

(V. F. G.)

HOLYHEAD, a seaport town and urban district in the Anglesey parliamentary division of Wales, on Holy or Holyhead Island at the western end of the county of Anglesey. Pop. (1961) 10,408. Area 1.1 sq.mi. It is a railway terminus and one of the main ports for Ireland. 263½ mi. by rail and 257 mi. by road N.W. of London. There are many traces of prehistoric and Roman occupation including a large hill fort on Holyhead mountain and the Roman fort of Caer Gybi. A fishing village. Holyhead was selected as a port for Dublin in 1801 and in 1815–19 T. Telford built the Shrewsbury–Holyhead road with the Menai bridge. A new harbour protected by a breakwater (1½ mi.) was opened in 1873 and enlarged in 1875–80. Steamers ply to Dun Laoghaire and Greenore, and as well as port activities there are quarrying and some light industry. The town is also a seaside resort. Holyhead mountain (720 ft.) is a heather-covered granite rock joined by a suspension bridge to South Stack. where there is a lighthouse. Thousands of sea birds breed on the surrounding cliffs.

HOLY ISLAND or LINDISFARNE, an island in the North sea. 2 mi. from the coast of Northumberland, in which county it is included. Except at high tide it can be reached on foot from the mainland. Area 2.1 sq.mi. Pop. (1951) 238. To the north are sand hills. noted for wild flowers. The south is fertile and under cultivation. There is a lake of 6 ac. in the northeast and three miles of sandy beach on the north shore. The village lies at the southwest angle, beside a small, natural harbour used by fishing boats and by yachts in summer. To the east is the castle. built on a basaltic rock rising about go ft. from the sea. and off the southwest shore is St. Cuthbert's Island. a flat grass-covered rock with traces of a chapel used as a retreat by St. Cuthbert and his monks, according to Bede.

The island's history begins with the arrival in 63j of St. Aidan. who came from Iona at the request of King Oswald. later saint and martyr, to preach to the Northumbrians. He made it the site of his church and monastery and the head of the diocese. The sixth bishop in succession was St. Cuthbert (685–687) who was buried in the place of honour on the south side of the altar. In 793 the Danes landed. burning the settlement and killing many of the monks. The survivors rebuilt the church but in 875, fearing a second invasion. they fled inland with St. Cuthbert's body, the Lindisfarne Gospels—a 7th-century art treasure—and other relics. They settled first at Chester-le-Street and eventually at Durham (995). In 1082 the prior and convent of Durham refounded the monastery of Holy Island as a dependent cell. Threatened again by invasion, the island was garrisoned toward the end of the 16th century. During the Great Rebellion the castle was held for the king until 1646. In the first Jacobite rising (1715) it was seized for the Old Pretender. The parish church of St. Mary, close by the village market place, grew from a Norman core. The southwest front may include part of the original building (1146) while the three Norman arches of the north arcade show the ornamental use of alternate red and white stones. Kearby are the picturesque red sandstone ruins of Lindisfarne priory (c. 1100) and the museum containing carved stones of the Viking period. A Celtic cross on the village green. designed by John Dobson, was set up in 1828 on the site of the old market cross. The castle. built *c.* 1500, was restored as a private residence by Sir Edwin Lutyens after 1900. Sir Edward de Stein presented it to the National trust in 1944. Inshore fishing and tourist traffic are the principal resources. The nearest railway station is Beal, opposite the island but 1¼ mi. inland. As early as the 1 jth century the inhabitants were governed by two bailiffs. There are coast-guard and lifeboat stations.

For Bibliography, *see* NORTHUMBERLAND. (E. M. Hw.)

HOLYOKE, a city in Hampden county, Mass., U.S., 8 mi. N.W. of Springfield, between the Mt. Tom range on the west and the Connecticut river on the east. The city's many hills and industrial canals give it a European character. The residents are mainly Roman Catholic and tend to group themselves into districts which are predominantly Irish, French, Polish and German.

Holyoke was first part of Springfield (*q.v.*) and was included in West Springfield when that town was incorporated in 1774. Holyoke was settled in 1725. Industrial development began with the building of a dam across the Connecticut river in 1828. The present dam at Hadley falls, providing waterpower for the paper mills, was completed in 1900 to replace the second one which was completed in 1849. Holyoke was incorporated in 1850 and became a city in 1873.

The city enjoys considerable cultural and economic autonomy (its public utilities are municipally owned). and is identified as part of the Springfield-Holyoke metropolitan area. Once regarded as "The Paper City," its industry became diversified after the depression of the 1930s. Manufactures include electric equipment, beer, fabricated steel. leather and synthetic fabrics; however, paper, printing and textiles remain the most important products. Mount Holyoke college (1837) is at South Hadley across the river. The census figure for 1960 of 52,689 is 13.7% below the 1920 peak population of 60,203. (GE. G.)

HOLY ORDERS, a grade or status in the ordained ministry of the Christian church, comprising the major orders of priest. deacon and subdeacon and the minor orders of porter (doorkeeper). lector, exorcist and acolyte. The term "order" (Lat. *ordo*, plural *ordines*) was adopted by the church from Roman civil life and was first used ecclesiastically by Tertullian to mean both clergy and laity. Gradually. however, it came to mean some office to which a person had been specifically admitted by a bishop and authorized to perform its duties. By the 6th century a bishop admitted young boys into his *familia* ("household"). giving them their first tonsure: after which they were trained to discharge minor duties in the church. This adoption rite included the verse Ps. xvi, 6. containing a reference to "inheritance" (Gr. *clerus*), meaning that the boy was now a clerk and a member of the clergy, having office in one of the four minor orders. Later he could be ordained by the bishop to the major orders of subdeacon. deacon, priest and bishop (at that time considered an order apart from the priesthood).

In the earlier centuries there is no evidence either that a clerk in a lower order was required to pass by regular steps to a higher order or that a layman could not pass directly to any office in the church. By the 9th century. however, there were cases of clergy being deposed from the higher orders because they had not passed through the lower. In consequence it began to become the rule that a clerk must progress from the lower to the higher order.

and that he should do so at regular intervals of time. These requirements are still observed; it is for instance not permissible to receive two major orders on the same day. Though early in the history of the church the office of bishop was regarded as completely separate from the other orders. later bishops and priests were classed together as *sacerdotes.* This usage was confirmed by the 23rd session (1563) of the Council of Trent. according to which archbishops, metropolitans and patriarchs are bishops who hold separate grades not of the episcopate but of the priesthood. Some eastern churches. however, notably the Nestorian, Syrian and Coptic, continue to recognize within the episcopate different grades. each of which is entered upon after a distinctive ordination.

Roman Catholic Church.—A candidate for holy orders must be a baptized man. not suffering under canonical impediment nho has a vocation, has reached the right age, has attained the appropriate academic standard. is of suitable character and has a specific clerical position anaiting him A candidate for the subdiaconate must be at least 21 years old for the diaconate 22. for the priesthood 23 for the episcopate 30. All persons in holy orders (which once given, have an indelible character) must be celibate and recite the divine office daily. The chief duty of both deacon and subdeacon is to assist the priest at high Mass, when the subdeacon reads the epistle and the deacon the gospel (though in practice tno priests normally act as deacon and subdeacon). The deacon is also allowed on occasion to baptize and to preach. The priest has authority to celebrate Mass. to pronounce absolution. to administer solemn baptism, to anoint the sick, to bless and to preach He enters upon his office through the sacrament of ordination. which is administered by the bishop. If appointed to a parish he has the cure of souls within that parish.

Bishops are either elected by the cathedral chapter or chosen by the pope from a list of names submitted by the chapter: in both cases the pope's approval is requisite. After taking an oath of fidelity to the holy see. undertaking to visit Rome at appointed intervals there to report upon the administration of his diocese, and making a profession of faith. the bishop elect is consecrated by at least three bishops. The bishop is normally the chief pastor in a diocese, where he alone has authority to ordain. to confirm and to bless the chrism for confirmation and oil for anointing the sick

Church of England.—In the 16th century the Church of England abolished the minor orders, the subdiaconate and the necessity for celibacy. The requisites for entering on holy orders are the same as in the Roman Catholic Church. save that the deacon must be 23 years old. All persons in holy orders are required to recite matins and evensong daily. The deacon assists the celebrant at the Eucharist by reading the epistle and administering the chalice; he may perform baptisms and is allowed occasionally to preach. He normally remains in the diaconate a year before being ordained to the priesthood by the bishop As a priest he celebrates the Eucharist, pronounces absolution and gives the blessing. As a "clerk in holy orders" he is freed from certain civil obligations and at the same time labours under certain disabilities in order to discharge his office more efficiently. Although holy orders are regarded by canon law as indelible, the Clerical Disabilities act of 1870 made provision for a member of the clergy to execute a deed of relinquishment of holy orders.

A priest is consecrated bishop by at least three other bishops, thereby receiving authority to consecrate. ordain and confirm. A diocesan bishop, who is appointed by the crown and elected by the dean and chapter after they have received the *conge' d'élire* (*q* v.). takes an oath of temporal allegiance to the sovereign before he enters into full possession of the temporalities of his bishopric

Other Episcopal Churches.—Some churches that are episcopally governed have no archbishops or metropolitans. The seven bishops of the Episcopal Church in Scotland elect one of their number as "primus" to have authority to convoke and preside at the Episcopal Synod. The Protestant Episcopal Church in the United States elects a presiding bishop to preside at the General Convention and the National Council of the church. Similarly, the chief bishop of the Polish National Catholic Church in the United States is known as prime bishop.

Orthodox Eastern Church.—A candidate for holy orders must fulfill the same requirements as in the Roman Catholic Church: save that celibacy as such is not required for the diaconate or priesthood. A priest may be a married man if he was married before his ordination but must not remarry if his wife dies after he is ordained. A priest unmarried at ordination must remain celibate. Only unmarried or widowed priests may be consecrated bishop. The functions of bishops. priests and deacons do not differ from those in the Roman Catholic Church save that the priest has authority to administer confirmation, which takes place at the same ceremony as baptism. There are only two minor orders (though this terminology is not used). lectors and subdeacons. and in practice these grades of the ministry have tended to lapse. A priest can divest himself of his orders, which are not indelible, and become a layman.

(J. W. L.)

HOLY ROMAN EMPIRE is the designation commonly given to the varying complex of lands ruled over first by Frankish and then by German kings for ten centuries from the coronation of Charlemagne in 800 until its dissolution in 1806. In fact, the precise term *sacrum Romanum imperium* dates only from 1254, though the title "Holy empire" reaches back to 1157 and the term "Roman empire" was used from 1034 to denote the lands under Conrad II's rule. The term "Roman emperor" is older, dating from Otto II (d 983). This title, honever, was not used by Otto II's predecessors, from Charlemagne to Otto I. who simply employed the phrase *imperator augustus* without any territorial adjunct. The first title that Charlemagne is known to have used, immediately after his coronation in 800, is: "Charles, most serene Augustus, crowned by God, great and pacific emperor, governing the Roman empire." This clumsy formula, however, was soon discarded.

These terminological questions reveal some of the problems involved in the early history of the empire. It can be regarded as a political institution. or approached from the point of view of political theory, or treated in the context of the history of Christendom as the secular counterpart of a world religion. The history of the empire is also not to be confused or identified with the history of its constituent kingdoms, Germany and Italy, though clearly they are interrelated. The constitcent territories retained their identity; the emperors, in addition to the imperial crown. also wore the crowns of their kingdoms. Finally, whereas none of the earlier emperors from Otto I had assumed the imperial title until actually crowned by the pope in Rome, after Charles V none was actually emperor in this sense, though all laid claim to the imperial dignity as if they had been duly crowned as well as elected. Despite these anomalies and others, the empire, at least in the middle ages, was by common assent. along with the papacy, the highest and most important institution of western Europe.

Theologians. lanyers, popes, ecclesiastics, rulers, rebels like Arnold of Brescia and Cola di Rienzi, literary figures like Dante and Petrarch, and the practical men, members of the high nobility, on whom the emperors relied for support, all saw the empire in a different light and had their own ideas of its origin, function and justification. Among these heterogeneous and often incompatible views, three may be said to predominate: (1) the papal theory. according to which the empire was the secular arm of the church,

set up by the papacy for its own purposes and therefore answerable to the pope and. in the last resort; to be disposed of by him; (2) the imperial or Frankish theory. which placed greater emphasis on conquest and hegemony as the source of the emperor's power and authority and according to which he was responsible directly to God: (3) the popular or Roman theory (the '*people!' at this stage being synonymous with the nobility and in this instance with the Roman nobility): according to which the empire. following the. tradition of Roman law, was a delegation of powers by the Roman people. Of the three theories the last was the least important; it was evidently directed against the pope. whose constitutive role it implicitly denied. but it was also a specifically Italian reaction against the predominance in practice of Frankish and German elements.

It is also important to distinguish between the universalist and localist conceptions of the empire, which have been the source of considerable controversy among historians. According to the former, the empire was a universal monarchy, a "commonwealth of the whole world. whose sublime unity transcended every minor distinction"; and the emperor "was entitled to the obedience of Christendom." According to the latter, the emperor had no ambition for universal dominion; his policy was limited in the same way as that of every other ruler. and when he made more far-reaching claims his object was normally to ward off the attacks either of the pope or of the Byzantine emperor. According to this view, also. the origin of the empire is to be explained by specific local circumstances rather than by far-flung theories.

Origins of the Empire and Sources of Imperial Ideas.— There was no inherent reason why, after the fall of the Roman empire in the west in **376** and the establishment there of Germanic kingdoms. there should ever again have been an empire, still less a Roman empire, in western Europe. The reason why this took place is to be sought (1) in certain local events in Rome in the years and months immediately preceding Charlemagne's coronation in 800; and (2) in certain long-standing tendencies which made this particular solution of a difficult situation thinkable. These long-standing tendencies are to be regarded as preconditions rather than causes of the coronation; they do not account for it. but without them it is difficult to imagine how it could have taken place.

The first is the persistence, despite the fact that it was no longer a political reality west of Italy, of the idea of the universal and eternal Roman empire. The importance of this tradition may easily be exaggerated. After the establishment of the Germanic kingdoms. kings such as Clovis in Gaul and Theodoric in Italy were glad to accept Roman titles from the Byzantine emperor. who sought to maintain the formal unity of the Roman empire by treating them as his vicars and lieutenants; but this was a short-lived expedient. By the 8th century any sense of belonging to the empire, now confined to eastern Europe, had disappeared in the west.

Far more effective in the minds of the barbarian peoples of the west was the idea of the *imperium Christianum* or "Christian empire." which took shape after the conversion of Constantine (*q.v.*) the Great and the reconciliation between Christianity and the Roman empire. Sot only did the Christian church become a state church. including in its liturgy prayers for the empire and the emperor, but it also brought the Roman empire into the framework of Christian eschatology, as the last of the world monarchies whose end would mark the inception of the kingdom of God. Through Christian iconography and through the liturgy the church's view of the empire as a vehicle of God's will, for the Christianization of the world. became prevalent. It was expressed with peculiar force in the letters of Charlemagne's adviser Alcuin.

Apart from the persistence of the idea of a Christian Roman empire, a third precondition for the establishment of an empire in the west was the existence of a candidate of sufficient power and standing in the person of the Frankish king. The expansion of the Frankish kingdom until it comprised most of western Europe. particularly its acquisition of the Lombard kingdom in northern Italy in **773,** is described elsewhere (*see* FRANCE: History; also CAROLINGIANS); its impcrtance and the importance of the ties forged by Charlemagne's immediate predecessors with the papacy are obvious. Though it is scarcely true that Charlemagne's accession to the empire was simply a consequence of this expansion. his outstanding position was evidently a precondition of his elevation to the imperial throne.

When we turn from the preconditions to the causes of the events of 800 and from the realm of ideas to that of political facts, we enter another world. It is the world of the Roman. Eastern or Byzantine empire. of which the pope was a subject, confirmed in his bishopric like other bishops by the emperor. By the 8th century, however. the imperial position in Italy. centred in the exarchate of Ravenna (*q.v.*), was crumbling. Confronted by the power of Islam. the empire concentrated on the problems of the east and was unable to defend its Italian lands from the Lombards, who had entered Italy in **568.** Furthermore. the emperors of the Isaurian dynasty. of whom the first was Leo III (717–741), were estranged from the papacy by the iconoclast controversy. Hitherto fear of the Lombards had kept the popes faithful to the emperor and to the exarch in Ravenna. Now the situation changed. When the Lombards renewed their advance southward. taking Ravenna in **751** and driving out the exarch, the pope appealed in vain to the emperor, then turned to the Frankish king. Pepin, who invaded Italy, reduced the Lombard king Aistulf to

(TOP) EMPIRE OF CHARLEMAGNE ABOUT A.D. 800: (BOTTOM) EMPIRE IN THE 16TH CENTURY

submission (754) and then, returning in *756*, bestowed on the papacy the territories belonging to the exarchate. Thus was born both the temporal power of the papacy and the close alliance between the papacy and the Frankish monarchy.

Particularly significant of the anomalous position that had arisen in Italy was the action of the pope in conferring on the Frankish king the title of patrician, which could legally be conferred only by the emperor; in the form the pope gave it (*patricius Romanorum*), the title was meant to authorize its possessor to defend and support the Holy See against its foes. Even so. the papacy was reluctant to break its constitutional links with the imperial system. and this was particularly so under Pope Adrian I (772–795), after Charlemagne had in *774* defeated the last independent Lombard king. Desiderius, and taken his kingdom. As king of Lombardy the defender might become as dangerous to the pope as those against whom he had provided defense.

The events briefly related show. first, the growing estrangement between east and nest; second, the difficult position of the pope between the emperor and the Frankish king; third. the tenuousness of the imperial hold over Rome and central Italy. After the expulsion of the exarch in 751, the pope himself, now in de ***facto*** possession. probably hoped to become the emperor's successor in the west. Whether the document itself belongs to the *750s* or not. this was the sense of the forged Donation of Constantine. in which the emperor Constantine I is represented as having conferred on Pope Silvester I the imperial palace of the Lateran, the imperial insignia and "all the provinces, places and cities of Italy and the western regions" (*see* DONATION OF CONSTANTINE). Such ambitions, honever. proved illusory when Charlemagne became king of the Lombards. When it was even rumoured that Charles intended to depose Adrian and set up a Frankish pope in his place, it would have been folly for the pope to think of formal severance from the existing empire. Nevertheless, the empire's shadowy titles were unlikely to be respected long in Italy unless the emperor took action. From *781* papal documents mere no longer being dated by the emperor's regnal year, and the pope was minting his own coins.

Coronation of Charlemagne as Emperor. — By comparison with Adrian. Pope Leo III *(795–816)* was a man of inferior calibre. Where Adrian had tried to maintain independence by balancing the Byzantine emperor against the Frankish king. Leo from the first showed subservience to the latter. Both in Constantinople and in Rome the situation was unstable. In Constantinople. after troubles reaching back to *790*, the empress Irene had her son Constantine VI blinded and deposed *(797)* and took his place, the first woman to rule the empire in her own right. Her constitutional position was thus doubtful; Alcuin in the west. in *799*. regarded the imperial throne as empty. Meanwhile. in Rome, the hostile nobility exploited the opportunity to attack Leo. who fled across the Alps to his protector, Charlemagne, at Paderborn. This was in Aug. *799*. Though unfavourably impressed by the pope, Charlemagne was persuaded by Alcuin to send him back to Rome with a commission which adjudged the complaints against him false and arrested and deported his accusers. The situation, however, was still uncertain. In view of the plight of both pope and emperor, "the whole salvation of the church of Christ" now rested (so Alcuin wrote) in Charlemagne's hands. and in the autumn of 800 he set out for Rome "to restore the state of the church which was greatly disturbed." On Dec. 23 Leo solemnly purged himself of the charges against him. Two days later, on Dec. *25*, a large gathering assembled in St. Peter's, where the pope was to consecrate Charlemagne's son as king. Suddenly, as Charlemagne rose from prayer. Leo placed a crown on his head and. while the assembled Romans acclaimed him as "Augustus and emperor," the pope abased himself before Charlemagne, "adoring" him "after the manner of the emperors of old."

It seems clear that this coronation was the work of the papacy. not of the Frankish king, who is said to have been surprised and angry at it. The immediate beneficiary of the coronation was the pope, whose position henceforth was secure. Charlemagne was left to face its momentous consequences and, particularly, to secure that recognition from Constantinople without which his title was legally invalid. This, according to the chronicler Theophanes, he sought to do by offering marriage to the empress Irene, hoping thus "to reunite east and west." If so. a revolution in Constantinople and the deposition of Irene *(802)* brought the plan to nothing. In any case, the coronation of Charlemagne was an extra-legal, indeed an illegal and revolutionary proceeding. The pope had no right to make him emperor. Nor did the coronation create a new western by the side of the existing eastern empire A usurper in the eyes of the Byzantines. Charlemagne had not the least prospect of succeeding to the throne of the Caesars. The only imperial territories on which he laid hands were the duchy of Rome and the former exarchate. Otherwise he remained. as before, king of the Franks and of the Lombards. Since in *806* he made arrangements to divide his territories among his three sons, it is even doubtful whether Charlemagne's empire would have survived had not the two elder sons died before him, leaving the undivided inheritance in *814* to the third son. Louis I the Pious.

While the immediate context of the imperial coronation of 800 was limited, it had wider connotations. In the first place, the separation between east and west was now an accomplished fact in the political sphere; for, though the intention in *800* was not to divide the empire, this was the practical outcome. In *812*, after unsuccessful mar and wearisome negotiation, the Byzantine emperor Michael I recognized Charlemagne's imperial title. It was still a personal title, and Charlemagne was recognized merely as emperor, not as emperor of the Romans; in other words. the emperor in Constantinople maintained his claim to be the only true successor to the Roman Caesars. Furthermore, the recognition was grudgingly given. and later, when Byzantium was stronger and the Carolingians weaker. Michael's successors refused to extend it automatically to Charlemagne's successors. Thus the second consequence of the act of *800* was a rivalry with Constantinople which remained an important factor in imperial history at least until *1204*. In the third place, Charlemagne's coronation involved him and his successors ever more deeply in the ecumenical pretensions of the papacy. The relationship between the papacy and the Frankish rulers. close for nearly *50* years before *800*. was intensified now that the Roman see was the first metropolitan church of Charlemagne's dominions. Religious emperors and their ecclesiastical advisers would henceforward see as the main function attaching to their imperial dignity the promotion of Christian unity. Furthermore, the fact that the pope had crowned Charlemagne emperor — rightfully or not — could not but impress. It was the pope who had taken the initiative. Had he not, in fact, constituted Charlemagne emperor? In Innocent III's time it was to be argued that Pope Leo III had transferred the empire from the Greeks to the Germans and that his successors could transfer it elsewhere if they so wished. This was a later doctrine; but already to Charlemagne the dangers were evident. Hence when, in *813* after his agreement with Michael I. Charlemagne decided to associate his surviving son, Louis, in the exercise of imperial power, he framed his actions accordingly. The ceremony took place not in Rome but in the imperial chapel at Aachen; the pope was not present; the constitutive act was the acclamation of the gathered Frankish nobility; and Louis either received the diadem from his father or took it with his own hands from the altar. The contrast with the Roman ceremony of *800* was deliberate. Henceforward the conflict between the two contrary views or theories of the empire — the papal and the Frankish — was to be a dominant theme.

The Carolingian Empire. — Louis the Pious *(814–840)* was a man in every way different from his father. For him the word empire was to be the unifying idea holding together his various dominions, and accordingly he abandoned his separate royal titles. This was the underlying notion of the *Ordinatio imperii* of 817; by this, Louis made his eldest son. Lothair I, emperor with him. while the younger sons, Pepin and Louis the German, received subordinate kingdoms (Aquitaine and Bavaria). Louis I's ideas, however, aroused the conservative opposition of the Frankish nobility. and soon the Frankish lands were involved in civil mar. Furthermore, internal dissension helped the papacy, mhich increased its influence by favouring one party or the other. Already in *816* Pope Stephen *V* (IV) persuaded Louis to receive unction

at his hands. perhaps also to be recrowned. thus repairing the defect of 813; and though Lothair I had been raised to the imperial dignity in 817. as Louis had been in 813, without papal intervention. he also saw fit to strengthen his title by being crowned by Paschal I in Rome in 823. Thus the empire, instead of becoming an appendage of the Frankish kingship, was drawn back into the papal sphere Lothair's son Louis II was crowned by the pope in 850, to be sole emperor from Lothair's death in 855 to his own in 875; his uncle Charles II the Bald was emperor from 875 to 877; then Charles III the Fat was crowned emperor in 881. But the imperial title. without power to support it, was a mere name, and with the dislocation of the Carolingian realm, culminating in the deposition of Charles the Fat by the East Frankish magnates in 887. its decline was rapid. From 888 France, Germany and Italy were separate states, with the kingdom of Burgundy and Lotharingia (Lorraine) as debatable lands. Who, in these circumstances, was to be emperor? The nominee of the pope, himself a puppet of Italian aristocratic factions? Or Charlemagne s rightful heir, whoever he might be? Or simply the strongest ruler of western Europe? For the moment, the first solution prevailed, and there followed a series of emperors chosen from the Italian nobility, starting with Guy of Spoleto (891–894) and his son Lambert (892–898), in concurrence with the East Frankish king Arnulf. who was also crowned emperor in 896 (d. 899). But such men were of little use to the papacy, and the papacy, in the depths to which it had now sunk, was little use to them. Louis III, crowned in 901. was deposed in 905 by Berengar of Friuli, who was himself crowned by the pope in 915. but on Berengar's death (924) the powerful Roman family of the Crescentii, determined to keep authority in its own hands. stepped in and suppressed the imperial title. Thus the empire created in 800 disappeared. ineffective and unmourned.

The Ottonian Empire.--While in Italy the empire was in process of dissolution, north of the Alps imperial ideas persisted, but not in the form associated with the papacy. The Frankish tradition of empire looked back to Charlemagne; amid the divisions of the dying 9th century it reflected the notion of Frankish unity. It was also seen as the expression of power and hegemony and of rule—as Charlemagne had ruled—over a number of different countries Thus the West Frankish king Charles II the Bald had been proclaimed emperor and Augustus when he invaded Lotharingia in 869—six years before he was crowned emperor in Rome—because he was now ruler of two kingdoms. The first Saxon ruler of Germany. Henry I, was acclaimed emperor (the chronicler Widukind relates) because of his victory over the Hungarians in 933. as was his son. Otto I. after the battle of the Lechfeld in 955 This is a Frankish idea of empire which has nothing to do with Rome Indeed. the successor-states which we call France and Germany remained Frankish—the West Frankish and the East Frankish kingdoms, though the latter was now ruled by a Saxon. As such, it was their ambition to succeed to the Frankish inheritance. and it was inevitable, in view of the anarchic state of Italy, that the ruler of the one or the other, when strong enough. would cross the Alps. In fact, it was the East Frankish kingdom which recovered first from the 9th-century anarchy, not least because its kings knew how to use the Frankish church for their ends.

In this Otto I. who succeeded to the East Frankish throne in 936, was the true heir of Charlemagne; he made churchmen his ministers and established missionary bishoprics on the Elbe river to spread Christianity among the Wends. In the west the Carolingian Louis IV of France was his protege, and only Otto's support kept the young king of Burgundy, Conrad, on his throne. In 951 Otto descended on Italy, married the late king's widow and forced the new king. Berengar of Ivrea, to hold his kingdom as a vassal of the German crown. Ten years later, summoned by the pope when Berengar was on the point of taking control in Rome. Otto returned to Italy He was crowned emperor by Pope John XII on Candlemas day 962.

Once again, as in 800, it was the pope who took the initiative; his need for protection was the immediate cause of the coronation. But Otto's empire was more limited in scope than Charlemagne's, its pretensions less universal. In the intervening period the import of the title imperator *augustus* had shrunk, so that by Otto's time it scarcely extended beyond protection or "advocacy" of the Roman church. Likewise the extent of the empire, territorially, had decreased. Neither Otto I nor his successors made any claim, as heirs of Charlemagne. to rule over the West Frankish lands. Henceforward what came to be known as the empire meant simply a union of Germany and northern Italy (and after 1032 the kingdom of Burgundy) under a single rule. This was far from the ecumenical pretensions of Rome. and though, partly because of the extent of their territories, partly because of their special connection with the papacy, the Ottonian and Salian emperors enjoyed pre-eminence among the rulers of western Europe, they certainly did not seek to exercise world dominion. Nor did they seek to challenge the Byzantine emperors in their rule over the empire of the east. Nevertheless the problem of the relations of the two empires necessarily reasserted itself, for the Byzantine empire had made rapid recovery and was preparing, under Nicephorus II Phocas and Basil II, to embark on expansion and reconquest. Fears of Byzantine interference in Roman politics and conflicting claims in southern Italy soon brought the two powers into rivalry, and the conflict proved to be the spur for a major development—the romanization of the western empire. Whereas Otto I had laid no claim to the Roman title, Otto II (co-emperor 967; sole emperor 973–983), to bolster his claims against Basil II, proclaimed himself Roman emperor. From this it was only a short step to describing the empire itself as the Roman empire, and this change occurred in Conrad II's reign (1024–39; crowned 1027). It was reinforced, from 1040, by the introduction of the title "king of the Romans" for the emperor-elect before his coronation, or for the emperor's designated successor. It is noteworthy, however, that these formal changes were the result not of claims to the heritage of ancient Rome or of universal pretensions but simply of rivalry mith Byzantium.

In this development the reign of Otto III (983–1002; crowned 996) forms an interlude. The son of a Greek princess, imbued mith Byzantine traditions, Otto III drew on Roman, Carolingian and Christian strands to form a new synthesis combining the heterogeneous elements in the imperial idea Rome was to be his capital, the pope his lieutenant in the spread of Christian dominion. How much of this would have survived, if Otto had lived longer, remains doubtful. In fact. distance alone made unified imperial rule over Germany and Italy impossible. Otto himself lost Rome shortly before his death. What did survive, as the characteristic feature of the empire from Otto I to Henry III, was the close subordination of pope to emperor. Otto I deposed John XII and Benedict V; Otto III nominated his cousin. Gregory V, and his tutor, Silvester II; and after neglect of Italian affairs under Henry II (1002–24; crowned 1014) and Conrad II. Henry III (1039–56; crowned 1046) deposed Benedict IX and Silvester III and compelled Gregory VI to abdicate. This was not oppression or force but the fulfillment of the emperor's supreme duty—to watch over the welfare of the church. The iconography of the time shows the emperor, not the pope, as the representative of St. Peter and often standing alone as God's vicar on earth. The period from 962 to 1046, in fact, saw the empire at its zenith. No other kingdom of Europe was its match; while the papacy, except when under imperial protection, was the degraded tool of Roman factions. Morally, also, the empire had the support of the greatest reformers of the age—the abbots of Cluny, for example—who looked to the emperor rather than to the pope as the effective head of Latin Christendom.

Empire and Papacy.—From the middle of the 11th century the situation began to change. One cause was the rapid progress of European economic recovery, which brought shifts of power detrimental to Germany, More immediately important was the revival of the papacy, which the emperors had done so much to further. After Henry III's death in 1056 the initiative passed into papal hands. It was favoured by the long minority—till 1065—of Henry IV (crowned 1084; d. 1106), which enabled the papacy to act without fear of intervention from north of the Alps, and by the appearance of allies—particularly the Normans of the kingdom of Sicily, who for their own purposes supported the papacy against the empire. As they reached maturity the peoples of

Europe turned to the pope as leader of Christendom. Even within the imperial frontiers the emperor's power meant more to the Germans than to the inhabitants of Burgundy or of Italy, for nhom it betokened subjection to German rule Furthermore, only Otto 111—and he for less than four years—made Rome the seat of empire; all the rest, from Charlemagne onward, concentrated their efforts north of the Alps. In practice, therefore, the empire nas a very imperfect realization of the ideal of an *imperium Christianum;* and as soon as it was in a position to vindicate its independence. the papacy found many adherents. Under Gregory VII (1073–85) the papal theory of the empire, as formulated in the 9th century. was revived, but now on broader and firmer foundations The result was the conflict, from 1076 until 1122, known as the Investiture contest (see INVESTITURE CONTROVERSY). The real issue however, was not the investiture of bishoprics but the place of the emperor in Christian society and his relations with the papacy Only the pope, Gregory VII asserted, might use the imperial insignia; he might lawfully depose emperors, but should himself be judged by none (these lapidary statements are among the 27 included in the Dictatus *papae* of 1075 and were set down in Gregory's register). Thus the claim to independence turned rapidly into a claim to superiority In particular the sacred character of the emperor was challenged and his claim to be responsible directly to God. Instead, on the basis of the Donation of Constantine and a papal interpretation of the coronation of 800, it nas argued that it was for the pope to convey the imperial dignity and if he thought fit, to withhold or withdraw it. The Investiture contest was brought to a close by compromise in the treaty of Worms of i122 between Calixtus II and Henry V; but Gregory VII's claims nere taken up again by Alexander III, Innocent III Innocent IV and Boniface VIII, in a series of conflicts that shook the empire to its foundations.

The challenge thrown out by Gregory VII forced the emperors to seek new foundations for their position Gregory's great opponent Henry IV had still asserted the traditional rights of his father. His successors in the 12th century, Henry V (1106–25; cronned 1111), Lothair II (1125–37; crowned 1133). Frederick I Barbarossa (1152–90; crowned 1155) and Henry VI (1190–97; crowned 1191), shifted their ground. To counter the arguments of church lanyers they grasped the weapons provided by the revival of Roman law. A new and more exalted conception of the empire was the result Best knonn was the addition by Frederick Barbarossa, in 1157, of the word *sacrum* to the name of the empire. which non became the "Holy empire" as a counterblast to the *sancta ecclesia.* Equally characteristic mas the canonization of Charlemagne by Frederick's antipope Paschal III in 1165 In this nay Frederick emphasized continuity with the Frankish past and asserted his rights as Charlemagne's successor They derived, he argued not from conferment by the pope or by the Roman people but from Frankish conquest.

Unlike earlier emperors. who had based their position on their special relation with the church, the Hohenstaufen emperors emphasized its secular foundations Against Pope Innocent III's claims to confer the imperial crown. imperial lanyers asserted that "he who is chosen by the election of the princes alone is the true emperor, even before he has been confirmed by the pope" Nor is it surprising that, confronted nith the universal claims of the papacy the Hohenstaufen emperors asserted rights no less universal Though in day-to-day politics in their relations (for example) nith the kings of France or of England, there is no sign that they were seeking world dominion. nevertheless the new imperialism soon called forth protests from all sides—from England and France from Denmark and Hungary. "Who," asked John of Salisbury. "appointed the Germans to be judges over the nations?"

Meanwhile the conflict with the papacy and the desire to restore the territorial basis of imperial power, which the Investiture contest had shattered. dren the emperors more and more into Italy, where they encountered the same national reaction Unable to defeat the Lombard league. Frederick I patched up a peace at Constance in 1183. His ultimate sovereignty was recognized, but his power in Italy was fatally compromised. After his son. Henry VI. had married the heiress of Sicily, the power of the Sorman kingdom was used to restore the imperial position in Italy. It was a grandiose policy but overstrained. The papacy, fearing that Rome would be engulfed, reacted violently.

Innocent III, profiting from German dissensions after the early death of Henry VI (1197), played upon the German factions (Otto IV, not established as king till 1208, was crowned emperor in 1209). Henry VI's son Frederick II (1212–50; crowned 1220), by the *Privilegium* in *favorem principum ecclesiasticorum* (1220) and by the *Statutum* in favorenz *principum* (1232), made far-reaching concessions to the German princes in order to ensure their support for his Italian policy. but in vain. In spite of his striking victory at Cortenuova in 1237 Frederick failed to crush the Lombards and mas excommunicated in 1239 and deposed in 1245. His death in 1250 marked the effective end of the medieval empire. In Germany a long interregnum (1250–73) brought down the imperial structure. In Italy, to ensure that there could be no restoration. the papacy called in the Frenchman Charles of Anjou (see CHARLES I of Naples and Sicily). When Rudolf of Habsburg succeeded as German king in 1273, he was only the head of a federation of princes, while in Italy he abandoned all claims over the centre and south. retaining only titular rights in Lombard

The Empire after Frederick 11.—It is characteristic of the new situation that Rudolf of Habsburg, though he made a number of attempts, never achieved the imperial dignity. Hencefornard the title was largely in abeyance. For a century after Frederick II's death the only emperor was Henry VII (king from 1308 to 1313), who was crowned in Rome in 1312 by legates of the Avignon pope. Thereafter till the end of the empire there were in all only four emperors duly crowned: Charles IV. crowned by a legate in 1355; Sigismund. by the pope in 1433; Frederick III. in 1452; and Charles V, by the pope but at Bologna, in 1530 If the empire continued to exist, it was due partly to the force of tradition, partly to the exigencies of German politics, partly to fear of the dangerous conflict of interests which any plan for its abolition would involve.

The Germans. naturally, were unwilling to surrender hope of regaining something of the empire's former power: both Henry VII and Louis IV (king from 1314 to 1347; his Roman coronation in 1327 nas by representatives of the people) sought to revive the Italian policies of the Hohenstaufen. But the balance had swung against them. France was already striving for the imperial position which Napoleon was ultimately to secure and determined at least that the Germans should not recover it. Moreover, in Germany itself, civil war had undermined the power of the kingship. and the elective monarchy was effectively controlled by the princes through the college of electors (*q.v.*), definitely established soon after 1250. French pretensions to leadership in Europe provoked a last tardy revival of imperialist sentiment both in Germany (Alexander of Roes at the end of the 13th century, Engelbert of Admont at the beginning of the 14th) and in Italy (Marsilius of Padua and Dante), but Charles IV, a sober realist, drew the necessary conclusions. By now the axiom that "the king is emperor in his kingdom" was firmly established; it marked the end of any universalist dream. Charles set out accordingly to make the empire a specifically German institution. By agreement nith Pope Clement V, he formally abandoned Italy; he would only enter Rome on the day fixed for his coronation and leave again the same day. This he did on April 5, 1355. Then he turned to the definition of the German constitution, particularly the rights of the electors, in the Golden bull (*q.v.*) of 1356. The change nas reflected in the final evolution of the empire's title: *sacrum Romanum imperium nationis Germanicae* (the Holy Roman Empire of the German Nation). This title. which appears under Frederick III (king from 1440, emperor from 1452 to 1493), indicates clearly enough that the emperor's powers were limited to his German lands In 1508 Frederick's successor Maximilian I. unable to go to Rome assumed with papal consent the style "elected emperor" (*imperator electus;* Ger. *erwählter* Kaiser).

The Empire in Modern Times.—The history of the empire after the promulgation of the Golden bull may be treated briefly. because from that time it is essentially a part of German history. It is true that memories of an imperial past continued to have an

influence on German thinking and that in the Habsburg lands there was a sense of belonging to a multinational empire. A few emperors — Sigismund in the 15th, Charles V in the 16th century — may even have thought to recover part of the old imperial prerogative. It was also possible to make something of the empire's leadership of Christendom against the Turk. But institutionally the role of the empire was almost continuously whittled away. After the failure of the project of imperial reform sponsored in 1495 by the elector of Mainz, Berthold of Henneberg (*q.v.*), the hope vanished of endowing the empire with permanent institutions effective beyond the limits of the different principalities. The Reformation entrenched the princes firmly in their rights and accentuated their autonomy.

When Charles V, opening the diet of Worms in 1521, declared that "the empire from of old had not many masters, but one, and it is our intention to be that one," he was shutting his eyes to the realities. The extent of his dominions mas imposing. but they were a weak dynastic agglomeration; and though Charles championed the Catholic Church against the Reformation, his empire was neither in spirit nor in fact a revival of the medieval empire. When he accepted the peace of Augsburg in 1555 and abdicated in 1556, the change begun with the accession of Rudolf of Habsburg was completed. With Germany split into two religious camps, the emperor was little more than the head of a religious faction. Furthermore, the fact that after Sigismund of Luxembourg's death (1437), with one short intermission for Charles VII from 1742 to 1745, the imperial crown, though in theory elective, was hereditary in the Habsburg dynasty of Austria, produced a cleavage of interests between emperor and empire.

From 1556 until its end under Francis II in 1806 the empire meant little more than a loose federation of the different princes of Germany, lay and ecclesiastical, under the presidency of the house of Austria. After the Thirty Years' War, no emperor again attempted. as Charles V had done, to re-establish a strengthened central authority; and the treaty of Westphalia (*q.v.*) in 1648 marks its final organization on federal lines. Yet even at the end the empire had loyal adherents, particularly among the small knights and noblemen of western Germany. who regarded it as their safeguard against princely absolutism. and its role was not so entirely negative as is sometimes thought. Its loose structure still suited to some'degree the cosmopolitan spirit of the 18th century. But with the French Revolution, and the intensified nationalism which followed, it became an anachronism.

As far back as the end of the 13th century French kings had been scheming to annex the title as well as to absorb the outlying territories of the empire. With Napoleon this ambition came within reach. Posing as the new Charlemagne ("because, like Charlemagne, I unite the crown of France to that of the Lombards, and my empire marches with the east"), he resolved in 1806 to oust Francis II from his title and to make the Holy Roman empire a part of the Napoleonic "new order." He was anticipated, however, by Francis, who in 1804 had assumed the title "hereditary emperor of Austria" and who, resolving that no other should wear the crown which he was powerless to defend, resigned the old imperial dignity on Aug. 6, 1806.

So perished the Holy Roman empire. The extent and character of its influence will always be a matter for debate; but it left a deep imprint on Europe, Nor did it cease to be influential after its extinction. The debate about the medieval empire was an ideological background to the creation of the Second Reich or German empire in 1871, and even Hitler's Third Reich drew sustenance from memories, often thwarted and perverted, of Charlemagne and Otto the Great and Frederick II.

The classical account of the imperial constitution after the Thirty Years' War is Severinus de Monzambano (Samuel Pufendorf), *De statu imperii Germanici liber* (1667; new ed. 1910). Imperial institutions are best studied in handbooks of German legal history, such as R. Schroder, *Lehrbuch der deutschen Rechtsgeschichte,* 7th ed. (1932). (G. BH.)

HOLY SPIRIT, THE. In Christian theology, the Third in the divine Trinity (*q.v.*). The limits of this article allow only the briefest summary of the history of the doctrine. It has been marked by three great controversies, which have centred in turn about the divinity of the Holy Spirit; his relation to the Son and his distinct personality.

The Divinity of the Holy Spirit. — In the pre-Arian period, the doctrine of the Holy Spirit was not a matter of controversy. In the form of baptism and in the interrogations put to the neophyte. both of which derived from Matt. xxviii, 19, the Holy Spirit appears as sharing nith Father and Son in the one "name" of God and as being with them the object of Christian faith and the agent of the grace of regeneration. In early doxologies, the Holy Spirit is named along nith Father and Son as the object of praise and adoration. In the primitive creeds (simple developments of the baptismal formula and brief summaries of the apostolic rule of faith), belief in the Holy Spirit was professed in a distinct article, whose parallel structure to the articles on the Father and the Son indicates the essential place of the Spirit in the Trinity. Early interpretations of the creed keep this parallelism and, again after the fashion of the creeds. bring the Holy Spirit into close relation with the gifts of God in the new dispensation — the holiness and unity of the Church, the inspiration of its sacred writings, its guidance in the truth, the forgiveness of sins and the resurrection of the body. In certain pre-Nicene private theological speculations there is a tendency to subordinate the Holy Spirit to the Son, as the Son to the Father. Moreover, in a few writers of inferior authority, like the confused *Shepherd* of Hermas and the unorthodox Tatian. there is some uncertainty about the Spirit's personal distinctness. But the collective faith of the Church as such shows no traces of these errant tendencies. Its simplicity and definiteness appear, for instance, in the famous oath of Clement of Rome: "As God lives, and the Lord Jesus Christ lives, and the Holy Spirit, who are at once the faith and the hope of the elect" (*Epist* ad Cor. I. lviii. 2).

At first, Arianism put forward no more than a doctrine of the Word, as God in name only, quite other in substance than the Father, and created by him in time (see ARIANISM; ATHANASIUS, SAINT). Arius was apparently conscious of the consequences of his position. but he refrained from working out his theory of the "infinite inequalities" nithin the Trinity. The council of Nicaea was content to define the single point explicitly at issue, the consubstantiality of the Son. and simply added to its creed the traditional third parallel member: "And [we believe] in the Holy Spirit."

In fact, it was not until after 350 that a new phase of the Arian controversy was initiated in Egypt, whence Arianism itself had come. About 359 Serapion. bishop of Thmuis in the Delta. wrote to Athanasius. then in his third exile, that certain members of the Arian party, repelled by its irreverences, had returned to the Nicene doctrine of the Son, but rtfused to admit the

Godhead of the Holy Spirit, "affirming that he is not only a mere creature. but simply one of the ministering spirits, who differs only in degree from the angels" (Athanasius. *Epist.* ad *Serap.* I, i). The new debate was joined on the single issue of the Spirit's divinity; his distinct personality was universally assumed, save, of course, by Sabellians like Marcellus of Ancyra (d. 374). Athanasius called his new adversaries the "enemies of the Spirit" (πνευματόμαχοι), or the "trope-mongers" (Τροπικοί) from their habit of explaining away in terms of metaphor the scriptural passages on the divinity of the Holy Spirit. He makes short work of their orthodox pretensions: "This view is no different from that of the Arians. . . . If they think wrongly about the Holy Spirit, they do not think rightly about the Son" (ibid., ii). He makes it clear that their view had no scriptural inspiration, but derived from the same sort of rationalism (cf. ibid., xv, xvii; II, i; IV, i) that gave rise to Arianism itself, and that apparently had radiated from the school of Lucian of Xntioch (d. 312). The standpoint of his refutation is the customary patristic one: "This is not the apostolic faith, nor may a Christian at all tolerate such views" (ibid., I. xiv); and his arguments are from the common patristic sources—the Scriptures, and "the tradition and the teaching and the faith of the Catholic Church from the beginning, which the Lord gave: and the Apostles preached, and the Fathers defended" (ibid., xxviii). In 362, the important synod of Alexandria demanded of those who would share the Catholic communion the condemnation of "those who say that the Holy Spirit is a creature, and separate from the substance of Christ" (Athan., Tom. ad *Antioch.*, iii). In effect. this was to apply the Nicene *homoousios* to the Holy Spirit; at the first direct challenge, the Church was instantly conscious that such had always been her faith.

Meanwhile. the Semi-Arian bishop of Constantinople, Macedonius. exiled by Constantius in 360, was heading a similar school of thought, and gaining many adherents around the Hellespont, in Thrace and in Bithynia. The Macedonians, as they were called, ever. succeeded in deceiving Pope Liberius and in spreading their ideas in the west. But Damasus. Liberius' successor, saw more clearly and condemned Macedonianism with characteristically western definiteness (*Tomus* Damasi, Heinrich Denzinger, *Ench. Symb.* no. 58 *ff.*). The dispute in the east grew more violent when Eunomius, head of the radical Arian party, entered the lists on the side of the Macedonians, much to their distress. He was opposed by Basil of Caesarea (*q.v.*), the chief Catholic champion after the death of Athanasius in 373. Basil himself died on the eve of the final defeat of Arianism and its Macedonian offshoot: accomplished politically by the extreme repressive measures of Theodosius, and theologically by the council of Constantinople in 381. which reaiiirmed the faith of Nicaea and condemned explicitly all shades of Arian opinion. In the Nicene-Constantinople creed (almost certainly the work of the council of 381), the article on the Holy Spirit is expanded thus: "[We believe] in the Holy Spirit, the Lord, the giver of life, who proceeds from the Father, who with the Father and the Son is together worshipped and glorified. who spoke through the prophets" (Denzinger, no. 86).

The formulas reveal the customary reverence of the early eastern Church for scriptural language, when it sufficed for the purpose. The Holy Spirit is not explicitly called God; for the Scriptures do not explicitly call him God; but such a description is given of him that clearly forbids any thought of him as a creature; his action is divine, he shares equally with Father and Son in the honour due to God, and, above all, he proceeds from the Father—a formula that in the context clearly implies equality in divinity with the consubstantial Son, who is likewise from the Father, and that directly rules out the Macedonian idea of the Holy Spirit as the creature of the Son. Moreover, as at Nicaea the personal property (ἰδιότης) of the Son had been marked by calling him, not simply God, but "God of God," so at Constantinople the personal property of the Holy Spirit is indicated with the degree of clarity that the Scriptures permitted; he is described in relation to the Church as the cause of its unity, holiness, catholicity and apostolicity and of the gift of liie (regeneration and resurrection) found in her. By his function in the economy of salvation, in which he is considered as bringing to its term and perfection the life-giving work of Christ, the union of men with God and with each other, the place of the Spirit in the economy of the divine life itself is suggested: in him, as the Third Person, the divine life of completest unity comes to its term and its perfection.

As a matter of fact, the Arian controversy, especially perhaps in its Macedonian phase, illuminates the intimate unity in Catholic thought between the nature of God, as subsistent in Three who are coequally divine, and the nature of man's salvation, as consisting in a true deification (Θέωσις), whereby man individually shares in the nature of God (II Peter i, 4), and collectively, as gathered into the unity of the Church, somehow faintly reflects the unity of the divine life (John xvii, 20–26). Against the Arians, Athanasius had argued that if the Word Incarnate is not truly God by nature, he could not deify man (De Synod. li; et alibi). In his "Letters to Serapion" he uses a similar argument: "All of us are said to be sharers of the Godhead through the Spirit. . . . But if the Holy Spirit were a creature, no share in the Godhead would result in us through him; we would be joined simply to a creature, and be alien from the nature of God, in no respect sharing in it" (Epist. ad *Serap.* I, xxiv). The premise of the argument—man's deification, the gift that "comes from the Father through the Son by the Holy Spirit" (ibid., xx, xxiv, xxx, etc.)—is assumed to be an admitted commonplace of Christian faith. Its denial was seen by Athanasius, and by the Greek Fathers in general, as an intrinsic element of the Macedonian "impiety"; by separating the Holy Spirit from the inner life of God, they separated mankind from a share in that life and reduced Christianity to a bare naturalistic moralism, devoid of its proper supernatural character as gift and mystery.

The Procession of **the** Holy Spirit.—The second great controversy, which formally began with Photius' (*q.v.*) Encyclical *to* the Oriental *Thrones* in 867, revolved about the celebrated *Filioque;* at issue was the question of the Holy Spirit's origin from the Son. On this question, two modes of thought had long been current. The Antiochian school, scrupulously devoted to the letter of Holy Scripture and to the preservation of the intratrinitarian distinctions, described the origin of the Holy Spirit by the formula, "from the Father through the Son." The preposition "through" (διὰ) admitted that the Son was an active principle of the Spirit, but emphasized that he was such in his order as Son, who himself receives all from the Father. The Antiochians thought that this order, as well as scriptural usage (cf. John xv, 26) would be violated by saying that the Spirit is "from" the Son or that he "proceeds" from the Son. They kept strictly to the characteristically eastern, dynamic image of the Trinity, the straight line, which represents the divine life as originating in the Father, who has no origin, and as being communicated from the Father to the Son, and through the Son to the Holy Spirit. The formula, "through the Son," became exclusively legitimate in Byzantine usage. The Alexandrian school, following their master. Origen, likewise preferred this formula. However, more concerned with the sense than with the sheer words of Scripture, many Alexandrians felt no difficulty in using at times another formula, "from the Father and from the Son." as identical in sense. Alexandrian usage passed to the west in Hilary of Poitiers; then Augustine took the subordinate formula, ex *Patre* et *Filio*, and gave it dominance; it expresses more directly the reality of the Son's principiation of the Spirit. Behind it was what became the characteristically western, static image of the Trinity, the triangle, whose one perimeter (logically prior) encloses the three distinct angles (logically posterior).

Both of these formulas express, with variant emphases, the one common doctrine, that the Holy Spirit has a relation of origin to the Son. But their verbal divergence gave rise to disputes, which were themselves largely verbal, such as that between Martin I and the Byzantines in the 7th century, and in the 8th century the attack by the authors of the *Libri Carolini* upon the doctrine of the second synod of Nicaea. Photius seems to have had in mind the emphatic Caroline rejection of the formula, "from the Father through the Son." He does not himself use the formula, but he strongly denounced the "adulteration of the symbo!" by the addition of the Latin *Filioque*—an addition first made in Spain,

where it was current in the latter half of the 7th century, and whence it spread to Gaul and Rome, At the same time, he misunderstood the content of the formula, imagining that the Latins were asserting the procession of the Spirit from the Father and the Son as from two co-ordinate and distinct principles, to the destruction of the divine "monarchy." He himself held a view that was neither Greek nor Latin; its image would be neither a straight line nor a triangle, but a simple angle, whose apex was the Father, from whom alone in co-ordinate fashion the Son is generated and the Spirit proceeds. This was to exclude the Son completely as an originating principle of the Spirit. In the 11th century, under Michael Cerularius, there was a renewal of the full Photian theory, that the addition of the *Filioque* to the creed was illegitimate and opposed to Catholic truth, which asserts the procession of the Spirit from the Father alone. The Roman Catholic view is that the addition was legitimate and true (cf. Council of Florence, Denzinger, no. 691).

Today, even the Orthodox admit that the *Filioque* was by no means the cause of the eastern schism. But it did become central in the ensuing controversies, and it is still an obstacle to reunion. Up to the end of the 19th century, the Graeco-Slav churches held to rigid Photianism. After 1870, Orthodox contact with Anglo-Catholics and Old Catholics brought about some mitigation in certain quarters. Some favour as well as opposition was shown to the distinction of V. V. Bolotov, published in his 23 theses on the *Filioque (Revue internationale de théologie,* VI, 681–712 [1898]), between the dogma and the theology of the Holy Spirit: the dogma asserts only that he proceeds from the Father; whether he proceeds from the Father alone or from the Father and the Son is a matter of free theological opinion. Conceivably, this distinction might furnish the basis for union with Anglo-Catholics, but from the Roman Catholic standpoint it merely transposes the difficulty to another plane; for the Roman Catholic Church holds the *Filioque* as a dogma. From this standpoint, the hope for agreement lies in two facts: (1) Orthodox professions of faith and liturgical formulas, notwithstanding their customary Photian interpretation, themselves affirm only the procession of the Spirit from the Father as from the source (αἴτιος) of divinity; this assertion as such does not exclude his relation of origin also to the Son; (2) the truth of Bolotov's contention, in his seventh thesis, that the Photian view can find no support in either the Greek or the Latin Fathers, may come to be increasingly recognized.

The Personality of the Holy Spirit.— In modern times, the reversion to a dynamic type of Sabellianism within the liberal Protestant school brought about a fundamental reinterpretation of the doctrine of the Holy Spirit. As Macedonian views of the Spirit were an evolution of Arian views of the Son, so liberal Protestant theories of the Spirit were developed as a pendant to liberal Christology (see JESUS CHRIST). In so far as one may generalize about a group of highly individualistic writers, one may say that the liberal theory regards the doctrines of the Son and the Spirit as later interpretations of the primitive Christian experience of God in Christ. By a process of evolution similar to that which resulted in the diuinization of Jesus in the Christian consciousness, the Holy Spirit reached the status of a personification, first in St. Paul, more clearly in St. John, quite definitely in the form of baptism, which was later interpolated in the text of St. Matthew. Generally speaking. the essential liberal affirmation is that Christian experience is trinitarian; whether God is himself a Trinity is a question that, after Kant, came to be regarded as largely meaningless.

A fairly typical set of conclusions is reached by P. Feine, sufficiently in the main stream of liberal thought (*Theologie des neuen Testaments,* 2nd ed. [Leipzig, 1912]). He admits — what, of course, other liberals would deny — that St. Paul distinguished the Holy Spirit from the person of the believer, and also from God and Christ, over against whom the Spirit stands as a distinct person. But this is a simple personification, like that of Sin, the Law, Justice, etc. Actually, in speaking of God, Christ the Lord and the Holy Spirit. St. Paul by no means asserts that there are distinctions within the Godhead: "It is the theory oi the so-called economic Trinity that we find in him" (p. 410). God, Christ, the Spirit stand for theological projections of his own experience, which is somehow repeated in every believer. "The vital experience which Paul objectiiied in the doctrine of the Holy Spirit is at bottom nothing else but the consciousness that we, as believers, have achieved a share in the life of the Christ who died and rose again" (p. 411). H. Gunkel had put the same idea when he said that Paul's doctrine of Christ and of the Spirit were simply "two different interpretations of the same experience" (*Die Wirkungen des hl. Geistes . . .,* 3rd ed., p. vii [1909]). Consequently, "Christ" and "the Holy Spirit" are, indeed, distinct theological doctrines; but in reality, "the Holy Spirit" is (or better, means) "the risen Christ" as experienced by one who believes that Jesus is risen, just as "the risen Christ" is (or means) "God" as experienced by one who believes that in Jesus the redemptive power of God was realized.

Roman Catholic scholars find considerable value in the researches of rationalist exegetes on the workings of the Holy Spirit as portrayed in the Scriptures. In Roman Catholic theology, the action of the Spirit is studied in several connections. The treatise on divine grace, especially in the section on "the gifts of the Holy Spirit," deals extensively with the interior action of God on the soul, with primary reference to the normal ways of the Christian life. The action of the Holy Spirit through his gifts in the higher forms of prayer and tnystical experience is studied from both the empirical and the theological standpoint in treatises on ascetical and mystical theology. Again, the treatise on the Church develops the Spirit's relation to the Body of Christ, as its soul—its interior principle of life, growth, unity and holiness.

In the field of trinitarian theology, the question of what the Holy Spirit is within the Godhead and in relation to the Father and to Christ holds the primary place. However, the mode of approach to this question, so far as scriptural exegesis is concerned, is through what the Spirit does; for it has been commonplace since earliest Christian times that the person of the Holy Spirit has been revealed in and through his action, and not, as in the case of the Son, by an incarnation. From the more polemical point of view, the acute question is not so much whether the Spirit's personality is in the text of the New Testament (this is admitted by many liberal scholars), but rather how it got there. Is it simply a doctrinal creation of the Christian consciousness, speculat ng about its own experience of God, or is it a divine revelation in the traditional sense—a truth not created by the Christian community, but received by it from Christ, who was consubstantially the Son of God—a truth, therefore, whereby the believer is validly informed about the transcendental factor in all religious experience, which is the nature and inner life of God as he is in himself. This latter is the Roman Catholic position, with which Eastern Orthodoxy, Anglicanism and orthodox Protestantism agree.

From the more positive point of view, Roman Catholic exegesis sees its initial problem in tracing the steps in the progressive revelation of the Holy Spirit and in showing: first, the continuity between the Old and New Testaments (through the common concepts of "the spirit of God" as the divine energy operative in the world and in men and as the messianic gift); second, the distinctiveness of the New Testament revelation, in which the Spirit gradually emerges as personal, One truly divine and other than Father and Son: and third, the dependence of the revelation at every step upon the prior, clarifying revelation of the Son, in whom the Father himself is revealed. Roman Catholic theology, in dependence on patristic sources, further analyzes the scriptural appellations of the Spirit—Holy Spirit, the Gift, Love—as part of its search for some intelligence of the Spirit's mode of origin, his relations to Father and Son and his own distinguishing personal characteristics.

HOLYSTONE, a soft kind of sandstone used by sailors for scrubbing and cleaning the decks of ships. The origin of the word is doubtful. Some authorities hold that it arose from the general practice of scrubbing the decks for Sunday service; while others think the name arises from the fact that the stone so employed is naturally porous and full of holes. A small flint or stone having a natural hole in it, and worn as a charm, is also called a holystone.

HOLY WATER, technically the water with which Christian believers sign the cross on their foreheads on entering or leaving church. The decretum of Gratian enjoins that it should be exorcized and blessed by the priest and sprinkled with exorcized salt. This rite is found in the Gelasian, Gregorian and other sacramentaries. In the east the water was blessed once a month; in the Latin Church it is now blessed every Sunday. In the 4th century in the east it was usual to wash the hands on entering

the church (see ABLUTION), In the early church water was not expressly consecrated for baptisms and other lustrations.

HOLY WEEK in the church year is the week between Palm Sunday and Easter (*qq.v.*); it is observed with especial solemnity as a time of devotion to the passion of Christ. In the Greek and Roman liturgical books it is called the "Great Week" not, as John Chrysostom remarks in his homily on Ps. cxlv, 2, that it contains either longer or more days than other weeks but because great deeds were done by God in it. The name "Holy Week" also is very old and was used in the 4th century by Athanasius and Epiphanius. Originally only Friday and Saturday, the nucleus of Holy Week, were observed as holy days: later Wednesday was added as the day on which Judas planned with the Jews to betray Jesus Christ, and by the beginning of the 3rd century the other days of the week had been added. The pre-Nicene church concentrated its attention on the celebration of one great feast. the Christian Passover (*pascha*), on the night beta-een Saturday and Easter Sunday morning, but by the later 4th century the practice had begun of separating the various events and commemorating them on the days of the week on which they occurred: Judas' betrayal and the institution of the Eucharist on Maundy Thursday (*q.v.*); the passion and death of Christ on Good Friday (*q.v.*); his burial on the Saturday; and his resurrection on Easter Sunday. The Holy Week observances in the Roman missal were revised in 1956 so as to take place at the correct time of day.

See W. J. O'Shea, *The Worship of the Church* (1957); H. Thurston, *Lent and Holy Week* (1904). (L. C. S.)

HOLYWELL (TREFFYNNON, "well town"), a town and urban district (established 1894) in Flintshire, Wales, lies on the left bank of the Dee estuary. Pop. (1961j 8.459. The holy well is that of St. Winifred (Gwenfrewi), who is said to have lived in the 7th century and to have been beheaded by her lover. Her head rolled down the hillside and when it rested water immediately gushed forth there. St. Beuno was believed to have restoied her to life. The site became one of the most famous well-shrines in medieval Britain and continues to attract both Protestants and Roman Catholics. The well itself is covered by a Gothic chapel founded by Margaret, mother of Henry VII. In 1870 a hospice for poorer pilgrims was built. The parish church (rebuilt 1769) has some remnants of an earlier building and a 15th-century embattled tower. About 2 mi. from the town are the remains of Basingwerk abbey. partly Saxon and partly Early English. It became a Cistercian house in 1131 and was dissolved in 1535. The district around had copper. lead and coal mines in the 18th century. while the town possessed chemical and textile works. Modern industries are a'ssociated with the north Wales coal field. (E. G. Bow.)

HOLZ, ARNO (1863–1929). German writer, was born on April 26. 1863. at Rastenburg. East Prussia, son of a chemist. His early lyric poetry attracted considerable attention: but his principal work, undertaken often in collaboration with J. Schlaf. was critical. He was in personal touch with many German naturalist writers. In *Die Kunst, ihr Wesen und ihre Gesetze* (1891) Holz really inaugurated the German impressionist school. In his *Revolution deu Lyrik* (1899) he rejected rhyme. strophe and rhythm and all verbal music, maintaining that poetry must live by its meaning alone. His two volumes *Phantasus* (1898–99) were written on this theory. Holz's original work exercised a notable influence on the entire current of German literature.

BIBLIOGRAPHY.—Holz's collected works, 10 vol. (1924–25); *Briefe 1881–1921*, ed. by H. H. Borcherdt (1947); *Briefe*, ed. by Anita Holz and M. Wagner, introduction by H. H. Borcherdt (1949).

HOMAGE, one of the ceremonies used in the granting of a fief and indicating the submission of a vassal to his lord. It could be received only by the suzerain in person. With head uncovered the vassal humbly requested to be allowed to enter into the feudal relation; he then laid aside his sword and spurs, ungirt his belt and kneeling before his lord; and holding his hands extended and joined between the hands of his lord, uttered words to this effect: "I become your man from this day forth. of life and limb, and will hold faith to you for the lands I claim to hold of you." The oath of fealty, which could be received by proxy. followed the act of homage; then came the ceremony of investiture, either directly on the ground or by the delivery of a turf, a handful of earth, a stone or some other symbolic object. The obligations involved in the act of homage essentially resembled the obligations undertaken toward a Teutonic chief by the members of his *comitatus* or *gefolge,* one of the institutions from which feudalism directly sprang. Besides *homagium ligeum,* there was a kind of homage which imposed no feudal duty; this was *homagium per paragium,* such as the dukes of Normandy rendered to the kings of France, and as the dukes of Normandy received from the dukes of Brittany. The act of liege homage to a particular lord did not interfere with the vassal's allegiance as a subject to his sovereign, or with his duty to any other suzerain of whom he might hold lands. (*See* FEUDALISM.)

HOME, EARLS OF; Alexander Home or Hume, 1st earl of Home (c. 1566–1619-1. was the son of Alexander, 5th Lord Home (d. 1575), who fought against Mary, queen of Scots, at Carberry Hill and at Langside, but was afterward one of her most stalwart supporters. being taken prisoner when defending Edinburgh castle in her interests in 1573 and probably dying in captivity. He belonged to an old and famous border family, an early member of which. Sir Alexander Home, was killed at the battle of Verneuil in 1424. Sir Alexander (d. 1491) was created a lord of parliament as Lord Home in 1173, being one of the band of nobles who defeated King James III at the battle of Sauchieburn in 1488.

Alexander, 6th Lord Home (d. 1619), was warden of the east marches, and was often at variance with the Hepburns, a rival border family whose head was the earl of Bothwell. Home accompanied James to England in 1603 and was created earl of Home in 1605: he died in April 1619.

His son James, the 2nd earl, died childless in 1633 when his titles passed to a distant kinsman, Sir James Home of Coldingknows (d. 1666). a descendant of the 1st Lord Home. This earl was in the Scottish ranks at the battle of Preston and lost his estates under the Commonwealth, but these were restored to him in 1661. His descendant, William, the 8th earl (d. 1761) fought on the English side at Prestonpans, and from his brother Alexander, the 9th earl (d. 1786): the present earl of Home is descended. In 1875 Cospatrick Alexander. the 11th earl (1799–1881), was created a peer of the United Kingdom as Baron Douglas, and his son Charles Alexander, the 12th earl (1834–1918), took the additional name of Douglas. The principal strongholds of the Homes were Douglas castle in Haddington and Home castle in Berwickshire.

HOME, JOHN (1722–1808), Scottish dramatic poet, was born at Leith. Graduating M.A. at Edinburgh university he mas licensed to preach by the presbytery of Edinburgh in 1745. In July 1746 Home was presented to the parish of Athelstaneford, Haddingtonshire. His first play, *Agis:* a *tragedy,* founded on Plutarch. was rejected by Garrick. The ballad of *Gil Morrice* or *Child Maurice* (F. J. Child. *Popular Ballads,* ii. 263) supplied him with the outline of the simple and striking plot of *Douglas,* on which he spent five years' labour. The play was rejected by Garrick. but n-as produced in Edinburgh on Dec. 14, 1756, with overwhelming success; in spite of the opposition of the presbytery. who summoned Alexander Carlyle to answer for having attended its representation. Home wisely resigned his charge in 1757, after a visit to London, where *Douglas* was brought out at Covent Garden on March 14. Peg Woffington played Lady Randolph, a part which found a later exponent in Mrs. Siddons. Gray said that the author "seemed to have retrieved the true language of the stage," but Samuel Johnson held aloof from the general enthusiasm. Home died at Merchiston Bank, near Edinburgh, on Sept. 5, 1808.

The Works of John Home were collected and published by Henry Mackenzie in 1822 with "An Account of the Life and Writings of Mr. John Home." Poems omitted from this edition are printed in vol. ii. of *Original Poems* by *Scottish Gentlemen* (1762). *See* also Sir W. Scott, "The Life and Works of John Home" in the *Quarterly Review* (June 1827).

HOME ECONOMICS. This is a phrase now widely used in the United States to describe a subject of study which would in the past have been called "domestic economy." The range of types of the teaching of home economics is wide, as the subject is

taught in elementary schools, high schools, vocational schools, private schools for girls, technical schools, colleges, universities and schools or colleges for teacher training. A further type of teaching is offered by the extension service of the U.S. department of agriculture, the home economics staff (women) doing their work through lectures, demonstrations, printed matter and the training of local leaders. This extension work is done chiefly in rural districts, but in some States there is similar work in cities. The vocational work is under the direction of the Federal board of vocational education.

In the institutional field the opportunities are many. Hospitals, sanitoriums, homes for the aged or for children, homes for the handicapped, such as the blind and crippled, employ "dietitians," "dietitian"-housekeepers or housekeepers trained in home economics. Private schools employ "dietitians," housekeepers and matrons so trained. All these positions are usually resident. Tearooms, cafeterias and restaurants employ many trained women in different capacities and are frequently owned by women. Many social welfare organizations, such as charity organization societies, have home economics departments, and these, as well as some hospitals, employ trained women as "visiting housekeepers." They are employed also in health centres, social settlements and other welfare enterprises.

Training for work as budget consultant is part of home economics, and such specialists are employed by banks, welfare organizations and a few department stores. A few are established privately as budget consultants Women's magazines and some newspapers have home economics workers, often specialists in one or another part of the field.

Those who have done advanced work in physiological chemistry, textile chemistry or some other branch of science with applications to home economics, may do laboratory or research work. Manufacturing and distributing firms whose product is food or household equipment employ trained home economics women as an adjunct to the advertising department. This staff plans the educational work of the firm, plans and prepares leaflets and matter for advertising pages, and co-operates with the advertising department to make sure that all information given to the public is accurate and helpful. Advertising firms sometimes employ a home economics woman for service to their clients, and this may include speaking over the radio, which is popular as a means of advertising foods and household equipment.

For the work described, professional training is necessary. Some women not so trained are now employed in some of the fields other than teaching, but the necessity for training is recognized more each year, so that it is increasingly difficult for a woman with inadequate or no training to secure and hold such positions.

(I. . L.)

HOME EQUIPMENT. During the 20th century home equipment developed from simple hand-operated tools for cooking, washing and cleaning into highly complicated mechanical appliances, many of them automatically controlled. There were a number of reasons for this development, one of the main ones being the near disappearance of the domestic servant. Equipment was therefore designed to save the housewife's time and energy and to take the drudgery out of housework. The demand for these new and improved appliances was increased by the growing number of married women gainfully employed outside the home, many of whom continued with paid work for the first few years after marriage in order to purchase equipment which later would make running of the home, with children, less burdensome.

This equipment included such basic appliances as ranges or cookers, refrigerators, washing machines, vacuum cleaners and hand irons. In addition, there was a growing market in the second half of the 20th century for such items as automatic dishwashers, garbage grinders, power mixers, electrically heated blankets and air conditioners. Also contributing to the increase in number of basic electrical appliances — as well as of such newer types of equipment as electronic cookers, electric frying pans and saucepans, etc.—in use was the extension of electric power to homes.

KITCHEN EQUIPMENT

RANGES AND COOKERS

The range is one of the most necessary items of home equipment. The four principal types of ranges, according to the fuels used, are gas (natural or manufactured), electric, kerosene (also gasoline and fuel oil in the U.S.) and solid fuel (wood, charcoal, lignite, bituminous coal, anthracite or coke). The following discussion of ranges will be limited to gas and electric types

Traditionally, regardless of the type of fuel used, surface cooking units and oven were combined in one frame; after about 1930, most of the models were 36 in. in height with oven and broiler or grill below the surface units. Later, however, particularly in the U.S., the divided range began to be popular, with the surface cooking units installed in a counter area while the oven, raised to waist height, was built into a wall in another area of the kitchen. The divided range has distinct advantages in use but requires more space for installation than does the conventional range. Moreover, installation costs are higher, since either gas or electrical wiring must be carried to two locations.

Gas Range or Cooker. — Four types of gas are used in the U.S.; natural gas, manufactured gas, a combination of the two and liquefied petroleum. The first three require piping from the gas mains to the home, but liquefied petroleum can be brought to homes in cylinders or placed in tanks under the ground in the home yard. These gases vary in composition and heating values.

Two types of gas are used in the United Kingdom: town gas and Calor gas, the latter much higher in calorific value. The former is supplied through pipes and is available in all urban areas; the latter is delivered in cylinders.

The efficiency, durability and safety of gas ranges have steadily improved. Most manufacturers submit their gas appliances for testing, in the U.S. to the American Gas association, in the U.K. to the Gas council. Minimum requirements agreed on by the A.G.A. and the British Standards institution include gauge of metals to be used in various parts; regulation of flues, valves, ovens, etc.; conditions of gas consumption; protection against gas leakage, carbon monoxide production and fire hazard; satisfactory distribution of oven heat; and thermal efficiency of top burners.

Approximately 75% of food cookery is done on the surface units. Although the burners differ in design, their principal parts include the mixer, mixing tube and burner head. The mixer carries an air regulator (shutter) and an opening, either fixed or adjustable, for the orifice (through which the flow of gas is controlled).

The ports or openings in the burners usually are drilled horizontally on the rim and at a 45° angle in the centre of the burner, so that they do not clog with spilled-over foods so easily as did earlier vertical ports.

Burner sizes usually range from $2\frac{1}{2}$ to $3\frac{1}{2}$ in. in diameter. The larger or giant burner is built for a heat capacity of not less than 12,000 B.Th.U. (British thermal unit) per hour, while regular burners take 9,000 B.Th.U. in the U.S. and 10,000 B.Th.U. in the U.K. Some ranges have separate simmer burners; in others the burners can be regulated so that only the centre ports function, providing heat as low as 500 B.Th.U. per hour. A later development on gas ranges was the thermostatically controlled burner. The control device,, centred in the burner, presses against the bottom of a utensil (only utensils with flat bottoms can be used) and, when the temperature of the utensil reaches that set on the burner valve, the flow of gas is automatically reduced and the gas flame controlled to hold the utensil at that temperature. This development served to simplify meal preparation, as the food being cooked could be left almost unattended without burning or overcooking.

When the burners are operating, gas flows from the main line through a horizontal pipe called the manifold. Burner valves, operated by hand, direct the flow of gas through the orifice and mixer of the burner at very high velocity. "Primary" air is sucked through the partly open shutter and mixed with the gas in the tube; this mixture of gas and air will not burn until it comes in contact with the "secondary" air surrounding the burner.

The range top usually consists of four burners with cooking

vessel supports arranged in various ways, the main arrangements being two behind two or all across the back. In some models, particularly in the U.K., a broiler or grill forms part of the range top, a space being provided for the broiler pan between the top of the oven and the range top. Another position for the broiler is above the range at eye level. In the U.S. the oven burner usually serves for broiling, with the broiler pan, often built in, being placed in a special compartment beneath the main oven.

Most ranges are equipped with automatic lighting by means of a small pilot flame which is kept constantly burning by gas released through a bypass line. As the burner is turned on, some of the gas-air mixture passes into a flash tube, is ignited by the pilot light and in turn lights the main burner.

The oven consists of a metal box heated by a burner, usually located at the bottom of the back wall. To minimize heat loss the oven is made with double walls, the space between being filled with insulating material. Slag wool was formerly used, but aluminum foil and glass fibre have come to be more generally employed, the former because it reflects radiant heat and the latter because it has low thermal conductivity and a high specific heat, thus preventing a sudden fall in temperature when a large quantity of cold food is placed in the oven. The surfaces of the oven are finished with porcelain enamel. A vent is provided for discharging the products of combustion of the gas and of steam evolved during cooking. Commonly the vent is located in the upper part of the back wall. where it leads into a pipe that discharges through the back panel of the range top over the burners. A constant oven temperature is provided by means of a thermostat, either rod or liquid type. The dial setting in the U.S. is by temperature and in the U.K. by number which corresponds directly to temperature. The time taken to reach a given temperature setting from cold varies in different models, but is generally about 15 min.

Special features include folding tops to cover burners when not in use; lighted back panels and oven lights; electrically controlled clock timers and minute timers; nontipping oven racks; rotating temperature guide; lock-position burner valve handles; motor-driven rotisseries; infrared lamps for warming oven; outlets for electrical appliances; chrome-lined ovens; pull-out towel racks; built-in meat thermometers and griddles.

Electric Range. — In the U.S. standards for performance and safety of electric ranges are determined by the National Electrical Manufacturers association, American Standards association and the Underwriters laboratories; in the U.K. by the British Standards institution.

Two types of units, the tubular or radiant and the solid plate, are available. In the U.S., the former is almost universal except on older models. In the U.K. the latter is most generally employed, but use of the first type is increasing. The tubular design consists of a tube of stainless steel or nickel-chromium-iron alloy into which coils of resistance wire are inserted and the tube filled with fused magnesium oxide powder. The tube is flattened on the top to allow for better contact and conduction of heat to the utensil. The solid type consists of a plate of a nickel-containing alloy of cast iron, grooved on the underside to house spiral resistance wire embedded in refractory cement. The upper side has a flat machined surface to ensure maximum contact with a cooking vessel placed on it. One type of tubular unit utilizes two tubes in spiral form to provide different heat patterns with different switch settings; for small utensils the inner coil alone may be heated. The second type of tubular unit uses a larger diameter tube with two or three inserted resistance coils, producing even heat over the whole system.

In the U.S. infrared units also have been developed. These consist of a gold-lined 1,550-w. infrared bulb mounted in a metal reflector and covered with a red glass cover. Infrared type units heat by radiation, whereas other electrical units heat mainly by conduction; because infrared heat is instantaneous, it is especially good for rapidly heating small amounts of liquid or foods. A range usually has only one top-surface unit of this type, but it is used extensively for broiling foods in restaurants and for exhibition purposes.

Most surface units are of two sizes: 8 in., with wattages of 1,600–2,100 in the U.S. and 1,800–2,000 in the U.K., and 6 in., with wattages of 1,100–1,600 in the U.S. and 1.000 in the U.K. (where, however, surface units with higher loadings similar to those in the U.S. are available and growing in popularity). Control of surface units is effected either by means of a 5- or 7-heat switch or by a timer giving an infinite number of heat settings. Many ranges have one or more surface units temperature-controlled by a thermostat.

Oven construction and finish in the electric range are similar to those in the gas range. Heating elements usually are located on the lower part of the two side walls (in the U.K.) or in the ceiling and floor (in the U.S.). They are of two types: the open coil. consisting of a continuous coil of high-resistance wire. which glows red when a current passes, and the tubular sheathed wire, which remains black when current flows. Oven control is by a thermostat, the settings given ranging up to 500° F

Special features include push-button controls and illuminated dials with different colours for each heat setting; thermometer for meat roasting with cable connections to a thermostat dial in the back panel; motor-driven rotisserie; vertical broiler with tno elements to broil on both sides simultaneously; electric filter in oven vent to eliminate smoke and odours from oven; divided oven doors which, as they open, automatically pull out shelves; specialized surface cooking units such as a deep-well cooker or a griddle that can be covered and converted to counter space when not in use; outlets for electrical appliances; and even radios.

Electronic Oven. — In this oven energy from the high-frequency radio band is used for cooking. The radio waves penetrate to the centre of the food and are absorbed evenly throughout, whereas in conventional methods heat is absorbed by the exterior only and transferred by conduction to the centre. Two outstanding features of the electronic method are very short cooking times (often measured in seconds) and complete absence of heat in the oven. The containers used are all made of glass, china, plastic or paper, which transmit the waves and themselves remain unheated. The metal walls of the oven reflect the waves and also remain cool. Electronic ovens were used by caterers in the U.S. for several years before domestic models became available in the 1950s. A magnetron is used for the generation of energy of 2,450 mc. and 12.7 cm. wave length. It has a normal output rating of 2 kw. and is suitable for a maximum operating demand of 5.23' kw.

The appearance of food cooked in this type of oven is diiferent from the conventional, and for foods. such as steaks, that require a brown exterior a conventional broiler must be used as well. This usually is incorporated in the electronic oven. As a safety precaution the oven is designed so that the unit will not function when the door is open. Microwave energy produces no effects on the body except those normally produced by heat.

Refrigerators and Freezers

Refrigerator. — The refrigerator is an appliance in which food and other materials are preserved at temperatures near freezing point (32" F.); in the freezer, food is frozen and preserved at 0° F. and lower. The period during which foods can be preserved in a refrigerator is limited to a few days; they may be preserved in a freezer indefinitely. The refrigerator usually contains a compartment maintained at a temperature considerably below freezing point where frozen foods can be stored, but unless the temperature is 0° F. or less frozen foods should not be stored in it for more than a few weeks. One reason for keeping foods at low temperatures is to inhibit the growth of microorganisms, which cause decay in food. The optimum temperature for the growth of yeasts, molds and bacteria is 70"–SO° F.; at 40°–50° F. the rate of growth, although not stopped completely, is slowed considerably. Practically no growth takes place below 10° F., but storage temperatures near 0° F. are recommended for frozen foods, to discourage ice crystal growth. In many foods the formation of large crystals causes rupture of cell walls and subsequent rapid deterioration of food on thawing. (See also **Food** Preservation [in the Home]; Food, Care **and** Storage of [in the Home].)

The first home refrigerator, made early in the 19th century, consisted of an insulated cabinet into the top of which a block of ice was inserted. Melt water was carried off by a drain pipe extending through the cabinet and out the bottom. The food stored in the section below the ice compartment was kept cool by cold air currents. The modern refrigerator, use of which gradually became widespread after 1918. is automatic, generally operating on one of two basic principles, namely compression and absorption (see REFRIGERATION). The advantages of the compression type are lower running costs and a greater reserve of cooling power, which in practice means that ice cubes can be made more rapidly. The main advantages of the absorption type are that it is completely silent and, because there are no moving parts, there is less possibility of defects developing in operation. Also, because heat is the source of energy used, it can be operated by gas or kerosene as well as electricity.

The automatic home refrigerator consists of a double-walled box with a hinged door, the space between the walls being filled with insulating material. The outer walls of pressed steel have an exterior finish of baked enamel (porcelain enamel may be used for the top surface if it is intended as a working area). The interior walls, when made of pressed steel, are finished with acid-resisting porcelain enamel. The door is also double-walled and insulated. A rubber gasket on the frame maintains a seal and prevents leakage of warm air into the box when the door is closed and locked by means of a latch, a friction locking device or magnets embedded around the frame. Polystyrene is used increasingly for both outer and inner walls, primarily because it can be molded in a complete whole without joints. Shelves and trays usually are made of anodized aluminum or of mild steel wire coated with tin, chromium or polyvinyl chloride.

The sizes of refrigerator cabinets available range from 3 cu.ft. to 16 cu.ft. in the U.S. and from 1½ cu.ft. to 10 cu.ft. in the U.K. The horsepower rating of motors ranges from ⅛ to ⅕ and heating units from 150 to 350 w. Temperature is thermostatically controlled by a dial that may be adjusted to effect changes as required. The setting must be related to the external temperature.

All foods should be as cool as possible when they are put into the refrigerator and should be wrapped or tightly covered to prevent drying out by the evaporator in the cooling compartment. In cold-wall models, however, unwrapped food does not dry because evaporation takes place in another compartment.

Special features include automatic defrosting; frozen food storage accommodation of 2–3 cu.ft.; rotating or adjustable shelves; automatic ice cube dispensers; and door racks and special compartments for foods such as butter, eggs, cheeses and fresh vegetables.

Freezer. — The food freezer is a cabinet or chest, maintained at a temperature of 0° F. or lower, in which fresh foods can be frozen and frozen foods can be stored indefinitely without deteriorating. In rural areas freezers are used for preserving fruit, vegetables, meat and poultry produced locally in excess of requirements and also for maintaining a store of commercially frozen foods for everyday use. In urban areas freezers are used mainly for storing commercially frozen foods.

All freezers are operated by the compression system, using motors ranging from ⅛ to ¼ h.p. In the chest type the evaporator coils are clamped to the sides and bottom of the inner wall; in the upright type they are attached to the walls and undersides of fixed shelves. Both types have a thicker layer of insulation than the average refrigerator, usually about 4–6 in. There are advantages in both types of construction. Foods are generally more easily removed from the upright type, which occupies less floor space.

The chest type is more economical in operation because when the lid is opened the cold air inside, being heavier than the warm air above, remains in the chest, whereas in the cabinet type the cold air falls out and is replaced by warm air when the door is open. Two sizes are generaliy available in the U.K., 4 cu.ft. and 9 cu.ft. In the U.S. the range is normally from about 5 cu.ft. to 18 cu.ft.

COOKING EQUIPMENT

Basic Utensils. — Saucepans. — Saucepans are made of cast iron or sheet steel with a protective coating of tin or porcelain enamel, and of stainless steel, sheet or cast aluminum, copper, brass, nickel, Monel metal and glass flameware. Desirable qualities of the material used for pans are durability; hardness to resist scratching, pitting, abrasion and percussion; strength to keep their shape under strain; a surface relatively easy to keep clean; resistance to moisture and alkalies; and high thermal conductivity. Choice, therefore, usually is governed by cost and the extent to which the material conforms to the above qualities. Stainless steel is one of the best materials, but it is expensive and, because it has a relatively low thermal conductivity, is not satisfactory for all types of cooking unless thickly clad on the base with copper, brass or aluminum. The other important feature affecting choice is design of the pan and cover. Balance, internal radius of the corners at the base for easy cleaning, shape, length, thermal insulation, efficiency of fixing and comfortable grip of the handle, general design of the cover for easy cleaning and the design of the knob for grip are all points to consider.

Casseroles. — Materials used for casseroles, in addition to those given for saucepans, include heat-resisting glass and ceramic materials. Enameled iron, stainless steel and some ceramic materials that can be used on a surface cooking unit as well as in the oven or on the table as a serving dish are especially popular.

Frying and Omelet Pans and Deep Fryers. — Materials used for frying and omelet pans are the same as those for saucepans, a heavy gauge being found more satisfactory because it does not buckle or warp in use. Deep fryers are made of iron, steel, stainless steel or aluminum. These are provided with a wire immersion basket for holding and draining food and a cover for use in case the fat catches fire.

Kettles. — The kettle for boiling water to make tea is an essential item of the kitchen in the U.K., but less common in kitchens in other countries. Materials used include iron; steel, with or without enamel; stainless steel; and aluminum.

Pressure Cookers. — Basically a pressure cooker is a saucepan with a cover that forms an airtight seal when locked in place and traps the steam that otherwise would escape during the cooking process. As the pressure inside builds up, the food is cooked at temperatures above those attainable in an ordinary saucepan. Safety valves are provided to vent the pressure before it can build up to an explosive level. Pressure cookers are especially useful at high altitudes, where normal cooking temperatures cannot be obtained with conventional saucepans.

Knives. — Many different sizes and shapes of knives are used in the kitchen, the two most useful being the chopping knife in different sizes and the vegetable paring knife. The blade is made of stainless steel or carbon steel, the latter, when of good quality, maintaining the best cutting edge if sharpened regularly. The rearward continuation of the blade, called the tang, should extend throughout the length of the handle, to which it should be firmly riveted. The handle should be of material which is impervious to water (hardwood, bone, plastic or laminated plastic) and be comfortable to hold firmly while in use. (See also CUTLERY.)

Baking Sheets and Cake Tins. — These are made of tinned sheet steel or aluminum, which should be of a heavy gauge that will remain rigid and flat in use and not buckle or bend. A surface that is easy to clean and not likely to cause food to stick, if used ungreased, is produced by coating with silicones and by anodizing aluminum.

Whisks. — These are made in many different sizes and shapes, the hat- or balloon-shaped type being used for simple, short operations and the hand-operated rotary egg beater for longer periods. Comfort and efficiency in use and cleaning are important factors which should influence choice.

Graters. — Graters are made in tinned steel, aluminum, stainless steel and plastic. When choosing it is important to consider efficiency in use and to check for jagged edges that will tear the fingernails.

Electrically Heated Utensils. — Individually heated and thermostatically controlled cooking utensils include skillets, fry-

ing pans and deep fryers, roasters and rotisseries, saucepans, kettles, pressure cookers, coffee makers, toasters, broilers, hot plates and sandwich grills, waffle irons, corn poppers and egg cookers. With a proper combination of these utensils, an entire meal can be cooked without the use of a range.

Motor-driven Appliances. — Another class of kitchen appliances are those small devices classed as motor-driven. These include ice crushers, beaters, juicers, blenders, coffee grinders, knife sharpeners, can openers and exhaust fans.

Washing, Mixing and Disposal Equipment

Sinks and Dishwashers. — Materials used for sinks include glazed fire clay. porcelain enamel, aluminum, stainless steel and plastics such as methyl methacrylate and glass fibre bonded with polyester resins. As the kitchen sink receives a great deal of hard wear and often rough treatment, it must be resistant to chipping, cracking, scratching and breaking.

A mechanical dishwasher consists of a porcelain-enameled compartment in which two wire racks are hung. The racks, usually plastic-coated. are designed to hold a given number of dishes, flatware and utensils. A device, usually located in the bottom of the compartment. forces water over the dishes by means of a fan-like impeller. which throws the water upward. or of a rotating perforated arm through which the water is forced up and around in the compartment. The amount of water used varies from seven to ten gallons and must be at a temperature of 150° F. or higher to ensure efficient washing and drying. Many machines are completely automatic. the length of each operation being controlled by a timing device. After the final rinse the dishes are dried in one of two ways: (1) by a sealed heating element. located beneath the racks or outside the tub, over which hot air is blown by a fan; (2) the cover or door opens automatically and the hot dishes dry because of the amount of heat they have retained. Dishwashers are available nith either top opening, pull-out drawer or front opening, the top opening being the least popular because it is less easily placed in the kitchen.

Food Mixers. — Beating, whisking and kneading are performed automatically by the basic model mixer, and attachments can be added for blending and making purées, mincing, coffee grinding, juice extracting, shredding and grating.

Three different systems are used for the basic operation: (1) a detachable beater or whisk is attached to a vertical spindle which rotates about a secondary axis concentric with the mixing bowl; (2) two whisks fixed to a central shaft rotate at high speed and in so doing cause a mixing bowl to revolve slowly; (3) a mixing bowl is electrically driven to revolve at a medium speed and the contents are beaten by a wooden dolly attached to an arm projecting over the bowl. The dolly also rotates by friction from the rim of the bowl with which the rubber-lined upper surface of the dolly is in contact. The apparatus is driven by an electric motor. usually portable, of $\frac{1}{16}$ to $\frac{1}{4}$ h.p. The motor is heavy and unwieldy to lift, however, and therefore frequently is kept permanently in the place where it is used. In one available model the motor is fixed immediately beneath a working surface and is provided with a projection to which the bowl and beater arm can be attached. This type has the advantages that only the lightweight bowl and mixer need be lifted and that the work area is free from obstruction when the mixer is not in use. Hand models of type (2) are generally available and useful for whisking eggs and beating potatoes, but they are not very satisfactory for longer operations, such as cake mixing. because they save only energy and not time. Most models with high-speed whisks are made with a detachable head for manual use.

Food mixers are generally satisfactory in operation but, when purchasing, it is advisable to ensure that they are simple to operate and that the motor in running is reasonably quiet.

Food Waste Disposer. — The food waste disposer or garbage grinder, designed to pulverize food waste, is fitted into a sink drain so that, with the aid of a continuous flow of cold water, the resulting material is flushed into the sewage system. It consists essentially of cutting knives of high-quality steel that rotate at high speed inside the food waste container, The electric motor driving the blades is generally $\frac{1}{4}$ h.p. for the small home model. Two different methods of control are used. In one, a switch starts the motor but the operator is responsible for turning on the water and feeding waste into the hopper. A hand guard usually is provided with this type. In the other, the top of the disposer is locked in place and, when the cold-water faucet is turned on, a small quantity of water is bypassed through a separate pipe, where the pressure trips a switch and starts the motor. This method ensures a good flow of water for flushing the drainpipe, The disposer will pulverize a great number of materials composing kitchen waste, but certain items for which it is not satisfactory include paper, tin cans and large bones. Stringy foods such as corn-husks, artichokes or celery are difficult to pulverize unless added with other foods and in small amounts.

LAUNDRY EQUIPMENT

Washing Machine. — This consists of a tub in which articles are agitated in soapy water by a mechanical device of which there are two main types, the agitator and the cylinder. In the former an attachment with blades or fins is fitted over a central shaft, which rotates first in one direction and then in another, in so doing moving the clothes in the water. In the latter a perforated drum revolves on a horizontal axis and carries the articles with it. Some types of small machines work by means of an impeller, a finned disk fitted in the side wall or base of the tub; rotation of the impeller causes the clothes to rotate in the water. Almost all washing machines incorporate in their designs a device for extracting water from the clothes. This device may be either a power-driven or hand-operated wringer or a rotating perforated drum revolving at high speed on either a vertical or horizontal axis. The tub is usually of aluminum. stainless steel, sheet steel lined with porcelain enamel or glass fibre bonded with polyester resin. The agitator attachment is normally made of aluminum alloy or reinforced Bakelite. Tubs are designed to hold 44–10 lb. of dry clothes and about 5–17 gal. of water. The motor is of $\frac{1}{8}$ or $\frac{1}{4}$ h.p. and energy is transmitted to the drum or agitator shaft by belt, gears or friction wheels.

Washing machines may be (1) fully automatic; (2) semiautomatic; or (3) hand-operated. In (1), after the articles have been placed in the tub, the controls adjusted and the current switched on, the washing cycle is completed without further attention by the operator. This cycle consists of filling the tub with hot water, washing for a set time, rinsing one or more times and extracting the water. In (2) the amount of attention necessary by the operator varies. This type always bas a power-driven device for washing and usually one for extraction and emptying of the tub, but in general each process must be started and stopped by the operator. In (3) the mechanical device for both washing and extraction of water is hand-operated. In many washing machines in the U.K. an electric heating element or gas burner is included so that water can be heated and articles can be boiled in the tub.

Spin Dryer or Extractor. — The spin dryer does not dry clothes but merely extracts water from them, the amount remaining being 33%–50% of the dry weight of the articles compared with 100%–150% for the conventional power-driven wringer. The method of extraction by rotation of a perforated drum on a vertical axis is similar to that used in some washing machines, but the speed of rotation is generally higher, ranging from 1,000 to 2,800 r p.m., and the percentage of water extracted therefore also is higher.

Clothes Dryer. — Cabinet dryers, heated by gas or electricity. can be used for drying clothes after washing or airing them after ironing. These appliances usually are made nith metal bars over which the clothes are hung.

The automatic dryer, sometimes called the tumbler dryer, is a power-driven device which, through heat and tumbling (with or without air flow), evaporates water from fabrics for a period of time determined by the operator. Although all dryers operate on the same principle of tumbling clothes in a cylindrical basket or drum, in the presence of heat, they fall into two general types, those that are time-controlled and those that are temperature-controlled. The former may have two dials, one to control drying

time, the other to set the degree of heat desired according to the fabric being dried; some have only one dial, for timing the operation, temperature being thermostatically controlled. Temperature-controlled dryers have a thermostatic control set for a desired temperature; when sufficient moisture has evaporated to cause a rise in temperature equivalent to the setting, the machine stops.

The capacity of the automatic dryer is rated as 8–9 lb. dry clothes or 16–18 lb. wet weight. Most dryers have a moisture removal rate of 8–12 lb. per hour.

Hand Irons and Power Irons. — Heat, moisture and pressure are necessary to remove from fabrics the creases acquired from washing and drying. When heated and damp, the fibre temporarily becomes plastic so that the pressure of the iron removes the creases. Before electricity was generally available irons were heated in the coal fire, on the range top or by gas or charcoal.

The electric hand iron consists of a sole plate of aluminum alloy, cast iron or steel plated with chromium, to which is attached a well-insulated cover and handle made of wood or plastic. Heating elements are of two types: In the herringbone, mica-insulated type the element is firmly clamped against the sole plate by means of a pressure plate; the efficiencyand life of the element depends to a great extent on the uniformity of this pressure. The later type, with a ceramic-insulated element cast into the sole plate, gives more uniform heating if well designed and has a longer life. The electric loading of hand irons ranges from 630 to 1,000 w. and the weight from 3 to 6 lb. Many irons are made with a thermostatic control, the settings being labeled in terms of the fabrics for which they are suitable. Temperatures widely recommended are as follows: synthetics, 300" F.; silk, 325"; rayon. 350"; wool, 375"; cotton, 425°; linen, 475°.

The steam iron, which became very popular in the second half of the 20th century, is a heat-controlled iron containing a reservoir of water which is heated in the iron and released as steam through holes in the sole plate. There are two major types of steam irons, the kettle and the flash boiler. The former holds one to two cups of water, all of which must be heated to boiling point before steam issues from the sole plate. The latter, which holds varying amounts of water, produces steam instantly when each drop of water comes into contact with the sole plate. Both types also can be used for conventional dry ironing.

There are two types of power irons, the flat plate or press and the rotary or mangle, both of which require practice to acquire the skill necessary to iron all types of articles. In the press, a hinged, thermostatically controlled, electrically heated, rectangular metal shoe, about 2 ft. x I ft., is lowered onto a padded ironing board on which the article to be ironed has been arranged. Considerable pressure (about 300 lb. per square inch) is exerted by the shoe on the article, thus producing a satisfactory finish on such articles as starched linen and cotton. The electrical loading is 1,350 kw. In the rotary type the article passes between a padded revolving roller and a concave polished metal shoe that presses firmly on the roller. The shoe, electrically heated and thermostatically controlled, may be located either above and slightly to the back of the roller or below and slightly in front of it. In the former, articles pass under the shoe and over the roller, which has one open end and is supported at the other end. In the latter, the articles pass over the shoe and under the roller, which may have one open end or be open at both ends. In the latter case it is supported by a wishbone-type frame. The electrical loading of the sole plate ranges from 1,250 to 1,600 w., and the roller is driven by a small electric motor of about $\frac{1}{8}$ h.p. These irons may be either portable or cabinet type. Some models also may be fitted to the washing machine as an alternative to the wringer.

CLEANING EQUIPMENT AND MATERIALS

Carpet Sweeper. — This is a hand-operated machine designed to remove surface dirt from rugs and carpets. It consists of a long-handled metal or wooden container on wheels. Inside the container is mounted a cylindrical brush that rotates when the appliance is pushed over carpets and other floor surfaces. The dirt picked up by the rotating brush is deposited in two pans alongside the brush.

Suction or Vacuum Cleaner. — This is an electrically operated machine consisting essentially of a high-speed fan, driven by an electric motor, which draws air through the machine. It is designed with a nozzle opening that, when placed on the surface to be cleaned, sucks up dust as air is drawn through the carpet material. Embedded dirt is difficult to remove by suction only, and brushes and other agitators to loosen it often are included in the nozzle.

There are two main types of suction cleaner; the upright and the canister. The former is a long-handled metal or plastic container in which is located the motor, the fan and the rotating cylindrical brush driven by a belt from the motor. When the current is switched on, the brush rotates and air is drawn over it through the container and into a bag suspended from the handle. The bag is made of either fabric or paper which permits the passage of air but not of dust, which is deposited in the bag. The canister type consists of a metal or plastic cylinder or sphere in which is located the motor, the fan and the bag in which the dust is deposited. A flexible hose attached to a tube with a nozzle end is fixed into a hole in the cylinder or sphere. When the current is switched on air is sucked through the nozzle; with it is carried dust, which is deposited in the bag. **A** brush and an agitator may be included in the nozzle.

Motors range in size from $\frac{1}{2}$ h.p. to $\frac{3}{4}$ h.p. and in speed from 6.000 to 16,000 r.p.m. and more. Canister types usually have larger motors, but the amount of suction depends primarily on the size, speed and design of the fan and the design of the fan chamber. Suction, and thus efficiency, is reduced as the amount of dirt in the bag increases, hence it should be emptied frequently. Where the design incorporates a paper bag, the bag can be removed and replaced by a new one.

Most suction cleaners are designed to be used with tools for other cleaning jobs. Such tools include a crevice tool and brushes for dusting and for cleaning upholstery, walls and bare floors. A spray device for paints, insecticides or other liquids. and a demothing device may be attached to a second hole on the reverse or "blower" side of the fan in most models.

Cleaning **of** Rugs. — Soil that sticks to and cannot be removed from rugs by regular vacuuming often can be removed by rug-cleaning powders made of sawdust or clay products and mixed with a spirit solvent. This mixture can be spread over and into the nap or loops of the rug with the floor brush attachment of a vacuum cleaner or with a broom. As the solvent evaporates, the soil becomes attached to the powdery material, which, when dry, is removed from the rug by the vacuum cleaner. This type of cleaning product is especially suitable for oily types of soil.

Another method of cleaning rugs is to use concentrated liquid synthetic detergents. Added to water, these may be sprayed or sprinkled on the rug and scrubbed with a stiff brush or broom until all lather has disappeared. When dry, the rug is vacuumed to remove residual soil and detergent.

Floor Polisher. — The floor polisher usually consists of one, two or three motor-driven disk-shaped brushes, with long stiff bristles, that revolve at high speed. The heat created by the friction of the brushes melts wax into the floor and gives a polish. The utility of these machines is increased by the attachment of steel wool pads, which may be used for soil removal instead of scrubbing; or sandpaper disks may be inserted for use in roughening surfaces before applying new finishes; or the brushes may be used for actual scrubbing with water. Felt disks also are available for high-lustre polishing.

Cleaning Materials. — Cleaning materials may be classified according to the general action they have, which may be one or a combination of two or more of the following: (1) Solvent; water and certain spirits used for grease removal are the main solvents. (2) Detergent; soap and synthetic detergents are used for clothes, dishmashing and for floor and general-purpose cleaning. (3) Abrasive: powders made up of particles of different sizes are used for their mechanical action in cleaning and polishing, those with fine particles of smooth shape being used on soft, easily scratched materials and powders with large, hard, sharp particles being used on harder materials. (4) Protective; waxes, silicones, oils and

plastic materials are used to form a protective layer on floors and furniture. (5) Bleaching and bactericidal.

HEATERS, WATER SOFTENERS AND AIR CONDITIONERS

Water and Space Heaters.— The fuels used for appliances for water and space heating are solid fuel (coal or coke), oil, gas and electricity, the first two being most generally used for central heating systems because of lower running costs. The heat generated in the home furnace is transferred to the rooms of the house either by hot-water pipes and radiators or by hot-air ducts. Underfloor heating also is employed, with either hot-water pipes or electric elements embedded in the concrete subfloor.

Piped hot-water systems may be either direct or indirect, the latter being used for combined central and water heating. Direct systems employ independently fired water heaters using gas or electricity and are sometimes used as auxiliaries of the indirect systems during the summer months when the main heating system of the house is closed down. Independent heaters are thermostatically controlled, water temperatures of about 140° F. being generally used to minimize heat losses and scaling, which increase rapidly at higher temperatures. (For a more complete discussion of heating systems *see* HEATING AND VENTILATION.)

Water Softeners.— From the gases in the air, minerals and organic matter on and in the earth's surface, water picks up matter that makes it coloured, cloudy, iron-contaminated and hard with calcium and magnesium salts. Water with as little as 4 or 5 gr. (1 gr. = $\frac{1}{2\,0\,0}$ oz.) hardness causes soap to unite with the minerals, forming insoluble soap curd and causes scaling in water pipes and heaters.

Water hardness can be reduced by the use of packaged chemicals or a mechanical water-conditioning appliance. Of the packaged chemicals, one type, the hexametaphosphates, leaves the minerals in solution but makes them inactive. Other types of phosphates generally precipitate out the minerals. These chemicals generally must be added manually to washer. dishpan or bathtub and are difficult to dispense in showers or dishwashers.

The mechanical softener, on the other hand, is plumbed directly into the water system and removes hardness minerals by a process known as ion exchange. A tanklike container holds a quantity of beadlike ion exchange resins, which have an affinity for the calcium and magnesium ions found in hard water and prefer them to the sodium ions with which they were originally saturated. Thus, if water containing calcium and magnesium ions passes through a bed of the resin which contains a high concentration of sodium ions, the calcium and magnesium ions in the water will be replaced by the sodium ions of the resins and the calcium and magnesium will combine chemically with the resins. Mechanical water softening cannot be a continuous process, however, since the resins eventually become saturated with calcium and magnesium ions and must be regenerated. This is accomplished by washing the resins with a salt brine solution, which causes the resins to give up their load of calcium and magnesium ions and reunite with sodium ions. Following the wash, the brine, which now consists of calcium and magnesium chlorides, is flushed out of the system through a special outlet. This process may be repeated over and over. While ion exchange resins are not designed to remove iron compounds from water, they do remove some iron. For high iron content waters, however, special filters are necessary. Phosphate feeders inserted in the water line will help, in some cases, to keep the iron in suspension and retard its deposition on fabrics, plumbing fixtures and the like. (*See* also ION EXCHANGE.)

Air Conditioners.— The term air conditioner commonly implies the appliance installed in a window for the purpose of cooling, dehumidifying and purifying the air in a given area, usually one room. A true air-conditioning system, however, is a central unit designed for both heating and cooling, which works interchangeably and automatically to condition the air and maintain it at a set temperature throughout the home.

The room conditioner is most frequently installed in a window or other opening in the outside wall. Such units are generally rated from $\frac{1}{2}$ to $1\frac{1}{2}$ tons, a "ton" being equal to the amount of cooling produced by the melting of one ton of ice in 24 hours. Larger conditioners usually are water- rather than air-cooled and require $1\frac{1}{2}$–5 h.p. motors. The motor of the ordinary room conditioner generally is about $\frac{1}{3}$–1 h.p. Any size over that requires a 240-v. circuit.

The mechanism of the room conditioner is the same in principle and similar in construction to that of the compression-type refrigerator. Air is drawn through a filter that removes dust, smoke and pollen; the clean air, which may also be moisture-laden during hot humid weather, then passes over the cooling coils, causing some condensation. The condenser fan throws the excess moisture onto the condensing coils, where it may all be evaporated or channeled to drain outside the conditioner. Heat from the condenser is dissipated outside the house, and cool air is blown through vents into the room by the fan. Adjustable vents allow for the air to be circulated in different directions — up, down or sideways — in the room to prevent drafts on the occupants. The air is usually about 15°–25° cooler than the temperature of the room would be without the conditioner. Some models are thermostatically controlled so that when the temperature of the room drops below that of the temperature setting the cooling unit shuts off and only the fan continues to operate, providing circulation without cooling. This feature is advantageous for nights when outside temperature may drop below that of early evening. Some models have to be manually set and operate until the user changes the control. Still other models have a heating element to warm the room on cool days. Certain models are designed only to cool and recirculate the air already in the room, others have a vent that can be adjusted to pull air in from outside or recirculate that in the room. The latter is advantageous on very hot days when it is easier to keep the already cooled air at the desired temperature than to cool that from the outside. If air becomes stale the vent can be opened to replenish it. Portable models that do not require permanent installation also are manufactured. To reduce noise, motors, compressors and fans are mounted on rubber. Since air conditioners can dry, cool and remove dust and pollen from the air, they are of aid to persons with hay fever and asthma. (*See* also HOUSE DESIGN; AIR CONDITIONING.)

(EL. K. W.; J. E. WA.)

SEWING MACHINES

Flat Bed and Free Lower Arm.--Most home sewing machines are the flat-bed type, on which it is difficult to sew or mend narrow tubular parts such as socks, elbows of a sleeve or knees of trousers. Free lower-arm machines have an enclosed lower portion over which tubular fabrics may be slipped.

Portable and Cabinet Styles.— Portable full-size heads of steel machines may weigh more than 30 lb. and are not easily carried; those made of aluminum are of course considerably lighter. Smaller-size heads weigh less, but they provide less free space for maneuvering fabric while sewing. It is more difficult to sew heavy or bulky fabrics on very small machines. Some carrying cases are designed to open to create a flat surface for the free-arm machine or double in use as a suitcase. Certain portable machines are made so that they can be locked easily into a cabinet or be removed by lifting a lever in the machine. Specially constructed tables, with a removable section in the top and a supporting base, into which portable machines may be set, provide a flat surface for sewing at a comfortable height.

Oscillating and Rotary Types.—It can be determined whether a machine is oscillating or rotary by noting the direction of the movement of the bobbin race (which is around the bobbin case) while stitching. Oscillating machines have a semicircular, backward and forward mechanical movement around the bobbin case, which clicks when the race starts to reverse itself. This knocking may cause wearing of parts. The mechanical movement in rotary machines is circular, continuous and smooth, with potentially greater speed and less vibration and noise during operation.

Stitching.— When a machine is evaluated, the stitch should be tested on several kinds of fabric — limp, thick and sheer. It should be noted if the machine stitches in the reverse position, for this is used in backstitching, for securing forward stitching and

for mending. The machine head or upper tension may obscure the stitching area, and a slant-needle type machine may provide greater visibility than the vertical-needle machine.

Home sewing machines do three types of stitches: straight lock stitch, chain stitch and zigzag lock stitch.

Straight Stitching. — The commonest machine stitching is a straight. flat stitch produced by the interlocking of spool and bobbin threads, which is fairly difficult to rip out. Straight lock stitch machines often have the reverse stitching feature and sometimes accommodate attachments that do limited kinds of zigzag stitches and make buttonholes.

Chain Stitching.—Chain stitching is produced by one thread which loops over itself, as in knitting or crocheting. The stitching, which may be seen on feed and sugar bags, can be readily unlooped and pulled out, and to be secure the stitched ends therefore must be completed properly. A chain stitch is more upraised than a lock stitch, and since bulky stitching generally is undesirable there is little demand for new chain-stitch machines.

Toy machines for children are the chain-stitch type, being easy to thread because no bobbin is inserted. Toy model machines are adequate for occasional mending.

Zigzag Stitching.—Zigzag stitching is a lock stitch of bobbin and spool threads which zigzag because the threaded needle shifts from side to side during sewing. A close zigzag stitch results in a satin stitch. Buttonholes can be made without attachments, but care must be taken to move the proper levers on the machine and a semiautomatic buttonhole attachment is available for some machines to decrease the probability of mistakes in machine adjustments. Buttons can be sewn on with the shifting needle. By inserting two threaded needles, two rows of stitching can be done at one time. Although all zigzag machines do straight lock stitches, on some models the straight stitching is not so regular as it might be. Attachments can be used on zigzag models as on straight-stitch machines. Zigzag stitching usually is demonstrated on stiff fabrics, but it should be tested on limp fabrics too. The overcasting stitch also should be tested by sewing the cut edge of fabric; if the overcasting draws, the tension should be readily adjustable to improve the stitching.

Semiautomatic zigzag models produce decorative zigzag stitches by means of a lever moved manually and rhythmically while sewing. The right hand, working the lever, cannot be used to control the fabric, and as the hand becomes tired the rhythm is changed, resulting in an irregular stitch. Automatic zigzag stitching is done with the insertion of special cams (disks) or by built-in cams. Machines with built-in cams are capable of limited design variations by adjustments in the width (bight) and length of the stitch, and some of these machines accommodate insertable cams for additional decorative stitching. Machines with insertable cams are more versatile because the manufacturer may continue to make cams with new designs and because, since some cams come in several parts, new designs can be created by interchanging the parts. The important thing to consider when comparing automatic zigzag machines is whether it is necessary to have an almost unlimited variety of designs. Ease in inserting the cams also needs to be considered. Zigzag machines vary in complexity of machine adjustment for each decorative stitch.

Speed *and* Vibration. — Electric home machines may vary in maximum stitching speed within the range of 700–1,400 stitches per minute. On some machines, the maximum speed can be controlled by a lever. The rapidity with which a machine starts and stops sewing is important, and time is wasted if the handwheel must be grasped in starting or stopping. On all kinds of machines, speed of stitching is controlled by the operator. A machine should be tested for amount of vibration when sewing at all speeds, for vibration is likely to be the fault of the machine head rather than of the table. Vibration makes it difficult to control the fabric.

Bobbin. — Ease of bobbin insertion is an important factor. Some machines have built-in bobbin cases; in others the bobbin first must be inserted in a removable bobbin case or shuttle, then placed in the machine. In some machines the bobbin must be inserted on a vertical plane, in others on a horizontal plane; the latter often provides easier insertion and better visibility. Some machines have a "nonjamming" bobbin feature that prevents the thread from clogging the bobbin race if stitching is done when no fabric is under the needle, or that makes it possible to remove a caught thread easily.

Attachments. — The hinged presser foot is useful for sewing over irregular surfaces and pins. Adjustable cording and zipper feet make it possible to stitch close to an upraised surface, such as the teeth of a slide fastener or cording. The buttonhole attachment, adjustable or automatic with the insertion of templates, is useful on lock-stitch machines. Templates are available for both keyhole (one rounded end) and straight buttonholes. Tuckers, hemmers, rufflers and darning and quilting feet are other attachments. Practice often is necessary for skillful use of attachments. They usually are demonstrated on stiff fabrics, and careful adjustment may or may not make it possible to work on limp or glossy fabrics. An automatic zigzag attachment is available for certain brands of straight lock-stitch machines.

Machine Operation. — Sewing machines are powered by a handwheel, a foot treadle or electricity. Nonelectric machines often can be electrified, and electric machines can be adjusted so that they can be operated by a handwheel or foot pedal. Electric machine stitching is regulated by knee or foot levers, some machines having both features. A knee lever located in the proper position for the user may be a better choice than a foot pedal, which is so easily shifted that it is annoying to relocate it after the foot is removed. Foot-pedal machines may be altered to operate with knee levers. Machines may operate with built-in gear drives or with the less expensive friction or belt drives. either enclosed or exposed. A stretched belt or worn-out friction drive usually can be replaced easily with little cost, but the replacement of part of the gear drive requires skill and is more costly. *(See* also SEWING MACHINES.)

HOME OFFICE: see GOVERNMENT DEPARTMENTS.

HOMER (Ὅμηρος), the traditional epic poet of Greece. The name is especially applied to the author of the two great epic poems, the Iliad and Odyssey (ἡ Ἰλιὰς πόησις, ἡ Ὀδυσσείαπόησις), which were recited or performed by rhapsodes at the Panathenaea at Athens, every four years during the classical period. An analysis of their contents will be found under the title HOMERIC POEMS, together with an account of the rest of the Homeric cycle.

The great books which come from an age before literary record are sometimes anonymous, like the Eddas, sometimes attributed to famous figures in the tradition, as the Psalms in mass to David and the Pentateuch to Moses, sometimes to a definite but unknown person, as the Chanson de Roland to Thorold, sometimes to gods or mythical characters, like the poems in Book X. of the *Rigveda*. The special difficulty about Homer is that, whereas David and Moses have an independent existence, whether or no they wrote the works ascribed to them, Homer has not: he is nothing but the author of the Homeric Poems. The poems are facts and "Homer" a hypothesis to account for them.

Lives of "Homer." — There are indeed certain traditional "Lives of Homer." Eight are published in the Oxford text of Homer, vol. 5, together with the Contest oj *Homer* and Hesiod. The longest and best is composed in Ionic Greek under the name of Herodotus. The dates of these lives are hard to determine, particularly since the latest may contain nuclei of ancient tradition. But it seems likely that the demand for a life of Homer arose at least as early as the general interest in literary biography in Greece, *i.e.*, about the time of Aristotle; and that, when it arose, there was no material for satisfying it beyond romance and conjecture. The existing lives seem to be made up out of deductions from certain passages in the Homeric poems and from proverbs and popular verses. The Lives quote many of these, sometimes lines about particular places — Smyrna and Kyme (Epigr. iv.), Erythrae (Epigr. vi., vii.), Mt. Ida (x.), Neon Teichos

(i.), sometimes about particular trades or occupations—potters, sailors, fishermen, goatherds, etc. The verses are attributed to Homer, and occasions are invented for his uttering them. Similarly various characters in the epics, Mentes, Mentor, Tychius etc., are explained as real persons whom he rewarded or punished by putting them into his books. There is romance in the conception of the divine poet, blind, old and poor, wandering from city to city; and it may mell be real history which, amid the many varying stories, always brings Homer from Ionia, and almost always from that part of Ionia which was originally Aeolic.

Seven cities are recorded as claiming to be Homer's birthplace: "Smyrna, Chios, Colophon, Salamis, Rhodos, Argos, Athenae," but it is not always the same seven. Kyme, Ithaca, Ios, Pylos come in some lists, while Sparta, Egypt and Babylon also compete. Many of these fall away as obvious inventions; Sparta comes from the Lycurgus romance; Egypt and Babylon belong to the conception of Homer as "all-wise," full of the learning of the east. Smyrna and Chios have the most support, followed by Kyme and Colophon.

As to Homer's date, the pseudo-Herodotean Life puts his birth at 1102 B.C. Elsewhere the estimates vary from 685 B.C. (the historian Theopompus) to 1159 B.C. (certain authorities in Philostratus). Herodotus considers that "Homer and Hesiod" made the Greek pantheon "not more than **400** years before me": *i.e.*, about **830.** Aristarchus puts his floruit at 1044 B.C. These dates seem to be based on the date of the Trojan War and a conjecture of Homer's relation to it.

Sometimes one can place a poet's date and nationality by his dialect. But the Homeric dialect has no contemporary parallel by which it can be judged, and as it comes to us in the poems is clearly not a dialect that was ever spoken, but one created by the epic tradition, and even by the hexameter metre, for its own purposes. In the main it is an Ionic dialect, like an early stage of that written by Herodofus; hut the surface of the poems has been unconsciously Atticized, an inevitable result of the Panathenaic recitation and the Athenian book trade. When this surface corruption is removed we find many non-Ionic forms which have all the appearance of being Aeolic—the dialect of Thessaly, Lesbos and Aeolis. It is also clear that, where two forms are metrically equal, the Ionic form is generally preferred.

This would seem, by all analogy, to show that either the poem itself or at any rate the poetry which created the Epic dialect, had once been Aeolic, just as the people of Smyrna, Chios and the neighbourhood had. (The phenomenon is not uncommon in traditional poetry. Thus the English poem, Sir Degrevant, is shown to be taken over from a Norman original by the fact that, while the hero is normally called Degrevaunt, and of course remains so when required to rhyme with "avenaunt," "recreaunt," he becomes "Degrivauns" when he has to rhyme with "countenauns" and "Frauns." In Norman, "Degrevans" was nominative and "Degrevant" accusative.)

But beneath both the Ionic main stream and the Aeolic incidents there is an element of very old Greek, comprising many expressions which were not understood in classical or Alexandrian times, and many more which needed a commentary (*ἀμενηνὰ κάρηνα, διάκτορος ἀργειφόντης*). What is more remarkable, there are some forms (such as *ϝάναξ, πτόλις, κέραμος*) which are found in Cyprian and Arcadian, and nowhere else. That is, they belong to the ancient undivided language mhich survived in these two isolated and mutually remote dialects. The problem may be raised whether the Homeric dialect does not contain an element of the pre-Greek language of the Aegean, derived perhaps from pre-Homeric Minoan poetry. Doubtless there is such an element but it does not seem noticeably stronger in Homeric than in classical Greek (cf. Haber, *De Lingua antiquissimorum* Graeciae *Incolarum*, 1921.)

The Text of the Poems.—These observations, which seem at first sight so confusing, nevertheless yield a result. The man "Homer" cannot have lived in six different centuries nor been born in seven different cities; but Homeric poetry may well have done so. The man cannot have spoken this strange composite epic language, but the poetry could and did. Let us turn back therefore from the unknown man to the known book.

The works of Homer "and no other poet" (Lycurg, in Leocr. p. **209)** were recited at the Panathenaea in accordance with a law attributed variously to "our ancestors," Solon, Hipparchus or Peisistratus. The "works" were the Iliad and Odyssey. They had to be recited *ἐξ ὑποβολῆς* or *ἐξ ὑπολήψεως, i.e.,* by giving or taking a cue; there was a fixed order, so that where one man left off another began. The custom continued at least to the times of the author of the pseudo-Platonic dialogue *Hipparchus,* and seems to have started with the foundation or re-foundation of the Panathenaea by Peisistratus.

If there was a fixed order, there must have been something like a written text; and as a matter of fact we find in the scholia an accepted tradition, supported by certain corruptions in the text, that the poems were once written in the old Attic alphabet, an archaic and awkward script with no double letters or long vowels. This tradition has been considered incredible on the grounds that the new, or Ionic, alphabet was used in Athens for literary purposes from very early times, the old script being purely for official documents; that Homer must have come to Athens in Ionic script; and finally that several passages in tragedy which describe the writing of heroic times always take the Ionic script for granted. (Eurip. *Theseus,* fr. 382 N.; Agatho fr. **4,** Achaeus fr. **33,** Theodectes fr. 6.) The conclusion seems to be that, if the Panathenaic text of the Iliad and Odyssey was ever written in the old Attic script, it must have been an official document, drawn up by order of the state.

There is some evidence that this was so. A tradition which Wolf described as aox *totius* antiquitatis speaks of a text or an arrangement, or recension, of the works of Homer by Peisistratus, tyrant of Athens between 560 and 527 B.C. The oldest witness is one Dieuchidas of blegara in the fourth century B.C., to whom may perhaps be added the Aristotelian Dicaearchus and the grammarian Crates, who founded the art of *grammatike* in Rome. (He was detained there by breaking his leg when on an embassy from Attalus II. to the Senate.) The clearest are writers of the early Roman period and various scholia and lexica. Cicero puts it that Peisistratus *primus Homeri libros, confusos antea,* sic *disposuisse dicitur ut nunc habemus* (is reported to have been the first to arrange in their present order the books of Homer, which were previously in confusion); Josephus says that Homer left nothing in writing; the poems were afterwards put together from the varying memory of different places; Suidas, the Lives, Eustathius and the Townley Scholia explain that Homer sang his poems *σποράδην,* "in a scattered way," as he travelled about, and that Peisistratus afterwards collected them. Pausanias, Aelian, Diogenes Laertius, mention or assume the tradition; indeed one may say that it is the accepted view of the grammarians with the exception of Aristarchus, who held that Homer himself was an Athenian.

Such authority is of course not conclusive. But there is very little of our grammatical record that has more ancient credentials, and even if there were no tradition at all, it is hard to conceive how the Panathenaic recitation could have been established without some editing of the poems, under the orders, presumably, of Peisistratus or his artistic son, Hipparchus.

There must then have been an authoritative Athenian text in the second half of the sixth century B.C. That is the earliest solid fact in the record of the Homeric poems. The curious thing is that this text did not maintain itself. There is little evidence affecting the text of Homer in the fifth century, after the fall of the Peisistratidae, but as soon as quotation becomes common, in the fourth and third centuries, it is clear that the current texts varied considerably both from one another and irom our vulgate. Still more striking is the evidence of the early papyri, numbering about **zoo** which have been discovered since 1890. Eleven of these are earlier than 150 B.C.; the rest later. Roughly speaking those later than 150 B.C. generally agree with our present vulgate texts; of the eleven supposed to be earlier ten differ "wildly" from our vulgate and one (Pap. **Ox.** 1388), has proved to be later.

The Establishment **of the** Text.—Evidently something happened about 150 B.C. which reduced the current texts of Homer from disorder into order, and the grammatical tradition enables us to see what it was. It was about 150 B.C. that the famous Aristarchus of Samothrace, then head of the Alexandrian-library, published the edition, or rather the two successive editions, of the text of Homer which were afterwards recognized as authoritative. This fact was for long obscured by the language of the scholia, which dwell on Aristarchus's extreme "caution" (εὐλάβεια) in treating the text and often seem to be in doubt what his reading really was. When he does not "condemn" a spurious line, that normally means that it had not yet made its way into the text. But it is clear that his caution did not prevent conjectures and large condemnations; and the occasional uncertainty as to his reading only shows that the current texts a few generations afterwards were not infallible and could not be trusted without further question. It seems probable, especially after the recent work of Cauer, Wecklein and Bolling, that the present vulgate text was approximately, at any rate, the text of Aristarchus. It is still disputed how far he created that text, and whether it is really some old text—that of Peisistratus, or even of Homer himself—re-established by the great critic out of the mss. which he collected.

It seems clear that from the time of Aristotle and Aeschines on to that of the earliest papyri the texts of Homer were in an extremely fluid state. (Aristotle for example cites from Homer five completely unknown phrases or passages; he quotes many passages in a strange shape; he found several passages not where we have them but in another context; and in order to show how short a *resumê* can be he remarks that Odysseus' story to Penelope in *Od.* xxiii. "occupies only 60 lines," while in our texts it only occupies thirty-three.) The first great Alexandrian scholar, Zenodotus of Ephesus (b. 325) set himself vigorously to cope with this confusion. He rejected freely passages which he thought spurious, and probably he found mss. which were considerably shorter than ours. He had not reached the wonderful knowledge of Homeric idiom which was the distinction of Aristarchus; but he had the advantage of catching the text at an earlier stage, and thus was spared some interpolations which had not yet been made, while he preserved many ancient readings and forms (φὴ κύματα B 144, δαῖτα A 5, κυνύλαγμον Φ 575, ἀψ *drab* Φωκήων γ 307). His text must have been at least a thousand lines shorter than that of Aristarchus, and it was his vigorous pioneer work which made the "caution" of Aristarchus possible (see *infra*, "Study of Homer in Antiquity").

The Poems Before **Aristarchus.**—We find thus two stages of something like *terra firma* in the history of the Homeric text: the present vulgate, established (approximately) by a process which set in about 150 B.C. and was probably due to Aristarchus. Before that a long period of uncertainty, and then earlier, about 550 B.C., the so-called "Peisistratean recension," by which we can only mean the text in the old Attic script which was composed or used for the purposes of the Panathenaic recitation. This is the earliest stage of which we have any record; any suggestion about the previous history of the poems must rest on conjecture, and conjecture supported by little external evidence. Yet it is clear that the year 550 B.C. is an extremely late stage in the history of the Homeric poems, or at least of Homeric poetry. As in almost all departments of Greek literature only the latest growth was preserved; the last stage of the epic like the last of choric poetry, and the last of tragedy. We can at best try by different roads to pierce into this darkness.

1. Were the poems recited elsewhere before they came to Athens? It would seem at first sight probable. There certainly was a good deal of epic recitation; but of the *Iliad* and *Odyssey* no public recitation is recorded, and it is noteworthy that when Zenodotus and Aristarchus ransacked the Greek world for mss. they seem never to have lit on any fragment of a pre-Peisistratean ms. No Ionic *Iliad* or *Odyssey* seems to have been in existence in the third century B.C. This seems to show either that the poems had not been committed to writing before they came to Athens, or else that the poems written in Ionic, and recited for many generations at Ionian gatherings, were in some way completely outshone and driven out of the market by the Attic poems. At any rate there is no trace of an earlier written text of the *Iliad* or *Odyssey* as we know them.

2. For what occasion can the poems have been intended? As epics for reading they are wonderful, yet it seems certain that there was no large reading public in Greece in the sixth century B.C., much less in that far more remote period when Homeric poetry first took shape. As lays for ordinary recitation they are not suitable. A recitation ought not to last more than an hour or two, but the *Iliad* would last about twenty hours. And the poems are decidedly unities; they are not strings of separate lays or cantos. They absolutely refuse to fall apart into separate lays, as is proved by the subsequent history of Lachmann's famous attempt to make them do so. There were rhapsodes reciting Homeric poetry all over Greece in the sixth century; we hear of them at Sicyon, Sparta and Syracuse. But they can hardly have been reciting the *Iliad* and *Odyssey*. Those gigantic wholes must have been meant for some very great and rare occasion, such, for example, as the Panathenaea—the solemn gathering of all the Ionian cities to their Metropolis once every four years. If the poems were first written down in the time of Peisistratus it may well be that they first received their present form at that time. Indeed such would be the natural conclusion. For the rhapsode, at each performance that he gave, regularly drew both upon his memory and his invention. He knew the style, the language and the facts, and could begin his recitation from any point he chose, as bards in the *Odyssey* do. (τῶν ἀμόθεν γε, *Od.* i. 10, ἔνθεν ἑλών, *Od.* viii. 500.) For the new Pan-Athenian festival which he was founding Peisistratus would naturally have a special version or arrangement made.

3. Thus we cannot be certain that the poems in their present form existed before the sixth century, but we can be quite certain that everything but the form is vastly older. By form is here meant the selection and arrangement of the incidents. The subject matter, the language used in describing it, the poetical style, and above all the manners and customs of the society depicted belong to an age which can in part be dated and in part reaches back to the dimmest antiquity.

Internal Evidence.—In facing this problem the first thing to realise is that the poet is not naïvely describing the world as he himself knew it, but, like almost all narrative poets after him, describing with deliberate artistic purpose a long past age which he knew from earlier poets and from tradition. This is shown not merely by the occasional contrast between the heroes and "men as they now are" (οἷοι νῦν βροτοί εἰσι, cf *Il.* xii., 14 *sqq.* xx., 302 *sqq.*), but much more by the fact that a number of customs are mentioned in metaphors and similes which are carefully excluded from the narrative itself.

Thus in the narrative there are no trumpets, no garlands, no eating of fish (except by starving men, *Od.* xii. 331, iv. 368), fowl, vegetables, milk or boiled meat; but most of these things were evidently known to the poet and occur in similes or descriptions. Paintings are not mentioned, nor yet coins; a statue, and a sitting statue, is once implied but not directly mentioned (*Il.* vi. 303); the art of writing is left doubtful, but any direct mention of it is skilfully avoided and the scholiasts left to take divergent views (*Il.* vi. 168, vii. 175 with schol.). Cavalry is never mentioned (*Od.* xviii. 263) though riding is known: the use of cavalry was extremely old, but the chariot was more "heroic." In a similar archaizing spirit there is no mention of colonies, nor of the great "modern" Ionian trading cities like Miletus, just as there are no Dorians; yet the mask slips, for we hear of an old Sicilian woman (*Od.* xxiv. 211, 366, 389) possibly of a colony (*Od.* x. 108 ?Artakia), and a good deal about certain Heracleidae, who were the Dorian chieftains (*Il.* v., 628, ii. 653) and still more about their ancestor Heracles.

There are abundant "arts and crafts": a famous cup, brooches, belts, necklaces of amber and gold, stained ivory, ivory reins, and a shield from the divine smithy which surpasses the handi-

work of man, but is doubtless modelled on it. As to food, the scholiasts remark that "the heroes" took three meals a day, and each meal consisted of the roast flesh of the larger quadrupeds. The recurrent phrase "unspeakable flesh and sweet strong wine" (κρέα ἄσπετα καὶ μέθυ ἡδύ) betrays the admiration felt by a later generation for such heroic tastes. The dead are burned. The bale-fires make a vivid stain in the scenery of the epic. The Greeks had always the custom of burial, and had mostly not enough wood for pyres. The weapons are made of bronze (χαλκός).

Homer like Hesiod knows of a time when "black iron was not," except indeed as a material for tools, clubs, arrowheads and other easily workable objects. He knows, as Aristotle knew, that the classical Greek custom of the marriage-dowry was recent, and that in the old days "they bought their women" by giving bride-gifts (ἕδνα). It is wonderful how clearly these last three customs are realized, and how carefully the illusion is kept up. There is a slip in the use of a late proverb "iron of itself draws a man on" (Od. xvi. 294, xix. 13) where "iron" is used for "a weapon"; and once or twice the word ἕδνα is used as if it meant "dowry" (Od. i. 277, ii. 53,196). But in the main the picture of the heroic age is wonderfully well maintained. The schools of bards must have had a fine training in the tradition, though we must remember also that our present text has passed under the eyes of many jealous critics before its final revision by Aristarchus.

For the fact is that the Scholia, or remains of ancient commentaries, with which the Iliad is richly provided and the Odyssey not deficient, are more occupied with the distinction of the Homeric from the non-Homeric (or "more recent") than with any other problem. Aristarchus and his disciples have lynx eyes for subtle points of language, belief and custom. It is no exaggeration to say that modern scholarship had no conception of many subtle uses of words in Homer until the Scholia to the ms. called Venctus A were published by Villoison in 1788. (*E.g.*, that φόβος is "flight," δέος "fear," τρεῖν is "retire," not "to tremble," θῦσαι "to cense," not "to slaughter"; that φράζω is "to point out," not "to say," σῶμα is "a dead body"; σχέδον "near," not "almost," πάλιν "backwards," not "again," τάχα "quickly," not "perhaps," γράφειν "to scratch," not "write".) And the observation of customs was almost equally acute. The explanation seems to be clear. It is not to be supposed that either Peisistratus or Aristarchus had access to a flawless ms. many centuries old by which variations could be checked; but there were traditional texts and a traditional knowledge, both in the schools of bards and to a less extent among the critical public, by which all variations or new compositions could be tested and kept true to standard. It is most instructive to see how those remains of ancient epic which were not selected for the great recitation and thus fell into neglect break all the Homeric rules in language, verse and custom alike, while on the other hand they never approach, as many passages in Homer do, to the lyrical hexameters characteristic of the fifth century.

Study of Homer in Antiquity. — The critical study of Homer, that is, of the mass of epic literature concerned with the heroic saga, began in Greece, as Monro says, "almost with the beginning of prose writing." The first names recorded are those of Theagenes of Rhegium (6th century B.C.) and his pupil Metrodorus of Lampsacus. In the fifth century educated men from the impoverished islands and cities of Ionia sought a living in Athens by teaching literature and especially Homer. A typical instance is the adventurer Stesimbrotus of Thasos. From this time onward the study of Homer was a regular feature of Greek mousike.

It is noteworthy that, from the very first, exegesis took two forms: explanation of the glossae, or hard words, and allegorical interpretation and justification of the subject matter. The principle set out in the Homerica Problemata of Heracleitus (1st century A.D.) "If Homer used no allegory he committed all impieties" (εἰ μηδὲν ἠλληγόρησεν πάντα ἠσέβησεν) was, as one can see from Plato, accepted early, and regarded as a natural thing. On this system Hera was the Air (ηρ-α = α-ηρ), the adultery of Ares and Aphrodite was the combination in the world of Strife and Love, and so on.

The interpretation of glosses is mentioned in Aristophanes, Daitales frag. 222, where a father asks his son the meaning of κόρυμβα and ἀμένηνα κάρηνα. Many strange interpretations, recorded in the Scholia as coming from "the glossographi" serve to illustrate these painful beginnings of the science of *grammatike*. The phrase νέκρους κατατεθνηώτας ("the dead corpses") was objected to as tautologous. "No," said the glossographi, Νεκροι = νέρι, "young men," with κρ "added for euphony." Τοῖος was interpreted as ἀγαθός, a meaning of course which it sometimes implies (τοίου γε καὶ πατρός Od. iv. 206, and even τοῖο γέροντος as ἀγαθοῦ γέροντος *Il.* xxiv. 164). It is noteworthy that Aeschylus actually uses τοῖος as "good" (Suppl. 400), and so, it is said, did Callimachus.

Many individuals are recorded as having made a text of Homer. Probably it was a common thing for students and poets, such as Antimachus and Philetas, instead of buying a book from a shop, to write out their own text. We hear that Plato's library passed on eventually to the library at Alexandria, which may account for the close resemblance of the Homeric quotations in Plato to our vulgate. Aristotle makes many interesting criticisms on the poems from the aesthetic point of view, but seems to have had a text widely differing from ours. Among fourth-century critics was Zoilus Ὁμηρομάστιξ, who shocked public opinion by his attacks on Homer.

The first approach to a really scientific treatment of the poems was made by the great scholars of Alexandria, Zenodotus (d. 260? B.C.), Aristophanes of Byzantium (about 262–185) and Aristarchus of Samothrace, who resigned his post as head of the Alexandrian library in 137 B.C. The work of Zenodotus is still something hard to appreciate. We can see that the texts of Homer in his time fluctuated wildly and in order to establish a fairly "correct" text he had to cut his way boldly through a jungle. His rejections, as recorded in the scholia, are very extensive; his Iliad must have been very much shorter than the present vulgate. He frequently rejected passages for "unseemliness," διὰ τὸ ἀπρεπές (see below, "Expurgation"). We often hear of lines which Aristarchus or some later scholar doubted, but Zenodotus οὐδὲ ἔγραφεν. This used to be explained as a sign of his recklessness; but, as Professor Bolling of Ohio has pointed out, there has been, as far as our record reaches, a constant tendency to add lines to the Homeric text, and probably the statement that Zenodotus "did not even write" a line means that it did not exist in his day.

Zenodotus had nothing like Aristarchus's delicate and intimate knowledge of Homeric idiom: he thought that the dual (which had disappeared by his day) was merely another form of the plural; he was capable of such a metrical solecism as προφανείσας ἰδών (*Il.* viii. 378). On the other hand he seems often to have preserved ancient forms and readings which were rejected afterwards by Aristarchus (&# ἀπὸ Φωκήων Od. iii. 307; φὴ = ὥς *Il.* ii. 144, xiv. 499; ἐπεὶ κυνυλαγμὸν ἀκούσῃ 11. xxi. 575).

Our knowledge of Aristarchus comes chiefly from the rich scholia to the Venetus A, first published by Villoison in 1788. They quote largely from four scholars Aristonicus (Augustan era), Didymus (who wrote against Cicero De Republica), Herodian and Nicanor (2nd century A.D.). They are sometimes in doubt about Aristarchus's views, and evidently possessed no ms. which could be held as authoritative. We learn from them of his σημεῖα or signs, which frequently occur in the Venetus A itself. One would have expected, considering the very imperfect state of Greek γράμματα at the time, with no system of punctuation or even of dividing word from word, that any new "signs" would have been devoted to supplying this want; but Aristarchus's signs deal chiefly with the genuineness or spuriousness of particular lines. There was also a sign (diple, like a V on its side) to give the reference to a note; and another to call attention to mistakes of Zenodotus (*diple* with dots).

His critical material comprised many mss. κατὰ πόλεις and several κατ' ἄνδρα. The latter were the work of individual scholars, the former apparently those used by certain cities for the public official recitations. He never mentions the Athenian

recension, evidently because he assumes it as his basic text. He speaks of the "better" or "more careful" texts, and the "common," "ordinary," and of one as ἡ πολυστίχος ("of many lines"). He evidently had no access to any text or fragment of text earlier than the Athenian recension, and shows no sign of having any which went back to the sixth or even the fifth century. With this imperfect material and the help of Zenodotus' pioneer work Aristarchus produced a text which immediately won recognition as the classical recension of Homer in antiquity and was probably, though the point is still disputed, the foundation of our present vulgate. Certainly, of our existing papyri, those written before the time of Aristarchus (150 B.C.) differ widely, while those later are almost uniform.

Aristarchus did even more remarkable work in exegesis. He not only corrected the errors of the glossographi in explaining the obsolete words, he observed with great acuteness the peculiar Homeric uses of common words (see above). He distinguished dual and plural; he saw that in Homer 6 ἡ τό was a pronoun, and he rejected the theories of Homer's allegory of universal knowledge. On the other hand his grammatical explanations often betray the infancy of the science (the first Greek grammar was the work of his disciple Dionysius Thrax). For example he uses freely the theory of "enallage" or "change of case": Ἵπποτα is "the vocative instead of the nominative"; in τὸν δὲ σκότος ὄσσε κάλυψεν, τὸν is "instead of τοῦ."

The Heroic Age.—The poems, even as they stand now, approximately in the form fixed for them by Aristarchus, nearly a thousand years later than the events they profess to describe, have an almost entirely consistent style and phraseology and give an almost entirely consistent description of the age about which they write. Of course "consistent" is by no means the same as "true." Yet, though we have practically no direct information about the Homeric age, we can, by analogy from other literatures better supplied with contemporary history, understand its general character and see that the description seems to be based on fact. The poets described a society which they did not themselves know and could not well have invented, but which corresponds closely to a type known to have existed elsewhere under given conditions. It was easy, of course, for a romantic Greek bard to make his ancient heroes ignorant of iron weapons and the art of writing, or to imagine an idyllic princess washing the royal clothes in the river.

But there are other characteristics of the age which can hardly be inventions. The heroes of Homer belong to a *Wanderzeit*. The kings had, in general, no national territories and no strong ties of kindred; they depended on their "companions" (ἑταῖροι, *comites*) or personal followers, who were largely adventurers like themselves. They are untroubled by the sanctities and duties attaching to the tribe or to the buried tribal ancestors. They practise no arts but song and war. They carry their wealth about with them in the form of brooches, belts, rich armour, necklets and caparisons. They burn their dead, they build no temples but worship at altars in the open air: and they worship a collection of gods who are just like themselves, gods who feast and sing and conquer and utter judgments, but who never work, have never created a world—only conquered and divided it—and who are to an extraordinary degree rootless and international. They stand or fall by their personal qualities; their strength and courage, their faithfulness and military honour, and the fact that since they fear no one they never tell a lie.

The above picture needs qualification if we take account of details; *e.g.* the Odyssey is a romance of the return of the wanderer, and implies the existence of a real home; the catalogue of ships in Iliad ii. gives geographical kingdoms to all the heroes. But in the main it is true, and it corresponds to the type of society that we find in many parts of the world under particular historical conditions. It occurs where an old and rich civilization is in process of being broken up by barbarian conquerors. 'It is the type called by Professor Chadwick a "heroic age," and can be traced in northern Europe during the break-up of the Roman empire, in the Balkans during that of the Greek empire, and in other parts of the world that have produced heroic poetry. The description of Attila's camp by the Byzantine historian Priscus is curiously Homeric in its details. (See Gibbon, ch. xxxiv.)

Discoveries.—This discovery has changed the character of the problem of the Homeric age. We saw above that the poets were consciously describing an age long past and notably different from their own. We now see that they were not merely describing a sort of "youth of the world," remarkable chiefly for a rude idyllic simplicity in which the contrast is between "Homer" and οἱ νεώτεροι. Nor yet were they, as Schliemann's great discoveries first suggested, depicting the great age of Troy, Mycenae and Cnossus. It was a particular period in history, to be contrasted both with the rich decadent civilization that went before and the peculiar classic Hellenism which came after.

The first palaces of Crete must have been built about 2000 B.C., and not long after there are signs of that movement of the Aryan tribes which was to have such incalculable effects on human history. The second town of Troy was laid under seven feet of ashes; at Orchomenos, Corinth and Argos citadels were destroyed and rebuilt, apparently by Northern conquerors. The northern "megaron," or hall with a porch and central hearth, begins to be found in Greece. Hitherto the "Kefti" or Men of the Isles have been in close connection with Egypt, but about 1700, when the Hyksos dynasty largely cut that country off from civilized commerce, the Cretan cities begin to turn more to Greece. Argos learns to grow the vine and olive; it adopts the Cretan woman's dress and the Cretan frescoes, while it still keeps its northern beard and tunic and *megaron*. A century or so later perhaps the Aryan invaders, or Achaioi(?), take to the sea. They had first called the sea by an "Aegean" or pre-Hellenic word, θάλασσα; then they called it ἅλς, "the salt"; it may be significant that at last they used the name πόντος, a good Greek word meaning "path." It was a path that led both to Crete and to Egypt. About 1450, Phaestus and other Cretan palaces were destroyed. For some 50 years Cnossus ruled alone: then comes the destruction of Cnossus itself—a sudden attack, it would seem, in the midst of some great court ceremony—and the end of the Minoan empires. After about 1400 B.C. only Mycenean work is found in Egypt, not Cretan.

Achaioi from Mycenae seem to take the vacant place. In Crete the royal tomb becomes a common pit; portraits of chieftains wear the northern beard and moustache. New towns are called by Achaean names; there is a decline in art and a cessation of wall-painting. It is significant, too, that after this date there is no further mention of the Kefti in Egyptian records.

Civilization has gone back but is by no means destroyed. Writing remains and there are signs of abundant wealth and mass production for commercial purposes. Speculative historians have fancied that in the Tell-el-Amarna letters and other records of this period they find some of the great names of Greek saga, an Alaksandus of Uilusa who reminds them of Alexandros of Ilion, an Attarissyas of Ahhia or Ahhijava who sounds remotely like Atreus the Achaean. With much more probability we begin now to identify names of various peoples, or at least hordes of men, who are known to Greek tradition.

At the battle of Kadesh in 1290 the Hittites had in their motley host Iliouna, Dardanoui, Masa, Pedasa, Kerkisha, Loukki and Danaouna. If the terminations -na and -sha denote "peoples" or "hosts," as Egyptologists suggest, we can hardly be wrong in recognising at least the people of Ilion, the Dardanoi, Lukioi and Danaoi. About 1230 and 1225 Merneptah of Egypt defeats in the Delta "uncircumcised Akhaiusha" "from the sea-lands," "who fight to fill their belly daily." With them are Toursha, Shardina, Loukki and Shakalasha, wanderers who may have given their names afterwards to the Tyrseni, the Sardinians, Lycia and Sagalassus. About 1194 Rameses defeated a similar locust-like multitude advancing "by sea and land, with women and children in ox-carts." They had destroyed the Hittite empire and "no people had stood before them."

Troy.—Most of the cities they destroyed have perished without

record, but Greek tradition tells us that the great sixth city of Troy, Homer's Troy, was sacked about this date. It was sacked, after a long siege perhaps, by a host that may be called indifferently Akhaiu-sha or Danaou-na — Homer has also a third name, Argeioi—and who are led by a "king of men" who is "lord of many islands" and has doubtless gathered in his thousand or twelve-hundred ships a great force of "the peoples of the sea." (Greek legend also makes Agamemnon and Menelaus joint kings of Sparta, or one of Mycenae and one of Sparta; it also involves them in some ritual king myths; but it is perhaps not rash to detect an element of real history in the Homeric picture.) The fall of Troy seems to be the sign or cause of the final crash. About 1200 the infiltration of further West-Greek tribes becomes a regular invasion. The pirates, or "peoples of the sea" receive an increase both from new "Dorian" invaders and from the broken men of the old Minoan or Achaian kingdoms, but by now there is little rich plunder left. It is a time of *συνεχεῖς στρατεῖαι καὶ μεταναστάσεις*, "constant warfarings and uprootings" (Diodorus v. 80: *cf.* Thuc. i., 2).

Homer's narrative of the siege of Troy is doubtless related to the real siege much as the Norse or German or French poems are related to the actual brutalities of the age they describe. The facts have been idealised and transfigured by memory, and confused with abundant myth, folklore and fiction; but some of the truth can be descried, as in a palimpsest, beneath the poetry. We can see in the first book of the *Iliad* a plague-stricken army, or mob of mixed peoples under diverse leaders, pinned to the barren sea shore, the narrow space choked with dead dogs and mules, the piles of burning corpses, the best fighting force in mutiny because of a quarrel about a captured woman; and the various bands "fighting to fill their bellies daily" by raids on the exhausted neighbourhood. At the end of Book VII., on the arrival of a wine-ship, we see the soldiers selling all they have, bronze, iron, shields, cattle and captives, for liquor and lying all night long on the beach under a thunderous sky.

We can also see, not from direct statements in the Homeric poems, but from implications there and direct statements in the rest of the poetic tradition, that the fall of Troy was the beginning of a dark age. If Troy fell the rest of Achaian Greece fell with it, including Thebes, Argos and Mycenae. The great kingly houses disappear. The *epos* knows little of the after history of the Homeric heroes except a disastrous series of so-called "returns"; the conception belongs to a later age which conceived these wandering hordes as the armies of regular Greek cities. The sons of Agamemnon, Achilles and Ajax and Odysseus are just remembered, but after them there is darkness.

We are justified therefore in recognising the siege and destruction of the sixth city of Troy, about the year 1200 B.C., as forming the historical nucleus of the poems, just as the defeat of Charlemagne's rearguard by the Basques in the valley of Roncesveaux is the historical nucleus of the Chanson de Roland. The real Hrodland, count of the march of Britanny was killed in that battle on Aug. 15, 778; our existing *Chanson de Roland* was written soon after 1066, three hundred years later. But we know that songs or lays on the subject were soon composed: they are mentioned as widely known (*vulgata*) in a book written less than 60 years after the battle (Life of Louis I., in Pertz SS. ii 608). And an analysis of the existing *Chanson* shows, beyond question, that it is a re-treatment (*remaniement*) in large part built up out of previous poetic treatments of the same subject.

Using this comparison as it stands, we may observe that the gap between the fall of Troy and the earliest text of Homer known to us is much greater than 300 years: our present text probably dates from Aristarchus about 150 B.C., and even if we assume that that is in the main identical with the text of Peisistratus we only get back to the latter part of the sixth century B.C. and Troy fell at the beginning of the twelfth. There must have been, during those centuries of oral transmission, uncontrolled by any fixed record or any learned class, much reshaping of the poetry and much transformation of the historical facts.

Date of Composition. — Innumerable attempts have been made to fix some time and place at which "Homer" may have lived, or at which the *Iliad* or the *Odyssey* or both, in more or less their present form, may have been composed. All have failed, and it is well to consider the reasons for their failure.

In the first place, we do not yet know what question to ask, and until we do we can hardly expect the right answer. Yet, from the nature of the case, to know the right question implies an understanding of the whole problem which is at present beyond us.

Next, we have no contemporary record to guide us. Even the political history of Greece between 1200 and 600 B.C. is extremely scanty and unreliable; and the history of literature before the time of Peisistratus is practically non-existent. Callinus in the early seventh century is said to have mentioned the *Thebair*, an epic now lost, as the work of Homer. Herodotus (v. 67) tells us that, in the early sixth century, Cleisthenes the tyrant of Sicyon put a stop to the contests of rhapsodes because the Homeric poems "glorified Argos and the Argives."

This shows that there were recitations of Homeric poetry in Sicyon before the time of Peisistratus, but nothing of what that poetry was. Our extant *Iliad* and *Odyssey* do not glorify the Argives in any special sense, but they do use the word "Argives" for the Greeks as a whole, which may have been enough to disturb Cleisthenes. There is a general reference by Xenophanes, an early contemporary of Peisistratus, to the immoral stories about the gods in Homer and Hesiod. There is no other pre-Peisistratean evidence. It is indeed conjectured that the Simonides who quotes a line of the *Iliad* (vi. 126) as the work of "a man of Chios" was perhaps the old seventh-century poet from Amorgos; but both Plutarch and Stobaeus, who are our sources for the information, clearly meant the famous Simonides of Ceos, who belongs to the fifth century. One would like to know whether by "a man of Chios" he really meant the traditional Homer or was merely referring to some contemporary Homeric rhapsode, such as Cynaethus of Chios.

The Homeric Tradition. — The other early references chiefly use the name "Homer" as covering the whole heroic or epic tradition. Aeschylus is reported to have described his plays as "slices from the great banquets of Homer" — which is true if "Homer" means the heroic tradition, markedly untrue if it means the *Iliad* and *Odyssey*. Simonides refers to Homer as telling how "Neleager surpassed all the youths in spear-throwing across the wild Anauros"—which is not in our Homer: Pindar (Nem. vii.) says that Homer praised Odysseus — which may mean, but does not by any means prove, that Pindar read the *Odyssey* as we have it. He makes two other references to Homer, neither of them quite irreconcilable with our poems but certainly not sufficing to prove that he knew them. A late schoolmaster, Theodorus (see *infra*), made a sort of wall-picture which he called *τάξιν Ὁμήρου* —an arrangement of the events of the whole early heroic tradition, in which the *Iliad* and *Odyssey* form only a fragment. An "arrangement of Homer" of a different kind was needed for the great Panathenaic recitation, and took the form — so we have definite evidence—of our present *Iliad* and *Odyssey*.

The effect of the recitation and the published text which seems to have accompanied it was quickly seen. By the latter part of the fifth century, especially among Attic writers, the *Iliad* and *Odyssey* are well-known and often mentioned: they are accepted as the only canonical works of Homer, though other poems — epics, hymns, epigrams and the like — are occasionally mentioned. Herodotus for instance is doubtful about the *Epigoni* and is against the authenticity of the *Cypria* because in his time it differed from the *Iliad* in its account of the travels of Paris. (It was altered later and made to agree: *see* Proclus' epitome.) Aristotle treated the comic *Margites* as genuine. It may be noted, also, that Attic tragedy, which drew its material from the heroic saga, *i.e.*, from "Homer" in the old sense, carefully avoided the "Homer" that was recited at the Panathenaea. It never trespassed on the *Iliad* and *Odyssey*.

Lastly it is worth remarking that, while all early quotations from Homer are apt to vary considerably from our texts, the

non-Attic writers vary much more than the Attic. Hippocrates, the Coan physician, who lived chiefly in Ionia, has many quotations which do not occur at all in our Homer, including one which he says is "frequent"; the same is true of Aristotle, born in Stageira and trained in the Ionic tradition. And it is noteworthy that a speech of Syagrus the Spartan in Hdt. (vii. 159) not only quotes a hexameter line which is not in our Homer, but seems to quote a Homer who made Agamemnon a king of Sparta. In our Homer he is king of Mycenae, though traces of Sparta seem occasionally to cling to him (*e.g.*, *Od.* iv., 514ff). The "Homer" that was "sung in scattered bits" about Greece before the time of Peisistratus may well have been very different from the Iliad and Odyssey.

Thus one may be fairly sure from the external record that there existed before the time of Peisistratus masses of heroic poetry, reputed to be very old and to be in general the work of "Homer." As to its form we can say little. It probably consisted normally of lays, of a length suitable for recitation; the length perhaps of the Catalogue or the Doloneia (400–600 lines). Whether there were already any great epics, too long for ordinary recitation but suitable for some great "panegyris" such as the Panionia or the four-yearly gathering of the Ionians at Delos, we have no evidence. Many scholars have concluded that the Peisistratean recension provided the first written text of the Homeric poems. Certainly there is no record of any written text of the Iliad and Odyssey previous to that; yet it seems almost impossible that no lays at all should have beeen written down, and the composition of the two great'poems does at times seem to suggest the use of written sources.

A Crystallization of Tradition. — Thus while it seems probable that songs or lays about the siege of Troy and other achievements of the heroic age came into existence very soon after the events themselves, the first long epics in written form of which we have any knowledge appear in Athens in the sixth century, some 600 years later. The poems that we possess represent the last stage of epic creation, though, as far as we know, the most perfect. The history of epic poetry between 1200 and 550 is entirely obscure, and conjecturable only by indirect internal evidence. Some conclusions, however, can be drawn from the language, metre, subject matter and composition of the two poems. For example (1) it is clear from the composition that each poem is a unity, but a unity imposed on a variety of sources. The unity is made up by combining different lays or parts of lays and smoothing away the discrepancies. It is clear also that in the last shaping of the poems Athenian influence counted for much.

(2) The subject matter shows that the poems cannot be explained as creations of some one age midway between Troy and Athens. Some elements of custom, story and diction go back to remote antiquity, and some again are not earlier than Athens of the sixth century.

(3) The language shows traces of Attic, not only on the surface but also a little below; a great body of Ionic; traces of a definitely Aeolic dialect; and remains also of some very ancient Greek, not definitely assignable to any particular dialect and already unintelligible in classical Athens.

(4) The metre shows signs of long development, and has, to a degree perhaps unexampled in the history of literature, conditioned and almost created the Epic dialect. Many centuries of hexametric or at least dactylic composition must have preceded the present form of Homeric verse.

To take these points in detail: the old explanation of the poems (Hermann and Grote) as an original nucleus plus interpolations or late additions, and of the occasional discrepancies as due to the interpolators, must by now be given up. For example, there is the discrepancy between books ix. and xvi. of the Iliad, the Embassy and the Patrocleia. In xvi. Achilles, seeing the defeat of the Greeks, breaks into a splendid complaint that if only Agamemnon would seek his friendship and offer atonement, the Trojans would soon fly and choke the trenches with their dead. Yet the whole of book ix. has been occupied by Agamemnon's offers of princely atonement and Achilles' rejection of them. The discrepancy is manifest; but it is not well explained by supposing that a late poet invented Bk. ix. and interpolated it.

Why should he so upset the story? It is explained at once if we suppose that a poet engaged in building up the great epic out of old material found both the Embassy and the Patrocleia in existence, and, not liking to sacrifice either, wove them both in and smoothed out the more alarming difficulties. Similarly he found — so the Scholia tell us — Bk. x., the Doloneia, as a separate lay. It is somewhat foreign in style and it makes some little trouble, but it was too good to throw away. So again some parts of the Iliad imply the existence of a wall round the ships while others ignore it. It is much easier to suppose that the poet-editor found some lays with a wall and some without, and chose to combine them, than to imagine an "interpolator" who made gratuitous trouble by putting in a wall here and there.

Just so in the *Odyssey*, there is much confusion as to Odysseus' disguise: he is sometimes disguised and sometimes not. Also there are three incidents in which something is thrown at the disguised Odysseus by one of the suitors. The three do not form a climax or show any relation to one another (p 462, σ 394, υ 299). He is twice insulted by one of his own servants. In one place the offender is Melantho, daughter of Dolios (a, τ), in the other it is Melanthios, son of Dolios (p, υ, ϕ, χ). The Melantho part never mentions Melanthios, nor the other part Melantho — though it speaks of other wicked maidservants. Again, in the long story of adventure which Odysseus relates in the first person we find one interruption of third-person verbs (ι, 54, 55), and some passages which perhaps show traces of having been once written in the third person. In all such cases the hypothesis of "interpolations" or "late additions" is of little help. The probable explanation is that two or more different sources have been combined by the — shall we call him poet or editor? He is both; but the Greeks called him $\rho\alpha\psi\omega\delta\sigma\varsigma$, or "a stitcher of songs."

So far the divergent sources that we have considered have been merely different versions of the same body of saga. The Embassy was always an incident in the Wrath of Achilles — or some similar Wrath; both Melantho and Melanthios had a part in the adventures of Odysseus, or somebody very like Odysseus. But we also find in both poems lays or long passages of quite extraneous origin.

For example, the Catalogue of Snips in Iliad ii. is, by general agreement, an old document originally composed for a different context. It describes the mustering of the ships at Aulis, not their stations on the coast of Troy, and in various ways it shows signs of adaptation, and imperfect adaptation, to its present place. Further there are passages in Qdyssey iii. and iv. which give abbreviated accounts of the Homecomings, or Nostoi, of various Greek heroes. Presumably they are derived from the Epic (or collection of lays) called *The* Nostoi. There are fragments derived from some Heracleia, or poem on Heracles, and it seems likely that some of the Androktasiai or "slayings of men" by various heroes may contain faded memories of real fighting in different parts of the Aegean world. If this is so, we must not reject the possibility of further "liftings"; notably a strong case has been made out for the suggestion that the exploits of Diomedes in the Iliad are in part taken from those of his father Tydeus in the Thebais, and that Hector himself, whose grave was shown in Thebes, was originally the defender of Thebes, not of Troy. The business of the song-stitcher was to make a great epic for the Panathenaea or some similar great occasion, and he had all the riches of "Homer" to draw upon.

Subject Matter. — Most of the typical Minoan or Mycenaean objects seem to have disappeared from the mainland of Greece by 1400 B.C., some 200 years before the fall of Troy. Some of these Homer does not mention (*e.g.*, figure-of-eight shields, inlaid sword-blades, long rapiers), but he mentions elaborate palaces with bath-rooms ($\dot{\alpha}\sigma\dot{\alpha}\mu\iota\nu\theta\sigma\varsigma$, a pre-Greek word), Nestor's cup with the doves drinking (*Il.* xi. 633), a helmet with boar's tusks (x. 261–5) and the inlaid metal-work on the shield of Achilles. These are very ancient indeed but may be explained by traditional knowl-

edge helped out by actual relics. If we ourselves have seen a Mycenaean cup like Nestor's presumably a classical Greek may have done so. Even Euripides describes a Mycenaean inlaid swordblade (Electra 476, cf. Heracles 418). The big shield which took the place of body armour and is often called Mycenaean remained in use, as Herodotus tells us, till about 650. It is found in Tyrtaeus and in a relief representing Ionian or Carian mercenaries approaching Sennacherib (705–680). A rather similar problem is presented by the discovery among Minoan remains of thirteen rings from Thisbe; the genuineness is avouched by Sir Arthur Evans. These are engraved with scenes or motives which are prominent in the poems or in later Greek saga: a man clinging under the body of a woolly ram, like Odysseus in Od. ix., a young prince slaying a king in a chariot in a narrow defile, as Oedipus slew Laius; a creature like Scylla with many heads attacking a ship, as in Od. xii. 245; a young prince, like Orestes, killing two guilty lovers. In Cnossus itself we find repeatedly the motive of a siege of a city, the hardest work of ancient warfare, which took poetic shape in the Thebais and the Iliad.

The existence of such motives in very early pre-Homeric times gives no evidence as to the date of any particular treatment of them in poetry. On the other hand the *Iliad*, though not the Odyssey, also clothes the heroes in the bronze panoply which came in not long bkfore the time of Peisistratus, and often refers to the hoplite tactics which go with the panoply. More than that, Homer dresses both men and women, not in Mycenaean bathing drawers nor Bounces, but in the "old-fashioned Attic style." He describes—in a book remarkable both for "lateness" and for beauty—a procession taking a peplus to Athena in exactly the manner of the Panathenaean peplus; he makes Athena leave Odysseus and go home to the "strong house of Erechtheus," or Erechtheum, on the Athenian acropolis. It also seems significant that the adventures of Odysseus in the Odyssey are turned into a contest between Poseidon and Athena, with the latter victorious, one of the most characteristic local Athenian myths, while a sympathetic character who protects and helps Telemachus is called "Peisistratus" and made the son of Nestor, from whom Peisistratus of Athens claimed descent. One need not dwell on the supposed "Athenian interpolations" which were noted in antiquity. The omissions are equally significant. In the Catalogue, for instance, Thebes, Aegina, Megara are omitted entirely; Salamis is suppressed and Corinth belittled. Athens, and no other city but Athens, has reasons for just these suppressions. .Of course, the symptoms are never gross. The poems are as far removed from flattery or boastfulness as the rest of classical Greek literature.

Language.—Apart from problems of local dialect, the dialect of Homer is an early or "primitive" form of the language which we know as Greek in the classical age. This can be shown by comparing the grammatical formation and syntax of Homer with those of Attic. (The comparison of the vocabulary is in the nature of things less conclusive.)

1. The first aorist in Greek being a "weak" tense, *i.e.*, formed by a suffix (-σα), whereas the second aorist is a "strong" tense, distinguished by the form of the root-syllable, we expect to find a constant tendency to diminish the number of second aorists in use. No new second aorists, we may be sure, were formed any more than new "strong" tenses, such as came or sang, can be formed in English. Now in Homer there are upwards of 80 second aorists (not reckoning aorists of "verbs in p~," such as ἔστην, ἔβην), whereas in all Attic prose not more than 30 are found. In this point therefore the Homeric language is manifestly older.

2. While the whole class of "strong" aorists diminished, certain smaller groups in the class disappeared altogether. Thus we find in Homer, but not in the later language:

(a) The second aorist middle without the "thematic" ε or ο: as ἔβλη-το, was struck; ἔφθι-το, perished; ἆλ-το, leaped.

(b) The aorist formed by reduplication: as δέδαεν, taught; λελαβέσθαι, to seize. These constitute a distinct formation, generally with a "causative" meaning; the solitary Attic specimen is ἤγαγον.

3. It had long been known that the subjunctive in Homer often takes a short vowel (*e.g.*, in the plural, -ομεν, -ετε instead of -ωμεν, -ητε, and in the Mid. -ομαι, etc. instead of -ωμαι, etc.). This was generally said to be done by "poetic licence," or *metri gratia*. In fact, however, the Homeric subjunctive is almost quite "regular," though the rule which it obeys is a different one from the Attic. It may be summed up by saying that the subjunctive takes ω or η when the indicative has ο or ε, and not otherwise. Thus Homer has ἴ-μεν, we go, ἴ-ο-μεν, let us go. The later ἴ-ω-μεν was at first a solecism, an attempt to conjugate a "verb in pi" like the "verbs in ω." It will be evident that under this rule the perfect and first aorist subjunctive should always take a short vowel; and this is the case, with very few exceptions.

4. The article (6, ἡ, 76) in Homer is chiefly used as an independent pronoun (he, she, it), a use which in Attic appears only in a few combinations (such as ὁ μὲν . . . ὁ δέ, the one . . . the other). This difference is parallel to the relation between the Latin ille and the article of the Romance languages.

5. The prepositions offer several points of comparison. What the grammarians called "tmesis," the separation of the preposition from the verb with which it is compounded, is peculiar to Homer. The true account of the matter is that in Homer the place of the preposition is not rigidly fixed, as it was afterwards. Again, "with" is in Homer σύν (with the dative), in Attic prose μετά with the genitive. Here Attic poetry is intermediate; the use of σύν is retained as a piece of poetical tradition.

6. In addition to the particle ἄν, Homer has another, κεν, hardly distinguishable in meaning. The Homeric uses of ἄν and κεν are different in several respects from the Attic, the general result being that the Homeric syntax is more elastic, and that the less common combinations of the earlier period were disused altogether in the later.

7. In the vocabulary the most striking difference is that many words appear from the metre to have contained a sound which they afterwards lost, viz., English *W*, written in some Greek alphabets by the "digamma." This letter, however, died out earlier in Ionic than in most dialects, and there is no proof that the Homeric poems were ever written with it.

In many epics the nationality of the author, or of both author and scribe, can be fixed by the dialect. Thus the author of the *Chanson* de Roland was probably a native of the Ile de France, while the scribe was an Anglo-Norman. Similar conclusions may be drawn about many of the medieval German poems. But Homer's is no definite spoken dialect—it is a traditional dialect, regularly used for epic, shaped and twisted to an extent probably without parallel in literature by the needs and conveniences of the epic hexameter. In the main the poems are Ionic, with an Aeolic under-current. That suits the tradition, almost universal in antiquity, that the poems came from Ionia, and that "Homer was born" in Smyrna, Chios or Colophon, in regions where an Ionic population had superseded an Aeolic. We cannot however answer simply that the dialect is that of Smyrna or Chios at a given date; for it is clear that some process of transmutation has taken place. In general, Aeolic forms are left (Ἀτρείδαο, κεν, ῥοάων, Μυρμιδόνεσσι) where the Ionic form was not metrically equivalent; wherever the two are metrically equivalent. the Ionic is preferred. An exception like θεά is left because there was no Ionic θεή; θεός was the form used. Νηός has always its Ionic form because the older poetry did not, apparently, mention temples, but only altars. Other exceptions are due to various accidental causes. The attempt has been made to argue that these "aeolic" forms were not really dialectic at all, but merely belonged to an older form of the Greek language from which both Aeolic and Ionic afterwards developed. The digamma, for instance, ϝ, a w-sound which gradually disappeared from the Greek language like h in French or w in whom, wrong, in English, is practically a living letter in Homer. (Roughly 3,354 places imply the ϝ while 617 ignore it.) By the sixth century ϝ was dead in Ionic though alive in both Doric and Aeolic, and the ancients actually called it "the Aeolic letter"; but two centuries earlier it may well have been current in all forms of Greek.

This view however is disproved by the presence of new formations, which occur in Aeolic and in Homer, but are certainly not "Old Greek." There seems to have been some definitely Aeolic period in the development of the epic. On the other hand there is abundant evidence of "Old Greek," dating from a time prior to any Aeolic or Ionic of which we have written record. There are many phrases which were not understood in classical times, or at least had to be taught in school: *ἀμένηνα κάρηνα, διάκτορος ἀργειφόντης, νήδυμος, τοῖος* (*cf.* Ar. Fr. 222 Daitales). And, equally significant, there are words which, in ordinary speech, only occur in Cyprian and Arcadian, such as *ϝάναξ, πτόλις, κέραμος* (a prison). Arcadia, isolated in the mountains of the Peloponnese, and Cyprus, isolated among the Semites of the eastern Aegean, preserved in common fragments of the very oldest Greek, which had perished elsewhere.

We have here phenomena corresponding to the Mycenaean cups and primaeval motives; while on the other hand the Attic influence on the language is equally conspicuous. It occurs in two forms. First, there are numerous Atticisms which are shown to be wrong by the metre, and must therefore be simply mistakes by the Attic scribe. Some are unmistakable like *Ἕως ὁ ταῦθ' ὥρμαινε*, where *ἕως* must be a mistake for *ἦος*. Others are almost certain but not quite: *Τοῖς δ' Ἀγελέως μετέειπεν* offends against Homeric idiom and has probably supplanted *τοῖσ' Ἀγέλαος ἔειπεν*; *ἣν που ἐφεύρῃ* is pure Attic and is more likely to be the mistake of an Attic copyist or reciter for *αἴ κεν ἐφεύρῃι* than an original un-Homeric effort of a poet. But beyond a few clear cases we cannot be sure. If we remove drastically all the obvious "surface corruption" there remains a more deep-seated Attic element: *ἥλιος, ἀμοθεν* ye, *βεβῶσα, ἧντο, εὔσφορος* (as a dactyl *Il.* xxiii.) are isolated, but *ὅπως* (for Aeolic *ὄππως*, Ionic *ὅκως*), *ἕπεσθαι* (for *ὀπάζειν*) are common; and one has to remember that these Atticisms represent merely what has been left after generations of grammarians have gone over the text carefully to remove all that was not "Homeric."

Metre.—Lastly, this dialect has been re-shaped by the needs of the metre. To mention only a few of the instances: wherever three or more short syllables came together, or where a short came between two long, the word had to be changed before it could get into the hexameter; hence forms like *γεινόμενος, Τειρεσίας, εἰν ἀγροῖι, εἰνὶ θύρῃσι*, with *ει* for e; *ἀπειρέσιος* or else *ἀπερείσιος*; *ἰστίη, προθυμίῃσι, Ἀπόλλωνα, εἰλήλουθα*. Analogy of course plays a part in these changes, *e.g. τιθήμενος* in place of *τιθέμενος* because of *τίθημι, μαχειόμενος* from the rhythm of *μαχησόμενος*, contrasted with *ἠὲ περὶ πτόλιος μαχεούμενος ἠδὲ γυναικῶν* (w 113, λ 403) because of Σ 265 *ἀλλὰ περὶ πτόλιος* re *μαχήσεται ἠδὲ γυναικῶν*. Liberties are taken both with accidence and with syntax in order to obtain forms that are metrically convenient; especially conspicuous is the effort to obtain words or phrases which fill the final dactyl-spondee after the Bucolic diaeresis: *ἡνιοχῆα* acc. of *ἡνιόχος, Αἰθιοπῆας* of *Αἰθίοπες, Σαρπήδοντος* for *Σαρπήδονος, εὐρέα πόντον* (from *εὐρέι πόντῳ*); the alternation of singular and plural in such words as *ἱπποσύνης ἱπποσυνάων, νηπιέη νηπίῃσι, κονίῃ κονίῃσι*, that of active and middle in *εἰσορόωντες εἰσορόωνται, μητιόωντες μητιάασθαι* are to be explained thus. Similarly the gen. in *οιο* is prevalent in choriambic words *Ἀντιμάχοιο, ἡνιόχοιο, ἀτρυγέτοιο*, whereas for obvious reasons we always have *Ἀξίου, εὐξόου, ἑταίρου, κελεύθου*, and also *Μενελάου, ἐνιαυτοῦ, μεγαθύμου*. In spondaic words (*ἀγροῦ, οἴκου, σίτου*) *-ου* is much commoner than οιο.

Thus the metre both preserves ancient forms and invents new forms. As to contraction of vowels, Epic prefers the old uncontracted forms but admits the shorter forms, usual no doubt in contemporary speech, for special reasons. Metrical necessity produces *πελάγει, ἐφίλει* (and *φίλει*), *ἀγαπᾶς, φοβεῖται, πειρώμενος*, etc.: the convenience of having all the cases of a noun metrically identical has some effect (*Τυδείδεω, ἀπασεῶν, ἡμέας, ὑμέας*); while analogy also plays its part (*ἀναβῆι* for *ἀναβήῃι* from *ἀναβάς, ὑπέρθυμον Διομήδεα* from *ὑπέρθυμος Διομήδης*), sometimes assisted by an actual mistake: *πῶυ μέγ' οἰῶν* must have come from some rhapsode who pronounced Γ 198 *ὅς τ' οἰῶν μέγα πῶυ* wrong. Similarly a bard who said *τρεῖτ'* in *νίκην ἀλλ' αὐτοὶ τρέετ' ἄσπετον* (*Il.* xvii. 332) proceeded to say *τρεῖν μ' οὐκ ἐᾶ Ἀλλὰς Ἀθήνη* (*Il.* v. 256). The fact that the Greek language had thus to be stretched and twisted in order to satisfy the needs of the hexameter has led to the suggestion that the hexameter must be a foreign metre, made to suit a language other than Greek (Meillet, Origines *Indo-Européennes* des *Mètres* Grecs, 1923). The conclusion is not probable. After all no known language suits the hexameter half as well as Greek, and the variety of forms of words was satisfactorily explained by the ancients as due to the "singing" of early epic verse (Athenaeus xiv. p. 632d.), and Greek was spoken in the Aegean by 1400 B.C. (Buck, in Class Phil. xxi.).

The misuses of the old language by rhapsodes who were accustomed to something much later may be compared with *στεῦτο* for "stood" in Od. xi., 584 of *δεδουπότος Οἰδιποδαο* for "having died" (*Il.* xxiii. 679), of the misunderstanding of *ἕδνα* "bride-price" as if it meant "dowry" in *Od.* i. 278, ii. 194, or the introduction of the proverb "iron itself draws a man on" (Od. xvi. 294, xix. 13).

The Homeric Style.—These considerations may be thought to lead to a rather chaotic result, if not a purely negative one. Yet, though they do not encourage attempts to discover the age or birthplace of "Homer," they do help us to understand the great qualities of the Homeric style. If we compare the Homeric poems with the Aeneid or Paradise Lost we feel in them much more directness and vital force. They have the quality of the heroic age, of the Volsunga saga or of Beowulf. If we compare them with these latter, we feel them to be far richer in language, larger and closer in construction, nobler in artistic form. They unite, to a degree that is perhaps unique in literature, primitive force with artistic dignity and accomplishment Poems like Iliad vi. and xxiv., for example, are hardly conceivable except as the work of minds as civilized as that of Aeschylus on material as rude and fierce as the End of the Niblungs.

The same considerations throw light on another quality of Homer, which persists all through the higher Greek poetry. The grand style concentrates on the main subject, not on detail. It is not precise or realistic. It deals in types more than individuals. The main characteristics of the main characters, the main interest of the main story, are intensely clear, but the mass of not strictly relevant detail which contributes so much to the lifelikeness of modern fiction is mostly omitted. There are many ships described in Homer, and described vividly, but no one is ever distinguished from another. They are merely "black," "hollow," "swift," "well-balanced," "red-cheeked" or the like.

There are two quite distinct styles of fighting and of armour: first the classical battle of hoplites in phalanx with small bronze shield, breastplate and backplate, which has been introduced into many parts of the Iliad; and second, below this, the fighting of particular champions (*πρόμαχοι*) in Mycenaean style with the great leather shield, reaching from neck to ankles and making body armour unnecessary, while an ill-armed mob behind, with little protection beyond goat-skins (*λαισήια*) help with stones, darts and arrows. Yet the epithets seldom make clear what sort of shield is meant; the general descriptions often leave obscure what style of fighting. The same with the topography.

This quality enabled the bards freely to compose poetry about times and places of which they had no personal knowledge, provided only that they observed the traditional epic manner and were permeated by its spirit. A modern artist, especially a novelist, generally has two aims which seem to us normal, but which are entirely alien to the spirit of Homeric poetry. First, he aims at detailed descriptions of phenomena; while "Homer" aims straight at the emotional effect with a minimum of detail. For example, the similes taken from lions in the *Iliad* might always have been written by one who had never seen a lion, but never by one who had not been imaginatively thrilled by poetry about lions. Secondly, the modern artist is generally conscious of himself as opposed to his audience, and aims at producing something "original." The book he writes is printed

and preserves its sharp edges, whatever the taste of the reader may be.

But the ancient bard was, in the main, performing things already well known, the common possession of himself and his audience. An ancient bard could not be eccentric or go against the prevailing taste. A poem so written would simply not live. It would not fit its environment, and the next reciter would alter it. It is essential, in trying to understand ancient oral poetry, to realize this fact: the successful oral poem, like the speech of a popular orator nowadays, must be the joint product of the artist and his public. Thus a rhapsode describing Irhaca or Troy or Achilles must avoid any sharp clash with the public conception of those subjects. He must not contradict people's expectations and memories. The real facts, as they would appear in a modern book of reference, do not much matter, though, in order no doubt to avoid awkward clashes, he does generally abstain from precise detail. When there is detail it is still generic.

There is an oak on the plain of Troy; oaks are common on plains. There is a fig-tree growing in or beside the mall, making a place where the wall is climbable (*Il.* vi. 433). That may well be evidence for the existence of a poem describing the scaling of the wall by help of the fig-tree; it is no evidence that there was actually a fig-tree in the wall of historical Troy. The one detailed statement about the rivers of the plain of Troy, viz. that they meet (*Il.* v. 774), is rejected as geographically impossibleeven by those scholars, like Leaf and Robert, a-ho try to identify the local details. In the descriptions of Ithaca, some points can be found on the island, and doubtless could on other islands also; some seem to suit Eeucas but not Ithaca, while in some again the detail seems to be the remnant of a myth. The isle of Odysseus is described as "low down, farthest away in the sea toward the darkness: the others are separate, toward the dawn and the sunlight." That description is utterly unsuitable to the real geography, but sounds like a description of a mythical Isle of the Setting Sun, in the far west, which possibly lingered in the minds of poets and audiences from an older poem.

It is worth observing that this vagueness of detail, this use of the generic and typical rather than the hard particular, is characteristic of the higher Greek poetry in general, and is probably due to the same cause—the dependence of the poet on the tradition as known to, or accepted by, his audience. Thus Aeschylus in the *Agamemnon* makes his beacon-signals start from Mt. Ida, though in fact the top of Mt. Ida is some 30 miles in the wrong direction. He does so because Mt. Ida is always in tradition the mountain of Troy. Both audience and poet take it for granted. For somewhat similar reasons, the tragedians give no names to their subordinate characters: they are merely Servant, Messenger, or Nurse.

Historicity.—Far more precarious than the geographical identifications are attempts to extract history from the Homeric narrative. It is quite likely that there are hard nuggets of history preserved unchanged in the poems, but it is impossible to distinguish history from myth, folk-lore and fiction in such a slowly grown and beautifully welded whole. If Odysseus burns out the eye of a one-eyed giant, if he escapes from the cave by clinging under the belly of a ram while the Cyclops stops and feels the ram's back, one cannot say that such things never happened, but one should not forget that they occur in dozens of folk-taies. If Odysseus had 360 boars, one of whom died every night, one cannot but think of the sun or the year, as described in ancient riddles: one cannot help noticing with interest that the day on which Odysseus and Penelope met was the exact day in which ancient astronomers considered that the sun cycle and moon cycle coincided: the day called "the meeting of sun and moon" in Meton's *Eikosieteris* or 20 year cycle. Such solar material may quite well be blended with a story of real life. One must simply wait for the evidence.

Again, there is nothing at all impossible in the story that the cause or pretext of the Trojan War was the rape of a princess. Yet the fact that a statement is possible is no proof that it is true; and one must remember that Helen was, in historical times a marriage goddess in Sparta, and as such must herself go through the marriage ceremony, which comprised in Sparta the carrying off of the bride. Hence Helen in saga is constantly "carried off"—to Sidon or Troy by Paris, to Egypt by Hermes, to Deceleia by Theseus or the Apharetidae, to Parmon by "a robber." There is ritual significance also in the fact that she is generally restored by twins, either her brothers, the Dioscuri, or the *gemini* Atridae; and that, as with other marriage-goddesses, the story sometimes explains that it was not the true goddess but only an "image" that the ravisher seized.

There will be little difference of opinion as to the existence in Homer of real history, mixed up with fiction, folk-lore and myth; it is also clear that we have not at present any body of evidence by which to sift out the history. It would moreover be a great error of method to suppose that in such a combination there is always, or usually, a true nucleus and a fictional or mythical penumbra. In the Niebelunglied, for example, the myth seems to be the nucleus, which has attracted into it some historical figures like Atli and Dieterich of Berne (Attila and Theodoric). The same would hold of most historical novels.

Nor should much weight be attached to the fact that the incidents of the Iliad are generally of the possible sort; marvels and monsters are kept outside the story. That is purely a question of style. The Iliad is tragic, and serious. The Odyssey veers towards the fairy-tale in the Story of Odysseus (ix. to xii.) and comes back to reality in the later books. The *Argonautica* was τερατώδης, "full of marvels," throughout. On the other hand the actual names borne by the chief heroes may well be historical or at least derived from history. Atreus, Paris, Helene, Odysseus (or Olytteus) do not seem to be Greek words; Achilleus, Agamemnon, Menelaus look like non-Greek words twisted into a semblance of Greek. If so, they are probably not invented but derived from real persons who bore names more or less like them, while Diomedes (Zeus-counsel), Neoptolemus (War-new), Hector (Holder) and perhaps Priam (King) seem like pure Greek names which anyone could invent.

HOMERIC MORALITY

It is strange to read in old books that Homer has "no law and no morality." It seems so very contrary to the truth. Homeric law is the law of the heroic age: there is no code, but the king delivers judgments (θέμιστες), based no doubt on custom and public opinion. If they are unjust there is a general Nemesis, or Indignation, of men, and probably a punishment of all the land by the gods. In times of peace, as in the Odyssey, there is praise for "some blameless king, who in the fear of God rules among men many and strong, and upholds righteous judgments; to him the black soil bears wheat and barley, the trees are heavy with fruit, the flocks bring forth unfailingly and the sea provides its fish, because of his good leading; and the peoples prosper under him." (Od. xix. 111.) So Odysseus "had no evil thoughts, but was kind as a father to his people" (Od. ii. 230 sqq., v. 8 sqq., etc.) In war, of course, such as we have in the Iliad, there is not so much question of law or justice, though it is noteworthy that the *gerontes*, or elders, have some influence beside the king. In Troy this is natural, since the Trojans are still living at home among their native sanctities. Rut even in the Achaean camp Nestor carries weight in the council of chieftains on the ground of his age and experience.

In the main, as in other heroic ages, morality has gone back to first principles, to what Homer calls *aidôs* and nemesis. *Aidôs* is generally interpreted as "shame" or "sense of honour," nemesis as "righteous indignation." *Aidôs* is what you feel about your own actions: the honour that compels you, the shame that deters you, the ruth or remorse that haunts you. Nemesis, or "the nemesis of men," is what is felt by the onlooker about the act of another, done or contemplated. If you feel disposed to run away in battle, or if you continue to be angry after receiving atonement, think of the "nemesis of men"! When Helen is asked to go and let Paris make love to her when he has emerged with doubtful honour from a battle with Menelaus, she says roundly: "I will

not go. Νεμεσσητὸν δέ κεν εἴη; it would be a thing to feel *nemesis* at." The word *nemesis* soon passes away from the sphere of ordinary human blame. It becomes the haunting impalpable wrath of the earth and sun, the "innumerable *Keres*," the gods and the dead. The deeds that rouse it fall mainly into three categories; first, actions that imply cowardice. "*Aidôs*, ye Argives . . . will ye not stand? . . . I have *nemesis* against you in my heart." Secondly, perjury and lying. This never occurs in Homer, because the heroes never commit the action, except perhaps Pandarus, who is killed. But it is the most typical source of shame in the rest of the heroic tradition.

Thirdly, and much the most important, any wrong or treachery towards the helpless, the stranger, the suppliant, and the aged. The feeling often occurs in Homer, but the doctrine is most clearly expressed by a passage in Hesiod (*Works and Days* 327 *sqq.*). "It is all as one thing—the man who wrongs a suppliant or a stranger, the man who violates his brother's bed; the man who in heartlessness sins against orphan children; the man who reviles his old father on the bitter threshold of age: with that man Zeus himself is wroth." The parable of the prayers, Daughters of Zeus, in *Il.* ix. 502 illustrates the same feeling. They are prayers for mercy or forgiveness. Lame, and wrinkled and half-blind, they stagger after the footsteps of Ate (Blindness, or Evil) trying to heal the harm she has done. . . . And woe to the man who rejects them, for the daughters of God speak to their Father. Such a man would be Ἀναιδής.

Expurgations.— A saga, or a body of poetry, which lasts on in tradition from one age to another is almost certain to be altered to suit changes of taste, particularly if the standard is rising. The Northern epics were modified as their people became Christian. The books of the primitive polytheistic Hebrews were modified as the religion of Jehovah prevailed. The acting texts of Shakespeare changed most sensitively in the 18th and 19th century. In Homer, as Plato explains in the *Republic*, there are occasional passages which hurt the moral sense of a later age, and "we must beg Homer not to be angry if we delete them" (*Rep.* iii. p. 387b). Zenodotus and Aristarchus are recorded as having acted in this spirit after Plato, and other critics and poets had evidently done so before. Zenodotus mostly deleted what was ἀπρεπές, "unseemly"—abusive language, attribution of fear to the Gods or heroes, of a mean motive to Achilles or Agamemnon, of a list of amours to Zeus, and the like. These expurgations are recorded in the Scholia. So is the meditated parricide of Phoenix and a suggestion, by Ajax, of all people, that the Achaeans should "pray silently, so that Trojans should not hear."

There has been a complete expurgation of certain primitive vices, which were current in most parts of later Greece (Schol. on *Il.* xvi. 97 sqq., xx. 231 sqq. v. 266). The brother-and-sister marriage of Alcinous and Arete is turned into one between uncle and niece. (Schol. *Od.* vii. 55 *sqq.*) The torture of Hector before death has been turned into an insult to his body after death. In general, mutilation, stripping of the dead, torture and beheading have been either removed or softened down. Poisoned arrows are condemned, though it is clear that Homer's arrows, like those of Heracles in Hesiod, originally "had death on the tip and wept in drops" (*Aspis* 132). There has also been a vigorous and almost complete excision of human sacrifice. Homer says nothing of the sacrifice of Iphigeneia or Polyxena; "rightly," says Pausanias, "he omitted such a cruel and unlawful deed." The one human sacrifice which seems to have been too firmly fixed in the legend to admit of expurgation, viz., the sacrifice of twelve noble Trojans by Achilles at the pyre of Patroclus, is hurried over in a shamefaced line and a half, without even a principal verb, and is followed by the words: "Yea, he devised evil things in his heart." The *Odyssey*, which is in many ways less a mirror of chivalry than the *Iliad*, admits something very like torture for Melanthios and the treacherous bondmaids. After all, they were only slaves!

Each case needs separate consideration, but the fact of expurgation can hardly be denied. The real Akhaiusha who took Troy were probably a horde of savages. We can see the unexpurgated account of their doings in the fragments of the Epics that were considered "non-Homeric," *i.e.*, which never passed through the furnace of the Panathenaic recitation. But the "godlike Achaioi" of Homer have been made into ideals of manly chivalry, held up to the imitation of the young, and must not be described as practising the "beastly devices of the heathen." The true spirit of Homeric chivalry comes out in the parting of Hector and Andromache in *Il.* vi., the reconciliation of Achilles and Priam in *Il.* xxiv., or the words of Odysseus over his dead enemies: "Unholy it is to vaunt over slain men."

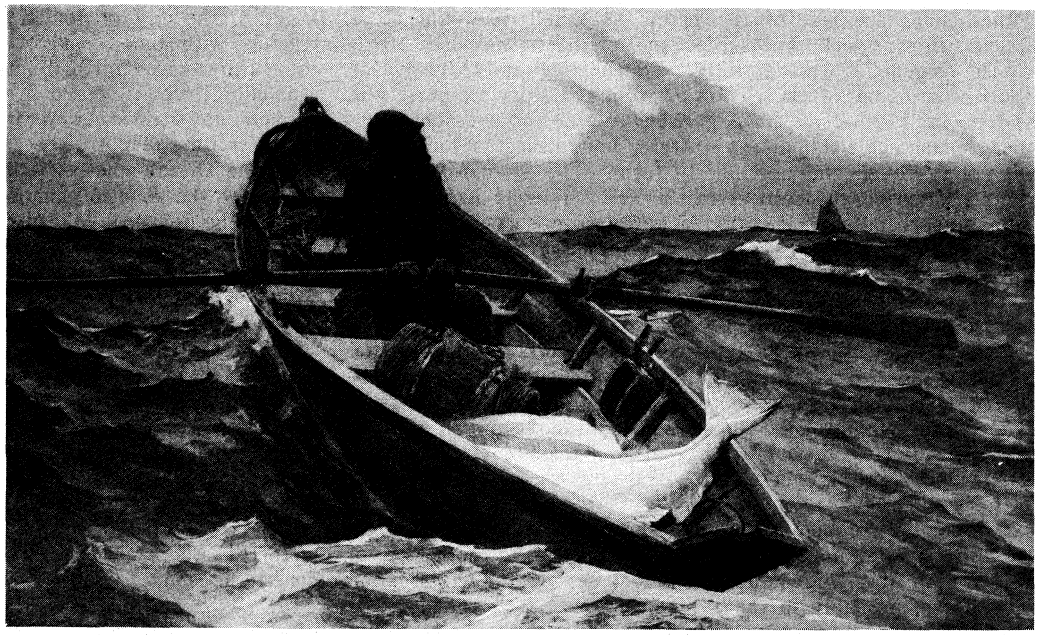
BIBLIOGRAPHY.—(1.) Editions of text: *Editio princeps* by Demetrius Chalcondylas, Florence (1488); Aldines (1504, 1517). *Modern Critical Texts.* La Roche, *Odyssey* (1867–68), *Iliad* (1873–76); Ludwich, improvement on La Roche, *Odyssey* (1889–91), *Iliad* (1901, 1907); Allen (Oxford, 5 vols., 1908 and after); based on fullest examination of mss. and papyri. (2.) Editions which attempt to restore the text to some pre-Aristarchean form:—Payne Knight (1820, after *Prolegomena*, 1816), a curiosity of wild restoration; Brandreth, *Ilias* (1841); Fick, text restored to "the original Aeolic," *Odyssey* (1883), *Iliad* (1886); Less adventurous, Van Leeuwen and Mendez da Costa, several editions (1889–1912), with prolegomena and notes, and restoration into supposed "original Ionic"; Platt (Cambridge 1892, 1894) removes surface corruption and restores the digamma where the case is clear. (3.) Commentaries:—Van Leeuwen (as above); Leaf, *Iliad* (2nd ed. 1900–1902) the best commentary in English; Ameis, afterwards continued by Hentze and (7th ed.) by Paul Cauer (1913), probably the best in German; a remarkable edition of the *Odyssey* in six vols., treated dramatically, by V. Bérard (Paris 1924); *Odyssey* I.–XII., Merry and Riddell, XIII.–XXIV., Monro (1886, 1901), with valuable appendices. (4.) Scholia. The Venetian Scholia, first pub. by Villoison (1788); Best Edition, *Iliad* (4 vols.) and *Odyssey* (2 vols.) by Dindori; Townley, *Scholia to Iliad* (2 vols.) by Maas (1855–88); Eustathius' vast commentary, pub. Rome 1542, reprinted Stallbaum (Leipzig, 1827). Books on the Scholia:—Lehrs, *De Aristarchi Studiis Homericis* (1833, 1865), very interesting; more elaborate, Ludwich, *Aristarchs Hom. Textkritik* (2 vols. 1884, 1885); Roemer, *Homerexegese Aristarchs* (ed. Belzner 1924); Wecklein, *Über Zenodotus und Aristarch* (1919). (5.) Books on the Text:—La Roche, *Hom. Textkritik* (1866) and *Hom. Untersuchungen* (1869); Ludwich, *Die Homerische Vulgata als voraristerchisch erwiesen;* Agar, *Homerica* (1908); Bolling, *External Evidence for Interpolation in Homer* (1925).

(6.) General:—Wolf, *Prolegomena ad Homerum* (1795, ed. Volkman 1844). Wolf was to some extent preceded by Wood, *Essay on the Original Genius of Homer* (1769); and the Abbé d'Aubignac, *Conjectures Académiques* (pub. 1715 but written about 1669). Compare also Vico, *Il vero Homero*, 1744. Hermann, *De Interpolationibus* and *De Iteratis apud Homerum*, in his *Opuscula* (5 vols.); Lachmann, *Betrachtungen über Homers Ilias* (1837–41, ed. Moritz Haupt 1865, 1874); Erhardt, *Entstehung der Hom. Gedichte* (1894); Jebb. *Introduction to Homeric Study* (1887), still useful; Browne, *Handbook of Homeric Study* (1908); Seymour, *Life in the Homeric Age* (1907); Cauer, *Grundprobleme der Homerischen Kritik* (3rd ed. 1921–23) gives the best conspectus of the whole problem. Chadwick, *The Heroic Age* (1912) brought new light on the Homeric question by a study of "heroic ages" as a type. Rothe, *Ilias als Dichtung* (1910), *Odyssee als Dichtung* (1924), a good restatement of the old "unitarian" point of view; *cf.* M. Stawell, *Homer and the Iliad* (1909). Drerup, *Homerische Poesie* (5 vols. 1921); the first gives a valuable conspectus, specially devoted to correcting Cauer, learning great, but standpoint somewhat uncritical. G. Murray, *Rise of the Greek Epic* (1907, 3rd ed. 1925); T. W. Allen, *The Homeric Catalogue of Ships* (1921) and *Origin and Transmission of the Homeric Poems* (1926); U. von Wilamowitz-Moellendorff, *Homerische Untersuchungen* (1884) and *Homer und die Ilias* (1920) and *Heimkehr des Odysseus* (1926); Eric Bethe, *Homer und die Heldensage* (1902), valuable on the nuclei of historical fact, transmuted, in the poems, and *Homer, Dichtung und Saga* (3 vols. 1914–27). Seeck, *Quellen der Odyssee* (1887), struck out a new line of inquiry; vigorously followed up by Miilder, *Ilias rind ihre Quellen* (1910). J. A. K. Thomson, *Studies in the Odyssey* (1914), emphasizes tradition and attempts imaginative understanding; E. Schwartz, *Odyssee* (1924); Finsler, *Homer in der Neuzeit* (1912) and *Homer* (1908), very wide reading; Bédier, *Les Légendes Epiques* (1908–13). Ingenious are:—Butler, *The Authoress of the Odyssey* (identified as Nausicaa 1897); Shewan, *The Lay of Dolon* (1911); Smyth, *A Nu:terical Law in the Homeric Poems* (1914). (7.) Among older books Welcker's *Epische Cyclus* (1835–49), is still valuable; also Sengebusch, Introductions to Dindorff's text of Homer (1855–56); Friedlaender, *Wolf bis Grote* (1853); Kirchhoff, *Homerische Odyssee* (1869); and Paley, articles cited in Sayce's Appendix to vol. 1 of Mahaffy's *Greek Literature.* Andrew Lang's books, though injured by their polemical tone, are still useful:—Homer *and his Age* (1906), *Homer and the Epic* (1895) and *The World of Homer* (1910). Gladstone's *Studies on Homer* (1858), *Juventus Mundi* (1869) contain some brilliant suggestions; Hayman's *Odyssey* (1866), has useful notes. Geddes, *Problem of Homeric Poems* (1878); *Nitzsch's* voluminous writings, *Erläuternde Anmerkungen zu*

Homers Odyssee (1826–40), etc., have lost most of their value; Nägelsbachs, *Anmerkungen zur Ilias* (first three books) much praised (1864).

(8.) Archaeology:—All books are dependent on the discoveries of Schliemann at Troy and Mycenae, between 1869 and 1896, summed up in Schuchhardt, *Schliemann's Excavations* (1891, Eng. tr. 1891), and later on those of Sir Arthur Evans and others in Crete, summed up in Evans, *The Palace of Minos at Knossus* (3 vols. 1921–28); *cf.* W. Leaf, *Troy* (1912), *Homer and History* (1915) and *Strabo on the Troad* (1923); Robert, *Studien zur Ilias* (1901); Helbig, *Das H. Epos durch die Denkmaler erklart* (1884, 1887); Buchholtz, *H. Realien* (1871–73); Reichel, *H. Waffen* (epochmaking); V. Bérard, *Les Phiniciens et l'Odyssée* (1902–03), fascinating rather than convincing; Noack, *H. Palaste* (1903); *cf.* Dörpfeldt in *Mitth. Arch. Inst. Ath.* (1905); Ridgeway, *Early Age of Greece* (1901), first emphasized the northern invasions. Wace and Thompson, *Prehistoric Thessaly;* Sartiaux, *Troie* (1915); Macurdy, *Troy and Paeonia* (192j); Hall, *Oldest Civilization of Greece* (1901), and *Ancient History of Near East* (1913), and *Aegean Archaeology* (1915); Dussaud, *Les Civilisations Pre-helleniques* (2nd ed. 1914); Glotz, *Civilisation égéenne* (1924); Heusey, *Histoire du Costume antique* (1922).

(9.) Language:—Buttmann, *Lexilogus* (1818–25), still interesting; Monro, *Homeric Grammar* (2nd ed. 1891); van Leeuwen and Mendez da Costa, *Eucheiridion Dictionis Epicae* (2nd ed. 1918); Dielitz, *H. Formenlehre* (1908); Freund, *Formenlehre d. H. Mundart* (1906); Schulze, *Quaestiones Epicae* (1902); Delbruck, *Syntaktische Forschungen* (1871–72); Thumb, *Das Digamma* (1898) and *Die Gr. Dialekte* (3rd ed. 1928); Bekker, *Homerische Blatter* (1863–72); Cobet, *Miscellanea Critica* (1876); Bechtel, *Vokalkontraktion bei H.* (1908); Meillet, *Aperçu d'une Histoire de la Langue Grecque* (1920), very good; Wackernagel, *Sprachliche Untersuchungen zu Homer (1916).* (10.) Metre:—Hartel, *Homerische Studien;* Solmsen, *Untersuchungen zur Gr. Laut- und Verslehre* (1901); Danielsson, *Zur Lehre vom H. Digamma,* Ind. Forsch. XXV.; Witte in Pauly-Wissowa's *Realenzyklopedie,* "Homeros"; Drewitt, "Scansion in H. Verse," in *Class. Quarterly* (April 1908); Usener, *Altgriechischer Versbau* (1886); Schroder, *Vorgeschichte des H. Hexameters* (1908). (11.) Lexica, etc.:—*Concordance to Iliad* by Prendergast (1875) and *to Odyssey* by Dunbar; *Lexicon Homericum* by Ebeling (1880–85); Gehring, *Index Homericus* (1891); *Facsimile* of codex Venetus A, Sijthioff (1901), with introduction by Comparetti. The chiei classical periodicals (such as, in England, *Journal of Hellenic Studies, Classical Quarterly, Classical Review,* Liverpool *Annals* of Archaeology, and in America *Classical Philology, American Journal of Archaeology)* contain *passim* articles on Homer, *e.g.,* many on mss. by T. W. Allen in the *Class. Review;* the literature is summarized from time to time in Bursian's *Jahresberichte:* clxvi (text), clxxxii (general and archaeological). The histories oi Greece and of Greek literature all treat of Homer. For a summary of the plots of the *Odyssey* and *Iliad* see HOMERIC POEMS. (G. G. A. M.)



BY COURTESY OF MUSEUM OF FINE ARTS, BOSTON, MASS.

"THE FOG WARNING" BY WINSLOW HOMER IN THE MUSEUM OF FINE ARTS, BOSTON

HOMER, LOUISE (1871–1947), U.S. operatic singer, was born Louise Dilworth Beatty in Pittsburgh, Pa. She studied music in Philadelphia and Boston and for two years in Paris. She made her debut in Vichy in 1898. The next season she appeared as Amneris in *Aïda* at Covent Garden. London, and the season thereafter she was with the Royal Opera in Brussels. She made her first appearance in New York city with the Metropolitan Opera company in 1900 and during her long career there developed her unusually rich contralto voice.

In 1920 she joined the Civic Opera company of Chicago. In 1923–24 she was selected as one of the 12 greatest living American women by the National Association of Women Voters. She was married in 1895 to Sidney Homer, the composer. She died May 6, 1947, in Winter Park, Fla.

HOMER, WINSLOW (1836–1910), U.S. painter, universally regarded as one of the greatest of American artists, was born in Boston, Mass., on Feb. 24, 1836. Apprenticed at 19 to a lithographer, he left on his 21st birthday to become a free-lance magazine illustrator. He moved to New York city in 1859 and during the Civil War attracted attention as a pictorial reporter for *Harper's Weekly.* He also began to paint during the war, his first important work in oils being "Prisoners From the Front" (1866; Metropolitan Museum of Art, New York city). His earliest water colours date from 1873.

Almost entirely self-taught and little influenced by other artists, American or European, Homer from the first painted with a freshness and clarity of vision which made him a pioneer of naturalism. In his early work, his favourite subjects were scenes of country life, both fashionable (*e.g.,* "Long Branch," 1869; Museum of Fine Arts, Boston) and rustic (*e.g.,* "Snap the Whip," 1872; Butler Institute of American Art, Youngstown, O.). But from the mid-1870s his interest shifted to more dramatic subjects, reflecting the rugged lives of Adirondack hunters and New England fishermen, as in "Huntsman and Dogs" (1891; Philadelphia Museum of Art) and "The Herring Net" (1885; Art Institute of Chicago). His art was never stagnant, however, constantly growing in depth of feeling and breadth of execution.

Homer traveled to Europe in 1867 and again in 1881–82, when he produced a series on sea subjects deriving from his two-year stay in Tynemouth on the northeast coast of England. In 1883 he made his permanent home at Prout's Neck on the Maine coast. There he spent most of each year, almost a recluse, leaving only on painting trips to the Adirondacks, Florida and the British West Indies, where he found inspiration for some of his finest water colours (*e.g.,* "Rum Cay," 1898–99; Worcester Art museum). At first hostilely received by critics; his work began to receive acclaim in the mid-1880s with "The Life Line" (Philadelphia Museum of Art), "Eight Bells" (Addison Gallery of American Art, Boston) and other dramatic sea pieces, culminating with "The Gulf Stream" (Metropolitan Museum of Art) painted in 1899. He did little painting after 1904 and died at Prout's Neck on Sept. 29, 1910.

See William Howe Downes, *The Life and Works of Winslow Homer* (1911); Lloyd Goodrich, *Winslow Homer* (1944). (D. H. W.)

HOMERIC POEMS. This title is commonly given to the whole cycle of the early Greek epics, including the Odyssey and the Iliad as well as the rejected epics.

In the article HOMER a full discussion is given of the "Homeric question." For bibliographical information also the reader is referred to the article HOMER. In the present article will be found merely (1) a discussion of the cyclic poems other than the Iliad and the Odyssey, (2) an analysis of the plots of the Iliad and the Odyssey.

The **Rejected** Epics.—As soon as the two great wholes, Iliad and Odyssey, were given exclusive rank as "Homer" at the

Panathenaea the rest of the heroic *epos* fell, it would seem, quickly into neglect. The subject matter indeed was used freely by the tragedians, who carefully avoid the *Iliad* and *Odyssey*, but though the names of many epics or groups of story are preserved, the poems themselves have perished utterly except for a few meagre fragments (about 120 scattered lines altogether) and those in a very rough and unscholarly form. The Homeric rules of metre, language and subject matter are carelessly ignored, presumably because the attention of scholars was concentrated on the two great poems. We hear much in later times of various '(cycles," "the Trojan cycle," "the Theban cycle," and "the Epic cycle" as a whole. The epic cycle is a "ring" or collection, covering the whole epic saga; the Trojan or Theban is that part of it which deals with Troy or Thebes. Thus a certain Proclus (presumably the Neo-Platonic philosopher, 5th century A.D.) in his *Chrestomatheia Grammatike*, or *Compendium of Literature*, included "an account of the so-called Epic cycle, beginning with the Marriage of Heaven and Earth, and . . . made complete out of various poets" till it ends with the death of Odysseus at the hands of his son Telegonus.

Among the *Tabulae Iliacae* in Jahn's *Bilderchroniken* (1873) there is a large relief (No. 1) illustrating scenes in the history of the Trojan War, drawn up for school use by the grammarian Theodorus, probably in the 1st century B.C. It is called *τάξις Ὁμήρου*, "an arrangement of Homer," and is duly "made up out of various poets." Thus the post-Homeric part of the "Trojan Cycle" is taken from "the *Aethiopis* according to Arctinus, the so-called *Little Iliad* according to Lesches of Pyrrha and the *Sack of Ilium* according to *Stesichorus*." Elsewhere we hear of the *Sack of Ilium* by (or "according to") Arctinus of Miletus. Evidently the Sack of Ilium is a fixed mass of legend, a traditional subject, which the cycle-maker could tell "according to" the version of any one of its successive composers, even at times preferring a lyric poet like Stesichorus to any of the epic writers.

The *Tabulae Iliacae* refer to a large number of these ancient poems, more indeed than we can identify from the fragments (*cf.* Jahn, No. VI.). Those poems whose names are known are attributed by Athenaeus and Pausanias. our earliest authorities, to various authors. Athenaeus refers to "him who made the *Titanomachy*, whether Eumelus or Arctinus or whatever name he prefers"; "him who made the *Cypria*, Hegesias or Stasinus or Cyprias"; but he generally leaves the author anonymous: *Ὁ τὴν Ἀλκμαιωνίδα ποιήσας*, *ὁ τοὺς Νόστους ποιήσας*. Occasionally we find a plural: *οἱ τὴν Ἡρακλείαν ποιήσαντες*, *οἱ τῶν Κυπρίων ποιηταί* (Eratosthenes *ap.* Strabo 688: Schol. v on *Od.* xvi. 57). This means, not of course "the committee which composed the Heracleia," but "the various poets or 'makers' who made versions of the Heracleia."

An epitome of Proclus' account of the poems which formed the sources of his Epic cycle is given partly in Photius' *Bibliotheca* (*c* 850 A.D.), partly in the Venetian scholia. The epitome gives a definite list of poems each with a definite author: the *Iliad* by Homer, *Aethiopis* by Arctinus of Miletus, *Little Iliad* by Lesches of Mitylene, *Sack of Ilium* by Arctinus, *Nostoi* or *Homecomings* by Agias of Trozen, *Odyssey* by Homer and *Telegonia* by Eugammon of Cyrene. This definiteness is apparently the result of epitomizing the longer and more doubtful accounts given by earlier authorities; and references to these same poems elsewhere show that they were far from definite wholes. The same incidents are quoted now from the *Sack* and now from the *Little Iliad*. Similarly an attempt to give definite dates to the separate poets breaks down on examination.

It is noteworthy that the poems about the *Sack of Troy* seem to be pro-Trojan or at least anti-Greek in sympathy. As in Euripides' *Trojan Women*, all possible cruelties and crimes are attributed to the conquerors. This may be due merely to the nature of the theme. Any poet telling of the sack of a town, whether he takes the romantic tone of the *Little Iliad* or the tragic tone of the *Sack of Ilium*, is fairly sure to make the most of the sufferings of the conquered women and children; but we may observe also that the alleged authors are mostly drawn from towns outside the traditional Homeric birthplaces; and that Miletus, for instance, the city of Ionian science and commerce, may have regarded with some feeling of opposition the barbarous glories of the old towns which it had outstripped.

It is not to be supposed that these poems of the Trojan cycle, in their late versions, were true representatives of the rejected epic literature. The true rock from which the *Iliad* was hewn is lost. The Theban epics, especially the *Thebais*, seem to have come nearest to the *Iliad* in general esteem, and to have been largely used in the final make-up of that poem; next to them in importance, perhaps, were Thessalian lays about the ship Argo (*πᾶσι μέλουσα*, *Od.* xii. 70) and Argive lays about Heracles. The *Titanomachies* and poems about the origin of the world belong to the Hesiodic group rather than the Homeric.

Plot of the Iliad.—I. (*Λοιμός. Μῆνις.*) Chryses, priest of Apollo, comes to the Greek camp with ransom, to buy back from Agamemnon his captive daughter, Chryseis. Scornfully refused, he prays to Apollo to avenge his daughter's wrong. Apollu sends pestilence on the host. After nine days Achilles calls an assembly, discovers the cause of the pestilence, and demands that Chryseis be restored to her father. Agamemnon consents, but takes instead Achilles' own prize, Briseis. Achilles renounces his allegiance. His mother Thetis persuades Zeus to make the Greeks rue the wrong done to her son.

II. (*Ὄνειρος. Βοιωτία, ἢ κατάλογος τῶν νεῶν.*) Zeus thereupon beguiles Agamemnon with a dream to begin a pitched battle. Agamemnon, to try the temper of his men, proposes to abandon the expedition; they, led by a demagogue, Thersites, are only too ready to do so; but Odysseus beats Thersites and rallies them. There follows a Catalogue of the Greek ships as they were marshalled at Aulis before starting to Troy (484–760), and of the Trojans and their allies (816–877).

III. (*Ὅρκοι. Τειχοσκοπία. Μενελάου καὶ Πάριδος μονομαχία.*) Paris challenges Menelaus to single combat for Helen; a truce is proclaimed. Helen and Priam watch the Greek army from the Walls of Troy. Paris is nearly slain, but saved by Aphrodite.

IV. (*Ὁρκίων σύγχυσις. Ἀγαμεμνονος ἐπιπώλησις.*) Athena, to injure the Trojans, persuades Pandarus, son of Lycaon, to break the truce by treacherously shooting Menelaus. Wrath of Agamemnon: he marshals the host and the armies join battle, the Trojans now involved in a curse.

V. (*Διομήδους ἀριστεία.*) Diomedes' day: he makes great slaughter of the Trojans, especially of the traitor Pandarus by a wound through the mouth (290–296). He wounds Aphrodite, who is protectirig her son Aeneas, and sends her weeping to Olympus. He is beaten back from Troy by Apollo. Ares helps the Trojans; the Greeks are failing, when Athena mounts in Diomedes' chariot and they charge and wound Ares, who flies with a shout like ten thousand men

VI. (*Ἕκτορος καὶ Ἀνδρομάχης ὁμιλία.*) Hector goes back to Troy to bid the women make a great procession and prayer to Athena. Meanwhile Diomedes and the Lycian Glaucus are about to fight, when they recognize one another as hereditary guest-friends, and part with gifts. Hector gives his message, says farewell to his wife Andromache and their child, who is frightened of his father's plume; he collects Paris and goes back to the battle never to return.

VII. (*Ἕκτορος καὶ Αἴαντος μονομαχία. Νεκρῶν ἀναίρεσις.*) Hector challenges all the Greeks; the lot falls on Ajax; the fight is indecisive and they part with gifts. In Troy Antenor urges that, since they now fight with a curse upon them, they give back Helen and her treasure and ask for peace. Paris will not give up Helen, but offers to restore the treasure and add more. This offer is sent next day to the Greeks and refused; a truce is made for the burial of the dead; the Greeks build a wall round the ships. A wine ship comes from Lemnos and the Greeks lie on the shore drinking.

VIII. (*Κόλος μάχη.*) Zeus, to fulfill his promise, commands the gods to keep away from the battle and himself comes to the top of Mt. Ida. He weighs the fates of Greeks and Trojans and drives the Greeks back with thunderbolts. Agamemnon and Teucer resist desperately; Poseidon, and then Hera and Athena, try again to help the Greeks, but are warned back. The Trojans bivouac on the

field and their fires surround the Greek camp.

IX. (Πρεσβεία πρὸς Ἀχιλλέα. Λίται.) At a secret meeting of the chiefs, Agamemnon again offers to abandon the expedition and set his followers free; Diomedes and Nestor insist on continuing. Watches are set lest the Trojans attack by night. Agamemnon next offers to make atonement to Achilles and implore his forgiveness, to return Briseis untouched, and splendid gifts with her. Odysseus, Ajax and Achilles' old tutor Phoenix go to beseech Achilles, who passionately refuses all their offers and declares he will sail for home on the morrow. Phoenix stays with him; the other envoys return.

X. (Δολωνεία.) Agamemnon and Menelaus call the chiefs to watch by the trench. Odysseus and Diomedes go out as spies. They capture and kill a Trojan spy, Dolon; by his information they surprise the camp of the Thracians, kill Rhesus, take his horses and escape.

XI. (Ἀγαμέμνονος ἀριστεία.) Agamemnon by desperate valour beats back the Trojans until he is wounded. Diomedes and Odysseus, rallying the Greeks, are both wounded; then Machaon and Eurypylus. Achilles, seeing the wounded hlachaon pass, sends Patroclus to enquire. Nestor urges on Patroclus that Achilles should either return to the war or send Patroclus with the Myrmidons.

XII. (Τειχομαχία.) The Trojans assault the Greek wall. Asius' chariot charge is defeated; Sarpedon tears down a turret; at last Hector breaks through one of the gates, and the Trojans rush in.

XIII. (Μάχη ἐπὶ ταῖς ναυσίν.) Poseidon, hidden from Zeus, encourages the Greeks. The two Ajaces and, above all, the grey-haired Idomeneus uphold the battle. The Trojans waver but rally.

XIV. (*Arbs* ἀπάτη.) Nestor and the wounded chiefs throw themselves again into the battle. Meantime Hera, having borrowed the magic girdle of Aphrodite and persuaded Sleep to help her, beguiles Zeus from his watch and sends him to sleep. Poseidon openly aids the Greeks; Hector is felled by a great stone and the Trojans driven back.

XV. (Παλίωξις παρὰ τῶν νεῶν.) Zeus awakes. At his bidding Poseidon retires, Apollo puts new strength into Hector and. bearing his aegis, leads the Trojans on past the wall and up to the ships. Patroclus returns to Achilles and implores him with tears to help the Greeks. Ajax with a great naval ramming-pole, leaping from ship to ship, is holding the Trojans back, when Hector brings fire to burn the ship of Protesilaus.

XVI. (Πατροκλεία.) At Patroclus' entreaty Achilles, though he will not himself fight till Agamemnon offers atonement. gives his chariot and armour to Patroclus and bids him drive the Trojans back but not go further, when once the camp is clear. Patroclus with the Myrmidons routs the Trojans, kills Sarpedon and many others, and pursues right up to the wall of Troy, where he is stopped by Apollo. He kills Hector's charioteer; then, dazed by Apollo, and wounded by Euphorbus, he is slain by Hector, while Automedon with the immortal horses of Peleus flies to the ships.

XVII. (Μενελάου ἀριστεία.) Hector strips Achilles' armour from the corpse of Patroclus. A desperate battle arises about the body Antilochus is sent to bear the news to Achilles. The immortal horses stand weeping for Patroclus and then return to the battle. At last Menelaus recovers the body, and bears it back to the ships while the Ajaces cover his retreat.

XVIII. (Ὁπλοποιία.) Antilochus gives the news: despair of Achilles. His mother Thetis rises from the sea to help. "Give me armour that I may slay Hector." "My son, it is written, that when Hector dies you die." "Would I were dead now, who failed to save my friend." So Thetis goes to beg Hephaestus to make her son new armour. The Trojans are pressing on to recover the body of Patroclus, when Achilles shouts his war cry from the trench and they stop. They encamp on the plain. The Greeks bring the body to Achilles' tent and prepare it for burial. The Shield of Achilles is described (356–617).

XIX. Achilles receives the arms. He calls an assembly, renounces his wrath and demands instant battle. Agamemnon confesses his fault and offers gifts of atonement. The army eat before battle, but Achilles will not eat till Hector is slain. He mounts his chariot and calls to the immortal horses: "Bear me safe through this battle; do not leave me dead as you left Patroclus." And the horse Xanthus speaks: "Yes, this one time; but never again. Your death is close." "I know it," he answers and drives with a shout into the battle.

XX. (Θεομαχία.) His promise fulfilled, Zeus now allows the gods to mix in the battle as they choose, while he watches from Olympus. Hera, Athena, Poseidon, Hermes, Hephaestus help the Greeks; Ares, Apollo, Artemis, Leto, Aphrodite and the river Xanthus the Trojans. Achilles on foot fights with Aeneas, who is saved by Poseidon to be hereafter king and father of kings to the Trojans; with Polydorus, whom he kills, and with Hector, who is saved by Apollo. He puts the Trojans to flight.

XXI. (Μάχη παραποτάμιος.) Achilles drives the Trojans, part into the city, part into the River Xanthus. He kills Lycaon, though a suppliant, and takes twelve youths to be sacrificed at the pyre of Patroclus. He kills Asteropaeus, and mocks at his River-ancestor. The river Xanthus, choked with dead, rises in flood against Achilles to beat down his shield and drown him. There is a battle of water and fire. The gods are again in strife on the plain. Then all vanish except Apollo who tempts Achilles away from the city till the fugitives are safe within the gates.

XXII. (Ἕκτορος ἀναιρέσις.) Hector alone stays outside, awaiting Achilles, while his parents implore him to come in. As Achilles comes he turns to fly, and is pursued three times round the city; then he stands. Zeus weighs the fates of the two men in his scales, and Hector's fate falls Apollo deserts him, while Athena, taking the shape of his brother Deiphobus, betrays him. When both have thrown their spears she sends that of Achilles back to him. Achilles kills Hector and refuses his dying prayer for burial. He drags the dead body behind his chariot to the ships, while Hector's parents and wife make lamentation on the city wall.

XXIII. (Ἆθλα ἐπὶ Πατρόκλῳ.) The Myrmidons make a procession round the bier of Patroclus, and hold a funeral feast. That night the ghost of Patroclus appears to Achilles: "Bury me quickly that I may cross the river; and let your bones lie with mine in the golden jar." Next morning a great pyre is built and the body burnt, with many victims, among them the twelve Trojan youths, "an evil deed." Funeral games in honour of the dead (257–897).

XXIV. (Ἕκτορος λύτρα.) For many nights Achilles has neither sleep nor food. Each day he drags the dead Hector behind his chariot round Patroclus' grave, but Apollo preserves the body from decay. By command of Zeus Thetis warns Achilles of the wrath of the gods. "My son, take food and sleep. Remember your own death is close Fear the gods, and give back Hector's body for burial." Iris sent from Zeus bids Priam rise from the dust, go to Achilles with ransom and ask for Hector's body. The old king starts by night with a chariot laden with gold, and guided by Hermes finds his way unseen to Achilles' tent. "Achilles, remember your own father; I am more wretched than he, and I have done what no man on earth has done before, lifted to my lips the hand that killed my son." Then the two enemies weep together in their common misery, and at dawn Priam takes back the dead Hector to Troy, where Andrornache, Hecuba and Helen lament over him, and a very great funeral is made.

Plot of the Odyssey. —I. (Θεῶν ἀγορά. Ἀθηνᾶς παραίνεσις πρὸς Τηλέμαχον.) It is the tenth year after the fall of Troy. Athena reminds the Gods in council of Odysseus, whom Poseidon —now absent— has plagued so long. He is now detained in the Isle of Calypso, while suitors beset his wife and plunder his substance. Zeus agrees that Hermes shall be sent to Calypso, while Athena goes to Ithaca and. in the form of Mentor, stirs up Telemachus to call a gathering of the people in protest against the suitors and himself to go in search for his father. In the hall Phemius sings of the sad homecoming of the Greeks from Troy.

II. (Ἰθακησίων *byoph.* Τηλεμάχου ἀποδημία.) In the gathering Telemachus demands the help of the people against the suitors. Antinous answers that as soon as Penelope gives her hand to one of them they will go. Telemachus demands a ship in which to search for his father, but Leiocritus, a suitor, dismisses the assembly. Athena, disguised as Mentor, gets him a ship. He collects provisions and, without Penelope's knowledge, starts at night.

III. (Τὰ ἐν Πύλῳ.) They come to Pylos and are welcomed

by the aged Nestor. He knows nothing of Odysseus, but tells of the homecomings of various chiefs, and the death of Agamemnon. Menelaus, who has just returned from great wanderings, may know of Odysseus. At evening the disguised Mentor vanishes and is recognized as divine by Nestor. Telemachus spends the night with Nestor, and starts next day with Peisistratus, son of Nestor, for Sparta. The first night is spent at Pherae.

IV. (*Τὰ ἐν Λακεδαίμονι.*) They find Menelaus celebrating the double wedding of a son and a daughter, and are led to his splendid palace. A mention of Odysseus reveals Telemachus to Menelaus, while Helen recognizes him at sight. They talk of Odysseus and are filled with grief till Helen gives them a nepenthe from Egypt. Next day Menelaus relates how Proteus the sea-god told him of the fates of Agamemnon and Ajax the Locrian, and how Odysseus was in the isle of Calypso. Meantime the suitors have learned of Telemachus' expedition and send a ship to ambush him at the isle of Asteris. Penelope hears of her son's voyage and of the plot against him, and weeps till Athena comforts her with a dream.

V. (Καλυψοῦς ἄντρον. Ὀδυσσέως σχεδία.) Hermes arrives at the isle of Calypso and gives the message of the gods. Calypso weeps but obeys, and helps Odysseus to build a flat-bottomed boat. The parting of Odysseus and Calypso. On the 18th day he is in sight of Scheria, the land of the Phaeacians, when Poseidon, returning from the Aethiopians, sees him and wrecks his boat. The sea-goddess Ino gives him a veil which bears him up till, naked and half-dead, he reaches a river mouth and, covering himself with leaves, falls asleep.

VI. (Ὀδυσσέως ἄφιξις εἰς Φαίακας.) Nausicaa, daughter of King Alcinous, comes with her maidens to wash clothes at the river mouth. While the clothes are drying they play ball, and their voices wake Odysseus, who comes out and begs for protection. They all run away except Nausicaa, who receives him and gives him food and raiment, and tells him the way to her father's house. As she returns he follows at a distance and at evening comes to a grove of Athena outside the walls.

VII. (Ὀδυσσέως εἴσοδος πρὸς Ἀλκίνουν.) Athena, disguised as a girl, leads Odysseus unseen into Alcinous' splendid hall, where he supplicates the queen, Arêtê. The king and queen accept him, and promise him gifts and a ship to take him home. He tells of his voyage from Calypso's Isle.

VIII. (Ὀδυσσέως σύστασις πρὸς Φαίακας.) A feast is held and games, in which Odysseus, being taunted, wins the discus throwing, though he will not otherwise compete. The bard, Demodocus, sings the loves of Ares and Aphrodite. In the evening gifts are brought to Odysseus. Demodocus sings of the taking of Troy at which Odysseus silently sheds tears, but Alcinous marks him and asks his name and race.

IX. (Ἀλκίνου ἀπόλογοι. Κυκλώπεια.) "I am Odysseus, son of Laertes. From Troy we came first to the Cicones, where in raiding I lost 72 men; thence to the land of the Lotus-eaters; then to the isle of the Cyclops, who killed and ate six of my men, but we blinded his one eye as he lay drunk. So we escaped.

X. (Τὰ περὶ Αἰόλου καὶ Λαιστρυγόνων καὶ Κίρκης.) "Thence to the isle of Aeolus, king of the winds, who gave me the winds, all tied up in bags, except the west-wind, which blew me homewards. But my men thought the bags held treasure, and opened them, so the winds rushed out and drove us away to the land of the Laestrygones, giants and cannibals. where I lost 11 ships out of 12. Thence to a beautiful wooded island, where we heard a goddess singing in the forest. She was Circe. and she turned into swine the men I sent out; but Hermes gave me a magic root, and when she struck me with her wand I defied her, and she was subdued to me. There we stayed a year. She told me that before reaching home I must go to the land of the dead beyond the ocean and consult the spirit of the seer Teiresias."

XI. (Νέκυια.) "I came to the dark land of the Cimmerians and made sacrifice. The ghosts gathered about the blood, but I would suffer none to drink till Teiresias came. The first ghost I saw was my comrade Elpenor, who had been killed by an accident just as we started; then came my mother, Anticleia. Teiresias told me of my future fates; my mother, who had died of grief for me, told me of home. Then I saw the beautiful women of the past, and the heroes; Ajax would not speak to me Then Minos and Orion, and those punished for sin, Tityus, Tantalus, Sisyphus and the shadow of Heracles."

XII. (Σειρῆνες, Σκύλλα, Χάρυβδις, *βόες* Ἡλίου.) "I returned to Circe, who told me of my future voyage, and warned me above all not to kill the oxen of the Sun. Thus I stopped my men's ears when we passed the sirens; though I listened myself, tied to the mast. Then we passed the Wandering Rocks and Charybdis the whirlpool, though Scylla took six of my men. Then a tempest held us on shore in Thrinacia for a month, and my companions, starving, at last killed the oxen of the Sun while I was asleep. Then, when we put to sea, came storm and thunderbolt; my ship and all my men were destroyed; I was driven back through Charybdis, and escaped clinging to the mast and keel to the isle of Calypso"

XIII. (*Ὀδυσσεὺς ἀνάπλους παρὰ Φαιάκων καὶ ἄφιξις εἰς Ἰθάκην.*) The story over, the Phaeacians give Odysseus their gifts, and the next evening the ship starts. It arrives before dawn at the harbour of F'horcys, near a cave of the Nymphs; and Odysseus is left asleep on the shore. The ship on its way back is turned by Poseidon into a rock. Odysseus wakes and does not know his own land, till Athena, disguised as a youth, explains to him. She disguises him as an old beggar.

XIV. (Ὀδυσσέως *apds* Εὔμαιον Ὁμιλία.) He finds the hut of his old swineherd, Eumaeus, and is welcomed as a stranger. They talk of Odysseus. He tells false stories, how he is a Cretan, and how he has seen Odysseus, who will soon return. Eumaeus thinks both Odysseus and Telemachus are dead, but remains true to them. The night is very cold, and Odysseus borrows a cloak.

XV. (Τηλεμάχου *apds* Εὔμαιον ἄφιξις.) Telemachus in Sparta is warned by Athena of the suitors' ambush. He returns with Peisistratus to Menelaus and to Nestor. There he leaves Peisistratus and takes with him Theoclymenus, an Argive seer now in exile. He escapes the ambush and lands in Ithaca far from the city. Meantime Eumaeus, the child of a prince, taken by slavers, has told Odysseus the story of his life, and discussed how Odysseus is to go to the city safely.

XVI. (Ἀναγνωρισμὸς Ὀδυσσέως ὑπὸ Τηλεμάχου.) Telemachus arrives at the hut, and sends Eumaeus to the city to tell his mother of his safe return. Alone with Telemachus, Odysseus —retransformed by Athena— reveals himself, and they discuss the battle against the suitors. The suitors' ambush-ship returns baffled. Eumaeus comes back to the hut.

XVII. (Τηλεμάχου ἐπάνοδος εἰς Ἰθάκην.) Telemachus returns to the palace and brings Theoclymenus as a guest. He tells Penelope what he has heard from Menelaus. Theoclymenus prophesies that Odysseus is alive. Odysseus arrives, disguised as a beggar; only the old dog Argus, lying neglected on the dunghill, recognizes him and dies. Odysseus is insulted by the goatherd Melanthius. At the feast he receives food from the suitors, though Antinous throws a stool at him. He promises to speak to Penelope at nightfall.

XVIII. (Ὀδυσσέως καὶ Ἴρου πυγμή.) The suitors incite another beggar, Irus, to drive Odysseus off the threshold. Odysseus almost kills him with a blow. Penelope rebukes the suitors for their unkindness to the beggar, and makes them bring her gifts, as suitors should. The handmaid Melantho insults Odysseus and Eurymachus throws a footstool at him.

XIX. (Ὀδυσσέως καὶ Πηνελόπης ὁμιλία. *Τὰ νίπτρα.*) Odysseus, with Telemachus, removes the weapons from the Hall. Melantho girds at him but Penelope calls him to her, and tells how she made the suitors agree to wait till she should have finished her web; but now they have found her undoing it during the night, and will wait no more. Odysseus tells her he is a Cretan: he says that Odysseus —whom he describes exactly— will return this very year on the day that ends one month and begins another (*i.e.*, on the morrow). The old nurse Eurycleia washes his feet and recognizes him by a scar on the knee; but he warns her to silence. Penelope arranges that she will agree to wed the suitor who can bend Odysseus' bow and shoot through the sockets of twelve axe-heads.

XX. (*Th πρὸ τῆς μνηστηροφονίας.*) Odysseus lies sleepless, listening to the weeping of Penelope, till Athena comforts him. The palace is prepared for the feast of Apollo and the new moon (the winter solstice at the end of the 19th year). The suitors conspire in the agora against Telemachus, but are deterred by bad omens, and return to feast. One throns a cow's foot at Odysseus. Theoclymenus the seer feels that there is sudden darkness on the hall, and blood and a sound of weeping. and ghosts hurrying toward the darkness. The suitors mock him, but he goes from them.

XXI. (Τόξου θέσις.) Penelope brings out Odysseus' old bow, and proposes the trial to the suitors. Eumaeus and the cowherd Philoetius weep at the thought of their master. First Leiodes the bard tries the bow in vain; then many others. Antinous bids the goatherd grease and warm it. Meantime Odysseus outside reveals himself to the swineherd and cowherd. Eurymachus tries the bou. Xntinous puts off further trial till after the feast. Then Odysseus begs to be alloned to try; the suitors refuse. but Penelope insists. Eumaeus gives him the bow; Eurycleia shuts the postern and Philoetius the other door of the hall Odysseus bends the bow and shoots straight through the holes in twelve axeheads. Telemachus, fully armed, leaps up beside him on the threshold.

XXII. (Μνηστηροφονία.) "Now for another target that none has ever struck!" He shoots Antinous through the throat, then Eurymachus. then others till he has no arrows left. Telemachus has brought spears and armour for four; and Odysseus. Telemachus, Eumaeus and Philoetius arm. Meantime the suitors have sent the goatherd, Melanthius. to bring arms for them; he has brought twelve sets. when the other herds catch him and tie him to a post. There is a great fight aith spears, while Athena watches in the shape of a swallow, and all the suitors are slain except the bard and the herald, who were innocent. Odysseus has the corpses removed, twelve guilty bondmaids hanged, and Melanthius mutilated and slain. Then he burns sulfur and purifies the hall.

XXIII. (Ὀδυσσέως ὑπὸ Πηνελόπης ἀναγνωρισμός.) Penelope is awakened from sleep by Eurycleia nith the news. She comes down to the hall. sees what has been done, but she cannot believe: "her eyes stay like horn or iron." Odysseus, much hurt, makes the men and the faithful handmaids dance and make merry. so that the slaying may not be known outside. When he comes back to Penelope she tests him by ordering that his bed be brought outside the chamber. "Now who has moved my bed. ahich I built on a stump of olive?" At that she knows him, and throws herself in tears into his arms. "Forgive me. All these years I have schooled myself not to be deceived by some stranger who should pretend to be you!" So they were rejoined, and came again to their ancient marriage-bed. Through the long night they lay and Odysseus told his story. In the morning he set off aith his son and the herdsmen to see his father Laertes.

XXIV. (Νέκυια δευτέρα. Σπονδαί.) The souls of the suitors, guided by Hermes to the shades, meet Agamemnon and Achilles, and tell their story. Odysseus meantime finds Laertes working in his orchard. in much poverty, and reveals himself. In the city the news of the slaying is known, and the kindred of the suitors come out to Laertes' farm for vengeance led by Eupeithes, father of Antinous. A battle begins and Laertes slays Eupeithes, but Athena stops the strife and makes an oath of peace between Odysseus and his enemies. (G. G. A. M.)

HOME RULE (MUNICIPAL). The major aim of municipal home rule in the United States is to enable cities to govern themselves without interference from state legislatures. The desirability of encouraging local authorities to assume responsibility for local governmental services has been recognized in most countries which follow the Anglo-Saxon governmental tradition and in a number of others, such as Germany and Switzerland. This was the prevailing view in the United States immediately after the Revolution.

During the 19th century, however. the legislatures, under one pretext or another, gradually extended their control over local affairs. The means used were usually either special acts granting or changing the charters for individual cities or general incorporation acts for classes of cities. Laws were even passed to change the names of municipalities, grant public-utility franchises and fix the pay of local employees.

This legislative control of cities was bad both for the cities and for the legislatures. It tended to sap the initiative and responsibility of local officials, to promote governmental extravagance and to decrease public interest in local government. Furthermore, the volume of local legislation was sometimes so great that it required much of the legislators' time, thus preventing adequate consideration of major issues of state policy.

As urban centres grew in importance, they became increasingly restive of legislative interference. Municipalities were generally underrepresented in the legislatures because of failure to redistrict after each census or of unwillingness to take account of the faster growth of cities. As a result urban centres had a proportionately decreasing voice in the legislatures that controlled them. It was natural that local officials should seek some means of redressing this political balance.

Beginning with Missouri in 1875, more than half the states by the second half of the 20th century had adopted constitutional provisions conferring some poaer of self-government on their cities; *i.e.*, giving them home rule. These clauses vary greatly. Some are very general, giving cities broad powers "to determine their local affairs and government" (Wisconsin, 1924). Others provide an enumeration of the powers cities may enjoy (Colorado, 1901). Some merely withdraw constitutional objections to a grant of home rule by the legislature (Utah, 1932), while others are so specific that they can be put into effect uithout further legislation (Oklahoma, 1907). Oregon in 1906 extended home rule to "every city or town." but many states limit it to cities of a certain size or even to a single city. A few states extended home rule to counties and townships, but usually not to special-purpose governmental units such as school or park districts.

The heart of any home-rule article is the power it gives to the cities. These grants of power do not interpret themselves. In practice the state supreme court must decide it any specific matter is one of local concern or if the state's interest is paramount. Because the supreme courts are state organs, they often tip the scales against local autonomy. To prevent this some states specify in detail the exclusive powers given to localities, thus creating a government within a government, or local sovereignty. If the state constitution can be amended easily (*e.g.*, by an initiative petition followed by a popular vote, as in California), a narrow judicial construction of local powers can be reversed by constitutional amendment. The campaign to obtain more precise statements of local powers also sometimes modifies judicial aversion to local self-rule.

After 1945 there was a tendency to veer away from tight constitutional formulas. It was proposed, for example, that cities be authorized to exercise any powers within their boundaries that were not denied to them by the state constitution or by statutes that applied throughout the state. These proposals also commonly included prohibitions against the passing of special laws for a limited group of cities and against the imposition of financial burdens on cities; *e.g.*, legislative salary fixing for city employees. Reliance was placed on political and financial responsibility for both cities and states rather than on constitutional fences erected around each level of government. This method of obtaining local autonomy was patterned on the federal-state relationships provided in the United States constitution, in which the residual powers rest by definition with the states. The Texas supreme court, exemplifying this approach, interpreted the home-rule action of that state's constitution consistently with these proposals.

HOMESTEAD, a borough of Allegheny county, in southwestern Pennsylvania, U.S., located on the Monongahela river, across from the southeastern edge of Pittsburgh. Homestead is part of a steel-producing complex which has long included several neighbouring communities. All are in the Pittsburgh (*q.v.*) standard metropolitan statistical area (for comparative population figures see table in PENNSYLVANIA: Population).

The borough developed with the growth of Andrew Carnegie's steel empire in the last quarter of the 19th century. Part of this development was the noted Homestead strike of July 1892, which occurred in the huge steelworks. now in Munhall borough, when company guards (Pinkerton detectives) hired by Henry C. Frick, a Carnegie associate, fought a pitched battle with the strikers who controlled the town. State militiamen were sent to quell the trouble. The strike directly influenced the presidential election of 1892 and retarded the unionization of steelworkers for more than 40 years. Homestead was laid out in 1871 as Amity Homestead and was incorporated and renamed in 1880. With Braddock (*q.v.*) it was the centre of the world's most advanced steel production in the 1890s. The steel mills are now chiefly located in adjacent communities. Industries include the manufacture of heavy mill machinery, tools, cement blocks and bricks. (P. R. J.)

HOMESTEAD AND EXEMPTION LAWS, enacted mainly in the United States, were based on the belief that the public domain belonged to the people and that each head of a family was entitled to a home or farm, the possession of which should be protected against seizure for debt. This theory developed gradually for half a century after 1785. The earlier laws were intended primarily to procure revenue for the federal government, and for several years before the financial panic of 1837 they mere successful in that regard. But up to that time the main result was encouragement of sales in large blocks for the benefit of speculators. In the original 13 states with their later subdivisions of Maine, Vermont and West Virginia, and in the trans-Appalachian states of Kentucky. Tennessee and Texas, the public lands belonged to the states and were not affected by federal land policy. In the rest of the original territory, and in new areas as they were annexed, the land not already in private possession constituted the federal public domain.

By 1835 the sale of these lands had extinguished the public debt, and thereafter there grew an increasing clamour for legislation to relieve the condition of tenant farmers and hard-pressed city labourers through the adoption of a general homestead law. Labour parties in the east were the first to urge that such legislation be adopted. to relieve the eastern labour market of a surplus that nas causing distress and to give both industrial and rural toilers the chance to work on their own land. The Pre-emption act of 1841 gave some relief to actual and prospective squatters on the public domain, but the continuation of a minimum price of $1.25 an acre defeated the main purpose of the advocates of free farms. Between 1845 and 1860 various homestead bills were introduced in congress, that of 1860 being vetoed by Pres. James Buchanan. Before 1856 the support for the measure came from the states west of the Appalachians, while the opposition centred in the Atlantic seaboard states. The contest was essentially between western farmers, seeking easy expansion, and eastern landlords and industrialists, eager to preserve high rents and cheap labour. But when the eastern Republicans of 1856, in order to cement relations with western Republicans, gave up opposition to a homestead law and combined free farms with the issue of antislavery expansion, the contest became one between north and south.

Homestead **Act** of **May** 20,1862.—This act secured easy adoption because of the secession of the southern states. It provided that any citizen or alien who had declared the intention of becoming a citizen, if 21 years old or the head of a family, or if a veteran of at least 14 days' service in the armed forces of the United States during an actual war, and if he or she had never engaged in war against the United States or assisted in such a war, on payment of $10 might file claim to not more than 160 ac. of the surveyed public domain. After having "resided upon or cultivated" this land for the following five years, and if by then a citizen, the settler could receive a patent on payment of additional fees. This homestead could not be seized by any creditor to satisfy any debts previously contracted.

In the next 40 years there were numerous amendments to the law. In 1866 the bar against former Confederates was dropped, Before long there was a prohibition against separate homesteads for both husband and wife. The choice between residence or cultivation for the first five years gave way to the requirement of both residence and cultivation. Also, in time. the various states provided that homesteads should not be seized for debts contracted after the land was patented. These are known as exemption laws, and they vary widely in their protective features.

Shortcomings of the Law.—The Homestead act failed signally in its purpose of relieving labour pressure in the cities. The bulk of fertile land with abundant rainfall was already in private hands. Such tracts as remained were far removed from the congested labour market, and there was no legal provision for free transportation to the land. Nor was there any offer of sustenance or training in successful farming practices during the dreary years of making a beginning. Day labourers and tenants could not even acquire the necessary capital for investments in housing, implements, fences and livestock necessary for successful ventures. Even practised farmers usually failed on their raw homesteads, and to 1890 only one in three of the homesteaders managed to remain long enough to get deeds to their farms. Also, the Homestead act did not put an end to the granting of land in large blocks to monopolists. By 1900 fewer than 600 000 farmers received patents, totaling about 80,000 000 ac , while railroad companies alone were given 183,000,000 ac . after all reductions for failure to live up to contracts. P. W. Gates (see **Bibliography,** below) listed many other forms of land monopoly. Furthermore, the "commutation clause" of the Homestead act made petty speculators of many of the homesteaders. Six months after settlement they could buy the land at $1.25 an acre. By acting as agents for persons nanting huge estates, many of them made a neat profit without ever becoming actual homesteaders. This reduced the number of bona fide homesteaders before 1900 to probably around 400,000 and the aggregate acreage of their farms to possibly 55,000,000. In the 40 years between the passage of the Homestead act and the beginning of the 20th century, about one new farm in ten in the United States was a free homestead, while many more were purchased from speculators.

Later Homestead Laws.—Later acts were less beneficial to settlers than nas the original act of 1862. In the west only the arid and semiarid lands were left for disposal by 1900 The Kinkaid act of 1904, applying only to aestern Nebraska, allowed 640-ac. tracts, which were enough for meagre subsistence at dry farming. But the Mondell act of 1909 gave only 320 ac. in the rest of the west. This mas just enough to lure farmers to their doom, unless they acted as agents for land monopolists. The same was true of the Stock-Raising Homestead act of 1916, which granted 640 ac in a region where one cow needed from 50 to 100 ac. of pasture and 10,000 ac. were barely enough for successful livestock raising.

In Alaska the Homestead act of 1898 limited claims to 80 ac. and required homesteaders to pay for their own surveys. The limit was expanded to 320 ac. in 1903 and reduced to 160 ac. in 1906. Leasing for fur farming was authorized in 1926 and for grazing in 1927.

By the second half of the 20th century about 250,000,000 ac. had been patented under the various U.S. homestead laws, but a good share of this had been turned over at a profit to the owners of large estates. The Taylor Grazing act of 1934 helped remedy the situation by removing nearly all the remaining pasture land of the far west from homestead entry and allowing its use only under lease from the government.

Canadian Laws.—Canada provided for the acquisition of homesteads on its public lands through the Free Land Homestead act of 1872. and the provinces adopted exemption laws similar to those of the United States. Homesteads were generally a quarter section (160 ac.), which claimants were required to reside upon and cultivate or otherwise improve; homesteaders meeting the

requirements became eligible to pre-empt a second quarter section. *See* also AGRICULTURE: *Gnited States;* LAND TENURE: ECONOMIC AND AGRARIAN ASPECTS: *The Gnited States;* NEBRASKA: *Hzstory;* SMALL HOLDINGS: *United States;* UNITED STATES (OF AMERICA): *History: Struggle for National Government, 1783–1865: Slavery and the Westward Movement. HOMEYER, KARL GUSTAV (1795–1874), German jurist, born on Aug. 13, 1795 at Wolgast in Pomerania. He became professor of law (1827) at Berlin, and in 1854 a member of the council and of the upper house of the Prussian diet. He died on Oct. 20, 1874. His principal works are his edition of the *Sachsenspiegel* (in 3 vol., 1827, 3rd ed., 1861, containing also some other important sources of Saxon or Low German law), which is still unsurpassed in accuracy and sagacity of research; *Die Haus- und Hofmarken* (1870); and many papers contributed to the *Transactions* of the Berlin Academy: *Über die Heimat* (1852); *Genealogie der Handschriften des Sachsenspiegels* (1859); *Die Stadtbücher des Mittelalters* (1860); *Der Dreissigste* (1864), etc.

HOMICIDE, the general and neutral term for the killing of one human being by another. The nature of the responsibility of the slayer to the state and to the relatives of the slain has been one of the chief concerns of all systems of law from the earliest times, and it has been variously considered from the points of view of the sanctity of human life, the interests of the sovereign, the injury to the family of the slain and the moral guilt, *i.e.*, the motives and intentions of the slayer.

In England under the Norman system homicide became a plea of the crown, and the rights of the kindred to private vengeance and to compensation were gradually superseded in favour of the right of the king to forfeitures where the homicide amounted to a crime (felony). Though homicide was thus made a public offense and not a matter for private vengeance, it took long to discriminate between those forms of homicide which should and those which should not be punished. The terms in English law used to describe *criminal* homicide are murder, manslaughter and *felo de se* (or suicide by a person of sound mind).

After the Conquest, and for the protection of the ruling race, a fine (also called *murdrum)* was levied for the king on the hundred or other district in which a stranger was found dead, if the slayer was not brought to justice and the blood kin of the slain did not present Englishry, there being a presumption (in favour of the Exchequer) that the deceased was a Frenchman. After the assize of Clarendon (1166) the distinction between the killing of Normans and Englishmen gradually evaporated and the term murder came to acquire its present meaning of deliberate as distinct from secret homicide. In 1267 it was provided that the murder fine should not be levied in cases of death by "misadventure" *(per infortunium).* But at that date and for long afterwards homicide in self-defence or by misadventure or even while of unsound mind involved at the least a forfeiture of goods, and required a pardon. These pardons, and restitution of the goods, became a matter of course, and the judges appear at a later date to have been in the habit of directing an acquittal in such cases. But it was not until 1828 that the innocence of excusable homicide was expressly declared. The rule is now expressed in s 7 of the Offences against the Person Act 1861: "No punishment or forfeiture shall be incurred by any person who shall kill another by misfortune, or in his own defence, or in any other manner without felony."

The further differentiation between different degrees of criminal homicide was marked by legislation of Henry VIII. (1531) taking away benefit of clergy in the case of "wilful murder with malice prepensed" (aforethought). That phrase is still the essential element in the definition of "wilful murder," which is committed "when a person of sound memory and discretion unlawfully killeth any reasonable creature in being and under the king's peace with malice aforethought either express or implied" (3 Co. Inst. 47), and the penalty is death (Offences Against the Person Act 1861, s. 1). Attempted murder is a felony and the penalty penal servitude for life. In the case of conspiracy and incitement to murder, a misdemeanour, the penalty is penal servitude for ten years. The whole development of the substantive law as to murder rests on judicial rulings as to the meaning of malice prepense coupled with the extrajudicial commentaries of Coke, Hale and Foster; for parliament, though often tempted by bills and codes, has never ventured on a legislative definition.

The expression "malice prepense" or "aforethought" has given rise to much discussion, especially when used to include so-called "constructive" murder. It implies an intent preceding the act intended. Express malice is the positive possession of an intention, and implied malice the possession of an intention shown by the acts of the accused. And so malice is implied where knowledge exists that the act is likely to kill or do grievous bodily harm to any person; where a police officer is resisted in the execution of his duty; where a felony is attempted or committed and death results, certainly if death were likely to result.

As in the case of other crime, infancy and insanity are excuses for homicide. A child under seven years of age is absolutely presumed to be *doli incapax,* and between seven and 14 there is a presumption but it may be rebutted. Now by the Children Act 1908 a sentence of death may not be pronounced or recorded against a child under 16. A person who satisfies the rules in *McNaghten's Case* (10 Cl. and F. 200) must be found guilty but insane. Drunkenness which produces insanity may be an excuse within *McNaghten's Case,* but drunkenness which falls short of this is no excuse, as in *Beard's Case* (26 Cox, C.C. 573) where the accused, under the influence of drink, while ravishing a girl inadvertently suffocated her. That was held to be murder. Again, in cases of homicide, the death must occur within a year and a day after the act of the accused.

Justification and Excuse.—English law still retains so much of its mediaeval character as to presume all homicide to be "malicious, and therefore murder, unless it is either *justified* by the command or permission of the law, *excused* on the ground of accident or self-preservation, or alleviated into manslaughter by being the involuntary consequence of some act not strictly lawful or occasioned by some sudden and sufficiently violent provocation." The truth of the facts alleged in justification, excuse or alleviation is for the jury to determine: the question whether, if true, they support the plea for which they are put forward, is for the court.

In the administration of the English criminal law as to homicide the consequences of too strict an adherence to the technical definitions of the offences are avoided (a) by the exercise by the jury of their powers to convict of manslaughter only even in cases where they are directed that the offence is murder or nothing; *(b)* by the report of the judge as to the particular circumstances of each case in which a conviction of murder has been followed by the statutory sentence of death; *(c)* by the examination of all the evidence in the case by the Home Office in order to enable the secretary of State to determine whether the prerogative of mercy should be exercised.

Homicide is *justifiable* and not criminal when the killing is done in the execution of the law. The most important case of justifiable homicide is the execution of a criminal in due course of public justice. This condition is most stringently interpreted. The execution must be carried out by the proper officer or his deputy: any person executing the sentence without such authority, were it the judge himself, would be guilty of murder. And the sentence must be strictly pursued: to execute a criminal by a kind of death other than that to which he has been judicially condemned is murder.

Homicide committed by an officer of justice in the course of carrying out his duty, as such, is also justifiable; *e.g.,* where a felon resists a legal arrest and is killed in the effort to arrest him;

where officers in dispersing a riotous assemblage kill any of the mob, if the riot cannot be otherwise suppressed. In these cases the homicide must be shown to have been absolutely necessary. Again, homicide is justifiable if committed in the defence of person or property against forcible and heinous crime, such as murder, violent robbery, rape or burglary.

Homicide is *excusable* and not criminal at all when committed either by misadventure or in self-defence. In the former case the homicide is excused; where a man in the course of doing some lawful work, accidentally and without intention kills another, *e.g.*, shooting at a mark and undesignedly hitting and killing a man. The act must be strictly lawful, and death by misadventure in unlawful sports is not a case of excusable homicide. Homicide in self-defence is excusable when the slayer is himself in immediate danger of death, and has done all he could to avoid the assault. Accordingly, if he strikes and kills his assailant after the assault is over, this is not excusable homicide. But if the assault has been premeditated, as in the case of a duel, the death of either antagonist has under English law always been held to be murder and not excusable homicide. The excuse of self-defence covers the case in which a person in defence of others whom it is his duty to protect—children, wife, master, etc.—kills an assailant (*see* s. 7 of the Offences against the Person Act 1861 supra).

Manslaughter.— In English law the term "manslaughter" is applied to those forms of homicide which though neither justifiable nor excusable are attended by alleviating circumstances which bring them short of wilful murder. The offence is not defined by statute, but only by judicial rulings, and may be described as unlawful and felonious killing without malice express or implied. Its punishment is as a maximum penal servitude for life, and as a minimum a fine or recognizances to be of good behaviour. The quantum of punishment between the limits above stated is in the discretion of the court, and not, as under Continental codes, with fixed minima; and the offence includes acts and omissions of very varying gravity, from acts which only by the charitable appreciation of a jury fall short of wilful murder, to acts or omissions which can only technically be described as criminal.

There are two main forms of "manslaughter":—

1. "Voluntary" homicide under grave and sudden provocation or on a sudden quarrel in the heat of passion, without the slayer taking undue advantage or acting in an unusual manner. The substance of the alleviation of guilt lies in the absence of time for cool reflection or the formation of a premeditated design to kill. Under English law the provocation must be by acts and not by words or gestures, and must be serious and not trivial, and the killing must be immediately after provocation and while the slayer has lost his self-control in consequence of the provocation. The provocation need not be by assault or violence, and perhaps the best-recognized example is the slaying by a husband of a man found committing adultery with the slayer's wife.

2. "Involuntary" homicide as a result of rashness or negligence in respect of matters involving danger to human life, *e.g.*, in driving trains or vehicles, or in dealing with dangerous weapons, or in performing surgical operations, or in taking care of the helpless.

The whole question of criminal responsibility for negligence was considered by the court of criminal appeal in 1925 in *Rex.* v. *Bateman* (28 Cox C.C. 33) and it was there laid down that it was not a question of epithets, but that "in order to establish criminal liability the facts must be such that, in the opinion of the jury, the negligence of the accused went beyond a mere matter of compensation between subjects and showed such a disregard for the life and the safety of others as to amount to a crime against the State and conduct deserving punishment." In the criminal courts the amount and degree of negligence is the determining question, and there must be *mens rea.*

From the point of view of civil as distinct from criminal responsibility homicide does not by the common law give any cause of action against the person causing the death of another in favour of the wife or blood relations of the deceased. In early law this was otherwise; and the mer of the deceased came historically before the right of chief or State. But under English law the rights of relations, except by way of appeal for felony, were swept aside in favour of the Crown, on the principle that every homicide is presumed felonious (murder) unless the contrary is proved, and that in all cases of homicide not justifiable by law a forfeiture was incurred. Trial by battle or appeal for felony was abolished in 1819 by 59 Geo. III., C. 46 in consequence of the case of *Ashford* v. *Thornton* (1 B. and Ald. 405) where the right was successfully maintained. The rights of the relatives were also defeated by application of the maxim *"actio personalis moritur cum persona"* ("a personal action dies with the person") to all proceedings for injury to the person or to reputation.

In England the law was altered at the instance of Lord Campbell in 1846 (9 and 10 V. c. 93) so as to give a right of a claim by the husband, wife, parent or child of a person killed by a wrongful (or even criminal) act, neglect or default by another which would have given the deceased if he had survived a cause of action against the wrongdoer. The compensation payable is what the surviving relative has lost by the death, and under the Workmen's Compensation Acts (in all cases to which they apply) the employer is liable even without negligence to compensate the dependants of an employee killed by an accident arising out of and in the course of the employment; and in such cases even if the death was due to serious and wilful misconduct by the employee, compensation is payable.

In the Indian penal code the definitions of murder are so drawn as to limit the offences to cases where it was actually intended to cause death or bodily injury by the acts or omissions of the slayer, and the definition of culpable homicide short of murder is so drawn as to exclude the forms of unintentional manslaughter due to neglect of duty.

In European codes distinctions corresponding to those of the English law are drawn between premeditated and other forms of criminal homicide; but more elaborate distinctions are drawn between the degrees of deliberation or criminality manifested in the slaying, and the minimum or maximum penalty is varied accordingly.

The most notable difference between England and the United States in regard to the law on this subject is the recognition by State legislation of degrees in murder. English law treats all unlawful killing not reducible to manslaughter as of the same degree of guilt in law. American statutes seek to discriminate for purposes of punishment between the graver and the less culpable forms of murder. *See* CAPITAL PUNISHMENT; CRIMINAL LAW; MURDER; MANSLAUGHTER; FELO DE SE.

HOMILETICS, in theology the application of the general principles of rhetoric to the specific department of public preaching (Gr. ὁμιλητικός, from ὁμιλεῖν, to assemble together). It may be further defined as the science that treats of the analysis, classification, preparation, composition and delivery of sermons. (*See* HOMILY; PREACHING.)

BIBLIOGRAPHY.—The older literature is cited in W. G. Blaikie, *For the Work of the Ministry* (1873); and D. P. Kidder, *Treatise on Homiletics* (1864). *See* also *A. E.* Garvie, *The Christian Preacher* (1920); the published lectures delivered at Yale university on the Lyman Beecher foundation; Hastings' E.R.E., *s.v.* "Preaching."

HOMILY, a simple religious address confining itself principally to the practical exposition of some ethical topic or some passage of Scripture. The Greek word ὁμιλία, from which homily is derived, means communion, intercourse and especially interchange of thought and feeling by means of words (conversation); it was early employed in classical Greek to denote the instruction which a philosopher gave to his pupils in familiar talk (Xenophon, Mem. I. ii. 6, 15). This usage of the word was long preserved (Aelian, *Varia Hist.* iii. 19); and the ὁμιλήσας of Acts xx. 11 may suggest a didactic character in the apostle Paul's discourse in the upper chamber of Troas, when "he talked a long while, even till break of day." The custom of delivering expositions or commerits more or less extemporaneous on the lessons of the day had become a regular part of the service of the Jewish synagogue; and this custom passed over soon and readily into the Christian Church, as may be gathered from the first *Apology* (lxvii.) of Justin Martyr, where we read that, in connection with the practice of rending portions from the collected writings of the prophets and from the memoirs of the apostles, it had by that tirie become

usual for the president (b προεστώς) to deliver a discourse in which "he verbally instructs and exhorts us to the imitation of these excellent things." This discourse was later regarded as a part of the regular duty of the bishop, but he could devolve it, if he thought fit, on a presbyter or deacon, or even on a layman. An early and well-known instance of such delegation is that mentioned by Eusebius (*Hist. Eccl.* vi. 19) in the case of Origen (A.D. 216). In course of time the exposition of the lesson for the day came more frequently to assume a more elaborate character; but when it did so the fact was as far as possible denoted by a change of name, the word ὁμιλία being reserved for the expository or exegetical lecture as distinguished from the pulpit oration or sermon. While the church of the 3rd and 4th centuries could point to a brilliant succession of great preachers, whose discourses were wont to be taken down in shorthand and circulated among the Christian public as edifying reading, it does not appear that the supply of ordinary homiletical talent kept pace with the rapidity of church extension throughout the Roman empire. In the smaller and remoter communities it not uncommonly happened that the minister was totally unqualified to undertake the work of preaching; and though, as is curiously shown by the case of Rome (Sozomen, *Hist. Eccl.* vii. 19), the regular exposition of the appointed lessons was by no means regarded as part of the necessary business of a church, it was generally felt to be advisable that some provision should be made for the public instruction of congregations. Even in Jerome's time (*De Vir. Ill. c.* 115), accordingly, it had become usual to read, in the regular meetings of the churches which were not so fortunate as to possess a competent preacher, the written discourses of celebrated fathers; and at a considerably later period we have on record the canon of at least one provincial council (that of Vaux, probably the third, held in A.D. 529), positively enjoining that if the presbyter through any infirmity is unable himself to preach, "homilies of the holy fathers" (*homiliae sanctorum patrum*) are to be read by the deacons. Thus the finally fixed meaning of the word homily as an ecclesiastical term came to be a written discourse (generally possessing the sanction of some great name) read in church by or for the officiating clergyman when from any cause he was unable to deliver a sermon of his own. As the standard of clerical education sank during the dark ages, the habit of using the sermons of others became almost universal. Among the authors whose works were found specially serviceable in this way may be mentioned the Venerable Bede, who is credited with no fewer than 140 homilies in the Basel and Cologne editions of his works, and who certainly was the author of many *Homiliae* de *Tempore* which were much in vogue during the 8th and following centuries. Prior to Charlemagne it is probable that several other collections of homilies had obtained considerable popularity, but in the time of that emperor these had suffered so many mutilations and corruptions that an authoritative revision was felt to be imperatively necessary. The result was the well-known *Homiliarium,* prepared by Paul Warnefrid, otherwise known as Paulus Diaconus (*q.v.*). It consists of 176 homilies arranged in order for all the Sundays and festivals of the ecclesiastical year; and probably was completed before the year 780. Though written in Latin, its discourses were doubtless intended to be delivered in the vulgar tongue; the clergy, however, were often too indolent or too ignorant for this, although by more than one provincial council they were enjoined to exert themselves so that they might be able to do so. Hence an important form of literary activity came to be the translation of the homilies approved by the church into the vernacular. Thus we find Alfred the Great translating the homilies of Bede; and in a similar manner arose Aelfric's Anglo-Saxon *Homilies* and the German *Homiliarium* of Ottfried of Weissenburg. Such *Homiliaria* as were in use in England down to the end of the 11th century were at the time of the Reformation eagerly sought for and destroyed, so that they are now extremely rare, and the few copies which have been preserved are generally in a mutilated or imperfect form.

The books of *Homilies* referred to in the xxxvth Article of the Church of England originated at a convocation in 1542, at which it was agreed to make certain homilies "for stay of such errors as were then by ignorant preachers sparkled among the people." After some delay a volume was published in 1547 called *Certain Sermons, or Homilies, appoynted by the Kynges Maiestie to be declared and redde, by all Parsones, Vicars, or Curates, euery Sōday in their Churches, where thei haue cures.* A second book of *Homilies* was issued in 1563, called *The Seconde Tome of Homelyes, of such matters as were promysed and Instituted in the former part of Homelyes, set out by the aucthoritye of the Quenes Maiestie: And to be read in eurey paryshe Churche agreablye.* Of the 12 homilies in the first book, Nos. 1 and 3–5 are by Cranmer, No. 6 by Bonner, No. 2 by Nicholas Harpsfield, No. 11 by Thomas Becon. The authorship of the rest is uncertain: 8 and 9 may be by Ridley and 12 by Latimer. Of the original 20 in the second book, Nos. 1–3, 7–9, 15, 16, 19 are probably by Jewel; No. 4 by Grindal; Nos. 5, 6 by Pilkington; others are derived from other sources; *e.g.,* 10 from Erasmus' *Paraclesis,* etc.; 14 from Tavernier's *Epistles,* etc. No. 21 was added by convocation in 1571. The two books were combined in *Certain Sermons or Homilies appointed to be read in Churches* (London, *1623). See* J. Griffiths, *The two books of Homilies* (Oxford, 1859); J. T. Tomlinson, *Prayer Book, Articles and Homilies* (London, 1897).

HOMMA, MASAHARU (1888?–1946), Japanese army officer. was born in Niigata prefecture. Honshu. He was convicted after World War II of permitting atrocities against prisoners under his command.

During World War I he was an observer with the British forces in France, and in 1921 he served as Japanese resident officer in India. In 1930 Homma was appointed military attaché in London, where he was decorated with the military cross of the British empire. In 1939 he commanded Japanese forces at Tientsin. China, when the Japanese army blockaded the foreign concession there.

In Dec. 1941, a few days after the Japanese air attack on Pearl Harbor. Homma, then a lieutenant general, led the Japanese invasion of the Philippine Islands. Although it was commonly supposed that Homma had been superseded by Gen. Tomoyuki Yamashita after the campaign had bogged down at Bataan and Corregidor, subsequent evidence suggested that Homma held the supreme command throughout the campaign. He also directed "mopping up" actions against stray U.S. and Filipino forces in the Visayas and Mindanao areas.

Homma, who arrived in Tokyo to surrender to U.S. forces on Sept. 14. 1945, was brought to trial in December. He was formally charged with having been responsible for the "death march" on Bataan, which occurred shortly after the Japanese conquest. It was estimated that more than 17,000 Filipino and U.S. troops died during the forced march. The trial opened in Manila. Jan. 3. 1946. with a military commission presiding. Convicted Feb. 11 for ordering the death march and for condoning other atrocities, Homma was sentenced to be shot. An appeal to the U.S. supreme court was rejected, and Homma was executed by a firing squad at Los Banos. Luzon. on April 3, 1946.

HOMOEOPATHY. A system of therapeutics based upon the law *similia similibus curantur,* which was introduced in 1796 by Samuel Hahnemann (*q.v.*), a native of Meissen, Ger. Some points of Hahnemann's system were borrowed from previous writers, *e.g.,* Hippocrates and especially Paracelsus (c. 1490–1541). The words *similia similibus curantur* occur in the Geneva edition (1658) of the works of Paracelsus, as a marginal heading of one of the paragraphs. The essential tenets of homoeopathy are that the cure of disease is effected by drugs that are capable of producing in a healthy individual symptoms similar to those of the disease to be treated, and that to ascertain the curative virtues of any drug it must be "proved" upon healthy persons — that is, taken by individuals of both sexes in a state of health in gradually increasing doses.

Another peculiar feature of homoeopathy is its theory of dose. Most homoeopathists believe in the action of minute doses of medicine. Many employ low potencies; *i.e.,* mother tinctures, first. second, sixth dilutions, etc.. while others use hundred-thousandths and millionths. However, the American Institute of Homoeopathy of the United States adopted the following resolution and ordered it to be published conspicuously in each number

of the *Transactions* of the society: "A homoeopathic physician is one who adds to his knowledge of medicine a special knowledge of homoeopathic therapeutics. All that pertains to the great field of medical learning is his by tradition. by inheritance, by right."

In the medical profession homoeopathy at mid-20th century remained under the stigma of being a dissenting sect. In the United States it was disappearing; there mere comparatively few practitioners and no medical schools emphasizing this approach to therapeutics. There was still an "official" homoeopathic compendium in the United States but it was 'official" only by virtue of its being included in the compendiums recognized in the federal Food. Drug and Cosmetic act. (A. E. SH.)

HOMOLOGY, in biology. is the similarity of structure, physiology. development and evolution of organisms based upon common genetic factors (see EVOLUTION. ORGANIC; GENETICS: VARIATION). It is contrasted with analogy. which is a similarity of function not based upon common genetic factors, but appearing independently in convergent evolution. Biological analogy should not be confused with chance resemblances.

Richard Owen (1804–92) is given the credit for defining both homology and analogy in precise terms. Confusion between the two is the largest source of error in modern systematic biology. Homologues and analogues may be present in the same structures or processes. The. two can only be separated by considering the relations of whole patterns and systemic units and discovering. comparing and statistically analyzing each similarity and difference.

Genetic Homology. — The complicated gene structure. consisting of large molecules bonded together in a pair of chains, can be modified (undergo a mutation). Homology is based upon the postulated identity both of units within the molecules in the chain and the linear arrangements of the molecular units in the larger chain. Parallel and independent identical mutations may take place within the same or different species, but the mathematical probabilities of independent origin of complex genetic patterns are slight.

Ontogenetic Homology. — Genetic factors determine the nature and sequence of many events beginning with the earliest stages of embryonic development and continuing throughout life. So there are homologues in the life histories of genetically related individuals. Special subcategories of homology are set up to cover cases where similar structures appear in the same individual (each of the arms of a starfish or the legs on each segment of a lobster), or in different individuals in a genetically related population (sexual homologues or castes of social insects).

Phylogenetic **Homology.**—Homologues in different species are theoretically inherited from a common ancestry and are presumably initiated by identical genes or gene parts. The number and complexity of such homologues indicate the degree of relationship between phylogenetic groups. Hence homologues are the foundation for "natural systems" of classification and form the basis for evolutionary theory and interpretation.

Because of gross evolutionary changes and analogous functions, homologues are not always apparent to the casual observer, particularly in cases involving vestigial organs and extreme adaptations. For example, dog's paws, bat's wings, whale's flippers and man's hands have many homologues in common. Study of embryonic development is often helpful in establishing obscure homologies in relatively unrelated branches of the evolutionary tree.

HOMOPHONY, a musical term signifying literally "like voices." that is. voices or instruments in unison, but which in practice has come to signify music with one outstanding part, to which the other parts are subordinate, as opposed to polyphonic music, composed of a number of parts of more or'less equal importance.

HOMOSEXUALITY, also called SEXUAL INVERSION, is usually defined as the sexual attraction of a person to one of the same sex (from Gr. *homo-,* "same"; not from Lat. *homo,* "human being," "man"). This usually, but not necessarily always, leads to various physical activities culminating in orgasm or sexual climax. Female homosexuality is often referred to as lesbianism (*q.v.*). The term pederasty implies sexual relations between men and boys.

Contrary to the popular belief, homosexual behaviour can be seen not only in human beings but also in animals, sometimes in immature ones, but more often in those deprived of a normal sexual outlet. It is believed that conditioning may have a great deal to do with such behaviour, although much arises spontaneously.

Apes appear to pass through a stage of undefined sexual activity, and S. Zuckermann noticed mutual masturbatory activities which in humans would be regarded as overt homosexuality. R. M. and A. Yerkes state that heterosexual, homosexual, exhibitionistic and masturbatory activities occur in immature animals. Sodomy in apes has been noted.

Many human societies disapprove of homosexuality, but some. for example the ancient Greeks, accepted it as normal. C. S. Ford and F. A. Beach, who studied primitive societies, state that 49 out of 76 (*i.e.,* 64%) accepted homosexuality as being normal. In some of these, persons were allowed to wear clothes of the opposite sex and to form homosexual unions which were accepted as "marriages." In some cases this was related to shamanism, and the homosexual was considered as having magical powers. In other societies (the Siwans of North Africa, the Arunta or Aranda of Australia, the Keraki of New Guinea, etc.) men and boys indulge in anal intercourse. Homosexuality is then common and even universal. Sometimes it is related to initiatory rites.

Such behaviour in primitive societies occurs among females as well as among males and is usually confined to mutual masturbation, but an artificial phallus may be employed. It is probably not so common among females as males.

Lest it be thought that homosexuality appears in such preliterate societies because it is permitted, it must be pointed out that even in those where it is harshly repressed it still makes its appearance; the death penalty itself has failed to stamp it out.

Theories of Causation. — There appear to be four possibilities in the causation of homosexuality in human beings: (1) a genetic aberration; (2) an endocrine disorder; (3) a psychological condition; or (4) a mixture of two or more of these.

The view that homosexuality is a genetic aberration is frequently advanced. The homosexual often says that he was born like it and has been so as long as he can remember. Such genetically produced intersexuality (that is, male homosexuals regarded as more or less feminized males or as real male intergrades which are genetically female) has been worked out extensively. Thus in insects (butterflies, for example). it is possible to demonstrate series with males and females at the extremities, but with a very gradual transition between. Physical intersexuals can be found in practically all animals, and the condition is often due to disease of the adrenal glands. The possibility that the homosexual is a psychical manifestation of such a condition at once suggests itself. Unfortunately for those who hold this view, its application to human beings has not been confirmed. No one has ever been able to prove that it occurs, and homosexuals certainly do not show any physical signs of the concomitants which might be expected.

An endocrine causation has always seemed a likely one, but here again unfortunately there is no proof. Most homosexuals show no evidence of glandular disease. Castration does not cause the condition, nor does the injection of female hormones into the male (or vice versa) do so. In some cases the injection of male hormones in a male has increased his homosexuality (by increasing the sexual urge). The excretion of hormones in homosexuals is usually normal.

No discernible difference between the physique of the homosexual and that of the heterosexual has been shown by any recorded tests, microscopical, macroscopical, biochemical or endocrine.

There remains the psychological causation. A view is often advanced that homosexuality is pure degeneracy. This is used as a vehicle of abuse but has little scientific meaning. It has been suggested, for example, that the ancient Romans became degenerate and lost their world dominance through perverted sex, or alternatively that homosexuality was a symptom of their degeneration; but it is now thought that any deterioration in the Romans that cannot be explained by political or economic causes is better attributed to malaria than to perversion. Since homosexuality appears to be determined before puberty, the hypothetical degeneracy mould have to have set in very early, and usually no other evidence can be found either of physical or of intellectual degeneracy in homosexuals. In fact, some of them are fine creative artists and almost all are physically normal.

It is probable that sexual inversion goes much deeper than degeneracy and is related to development, This is suggested because it rarely appears by itself and is frequently associated with other paraphilias (*i.e.*, abnormal immature ways of obtaining sexual pleasure). Moreover, sexuality in the human being is not clear-cut but shades off. Thus A. C. Kinsey found that 35.5% of all individuals in a series of 1,058 males had had one or more homosexual experiences. He thought that between one-quarter and one-third of all males in any middle age group had had some homosexual experience and that in the course of a lifetime 50% would be involved in this behaviour. These statistics belong to the United States, and there are no comparable ones for Europe, but it is believed that a somewhat similar result could be obtained there.

It is generally accepted by psychologists that men who in normal circumstances will behave heterosexually and enjoy a normal life with women may become inverted if deprived of female company (in prison, in prison camps. in warfare, at sea and so on). The percentage of cases in which this occurs is not known.

The idea of psychological causation mas first developed by Sigmund Freud. who put forward the view that homosexuality was due to aberrations of the emotional development. He thought that the main factor was an overattachment of the boy to his mother and hostility to his father, which would result in his molding his personality too much on his mother and so acquiring too many feminine reactions and thus tending to behave as a woman. Freud's view is upheld by the fact that a large number of inverts give a history of an unhappy home in which the father has been unsatisfactory or else died when the patient was young (and so had not been available to shape his personality). Other views of Freud's regarding the development of the libido, or sexual interest, from oral through anal to phallic stages explain the behaviour of inverts u-ho indulge in oral and anal perversions. They explain, also, the association of homosexuality with other sexual abnormalities such as bisexuality, transvestitism (or the wish to dress as a member of the opposite sex) and transsexuality (the desire to change sex). Bisexuality is usually considered to be undeveloped sexuality, with the patient fixated between heterosexual and homosexual stages; transvestitism as somewhat similar but limited to an identification with the mother only as far as clothes are concerned; and transsexuality as a wish to be as like her sexually as possible. Unconscious fear of castration also plays a part.

Social Aspects.—Although medically inversion must be considered an illness, there is doubt that, particularly in large towns and cities, it becomes exploited as a vice. Thus homosexual prostitutes exist and maintain *souteneurs* much as in heterosexual prostitution. These exploit the less sophisticated and frequently blackmail them. This explains the fact that homosexuals sometimes sink down in the social scale as suggested by G. W. Henry and A. A. Gross.

Not all male homosexuals are of the outwardly effeminate type, and some can be dangerously violent. Crimes of jealousy, sometimes leading to murder, are caused by this abnormality. But other homosexuals have made valuable contributions to society, notably in the field of the arts, though it is improbable that it is the sole or even the main cause of genius, as some homosexuals assert. Freud suggested that inversion is the cause of paranoid insanity (in which the patient suffers from delusions of persecution).

A certain number of homosexuals are curable by psychological treatment, a fact which invalidates the view of its causation by genetic or glandular aberrations. Treatable cases are those who suffer from excessive timidity with members of the opposite sex or who have painful symptoms. Excessively feminine men are not suitable for psychological treatment.

Legal Aspects.—The code of laws discovered at Bogazkoy indicates that homosexuality may not have been universally forbidden among the Hittites. but only between father and son. Middle-Assyrian lams of the time of Tiglath-pileser I (12th–11th century B.C.), however, punished it by castration. There is some doubt about the attitude to the homosexual temple prostitute, or kadcsh, in the earliest period of Judaism, but by the time of the composition of the "Holiness code" any form of homosexuality was sternly forbidden among the Jews (Lev. xviii. xx); such practices were regarded as pagan, the way of the Chaldean, of the Canaanite or of the Egyptian, a form of idolatry. This Jewish prohibition was introduced into Christianity by St. Paul. The story of Sodom and Gomorrah, according to D. S. Bailey, has throughout the ages coloured the attitude of the church more and more. The institution of ecclesiastical courts made it possible to enforce laws based on it, and these were finally absorbed into English civil law. The medieval penalties were severe: ancient laws state that sodomists, for example, should be buried alive, burned alive or merely "put to death." Sodomy. hen-ever, was regarded as a sin and tried by the church until an act uas passed in the reign of Henry VIII. The death penalty remained until two acts passed in the 19th century (see below).

English Law in the *20th* Century.—Homosexuality provides three offenses against English law: (1) sodomy; (2) gross indecency between male persons; and (3) indecent assault.

Sodomy (*i.e.*, anal intercourse) is punishable under the Offences Against the Person act, 1861, s. 61 and 62, and also under the Criminal Law Amendment act, 1885, s. 11. Under the Offences Against the Person act the sex of the passive partner is immaterial since the behaviour is defined as against mankind (*i.e.*, any human being), and men have been indicted for offenses against women. These offenses are triable at the assizes, and the maximum penalty is imprisonment for life. The passive party, if consenting and over 16 years old, is also guilty.

Gross indecency between male persons is a misdemeanour under s. 11 of the Criminal Law Amendment act, 1885, and is defined as "an act of grossly indecent nature between male persons." This is usually mutual masturbation, either manual or intercrural, between two males. In the case of boys consent does not legitimize the offense. nor does the fact that puberty has been passed (as in offenses against girls over 16 years old). If over 16, the consenting party becomes equally guilty. Oral as well as masturbatory practices are covered by the act. When practised by those kt loco *parentis* the offense is regarded as aggravated. The influence of alcohol cannot be pleaded in mitigation. Gross indecency between male persons is a misdemeanour and, provided that a qualified chairman is present, may be tried at quarter sessions and is punishable with tno years' imprisonment.

S. 62 of the Offences Against the Person act, 1861, prescribes a punishment not exceeding ten years' servitude for any indecent assault upon a male person. The offense is not defined, but to constitute it there must be (1) an assault and (2) circumstances of indecency. Assault means not that violence must have been committed but that consent was not given for whatever took place. This is usually touching, undoing clothing and so on.

Statistics appear to show that homosexual offenses were increasing in the 1950s, but how much this was a real increase and how much caused by an increase in police prosecutions it is impossible to say. The report of the Departmental Committee on Homosexual Offences and Prostitution (the "Wolfenden report"; Sept. 1957) made various recommendations the chief of which were that homosexual behaviour between consenting adults in private should no longer be a criminal offense, that buggery (anal intercourse) should be reclassified as a misdemeanour and that, except for some grave reason, proceedings should not be instituted in respect of homosexual offenses incidentally revealed in investigating allega-

tions of blackmail. See also LESBIANISM; SEXUAL DEVIATIONS.

HOMS (AL KHUMS), a town of Libya, Africa, lies on the Mediterranean coast at the foot of the northern spurs of the Jabal Nafusah. Pop. of Homs district (1954 census) 30,089, almost all Arabs. The seat of a prefecture, Homs has straight streets and well-kept public gardens. There are many Turkish buildings, mosques, a Roman Catholic church, schools and a modern hotel. Near the town is the military area, occupied in the mid-20th century by British troops. Local industries comprise the Sidi Muftah tunny-fish enterprise, a soap factory and the esparto paper factory. The district produces dates and olive oil, and the good sea fishing is well exploited.

The town of Homs was founded by the Turks and gained importance about 1870 when the British started the esparto industry there. In the environs are the ruins of several Italian forts from World War I. Less than 2 mi. to the east is the ancient city of Leptis Magna (Labdah), with its extensive Roman remains. *See* LEPTIS. (E. V. CI.)

HONAN (HO-NAN SHENG), one of the most densely peopled and historically one of the most famous of the provinces of China. Area 63,761 sq.mi. Pop. (1953) 44,214,594. Its name signified "south of the river," *i.e.,* of the Yellow river, but a part of the province lies north of the river. Honan comprises the southwestern portion of the great plain of north China, broken in the west by eastward extensions of the Tsinling Shan (*q.v.*) axis, which have a general elevation of about 3,000 ft. The northern section of Honan was separated in 1949 to form the short-lived province of P'ing-yiian which was abolished and restored to Honan in 1952. The southern boundary of Honan follows in part the crest of the Ta-pieh Shan (Huai-yang Shan) which divides the Huai Ho (*q.v.*) from the Yangtze basin, but in the southwest it includes the upper valley of the Han river which affords direct communication with the tricity conurbation of Wu-han (*q.v.*).

Honan was the chief centre for the spread and dispersion of early Chinese culture and civilization. The open lands above the marshy levels of the Yellow, Huai and upper Han rivers were not only valuable settlement sites but controlled the lines of movement either along the Huai-Yellow river watershed to Shantung province or by the Huai-Yangtze divide to the culture centres of the Yangtze valley. Honan was also the terminus of the corridor route from the west betneen the Shansi plateau and the easterly spurs of the Tsinling Shan. In earlier Chinese history sites along the right bank of the Yellow river, between the cities of Lo-yang to the west and K'ai-feng (*q.v.*) to the east, frequently served as political centres, these two cities often being the capitals. Hence, much of the political history of China prior to about A.D. 1200 focused upon the Honan area. An-yang, north of the Yellow river, has notable archaeological sites.

Honan is mainly rural in character, with more than 90% of the population living in villages and small towns. The chief urban settlements are located along the Lung-hai and Peking-Hankow railways. The densest grouping is in the eastern section on the higher agricultural land. A secondary focus of population occurs in the upper Huai basin with Nan-yang as its centre. Honan normally leads China in wheat production and ranks high in the production of cotton, millet, tobacco, soybeans, peanuts and sesame. But the danger of drought and flood (from both the Yellow and Huai) constantly menaces the countryside. The Chinese Communists have done much river reclamation work on the upper Huai system, building detention dams, canals and irrigation systems in an effort both to decrease flood dangers and mitigate drought problems.

The main earlier industrial development had been the growth of coal mining in northern Honan and the establishment of agricultural processing industries in the towns along the rail systems. After 1952 the old cities along the Yellow river, K'ai-feng, Cheng-chow (Cheng-hsien) and Lo-yang, began to expand industrially. Chengchow (pop., 1953, 594,700), at the intersection of the Lung-hai and Peking-Hankow rail systems, became the provincial capital in Oct. 1954 and is growing rapidly, a new industrial suburb taking shape in the western outskirts. Textile mills, machinery plants, power plants at dams along the Yellow river and added agricultural processing factories were either being built in the late 1950s and early 1960s or were projected. Some of these projects will serve both power development and flood-navigational control on the Yellow river. The 30-mi.-long People's Victory canal, a combined irrigation and communication project, links the Yellow river north of Chengchow nith the Wei Ho at Hsin-ch'iang (Sinsiang). Despite the new industrial developments, Honan's manufacturing patterns still continue to revolve chiefly around the processing of agricultural products, notably cotton, flour and oilseeds. If the current trend of industrialization continues, however, Honan is certain to show increasingly complex industrial patterns and a marked shift in population distribution through increased urbanism. (J. E. SR.)

HONDECOETER, MELCHIOR D' (1636–1695), Dutch painter who specialized in bird studies, was born at Utrecht. Old historians say that he was the grandson of Gillis and son of Gysbert Gillisz d'Hondecoeter, as well as the nephew by marriage of J. B. Weenix who certainly influenced his style. As to Gysbert and Gillis, however, it is uncertain that they were father and son, since both were registered as painters at Utrecht in 1637. Melchior lived at The Hague (1659–63) and at Amsterdam, where he married in 1663 and lived till his death on April 3, 1695.

Melchior d'Hondecoeter chose birds as his subject, perhaps because his father had painted birds or because his uncle Weenix taught him to study the feathered tribe. Melchior, however, began his career with a different specialty from that by which he is usually known. De Stuers affirmed that he produced sea studies. He acquired celebrity, however, as a painter of birds, which he represented vividly. Without the brilliant tone and high finish of Jan Fyt, his birds are full of action; and it was said that he displayed the maternity of the hen with as much tenderness and feeling as Raphael, the maternity of Madonnas. Few of his pictures are dated, though more are signed. Among the former should be noted the "Jackdaw Deprived of His Borrowed Plumes" (1671); "Game and Poultry" and "A Spaniel Hunting a Partridge" (1672); and "A Park With Poultry" (1686). Hondecoeter's earliest works are more conscientious, lighter and more transparent than his later ones. At all times he is bold of touch and sure of eye, giving the motion of birds with great spirit and accuracy.

Hondecoeter, in great favour with the magnates of the Netherlands, became a member of the painters' academy at The Hague in 1659. William III employed him to paint his menagerie at Loo, and the picture, acquired by The Hague museum, shows that he could overcome the difficulty of representing India's cattle, elephants and gazelles. But he is better in homelier works, with which he adorned the royal chbteaux of Bensberg and Oranienstein at different periods of his life.

HONDO, Central American stream with headwaters in British Honduras (Belize), northeastern Guatemala and southern Mexico. Its northeast or east-trending course marks the frontier between Mexico (Quintana Roo territory) and British Honduras. In the 30 mi. above its outlet on Chetumal bay (Caribbean sea) it is navigable for small craft. High-water navigation extends to the confluence of the Xmoscha and Azul rivers. (J. T.)

HONDURAS (REPÚBLICA DE HONDURAS), a republic occupying the central portion of Central America, with a coast line of 400 mi. on the Caribbean sea and a frontage of about 50 mi. on the Gulf of Fonseca, on the Pacific ocean. It is bounded on the north by the Caribbean sea, on the southeast by Nicaragua, on the south by the Pacific ocean and El Salvador and on the west by Guatemala. Area 43,277 sq.mi. Pop. (1950) 1,368,605.

The name is Spanish (translated "depths") and is explained with equal insistence as referring either to the deep waters found by Columbus offshore or to the deep, wavelike valleys and ridges that traverse nearly the entire country, excepting for the relatively narrow coastal plains. The country faces on the sea to the north and

shares frontage on the Gulf of Honduras with British Honduras and Guatemala, which has a short Caribbean coast line. The strategic Bay Islands (*q.v.;* Islas de la Bahia), about 30 mi. off the north coast, became part of Honduras in 18jg after a long dispute with Great Britain.

The easternmost extension of Honduras is Cape Gracias a Dios, where the Caribbean coast line of Central America turns abruptly southward. The frontier with Nicaragua, which was delineated in 1906 and reaffirmed by a decision of the International Court of Justice in 1960, runs through a sparsely inhabited territory along the Río Segovia (or Coco or Wanks). (See History, below.) The boundary continues south-weshard from an upper tributary of the Segovia across the continental divide to the eastern end of the Gulf of Fonseca. There, for a short distance, Honduras fronts on this great arm of the Pacific, holding sovereignty over the islands of Tigre (where its Pacific port, Amapala. is situated), Zacate Grande and Gueguensi. The boundary line with El Salvador starts at the mouth of the Goascorán river and follows an irregular line through the mountains, first in a northerly and then in a westerly direction, to a point directly west of Ocotepeque; there the boundaries of Honduras, El Salvador and Guatemala meet.

The boundary line between Honduras and Guatemala was in dispute from the early days of the Spanish regime until the 20th century. With the development of the banana industry, conflicting concessions by the two governments brought the issue to a head in 1927, but threatened hostilities were averted by United States mediation and an eventual arbitration by that country, Costa Rica and Chile.

This article is divided into the following sections:

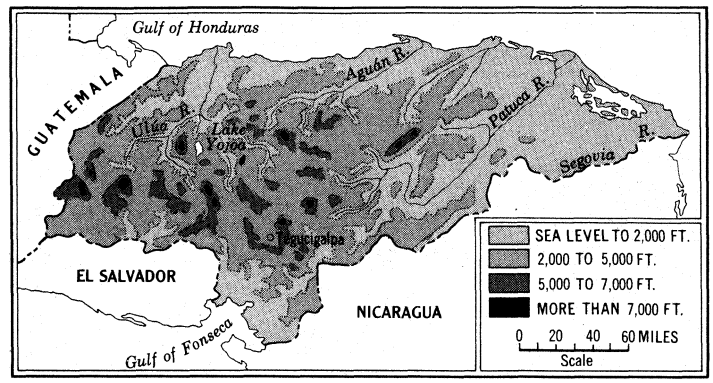
Further aspects of Honduras may be found in short articles on the departments and more important cities.

I. PHYSICAL GEOGRAPHY

The general aspect of the country is mountainous. Although the southern part of the country close to the Pacific is of volcanic origin, no active volcanoes exist. No clear-cut pattern of mountain trends is apparent. Some tendency for ranges in the northern part of the country to trend southwest-northeast is apparent, enveloping extensive valleys, but many transverse ranges also exist. In the southern part, mountains are prolonged commonly toward the north and northwest. whereas the central part is constituted in general by a dissected upland with numerous small peaks.

Geology. — In general the geological formations in Honduras have roughly an east-west orientation. Except for a narrow plain of Pleistocene alluvium, bordering the Gulf of Fonseca, the mountains of southnestern Honduras consist of alternating series of andesitic tuffs and lava flows of Tertiary age. From west of Tegucigalpa eastward are broad areas of Triassic and Cretaceous crystalline (granite) and metamorphic rocks, forming the many mountain ranges. The northern mountains, east of the Ulúa basin, consist of Pre-Cambrian, or possibly Paleozoic, crystallines with alternate bands of Cretaceous sedimentary rocks and Cretaceous granitic intrusions between ranges of older rocks. Northwestern Honduras has large areas of Tertiary andesitic tuffs and lavas, older Cretaceous sedimentaries and, in the sierras near Guatemala, Cretaceous granitic intrusions. Narrow stretches of northern coastal plains, the broad Ulúa-Chamelecón and Aguán valleys and the wide eastern coastal plains consist chiefly of Pleistocene sediments and Recent alluvium.

Relief and Drainage. — Flat to undulating plains comprise about 20% of Honduras. Bordering the Gulf of Fonseca, low piains, 10 to 25 mi. wide, are fairly well drained by many short streams and the Goascorán, Nacaome and Choluteca rivers, whose sources lie in high mountains. Narrow, poorly drained coastal

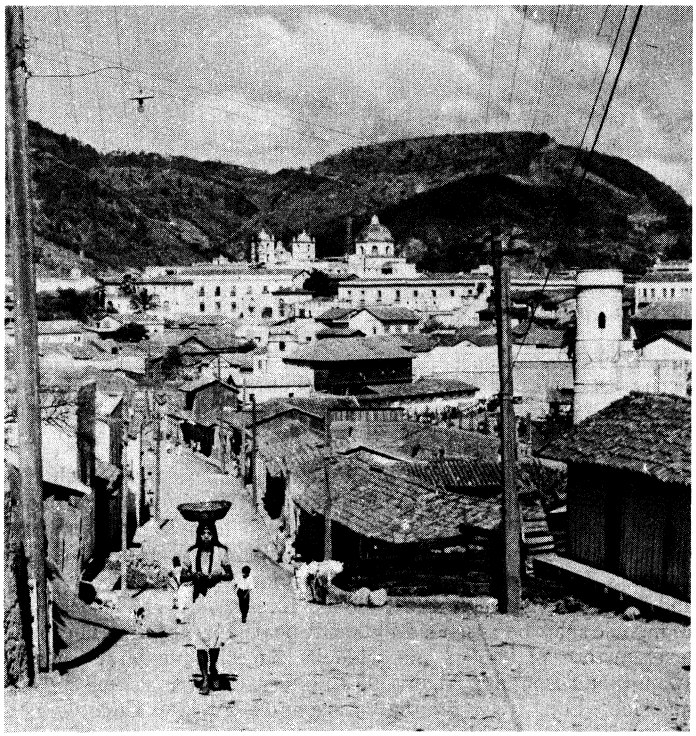


SURFACE FEATURES OF HONDURAS. THE COUNTRY IS CHIEFLY MOUNTAINOUS. WITH WIDE FRONTAGE ON THE CARIBBEAN SEA AND A NARROW PACIFIC OCEAN SHORE LINE

plains in the north, separated by mountain spurs that reach the ocean, merge with the alluvial plains of the Ulúa-Chamelecón, Comayagua and Aguán rivers. The Ulúa-Chamelecón plains, 30 mi. wide in the lower portion, extend 65 mi. inland. The Ulúa and tributary Jicatuyo, rising near El Salvador, are over 250 mi. long and navigable by light-draft boats for 150 mi. The Aguán-Mangulile may be ascended by small boats for 50 mi. The low-level eastern plains, 70 mi. wide in places, have large coastal swamps and lagoons; Laguna de Caratasca is 41 mi. long and 14 mi. wide. Long rivers are the Patuca and Segovia or Coco (*q.v.*); the latter, rising within 50 mi. of the Gulf of Fonseca and flowing eastward for 300 mi., is navigable by small vessels for 200 mi. Highlands, comprising 80% of Honduras, consist of many high mountain ranges, reaching 8,000 ft. in the west, and deep structural basins in which are canyonlike valleys and intricately ramifying tributaries — all contributing to the very rugged relief. Many basins, the largest being the Humuya, 32 mi. by 16 mi., lie 2,000 to 5,000 ft. above sea level.

Climate. — The climate is generally hot, with high humidity in the tropical coastal lowlands becoming modified by altitude toward the interior. Lowlands below 1,500 ft. have mean annual temperatures between 79° and 82° F. The north coast is occasionally affected from October to April by "northers" — cool northern winds of continental origin. Mountain basins and valleys, from 2,000 to 4,000 ft., have mean annual temperatures between 67° and 74° F. At Tegucigalpa, located on hilly terrain at an altitude of 3,200 ft., the rainy season starts in May and continues until the middle of November with temperatures sometimes reaching 90° in May and dropping to 50° in December, the coolest month. Around 7,000 ft., mean annual temperatures are about 58° F. In the northern and eastern coastal and alluvial plains and on adjacent mountains mean annual precipitation ranges from 70 to 110 in. or more, with a less rainy (but not rainless) season from March to June; these areas occasionally have summer hurricanes with strong winds and heavy rains. Pacific plains and mountain slopes get 60 to 80 in. of rain annually, but there the months December to April receive little or no rain. Interior sheltered mountain basins and valleys get 40 to 70 in. annually, with December to April having little rain. Interior higher mountains receive considerably more in a longer rainy season.

Vegetation. — In eastern Honduras the coastal and lagoon swamps have mangrove and palm forests, and west of these are low rainy sandy plains with pine-savanna (*Pinus* caribaea) forests, extending inland for 40 mi. or more. West of the pine-savanna forests, in low valleys and on lower mountains, rainy all year, and on the low rainy northern mountains, are broad belts of dense evergreen broadleaf forests with many species of large trees including mahogany, lignum vitae, Spanish cedar, balsa, rosewood, ceiba, sapota (yielding chicle used for the base of chewing gum), Castilla rubber, etc. The high rainy mountain slopes of highland Honduras support excellent oak-pine forests. The interior highland basins and valleys have open, dry deciduous woodlands and temperate grasslands. The Pacific plains and adjacent mountain slopes have deciduous tropical forest and savanna. Mangrove oc-



LANKS FROM BLACK STAR
STREET IN TEGUCIGALPA, **CAPITAL** OF HONDURAS

cupies the low coastal swamps.

Animal Life.—In the native animal life of Honduras insects, birds and reptiles are most numerous. There are many species of butterflies, moths, beetles, bees, wasps, spiders, ants, flies and mosquitoes, Most of these are beautifully coloured. Many species of land birds are common throughout the country. Waterfowl in large numbers inhabit the coastal areas. Crocodiles, snakes, lizards (giant iguana and others) and turtles are in the tropical forest areas. Bears, pumas, leopards and panthers are rarer but may be found in the hills. Fish and mollusks are abundant in lagoons and coastal waters, but the annual catch does not exceed 400,000 lb.

II. GEOGRAPHICAL REGIONS

Honduras may be divided into four distinct geographical areas: (1) the eastern lowlands and eastern mountain slopes; (2) the northern coastal and alluvial plains and coastal sierras; (3) the central highlands; and (4) the Pacific lowlands and lower mountain slopes.

The Eastern Lowlands and Eastern Mountain Slopes.—These are hot and rainy all the year and densely forested. This region embraces about 20% of the country's area but its population, all rural, comprises only 5% of the national total. It has no highways or railways, depending entirely on boat transportation on the rivers, lagoons and coastal waters. Chief economic activities are lumbering, forest gathering, primitive subsistence agriculture and fishing. The lagoons and coastal waters are the chief fishing grounds of the country.

The Northern Coastal and Alluvial Plains and Coastal Sierras.— The plains are artificially drained in part and the entire region embraces about 13% of Honduras. The coastal settlements are inhabited by about 20% of the nation's population. The three railways are confined to this north coastal region which has four of the five important ports of the country; Puerto Cortés, the leading port, is connected with the highlands via the Inter-Coastal highway. The coastlands with their productive clay loam and sandy loam soils produce all the bananas exported from Honduras and at least half the rice and cassava. The area is significant in the production of corn, beans, cattle, poultry and swine and manufactured articles. the last especially in San Pedro Sula (*q.v.*), the second city in Honduras.

The Central Highlands.— Extending northwest-southeast from Guatemala to Nicaragua, the highlands comprise about 65% of the national territory and have 70% of its population. This region consists of rugged mountain ranges and intermontane basins and deep valleys between 2,000 and 5,000 ft. in altitude. The population is concentrated chiefly in basins and valleys, many of which have fertile soils derived from lavas and volcanic ashes. There are road connections with both coasts via the Inter-Coastal highway. The region produces all the nation's coffee, tobacco, potatoes and wheat and the bulk of its corn, sorghum, beans, fruits, vegetables, cattle, poultry, swine, minerals, hardwood-pine forest products used in Honduras and manufactured commodities.

The Pacific Lowlands and Lower Mountain Slopes.—These comprise only about 2% of the national area and have only 5% of the population. The region, level to hilly, has fertile alluvial and other soils derived from lava and volcanic ashes. Although small, it produces all the country's sesame seed, the bulk of its cotton and small amounts of corn, sorghum and cattle, swine and poultry products. The Inter-American highway from El Salvador to Guatemala crosses the region and Tegucigalpa can be reached via the Inter-Coastal highway. (C. F. J.)

III. THE PEOPLE

Honduras is predominately a mestizo (mainly Spanish-Indian) country. According to the 1950 census, ethnic distribution was as follows: mestizos 91%; Indians 6%; Negroes 2%; and whites 1%. Although there is no racial discrimination of an institutional or governmental nature and very little in social relations, the ruling upper middle classes tend to be lighter skinned than the lower classes. The mestizos of Honduras are generally darker and more Indian in appearance than those of certain other Latin-American countries such as Chile, Uruguay and Argentina. Mestizos predominate in every department but Intibucb and the Bay Islands. The greatest concentrations of Indians live in Intibucá (about 30% of the national total) and La Paz (about 18%). These two departments, located in the southwest near the Guatemalan border. coincide roughly with the important Indian centres of the pre-Spanish period. There are small, isolated groups of non-Spanish-speaking Indians, such as the Jicaques, Mosquito, Zambos and Payas, but they are declining in numbers. The Bay Islands of the Atlantic coast are populated mainly by descendants of Negroes and Caribs and by white Protestants of English extraction, who dominate the political, social and economic institutions. Negroes, mostly from Jamaica, were introduced in the northern coastal area to work on the banana plantations, where English is now widely spoken. Their immigration is now illegal. There are very few Negroes in the urban centres of the interior. A pronounced shift in population took place in the early decades of the 20th century from the cool, pine-forested mountains and plateaus and fertile valleys of the interior to the hot, humid north coast where economic opportunities were afforded by the United Fruit company. In later years, shifts back to the area of more pleasant climate took place.

Roman Catholicism is the predominant faith, and freedom to all creeds is guaranteed by the constitution. No religion is state supported. See also INDIAN, LATIN-AMERICAN. (W. S. Ss.)

IV. HISTORY

Centuries before the white man came to the new world, Honduras was the original homeland, along with Guatemala, of the remarkable Maya people, the pioneers of higher civilization in the Americas. But when Columbus, on his fourth voyage, touched the Honduras coast (1502) the Mayas had deserted Copbn, Quiriguá and other Honduran sites for lands in the Yucatán peninsula, where the conquistadors found them a short time later.

Honduras, though largely unexplored, became a bone of contention between the Spaniards of Mexico and the Spaniards of Panamb. Hernbn Cortés (*q.v.*), conqueror of Mexico, considered that it lay within his sphere and when word came that Gil Gonzblez Dávila, acting under orders of Gov. Pedrarias Dávila of Panamb, was colonizing the area, Cortés countered by sending his lieutenant, Cristóbal de Olid, to expel the intruder. Olid arrived, bested Dbvila and then set himself up as independent of Cortés.

This brought Francisco de las Casas from Mexico. Then Cortés, fearing that Casas might succumb to a like temptation, made his memorable overland march to Honduras. After some exploration and looting he returned to Mexico the next year (1526). Spanish rule was inaugurated but settlements were soon engaged in rivalries for wider authority. Pedro de Alvarado (*q.v.*), another of Cortés' lieutenants, was sent in 1536 to restore order. He founded San Pedro Sula (*q.v.*) in the valley of the Ulúa, and later Comayagua (*q.v.*), the first capital of Honduras, was established in the Comayagua valley by Alonso de Cáceres. This period was marked by bloody struggles against Lempira, the Indian chieftain who for a time successfully resisted the Spanish advance into the interior. His name now designates the monetary unit of Honduras and is a national symbol of liberty and valour.

Colonial Period.——In 1539 Honduras, along with the four other provinces of the Central American strip, was incorporated into the captaincy general of Guatemala, and it remained a part of that administrative division of the Spanish Indies through the colonial period. In the 1570s a silver strike in the highlands brought a rush of prospectors which resulted in the rise of an important population centre at Tegucigalpa (*q.v.*). The coastal area along the Caribbean became a rendezvous for the pirates and buccaneers who preyed on the Spanish treasure ships and attacked the colonial ports. Later the region, with its fine logwood forests, attracted English cutters, who by the end of the 18th century controlled the Mosquito Coast (*q.v.*) from the San Juan river, in Nicaragua, to Belize, and also the Bay Islands offshore. The Spanish resented this trespass but were unable to oppose it effectively.

Independence.— In 1821 Mexico won its independence from Spain, and on Sept. 1j, 1821, the Central American provinces comprising the captaincy general of Guatemala also announced their independence. In 1822 they became part of the Mexican empire of Agustin de Iturbide (*q.v.*), but following the latter's downfall in 1823 they broke away to form the Central American federation. Manuel José Arce, the first president. faced an almost impossible task in trying to weld the five states (Honduras, Guatemala, El Salvador, Nicaragua and Costa Ricaj into a functioning unit. Serious unrest began to show as early as 1826 and in 1829 Arce resigned. In 1830 Francisco Morazán was elected to head the union. Morazán was a Liberal whose impact on his native Honduras and on the confederation was in terms of liberalism! one of whose principal goals was the curtailment of the power and age-old privileges of the church and the clergy. By the late 1830s the Conservative opposition proved too much for Morazán. The confederation collapsed and the Central American states assumed the status of independent nations. Honduras declared its absolute independence Nov. j, 1838. Rafael Carrera (*q.v.*) assumed the leadership in Guatemala; the Conservatives in Honduras took control under the leadership of Francisco Ferrera; who was inaugurated as the first constitutional president Jan. 1, 1841; Morazán, who had gone to El Salvador, finally withdrew.

The domination of the Conservatives; in Honduras and generally throughout Central America, lasted until the 1870s. The church was restored to its former commanding position. In 1861 the Honduran government signed a concordat with the Holy See, as Guatemala had done a few years before. The ascendancy of Justo Rufino Barrios in Guatemala (1871–85) influenced a return to liberalism in Honduras where Marco Aurelio Soto, a Liberal, assumed the presidency (1876). A new constitution (1880) sought to undo the work of the Conservatives. Five years later, Barrios attempted to revive the old Central American union but in resorting to force he overstepped himself. Liberals in Honduras and elsewhere proved to be nationalists first and blocked this attempt at domination by Guatemala. This resulted in a return to power by the Conservatives almost everywhere.

During the turbulent second half of the 19th century, Honduras was often disturbed by interference from Guatemala. In the first decade of the 20th century meddling came from another quarter, the current strong man in Nicaragua, José Santos Zelaya, who put Manuel Bonilla into the Honduran presidency. This interference led in 1911 and 1912 to something more serious than the periodic revolutions, Pres. William Howard Taft was pressured to send in marines to protect U.S. banana investments which by this time had grown considerably. The earlier Cuyamel company had been joined first by the Standard Fruit company and then by the Gnited Fruit company in exploiting this Honduran product; all three had made large capital outlays in the form of improved port facilities, railroads, workers' settlements and similar developments in the plantation area, the lowland region along the Caribbean coast.

In 1918 Honduras followed the lead of the United States and declared war on Germany but took no active part. Political upheavals continued after World War I. In 1932, after years of unrest, a strong man. Gen. Tiburcio Carias Xndino, was elected president. an office which he held until 1949. Carias dealt with several abortive revolutions during his term of virtual dictatorship.

Honduras declared war on Japan Dec. 8, 1941, and on Germany and Italy Dec. 13. Lack of shipping during World War II occasioned much economic distress. Export surpluses of bananas, coconuts and copra piled up, leading to widespread unemployment and consequent unrest. However, the government was able to maintain itself and promulgated some beneficial reforms. The United Fruit company increased wages for its employees and inaugurated several new enterprises, such as the planting of improved Hevea rubber trees and the raising of the tropical fibre-yielding plant abaci. Carias survived a revolution in 1947, but two years later the combination of two rival parties proved his undoing. Juan Manuel Gálvez assumed control and sought to restore constitutional guarantees.

Between 1954 and 1956 there was the short-lived dictatorship of Julio Lozano Díaz. A ten-meek strike among the workers of the United Fruit company was fomented quite openly by Communist elements. The reform interest. thus aroused, led to the formulation of a new labour code which gave the workers the right to organize and to bargain collectively. This labour relations program was the product of co-operation between the Inter-American Regional Labor organization the International Labour organization, the Honduras ministry of labour and a group of business leaders.

Despite impressive gains on the labour front. Hondurans were restive under the Lozano Diaz regime. He was unseated by a bloodless coup in Oct. 1956, and a three-man junta took control of the country. The junta, headed by Col Hector Caraccioli, quickly won the confidence and support of the people and very soon had the recognition of almost all other governments. Though there were several changes of personnel nithin the junta, it ruled with moderation and, according to its promise, took steps for the election of a constituent assembly. set for Sept. 1957. Earlier in that year there was a border dispute nith Nicaragua over rival territorial claims to an area north of the Segovia river mhich flows eastward to the Atlantic. Prompt and effective action by the Organization of American States prevented hostilities. A decision in 1960 by the International Court of Justice awarded the area to Honduras.

In the September election there was a minimum of official interference and a lack of disturbance throughout the country. The constituent assembly met in October, drafted a constitution and availed itself of the power, written into the constitution, to choose the first president. The Liberal leader. Ramón Villeda Morales. was elected. He took office on Dec. 21, 1957. His first official act was to proclaim the new constitution in force; this replaced the 1936 constitution, suspended in Dec. 1954. A minor revolt against the government was suppressed in May 1959. See also CENTRAL AMERICA: *Anthropology.* (J. F. BN.)

V. POPULATION

The official census of population of 1961 was 1.883.480, with a density of 13 5 persons to the square mile: in 1927 it was 892.887 and in 1950 it was 1,368.605. The rate of increase (doubled in 30 years) is more than twice that of the world in general. This population gronth is greater in the cities than in the rural areas. Tegucigalpa (*q.v.*), the capital, had a population (1961) of 133.-887. The second city is San Pedro Sula nith a population of 58.-126 Among the smaller cities are Puerto Cortés, Choluteca, La Ceiba Santa Rosa de Copán, Tela and Comayagua.

The liberal agrarian laws of Honduras encourage most of the

people (about 69%) to live in the rural areas and exploit subsistence farms or engage in small cattle-producing enterprises.

VI. ADMINISTRATION AND SOCIAL CONDITIONS

Constitution and Government. — Since acquiring independence, Honduras has been described constitutionally as a democratic, representative, unitary state with power divided among legislative, executive and judicial branches. The country has had 15 constitutions, the latest having gone into effect on Dec. 21, 1957. As in most Latin-American countries, there is frequently a wide gap between what the constitution says about government and politics and what happens in practice. Thus power has frequently been mobilized and changed by violent, undemocratic means. Peaceful methods have included *imposición* ("rigged election"), *candidato único* ("single candidate") and *continuismo* (continuing the president in power beyond his legal tenure). Although the legislature is given the power to pass laws, practically all important legislation is drafted by the executive and his assistants. The congress in theory has great authority to check the administrative activities of the president, but only in the period 1925–31, when several cabinet ministers appointed by the president were forced to resign through censure, was such authority effective. The election of Carias in 1932 re-established strong, centralized dictatorial government and the constitutions of 1936 and 1957 forbade congress to censure any cabinet member appointed by the president. Honduras has a single-house legislature with single-member districts based on a ratio of one deputy for each 30,000 inhabitants. The constitution of 1957 fixes the number of deputies at 58. The congress convenes each year on Nov. 21 for 100 days. The sessions can be extended to 150 days, and special or extraordinary sessions can be called. All men and women who are citizens and over 18 years of age are permitted to vote. and a national electoral council, created in the constitution of 1957, supervises elections. Suffrage was extended to uomen in 1955. The president is elected directly by popular vote for a period of six years with a second term prohibited (art. 199).

The justices of the supreme court are elected by the congress (art. 217) for six years. The supreme court exercises centralized control over the lower courts, including the appointment of the justices of the appellate courts, the judges of letters (courts of original jurisdiction), labour judges and others. The supreme court has original and exclusive jurisdiction to declare acts of the legislature unconstitutional (art. 237). The departments are subject to the control of the central government, but the constitution declares that the municipalities are autonomous. Although U.S. influence was strong in certain aspects of the early constitutions, Spanish influence has always been great.

By the 1960s Honduras, like most other Latin-American countries, had moved more and more in the direction of the "interventionist" or "welfare" state. There are a number of provisions in the constitutions of 1936 and 1957 which give the central government great power to direct and regulate social relations and the economic system. In Feb. 1955 the Honduran basic labour code came into effect. It granted the right to work, minimum wages, an eight-hour day and 48-hour week, freedom of unionization, collective bargaining, conciliation and the right to strike. The cost of living index (Tegucigalpa) rose steadily in the 1950s (1953 = 100. 1958 = 105).

Education. — The Honduran educational system follows the European model of centralized control through the ministry of education. According to law, education is free and compulsory for all children from ages 7 to 15. Efforts have been made to combat illiteracy, which in the 1960s was probably more than 60% for those 10 years of age and over. In the late 1950s there were about 400.000 children of school age and according to official statistics less than half were attending school. There were approximately 2,350 primary schools which had about 140,000 pupils and 4,500 teachers, and about 50 secondary, normal and technical schools with over 10.000 pupils and 1,350 teachers. The National university in Tegucigalpa (founded 1847) with six faculties (judicial and social sciences, medicine and surgery, physical and mathematical sciences, chemistry and pharmacy, economics, odontology) had an enrollment of about 1,000 and 130 faculty members. (W. S. Ss.)

VII. THE ECONOMY

Production. — The economy of Honduras is essentially agricultural. The two large U.S. banana companies (United Fruit — operating through its subsidiary the Tela Railroad company — and Standard Fruit company) on the north-coast plantations hold about 5% of the nation's agricultural lands, provide 20% of the national income. 50% of all agricultural production, 60% of all export value and 13% of government income. But Panama disease. affecting the roots, and Sigatoka (leaf spot) have hampered cultivation. The industry, perforce, is tied intimately to railways and ocean shipping.

Maize (corn and Kaffir corn) is the chief staple foodstuff grown by Honduran farmers and occupies more than one-half of all cultivated land. Sorghum, beans and rice are also common crops. Although wheat is grown in the highlands, considerable quantities of grain and flour are imported to meet domestic requirements.

Important export crops, other than bananas, are coffee beans, abacá fibre (Manila hemp), tobacco and coconuts. Pasture uplands are very extensive in the interior; exports of cattle and swine go principally to El Salvador. Large expanses of coniferous forest as well as other kinds of forest exist, but exploitation has been relatively small. Mahogany had been the traditional timber exported, but in the 1960s pine far exceeded mahogany in quantity and value. Largely unexploited mineral resources are considerable and include lead, antimony, zinc. iron, coal, mercury and copper. Production of silver and gold, however, has remained of some importance for many years.

Foreign Trade. — Exports in the late 1950s were valued at more than $70,000,000 (140,000,000 lempiras) annually. Imports were slightly less. About 73% of the exports went to the United States and Canada, while approximately 70% of the imports came from those countries. Bananas accounted for about 60% of the exports, coffee 19%, wood 7% and silver 2%.

Finance. — The Honduras monetary unit is the lempira, stabilized after 1934 at two to the U.S. dollar. The government has not made extensive use of exchange control. For fiscal 1958 estimated government revenues were 75,200,000 lempiras and estimated government expenditures 92,400,000 lempiras. The debt, in lempiras, amounted to more than 20,000,000 and, in foreign currencies, to the equivalent of almost 4,500,000 lempiras. Two private banks operate in Honduras: Banco de Honduras, locally controlled, and Banco Atlántida, which is U.S. capitalized. In 1950 two Honduran government banks, the Banco Central de Honduras and the Banco Nacional de Fomento, were inaugurated. The former centralized the financial operations of the state and became the only bank of currency issue. The Banco Nacional de Fomento was intended primarily to grant loans for agricultural development. In 1958 there were nearly 40,000,000 lempiras of currency in circulation and approximately 25,000,000 lempiras of deposit money.

Transport and Communications. — Honduras has only 63 mi. of public-service railroads. In the late 1950s the two fruit companies owned an additional 272 mi. of railroad trunk lines and about 72j mi. of branch lines, which are confined to the north coastal banana region and also provide some passenger transport facilities.

The Inter-American highway, running from El Salvador to Nicaragua, cuts across southern Honduras for about 100 mi.; a branch highway, not entirely in good condition, leaves it at Jicaro Galán and runs north through Tegucigalpa to the north coast.

Air transportation is of great importance within Honduras and is frequently the normal means of conveyance for passengers and freight. International service is provided by Pan American World Airways, Taca International (Transportes Aéreos Centro Americanos) and Transportes Aéreos Nacionales (TAIL'). (W. C. GN.)

HONDURAS, BRITISH: *see* BRITISH HONDURAS.

HONE, WILLIAM (1780–1842), English writer and bookseller. was born at Bath on June 3, 1780.

Hone received no systematic education and was taught to read from the Bible only. His father having moved to London in 1783, he was placed in an attorney's office in 1790. After two and a half years in the office of a solicitor at Chatham, he returned to London to become clerk to a solicitor in Gray's Inn. But he disliked the law, and had already acquired a taste for free thought and political agitation. Hone married in 1800, and started a book and print shop with a circulation library in Lambeth Walk. He soon moved to St. Martin's Churchyard, where he brought out his first publication. Shaw's *Gardener* (1806). It was at this time that he and his friend. John Bone, tried to realize a plan for the establishment of popular savings banks, and even had an interview on the subject with the president of the board of trade. This scheme, however, failed. Bone joined him next in a bookseller's business; but Hone's habits were not those of a tradesman, and bankruptcy was the result. He was in 1811 chosen by the booksellers as auctioneer to the trade and had an office in Ivy lane. Independent investigations carried on by him into the condition of lunatic asylums led again to business difficulties and failure, but he took a small lodging in the Old Bailey, keeping himself and his now large family by contributions to magazines and reviews. He hired a small shop: or rather box, in Fleet street, but this was on two separate nights broken into, and valuable books lent for show were stolen.

In 1815 he started the *Traveller* newspaper, and endeavoured vainly to exculpate Eliza Fenning, a poor girl who was executed on a charge of poisoning.

From Feb. 1 to Oct. 25, 1817, he published the *Reformer's Register,* writing in it as the serious critic of the state abuses, which he soon after attacked in the famous political squibs and parodies, illustrated by George Cruikshank. In April 1817 three ex officio informations were filed against him by the attorney general, Sir William Garrow. Three separate trials took place in the Guildhall before special juries on Dec. 18, 19 and 20, 1817. The first: for publishing Wilkes's *Catechism of a Ministerial Member* (1817), was before Justice Abbot (afterward Lord Tenterden); the second, for parodying the litany and libeling the prince regent, and the third, for publishing the *Sinecurist's Creed* (1817), a parody on the Athanasian creed, were before Lord Ellenborough. Hone was acquitted on each count, and received a popular ovation.

Among Hone's most successful political satires were *The Political House That Jack Built* (1819), *The Queen's Matrimonial Ladder* (1820), in favour of Queen Caroline, *The Man in the Moon* (1820), *The Political Showman* (1821), all illustrated by Cruikshank. In 1826 Hone published the *Every-day Book,* in 1827–28 the *Table-Book,* and in 1829 the *Year-book;* all three were collections of curious information on manners, antiquities and various other subjects. These entertaining books are the works by which Hone is best remembered In preparing them he had the approval of Southey and the assistance of Charles Lamb, but they were not profitable, and Hone was lodged in King's Bench prison for debt. Friends rescued him and set him up in a coffee-house in Gracechurch street; but this, too, ended in failure. Hone became devout in later years, and used to preach in Weigh House chapel, Eastcheap.

He died at Tottenham on Nov. 6, 1842.

HONE, a variety of finely siliceous stone employed for whetting or sharpening edge tools, and for abrading steel and other hard surfaces. Hones are generally prepared in the form of flat slabs or small pencils or rods, but some are made with the outline of the special instrument they are designed to sharpen. Their abrading action is due to the quartz or silica which is always present in predominating proportion, some kinds consisting of almost pure quartz, while in others the siliceous element is mixed with aluminous or calcareous matter, forming a uniform compact stone, the extremely fine siliceous particles of which impart a remarkably keen edge to the instruments to which they are applied. In some cases the presence of minute garnets or magnetite assists in the cutting action. Hones are used either dry, with water or with oil, and generally the object to be sharpened is drawn with hand pressure backward and forward over the surface of the hone, but sometimes the stone is moved over the cutting edge.

The coarsest type of stone which can be included among hones is the bat or scythe stone, a porous fine-grained sandstone used for sharpening scythes and cutters of mowing machines. and for other like purposes. Next come the ragstones. which consist of quartzose mica schist and give a finer edge than any sandstone. Under the head of oilstones or hones proper the most famous and best-known qualities are the German razor hone. the Turkey oilstone and the Arkansas stone.

The hones yield on analysis 98% of silica, with small proportions of alumina, potash and soda and mere traces of iron, lime. magnesia and fluorine. They are white in colour, extremely hard and keen in grit, and not easily worn down or broken. Geologically the materials are called novaculites and are supposed to be metamorphosed sandstone silt, chert or limestone resulting from the permeation through the mass of heated siliceous waters. The finer kind is employed for fine cutting instruments, and also for polishing steel pivots of watch wheels and similar minute work, the second and coarser quality being used for common tools. Both varieties are largely exported from the United States in the form of blocks. slips, pencils. rods and wheels.

HONEGGER, ARTHUR (1892–1955), Swiss composer, was born at Le Havre. France, on March 10, 1892. He studied at Zürich before entering the Paris Conservatoire in 1912, where he studied under André Gédalge, C. M. Widor and Vincent d'Indy.

As one of the group of composers known as Les Six he must be classed with the modern French school and he undoubtedly owes much to Claude Debussy and Florent Schmitt. But there is a sturdy element in his music which recalls his true nationality and in the mass effects of his later oratorios he broke away more and more from French traditions. While some of his harmonic audacities were startling, the impetus of his rhythm was so strong that they fell into place.

His personal idiom became well established. The clashing of scale passages and rhythmic figures in contrary motion was a device which he used constantly with great effect. His respect for sonata form is shown particularly in his chamber music. The success of his biblical drama *King David* (1921) made him known to a wide public whose ear would normally have been shocked by atonality and modern counterpoint. The choruses are the outstanding feature of this work, which was completely revised as an oratorio in 1926.

After *King David,* Honegger's best-known work was *Pacific 231* (composed 1923), a brilliant example of modern program music which at once hit the popular taste. The two works represent the extremes of Honegger's style. In his opera *Judith* (1925, later adapted as an oratorio) the choruses are again the backbone of

the work. The form is more concise and the rhythm sharper and more syncopated than in King David.

Both here and in his later opera *Antigone* the solo parts tend to be dramatic rather than lyrical, his aim being to replace recitative by a melodic leading of the singing voice. which was to grow out of the text itself, to avoid dwelling on high notes (in the interests of distinct enunciation) and to be definitely noninstrumental. Honegger also wrote much incidental music to plays and motion pictures. His best-known symphony was the *Symphonie liturgique* (1946). He died in Paris on Kov. 27, 1955.

HONESDALE, an industrial borough in northeastern Pennsylvania, U.S., seat of Wayne county, is situated at the confluence of the Lackamaxen and Dyberry rivers, about 30 mi. N.E. of Scranton. An important hub of early turnpikes, it is located in a region noted for recreational facilities. Honesdale, named for Philip Hone, who pioneered construction of the Delaware and Hudson canal, was settled in 1827 and incorporated in 1831. From 1828 to 1898 it was the transfer centre for coal brought over the Moosic mountains by gravity railroads from the Lackawanna valley to the canal barges. The town is the site of one of the world's largest coal storage markets. In 1829 the "Stourbridge Lion," the first locomotive to run on rails in America, was initially tested there. Condensers, refinery equipment, knitted goods and shoes are manufactured. For comparative population figures see table in PENNSYLVANIA: *Population.* (A. D. S.)

HONESTY (*Lunaria annua*), a hardy biennial of the family Cruciferae, suitable for garden cultivation. It is an attractive everlasting plant tno feet to four feet high. with a silvery dissepiment The similar but less ornamental perennial honesty (L. rediviva) is also cultivated

HONEY is a sweet. viscid liquid obtained by honeybees from nectar secreted by plants. The nectar is ripened into honey by the inversion of the greater portion of the sucrose sugar of nectar into levulose (fructose) and dextrose (glucose) and by the removal of excess moisture. During the summer period, if plant nectar is not available, bees may also collect insect honeydew (see APHIDES).

This article deals nith the uses of honey, the forms in which it is marketed, its composition and physical properties and world production. Production practices and races of bees cultivated in various countries. and extraction, storage and handling of honey are discussed in the article BEEKEEPING.

Uses of Honey. — Honey was of great importance as an article of diet to the ancients. being almost their only available source of sugar. It was valued also for its medicinal virtues; was used for making mead (*q.v.*); and was mixed with wine and other alcoholic drinks. In Egypt it was valued as an embalming material; in India and other eastern countries for the preservation of fruit and the making of cakes, sweetmeats and other foods. Honey is mentioned in the Bible, *i.e.,* a land flowing with milk and honey (Ex. iii. 17; Kum. xiii, 27) and in the Koran, and is alluded to by Homer, Herodotus. Euripides and other ancient writers.

Honey still is used to sweeten and give special flavour to foods such as cereals, fruits, candies and baked goods. With candies, the tendency of honey to absorb moisture offers slight problems, but with bakery goods this hygroscopic property causes them to absorb and retain moisture for a long time and thousands of pounds of honey are used annually in making breads and cookies. Honey is used in ice cream manufacture to replace all or a part of the sugar. It gives further variety to flavours but has the slight objection of requiring a lower freezing and storage temperature. Honey is used as a vehicle for medicines, such as honey cough syrups. Under the advice of qualified physicians, honey with milk has been recommended for feeding infants, especially those suffering from rickets. scurvy, malnutrition. anemia. inflammation of the intestine and the effects of prematurity. For athletes and others undergoing strenuous physical labours honey has been uidely used: since the dextrose portion of honey is quickly absorbed into the blood stream and the levulose is largely changed in the liver to glycogen and then into dextrose, honey thus provides an immediate as well as an extended source of energy. This particular characteristic of honey is the background for its recommended use by some doctors for diabetics. Honey fortified nith particular pollens has been employed successfully in alleviating the symptoms of hay fever.

Honey has antiseptic properties and has been used in healing wounds. cuts. bruises, lacerations. sore nipples and burns. It has been used as a plant stimulant and for feeding animals. including fish and dairy cows (especially for the prevention and cure of acetonemia. a disease of cows at calving time). It also has been used as a facial pack in the beauty parlour. in hand lotions, in curing pipe bowls. in cigarettes, chewing tobacco and gums, as a spray adherent, as a centre for golf balls, as an antifreeze mixture for auto radiators and as a preservative for eggs in cold storage.

Forms of Honey Marketed. — Extracted or liquid honey, sometimes called strained honey, is produced in medium- to large-sized frames, provided with wired heavy wax foundations (medium brood), which are usually removed from the hive when 75% or more of the wax cells are capped. Extracted honey may be sold in the original liquid form or in a granulated form as creamed honey, spun honey and candied honey.

Comb honey, less common in the markets. may be found as section comb honey, bulk comb honey, cut comb honey and chunk honey. Section comb honey is produced in small lots weighing 11 to 1j oz., the original comb being contained in a square wooden frame. For bulk comb honey, a frame is provided with a thin surplus foundation. as also in section honey. When well capped, it is removed and sold as produced; or the contained comb may be cut up into parts and the individual pieces sold as cut comb honey; or one or more of these pieces may be placed in a jar and liquid extracted honey poured over it, the product being known as chunk honey.

Composition. — Honeys vary in composition according to floral source, environmental conditions (chiefly relative humidity), ripeness when extracted, methods used in processing and conditions of storage. A general idea of the variations in composition may be obtained from the table of the analyses of 92 U.S. honeys (U) and 106 California honeys (C) by C. A. Browne and by J. E. Eckert and H. W. Allinger, respectively.

Table I. — Major Constituents of Honey
(in percentages)

Constituent	Average		Maximum	Minimum
	U.S.	Calif.		
Water	17.70	16.50	U 26.88	U 12.42
Levulose (fruit sugar)	40.50	40.41	U 48.61	U 24.35
Dextrose (grape sugar)	34.02	34.54	U 46.40	U 24.73
Invert sugars	74.98	74.95	U 83.36	C 60.52
Sucrose (cane sugar)	1.90	2.53	C 11.00	UC 0.00
Dextrins	1.51	0.91	C 11.91	C 0.02
Ash (minerals)	0.18	0.21	C 1.14	C 0.02
Acid	0.08	0.16	C 0.45	U 0.04
Undetermined	4.9	4.72	C 7.51	U 0.04

Other substances occurring in honey in minute amounts are pollen; a partial source of vitamins. minerals and amino acids; beeswax (*q.v.*); proteins and related compounds such as amino acids, globulins, albumins, proteoses and peptones; and colour substances containing plant pigments, chlorophyll decomposition products. colloidal particles and tannic acid. Aroma and flavor substances contain essential oils, terpenes, aldehydes, methyl anthranilate, diacetyl and volatile and nonvolatile acids. Traces of higher alcohols include mannitol, dulcitol, etc. Sugars include maltose, melezitose, erlose, etc. In addition, honey contains other minute amounts of enzymes, vitamins, acetycholine and yeasts. Substances indicated by biological activities include a plant-rooting hormone. an estrogenic factor, a guinea pig antistiffness factor and antibacterial substances.

Table I shows the average mineral or ash content of the two groups of honey to range from 0.18% to 0.21%. Tables (by H. A. Schuette, et *al.*) of the average mineral content in groups of light and dark honeys list the followiug minerals: potassium, chlorine. sulfur, calcium, sodium, phosphorus, magnesium, silica (SiO_2), silicon (Si), iron, manganese and copper. One investigator, J. W. White, has listed the most plentiful ash constituents as calcium, magnesium, iron. manganese. copper, phosphorus, sili-

con, nickel, boron, aluminum and potassium.

Formic acid has been considered as the principal acid of honey, but modern investigators indicate it as relatively unimportant and name additionally acetic, malic, butyric, valeric, caproic, capric, lactic. tartaric, oxalic, succinic, citric, phosphoric, and in some honeys such as buckwheat, tannic acid, which in addition to giving a stringent taste is probably responsible for its dark colour. The vitamins in honey include minute amounts of A but more significant and nutritional amounts of various components of the B complex, several of which are involved in carbohydrate and amino acid metabolism. The amount of vitamin C (ascorbic acid) in honey seems to be quite variable, with indication of its decrease with age.

Among the plant pigments found in honey are carotin (yellow), xanthophyll (yellow) and some of unknown composition (bright yellow and dark green). A sugar derivative, anthocyanin, is thought to be responsible for the rose-red colour of white clover honey at high altitudes and the dark colour of willow herb honey of Alaska.

The enzymes of honey, present only in minute traces and not significantly important in human nutrition, do have a pronounced effect on the nature and character of honeys. They are commonly listed as invertase, diastase or amalyase, catalase and inulase. The presence of inulase in most honeys is questioned since it is not known to occur in higher plants, but is present in all monocotyledonous plants and in bacteria. yeasts and fungi.

The presence of an acid-producing enzyme, a phosphatase-hydrolyzing glycerophosphate and an enzyme which possibly oxidizes ascorbic acid may account for the general lack of vitamin C in honey.

Physical Properties. — The specific gravity and weight per gallon of honey are primarily dependent upon the water content which in turn is related to the degree of ripeness nhen stored by the bees and the atmospheric conditions to which later exposed. The specific gravity, water content and weight per gallon of honey can be determined by means of a hydrometer, by determination of the refractive index by means of a refractometer or by carefully weighing a given volume. Tables are available for converting a particular measurement to corresponding equivalents. The minimum weight per gallon of U.S. grade A or U.S. fancy and U.S. grade B is 11 lb. 12 oz. Consulting the tables for equivalents this weight is found to correspond to a moisture content of 18.6%, a Brix hydrometer reading of 79.8° at 68" F. (20° C.), a Baumé hydrometer reading of 42.29° at 60° F. (1j.j5° C.) and a specific gravity of 1.4129.

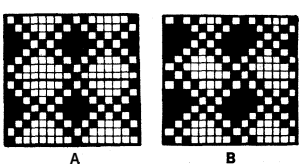
Heating honey is commercially used to control certain physical and chemical changes which may occur and may have a tendency to impair the quality of the product. These more or less interrelated changes are moisture absorption, granulation, fermentation, discoloration or darkening and loss of or masking of the original delicate flavour and aroma of the honey.

Granulation (crystallization or sugaring) of honey is that phenomenon in which the dextrose sugar is unable to stay in solution at a given temperature. The tendency of a honey to granulate is primarily dependent upon the concentration of its sugars in relation to its water content and the relative proportion of levulose and dextrose; *i.e.,* its L/D ratio. A water content of more than 20% seems to be sufficient to inhibit all but a trace of granulation in most honeys, but this is not a practical means of control. Original honeys with an L/D ratio between 1:0 and 1:2 usually crystallize rapidly, while there is much delay where the ratio exceeds 1:3. The temperature most favourable for granulation seems to be between 50° and 6j° F., with 55° to 57° F. suggested for most honeys. When the water content is above 21.5% rapid aerobic growth of honey-fermenting yeasts takes place. While fermentation of honey may be controlled by destroying the contained yeasts by heating to 145° F. for 30 min.. then straining and placing in containers while hot and sealing to prevent recontamination. it is evident that heating to higher temperatures to prevent granulation will also control fermentation. While the degree of heating varies with the L/D ratio, usually 155°–160° F. for 30 min. is suggested for quick granulating honeys, while a lower temperature will suffice for honeys with relatively high levulose content such as tupelo and most, fall honeys. Overheating tends to darken honeys and to impair or mask their original flavour and aroma due to the breakdown of the levulose content. A similar result occurs in storage at high temperatures and even at room temperature over a long period of time.

World Production. — In the second half of the 20th century the leading honey-producing countries were the United States. Canada, Australia and the United Kingdom. Annual production in the United States averaged about 100,000 metric tons and that in Canada about 10,000 metric tons. Annual production in the United Kingdom was also about 10,000 metric tons and in Australia about 15,000. Other producing countries in Europe, in order of quantity produced, included Spain, Poland. Italy, west Germany, France, Denmark and east Germany. Germany had been a leading producer before World War II. Countries producing lesser quantities included Yugoslavia, Czechoslovakia, Bulgaria, Austria, Switzerland and Greece. Honey also was produced in Brazil. Chile and Uruguay in South America; in Taiwan and South Korea in Asia; in Turkey (a major producer), Israel, Egypt and Syria and on Cyprus in the middle east; and in New Zealand, the British West Indies and Guatemala. Production in the U.S.S.R. and mainland China was not reported. Local consumption of honey produced by domestic and wild bees was important in many places.

Milum, "Honey" in R. *A.* Grout (ed.), ***The Hive and the Honey Bee,*** rev. ed., pp. 363–404 (1949); Food and Agriculture Organization of the United Nations, ***Yearbook of Food and Agricultural Statistics*** (annual). ***See*** also ***American Bee Journal*** (monthly); ***Bee World*** (monthly); ***Gleanings in Bee Culture*** (monthly) (V. G. M.)

HONEYCOMB, a cloth so called because of the particular pattern made by the arrangement of the crossing of the warp and weft threads; these form cells somewhat similar to those of the real honeycomb. They differ from the latter in that they are rectangular instead of hexagonal. The bottom of the cell is formed by those threads and picks which weave "plain," while the ascending sides of the figure are formed by the gradually increasing length of float of the warp and weft yarns.



DESIGNS USED IN THE MANUFACTURE OF HONEYCOMB TOWELING
The pattern at left is known as the "perfect seven-thread honeycomb"; that at right is a modification of the "perfect honeycomb"

The figure shows two of the commonest designs which are used for these cloths, design A being what is often termed the "perfect honeycomb." In the figure it will be seen that the highest number of successive white squares, representing a weft thread floating or passing over warp threads. is seven, whereas the corresponding highest number of successive black squares. a warp thread passing over weft threads or picks, is five. Two of each of these maximum floats form the top or highest edges of the cell, and the number of successive like squares decreases as the bottom of the cell is reached when the floats are one of black and one of white (see middle of design, etc.). The ueave produces a reversible cloth, and it is extensively used for the embellishment of quilts and other fancy goods. It is also largely used in the manufacture of cotton, linen and union towels. B is, for certain purposes, a more suitable weave than A, but both are very largely used in the towel industry.

(T. W.)

HONEYDEW, a secretion consisting of exudations of sugar from the leaves of various trees under certain atmospheric conditions. It is usually the result of a superfluity of sap, but may also be produced by the puncture of certain insects (see APHIDES); the latter condition constitutes a form of plant disease.

HONEY EATER or HONEYSUCKER, any of numerous songbirds constituting the family Meliphagidae, confined to Australia, New Zealand, the Malay Islands and nearby Oceania. where they are common and conspicuous. They range in size from that of a warbler to that of a jay and have a curved bill and protrusible tongue for procuring nectar and insects from flowers. They may

be dull with black, brown?gray or olive or may have conspicuous marks and brilliant colours; the inconspicuous females, duller and smaller than the males, seem much fewer in numbers. They live in treetops, along forest edges and about plantations, building a cup-shaped nest of twigs, fine roots and fibres, usually high in the fork of a tree, and lay one to three eggs. Both parents, share the rearing of young. They usually have loud musical calls and good songs. Well-known species are the wattlebirds *(Coleia)* of Australia, especially C. *carunculata,* grayish-brown with thin white stripes on the upper parts and tail tipped white; they possess fleshy, pendulous ear wattles. The bellbirds of Australia (*Manorhina melanophrys*) and New Zealand *(Anthornis melanura),* the coldong or four-o'clock *(Tropidorhynchus corniculatus)* of Australia, also known as friarbird, and the rare stitchbird *(Nyctiomystis cincta)* of North Island, New Zealand, belong to this family. The crow honey eater (*Gymnomyza aubryana),* 16 in, long, black with red-orange or yellow wattles, is one of the largest. One of the smallest and most brilliant among the many species in Southwest Pacific islands is the cardinal honey eater (*Myzomela cardinalis),* four to five inches long. the male black with scarlet head. breast and middle back. There are about 160 species in the family, New Guinea alone having about 19 genera and 61 species.

(G. F. Ss.)

HONEY GUIDE, the name for a dozen species of small old world birds, grouped in two to four genera, constituting the family Indicatoridae, closely related to the barbets *(q.v.)* and placed with the woodpeckers in the order Piciformes. They are yoke toed and have short legs and short, stout! somewhat blunted bills. They are inconspicuously coloured, brown or olive gray, with considerable white in the tail. The largest (eight inches long) and best known is the black-throated honey guide *(Indicator indicator),* from Senegal and Ethiopia to the Cape except in tropical forests. It chatters loudly and guides natives. especially woodchoppers! and various animals (ratel, leopard, snakes) to bee trees, sharing in bee larvae and honey on which it lives almost exclusively. Other individuals nearby do not join the hunt. It lays its white eggs in the cavities of hole-nesting birds.

A number of other species are found in Africa, one in the Himalayas of northern India *(I. xanfhonotus)* and one in the Malay peninsula and Borneo *(I. archipelagicus).* The smallest is the sharp-billed or dwarf honey guide *(Prodotiscus insignis),* 4½ in. long, of Congo and west African forests, with the slightly larger *P. regulus* and *P. zambesi* in the grasslands of south Africa and the Cameroons. The lyre-tailed honey guide (*Melichneutes robustus)* and rare *Melignomon zenkeri* occur in the Belgian Congo and Cameroons forests.

(G. F. Ss.)

HONEY LOCUST, the popular name of a North American tree (*Gleditsia triacanthos),* of the family Leguminosae, native to fertile soils from western Pennsylvania through Ohio and Ontario to Michigan and Minnesota and south ard to Alabama and Texas, and also naturalized from cultivation eastward of this range. It reaches from 75 to 140 ft. in height with a trunk 2 or 3 or sometimes j or 6 ft. in diameter, and develops slender spreading branches which form a broad, flattish crown. The branchlets bear numerous simple or three-forked (whence the species name *triacanthos)* sharp, stiff thorns three to four inches long, at first red in colour, then chestnut brown; they are borne above the leaf axils and represent the undeveloped branchlets; sometimes they are borne also on the trunk and main branches. The long-stalked leaves are seven to eight inches long. Both pinnate and bipinnate leaves are usually found on the same tree. The former have from 7 to 1 j pairs of oblong leaflets and the latter, 4 to 7 pairs of pinnae. The flowers, which are of two kinds, are borne in racemes in the leaf axils; the staminate flowers in larger numbers. The brown pods are often 12 to 18 in. long, have thin, tough walls and contain a quantity of sweetish, succulent pulp between the numerous seeds; when drying they contract into spiral-like structures which are often driven by winter winds over snow for considerable distances before releasing their seed.

JOHN H. GERARD

SPINY BRANCHLETS OF THE HONEY LOCUST (GLEDITSIA TRIACANTHOS)

The tree was first cultivated in Europe toward the end of the 17th century by Bishop Compton in his garden at Fulham, near London, and is now extensively planted as an ornamental tree. The much smaller water locust (G. *aquatica*), with shining brown pods, one to two inches long and containing only one or two seeds, inhabits deep swamps in the Mississippi valley from Illinois southward, ranging also eastward to South Carolina and Florida. The name of the genus commemorates Johann Gottlieb Gleditsch (1714–86), a friend of Linnaeus and the author of one of the earliest works on scientific forestry.

HONEYSUCKLE, botanical name *Lonicera,* a genus of climbing, erect or prostrate shrubs, of the family Caprifoliaceae, so named after the 16th-century German botanist Adam Lonicer. The common British species is L. *periclymenum,* the woodbine; *L. caprifolium* and *L. xylosteum* are found in a few counties in the south and east of England. Some of the garden varieties of the woodbine are very beautiful and are held in high esteem for their delicious fragrance, even the wild plant, with its pale flowers, compensating for its sickly looks "with never-cloying odours." The North American subevergreen *L. sempervirens,* with its fine heads of blossoms, is commonly called the trumpet honeysuckle; the most handsome of all the cultivated honeysuckles, it is a distinct and beautiful species producing both scarlet and yellow flowered varieties. The Japanese *L. flexuosa* var. *aureoreticulata* is esteemed for its charmingly variegated leaves netted with golden yellow.

ROCHE

TRUMPET HONEYSUCKLE (LONICERA SEMPERVIRENS)

The fly honeysuckle, L. *xylosteum,* and *L. tatarica,* both European and both hardy shrubs of dwarfish, erect habit, are among the oldest English garden shrubs and bear axillary flowers of various colours, occurring two on a peduncle. There are numerous other species, many of them grown in gardens and well worth cultivating in shrubberies or as climbers on walls and bowers, either for their beauty or the fragrance of their blossoms.

There are about 175 species, widely distributed in the northern hemisphere. upward of 30 of which, together with numerous varieties. are more or less cultivated. About 25 species, inclusive of several naturalized from the old world, are found in the United States and Canada.

Honeysuckles *(Lonicera)* flourish in any ordinary garden soil. Pruning should be done about March, cutting out some of the old wood and shortening back some of the younger growths of the preceding year.

In the western counties of England the name honeysuckle is applied to the meadow clover, *Trifolium pratense.* Another plant of the same family (Leguminosae). *Hedysarzim coronarium,* a very handsome hardy biennial, is called the French honeysuckle. The name is moreover applied with various affixes to several other totally different plants. Thus white honeysuckle and false honeysuckle are names for the North American *Azalea viscosa;* Australian or heath honeysuckle is the Australian *Banksia serrata;* Jamaica honeysuckle, *Passiflora laurifolia;* dwarf honeysuckle, the widely spread *Cornus suecica;* Virgin Mary's honeysuckle, the European *Pulmonaria officinalis.* The West Indian honeysuckle is known as *Tecoma capensis,* which is also a name applied to

Desmodium.

HONFLEUR, seaport of France in the *département* of Calvados, 57 mi. N.E. of Caen by rail, on the Seine estuary opposite Le Havre, with which it communicates by steamboat. Pop. (1954) 8,054.

Honfleur dates from the 11th century and is 500 years older than Le Havre, which supplanted it in the 18th century. During the Hundred Years' War it was frequently taken and retaken, the last English occupation ending in 1440. In 1562 the Protestants took it after a siege of the suburb of St. Léonard; and though Henry IV captured it in 1590 he had again to invest it in 1594 after the rest of Normandy had submitted to his arms.

Early in the 17th century Honfleur was a centre for exploration; its colonists founded Quebec, and Honfleur traders established factories in Java and Sumatra and a fishing establishment in Newfoundland.

The most noteworthy building is the timber church of St. Catherine. The church tower stands on the other side of a street. Above the town is the chapel of Nôtre-Dame-de-Grâce, a shrine visited by pilgrim sailors; it was founded in 1034 by Robert the Magnificent of Normandy and rebuilt in 1606. The town has a tribunal and a chamber of commerce. The port consists of the tidal harbour and four floating basins. A reservoir affords the means of sluicing the channel and supplying the basins. The harbour was begun by Duquesne in 1668. Honfleur has regular steamship service for passengers to Le Havre, Southampton and London and bus service with Trouville.

Honfleur exports mainly to England and trades in poultry, butter, eggs, cheese, chocolate, baskets, shell work, vegetables, fruit, seeds and purple ore. Timber from Scandinavia, English coal and artificial manures are imported. There are important sawmills as well as shipbuilding yards, iron foundries and manufacturing of chemical manures, oil and shoes.

HONG KONG, a British crown colony off the Kwangtung coast of southern China, comprising the island of Hong Kong and adjacent islets, Kowloon peninsula and Stonecutters Island (Ngon Shun Chau) and the leased New Territories on the mainland with surrounding islands. The total area of the colony is 3984 sq.mi., of which Hong Kong Island is 29 sq.mi. and Kowloon, $3\frac{3}{4}$ sq.mi. Hong Kong Island is 11 mi. long and from 2 to 5 mi. wide, and lies 90 mi. S.E. of Canton and 40 mi. E. of Portuguese Macao. It is separated from the mainland by a channel which is about one mile broad between Victoria, the island's capital, and Kowloon, and $\frac{1}{3}$ mi, at its narrowest point. The harbour formed by the channel can take ocean-going ships up to 40,000 tons, and compares in size and beauty with any in the world.

PHYSICAL GEOGRAPHY

Geology, Structure and **Relief.**—Hong Kong and the New Territories are part of the great batholith of granitic rocks which covers southeast China from Chekiang to Cambodia. The age relationships of the major groups of rocks are associated with the intrusions and mountain building of the Jurasside, Laramide and Alpine revolutions. Apart from small areas of sedimentary rocks belonging to the Lias and Eocene systems, the rest of the colony (approximately 90%) is composed of acid volcanic, porphyritic and granitic rocks. The general structure of the region is that of an asymmetrical anticline which strikes northeast to southwest and is parallel in trend with the China coast. The axis of the monocline passes almost exactly through the centre of Hong Kong and is marked by a depression which is the Tolo channel.

Generally the area consists of numerous rugged and irregular islands with deeply dissected peninsulas. A general picture is that of an upland terrain which has been invaded by the sea. The uplands and mountains are eroded remnants of rock formations. Weathering is almost entirely caused by chemical action aided by the alternation of wet and dry seasons. As a result, decay to a mantle of laterite is common, often to depths exceeding 100 ft. The highest peaks and the most prominent ranges of hills are composed of either porphyries or volcanics. They are in contrast to the granite hills which occur generally at lower elevations but which have well-etched peaks and sharp ridge lines. The plains are all recent alluvial deposits. Benches, marking former sea levels up to 400 ft. or more, indicate the deep submergence of the whole region within recent geological times. Submerged weathered rock surfaces overlain by peat deposits have been discovered by boring in the harbour. The highest peaks are: Tai Mo Shan (3,140 ft.) and Ma On Shan (2,300 ft.), both on the mainland; Lan Tao peak (3,061 ft.) and Sunset peak (2,857 ft.), both on Lan Tao. and Victoria peak (1,805 ft.) on Hong Kong Island. There are many steep-sided slopes which, with the exception of those on the island, are barren or covered by a very coarse, scrub-like vegetation for the most part.

Soils.—In general the natural residual soils of Hong Kong are acid. The igneous rocks from which they are derived have a silica content higher than 65%. There is a wide variation in the natural soil types. Typical are a grayish sandy loam, yellow-gray loam, pinkish-brown loam and black clay-loam. Most soils have a ratio of silica to alumina which is less than two. By comparison with soils in more temperate climates, they are low in fertility and need the addition of lime, potash and superphosphates.

Climate.—Lying only just inside the northern tropic, the colony has a climate classed as subtropical. It has highly contrasting seasons which range from a hot, humid summer (June to August, mean 82° F.) to a cool, temperate winter (January to February, 60°). The climate is controlled by the northeast monsoon, which blows from October to April, and the southwest monsoon, from June to August; the area receives three-quarters of its annual rainfall during the latter period. In summer there are periods of bad weather caused by typhoons as well as strong winds and heavy rains caused by tropical depressions. The mean relative humidity exceeds 80% in the summer, but occasionally falls to as low as 20% in early winter. The average daily duration of sunshine ranges from three hours in March to seven hours in October. There is a wide range of annual rainfall: the average is 84.76 in., but in 1889, 119 in. was recorded, and in 1895, only 45.83 in. The Tai Lam Chung reservoir, completed in 1957, and a number of other reservoirs provide water during dry periods and help to prevent flooding during the monsoons.

Vegetation and Animal Life.—Centuries of exploitation through cutting and burning have removed all traces of the natural vegetation cover. Today, owing to intensive schemes of reforestation, the island is well wooded with a wide range of trees such as banyan, eucalyptus, cotton, camphor, acacia, olive, palm and coniferous species. Cultivated land, mainly for rice and vegetables, covers about 50 sq.mi. Marsh land with mangroves, coarse grassland which is of little use as pasture and bare, eroded badlands make up the rest of the area. Apart from snakes, lizards, frogs and a few wild deer, monkeys, boars and an occasional tiger or leopard on the mainland, the animal life of the colony is domestic, the stock comprising principally fowl, ducks, pigeons, pigs and cattle.

HISTORY

Archaeological remains of pottery, stone implements, rings and bronzes found on more than 20 sites throughout the colony are evidence of settlements in Neolithic times. One characteristic design found nowhere else in Asia, the double F, belongs to the 3rd century B.C. The earliest peoples in Hong Kong are thought to have come from north China on their way to Borneo, the Philippines and Formosa in the 2nd millennium B.C. The Cantonese appear to have begun to settle in the area about A.D. 500; later came the Hakka, and by the middle of the 17th century, the Hoklo, who maintained a reputation as pirates.

Hong Kong was also a scene of the last struggles of the dying Ming dynasty with the newly risen Manchus (mid-17th century). There are one or two relics that provide little but pointers to some bygone incidents, such as a Han dynasty tomb in Kowloon, and the Sung Wang T'ai, a granite boulder near the village of Ma Tau Chung, which commemorates the flight through the Kowloon area of the last emperor of the Sung dynasty late in the 13th century. In A.D. 964, about 8,000 troops were stationed at Tai Po in the New Territories to protect the pearl industry for the Sung emperor.

BERNADINE BAILEY

HONG KONG HARBOUR. SEEN FROM VICTORIA PEAK. SHOWING THE BUSINESS DISTRICT OF VICTORIA AND KOWLOON PENINSULA ACROSS THE BAY

Before the British occupation. Hong Kong Island was inhabited only by a small fishing population and was a notorious haunt of pirates. It was used as a base for British ships during the first Opium War of 1839–42 but its harbour had been used to shelter opium-carrying vessels since 1821. The great commercial and strategic significance of this deep, sheltered harbour, possessing east and west entrances and lying right on the path of the chief trade route to China, was quickly realized. Its cession in perpetuity to Great Britain in 1841, confirmed by the treaty of Nanking (1842), was one of the chief results of the war and Hong Kong grew within less than a century to be one of the world's greatest ports. *(See* CHINA: History.)

At the outset, however, Hong Kong was menaced because of its proximity to the mainland, where conditions were almost always insecure. **A** special source of danger was the Kowloon peninsula, which dominated the harbour and threatened Victoria. In 1860, by the convention of Peking, Britain obtained possession of part of Kowloon and Stonecutters Island. In 1898 Britain was granted a gg-year lease of the mainland known as the New Territories, which included Mirs bay and Deep bay (Hau Hoi Wan) and surrounding islands. Kowloon became an outlet for the overflow population of Hong Kong and a field for its industrial development, while the New Territories were a potential source of raw material for its trade and industry.

Hong Kong afforded an impartial refuge, both for persons and capital, during the internecine struggles which followed the inauguration of the Chinese republic in 1911. The emergence of nationalism was accompanied by hostility toward foreign interests and during 1925–27 a boycott excluded British trade from all the ports of south China. After the Japanese conquest of Manchuria, however, Chinese official relations with the British in Hong Kong became increasingly friendly. From 1937 Hong Konq was once more a refuge, hundreds of thousands of Chinese fleeing there before the advancing Japanese. With the outbreak of nar in Europe in 1939 the position of the colony became precarious. and when the Japanese opened hostilities on Dec. 7, 1941, they immediately attacked Hong Kong; after bitter fighting the colony was surrendered on Christmas day. It was liberated by British troops on Aug. 30, 1945, and civil government was re-established in May 1946, after which the colony made an astonishingly rapid recovery. Thousands of Chinese returned, producing a housing problem which was made more acute by the influx of refugees fleeing from the Communist armies in the Chinese civil war between 1948 and 1950. A survey made in 1954 for the United Nations estimated the number of Chinese refugees in Hong Kong at 700.000. The flow has since continued in fluctuating waves and the estimated number in Jan. 1959 was over 1.000.000.

POPULATION AND ADMINISTRATION

Population.—Of the total land area, 12 sq.mi. (mainly round the harbour) are developed for residential, commercial or industrial purposes; 50 sq.mi. are cultivated; and the rest is largely hillside or swamp which is unsuitable for agriculture and could not be developed for other purposes without an unwarrantably heavy expense. Thus the immediately usable land is 62 sq mi. From this area and the fishing grounds around Hong Kong about 850.000 people obtained a livelihood in 1931. By Dec. 1941, when the Japanese invaded the colony from the mainland, the population had increased to 1 600.000. On the British reoccupation in 1945 the number had decreased to about 600.000. By the end of 1946 it was again around 1 603.000; by 1955, 2,400,000, and by the 1961 census it was 3.128.044. Not all of the increase was immigrant population; much was due to natural increase.

Chinese comprise more than 99% of the population. The bulk are from Kwangtung, Cantonese being the largest group followed by Hakka, Hoklo and Tanka. Since 1949 many have come from Shanghai. At the end of 1958 the number of British subjects (United Kingdom and Commonnealth), excluding forces personnel, numbered about 15,000. Other nationalities were: Ameri-

can 2,147; Portuguese 1,630; Filipino 581; Japanese 359; Dutch 354; French 312; Italian 281. English is the official language. A great variety of Chinese languages and dialects are spoken in the colony, but Cantonese is the lingua franca. Others widely used are Hakka, Chiuchow, Mandarin and Shanghai. The main religion is Buddhism, but Christian denominations are well represented and there are small groups of Moslems.

Administration.—Hong Kong is administered, under letters patent of 1917, by a governor, an executive council and a legislative council; the two councils include Chinese members. An urban council has statutory responsibility for such matters as public health and sanitation. The New Territories are in the hands of a district commissioner aided by four district officers. Direct taxation on incomes and profits was begun in 1947 and the standard rate of tax has remained at 12½% since 1950. There are estate and stamp duties and entertainment, betting and sweepstake taxes.

Living Conditions.— The daily wage in 1959 was as follows: skilled workmen H.K.$ 7 to H.K.$ 12; semiskilled H.K.$ 4 to H.K.$ 8; unskilled H.K.$ 2.50 to H.K.$ 6. A bonus of one month's wages is normally paid at Chinese New Year. Some Chinese firms provide free food and accommodation for full-time employees. The average daily hours of work are 9 hours for men and 9½ hours for women. In European undertakings the 48-hr. week is standard. Because of the constant flow of refugees from China there is no shortage of labour, but the refugees have accentuated the housing problem. The majority of the population lives in overcrowded tenements along the fringing settlements of the harbour in Victoria and Kowloon. Domestic buildings damaged during World War II were replaced by 1950 and about 1,000 new buildings a year have been constructed. Rents are higher than in most other places in the world and the average workman pays from 25% to 45% of his wages in rent. There are many thousands of roof dwellers, squatters and street sleepers who cannot be housed. The results of a housing survey by the University of Hong Kong in 1957 showed that 79% of all households were sharing their accommodation with others; 95,000 households lived in cubicles; 43,000 in bed spaces; 8,000 in attics; and 4,000 on verandas. Out of the 267,000 households surveyed, only 20,400 had a living room not used for sleeping.

Welfare.— The voluntary welfare organizations and the government social welfare department co-operate closely. More than 40 voluntary organizations are federated in the Hong Kong Council of Social Service. In the fields of housing, education and public health great efforts have been made, but in the face of the high rate of population increase, the problem has remained a very formidable one.

The government controls or performs anti-epidemic and anti-malarial work, tuberculosis control, maternity work, infant welfare, social hygiene, public health propaganda, food and drug control and other health measures. It maintains and operates 12 general and special hospitals and many dispensaries, and provides grants to several others. There are also 19 private hospitals run by charitable and missionary institutions.

Justice.— The courts of Hong Kong include the supreme court, district court, magistrates' courts, marine court and tenancy tribunals. The laws of England with modifications for local conditions are used. The judiciary and the courts are independent of the government administration. The police force has an establishment of over 7,000. Only about 300 are British officers and the rest, except for a few Indians and White Russians, are Chinese. There is an auxiliary police force and villages are policed by locally selected village guards.

Education.— Since World War II education has made enormous progress. While in 1945 there were roughly 4.000 children in schools, by Sept. 1958 there were 418,546. The number of schools of all types is about 1,350. Private schools represent 65% of all schools in Hong Kong. All education is voluntary, but not free. It is controlled under the Education ordinance of 1952, amended by a 1958 ordinance. Schools run by missionary bodies receive grants, and vernacular primary schools, mainly in the rural areas, are subsidized. Postsecondary education has received attention, since most graduates from the secondary schools no longer return to China to study at university level. A Chinese colleges' joint council was set up in 1958 to further the growth of these colleges, and scholarships to them are awarded by the government. A professional teachers' training board controls teacher training. In all, 13,334 teachers were teaching in 1958.

The University of Hong Kong, founded in 1911, is an independent body, mainly supported by government grants but with some endowment funds. There are four faculties: arts, science, medicine and engineering and architecture. With students of the Institute of Oriental Studies and the social study course, there were 1,126 undergraduate and postgraduate students in 1958. The standard of teaching is that reached in the United Kingdom, and the minimum qualification for entry is the matriculation examination.

Local Forces and Civil Defense.— The colony's auxiliary services comprise the Royal Hong Kong defense force, the auxiliary police and the essential services corps. The latter is split into four autonomous services: essential services corps proper, civil aid services, auxiliary fire service and auxiliary medical service. All these services, which consist partly of volunteers and partly of persons enrolled since 1951 under compulsory service for locally resident citizens of the United Kingdom, are financed locally. Volunteer service in Hong Kong first began in 1854. In 1941 the Hong Kong volunteers proved their value by their gallant resistance to the Japanese.

THE ECONOMY

The foundation of Hong Kong in 1841 as a free port was the response of the government of Great Britain to the need of merchants for a trading centre on the China coast that could offer protection and safety. The only safe deep-sea anchorage between Shanghai and Indochina, Hong Kong became the entrepôt for trade throughout southern China and the western Pacific, with its own banking and insurance institutions; its prosperity depended on the freedom of trade. But the colony later added to its earlier function that of a manufacturing and industrial area. This movement received its first impetus during World War I when supplies from Europe were reduced; but the greatest impetus began about 1935, with the establishment of factories as a result of the disturbed conditions in southern China and of imperial preference (*q.v.*) under the Ottawa agreements. After World War II, industrial expansion continued rapidly. In 1949 refugees from China streamed in, with money, technical knowledge and new ideas. It was this that saved Hong Kong from financial disaster, since its position as an entrepôt had seriously declined. In 1950–51 Hong Kong further stifled its trading activity when it supported a United Nations' resolution and banned all exports to North Korea and the export to China of about 200 items of strategic importance. The switch from trade to manufacture was so rapid that few at first realized its significance. By the end of the 1950s locally manufactured goods accounted for approximately 40% of the entire value of the exports.

Agriculture.— Before Hong Kong became a British colony, agriculture, together with a little fishing, was its sole basis of livelihood; but trade and industries have almost obscured this aspect of its life. Rice, the chief crop, occupies about two-thirds of all farm land. Six to eight crops of Chinese vegetables are harvested annually and vegetables are sold through the government marketing organization. In the cool months cauliflower, cabbage, lettuce and tomatoes are grown in large quantities. Sweet potatoes, peanuts, taro, radishes, yams, sugar-cane and ginger are also grown. Fruit production is rapidly developing. In favourable locations there are plantations of pineapples, oranges, bananas, litchis, papayas, figs, pomelos, apricots and peaches.

Forestry.— The forestry division of the agriculture, fisheries and forestry department encourages forestry generally and is directly concerned with afforestation of water catchment areas, village forestry and scenic beauty. For nearly 75% of the colony, forestry is the only economic form of land development. In the New Territories about one-quarter of the entire area has been set aside for forestry reserves. The main species planted are of pine (*Pinus massoniana*), *Casuarina* and *Eucalyptus*.

THREE LIONS

STREET LIBRARY IN HONG KONG

Mining. — The chief economic minerals mined and worked are iron, lead, graphite, tungsten, kaolin clay, feldspar, sand and crushed granite. The most active concern is the iron mine at The Hunchbacks (Ma On Shan), and a monthly average of about 9,000 tons of ore is shipped, mainly to Japan.

Fisheries. — Marine fish is the main primary product of Hong Kong and its volume is the largest of any port in the colonies. The industry employs over 8.500 junks of various sizes and 20 Japanese-type trawlers. A government fish marketing organization (nonprofit) controls the landing and wholesale marketing. Fish is exported to other countries in the far east and to the U S.

Industries. — Heavy industries include more than 20 shipbuilding and repair yards. steel rolling and processing mills and cement factories. The following well-established light industries are responsible for about one-third of the entire value of the colony's exports: electric bulbs, canned goods, ceramics, cotton goods, enamelware, flashlights, matches, paint, plastics, rattanware, rope, rubber, shirts, shoes, sugar and textiles.

Trade. — From 1945 to 1948 trade expanded rapidly because of the general shortage of consumer goods. Trade with China improved in 1949 but after the imposition of the embargo on certain strategic articies in 1951 the tonnage of goods handled for China fell by 17½% compared nith the previous year. By 1957 when the embargo was modified, the Chinese government had begun to make bulk deals direct with foreign governments. The economic effects of the Korean War brought one compensation, however: the United States enacted in 1952 its Foreign Assets Control regulations whereby the importation of goods into the U.S. originating from China and North Korea was prohibited. Many Chinese-style products could still be imported by American firms and the market for these goods became extremely valuable to Hong Kong. Certificates of origin were instituted. Over 56% of the value of all exports was taken by six countries: United Kingdom (the most valuable customer), Malaya, United States, Thailand, Indonesia and China. Of the value of total imports, 64% came from China (the principal source). Japan, the United States and the United Kingdom. The main imports from China were foodstuffs, vegetable oils, Chinese medicines, glassware, tea, coal, cement, feathers, hides and silk.

Banking, Currency and Finance. — The unit of currency is the Hong Kong dollar, divided into 100 cents. Its exchange value fluctuated with the price of silver until 1935. Since then it has been tied to the English pound and an exchange fund has kept its value remarkably steady at 1s. 3*d*. (U.S.$ 0.17½). Besides locally incorporated banks there are also branches of many foreign banks, and insurance companies of international standing are well represented. There is a local stock exchange and facilities are also available for the buying and selling of stocks and bonds on the American and European markets.

Apart from the cost of external defense, to which a local contribution is made, Hong Kong is financially self-supporting. Since 1947 the budget has been balanced each year, often with a surplus, and at the close of the 1950s annual revenue and expenditure each amounted to between H.K.$ 589,900,000 and H.K.$ 629,300,000. The public debt in the form of repayable loans totalled nearly H.K.$ 85,000,000.

Transport and Communications. — Almost all the 479 mi. of roads in Hong Kong and the New Territories are of concrete or asphalt and are classified as first class. There are many motor vehicles of all types. A government-owned railway connecting with Canton and Peking runs from Kowloon for 22 mi. to the frontier. Ocean-going ships of all nations maintain regular services to the port, which is equipped with modern navigation aids. Ferries operate between Kowloon and Victoria and to outlying districts. The Hong Kong international airport at Kai Tak is located alongside the harbour on the mainland and a modern runway, constructed on a promontory extending into Kowloon bay, was opened in 1959. Letter and parcel post external services and efficient cable and radio services keep Hong Kong in touch with the world. Wired radio and television broadcast daily programs. Weather observation and forecasting is done by the Royal observatory.

(S. G. D.)

HONITON, a market town and municipal borough in Devonshire, Eng. The centre of a dairy farming area, it lies among hills in the widening valley of the Otter river, 17 mi. E.N.E. of Exeter by road. Pop. (1951) 4,613. Area, 4.9 sq.mi. Honiton (Honetona, Huneton, meaning "Huna's farm" rather than the popularly accepted "Honeytown") was probably the site of an early settlement but it does not appear in history before the Domesday survey. It was then a considerable manor, held by Drew (Drogo) under the count of Blortain, who had succeeded Elmer the Saxon, with a subject population of 33, a flock of 80 sheep, a mill and 2 saltworkers. The borough was founded before 1217 by William de Vernon or de Redvers, earl of Devon, whose ancestor Richard de Redvers had received the manor from Henry I. In the 14th century it passed to the Courtenays and in 1698 Sir William Courtenay was confirmed in the right of holding court leet, view of frankpledge and the nomination of a portreeve, these privileges having been surrendered to James II. The borough was represented by two members in parliament in 1300 and 1311, and then not again till 1640, from which date it returned two members until disfranchised by the act of 1868, the returning officer being the portreeve, who was also the chief magistrate of the borough until its incorporation by charter of 1846. In 1221 Falkes de Breauté, then custodian of the borough, rendered a palfrey for holding a three days' fair at the feast of All Saints, transferred in 1247 to the feast of St. Margaret and still held under that grant. A market for corn and other produce is still held on Saturday by prescription. The wool manufacture flourished at Honiton in the reign of Henry VII, and it is said to have been the first town at which serges were made but the industry entirely declined during the 19th century. The town borders the wide main road for about a mile. The restored church of St. Michael, formerly a parish church about ½ mi. from the town. was built by Peter de Courtenay, bishop of Exeter, about 1482. It contains the black marble tomb of Elizabeth I's physician, Thomas Marwood. St. Margaret's

hospital, founded as a lazar house in the 14th century, is converted into almshouses. Honiton was formerly the centre of a famous lace industry, established by refugees from Flanders under Elizabeth I. The delicate fabric made by hand on the pillow was long in demand; its sale was, however, greatly diminished by the competition of cheaper machine-made goods. Genuine Honiton lace is still made in the neighbourhood, however, the craft being taught in the schools and fostered by women's institutes. The town gives its name to one of the parliamentary divisions of Devon. returning one member.

HONOLULU, capital and principal port of Hawaii and seat of the city and county of Honolulu, at 21° 18′ N., 157° 51′ W., is on the south coast of Oahu Island, 2,091 nautical miles S.W. of San Francisco. A modern city in mid-Pacific, with a special picturesqueness of its own, it is the crossroads of transpacific steamer and air routes, the centre of similar interisland services and the main port of trade with the U.S. mainland. During World War II and the Korean war it was a staging area of prime importance. Not only is the city the gateway to the other Hawaiian islands but is itself, along a-ith its suburbs of Waikiki and Pearl Harbor, a sight-seeing goal for thousands of tourists annually.

The city extends about 10 mi. along the Oahu shore and 4 mi. inland across a plain a mile wide and up ridges and valleys to a mountain range from 2.000 to 3,100 ft. high. Near the middle are the modern harbour, business section, civic centre and, a mile back. Punchbowl crater (500 ft., containing the National Memorial Cemetery of the Pacific); at the east end, like a lion couchant, stands Diamond Head crater (760 ft.); at the west end the lower Salt lake craters separate the city from the naval base of Pearl Harbor. With its ocean front; colourful vegetation and background of mountains and blue sky. Honolulu is considered one of the most beautiful of cities. Tempered by cool trade breezes, the plain has a temperature range of from 56° to 88' F., with a mean of 74.6°, while annual rainfall averages 28.6 in., the temperature decreasing and rainfall increasing with altitude.

The residential area spreads between mountains and sea and includes homes in a dozen architectural traditions. Business buildings rise near the busy harhourside. centre of trade and shipping for all Hawaii. The civic centre, a spacious park, contains or is bordered by the federal building. the territorial capitol (Iolani palace, the only former royal palace now under the U.S. flag). city hall, judiciary, library, archives. tax and armoury buildings, and the residence of the governor, Washington Place. The city has a stock exchange and a chamber of commerce and there are pineapple canneries, ironworks and a few light industries.

History. — Honolulu means "sheltered harbour." It mas overlooked by James Cook in 1778 and by other early explorers, and was not discovered until 1794. Thereafter it became a place of resort for vessels (especially whalers and sandalwood traders) and merchants from the beginning of the 19th century. Kamehameha I (the Great) lived there from 1803 to 1811. In 1820 the city became the principal residence of the sovereign and soon afterward of foreign consuls. but it did not become the permanent. capital until 184j.

Russian forces arrived at Honolulu in 1816 and the city was later occupied by Great Britain (1843) and France (1849), but was returned to the independent kingdom of Hawaii each time. After about 1820 the city assumed first importance in the islands and its history is closely comparable with that of Hawaii as a whole. Honolulu continued as the capital city when Hawaii was annexed to the U.S. (1898) and when it became a state (1959).

The most critical day of the 20th century in Honolulu was Sunday. Dec. 7, 1941, when the city was under sporadic attack by Japanese planes. which bombed military installations on the island of Oahu, particularly the naval base at neighbouring Pearl Harbor. Civilian casualties in Honolulu numbered at least 57 dead and many injured. Thereafter Honolulu became the spear point for the steady attack against the Japanese forces in the Pacific during World War II. The Korean war lent further emphasis to the strategic importance of the city. In the second half of the century, Honolulu became an increasingly important centre for tourist travel and an expanding residential area, marked also by an expansion of light manufacturing.

Administration, Area and Population. — The centre of government for the executive, legislative and judiciary branches of Hawaii: Honolulu is also the seat of the city and county of Honolulu, set up in 1907 by the territorial legislature. The area of the city and county covers a total expanse of 540,000 sq.mi., in a roughly triangular region of the Pacific ocean running northwest almost to Midway Island and south to Palmyra Island. However, for most purposes the city-county area is that of the island of Oahu. Pop. (1960) city, 294,179; county (the standard metropolitan statistical area), 500.409. For comparative population figures see table in HAWAII: Population.

Transportation.—As the "crossroads of the Pacific," Honolulu is a main stop on all world steamer and air routes. Many bus routes connect with lines over the concrete and macadam roads of rural Oahu, and two tunnels through peaks of the Koolau range behind the city lend speedy access to the growing residential areas of the north shore. Honolulu and its hinterland are supplied with light and power, gas, water and sewer systems. The region is connected to the rest of the world by interisland telephones, ship-to-shore radio, transpacific cable and interisland and transpacific radio. The chief exports are sugar and pineapple products.

Cultural Activities. — The University of Hawaii is in Honolulu (see HAWAII). There are numerous civic. scientific: historical, literary, art, dramatic, musical, professional, industrial, religious and social welfare organizations. Churches include those of Christian and several oriental denominations. Periodicals are published in several languages. Honolulu had nine radio stations and three television stations and two daily newspapers in English in the latter 1950s. People of many cultural and racial backgrounds mingle freely and harmoniously in various activities.

HAWAII HALL. UNIVERSITY OF HAWAII

Recreation. — There are many drives, parks and playgrounds, the largest parks being Kapiolani, between Diamond Head and Waikiki, and Ala Moana, along the shore. Much was done for beautification, including the elimination of billboards from roadsides. There is a profusion of introduced plants. particularly flowering varieties. Most mainland sports can be enjoyed 12 months of the year.

Waikiki, a beach resort 4 mi, from downtown Honolulu, is a centre ior water sports, surfboard riding and canoeing in particular. There rise many hotels, some of which are as high as 14 stories. Facilities include a yacht harbour and an aquarium.

Pearl Harbor, an important base for the U.S. navy for many years, adjoins Honolulu to the west, centred on a cloverleaf-shaped. improved harbour which is one of the largest and safest in the world. The right to use Pearl Harbor as a coaling and repair station was granted to the U.S. by the Hawaiian monarchy in 1887, but congress did not authorize funds for construction of a naval base until 1907. Ships may tie up at Ford Island or anchor in the arms of the harbour. There are fueling and repair docks,

dry docks, a submarine base, shops, supply depots and training centres. From 1947 Pearl Harbor was the headquarters for the unified command of the U.S. army, navy and air force for the Pacific area. See also HAWAII; WORLD WAR II. (A. G. DY.)

HONORIUS, the name of four popes and one antipope.

HONORIUS I (d. 638), pope from 625 to 638, a member of a distinguished Campanian family, was elected pope Oct. 27, 625. In his government of the church Honorius continued the policies of St. Gregory the Great. He sent missionaries to Anglo-Saxon England, admonished the Christian Celts to conform to the Roman rite and, in co-operation with several councils, reorganized the recently converted Visigothic Spain. He was less successful in his attempts to convert the Arian Lombards. He died Oct. 12, 638.

Honorius I was condemned in 681 by the third council of Constantinople as a heretic because in the Monothelite controversy he had assumed a conciliatory policy out of practical considerations. Leo II in 682 confirmed the condemnation, saying that Honorius had "permitted the faith to be stained." That Honorius was actually a heretic is open to question, for he seems to have misunderstood the point at issue and his language is quite unscientific. His lapse was much discussed at the time of the Vatican council (1870) in connection with the promulgation of the doctrine of papal infallibility; that doctrine, however, requires that only when a pope speaks ex cathedra is he infallible, and it has not been shown that any opinion of Honorius was an ex cathedra definition of faith or morals.

See J. Chapman, *O.S.B.*, ***The*** *Condemnation of Pope Honorius* (1907).

HONORIUS II (Peter Cadalus) (d. 1072), antipope from 1061 to 1072, was born in the territory of Verona. Bishop of Parma c. 1045, he mas an opponent of the reform movement in the church. When Hildebrand (afterward Pope Gregory VII) and his fellow reformers, in virtue of the decree on papal elections of 1059, brought about the election of Alexander II on Sept. 30, 1061, without imperial sanction, Agnes, regent for Henry IV, was able with the aid of Lombard and German bishops to have Cadalus chosen at Basel as Honorius II, on Oct. 28, 1061. He was installed at Rome by force of arms in April 1062. Duke Godfrey of Tuscany succeeded in persuading both contenders to await the imperial decision. Agnes in the meantime had lost the regency and Anno of Cologne, who succeeded her, ordered an investigation which resulted in a decision favourable to Alexander. Cadalus in May 1063 again established himself in Rome but had to depart the following year when the council of Mantua again decided in favour of Alexander. Cadalus lived in obscurity till 1072, apparently maintaining his claims till the end.

HONORIUS II (Lamberto Scannabecchi) (d. 1130), pope from 1124 to 1130, was born of a humble family at Fagnano near Imola, rose to be cardinal bishop of Ostia (1117) and was Calixtus II's legate to Germany. His pacific temperament helped to close the investiture (*q.v.*) controversy by the concordat of Worms (1122) and won him the good mill of the imperialists. In the conclave that met to elect a pope on the death of Calixtus, the Frangipani won the people for Honorius after Theobald had been chosen as Celestine II. When Honorius offered to resign. the cardinals renewed his election (Dec. 15, 1124). His reign, which was an era of peace and reform, saw the pope come to an understanding with the rulers of the period. As a result his position was greatly strengthened. Henry I of England accepted a papal legate; Louis VI of France settled his contests with the French hierarchy; Lothair of Supplinburg owed his election as emperor to papal support and paid his debt by deferring to the pontiff. Honorius was forced, however, to recognize the claims to Apulia of Roger II of Sicily. He died at Rome on Feb. 13, 1130.

HONORIUS III (Cencio Savelli) (d. 1227), pope from 1216 to 1227, nas a Roman aristocrat who became treasurer of the Holy See in 1188 and a cardinal in 1193. He was elected to succeed Innocent III as pope on July 18, 1216, and gathered the fruits of the reign of that great pontiff at least in the spiritual sphere. Under him, the Dominicans, Franciscans and Carmelites were approved and church life revitalized. Honorius resisted the emperor Frederick II, once his pupil, but avoided an open break in the hope that the emperor would take the crusade seriously. But Frederick outmaneuvered the elderly prelate in this as in other matters. The activities of Honorius, however, in the interests of justice and peace were felt throughout the west. He was, among other things, instrumental in securing the crown of England for the minor Henry III. He died March 18, 1227.

HONORIUS IV (Giacomo Savelli) (c. 1210–1287), pope from 1285 to 1287, was a grandnephew of Honorius III. Cardinal in 1261, he was elected unanimously on the first ballot (April 2, 1285) although aged, infirm and only a deacon. During his short reign he favoured the mendicant orders and promoted the study of Oriental languages in order to effect a union with the Eastern churches. He intervened against Aragon in the dispute over Sicily. He died at Rome on April 3, 1287. (J. V. HN.)

HONORIUS, FLAVIUS (384–423), son of Theodosius I, ascended the throne as "emperor of the west" in 39j. During the early part of his reign the west was attacked on all sides by barbarian hordes. Italy was saved by the exertions of Honorius' guardian and father-in-law, the Vandal Stilicho (*q.v.*), but Gaul was overrun by barbarians (winter 406–407) and in 409 the central government was forced to abandon Britain. After the murder of Stilicho (408), Italy was again invaded by Alaric the Visigoth and in 410 Rome was taken and sacked. Alaric died in the same year and in 412 Honorius concluded peace with his brother-in-law and successor Ataulphus (Adolphus), who married the emperor's sister Placidia and withdrew with his troops to southern Gaul.

A succession of usurpers arose (411–416) in Gaul and Spain, but were overthrown by Honorius' general Constantius, who was rewarded with a share in the government (d. 421). It was only as a supporter of the orthodox church and persecutor of the heathen that Honorius displayed any energy. In 399 the exercise of the pagan cult was prohibited and the revenues of the temples, which were to be appropriated for the use of the public or pulled down, were confiscated to defray the ekpenses of the army. Honorius was equally severe on heretics, such as the Donatists and Manichaeans. He is also to be credited with the abolition of the gladiatorial shows in 404 (although there is said to be evidence of their existence later), a reduction of the taxes, improvements in criminal law and the reorganization of the defensores *civitatum,* municipal officers whose duty it was to defend the rights of the people and set forth their grievances. Honorius at first established his court at Milan, but on the report of the invasion of Italy, fled to Ravenna, where he resided till his death on Aug. 27, 423.

HONOS, the Roman deified abstraction of Honour, particularly as a military virtue. The earliest shrine of this deity in Rome, not earlier than the 3rd century B.C., was located just outside the Colline gate. A double temple of Honos and Virtus stood outside the Porta Capena and another, built by Marius, was probably located on the Capitoline. See also VIRTUS.

(R. B. LD.)

HONOUR, a term which may be defined as respect, esteem or deference paid to, or received by, a person in consideration of his character, worth or position; also the state or condition of the person exciting the feeling or expression of such esteem; particularly a high personal character coupled with conduct in accordance with a discriminating sense of what is right and true and due to the position so held. Further, the word is commonly used of the dignities, distinctions or titles, granted as a mark of such esteem or as a reward for services or merit, and quite generally of the credit or renown conferred by a person or thing on the country, town or particular society to which he or it belongs. The standard of conduct may be laid down not only by a sense of what is due to lofty personal character but also by the usages of society; hence it is that debts which cannot be legally enforced, such as gambling debts, are called "debts of honour." Similarly in the middle ages and later, courts, known as "courts of honour," sat to decide questions such as precedence, disputes as to coat armour, etc. (see CHIVALRY); such courts, chiefly military, are found in countries where dueling has not fallen into desuetude (see DUEL).

In English the word mas spelled with or without the *u* indifferently until the 17th century, but during the 18th century it became fashionable to spell the word "honor"; Johnson's and Webster's

Dictionaries stereotyped the English and American spellings respectively.

HONOURABLE ARTILLERY COMPANY. On Aug. 25, 1537, Henry VIII granted a charter of incorporation to the Guild of Fraternity of St. George, a guild of archers and handgunmen. The wording of the charter, however, implies that a guild existed before the grant was made and that it was now receiving royal support. As a military formation it is probably the oldest regiment in the world. All kinds of archery being classified as artillery, this guild of archers soon became known as the artillery company. (It has, however, had numerous designations.) Under the charter the government of the guild was placed in the hands of four masters or rulers and they were charged, among other things, with the establishment of a perpetual fraternity of St. George for the general encouragement of the "Science of Artillery for Longe Bowes Crosbowes and Handgonnes, etc."

Under Edward III the chief resort of London archers for practice was in the open spaces at Finsbury and Moorfields, later known as the artillery ground or artillery garden, and in this neighbourhood the H.A.C. always had its headquarters, except for the first few years of its existence. During the early years following its incorporation the company was the training centre for the City of London when necessity demanded an augmentation of the forces, a notable occasion being the year of the Great Armada. On this occasion not only did it train the citizens of London in the science of small artillery, but many of its members went to several parts of the kingdom with the rank of officers to train the various trained bands.

The system of training inaugurated in London by the company stimulated the corporations of other towns to follow their example, notably in the early part of the 17th century. None of these provincial companies survived but an offshoot of the old company continued to flourish in the U.S. as the "Ancient and Honourable Artillery Company of Boston, Massachusetts," the oldest military body in the new world, whose original title was the "Military Company of Massachusetts." The original members of this American company were members of the London company who had migrated in the 16th century. They trained the citizens in the art of war and when the militia came into existence, its officers were drawn from the company.

The roll of the regiment contains the name of one of England's greatest poets, John Milton, who was entered on June 2, 1635. His military career was short but no doubt he gained an intimate knowledge of the pike or musket. Charles I took an interest in the company and sanctioned the enrollment of the prince of Wales, then only 11 years old, and his brother, James, duke of York, as members of the company. The elector of Palatine, a grandson of James I, became a member on the same day—June 1, 1641.

At the outbreak of the Great Rebellion the company represented the only efficient trained bands in the country and parliament regarded them as a reliable reserve. Of their number the name of Skippon is known to history. Capt. Philip Skippon was captain of the company in 1639 and became commander of the forces with the rank of sergeant major general in 1642. He joined the parliamentary forces and became chief of the staff to the earl of Essex.

In 1660 the duke of York was elected commander in chief of the company, he being the first and last holder of that title. His successor, William III, styled himself captain general and this title still survives, the reigning monarch being captain general of the company. In the middle of the 17th century the company was in great favour at court and many of the nobility and gentry of the royal household enrolled themselves as members; *e.g.,* Prince Rupert, the duke of Albemarle, the earl of Sandwich, Lord Craven, the dukes of Monmouth, Ormonde, Manchester, Anglesey and Buckingham. Other distinguished members of the company about this time were Marlborough, Christopher Wren the architect, Vauban the great French engineer, William, 2nd earl of Denbigh and Kirke, the notorious colonel of "Kirke's lambs." The company kept abreast of the times as regards developments in the military art and in 1714 added some grenadiers to the establishment. In 1860 a troop of horse artillery was added but this was disbanded in 1869.

This is the only regiment which has the unique distinction of having battle honours on its king's colour only. (T. J. E.; X.)

HONTHEIM, JOHANN NIKOLAUS VON (1701–1790), German historian and theologian, was born of noble family on Jan. 27, 1701, at Trier. He was educated at Trier, Louvain and Leyden, and after traveling extensively in Europe, spent three years in Rome, where he was ordained priest in 1728. Returning to Trier as canon, he became a professor at the university in 1732, but six years later went to Coblenz as official to the archbishop-elector. In 1747, broken down by overwork, he retired to St. Simeon's at Trier, and in May 1748 was appointed auxiliary bishop and vicar-general. He was consecrated at Mainz, in Feb. 1749, under the title of bishop of Myriophiri *in partibus*. The archbishop of Trier was practically a great secular prince, and upon Hontheim fell the whole spiritual administration of the diocese; this work, in addition to that of prochancellor of the university, he carried on singlehanded until 1778. Hontheim died on Sept. 2, 1790, at his château at Montquentin near Orval.

As a historian his reputation rests on his *Historia Trevirensis diplomatica et pragmatica* (3 vol., 1750) and his *Prodromus historiae trevirensis* (2 vol., 1757). The *Historiae scriptorum et monumentarum Trevirensis amplissima collectio* remains in manuscript at the city library of Trier. It is, however, as "Febronius" that Hontheim is best remembered. The character of his book on "the state of the church and the lawful power of the Roman pontiff" is described elsewhere (*see* FEBRONIANISM). The author of the book was known at Rome almost as soon as it was published; but it was not till several years afterward (1778) that he was called on to retract. The removal of the censure followed (1781) when Hontheim published at Frankfurt his *Justini Febronii acti commentarius in suam retractationem*, etc.

HONTHORST, GERARD VAN (1590–1656), Dutch historical, portrait and genre painter, born at Utrecht on Nov. 4, 1590, was brought up in the school of Abraham Bloemart. He then went to Italy, where he was influenced by the realism and chiaroscuro of the great Michelangelo da Caravaggio. Home again in 1622, he entered the Guild of St. Luke, becoming dean in 1625–26–28 and 1629. The queen of Bohemia, sister of Charles I and electress palatine, being an exile in Holland, asked him to teach her children drawing; and Honthorst, thus approved, was invited by Charles I to England. There he painted several portraits and a vast allegory, now at Hampton Court, of the king and queen of Bohemia as Diana and Apollo in the clouds receiving the duke of Buckingham as Mercury and guardian of the king of Bohemia's children. In his home at Utrecht Honthorst finished, in 1631, a large picture of the king and queen of Bohemia "and all their children." For Lord Dorchester about the same period he completed some illustrations of the *Odyssey;* for the king of Denmark he composed incidents of Danish history, of which one example remains in the gallery of Copenhagen. In 1637 he settled at The Hague, and became court painter (1641).

His most attractive pieces are those in which he cultivates the style of Caravaggio, those, namely, which represent taverns peopled with players, singers and diners. He shows great skill in reproducing scenes illuminated by candlelight (*e.g.,* "Christ Before Pilate"), and he liked to transmute every subject into a night scene. He died on April 27, 1656.

HOOCH, PIETER DE (1629–after 1683), Dutch genre painter noted for his interior scenes, was born in Rotterdam. He was a pupil of N. Berchem at Haarlem. From 1653 he was in the service of Justus de Grange, and lived at Delft, The Hague and Leyden. In 1654 he married a girl of Delft, Jannetje van der Burch. From 1654 to 1657 he was a member of the painter's guild of Delft, but after that date we have no traces of his doings until about 1667, when his presence was recorded in Amsterdam. His dated pictures prove that he was still alive in 1683. His work shows affinity with the painting of Vermeer, who was living at Delft at the same period as De Hooch. De Hooch only once painted a canvas of large size, and that unfortunately perished in a fire at Rotterdam in 1864. But his small pieces display perfect finish combined with great power of discrimination. Though he

sometimes painted open-air scenes, these were not his favourite subjects. He was most at home in interiors with the radiance of the day, in different intensities, seen through doors and windows. He thus brought together the most delicate varieties of tone. His simple household scenes, done while he lived in Delft, are considered his best works. After moving to Amsterdam he attempted more elegant scenes of society life that lack the homely charm and intimacy of his earlier works.

"THE COURTYARD OF A HOUSE IN DELFT" BY PIETER DE HOOCH. IN THE NATIONAL GALLERY. LONDON

Over 320 works of De Hooch are located in European and American galleries.

HOOD, JOHN BELL (1831–1879), U.S. soldier, lieutenant general of the Confederate army. mas born at Owingsville, Ky., in **1831** and graduated at West Point Military academy in 1853. As a cavalry officer he saw service against Indians, and later he was cavalry instructor at West Point. He resigned from the U.S. service in **1861**, and became a colonel in the Confederate army. He was soon promoted brigadier general, and with the famous "Texas brigade" of the army of northern Virginia he served throughout the campaign of **1862.** At Gettysburg he commanded one of the divisions of Longstreet's corps, receiving a wound which disabled his arm. With Longstreet he was transferred in the autumn of **1863** to the army of Tennessee. At the battle of Chickamauga (Sept. 19–20) Hood was severely wounded again and his leg was amputated. He remained with the army of Tennessee as a corps commander. and when the general dissatisiaction with the Fabian policy of Gen. J. E. Johnston brought about the removal of that officer. Hood was put in his place. But in spite of skill and courage he was uniformly unsuccessful in the battles around Atlanta. In the end he had to abandon the place, but he forthwith sought to attack Sherman in another direction. and finally invaded Tennessee. His march was pushed with the greatest energy, but he failed to draw the main body of the enemy after him. and. while Sherman with a picked force made his "march to the sea," Thomas collected an army to oppose Hood. A severe battle was fought at Franklin on Nov. **30, 1864,** and finally Hood was defeated and his army almost annihilated in the battle of Nashville on Dec. **1j-16,1864.** He was then relieved at his own request (Jan. **23,** 1865). After the war he engaged in business in New Orleans. where he died of yellow fever on Aug. **30, 1879.** His experiences in the Civil War are narrated in his *Advance and Retreat* (1880).

HOOD, SIR SAMUEL (1 **762-1814),** British vice-admiral, entered the navy in 1776. His first engagement was the battle off Ushant in 1778, and he was present in the West Indies, under the command of his cousin Sir Samuel Hood, at all the actions which culminated in Lord Rodney's victory of April 12, 1782. After the peace, he spent some time in France, and on his return was given the command of a sloop, from which he proceeded in succession to various frigates. Early in **1793** the "Juno" went to 'the Mediterranean, and Hood distinguished himself by an audacious feat of seamanship in extricating his vessel from the harbour of Toulon, which he had entered in ignorance of Lord Hood's withdrawal. Soon afterward he was put in command of a frigate squadron for the protection of Levantine commerce, and in 1797 was given the "Zealous" **(74** guns), being present at Nelson's unsuccessful attack on Santa Cruz. He conducted the negotiations which relieved the squadron from the consequences of its failure. At the battle of the Nile the "Zealous!' put her first opponent out of action in 12 minutes, and Hood immediately engaged other ships. the "Guerrier" being left powerless. When Nelson left Egypt Hood commanded the blockading force off Alexandria and Rosetta. Later he rejoined Nelson on the coast of the two Sicilies.

In the "Venerable" Hood was present at the action of Algeciras, and the battle in the Straits of Gibraltar (1801) when his ship suffered heavily. A year later Captain Hood was employed in Trinidad as a commissioner and, upon the death of the flag officer commanding the Leeward station, succeeded him as commodore. Island after island fell to him and soon, outside Martinique, the French had scarcely a foothold in the West Indies. In command next of the squadron blockading Rochefort. Hood had a sharp action on Sept. 25, 1805, with a small French squadron which was trying to escape. On this occasion he lost an arm. Promoted rear admiral, Hood brought the operations against Madeira to a successful conclusion (1807) and a year later took part, in the "Centaur," in the war betn-een Russia and Sweden. Present in the roads of Corunna at the re-embarkation of the army of Sir John Moore, Hood thence returned to the blediterranean. where for two years he commanded a division of the British fleet. In 1811 he became vice-admiral. He died at Madras, Dec. **24,** 1814.

ALEXANDER HOOD (1 **758-98),** brother of Adm. Sir Samuel Hood, entered the navy in 1767, and accompanied Capt. James Cook in his second voyage round the world. Under Lords Howe and Rodney he distinguished himself in the \Vest Indies, and at the victory of April 12. 1782, was in command of one of Rodney's frigates. Under Sir Samuel Hood he then proceeded to the Mona passage, where he captured the French corvette "Cérès." It was not until 1797 that he went afloat again. His first experience was bitter; his ship, the "Mars," was unenviably prominent in the mutiny at Spithead. On April 21. 1798, occurred the famous duel of the "Mars" with the "Hercule." fought in the dusk near the Bec du Raz, in which. though successful, Hood lost his life.

HOOD, SAMUEL HOOD, 1ST VISCOUNT (1 724–1816), British admiral who served during the Seven Tears' War and the American and the French Revolutionary wars, was born on Dec. 12, 1724. He entered the navy on May **6.** 1741, served part of his time as midshipman with Capt. George Rodney in the "Ludlow Castle" and became lieutrnant in **1746.** In 1754 he was made commander of the "Jamaica" sloop, and served in her on the North American station. where in 1756 he was posted to the "Lively." He returned to England later in the year in the "Grafton." to which he had been appointed by Commodore C. Holmes. In 1757, while in temporary command of the "Antelope" (50 guns), he drove a French ship ashore in Audierne bay and took two privateers. In recognition of his services he was given command of the frigate "Bideiord." In 1; 59, when captain of the "Vestal" (32), he captured the French "Bellona" (32) after a

sharp action off Cape Finisterre. During the war his services were wholly in the English channel, and he was engaged under Rodney in 1759 in destroying the transports collected by the French for the proposed invasion of England. In 1760 he mas sent by his own request to the Mediterranean. In 1778, after further service in North America,. he became commissioner of the dockyard at Portsmouth and governor of the naval academy; and in 1780 mas promoted rear admiral and was sent to the West Indies as second in command under Lord Rodney (*q.v.*).

Hood joined Rodney in Jan. 1781. and remained in the West Indies or on the coast of North America until the close of the American Revolutionary War. The turn taken by the campaign of 1781 was largely due to Rodney's neglect of his advice. If he had been allowed to choose his own position, there seems to be no doubt that he could have prevented the comte de Grasse from reaching Ft. Royal with the reinforcements from France in April. When the fleet went on to the coast of North America during the hurricane months of 1781, he was sent to serve with Adm. Thomas Craves in the unsuccessful effort to relieve the army at Yorktown. When he returned to the West Indies he was for a time in independent command because oi Rodney's absence in England, and the British islands of St. Kitts and Nevis were attacked by the French admiral. De Grasse, with a force much superior to Hood's squadron. Hood's attempt to save it from capture. Jan. 1782, with 22 ships to 29, failed, but the bold movements by which he first turned the French out of their anchorage at ihe Basseterre of St. Kitts, and then beat off the attacks of the enemy, were the most brilliant things done by any British admiral during the war. He was made an Irish peer for his share in the defeat of De Grasse on April 9 and 12 near Dominica.

On the outbreak of the French Revolutionary War Hood was sent to the Mediterranean as commander in chief. His period of command (May 1793–Oct. 1794) was very active. In August he occupied Toulon on the invitation of the French royalists, and in co-oweration with the Swaniards. In December of the same year the allies. who did not work harmoniously together, were driven out. mainly by the generalship of Napoleon, and Hood now occupied Corsica: which he had been invited to take in the name of the king of England by Pasquale Paoli. Meanwhile the French at Toulon had recovered sufficiently to send a fleet to sea. In June Hood sailed in the hope of bringing it to action. The plan which he laid to attack it in Juan gulf in June may possibly have served to some extent as an inspiration, if not as a model, to Nelson for the battle of the Nile. but the wind was unfavourable, and the attack could not be carried out.

In October, Hood. who was now full admiral, was recalled to England. He ,held no further command at sea, but in 1796 he was named governor of Greenwich hospital, a post which he held until his death on Jan. 27, 1816. A peerage of Great Britain was conferred on his wife as Baroness Hood of Catherington in 1795, and he was himself created Viscount Hood of Whitley in 1796.

HOOD, THOMAS (1799–1845). British humorist and poet, the son of Thomas Hood. bookseller, was born in London on May 23, 1799. On the death of her husband in 1811 Mrs. Hood removed to Islington. where Thomas Hood had a schoolmaster who appreciated his talents. The boy earned a few guineas—his first literary fee—by revising for the press a new edition of *Paul* and *Virginia*. After a short period in a countinghouse. where the confinement threatened his health, he was transferred to the care of his father's relations at Dundee. On his return to London in 1818 he learned engraving. in n-hich he acquired a skill that enabled him to illustrate his own works.

In 1821 he became subeditor of the *London Magazine,* and thus came into contact with Charles Lamb, Cary, De Quincey, Allan Cunningham. Proctor. Talfourd, Hartley Coleridge, the peasant-poet Clare and other contributors to the magazine. He had married in 182j. and *Odes and* .Addresses—his first work—was written in conjunction with his brother-in-law J. H. Reynolds, the friend of Keats. The *Plea of the Midsummer Fairies* (1827), a book of verse written under the strong influence of Keats, and a dramatic romance. *Lamia,* published later, belong to this time. But reputation came to him not from his serious verse. but from the series of the Comic Annual, dating from 1830, which Hood undertook and continued, almost unassisted, for several years. He treated current events in a fine spirit of caricature: entirely free from grossness and vulgarity, without a trait of personal malice and with an undercurrent of true sympathy and honest purpose that gives these papers, like the sketches of Hogarth, a permanent value. Hood was an inveterate punster, and annoyed his more serious readers by his excesses in this direction. He defended himself in the couplet:

> However critics may take offence,
> A double meaning has double sense.

In another annual called the Gem appeared the poem on the story of "Eugene Aram," which first showed his full poetical power. Hood started a magazine in his own name: and conducted this work from a sickbed. To this period belong those poems, too few in number, but immortal in the English language, such as the "Song of the Shirt" (which appeared anonymously in the Christmas number of Punch, 1843), the "Bridge of Sighs" and the "Song of the Labourer," which pictured in moving verse the appalling condition of the industrial worker of his day.

Hood was associated with the *Athenaeum,* started in 1828 by J. Silk Buckingham, and he was a regular contributor for the rest of his life. Prolonged illness brought on straitened circumstances; and Sir Robert Peel allotted to him a small pension from the civil list, which was continued to his wife and family after his death on May 3, 1845.

BIBLIOGRAPHY.—The list of Hood's separately published works is as follows: *Odes and Addresses to Great People* (1825); *Whims and Oddities,* two series (1826 and 1827); *The Plea of the Midsummer Fairies, Hero and Leandcr, Lycus the Centaur and other Poems* (1827), his only collection of serious verse; *The Dream oj Eugene Aram, the Murderer* (1831); *Tylney Hall, a* novel, 3 vol. (1834); *The Comic Annual* (1830–42); *Hood's Own; or, Laughter From Year to Year* (1838; 2nd series, 1861); *Up the Rhine* (1840); *Hood's Magazine and Comic Miscellany* (1844–48); *National Tales,* 2 vol. (1837). a collection of short novelettes; *Whimsicalities* (1844), with illustrations from Leech's designs; and many contributions to contemporary periodicals.

The chief sources of his biography are: *Memorials of Thomas Hood, Collected, Arranged and Edited* by *His Daughter* (1860); his "Literary Reminiscences" in *Hood's Own;* Alexander Elliot, *Hood in Scotland* (1885). *See* also the memoir of Hood's friend C. W. Dilke, by his grandson Sir Charles Dilke, prefixed to *Papers of a Critic;* and M. H. Spielmann's *History of Punch.* There is an excellent edition of the *Poems of Thomas Hood,* 2 vol. (1897), with a biographical introduction of great interest by Alfred Ainger.

HOOD, a covering for the head. Some form of hood as a loose covering easily drawn on or off the head has formed a natural part of outdoor costume both for men and women at all times and in all quarters of the globe where climatic conditions called for it. In the middle ages and later both men and women wore it, but with men it tended to be superseded by the hat before it became merely an occasional and additional head covering in time of bad weather. For illustrations and examples of the hood as worn by men and women in medieval and later times see DRESS; as forming a distinctive mark of degree in academic costume see ROBES. The word is applied to many objects resembling a hood in function or shape, such as the belled covering for the head of a hawk trained for falconry, the endmost planks in a ship's bottom at bow or stern, and, in botany and zoology, certain parts of a dower or of the neck of an animal: which recall this article of dress.

HOOD MOLD, in architecture, a molding projecting from the face of the wall. immediately above an arch or opening whose curvature or outline it follows. It originated in the Romanesque period (see ROMANESQUE ARCHITECTURE) as a protection to the moldings below and to throw water away from the opening. and was later developed into an important decorative feature. It is almost universal over exterior arches in the Gothic work (see GOTHIC ARCHITECTURE) of France, Germany and Spain; in England it was. furthermore. common in interior work, especially in nave arcades. In profile. the hood mold has. usually, a downward sloping upper surface. and a hollow below to act as a drip; at its lower end, near the spring of the arch, it is either received upon the capital of a column or ends in a projecting. carved, ornamented boss. When used in a place other than an arch or opening, it is

known as a drip mold. *See* MOLDING.

HOOFT, PIETER CORNELISROON (1581–1647), Dutch poet and historian, was born at Amsterdam on March 16, 1581. His father was for some time burgomaster of Amsterdam. As early as 1598 the young man was made a member of the chamber of rhetoric De Eglantier, and produced before that body his tragedy of *Achilles and Polyxena*, not printed until 1614. In June 1598 he left Holland and proceeded to Paris, Venice, Florence and Rome, and in 1600 to Naples. During his Italian sojourn he made a deep and fruitful study of the best literature of Italy. He returned through Germany, reaching Amsterdam in May 1601. In 1602 he brought out his second tragedy, *Theseus and Ariadne* (printed 1614). In 1605 he completed his beautiful pastoral drama *Granida* (printed 1615). Hooft produced three other plays: *Geeraerd van Velsen* (1612, printed 1613); *Ware-nar* (1616), adapted from the *Aulularia* of Plautus; and *Baeto* (1625). He studied law and history at Leyden from 1606 to 1609, and in June of the latter year received from Prince Maurice of Orange the appointment of steward of Muiden, bailiff of Gooiland and lord of Weesp, a joint office of great emolument. He repaired and adorned the decayed castle of Muiden, where he lived for the rest of his life. There he entertained the poet Vondel, the scholar Barlaeus, Constantin Huygens, Vossius, Laurens Reael and others.

In 1618 he abandoned poetry for history. His prose works are *Hendrik de Grote* (Henry IV of France; 1626); *Miseries of the Princes of the House of Medici* (1638); *Nederlandsche Historien* (in 20 books, 1628–47), embracing the period from 1555 to 1585, a magnificent performance, to the perfecting of which he had given 1j years of labour. The seven concluding books were published posthumously in 1654. Hooft died on a visit to The Hague, on May 21, 1647, and was buried in the New church at Amsterdam.

Hooft is one of the most brilliant figures that adorn Dutch literature at its best period. He was the first writer to introduce a modern and European tone into belles lettres, and the first to refresh the sources of native thought from the springs of antique and Renaissance poetry. His lyrics and his pastoral of *Granida* are strongly marked by the influence of Torquato Tasso and Jacopo Sannazaro; his later tragedies belong more exactly to the familiar tone of his native country. But high as Hooft stands among the Dutch poets, he stands higher—he holds perhaps the highest place—among writers of Dutch prose. His historical style won the warmest eulogy, and his letters are the most charming ever published in the Dutch language.

BIBLIOGRAPHY.—Hooft's poetical and dramatic works were collected in 2 vol. (1871, 1875) by P. Leendertz. His letters were edited by B. Huydecoper (1738) and by Johannes van Vloten, 4 vol. (1855). The best original account of Hooft is given by G. Brandt in his *Leven van P. C. Hooft* (1677), and his funeral address (1647), edited together by J. C. Matthes (1874) There is an account of the Muiden circle in Edmund Gosse's *Northern Studies* (1879). *See* also P. Prinsen, P. C. *Hooft* (1922).

HOOGHLY (HUGLI), a town and district in the Burdwan division of West Bengal, India. The town, situated on the right bank of the Hooghly river, 24 mi. above Calcutta by rail, forms a municipality with Chinsura. Pop. (1951) 56,805.

HOOGHLY DISTRICT (area 1,217 sq.mi.; pop., 1951, 1,604,229) is flat, with a gradual ascent to the north and northwest. Along the Hooghly outside the towns a series of orchards and gardens, villages and temples are interspersed with the factories. Baidyabati, Champdani, Bhadreswar, Serampore and Rishra and Konnegar are all mill towns on the river. The principal rivers besides the Hooghly are the Damodar and the Rupnarayan. The highest land lies nearest the rivers, and the lowest levels are found midway between two streams. There are in consequence considerable marshes.

Rice and jute are the principal crops.

HOOGHLY (HUGLI), a highly important waterway in West Bengal, India, giving access to Calcutta (*q.v.*) from the Bay of Bengal (go mi.). It was formerly the most westerly of the channels by which waters from the Ganges reached the sea. It originated as the lower part oi the Bhagirathi, a distributary taking off from the main Ganges 7 mi. S.W. of Suti, hlurshidabad district, and it is given the name Hooghly at Nabadwip, about 120 mi. from the sea. But like other deltaic distributaries the Bhagirathi and the channels it receives on its left (east) side were subject to sudden changes and silting. and they carry little, if any, Ganges water to the Hooghly. The main outflow now comes from several rivers rising to the northwest on the Chota Nagpur plateau, the Ajay, which joins the Bhagirathi at Katwa, 40 mi above Santipur; below Calcutta, the Damodar, location of the large power and irrigation project in the 1950s; the Rupnarain and the Haldi. For 40 mi. above Calcutta the Hooghly is silted up, yet it was there that all the famous ports of Bengal once stood. Navigation up to Calcutta is kept open only by dredging and the scour of a bore that rushes up at high tide. The channel, well buoyed and lighted, is safe for large ocean-going vessels. From Calcutta the Hooghly flows west and south till it meets the Rupnarayn estuary; then twists east, south and southwest, entering the Bay of Bengal in 21° 41′ N., 88° E. Places of note on the Hooghly include Hooghly town, headquarters of the district of the same name; the former French settlement of Chandernagore; Serampore, site of the first university college in India (1818); and Howrah, opposite Calcutta all on the right bank. On the left bank, in addition to Calcutta are Barrackpore, important in the 1857 mutiny, Kidderpore (docks) and Diamond Harbour.

HOOGSTRAETEN, SAMUEL VAN (1627–1678), Dutch painter oi interiors and religious subjects, was born in Dordrecht, hug. 2, 1627. He studied first under his father Dirck and then, after his father's death in 1640, under Rembrandt. From 1651 to 1654 he traveled in Germany, Austria and Italy, staying for some time in Rome and Vienna. His name appears in The Hague painter's guild in 1668. In 1671 he bought a house in Dordrecht, where he died on Oct. 19, 1678. As a painter Hoogstraeten produced biblical and classical subjects, portraits, landscapes, genre and still life. His style was not profoundly influenced by Rembrandt, although an exception is the fine early head of a youth. His genre pieces are probably his most successful works, but he is best known for his ingenious perspective and *trompe l'oeil* (deceptively realistic) designs. In the latter class is "Peep Box: Dutch Interior," at the Detroit Institute of Arts.

Hoogstraeten also wrote on painting techniques.

(R. E. W. J.; X.)

HOOK, THEODORE EDWARD (1788–1841), English author, was born in London, spent a year at Harrow and subsequently matriculated at Oxford, though he never resided at the university. His father. James Hook (1746–1827), the composer of numerous popular songs, took great delight in exhibiting the boy's extraordinary musical and metrical gifts, and the precocious Theodore became "the little pet lion of the green room." At the age of 16, in conjunction with his father, he scored a dramatic success with *The Soldier's Return*, a comic opera, rapidly followed by a series of more than a dozen sparkling ventures, the instant popularity of which was hardly dependent on the inimitable acting of John Liston and Charles Mathews. Hook gave up ten of the best years of his life to the pleasures of the town, winning a foremost place in the world of fashion by his matchless powers of improvisation and mimicry, and startling the public by the audacity of his practical jokes. His unique gift of improvisation eventually charmed the prince regent into a declaration that "something must be done for Hook," and Hook was appointed accountant general and treasurer of the Mauritius with a salary of £2,000 a year. For five delightful years he was the life and soul of the island, but in 1817 he was arrested and brought to England on a criminal charge. A sum of about £12,000 had been abstracted by a deputy official. and for this amount Hook was held responsible.

During the tardy scrutiny of the audit board he lived obscurely and maintained himself by writing for magazines and newspapers. In 1820 he launched the newspaper *John Bull*, the champion of high Toryism and the virulent detractor of Queen Caroline. Witty incisive criticism and pitiless invective secured it a large circulation.

He was arrested for the second time because oi his debt to the state, which he made no effort to defray. In a sponging house,

where he was confined for two years, he wrote the nine volumes of stories afterward collected under the title of *Sayings and Doings* (1826–29). In the remaining 23 years of his life he poured forth no fewer than 38 volumes: besides numberless articles, squibs and sketches. The best of his many racy novels are *Maxwell* (1830), *Love and Pride* (1833), the autobiographic *Gilbert Gurney* (1836), *Jack Brag* (1837), *Gurney Married* (1838) and *Peregrine Bunce* (1842).

Hook died on Aug. 24, 1841.

HOOKE, ROBERT (1635–1703), English experimental physicist who discovered the first law of elasticity for solid bodies, known as Hooke's law, was born July 18, 1635, at Freshwater. Isle of Wight. After 1655 he was employed by Robert Boyle, who used his skill in the construction of his air pump. On Nov. 12, 1662, he was appointed curator of experiments to the Royal society, of which he was elected a fellow in 1663, and filled the office during the remainder of his life. In 1665 he was appointed proiessor of geometry in Gresham college. He was secretary to the Royal society between 1677 and 1683, publishing in 1681–82 the papers read before that body under the title of *Philosophical Collections.* He died on March 3, 1703, in London.

Hooke's scientific achievements would probably have been more striking if they had been less varied. He originated much, but perfected little. His optical investigations led him to adopt in an imperfect form the undulatory theory of light. He was the first to state clearly that the motions of the heavenly bodies must be regarded as a mechanical problem, and he approached in a remarkable manner the discovery of universal gravitation. He invented the wheel barometer, discussed the application of barometrical indications to meteorological forecasting and originated the idea of using the pendulum as a measure of gravity. He is credited with the invention of the anchor escapement for clocks, and the application of spiral springs to the balances of watches (1676).

See WATCHES.

His principal writings are *Micrographia* (1665); *Lectiones Cutlerianae* (1674–79); and *Posthumous Works,* containing a sketch of his "Philosophical Algebra," published by R. Waller in 1705.

See M. 'Espinasse, *Robert Hooke* (1956).

HOOKED RUG, a rug made by pulling narrow strips of wool or cotton cloth or wool yarn, with a tool roughly resembling a buttonhook, up through a basic material of coarse linen or burlap. The loops, approximately a half inch high, and the width of two, three or four mesh openings in the basic material, are often clipped. Frames of various designs hold the basic material taut. Frequently the rug is made by pushing, instead of pulling, the loop through the basic material, the instrument used being then generally a large threaded needle.

The origin of the hooked rug is obscure; beginning perhaps in the Scandinavian countries, the art was brought to America, by way of Great Britain, for its highest development. It has thrived best in New England and Canada. Early American examples show considerable variety in colour in a generally crude floral, animal or geometric design.

HOOKER, JOSEPH (1814–1879), U.S. general?was born in Hadley, Mass., Nov. 13, 1814. He was educated at West Point (1833–37), and entered the 1st U.S. artillery. In the war with Mexico (1846–48) he rose to the rank of lieutenant colonel. In 1853 he left the service but at the beginning of the Civil War he was commissioned brigadier general of volunteers, and major general on May 5, 1862. In the engagement of Williamsburg (May 5) he received the sobriquet of "Fighting Joe."

In the Maryland campaign (September) he was at the head of the 1st corps, army of the Potomac. forced the defile oi South Mountain and opened the way for the advance of the army. The 1st corps opened the battle of Antietam, and in a sanguinary fight with Confederates under "Stonewall" Jackson, Hooker was severely wounded. He was commissioned brigadier general in the U.S. army Sept. 20. 1862, and in the battle of Fredericksburg he commanded the centre grand division. When Burnside resigned the command Hooker succeeded him, and effected a much-needed reorganization in the army. In this task, as in subordinate commands in battle. Hooker was excelled by few. But his grave defects as a commander in chief were soon to be obvious. By a well-planned movement. he placed himself on the enemy's flank, but at the decisive moment he checked the advance of his troops. Lee turned upon him, Jackson surprised and destroyed a whole army corps. and the battle of Chancellorsville *(see* WILDERNESS), in which Hooker was himself disabled. ended in retreat. The second advance of Lee into Union territory was resisted by Hooker. who followed the Confederates only a day behind them, until. finding himself distrusted. he resigned the command.

When Rosecrans was besieged in Chattanooga, two corps of the army of the Potomac were sent over by rail. and Hooker went with them in command. He won the "battle above the Clouds" on Lookout mountain. He took part in all the battles and combats of the Atlanta campaign of 1864. When General McPherson was killed before Atlanta. the command oi the army of the Tennessee fell vacant. Hooker was entitled to receive it, but Sherman feared to commit a whole army to a man of Hooker's temperament, and the place was given to Howard. Hooker thereupon left the army. He retired on Oct. 1j, 1868, and died at Garden City, Long Island, on Oct. 31. 1879.

HOOKER, SIR JOSEPH DALTON (1817–1911), English botanist, noted for his botanical travels and studies on geographical distribution and for his encouragement to Charles Darwin. was born on June 30. 1817 at Halesworth, the son of Sir William Jackson Hooker (*q.v.*). He took his M.D. at Glasgow university in 1839 and then joined Sir James Ross's antarctic expedition as assistant surgeon. On his return in 1843 he published *Flora Antarctica* (1844–47), *Flora Novae Zelandiae* (1853-jj) and *Flora Tasmanica* (185j-60). His next expedition was to the northern frontiers of India (1847–j1), where he made a survey of previously unexplored regions. In 185j he was appointed assistant director of Ken- gardens and in 1865 succeeded his father as director. He was president of the Royal society from 1873 to 1878. It was to him that Darwin first imparted his theory of natural selection in 1844. and he. with Sir Charles Lyell, induced Darwin to make public his views on the origin of species (1858) after A. R. Wallace had communicated similar ideas.

Hooker's works. in addition to those already mentioned. include *Outlines of the Distribution of Arctic Plants* (1862); a standard *Student's Flora of the British Isles* (1870); a monumental work. the *Genera plantarum* (1862–83). in collaboration with G. Bentham; and *Flora of British India* (1855–97). Among other honours he was awarded the Order of Merit in 1907.

He continued his botanical studies until his death at Sunningdale, Berkshire, on Dec. 10, 1911.

See L. Huxley, *Life and Letters of Sir J. D. Hooker,* 2 vol. (1918), with list of works; W. B. Turrill, *Pioneer Plant Geographer* (1953).

HOOKER, RICHARD (1554–1600), Anglican divine. author of *The Laws of Ecclesiastical Polity* and aptly known. in his own time and since, as the "judicious Hooker," was born of middle-class parents at Heavitree, near Exeter, in March 1554. Educated at Exeter school. he secured the patronage of John Jewel, bishop of Salisbury, through whose influence he entered Corpus Christi college. Oxford. Elected a foundation scholar in 1573. Hooker became a fellow in 1577. In his earlier years he was not without some Puritan sympathies, since his patrons — Jewel. and his uncle John Hooker — had been fellow-exiles in Mary's reign. In 1584 he vacated his fellowship for the benefice of Drayton Beauchamp. Buckinghamshire, but in the next year became master of the Temple. His appointment created a difficult situation. since Walter Travers, a popular preacher. was already established as reader; the master was loyal Anglican, the reader firm Presbyterian. so that on Sundays "the pulpit spake pure Canterbury in the morning and Geneva in the afternoon." The inevitable partisanship "turned to his extreme grief," for Hooker was of gentle disposition; also Travers' brother had married Hooker's sister. He sought release in order to examine in peace and quiet the principles underlying the establishment of the Church of England. In 1591 therefore he accepted the living of Boscombe in Wiltshire and a prebend in Salisbury cathedral. But he probably continued to live in London and there wrote the first four books of his

imperishable *Of the Laws of Ecclesiastical Polity* (published 1593). He had married Joan Churchman in 1588 and probably lived in her father's house till appointed to the rectory of Bishopsbourne, near Canterbury, in 1595. The legend, repeated by Thomas Fuller, John Gauden and Izaak Walton, that Joan was an unpleasant shrew of a wife, was accepted until disproved by C. J. Sisson in 1940. Hooker died at Bishopsbourne on Nov. 2, 1600, and was buried in his own chancel.

The *Laws of Ecclesiastical Polity* was planned to include eight books. There is evidence that Hooker completed these manuscripts: William Covell, writing in 1603, says that Hooker told him so. After his death they were entrusted to Dr. John Spenser, president of Corpus Christi college, who bequeathed them in 1614 to the bishop of London; about 20 years later George Abbott, archbishop of Canterbury, placed them in the Lambeth library. The fifth book had been published in 1597, but the last three books did not appear in their author's lifetime. Of these the present book 6 (which seems not germane to Hooker's general purpose) and book 8 (on the royal supremacy) did not appear until 1648; while book 7 (devoted to an examination of episcopacy) remained unknown until published in 1662, by Gauden, the unscrupulous bishop of Exeter.

This long delay in publication has aroused doubt about the authenticity of the last three books. Izaak Walton on hearsay evidence 40 years old alleged that Puritan friends of Joan mutilated the manuscripts. It is equally reasonable to assert, with Henry Hallam and Coleridge, that the enemies of Puritanism tampered with the two books on episcopacy and the royal supremacy, for in book 7 particularly the necessity of monarchical episcopacy is much more strongly urged than in the earlier books.

The Laws of Ecclesiastical Polity, a masterpiece of Elizabethan literature for its balanced, dignified style, is of great importance in theology, in political philosophy and as an exposition of the Tudor constitution. Hooker set himself to defend the Elizabethan settlement in church and state against Roman Catholics and Puritans. The safety of the realm demanded unity among its subjects, and as "Religion is the chiefest stay of the Commonwealth," Hooker's basis and outlook are theological. His most important single contribution was to affirm the Anglican tradition as that of a threefold cord not quickly broken—Bible, Church and Reason. Roman Catholics put Bible and tradition on a parity, while Puritans looked to Scripture as sole authority. Hooker avoided both extremes, allouing to Scripture absolute authority where it spoke plainly and unequivocally; where it was silent or ambiguous, wisdom would consult the tradition of the church in an interpretative role; but he insisted that a third element in religion lay in man's reason, itself part of the universal law and illuminated by God, which should be obeyed whenever both Scripture and tradition needed clarification, or failed to cover some new circumstance. Thus he not only avoided the "either-or" of Scripture *versus* tradition, but introduced a third and new element, human reason.

Consistently, therefore, Hooker distinguishes between "things necessary" in religion (*i.e.*, the great Christian truths contained in or deducible from Scripture, which must be believed) and "things accessory and dependent," which merely must not be contrary to Scripture. Thus, as an orthodox believer defending some ancient Catholic doctrines and explaining Anglican teaching—*e.g.*, finding auricular confession "profitable"—he resists the excesses of earlier reformers. But on the inflammatory though "accessory" topics of church polity, rites and ceremonies, he held that as Scripture prescribes no particular form of church government, reason permits that "the public society of God" in any land is free to erect its own polity and choose its own rites, for the church is an organic institution, in which the Holy Spirit still leads men into further truth by the light of reason. Thus, for example, while the Church of England has retained episcopacy, Hooker cannot deny validity to those reformed churches which reject it.

The core of Hooker's arguments on the relations of church and state is unity, the great concept of medieval thinking. In his view, the Puritans adupted an impossible position; they claimed to be loyal to the queen while repudiating the queen's church. "When they strike at the State Ecclesiastical, they secretly wound the Civil State." By law and by reason an Englishman must be an Anglican, pledged to serve Elizabeth as the supreme magistrate of his country and the supreme governor of his church. Both offices came to her through the wisdom of God and the laws of parliament, representing the authority of the whole realm. The church is the same society as the state, organically one, differing only in function. To preserve that identity and consequent unity—the alternative is division and ruin—there must be a supreme head over both; and Scripture, history and reason teach that this must be the sovereign. The church is not less divine by being organically bound with the state, but more so, because the state itself is of divine origin existing to a divine end (*i.e.*, to make "good" citizens).

Hooker's thesis necessarily introduced the question of authority and obedience, and these may only be harmonized by law.

> Of Law there can be no less acknowledged, than that her seat is the bosom of GOD, her voice the harmony of the world: all things in heaven and earth do her homage, the very least as feeling her care, and the greatest as not exempted from her power.

Thus, law is far from being mere command; it emanates from God and so is apprehended by man through reason. This natural reason directs individual men how to order their lives; and thus when men come to live together in a political society or commonwealth (itself natural as guaranteeing the satisfaction of human needs and fellowship) reason dictates that commonwealth must be inspired by law, which must establish government, or anarchy would prevail. Thus authority and obedience in society are natural as partaking of divine law.

It is not surprising that Sir W. S. Holdsworth declares that the *Ecclesiastical Polity* provides the best summary of the actual state of the law of sovereignty in the 16th century, and that in it the theory of the English state in that century can most clearly be seen. It is, therefore, of great historical interest because it is the only book which not only describes Tudor polity in church and state but also explains its underlying principles; while its constitutional importance is enhanced because the results of the controversies of the 17th century were to give practical effect to the theory of the state outlined in it.

Yet Hooker's apology is not wholly consistent: at one moment he asserts the sovereign's supremacy, at another the necessity of the subject's consent. Consequently people in opposite camps have cited him. Thus in 1932 and 1933 studies of his teaching on the Tudor state appeared in Italy and Germany, while in England republican writers such as Milton, Sidney and Locke have accepted his emphasis on the supremacy of the law as above prerogative rule, and have drawn from him the doctrines of the original freedom of man, of the contract by which he conditionally surrendered his freedom and of the resultant necessity for his real consent to proposals for law and of government: but conservative Hooker denies what they logically affirm, man's right to resist tyranny in the sovereign power.

BIBLIOGRAPHY.—The standard edition of the *Laws of Ecclesiastical Polity* is that *by* John Keble, 3 vol. (1836; rev. ed. by R. W. Church and F. Paget, 1888), to which is prefixed Izaak Walton's *Life*, written in 1665 to correct the *Life* by John Gauden in his 1662 edition of the *Works*. An account of Hooker's life is also prefixed to R. W. Church's 2nd edition of book 1 of the *Ecclesiastical Polity* (1876). C. J. Sisson's *Judicious Marriage of Mr. Hooker* (1940) challenged and superseded all these lives but is not in itself a complete biography. Contemporary criticism included William Covell's *Just and Temperate Defence of the Five Books* (1603). A. P. d'Entreve, *Ricardo Hooker* (1932), and G. Michaelis, *Richard Hooker als politischer Denker* (1933), show that Hooker was studied under the Fascist and Nazi regimes. *See* also R. A. Houk's introduction to his edition of book 8 (1931); P. Munz, *The Place of Hooker in the History of Thought* (1952); F. J. Shirley, *Richard Hooker and Contemporary Political Ideas* (1949); W. S. Holdsworth, *History of English Law*, vol. iv (1924), which deals with Hooker's philosophy of the Tudor state.

(F. J. SH.)

HOOKER, THOMAS (1586–1647), American clergyman, through his piety, zeal and wisdom unquestionably one of the foremost of colonial pastors, was born, probably on July 7, 1586, at Marfield, Leicestershire, Eng. He took his M.A. in 1611 at Emmanuel college, Cambridge, the intellectual centre of Puritan-

ism; remained there as a fellow for a few years; and then preached in the parish of Esher in Surrey. About 1626 he became lecturer to the church of St. Mary at Chelmsford. Essex. delivering on market days and Sunday afternoons evangelical addresses which were notable for their moral fervour. In 1629 Archbishop William Laud took measures to suppress church lectureships, which were an innovation of Puritanism. Hooker was placed under bond and retired to Little Baddow, near Chelmsford. In 1630 he was cited to appear before the court of high commission, but he forfeited his bond and fled to Holland, whence in 1633 he emigrated to the colony of Massachusetts Bay in America. He became pastor at Newtowne (now Cambridge, Mass.) of a company of Puritans who had arrived from England in the previous year and, in expectation of his joining them, were called "Mr. Hooker's Company." Hooker publicly criticized the limitation of suffrage to church members, and, according to a contemporary historian, William Hubbard *(General History of New England).* "after Mr. Hooker's coming over it was observed that many of the freemen grew to be very jealous of their liberties." He was a leader of the emigrants who in 1636 founded Hartford. Conn. *(see* CONNECTICUT). He declared, before the Connecticut general court of 1635, that "the choice of public magistrates belongs unto the people by God's own allowance" and "they who have the power to appoint officers and magistrates, it is in their power, also, to set the bounds and limitations of the power and place unto which they call them." Though this theory was in advance of the age and caused many historians to call him "the father of American democracy," Hooker had no idea of the separation of church and state — "the privilege of election. which belongs to the people," he said, must be exercised "according to the blessed will and law of God." Hooker was pastor of the Hartford church until his death on July 7, 1647.

See G. L. Walker's *Thomas Hookrr* (1891), the best biography, which contains a bibliography of Hooker's published works.

HOOKER, SIR WILLIAM JACKSON (1785–1865), English botanist famous for his work as the first director of the Royal Botanic gardens at Kew, Surrey, was born at Norwich on July 6. 1785, and educated at the high school there. The natural history specimens of his first botanical expedition to Iceland in 1809 were lost on the homeward voyage through the burning of the ship, but Hooker was able to publish an account. mainly from memory, of the island and of its inhabitants and vegetation *(Tour in Iceland,* 1811). In 1814 he spent nine months botanizing in France; Switzerland and northern Italy; and in 1815 he married Maria Turner and settled at Halesmorth, Suffolk, devoting himself to systematic botany and the analysis of his herbarium, which became of world-\vide renown among botanists. In 1816 he published the *Britislz Jungermanniae,* succeeded by a new edition of William Curtis' *Flora Londinensis;* by the *Muscologia Britannica,* prepared in conjunction with T. Taylor (1818; 2nd ed., 1827); and by his *Musci Exotici* (2 vol., 1818–20), devoted to new foreign mosses and other cryptogams. In 1820, on the recommendation of Sir Joseph Banks, he was offered and accepted the regius professorship of botany in Glasgow. In 1821 he brought out the *Flora Scotica.* In 1841 he was appointed director of the Royal Botanic gardens at Kew; and under his direction the botanical collection expanded sixiold. By his energy and influence he greatly advanced knowledge of the higher plants and ferns, algae. lichens and fungi. He died on hug. 12. 1865. One of his sons. Sir Joseph Dalton Hooker (*q.v.*), followed his father's lead in botany.

Hooker's most important works besides those mentioned above include: *Exotic Flora* (1822–27); *Botanical Magazine* (1827–64); *Incones Filicum,* with *R.* K. Greville (1829–31); *British Flora,* with G. A. W. Arnott *et al.* (1830; 8th ed., 1860); *Flora Borealis Americana* (1829–40); *Journal of Botany* (1830–42); *Icones Plantarum* (1836–54); *The Botany of Captain Beechey's Voyage to the Pacific and Behring's Straits,* with *G. A.* W. Arnott (1830–41); *Genera Filicunz* (1838–42); *London Journal of Botany* (1842–48); *Species Filicum* (1846–64); *Journal of Botany and Kew Garden Miscellany* (1849–57); *Niger Flora* (1849); *Filices Exoticae* (1857–59); *British Ferns* (1861–62).

See J. D. Hooker, *Sir William Jackson Hooker* (1903).

HOOKWORM is a parasitic roundworm. When present in excessive numbers, two important parasites. *Ancylostoma duodenale* and *Necator americanus,* cause hookworm disease in the human being.

A malady resembling hookworm disease was described in Egypt as early as 1600 B.C. *A. duodenale* was discovered in Europe and associated with the disease in the middle of the 18th century. *N. americanus* was discovered in America in 1901–02 by Charles W. Stiles. It probably originated in Africa and was introduced into the new world by slaves.

The female worm deposits eggs in the intestine of the host. Each egg contains a two- to eight-segmented embryo, when passed in the feces. The embryo grows in the soil and hatches in 24 to 48 hours as an immature, noninfective larva. After two to three days it molts and develops into a mature, infective, nonfeeding larva. On contact with the human skin it molts again and penetrates the deeper skin layers, often causing "ground itch." It then invades lymph and blood vessels, is carried to the lungs. passes up the respiratory tree to the mouth and is swallowed. The larva undergoes a third molt, anchors itself to the intestinal mucosa, molts for a fourth time and becomes an adult worm. The worms live in the small intestine, and eggs are passed in the feces as early as five to six weeks after the larvae enter the skin.

The average sizes of adult worms are: *A. duodenale:* males 7-11 × 0.45 mm., females 9-14 × 0.6 mm.; N. *americanus:* males 6-9 × 0.2j mm., females 8-12 × 0.4 mm. The worms live in the intestine for many months. A few may persist for six to seven years or longer. Continual reinfection and acquired partial resistance result in a more or less constant number of worms harboured. Infective larvae when swallowed can develop in the intestine without preliminary lung passage, but this mode of transmission is not common in nature. There are two dog hookworms, *A. brasiliense* and *A. caninum,* which may infect man. Usually they cause an aberrant infection. "creeping eruption" or larva migrans. This disease is characterized by serpiginous tunnels in the skin caused by migrations of larvae that are unable to penetrate the innermost layers.

Hookworm infection occurs in a zone from approximately latitude 38° N. to 34° S. and may be encountered in cooler regions. particularly in mines and tunnels. The geographical distribution is determined by temperature and rainfall. which influence development of free-living larvae. Other important factors are drainage, type of soil, social habits and customs, poverty and bad sanitation. Optimum temperature ior larval development is between 70° and 85° F., *4. duodenale* being better adjusted to the lower range than *N. arnericanus,* which predominates in warmer regions.

Fully developed eggs and newly hatched larvae die in a few days ii kept below 43° to 46° F. Mature larvae can resist freezing temperatures as long as six days; developmental time is tripled at temperatures of jj° to 60° F. Under optimum conditions, iniective larvae may remain viable in the soil for several months or longer, but under natural conditions in the tropics the majority rarely survive longer than five or six weeks. A minimum rainfall of 40 in. per annum is required to maintain the infection in endemic proportions. The distribution of the rainfall throughout the year is also important; *e.g.,* a long dry season is detrimental to larvae in the soil. Drainage and subsoil water level are important in irrigated regions, or where canals are present. Coarse, sandy soil with humus is much more favourable for larval development than fine clay or silt loam, since larvae migrate vertically with changes in moisture and temperature. They cannot pass rapidly through fine-textured soils and thus become dry and die.

Hookworm disease is a scourge of tropical climates, resulting in a debilitated anemic population. Anemia in hookworm disease results from sucking of blood by the adult worms in the intestine and the attendant inflammation of the bowel. A single *A. duodenale* can remove, on the average, almost one cubic centimetre of blood a day. As a bloodsucker, *N. arnericanus* is about one-fifth as efficient. Infected individuals on adequate diet have been classified in iour groups, according to numbers of *N. americanus* harboured: (1j carriers, 2j or fewer worms — no symptoms; (2) light infections, 26 to 100 worms — few or no symptoms; (3) mod-

erate infections, 101 to 500 worms—moderate symptoms; (4) heavy infections, more than 500 worms—severe symptoms. In general. the symptoms in classical, heavy infections include pallor or' skin and mucous membranes, edema of the face and extremities, constipation alternating with diarrhea, abdominal tenderness, increased appetite for bulky foods or unusual substances (clay eaters j, sexual derangements (delayed puberty, impotence, irregular menstruation), endocrine insufficiency, stunted growth, cardiac weakness, palpitation, hypersensitiveness of the skin to cold. physical debility, fatigue. dullness. apathy and melancholia.

Microscopic laboratory diagnosis is made by searching for characteristic eggs in feces. In moderate or heavy infections, eggs are easily found. In light infections, so few eggs may be present that concentration by brine or zinc suliate flotation methods should be used. Egg-counting techniques are useful in estimation of the number of worms harboured by an individual. Parasitism with a very few eggs in feces is harmless. The laboratory report, therefore, should indicate the degree of infection, as determined by the egg count.

Treatment **and** Control.— Treatment involves removal of the worms and reduction of anemia. Worm removal in severe cases requires great skill. The vermifuge may be harmful if given before the patient is improved physically. Thus preliminary blood transfusion may be required with dietary and iron therapy before the vermiiuge is given. Many vermifuges have been used. Thymol, oil of chenopodium and carbon tetrachloride are effective but also toxic. They were supplanted by tetrachlorethylene and hexylresorcinol. The former is a safe drug and removes 90% or more of the worms on a single treatment. It may, however. cause migration of the roundworm *Ascaris lumbricoides*. Hexylresorcinol has no serious contraindications, is effective against 80% of the worms and removes 90% of *A. lumbricoides* on a single treatment. "Creeping eruption" caused by the larva of the dog hookworm is treated by freezing the migratory larvae in the skin with carbon dioxide snow or ethyl chloride spray. Mass treatment of large groups of heavily infected persons has been successful in reducing the incidence of hookworm, especially during the dry season when the soil contains few larvae and reinfection is minimal. Repetition of treatment every two to three years may be required.

Transmission of infection depends upon indiscriminate disposal of human infected excreta. Where all workers in the soil go barefoot. there is ample opportunity for intimacy of contact with polluted soil. The wearing of shoes would eliminate the disease. but in most hookworm regions the people cannot afford shoes and are ignorant of the dangers of bad sanitation. Without proper education and improvement in standard of living, little can be accomplished in securing satisfactory, permanent hookworm control. The International Health board of the Rockefeller foundation pioneered in hookworm control and pointed the way for adequate control programs. The essentials of this program are: (1) education in the principles of sanitation, emphasizing the importance of adequate disposal of feces, and aid in construction of simple sanitary toilets; (2) establishment of full-time local health services staffed by trained competent personnel; (3) examination and treatment of persons infected with hookworm disease; (4) continuous observation of the area to prevent the return of former unsanitary conditions. The success attained indicates the possibility of global control of this insidious tropical disease. *See* PARASITIC DISEASES; PARASITISM AND PARASITOLOGY; TROPICAL MEDICINE. (I. R.)

HOOLOCK: *see* GIBBON; PRIMATES.

HOOPER, FRANKLIN HENRY (1862–1940), editor of the *Encyclopedia Britannica* from 1932 to 1938, was born at Worcester, Mass.. Jan. 28, 1862. a brother of Horace Everett Hooper (*q.v.*). He graduated from Harvard in 1883. He was associated with the Century company from 1883 to 1896. being one of the editors of the *Century Dictionary*. He was literary adviser and manager for James Clarke and company. publishers. 1897–99. and became an editor of *Encyclopedia Britannica* in 1899. He was connected with five diiferent editions of the *Britannica:* associate editor of the 10th edition (1902); managing editor of the 11th edition (1910); and American editor of the 12th (1922). 13th (1926) and 14th (1929) editions. In 1932 Hooper became editor in chief. He edited and planned *These Eventful Years* (1924). and was also editor of *Britannica Junior* and the *1938 Britannica Book of the Year*. He retired in April 1938 and died near Saranac Lake, N.Y., on Aug. 14, 1940.

HOOPER, HORACE EVERETT (1859–1922), publisher of the *Encyclopædia Britannica*, was born in Worcester, Mass., on Dec. 8, 1859. He was of English descent; his father's ancestors included "King" Hooper. who had controlled much of the Massachusetts fishing interests in the 1700s, and his mother was a descendant of John Leverett. governor of Massachusetts, 1672–79. Hooper ended his formal education at the age of 16. after attending schools in Worcester and Washington, D.C. He clerked in bookstores. then went to Denver. Colo., where. with others, he organized the Western Book and Stationery company to sell books in western states. In 189; he shifted his headquarters to Chicago, Ill., where he organized. among other enterprises. a highly successful sale of the *Century Dictionary* through colourful and aggressive advertising. On a vacation trip to London in 1897, he became cognizant of an opportunity to market the ninth edition of the *Encyclopædia Britannica* by similar methods. With three others—Walter Montgomery Jackson and the Clarke brothers. James and George—he secured reprint rights from A. and C. Black. the work's publishers. then persuaded the *Times* (London) to lend its reputation and imprimatur to the reprint edition. He reduced the price and revolutionized the sale of the set by instituting an installment payment plan. *Times* officials anticipated meagre results! but the sale was astounding; in the first three months of 1898 some 10,000 sets were sold and in the subsequent five years another 50,000.

The success of this venture led Hooper to prepare, in 1902, a supplement of 11 volumes (under the joint editorship of Sir Donald Mackenzie Wallace, Arthur T. Hadley, president of Yale university. Hugh Chisholm and Hooper's brother Franklin) which, added to the ninth, formed the tenth edition. Again the sale, sparked by flamboyant advertising and promotional techniques. was large. Consequently. Hooper's influence at the *Times* expanded; he took an active part in its management as advertising director and was instrumental in organizing the *Times* Book club. a move that led him into rancorous controversy with various book publishers. Shortly after Lord Northcliffe became proprietor of the *Times* in 1908. Hoopcr's connection with that paper ended. He continued to live in England. but also maintained homes in the United States.

In 1903 Hooper had organized the preparation of an entirely new edition of the *Encyclopædia Britannica*, the 11th. Unlike previous editions, this one. edited by Hugh Chisholm, was to be issued as a single unit and not volume by volume. Despite difficulties occasioned by Hooper's separation from the *Times* and his subsequent legal wars with his erstwhile partner. Jackson, the edition was published, under an arrangement with Carnbridge university. in 1910–11. It was successful, its sale reaching some 75,000 in the next few years. In the years immediately preceding and during World War I. Hooper initiated other publishing projects, notably an edition of the *Encyclopædia Britannica* in smaller and cheaper form known as the Handy Volume issue. of which some 200,000 copies were sold. His final enterprise was the publication early in 1922 of the three war volumes of the *Encyclopcedia Britannica* which, with the 29 volumes of the 11th edition. constituted the 12th edition.

A master salesman and a daring innovator, Hooper was passionately devoted to the educational product he offered. He was convinced that the *Encyclopedia Britannica,* as a medium of popular education, was without a peer. When he died in Bedford Hills, N.Y., on June 13, 1922, the *New York Times* offered apt estimate: "In the view of the public, his success lay in the originality, boldness and brilliance of his operations. But that was merely the surface. The deeper source was his faith in the intelligence and the ambition of a great mass of citizens. Many professional educators of note have done less than he toward popular enlightenment:"

See Janet E. Courtney, *Recollected in Tranquillity (1928)* and *An Oxford Portrait Gallery* (1931); Herman Kogan, The *Great* EB *(1958)*. (HN. K.)

HOOPER, JOHN (d. 1555), bishop of Gloucester and Wortester and martyr. was born in Somerset about the end of the 15th century and graduated B.A. at Oxford in 1519. In 1538 a John Hooper appears among the names of the Black friars at Gloucester, another among the White friars at Bristol who surrendered their houses to the king, and another as canon of Wormesley priory in Herefordshire; but identification of any of these with the future bishop is doubtful, and in the sentence pronounced against him by Stephen Gardiner he is described as *"olim monachus* de *Cliva Ordinis Cisterciensis"; i.e.,* of the Cistercian house at Cleeve, Somerset. Before 1546 he was employed in the household of Sir Thomas Arundell, and Hooper speaks of himself at this period as being "a courtier and living too much of a court life in the palace of our king." But he chanced upon some of Huldreich Zwingli's works and Heinrich Bullinger's commentaries on St. Paul's epistles; and after some molestation in England and some correspondence with Bullinger he took refuge on the continent. reaching Strasbourg in the midst of the Schmalkaldic war. There he married Anne de Tserclaes, and later proceeded by way of Basle to Zürich, where his Zwinglian convictions were confirmed by constant intercourse with Bullinger, Zwingli's successar.

In May 1549 Hooper returned to England. He at once became the principal champion of Swiss Protestantism against the Lutherans as well as the Catholics and was appointed chaplain to the protector Somerset. After Somerset's fall he became Warwick's chaplain and after a course of Lent lectures before the king was offered the bishopric of Gloucester. This led to a prolonged controversy; Hooper had already denounced the "Aaronic vestments" and the oath by the saints prescribed in the new ordinal, and he refused to be consecrated according to its rites. Thomas Cranmer, Nicholas Ridley, Martin Bucer and others urged submission; but he spent some weeks in the Fleet prison before he submitted to consecration with the legal ceremonies (March 8, 1551).

Although he had opposed Northumberland's plot for the exclusion of Mary from the throne, he was sent to the Fleet on Sept. 1, 1553, on a doubtful charge of debt to the queen; the real cause was his staunchness to a religion which was still by law established. Edward VI's legislation was, however, repealed in the following month, and in March 1554 Hooper was deprived of his bishopric as a married man. There was still no statute by which he could be condemned to the stake, but Hooper was kept in prison, and in December the heresy acts were revived. On Jan. 29, 1555, Hooper, John Rogers, Rowland Taylor and others were condemned by Gardiner and degraded by Edmund Bonner. Hooper was sent to Gloucester, where he was burned on Feb. 9.

Hooper was the first of the bishops to suffer, because his Zwinglian views placed him further beyond the pale than Cranmer, Ridley and Hugh Latimer. He represented the extreme reforming party in England. While he expressed dissatisfaction with some of Calvin's earlier writings, he approved of the *Consensus Tigurinus* negotiated in 1549 between the Zwinglians and Calvinists of Switzerland; and it was this form of religion that he laboured to spread in England against the wishes of Cranmer, Ridley, Bucer, Peter Martyr and other conservative theologians. He would have reduced episcopacy to narrow limits, and his views had considerable influence on the Puritans of Elizabeth I's reign.

HOOPER, JOHNSON JONES (1815–1862), U.S. humorist and author of a series of tall tales describing "Some Adventures of Captain Simon Suggs," a shifty backwoods frontiersman He was born in Wilmington. N.C., and at the age of 20 moved to the frontier town of Lafayette, Ala., to read law under an elder brother. In 1842 he accepted the editorship of the East Alabamian, a weekly newspaper, for which he wrote "Taking the Census," a humorous essay, and the Simon Suggs series. Copied by the New York Spirit of the Times and widely quoted, these stories quickly brought Hooper national fame. In 1845 they were first published in book form. A second volume, *A* Ride With Old Kit Kuncker, was issued in 1849.

Meantime, Hooper had become known as a fearless journalist and. after editing several smaller papers, he became co-owner and editor of the Montgomery Mail. An ardent secessionist, in 1861 he was elected secretary of the provisional congress of the Confederate states and, when the capital was transferred from Montgomery, he moved to Richmond, where he died 13 months later.

See W. Stanley Hoole, *Alias* Simon Suggs: *the Life* and Times of Joknson Jones *Hooper* (1952). (W. S. HE.)

HOOPOE, any of about seven species of old world birds related to the rollers, having a slender decurved bill and constituting the families Upupidae (cinnamon-coloured hoopoes) and Phoeniculidae (glossy blue-black wood hoopoes) in the order Coraciiformes. The common hoopoe (*Upupa epops*), with nine races. ranges over Europe, Africa, Madagascar, Asia and Malaya to Sumatra. It is the size of a large thrush, with head and neck golden buff, its handsome semicircular crest opening and closing continually, bordered narrowly with white and tipped with black. It feeds on insects, grubs and worms and is filthy in food and habits. Its six to nine bluish or greenish-to-olive eggs are laid in a hole in bank, wall or tree, without nest. The other six species (*Phoeniculus* and *Rhinopomastus*) are called wood hoopoes or kakelaar; they have a long, wedge-shaped tail and no crest and inhabit savannahs and forests in Africa south of the Sahara. The different species are 9 to 18 in. long. They are shy, flitting among branches and climbing about trunks for insect food. Four whitish eggs are laid in a hole in a tree. The purple kakelaar (*P. purpureus*), with 12 races, extends well over Africa. (G. F. Ss.)

HOORN, a seaport in the province of North Holland, Netherlands, on a bay of the IJsselmeer called the Hoornerhop, 23½ mi north by east of Amsterdam. Pop. (1957 est.) 15,607 (mun.). In 1356 it received municipal privileges, and in 1426 it was surrounded with walls. There in 1416 the first great net was made for the herring fishery. In 1569 Spanish forces entered the town; but in 1572 it cast in its lot with the states of the Netherlands. Among the celebrities of Hoorn is William Schouten, who discovered in 1616 the passage round Cape Horn, or Hoorn, as he named it. Hoorn is distinguished for the beauty of its numerous gabled houses of the 16th and 17th centuries. Many of these are decorated with inscriptions and bas-reliefs, some of which commemorate the battle on the Zuider Zee in 1573. The Gothic bastion tower overlooking the harbour was built in 1532, the East gate not later than 1578. Among the public buildings are the St. John's hospital (1563); the old mint; the hospital for aged men and women (beginning of 17th century); the weighhouse (1609); the town hall; and the old courthouse, which dates from the beginning of the 17th century. though parts of it are older. There is a considerable trade with other parts of the Netherlands, especially in cheese and cattle. The small industries include gold and silver work, tobacco factories, sawmills and some boatbuilding yards.

HOOTON, EARNEST ALBERT (1887–1954), U.S. physical anthropologist, was a leading anthropometrist, known for both his scientific and his popular writings. Born Nov. 20, 1887, in Clemansville, Wis., he was educated in the classics at Lawrence college in Appleton, Wis. (A.B., 1907), and at the university of Wisconsin in Madison (M.A., 1908; Ph.D., 1911), where he also taught. He went to Oxford university as a Rhodes scholar in 1910. There his interest suddenly shifted from classical writers to the tribes they had described, and Hooton took up physical anthropology, largely independent of the continental traditions. He received his Ph.D. at Wisconsin in 1911, a diploma in anthropology at Oxford in 1912. and in 1913 a research degree from Oxford. He became an instructor at Harvard in the same year and was named professor in 1930, a position he held until his death in Cambridge, Mass., on May 3, 1954.

His originality in an undeveloped field, his avidity for the courses he taught, and a clear and witty delivery made him an outstanding teacher. The majority of professional workers in physical anthropology for a generation were his students, so that the influence of his formulations and methods was exceptional. His early research was on the craniology of Guanches and of American Indians. Out of his monumental study of the skeletons from the extinct Pecos (New Mexico) pueblo (1931), he developed a scheme of racial types that he believed to have composed the Indian stock as a whole, suggesting non-Indian components such as Mediterranean and Negroid. He was editor of the Harvard

"African Studies" series (1918–33) and organized and directed the Harvard Irish survey after 1932, from which stemmed a large number of publications in various fields of anthropology. His interest in types was carried further in his investigation of American criminals, but in the later part of his career he turned to the bodily constitution of the individual, being a major supporter of the method of body typing developed by W. H. Sheldon *(see* PERSONALITY: *Morphological* or *Physical Types)*. His criminal studies provoked considerable controversy, since he stressed the biological component of behaviour and the notion of the constitutional inferiority of criminals at a time when these ideas were in particular conflict with contemporary criminological opinion.

He was a writer of grace and precision, for which he credited his classical education. Beginning with *Up from the Ape* (1931; rev. ed., 1946), he published a series of popular books for laymen, including *Apes, Men and Morons* (1937), *Crime and the Man* (1939), *Why Men Behave Like Apes and Vice Versa* (1940) and *Man's Poor Relations* (1942), all notable for the presentation of information with humour and strength of personal view.

(W. W. H.)

HOOVER, HERBERT CLARK (1874–), 31st president of the United States, was born on Aug. 10, 1874, in the village of West Branch, Ia. He was the second of three children of Jesse Clark and Huldah Minthorn Hoover, both Quakers with a long American Quaker ancestry. Jesse Hoover, the village blacksmith, finally established a farm-implement business. He died when Herbert was six years old. Huldah, an unusually gifted woman, was a school teacher. She spoke frequently at Quaker meetings and took part in local "prohibition" campaigns. After Jesse's death she kept the family, taking in sewing, and carefully saving the life insurance left by her husband toward the education of the children. Herbert attended the public school at West Branch, but upon the death of his mother when he was eight, he was sent to the home of an uncle, Henry John Minthorn, a country doctor living in Newberg, Ore.

When he was 15, his uncle established a land settlement business in Salem, Ore., and for two years Herbert worked as office boy. He picked up the rudiments of typewriting, and in a business college in Salem developed a knowledge of mathematics. From a public library a friend brought him a copy of *Ivanhoe*, which opened to him the world of literature. A chance encounter with an engineer caused him to think of the importance of a college education and he determined to become a mining engineer. Declining scholarship aid at Earlham college (Quaker) because it had no engineering course, he turned his attention to Stanford university, which was about to open in California. Hoover entered Stanford as a member of its first freshman class on Oct. 1, 1891, and worked his way to graduation (A.B.) by typing and by operating a laundry agency and a newspaper route. During summer vacations he served as an assistant with a state geological survey in Arkansas, and with the U.S. geological survey in California and Nevada. Despite his working to earn his living, he participated in extracurricular activities, including a term as football team manager. He records in his *Memoirs* his contacts with Sen. Leland Stanford and, on one occasion, with former president of the United States, Benjamin Harrison, who was at Stanford delivering a special series of lectures on government.

After graduation from Stanford in 1895, Hoover worked for a brief time as a labourer in California mines. He then joined the staff of Louis Janin, a mining engineer in San Francisco, Calif., and in Oct. 1897, on his nomination to Bewick, Moreing & Co. of London. was placed in charge of their projects in Australia. Meanwhile, he had been reading books on economics in his spare time. While visiting England, he was deeply impressed by the historic landmarks in the long history of the British people. His work in Australia, filled with adventure and experience for himself, was profitable for his employers. They transferred him to China, where he became chief engineer in the newly organized bureau of mines of the Chinese government. Returning to London from Australia and then journeying to California in 1899, he married Miss Lou Henry (1874–1944), whom he had known as a fellow student at Stanford. He and his bride reached Peking in March 1899. Caught in the Boxer rebellion in June 1900, they were active in relief work until the arrival of international forces who rescued all foreigners in August.

In Nov. 1901 Hoover became a partner of Bewick, Moreing & Co., from which he withdrew after seven years to take up an independent career. He engaged in mining activities throughout the world, maintaining offices in New York city, San Francisco and London. Until 1914 he spent much of his time in England, but he also acquired a house at Stanford university, because he and Mrs. Hoover wished to spend more time in the U.S. as their two sons Herbert (1903–) and Allan Henry (1907–) grew up.

Hoover gave much thought during those years to engineering, which, in his lifetime thus far, had been transformed, as he put it, "from a trade into a profession." Lectures he gave at Columbia and Stanford universities were published in 1909 under the title *Principles of Mining*. He had also become interested in earlier writings on applied science, especially in Georgius Agricola's *De re Metallica*, printed in Latin in 1556. For five years Mr. and Mrs. Hoover spent their spare time in its translation which was published privately by them in 1912. A trade edition was published in 1950.

Always retaining a close interest in his native land, Hoover had thought of entering public service in some capacity, but his contacts in engineering and in government transcended national boundaries and his association with those active in politics were few, even in California, where he retained his residence. The factional political struggles that rocked the U.S. in the first decade of the 20th century apparently left little impression on him.

Prior to World War I he had for 18 years lived abroad, working as an administrative engineer on industrial projects in Russia, China, India, Australia, New Zealand, South Africa. Canada, Great Britain, Belgium and Mexico, as well as in the United States. Everywhere he went he participated in the daily life and work of the people.

As a U.S. citizen long resident in London, Hoover at the outbreak of World War I in Aug. 1914, organized and served as chairman of an "American Committee" in London which aided in securing passage home for more than 100,000 American tourists. The Commission for Relief in Belgium, a voluntary organization to which U.S. officials and residents in London gave full support, was started in Oct. 1914 with Hoover as chairman. Soon afterward he made the first of many visits to observe the problem of destitution in Belgium. Hoover concluded agreements with the British which permitted passage of food, clothing and medical supplies through the Allied blockade. The Germans, in turn, gave protection to the distribution of these supplies to the 10,000,000 people of Belgium and northern France. He ultimately secured subsidies for support of the commission from the governments of France, Great Britain and the United States. Under his direction, the commission expended nearly $1,000,000,000.

When the United States entered the war in April 1917, Hoover returned to the United States and in May Pres. Woodrow Wilson appointed him U.S. food administrator. In this work of stimulating production and conserving supplies, he called upon and obtained voluntary action from the American people. He organized the U.S. Grain corporation, Sugar Equalization board and Food Purchase board, agencies which, under his direction, handled over $8,000,000,000 in supplies for the U.S. public and military forces and for the Allies. During the critical year July 1, 1918–July 1, 1919, Hoover's Food administration furnished 18,500,000 tons of food, more than three times the normal export, to the Allies and famine areas of Europe. He served at this time as a member of President Wilson's War Trade council and as chairman of the Inter-allied Food council.

Hoover served also as alternate chairman of the Supreme Economic council and as a member of the advisory economic committee of the U.S. delegation to the peace conference. Establishing his headquarters in Paris, he co-ordinated the continuing work of the Food administration, the Belgian and Northern France Relief commission and the Relief and Reconstruction of Europe commission, of which he had been appointed director general by the Allied governments. These operations spread over 30 European

countries where, with the authorization of congress and an appropriation of $100,000,000, Hoover eventually established a special relief program for 10,000,000 undernourished and homeless children.

Altogether at this time he directed, on behalf of the Allies and the United States, the handling of $3,254,000,000 in relief funds and the distribution of more than 23,000,000 tons of food stuffs, medical supplies and clothing. In order to carry on this work effectively, Hoover obtained the mandate of the Allied powers to manage the railways and coal mines, waterways and ports in eastern Europe. With the termination of official activities at the signing of the peace, he set up a volunteer organization to continue relief work among European children and support for the people of Austria, Hungary, Armenia and Russia, raising over $250,000,000 for this purpose.

During the war Hoover had been gathering historical material, and had professional collectors in all belligerent countries engaged in gathering and holding material on the war. With the armistice he embarked upon an enterprise which he refers to in his *Memoirs* as a side issue, but which resulted in one of his great contributions to the writing of the history of the modern world. The large body of manuscript and particularly fugitive material dealing with the years of the war comprised the documentary story of both the established and revolutionary governments of western Europe. These materials were deposited for the use of scholars in a newly established war library at Stanford university. Later known as the Hoover Library on War, Revolution and Peace, it was enlarged to include materials on World War II and the history of governments and peoples throughout the world, finally becoming the Hoover institution.

His experiences during the war and reconstruction years (1914–21) had left deep impressions on Hoover's thinking and he gave expression to these in a little book. *American Individualism* (1922). He wrote that "Our individualism differs from all others because it embraces these great ideals: that while we build our society upon the attainment of the individual. we shall safeguard to every individual an equality of opportunity to take that position in the community to which his intelligence. character, ability, and ambition entitle him; that we keep the social solution free from frozen strata of classes; that we shall stimulate effort of each individual to achievement; that through an enlarging sense of responsibility and understanding we shall assist him to this attainment; while he in turn must stand up to the emery wheel of competition."

Later in the same book, Hoover reflected that "There is never danger from the radical himself until the structure and confidence of society has been undermined by the enthronement of destructive criticism. Destructive criticism can certainly lead to revolution unless there are those milling to withstand the malice that flows in return from refutation. It has been well said that revolution is no summer thunderstorm clearing the atmosphere. In modern society it is a tornado leaving in its path the destroyed homes of millions with their dead women and children."

These reflections help in explaining the later developments in Hoover's thought and action as he entered upon his long public career in 1921 as secretary of commerce, first in the cabinet of Pres. Warren G. Harding, and later, in the cabinet of Pres. Calvin Coolidge. Secretary Hoover undertook the reorganization of the department on the basis of voluntary co-operation among the commercial, agricultural and labour interests of the nation. He organized a multitude of committees representative of business and labour whose functions were to reduce wastes in manufacturing and distribution. He organized new divisions in the department to cover radio broadcasting and commercial aviation, and other divisions to answer the growing need of the country for better housing and greater highway safety. He also expanded the department's foreign trade activities.

During this period he served as a member of the advisory board of the Conference on Limitation of Naval Armaments (1921–22) and as a member of the World War Foreign Debt commission. He served also as chairman of the Colorado River commission and the St. Lawrence Waterway commission. The work of these commissions culminated in the erection of the Hoover dam (1930–36), and the construction of the St. Lawrence seaway.

In 1922 Hoover organized the American Child Health association and became its first president. Likewise, in 1923 he organized the Better Homes in America association. He served as chairman of a National Research fund established by the National Academy of Sciences for the support of research in pure science and raised over $5,000,000 for this purpose.

While secretary of commerce, he was placed in charge of relief at the time of the disastrous Mississippi flood of 1927. For this project he raised over $34,000,000 in charitable funds and directed the removal of 1,500,000 persons from danger areas to temporary camps and afterward restored them to their homes.

Prior to his cabinet service, under Presidents Harding and Coolidge, many indications appeared that Hoover's unusual services during World War I, especially his service as food administrator for President Wilson, had produced in the public mind a growing belief that he had unusual qualifications for the presidency of the United States in the post-war world. This was demonstrated by members of both political parties who discussed his availability during the preliminary canvass of 1920. But his appeal as a national figure was not regarded with favour by the leaders in control of either party. In the course of the discussion it was revealed that he had been and was a registered Republican. Despite activity for his nomination by many friends, his possible candidacy was scarcely considered at the Republican national convention of 1920. The well-known opposition of his fellow Californian, Sen. Hiram Johnson, which influenced many progressives, and the final nomination of Warren G. Harding, an old-line conservative, were indicative of the moderate position Hoover appeared to occupy. In the Republican national convention of 1924, he mas given 300 votes for the vice-presidency. All this provided significant background for his entrance upon an active canvass when President Coolidge chose not to be a candidate in 1928. Hoover was strong in the presidential primary contests. and in the convention of 1928, overcame the opposition candidates backed by senate leaders. as well as the candidacy of Gov. Frank Lowden of Illinois. Yet the nomination was not enthusiastically supported by experienced party leaders, for they were divided on the issues of prohibition and farm relief, on each of which the presidential nominee had his own program. With some marked defections, Hoover nevertheless held the Republican electoral vote of the previous two campaigns and added votes from southern states that would not support Alfred E. Smith (*q.v.*), the Democratic nominee. Although he polled 21,391,993 votes, 4,500,000 more than had his predecessor, Calvin Coolidge, it became clear that many progressive Republicans viewed Hoover with distrust, and the regular Republican organization still considered him an outsider.

Aware of these conflicting elements — for he had lived in the midst of them for eight years as a cabinet member and had seen the results of their existence in the trying days of President Wilson's war administration — Hoover bent every effort to make the transition from the Coolidge administration as painless as possible. At the same time, his cabinet appointments made it clear that his was to be a personal administration.

Beneath the surface of the highly emotional presidential campaign of 1928 were evidences of the impending crisis in party government that had threatened the disruption of the Republican party ever since the disappearance of the Progressive party in 1916. The choice of Hoover, who stood apart from factions in the party, had obscured the issues in this factionalism and the importance of the personalities involved. But these were at once revealed in the new congress that met to deal with farm relief and with limited revision of the tariff. The centre of the fight was in the senate.

President Hoover presented his program for what he had termed in his campaign "The New Day," a realization of the great economic and social potentialities of the American people in an age of developing science. He pushed toward the enactment of this program throughout his four years in office.

Three developments forced him repeatedly into activities in other fields: (1) the overwhelming need of new federal action on

prohibition; (2) the growing importance of an energetic U.S. program overseas to meet rising tides of economic and political uncertainty; and (3) the long train of demands upon the president caused by the stock market crash in the autumn of 1929 and the ensuing widespread depression. On each of these, the President's program as it developed was the object of attack by his Democratic opponents. by a large body of U.S public opinion, and particularly by members of his own party in the senate.

Despite continuous strife among Republican congressmen Hoover succeeded in establishing the Federal Farm board to serve agriculture, and in increasing the powers of the Tariff commission, thus protecting the principle of a flexible tariff. He also obtained senate approval of the London Naval treaty on July 22, 1930.

The defeat of the Republicans in the congressional elections of 1930 signalized not only the downfall of effective party government in congress, but also the rise to first place in public estimation of a great need for partisan leadership in the presidency. In the ensuing two years of his term in office, Hoover offered that leadership, and in the campaign for re-election more vigorously defended and explained his program for the termination of depression at home and abroad.

The U.S. had been making a slow but certain recovery from the recession when, in 1931, inflation in Europe, unbalanced budgets, unlimited currency issues and excessive borrowing by European nations from U.S. banks resulted in the gigantic European financial collapse of that year. The president, proposed to the European governments a moratorium upon all debt payments for one year, obtaining in record time support for his proposals not only from U.S. financial leaders but from senate and house members of both political parties.

Frequently at odds with independent members of his own party and opposed vigorously throughout his administration by Democratic congressmen and the Democratic national committee, Hoover nevertheless obtained a considerable amount of constructive legislation during his administration. The Reconstruction Finance corporation was created (1932), to save building and loan organizations and savings banks, and to prevent the collapse of weaker banks, trust companies, railways and industries. Home loan banks were set up to aid homeowners in meeting their mortgages and Agricultural aid banks, to help farmers.

The Republican national convention of 1932 renominated Hoover on a platform of his own choosing, and he was supported by the party organization in the ensuing campaign. Despite his extensive and constructive program for dealing with the problems of the depression, and his defense of that program in the campaign, the electorate failed to return him to office: and the Republican party returned to congress a smaller number of representatives than at any time since 1897. Hoover was defeated by Franklin D. Roosevelt by 22,821,857 to 1j.761.841popular votes—in effect a reversal of the vote of 1928. For further details of the Hoover administration, *see* UNITED STATES (OF AMERICA), THE: *History*.

None of Hoover's predecessors had had such extensive experience as he in handling both domestic and foreign problems. Likewise, none of his predecessors had been confronted with so many difficult problems at home and abroad. Despite the record he had made as president and his defense of it in the campaign, the voters had decided that they wished a political change in order to deal with the problems of the depression as they saw it. Furthermore, repeated crises in "party politics" had again brought the United States to the verge of abrupt political change, as in the elections of 1828 and 1860.

Having served his nation continuously since April 1917, Hoover retired on March 4. 1933, taking an apartment in New York city and reopening his home on the Stanford campus near Palo Alto, Calif. There, a trustee of the university since 1912, he had established not only the Hoover institution, but also had led in establishing a graduate school of business and a food research institute.

At no time during the 12 years of Franklin D. Roosevelt's administration was former President Hoover called into service by his successor. Hoover opposed most of the measures, domestic and foreign, of the Roosevelt administration, voicing more than any other individual the "loyal opposition" of the U.S. system of government. He opposed the involvement of the United States in World War II and on June 29, 1941, in discussing a tacit alliance with Soviet Russia, he said in a radio broadcast: "If we go further and join the war and we win, then we have won for Stalin the grip of communism on Russia. . . . Again I say, if we join the war and Stalin wins, we have aided him to impose more communism on Europe and the world. At least me could not with such a bedfellow say to our sons that by making the supreme sacrifice, they are restoring freedom to the world. War alongside Stalin to impose freedom is more than a travesty. It is a tragedy."

Hoover continued to be sharply critical of the foreign policies of the Roosevelt administration, yet continued to address his countrymen in discussions of the ends of peace to be achieved in the course of the war. In particular did he attack radical influences in the U.S. government, distinguishing, however, between socialist attack by ballot and communist attack by secrecy and violence.

In view of Hoover's record as relief administrator during World War I, it mas not surprising that the former president organized relief for Poland, Finland and other European states after World War II. Pres. Harry S. Truman summoned him to aid in the organization of relief during the great famine of 1946. In order to co-ordinate the work, Hoover visited 39 countries. In 1947 he undertook a mission to Germany and Austria for President Truman, to advise upon U.S. policies in the administration of those occupied countries. In response to requests from both Pres. Dwight D. Eisenhower and Chancellor Konrad Adenauer, Hoover repeated his visit to Germany in 1954.

For more than 35 years Hoover had called attention to the inefficiency, waste and rising costs of government services. During his administration, he had made marked contribution to improvement under the difficult conditions of depression. In 1947, congress by unanimous action created a bipartisan Commission on Organization of the Executive Branch of the Government, and Hoover was selected its chairman. Known popularly as the Hoover commission, this group, after extensive hearings and research, made 270 specific recommendations, of which, with President Truman's aid, 70% were adopted in the interest of reducing expenditures by eliminating overlapping and waste in the swollen number of bureaus, sections, services and units.

In 1953 a second Hoover commission was created with wider power. Hoover was again chosen chairman and aiter two years reported on his exhaustive inquiry. The commission brought in 375 recommendations, many of which were adopted.

In the course of his long public career, Hoover gathered about him a host of admirers and supporters. He twice received the unique distinction of joint resolutions of appreciation from congress. He was honoured by more than 80 universities and received medals, awards and testimonials from all parts of the world. His birthday became the occasion for an outpouring of appreciation and regard on the part of his fellow citizens.

In 1958 he published *The Ordeal of Woodrow Wilson*, based upon his own observations of the struggle over the treaty of peace ending World War I and the establishment of the League of Nations. This book was widely acclaimed as a major contribution to the literature of international relations. Hoover had dealt with some of the details of this theme first in a small volume, *America's First Crusade* (1941), and again at greater length in the first volume of his *Memoirs*, published in 1951. In this and the following year, he published three volumes of his *Memoirs*. His other works include *The Challenge to Liberty* (1934); with Hugh Gibson, *The Problems of Lasting Peace* (1942); and seven volumes of his *Addresses Upon the American Road* (1938–55).

Hyde, The *Hoover Policies* (1937), provides further information on the developments of the Hoover administration. (E. E. R.)

HOOVER, HERBERT WILLIAM (1877–1954), U.S. industrialist, was for 26 years president of the Hoover company of North Canton, Ohio, pioneer manufacturer of electric vacuum cleaners. Born near Canton, Oct. 29, 1877, Hoover joined his

father in the leather goods business in 1898 after attending Hiram college. He saw the potentialities in the electric suction sweeper and with his father developed the product which later became the Hoover vacuum cleaner. From maker of 400 cleaners in 1908 the Hoover company grew to be a major producer of vacuum cleaners with plants in several countries. Hoover died in North Canton, Sept. 16. 1954. (J. S. BL.)

HOOVER, THEODORE JESSE, (1871–1933), U.S. mining engineer, naturalist and educator. elder brother of Herbert Clark Hoover, was born in West Branch, Ia., Jan. 28, 1871, the son of Jesse Clark Hoover, village blacksmith, dealer in agricultural machinery, and Huldah Minthorn Hoover. Quaker minister. He was educated in the public schools and at Penn college in Iowa and received his A.B. degree in mining engineering from Stanford university in 1901. From 1903 to 1919 he was manager or consulting engineer in the gold mines of California. west Australia. Mexico and Alaska: was an engineer or administrator of lead and silver mines in Burma, copper mines in Finland and Russia, and had offices in London and San Francisco.

In 1919 he returned to Stanford university as professor of mining and metallurgy, becoming dean of the school of engineering in 1925 until his retirement in 1936. Thereafter he lived at his ranch in Santa Cruz county, Calif. As a writer, conservationist and naturalist. he directed a definitive study of the life cycle of the Pacific coast steelhead trout! assisted by the California fish and game commission. He was the author of *Concentrating Ores* by *Flotation* (1912), *Economics of Mining* (1933), *The Engineering Profession* (1941) and of numerous articles in technical publications. He was a member of the American Society of Mining and Metallurgical Engineers, a life member of the Cooper Ornithological society and colonel in the C.S. army reserve. He died near Santa Cruz on Feb. 4, 1955. (HT. H.)

HOOVER DAM, a solid masonry dam 726 It. high. on the Colorado river near the Arizona-Nevada boundary. The dam is 31 mi. S.E. of Las Vegas, Nev., and 8 mi. N.E. of Boulder city. Nev. First called Boulder dam. C.S. congress in 1947 officially changed the name to Hoover dam. The dam has an installed capacity of 1,249,800 kw. and a reservoir capacity of 29,827,000 ac.ft. See COLORADO RIVER; ARIZONA: *Physical Geography; History.* For engineering and construction details *see* AQUEDUCT: *Nigh-Pressure Hydroelectric Pipes; DAM: Solid Masonry Gravity Dams.*

HOP is a twining perennial plant commonly placed in the Cannabinaceae or hemp family. It is of common occurrence in temperate North America, in the southern counties of England, in Europe extending into Asia and to a limited extent in temperate South America. Besides the common hop (*Humulus lupulus*), which includes all commercial varieties, there is a related annual species called the Japanese hop (*H. japonicus*). Two types native to North America have been called *H. americanus* and *H. neomexicanus,* respectively, but botanists are not in universal agreement with respect to this classification.

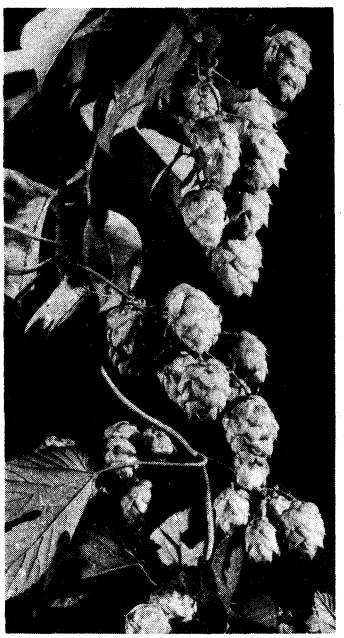
Description of the Plant. — The hop is a long-lived herbaceous perennial with rough twining stems often 25 ft. long which always wind in a clockwise direction. New vines (*i.e.,* stems; called "bines" in England) are produced each season and die following maturity. An extensive root system penetrates the soil to a depth of 15 it. or more. Young vines have been observed. under favourable conditions. to grow six inches or more in 24 hours. Strong hooked hairs help the stem cling to its support. The leaves. dark green, hairy, heart-shaped, and deeply three- to five-lobed with serrated margins. are borne oppositely on long petioles.

The plant is dioecious; *i.e.,* the male and female flowers are produced on separate plants. The male flowers form panicles two to six inches long and consist of a small, greenish live-parted perianth enclosing five stamens. The female flowers are in short axillary spikes or catkins. During the development of the inflorescence the stem elongates and the bracts enlarge greatly to form the scales or petals of the mature cones (strobiles). The mature cones. two to four inches long. are yellowish-green. oblong or ovoid and loose and papery to the touch. Mature, dried strobiles constitute the hops of commerce.

The pollen is carried by the wind to the female flower. Following fertilization a single ovule develops. The fruit is an achene which contains a spirally coiled embryo.

The fruits and the bases of the bracts forming the mature cone are covered with sticky, yellowish granules consisting of glandular hairs or glands called lupulin. These glands contain an oleoresin consisting of essential oils and resins which possess the characteristic aroma and bitter taste to which the brewing and medicinal properties of hops are attributable.

Geographical Distribution and Production. — Hops are grown commercially over a wide range of climatic and soil conditions. In general, rich alluvial soils or deep sandy or gravelly, well-drained loams are preferred. Soils that are heavy and wet, unduly shallow, or stiff and clayey should be avoided. Hops are produced successfully in milder regions which have abundant rainfall or where adequate moisture can be supplied through irrigation. They are not adapted to regions which are subject to long and severe winters. Prolonged cold, damp and foggy weather in the spring. excessive winds during the growing season and excessive rainfall during the harvest months usually cause damage to the crop.



AOCHE

FIG. 1.—HOP VINE AND CONES (HUMULUS LUPULUS)

In North America the hop is cultivated extensively in Washington, Oregon. California and Idaho and to a lesser extent in New York and British Columbia. It is grown commercially in England. Germany. Czechoslovakia, the U.S.S.R.. France. Australia, Yugoslavia. Belgium and Poland and to a limited extent in Japan, New Zealand. South America and South Africa. The United States leads all countries in production, followed closely by England and then by Germany; the combined annual production of these three countries ordinarily account for about three-quarters of the world's total production.

Culture. — The production of hops is a complex and highly specialized industry. The time at which the various cultural and management operations are performed and the care with which they are done can have great influence on the yield and market acceptability of the crop. In all regions the growing areas tend to become localized. As a result, certain practices have tended to become traditional within areas but to vary from one area to another.

Commercial hop fields are propagated from "root cuttings" (actually sections of underground stems): not from seeds, to ensure uniformity of characteristics. Planting is done during the winter or early spring months when weather conditions permit. A common practice in the United States is to plant the cuttings in rows 7 to 8 ft. apart with the hills in the rows spaced 6½ to 8 ft. apart (680–1,000 or more hills per acre). In England one-year-old plants are commonly set in rows 6 to 9 ft. apart and spaced 3 to 7½ ft. apart in the rows according to the system of training to be used (774–2,420 hills per acre).

Each spring the young vines are commonly trained to climb strings suspended from wire trellises and attached to stakes at the hills, or, in some countries, they are allowed to climb poles located at the hills. The heights of the trellises vary from 8 to 25 ft. from one country to another. Practically all of the crop in the United States is grown on trellises 16 to 18 ft. in height. which facilitates harvesting by machinery. In the United States two strings are commonly attached at each hill and two vines are trained up each string. In England two or four strings are attached at each hill, according to the system of training used, and two vines are usually trained up each string. As a result, two to three times as many vines are grown per acre in England as are grown in the

United States.

Hops are heavy users of calcium, nitrogen, phosphorus and potassium. In most regions the natural fertility of the soil is supplemented by additions of these and other elements in organic or inorganic form. In the U.S. much needed organic matter is commonly supplied by applications of farmyard manure and harvesting residues. or by the growing of a cover crop of cereal grain or legume which is planted in the fall and plowed under in the spring. English growers apply relatively large amounts of organic matter in farmyard manure, hoof-and-horn meal. fishmeal and other materials which are plowed under in the spring.

Hops are commonly produced under irrigation in the United States where summertime precipitation is low. Irrigation is not practised in England where rainfall during the growing season is usually sufficient.

Hops may be produced either with or without seeds. Their dioecious or unisexual character enables the grower to produce either type by exclusion of male plants from the hop fields or by planting one male plant to about every 100 or 200 female plants. Seeded cones are larger than those of the seedless type and, for this reason, seeded hops produce higher yields. Their lupulin content. however. does not differ materially from that of seedless hops. Seedless hops are considered to be superior to the seeded type for brewing purposes. Male plants are excluded in most of continental Europe. and seeded hops are not produced there. The production of seeded hops is a common practice in England and in some areas of the United States.

Diseases and Insect Pests.—Two fungus diseases (downy mildew and progressive *verticillium* wilt) and virus diseases are perhaps the most destructive diseases of hops. All commercial varieties are susceptible in some degree to downy mildew, which attacks the plants in all stages of growth, reduces yields, causes discoloration of the cones and affects their quality. By repeated removal and destruction of the diseased portions of the vines and frequent applications of liquid sprays or dusts containing copper sulfate (Bordeaux mixture) or zinc, the disease usually can he held in check.

Verticillium wilt, an important disease in England, invades the soil and infects all parts of the plants, plugging the water-conducting tissue and subsequently causing death. There are no control measures once the fungus has been introduced into the field, although some commercial varieties are more tolerant to the disease than others.

The various types of virus diseases cause various symptoms in the plants. A diseased plant cannot be cured. Virus diseases can, however, be kept in check by prompt removal of infected hills, which are replaced with cuttings from healthy plants. Control of insect vectors retards spread of virus diseases.

Sooty mold can cause serious damage if hop aphids (plant lice) are not controlled. The aphids secrete a sticky substance called honeydew on which the mold will grow and produce discoloration and undesirable flavour in the cones. Red mold will attack the leaves and later infect the inflorescences of the hops which will reduce yield and lower quality. Both of these fungus diseases can be controlled.

Many different species of insect pests have been known to infest hops, but only a few of them present a persistent problem. The most important of these are the aphids and the spider mites. The hop aphid is a sucking insect which will devitalize the plant by extracting the sap from the leaves. It will also excrete honeydew on which sooty mold will develop. Excessively moist and damp weather encourages the attack of hop aphids.

The spider mite is prevalent in all growing regions, especially during seasons of high temperature and drought. It injures the plant by puncturing the leaves and withdrawing the sap. Each puncture usually results in the appearance of a small light-coloured spot on the leaf surface. As the spots become more numerous the infested leaf will gradually shrivel and die. The spider mite will also attack the cones; causing them to turn reddish-brown, adversely affecting their marketability.

Both spider mites and hop aphids can be controlled by spray applications of contact-type insecticides containing organic phosphate or chlorinated hydrocarbon formulations. Systemic insecticides, *i.e.*, those which are absorbed by the plant and transported in the sap, have been used to provide effective protection over a considerable length of time.

Harvesting, Drying and Baling.—Hops should be harvested when fully mature. Full ripeness is indicated by bright, yellowish-green. sticky, resilient cones that are crisp and papery to the touch, and by hard purple-red seeds. In this condition they possess a maximum of lupulin, which contains the resins and essential oils so important in the brewing of beer and ale. Unripe cones are smaller and contain more moisture and less lupulin. Overripe cones become darker yellow or reddish and shatter easily. resulting in some loss of lupulin. The date of maturity depends upon the variety and environmental conditions, but is fairly constant from year to year within a region for any particular variety.

Hops are picked either by hand or by machine. In the United States they are picked almost entirely by machine. in England by machine to a large extent, but a considerable portion is picked by hand. Hand picking predominates in the remaining hop growing countries of the world. Picking begins shortly before the middle of August in some regions and continues until late September in others.

The machines used for picking consist of various designs, but most of the machines in large scale use have wire picking fingers or loops mounted on bars which travel against the vines, plucking the cones as they pass. Picking machines are either stationary, being housed in large sheds, or are portable. The former have a larger capacity and require a larger labour force.

Freshly picked hops contain 65% to 80% moisture. depending on the variety and climatic conditions. Drying to approximately 10% moisture is accomplished in kilns, usually referred to in England as oasts. The size and construction of the kilns and the methods of conducting the heated air through the hops differ. American kilns are usually of frame construction, although some are built of concrete and brick. Individual kiln floors are usually square or rectangular, 32 by 32 ft. being a common size. The freshly picked hops are loosely and evenly scattered on the slatted floor of the kiln, which is covered with burlap to prevent the hops

MUSTOGRAPH AGENCY

FIG. 2.—HOP KILNS. OR OASTHOUSES, AT EAST FARLEIGH. ENG.

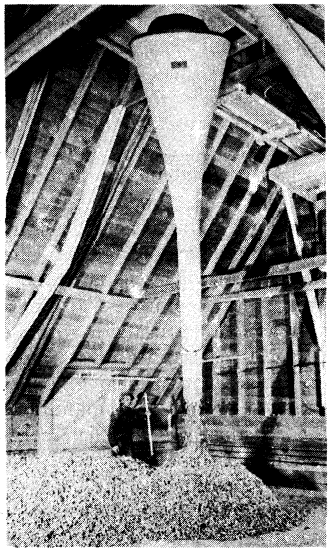
from falling through. Air which has been heated by a stove or furnace passes through the hops from below. Air passage is accomplished by natural draft (convection) or by forced draft. In the forced-draft kilns a current of heated air from the outside is forced through the hops by means of bottom blower fans or by suction fans placed in the cupolas of the kilns. The forced draft kilns are by far the more common because of greater capacity, since a bed of hops up to 40 in, in depth may be dried at one time. Heating is accomplished by burning wood, oil or gas.

The typical kiln in England is either a square (16–20 ft.) or a circle of 16–20 ft. diameter. Most oasthouses are built of brick and have a tapering roof which is surmounted by a pivoted nooden cowl. The cowl assists in preventing a back draft in windy weather,

particularly in natural-draft kilns. All modern kilns are equipped with fans, and fans have been installed in many old natural-draft kilns. Many kilns are heated by open anthracite fires; the products of combustion pass through the hops. Other systems of heating in England employ oil flame or steam radiators.

Low drying temperatures are recommended for production of hops of best quality. Temperatures exceeding 150° F. are discouraged because the hops are likely to darken in colour, with destruction of their resinous and aromatic constituents. The time required for drying a particular lot of hops depends upon humidity, temperature, air velocity and moisture content of the hops, and will vary from 6 to 20 hours.

After hops have been dried sufficiently in the kiln they are removed to a cooling house where they are stored in large heaps for a period of 1 to 12 days, depending upon the capacity of the coolers. During this time they undergo a curing process which equalizes the moisture content, modifies the pleasant aroma and causes them to become tougher and more pliable for baling.



BY COURTESY OF JOHN I. HAAS, INC.

FIG. 3.— FRESHLY PICKED HOPS ENTERING A KILN; THEY ARE DRIED BY HEATING FROM BELOW

Baling is the last step preparatory to marketing. After drying and curing, the common procedure in the United States is to compress the hops into rectangular bales of approximately 18 cu.ft. weighing about 200 lb. and finally to wrap them in heavy burlap for marketing. In England they are compressed into "pockets"—large bags made of jute sacking about six feet in length and two feet in diameter—containing slightly more than 1½ cwt. of hops.

Properties and Uses.—Hops have been used almost exclusively for brewing purposes for 1,200 years or more. They are also reputed to have certain medicinal properties and are of value as a bitter stomachic for stimulating appetite and aiding digestion.

Their brewing value is based on their content of bitter (soft) resins, their essential oils and perhaps their tannins. These constituents, which are extracted from hops by boiling in wort (an aqueous infusion of malt), impart the desired mellow bitterness and delicate hop aroma to brewed beverages and aid in their preservation. There is a wide range in brewing value among the many commercial varieties of hops. The content of total soft resins ranges from 15% to 22% in American and British hops and from 11% to 16% in the inherently milder continental European hops. The percentage of essential oil which contributes to aroma varies from 0.2% to 2.5% or more in commercially dried hops.

(S. N. B.)

HOPE, ANTHONY, the pen name of SIR ANTHONY HOPE HAWKINS (1863–1933), British novelist, who was born on Feb. 9, 1863. He was educated at Marlborough and Balliol college, Oxford, and was called to the bar at the Middle Temple in 1877. He won a great popular success with the publication (May 1894) of *The Prisoner of Zenda.* This was followed a few weeks later by *The Dolly Dialogues.*

The Prisoner of Zenda established a fashion for what was christened, after its fictitious locality, "Ruritanian romance"; *The Dolly Dialogues* was the forerunner of a whole school of epigrammatic drawing-room comedy. In 1894 also appeared *The God in the Car,* a novel suggested by the influence on English society of Cecil Rhodes's career; and *Half a Hero,* a complementary study of Australian politics.

In a series of novels Anthony Hope advanced from his light comedy and gallant romantic inventions to the graver kind of fiction of which *The God in the Car* had been an earlier essay. Other notable novels were: *Quisante* (1900), a study of English society face to face with a political genius of an alien type: *Tristram of Blent* (1901), a study of family pride; and the witty *The Intrusions of Peggy* (1902). He was knighted in 1918.

HOPE, THOMAS (1769–1831), English writer, designer and connoisseur, born in London in 1769, eldest son of John Hope, one of a wealthy family of Scottish merchants and bankers settled in London and in Amsterdam. nhere Thomas gren up. About the age of 18 Hope traveled widely in Europe. Asia Minor and Egypt, studying and sketching architecture. About 1795 he settled in England, and in the following years he designed the furniture and decoration of his London house in Duchess street and his country house at Deepdene, Surrey. to provide a suitable background for his fine collection of ancient and modern sculpture. In 1807 he published his furniture designs in a folio entitled *Household Furniture and Interior Decoration.* This work. though much criticized by his contemporaries. exercised considerable influence on Regency furniture. It provided a wide range of furniture based on "correct" classical and Egyptian models. In 1819 Hope anonymously published a novel: *Anastasius, or Memoirs of a Modern Greek, written at the close of the 18th century.* It mas at first generally attributed to Lord Byron. but Hope later revealed his authorship. Hope died in London on Feb. 3, 1831.

See M. Jourdain, *Regency Furniture,* rev. ed. (1948). (J. E. LE.)

HOPEH (HO-PEI SHENG), the most northeasterly of the historic 18 provinces of China proper, situated between the lower Yellow river and the Great Wall. The name Hopeh, meaning "north of the (Yellow) river," was given to the province in 1028. Previously, the province was known as Chihli. meaning "directly controlled," for it contained the city of Peking (Peiping) which was, before 1928 and again from 1949. the capital of China.

Before 1949 Hopeh had an area of 54,000 sq.mi. Under the Communist regime. after 1949. the province increased its area to about 75,000 sq.mi. as a result of annexations from the iormer provinces of Chahar (1952) and Jehol (1956). The population of Hopeh within its expanded borders was about 39,000,000, based on the census of 1953. Another administrative change took place in 1958, when the seat of the provincial government was transferred from Pao-ting. the historic provincial capital. to Tientsin.

The greater part of the province lies in the north China plain, which shelves almost imperceptibly toward the shallow gulf of Po-Hai, an arm of the Yellow sea. The surface of the plain consists of alluvium, river sands and loess, which form a fertile though thin veneer over a subsurface made up of infertile marine gravels. Hopeh is one of China's leading producers of winter wheat and cotton. Other crops are soybeans. peanuts and other oilseeds. In the newly annexed territory north of the Great Wall, extending to the windswept Mongolian plateau, livestock herding becomes more important. In that area of low rainfall and cold winters, hardier crops such as spring wheat, millet and potatoes are grown.

Coal is Hopeh's leading mineral resource. The Kailan basin, centred on T'ang-shan, is one of China's main coal producers. Kailan coal is suitable for power-station fuel and other steam-generating uses. The Men-t'ou-kou mine. west of Peking. yields anthracite. Fengfeng. near the city of Han-tan, is a coking-coal centre that was expanded by the Communist regime after 1949. Iron ore is mined in the Lung-yen district near Hsiian-hua in former Chahar province, and at Wu-an, west of Han-tan. Other mineral industries are based on gold and copper deposits in the P'ing-ku-Tsun-hua area near the Great Wall, and on coastal salines, centred on the town of Han-ku on the gulf of Po-Hai.

The coal and iron-ore resources furnished the basis for an integrated iron and steel industry at Shih-ching-shan, a western suburb of Peking. Blast furnaces at Shih-ching-shan produced 430,000 tons of pig iron in 1957. The pig iron was converted into steel at Shih-ching-shan itself, as well as at smaller steel plants in Tientsin and T'ang-shan. Before Communist rule. Tientsin was the province's only metal-fabricating and manufacturing city. After 1949 industrial expansion was promoted in Peking. the national capital, which built new plants and iactories in industrial suburbs. Peking's metal industries produce automobiles, tractors, locomotives and bridge girders. As a leading cotton-growing province, Hopeh has been developed also as a textile producer. Large

cotton mills operate at Peking, Shih-chia-chuang and Han-tan.

Hopeh's population is made up almost entirely of Chinese speaking the northern Mandarin dialect, China's national language The only national autonomous areas reserved for ethnic minorities are tno autonomous *hsien* (counties) of the Hui (Chinese Moslems) at Ta-ch'ang east of Peking, and at Meng-ts'un, near the Shantung border in the southeast. Both autonomous *hsien* mere established in June 19j6.

The province's largest cities, with 1953 populations, are Peking (2,768,149), Tientsin (2,693,831), T'ang-shan (693,000), Shih-chia-chuang (373,400), Kalgan (299,300), Pao-ting (197 000), Ch'in-huang-tao (186,800) and Hsuan-hua (114,100). (T. Sd.)

HOPEWELL. This name is given to a spectacular cultural development shared by prehistoric American Indians from about 100 BC to AD. 500 in what is now the southern part of Ohio. Typical monuments—groups of burial mounds nith extensive enclosures of banked earth—are the M. C. Hopewell. Mound City, Harness and Seip groups, all in Ross county; Turner in Hamilton county; Tremper in Scioto; the Ft Ancient hilltop enclosure in Warren; and the works at Marietta and Newark. Archaeological excavations have been carried out since 1846 by various institutions, notably the Ohio State museum and the Ohio State Archaeological and Historical society. Across the northern United States from western New York to Kansas City are concentrations of other prehistoric sites called Hopewellian but representing coordinate cultural developments not necessarily tributary to Ohio. Southward to the Gulf of Mexico a number of cultural groups were variously affected by the spread of Hopewellian ideas.

Some Hopewellian sites yielded considerable evidence of domestic occupation and data concerning the economic systems upon which contemporary societies were based. The major sites, especially in Ohio, have the character of mortuary precincts, however, and since excavators have not been unmindful of the occurrence of fine museum specimens deposited as offerings in mounds and graves, there is even more information about burial customs.

Some details of architectural and building practices are known from the remains of charnel houses and log tombs found under the burial mounds as well as from the occasional remains of domestic dwellings. The relics of costumes and objects deposited with the dead reveal something about technology and kinds of raw materials. Differential placement of burials contrasting in regalia and wealth of offerings suggests distinctions of social status and permits some inferences about the kind of society in which such differences could occur. It is also possible that Hopewellian communities included specialist artisans. The wealth of objects buried with the dead required constant replacement, While virtually nothing is known concerning religion, it appears from grave offerings that the status granted in life was expected to be maintained in the hereafter. The elaborations of mortuary and probably other ceremonies may have required a specialized priesthood to look after such matters.

Reconstruction of the lifeways of the various Hopewellian peoples is an engrossing task. The economy—to judge from preserved food remains—was based on hunting, fishing and gathering wild plant foods. That cultivation was known is attested by occasional finds of carbonized maize, and of maize and beans at a site near Kansas City. Yet the basic orientation may have been toward hunting and gathering rather than toward agriculture. There is better information concerning technology. Tools and weapons were of chipped and ground stone, bone, wood and cold-hammered copper. The art of smelting was unknown. Ground stone axes were used to fell the timbers for domestic and mortuary buildings. Chipped flint drills, knives, scrapers and projectile points had many uses at home as well as in hunting. Woven textiles have been iound with burials, preserved by the salts of copper objects placed with them, and small painted pottery figurines also show details of dress and hair style.

The Hopewellians excelled in crafts and so skillful was the workmanship on many of the objects deposited with the dead that these are often sought by museums and collectors of art objects. These include copper "Panpipes," breastplates, headdresses, bracelets and many other items, but especially noteworthy are stone pipes carved in the forms of birds and animals.

Other information—stylistic changes in artifact forms—permits tentative conclusions concerning the origin, spread and eventual disappearance of the cultural efflorescence achieved by the Hopewellian societies. Most features of Hopewellian life had a gradual historical development in the northern United States east of the Mississippi and the people themselves were a longheaded physical type indigenous to the region. The basic mortuary practices also had a long history in the area, but many specific details in Ohio Hopewell were borrowed from a related culture—Adena—that lay immediately southward in Kentucky, began earlier and ended sooner. The various northern Hope~vellian groups possessed their own cultural traditions, but at about the time of the great Ohio development they are found to share similar burial habits. some kinds of artifacts, and their economies were probably based upon similar adjustments to natural resources. All these societies were historically related, and there was much interaction and trade among them that would have promoted the spread of ideas, furthering the likenesses among the various groups. This trade extended far beyond the borders of the northern Hopewellian societies, however, and was at least in part the instrument through which cultural linkages were established with the south. From the Lake Superior region came native copper which was cold-hammered into ornaments; from the Carolinas, mica which was carefully cut in abstract and naturalistic forms and attached to costume; from the Atlantic coast and Florida came seashells for other ornaments and the large *Cassis* shells for cups; evidently it was the west which supplied obsidian for manufacture of fine black spearheads. Although most Hopewellian ceramics were of local origin, simple wide-mouth pots decorated with impressions of cord, fabric or a cord-wrapped stick, there was widespread in the north at this time a finely made and tastefully decorated pottery that may have been manufactured in only one or a few places.

The offerings in the Ohio mounds were the most varied and elaborate, but there is no evidence that Ohio exercised political domination over the other northern areas although it must have been a major hub of Hopewellian trade. After about A.D. 500 the more spectacular features of Hopewellian burial practices gradually disappeared and were replaced by simpler rites. It is uncertain whether this represented some kind of total cultural decline or simply an unwillingness to continue to devote so much wealth and effort to the care of the dead in the hereafter. Whatever the case, there was a corresponding decline in the quantity and quality of the fine articles immolated with the dead and a virtual disappearance of the trade in the materials from which these had been made. Important social changes may have taken place at this time; some of the later sites are smaller and show much less in the way of material equipment, suggesting a simpler kind of social organization and a more unsettled way of life.

HOPI. A division of Shoshonean Indians in northern Arizona, inhabiting seven small towns and forming part of the Pueblo group.

They are also known as Moki or Moqui and their district as Tusayan. They were discovered by Tobar of Coronado's expedition in 1540, annexed in 1598 by Oñate, missionized in 1629. After the Pueblo rebellion of 1680 most of the Hopi moved their towns onto mesas for defense; only Oraibi perhaps still occupies the same site as in 1540. Soon after the rebellion, groups of Tewa from the Rio Grande established themselves among the Hopi; one of these remained and still preserves its old speech in the town of Hano. A single mission was re-established, at Awatobi, but per-

manently abandoned on the destruction of this pueblo by the other Hopi. Awatobi and Oraibi were the largest towns in this period; Shongopovi, Mishongnovi and Walpi already existed; Sichomovi and Shipaulovi were founded in the 18th century. The population, perhaps 4,000 at discovery, has long been nearly stationary at about 2,000, nearly half of it in Oraibi until factionalism bet een the conservative and progressive elements in that town led to a secession and the founding of Hotavila.

Since their discovery, the Hopi have been the westernmost of the Pueblos. Spanish influence therefore rested lightly on them and native culture has been maintained more purely than at Zuñi, Acoma and especially the Rio Grande towns. The Hopi snake dance, perhaps the most famous native ceremony still practised in the United States, owes its interest and repute to the purity of its aboriginal flavour; except in details, it was like other Pueblo rites before these were modified or abandoned. The Hopi are also the last of the Pueblos to grow, spin and weave a native cotton.

See the series of monographs by Fewkes **and** Mindeleff in *Reports of the Bureau of American Ethnology.* **(A. L. K.)**

HÖPKEN, ANDERS JOHAN, COUNT VON (1712–1789), Swedish statesman, was the son of Daniel Niklas Höpken, one of Arvid Horn's most determined opponents and a founder of the Hat party. When in 1738 the Hats came into power the younger Höpken obtained a seat in the secret committee of the diet, and during the Finnish war of 1741–42 was one of the two commissioners appointed to negotiate with Russia. During the diet of 1746–47 Höpken's influence was of the greatest importance. It was chiefly through his efforts that the estates issued a "national declaration" protesting against the arrogant attitude of the Russian ambassador, who attempted to dominate the crown prince Adolphus Frederick and the government. This spirited policy restored the waning prestige of the Hat party and firmly established their anti-Muscovite system. In 1746 Höpken was created a senator. In 1751 he succeeded Gustaf Tessin as prime minister, and controlled the foreign policy of Sweden for the next nine years. On the outbreak of the Seven Years' War, he contracted an armed neutrality treaty with Denmark (1756), but in the following year acceded to the league against Frederick II of Prussia. During the crisis of 1 76—62, when the Hats were at last compelled to give an account of their stewardship, Höpken retired from the senate and from the premiership. After the revolution of 1772 he re-entered the senate, finally retiring in 1780.

See Carl Silfverstolpe, *Grefve Höpkens Skrifter* (Stockholm, 1890–93). (R. N. B.)

HOPKINS, EDWARD WASHBURN (1857–1932), U.S. philologist, and outstanding Sanskrit scholar, was born at Northampton, Mass., Sept. 8, 1857. Receiving his training in classics at Columbia university and in Sanskrit at the University of Leipzig (Ph.D. 1881), Hopkins later taught at Columbia (1881–85), Bryn Mawr (1885–95) and at Yale (1895–1926), where he became Edward E. Salisbury Professor of Sanskrit and Comparative Philology. Hopkins' monograph on "The Social and Military Position of the Ruling Caste in Ancient India," in the *Journal of the American Oriental Society* (1889), is still the best account of its subject. In *The Great Epic of India* (1901) he furnished the first statistical and scientific evidence for distinguishing the chronological layers of the *Mahabharata.* More widely read were his books: *The Religions of India* (189j), *Epic Mythology* (1915), *The History of Religions* (1918), *Origin and Evolution of Religion* (1923) and *Ethics of* India (1924). Hopkins died on July 16, 1932.

See *Journal of the American Oriental Society,* 52:314–315 (1932), for a bibliography of Hopkins' work. (D. H. H. I.)

HOPKINS, ESEK (1718–1802), first commodore of the American navy, was born in Scituate, R.I., April 26, 1718, and went to sea at the age of 20. Ability as a seaman and trader and a wealthy marriage placed him at the head of a large merchant fleet prior to the French and Indian War. Successful privateering during that war added to his opulence and gave him a naval reputation. Rhode Island named him a brigadier general of its land forces at the outbreak of the American Revolution, but a call from the Continental Congress, where his brother was chairman of the naval committee, induced him to forsake the army and, on Dec. 4, 1775, accept the command of the first Continental fleet then outfitting at Philadelphia. Instructed to attack Lord Dunmore's British fleet in the Chesapeake, Hopkins considered his orders discretionary, and the enemy too strong. He sailed his fleet of eight armed vessels, therefore, to the Bahamas, captured considerable war material at New Providence, and, upon his return, fought an inconclusive action with the British ship "Glasgow," April 6, 1776. Dissatisfaction with the achievements of the fleet and its subsequent inactivity in Rhode Island, brought an investigation in congress where Hopkins, in Aug. 1776, was ably defended by John Adams, who sensed an anti-New England spirit behind the attack upon the commodore. Censured for disobedience of orders, but saved from dismissal, Hopkins returned to Rhode Island, his command restricted to only "the fleet formerly put under his care." At loggerheads with most of his officers, and unable to man his ships and dispatch them as a fleet, he soon lost the confidence of congress. When a group of officers preferred formal charges against him, congress, on March 26, 1777, suspended him from his command. Hopkins managed to have several of his principal accusers court-martialed and "broken," but he never regained his command. Dismissal from the navy came on Jan. 2, 1778. Thereafter, until his death at Providence, Feb. 26, 1802, he played a prominent part in Rhode Island politics.

See *Journals of Continental Congress, 1775–1778* (1905–1908); *Esek Hopkins Letter Book* and *Correspondence of Esek Hopkins* (1932, 1933); Edward Field, *Life of Esek Hopkins* (1898). (W. B. CK.)

HOPKINS, SIR FREDERICK GOWLAND (1861–1947), English biochemist and Nobel laureate, was born on June 30, 1861, at Eastbourne, East Sussex. In 1888 he began his medical studies at Guy's hospital. He combined activities in research with clinical work and after taking his degree at the University of London in 1894 became a member of the staff of the medical school of Guy's. In 1899 he was called by Sir Michael Foster to Cambridge, where he joined the illustrious school of physiology which Foster was founding. Trinity college created the post of prelector in physiological chemistry specially for him.

Hopkins showed that the wing pigments of certain butterflies were derivatives of uric acid, and gave a new turn to thought concerning animal pigmentation by demonstrating that excretory substances may function in ornament. He early realized that one of the urgent needs of biochemistry, then entering its modern phase under Felix Hoppe-Seyler and Franz Hofmeister, was accurate knowledge of the proteins. He succeeded (with S. W. Cole) in isolating from proteins the amino-acid tryptophan. In 1906, in collaboration with W. Fletcher, he laid the foundation of modern knowledge of the chemistry of muscular contraction by his researches into lactic acid production in muscle. In the same year he published preliminary reports of experiments involving "pure diets" which proved the existence of essential amino acids and of those accessory factors in foods which were afterward to be known by the name of vitamins; full results of the vitamin experiments were published in 1912. Another important research was that of 1910 (with G. Savory) on Bence-Jones protein. In 1921 Hopkins made his most fundamental contribution by isolating from living tissues the sulfur-containing dipeptide glutathione and by showing its great importance for oxidation in living cells.

Among the many honours Hopkins received were the Royal medal (1918) and the Copley medal (1926) of the Royal society; the Nobel prize (jointly with Christiaan Eijkman; *q.v.*) for physiology (1929); and the Order of Merit (1935). He was knighted in 1925. Hopkins died on May 16, 1947, at Cambridge, Eng. (J. NE.; X.)

HOPKINS, GERARD MANLEY (1844–1889), English poet, was born at Stratford, Essex, on July 28, 1844. He wrote his first'poetry while a pupil at the Cholmondley grammar school, Highgate, London, but at this time was more concerned with painting than with poetry. In April 1863 he went up to Balliol college, Oxford, where Matthew Arnold was professor of poetry in the university. Under the waning influence of the Oxford movement, Hopkins abandoned his Anglican upbringing to enter the Roman Catholic Church in 1866, and two years later joined

the Society of Jesus. In 1877 he was ordained priest and, after working among Irish immigrants in the Liverpool slums and teaching Latin and Greek at Stonyhurst college in Lancashire, he became professor of Greek at University college. Dublin, in 1884. On June 8, 1889, he died of typhoid fever in Dublin and was buried in the Jesuit cemetery at Glasnevin.

It was while studying theology at St. Asaph in Wales, during his novitiate, that Hopkins entered his most productive period as a poet. culminating in his long poem, "The Wreck of the Deutschland" (1875).

Hopkins' collected poems were first published in 1918, by Robert Bridges, then poet laureate, to whom he had entrusted his works. His innovations in metre and rhythm, his abnormally sensitive use of language and the depth and passion of his religious convictions made an immediate impact on the young poets of the 1920s and '30s.

The main features of Hopkins' poetry are the complex pattern of rhyme, alliteration and assonance that he wove around his generous use of sprung rhythm. Sprung rhythm is a method of manipulating stressed and slack syllables in a line of poetry to achieve desired effects, that had not been used in English verse since the time of Robert Greene and the early Elizabethans. He used the term "inscape" to express the vital quality behind all his creative activity — the quality of discerning the distinctive character of the person or object observed. Hopkins derived philosophical justification for this conception from the works of John Duns Scotus (*q.v.*).

(B. E. O.)

HOPKINS, HARRY LLOYD (1890–1946), administrator of federal relief during the New Deal and Pres. Franklin D. Roosevelt's close adviser and personal emissary during World War II, was born at Sioux City, Ia., on Aug. 17, 1890. He entered social work in New York city immediately after his graduation from Grinnell (Ia.) college in 1912. In 1931 when the acuteness of the depression forced large-scale state aid to the unemployed, he became executive director, then chairman, of the New York state temporary emergency relief administration under Gov. Franklin D. Roosevelt. In the spring of 1933 when Roosevelt became president, he appointed Hopkins administrator of the new Federal Emergency Relief administration. Hopkins immediately began distributing an initial $500,000,000 in federal grants-in-aid to establish state relief programs. He tried to resist political pressures and laboured vigorously to estahlish relief agencies of high professional standards. He combined crusading moral fervour with hardheaded executive ability. Worrying about the moral erosion and loss of skills of those who had not worked for years, he persuaded President Roosevelt to estahlish a work relief program, the Civil Works administration (CWA), in the fall of 1933. Criticism of the makeshift nature of many of the projects led to the abolishment of the CWA in the spring of 1934. Heavy Democratic victories in the fall elections of that year encouraged Hopkins to pressure the president to recommend extensive reforms in 1935. These included the establishment through an act of congress of a more substantial work relief program, the Works Progress administration (WPA). Some parasitism, and by 1938 much politics, entered into the WPA. Republicans charged that the enormous relief funds were being spent to influence elections and claimed Hopkins had remarked. "Spend and spend, tax and tax, elect and elect." Yet Hopkins altogether spent a total of $8,500,000,000 for unemployment relief with the record marred by a few relatively insignificant scandals compared with many substantial public works achievements, and the aiding at one time or another of about 15,000,000 people. By the time of the election of 1936 Hopkins had become deeply interested in politics and increasingly an adviser to President Roosevelt. In the late 1930s he developed presidential ambitions. Roosevelt appointed him secretary of commerce in 1938. A serious stomach operation leaving him in permanently precarious health put an end to his political ambitions but, if anything, made him more valuable to Roosevelt as a trusted confidant. He acted as personal manager for Roosevelt at the Democratic convention in July 1940. In Aug. 1940 he resigned as secretary of commerce to devote himself fully to working on the problems of the defense crisis and aiding Great Britain. He made several trips to London, and after, the U.S.S.R. entered the war, to Moscow, to discuss assistance, and after the United States entered the war, strategy. Hopkins was head of the lend-lease program in 1941 but until the end of the war functioned for the most part informally as the president's adviser, so close to Roosevelt that he even lived in the White House. His final service after Roosevelt's death was to visit Moscow in the spring of 1945 to help arrange the Potsdam conference for Pres. Harry S. Truman. Hopkins had long been thin and wracked by pain; he died in New York city on Jan. 29. 1946.

See Robert Sherwood, *Rooscvelt and Hopkins* (1948). (FK. F.)

HOPKINS, MARK (1802–1887), U.S. educator and moral philosopher, of whom it was said that "The ideal college is Mark Hopkins on one end of a log and a student on the other." was born in Stockbridge. Mass., on Feb. 4. 1802. He became identified with a philosophical outlook that combined 18th-century puritanism and 19th-century progress. His teachings at Williams college, Williamstown, Mass., where he was in charge of instruction of the senior class from 1830 to 1887 and president from 1836 to 1872, and his four series of lectures before the Lowell institute, Lowell, Mass., gave him an opportunity to preach the "gospel of wealth," which emphasized the importance of striving to possess property and of treating wealth with the responsibility of Christian stewardship.

Hopkins was firmly established in the folklore of U.S. education by the above-quoted aphorism, attributed to Pres. James A. Garfield, his former student. This aphorism may be considered to define the purposes of the liberal arts college in the United States, suggesting an emphasis on self-education, close student-faculty relations and moral as well as intellectual training. Hopkins' retirement from the Williams presidency in 1872 meant an acceleration of those tendencies toward secularism, intellectualism and professionalism that he deplored. He died at Williamstown on June 17, 1887.

Hopkins is sometimes confused with a contemporary Mark Hopkins, who was associated with Theodore Judah. Collis P. Huntington and Leland Stanford in California railroad development.

(F. RII.)

HOPKINS, SAMUEL (1; 21–1803), American Congregational theologian, a disciple of Jonathan Edwards (*q.v.*), was born in Waterbury, Conn., on Sept. 17, 1721. He was graduated from Yale college in 1741; studied divinity at Northampton, Mass., under Edwards; and in Dec. 1743 was ordained minister of the Congregational church in frontier Housatonick (later named Great Barrington, Mass.), where he continued his contacts with Edwards and served until 1769. From April 1770 to his death on Dec. 20, 1803, he was minister of the First church in Newport, R.I. He and Joseph Bellamy were Edwards' most important and creative disciples, Hopkins being the more arresting, controversial and influential of the two. His uningratiating manner and severe views on unregeneracy, church membership and baptism led to his dismissal at Great Barrington and to much dissatisfaction at Newport; hut "Hopkinsianism" flourished despite the ravages of imperial wars and the Revolution. *A System* of *Doctrines Contained in Divine Revelation* (1793) is Hopkins' masterpiece, a closely reasoned dogmatics developing the great Edwardscan themes yet adjusting them to the growing humanitarian temper of the times. His most widely discussed contentions were these: that God's permission of sin stemmed from his concern for the happiness of the whole and hence is "advantageous"; that human virtue con-

sists in a similar concern for the whole, with disinterested benevolence or complete submission to God's will being the supreme motive, even unto willingness to be damned; that sin consists essentially in self-love; and that there is no promise of salvation but in the exercises of holiness of regenerate men. His work had great effect in expanding missionary activity in America and abroad (particularly Africa) and in developing philanthropic social attitudes. Beginning in the early 1770s he began to speak and write actively for Negro emancipation and against the slave trade, being one of the first New England Congregationalists to do so.

BIBLIOGRAPHY.—Hopkins' *Works*, 3 vol. (1852) contains a good biography by E. A. Park; Stephen West's *Sketches of . . . Hopkins* (1805) is largely Hopkins' autobiography. *See* also Williston Walker, *Ten New England Leaders* (1901): F. H. Foster. *Genetic History of the New England Theology* (1907); Joseph Haroutunian, *Piety Versus Moralism* (1932). (S. E. A.)

HOPKINSON, the name of two English engineers and physicists, father and son.

JOHN HOPKINSON (1849–1898), chiefly known for his work in the electrical field and in particular for his analysis of the magnetic circuit, was born in Manchester on July 27, 1849. After a brilliant career at Cambridge and London universities he entered, as a pupil, the engineering works in which his father was a partner. In 1872 he became engineering manager in the glass manufactories of Chance Brothers and Co. at Birmingham, where he studied the problems of lighthouse illumination and advocated the group-flashing method of differentiating lights. He also undertook researches on electrostatic capacity, the phenomena of residual charge and other problems arising out of Clerk hfaxwell's electromagnetic theory.

In 1878 Hopkinson established in London a successful practice as a consultant engineer. His work was mainly electrical: he acted, for instance, as consultant to the English Edison Co., to the Metropolitan Electric Supply Co. and to Mather and Platt on the City and South London railway. He was also in great demand as an expert witness in patent cases. In the early 1880s Hopkinson was almost alone in his grasp of the correct principles underlying the new application of electricity to "the electric light." In conjunction with his brother Edward he worked out the general theory of the magnetic circuit in the dynamo, making great improvements in its design and efficiency; he analyzed the process of commutation; and he took a leading part in the development of the three-wire system of distribution. He also elucidated the theory of alternating current, and the parallel operation of alternators.

In 1890 Hopkinson took charge, with the title of professor, of the newly founded Siemens laboratory at King's college, London. He received, among other distinctions, a Royal society medal, and was twice president of the Institution of Electrical Engineers. His death occurred on Aug. 27, 1898, when, together with one son and two daughters, he was killed in an accident while climbing the Petite Dent de Veisivi, Switz. (M. K. W.)

BERTRAM HOPKINSON (1874–1918), distinguished for his work in aeronautics and for his researches on the process of explosions, was born at Birmingham, Eng., on Jan. 11, 1874, the eldest child of John Hopkinson (*see* above). When his father was killed, Bertram took up his unfinished work. designing electric tramways at Crewe, Newcastle and Leeds. In 1903 he succeeded Sir J. Alfred Ewing (*q.v.*) as professor and head of the engineering department, Cambridge, and under his leadership the department grew in numbers and reputation. He was an effective teacher with a passion for research, covering such diverse subjects as the properties of steel, the dynamics of explosions and the hunting of alternators. He was elected a fellow of the Royal society in 1910 and a fellow of King's college, Cambridge, in 1914. In 1915 he was appointed to the department of military aeronautics of the royal flying corps, taking charge of the design of bombs and establishing an armament experiment station at Orfordness. In 1916 the testing of airplanes was put under his charge and his influence on the general development of aeronautics steadily increased. On Aug. 26, 1918, he was killed while piloting a Bristol fighter. (J. F. BR.)

HOPKINSON, FRANCIS (1737–1791), U.S. author, musician and statesman, one of the signers of the Declaration of Independence, was born in Philadelphia, Pa., Sept. 21, 1737. His father, Thomas Hopkinson, a lawyer, was first president of the American Philosophical society and trustee of the College of Philadelphia, predecessor of the University of Pennsylvania. Francis Hopkinson was enrolled as the first student in the college, from which he received his bachelor's degree in 1757, his master's in 1760 and the degree of LL.D. in 1790. He aided the revolutionary movement and the later struggle for the adoption of the constitution by a series of prose and poetic satires, which were widely reprinted and most effective. Among them are *A Pretty Story* (1774) and *Tize Battle of the Kegs* (1778). He published *A Collection of Psalm Tunes* (1762) and composed *Seven Songs for the Harpsichord or Forte-Piano* (1788). He died May 9, 1791. His *Miscellaneous Essays and Occasional Writings* was published in 1792.

HOPPE-SEYLER, FELIX (1825–1895), German physiologist, became in 1856 assistant to Virchow in Berlin, in 1864 professor of applied chemistry at Tübingen and in 1872 professor of physiological chemistry at Strasbourg. He pursued important researches on blood and metabolism, and was the first to obtain lecithin in the pure state. His most important studies concern milk, bile, urine and chlorophyll.

Hoppe-Seyler wrote a handbook of chemical analysis applied to physiology and pathology (1858) and a treatise on physiological chemistry (1877).

HOPPNER, JOHN (1758–1810), English portrait painter, who emulated the style of Sir Joshua Reynolds, probably was born on April 4, 1758, at Whitechapel. His father was of German extraction, and his mother was one of the German attendants at the royal palace. Hoppner received the patronage of George III, whose regard for him gave rise to the report that he was the king's natural son. As a boy he was a chorister at the royal chapel, and in 1775 entered as a student at the Royal Academy. In 1778 he took a silver medal for drawing from life, and in 1782 the Academy's highest award, the gold medal for historical painting, his subject being King Lear. He first exhibited at the Royal Academy in 1780. His earliest love was for landscape, but necessity obliged him to turn to the more lucrative business of portrait painting. At once successful, he had throughout life the most fashionable and wealthy sitters, and was the greatest rival of the king's painter, Thomas Lawrence. The prince of Wales especially patronized him, and many of his finest portraits are in the state apartments at St. James's palace, the best perhaps being those of the prince, the duke and duchess of Tork, of Lord Rodney and of Lord Nelson. Among his other sitters were Sir Walter Scott, Wellington, Frere and Sir George Beaumont. A *Series of Portraits of Ladies* was published by him in 1803, and a volume of translations of eastern tales into English verse in 1805. Ideal subjects were very rarely attempted by Hoppner. though a "Sleeping Venus," "Belisarius," "Jupiter and Io," a "Bacchante" and "Cupid and Psyche" are mentioned among his works. Hoppner died on Jan. 23, 1810.

He was confessedly an imitator of Reynolds. When first painted, his works were much admired for the brilliancy and harmony of their colouring, but the injury due to destructive mediums and lapse of time which many of them suffered caused a great depreciation in his reputation. The appearance, however, of some of his pictures in good condition has shown that his fame as a brilliant colourist was well founded.

HOPSCOTCH, a children's game played on a diagram drawn on the ground or other flat surface, having named or numbered spaces. The game is world-wide and has many variations. In a common form, each player tosses or kicks some small flat object into each division. in sequence, and then hops on one foot through the spaces to get the object and return. When he misses (by stepping on a line, putting both feet down, etc.), he forfeits his turn until the other players have played. The winner is the player who moves through all the spaces first. (N. F. J.)

HOPTON, RALPH HOPTON, BARON (1598–1652), Royalist commander in the English Civil War, appears to have served in the army of the elector palatine in the early campaigns of the Thirty Years' War, and in 1624 he was lieutenant-colonel of a regiment raised in England to serve in Mansfeld's army.

Charles I. at his coronation. made Hopton a Knight of the Bath. Hopton, as member of parliament successively for Bath, Somerset and Wells, at first opposed the royal policy, but after Strafford's attainder (for ahich he voted) he gradually became an ardent supporter of Charles, and at the beginning of the Civil War he was made lieutenant-general under the marquess of Hertford in the west. His first achievement was the rallying of Cornwall to the royal cause, his next to carry the war from that county into Devon. In May 1643 he won the brilliant victory of Stratton, in June he overran Devon, and on July j he inflicted a severe defeat on Sir William Waller at Lansdown. In the last action he was severely wounded by the explosion of a powder wagon and he was soon after shut up in Devizes by Waller, where he defended himself until relieved by the victory of Roundway Down on July 13. He was created Baron Hopton of Stratton. But his successes in the west mere cut short by the defeat of Cheriton or Alresford in March 1644. After this he served in the western campaign under Charles's own command, and toward the end of the war he succeeded to the command of the royal army. It was no longer possible to stem the tide of the parliament's victory, and Hopton, defeated in his last stand at Torrington (Feb. 16. 1646), surrendered to Fairfax. Subsequently he accompanied the prince of Wales in his attempts to prolong the mar in the Scilly and Channel islands. He died in exile, at Bruges in Sept. 1652.

HOR, MOUNT, the scene of Aaron's death, according to the Bible. and since the time of Josephus. generally identified with Jabal Hārōn, about 4,500 ft., near Petra. A shrine on the summit is said to cover the grave of Aaron, and is an object of pilgrimage to the surrounding tribes, but it is obviously of comparatively modern construction. This identification is challenged by many, and other localities have been suggested, *e.g.,* J. Madāra, Hermon, etc.

HORACE (QUINTUS HORATIUS FLACCUS) (65–8 B.C.), the celebrated Roman poet, mas born on Dec. 8, 6 j B.C., at Venusia, a small town of southeast Italy. He was a contemporary and friend of Virgil. His work comprises short meditative personal poems. in which irony of observation and reflection are combined with the more lyrical qualities of poetry in a way more common in modern literature than in antiquity, and longer, more discursive hexameter verse essays dealing in a sophisticated and personal fashion nith everyday ethics and manners and with literary criticism. There are extant 121 lyric poems (Odes, Epodes and Carmen *saeculare*) and 41 verse essays (Satires, sometimes called *Sermones;* Epistles and Ars *poetica*). It is not likely that Horace published more. The verse essays have always been popular, though few place them in the front rank of literature. The reputation of the lyric poems has fluctuated. Horace's ability to embody conspicuously sane pronouncements on the problems and follies of his fellow men, or succinctly evocative vignettes of city life and scenes of natural beauty, in memorable phrases that have the impact of epigrams while retaining an unmistakable note of serene high seriousness has established his position among the general lettered public of all ages as the best-loved Roman poet. A reputation so founded, on the striking turn of phrase (Quintilian's *felicissime audax*) and evident quality of craftsmanship (Petronius' *curiosa* felicitas) rather than on the merit of complete poems (their development of thought is often elliptical and elusive), has often led to some disparagement by those whose poetic standards are exacting. This has been true particularly at times when imagination and spontaneity have been the prized qualities of poetry, at the expense of structural strength and subtlety of technique. Moreover, the charm of Horace's personality that pervades his work and his evident warm humanity have hindered recognition of his claims as a serious and original artist. In the mid-20th century, nhen technical accomplishment and the more intellectual qualities of poetry again came to the fore. and, as a result of sympathetic revaluations by scholars, the reputation of Horace's lyric poetry seemed more secure than it had for 150 years.

Horace lived in one of the best-documented periods of Roman history. Moreover, several of his poems are directly autobiographical and more about him can be gathered from remarks scattered through his work. However, this material needs critical handling. The information provided by the Satires is incidental and scattered, but contemporary and probably reliable. Certain of the Epistles are more consciously autobiographical, but what Horace says about his poetic formation should be accepted with caution. since he is looking back over a period of 20 years. In the lyric poems there is a good deal of attitudinizing and probably a certain amount of poetic fiction. Further information, about the later part of his life especially, can be derived from a condensed version of a biography by Suetonius, an undiscriminating mixture of gossip and fact which, however, preserves valuable quotations from contemporary documents.

Horace's father, a freed slave, held a minor official post as collector of market dues (coactor *argentarius*) in Venusia, which was the seat of a Roman garrison and colony. Culturally the influence of Greece was perhaps as strong as that of Rome, for Venusia was on the periphery of the centuries-old Greek civilization of south and southwest Italy. His southern upbringing may have contributed to that easy familiarity with Greek culture with which his work is penetrated, in contrast to the more flamboyant Hellenism of Catullus or Propertius, though the ambition of his father contrived soon to provide him with the expensive standardized education that his betters enjoyed, first at Rome and later at Athens. Horace's first sojourn in Rome was short and fell in the unquiet years following Julius Caesar's crossing of the Rubicon in 49 B.C. By the time of the assassination of the dictator in 44 B C. Horace was already in Athens. He was acquiring, he later tells us, that moralistic approach to literature which constantly recurs in his poetry, when he was engulfed by the'march of events. Out of idealism, or through personal friendships, he joined the armies of Brutus. For perhaps two years he moved about in Greece and the near and middle east until the inevitable trial of strength came with Antony and the future emperor Augustus. Brutus' defeat at Philippi (autumn, 42 B.C.), in which Horace states he took part as a *tribunus militum,* ended this episode in his career. To his intellectual development it contributed a personal acquaintance with the greater Roman world and that sense of personal involvement in the fortunes of the state which adds occasionally deeper and more passionate overtones to his lyric poetry, leaving him midway between the frivolous antimilitarism of Propertius or Tibullus and the intellectual idealism of Virgil.

Horace returned to Rome after Philippi, as those who wished were permitted to do by a liberal amnesty. He was now about 25 years old, reasonably rich in experience, but destitute in a city he had known only as a schoolboy. He resisted despondency and bitterness with a resilience and determination worth bearing in mind as correctives to the humorously self-depreciatory autobiographical sketches which he affects. He obtained a moderately important administrative post (scriba *quaestorius*) and began writing verse. His early work shows talent rather than genius. But the new regime supported literature generously, and within about five years Horace was able to claim publicly (*e.g.,* Satires i, 5, and i, 10, 81 ff.) that the greatest political figures in Rome, above all Maecenas, were his friends, as well as the leading personalities of literature, especially Virgil.

Horace's devotion to literature continued for nearly a quarter of a century more. He became perhaps the first example in Roman society of a professional man of letters, claiming freedom to write as he chose. He accepted patronage (his small farm in the Sabine hills northeast of Tibur given him by Maecenas some time before 31 B.C. is the most famous example), but resisted vocally all that seemed to him an attempt to restore the old relationship between patron and poet (familiar in Roman society from the 2nd century B.C. onward, and still existing in Horace's day) which imposed on the artist the task of his master's glorification. It is likely that Horace's refusal to attempt epic poetry (the commonest genre in his day) sprang less from the diffidence in his ability that he professes than from the suspect integrity of a form uhich at Rome had become too exclusively devoted to the eulogy of statesmen. Horace's stand was new and his position delicate: Maecenas (to judge from the surviving scraps of his verse) possessed enthusiasm for literature rather than taste and, in applying

pressure to the poets of the Augustan age to serve the regime, he was probably unaware of the artistic problems involved for the writer scrupulous about his integrity.

The decade which followed the battle of Actium (31 B.C.) and the final overthrow of the opponents of the new regime undoubtedly appeared to those like Virgil and Horace who had lived through the horror of almost constant civil war lasting from their early childhood as a new era of peace and hope. The term "Augustan poets," often applied to Horace and Virgil (and their contemporaries), is historically misleading. Both were grown men already writing before the civil wars ended and their intellectual formation was largely complete before the Augustan age began. Virgil (d. 19 B.C.) did not live to see the more ruthlessly totalitarian character of the emperor fully emerge, and the *Aeneid* reflects the genuine enthusiasm aroused by the beginnings of Augustan rule. Horace's poetry of that period occasionally expresses similar feelings (particularly *Odes* iii. 1–6), but his position during the decade by uhich he survived Virgil is less clear. He became rhe emperor's friend. and in his later works references to Augustus become more frequent and tinged with flattery and those to Maecenas rare. It is perhaps not coincidental that at this time Augustus and Maecenas were estranged, though we are told that all his life Maecenas regarded Horace as a loyal friend. In Horace's latest norks *(Epistles* ii, *Odes* iv) open adulation of the emperor and his family appears. How far the need for this decided Horace to give up writing is not clear. At all events, he appears to have written no lyric poetry during the last 5 years of his life and little during the last 15, while, in the three long verse essays which he wrote after Virgil's death, though they deal with literature, his attitude to poetry at times seems curiously sour. As an artist of the highest literary standards, Horace may have felt he had exhausted his genius, though in a poet whose genius was for detailed craftsmanship rather than spontaneity this is not an immediately convincing explanation. He died in Rome on Nov. 27, 8 B.C., after a sudden illness, a few days before the completion of his 57th year.

WORKS

The 30 years of Horace's writing life fall into three periods: a period of rapid development from his return to Rome after Philippi to about the battle of Actium (roughly 40–30 B.C.); the period of his finest work in both styles, covering the next decade; a period, covering probably another decade, of decline in his creative and imaginative powers.

First period.—Satires and Epodes.—The *Satires:* Book i contains work down to about 35 B.C.; Book ii to about 30 B.C. The writing of the *Epodes* seems to have extended over the whole decade.

Horace's initial ambitions as a writer were limited. He began with experiments in two distinct styles. One was a loose form of hexameter verse which he made the vehicle of something very like the modern prose essay. In the space of about 100 lines he argued ethical and literary questions, usually from a very individual viewpoint forcibly maintained, the whole varied by moralizing anecdotes and marked by abrupt transitions intended to create the appearance of spontaneity, though scrutiny shows the essays were in fact carefully composed. The Romans called this *satura.* Horace says *(Satires* i, 10. 46 ff.) that he chose the form in order to have no serious contemporary rival. He expected little difficulty in doing better than the originator of the genre. Lucilius (whose talent he freely admits), by avoiding Lucilius' slipshod methods of composition and the roughnesses of expression which the evolution of the Latin language and technical improvements in the hexameter had eliminated in the 60 years since Lucilius' death. His honesty is disarming and no doubt sincere.

It is clear from *Satires* i, 4, 41 ff. that he originally regarded his essays as something more like prose than poetry. At this stage poetry meant for Horace the high style and impassioned diction of epic and tragedy. His view of the nature of poetry quickly became more subtle and his recipe for satire more exacting. In a fine appraisal of the genre in *Satires* i, 10, 7–14 he claims it can rise, at least occasionally, to the status of real poetry. Of the ten satires of Book i, two deal with literary criticism, four are sermons delivered from a practical unintellectual standpoint in general adherence to the current Epicurean philosophy, while the remaining four have a loose narrative form displaying that interest in character and situation which is also a feature of Horace's lyric poetry. The eight satires of Book ii include a number of experiments in dramatic form and a good deal of that argument about rival ethical theories which (as the treatises of Cicero on popular philosophy show) fanned among the Romans of this period something akin to the heat of religious controversy. The sixth satire of Book ii and the fifth, ninth and perhaps sixth of Book i are those which can be read today with the greatest pleasure. After about ten years of experiment. Horace seems to have felt his poetic intentions and abilities had outgronn this form and he gave himself over exclusively to the kind of lyric poetry which had also begun to take shape during this first period.

The collection called *Epodes* contains 17 poems from 16 to 102 lines in length. The form and, to some extent, the style are based on the iambic poems of Archilochus, a Greek poet of the 8th or 7th century B.C. Horace probably took him as his model mainly to break away from contemporary trends. The influence of Catullus (who died when Horace was about ten) is clear, though unacknowledged. Horace avoids the actual iambic metres used by Catullus, wishing perhaps to disassociate himself from Catullus' successors in his own day. Most of the poems show a pleasant talent and technical competence with some flair for the grotesque and gruesome, spoiled occasionally by a precarious sense of humour. The *Epodes* also contain the first examples of Horace's use of poetry for impassioned commentary on political issues. He admits difficulty in completing the collection; presumably, as with the *Satires,* he outgrew the limitations of the form. Four poems (11, 13–1j), uhich differ sharply from the rest, are better regarded as early odes, included to bring the book up to the minimum dimensions for publication. These four also contain the best nriting.

Second period.—Odes i–iii and Epistles i.—To the seven or eight years after the battle of Actium belongs Horace's most ambitious and permanent contribution to literature. Three books of *Odes* were probably published together in 23 B.C. It was a period of national resurgence after 30 years of civil strife. During most of it, Virgil was working on his national epic, the *Aeneid.* Both factors are likely to have added stimulus to Horace's poetic concentration. *Odes* i–iii comprise *88* poems mostly from 16 to 50 lines long, with a few shorter and a few longer pieces.

The predominating formal theme of rather more than a third is friendship (a friend is normally addressed), with which are mixed in varying proportions counsel, encouragement or philosophical reflection. The hortatory tone adopted by the adherents of Epicureanism in their letters to one another may have contributed to the formal layout, but often the poetic intent obviously transcends the philosophical. For example ii, 10 (*Rectius uiues, Licini, neqzte altum, . .*) is primarily hortatory though with serious poetic qualities as well; whereas in i. 4 (*Solvitur acris hiems . . .*) the philosophical commonplace formally provides a thread to link the rich imagery of the first part of the poem with that of the second part, tuning the simple sensuousness of the imagery with pervading attitudes of irony and melancholy. The famous ode ii, 14 (*Eheu fugaces, Postume, Postume, labuntur anni . . .*) on the other hand, while dealing with a similar commonplace. is one of a group of odes (compare, for example, i, 27; ii, 3; iii, 13) in which a dramatic context is discreetly suggested.

Nearly another third of the odes deal with love. Horace treats this theme differently from either Catullus or Propertius and contemporary poets. Where they are concerned more nith the analysis of emotions arising out of a single affair and the effect on the poet of his involvement in it, Horace chooses typical situations. The emphasis is not on the facts of the situation, but on the possibilities of irony, pathos or charm they offer to the poet as observer. These love poems are characterized therefore by a high level of detachment, in contrast to the open and forceful personal comment of his earlier period. Judgment of the situation does not go beyond a slightly ironical or melancholy implication. As a result of this humanist and realist standpoint, the

themes chosen for study are more often trivial than heroic. In solving the problems raised by the need in such short poems for maximum concentration of complex data, Horace drew upon the formal conventions of Greek epigram: the technique, for example, of writing a poem as a fragment of a story with only enough of the facts given to form a sketched-in background to the real point —a humorous remark, a pathetic situation, etc. To the conventions of epigram Horace makes two notable contributions. He writes a rather longer poem which can study fairly complex emotional patterns instead of a single point. Secondly, he exploits a technique of oblique description of scene. The poems become a kind of puzzle, setting the task of fitting together the relevant data, which are suggested rather than overtly presented. As in the philosophical odes, some poems are dramatic monologues rather than poems actually directed to their addressee—studies, as it were, in the process of the unwinding of the speaker's thoughts (*e.g.,* especially i, 5; iv. 13).

The remaining odes deal with the practice of poetry and miscellaneous topics, including short formal hymns to gods and goddesses. The six great Roman odes that begin Book iii form a group on their own. On the whole Horace's attempt to adapt his intimate personal style to the grander themes of patriotic poetry is successful. He stresses the moral seriousness of the new regime with a severe sobriety that scrupulously avoids adulation. Some of Horace's best imaginative writing (the picture of traditional rustic life in iii, 6; the superb episode of Regulus in iii, 5) is found here.

About three-quarters of the collection are written in one or other of two types of four-line stanza associated with the Greek lyric poets of the 7th century B.C. (His Sapphics and Alcaics are written to stricter rules than obtained in Greek. Long syllables are regularized where shorts had been permitted, an effect more congenial to Latin and to the serious tone of Horace's poetry. He made similar modifications in his Asclepiads and other metres and in general regularized the use of caesurae.) It is in this technical metrical sense that the ancients called the poems lyrics. They are, of course, no more songs than modern meditative lyric poems are. In an epilogue poem (iii, 30) Horace claims that he re-created Aeolic poetry (*i.e.,* Sappho and Alcaeus) in Italian verse:

> dicar, . . .
> princeps Aeolium carmen ad Italos
> deduxisse modos.

Elsewhere (Epistles i, 19, 32 ff.) he indicates that his main indebtedness was to Alcaeus. In both places Horace seems to suggest affinity in style and spirit as much as in metrical form. His words are allusive rather than specific and, as Alcaeus' poetry survives only in fragments, the nature and validity of Horace's claim are hard to fix. Modern critics differ sharply. According to a view popular among German critics, Horace, after beginning as a Hellenistic poet in spirit (Epodes and early Odes), became increasingly "classical." Others follow Giorgio Pasquali's theory of a tension in Horace between the essentially Roman-Hellenistic background and subject matter of the Odes, and their consciously pre-Hellenistic, classical form. The predominating 19th-century view that the content of the Odes is trivial perhaps stems from an often-quoted remark attributed to Goethe allowing the technical perfection of the Odes, but denying them any status as real poetry. The harshness of this criticism is probably due to their lack, in Goethe's view. of worthwhile personal experience (*Eriebnis*).

A book containing 20 hexameter epistles was published about 20 B.C. Horace, who was 44, describes himself as "a little baldish man, easy-going though quick-tempered, fond of the sun." The Epistles in many ways resemble the Satires, but show, too, the influence of the literary development of the short personal letter as shaped by Catullus in verse and Cicero in prose: compare, for example, i, 5 (an elegant discursive invitation to dinner) with Catullus, 13. About six more of the epistles are of this kind, the best perhaps being 9—a delightfully tactful letter of introduction. The tone is not unlike that of the lighter odes.

In a second group the jerky allusive style of the Satires persists with little progress stylistically beyond the point Horace reached a decade earlier. The quality varies: i, 18 is a piece of advice, opportunist in tone, on how to win influential friends; 7 an altogether delightful letter to Maecenas (and, incidentally, an eloquent testimony to the ease of their relationship). The epistolary form is sometimes an obvious fiction: in 16 the charming opening paragraph describing Horace's farm is obviously sewn on to the dullish sermon which follows it.

A third group attempts the exposition of an essentially practical philosophical attitude toward life: uirtus est *uitium* fugere, et *sapientia* prima stultitia caruisse, "Virtue consists in avoiding vice. To be free of folly is the first step to wisdom" (Epistles i, 1, 41 f.); and, *mihi res* non me rebus subiungere *conor,* "To be the master of circumstance, not its slave, that is my aim" (Epistles i, 1, 19). The quality of the style in this third group is high. The sentences. though often free of any ornament, possess a dry, terse quality and a serenity of tone that makes them admirable writing. The book, however. has few essentially poetic qualities.

Third period.—Odes *iv,* Carmen saeculare, Epistles ii and Ars poetics.-Horace implies that the odes won him recognition as Rome's leading poet (after Virgil's death) rather than popularity. The poetry was perhaps too uncompromisingly hard. In 17 B.C. Horace was commissioned to compose a choral hymn for the secular games, which heralded the start of a new century. The Carmen saeculare, in sapphics, is diligent rather than inspired work, an elaborate invocation of the appropriate deities. It is more a hymn for an official occasion than a poem. Also at the emperor's suggestion a fourth short book of odes appeared about 13 B.C., comprising partly poems attempting but not achieving, the old style (the best are the Spring ode, 7, and the fine dramatic monologue, 13), and partly very competent laureate writing (4, 5, 14, 15), more openly laudatory than hitherto. Some odes look like work written earlier (*e.g.,* 12; perhaps 7); others (*e.g.,* 8; g) have a straight expository style devoid almost of imagery and verbal poetry that makes them read like epistles done into lyric metres. A weakness of Horace's lyric writing is that little springs from his o n fancy, experience or intellectual strength. The core is the delicate handling. with just the right mixture of approbative and satirical attitudes, of external everyday incidents. This gives a context too limited for extensive repetition.

About this time. Horace published three more long epistles dealing more or less loosely with literary criticism, though his personal attitude to poetry became progressively less sympathetic. A public letter to Augustus on the state of poetry in Rome vigorously defending contemporary writers and a sermon on avaritia introduced by a diffuse discussion of his abandonment of lyric make up Epistles ii. The date of composition is uncertain. The third, usually called Ars poetica, is Horace's longest single composition. Its date (whether early or late in the last decade of Horace's life) is debated. The work has acquired in the history of criticism a fame and at times an authority it hardly deserves. It lacks the intellectual calibre of Aristotle's Poetics and was aimed presumably at a more modest target, though the circumstances of its writing are unknown. It is a kind of practical survey of the history and theory of dramatic poetry. glancing occasionally at lyric and epic, and drawing heavily on Greek theory as propounded by Neoptolemus of Parium and Philodemus, though the issues were contemporary and Roman. The essay, though obviously laid out with care, makes difficult reading. It suffers seriously from Horace's habit of expressing himself in vigorous precepts (many have become famous) and aphoristic illustration, rather than connected argument. There is much good sense, but little fresh criticism, not enough evidence he had fully thought out his critical standpoint, or himself appreciated the complexity of his own poetic achievement.

HORAE, in Greek and Latin mythology the Seasons. In the Iliad they are the custodians of the gates of Olympus. In the Odyssey they are represented as bringing round the seasons in regular order. The brief notice in Hesiod's Theogony, where they are called the children of Zeus and Themis who superintend the operations of agriculture, indicates by the names assigned to them (Eunomia, Dike, Eirene; *i.e.,* Good Order, Justice, Peace) the extension of their functions from nature to the events of human life, and at the same time invests them with moral attributes.

At Athens they were apparently two in number: Thallo and Carpo, the goddesses of the flowers of spring and of the fruits of summer. In honour of the Horae a yearly festival (Horaea) was celebrated.

In later mythology, under Alexandrian influence, the Horae became the four seasons, daughters of Helios and Selene, each represented with the conventional attributes. Subsequently, when the day was divided into 12 equal parts, each of them took the name of hora. (See also GRACES.)

HORAPOLLON, of Phaenebythis in the nome of Panopolis in Egypt, Greek grammarian, flourished in the 4th century A.D. According to Suidas, he wrote commentaries on Sophocles, Alcaeus and Homer, and a work, Temenica, on consecrated places. Photius calls him a dramatist as well, and credits him with a history of Alexandria.

Under the name of Horapollon two books on Hieroglyphics are extant, which profess to be a translation from an Egyptian original into Greek by a certain Philippus. The translation is evidently late and has been ascribed to the 15th century. All that can be said is that there is evidence of the hieroglyphic tradition being still alive in the days of the author.

HORATII AND CURIATII, in Roman legend, two sets of three brothers born at one birth on the same day—the former Roman, the latter Alban—the mothers being twin sisters. During the war between Rome and Alba Longa it was agreed that the issue should depend on a combat between the two families. Two of the Horatii were soon slain; the third brother feigned flight, and when the Curiatii, who were all wounded, pursued him separately he slew them one by one.

When he entered Rome in triumph, his sister recognized a cloak which he was wearing as a trophy as one she had herself made for her lover, one of the Curiatii. She thereupon invoked a curse upon her brother, who slew her on the spot. Horatius was condemned to be scourged to death, but on his appealing to the people his life was spared.

The origin of the story is obscure and disputed. It obviously contains a traditional origin for the right of appeal to the people. The root of the legend is probably in the sororium *tigillum,* the purificatory yoke under which Horatius had to pass.

HORATIUS COCLES, a legendary hero of ancient Rome. With two companions he defended the Sublician bridge against Lars Porsena and the whole army of the Etruscans, while the Romans cut down the bridge behind. Then Horatius threw himself into the Tiber and swam in safety to the shore. A statue was erected in his honour in the temple of Vulcan, and he received as much land as he could plow round in a single day. According to another version, Horatius alone defended the bridge, and was drowned in the Tiber. E. Pais finds the origin of the story in the worship of Vulcan, and identifies Cocles (the "one-eyed") with one of the Cyclopes.

HORDEUM, a genus of perhaps 20 species of annual or perennial grasses, widely distributed in temperate regions. The two important species are barley (H. vulgare) and squirreltail grass (H. *jubatum*). See BARLEY; SQUIRREL-TAIL GRASS.

HOREA, NICOLAS URSU, Rumanian patriot (1735?–1785), was born in Zlatna, Transylvania. In 1783 the peasants of Transylvania were in turmoil about the proposed transfer of part of their territory from noble rule to the military frontier system. Horea declared that unless the serfs were liberated they would rise and wipe out their oppressors. Joseph II of Austria is said to have answered: "Thut Ihr das" ("Do so"), and to have given him a paper of secret instructions. Horea organized an army out of the peasants who were being conscribed and armed for the frontier regiments. This alarmed the authorities, who suspended the recruiting; whereupon, in Nov. 1784, hostilities broke out. At first the peasants genuinely believed themselves to be fighting for the emperor; but Horea proclaimed himself "emperor" and "king of Dacia." He was at last defeated and captured (Dec. 27, 1784). Convicted of high treason, Horea was broken on the wheel (Feb. 28, 1785). (C. A. M.; X.)

HOREB, the ancient seat of Yahweh, the tribal god of the Kenites, adopted by His covenant by Israel. This is the name preferred by the Elohistic writer (E) whose work is interwoven into the Old Testament narrative, and he is followed by the Deuteronomist school (D).

The Yahwistic writer (J), on the other hand, prefers to call the mountain Sinai (*q.v.*), and so do the priestly writers (P). This latter form became the more usual.

HORE-BELISHA, LESLIE HORE-BELISHA, 1ST BARON (1893–1957), British politician, who as minister of transport, 1934–37, initiated measures against road accidents which included the erection of "Belisha beacons" to make pedestrian crossings safer, was born in London on Sept. 7, 1893. After serving in World War I, he went to St. John's college, Oxford, and in 1923 was called to the bar and entered parliament as a Liberal. He joined the national government as secretary to the board of trade in 1931, was financial secretary to the treasury, 1932–34, entered the cabinet in 1936 and became secretary of state for war in 1937.

His energy achieved considerable reforms, but also led to friction with Prime Minister Neville Chamberlain, which resulted in his resignation in 1940. From 1942 to 1945 he sat in parliament as an Independent, and in 1945 became minister of national insurance in Winston Churchill's caretaker government, but lost his seat at the general election.

Hore-Belisha was raised to the peerage in 1954. He died at Rheims, France, on Feb. 16, 1957.

HOREHOUND (HOARHOUND). Common or white horehound (*Marrubium* vulgare) is a white-woolly, perennial herb of the mint family (Labiatae). Native to Europe, north Africa and central Asia it has become widely naturalized in North America—from Maine southward to North Carolina and westward to northern Mexico and British Columbia. It is cultivated in Britain and is occasionally found as an escape on drier soils. The plants are coarse, strongly aromatic, from one to three feet tall with roundish-oval, bluntly toothed leaves which are white and woolly below and pale green and downy above. The flowers are small, whitish, densely clustered in axillary whorls; the calyx has ten short teeth, each terminating in a hooked spine. The leaves and flowering tops of white horehound are in some demand as a crude drug. Infusions or extracts of horehound in the form of syrup, beverage or candy are favourite domestic remedies for coughs, colds and pulmonary affections. Black horehound (Ballota nigra) is a hairy perennial herb with a fetid odour, belonging to the same family. It does not have the white-woolly appearance of white horehound and has rose-purplish flowers with five broad calyx teeth. It is occasionally found as an adulterant of white horehound in the crude drug form. It is native to the same regions as white horehound and has become naturalized in North America from southern New England to Maryland and Pennsylvania. (Q. J.)

HORGAN, STEPHEN HENRY (1854–1941), G.S. inventor and pioneer in the development of the halftone engraving process, was born Feb. 2, 1854, near Norfolk, Va. He studied photography in his youth and in 1874 went to New York to join the old Daily Graphic as a photographer.

While on the Graphic, he developed a process for making halftone pictures, using a glass screen made up of fine parallel lines. Using this method, the Graphic in March 1880 printed the first halftone to appear in a newspaper, from an original plate run on a slow-speed press. In 1893 Horgan became art director of the New York Herald and studied ways to apply the halftone to high-speed presses.

He sold the idea to the *New* Pork *Tribune,* which became the first paper to print a halftone on a high-speed press. Horgan also contributed to the technique of transmitting colour pictures by wire. He died in Orange, N.J., Aug. 30, 1941.

See also PHOTO-ENGRAVING.

HORIZON, the apparent circle around which the sky and earth seem to meet. At sea this circle is well defined, the line being called the sea horizon, which divides the visible surface of the ocean from the sky. In astronomy the horizon is that great circle of the sphere the plane of which is at right angles to the direction of the plumb line.

Sometimes a distinction is made between the rational and the apparent horizon, the former being the horizon as determined by a plane through the centre of the earth, parallel to that through the station of an observer. But on the celestial sphere the great circles of these two planes are coincident, so that this distinction disappears.

The dip of the horizon at sea is the angular depression of the apparent sea horizon, or circle bounding the visible ocean, below the apparent celestial horizon as above defined. It is due to the rotundity of the earth and the height of the observer's eye above the water.

The dip of the horizon and its distance when the height of the observer's eye above sea level is h feet, are approximately given by the formulas: dip = $0.97\sqrt{h}$; distance = $1.17\sqrt{h}$ sea miles. The difference between the coefficients 0.9; and 1.17 arises from the refraction of the ray.

HORMISDAS, pope from July 514 to his death in Aug. 523, was a native of Campania. He obtained the reunion of the eastern and western churches, which had been separated since the excommunication of Acacius in 484. After two unsuccessful attempts under the emperor Anastasius I, Hormisdas nas able to come to an understanding in 518 with his successor Justin and with the patriarch John of Cappadocia. In 519 legates were dispatched to Constantinople; the names of the schismatic patriarchs were erased from the diptychs, and union was resumed with the Holy See. Hormisdas secured Dionysius Exiguus to edit the synodal decrees of the Greek church. His memorials and briefs were printed by J. P Migne, *Patrologin latina,* volume 63.

HORMIZD or HORMIZDAS, the name of five kings of the Sassanid dynasty (see PERSIA. *History).*

1. HORMIZD I (reigned 272–273), son of Shapur I, appears in Shapur's wars against Rome: but scarcely anything is known of his short reign. In the Persian tradition of the history of Ardashir I, preserved in a Pahlavi text, he was the son of a daughter of Mithrak, a Persian dynast, whose family Ardashir had extirpated because the magians had predicted that from his blood would come the restorer of the empire of Iran. Only this daughter was preserved by a peasant; Shapur married her, and her son Hormizd was afterward acknowledged by Ardashir. In this legend the great conquests of Shapur are transferred to Hormizd.

2. HORMIZD II, son of Karseh, reigned from 302 to 309. Of his reign little is known save that he persecuted the Manichees. After his death his son Adarnases (Adhur-Narseh) took the crown but was killed by the grandees; another son, Hormizd, was kept a prisoner, and the throne reserved for the infant of a concubine of Hormizd II. Hormizd escaped from prison and found refuge at the court of Constantine the Great.

3. HORMIZD III, son of Yazdegerd I, succeeded his father in 457. He continually had to fight with his brothers and with the Ephthalites in Bactria, and was killed in 459 by Peroz, who was preferred by the Zoroastrian clergy.

4 HORMIZD IV, son of Chosroes I, reigned 579–590. Some characteristic stories are told of him by Tabari. Hormizd protected the common people and introduced a severe discipline in his army and court. When the priests demanded a persecution of the Christians, he declined on the ground that the throne and the government could only be safe if it gained the good will of both concurring religions. Consequently he raised a strong opposition in the ruling classes. From his father he had inherited a war against the Byzantine empire and against the Turks in the east, and negotiations of peace had just begun with the emperor Tiberius, but Hormizd haughtily declined to cede anything of the conquests of his father. Therefore the accounts given of him by the Byzantine authors, Theophylact, Simocatta (iii, 16 ff.), Menander Protector and John of Ephesus (vi, 22), are far from favourable. In 588 his general, Bahram Chobin, defeated the Turks, but in the next year was beaten by the Romans; and when the king superseded him he rebelled. This was the signal for a general insurrection. The magnates deposed Hormizd and proclaimed his son Chosroes II king. In the war which followed between Bahram Chobin and Chosroes II, Hormizd was killed (590).

5. HORMIZD V was one of the many pretenders who rose after the murder of Chosroes II (628). He maintained himself about two years (631, 632) in the district of Sisibis.

(ED. M.; T. C. Y.)

HORMONES. The realization that blood is a carrier of many principles that affect mental and physical health dates back at least as far as the Hippocratic humoural theories. Also, the appearance of generalized effects after castration of men and domestic animals was well known in biblical times and through the middle apes. The documentary woodcut (fig. 1) from Gesner's *Historia Animalum* (1551) expresses correctly the consequences of orchectomy (removal of testes) for growth of feathers, combs and wattles, and for certain behaviour patterns (fighting, crowing). However, the birth of a true science of internal secretions usually is dated only with the year 1849. At that time. the German physiologist Arnold Adolph Berthold reported on the restitution of cock characteristics by the implantation of testes into capons. He inierred that the testes produce a substance which is released into the blood stream. Generally distributed throughout the body. these substances induce reactions in specially responsive "target organs." often histologically complex systems such as combs. feather germs or the hrain. In spite of much experimentation, virtually no progress on testicular secretion was accomplished until 192; when L. C. McGee extracted from hull testes an alcohol and ether soluble material which. after injection into capons, fully restored the male characteristics. Following this discovery. various laboratories pursued work toward the chemical identification of the substance. By 1934. A. Butenandt had found the chemical structural formulas for the two most important androgens. which were named androsterone and testosterone.

The progress from observations on normal and deficient. often sick organisms. to experiments of extirpation, reimplantation and injection of organ extracts is typical for investigative work on endocrine organs. The next step—chemical identification of the

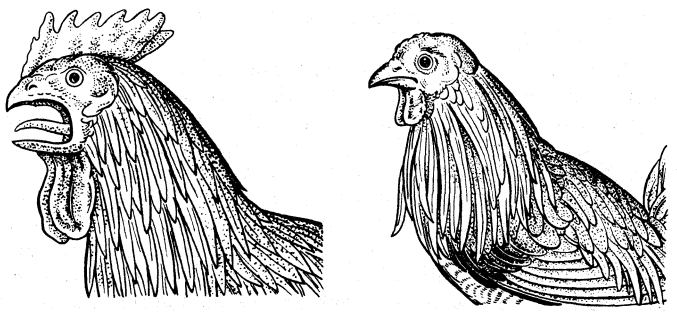

FIG. 1.—COCK (LEFT) AND CAPON, SHOWING DIFFERENCES IN COMB AND WATTLES. REDRAWN FROM WOODCUTS IN KONRAD GESNER'S "HISTORIA ANIMALUM." ZURICH. SWITZ.. 1555

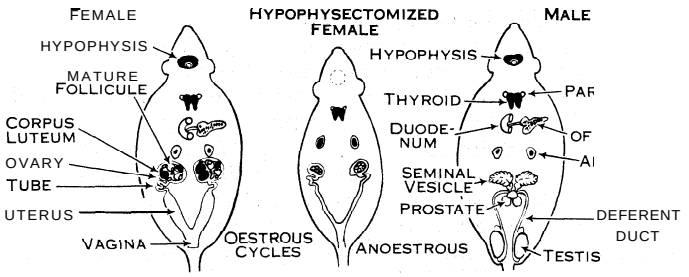
active principles—has been successful mostly if the chemicals involved nere not of proteinic composition.

In the meanwhile (1904), the term hormone had been introduced by W. M. Bayliss and E. H. Starling to denote in general the products of internal secretion. It soon found widespread acceptance, and its meaning was extended beyond the original limitation to blood-borne substances. Thus one speaks also of neurohormones, insect and plant hormones. There is a tendency to apply the name to any substance which carries inductive excitation from one part of the body to another. In this wider formulation the hormones appear in the role of chemical messengers. They may remain confined within the membrane of a single cell, carrying their "message"

from one district of a protozoan to another. or from the peripheral dendrites of a nerve cell to its central ganglionic body and nucleus. Also, the original restriction to substances produced within the organism fell when the chemists were able to synthesize not only the naturally occurring hormones but also structurally different mimetic hormones n-hich, in some instances, act as almost ideal. substitutes (*e.g.*, stilbestrol for the natural female sex hormones).

With such liberal acceptance of new connotations, the term hormone risked danger of becoming vague or ill-defined. However, the following survey includes only the typical and most important endocrine systems and hormones.



BODY WEIGHT	260 g	BODY WEIGHT	180 g	BODY WEIGHT	300g
HYPOPHYSIS	12 mg	THYROID	13 mg	HYPOPHYSIS	8mg
THYROID	24 mg	ADRENALS	16 mg	THYROID	24 mg
ADRENALS	65 mg	ACCESSORY SEX ORGANS	150 mg	ADRENALS	45mg
ACCESSORY SEX ORGANS	1,000 mg	OVARIES	16 mg	ACCESSORY SEY ORGANS	2,000 mg
OVARIES	80 mg			TESTES	3,000 mg

E. WITSCHI

FIG. 2 — THE VERTEBRATE ENDOCRINE SYSTEM SHOWN IN A NORMAL FEMALE A HYPOPHYSECTOMIZED FEMALE AND A NORMAL MALE RAT, ALL LITTER MATES

The hormone producing glands are scattered throughout the body; but among them the hypophysis plays a dominant role, being functionally related to nearly all others. Often it controls the degree of their secretory activity. In many cases reciprocal influences result in delicately balanced equilibria.

The general principles of hormonic action were clearly worked out by mid-20th century; but this brief sketch can merely refer to the participation by hormones in the highly complex sequences of reactions which sustain menstrual cycles, pregnancy or the phenomena of stress. Hormones. always in astoundingly small quantities usually weighed in millionths of grams, often start reaction chains that influence the entire future course of the life process. They serve not as building stones but rather as executive officers, organizing and directing growth, differentiation and maintensnce of organisms by control over enzymatic chemical transformations. Their importance becomes most evident in their failures. under pathologic conditions, and in senescence. Hence their growing usefulness as therapeutic agents in medical practice.

Thyroid. — Through release of a thyrotrophic hormone, the hypophysis stimulates production and release of thyroxin by the thyroid gland. Thyroxin produces spectacular effects in some amphibians. particularly the frog, inducing metamorphosis of the long-tailed aquatic larva into the four-legged terrestrial adult form. In the higher vertebrates, including man. it mainly intensifies the respiratory metabolism, drawing on the carbohydrate. fat and protein reserves of the body. Hyperactivity of the thyroid increases the rate of basal metabolism, a condition typical of exophthalmic goitre. Failure of the thyroid to secrete adequate amounts of hormone leads to low metabolic rates and cretinism (*q.v.*). While the cause for either too high or too low thyroxin production often lies with abnormal thyrotrophic functioning of the hypophysis. the resulting conditions are usually treated by partial destruction of the thyroid through surgery and irradiation or by the administration of sdditional dosages of thyroxin. Since the thyroxin molecule contains four atoms of iodine. a deficiency of this relatively scarce element in water and food intake is probably the most common primary cause of disturbances in thyroid function. Therapeutically thyroxin is administered for the stimulation of metabolism, and also as a reducing agent. Thiourea and thiouracil inhibit the secretion of thyroxin, but their continued use leads to a goitrous enlargement of the thyroid.

Thyroxin disappears relatively quickly from the blood stream. J. Gross and C. P. Leblond, using thyroxin tagged with radioactive iodine, show that the liver is nearly eight' times as active in the elimination process as the kidneys. (See also GOITRE; THYROID).

Parathyroids. — Laterally attached to the thyroids are from two to four small parathyroid bodies. Their hormone regulates the blood calcium and phosphorus levels. Extirpation of the glands often leads to tetany and death. Parathormone production seems not to be controlled by the hypophysis.

Duodenal Gland. — The duodenum is not anatomically a typical endocrine gland; but upon the entrance of acid stomach contents. certain cells of its inner lining release a polypeptide called secretin into the blood stream, which induces active flow of pancreatic juice and bile. It was during the study of these relationships that Bayliss and Starling (1904) introduced the term horn one for blood-borne chemical messengers.

Islet Glands. — Special cell islets (of Langerhans) of the pancreas which do not connect with the pancreatic duct system, release into the blood stream the polypeptide hormone insulin. the most important regulator of carbohydrate metabolism. Under its influence blood sugar (glucose) is built up to glycogen and stored in liver and muscle cells. Deficient insulin production leads to a rise in the blood-sugar level. Sugar is incompletely removed after meals, and the mobilization of liver glycogen by intervention of two antagonists or' insulin remains uninhibited. Of the latter, the diabetogenic principle of the hypophysis counteracts the production of insulin as well as its glycogen storing activity in the liver (B. Houssay). The second antagonist, glucagon. is a companion hormone which is also produced in the pancreatic islets. Normally it assists in balancing and adjusting insulin activity. Glucagon and insulin are produced by separate islet cells, which are designated as α and β cells respectively. As a whole, the α cells are more resistant to damage. Particularly under alloxan treatment they still persist. after all β cells have been destroyed. This explains why in many diabetic animals blood-sugar levels are lowered after removal of either the hypophysis or the pancreas.

If the blood-sugar concentration rises above the so-called renal threshold, it passes into the urine and establishes the morbid condition known as diabetes mellitus (*q.v.*). This formerly dreaded and inevitably fatal sickness is now easily controlled by the injection of extracted insulin after methods developed by F. G. Kanting and C. H. Best. Work by C. F. and G. T. Cori and others opened a path toward an understanding of the chemistry of glycogen formation in the liver under the influence of insulin and its hypophyseal antagonist.

Adrenal Medulla. — The adrenals are composites of two glands of different embryologic origin and secretory functions. The adrenal medulla derives from ectodermal sympathoblasts which separate late from sister cells that differentiate into sympathic ganglia. It is therefore not surprising that its hormones. epinephrine (adrenaline; *q.v.*) and norepinephrine (noradrenaline), produce similar effects as the activated sympathic nervous system. In fact, the latter itself releases a "neurohormone" which may be identical with noradrenaline. These medullary hormones, whose chemical constitution was cleared up as early as 1904, are, however. of uncertain physiologic importance. They constrict the capillaries in resting muscles and thus may play a role in directing the blood flow toward working muscles. They also can mobilize glycogen stores of the liver and thereby act as antagonists of insulin. Since fright and other forms of emotional stress cause an increased outpour of adrenaline, they effect a rise in the blood-sugar level. which in turn enables muscles to do increased work ("emergency function" of adrenaline, after W. B. Cannon). While apparently adrenal medullary function is not controlled by the hypophysis. it seems that adrenaline is able to influence at least one phase of hypophyseal activity. namely. the release of corticotrophic hormone under conditions of stress. (See ADRENAL GLANDS.)

Steroid Glands. — The adrenal cortex, testis and ovary are a complex of endocrine glands that produce about 30 known hor-

mones, all belonging to the chemical order of steroids. One may summarily speak of the steroid glands. Embryologically they are closely related to each other and to the middle kidney (mesonephros). All are derived from the intermediate mesoderm. The proportion of kidney and endocrine gland formation from the embryonic blastema can be shifted. Some such experimental changes may even lead to partial or complete sex reversal.

While the testis and ovary are foremost germ cell producing organs. the adrenal cortex functions exclusively as a hormone gland. Histologically it is the least differentiated of the three; but in respect to hormone production it is the most versatile. In fact. it can produce not only the characteristic corticoids but under special conditions also sex hormones which are usually elaborated by the follicular and interstitial cells of the sex glands.

With regard to prevailing physiologic actions the go-odd hormones fall into five groups: androgens, estrogens, gestagens. glucocorticoids and mineralocorticoids.

Androgens (*e.g.*, androsterone, testosterone) are characteristic products of the testis and maintain the male secondary sex characters.

Estrogens (*e.g.*, estradiol) are primarily produced by the ovarian follicles and support the female secondary sex characters. According to the higher or lower amounts released into the blood, the animal is in the oestrous or the anoestrous condition (cf. fig. 2). the oestrous or "heat" phase being characterized by a high development of the uteri and other parts of the female genital tract, and by a receptive behaviour toward the male.

Gestagens (*e.g.*, progesterone) typically are released by the yellow bodies (corpora lutea) of the ovaries; they direct the preparations for and maintenance of pregnancy, in the uterus.

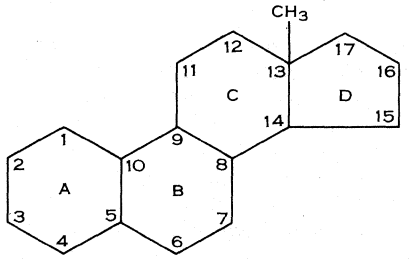
Glucocorticoids (*e.g.*, cortisone, hydrocortisone) of the adrenal cortex cause the transformation of proteins into glucose and liver glycogen. Under extreme dosages the rise in blood sugar may even lead to diabetes; but at the same time glycogen stores of the body are replenished at the expense of proteins. These hormones produce euphoric effects and give symptomatic relief in many inflammatory afflictions such as iritis and arthritis.

Mineralocorticoids (*e.g.*, desoxycorticosterone, aldosterone) are of vital importance in the maintenance of electrolyte and water balance. After pathologic shrinking of the cortex (Addison's disease, *q.v.*) or following surgical removal. the kidney thresholds for sodium, chloride and water fall very low; the excretion of urine and salt are highly increased. Patients and animals may be partly maintained with high water and salt rations. Addison's disease, once unavoidably fatal. came to be controlled by administrations of desoxycorticosterone and hydrocortisone. The important aldosterone was discovered in 1954. The production of the glucocorticoids is stimulated by the hypophyseal ACTH (adrenocorticotrophic hormone). Quite to the contrary, mineralocorticoids are released in response to the concentration of sodium. potassium chloride and water in the blood serum. Thus, hypophysectomy does not markedly upset the electrolyte and water balance; however, the effect of low salt diets is largely obviated through an immediately increased output of aldosterone.

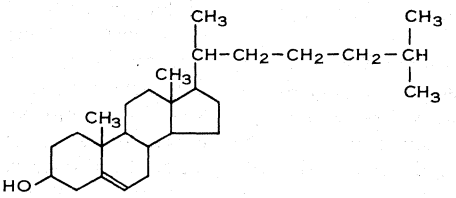
Probably the three steroid glands prepare their hormones from the universally distributed cholesterol. By the use of cholesterol and acetate which were both labelled with radioactive carbon, O. M. Hechter could show that perfused isolated adrenals use these materials for the biosynthesis of corticoids. Cholesterol and the steroid hormones have a common nucleus of a cyclopentane and three benzene rings. They differ in the array of attached hydrogen and oxygen atoms. short side chains and the occurrence of double bonds. In writing the constitutional formulas it is customary to omit hydrogen atoms which are attached to the basic skeleton. In the selection of formulas of six representative substances given below, estrane and cholesterol are not hormones, but the first is of interest as the chemically simplest parent hydrocarbon of the entire order of steroids. and the second as the probable starting base of biosynthesis of the natural hormones.

The distribution of the sites of manufacture of the steroid hormones shows many surprising features. The ovaries of most and possibly all vertebrates produce not only female but also male sex hormones, often in sufficient quantity to induce recognizable heterosexual effects. The reverse situation seems rather exceptional, but at least the testes of the human male and the stallion produce considerable amounts of estrogens. The adrenal cortex elaborates small amounts of male sex hormones almost regularly, and in both sexes. If the output becomes excessive it leads to various degrees of masculinization in young girls as well as in adult women. Prevailing symptoms are the change of voice and growth of beards (hirsutism). These variations and abnormalities become in a sense comprehensible through the established close embryologic relationships between the endocrine components of the three types of glands. However, the further fact that estrogens and progesterone are also fabricated by the chorionic (*i.e.*, embryonic) placentae of human male and female foetuses remains entirely unexplained.

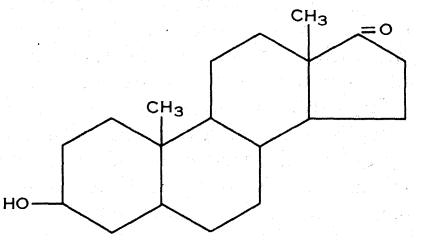
Hypophysis (Pituitary). — The hypophysis, master gland of the endocrine system, consists of two loosely connected parts which usually are distinguished as the anterior and posterior lobes (fig. 3). The latter, being an outgrowth of the floor of the forebrain and consisting mainly of large bundles of nerve fibres, is also called the



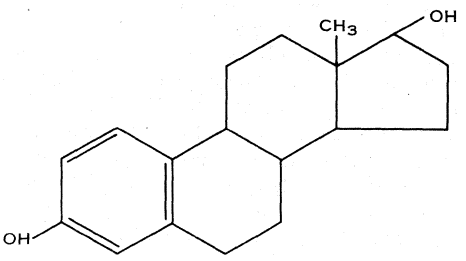
ESTRANE

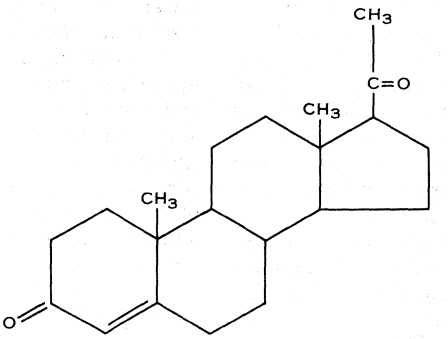


CHOLESTEROL

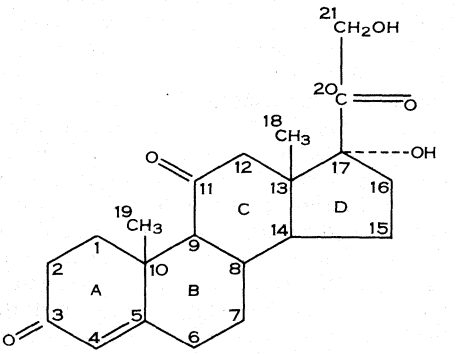


ANDROSTERONE



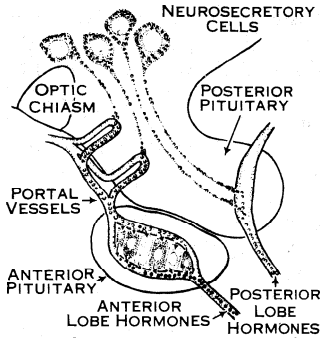


PROGESTERONE



CORTISONE

nervous part. The former, much like the lens of the eye. starts from an embryonic epiderm plate (placode). Invaginating first as a pouch, it grows toward the nervous part, to which it becomes broadly attached. Sometimes one distinguishes between an anterior lobe proper and an intermediate lobe, the latter developing from that part of the epidermal pouch which applies itself directly to the posterior lobe.



FROM E. SCHARRER, "EXPERIENTIA," VOL. X, FASC. 6, P. 266 (1954); BY COURTESY OF VERLAG BIRKHAUSER

FIG. 2.—HYPOTHALAMUS AND HYPOPHYSIS

All hypophyseal hormones are proteins or polypeptides. Consequently their separation presents great difficulties and even their total number is not knonn. Usually they are designated on the basis of a characteristic action or relationship. often with a suffix "trophin" or "tropin" attached which. however. is without deeper meanina. Increasingly popular are abbreviations as given in the following partial list of hormones oi the anterior lobe. Those of the posterior lobe and the hypothalamus are described below.

- Thyroid stimulating hormone (TSH) or thyrotrophin
- Adrenocorticotrophic hormone (corticotrophin, or ACTH)
- Follicle stimulating hormone (FSH)
- Interstitial cell stimulating hormone (ICSH)
- Luteinizing hormone (LH)

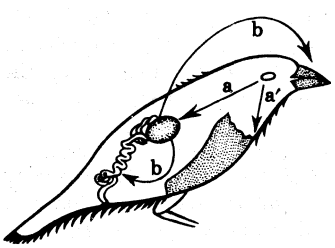
} gonad stimulating hormones

- Growth hormone (GH) or somatotrophic hormone (STH)
- Melanophore expanding hormone (MEH) or intermedin

The separate existence of ICSH and LH is contested; distinction rests entirely on differences in biologic reactions. On the other hand it seems possible that further work may lead to the identification oi even larger numbers. Already mentioned were indications that the parathyroids and the pancreatic islets may be hormonally linked with the hypophysis.

Chemically these hormones fall in two groups: simple proteins and glucoproteins. Their molecular weights range between about 2,000 and 100,000. Only the two last ones of the above list act directly and exclusively on peripheral targets. The melanophore expanding hormone controls adaptational colour changes in many amphibians and fishes. It is just as prevalent in the hypophysis oi warm blooded animals, but neither in birds nor mammals has it any known influence on pigmentation or on other characteristics. It is sometimes called intermedin because in frogs it was particularly found in the intermediate lobe While the anterior lobe as a whole is the most likely place oi origin, it has also been extracted from the hypothalamic region of the brain.

The growth hormone is important mainly through its protein-sparing influence on the general metabolism. Nitrogen excretion being reduced, it favours a compensator)- increase of fat oxidation. It has a marked influence on epiphyseal bone growth. The deficiency or absence of this hormone, as after hypophysectomy, leads to dwarfism (*cf.* fig. 2); on the other hand hypersecretion or injection of additional hormone causes gigantism in young animals and acromegalism in individuals that had already stopped growing.



E. WITSCHI

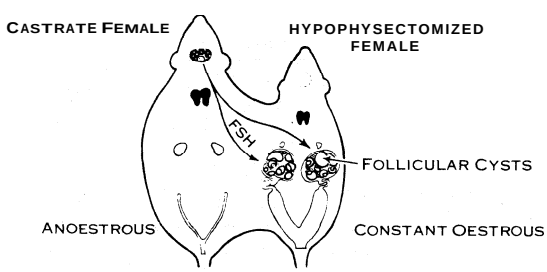
FIG. 4.—DIRECT AND INDIRECT GONADOTROPHIN REACTIONS IN THE AFRICAN WEAVER FINCH EUPLECTES

The other hormones of the list have in common their effect upon endocrine glands and are recognized mainly irom the induced secondary effects. Thus, administered thyrotrophin is usually not evaluated from immediate effects in the thyroid but by observed changes in metabolic rates or in amphibian metamorphosis, which really are responses to thyroxin. Probably most hormones of this group exert also some peripheral influences. In the case of the African weaver finch the gonadotrophic hormones (a, fig. 4) induce the testes to release androgen (h, fig. 4), which in turn elicits two independent secondary reactions, namely the enlargement of the seminal ducts and melanin production in the bill; but LH stimulates also directly melanin production in certain feather germs of the nuptial plumage oi the cock (a', fig. 4). Similarly the luteotrophic hormone stimulates another endocrine gland, the corpus luteum of the ovary, and also a peripheral endorgan, the mammaries, where it initiates and sustains milk secretion.

The two-step system of hormonal control seems to facilitate the correlation and equilibration of hormonic systems, particularly within the large steroid complex. As concentration of a steroid hormone in blood rises, it slows and checks the further increase in output of the corresponding hypophyseal "trophin." These reiationships are not always immediately obvious but can be demonstrated in specially arranged experiments. Fig. 2 illustrates the consequences oi hypophysectomy periormed at the age of eight weeks. The animal barely gained further weight. The cortices of the adrenals are shrunk and the ovaries are in an immature condition. The secondary sex characters are as underdeveloped as those oi a total castrate. If united in parabiosis with a normal sister rat, the deficiencies remain unrelieved. This must be so, because all hormones disappear relatively iast from the blood stream and the exchange of blood through the parabiotic bridge is too slow (1 ml. per 10 min.) to carry effective amounts from the normal to the hypophysectomized member. But if now the normal iemale is castrated, its uninhibited hypophysis at once pours out FSH at an estimated fivefold rate. This is enough to spill over also into the other member and to stimulate an excessive follicular growth. The subsequent release of estrogen is sufficient to stimulate also the animal's own sex ducts, though not those of the castrate partner (fig. 5).

The described experiment serves also in the elucidation of the nature of the so-called antihormones. Purified FSH from sheep or beef hypophyses injected into rats for periods of ten days or more seems to lose first slowly, then almost suddenly its effectiveness. This observation led to the notion of antihormones, *i.e.*, a class of substances u-hich were assumed to play a role in the deiense against overstimulation. However, in parabiosis experiments, with an arrangement as shown in fig. 5, oestrous and large ovaries are maintained ior indefinite times; several experiments were kept running for more than one year. This proves that the "antihormones" actually are antibodies oi an immunity reaction; *i.e.*, of the rat's defense against injected beef or sheep proteins.

The posterior lobe or neurohypophysis stores and releases at least two hormones. V. du Vigneaud succeeded in identiiying and synthe-



E. WITSCHI

FIG. 5.—PARABIOSIS OF A CASTRATE FEMALE AND A HYPOPHYSECTOMIZED FEMALE RAT

sizing vasopressin, which increases blood pressure and causes water retention (antidiuretic effect), and oxytocin, which causes contraction of smooth muscles. The latter is used clinically to induce labour in childbirth.

Hypothalamus and Neurosecretion.—The research of E. Scharrcr, R. Collin and others seems to establish that the posterior lobe only stores vasopressin and oxytocin, which actually are the products of neurosecretion by specialized cells of the hypothalamus, a part of the iorebrain (fig. 3). This discovery also opened the door to the understanding of many long known iacts which indicate that the neural and the hormonal control systems are not absolutely separate. Obviously, the latter is in many instances governed by the iormer. It is well known that light, particularly increased day length, oiten causes an increased output of gonadotrophic hormones by the anterior hypophysis. Jacques Benoit collected suggestive evidence for the existence of a pathway from the region of the optic nucleus in the hypothalamus to the anterior lobe oi the hypophysis. Apparently, some substance that is prepared by neurosecretory cells is secreted first into a small system of portal veins that drains irom the hypothalamus into the anterior lobe. Here apparently the neurosecretion, acting as a hormone, induces the release of the gonadotrophins which bring about the seasonal recrudescence of the sex glands of many wild birds and mammals, thus bringing on the chain of events characteristic of the breeding season. See also HYPOTHALAMUS.

The Placenta.— As mentioned beiore, the implantation of the iertilized egg, or rather of the young germ issued from this fertilization, is aided by maternal ovarian hormones. First the follicular estrogens and later progesterone, the hormone of the corpus luteum, prepare the endometrium or inner lining oi the uterus ior the arrival of the germ (R. Courrier). On the seventh day aiter fertilization the human

blastocyst attaches itself to the uterine wall and immediately begins to draw nutrition from the maternal circulation. The following week being the last of the normal menstrual cycle, it obviously becomes necessary to prevent shedding of the endometrium; *i.e.*, menstrual flow. This the embryo accomplishes by production and release of the chorionic gonadotrophin, CGH, into the maternal bloodstream. This hormone, substituting for the falling and soon discontinued LTH supply, stimulates the continued production of progesterone by the corpus luteum of the maternal ovary. Without it the activity of the corpus would subside by about the 25th day of the cycle. By the time of the first "missed period," only two weeks after fertilization, the CGH has reached a sufficiently high level in blood and urine of the mother. to become detectable by means of several pregnancy tests (Aschheim-Zondek, Allen-Doisy. Friedman, etc.). The chorionic gonadotrophin. like the hypophyseal gonadotrophins. is a glucoprotein; but it is chemically and physiologically distinctly different. Later a specialized area of the chorion. the disc placenta, produces not only gonadotrophin but also estrogen and progesterone. The hormonal control over the maintenance of pregnancy thus passes entirely from the mother to the foetal placenta. The latter also exercises control over its termination ; *i.e.*, over the events that lead to the birth of the child.

Tumours and Cancers.— Some endocrine glands, particularly the thyroid, may metastasize and spread hormonally active tissues over the body, lungs, bone marrow and so on. By the use of radioactive iodine such foci can be detected and partly also destroyed.

Ovarian embryomas, usually in the form of cysts containing more or less distinct parts of an embryonic body, may produce large quantities of chorionic gonadotrophin, the same as in normal pregnancies. Most probably, such tumours start from parthenogenetic ovarian eggs.

Similar embryomas may develop also in testes oi young men. Rut they start early upon a definitely malignant course. Metastases of this testicular chorionepithrlioma locate particularly in the lungs and the brain but also in other parts of the body. CGH is oiten produced and poured into the blood stream of these patients in much larger quantities than observed in typical pregnancies. (*See* also ENDOCRINOLOGY.)

HORMONES, INVERTEBRATE. Certain invertebrate animals, just as vertebrates, possess specialized glandular elements which produce and liberate into the body fluids, special chemical substances called hormones. These hormones, through their specific influences upon other cells and tissues, co-operate with the nervous system in the integration of various bodily functions. Although evidence exists suggesting widespread occurrence of hormonally regulated phenomena among invertebrates, extensive investigations have been carried out chiefly for crustaceans and insects.

Hormones and Colour Change. — The walking-stick insect *Dixippus* shows striking colour changes which result from dispersion (dark phase) and condensation (light phase) of brown and red pigments contained within the general hypodermal cells. The dispersal of the pigments occurs in response to a blood-borne hormone produced chiefly in the brain of the insect but found also, in smaller amounts, in the ventral and subesophageal ganglia and in the corpora allata *(see* below). The same character of hormonal control seems also to prevail for colour changes in *Corethra* (Diptera) larvae.

Some of the most striking instances of colour changeability among animals are found among higher crustaceans, particularly certain shrimp and crabs. These changes are brought about largely by differential movement of several types of pigments within highly branched integumentary pigment cells (chromatophores) controlled almost exclusively by means of hormones.

One of the most important places of liberation of colour-change hormones into the blood in crustaceans is the sinus gland. usually located in the eyestalks when these are present. In other forms it is located in the head close to the brain. This gland consists of clusters of secretion-filled terminations of the fibres of neurosecretory cells; these clusters, termed X-organs, occur in nervous ganglia within the eyestalks. Other sinus-gland fibres originate in neurosecretory cells in the brain and possibly in still other central nervous organs. The most studied X-organ is the medulla terminalis ganglionaris X-organ (MTGX), though others have been described. The colour-change hormones are formed in the nerve cells and move along inside the fibres to the nerve terminations in the sinus gland from which they are released.

A second important place of liberation of colour-change hormones into the blood is the postcommissural organ lying just posterior to the esophagus and closely associated with the tritocerebral commissure. Like the sinus gland, this organ, too, comprises the terminations of fibres of neurosecretory cells located some distance away, in this instance. chiefly in the brain. Again, the hormones formed in the cell bodies are transported within the nerve fibres to their point of eventual discharge into the blood. In view of the attenuated character of the neurosecretory complexes and their location in the nervous system. it has generally not been possible to employ the common endocrinological technique of observing the effects upon the animal of gland removal. An exception is the case of the important MTGX sinus-gland complex; this is easily removed by eyestalk amputation, after which the endocrine basis of consequent disturbances can be established by tissue implantations or extract injections.

Such studies reveal differences among the crustaceans with respect to their responses to eyestalk removal and MTGX sinus-gland replacement. The common prawn, *Palaemonetes,* behaves like numerous other macrural decapods (lobsters, shrimp, etc.). It possesses red. yellow, blue and white pigments in its chromatophores Eyestalk removal results in integumentary darkening by dispersion of the coloured pigments. Injection of extract of the eyestalk-gland complex results in rapid blanching by pigment concentration The fiddler crab. *Uca,* and most brachyuran decapods (true crabs) behave differently Eyestalk removal gives a response opposite to that seen in *Palaemonetes;* namely, a lightening by concentration of their predominating black and red pigments; eyestalk-gland implantation or extract injection produces rapid darkening The sand shrimp. *Crago,* behaves still differently; after eyestalk removal it assumes a mottled coloration. In certain integumentary areas its dominant black and red pigments are concentrated. in others dispersed, and elsewhere in an intermediate state. Eyestalk-gland extracts produce over-all paling of these eyestalkless animals.

The observed differences among crustaceans in response to eyestalk removal and MTGX sinus-gland complex replacement reflect, in part, differences in specific responses of chromatophores. In general, the gross response of the eyestalkless animals to injection of eyestalk extract is independent of whether the extract is made from their own eyestalks, or from those of species which themselves react differently. However, comparative study of various chromatophore types in single species, and among various species— together with separation of active fractions by differential solubilities, electrophoresis and paper chromatography — has revealed the eyestalk glandular complex to contain several different chromatophore activating hormones. Studies of extracts of the postcommissural organs have indicated that these organs, also, contain two or more powerful chromatophore activators. The majority of the chromatophore activators seem widely distributed among the decapod crustaceans, though some differences between species are found.

The long-known ability of certain prawns, shrimp and crabs to simulate the colour of their background appears to be approaching explanation in terms of a delicately regulated neurosecretion of a complex of hormones actively effecting both dispersion and concentration of pigments.

Hormones and Retinal Pigment Migration. — Movements of certain pigments in cells of the crustacean compound eye have been shown to be hormonally regulated. A distal, or iris, black pigment is located nearest the eye surface; a deeper, proximal black pigment lies close to the light-sensitive retinal elements, as does also a reflecting white pigment. Controlled movements of these three pigments give the eye optimal visual efficiency for each illumination level.

A hormone from the eyestalk MTGX sinus-gland complex is known to move the distal pigment to the light-adapted state in crustaceans. Prawns or crayfish in total darkness may be caused to assume the light-adapted position of the pigment, even while still

retained in darkness, by injection of extract of eyestalk-gland complex.

Much variability appears to occur among crustaceans as to a light-adapting influence of an eyestalk hormone upon eye pigments other than the distal. In some (*e.g.*, *Palaemonetes*) the reflecting pigment also responds; in others (*e.g.*, crayfish) the proximal pigment may respond. As with integumentary pigment cells the distal pigment has a double hormonal control; a second hormone is responsible for moving this pigment into its dark-adapted position. The state of eye adaptation is thus brought about by changing ratios of tno hormones.

Hormones and Growth, Molting and Metamorphosis.— Invertebrates such as crustaceans and insects which possess a hard or tough continuous exoskeleton typically grow by a series of abrupt steps involving the periodic casting off, molting or ecdysis, of the old skeleton and the production of a new one. Molting and the associated phenomena of growth and differentiation are regulated by hormones in arthropods.

In crustaceans the frequency of molting, high in the young. rapidly growing individual, diminishes as the animal ages. Some species (*e.g.*, crayfish and lobsters) continue to molt and grow throughout life. Other species (*e.g.*, certain crabs) cease molting and growth once the animal is fully mature. The molt cycle. which includes many morphological and chemical changes. is initiated by the cessation of secretion by the MTGX sinus-gland complex of a molt-inhibiting hormone and the production by it of a molt-accelerating factor. The complex appears also to liberate another hormone which regulates the amount of water absorbed just prior to the hardening of the new skeleton. Molting depends also on a gland. termed the Y-organ, located in the antennary or maxillary segment of the head. There is some reason to believe that the molt-inhibiting and accelerating hormones of the eyestalks exert their action through controlling the release of the Y-organ molting hormone.

The postembryonic development of insects, including both the larval and metamorphic periods, is governed by hormones. One of the complicating factors is that the hormones act upon cells, tissues and organs which themselves become altered in time with respect to their competence to respond to the hormones. The larval period is predominantly one of growth. At each larval molt a growing insect reconstitutes its larval characteristics, including its larval skin. The fully grown insect then undergoes a metamorphic molt in which adult structures become differentiated. The stimulus which initiates the succession of events terminating in a larval molt is known in only a few cases. For example, in the bloodsucking bug *Rhodnius,* which undergoes incomplete metamorphosis (hemimetabolous), the stretching of the body by a feeding of blood is followed by a molt in a definitely predictable manner. The stretching stimulates, through nerves, certain neurosecretory cells in the dorsal region of the brain (pars intercerebralis). These cells release a hormone which activates the prothoracic gland (located in the prothorax) which in turn releases a hormone, setting into motion the processes of molt. The prothoracic-gland hormone has been called the gromth and differentiation hormone; it has recently been obtained in pure chemical form and named ecdysone. Permitted to act alone, the hormone induces a metamorphic molt; but during normal larval growth, another gland begins to secrete soon after the prothoracic gland becomes active. This additional gland, the corpus allatum, liberates a factor termed the juvenile hormone, whose action is to cause the reconstructive processes during the molt to be directed to producing another larval generation.

In *Rhodnius,* in which there are typically five nymphal stages preceding the metamorphic molt, the juvenile hormone is secreted by the corpus allatum at each molt except that of the last-stage nymph. In the absence of the juvenile hormone, the insect metamorphoses into the adult. Diminutive adults have been obtained by the removal of the corpus allatum from nymphs earlier than those in the fifth-stage. On the other hand. sixth-stage nymphs which develop into giant adults have been obtained by transplanting juvenile corpora allata into otherwise normal last-stage nymphs.

This general manner of regulation of development appears to hold for all insects, with slight differences from group to group. In a completely metamorphosing (holometabolous) insect, *e.g.*, the giant silkworm Platysamia, the last larval, or caterpillar. stage is followed by a pupation molt under the influence of the prothoracic-gland hormone in the absence of the juvenile one. The pupa then enters a period of inactivity known as diapause under the influence of a diapause hormone produced by the subesophageal ganglion. Diapause may be terminated, and the metamorphic molt initiated, by subjecting pupas to a period of chilling followed by return to higher temperature. Such chilling activates the neurosecretory cells in the brain to produce the hormone which stimulates the prothoracic glands.

The glands involved in the regulation of gromth and differentiation in insects vary greatly in structure and in location in the body. The corpus allatum. in the head, may be paired or single. Prothoracic glands may differ greatly in size and cellular form. In the fly larva these two glands are united with a third gland of less well-knonn function, the corpus cardiacum, forming an organ termed the ring gland.

Hormones and Reproduction.— In many crustaceans a male reproductive hormone arises in a small organ, the androgenic gland, located on the sperm duct near its external opening. This male hormone is necessary for the development of the testes, male accessory sex organs and secondary sex characters. Removal of the gland results in gradual alteration of body form and functions, the castrate tending to resemble the female.

Activity of the crustacean ovary is regulated by an inhibitory hormone arising in the MTGX sinus-gland complex. In the breeding cycle, decrease in this hormone permits the maturing of the eggs and subsequent ovulation. In certain crustaceans which show in their life history a protandric hermaphroditism (first a functional male, later a female), the sexual transition is correlated with the disappearance of the ovary-inhibiting factor and the degeneration of the androgenic gland Evidence also suggests that the activated ovary liberates a hormone upon nhich depends differentiation of such breeding accessories as brood pouches and ovigerous hairs.

The maturation of the ovaries and the activation of certain accessory reproductive glands have been shown to depend upon a corpus allatum hormone in insects as diverse as cockroaches, grasshoppers, beetles. *Rhodnius* and flies. In these insects there appears, furthermore, to be a reciprocal relationship between the corpus allatum and the ovary. Removal of ovaries results in hypertrophy of the corpus allatum. Restoration of this gland to normal size is effected by implanting mature ovaries.

That some differences may occur among insects is evident; certain moths, nith corpora allata removed during the larval stage, are still able to develop fully functional ovaries and produce viable eggs. There is also evidence suggesting that a brain hormone, possibly liberated by way of the corpus cardiacum, exerts a regulatory action on the corpus allatum.

Another hormone, the prothoracic-gland hormone, is also essential to the development of functional ovaries and testes. in part in its general role in growth and differentiation of larval organs, and also through a more specific influence upon gonad maturation.

At least in the blowfly, a third hormone. found in neurosecretory cells of the brain, and also in the corpora cardiaca, contributes directly to the normal regulation of ovarian function.

Other Hormonal Activities.— Hormones have been implicated as regulators of many other specific processes in arthropods, probably essential metabolic correlates of the foregoing phenomena. However, another hormonal mechanism in crustaceans justifies separate mention. In the wall of the pericardial cavity (enclosing the heart) lies a cluster of fibre terminations of neurosecretory cells of the ventral nerve cord. These terminations, the pericardial gland. release a heart-accelerator hormone.

In a sipunculid worm. *Physcosoma,* certain glandular structures, the internephridial organs. found in association nith the large nephridial (excretory) tubules, have been reported to secrete a hormone essential for normal metabolism and viability. Removal of the glands leads to characteristic changes terminating with death; these changes are prevented by gland implantations.

Colour changes in the cephalopods are effected by an unusual kind of integumentary chromatophore, small elastic sacs of pigment having radially arranged muscle fibres. Although the chromatophore changes are controlled chiefly by nerves, two blood-borne hormones, tyramine from the salivary glands, and betain influence the chromatophore state.

Many invertebrates exhibit sexual dimorphism including differentiation of accessory organs or secondary sexual characteristics. Studies of animals castrated by parasitic infection, irradiation or surgical removal, and studies showing correlations of time of certain morphological changes nith states of gonadal activity have suggested that sex hormones, probably produced by the gonads, are essential for the development of these characteristics. Such studies have included animals as diverse as planarian worms, snails, earthworms, cephalopods and crustaceans.

General.— There appears to be no fundamental similarity of origin of endocrine glands between invertebrates and vertebrates, yet the parallel role of the endocrine systems of these two major divisions of the animal kingdom is striking. Furthermore, there is no established identity of any functional vertebrate and invertebrate hormone, though substances with actions resembling adrenin, estrogens, juvenile hormone and melanophore-stimulating hormone occur in both groups. Hormone secretion by nervous elements appears widespread throughout the animal kingdom

HORMUZ, an island in approximately 27° 4′ N., 56° 28′ E.. in the Strait of Ormuz, $1\frac{3}{4}$ mi. from the coast of Iran, and 11 mi. E.S.E. of Bandar Abbas. Pop. (1954 est.) 2,514. It has a perimeter of about 16 mi. with a greatest length of $4\frac{1}{2}$ mi. and is composed of jagged hills of variegated hues of reddish purple and white of an average of 300 ft. in height, with one peak rising to 600 ft. The principal geological formations are rock-salt, red ochre and a greenish clay; a white encrustation of salt covers large areas. The barrenness of Hormuz is relieved only by a few *Kunar* trees and some small patches of barley or melons. Gazelles are the only wild fauna. The only permanently inhabited place on the island is the village of Hormuz, close southward of the site of the older city and comprising some 300 mat huts.

Hormuz has a population which may rise to 1.000 males when the salt and oxide mines are being worked, but which falls to less than half in the summer when numbers migrate to the mainland. especially to Minab. for the date harvest or to escape the excessive heat. Iranians predominate, but there are also Baluchis and Arabs. The water supply is from rain collected in pools or cisterns and is brackish and often very scanty even for so small a population.

Hormuz Island is under the jurisdiction of the governor of the gulf ports—but until recent years the revenues were farmed from the Iranian government for a fixed sum.

The resources of the island are red oxide for export. and salt for local use; copper and iron ore are also present but are not worked. Red oxide (Hormuz red) has been an important article of export from Hormuz for centuries, and, since 1922. has been mined and exported under a concession granted to an Iranian merchant. Shipments of this commodity, during the period 1921–27, averaged annually: 2.666 tons to the United Kingdom, 583 tons to the United States. 448 tons to India, and 5,000 tons were sent to Germany during 1926–27. For the better handling of the mineral a truck line has been constructed for some hundreds of yards along the shore.

Of the old and famous city which stood upon the promontory on the northern shore, scarcely anything of definite shape stands at the present day, except the old Portuguese fort, and much even of that has been undermined and washed away by the action of the sea; but traces of buildings of massive foundations, constructed of stone quarried in the island, and a great number of ruined water cisterns remain.

The name Hormuz referred originally to a town on the mainland situated probably on Khor Minab, near the present day Minab in 27° 9′ N., 57° 5′ E. The earliest mention of this name occurs, it seems, in the voyage of Nearchus (325 B.C.) when that admiral anchored Alexander's fleet on the shore of Harmozia at the mouth of the Anamis (R. Minab) in Kirman, "in a country pleasant and agreeable and abounding in everything except olives." The foundation of the city which eventually arose here is ascribed to Ardashir Papakan, founder of the Sassanian dynasty, but it was only after the Arab conquest that it attained great prominence. It was situated one parasang (about four miles) from the sea on a river which ships ascended to the town. Idrisi, Istakhri and Muqaddasi describe the place as the chief market of Kirman. Indigo is mentioned as the most important product, and Yaqût states that this Hormuz had attracted all the trade of India. After about the year A.D. 1100 Hormuz was under a dynasty of Arab rulers, and subsequent to 1262 it came under the rule of the Ilkhani of Persia. Marco Polo twice visited the place, in 1272 and 1293, and describes the business of the port, particularly noting the export of horses. It can not be certainly ascertained what brought about the transference of the mart from the mainland to the island. Abul Fida says the town was destroyed by the "Tartars," but the Mongol invasion hardly touched the coast of Kirman.

Be that as it may, the new settlement was established by Qutb ud Din, on the island then known as Jerun or Zerun, and in spite of the unfavourable natural conditions, there arose a thriving centre of the world's commerce, from the 14th to the 16th centuries. The new Hormuz gradually superseded Qais (q *v.*) as the most important emporium trade of the Persian gulf. Friar Odoric gives the earliest notice of the city which he describes as strongly fortified and abounding in costly wares. It was visited in the lapse of time by a number of other travellers from all of whom we infer that it was a fine city rising out of the sea and serving as a mart for all the products of India, which were distributed hence over all Persia. The princes of Hormuz at one time or another appear to have held sway over other islands of the gulf and even over the shores of Oman. Nikitin, the Russian (c. 1470) conveys a similar impression of its importance and calls it "a vast emporium of all the World."

The appearance of the Portuguese in the Indian seas decided the fate of Hormuz. In 1507 the city was attacked by a Portuguese fleet under Alphonso d'Albuquerque and partially subdued but it was not until 1 j14 that, having captured Goa and Malacca, Albuquerque returned and completed his conquest, and built a castle. For about a century, Hormuz remained practically in the dominion of Portugal, though the hereditary ruler, paying from his revenues a yearly tribute to Portugal (in lieu of which the latter eventually took the whole of the customs revenues) continued to be the instrument of government.

The rise of the English trade and factories, in the Indian seas, in the early part of the 17th century, led to constant broils and friction with the Portuguese; while the success of the East India company in establishing trade relations with Persia only served to embitter the situation. Moreover Shah Abbas I resented the Portuguese occupation of such a position as Hormuz within his dominions and was strongly desirous of obtaining the aid of English ships in attacking it. During 1620–21 the fleets of Portugal and of the East India company more than once came into action in Indian waters, and in the latter year, the council of the company at Surat resolved on what was practically maritime war with the Portuguese flag, agreeing, though reluctantly, to lend the aid of their ships to the land forces of Persia, in an attack on the Portuguese. The combined forces first assaulted and destroyed the Portuguese fort on Qishm Island and then turned their attention to Hormuz itself. The siege was opened on Feb 18, 1622, and continued until May 1, when the Portuguese, after a gallant defense, surrendered. Hormuz never recovered from the blow.

The Persians transferred their establishments and material to Gombrun on the mainland, where Shah Abbas founded a port under the name of Bandar Abbas (*q.v.*), and in a few years Hormuz city was little more than a ruin.

HORN, ARVID BERNHARD, COUNT (1664–1742), Swedish statesman, was born at Vuorentaka in Finland on April 6, 1664, of a noble but indigent family. He served for several years in the Netherlands, in Hungary under Prince Eugene, and in Flanders under Waldeck (1690–1695). He was one of the generals of Charles XII. in the earlier part of the great Northern War. In 1704 he was entrusted with his first diplomatic mission, the deposition of Augustus II. of Poland and the election of Stanislaus I. Shortly after the accomplishment of this mission he was besieged by Augustus in Warsaw and compelled to surrender. In 1705 he was made a senator, in 1706 a count and in 1707 governor of Charles XII.'s nephew, the young duke Charles Frederick of Holstein-Gottorp. In 1710 he succeeded Nils Gyldenstolpe as prime minister. Both in 1710 and 1713 Horn was in favour of summoning the estates, but when in 1714 the diet adopted an anti-monarchical attitude, he gravely warned and ultimately dissolved it. After the death of Charles XII. (1718) it was Horn who persuaded the princess Ulrica Leonora to relinquish her hereditary claims and submit to be *elected* queen of Sweden. He protested against the queen's autocratic behaviour, and resigned both the premiership and his senatorship. He was elected *landtmarskalk* at the diet of 1720, and contributed, on the resignation of Ulrica Leonora, to the election of Frederick of Hesse as king of Sweden, whose first act was to restore to him the office of prime minister. For the next eighteen years he controlled both the foreign and the domestic affairs of Sweden, and it was owing to his care that Sweden so rapidly recovered from the condition in which the wars of Charles XII. had plunged her. Horn increased the influence of the diet and its secret committees in the solution of purely diplomatic questions, thus weakening the central government. In 1734, however, the opposition in the diet denounced his neutrality on the occasion of the war of the Polish Succession, when Stanislaus I. again appeared upon the scene as a candidate for the Polish throne; but Horn was still strong enough to prevent a rupture with Russia. Henceforth he was bitterly but unjustly accused of want of patriotism, and in 1738 was compelled at last to retire before the impetuous onslaught of the triumphant young Hat party. The rest of his life was spent at his estate at Ekebyholm, where he died on April 17, 1742. Horn in many respects resembled his contemporary Walpole. The situation of Sweden made his policy necessarily opportunist, but it was an opportunism based on excellent common-sense.

See V. E. Svedelius, *Arvid Bernhard Horn* (Stockholm, 1879); R. N. Bain, *Gustavus III.,* vol. i. (London, 1894), and *Charles* XII. (1895); C. F. Horn, *A. B. Horn: hans lefnad* (Stockholm, 1852).

HORN, PHILIP DE MONTMORENCY, COUNT OF (1518–1568), a man of illustrious descent and great possessions in the Netherlands, became in succession under Charles V. and Philip II. stadtholder of Gelderland, admiral of Flanders and knight of the Golden Fleece. In 1559 he commanded the fleet which conveyed Philip II. from the Netherlands to Spain, and he remained at the Spanish court till 1563. On his return he placed himself with the prince of Orange and Count Egmond at the head of the party which opposed the policy of Cardinal Granvella. When Granvella retired the three great nobles continued to resist the introduction of the Spanish Inquisition and of Spanish despotic rule into the Netherlands. But though Philip appeared for a time to give way, he had made up his mind to visit the opponents of his policy with ruthless punishment. The regent, Margaret, duchess of Parma, was replaced by the duke of Alva, who entered the Netherlands at the head of a veteran army and at once began to crush all opposition with a merciless hand. Orange fled from the country, but Egrnond and Horn, despite his warning, decided to remain and face the storm. They were both seized, tried and condemned as traitors, and were executed on June 5, 1568, in the great square before the town hall at Brussels. (*See* also EGMOND, LAMORAL.)

HORN, English hero of romance. *King Horn* is a heroic poem or gest of 1,546 lines dating from the 13th century. Murry (or Allof), king of Sudenne (Surrey and Sussex?), is slain by Saracen pirates who turn his son Horn adrift with 12 other children. The boat drifts to Westernesse (Cornwall?), where the children are received by King Aylmer (Aethelmaer). Presently Horn is denounced by one of his companions as the lover of the king's daughter, Rymenhild (Rimel), and is banished, taking with him a ring, the gift of his bride and a talisman against danger. In Ireland he serves for seven years, and slays in battle the Saracens who had killed his father. Learning that Rymenhild is to be married against her will to King Mody, he returns to Westernesse disguised as a palmer, and makes himself known to the bride by dropping the ring into the cup she offers him, with the words "Drink to Horn of Horn." He then reconquers his father's kingdom and marries Rymenhild. The story of Horn resembles the legend of Havelok the Dane, and Richard of Ely followed the Horn tradition in the 12th century *De gestis Herewardi Saxonis.*

King Horn was rc-edited for the Early English Text Soc. by G. H. McKnight in 1901.

HORN, CAPE, a steep rocky headland on Horn Island, at the southernmost extremity of South America, lies 55° 59′ S., 67° 12′ W. in Tierra del Fuego (*q.v.*) archipelago, Magallanes province, Chile. It was named Hoorn by the Dutch navigator Willem Cornelius Schouten who rounded it in 1616 and who was born at Hoorn, Netherlands. False Cape Horn, the southernmost point of Hoste Island, 35 mi. N.W., is sometimes mistaken for Cape Horn. Navigating the rough waters around the Cape is hazardous.

See Felix Riesenberg, *Cape Horn* (1941).

HORN, a class of wind instruments primarily derived from natural animal horns, and having the common characteristics of a conical bore and the absence of lateral holes.

Modern horns may be divided into three classes: (1) the short horns with wide bore, such as the bugles (*q.v.*), and the post-horn. (2) The saxhorns (*q.v.*), a family of hybrid instruments designed by Adolphe Sax, and resulting from the adaptation of valves and of a cup-shaped mouthpiece to instruments of the calibre of the bugle. (3) The French horn, one of the most valuable and difficult wind instruments of the orchestra, having a very slender conical tube wound round in coils upon itself.

The French horn consists of four principal parts — the body, the crooks, the mouthpiece, and the slides.

(a) The *body* is the main tube, having a bore of the form known as trunco-conical measuring approximately 7 ft. 4 in. in length. The body is coiled spirally, and has at one end a wide-mouthed bell from 11 to 12 in. in diameter, with a parabolic curve, and at the other a conical ferrule into which fit the crooks.

(b) The *crooks* are interchangeable spiral tubes of varying lengths, by attaching which to the mouthpiece the total length of the tube can be varied at will, and the pitch and key of the instrument thereby altered. The principle of the crook was known early in the 17th century, and it had been applied to the trumpet, trombone, and Jagertrummet before being adapted to the horn. From the crook, in turn, was developed the system of valves, which is but an instantaneous application of the same general principle to the individual notes of the harmonic series, each of which is thereby lowered a semitone, a tone, or a tone and a half as long as the valve remains in operation. The body of the horn without crooks is of the length to produce 8 ft. C, and forms

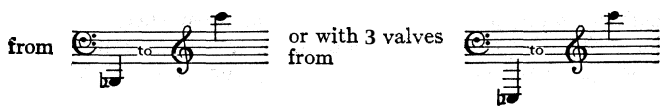
the standard, being known as the alto horn in C, which is the highest key in which the horn is pitched.

(c) The *mouthpiece* of the horn differs substantially from that of the trumpet. There is, strictly speaking, no cup, the inside of the mouthpiece being, like the bore of the instrument itself, in the form of a truncated cone or funnel.

(d) The *tuning slides* consist of a pair of sliding U-shaped tubes fitting tightly into each other, by means of which the instrument can be brought strictly into tune, and which also act as compensators with the crooks.

Pitch.—The pitch of the horn, as of other wind instruments, depends almost exclusively on the length of the air-column set in vibration, but varies in accordance with the amount of blowing force employed. As regards the fundamental tone, to set in vibration a column of air some 16 or 17 ft. long, is extremely difficult; hence it is quite exceptional to find a player who can sound the fundamental on the low C or Bb *basso* horns.

The practical aggregate compass of the natural horns from Bb basso at the service of composers therefore ranges (actual sounds)



Scale.—By means of hand-stopping, *i.e.,* the practice of thrusting the hand into the bell in order to lower the sound by a tone or a semitone, or by the employment of valves, this compass may be rendered chromatic almost throughout the range. The valve system consists of valves or pistons attached to additional lengths of tubing, the effect of which is almost invariably to lower the pitch. Horns are made with either two or three valves by means of which the pitch can be lowered at will a semitone, a tone or a tone and a half. The three devices—crooks, valves, and slides—are, it will be seen, all based upon the same principle, that of providing additional length of tubing in order to deepen the pitch of the whole instrument at will, and to transpose it into a different key. But valves and slides, being instantaneous in operation, give to the instrument a chromatic compass, whereas crooks merely enable the performer to play in many keys upon one instrument instead of requiring a different instrument for each key.

Timbre.—The *timbre* of the natural horn is mellow, rich and sonorous, and distinguished at the same time by a certain human quality which differentiates it from that of all the other members of the brass wind. But it may be noted that the timbre of the piston notes is more resonant and less pleasing than that of the open notes, probably owing to the fact that the strictly conical bore of the natural horn has in this case been replaced by a mixed cylindrical-conical one, as in the trumpet and trombone.

History.—The origin of the horn must be sought in prehistoric times, when, by breaking off the tip of a short animal horn, one or at best two notes, powerful, rough, unsteady, only barely approximating to definite musical sounds, were obtained. This was undoubtedly the archetype of the modern families of brass wind instruments, and from it evolved the trumpet, the bugle, and the tuba no less than the horn. Before civilization had dawned in classic Greece, the Egyptian, Assyrian and Semitic races were using wind instruments of wood and metal which had left the primitive ram or bugle horn far behind Among the Romans there were four instruments known by the name of *cornu:* (1) the short animal horn used by shepherds; (2) the longer, semicircular horn, used for signals; (3) the still longer *cornu,* bent and carried like the buccina, uhich had the wide bore of the modern tuba; and (4) a small instrument like the mediaeval hunting-horn, or post-horn, with a single spiral turn A terra-cotta model of one of the last named, slightly broken, but with the spiral intact, was excavated at Ventoux, in France, and is preserved in the department of Greek and Roman antiquities at the British Museum.

All these wind instruments, to which may be added the lituus or cavalry trumpet, and the long straight tuba, seem to have been used during the classic Greek and Roman periods merely to sound fanfares, and therefore, in spite of the high degree of perfection to which they attained as instruments, they scarcely possess any claim to be considered within the domain of music.

After the fall of the Roman empire, when instrumental music had fallen into disrepute, and had been placed under a ban by the Church, the art of playing upon such highly-developed instruments gradually died out in Western Europe. With the disappearance of the civilization and culture of the Romans the skilled crafts also gradually vanished, and the art of making metal pipes of delicate calibre and of bending them was completely lost, and had to be re-acquired step by step during the middle ages from the more enlightened East.

During the middle ages the bugle-horn or bull's horn was extensively used as a signal instrument on land and sea *(see* BUGLE), by the night-watchmen in cities, in the watch tower of the feudal castle, and by foresters and huntsmen. The hunting-horn is generally represented as small and crescent-shaped in the hunting scenes which abound in illuminated mss. and early printed books, and when played it was held with the wide end curving upwards in front of the huntsman's head.

Music.—The earliest orchestral music for the horn goes back beyond the middle of the 17th century. Already, in 1639, Cavalli, in his opera *Le Nozze de Tito* e *Pelei* (act. i. sc. 1) introduced a short scena, "Chiamata alla Caccia" in C major for four horns on a basso continuo.

Cesti's operas of the same period likewise contain many passages evidently intended for the horn, although the instruments are not specified in the score, which was nothing unusual at the time. Later Lulli, in the incidental music for a ballet, *La Princesse d'Elide,* which formed part of Molière's divertissement, "Les plaisirs de l'île enchantée," written for a great festival at Versailles, on May 7, 1665, introduced a piece entitled "Les violons et les cors de chasse," written in much the same style as Cavalli's scena, by which, indeed, it is believed to have been inspired. The introduction of the natural horn into the orchestra of the French opera did not occur, however, until much later, viz., in 1734, in André Campra's *Achille et Deidamie,* and then only in a fanfare. In the meantime the horn had already won a place in most of the rising opera houses and ducal orchestras of Germany, and had been introduced by Handel into the orchestra in London in his *Water-music,* composed in honour of George I.

Horns were also employed by Bach, while it scarcely needs saying how largely they have been used since by modern composers from the time of Beethoven (who had an especial fondness for the instrument) onwards.

HORN. The weapons which project from the heads of various species of animals, constituting what are known as horns, embrace substances which are, in their anatomical structure and chemical composition, quite distinct from each other; and although in commerce also they are known indiscriminately as horn, their uses are altogether dissimilar. These differences in structure and properties were thus indicated by Sir R. Owen:—"The weapons to which the term horn is properly or technically applied consist of very different substances, and belong to two organic systems, as distinct from each other as both are from the teeth. Thus the horns of deer consist of bone, and are processes of the frontal bone; those of the giraffe are independent bones or 'epiphyses' covered by hairy skin; those of oxen, sheep, and antelopes are 'apophyses' of the frontal bone, covered by the corium and by a sheath of true horny material; those of the prong-horned antelope consist at their basis of bony processes covered by hairy skin, and are covered by horny sheaths in the rest of their extent. They thus combine the character of those of the giraffe and ordinary antelope, together with the expanded and branched form of the antlers of deer. Only the horns of the rhinoceros are composed wholly of horny matter, and this is disposed in longitudinal fibres so that the horns seem rather to consist of coarse bristles compactly matted together in the form of a more or less elongated sub-compressed cone." True horny matter is really a modified form of epidermic tissue, and consists of the albuminoid "keratin." It forms, not only the horns of the ox tribe, but also the hoofs, claws, or nails of animals generally, the carapace of the tortoises and the armadilloes, the scales of the pangolin, porcupine quills, and birds' feathers, etc.

Horn is employed in the manufacture of combs, buttons, the handles of walking sticks, umbrellas, and knives, drinking cups, spoons of various kinds, snuffboxes, ktc. In former times it mas applied to several uses for which it is no longer required, although such applications have left their traces in the language. Thus the musical instruments and fog signals known as horns indicate their descent from earlier and simpler forms of apparatus made from horn.

In the same way powder horns were spoken of long after they ceased to be made of that substance; to a small extent lanterns continue to be "glazed" with thin transparent plates of horn.

HORNBEAM, any tree of the genus *Carpinus* of the birch family (Betulaceae). The American hornbeam, blue- or water-beech, is *Carpinus caroliniana,* a medium-sized tree, ranging from Nova Scotia to Florida and westward to Minnesota and Texas. Its extremely tough hard wood is used for the making of charcoal. The common hophornbeam, a native of the south of Europe, is Ostrya *vulgaris;* the allied American species, *O.* virginiana, is also known as ironwood from its hard! tight, close-grained wood. The genus Ostrya likewise belongs to the Betulaceae; its members may be distinguished from those of *Carpinus* by their papery saclike fruits.

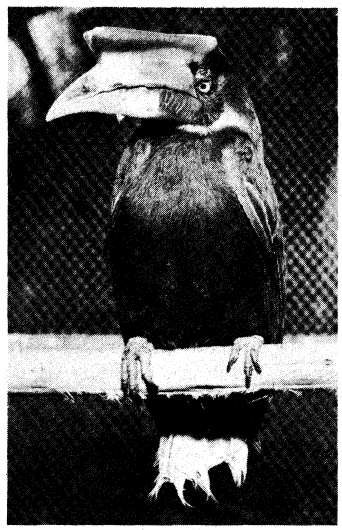
The European common hornbeam, or yoke elm, C. *betulus,* is indigenous to the temperate parts of western Asia and of Asia Minor and in Europe, where it ranges as high as 55° and 56" N. latitude. It is common in woods and hedges in parts of Wales and of the south of England. The trunk is usually fluted and twisted as though composed of several united stems. The bark is smooth and light gray. The leaves are short-stalked, in two rows, two to three inches long, elliptic-ovate, doubly toothed, pointed, numerously ribbed, hairy below and opaque, not glossy as in the beech. The stipules act as protecting scale leaves to the winter buds and fall when the buds open in spring. The flowers appear with the leaves in April and May. The male catkins are about one and one-half inches long, and have pale yellow anthers, bearing tufts of hairs at the apex; the female catkins attain a length in the fruiting stage of two to four inches, with bracts one to one and one-half inches long. The fruit is a small, green, angular nut, about one-fourth inch in length, borne at the base of a three-lobed, leafy bract.

The hornbeam thrives well on stiff, moist clay soils. into which the roots penetrate deeply; it does not flourish on chalk or gravel. It is, however, occasionally grown as a timber tree. its chief employment being for hedges. The wood of the hornbeam is white, close-grained, of considerable tenacity and little flexibility and is extremely tough and hard to work. But because of its toughness. it was once used to make cogwheels and spindles. A a fuel it is excellent and in France the leaves serve as fodder. The tree is a favourite with hares and rabbits, and the seedlings are liable to be destroyed by mice. The American Ostrya *virginiana* is of little commercial importance. (E. S. Hr.; N. Tr.)

HORNBILL, any bird of the family Bucerotidae classed with the hoopoes, rollers, kinghshers and motmots (*qq.v.*) in the order Coraciiformes. They are usually two to four feet long from tip to tail and are remarkable for the enormous bill, often surmounted by a colourful hornlike casque, solid in the helmeted hornbill (*Rhinoplax vigil*) of the East Indies, honeycombed with air spaces in the others. They are grotesque birds with loud croaking voices and noisy flapping flight. Although these tree-divellers are omnivorous feeders! most of them search out fruits.

The ground hornbills (*Bucorvus*) are more terrestrial. The larger species will devour snakes: the smaller also eat insects. The plumage is usually black or brown and white, the bill and casque yellowish, with black and orange or red, or largely red. The homrai or great Indian two-horned hornbill (*Buceros bicornis*), the largest, is nearly five feet long, ranging from Bombay to Sumatra.

The female—as in a wedge-tailed hornbill (Tockus *albotermina-tus*), of eastern and south Africa. the Papuan hornbill (Aceros *plicatus*) and perhaps most other species—is walled into a hollow tree by the male: imprisoned while she incubates two to four white eggs and cares for the naked helpless young until they can fly; the male regurgitates food in a gizzard lining and feeds the female through a small slit in the mud wall. Most remarkable is the huge rhinoceros hornbill (Buceros rhinoceros), nearly four feet long, black and white. with the huge casque turned up in front like another bill turned upside down; it inhabits forests of the Malay peninsula, Sumatra, Java and Borneo. One of the noisiest forest creatures is the rufous hornbill (B. hydrocorax) of the Philippines, known for its hissing, whistling flight and its raucous cry.



R. VAN NOSTRAND FROM THE NATIONAL AUDUBON SOCIETY

RUFOUS HORNBILL OR CALAO (BUCEROS HYDROCORAX), A HABITANT OF PHILIPPINE FORESTS

A dozen smaller species of *Tockus*—including the common gray (T. *nasutus*), red-beaked (T. *erythrorhynchus*) and yellow-beaked (T. *flavirostris*) hornbills—range over Africa, with a few species in India. They are scarcely two feet long. Other genera occur in central African forests, and in southeastern Asia. (G. F. Ss.; X.)

HORNBLENDE: see Amphibole.

HORNBOOK, a name originally applied to a sheet containing the letters of the alphabet, which formed a primer for the use of children. It was mounted on wood, and protected with transparent horn. The wooden frame had a handle, and it was usually hung at the child's girdle.

The sheet, which in ancient times was of vellum and later of paper, contained first a large cross—the crisscross—from which the hornbook was called the Christ Cross row, or crisscross row. The alphabet in large and small, letters followed. The vowels then formed a line. and their combinations with the consonants were given in a tabular form. The usual exorcism—"in the name of the Father and of the Sonne and of the Holy Ghost, Amen"—followed, then the Lord's Prayer, the whole concluding with the Roman numerals.

HORNBY, SIR PHIPPS (1785–1867), British admiral, was born on April 27, 1785, the son of Geoffrey Hornby, rector of Winwick (Lancs.). He entered the navy in May 1797, and served with Capt. William Bligh until 1804, when he was promoted lieutenant of the "Excellent." He took part in various naval engagements in the Napoleonic Wars, distinguishing himself in particular in the frigate action off Lissa (1811) under Adm. Sir William Hoste (*q.v.*).

From 1816 to 1832 Hornby lived in retirement and was then appointed superintendent of the Royal Naval hospital at Plymouth. He again went to sea in 1847, when he was made commander in chief in the Pacific. In 1851–52 he was a lord of the admiralty and became vice-admiral in 1854 and admiral in 1858. He died on March 19, 1867.

HORNCASTLE, a market town and urban district in the Horncastle parliamentary division of the Parts of Lindsey, Lincoinshire, Eng., at the foot of the western slopes of the Lincolnshire wolds, at the confluence of the Bain and Waring streams, 21 mi. E. of Lincoln by road. Pop. (1951) 3,809. Area 2.2 sq.mi.

The name, Hornecastre in Domesday Book, signified the horna or tongue of land by a Roman camp. There was a small Roman administrative centre, part of the walls of which remain. It is probably the *Banovallum* mentioned in the *Ravenna* Itinerary. The manor of Horncastle belonged to Queen Edith in Saxon times and was royal demesne in 1086. Under Stephen it belonged to Alice de Cundi, a partisan of the empress Maud, and passing to the crown on her death it was granted by Henry III to Gerbald de Escald. from whom it descended to Ralph de Rhodes. who sold it to the bishop of Carlisle in 1230. Horncastle was never a municipal or parliamentary borough, but during the middle ages

it was frequently the residence of the bishops of Carlisle. The see of Carlisle retained it until the reign of Edward VI when it was granted to Edward, Lord Clinton. but was recovered in the following reign. Horncastle was a centre of the Lincolnshire rebellion of 1536. Royalist troops occupied the town in 1643 and were pursued through its streets after the battle fought at Winceby, 4 mi. E.S.E. of the town. Its prosperity once depended largely on its fairs, the great horsefair described by George Borrow in *The Romany Rye* (1857) being granted to the bishop in 1230 for the octave of St. Lawrence. together with the fair on the feast of St. Barnabas. The church of St. Mary is mainly Decorated and Perpendicular, with some Early English remains and an emhattled western tower. Queen Elizabeth's grammar school was founded in 1562.

The prosperity of the town is chiefly dependent on agriculture with malting, tanning, canning and a large plant nursery. There is also a clothing factory. At Somersby, seven mi. E.N.E., Alfred Lord Tennyson was born. The red brick castle of Tattershall, 9 mi. S.S.W., dates from 1440.

HORNCHURCH, an urban district and parliamentary division of Essex, Eng.. 14 mi. E.N.E. of London by road and on the Inprebourne where it joins the Thames, with more than 3 mi. of Thames frontage. Pop. (1961) 128,127. Area 30.9 sq.mi. It is a "dormitory" area with industries such as light engineering and the making of office equipment, chemicals and clothing. Henry II founded there a hospice for the St. Bernard monks of Savoy. granting them the church and some land, and in 1245 the Savoy palace in the Strand. London. was attached to it. A stone, copper-horned bull's-head over the gabled east window of the parish church (the hull's-head is also on the seal of the French monastery) is probably the'origin of the name *Hornedecherche* in 1311. Royal flying corps. later royal air force, fighters stationed at Hornchurch distinguished themselves in the defense of Britain during World Wars I and II. A civic theatre was opened in 1953. Rainham. Upminster and North Ockendon have historic churches.

HORN DANCE, a dance performed at Abbots Bromley, Staffordshire. on Wakes Monday in September. Four men impersonate a fool, Maid Marian, a hobby horse and a boy with bow and arrows. Six more bear sets of antlers on their shoulders. A single file procession is followed by a mock battle between the three nith black antlers and three with white. Accordion and triangle provide accompaniment. The dance shows some similarities to a local custom observed prior to the English Civil War and may derive from a primitive fertility ritual.

See R. Crompton Rhodes, "The Truth About the Abbots Bromley Horn Dance," *Dancing Times,* N.S. no. *288* (Sept. 1934); Cecil J. Sharp, *The Sword Dances of Northern England Together With the Horn Dance of Abbots Bromley,* 2nd ed., rev. by Maud Karpeles (1951). (S. J. Cn.)

HORNE, HENRY SINCLAIR HORNE, 1ST BARON, cr. 1919 (1861–1929), British general. was born on Feb. 1, 1861. He joined the royal artillery in 1880 and served on the staff throughout the South African War (1899-1902). In 1912 he became inspector of artillery and in Aug. 1914 went to France in command of the artillery of the 1st army corps. At the end of 1915 he was given charge of the 15th army corps in Egypt and he took this to France in April 1916, commanding it during the opening phases of the battle of the Somme. His method of employing his guns during these operations attracted much attention and was signally successful, as was recognized by his being chosen in September to succeed Sir C. Monro as leader of the 1st army. His troops took a prominent part in the battle of Arras, 1917, and when the enemy. in March and April 1918, made its great effort they repulsed all attacks that were made upon their front. Then, when the Allies' counteroffensive developed in the late summer, their part in the final victories was conspicuous. For his services he was raised to the peerage as Baron Horne of Stirkoke and received a grant of £30,000. He held the Eastern command from 1919 to 1923 and retired in 1926. He received many honours, including the G.C.B. (1919). Lord Horne died on Aug. 14, 1929.

HORNE, ROBERT STEVENSON HORNE, 1ST VISCOUNT (1871–1940), British lawyer, politician and businessman, achieved success in whatever he attempted by steady ambition, a talent for organization and genial good humour. Born at Slamannan, Stirlingshire, he studied philosophy at Glasgow university, became interested in student politics and decided to read law. meanwhile taking a post as lecturer in philosophy at the University College of North \Vales. Bangor. Called to the Scottish bar in 1896, he took silk in 1910, and in the same year tried at both general elections to enter parliament as a Unionist. During World War I he worked first with Eric (later Sir Eric) Geddes in organizing railway transport at the front and then went to the admiralty, becoming director of materials and priority in 1917, and director of labour and third civil lord in 1918. Elected to parliament in 1918, he became minister of labour. dealing successfully with trouble on Clydeside, in the coalfields and on the railways. In 1920 he was made president of the board of trade and in 1921 chancellor of the exchequer. but after the dissolution of the coalition in 1922, loyalty to Lloyd George led him to refuse office under Bonar Law. He turned his energies to the management of such large undertakings as the Suez Canal company. Lloyds bank. and the Burma corporation. In 1934 he became chairman of the Great Western Railway company. He was created a viscount in 1937 and died on Sept. 3, 1940, at Farnham, Surrey.

HORNE, THOMAS HARTWELL (1780–1862), English theologian and bibliographer. was born in London on Oct. 20, 1780, and educated at Christ's Hospital, with Samuel Taylor Coleridge as an elder contemporary. On leaving school he became clerk to a barrister but showed a keen taste for authorship. As early as 1800 he published *A Brief View of the Necessity and Truth* of *the Christian Revelation,* which was followed by many works on varied subjects. He was appointed (1524) senior assistant librarian in the department of printed books in the British museum. After the project of making a classified catalogue had been abandoned. he took part in the preparation of the alphabetical one, and his connection with the museum continued until within a few months of his death on Jan. 27, 1562.

HORNED OWL, an owl with hornlike tufts of feathers, especially the large eagle owl (*q.v.; Bubo bubo*) of Europe, Asia and north Africa. The great horned owl (*B. virginianus*) of America, from arctic tree limits to the Straits of Magellan, is a powerful mottled brown predator often reaching two feet in length. Although its usual fare is small rodents and birds it has been known to carry off larger game, hens, turkeys, etc. Being adapted to desert and forest, the great horned owl migrates only during time of food shortage.

Related species of *Bubo* occur over Africa, India and Burma to the Malay archipelago. (*G.* F. Ss.; X.)

HORNED TOAD, the common name of North American lizards of the genus *Phrynosoma.* There are 17 species. of which 10 occur in the arid regions of the western United States and the remainder in similar situations in Mexico. They are short-legged. flat-bodied, harmless creatures of grotesque appearance. The hinder border of the head is armed with long or short sharp hornlike spines; the sides of the body and tail bear soft spinelike scales. The horned toads inhabit arid plains, deserts and dry forests and feed upon insects and chiefly upon ants. The eggs are retained within the body of the female until ready to hatch in some species, while in others the eggs are laid in the ground in sandy places. The common horned toad (P. *cornutum),* one of the largest species, is about 6 in. long, with a body width of 2½ in. It is abundant in high arid plains from western Nebraska southward to Texas and Mexico. Other species, some of which are less than 4 in. long. are found from Wyoming to Washington and southward to Mexico.

HORNEMANN, FREDERICK (1772–1801), German traveler in Africa and the first European in modern times to traverse the Sahara, was born at Hildesheim in Lower Saxony in Sept, 1772. Early in 1796 he offered his services as an explorer to the African association in London. In Sept. 1797 he arrived in Egypt and, after receiving assistance from Napoleon, on Sept. 5, 1798, joined a caravan returning from Mecca to the Maghreb. He was attached to a group of Fezzan merchants traveling with the pilgrims and assumed the character of a mameluke trading with the Fezzan. He was accompanied by Joseph Freudenburg,

a German convert to Islam who had made the pilgrimage to Mecca three times, who acted as his servant and interpreter. They traveled by way of the oases of Siwa and Aujila and reached Murzuk on Nov. 17, 1798. Hornemann remained there until June 1799 and then made a journey to Tripoli, dispatching his journals to London in August. He returned to Murzuk intending then to travel southward to Hausa country, and was the first European to establish its definite location. Nothing more was heard of him until a report reached Murzuk in 1819 that he had reached "Noofy" (Nupe) and died there in Feb. 1801.

Hornemann's journal was printed at Weimar in 1802; an English translation, Frederick Horneman's Travels from Cairo to *Mourzouck* with maps and commentary by Maj. James Rennell, was published in 1802.

See Heinrich Schiffers-Davringhausen, *The* ***Quest*** for *Africa,* **pp.** 285–86 (1957). (R. M. P.)

HORNET, a name given to several species of large wasps (*q.v.*), especially the European *Vespula* (Vespa) crabro and North American V. *maculata*. *See* SOCIAL INSECTS.

HORNEY, KAREN (née DANIELSEN) (1885–1952), U.S. psychoanalyst, author and teacher, whose importance stems from her dissatisfaction with the traditional Freudian approach to psychoanalysis, was born at Hamburg, Ger., on Sept. 16, 1885, the daughter of a Norwegian father and a Dutch mother. After study at the medical school at Berlin, she began the practice of medicine in 1913, studying meanwhile with Karl Abraham.

She became prominent in the psychotherapeutic field about 1930, moving to Chicago in 1932 to be assistant director of the Institute for Psychoanalysis there, and in 1934 to New York, where she lectured at the New School for Social Research and New York Medical college, trained other psychoanalysts and worked as a practising analyst. She was one of the co-founders of the American Institute for Psychoanalysis. Her death occurred in New Tork on Dec. 4, 1952.

Dr. Horney stressed the significance of social and environmental factors in determining the personality pattern of the individual and his conilicts. Her best-known books are The *Neurotic* Personality of *Our Time* (1937). *Our Inner Conflicts* (1945) and *Neurosis and Human* Growth (1950). Emphasis was placed on childhood training in such aspects of behaviour as weaning, cleanliness, sex taboos and aggression.

In later life, she maintained, experiences that are perplexing and threatening may contribute to behaviour anomalies. Dr. Horney. among others, questioned the "death instinct" theory advanced by Freud for explaining aggressive behaviour.

(R. M. D.)

HORNFELS, in petrology, a series of rocks that have been partially or wholly recrystallized by the heat of intrusive igneous masses. Most hornfelses are fine textured and massive, recrystallization having effaced the structures and textures of the original rocks and replaced original minerals by new assemblages. They are the characteristic rocks forming the inner zone of the thermal aureole of alteration surrounding bosses or laccoliths of plutonic rocks. The commonest types of hornfelses are derived from shales, impure limestones and basic igneous rocks. Shales give rise to brown or black hornfelses rich in biotite mica, andalusite and cordierite; while impure limestones give the "calc-silicate hornfelses" rich in pyroxene, garnet, idocrase or wollastonite. The hornfelses derived from basic igneous rocks are dark-green types rich in feldspar and pyroxene or monoclinic amphibole. These are the basalt or dolerite hornfelses. See also METAMORPHISM: *Types of Metamorphism.* (C. E. T.)

HORNIMAN, ANNIE ELIZABETH FREDERICKA (1860–1937), English theatrical manager, who was a pioneer in the repertory theatre movement, was born at Forest Hill, London, on Oct. 3, 1860. Educated privately, she studied art for a period at the Slade school, University college, London, under Alphonse Legros. Later she was secretary to W. B. Yeats.

Miss Horniman's first theatrical enterprise, at the Avenue theatre, London, in 1893, was a failure. In 1904 she became associated with the Abbey theatre, Dublin, and subsidized the Irish National Theatre society, which presented a series of plays by Irish dramatists dealing with various phases of Irish life. She is chiefly remembered, however, for her institution in 1907 of the repertory theatre movement in Manchester. She opened at the Gaiety theatre, Manchester, in 1908, and converted it into a repertory house, the first in Great Britain, in which some of the best-known plays of modern times were originally produced. In 1917 she was forced to disband her company, but retained control of the theatre until 1920. She died at Shere, Surrey, on Aug. 6, 1937.

See R. Pogson, *Miss Horniman and the Gaiety Theatre, Manchester* (1952).

HORNING, LETTERS OF: see PRACTICE AND PROCEDURE.

HORNPIPE. A term denoting (1) a musical instrument; (2) a dance; and (3) an item in the musical suite in 3/2 time.

The dance was supposedly performed to the instrument, and at times is synonymous with the jig, country dance (*qq.v.*) and reel. Commonly, "hornpipe" signifies a "round" or country dance (15th–16th centuries), a "longways" country dance in 3/2 time (17th–18th centuries) and particularly a solo dance (usually male) in 2/4 or 4/4 time. Known in all parts of Great Britain, it is characterized by intricate steps and sometimes by mimetic action (as in the "sailor's hornpipe," originally a stage dance in the 18th century). Particularly in northern counties, itinerant dancing masters taught new steps which were jealously regarded as personal to each individual and were performed solo to the fiddle at country balls.

See *Die Musik in Geschichte und Gegenwart,* ed. by F. Blume (1949). (M. J. D-S)

HORNSEY, a municipal (1903) and parliamentary borough in Middlesex, Eng , 6 mi. N of St. Paul's cathedral, on the "northern heights" adjoining the administrative county of London. Pop. (1961) 97,885. Area 4.5 sq.mi. The manor, called in the 13th century *Haringeie* (surviving as Harringay), early belonged to the see of London, the bishops having a seat there. In 1387 the duke of Gloucester, uncle of Richard II, assembled in Hornsey park the forces by which he compelled the king to dismiss his minister Michael de la Pole, earl of Suffolk. Finsbury park (115 ac.), administered by the London County council, Alexandra and Priory parks are nithin the borough. Highgate (q v) is largely in Hornsey borough as are Crouch End and Muswell Hill.

HORNWORT, a common name for the species of the genus *Ceratophyllum* of the Ceratophyllaceae family, a monogeneric family containing three or four species of cosmopolitan distribution. All grow under water and possess whorled, finely dissected leaves. Two species (C. *demersum* and *C. echinatum*) are widely distributed in quiet nater in temperate North America and are frequently used in the unheated aquarium. (J. M. BL.)

HOROLOGY, the science of measuring intervals of time; also, the principles and techniques of constructing instruments used for indicating time. It is treated in the folloning articles: CHRONOGRAPH ; CHRONOMETER; CLEPSYDRA ; CLOCK ; HOURGLASS; SUNDIAL; TIME MEASUREMENT; WATCH. The measurement and designation of long periods of time falls under the domain of chronology, and is dealt with in CALENDAR; CHRONOLOGY; DAY; MONTH; TIME; TIME, STANDARD.

HOROSCOPE: see ASTROLOGY.

HOROWITZ, ISAIAH (c. 1555–*c.* 1630). Jewish rabbi and mystic, nas born at Prague, and died at Safed (now in Israel). He held various rabbinates, notably at Frankfurt am Main (c. 1606) and at Prague (1614). From 1621 onward he lived in Palestine. In 1625 he was imprisoned by the pasha but, on being ransomed, settled in Safed, at that time the home of Jewish Cabala Horowitz' largest work, *Shelah* (abbreviated from the initials of the full title *Shene luhoth ha-berit,* "Two Tables of the Covenant"), is a compilation of ritual, ethics and mysticism. It has been often reprinted, especially in abbreviated form. His prayer book is also marked by cabalistic doctrines.

For an account of the Jewish mystics at Safed, *see* S. Schecter, *Studies in Judaism,* series ii (1908).

HORROCKS, JEREMIAH (c. 1617–1641), English astronomer and clergyman whose successful observations of the transit of Venus of 1639 are the first recorded of that phenomenon, mas born at Toxteth Park, near Liverpool. He was a student at Em-

manuel college, Cambridge, from 1632 to 1635; then he became a tutor at Toxteth and studied astronomy in his spare time. He was ordained to the curacy of Hoole, Cheshire, in 1639. He calculated that a transit of Venus, overlooked in Kepler's Rudolphine tables, would occur on Sunday, Nov. 24 (O.S.), 1639; when the transit took place, he fitted his observations in between church services. Horrocks was a brilliant young man, and before his death at Toxteth on Jan. 3, 1641, he had considerably advanced the lunar theory, reduced the solar parallax to 14″, suggested perturbations of the moon's orbit as due to the disturbing action of the sun, made observations of the tides, and investigated the irregularities of motion of Jupiter and Saturn.

HORS D'OEUVRE. Hors d'oeuvre in cookery is the name given to small appetizing morsels of food generally served cold, such as caviar, creamed meat or fish masked with aspic, etc. These dishes are served at the beginning of a meal and may be either handed round or placed ready in front of the diner.

Many different kinds of food are used for making hors d'oeuvre dishes; *e.g.*, meat, fish, vegetable or fruit. While some are "made-up" dishes, other foods are served in a raw state; *e.g.*, oysters. As far as possible, where "made-up" hors d'oeuvres are given, these should be prepared as complete portions so that they need no carving or cutting. Diminutive rolls, thin strips of pastry. toast or special small savoury biscuits are frequently used as canapés (foundations) for hors d'oeuvre mixtures. Sieved yolk of a hard-boiled egg, truffles, diced vegetables, aspic jelly. mustard and cress, parsley. etc., are among the many decorations used for these dishes. Where vegetable salads are used as hors d'oeuvres a mayonnaise sauce mixed with aspic jelly is often employed as a coating. Stuffed hard-boiled eggs, jellied molds of vegetables, fish, meat, etc., are other forms of hors d'oeuvre, also dainty sandwiches with a well-flavoured savoury paste.

Smoked and cured fish are popular forms of hors d'oeuvre; *e.g.*, smoked salmon and anchovies. Strips of smoked salmon are occasionally spread with a sawoury mixture and rolled. Anchovies may be boned and coiled round olives, etc. Prawns may be served au *naturel* by sticking them into a whole lemon. Crab and lobster meat form the basis of many creams, while bivalves, such as oysters or mussels, may be served with vinegar or lemon, a relish sauce, etc., and handed with brown bread and butter.

Hors d'oeuvre *varié* is a mixed dish of different kinds of foods; *e.g.*, sardines, anchovies, olives, some form of galantine, slices of tomato, beetroot, etc.

HORSE (*Equus* caballus). The horse is an important and valuable member of the Mammalia. For its zoological history the article EQUIDAE should be consulted; that on HORSE RACING AND BREEDING describes its speed development, this gift being the horse's age-old special attribute *(see* also HORSEMANSHIP AND RIDING). The present study is historical in the broad sense.

Origin and History. — The prehistory of the horse is largely speculative. the few clues being chiefly of a geological. archaeological or zoological nature. The horse preceded man on earth by many ages but little is known of its history previous to about 2000 to 3000 B.C. The zoological reconstruction of the horse from stage to stage has been made possible by the series of fossil skeletons unearthed in the trans-Mississippi region of the U.S., these antedating all others discovered by the second half of the 20th century; but the original habitat of the species remains controversial. One school of speculation contends for Central Xsia, whence migrants to North America crossed (hypothetically) to Alaska and thence made their way south and eastward, where for ages they increased and multiplied, changed vastly in form and then disappeared in some mysterious manner. Their presence there remained unknown until discovery of the remains of the dawn horse arid his successors. Be this as it may, it appears that the modern species descended from an Asiatic rather than an American ancestor! the preferred theory pointing to the north central portion of Asia as the region where its rise took place, followed by its distribution throughout the world.

This great equine migration divided into three main streams. One, moving eastward, resulted in the Chinese and other Mongoloid types. Another, moving westward, crossed into Europe and

there originated the vast hordes of primeval animals that eventually roamed almost the entire continent. The third and all-important one flowed to the southwest and found its way into Xsia Minor and the neighbouring lands of Iran (Persia). India and Arabia. Ultimately it crossed into Egypt, then spread from that country along all of north Africa. At the same time it crossed from Asia Minor into Greece and spread along the northern shores of the Mediterranean. It was from the horses of this final migratory stream that the ancestors of almost all modern improved breeds came. The Chinese and other Mongoloid horses remained too remote to be of any influence outside their own habitats: the same was true of the north European hordes. The destinies of the genus were bound up with that of the Mediterranean civilization, of which the modern horse is the descendant.

John Trotwood Moore. in a tribute to the horse, wrote: "Wherever man has left his footprint in the long ascent from barbarism to civilization we will find the hoofprint of the horse beside it." According to western European mythology and folklore, all the great early civilizations arose among horse-owning, horse-breeding and horse-using nations; those in which the horse was either unknown or in the feral: or untamed, state were backward and no great forward movement of mankind was made without the assistance of the horse. So consistently was this the case that the glorified figure of "the man on horseback" became the symbol of power. The image of the horse was stamped upon man's coinage, sculptured on his temples and even elevated to his pantheon and worshiped as divine.

There were two channels through which the oriental horse. the Arabian and the Barb (Barbary). were distributed in northern Europe. The first led them northward through Greece, Macedonia and the Gothic countries into the land of the Vandals. At the same time they were finding their way eastward to the region of the Huns and Scythians of Asia. The second channel was through the conquest of the Romans across the Alps into the countries now known as France and the Low Countries near the North sea corresponding to the present nations of the Netherlands, Belgium, and parts of Germany. Previously, shaggy descendants of the horse of Central Asia had constituted the equine population of this region. When the barbarians invaded the Roman empire, the vast number of horses which they possessed helped them to overthrow the Romans. The ages that followed witnessed the diffusion of oriental horses throughout. the countries of northern Europe and the breeding of improved types. The most important of these was the "great horse." which originated in the Low Countries; its size and strength were required to carry the heavy load of the medieval knight in heavy armour. These horses. the ancestors of modern draft breeds, were bred from the largest and most powerful of the northern European horses, but there was apparently an admixture of the oriental blood which the Romans

had brought in.

The crusades of the 12th and 13th centuries took the kings and nobility of northern Europe into the native land of the oriental horse. The speed and agility of these light horses so impressed the crusaders that large numbers were imported into England and France. The Moors took Arabian and Barb horses into Spain over a long period of time. They were crossed with the native stock and produced the superior horses of Spain that were sought after by other nations. The Spanish horses were taken to the Americas by the Spanish conquerors and settlers. Of oriental antecedents. they were the principal ancestors of the western equine population of both North and South America. They thrived in their new homes and multiplied into the numerous herds of the prairies and pampas.

The new world, unlike the old. was never populated by hordes of wholly wild horses. The wild bands, known as mustangs, cayuses or broncos. that became numerous on the American prairies mere the descendants of the domestic horses imported from Spain. So they were never of the same primitive character as the truly wild horse of Europe and Asia. Not only did the conquistadors take horses from Spain, the English colonists also imported and bred good horses.

The only truly wild horse remaining in the 20th century was the *Equus przewalski*, discovered in western Mongolia in 1879—a small (12 hands or 48 in.), rough, dun-coloured pony that was of wholly feral (wild) ancestry and habits. Specimens were acquired for many zoos. A few of these still exist in a wild state.

The modern horse spread throughout the habitable world because of its capacity to withstand the extremes of climatic conditions and its adaptability to the uses of man. In these respects the horse has no equal.

Classification.—No attempt has ever been made to classify all the breeds and types of horses of the world. There are several ways by which horses can be classified—by size, type, place of origin and use. The most common classification is division into draft horses, light horses and ponies. Light horses may be further divided into riding and driving types. However, there is a great overlapping of use as all light horses can be ridden, driven and used as light work horses. The coach horse is a blend between the two types with emphasis on style and height of action.

Riding horses may be classified by type and training regardless of their breeding. So any of the light breeds may qualify as riding horses. Hunters are trained to jump under field conditions. While usually predominantly of Thoroughbred breeding, they may be American Saddle horses, Standardbreds, part Arabian and even of unknown breeding.

Polo ponies are usually grade Thoroughbreds, that is, have one Thoroughbred parent. It is the nature of training that determines their classification (see also POLO). Stock horses are horses of suitable type and training to be efficient in working livestock under range conditions. Cutting horses are similar to stock horses but are more specifically trained to separate cattle. Roping horses are likewise stock horses but are trained for roping in rodeos, where winning is based upon catching and tying a calf or steer in the shortest possible time. In South America the Criollo (native, Spanish type) and grade Thoroughbreds with a Criollo foundation are used as stock horses. Most countries of the United Kingdom use grade or pure Thoroughbred horses for both polo and stock horses. Canada uses some grade Thoroughbreds, but the Appaloosa and Quarter horse and Arabians have gained recognition as stock horses.

The early horses were probably around 12 hands (48 inches) at the withers, and 14 hands was exceptional. Some modern horses reach 17 hands and occasionally 20 hands (80 inches). The Low Countries specialized in breeding for size, first for armoured knights and later for draft horses. The Belgian is the main survival. Other draft breeds of France and England were likewise bred up from the old "great horse." Large scale use of heavy horses for farm and draft labour was specifically a United States development, although in England the draft breeds were extensively used on the farm and for dray horses in large cities.

The primitive horse was of a prevailing dun-coloured coat. Bay is the standard horse colour among the older registered breeds with brown, black, chestnut, gray and roan completing the list. Extensive efforts have been made to associate coat colour with useful qualities such as speed, gameness and endurance, but the age-old folk proverb that "a good horse is always of a good colour" retains its validity.

All light breeds of horses are related to the Arabian, mostly through the Thoroughbred. The Arabian is regarded as the oldest breed. The Barb horse, of north Africa, is similar to the Arabian in many characteristics and is probably related to the latter. The Barb, along with other oriental horses, contributed to the origin of the Thoroughbred when they were crossed in various ways among themselves and with the light horses that were native to England.

The Thoroughbreds in turn were used to improve the Hackney, Cleveland Bay and Yorkshire Coach horses of England. Arabians contributed to the quality and the beauty of the head of the Welsh pony. All Standardbred horses trace back to a gray Thoroughbred stallion Messenger. imported to the Cnited States in 1788.

The Thoroughbred sire, Denmark, is recorded as the foundation stallion of the American Saddle horse, though most of the horses trace to him through his outstanding son, Gaines' Denmark, the son of a pacing mare. The Xrabian, and the Barb to a lesser extent, contributed more directly to the American breeds. The American Quarter horse and the Tennessee Walking horse have some Thoroughbred breeding.

Horse Terms.—The term horse is used to designate a male, either stallion or gelding, as well as the whole species. A normally sexed male horse is a stallion. and an unsexed male a gelding. A female is a mare and her young is a foal. A male foal is a colt; a female foal is a filly. They are often called colt or filly until mature. A stud is a place where horses are kept for breeding purposes. A stallion kept for breeding purposes is called a stud-horse. A small horse under 14.2 hands is a pony. A mule is a cross between an ass (*q.v.*) and a horse (see MULE).

Character of the Horse.—The intelligence of the horse has been appraised in widely different terms. Ordinarily it is ranked fourth among the "lower animals." following the elephant, the ape and the dog but it is sometimes dropped to tenth or even lower in the scale. Its psychology is difficult to construe with any pretense of exactitude. It is at once timid and courageous, affectionate and unfriendly, docile and ungovernable, hot-headed and phlegmatic, teachable and obtuse. As among human beings, brothers and sisters may be poles apart in temperament, though in certain families and tribes some traits are distinctly hereditary. The horse's sensitiveness is extreme, its memory is long; it has a tendency to form habits difficult to eradicate. Authorities testify that few horses are naturally vicious, and that those which become so have been, with few exceptions, the victims of bad handling, especially as colts. Certain of their instincts are highly developed. such as their ability to find their way home when their masters cannot; to become aware of unknown and unseen dangers; to detect the presence of water in deserts and barren wastes; to discriminate between enemies and friends at long range or close quarters. From time immemorial they have been exploited by man for his own benefit and often with wanton abuse; the Society for the Prevention of Cruelty to Animals was first inspired by their gross ill treatment. Being herbivores, they seldom attack either man or animal. An exception is the stallion protecting mares and foals from the Carnivora. The maternal instinct in the genus is likewise strong, and mares will fight desperately to defend their nursing foals.

Horses are customarily broken, either to saddle or to harness, when two years old—race horses usually as yearlings, the heavy breeds sometimes not until three. When males are gelded it is usually at an early age. Until the five-year-old season, the sexes classify as colts and fillies, subsequently as stallions and mares. Full maturity is attained with the sixth year. It has become the custom to date the ages of all horses from Jan. 1 of the year in which foaling takes place. While cases have been known in which yearling colts have begotten offspring, and yearling fillies been gotten with foal, successful breeders never use animals of either

sex until they are at least two or preferably three. The period of gestation for mares is 11 months. While a single foal is the usual result of a mating, mares frequently produce twins and, rarely, triplets; in such cases only one is likely to survive. When both live they are usually weaklings. Normally mares continue fertile until past the age of 20, but instances of maternity beyond 30 are of record. When used solely for breeding. 20 or more foals each have been produced by many brood mares. It is a popular belief that a horse at 20 years is physiologically equivalent in age to a man at 70, though there are authenticated cases of horses living to the age of 50.

The fertility of stallions corresponds with that of mares, but they may retain their potency a few years longer. Some of the highly refined and closely inbred strains, notably the Arabian and the Thoroughbred, are often scanty foal getters. Breeders of race horses ordinarily restrict a sire to from 25 to 40 mares per season, believing that this improves the quality of the offspring, but a normally vigorous sire in his prime may be allowed from 50 to 60, and part-bred and common stock horses often cover 100 or more. Hambletonian, the patriarch of the breed of standard trotters, was badly overbred; at 15 years he covered 217 mares and got 148 foals. From 13 to 17, inclusive, he covered 823 mares and got 524 foals, an average of 105 per season through five consecutive years. The drain on his vitality, however, was so great that. he had to be retired from service one season and thereafter to be limited to not more than 30 mares. Some famous progenitors have been remarkable controllers of both colour and form; others have had progeny of all hues and shades, without family resemblances.

When allowed to run wild and breed as nature prompts, horses will degenerate in size and type. Extremes of climate have similar effects. To an extent, stunting produced by environment becomes an attribute of heredity, like the size of the larger breeds. However, after the size and type are established, they must be kept in check by selection, especially when the animals are moved to a more favourable environment, including sufficient feed. There is a tendency for Shetlands to grow larger and they possibly would if it were not for rules limiting the size for registration.

Under ordinary conditions the horse remains healthy, hardy and sound until old age. It is susceptible to many diseases. however, especially those of the respiratory, circulatory and digestive systems. Unless starved, it is particular about food and often dainty; it is strongly affected by quality and sudden changes in food or water. The more highly bred, the more easily its physical organization becomes affected, but this is offset by the manner in which a hot-blooded horse will fight for its life and survive? when a cold-blooded horse, that is, one predominantly of draft-horse breeding, will succumb. Rangemen of the far western U.S. and Canada report that, in hard winters during which range horses obtain all their feed from natural sources, losses of the pure and part-bred light strains are much lower than those of heavy (cold) blood.

FEEDING AND CARING FOR HORSES

The natural feed of horses is grass. Idle horses that graze nutritious grasses in large pastures have fewer respiratory and digestive disturbances than more closely confined animals. However. some grain is essential to produce firm muscles and enduring qualities. Grain supplements the grass or hay and provides a more complete diet for working horses.

Hay usually provides sufficient calcium but may lack phosphorus. Calcium and phosphorus are essential for bone growth, protein for muscle growth. By-products of milling such as wheat bran, linseed meal, and soybean meal provide an abundance of phosphorus. Therefore a little of these feeds will offset the lack of phosphorus and protein that may occur in winter range feeds.

Horses are fed for long-time efficiency. For safety some bulk and a variety of feeds and. to insure sufficient consumption. palatable feeds should be provided. Horses do best when fed small amounts frequently according to age, type and amount of work. For efficiency grain is fed punctually three times a day. The bulk of the hay may be fed at night.

Oats, the most satisfactory grain feed, are palatable, bulky and nutritious. Barley. widely used, should be ground or preferably rolled. Corn (maize) is extensively fed but lacks protein and mineral. Grain sorghums may be used, but it is better to feed legume hay, to balance corn and grain sorghums.

Hays may be legume (alfalfa. clover, soybean) or grass. Timothy, the standard grass hay, is palatable and safe but may lack protein and caicium. Legume hay has more protein, vitamin A, and calcium. It usually is included in the ration of young horses. Hay cut early has more protein, minerals and vitamins than late cut hay. Hay and grain should be free from mold and dust. Moldy feeds cause digestive trouble; musty, dusty hay is associated with heaves. Horses will eat too much palatable hay; hence it may be necessary to limit hay for economy and health reasons.

Horses doing heavy work should receive from 1.2 j to 1.4 lb. of concentrates and 1.0 lb. of hay per 100 lb. of weight. As the work lessens, the grain is decreased and the hay increased. Idle horses or horses doing light work may be fed only hay.

Salt needs vary, but if salt is available. horses will adjust their requirements. Horses receiving a variety of good feed will seldom need a complicated and expensive mineral mixture. (See also FEEDS. ANIMAL.)

Grooming helps the appearance of a horse. Use of comb and brush eliminates the dead hair and dust and distributes the natural oil. resulting in a sleek appearance. The mane is brushed and trained to fall to the right side for most show horses. the left for stock horses. Some horses are shown with a roached (cropped) mane. The customs of the breed or show classes vary in this respect.

The most vulnerable portion of the equine anatomy is the underpinning. For more than 6,000 years, until the advent of the railroad. the horse was the sole agency of rapid transit on land, yet its legs and feet remain its weakest parts. A broken leg, unless the fracture is slight and not above the ankle, usually necessitates destruction; if saved, the animal is thereafter a cripple. The use of the horseshoe to protect the hoof from breaking, splitting and shelling away dates back to antiquity. and its importance is attested by its having become a symbol of good luck; the axiom "no foot. no horse" is world-wide. The texture of the hoof is strongly affected by climatic conditions and the nature of the habitat. The Arabian. reared in the desert where the ground is rough and stony and the climate dry. has a remarkably tough and sound hoof. while breeds common to moist latitudes are much more susceptible to foot ailments. Under natural conditions, horses keep their feet worn down, and trimming is unnecessary. Confined horses should have their feet trimmed level so the frog makes contact with the ground and the hoof and pastern are on the same straight axis. When horses are used. shoeing is necessary to protect their feet. Trimming may correct a faulty foot, especially of a young horse. After maturity, shoeing may alter the way of traveling but seldom corrects a natural fault. See also HORSESHOES. (J. A. GN.)

Diseases of **the** Horse.—Skeletal and Muscular Defects.—To allow proper utilization of the horse, it is essential that it remain sound of foot and limb. In part. this is dependent upon inherited characteristics. hence the emphasis placed upon conformation—the proper placement and development of the legs and body anatomical structures. Hard usage, especially when the horse is young. mineral imbalances in the feed, injuries and infection may also be responsible for defects. Some changes in the bones and tendon sheaths may be obvious without exciting lameness; others are definitely associated with lameness; sometimes it is difficult to detect the cause.

Parasites, External.—In certain areas. horses may be bothered by ticks. Depending upon the species of tick, stages in the life cycle may be completed on rodents or other animals with the horse as host for the adult. In others, as the spinose ear tick, only the horse is necessary as a host. Infection is picked up from vegetation carrying the proper stage of tick.

Mange in horses is caused by semimicroscopic mites. Infection may be spread by direct contact with infected animals and indirectly by blankets, harness. etc. Aside from the irritation and local changes in the skin, advanced cases may develop generalized symptoms of weakness. With neglect or where large numbers of

horses are held together this may develop into a serious scourge.

Lice on horses may be sucking or biting lice, the former being more injurious. Favourite locations are the mane and tailhead. Resultant irritation leads to rubbing, loss of hair and inflammation of the skin.

Adult botflies (*Gastrophilus* spp.) are of considerable importance due to the annoyance they cause horses. These flies deposit their eggs primarily on the hairs about the head, forelegs and chest wall, certain species having a predilection for a definite area. After a variable period. depending upon conditions. larvae develop. These are passively taken into the digestive tract by the horse's lips coming in contact with the hairs on which the eggs have been laid. or. with some species. this is an active process on the part oi the larvae. On reaching the stomach the larvae attach to the wall and undergo developmental stages. After some ten months they pass out with the feces. although some species may for a time attach themselves to the wall of the rectum with resultant irritation leading to tail rubbing. After evacuation irom the body the larvae enter a pupal stage in the ground and reappear as adult flies within a few weeks. Considerable numbers of larvae may be maintained on the stomach n-all in apparently normal individuals, but their presence is not harmless.

Parasites, Internal.—Ascarids or roundworms may become a serious problem in young horses; occasionally older horses also are seriously affected. Eggs irom adult worms in the intestine are passed out with the ieces. After a relatively short period of time they develop to the point where they are infectious. Ingestion of contaminated feed or water introduces the parasite; in its further development migration through the lungs occurs before the adult form appears in the intestine. Damage results irom migration in the developmental stage as well as from the adult forms. They are easily recognized by their large size. 6 to 12 in. in length.

Practically all horses harbour numerous small worms that conveniently may be grouped together as strongyles. a suborder of "thread worms," or Nematoda (*q.v.*). Their cycle is similar to that of the ascarids except that from the intestine the ingested larvae enter the circulation. Numbers are deposited in the mesenteric artery in the abdomen and its branches with resultant damage. but many finally reach the intestinal wall which they penetrate to emerge as mature parasites. This migrant journey may produce verminous colic. or. if the arteries of the hind legs are involved. transient weakness or paralysis of these parts. In addition. because of their large numbers and blood-sucking habits a constant drain is placed upon the host. Poor condition. weakness and death may result from heavy infestations.

The oxyurids or pinworms are also common in the colon and rectum of horses. These moderate-sized worms, up to several inches in length. may be seen passed in the feces or attached to the wall of the rectum. They are relatively harmless except for the irritation produced which frequently results in tail rubbing.

Parasites, Blood.—Several blood parasites knon-n as trypanosomes appear in horses. Transfer is primarily by blood-sucking insects: in some this is merely a mechanical transier but in others biological development in the vector occurs. Nagana affects mammals. especially horses, in Africa producing fever. subcutaneous edema, anemia and emaciation. It is spread through the tsetse fly. *Glossina* spp. Surra, another of the trypanosomiases. occurs in southeast Asia and is transmitted by flies. *Mal* de *caderas* is caused by *Trypanosoma equinum* and occurs in South America. Dourine. caused by T. *equiperdum,* is the exception to insect transmission as this disease is transmitted by coitus. Dourine is characterized by local inflammation of the external genital organs, urtical eruptions of the skin and symptoms of paralysis. This disease has. at various times. become widespread. (See also PARASITIC DISEASES; PARASITISM AND PARASITOLOGY.)

Infectious Diseases.—The respiratory group includes strangles, influenza and pleuropneumonia. Strangles is an acute, contagious disease marked by pronounced nasal discharge. irequently followed by swelling of the lymph nodes of the throat and to some extent other parts of the body, and in some instances by pneumonia. *Streptococcus* equi is usually considered to be the cause. The organism is resistant to drying and other agents so that a stable infected with pus containing the organism may remain infective for several months. Apparently healthy horses may harbour the organism. and young animals. by close contact with such individuals, may develop the disease. The active case of strangles especially serves as a source of infection by direct contact and dissemination of the causative organism hy contamination of water pails, etc. Recovery from an attack usually confers a lifetime immunity against strangles. Young animals in the six months to three years age group. being especially susceptible. should be protected against exposure if at all possible. Inclement weather, shipment and improper feeding and watering lower the animal's resistance.

Equine influenza or shipping fever is an extremely contagious disease marked by high fever and depression. Inflammation of the eyes is usually associated with the disease so that sometimes it is reierred to as pink eye. Nasal catarrh and swollen lymph nodes may simulate the appearance of strangles. Edema of the pendant parts of the body may develop. Occasionally panzootics comparable with pandemics of human influenza occur, but usually the infection is not widespread and is apt to be maintained in barns or other centres where there is a continual turnover in the susceptible horse population. Spread is probably air borne in most cases but the viral agent is also present in the saliva. urine. and semen. Transfer by coitus has been reported.

Equine contagious pleuropneumonia is typically an acute. iebrile disease marked by pneumonia and pleurisy. Many cases do not progress to this point but resemble influenza. However. the disease does not appear to be as iniectious as influenza and also has a longer incubation period. It is frequently complicated by *Streptococcus* equi infection. although probably viral in nature. Transmission is by droplet infection. Recovery confers immunity of an unknown duration.

Equine iniectious anemia is an infectious disease of chronic nature. sometimes termed swamp fever because of its association with low-lying lands. Acute attacks characterized by fever. weakness. anemia and edema of the chest and belly are apt to occur during the summer months. Many such cases appear to recover only to relapse again at some later time. The causative agent is a virus which experimentally has been found in the blood ior long periods: it is also present in the body discharges. Spread appears to be chiefly by blood-sucking insects going from an infected to a noninfected animal. The symptoms. while suggestive, cannot always be relied upon ior diagnosis, so that for an absolute diagnosis blood from a suspected case must be injected into a normal animal to reproduce the disease.

Infectious equine encephalomyelitis as the name indicates is an inflammation of the brain and spinal cord. Because of the disturbance in mental equilibrium it is popularly known as sleeping sickness. Early in the course of the disease the horse is inclined to walk aimlessly and to push against obstacles. Depression follows and. with paralysis of muscles. the animal may go down and be unable to rise. Animals that recover may retain permanent damage to the brain and fail to have complete control over muscular co-ordination. The cause is a virus. In the U.S., the eastern type of virus appears east of the Appalachian mountains: west of the chain. the western type appears. In South America, the Venezuelan virus is present. A similar disease. Borna disease. is seen in Germany. The American viruses are known also to affect humans. (See also ENCEPHALITIS.) Originally importance was attached to the horse as a reservoir for human iniection. Work with the eastern and western strains indicates mosquitoes to be the prime vectors. Viremia is present for a short period only in the horse. and it is only during this time that the horse is capable of iniecting mosquitoes. However, a number of birds, both wild and domestic, have been found to be inapparent carriers of the disease. Ordinarily the disease, transmitted by mosquitoes, smoulders in these reservoirs and flares up in extensive epizootics in the horse only when conditions are suitable. See also VETERINARY SCIENCE.

By-Products of the Horse.—The use of horseflesh for human food (hippophagy) was common among early mankind and still prevails in various countries, especially in time of scarcity or famine. From horsehide, tanned and untanned, a wide diversity of articles are fabricated. In cruder civilizations these include tents, coverings for all sorts of receptacles, articles of clothing. harnesses, etc. In the middle ages shields and bucklers, the leather coats worn under chain armour, and other portions of the knight's equipment were fashioned from it. Among numerous fine leathers derived from it was the elegant cordovan. In Greece and Rome the mane was used to ornament the helmets of warriors. In medieval and modern times the tail served as a battle standard among the Turks. Horsehair has been woven into fabrics for innumerable uses, among them the shirts worn by religious penitents. The strings of fine violin bows are made of white horsehair of the highest grade. Glue is made from the tissues, bones and blood of the horse, and serum is obtained as a by-product. Gelatins used in photography and in foods are other derivatives. Mares' milk is drunk by various primitive peoples and serves as the basis of koumiss, a fermented beverage of Mongolia and sometimes prescribed by physicians.

BREEDS OF HORSES

The following breeds are grouped by types.

Light Breeds.—Arabian.—The Arabian is a beautiful horse easily distinguished by his type and style. The head is broad and tapers to a fine muzzle capable of great dilation. The jaws are wide, eyes prominent and expressive. The neck is of moderate length and gracefully arched. The tail is light and gaily carried. The Arabian is small, seldom exceeding 1 j hands and 1,050 lb. in weight. The colours are chestnut, gray and bay, a few being brown but rarely black. They are never spotted or pure white. The gray fades to white in old age, but the skin remains dark throughout life. Their best gait is the gallop, which has been perfected by long use at the gallop in their native land. The Arabians are recorded in the stud books of different nations. Horses imported from Arabia are usually accepted for registration and are designated by the suffix D.B., an abbreviation for desert bred.

Thoroughbred.—The Thoroughbred, oldest of the improved breeds, is the running race horse of England. The term is often applied to any purebred horse. Such usage is incorrect. The other breeds may be called purebred or registered, but not Thoroughbred. The Thoroughbred represents the speed types. They are tall. narrow and light of leg and are characterized by refinement, long muscle, long. slender necks, short backs, prominent withers and long legs. The height averages 16 hands but varies from 1 j to 17 hands. In breeding condition the animals vary from 1,000 to over 1,400 lb. The prevailing colour is bay with a few chestnuts, browns, blacks and grays. The Thoroughbred has a long. low, straight stride. The trot lacks the height and flexibility of the other light breeds. Their most perfect gait is the gallop. As the Thoroughbred was used in establishing other breeds, so they are still used in improving grade horses throughout the world. Their breeding usually prevails in cavalry horses. The Thoroughbred is an international horse, found wherever racing is a sport. For a more detailed history of the Thoroughbred. see HORSE RACING AND BREEDING.

Standardbred.—The Standardbred is a harness race horse that originated in the eastern part of the United States. The Thoroughbred was fused with other breeds and types to produce a light breed with remarkable speed at the trot or pace. They are called Standardbreds because. when the breed was developing, they were required to trot or pace a mile in a standard of time. The Standardbred resembles the Thoroughbred in that it is light and narrow. However, they are usually longer in body, flatter of rib, lower to the ground and heavier of bone. Their weight and height varies a great deal. but they usually weigh 1,000 to 1,200 lb. and vary from 15 to 16½ hands. Bay is the dominant colour with brown. chestnut, black and gray. In earlier races, heat racing prevailed. a heat being a dash or part of a race. It took three and sometimes five heats to determine the winner. The type of racing and training developed stamina and enduring qualities. So they are a useful all-purpose horse.

American *Saddle* Horse.—This is a breed of riding horse possessing several easy riding gaits, great vigour and style. They are the prevailing riding horse of horse sho s in the United States. The Thoroughbred, Morgan, Standardbred, Arabian, pacers and easy riding horses of a mixed background contributed various qualities to this American breed. Selection for an easy riding gait. style and beauty, accompanied by line breeding (see ANIMAL BREEDING). helped shape them into a breed. This breed has a short, strong back and the barrel is more rounding than in most light breeds. The neck is long, slender and well arched; it blends smoothly into a well-shaped shoulder. The croup is long and almost level. They have most of the solid colours with limited white markings. They are shown under flat saddles as either three- or five-gaited horses. The three gaits are the walk, trot and canter. The five-gaited horse has these same three gaits plus the rack and one slow gait. The slow gait is usually the stepping pace but may be the running walk or foxtrot. The gaits are characterized by extreme animation and collection. Three-gaited horses are shown with a roached (clipped, standing) mane and a clipped tail. Five-gaited horses are shown with a full mane and tail. They may be used as pleasure horses. driving horses and quite often as hunters and jumpers.

Morgan.—Once the most famous and widely disseminated breed in the United States, the Morgan receded into the background and for a while their breeding was supervised by the government. The breed was founded by a horse known as Justin Morgan, after his owner. He was born about 1789 and died in 1821. He was one of those equine progenitors of such rare prepotency that his individual stamp still persists. He stood about 14 hands high and was a compact, active, virile and stylish little horse whose pedigree was probably a blend of Thoroughbred and Arabian with some other elements. The modern Morgan averages about 15 hands in height and from 1,000 to 1,200 lb. in weight. They are a stylish attractive horse with smooth lines, small ears, expressive eyes and a nicely crested neck. ,They are an all-purpose horse though they lean toward the riding-horse type more than formerly. The number of registered horses is increasing.

Tennessee Walking Horse.—This breed derives its name from the state of Tennessee and from its distinctive gait—the running walk. It is an older type, organized and recognized as a breed in 1935. In a broad sense: it originated from all the ancestors that could do a running walk. Allan F-I (b. 1886). a Standardbred stallion with several crosses of Morgan breeding. had the greatest influence on the breed. The Walking horse is heavier and stouter, and lacks the refinement and style of the American saddle horse. The head is usually carried low. Some are more sloping in the croup and more curved in the hocks than other riding horses. They average 15.2 hands in height and weigh from 1,000 to 1,400 lb. Some ponies derived from crossing with other breeds also will perform a running-walk gait. The Walking horse has a quiet. even temperament. and perhaps because of this they are a long-lived breed. In colour they are flashy. The colours are black. chestnut, bay, brown, roan, gray, yellow and pure white. They are satisfactory as a general-purpose horse. The running walk is a natural gait that may be improved but not acquired by a horse without the natural ability. The gait is faster than a flat-footed walk. with a speed of six to eight miles an hour. The front foot strikes the ground an instant before the diagonal hind foot. The horse has a low, gliding, reaching action, the hind foot overstepping the print of the fore foot by several inches. The foot movement is accompanied by a nodding head. The gait is pleasant to ride and easy on both the horse and the rider. The horse should also do a good walk and a slow, easy canter.

American Quarter *Horse*.—Although the breed association was organized in 1940. the breed itself represents an old type. The name was derived from its speed in quarter-mile races. The British North American colonies had short-distance running horses called quarter horses. The most prominent sire was Janus. an English stallion imported in 1756. With the advent of longer-distance racing. the type retreated into the background and finally found a home in the southwestern U.S. There it was kept alive by frontiersmen and cowboys in a desultory way until it became the sub-

ject of organized promotion and publicity. It is commonly used by cowboys for cutting cattle from herds. Its ancestral elements are chiefly Thoroughbred with an admixture oi the Spanish horse and other breeds of the range states. In type, the Quarter horse is a thick, short-muscled horse, varying in height from 14.1 to 1j.2 hands and in weight irom goo to 1.250 lb. In addition to the usual colours. buckskin, Palomino and grullo (smoky) colours exist. reflecting the Spanish ancestry. Holders of most short-distance records are Thoroughbreds or Quarter horses with considerable Thoroughbred breeding. However, the fastest horses are not always the best for use under range conditions.

Colour Breeds.--Following the organization of the Palomino Horse association in 1935, other groups began registering horses by colour, additional associations being formed to record the following breeds: Albino. Pinto and Appaloosa.

Palomino.—The Palomino is some shade of yellow or gold with a white or silver mane and tail. The colour does not breed true. Horses of proper colour, saddle-horse type and from at least one registered parent of several light breeds can be registered. Two associations register Palominos; their requirements are slightly different. This colour is popular for pleasure and parade classes. Their type and use depends upon their breeding and training. They may conform to the breed types of several light breeds.

Albino.—Foals are born pure white with a pink skin and remain white throughout life. They conform to riding-horse type.

Pinto.—This is Spanish for painted. Horses are registered on the basis of their colour pattern and light-horse conformation.

Appaloosa.—The most popular of the colour breeds, with several colour patterns. The name derives from the Palouse river of Idaho and Washington state. Some have a solid colour except for a white patch over the hips, interspersed with small. round spots of the same colour as the body. Others may have a basic solid colour with white dots over the entire body. or may be white with coloured dots. They sprang from Spanish stock. The Nez Percé Indians of Idaho selected them for colour and using ability. After the breed association was formed. the quality was improved by crossing with other breeds. especially the Arabian. They are of stock-horse conformation and useiul for many purposes. The breeders take great pride in the useful and enduring qualities of these horses.

Ponies.—Shetland.—The smallest, most numerous: and most popular of the pony breeds, Shetlands originated in the Shetland islands. 100 miles north of Scotland. where the feed is scanty and the climate severe. They are adapted to this environment. In the Shetland islands, they average about 10 hands and resemble miniature draft horses; in America lighter, more refined types are desired. They are of many colours, solid colours being preferred for show ponies, but spotted ponies being often preierred by children. Shetlands are lively, courageous, hardy and long-lived. They can be quite stubborn. but this may be avoided by proper training.

Welsh.—The Welsh descended from the native ponies of \Vales. being improved by a dash of Arabian and Thoroughbred breeding. About 12 hands tall, they may be used by man or child. They possess considerable spirit and ability for their size. Gray and dark colours are preferred in \Vales: cream and buckskin colours are popular in the United States.

Others.—Other ponies of England are the New Forest. Dartmoor and Exmoor. These breeds were improved by use of a few Arabian and Thoroughbred sires. They lack the quality of the Welsh but are larger and taller. The United States has no true breed of ponies. but small nondescript range horses are of pony size.

Coach Breeds.—These three breeds originated in England.

The Cleveland Bay is a breed which is always bay in colour. Only minute white markings are permitted for registration.

The Yorkshire Coach is related to the Cleveland Bay with more Thoroughbred breeding which is reflected in more quality and style. They are usually bay or brown in colour. Both the Cleveland Bay and Yorkshire Coach stand over 16 hands tall. They are of limited importance outside of their native regions.

The Hackney is the most popular coach horse because of its style and high action. Their height is from $14\frac{1}{2}$ to $15\frac{1}{2}$ hands tall. Their appearance is one of compactness and strength. The back is strong. the croup level with a high carriage oi tail. The colours are usually dark. but roan may be found. They are shown in most of the larger shows of the United States.

Lipizzan Horse (Lipizzaner).—This breed derived its name from the Austrian imperial stud at Lipizza. near Trieste. formerly a part of the Xustro-Hungarian empire. The foundation dates to 1580; detailed breeding records are available since 1700. The ancestry was Spanish. Arabian and Berber. The six strains {Pluto. Conversano. Neapolitano. Favory. Maestoso and Siglavy) are named irom their foundation sires. They are of comparatively small stature with a long back, a short, thick neck and ,powerful conformation. The head with a Roman nose, in contrast to the concave profile of the Arabian, and an attractive. expressive eye lacks the refinement of most light breeds. The colour is largely gray. hay and brown being but rarely found. The powerful. flexible and high action qualifies them for the intricate and difficult movements of haute *école* (high school) horses. the purpose for which they have been bred. They are found to a limited extent in countries that were originally a part of the Austro-Hungarian empire. A few have been exported to the United States.

Heavy **Breeds.**—*Belgian.*—As the name suggests, this type was produced in Belgium and is the modern direct descendant of the "great horse" of the middle ages developed in the Low Countries. Average height is 16 to 17 hands; weight 1.800 to 2.200 lb. Several colours exist, but in the U.S. light chestnuts or sorrels (with flaxen manes and tails) and roans are preferred to other colours. It is a breed of remarkable uniformity of build. style and other traits. Extremely docile. patient and willing. the Belgian excels in straight draft and farm work.

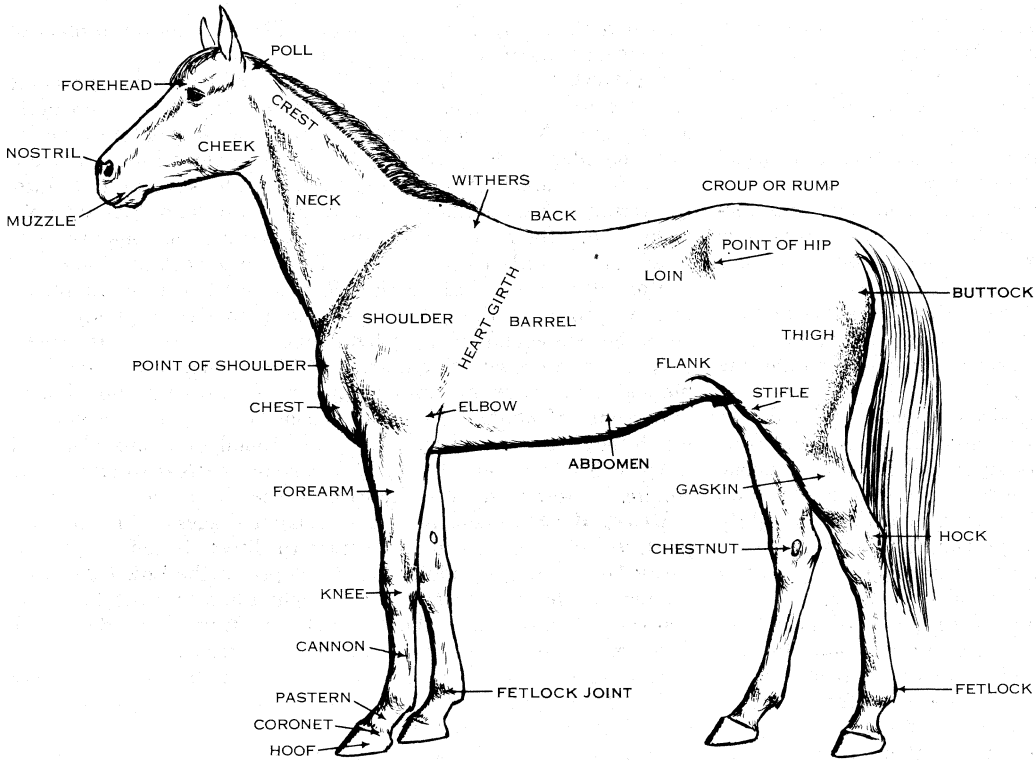
Clydesdale.—A breed native to Lanarkshire, Scotland, a county watered by the river Clyde. The iounder was a Dutch stallion brought in from England about 171j. It is slightly smaller than the Belgian or Percheron, though there are occasional immense specimens. Average size is 16 to $16\frac{1}{2}$ hands; weight 1.700 lb. The usual colour is very dark brown or bay, frequently black. which was that of the founder. There are prominent white markings. The Clydesdale is noted for its long and heavy fetlocks and its high action. both walking and trotting. It is esteemed for farm work.

Percheron.—Most famous of all modern draft breeds, also is known as Percheron-Norman or Norman Percheron. from having originated in the district of La Perche, Normandy. In blood it is a composité of the medieval "great horse." the latter French diligence or coach horse, and other strains with a leaven of oriental ancestry which is indicated by the head. often of small size, and Arabian contours. Average size is 16 to 17 hands; weight 1,900 to 2,100 lb. Despite its bulk. it is very active and nimble. The Percheron excels for draft and agricultural purposes.

Shire.--This breed is native to the middle section of England. It is equal to the Belgian in weight but taller. In colour they resemble the Clydesdale but are less extensively marked with white. They are characterized by a greater abundance of hair, called feather. around the pastern than the Clydesdale. They are heavier. coarser, steeper of pastern and lack the quality of the Clydesdale. They are farm and dray horses in England. This breed is not as popular in the United States as those breeds with less feather.

Suffolk or Suffolk Punch.--The typically English heavy breed, originating in Suffolk and existing as far back as 1586. Another descendant of the medieval "great horse." its vast bulk combined with singularly compact form led to the surname. Average height is 16 to $16\frac{1}{2}$ hands, but there is a range of from $15\frac{1}{2}$ upward; weight from 1.600 to 2,000 Ib. Colour is uniformly a dusty chestnut with flaxen mane and tail; few white markings. Like the Percheron. it often has a small, handsome head. testifying to oriental ancestry. It is a farm and not a dray type. The Suffolk, Clydesdale and Shire are used almost exclusively in Great Britain in preference to the Percheron and Belgian.

Wild Horses.—The European tarpan was the true wild species of horses found over much of Europe. In the middle ages they existed in the wilder and more inaccessible regions of Europe. A few survived until after 1900; they became extinct but a similar type has been produced by selective breeding. The "wild" horses of North and South America are feral horses or descendants of



PARTS OF THE HORSE

domestic horses that reverted to the wild state.

The only true wild horse is the *Equus przewalskii,* found in central Asia (see *Origin and History,* above). They are yellowish or light red in colour with a whitish muzzle. They usually have a dorsal stripe. The short, erect mane is without a foretop. The mane and tail are dark or black in colour. They are from 12 to 14 hands tall and resemble a large-headed, coarse, domestic pony. The low withers blend into a narrow back almost level with the withers. The croup is short and steep.

Breed Associations.— Breed associations register horses that meet all the qualifications for registration and promote the re.. spective breeds. A new association may admit horses that meet certain qualifications without the parents being registered. These qualifications may be type, colour, or speed. Standardbred horses, for example. were admitted to the registry if they could trot a mile in 2:30 or pace a mile in 2:25. The new associations may be known as open associations. The older associations require that each horse have a registered sire and dam to qualify for registration. These are known as closed associations.

Perhaps the oldest association for registering horses is the *General Stud Book* of England. An *Introduction to a General Stud Book* was published in 1791, and volume i in 1793. The publishers used various records that had been accumulated in connection with horse racing in England in establishing the registry. The *General Stud Book* is recognized as the official registry for the English Thoroughbred. Other leading nations have their own stud books for registering Thoroughbred horses. Registration certificates of Thoroughbred horses in one nation are usually recognized by all the other Thoroughbred registering organizations.

Other associations have been organized as new breeds developed. The names and addresses of some important ones are:

General Stud Book (Thoroughbred), London; Shire Horse Society, Middlcsex; Clydesdale Horse Society of Great Britain and Ireland, Glasgow.
Australian Jockey Club, Sydney, Australia.
Société Hippique Percheronne, Nogent-le-Rotron, France. Chevaux de Pur Sang, Paris.
L'Association des Eleveurs Italiens, Rome.
Gesellschaft für Ziichtungskunde, Bonn, Germany.
Sociednd Rural Argentina, Buenos Aires.
Canadian Thoroughbred Horse Society, Canadian Pony Society, Toronto, Ont., Clydesdale Horse Association of Canada, Winnipeg.
The Jockey Club (Thoroughbreds), New York; American Quarter Horse Association, Amarillo, Texas; The United States Trotting Association, Columbus, Ohio; American Shetland Pony Club, Laiayette, Indiana; Arabian Horse Club Registry of America, Chicago, Illinois; Palomino Horse Breeders of America, Mineral Wells, Texas; Appaloosa Horse Club, Moscow, Idaho.

HORSE POPULATION

The number of horses of the world has been decreasing as a result of the competition of mechanized equipment. In much of Europe and Asia, the horse has given way to food-producing animals. In the eastern half of the world, it is difficult to obtain accurate estimates of the horse population, but it is believed that the numbers remain about the same. The United States showed a pronounced decline from over 25,000,000 horses and mules in 1920 to fewer than 4,000,000 by 1950. Other American countries have shown less decline.

Some of the leading horse-producing countries are Bulgaria with about 500.000; France, 2,000,000; Japan, 1,000,000; and Argentina and Brazil 7,000,000 each.

New Zealand reached a peak of 400,000 horses in 1911 and declined to fewer than 150,000 in the 1950s. Great Britain had about 200,000 horses and ponies, with the numbers still falling and horse numbers in Australia and Canada have likewise declined.

Horse numbers appear to be increasing in Turkey, Yugoslavia and Brazil. The U.S.S.R., with an estimated 13,000,000 horses, and Poland, with 2,500,000, have had a great interest in horse breeding and since 1917, the Soviet Union has developed a few new breeds.

Draft horses have declined more than light horses which are used for pleasure and sports.

(J. L. HE.; J. A. GN.)

HORSE CHESTNUT. The name of a tree, *Aesculus hippocastanum* (family Sapindaceae or listed by some authors as Hippocastanaceae), thought to be indigenous in Greece, but now scattered throughout the temperate regions of the world. There are 20 or more named species and varieties of the genus *Aesculus. A. hippocastanum* in particular is called the common horse chestnut, but all are popularly known as buckeye or horse chestnut. Several species are shrubby, as A. *parviflora, A. discolor, A. neglecta* and *A, splendens,* but the majority are rapid-growing, pyramidal trees attaining a height of 60 ft. or more, They thrive well in moist sandy loam. The buds, conspicuous for their size, are, in some species, protected by a coat of viscous substance impervious to water. The buckeyes are deciduous with large palmately compound leaves, and white, red or yellow flowers in terminal panicles. They blossom in May or June and the fruit, superficially resembling the sweet chestnut, ripens about the middle of October. There is some disagreement as to uses to which the

JOHN H GERARD

HORSE CHESTNUTS (AESCULUS HIPPOCASTANUM)

fruit can be put, some authorities even maintaining that it is poisonous. *A* glabra, the American buckeye, in particular, is thought to have poisonous seeds and leaves. Most of the species have bitter flavoured seeds and bark, the bark being used for tanning. *A. californica, A. turbinata, A. octandra* are known to hear edible seeds which are used as sweet chestnuts. The wood of the horse chestnut is not particularly useful, but as ornamentals both trees an3 shrubs are very valuable. (P. W. Z.; E. S. HR)

HORSEFLY, the common name of the members of the family Tabanidae of the order Diptera (*q.v.*), but more specifically any member of the genus *Tabanus.* They suck blood and their bite is most painful. Other common names are gadfly, cleg and breezes. (C. H. CN.)

HORSE GENTIAN or FEVERWORT, common names for species of Triosteum, a small genus of weedy perennial herbs of the honeysuckle family, with three species common in the woods of North America and others in southeastern Asia. They are coarse, upright plants, growing to about four feet, having pointed leaves tapering to the base at the stem.

Inconspicuous flowers, borne in the axils of the leaves, are followed by orange-red fruits. They are of some use in wildflower gardens.

HORSE GUARDS, ROYAL: *see* GUARDS AND HOUSEHOLD TROOPS.

HORSEHAIR: see **HAIR.**

HORSE LATITUDES, the regions of light variable winds or calms, and nearly cloudless weather, under the central areas of the oceanic permanent or semipermanent subtropical anticyclones (see ANTICYCLONE). Their average latitude is about 30° N. and 30° S., but they move some degrees north and south with the sun. The origin of the name is obscure; some British meteorologists accept the tradition that it arose from the practice of throwing overboard horses which were being transported to America or the West Indies on sailing ships becalmed in these latitudes. (See WINDS, GENERAL CIRCULATION OF.) (R. G. SE.)

HORSE-MACKEREL or **SCAD,** a genus of fishes (*Trachurus*) found almost everywhere in the temperate and tropical zones of both hemispheres. Some go kinds of this fish and its close allies, the crevallys (*Caranx,* etc.), are known, mostly active, free-swimming fishes of warm seas, the majority being wholesome food; some species have a length of over 3 ft. Together with the American horsehead or ocean old-wife (*Argyreiosus* vomer), the pilot-fish (*q.v.*), and the true mackerel (*q.v.*) and its allies, they belong to the division Scombriformes.

HORSEMANSHIP AND RIDING, the art of managing the horse from his back; controlling his paces and the direction and speed of his movements. In the 16th century Pignatelli at Naples founded his famous academy of horsemanship, and the Italian school was so generally recognized that Henry VIII and other monarchs had Italian masters of the horse. The continental haute e'cole developed from the teachings of these early masters. The duke of Newcastle's Me'thode *nouvelle* de dresser les chevaux (1648) was the standard work of the day, and in 1761 the earl of Pembroke published his *Manual* of Cavalry Horsemanship. The Austrians at the imperial stables at Vienna and later the French at Saumur continued the haute e'cole system up to recent years. It, however, did not find favour in England for some time. In a modified degree it is seen today at shows and at the Olympic games as an example of extreme obedience and control of the horse. Haute *école* produced handiness and dexterity; the somewhat lofty head carriage while executing the haute e'cole manoeuvres should never be cramped; must flex and be free to extend at the wish of the rider without losing perfect balance—which always means control.

Haute *école* is simply a school for the proper understanding of the uses of the aids so that horse and rider better understand each other. When properly applied it puts the horse in such a position that he has little choice but to obey the rider's commands. The necessity of handiness, but not at the expense of speed, was recognized by horsemen in Great Britain. Consequently certain "aids" were adopted from the haute *école* to obtain this desideratum. These "aids" exist in the British Manual of *Cavalry* Training, vol. I. "A horse is said to be balanced when his own weight (and that of his rider) is distributed over each leg in such proportion as to allow him to use his powers with the maximum ease and efficiency at all paces." The head and neck form the governing factors in weight distribution, and it is by their position that the horse carries his weight forward or backward as his paces are extended or collected. Modern horsemanship includes: (a) learning to ride, (b) making an animal handy as a hack or charger or for polo, (c) schooling over fences, (d) show jumping, (e) riding to hounds, (f) racing over fences or on the flat.

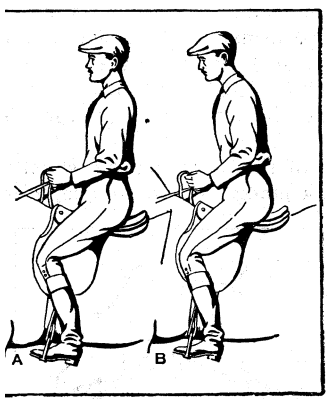

FIG. 2.—(A) CORRECT LEG POSITION, (B) CORRECT LEG POSITION IN ACTION

Riding for Beginners.—From Norman times through the Tudor, Stuart and Georgian reigns up to the early part of last century, riding was considered an essential part of a gentleman's education. The introducti'on of railways and later of motor cars has resulted in the retention of the riding horse merely for pleasure and sport. In spite of this there has been a large increase during recent years in the number of riders. All riding classes in horse shows are largely filled, including those for children, and in the hunting field the numbers have in no way diminished.

When mounting, the rider should take up the reins in his left

hand, at the same time holding a lock of the mane or the horse's neck above the withers with the same hand. Standing by the horse's near (left) shoulder facing the tail, he should hold the stirrup with the right hand for the reception of the left foot. Then place the right hand on the back arch of the saddle, spring off the right toe and drop lightly into the saddle. The rider's seat depends upon balance and contact. It is essential for the beginner to get a good natural seat, comfortable and strong without being stiff. After gaining confidence, first at the walk, then at the trot and canter without depending on the stirrups, the rider should dispense with the latter for short periods and develop both his balance and seat. First of all, sit square to the front with the muscles relaxed, with the flat of the thigh and the knee kept in contact with the horse or saddle flaps, the lower part of the leg parallel to the girth and the toes up. If the stirrups are now adjusted to support the foot in this position they will be at the required length. The body must be supple from the hips, swinging easily backwards and forwards as required or leaning over in the direction that the horse is turning. Ride as far as possible with a long rein; a strong and well balanced seat independent of the reins is essential for good hands. The upper arm should be normally parallel to the body. The reins when held in both hands should be round the third or little finger. In the case of double reins the bit (curb) reins should be outside round the little finger, unless it is intended to ride more on the bridoon, in which case the position is reversed. If the reins are held in one hand they are divided on one side by the little finger and on the other side by the forefinger. By pulling the arms towards the body the reins are shortened. A springy tension is obtained between the rider's hand and the bit, by (1) the fingers; (2) the flexion of the wrist; (3) the movement of the forearm from the elbow.

The beginner will find difficulty in retaining his stirrups, but must avoid the habit of raising the heels He must learn to use the stirrup only as a rest for the foot. If the stirrup is the proper length the heel will be lower than the toe because the stirrup holds the toe up, if the rider does not contract the muscles in the leg by pressing on the stirrup, which should be at a natural angle as when walking. Pressure should be firmer on the inside of the stirrup next to the horse so that the soles of the feet are turned slightly outward. In this position, a light pressure on the stirrup strengthens the contact and the rider will not lose his stirrups.

At the trot. rise with the action of the horse, leaning slightly forward; at the canter, sit upright. keeping the loins supple, with

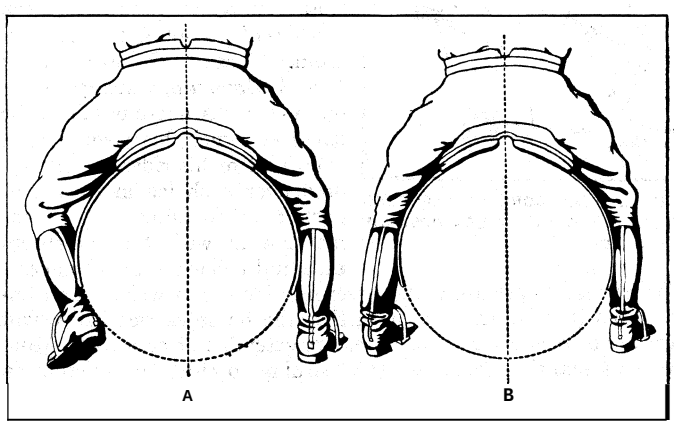

FIG. 3.— USE OF LEGS. A.—GRIPPING WHILE RIDING LEFT LEG. INCORRECT: RIGHT LEG. CORRECT. B.—AT REST: LEFT LEG, INCORRECT: RIGHT LEG. CORRECT

sufficient contact with the knee and thigh, and the leg below the knee vertical; at the gallop, shorten the reins, sit down in the saddle, lean slightly forward and increase the contact with the knees. At all times keep as light a contact with the horse's mouth as is compatible with adequate control.

Handiness.—Handiness is the result of perfect balance in a horse whose movements are readily controlled by the rider. First obtain direct impulsion and free forward movement. To make a horse walk out, close the legs to his flanks and lightly feel the snaffle in his mouth. Occasionally teach him to diverge from the straight line by leaning the rein against his neck on the opposite side to the change of direction. Preferably work on undulating ground. Increased impulsion from leg pressure in conjunction with the voice and possibly the whip. if your horse is slow or dull, will induce the horse to trot. When free forward movement at these paces has been obtained, the horse can gradually be taught to move collectively by a change of balance. The head is raised by means of the snaffle, a pressure of the rider's legs keeping the hind limbs well under the horse to support the weight thus brought back. Later he must be taught to bend from the poll and relax his jaw by a springy feeling of the fingers on the curb bit rein. the head being kept raised by the bridoon. The reins control the horse's forehand and the rider's legs the hindquarters; the combination of both controls the whole mass. The next stage is lateral impulsion, when the horse is taught to move diagonally forward (half passage) to one hand. To move to the half-right, apply a strong pressure of the left leg, pressing the left rein against the horse's neck, the right rein bending and leading him in the required direction, the right leg applied as required to hold the horse up to his bit. He must be keat collected and the head flexed in the direction he is moving. Reverse the aids to move diagonally to the left. To obtain lateral movement to either flank, accentuate the above aids. These lessons should be taught first at a walk, then at a collected trot and later at a canter The next lesson is the canter, which is a collected pace. For example, to canter with the off-fore leading, there are two methods. Firstly, trot collectedly on a large right-handed circle. increase the tension of the reins and the pressure of both legs, the left leg the stronger, at the same time flex the horse's head slightly to the left. He will then canter with the off-fore leading. Later, or if the horse is inclined to disobey this aid, make him half passage to the right at the trot, accentuate the aids to increase impulsion, when he will break into a canter aith the off-fore leading. then move forward on a straight line. Rexerse the aids to canter with the near-fore leading. To change the leading leg at the canter check to a trot, half passage in the required direction as above and break into a canter. By degrees reduce the number of paces at the half passage until the horse changes direct at the canter from one leading leg to the other. He must now be taught to canter on a loose rein, occasionally increasing the pace and stretching his neck and forelegs, again coming back to a collected canter, readily and smoothly adjusting his paces and balance and learning to control his momentum. The canter is the result of urging and restraining equally, so that in order to go the horse must give a little leap, which is the first step in a canter. He can now be taught to rein back one step at a time, being pressed forward at a walk, trot or canter in accordance with

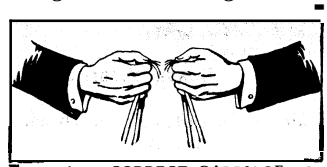

FIG. 4.— CORRECT CARRIAGE OF HANDS AND HANDLING OF REINS

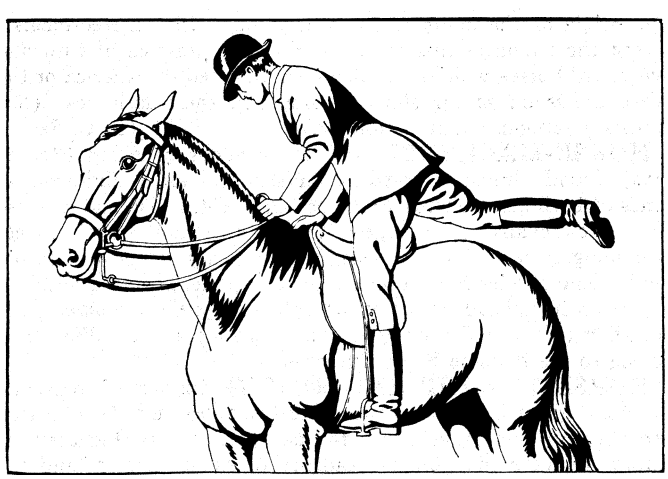

FIG 5.— RIDER MOUNTING CORRECTLY WITH RIGHT LEG FULLY EXTENDED

the aids applied. He must next be taught to turn on the haunches, the only correct way of turning sharply at fast. paces. To turn to the right or rightabout, lead the forehand round with the right rein, holding the horse up to the bit with the legs, lean the left rein against his neck, apply a strong pressure of the left leg to check a tendency of the hindquarters to move to the left, and thus keeping them under control, the horse consequently pivots the forehand round the hindquarters. Gradually accentuate the aids to sharpen the turn, reversing them to turn left-handed. The horse must now be taught to pull up on the haunches, by fceiing the reins, the rider at the same time closing his legs and leaning his body back. This must be practised first at a walk and trot and later at a canter. When the horse has learned to extend himself at the gallop and then come back to a collected canter, the halt from the gallop may be taught and finally the turn on the haunches from the gallop. Progress must be slow but progressive, and if the horse is not performing smoothly it is due to his training being hurried. Riding on a loose rein with short periods of collected work will teach him to relax his jaw to the curb bit. But the above syllabus must be executed first on a snaffle, then in a curb bit, again commencing at the first stage. The entire training may extend from 6 to 18 months according to the temperament, condition and previous training of the horse. Patience and sympathetic handling are essential.

Schooling over Fences.—First lessons may be confined to jumping free in a lane, using a trained horse as a leader, or the youngster may be led in hand over small obstacles. Training must be progressive over small but solid fences and ditches. Later, when mounted, the rider should approach the fence at a collected canter with the reins in both hands. Three lengths from the fence lower the hands, still maintaining contact with the horse's mouth. Unless the horse is a naturally free jumper, close the legs to retain impulsion and to keep the horse's hocks under him. The rider should be sitting upright ready to lean forward as the horse takes off, his own weight being borne on the knees and thighs, the leg below the knee being free to drive on the horse. As the latter raises his forehand, the rider inclines his body forward, his weight being approximately over the horse's centre of gravity. He must be prepared in mid-air to give the horse more rein which the latter will require while jumping. If the rider is leaning back at this period, he will upset the horse's balance and when jumping slowly he is liable to give the horse a chuck in the mouth as he is thrown back himself. This is known

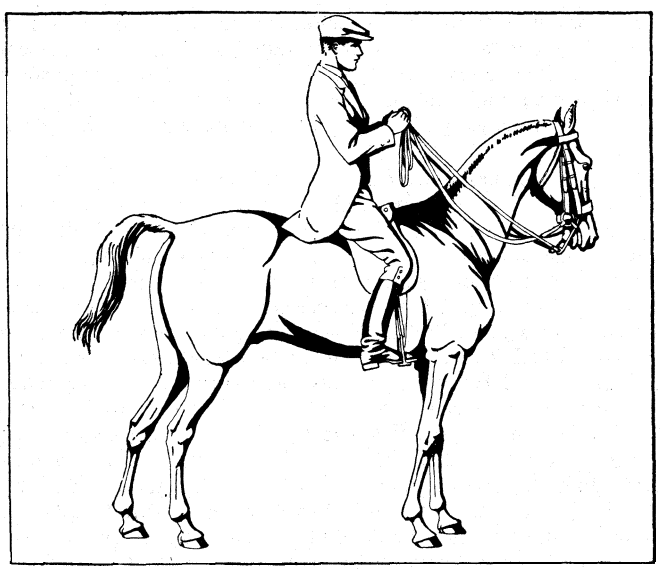

FIG. 6.—RIDER SHOWN COMING TO A CORRECT STOP

as the horse "jumping away" from his rider as opposed to the rider "going with" his horse. Schooling a youngster over simple fences the rider need not attempt to lean back. He can best assist the horse by keeping his weight constant over the latter's centre of gravity (approximately the dees of the stirrup leathers). The lighter the horse's mouth the lighter the contact between hand and mouth. To strengthen the seat and ensure correct balance over fences it is advisable to ride without stirrups. This is recommended to beginners, and on no account must the knee be kept stiff. This, of course, must be done only on a suitable horse.

Horses refuse from: (1) pain of the jar on landing, (2) heavy hands injuring the mouth, (3) too severe a bit. (4) fear of falling and lack of confidence. The cause once diagnosed, the remedy is obvious, rest and attention in the case of injury. Regain the horse's confidence, schooling over small fences if necessary in a snaffle. Concentrate on getting the horse to like jumping. Reward him, humour him, keep him quiet and unflurried. Only resort to punishment in extreme cases, after which it is essential to persevere and defeat a recalcitrant horse. If he runs out left-handed turn him sharply to the right and vice versa. If he takes off too close to his fences make use of a ditch or guard rail nine inches high and two to three feet from the fence. Normally he should take off not nearer than the height of the fence and not more than eight feet from it.

Show Jumping.—Practically the same procedure should be adopted, but the rider should exaggerate the leaning forward, thus minimizing the risk of touching the fence with the hind legs. The horse must lower his head to give free play to his loins when jumping, the more easily to tuck up his hind legs. It further assists him to judge his take-off and adjust his stride. Never steady a horse too late so that he cannot lower his head. The exaggerated forward seat is permissible as normally there is no question of jumping at speed over a drop on to sticky landing, hence there is no risk of the rider being thrown forward of the horse's centre of gravity and both coming to grief. A good horseman on a well balanced handy horse can lengthen or shorten his mount's stride as required to take off correctly. This necessitates a high standard of training and horsemanship. Show jumpers improve with years and experience. Horses like Broncho and Combined Training, who jumped for England and won the King George's cup and the championship at Olympia, were probably at their best when over 20 years old.

Riding to Hounds.—The seat is the same as for schooling over fences. Good horsemanship is essential for riding a young horse in a hunt. Never jump unnecessary fences, as it is unfair on the farmers and tiring to the horse. Hold your horse together over heavy ground, picking out the best going. Hold a gate open for the huntsman, shut it if you are the last to go through. Stand still when hounds check or are being cast, and if your horse has been galloping turn his back to the wind as wind on a horse's chest will almost always founder him. Then he is nine times out of ten worthless. Don't ride on the tail of hounds, but to a flank level with the tail hounds and preferably on the downwind side. Watch the leading hounds and the older ones in the body of the pack, who will generally put their more impetuous juniors right when scent is catchy. With regard to all fences, preferably select a sound take-off. Sail on at a low fence with a ditch beyond. With a ditch and possibly a blind one on the take-off, keep the horse collected up to the last few strides. Over trappy blind places it may even be advisable to jump from a walk or trot. Ride slowly over walls, timber and gates; *i.e.*, pull back to a collected canter unless there is a wide ditch beyond. Over a drop, though the rider leans forward as the horse takes off, his body on landing should not exceed the perpendicular to the horse's back. An experienced rider can feel whether the horse's balance is such that he may possibly pitch on landing, in which case he can lean back, or he may find it expedient to lean forward should he anticipate his horse dropping his hind legs in the ditch. If in mid-air the rider is too far forward or too far back, he cannot adjust his position and balance as described above. If he lands with his body too far forward and the horse overjumps and pecks badly, the rider's weight is thrown forward of the horse's centre of gravity and both will come to grief. The horse must have freedom of his head to stretch his forelegs over a wide place or to save himself if he has blundered on landing. Certainly the rider cannot keep him on his legs by holding him up with the reins. A horse that

stumbles can be held together to prevent this, but when he has actually stumbled badly, freedom of his head admits a reasonable chance of recovery. Banks are encountered in many countries. They may have a ditch on one or both sides and may be crowned with a hedge. Invariably they should be ridden at slowly to prevent the horse attempting to fly them, and at the same time giving him time to change his legs at the top. He requires a free head to alternate his change of balance when negotiating banks. A line of pollards indicates the presence of a brook. If the hounds attempt to jump it, it is safe to assume that the horse can clear it. The rider must be determined or he will fail to inspire his horse for the effort. Pull the horse together about 20 lengths from the brook, preparing him to adjust his stride for the take-off, then send him on with increased pace the last few strides, holding him straight at the obstacle. Impetus must be maintained, and this will ensure clearing a good 15 feet of water. Over dykes and big bottoms it may be necessary to crawl down one side, pop over the bottom and clamber up the far side. Obedience to the-rider's leg is necessary for opening gates. Once unlatched, the horse can be trained to push open the gate, the rider giving the final push with the hook of his" whip. When pulling back a gate with the latch on the left use the whip in the right hand, and vice versa.

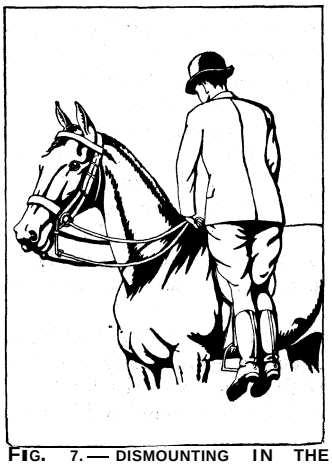

FIG. 7.— DISMOUNTING IN THE USUAL MANNER

Racing **Over** Fences.--Over hurdles the jockey keeps his weight constant over the horse's centre of gravity; viz., he adopts the modern seat of the flat race jockey, the weight being well forward over the pivot of the leading foreleg. This position gives the maximum assistance to the horse. In steeplechasing over park courses, the same principles are adhered to, but to a lesser degree, as the rider must be prepared to lean back if a horse blunders. The impetus of a bold fencer to some extent counterbalances the leaning back of the rider's body, but to enable the horse to get away from his fence with the utmost speed after landing, the rider must be forward in the recognized position for galloping. Over Liverpool, horses often fall from hitting the fences, but even more frequently from over-jumping. Under these circumstances the so-called forward seat increases the chances of grief. Here the first essential is to keep the horse on his legs and the rider in the saddle. This applies especially to a fence like Becher's brook, where the horse descends over the big drop at such an angle that he may pitch forward on landing. It does not follow that a horse will fall over a drop if the rider is not sitting back. Over timber, for instance, the horse can see a drop on the far side and he can adjust his balance accordingly. But in this case he cannot, added to which there is the momentum derived from the speed of his gallop and the fact that he has stood well back from the fence. Much depends upon the horse and his particular style of jumping and the speed at which the fence is taken. Under the following conditions it is advisable to sit back:— (1) when a horse is inclined to over-jump himself especially when going at great speed. (2) When the landing is heavy. (3) When the drop comes as a surprise and the horse is not prepared to adjust his balance accordingly. Coming at his fences a chaser should extend his paces, stand well back and gain ground at each obstacle.

Racing an the Flat.— This is confined to light-weights. Good jockeyship entails early apprenticeship to get the necessary experience. At first a lad should ride on easy horses, attention being paid to the length of his stirrups and reins. The American jockey, Tod Sloan, was the first exponent of the modern racing seat in Great Britain. The advantages are as follows: (1) Wind resistance is reduced to a minimum. (2) The racehorse must advance his centre of gravity with the free extension of his head and neck to get full extension of his fore-limbs. Therefore the rider's weight must be proportionately advanced. (3) The leading foreleg at the gallop exerts the greatest effort, consequently a tired horse keeps changing his legs; the rider's weight being over the pivot of the leading foreleg reduces this effort. (4) At the same time the rider relieves the horse's loins of as much weight as he can to enable it to bring its hind legs as far forward as possible. By adopting this method he obtains the maximum of propulsion.

The lad first learns to sit still and obey orders. He next learns to keep his place on different types of horses, driving a sluggard, soothing and restraining an impetuous youngster, remaining quiet on a free but temperate horse. During this home training he develops a judgment of pace and learns to appreciate the peculiarities of different horses. If he is to become a successful jockey he must have brains be keen, determined and in sympathy with horses. The latter quality is essential for good hands which alone can deal with a wayward animal. With these qualities he will develop confidence, and once endowed with this asset he is well on the road to success: smartly off at the start, with his horse instantly balanced in its gallop, seizing the opportunity of coming through his field, getting on the inside at the turns, keeping still when well placed and holding his horse together to make his final effort with a strong finish when required.

THE UNITED STATES

Riding, once the medium of transportation of men from place to place, became in the 20th century in the United States solely a medium of recreation. As such it increased rapidly, particularly in metropolitan and suburban areas The first essential for riding is adequate facilities—that is, good bridle paths in city parks; riding trails near cities; and in suburban districts, where wealthy men have large estates, arrangements whereby riders from one estate may use trails on neighbouring estates. For such purpose swinging gates or panels are installed to permit easy passage of riders. This adds variety to the route—which is important, for when men and women must ride over the same path every day they sometimes grow tired of the sameness of scenery and terrain.

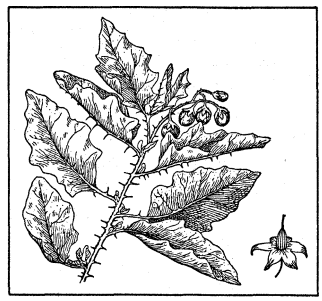
Chicago outranks other cities, except London, in excellency of bridle paths, its paths being broader, better constructed and better maintained than any others. Boston and New York have good paths through the public parks, and Washington's paths are good though somewhat narrow. One of the most beautiful stretches of bridle path anywhere extends through the Wissahickon natural park area In Philadelphia. Automobiles are forbidden in this area, which is an added attraction, for where riders are forced out upon paved highways in close proximity to speeding motor cars there is great danger of accident. St. Louis, San Francisco, Los Angeles and other cities also have built good paths and are steadily improving them. There is likewise amazing development throughout the country in riding trails—which are distinguished from bridle paths through the fact that they are natural trails leading over rights-of-way. Outstanding among these are trails on private estates about Piping Rock, L I., Greenwich, Conn., Aiken, S.C., Oconomowoc, Wis. and public trails in forest preserves of Westchester county, New York, and Union and Essex counties, New Jersey.

The second essential to riding is good mounts, and in these there is wide variety of choice. Some prefer three-gaited saddle horses, some five-gaited, while those who play polo want mounts

of the polo type. Still others, brought up in sections where hunting is popular, select their horses from hunter stock. The important thing is to get a horse that is sure-footed, light-mouthed and that will give the rider a pleasurable and safe ride.

(W. DI.)

HORSE NETTLE (*Solanum* carolinense), a North American plant of the nightshade family (Solanaceae), called also sandbrier, native to dry fields and waste places in the southern and southwestern United States and introduced northward to New England and southern Canada. It is an erect perennial, 1 to 4 ft. high, armed with sharp yellow prickles, and bearing large, more or less deeply-lobed leaves, light blue or white flowers: strongly resembling those of the potato, and orange-yellow berries, about ¾ in. in diameter. In sandy or gravelly soils the horse nettle sometimes becomes a troublesome and very persistent weed, spreading not only by its seeds, but also by its long underground rootstocks. (See SOLANUM.)



FROM MUENSCHER, "WEEDS" (THE MACMILLAN COMPANY)

THE HORSE NETTLE (SOLANUM CAROLINENSE) OR SANDBRIER

HORSENS, town of Denmark, at the head of Horsens fjord, on the east side of Jutland, 32 mi. by rail S.W. of Aarhus. Pop. (1955) 36,567. It is the junction of railways to Bryrup and to Törring inland, and to Juelsminde on the coast. There is also a good harbour. The monastery and church were built in 1270 and there is a museum with a famous collection of Stone Age material.

There is much pleasure boating on the fjord. The principal manufactures are textiles! tobacco, soap, engines, electrical apparatus, dairy produce and condensed milk. Organs are also manufactured.

HORSEPOWER is the common unit of power measurement, the rate at which work is done by an engine, turbine or motor, or absorbed by a driven machine. In the English system one horsepower equals 33,000 ft.-lb. of work per minute. This value was adopted by James Watt after experiments with strong dray horses and is about 50% more than the rate which an average horse can sustain for a working day. The electrical equivalent of 1 h.p. is 746 w., and the heat equivalent is 2,545 B.T.U. (British thermal units) per hour. In the metric system one metric horsepower (*cheval-vapeur* in France) equals 4,500 kg.-m. per minute (32,549 ft.-lb. per minute) or 0.9863 h.p.

Horsepower at the output shaft of an engine, turbine or motor is termed brake horsepower or shaft horsepower depending on whether it is usualiy measured with an absorption dynamometer such as a brake, or by a transmission dynamometer such as a shaft torsion meter (see DYNAMOMETER). Horsepower of reciprocating engines, especially in the larger sizes, is often expressed as indicated horsepower, which is determined from the pressure in the cylinders (see INTERNAL-COMBUSTION ENGINE; STEAM: *Steam Engine*). Brake or shaft horsepower is less than indicated horsepower by the friction horsepower of the engine itself. which may amount to 10% or more of the indicated horsepower. Electric motor horsepower can be determined from the electrical input in watts, allowing for heat and friction losses in the motor itself. Thrust horsepower of aircraft jet engines and rocket motors is equal to the thrust (pounds) times the speed of the aircraft (miles per hour) divided by 375 (which is one horsepower measured in mile-pounds per hour). (See JET PROPULSION; ROCKETS.)

Taxable or nominal horsepower of steam and internal-combustion engines is an arbitrary figure calculated from certain physical dimensions of the engine and bearing no exact relationship to actual power capacity. For motor vehicles in Great Britain and in some of the U.S. states the usual formula for taxable horsepower is $d^2n/2.5$, where d is cylinder bore of the engine (inches) and n is the number of cylinders. Maximum horsepower of modern automobile engines may be three to five times the taxable horsepower.

Rated horsepower or horsepower capacity of any machine is the potential output, and will be actually developed only when both speed and load circumstances permit. For instance, maximum horsepower rating of an automobile engine in a passenger car can be developed only if the speed is high enough (on the order of 75 to 100 m p.h. in driving gear) and the car accelerating or climbing so as to load the engine fully. Gear transmissions and torque converters permit engines to run fast enough to develop their maximum power at lower car speeds. They do not increase the horsepower, but make the power available at lower car speeds, thus increasing the propelling force at the wheels.

Rated horsepower of electric motors usually represents the shaft horsepower which can be sustained continuously without overheating to the point of causing damage to the internal insulation of the motor. Such motors usually are capable of momentary overloads well in excess of rated horsepower. (See MOTOR, ELECTRIC.)

(Co. C.)

HORSE RACING AND BREEDING. This article is divided into seven main sections dealing with the principal aspects of horse racing and breeding. For collateral information see also ANIMAL BREEDING; HORSE; HORSEMANSHIP AND RIDING.

Following are the main divisions of this article:

I. EARLY HISTORY

Contests of speed between horses are among the oldest diversions of man, having arisen, in all probability, soon after the domestication of the horse. The earliest dates for such contests have not even been approximated, but archaeologisis have turned up at ancient Hattusas, about a hundred miles east of Ankara in Asia hlinor, a lengthy treatise on the breeding and training of horses, written about 1500 B.C. (the dating of such texts is still far from exact) by "Kikkuli of the land of Mitanni," an expert apparently in the employ of a Hittite king. The Hittites became a powerful nation through their use of the light, spoke-wheeled war chariot; but their knowledge of horsemanship apparently came to them from older cultures which had already developed the equestrian arts as well as clumsy carts with four wheels of solid wood. The earliest full-length account'of a chariot race appears in book xxiii of the Iliad. Though it is of uncertain date, it attests a long antecedent history of conventions which had attached themselves to the sport. First prize was "a woman skilled in women's work, and a tripod of two-and-twenty measures with handles to it." Post positions were determined by lot, a patrol judge was sent out, and Antilochus received instructions from Nestor before the race and subsequently was disqualified from second place because of having followed them too well.

The first historical record of races for mounted horses is given in connection with the XXXIIIrd Olympiad, about 624 B.c., but the horse had been used for riding more than a thousand years

earlier. The Greeks made less use of horses, and were perhaps less skilled in handling them, than the earlier peoples of Asia or the later Romans. In Rome each of the various racing factions had its own colours and spent enormous sums in anticipation of competitive honours. Successful drivers were as popular and as well known as leading athletes of modern times.

Whether it was entirely fortuitous or largely the result of prehistoric selective breeding, the horses in the Mediterranean areas (whose river deltas became the centres of the first Western civilizations) were the ones best fitted to become ancestors of a breed specialized for speed, the modem thoroughbred. Wherever the Romans went in conquest, they took with them the fleet runners derived from the stock of Arabia, Asia Minor and North Africa; and wherever the Roman civilization persisted, the hippodrome was established. When Caesar invaded Britain in 5j B.C., he was opposed by skilled charioteers, and it was in the British Isles that modern organized racing had its beginning, together with the sovereign breed that came to be known as the thoroughbred.

II. GREAT BRITAIN

The aristocratic status of racing, established centuries earlier, was maintained in England, where it crystallized eventually into the familiar designation of "the sport of kings." The earliest English racing of which a description has been left took place about A.D. 1174, in the reign of Henry II, outside the gates of London at Smithfield, where horse fairs, usually attended by "earls, barons and knights," were held every Friday, the lords coming to inspect and buy "well-bred horses," while "multitudes of citizens" flocked thither to look on. The contenders were ridden by professional jockeys, who urged them forward by their cries and the use of whip and spur. The course was over the open field, cleared for the purpose.

The first mention of a formal event for a money prize, contested by a field of horses, occurred in the reign of Richard I (1189–99) when "at Whitsuntide" a purse of £40 in "ready gold" was run for by divers knights over a 3-mi. course. John, who followed Richard upon the throne (1199–1216), had "running horses" in his stables, this being the first mention of royalty in connection with them. The earliest mention of an established annual race meeting is of that held at Chester; in describing the race (there was only one) for the year 1512 (early in the reign or' Henry VIII), the chronicler stated that this event had been given "time out of mind." It is possible, therefore, to date its origin as previous to the year 1500. It was contested over the Roodee, just outside the city, the site of the later Chester course. This has been the scene of racing for five centuries.

The rise of the turf in England must, however, be dated from the advent of the Stuart dynasty, beginning with James I (1603–25). This monarch had previously patronized the sport in Scotland. Subsequently he sponsored meetings at Croydon and Enfield, in the suburbs of London, and associated himself with the infancy of racing at both Epsom and Newmarket. While Henry VIII had acquired numerous "coursers" from Italy and Spain as early as 1520 and had established studs at Hampton Court, at Malmesbury in Wiltshire, at Tutbury in Staffordshire, at Ripon in Yorkshire and elsewhere, it was not until the accession of James that their importance became notable. For this, the influence of his favourite, George Villiers, duke of Buckingham, was largely responsible, he being passionately addicted to racing and breeding and the importer of numerous oriental animals. As master of the horse (according to tradition the king first encountered him in a stable), he had charge of all the royal horses until his death in 1628, after the accession of Charles I (1625–49). Charles himself had little interest in the turf, but concentrated his breeding stock at Tutbury where, according to the inventory taken after his deposition and death in 1649, there was a stud of 139 horses, with 37 brood mares. They were dispersed in a series of sales, but six of them were taken over by Oliver Cromwell, who was obliged to suppress his sporting instincts in deference to his Roundheads, but privately indulged them.

1. Genealogy of the Thoroughbred.—When Charles II inaugurated the Restoration in 1660, he speedily demonstrated the propensities which won for him the title of "father of the British turf." It was his patronage which raised Newmarket to the position it thereafter occupied, as the headquarters of both racing and breeding in the kingdom. There, on various occasions, he rode and won both match and plate races; *i.e.*, races for money and races for trophies. The statement that he also bred on a large scale and "sent abroad the master of the horse, to procure a number of foreign horses and mares for breeding, and the mares brought over by him (as also many of their produce) have since been called royal mares," nhich first appeared in volume i of the General *Stud Book* in 1791, is incorrect. The English state papers disclose that throughout his reign Charles II formally contracted with various breeders to supply him with a stated number of animals annually, and upon his death but a single brood mare was found among his horses. The so-called royal mares are of historic importance, as they appear at the foundations of practically all the pedigrees in the *Stud Book*, either as "taproots" (earliest known mares in direct female lines) or collaterally. Analysis of these pedigrees has shown that the entire body of English thoroughbred horses, from the earliest times to the present day, descend in their female lineage from fewer than 50 "taproots," while the vast majority of them descend from fewer than 20. The former supposition that these foundation mares were of purely oriental blood is not tenable in the light of recent research. Only a few of them were imported, the remainder being native (English) bred and of mixed native and oriental blood. The majority of the foundation sires were oriental or quasi-oriental, but the antecedents of the majority are unknown. Few were ever certified as to blood or place of origin. By the old authorities they were termed "Arabians," "Turks," "Barbs." etc., in a loose and careless way.

But one thing emerges with certainty: the percentage of authentic Arabians was meagre, while that of Barbs was proportionately large. The Barb, indeed, may be designated as the preponderant influence of the foundation period. This arises from the much greater facility with which both stallions and mares of that strain could be imported, either direct from North Africa or from Spain or Italy. A long-sustained argument, pro and con, has raged between thoroughbred genealogists regarding the precise origin of the Arabian and the Barb. The theory that both descend from a remote ancestry which flourished in prehistoric Asia Minor, and that the Barb is an offshoot of the Arabian, was generally held by mid-20th century.

The most interesting fact. genealogically, regarding the modern thoroughbred is this: Of the vast number distributed over the entire world, all, without exception, can be traced in their male lineage from but three early 18th-century oriental progenitors: the Byerly Turk, the Darley Arabian and the Godolphin Barb or Godolphin Arabian. Furthermore, in turn, the lines of descent from them trace back through but a single descendant of each. Matchem (1748), grandson of the Godolphin; Herod (1758), great-great-grandson of the Byerly; and Eclipse (1764), great-great-grandson of the Darley horse.

The Byerly Turk was the first of these founding fathers to appear. It is known only that he was the charger of the English Captain Byerly at the battle of the Boyne in 1690, that he was supposititously a Turkish stallion brought in from Europe shortly before, and that he afterward became a service horse at Byerly's seat, Goldsborough hall, in Yorkshire. The Darley Arabian, in every way a most exceptional animal, came direct from Aleppo in 1704, certified as an Arabian of the best Mu'niqua (Maneghi) blood; he was sent from Syria by Thomas to his father, Richard Darley, of Aldby Park, Yorkshire, where he was kept throughout his career. The Godolphin Barb or Arabian was brought into England from France about 1730 by Edward Coke. As the "mysterious Frenchman," he has been the subject of much picturesque romance, myth and fable. Coke died in 1733 bequeathing the horse to his friend Roger Williams, who either gave or sold him to the earl of Godolphin, the horse dying his property in 1753 at his stud in Cambridgeshire.

In tracing lineage through the male, the prepotency of the Darley Arabian through Eclipse far outstripped that of the Byerly and Godolphin horses; but collaterally, the Byerly strain through

Herod is present through the greater number of crosses. Other oriental strains may be found, some of them in great frequency, in pedigrees at the developmental stage of the breed; these are not necessarily less important, but are less well kno n than the three ancestors which for many generations have monopolized the male lines.

2. The Classics.—It was the patronage of Charles II which brought Newmarket to the front as the English racing capital. That of Queen Anne (1702–14) gave Ascot its high distinction. Still earlier, Epsom Downs had found favour with James I, as noted, but it was not until late in the 18th century, with the foundation of the Derby (1780) and Oaks (1779), that its fame began. The St. Leger at Doncaster, in Yorkshire, founded in 1776, was the first-established of what are now known as the classics, which are five in number, the other two being the much younger 2,000 Guineas (1809) and 1,000 Guineas (1814), both run at Newmarket. These great stakes (races in which the money prizes are mainly the total of fees paid by owners of the horses) have been contested annually since their foundation, except the St. Leger which had to be abandoned because of war in 1939; all are exclusively for three-year-olds; and the Oaks and 1,000 Guineas are for fillies only. The premier all-ages English fixed event is the Ascot Gold Cup race, established in 1807. For military reasons the Derby, Oaks and St. Leger were transferred to Newmarket during World Wars I and II; the Gold Cup, not run in 1915–16 or in 1940, otherwise was shifted to Newmarket. These races vary in distance from 1 mi. (the Guineas), to $1\frac{1}{2}$ mi. (Derby and Oaks), $1\frac{3}{4}$ mi. (St. Leger) and 29 mi. (Gold Cup). All but the St. Leger are May and June events. it being run in September. Through long and eventful histories, crowded with picturesque and sensational incidents, they became the backbone of the British turf and acquired world-aide celebrity and imitation. The Derby is universally regarded as the greatest horse race of all. The winner of any classic or of the Gold Cup immediately assumes a place apart and an exalted value.

It may be said that the history of the turf, as an authentic chronicle, begins with that of the classics. However, the steady growth of racing and breeding from the time of Charles II had made an annual record of races run the previous year a necessity as early as 1727, when volume i was published of the work still extant as official, the *Racing Calendar*. Its founder, John Cheny, was succeeded by other publishers, most notably James Weatherby in 1772–73, whose descendants continued its issue until 1902 when it was purchased by the Jockey club, though Weatherby's have continued to produce it. James Weatherby is also notable as the originator of the *General Stud Book*, of which he issued a preliminary volume in 1791; not until 1808, after several revisions, did the edition ahich has become standard appear. This, the basic collection of pedigrees of race horses upon which all subsequent compilations of the kind ultimately rest, has been followed by many volumes. It is still compiled and published by Weatherby's. but it is the Jockey club which, in effect, lays down the rules that govern admission. Until 1913, thoroughbreds of other countries, duly registered in their stud books, had been accepted. Then, by the passage of the so-called Jersey act (sponsored by the earl of Jersey, one of the stewards of the Jockey club), it uas declared that only horses whose ancestors, in all removes, were registered in previous volumes would thereafter be admitted. This disqualified a vast number of animals bred outside England and Ireland, including most of the race horses in the United States and stock in other countries derived from North American strains. Since the modern American thoroughbred was descended from numerous ancestors imported before there was a stud book, it was impossible to document connections with a nonexistent registry. Thirty-five years of research, remonstrance, ridicule and logic failed to remove the exclusion clause. But immediately after World War II French owners achieved a spectacular series of victories in England, many of them with horses descended from "American" strains imported before France set up its own exclusion policy in 1913. In 1948 the stud book authority in France removed its ban on American horses, and shortly thereafter the British authority followed suit. The thoroughbred in North America now qualifies as a thoroughbred in any other country.

3. The Jockey Club.—The Jockey club, exercising control over racing and breeding in England, and indirectly in many other countries, was formed about 1750; precise records are lacking. In the beginning it comprised a small group of leading turfmen, mainly noblemen, who banded themselves together for the purpose of promoting the sport. Powerful from the first, it grew more and more so until it became not only a court of last resort but an autocratic one whose decrees are final. During a lengthy period it was the custom to delegate its authority to some ste ard who commanded general deference and who was popularly known as the "dictator of the turf." The first of them, Sir Charles Bunbury (1740–1821), was succeeded upon his death by Lord George Bentinck (1802–48), and he in turn by Adm. John Henry Rous (1795–1877), the last and most famous one, who had no successor. A board of three stewards administers Jockey club policy. The most important function of the Jockey club in regard to racing itself, is its law- and rule-making powers. Originally confined to Newmarket only, its authority later became supreme. Its code took the place of the many and diverse local ones promiscuously in vogue formerly, a centralization of authority sometimes irksome but on the whole beneficent. Thereafter, by acquiring first the *Racing Calendar* and then control of the *Stud Book*, it became arbiter of both the turf and the breeding industry, amenable only to the law of the land in its supervision of them. Its immense prestige is attested by world-wide imitation.

4. Matches and Handicaps.—The mechanism of organized racing as it now exists began to evolve in the 16th century. While, as has been seen, contests by fields of horses for money and other prizes are very ancient, when the sport began to assume definite status it tended most often to be a matter of matches, usually between two, but often three or more, owners. The early racing calendars were indeed officially known as "Match books, ana swarm with summaries of these events, often for large amounts, with tremendous sums wagered in side bets. The condition "owners to ride" was common, though professional jockeys were an institution dating far back into Roman days. Feeling ran high, and rough and foul riding were frequent until the strong hand of the Jockey club curbed it by drastic legislation. "Man-to-man" betting was the rule for centuries, either by direct personal wager or by means of go-betweens, and it is impossible to date the advent of the professional better who evolved into the bookmaker, along with "the ring," the milieu in which he operated. As in all things else, Newmarket was betting headquarters, under the aegis of the Jockey club at its famous rooms. In 1752 that body took a long lease of what were then known as the "coffee rooms," later acquired title to the property, converted it into a sort of combination clubhouse and gaming place and still occupies the premises, which have several times been rebuilt.

Meanwhile, off-course betting grew gigantic, with professional layers of odds established in London and elsewhere, patronized alike by the leviathans of the ring and the general public. "Betting on the races" developed into one of Britain's great national preoccupations, permanently to remain so. This situation naturally attracted the attention of the lawmakers and the censors of morals, and finally in 1926 was changed into a revenue-producing medium by the imposition of a tax of 2% on all wagers made at, and $3\frac{1}{2}$% on those made off, the course. This proving unsatisfactory, in 1928 a new Betting act was passed which legalized the use of the totalizator (pari-mutuel), a machine of French origination familiarly known as the tote (see *Totalizator*, below). The bookmaker was not, however, abolished and still handles a major portion of the betting. The tax (or take) deducted from the daily turnover of the tote varies from 10% to 15%, a meagre portion of which is allocated to a maintenance fund and grants of various kinds for the promotion of racing and breeding.

As the 18th century progressed, matchmaking steadily declined and racing programs were devoted chiefly to stakes, plates and the like for fields of horses ridden by professional jockeys, though the "gentleman jock" continued prominent well into the 19th century. These events usually closed their entries months, sometimes a year

or more, in advance of decision, and were eventually to include what are termed produce stakes. to which mares with foal are nominated, their produce racing as two-year-olds. The rise of races for two-year-olds — which were for long unknown, while events for three-year-olds were vastly in the minority, most performers being four-year-olds or older — dates from about 1779, when the first calendared event of that kind occurred. but it required several decades for them to become staple. The oldest fixture for that age still in existence, the Woodcote Plate (or Stakes), was founded in 1807, the Champagne in 1823 and the Criterion in 1829; but the Middle Park, familiarly "the two-year-old Derby,!' was first run only in 1866.

The original absence of all two- and most three-year-olds from the course inhered in the severity of the contests. Four-mile heats were the standard with weights seldom less than 10 stone (140 lb.) and frequently as high as 12 stone (168 lb.)—Eclipse carried 12 stone repeatedly — while in many match races, owners to ride, they were higher still, in some cases more than zoo lb. Immature animals could not meet such tests, and change inevitably took its course, introducing shorter distances and lighter weights, together with the elimination of heats and substitution of dashes exclusively. For a long time. weights were assigned according to the heights of the horses, a system that was bound to be abused and unsatisfactory and that gave way to systematic apportionments based upon three different factors: age, distance and season of the year.

The Jockey club provides a basic set of weight allowances whose theoretical purpose is to equalize the opportunities of horses of different ages. In practice it is used more as a point of departure, in races with penalties and allowances based on previous performances, than as a rigid standard.

To further complicate the already complex weight problem, the handicap injected into it still another ambiguous element. This concerns a type of race which came into vogue with the founding in 1539 of the two most famous ones, the Cambridgeshire and the Cesarewitch. Open to horses of all ages and sexes (including geldings. nhich are barred from the classics), but with occasional races for two- or three-year-olds exclusively, a handicap field is assigned weights upon the hypothesis of "bringing together" the best and the worst horses that start, and giving each an equal chance to win. The uncertainties of handicaps have proved so great that the principal ones are among the biggest betting races of the season.

The difficulty of winning a great handicap in England became so formidable that it became the established custom never to expose classic winners to the ordeal, though they are proclaimed to possess a class far loftier than any handicap horse may aspire to. This "confession and avoidance" is in contrast with former practice. when classic winners proved themselves in handicaps as well as against each other, thereby establishing an incontestable certificate of merit. It is a significant fact that the three dominant male lines in England (and also in most other parts of the world), namely, those of Bend Or, Isonomy and Hampton, were founded by horses that ran and won great handicaps, while, of the trio, Bend Or alone was a classic winner.

For some years after handicaps were first introduced, the weights were assigned by the various club managements. Later on there came a demand for centralization because of the widely different and often very eccentric assignments by the many local officials that apportioned them. It was felt that this should be remedied and that something more thoroughly rationalized should take its place. The difficulty lay in finding a man whose judgment of "public form" was so widely accepted that there would be general confidence in his work; his position and character should place him above suspicion.

Admiral Rous, last of the three "dictators of the turf" previously referred to, was chosen. His administration of his duties, which, roughly speaking, covered the last 25 years of his life (which closed in 1877), marked a new era in racing. While the imposts he meted out often aroused severe criticism. his work on the whole was such as to vindicate the trust reposed in him. Eventually, as the Jocliey club became more and more absolute in the control of the sport, the post of official handicapper was formally created and is now occupied by a man of its selection. The system has proved satisfactory. but has never been adopted in the U.S.

5. Race Courses. — Racing in England is exclusively over turf, the courses varying widely in shape and gradients. Ascot is roughly triangular. Doncaster kite-shaped, Epsom a tremendous U. Newmarket's great main course is shaped something like a boomerang, about $2\frac{1}{4}$ mi. in length, the last half quite straight. In the majority of the longer races the start is effected so far from the finish, where the grandstands are located, as to be out of sight of them; in many instances little can be seen of the contest until it is nearly over. A marked exception is the ancient Chester course, which is an oval of almost precisely one mile, lying on level ground, the horses being in plain view at all times.

The great differences in the various courses, differences in themselves as well as between each other, make it extremely difficult to establish any parity of judgment between performances over them. They have ascents and descents, waves and dips, sharp corners and difficult turns, and inequalities of turf and the earth beneath it, all impossible to co-ordinate; this has given rise to the saying "horses for courses," individual animals showing distinct preferences for certain ones and dislikes for others, the skill of jockeys being similarly affected. Because of these things, the time test was discredited by English turfmen until the 1940s, when Phil Bull, using sound statistical procedure, began to appraise the speed of individual runners in relation to fixed standards which made allowance for permanent and temporary differences in courses.

Race courses in England may otherwise be subdivided into two classes, namely, enclosed and unenclosed. Up to about 1873 all fell in the latter category. The general public were at liberty to make themselves at home anywhere about the course except in the small enclosure surrounding the stands at the finish line, to which admission was free for club members and their guests, a fee being charged to all others.

This practice continued at the old established meetings, but more recent parks are, almost without exception, fenced or walled throughout their entire extent, with a gate fee invariably charged. There was at first a loud outcry against enclosed courses, but they are now popular and, on "big" days, are crowded to capacity, having increased rather than diminished the hold of racing on the public. This hold is immense. Naturally no enclosed course can house the vast throngs that attend such meetings as Epsom, Newmarket, Doncaster, Liverpool, etc., which are genuine "outpourings of the masses." Derby day at Epsom, as a national holiday, has long been the theme of the artist, the minstrel and the novelist. It is estimated that as many as 250,000 people often assemble there to witness the decision of that event — the fact that many of them never catch sight of the horses in no way dampens their enjoyment. Grand National day at Liverpool is only second in its drawing power.

Proprietorship of courses varies. Newmarket is owned and administered by the Jockey club. Ascot is a crown demesne, and the Goodwood meetings are sponsored by the duke of Richmond. At Doncaster and other places the town corporation controls. There are clubs and holding companies which own the courses they operate or have long-term leases of the grounds. The Jockey club is, in the last analysis, always the ruling power. No regular meeting can be held unless licensed by it, on dates which it specifies. The powers with which it is clothed are such that it prohibits associations with enclosed courses from declaring dividends of more than 10%, prescribes the patterns of courses that must be constructed, etc.

6. The Rise of Commercialism. — By mid-20th century, horse racing itself offered little resemblance to that which launched the turf upon the tide of prosperity. Despite its aristocratic ensemble, with the royal family foremost in its support, it had become commercialized in many respects; and the epigram coined at the turn of the century. that "In England racing is a sport, in France it is an entertainment and in America it is a business," lost much of its pertinence insofar as England mas concerned. Commercialism retrenched distance racing to the danger point, substituting "quick action for your money." It placed precocious speed and two-year-old success at a premium, consequently inflated yearling

values, and made the market breeder, as distinguished from the sporting breeder, the producer of a large percentage of the animals that perform. The animals themselves were modified to meet conditions very different from those that formerly existed. The modern race horse may be said to have been remolded to fit the system into which he is dovetailed rather than, as was the case with his ancestors, having that system shaped to fit his own highest capacities. While speed is always the hallmark of the thoroughbred, his gameness, soundness and campaigning ability were, until the end of the 19th century, among the attributes for which he was most highly valued. In the 20th century this no longer ruled. He became much of a hothouse product and could with justice often be compared to the beautiful but short-lived triumphs of the florist, which fade untimely under stress of the stimulation that forced them to such premature efflorescence.

The decline of the British horse was attested by the unprecedented success of raiding French stables in the years following the close of World War II; the French turf, which breeds about one-half as many foals as are produced in England and Ireland, accounted for winners of the Derby, Oaks, St. Leger and Ascot Gold Cup. Most of the important weight-for-age races at the longer distances went to invaders from Europe. In 1956, for example, the richest of them, the 1½-mi. King George VI and Queen Elizabeth stakes. fell to an Italian champion, Ribot. unbeaten in a career of 16 races and generally acknowledged the best horse in Europe (see also Continental Europe, below). English breeders were aware of the declining stamina of their horses and of the reasons for it. but they could find no remedy. Caught between the millstones of high taxes and low purses, the more important private studs were dispersed or decimated; and the principal goal of breeders became sales to the "dollar areas," where demand for speed and precocity had weakened the native product to a still greater extent. It was because of economic pressure that exportation of top-class horses became the rule, rather than the exception, as it had been.

Before World War II prices at private treaty ranged as high as £60,000 (about $298,000), the sum paid in 1938 by M. H. Benson of London for the unbeaten Italian horse Nearco (1935), whose ancestry combined English, French, American and Italian strains. In 1942 Nearco was syndicated at a valuation of £62,000. In 1953 the Aga Khan sold Tulyar, unbeaten as a three-year-old the previous season, to the Irish National stud for £250,000 ($700,000), the highest price in thoroughbred history until the American colt Nashua was sold for $1,251,200 late in 1955. Tulyar changed hands again in 1955, going to an American syndicate for £240,000 ($672,000). In sales by auction the record price of 47,000 guineas (about $240,000) mas paid by an English syndicate in 1932 for the ten-year-old stallion Solario.

The highest price for a yearling was the 28,000 guineas (about $141,000) paid in 1945 by the Gaekwar of Baroda for Sayajirao, which two years later won the St. Leger. Several records were established when the late John A. Dewar's stock was offered at the Newmarket December sales in 1954. The 1,000 Guineas winner Festoon brought 36,000 guineas ($105,840), the highest price that had been paid for a filly just out of training; Festoon's half-sister Refreshed made 30,000 guineas ($87,200), surpassing the previous record of 18,000 guineas ($52,920) for a brood mare; Festoon's weanling full brother made 19,000 guineas ($55,860), the record for a foal; and a yearling filly by Chanteur II—Minaret—reached 17,500 guineas ($51,450). These exceptional prices are far removed from the economic norms of thoroughbred breeding, which by and large is an extremely hazardous enterprise.

Great Britain and the Republic of Ireland, though politically separate, still use the same stud book. About 40% of the brood mares registered for the two countries are in Ireland, the shift of breeding anay from England constituting another example of the result of economic pressure. Anglo-Irish breeding, bolstered by importation of staying stock from the continent. remained the principal source from which other countries made replenishment, but competition was rising.

Queen Elizabeth II, continuing a long tradition of the royal family, had a strong personal interest in racing, and her own stable was at the head of the list of winning owners in 1954. Among the first honours bestowed after her coronation was a knighthood for Gordon Richards, the first professional jockey to be accorded such a distinction. A few days after he had received the accolade, Sir Gordon rode his first Derby winner, Sir Victor Sassoon's Pinza, with the Queen's colt Aureole in second place. When Sir Gordon retired from the saddle he had ridden a total of 4,870 winners, a record surpassed in 1956 by the English-born G.S. rider Johnny Longden. Eddie Arcaro (U.S.) in 1958 became the third man in the world to attain 4,000 or more victories.

III. NORTH AMERICA

In 1664 when the English invaded New Amsterdam and renamed it New York, the commander of the English forces was Col. Richard Nicolls, who was to establish organized racing in the colonies. The next spring he laid out a a-mi. course on what then was called Salisbury Plain, Long Island, and announced that he would offer a silver cup each spring and fall, to be contested for over the course, which he called Newmarket. Racing persisted there for more than a century, during which time the racer was attaining the status of a breed. The first "bred" horse in the colonies was a son of the Darley Arabian called Bulle Rock, imported to Virginia in 1730; and in the next 45 years the planters of New York, Maryland, Virginia, the Carolinas and other colonies imported from England 113 stallions and 73 mares which became the foundation of U.S. thoroughbred breeding.

The American Revolution damaged, but did not destroy, the foundation, upon which soon rose an imposing edifice. Among the more than 100 stallions imported between 1783 and 1800 were four winners of the Epsom Derby, including the first one, Diomed, whose influence was a dominant force for many years. Except for the setbacks occasioned by the War of 1812 and the Civil War, racing and breeding continued to expand until the late 1890s, the beginning of a period of repression. Though New York was to remain the principal and most enlightened centre of racing, the breeding of race horses was centred early in Virginia and finally in Kentucky, whose inner bluegrass area for years has been more densely populated with light horse breeding stock—mainly thoroughbred and standardbred (see HORSE: *Classification*)—than any other region in the world. After the middle 1930s, however, Kentucky accounted for only about one-fourth of North American breeding; there were important studs in numerous other states. Swaps, winner of the 1955 Kentucky Derby, was bred in California, and Needles, the winner in 1956, in Florida; Tomy Lee, winner in 1959, was bred in England; other winners have come from Tennessee, Texas, Montana, Missouri, Ohio, New Jersey, Virginia and Kansas.

1. U.S. Racing Policy.—Before the Civil War the hallmark of excellence for an American thoroughbred was the ability to outdo the best competition in races of 4-mi. heats. (On one occasion, Oct. 13, 1832, at the Union course on Long Island, a field of America's best race mares ran a total of 20 mi. in one afternoon before the winner was determined.) It was during the Reconstruction period after the Civil War that American racing made its nearest approach to the English model, establishing the 14-mi. classic as the highest test of merit and setting up other fixtures, many of them still renewed annually. at distances between 1 mi. and 2 mi. The trend of the 20th century, steadily reinforced by considerations of a commercial nature and by competitive expediency on the part of the growing number of race tracks, was toward races which made no pretense of testing stamina. The most common distance for American races was three-quarters of a mile, and contests of 1¼ mi. or more became infrequent, even for horses of the highest class.

A corollary development which sets American racing apart from that of other countries is an inordinate emphasis on precocity. Two-year-olds begin running two- and three-furlong dashes in January, and the best of those which survive the excessive strain on immature bodies may compete in October for "the richest race in the world," the 1 1/16-mi. Garden State stakes at Garden State park in New Jersey. The winner of this race, which was inaugurated in 1953, earns more than $150,000. American racing tests

its cheaper horses, which constitute the great majority of runners, almost exclusively in claiming races (where each starter is eligible to be claimed from its owner at a given price). The best older horses are raced almost exclusively in handicaps, many of which have added-money values of $50,000 to $100,000. Contrary to the European custom of assigning such high weights to top-class horses that chances of victory are more or less equalized, the American handicapper, except in New York, seldom gives a champion more than 130 lb. to carry. Partly as a result of the arbitrary policy of limiting the range of weights, many moderately good horses have earned more than $100,000, and a number of the best have had total earnings ranging from $400,000 to more than a million. U.S. racing policies result in genetic debility which is remedied only by constant importations from countries with more respect for stamina.

The whole problem ties into that of the modern system of end-to-end (full-speed) race riding, just as in England. In order to facilitate this, the machine age has been invoked; and whereas in England the old-fashioned starting barrier is still used, in the United States it has been replaced by the starting gate, a mechanical device mounted on wheels and movable to any base. Into this the starters are locked, each in a separate stall, the front doors being electrically released by the starter when ready. The entire field then plunges headlong from the gate, reaching top speed in a few strides; they also get off on even terms. The starting gate is very old in principle, going back to the Roman Coliseum and Hippodrome, where its use seems to have originated. It expedites the starts, but many horses are injured in their effort to leap at once into full speed.

U.S. racing shows other wide departures from English racing in the plan and conduct of the meetings, and most especially in their length. The average English meeting lasts but three or four days, even in the case of the most important ones at Epsom, Ascot and Newmarket; in the U.S. they endure in numerous instances for 50, 60 and up to nearly 100 consecutive days, Sundays excepted. There is no centralized governing body like the English Jockey club; racing is controlled as a separate entity in each of the states where it is conducted under laws giving legal status to pari-mutuel betting.

Off-course betting is illegal in the United States, and the considerable amount of such illegal gambling has been a law enforcement problem of considerable difficulty. The controlling body, responsible to the state, is an appointed racing commission—usually consisting of three to five men—which operates independently of other commissions but recognizes and aids in the enforcement of their disciplinary actions. For purposes of parley and exchange of information the groups are organized as the National Association of State Racing Commissioners, with headquarters in Lexington, Ky. The existence of commissions as a means of control is largely a consequence of the pari mutuel, a system of betting originated in France. The money wagered goes into three pools, straight (winner), place (first or second) and show (first, second or third), and is distributed after the race among the holders of the winning tickets. There is also, at most tracks, a "daily double" in which the pool is divided among those who have placed their wagers on the winners of two designated successive races. Before the pools are distributed to the winning players they are reduced by a take-off which ranges up to 15% and slightly higher in some states. A part of this take is retained by the track for the payment of purses and other expenses and for the promotion of the breed; and the remainder, a fixed percentage of the gross total wagered, is paid to the state as a tax. The total of such taxes in the states where racing is organized under the supervision of racing commissions has reached annual figures in excess of $150,000,000, more than twice the amount paid out in stakes and purses. In terms of monetary gain the state governments received the principal benefit from the sport.

Racing is also conducted, on a smaller scale, in eastern and western Canada and in Mexico and Cuba, and for practical purposes the annual statistics usually include these in North American, rather than national, totals. The oldest fixed event run annually in North America is the Queen's Plate at Toronto, Ont., originally endowed in 1836 by King William IV and ever since by the British sovereigns.

All American tracks are prepared dirt ovals, usually of 1 mi., the largest being that at Belmont park, of 1½ mi.; they are scientifically constructed and almost precisely dead level. Most of them have chutes from which starts are made. There is only one straight course, the Widener at Belmont park, which is slightly more than six furlongs. Because of this quasi-uniformity, time is considered most important and enters into betting and handicapping calculations. California tracks are elevated in relation to the viewing area; this is thought to aid drainage and thus permit faster times.

As to the handicapping, this is usually done by the secretary of each club, an exception being that the Jockey club's official handicapper assigns all weights for the New York tracks. The weight scale of the Jockey club, formed in 1873 in New York state on the pattern of the English Jockey club, is basic throughout the country, but not mandatory. The scale was revised in 1953.

Betting on horse races increased after World War II, providing the tracks with such revenues that purses became larger than ever before. By the 1950s, more than 20 races with $100,000 purses were run annually in the United States, and minimum purses at some tracks rose almost to the levels at which important stakes races were being run before 1940. Total North American racing attendance rose to more than 30,000,000 annually, of which all but about 3,000,000 was accounted for in the U.S.; total wagering, to more than $2,000,000,000, of which about $35,000,000 was outside the U.S. (Most of the more than $2,000,000,000 total was comprised of the same money played and replayed numerous times.) Such totals were far higher than those of the years prior to World War II, but the increase was largely due to increase in number of tracks in operation and number of races offered annually; in the 1950s racing was not keeping pace with population growth or per capita income.

The Thoroughbred Racing Associations of the United States, Inc., or T.R.A., is perhaps the most important of a considerable number of organizations concerned with the maintenance and improvement of high standards, ethical and otherwise, in racing. Its membership consists of leading tracks whose pooled contributions support the Thoroughbred Racing Protective bureau, an investigative body which constitutes in racing an analogue of the Federal Bureau of Investigation in the affairs of the federal government and is in fact staffed by experienced investigators trained in FBI methods. This effective self-policing tended to minimize infractions of rules and to raise public confidence in the sport.

Racing is the most nearly universal of the great spectator sports. The most important racing countries place strong emphasis upon, and provide high values for, their leading international races, such as the Prix de l'Arc de Triomphe in France, the King George VI and Queen Elizabeth stakes in England, the Grande Premios Brasil and São Paulo in Brazil and others of like nature, usually testing mature horses over a distance of 1½ mi. or more. Because of its great distance from other major racing countries, and also because of its grassless tracks, the United States found it difficult to offer such international races. The situation was changed by the development of air transport and the construction of numerous turf courses inside the standard dirt tracks. Laurel Race course at Laurel, Md., inaugurated an international whose first running. in 1952, was won by an English runner, Wilwyn, and the second by a French horse, Worden. Santa Anita park, Arcadia, Calif., constructed an unusual turf course which begins outside the main track, covering sloping terrain like that of European courses, and finishes inside the dirt track.

2. Genealogy.—Racing is essentially international insofar as breeding is concerned. The modern American thoroughbred became thoroughly internationalized in blood. There are three long-established male lines, peculiar to America alone and popularly known as the Domino, Fair Play and Ben Brush families, but the breeding fabric represents a particoloured pattern, with these strains and the most fashionable English, French, South American, Australian and other foreign ones complexly interwoven. Kentucky retains its supremacy as the great breeding ground, with

Virginia, Maryland, New Jersey and California also prominent. Annual production of foals is almost 10,000, or about double that of England and Ireland. The American *Stud* Book is published by the Jockey club, and all thoroughbred foals must be registered. No horse not so registered can start at any recognized meeting.

The inheritance of racing class has fascinated students of the thoroughbred horse for generations, but the emphasis has been on genealogy rather than on genetics, with the result that race-horse breeding has a somewhat less scientific background than the breeding of other livestock. Because certain families (female lines) were more numerous and hence tended to produce more horses of exceptional class, various qualities were ascribed to different families — as, for instance, the postulate made by the Australian Bruce Lowe in the 1890s that families no. 3, 5, 8, 11 and 14 were the ones responsible for successful sires. The frequent recurrence in the pedigrees of noted runners of such names as St Simon, Isonomy, Hermit, Hampton and Bend Or led Lieut Col. J. Vuillier in France to construct a "theory of dosages" based upon a supposed optimum in the proportions in which these strains should be combined — a system which had some acceptance in continental Europe and in South America. Many breeders place their hopes upon the repetition or approximation of a "nick," or combination of bloodlines which already has produced one or more good horses. Such practice gradually gave way in the face of a growing comprehension of the elementary principles of genetics. Only one thoroughly scientific attempt to estimate the complicated probabilities in race-horse breeding was made in the first half of the 20th century — at the Eugenics Records offices of the Carnegie institution at Cold Spring Harbor, Long Island, N.Y., in the 1920s under the direction of Dr. H. H. Laughlin. Most breeders remained unaware of the conclusions reached and would find it difficult to apply them if they were understood. The American Thoroughbred Breeders association at its offices in Lexington, Ky., where the breeding industry centres, established a small research program to determine some of the more important probabilities involved, using simple standards of measurement. Previous studies. excepting the work at Cold Spring Harbor, had yielded erroneous conclusions, partly because they were based on examination of the ancestry of the best horses only, without recourse to the fundamental statistical procedure of using control groups, and partly because there was available no constant arithmetic measure for appraising individual runners and groups of runners in different generations and in different countries. Laughlin's arithmetic measure was a "yardstick" based on speed, with corrections for weight carried and variations in tracks. The "biological handicap," or genetic prediction index, he used was obtained by compounding the measurements of the individual runner, his parents and his sibs and half-sibs. Laughlin's complex prediction index was never put to practical use, except for a brief and inconclusive trial in the early 1930s at the Mereworth farm of Walter J. Salmon, who had financed the investigation.

3. The Progeny Index. — The index developed in the offices of the American Thoroughbred Breeders association was simpler, less expensive and more effective in predicting genetic probability. It was based on the assumption that relative earning power provided an approximate measure of a horse's class, constitution and soundness, the principal factors to be accounted for in quantitative measurement of the inheritance of racing ability. The basis for all calculations was the average monetary distribution per runner in a given year; and the performance of any runner in that year was expressed as a ratio to this "average expectancy." In 1933 the North American average per starter was $928 (9,176 runners, $8,516,325 total monetary distribution) and in 1955 the average was $2,941 (26,056 runners, $76,643.696). Thus a horse which earned $928 in 1933 had an index of 1.00 for that year, and a horse which earned $928 in 1955 had an index of .32. The yearly indexes, representing division of actual earnings by a corrective constant, are additive without the distortion entailed by summing the inconstant monetary units. The annual differences in opportunity are largest, of course, in countries with the most pronounced inflation; in France the average distribution per runner in 1925 was 9,773 francs, and 30 years later in 1955 it was 371,188 francs.

Studies making use of the average-earnings index have demonstrated that the earning power of the parent is directly proportional to the probable earning power of the offspring, within the limits circumscribed by chance assortment of genes and by environmental factors. (John Pirri. Jr., and Dr. Dewey G. Steele, professor of genetics at the University of Kentucky, using earnings as a measurement of relative success, were able to make a tentative estimate that heredity accounts for about 50% of the differences in racing class in the thoroughbred.) The most successful sires, with only occasional exceptions, are animals which, as race horses, ranked in the top 1% of their male contemporaries. The highest known full-lifetime progeny index for a thoroughbred sire is 4.75, indicating earning power at a rate 4.75 times the average expectancy; this index was computed for the unbeaten St. Simon, whose offspring raced in Great Britain from 1889 to 1912. Blandford, foaled in 1919, had a lifetime progeny index of 4.29 in Great Britain and Ireland. The sons and daughters of Bull Lea, outstanding American sire of the century, had a group index of 5.01 at the end of 1955; this stallion's 816 year-starters had earned a total of $10,758,394, an average of $13,184 per runner per year. The offspring of Nasrullah, a highly temperamental horse imported to Kentucky in 1950, had a joint British-Irish-American index of 5.05 at the end of 1956. In general, a sire with a progeny index of 1.80 or higher is recognized as successful, and in North America about 7.5% of stallions reach this level, though only about 1% maintain indexes of more than 3.00.

As with stallions, the probable genetic merit of females is best estimated by reference to their racing ability. Of course, a much larger proportion of females have relatively high chances of becoming good producers. About 5.7% of brood mares have racing indexes of 2.00 and upward; the top 10% begins at 1.20, the top 20% at 0.65. More than one-fourth of the thoroughbred brood mare population in North America is comprised of females never tested in competition on the race course.

It is common practice in all racing countries for breeders to select prospective brood mares largely, if not primarily, on the basis of ancestry; particularly they prefer the daughters of a sire already distinguished as a sire of brood mares or the daughters of mares already distinguished by their own racing or that of their offspring. This method frequently yields satisfactory results, but selection based on ancestry compares unfavourably with selection based on individual racing capacity. The highest known index for a group chosen on the basis of ancestry is that of 2.40 (at the end of 1954) for the progeny of daughters of the excellent stallion Blue Larkspur. This figure would be lowered considerably if the best race mares among Blue Larkspur's daughters were subtracted from the totals. On the other hand, the progeny index for the best American race mares as a group was 3.66; for winners of the English 1,000 Guineas (one mile), 3.61; for winners of the English Oaks ($1\frac{1}{2}$ mi.), 3.81. A study completed in 1952, based on actual results in North America, showed that high-class race mares produced 3 times as many horses with over-all racing indexes of 2.00 or higher as equal numbers of mares representing the average of the breed; 6 times as many with indexes of 4.00 and upward; 12 times as many with indexes of 10.00 and up; and 24 times as many top-class runners, as indicated by indexes above 20.00.

4. Breeding Race Horses. — Few games of chance are as hazardous and expensive as that of breeding race horses. An average-of-the-breed study completed in 1956 and based on North American results showed the following expectancies from 1,000 mares covered in 1945: 520 registered foals of 1946, 387 starters, 270 winners, 45 runners with racing indexes of 2.00 and upwards, 15 at 4.00 and upwards. Since a horse must earn about twice the average to pay his expenses in training, and about four times the average to account for production costs plus expenses in training, it is clear that the gold in the hills of race horse breeding is rather low-grade ore, except for the few studs whose refining methods have led them, by accident or design, to choose the best breeding stock. The rewards of breeding and owning race horses are primarily the intangible satisfactions of a sport. But such is the fascination of pursuing these satisfactions that prices of racing and breeding stock

have reached figures which have only the most tenuous connection with fiscal probabilities.

In 1955 executors of the estate of William Woodward, Jr., dispersed the 62 horses of his Belair stud and stable for $2,476,600 in an auction by sealed bids. One of the horses in the racing stable was the three-year-old Nashua, who had won 16 of his 20 races and earned a total of $945,415. There were five bids of more than a million dollars. Nashua went to a syndicate that had offered $1,251,200, and that later reported that it had been offered a still higher price for the colt. When he was retired to the stud at the end of the 1956 season, Nashua had earned a total of $1,288,565, surpassing Citation's record of $1,085,760. Round Table in 1958 became the third winner of more than $1,000,000, topping Nashua with $1,336,364. Nashua was an exceptional runner, and exceptionally sound, though not necessarily superior to champions that had earned smaller amounts in periods of less extravagant purses, or even to his contemporary the California-bred Swaps, who defeated him in the Kentucky Derby and lost to him in a special race later, and whose total winnings were $848,900. The famous Man o'War, who ran in 1919–20, had earned only $249,465 in winning 20 of his 21 races.

The other Belair horses brought large profits, totaling $610,000, when they were resold by auction early in 1956. One of these was Nashua's dam, Segula, who went to the Greek shipping magnate Stavros Niarchos for $126,000, the highest price ever paid for a brood mare in the U.S. (The top-class fillies Busher and Honeymoon were still in training when they brought $135,000 each at the Louis B. Mayer dispersal in 1947.) The Woodward estate's five shares in the syndicated stallion Nasrullah, sire of Nashua and other good horses, were sold for $251,000, a figure which indicated an approximate total valuation of $1,700,000 for the 16-year-old stallion. In the yearling auctions at Keeneland race course, Lexington, Ky., colts by Nasrullah brought $80,000, $86,000 and $80,000 in three successive years, 1954, 1955 and 1956. The $86,000 record was broken in 1956 at Saratoga Springs, N.Y., headquarters for the principal yearling sales in the east, when Rise 'n Shine, an English-bred son of Hyperion, was sold for $87,000. The highest priced yearling filly, sold at Keeneland, Ky., in 1956 for $63,000, was Idun, who went unbeaten in 1957, earning $220,955, the largest sum ever accumulated by a two-year-old filly.

IV. OTHER COUNTRIES

1. Continental Europe.—While Great Britain and Ireland are still the principal exporters of bloodstock, the studs of these countries have found it necessary to draw recruits from abroad in such pumbers that the British-Irish thoroughbred has become a product of international ancestry. The changing situation is largely due to the strength of competition from continental Europe; this rising strength, in turn, probably stems from the fact that racing in Europe adheres more strictly to what may be called the classic pattern than it does in Great Britain, the country from which the pattern was taken. (See also Great Britain: The Rise of Commercialism, above.)

Racing has long been established in most of the major countries of Europe and attained new heights of popularity after World War II. The British model for three-year-old classics is followed rather closely, each country having its equivalent of the 2.000 Guineas and the 1,000 Guineas races at a mile (1,600 m.), the Derby and Oaks at $1\frac{1}{2}$ mi. and the St. Leger at about $1\frac{3}{4}$ mi. There is, however, a major difference in that the courses in continental Europe have fewer races for two-year-olds and fewer races at the very short and very long distances. The cumulative effect of generations of selection for the classic distances, with only minor accents on precocity and speed on the one hand and extreme distance on the other, has been to render the British and Irish studs largely dependent upon bloodlines developed from the less diverse standards of continental racing.

France, which has attained a position of eminence in racing and breeding, has a limited program of two-year-old races, climaxed by the 1,600-m. Grand Criterium in October. The Derby and Oaks equivalents were founded in 1836 and 1843 respectively, the Poules d'Essai (Guineas) in 1841 and the Prix Royal Oak (St. Leger) in 1872. Older and richer than any of these is an additional classic, the 3,000-m. Grand Prix de Paris, dating from 1834; it is run at Longchamp at the end of June. Most important of the races for three-year-olds and upward is the 2,400-m. Prix de l'Arc de Triomphe at Longchamp in October, an international test with a larger value than any other race in Europe. French breeding is under government supervision, and the Société d'Encouragement, roughly equivalent to England's Jockey club, administers the conduct of horse racing.

In Germany and Italy and elsewhere in Europe, racing tends to follow the French pattern, rather than the British. Stallions from France and Italy have exercised such persistent influence that it is the exception to find a British classic winner, especially beyond the one-mile distance of the Guineas, without parents or near ancestors from Europe. Italy has produced so many horses of exceptional merit, such as the unbeaten Nearco, his half brother Niccolo dell'Arca, Donatello II, Tenerani and the unbeaten Ribot, best runner in Europe in 1955–56, that its influence on breeding in Great Britain and elsewhere is far out of proportion to its relatively small annual production. Among the most successful sires in the U.S. after World War II were Nasrullah, a son of the Italian Nearco (himself descended from English, French and American stock); Bull Lea, a son of the French-bred Bull Dog; and Princequillo, by Prince Rose, one of the best horses bred in Belgium.

European racing is under the direction of organizations whose authority is delegated by the government, usually through the ministry of agriculture. The fortunes of the sport have varied with military and economic conditions, but there has been no suppression like that in the U.S. In areas under Soviet domination, the horses, as well as the race courses, are owned by the state, and successful trainers and jockeys are rewarded less liberally than in countries where private enterprise persists. Hungary, one of the nations where Communism has created the anomaly of competition between horses under state ownership, was the birthplace of the phenomenal mare Kincsem, unbeaten in 54 races, and of Kisber, winner of the 1876 English Derby.

2. British Commonwealth.— In countries of the British commonwealth racing has been sedulously cultivated, rising to the greatest success and importance in Australia, New Zealand, Malaya, India, the Union of South Africa and Canada. Canadian turf affairs are so closely connected with those of the U.S. that they are generally considered together. Climatic conditions make Canadian breeding of local importance only; thoroughbreds produced north of the Great Lakes are, however, improving as a result of recent improvements in racing itself. Many of the fixed events of the Canadian meetings are restricted to Canadian breds. Conversely, countries which have long seasons of intense tropical heat, such as India and South Africa, have found it difficult to maintain thoroughbred production at a high level without making frequent importations of racing and breeding stock from areas of more favourable climate. Meetings were held in India as early as 1795, but it was not until 1857 that the Viceroy's cup was first given, which eventually became the most important fixed event of the Indian racing calendar. (After India attained independence the name was changed to that of the reigning British monarch.) The valuable Eclipse stakes is raced at Bombay. The first thoroughbreds from England reached Cape Town in 1792 but it was a long trek to organized racing of any scope, and the South African Derby was not established until 1885, the Oaks and St. Leger both dating from 1913. The chief all-ages event, the Johannesburg Summer handicap, was first run in 1896. The principal meetings are those held at Johannesburg, Cape Town and Natal.

Among the commonwealth countries, therefore, Australia and New Zealand easily stand first, both in the character of their racing and the class of horses they have produced. It is recognized that the breeders of "down under" have turned out animals comparing with the greatest ones of England, France and the U.S., and that to win their classics, cups and handicaps affixes a stamp of international significance. The Melbourne Cup race, run annually at the Flemington course, near that city, distance 2 mi., is among the most famous handicap races in the world; it was established in 1861 and the roll of winners includes the names of many grand per-

formers, headed by that of Carbine, whose feat of carrying 145 lb. to easy victory in 1890 in what was then record time, 3:28¼, stands unequaled in modern turf history as a weight-carrying feat. His intrinsic greatness he further demonstrated by his stud career in both Australia and England. Today his blood appears in the pedigrees of many of the best horses of all racing countries. Carbine was bred in New Zealand, which produced also the great gelding Phar Lap (1926) and numerous other runners which have dominated the turf in Australia. The two great racing centres of Australia are the Flemington course at Melbourne and the Randwick course at Sydney, but there are many other meetings, and Australia ranks second only to the U.S. in the number of races run annually. New Zealand's principal courses are at Auckland in the North Island and Christchurch in the South Island. The New Zealand Derby at Christchurch was established in 1860.

3. South America.—Racing is firmly established in the majority of the greater South American countries, with Argentina the leader and Brazil, Uruguay, Paraguay, Chile, Peru, Ecuador, Colombia and Venezuela all active. The courses at Buenos Aires, Santiago, Rio de Janeiro and São Paulo are among the most luxuriously appointed in the world.

In the matter of breeding Argentina ranks first and Chile second, though many successful studs are maintained in other countries. The "Purple Land" of Argentina is perhaps unexcelled for purposes of race-horse production, and its great stud farms, lavishly equipped, produced many runners which presumably could be ranked with the world's best. Both Argentina and Chile have a considerable export trade in thoroughbreds, of which many good ones have gained distinction in the United States. There is very little exportation of breeding stock from either North or South America to Europe.

In general, racing in South America is under the direction of Jockey clubs, which may have hundreds or even thousands of members but exercise their control through small boards of governors. These bodies have a lesser degree of autonomy than the Jockey club in England; usually they operate within the limits prescribed by, and under the immediate direction of, the national government. Venezuelan racing is administered directly by the government.

V. STEEPLECHASING AND HURDLE RACING

These forms of racing trace their ancestry directly back to the chase and the field of war, where the necessity of clearing the most formidable obstacles was paramount, and horses of great size, strength and agility, as well as speed, were required. In fact, if the history of the steeplechase (of which the hurdle race is a miniature form) is investigated, it mill be found almost invariably to have been sponsored in the beginning by cavalry officers and sportsmen avid for the excitement and danger of the hunt. It is therefore natural that in its organized form it still attracts many gentlemen riders, the weights being such as to allow their constant participation; and its administration is usually left to the National Hunt committee in England and to the National Steeplechase and Hunt association in the U.S. Many of the most important fixed events, with valuable and coveted trophies, are run at the various hunt club meetings over cross-country courses of great difficulty.

Steeplechasing reaches its annual apogee in the Grand National, which was first run in 1839 over the Aintree course at Liverpool, and attracts world-wide interest and enthusiasm, in which regard only the Derby at Epsom may be said to exceed it. The honour of winning it has been sought by sportsmen of many different nationalities, not only because of the lasting prestige that goes with a victory, but for the material reward; in value to the winner it has ranged as high as $64,625 (1929), though originally it was almost negligible. The course is of great danger and difficulty, being an irregular triangle in shape, which must be covered twice, making a total run of 4 mi 856 yd. and calling for 30 jumps. A number of these jumps, such as Becher's and Valentine's Brooks, the water jump, etc., are of tremendous hazard, causing many starters to come to grief during the course of the race. All told, during the 100 years and more of Grand National history, the number of contending horses that have either met their deaths or been permanently crippled is large; the human toll taken from the riders has also been considerable. This, however, seems merely to add to the fascination of the event, both to the participants and the public. Thirty or more horses often go to the post, of which sometimes but a scattering few ever finish, while on one occasion only a single horse completed both rounds without falling.

The Grand National is a handicap, with very high imposts. On three occasions 12 stone 7 lb. (175 lb.) has been carried to victory. While the general belief prevails that only a horse of prodigious strength and stamina and great size can win it, as a matter of fact it has been won by animals of many different shapes, sizes and types. Its nearest analogue in the U.S. is the American Grand National, run at Belmont park. The only horse that has ever won both events, Mrs. Marion du Pont Scott's Battleship, was a little horse standing but 15.1¾ hands (5 ft. 1¾ in.) and weighing less than 1,000 lb. in racing trim. Nevertheless, he carried 11 stone 6 lb. (160 lb.) at Aintree and defeated a field of 35 in 1938. He was then 11 years old and had won the American event four years before when 7 years old, under 147 lb. Battleship was bred in the United States, a son of Man o' War. Many of the renewals at Aintree have been won by Irish horses, and the belief prevails that the Irish hunting type is the most approved one for cross-country racing. It remains also to be said that many of the most famous Grand National winners have been half-bred, not purely thoroughbred. (J. L. HE.; J. A. ES.)

VI. HARNESS RACING

The trend in harness racing in the United States and Canada after World War II was away from the old country fairs, still the more numerous in number, to the arc-light mutuel circuit headlined by the two largest circuits, Yonkers raceway in Yonkers, N.Y. and Roosevelt raceway in Westbury, N.Y., both in the metropolitan New York area.

When the Old Country Trotting association pioneered nighttime light harness racing over a half-mile oval in the fall of 1940 at Westbury, there were but 126,000 fans for the season, who wagered oniy $1,704,000. The climb in interest and activity was steady after the end of World War II. Early in the second half of the 20th century the national annual attendance at harness races had grown to more than 10,000,000. The mutuel handle was more than $600,000,000.

Annual sales of horses were more than $5,000,000, and the leading sale at Harrisburg, Pa., was more than $2,000,000. L. B. Sheppard's Hanover Shoe farm of Hanover, Pa., paid $500,000 for the 1j-year-old bay stallion Adios in 1955 to Delvin Miller of Meadow Lands, Pa.

Not only did attendance and mutuel figures skyrocket on a national basis, but purses tripled in a decade from $7,338,876 immediately after World War II to $21,862,611. The famed three-year-old trot, the Hambletonian, was worth $117,117.98 in 1953.

While Roosevelt raceway and Yonkers raceway combined produced more than 50% of the national attendance and mutuel figures, there was a constant growth in the Maryland and Delaware areas, Detroit, Cleveland, Chicago and the west coast. Even the fairs through the middle west started to swing to night racing.

The Illinois State fair, in Springfield, held a one-week meeting worth almost $500,000 annually. On the night circuit the Messenger stake, William H. Cane stake, the American Classics and the Trans-America series were among the major events. The pacing side of the sport started to outstrip its trotting rivals.

1. The Standard-bred Horse.—The American standard-bred trotter is descended chiefly from thoroughbred ancestry and, as a breed, closely resembles the thoroughbred in many respects, the differences between the two being, at best, chiefly those of detail. As a recognized breed, while the beginnings date back to post-Revolutionary times, it was with the creation of the *American Trotting Register* in 1871, followed by the erection of the standard government admission thereto in 1879, that its history officially began. *(See* also HORSE.) The breed has been disseminated over almost the entire globe, and thousands of its select members have

been exported for racing, breeding and other purposes to most European countries, to the antipodes and elsewhere. In England it received little recognition and never gained a foothold, being unable to make headway there against the thoroughbred. However, in such countries as France, Germany, Italy, Belgium, Denmark, Sweden, Austria, Hungary, the U.S.S.R., Australia and New Zealand, the influence of American blood and American training and racing methods became dominant, though marked by diverse national differences.

To Messenger, an English thoroughbred stallion of fame upon the British turf, is given the credit of being the "great father" of the standardbred. He was foaled in 1780, imported in 1788 and died in 1808, leaving a large progeny. While his success as a thoroughbred progenitor was great, it was the remarkable trotting capacity of his descendants that rendered him a monumental figure. This came to a climax in his great-grandson Rysdyk's Hambletonian (1849), a stallion who was thrice inbred to him and who became the patriarch of the modern standard breed, which, indeed, might with equal propriety be termed a Hambletonian breed, so all-pervasive is his blood throughout its entire structure.

2. Records.—The standardbred, in the beginning built up from heterogeneous elements, has evolved into a breed which, like the thoroughbred, is established upon a basis of blood alone, whereas in the beginning it was founded principally upon that of performance. Selective breeding, long continued, has not only purified its blood and refined its physical structure, but has improved its speed until it has attained a rate once considered impossible.

The trotting records marking this progress were as follows (for one mile):

First 2:30 trotter—Lady Suffolk, 2:29½ (1845)
First 2:20 trotter—Flora Temple, 2:19¾ (1859)
First 2:15 trotter—Goldsmith Maid, 2:14 (1874)
First 2:10 trotter—Jay-Eye-See, 2:10 (1884)
First 2:05 trotter—Nancy Hanks, 2:04 (1892)
First 2:00 trotter—Lou Dillon, 1:58½ (1903)

The mile record for trotters, 1:55¼, was made in 1938 by E. J. Baker's Greyhound.

Harness race horses are divided into two classes, trotters and pacers, which ways of going are variants of one original gait; but whether trot or pace was first common to the prehistoric Equidae it is impossible to say. Within the present standardbred there is little difference in ancestry between performers at the two gaits; many animals have made fast records at both, the most notable instance being that of Calumet Evelyn (1:59½ trotting, 1:59¼ pacing), winner of many rich events in each division. The mile record for pacers at mid-20th century stood at 1:55 flat, by Billy Direct in 1938. As will be seen, the extreme rate of speed attained by trotters and pacers is practically the same.

All racing is over prepared dirt and clay tracks, which, to facilitate extreme speed, have a harder surface than those used by running horses. Many tracks are ovals of one mile but the great majority of those in use are a half mile and five-eighths of a mile in length. There is one notable three-quarter mile track at Vernon, N.Y.

The principal mile tracks belong to the Grand Circuit, an organization which was formed in 1873. Half-mile tracks also form part of the Grand Circuit schedule now. All racing is to sulky, a two-wheeled vehicle of the lightest possible construction, weighing about 25 lb., with pneumatic tires. The average driver weighs about 170 lb., though some famous reinsmen have scaled more; thus the gross weight pulled on most occasions is approximately 200 lb. In the early days of trotting in the U.S., racing under saddle was popular, but this has long since been discontinued. However, the champion Greyhound was sent for a saddle record in 1940 and was ridden a mile in 2:01¾ by Mrs. J. B. Johnson (later Mrs. Fred Van Lennep of Castleton farm), a lady who never before had attempted such a feat. With his professional trainer, the late S. F. Palin, up, Greyhound in 1937 set the record for 1½ miles at 3:02½ and in 1939 that for two miles at 4:06.

Racing to four-wheeled wagon is another form of the sport now discontinued. The record at this hitch was 2:00 minutes flat, first set in 1903 by Lou Dillon and equaled in 1911 by Uhlan. Both were owned and driven by C. K. G. Billings, an amateur, who weighed about 175 lb. and whose wagon weighed 49 lb., making the total weight pulled about 225 lb.

Harness racing in the U.S. and Canadian fair circuit is usually at one-mile heats, best two in three, or with three heats the limit, the horses being placed as they stand at the conclusion of the third. In case of ties the heat winners race off. The mutuel tracks dominantly hold all races as one-mile, single dash events. The administration of the sport is vested in the United States Trotting association, a central governing body, which also owns the *Trotting Register* and publishes it and the annual *Year Book* in which official summaries of all meetings appear. State racing commissions and the Harness Tracks of America, Inc., embracing the larger mutuel tracks, appeared with the growth of the mutuels and became increasingly active.

3. Futurities—There are numerous fixtures for two- and three-year-olds of high value, many of them classified as futurities. Older fixtures include the Hambletonian, Little Brown Jug, Kentucky futurity, Fox stake and the Horseman stake. With the evolution of the breed, the production of early and extreme speed became the great goal, and the two-year-old record of 1:58 was set by the pacer Torpid in 1956. The two-year-old trotting mark of 2:00 was made by Titan Hanover in a time trial in 1944 and was equaled in a race by Scott Frost in 1954. Titan Hanover also held the trot mark as a three-year-old, 1:58. The three-year-old pacing mark is held jointly by Tar Heel and Solicitor at 1:57⅖ for one mile, made in 1951; Torpid (retired to stud in 1958) did 1 1/16 mi. in 2:90⅝ in 1957. One of the leading breeding grounds is Kentucky; there Greyhound, a gelding, was bred by H. H. Knight, as was the champion mare Rosalind (1:56¾) by B. F. White, her trainer and driver. Billy Direct (1:55), the champion pacer, was a stallion and was bred in Tennessee by H. H. Ridge of Massachusetts, Adios Harry (1:55), who tied Billy Direct's mark in a race at Vernon, N.Y., in 1955, was bred by L. T. Hempt of Harrisburg, Pa. The champion pacing mare, Her Ladyship (1:56¾), was bred in Indiana by Clair Wolverton, a professional reinsman, as was the world's champion trotting stallion, Star's Pride (1:57⅛), bred by Henry J. Warwick of Westfield.

In extreme speed over fractional distances the harness race horse has attained rates which compare favourably with those of running horses. Billings in 1911 drove Uhlan to a four-wheeled wagon over a half-mile distance in 56¾ sec., and in 1913 his trainer, Charles Tanner, drove him one-quarter mile in 27 seconds flat. Joe O'Brien approached such clockings with Scott Frost in 1955 and again in 1956. Directum I, the pacing stallion, set a half-mile record of 55¾ sec. in 1916 with trainer Thomas W. Murphy.

The blood of Hambletonian has submerged all others in production of the standard type. On the trotting side it is now confined almost exclusively to two direct male lines known as those of Axworthy and Peter the Great. Axworthy traces to Hambletonian's son George Wilkes, and Peter the Great to his son Happy Medium. In the pacing genealogy, the principal male lines are those founded by Abbedale, descended from Hambletonian's son Electioneer, and by Direct, descended from his son Dictator. Individually there is no difference in type between trotters and pacers, as might be expected when their blood is in such large measure identical. The average standardbred stands about 15 to 15¾ hands (5 ft. to 5 ft. 3 in.) tall and weighs in racing trim between 850 and 1,000 lb., being smaller in pattern than the thoroughbred but upon sturdier lines.

Canada has produced few thoroughbreds capable of holding their own with those below the border, but many standard-bred stars on both gaits, the trot and the pace; including a two-minute trotter in Lee Hanover and several pacers led by Winnipeg (1:57¾), holder of the world record for geldings at that gait. None will forget Dr. Stanton, a two-minute trotter of more recent vintage.

VII. TOTALIZATOR

The totalizator, a complex mechanism employing both electrical and mechanical devices, is used on race courses for wagering under the pari-mutuel system. Its major functions are to print and issue tickets acknowledging wagers on various contestants; to summarize the sale of such tickets; and to display to public view the progress of wagering. Its popularity and the popularity of racing itself derive largely from the totalizator's speed and efficiency and from its numerous safeguards against unethical practice.

1. The Pari Mutuel.—The pari-mutuel method of wagering was developed in France by Joseph Oller. The descriptive French term (from *pari,* "bet," and *mutuel,* "mutual") is still in use, though the half-anglicized term mutuel betting is commonly heard in the United States. Oller's first *voitures des Poules* made their appearance at the Hippodrome de La Marche on March 5, 1865. The wagons carried equipment and personnel for selling numbered tickets. assigning the horses by lot and paying, after the race. the players who held the winning number. The pools, equivalent to American "jackpots." were simple lotteries. and later were suppressed by the courts for this reason. Oller at first provided only a larger facility for the popular practice of drawing the names of contestants from a hat and awarding the pool (in the U.S., the "pot") to the person who had drawn the winning horse.

In 1869 Oller instituted the pari-mutuel method, in which the player chose the horse he wished to back, and the payoff to the winners was made from the pool (the sum of wagers on the various runners) after deduction of a commission. The innovation gained quick popularity, since it allowed the player not only to make his own selection but to choose, by rough estimate at least, between long and short odds. The system was declared illegal in 1874, the courts holding that it violated the antilottery act of 1836, but in 1887 it was reinstated in favour. Except for the lottery operated under government direction, it remained as the only legal form of wagering on horse races in France, where—as in New Zealand—it included numerous off-course urban centres for accepting wagers which became a part of the pools at the course.

The pari mutuel was introduced into the United States in the 1870s, but proved less popular than bookmaking, a method imported from England about 1871. Churchill Downs, which also had auction pools and bookmakers, maintained a few machines for mutuel betting from the spring of 1878 until 1889, and revived it in 1908, when it was established by court decision as a legal method of betting on races in Kentucky. Thereafter mutuel betting became the predominant form of wagering on horse races in the United States, though it did not supersede the bookmaker in New York until 1940.

Mutuel betting does not thrive in competition with bookmakers, as was demonstrated by its early history and by the situation in England into the second half of the 20th century, where the books continued to be more popular. (*See* also *Great Britain: Matches and Handicaps,* above.) It had, before the totalizator was developed, two great deficiencies. Tickets were sold by hand, and each sale was recorded on a hand-operated tally machine; since the totals shonn on the various "clickers" were not summed up until after the race, the player had no accurate estimate of the odds Further, the integrity of the system depended upon the integrity of management and of many employees; and however honest the workers in the mutuel department may have been, the public mas alnays free to speculate upon the degree of dishonesty among them. The tote corrected both of these deficiencies, leaving the bookmaker with one major advantage, that he could offer the player a fixed price at any stage in the progress of wagering In the United States and in most other countries the tote came into favour because of its safeguards against sharp practice and the fact that, with bookmakers excluded, it submitted all wagers to the easy collection of commissions and taxes.

The pari-mutuel system is adapted to many types of wagering, including doubles and triples (combinations of horses in different races) and the involved cumulative bets which have their greatest popularity in South and Central America (*see* also *Double and Quinella Pools,* below); but its most common use is for straight (win), place and (in the United States) show pools. Except in North America, the general practice is to operate straight and place pools. Money in the win pool, after deduction of the stakeholder's fee, is divided among those who backed the winner. In the place pool, after commission has been deducted, the remainder is divided into three equal parts, and each third is divided among backers of the horses which placed (in the United States, showed); that is, which finished first, second or third. This method of calculation makes possible a return less than the amount wagered.

The North American methods are different; there are three pools instead of two, and the calculation is made in such a way that the return on a winning ticket must be greater than the sum wagered, even if the stakeholder must forfeit a part or all of its commission, and possibly more, to pay the winners a stipulated minimum of five or ten cents on the dollar as profit. The straight pool is for the winner only; the place pool is for the horses which finish first and second; the show pool, corresponding to the place pool of other countries, pays off on the horses which finish third or better. In calculating the place payoff the commission is taken off first; the money bet on the first two horses is subtracted from the pool; the remainder is divided into two equal parts; and each part is distributed among the backers of the first and second horses, plus their original stake. The show pool is calculated in the same manner, except that three horses, instead of two, must be accounted for.

*The **Two** Methods of Calculating Pari-Mutuel Returns*

	In U.S. ("Show" pool)	Elsewhere ("Place" pool)
Example		
Total pool	100,000 units	100,000 units
Amount bet on winner	50,000 units	50,000 units
Amount bet on second horse	10,000 units	10,000 units
Amount bet on third horse	5,000 units	5,000 units
Method of calculation		
Total pool	100,000 units	100,000 units
Stakeholder's fed (10%)	10,000 units	10,000 units
Amount returned to public	90,000 units	90,000 units
Amount bet on first three horses	65,000 units	(not considered)
Profit or actual winnings	25,000 units	(not considered)
Amount (of profit) shared by each group	8,333 units	30,000 units
Amount returned per unit wagered on winner	$\frac{8,333}{50,000} + 1 = 1.15$*	$\frac{30,000}{50,000} - .60$†
Amount returned per unit wagered on second horse	$\frac{8,333}{10,000} + 1 = 1.80$*	$\frac{30,000}{10,000} = 3.00$
Amount returned per unit wagered on third horse	$\frac{8,333}{5,000} + 1 = 2.65$*	$\frac{30,000}{5,000} = 6.00$

*Odd pennies above the nearest five cents are called breakage and are retained by the stakeholder. A two-dollar bet would return twice the amount shown.
†This is a loss of .40 units.

2. Totalizators.— A totalizator developed by George Julius was first used at the Ellerslie race course, Auckland, N.Z., in 1913. The electromechanical device was first called the Julius tote. later the Premier tote and, more recently, the Automatic tote. A company organized by Julius provided totalizators for several countries, including the United States, where the so-called American tote superseded it in popularity. The American Totalisator company was organized by Henry L. Straus of Baltimore, Md., with primary assistance from the brothers Charles A. and Gurnee Munn of Palm Beach, Fla. The first engineering development was directed by A. J. Johnston of the General Electric company, who was later assisted by O. C. Levy and H. C. Robinson of the Automatic Electric company. The first American totalizator, built in 1927–28 by Johnston, was taken in 1929 to England, where it was adopted. with modifications, by the Race Course Betting Control board, and was used first at Newmarket in 1930 and later at many other courses. This tote, based on automatic telephone equipment, had a minimum of mechanical parts.

The ticket-vending machines most widely used in the U.S. and Great Britain were developed in England by the Bell Punch and Printing company of Uxbridge. The simplest of various types of such machines is a hand-operated box which ejects preprinted tickets by means of a lever or slide. Most modern totes use a complicated device which prints and issues a ticket in the same

operation. When the better has given the program number of the entry he wishes to back, the vendor presses the corresponding key. Electrical impulses record the wager in the appropriate adding machine for the contestant and in the grand-total machine for the pool. The machines record the wager simultaneously and return an acknowledging impulse which sets the rotary press in motion. The press prints the mutuel ticket from a roll of specially designed laminated paper, cuts the ticket from the roll, ejects it from the machine and returns to a neutral position. The machines are capable of issuing from 40 to 55 tickets per minute.

The American tote uses a mechanical counter from which each vending machine produces a printed record of its sales. This device provides the only method for a complete audit of the tote operation and for checking against the possibility of error in the various money totals. Another type of vending machine is capable of issuing tickets in more than one pool and in more than one denomination from the same unit. In some situations they are more convenient than the one-pool, one-denomination machines, but they are slower in operation and have no mechanical counters to provide data for a complete audit. They were not generally adopted in the United States.

All vending machines are electrically locked by a designated official to render impossible any sale of tickets after a race has begun. They remain locked until precautions have been taken to ensure that they can issue tickets only for the next race. So many protective devices are in use that counterfeiting of winning tickets has been rendered virtually impossible. (J. A. Es.)

The adding machines in general use fall into two categories: (1) the electromechanical and (2) the electrical. The first makes use of a motor-driven collecting or accumulating device which actuates an electrically operated escapement mechanism, usually driven through slipping belts. As wagers are received, the locking gears are disengaged, and the driven shaft is permitted to turn a distance calibrated to correspond to the value of the wager (for example, 2° for a $2.00 bet and 10° for a $10.00 bet). The turning shaft either actuates a self-synchronous motor which keeps a similar motor operating the indicator board in step or actuates indicator drums by direct gearing or by means of chains and sprockets. This is the method used by the machines operating in most countries. In the U.S. and, to a large extent, in England, the electrical totalizator is used.

The electrical totalizator operates on an entirely different principle. Wagers are collected by means of either a multiple bank rotary switch or by a relay chain. As bets are collected, betting relays are actuated which correspond to the value of the wagers. These relays step appropriate rotary switches, in the units, tens, hundreds and thousands positions, etc. Each position of these switches energizes a combination of indicator relays which cause illuminated numerals to appear on the display boards. (H. L. Str.; Tm. S.)

In both systems, the problem is complicated by the necessity of maintaining not only great speed and accuracy, but of obtaining instantaneous alarms if a bet fails to get through. This alarm system must indicate both the source and the cause of trouble.

3. Tote Boards.—Totalizator indicator boards display either the number of units or the amount of money wagered on each contestant in each pool and the total for each pool.

In some cases the approximate odds are given for the win pool, instead of the amount wagered on each entry, but more usually both the amounts and the approximate odds are shown. The American tote uses an electric analogue computer for automatic calculation of the odds. In the place pool (place and show pools in the C.S.) only the amounts are shown; it is impossible to estimate the odds, since the payoff on any one horse will vary in accordance with the amount wagered on the other horse or horses whose backers are to share in a division of the pool. The tote boards display results of races, payoff prices, running time of the race, time of day, post time for the next race, a signal to indicate an inquiry by the stewards, and other information.

Early types of indicator boards were built on the cyclometer principle, using large drums driven by gears or by chains and sprockets. The mechanism was cumbersome, and the drums were so heavy that they were difficult to start and difficult to stop at the proper point. A more ingenious device was of the "flapper" type, with the top half of the numerals painted on a nest of flat plates and the bottom half on a similar nest of plates which flipped into position in sequence as the actuating shafts rotated. A third method used a vertical ribbon against a calibrated background on which the odds could be read as on a thermometer.

None of these devices approached, in speed or readability, the modern indicators consisting of nests of incandescent lamps, 24 lamps to the unit, combinations of which may display any numeral from 0 to 9. In the section showing approximate odds two nests of lights are placed opposite each betting entry, so that odds up to 99 to 1 may be indicated, but not 100 to 1. The only moving units are small telephone-type relays. Changes in indication are made automatically at extremely high speed, since there is no inertia and no necessity for running through a sequence before coming upon the correct digit. Indicator boards with such equipment may be placed anywhere, without reference to the distance from other units of the tote.

4. Double and Quinella Pools.—The totalizator operation includes wagering in the double and quinella, or quiniela, pools. In the daily double, as it is called in the U.S., the better attempts to select the winners of two races. In the quinella the payoff is made on tickets picking the horses which finish first and second in a given race, without reference to the order of their finish. These wagers require special vending machines, and the pools, of course, are separate from those of other types of betting. The vending machines most commonly used in North America for the double and the quinella have mechanical counters which register separate totals for each combination. Each machine, at the close of betting, produces a printed record of the wagering, and from the total and subtotals thus made available, the payoff price for the winning combination is computed. In another type of vending machine the wagers on each combination are summed automatically in the same manner as in straight, place and show betting.

HORSE-RADISH (Armoracia rusticana or *Radicula armoracia*), a hardy perennial plant of the family Cruciferae, grown for its fleshy pungent root which is used mainly as a condiment or table relish to promote appetite, but earlier occasionally used in medicine. Horse-radish, native to Mediterranean lands, is now grown generally over the temperate zones, and in many cool, moist areas it has become a troublesome weed. Large, coarse, glossy green basal leaves arise from the crown atop the large white root; petioles are long; blades are up to 1 ft. long and 4 to 6 in. wide, generally with wavy or crenate margins; leaves of the flower stalk are smaller, not petioled, and oblong or lance-shaped. Small white flowers are borne in terminal or axillary racemes; pods are small, oblong and tipped by a short, persistent style; seeds rarely are borne under field conditions.

Processors of horse-radish desire roots that are large, free of crown or root branches and free of woodiness due to age. For producing such roots, deep rich moist soil free of stones and trash is essential. Horse-radish is usually propagated in the spring by planting pieces of pencil-sized roots about 2 ft. apart in rows about 2½ ft. apart. They are planted at a slight angle with the upper ends covered about ½ in. deep. All but the terminal shoot should

be removed to prevent later formation of multiple crowns; the side roots are also rubbed off to minimize formation of crooked and branched roots. This is done by hand, removing the soil from the upper part of the root piece, rubbing off excess shoots and roots, then replacing the soil. The procedure is repeated after 6 weeks.

Roots should be harvested after only one growing season. They are plowed from the soil, washed and trimmed for sale. The root tissue is grated and packed in white or distilled vinegar in glass containers; cider vinegar causes undesirable darkening of the product. (V. R. B.)

HORSESHOE PITCHING. The origin of horseshoe pitching, as well as that of quoits from which it probably derived, is uncertain in place and date. Legend ascribes the origin of both games to the early centuries of the Christian era when the games were played by soldiers in their camps. Both games involve the attempt to throw an object, usually iron or steel, so as to encircle a stake, or hob (as it is called in quoits), or to get the-object as close to the stake as possible. The throwing object in quoits is a ring, usually metal, though in deck quoits played on shipboard the quoit is made of rope; in the 20th century rubber quoits sometimes replaced metal ones as a safety measure, the striking of the metal quoit on the metal hob occasionally striking off shards dangerous to the eyes. A miniature quoit game was once a favourite in English public houses. In Canada and Scotland quoits is often the summer game of curling clubs.

Horseshoe pitching is usually played by two or four players. When two play, they pitch from one pitching box, 6 ft. square, in the centre of which is an iron or steel stake 1 in, in diameter extending 14 in. from the surface and inclined 3 in. toward the opposite stake 40 ft. away (30 ft. for women and juniors). After both players have pitched two shoes each (an inning), they walk to the opposite box and pitch from it. When four play, each pair of partners pitches from opposite boxes. Singles are played to a winning score of 50, doubles to 21. After all shoes have been pitched in an inning, scoring is as follows: one point for each shoe closer than an opponent's if the shoe is six inches or closer to the stake; three points for each ringer (shoe enclosing the stake); four points for ringer and closest shoe. If shoes are equally distant or if opponents have the same number of ringers, these are considered ties and no points are scored. A leaning shoe has no value over one touching the stake. Horseshoes designed for pitching weigh 2½ lb., are 79 in. long, 7 in. wide at the greatest width, with a 3½ in. space between the calks, as the small toes at each open end are called.

The National Horseshoe Pitchers association was incorporated and became the governing body of the sport in 1921. World championship tournaments are held annually, 36 contestants engaging in round-robin play so that each plays all the others. Outstanding pitchers have been Ted Allen and Fernando Isais; the former holds the record (72) for consecutive ringers in tournament play. (E. O. BR.)

HORSESHOES. The horny casing of the foot of the horse and other solidungulates, while quite sufficient to protect the extremity of the limb under natural conditions, is found to wear away and break, especially in moist climates, when the animal is subjected to hard work of any kind. This, however, can be obviated by the simple device of attaching to the hoof a rim of iron, adjusted to the shape of the hoof. The animal itself has been in a very marked manner modified by shoeing, for without this we could have had neither the fleet racers nor the heavy and powerful cart-horses of the present day. Though the ancients were sufficiently impressed by the damage done to horses' hoofs to devise certain forms of covering for them (in the shape of socks or sandals), the practice of nailing iron plates or rim-shoes to the hoof does not appear to have been introduced earlier than the 2nd century B.C., and was not commonly known till the close of the 5th century A.D., or in regular use till the middle ages. The evidence for the earlier date depends on the doubtful interpretations of designs on coins. etc. As time went on, however, the profession of the farrier and the art of the shoesmith gradually grew in importance. It was only in the 19th century that horse-shoeing was introduced in Japan, where the former practice was to attach to the horse's feet slippers of straw, which were renewed when necessary, a custom which may indicate the usage of early peoples. In modern times much attention has been devoted to horse-shoeing by veterinary science, with the result of emphasizing that methods formerly adopted caused cruel injury to horses and serious loss to their owners. According to modern principles (1) shoes should be as light as compatible with the wear demanded of them; (2) the ground face of the shoe should be plain, and the face applied to the foot concave; (3) heavy draught horses alone should have toe and heel calks on their shoes to increase foothold; (4) the excess growth of the wall or outer portion of horny matter should only be removed in re-shoeing; care being taken to keep both sides of the hoof of equal height; (5) the shoe should fit accurately to the circumference of the hoof, and project slightly beyond the heel; (6) the shoe should be fixed with as few nails as possible, six or seven in fore-shoes and eight in hind-shoes, and (7) the nails should take a short thick hold of the wall, so that old nail-holes may be removed with the natural growth and paring of the horny matter. (For game, Horseshoes, *see* HORSESHOE PITCHING.)

HORSETAIL, common name for plants of the genus *Equisetum,* the only living genus of a unique subdivision of vascular plants, the Sphenopsida.

Members of this subdivision, fossil and living, characteristically have whorled leaves and, in some species, branches. When branches do occur, they develop in alternating radii with the leaves. This arrangement is known in no other group of living plants for elsewhere buds tend to occur in the axils of leaves.

The jointed, slender, herbaceous stems of *Equisetum* have hollow internodes. Superficially, the internodes are ridged and grooved. In living species the whorled leaves are arranged in a toothed sheath but are without chlorophyll; photosynthesis is

ROCHE

HORSETAIL SHOOTS. FERTILE SHOOTS ARE CAPPED BY CONICAL SPORE HEADS

accomplished in the green stems. The fossil forebears of the horsetails apparently were sizable trees with larger leaves, probably photosynthetic, which, at least in some forms, were separate from one another and not arranged in a sheath.

In reproduction, some horsetails have terminal, conelike strobili on aerial branches which later become vegetative. Other species, however, have separate, upright, aerial branches for vegetative and for reproductive shoots. In the latter, the strobilaceous branches appear first and, after the spores are shed, the green, vegetative shoots develop. Fertile appendages are whorled; each consists of a stalk bearing a flattened disk at its apex on the inner side of which is found a cycle of sporangia, each opening and shedding spores by a longitudinal slit on its inner side. The carboniferous, treelike horsetails and their sphenopsid allies are believed to have possessed the most elaborate reproductive strobili known among the vascular plants.

The spores, under low light intensity, grow to green, branched, small bisexual prothallia. The outer spore wall regularly breaks into four bands, which are hygroscopic and so coil and uncoil with moisture changes. Entangled by bands the spores, and the prothallia they grow into, are frequently shed in clusters.

This genus is comprised of about 27 living species, found on all continents. In the United States 13 species are described; of these 8 species are known in the eastern states and eastern Canada and 11 species in the west coast states and in adjacent Canada. Nine species are known in Great Britain. Generally horsetails are 30 in. or less in height. In the tropics, however, taller species are known. Accounts are given of specimens of *Equisetum giganteum* of the American tropics which attain heights of 10 to 12 yd. but which have a diameter of less than an inch. By contrast, a Mexican species two yards in height may have a diameter of up to four inches.

The horsetails have had little economic importance. At times, they have been used for scouring dishes and utensils of diverse kinds; their cleaning value is attributed to the silica in the walls of the epidermal cells, Undoubtedly the scouring rushes, as certain species were known, were beneficial in removing tarnish and dust from metallic surfaces, but the silica must have been equally hard on the metal itself. *See* PTERIDOPHYTA. (R. H. WE.)

HORSHAM, a market town and urban district in the Horsham parliamentary division of West Sussex, Eng., 38 mi. S.W. of London by road. Pop. (1951) 16,682. Area 3.0 sq.mi. The town, with houses dating from the 15th century onward, lies in the Weald near the source of the Arun. The name (Horsham in 947) indicates a place where horses were kept. The town is not mentioned in Domesday Book, but the Rape of Bramber, in which it lies, belonged then to William de Braose. His descendants held the borough and the manor of Horsham, which passed to the Mowbray family, afterward dukes of Norfolk. The church of St. Mary is mainly Early English and Perpendicular with remains of Norman work and a lofty spire. The grammar school, founded in 1532, was rebuilt in 1893. There is a local museum. Christ's Hospital school at West Horsham was removed thither from London in 1902.

Anciently the chief products were horseshoes and quarrels or wooden bolts for crossbows; today trade is mainly agricultural and there is a pharmaceutical factory. The town was represented in parliament from 1295 to 1885.

HORSLEY, JOHN (*c.* 1685–1732), British archaeologist. There is evidence that he was settled in Morpeth as a Presbyterian minister as early as 1709. At Morpeth Horsley opened a private school. Respect for his character and abilities attracted pupils irrespective of religious connection, among them Newton Ogle, afterward dean of Westminster. He gave lectures on mechanics and hydrostatics in Morpeth, Alnwick and Newcastle, and was elected a fellow of the Royal society on April 23, 1730. Horsley's great work, *Britannia Romana, or the Roman Antiquities of Britain* (1732), is one of the scarcest and most valuable of its class. There is in the British museum a copy with notes by John Ward (*c.* 1679–1758), biographer of the Gresham professors.

Horsley died on Jan. 12, 1732.

HORSLEY, JOHN CALLCOTT (1817–1903), English painter, was born in London, Jan. 29, 1817, and died there on Oct. 18, 1903. He was great nephew to Sir Augustus Wall Callcott. R A, and brother-in-lam to the engineer I. K Brunel and youthful intimate of Felix Mendelssohn. After studies at Sass's academy and the Royal Academy schools he became popular in the rustic genre of Sir David Wilkie and the 17th-century Dutch. He also painted murals ("Spirit of Religion." house of lords, 1845, etc.) and portraits ("Martin Colnaghi." exhibited at the Royal academy, 1889, now Tate gallery). He was elected A.R A. in 1855. R.A. in 1856, and was treasurer 1882–97. He was an early patron of the architect Richard Norman Shaw.

See J. C. Horsley, *Recollections of a Royal Academician* (London, 1903).

HORSLEY, SAMUEL (1733–1806). English divine, was born in London on Sept. 15, 1733. Entering Trinity college, Cambridge, he became LL.B. in 1758, and in 1759 succeeded his father as rector of Newington Butts, Surrey. Horsley was elected F.R.S. in 1767 and secretary in 1773, but, in consequence of a difference with the president (Sir Joseph Banks), he withdrew in 1784. In 1781 he became archdeacon of St. Albans. Horsley now entered in earnest upon his famous controversy with Joseph Priestley, who, in his *History of the Corruptions of Christianity,* had included among those corruptions the orthodox doctrine of Christ's divinity. Horsley sought to show that Priestley was "altogether unqualified to throw any light on a question of ecclesiastical antiquity" (*Tracts,* 1789, p. 85). The controversy was prolonged until 1790 when Priestley published his maturer book on the *History of Early Opinion,* which Horsley refused to read. In 1788 Lord Thurlow procured Horsley's promotion to the see of St. David's. As a bishop, Horsley was energetic both in his diocese, where he strove to better the position of his clergy, and in parliament. On Jan. 30. 1793, a few days after the death of Louis XVI, he preached before the house of lords a famous sermon at Westminster abbey on the dangers of the revolutionary spirit. At his eloquent peroration the whole assembly rose involuntarily from their seats. His support of the government was acknowledged by his successive translations to Rochester in 1793, and to St. Asaph in 1802. With the bishopric of Rochester he held the deanery of Westminster. He died at Brighton on Oct. 4, 1806.

See H. Horsley Jebb, *Life of Bishop Samuel Horsley* (1909).

HORSLEY, SIR VICTOR ALEXANDER HADEN (1857–1916), English surgeon and physiologist, was born at Kensington, London, on April 14, 1857. He studied medicine at University college. London, and, after qualifying in 1880, rapidly made his mark as an original investigator. In 1884 he was appointed superintendent of the Brown institution. London university, and in the following year assistant surgeon at University College hospital. These posts provided ample scope for his early researches on the role of the thyroid gland in the causation of myxoedema and cretinism, on epilepsy. on rabies, on the pituitary body and on the localization of function in the brain. He also carried out self-experiments in connection with various methods of anaesthesia. In 1886 he became surgeon to the National Hospital, Queen square, London, and was also secretary to the commission appointed to report on Pasteur's preventative treatment against rabies. In the following year he was appointed professor of pathology at University college. His work on cerebral localization had familiarized him with brain surgery, and after his appointment to Queen square he became famous for his pioneer work in neurosurgery. Before the end of 1886 he had done ten brain operations at Queen square, most of them successful. On June 9, 1887, he successfully carried out the first operation ever to be performed for removal of a tumour of the spinal cord. He had been elected F.R.S. as early as 1886, and was knighted in 1902. Horsley was a born reformer with an almost fanatical belief in the justice of his cause. He was violently opposed to the use of alcohol and tobacco, and was co-author with Mary Sturge of a well-known work on *Alcohol and the Human Body* (1907). During World War I he served in France, Egypt and Mesopotamia and carried his reforming zeal into the military hospitals of the middle east. He died of heat stroke at Amara, on July 16, 1916.

See Stephen Paget, *Sir Victor Horsley, a Study of His Life and Writings* (1919). (W. J. Bp.)

HORSLEY, WILLIAM (1774–1858), English musician, was born in London on Nov. 15, 1774, and died there on June 12, 1858. He was organist successively of Ely chapel, Holborn; the Asylum for Female Orphans; Belgrave chapel; and the Charterhouse. His compositions include three symphonies, but of greater importance are his delightful glees, such as "By Celia's Arbour," "O Nightingale," "Now the Storm Begins to Lower."

HORST, the term used in geomorphology more definitely for a block of the earth's crust that has remained stationary while the land has sunk on either side of it; *e.g.*, the Vosges. The word is also applied to those larger areas, such as the Deccan of India, where the continent remains stable, with horizontal beds forming a tableland, in distinction to the folded region such as the Himalaya mountains.

HORT, FENTON JOHN ANTHONY (1828–1892), British theologian, was born in Dublin. Ire., on April 23, 1828, and was educated at Rugby school and at Trinity college, Cambridge, where he was the contemporary of E. W. Benson, B. F. Westcott and J. B. Lightfoot. The four men became lifelong friends and fellow workers. In 1854, in conjunction with J. E. B. Mayor and Lightfoot, he established the *Journal of Classical and Sacred* Philology, and plunged into theological and patristic study. In 1857 he married and accepted the college living of St. Ippolyts, near Hitchin, Herts., where he remained for 15 years. In 1870 he was appointed a member of the committee for revising the translation of the New Testament. In 1872 he became fellow and lecturer at Emmanuel college and in 1887 Lady Margaret reader in divinity. In the meantime he had published, with his friend Westcott, the reconstructed Greek text of the New Testament. The revision committee had very largely accepted this text, even before its publication, as a basis for its translation of the New Testament. The text was vehemently attacked, but on the whole it was received as being the nearest approximation yet made to the original text of the New Testament. Hort died on Nov. 30, 1892. Next to his Greek Testament his best-known work is *The Christian* Ecclesia (1897).

HORTA, the capital of an administrative district comprising the islands of Pico, Fayal, Flores and Corvo, in the Portuguese archipelago of the Azores. Pop. (1960) 20,685 (mun.). Horta is a seaport on the southeast coast of Fayal and base for transatlantic air service via the Azores. The harbour, a bay 2 mi. long and nearly 1 mi. broad, affords good anchorage in 5 to 20 fathoms of water, but is dangerous in southwesterly and southeasterly winds. It is the headquarters of whale, tunny, bonito and mullet fisheries. Its exports include sperm oil, fruit. wine and grain.

HORTEN, a seaport of Norway, in Vestfold fylke (county), beautifully situated on Oslo fiord, opposite Moss. 38 mi. by water and 66 mi. S. of Oslo by rail. Pop. (1959 est.) 13,205. It is practically united with Karl-Johansvaern, which is defended by strong fortifications and possesses an arsenal and shipbuilding yards. There are also an observatory and a nautical museum.

There on April 9. 1940, the German cruiser "Emden" was badly damaged by the old minelayer "Olaf Trygvason," and some transports were sunk. At the narrows to the north of Horten the fort of Oscarsborg sank the cruiser "Blücher" and damaged the battleship "Gneisenau." This, the most effective Norwegian resistance, forced the Germans to proceed by land to Oslo.

HORTENSE (EUGÉNIE HORTENSE DE BEAUHARNAIS) (1783–1837), queen of Holland. was born in Paris on April 10, 1783. She was the daughter of the empress Josephine by her first marriage, and in 1802 married Louis Bonaparte. who was proclaimed king of Holland on June 6, 1806. The marriage was an unhappy one, and Louis endeavoured unsuccessfully to obtain a divorce, but Napoleon at length agreed to allow them to separate. Hortense was involved in the fall of Napoleon, and wandered from country to country, finally settling in Arenenberg, Switz., where she died on Oct. 5, 183;.

She was the mother of Napoleon Louis Charles, who died in infancy; Louis Napoleon (1804–31), crown prince of Holland; and Charles Louis Napoleon, afterward h'apoleon III (*q.v.*). She was the author of several songs, including *"Partant pour* la Syrie." Queen Hortense's *Mémoires* passed into the possession of Prince Napoleon, who died in 1926 before he had finished editing them. The work was completed by Jean Hanoteau: Les *Mémoires* de la reine Hortense (3 vol. [1928]; Eng. trans., 2 vol. [1928]).

HORTENSIA, the daughter of the Roman advocate and orator, Quintus Hortensius (*q.v.*), became known for the speech she made against the taxation of women without representation.

Nothing is known of Hortensia's life except for this episode, related by Appian. In 43 B.C. the second triumvirate was in great need of funds to carry on the war against Brutus and Cassius and proposed to raise money by taxing the property of 1,400 rich women. The women first applied for help to Octavia, sister of Octavian, and to the mother of Antony and were not repulsed, but the virago Fulvia, Antony's wife, drove them away with insults. Thereupon they proceeded to the Forum, and Hortensia spoke for the group before the tribunal of the triumvirs. She said that the triumvirs had deprived them of fathers, sons, husbands and brothers and now proposed to seize their property. She asked why, when the women had no part in the government or in the conduct of the war, they should be taxed for what the men had done. She declared further that the women would help resist a foreign enemy but they would never contribute their wealth for civil wars. The speech angered the triumvirs, Antony, Lepidus and Octavian, but they reduced the number of women liable to the tax from 1,400 to 400 and imposed a similar tax on the men.

HORTENSIUS, QUINTUS, dictator of Rome 286 B.C. When the people, pressed by their patrician creditors, "seceded" to the Janiculum, he was commissioned to put an end to the strife. He passed a law (*Lex Hortensia*) whereby the resolutions of the multitude (plebiscita) were made binding on all the citizens without the approval of the senate being necessary. He is said to have died while still dictator.

HORTENSIUS, QUINTUS (114–50 B.C.), surnamed Hortalus, Roman orator and advocate. At the age of 19 he made his first speech at the bar, and shortly afterward successfully defended Nicomedes III of Bithynia, one of Rome's dependants in the east, who had been deprived of his throne by his brother. From that time his reputation as an advocate was established. As the son-in-law of Q. Lutatius Catulus he was attached to the aristocratic party. The senatorial control of the courts reintroduced by Sulla helped him since many of his clients were former governors accused of extortion. He became quaestor in 81, aedile in 75, praetor in 72 and consul in 69. In the year before his consulship he came into collision with Cicero in the case of Verres, and from that time his supremacy at the bar was lost. But after 63 Cicero joined the party to which Hortensius belonged. Consequently, in political cases, the two men were often engaged on the same side (*e.g.*, in defense of Rabirius, Murena, Publius Cornelius Sulla and Milo). After Pompey's return from the east in 61, Hortensius withdrew from public life and devoted himself to his profession. In 50, the year of his death, he successfully defended Appius Claudius Pulcher when accused of treason and corrupt practices by P. Cornelius Dolabella.

Hortensius' speeches are not extant. His oratory, according to Cicero, was of the Asiatic style, a florid rhetoric, better to hear than to read. He had a wonderfully tenacious memory (Cicero, *Brutus,* 88, 95), and could retain every point in his opponent's argument. His action was highly artificial, and his manner of folding his toga was noted by tragic actors of the day (Macrobius, Sat., iii, 13, 4). He also possessed a fine musical voice, which he could skillfully command. He was very rich, and noted for the luxury of his houses and table. He wrote a treatise on general questions of oratory, erotic poems (Ovid, *Tristia,* ii, 441), and an *Annales* (Vell. Pat.. ii, 16, 3).

In addition to Cicero *(passim), see* Dio Cassius, xxxviii, 16, xxxix, 37; Pliny, *Nat. Hist.,* ix, *81,* x, 23, xiv, 17, xxxv, 40; Varro, R.R., iii, 13, 17.

HORTHY DE NAGYBÁNYA, MIKLÓS (NICHOLAS) 1868–1957), admiral in the Austro-Hungarian navy and regent of Hungary from 1920 to 1944, was born on June 18. 1868. at Kenderes, of an ancient Protestant family. He entered the naval academy at the age of 14 and after active service and various commands at sea, as well as at the Austro-Hungarian embassy in Con-

stantinople, he served at the military and naval chancellery of the emperor Francis Joseph I and in the naval department of the war ministry in Vienna. In World War I he distinguished himself as an able and daring naval commander and several times broke through the Allied blockade of the Adriatic sea. On May 14, 1917, in command of a squadron of three cruisers, he was wounded in action in the Straits of Otranto; he was promoted admiral and in Jan. 1918 commander in chief of the Austro-Hungarian navy.

In May 1919, at Kenderes, Horthy received an appeal by the Hungarian national government of Szeged to organize a national army to fight the Communist regime installed in Budapest, but the French, in control of the Szeged region, refused to help him in this task. The national army took shape only after the Rumanians had occupied Budapest and the "people's commissars" left the country. Horthy's troops entered Budapest on Nov. 16, 1919, after agreement with the Allied Supreme council, by which Horthy undertook to submit to a coalition government, until a constituent assembly had been elected. This assembly restored, on March 1, 1920, the principle of monarchy and proclaimed him regent.

Although Horthy was elected almost unanimously, partisans of the immediate restoration of King Charles clashed both with the more moderate Legitimists and the partisans of a new national monarchy. Horthy was considered by the firmest Legitimists as their man, but later they reproached him for frustrating the attempts at restoration in March and October 1921 and engaged in polemics against him. At the same time, the Democrats and Socialists considered Horthy the symbol of the reactionary "white terror," after the fall of communism. In the decade following 1921, Horthy's influence declined under the premiership of Count Stephen (István) Bethlen (q *v.)* and only reappeared in 1932 with the government of Gyula Gombos, head of the military party, who was considered to be the regent's personal choice. At this stage, the regent became somewhat unexpectedly a moderating factor. Though opposition to the peace treaties made Hungary an ally of Germany and Italy, Horthy contributed to the preservation of a constitutional system with substantial liberties and to the dissociation of Hungary from the German aggression against Poland. Although in June 1941 Hungary associated itself with the German war against the Soviet Union, the internal situation underwent little change and this was due partly to Horthy's more conservative than fascist views. On March 19, 1944, he was removed from Hungary by a ruse. while German troops occupied the country and deposed the government. On Oct. 15 Horthy concluded an armistice with the Russians and appealed to Hungarian troops to cease hostilities. He was taken prisoner, while the Nazi-controlled Arrow Cross movement formed a government. Horthy's captivity ended on May 1, 1945, when U.S. troops entered Bavaria. He retired to Estoril, Port., where he died on Feb. g, 1957.

HORTICULTURE, the division of agriculture which relates to the cultivation of fruits, vegetables and ornamental plants, is both an art and a science. It is an art in that through practice certain skills are developed in necessary operations, such as propagation, pruning and spraying, which are essential to successful culture. It is a science in that underlying these practices is an orderly array of fundamental facts uhich explain and direct their performance. "Horticulture" originally meant the culture of a garden or enclosure, in contrast with "agriculture," meaning the cultivation of a field.

This article is divided into the following sections:

I. INTRODUCTION

The association of horticulture with intensive culture of plants in small areas is a popular conception; yet some phases of horticulture have developed into industries which occupy important economic positions in the field of agriculture.

There are no hard and fast rules that determine when a crop or an operation is horticultural. The type of culture, the general custom and the purpose for which a crop is grown are determining factors. Sweet corn, cabbage and Irish potatoes are, for example, generally classed as horticultural crops; yet in some areas of the U.S. where they are grown extensively for processing and market they are classed as field crops. Even the tomato approaches field-crop status in some locations. Nut trees are considered horticultural crops when grown in orchards for nut production, but they become forest crops when grown for timber. Grasses are treated from the horticultural viewpoint when used for lawns but become agronomic when used for pastures.

Horticultural crops may be divided into four main groups, namely: (1) fruits; (2) vegetables; (3) flowers and ornamentals; and (4) nursery stock and seeds. The culture of fruits is known as pomology or fruit growing; of vegetables, as olericulture or vegetable gardening; of flowers, as floriculture; and of ornamental plants other than flowers, as ornamental horticulture. The planning and grouping of plants for the purpose of enhancing the beauty and value of the landscape is called landscape gardening or landscape architecture (*q.v.*).

A fruit. horticulturally, is the edible product of a perennial plant. usually moody; it is closely associated with the development of a flower. Fruits are divided into tree fruits. including deciduous forms such as apple, pear, quince, peach. cherry, plum and apricot; evergreen forms such as orange, grapefruit, lime, lemon, citron, avocado and mango; and small fruits, such as grape, strawberry, currant, gooseberry, raspberry and blackberry. (See FRUIT.)

A vegetable is popularly defined as the product of a herbaceous plant which provides fresh material either for culinary purposes or for salads. Vegetables may be botanically grouped according to the part of the plant which is used, as tuber—potato; *root*—beet, carrot, horseradish, parsnip, rutabaga, turnip, salsify, sweet potato; bulb—chive, garlic, onion, shallot; stem—asparagus; *bud*—cabbage. Brussels sprouts; leaf—lettuce, spinach, kale, mustard, chard; leafstalk—celery, rhubarb; *flower*—cauliflower, broccoli; seed—pea, bean; and *fruit*—cucumber, muskmelon. tomato, watermelon, pepper, eggplant. (See VEGETABLES)

Flowers and ornamentals are plants used for their aesthetic or decorative value. They may be grouped for convenience as shown below:

Flowers.—(1) *annuals,* completing the life cycle and dying within a year, requiring reseeding each season (cosmos, petunia, zinnia); (2) biennials, requiring approximately two years to complete the life cycle, requiring reseeding every other season (foxglove, Canterbury bell); and **(3)** perennials, living more than two years, not requiring frequent reseeding (chrysanthemum, phlox, peony).

Shrubs and Vines.—(1) *deciduous,* shedding the foliage each year (deutzia, honeysuckle, spiraea); and (2) evergreen, retaining the leaves the year round (narrow-leaved—mugho pine, Pfitzer juniper, yew; and broad-leaved—laurel, rhododendron).

Trees.—(1) deciduous, shedding the foliage each year (elm, maple, oak); (2) evergreen, retaining the leaves the year round

(narrow-leaved—fir, spruce, pine; and broad-leaved—citrus, holly).

Such arbitrary groupings, however, are not rigid. The petunia, snapdragon, and wax begonia are annuals in the north, where they are killed by winter cold, but they remain perennial where mild winter temperatures prevail. Candytuft, which is commonly called a herbaceous perennial, is shrublike and may properly be called a small shrub. See FLOWER; WILD FLOWER; TREE.

II. ORIGIN OF HORTICULTURAL CROPS

The first agriculture was in a sense horticulture. The first cultivated plants were taken from the wild. As cultivation advanced, culture became more intensive and more critical, and improved forms took the places of less desirable ones. Little by little, seed lines were improved, purified and standardized, and improved strains of fruits and ornamentals were perpetuated and increased by such methods of vegetative propagation as division, layering, suckering and grafting. New species and types were brought together and were hybridized in nature to give still more forms, some of which were improvements over the old. Finally, with the development of scientific methods, such as plant exploration, breeding and systematic testing, improved forms were produced by man to meet local conditions in various parts of the world.

This general outline can be followed in those areas and with those horticultural crops whose history is recorded. For example, the development of the grape in eastern North America prior to 1700 was nith native wild grapes, as *Vitis* labrzcsca, *V. vulpina* and V. aestivalis, raised from seed. About 1800, selections from these wild forms were made and propagated vegetatively by cuttings. as the Alexander or Cape grape. Gradually, other species, including the old-world grape (Vitis *vinifera*), were blended with native species by natural crossing and such improved varieties were produced as Catawba (1819), Concord (1843) and Delaware (1849). Finally, toward the close of the 19th century, systematic breeding methods began to raise the standards of quality, adaptability and production to the high level seen in such varieties as Ontario, Fredonia, Niagara, Golden Muscat and several seedless varieties. Likewise, the Persian walnut industry on the Pacific coast of North America was, until the beginning of the 20th century, based largely upon seedling trees, which have, however, gradually given way to selected varieties propagated by budding and grafting. Flowers, ornamental plants and vegetables have all shown this same general pattern of development. To protect originators of new plant materials, the U.S. established a plant patent law. July 1 1931. See PLANT PROPAGATION; GRAFTING (IN PLANTS); PLANT BREEDING.

III. HORTICULTURE AND THE HOME

Socially, horticulture has been and continues to be of great significance through its influence upon the settlement, development and refinement of areas and of peoples. It is closely identified nith the establishment of the home in which fruits, vegetables and ornamental plants are combined in a plan of unity and utility, and this has become the 20th-century conception of the private home garden. Gardening has passed through a number of widely differing styles and vogues. There have been the eras of very formal gardens with geometrically arranged beds and with trees and hedges trimmed to artificial forms, of gardens on the grand scale which involved removal of walls and boundaries and took gardening into the parks and fields, of wild gardens and of Victorian gardens with flower beds set in lawns. Trees and hedge plants are now commonly permitted to assume natural forms, the lawn is kept open. flower beds have given may to herbaceous borders, the rock garden has assumed a place of importance and sometimes provision is made for semiaquatic plants.

It is most important that there be a plan. In the U.S., for example, the areas in a home plan may be divided into: (1) a public area nhich is open to view of the public and which furnishes a setting for the home; (2) a private area which is in a sense an outdoor living room; and (3) a service area which includes drives, clothesyard, outbuildings and fruit and vegetable gardens. There is a wide range of plant materials from which to choose, and the choice should be made in consultation with local residents, nurserymen or professional horticulturists, or with the advice of nearby schools, colleges and experiment stations.

1. Lawn.—The lawn is one of the first considerations, since it serves as the floor covering of the outdoor living room, so to speak. Bluegrasses (Poa species) make good turf grasses, well suited to the temperate zone and widely used where the soil is neutral and of fair fertility. The Merion strain of Kentucky bluegrass (*Poa pratensis*) develops a thick, dark turf which is well suited to close mowing and which is resistant to leaf spot. Bermuda grass (Cynodon dactylon) is used in warmer regions, and bent grasses (Agrostis species) do well in moist cool climates, as in northeastern U.S. and along the west coast north from San Francisco. Fescues (Festuca species) are useful for shaded northern areas with low rainfall, and Roughstalk bluegrass (Poa trivialis) is good in moist, shaded conditions. A mixture of basic grasses is usually preferred: as 60% Kentucky bluegrass, 20% red fescue (Festuca rubra), 15% rye grass (*Lolium* species) and 5% redtop (Agrostis alba); or 80% Colonial bent (Agrostis *tenuis*) and 20% redtop. One-half to two ounces of seed are needed for a square yard of soil. Seeding should be done at the time of year when cool temperatures and moderate moisture can be expected. This means late summer, early fall or early spring in most regions. The introduction of selective herbicides such as 2,4-D (2,4-dichlorophenoxy-acetic acid) revolutionized lawn maintenance by controlling such common broadleaf weeds as dandelion and plantain. (See LAWNS, CARE OF.)

2. Trees.—Trees are employed to frame views, to provide points of interest, for shade, as screens, as background and as windbreaks. Some of the more common and dependable kinds, of which there are many, are listed below:

Deciduous.—Maple (Acer), hickory (Carya), dogwood (*Cornus*), hawthorn (*Crataegus*), beech (*Fagus*), honey locust (*Gleditsia*), walnut (*Juglans*), sweet gum (Liquidambar), tulip tree (Liriodendron), plane tree (Platanus), oak (Quercus), linden (Tilia), elm (*Ulmus*).

Evergreen.—Fir (*Abies*), cedar (Cedrus), cypress (*Cupressus*), spruce (Picea), pine (*Pinus*), yew (*Taxus*), arborvitae (*Thuja*) and hemlock (Tsuga). (See TREE; ARBORICULTURE.)

3. Shrubs.—Shrubs are used for much the same purposes as trees and, in addition, are used to separate areas and as foundation plantings. The shrub border outlines boundaries, and consists of high-growing plants in the background and low-growing plants in the foreground. Foundation plantings serve to visually tie the house to the ground, employing higher specimens at the corners and lower kinds between. A list of some common forms follows:

Deciduous.—Barberry (Berberis), butterfly bush (*Buddleia*), sweet shrub (Calycanthus), Ceanothzts, flowering quince (*Chaenomeles*), rockrose (*Cistus*), dogwood (Cornus), Cotoneaster, *Deutzia, Euonymus,* Forsythia, witch hazel (*Hamamelis*). *Kerria,* beauty bush (*Kolkwitzia amabilis*). privet (*Ligustrum*), honeysuckle (Lonicera). mock orange (*Philadelphus*), flowering currant (Ribes), rose (Rosa), flowering raspberry (*Rubus*), Spiraea, lilac (Syringa), *Viburnum* and *Weigela.*

Evergreen.--Abelia, Azalea, box (*Buxus*), *Camellia,* Cotoneaster, Daphne, juniper (*Juniperus*), mountain laurel (*Kalmia latifolia*), Rhododendron, fire thorn (*Pyracantha*) and yew (*Taxus*).

4. Herbaceous Annuals and Perennials.-Herbaceous annual and perennial flowering plants are employed in the foreground of the shrubbery border, usually in long narrow beds at the sides of the lawn, or in separate beds in the garden to provide cut flowers. The best effects are produced by group plantings so that as each group blossoms, a mass of colour is produced. Annuals must be reseeded each year, but perennials will grow up again each spring. In the fall. the old leaves and stems should be cleaned out of the bed. When the plants become overcrowded, they should be lifted, divided and replanted. Some common herbaceous flowering plants are listed below:

Annuals.—Ageratum, snapdragon (*Antirrhinum*), Aster, *Browallia,* Calendula, China aster (*Callistephus*), Centaurea, *Clarkia,* Coreopsis, Cosmos, larkspur (Delphinium), Gaillardia, *Gypsoph-*

ila, hound's-tongue (Cynoglossum), candytuft (Iberis), snapweed (*Impatiens*), sweet alyssum (Lobularia), stock (Mathiola), Petunia, Portulaca, *Salpiglossis,* sage (Salvia), scabious (Scabiosa), marigold (Tagetes), nasturtium (Tropaeolum), Verbena and Zinnia.

Biennials and Perennials.—Hollyhock (Althaea rosea), columbine (Aquilegia), hardy aster (Aster), Astilbe, bellflower (Campanula), Chrysanthemum, Coreopsis, Delphinium, pink (Dianthus), bleeding heart (Dicentra), Gaillardia, Gypsophila, day lily (Hemerocallis), Iberis, flax (Linum), lupine (Lupinus), forget-me-not (Myosotis), evening primrose (Oenothera), poppy (Papaver), Phlox, hardy primrose (*Primula*), speedwell (Veronica) and violet (Viola).

Perennials from Bulbs, Roots and Corms.—Canna, Crocus, Dahlia, snowdrop (Galanthus), Gladiolus, Iris, lily (Lilium), grape hyacinth (Muscari), Narcissus, *Oxalis,* peony (Paeonia), squill (Scilla), Trillium and tulip (*Tulipa*).

5. Vines.—Vines are used as ground covers and to cover walls. fences, trellises and pergolas. They are much more used in Europe than in the U.S., due in part to a less rigorous climate and to the preponderance of stone structures, to which vines more readily cling and with less injury to the structure. Some of the more common vines are Dutchman's-pipe (Aristolochia), bittersweet (*Celastrus*), Clematis, ivy (Hedera), morning-glory (*Ipomoea*), creeper (*Parthenocissus*) and wistaria (Wistaria).

6. Hedges.—Plants which are sufficiently dense in growth habit may be used as hedges, to serve as a mark of the property line, as a barrier, as a protection to privacy, as a means of providing a formal atmosphere and as a screen.

Most hedges should be pruned so that they are wider at the base than at the top, to avoid shading out of the lower branches. However, some narrow-growing materials, such as American arborvitae. and some vigorous-growing kinds, such as privet, may be clipped vertically on the sides without causing the lower branches to die.

Representative plants for several hedge purposes are: Formal ornamental—true dwarf box (Buxus sempervirens *suffruticosa*); informal ornamental—true hedge columnberry (Berberis thunbergi erecfa); flowering ornamental—Japanese rose (Rosa multiflora); evergreen—arborvitae (*Thuja*); coloured fruits—fire thorn (Pyracantha); coloured twigs—Tatarian dogwood (*Cornus* alba); protective thorny—English hawthorn (Crataegus oxyacantha); protective dense—box (*Buxus*); low, under 2-ft. high—dwarf Japanese yew (*Taxus cuspidata* nana); medium, about 4 ft.—Amur privet (Ligustrum amurense); Japanese barberry (Berberis thunbergi); high, 6 ft. or taller—Eastern arborvitae (*Thuja occidentalis*); and windbreaks and screens—Norway spruce (Picea abies).

(See also articles on the more important ornamental plants.)

7. Rock Garden.—Rock gardens are especially suited to sections where the climate is neither too cold nor too hot, and where sufficient moisture either is available or can be provided. They are especially popular in Great Britain, on the continent of Europe, in Japan and on the north Pacific coast of North America. In Japan a feature of the rock garden is the rocks themselves, many of which are of foreign origin. For the most part, the rock garden is a garden of alpine plants, commonly, plants which grow in mountain habitats.

The garden is constructed so as to provide the conditions required by the different plants which are to be grown, as sheltered crevices, boggy spots, dry banks, peaty soil, leaf mold and limestone rubble. Conditions should be made as nearly natural as possible. A north-and-south direction provides a variety of exposures for different plants. (See also LANDSCAPE ARCHITECTURE.)

Plants commonly used in rock gardens may be grouped according to their requirements for culture:

1. Woodland and pasture plants of the mountain regions—aconites, delphiniums, tulips, colchicums, campanulas, helianthemums, anemones, pinks, aquilegias, centaureas, geraniums, thalictrums and gentians (Gentiana asclepiadea and G. cruciata).
2. Shade-loving plants—ferns, certain lilies and some aconites.
3. Plants favouring moist or marshy places—buttercups, trilliums, cypripediums, bog orchids, parnassias, loosestrifes (*Lysimachias*), mimuluses and saxifrages.
4. Wall plants which love full sunshine—Corydalis lutea and C. *ochroleuca,* toadflax (Linaria), some campanulas and *Erinus alpinus.*
5. Plants of the peat bog—heath, blueberry, rhododendron.
6. Ordinary rock and alpine plants—golden tuft (Alyssunz saxatile *luteum*), alpine rock jasmine (Androsace alpina), anemones (Anenzone baldensis and A. *pulsatilla*), aubrieta (Aubrieta deltoidea Dr. Mules), rose daphne (Daphne *cneorum*), alpine pink (Dianthus *alpinus*), checkerberry wintergreen (Gaultheria procumbens), gentians (Gentiana *acaulis,* G. *sino-ornata* and G. verna), evergreen candytuft (Iberis *sempervirens*), saxifrages (*Saxifraga* cotyledon, S. umbrosa, S. burseriana), stonecrops (Sedum acre, S. album), cobweb houseleek (Sempervivum arachnoideum), moss campion (*Silene* acaulis), Sicily thyme (Thymus *nitidus*) and violet (Viola bertoloni).
7. Bulbous plants—snow-drops, narcissuses, scillas, fritillaries and crocuses.
8. Pioneer plants—willowweed (*Epilobium* dodonaei), alpine toadflax (*Linaria* aalpina), mountain wormwood (*Artemisia spicata*), twinleaf saxifrage (Saxifrage oppositifolia).
9. Dwarf trees and shrubs—redleaf Japanese barberry (Berberis thunbergi *atropurpurea*), rock cotoneaster (Cotoneaster *horizontalis*), Lawson false cypress (*Chamaecyparis* lawsoniana Fletcher), broom (*Cytisus* kewensis), winter daphne (Daphne odora) and spring heath (*Erica* carnea).

8. Rose Garden.—The rose offers a wide variety which makes it adapted to a great range of climatic conditions and individual tastes. Good effects are secured in a variety of ways, as with ramblers over a lattice, fence or pergola; with polyantha roses in mass plantings and in borders; and with a few plants in a bed for cut flowers. If a portion of the grounds is set aside for a rose garden, a good plan is to use climbers and pillar types as the border or enclosure. The rugosas and shrub roses are then used in a parallel planting inside the border and within this are the beds of hybrid perpetuals with the hybrid teas in the centre.

Roses will grow in most soil types if given plenty of sunshine and an adequate supply of moisture. They do especially well in heavy soils where a uniform climate and an even moisture supply are provided. Protection from insects and diseases is most important and can be secured fairly easily by using a combined fungicide-insecticide dust or spray, obtainable in ready-mixed formulations. Much winter injury is traced to weakening of plants through insect and disease attack. While there are hardy forms for colder sections, most roses need some degree of winter protection.

Roses require careful pruning. The operation is best left until late spring when danger from severe winter cold is past. All dead, weak and unripe wood should first be removed and the remaining wood should then be cut back for the results desired. Climbers need vigorous pruning. Wood more than two years' old should be removed and the six or eight new shoots which are left should be cut back and tied in place. If exhibition blooms are desired, hybrid perpetuals should be cut back to seven to nine buds per cane and hybrid teas to three or four buds per cane. On the other hand, if a quantity of flowers is desired, the canes should be merely cut back to live wood.

Roses are propagated on many different types of stocks, including the mul'tiflora, the manetti and the rugosa. Of these, manetti is most used for greenhouse roses and multiflora for garden roses.

The wide interest in roses throughout the world stimulates constant improvement and change, so that a list of desirable types and varieties changes in a short time. Of the five following popular types the hybrid tea roses are among the most popular.

Rambler and Pillar Roses.—Blaze (red), City of York (white), Climbing Talisman (yellow and copper), Dr. J. H. Nicolas (pink), Dorothy Perkins (pink), Doubloons (yellow), High Noon (yellow), New Dawn (pink), Silver Moon (white), Spectacular (red), Tausendschon (pink) and Torch (orange).

Hybrid *Perpetuals.*—Baroness Rothschild (pale pink), Frau Karl Druschki (white), General Jacqueminot (clear red), American Beauty (red), Georg Arends (light pink), Henry Nevard (pink), Mrs. John Laing (clear pink), Paul Neyron (deep pink) and Ulrich Brunner (cherry red).

Grandifloras.—Gold Coast (deep yellow), Merry Widow (red), Queen Elizabeth (pink) and June Bride (white).

Hybrid Teas.—Katherine T. Marshall (pink), Comtesse Vandal (white), Crimson Glory (red), Eclipse (yellow), Etoile de Hollande (red), Golden Dawn (yellow), McGredy's Ivory (white),

McGredy's Yellow (yellow), McGredy's Sunset (yellow orange), Mme. Edouard Herriot (salmon), Margaret McGredy (brick red), Mrs. Pierre S. du Pont (yellow), Nocturne (red), Peace (yellow blend), Radiance (pink), Red Radiance (red), Sutter's Gold (yellow) and Talisman (yellow and copper).

Small-flowered *Polyanthas*.—Chatillon Rose (pink), Miss Edith Cavell (red), Gloire du Midi (salmon), Pinocchio (pink) and Red Pinocchio (red).

Large-fiowered Polyanthas, Often Called *Floribundas*.—Betsy McCall (pink), Betty Prior (pink), Donald Prior (red), Else Poulsen (salmon pink), Fashion (pink), Irene of Denmark (white), Spartan (salmon red), Summer Snow (white), Vogue (pink), World's Fair (Minna Kordes) (red).

For more botanical and horticultural information see ROSE.

9. House Plants.— Accompanying an increase in city living was a fuller appreciation of plants in the home. Certain plants are useful as flowering pot plants, others as foliage plants and others (principally cacti, succulents and foliage plants) as terrarium and dish garden subjects. Trees dwarfed in the manner of the Japanese art of bon-sai (*q.v.*) make very effective arrangements. The following plants are generally successful in ordinary rooms:

Flowering Plants.—Begonia, airbrom (Billbergia), poinsettia (*Euphorbia* pulcherrima), *Fuchsia,* Gardenia, Amaryllis, Narcissus, florist's geranium (Pelargonium), azalea (Rhododendron), rose, African violet (Saintpaulia), gloxinia (Sinningia), Jerusalem cherry (*Solanum pseudocapsicum*) and tulip.

Foliage Plants.—China green (Aglaonema simplex), Norfolk Island pine (Araucaria excelsa), fern asparagus (Asparagus plumosus), cast-iron plant (Aspidistra elatior varieties), bird's-nest fern (*Asplenium* nidus), *Caladium,* treebine (*Cissus*), leaf-croton (Codiaezim), Coleus, tuftroot (*Dieffenbachia*), Dracaena, rubber plant (Ficus), English ivy (Hedera helix), baby tears (Helxine), sentry palm (Howea), Boston fern (*Nephrolepis* exaltata *bostoniensis*), screw pine (*Pandanus*), *Peperomia,* Philodendron, date palm (Phoenix), bowstring hemp (Sansevieria), strawberry saxifrage (Saxifraga sarmentosa), ivy arum (*Scindiapsus*), *Selaginella,* wandering Jew (Tradescantia *fluminensis*) and periwinkle (Vinca).

Cacfi and Succulents.—Agave, Aloe, Cereus, Crassula, *Echeveria, Epiphyllum,* Gasteria, *Haworthia,* Kalanchoe, *Mammillaria,* fig marigold (Mesembryanthemum), prickly pear (*Opuntia*) and houseleek (*Sempervivum*).

10. Vegetable Garden.— The vegetable garden is primarily to provide food for the family, yet it may reach considerable economic importance in the aggregate.

The size of the garden will be dictated by the size of the family, the interest in gardening, the labour available and the geographical location. Following is a suggested plan for a garden 30 by 60 ft. for temperate zone conditions and arranged in numbered rows according to season of planting: (1) asparagus; (2) lettuce and radishes; (3) spinach, followed by cucumbers and bush squash; (4) onion sets; (5) early turnips, mustard, cress; (6) early beets, followed by late cabbage; (7) onions; (8) parsley, carrots; (9) parsnips; (10) early peas, followed by string beans; (11) cabbage, cauliflower; (12) lettuce, followed by celery; radishes, followed by celery; (13) late peas; (14) string beans; (15) early sweet corn, followed by turnips; (16) late sweet corn; (17) dwarf lima beans, peppers; and (18) tomatoes and eggplant.

The garden soil should be well drained and should be kept both in good fertility for satisfactory crop yields and in good physical condition for ease in handling. Animal manures are no longer easy to procure, but where they are, there is nothing better. In order to destroy weed seeds it is a good plan to compost the manure. Peat moss, grass clippings, leaves and any other available types of organic matter are valuable and may be added to the compost pile. Peat moss is especially useful in the garden. A 2-in. top-dressing will produce most satisfactory results. Certain organic chemicals (synthetic resins) tend to granulate heavy clay soils and improve their structure. Where manures cannot be secured, commercial fertilizers may be used, employing them in the manner and at the rates recommended by the manufacturers. The use of so-called starter solutions, employing commercial fertilizers in water in small amounts, has been found beneficial in transplanting, and the side placement of concentrated fertilizers in bands a few inches from the plant and at a depth of 2 to 6 in. rather than broadcast over an entire area, has not only proved economical but has also resulted in increased yields. (See FERTILIZERS AND MANURES and articles on specific vegetables.)

11. Fruit Garden.— The fruit planting will be largely of small fruits where the available area is small and may include tree fruits where more room is available. For the temperate zone, the selection may include strawberries, red raspberries, black raspberries, purple cane raspberries, blackberries, currants, gooseberries, grapes, peaches, plums, sweet cherries, sour cherries, apples, pears and nut trees. Subtropical areas and warmer parts of temperate zone areas include citrus fruits, figs, persimmons and vinifera grapes. The choice of varieties is dependent upon local adaptation, so that advice should be sought from local residents, professional horticulturists, or nearby agricultural colleges or experiment stations. The tendency is to overplant the fruit garden. A few good selections well cared for are the most satisfactory.

Dwarf fruit trees, especially dwarf apple trees propagated on standardized East Malling (EM) rootstocks, are useful in the garden. The Angers quince is the best rootstock for dwarfing the pear. The Mahaleb cherry (*Prunus* mahaleb) is used for dwarfing the cherry and the St. Julien plum for the European-type plum (Prunus *domestica*), but there is as yet no thoroughly satisfactory d arfing rootstock for the stone fruits. (See Propagation of Plants, below.)

Planting distances for fruit trees will vary with the variety and geography, but are approximately as follows: Apples, 30 to 40 ft. each way; apples (dwarf, EM IX), 8 to 10 ft. each way; apples (semidwarf, EM I), 20 to 25 ft. each way; pears, 20 to 30 ft. each way; pears (dwarf) 10 to 15 ft. each way; plums. 16 to 25 ft. each way; peaches. 16 to 20 ft. each way; cherries (sour), 16 to 22 ft. each way; cherries (sweet), 20 to 30 ft. each may; apricots, 16 to 20 ft. each way; nectarines, 16 to 20 ft. each way; quinces, 8 to 14 ft. each way; figs, 20 to 25 ft. each may; mulberries, 25 to 30 ft. each way; Japanese persimmons, 20 to 25 ft. each way; loquats, 15 to 25 ft. each way; pecans. 35 to 40 ft. each way; walnuts, 40 to 50 ft. each way; oranges and lemons, 25 to 30 ft. each way; grapes, 8 to 10 ft. each way; currants, 4 by 5 ft.; gooseberries, 4 by 5 ft.; raspberries (black), 3 by 7 ft.; raspberries (red), 3 by 7 ft.; blackberries, 4 to 7 ft. by 6 to 8 ft.; cranberries, 1 or 2 ft. each way; blueberries, 4 by 8 ft.; and strawberries, $1\frac{1}{2}$ by $3\frac{1}{2}$ ft. Important varieties and details of cultivation are given in the article FRUIT FARMING.

IV. COMMERCIAL HORTICULTURE

Horticultural crops, with the exception of the Irish potato. are more important as a group than as individual crops. They include fruits, vegetables, ornamentals and nursery stock and seeds.

1. Fruits.— Principal fresh fruits of world commerce are the grape, apple, orange, pear, plum and banana; principal nuts are the almond, Brazil nut, chestnut, coconut, filbert, pecan and walnut. Large quantities of fruits are dried, canned, frozen and otherwise processed. The grape, including grapes grown for wine, for drying and for table use, is the leading fruit of the world.

The apple is the most important tree fruit of the temperate zone. The U.S. is the largest producer of apples and oranges, producing more than one-third of the annual world crop of each. The orange is the most important commercial tree fruit of tropical and subtropical regions. The principal orange-producing countries are the U.S., Spain, Brazil, Italy and Mexico. The date is an important crop in the drier areas of the world, especially in Asia Minor, Arabia and the Sahara desert region. There are more species of fruit in the tropics than in any other region, but most of them are only of local importance because of their highly perishable nature. The four of greatest commercial value are the banana, pineapple, coconut and Brazil nut. Others include mango, avocado, papaya, guava, sapodilla, cherimoya and prickly pear. The mango is as important to the people of India as is the apple to the inhabitants of the temperate regions. The banana is the great starch food of the tropics.

There is perhaps no period in the history of commercial horticulture in which so many changes have occurred on such an extensive scale and over so wide an area as during the period since 1920. Substantial increases have occurred in both production and consumption and important shifts have occurred in locations of the industry. Many new types and varieties have been introduced which have markedly altered consumer habits and trade customs. Great strides have been made in production methods and in harvesting and handling. Nut crops are both shaken from the tree and gathered mechanically. Modifications of this method of harvesting are used for blueberries, cherries and apricots for processing. Although not harvested mechanically, other fruits are transported and stored in large bins and boxes which reduces labour and handling costs. The results of this trend will be the groning of more fruit for processing. Higher packing standards have been almost universally adopted, and significant progress has been made in precooling, refrigeration, preripening and conditioning. The world transportation system has been revolutionized. Fast trucks, freight cars and ships designed and constructed essentially for carrying fruit play an important part, so that highly perishable products are transported over great distances to provide an abundance and a variety formerly considered impossible.

2. Vegetables. — Because of their bulk and their perishable nature, fresh vegetables do not figure prominently in world commerce as do fruits and nuts, yet large quantities are shipped into England from France. Spain and Italy, and the whole region north of the Alps receives early vegetables from the south. As canned, frozen and dried products, vegetables attain considerable importance in world commerce. In domestic commerce, however, vegetables surpass fruits in value. The sweet potato is a universal food crop in the tropics and offers much promise for development. Improvements in mechanical harvesting and handling of vegetables for processing have been rapid. Among crops handled successfully are beets, carrots, potatoes and onions. Modest success has also been realized with tomatoes and pickling cucumbers. Trends in this direction point toward further increases in vegetables grown for processing.

3. Flowers, Nursery Products and Seed. — Flowers and nursery products are relatively less important in world commerce than other horticultural crops. Nevertheless, the production of bulbs for export is of considerable importance in the Netherlands, and prior to the restrictive embargo placed by the U.S. on fruit-tree and rose rootstocks in 1930, considerable quantities of these materials were imported each year. Vegetable and flower seeds are of relatively greater importance in world trade than ornamental plants and nursery stock In California are located districts for the production of seed of onion. lettuce, carrot, radish, sweet pea, nasturtium, celery, aster and zinnia. In Washington are areas for spinach, turnip and beet seed; in Montana and Idaho, for garden pea seed; and in Indiana, for tomato seed. Denmark produces cauliflower seed; France and Italy, celery seed; England, seed of cabbage, broccoli and Brussels sprouts; and there is an important general seed-producing region at St. Rémy, France.

In domestic commerce, on the other hand, flowers, ornamentals and nursery stock are of great importance, especially in areas of older world civilization.

4. Propagation of Plants. — Horticultural plants are propagated (*i.e.*, increased in numbers) by two methods, namely, by seedage (sexual propagation) involving the formation and planting of seeds, and by vegetative means (asexual propagation) involving the use of a portion of the plant other than the seed. Propagation by seed is employed for plants which provide an abundance of seed and which can be bred readily to uniform and pure lines, as most annual flowers and many vegetables. Hybrid seed, such as that used for sweet corn, is produced by developing tno pure lines and then combining them by cross-fertilization. Such seed may produce superior yields, but seed taken from plants raised from hybrid seed should not be used for reseeding.

Seed of herbaceous plants. such as tomato. onion and zinnia. will germinate as soon as it is mature. On the other hand, seed of many wood plants must be afterripened before it will germinate. Thus, peach seed requires 12 weeks at about 41" F., under moist surroundings, and apple seed requires 8 weeks at approximately the same temperature. In nature, these conditions are provided out-of-doors in winter. Nurserymen and plant breeders either plant such seed in the early fall, or provide similar conditions by stratification in which seeds are placed in boxes or trays in alternate layers with sand, soil or peat moss and stored at temperatures of about 41° F. for the period of time required for the particular seed under treatment. (See SEED; SEED TESTING.)

Plants are propagated vegetatively from portions of leaves, stems or roots. Although in propagation by seed each plant varies somewhat from every other plant in the lot, in vegetative propagation all daughter plants are identical in genetic make-up and are also identical to the parent plant from which they are secured. This is of great importance in horticulture, since it means that a single plant with desirable characteristics can be retained and perpetuated, identical in all respects to the original. None of the common tree fruits, such as the apple, pear, cherry, plum and peach will produce true from seed; distinctive horticultural varieties, such as the Northern Spy apple and the Washington Navel orange, are propagated by vegetative means.

A combination of both seedage and vegetative propagation is common with many woody plants, such as fruit trees and roses, in which an inexpensive seedling root is raised from seed and upon which the desired variety is then budded or grafted. The portion of a plant which serves for the root or underportion is called the rootstock or stock, and the portion of a plant which is placed upon the stock is called the scion. The resulting plant is thus composed of a seedling root and a known-varietal top and may be termed a stion (combination of stock and scion). In combining a stock and a scion, various techniques are employed, all of which are a form of grafting. A common form is called budding, in which a single bud is grafted onto the stock during the active growing season, as contrasted with grafting with dormant scions in midwinter or early spring. Strains of plants which are propagated by vegetative means are called clones.

The standard rootstock upon which to propagate the apple has been crabapple seedlings grown from French-produced seed. Seedlings from seed of cultivated varieties of apple, such as Delicious and Rome Beauty are also used. Wide interest has developed in clonal, or vegetatively propagated, rootstocks, which has been intensified by the standardization and introduction of the EM rootstocks, named for the East Malling Horticultural Research station in England where they were standardized. Many of the EM rootstocks are dwarfing in nature, as EM IX (Jaune de Metz), which produces a tree 4- to 6-ft. tall. Others, in approximate ascending order of size tree which they produce, are EM VII, IV, II, I, XIII, XVI and XII, the last named producing a tree of standard size. EM VII and II are especially esteemed for commercial fruit production when a small tree is desired.

For the pear, seedlings of French-grown pears are commonly used, and, since about 1930, seedlings of such cultivated varieties as Bartlett and Winter Nelis have been employed. The oriental rootstocks have not proved generally as compatible with the more commonly cultivated varieties of pears (Pyrus *communis*), although they are superior for such a variety as Kieffer, which is a hybrid between the common pear (P. *communis*) and the sand pear (P. pyrifolia). For dwarfing, the Angers quince (Cydonia *oblonga* variety) is used, of which the EM A and B represent standardized types and EM C a very dwarfing type.

For the plum, seedlings of the myrobalan plum (*Prunus cerasifera*) are widely used. For the sweet cherry, seedlings of the wild mazzard (*Prunus avium*) are preferred; while for the sour cherry both the Mahaleb cherry (P. nzahaleb) and the mazzard are used, the former producing a tree slightly smaller, earlier-bearing and shorter-lived than the latter. For the peach, seedlings are from pits collected from wild trees ("naturals"); however, because of the gradual disappearance of wild peach trees, seed of Lovell and Muir canning peaches from California has been widely employed. Apricots are propagated upon seedlings of the Blenheim and Royal varieties; almonds, on seedlings of the bitter almond (*Prunus amygdalus* amara). The most popular rootstock for the pecan is the common pecan (Carya *illinoensis*); for the black walnut,

seedlings of the Eastern black walnut (*Juglans* nigra); and for the English walnut, seedlings of the California black walnut (J. californica).

Where the grape phylloxera (Phylloxera vitifoliae) is a problem, as with vinifera varieties of grapes (*Vitis* vinifera), resistant rootstocks are used, such as riverbank grape (*V.* riparia), sand grape (V. rupestris) and various species hybrids such as those between V. *riparia* and *V.* rupestris (no. 3306 and 3309).

The most widely used rootstock for the orange and grapefruit is the sour orange (Citrus *aurantium*), though the rough lemon is used on sandy soils and the grapefruit is used to some extent. The trifoliate orange (Poncirus trifoliata), because of its hardiness to winter cold is used along the Gulf coast areas outside the commercial citrus belt. The sweet orange is the standard stock for the lemon in California.

For the avocado, seedlings of the Guatemalan type are preferred; for the loquat, seedlings of the loquat (Eriobotrya *japonica*) or of the Angers quince; for the native persimmon, seedlings of native persimmon (Diospyros virginiana); for the Japanese or kaki persimmon, seedlings of the kaki persimmon (D. kaki) and the date plum persimmon (D. *lotus*).

Seedlings of Rosa *multiflora* are used largely for field roses, R. noisettiana Manetti and R. odorata for greenhouse roses, and R. rugosa for tree roses.

Plants may be propagated vegetatively in many ways, different methods being employed with different plant materials under different conditions and at different seasons. Thus, the quince may be propagated by hardwood stem cuttings in early spring; the strawberry by runners; lily of the valley by underground stems or rhizomes; black raspberry by tip layerage; dwarf apple by mound layerage; lychee or litchi nut by air layerage or Chinese layerage; blackberry by root cuttings; chrysanthemum by softwood stem cuttings during the growing season; sedum by leaf cuttings; and fruit trees and roses by budding and grafting.

Humidity, light, temperature, soil, rooting medium and the nature of the material itself play important parts in the method of propagation selected and the results secured. Continuous artificial mist has aided in the rooting of softwood cuttings; synthetic growth substances, such as indolebutyric acid, have increased the speed and degree of rooting; and synthetic plastic films, such as polyethylene, having proved of great value in air layerage and in propagation of cuttings. See PLANT PROPAGATION and GRAFTING (IN PLANTS) for further details.

5. Pest Control. — Pests of horticultural plants are controlled by both natural and artificial means. The development of varieties which are resistant to certain pests has become one of the important functions of plant breeding. For example, resistance to mosaic virus has been bred into red raspberries, wilt resistance into tomatoes, powdery mildew resistance into canteloupe and nematode resistance into peach understocks. Artificial controls include crop rotation, purification and grading of seeds, soil cultivation, sanitation, soil fumigation, placing of mechanical guards as protection against rodents and spraying, dusting and dipping with various fumigants, fungicides and insecticides.

Common insecticides include arsenate of lead, used as a stomach poison against chewing insects; nicotine, pyrethrum, rotenone, dinitro compounds and oils, used as contact insecticides; and hydrocyanic acid, carbon disulfide, paradichlorobenzene. ethylene dichloride. used as fumigants. Common fungicides include various sulfur compounds, bordeaux mixture and copper and mercury compounds. Intensive industrial research continues to develop many organic compounds which, in many instances, are replacing some of the old, standard materials enumerated above.

Pest control has become a highly specialized and essential part of the production of many horticultural crops. Mobile spray equipment has been developed which is tractor drawn and which may deliver 30 to 50 gal. a minute at 600-lb. pressure from tanks of 600- to 800-gal. capacity. With air-blast equipment, concentrated spray may be successfully applied with one-half, one-third or even one-tenth the standard amount of water. The airplane and helicopter are effective in the application of dusts and concentrate sprays, especially to row crops of vegetables and small fruits. Control of weeds is dealt with in the article WEED. For more detailed information on plant diseases and garden pests see PLANT DISEASES; ENTOMOLOGY.

Foliar nutrients and plant regulators for blossom thinning, prevention of preharvest drop and control of colour and maturity are also applied with spray equipment. (See SPRAYS AND DUSTS IN AGRICULTURE.)

6. Harvesting and Storing. — The time of harvest is dependent upon the nature of the crop itself, the use which is to be made of it and the facilities for storage. Beans are harvested in the green, immature stage when used as snap beans, but are left until full maturity when used as hard-shell beans. Daffodils are harvested when half open, roses, peonies and poppies in early bud stages and chrysanthemums, China asters and zinnias when fully open. Apples, pears and peaches for commercial shipment are harvested when the green fruit takes on a slightly yellowish tinge. In commercial fruit operations, careful inspections are made to determine the correct time to harvest; for if the fruit is harvested prematurely it will shrivel in storage, and if it is left too long on the tree it will lack long-storage qualities. Among the indexes of maturity are changes in colour, changes in the pressure required to puncture the flesh as measured by a mechanical pressure tester, and the predetermined time interval between full bloom and the usual harvest season.

Both common storage and artificial cold storage are used for horticultural products. Common storage depends upon natural outdoor temperatures and is provided by basement storage rooms in residences, by boxes or barrels sunk into the ground and by specially designed pits, caves and ventilated buildings. Cold storage is provided by refrigeration in specially constructed and insulated buildings. By the use of sealed chambers in which the concentration of carbon dioxide and other gases in the atmosphere is controlled and regulated, great improvement has been made in the storage life and quality of certain produce. Certain growth regulators, such as maleic hydrazide, applied to onion and potato plants several days prior to harvest, have inhibited sprouting and markedly lengthened the storage life of these vegetables. Large quantities of fruits and vegetables are also stored frozen.

V. SCIENTIFIC HORTICULTURE

Great development has occurred in the application of science to horticulture, particularly since 1900, which is reflected in horticultural organizations. For example, in 1849 in the U.S.. the American Pomological society was formed and focused its attention largely upon varieties of fruits, their performance and adaptation. In 1903 the American Society for Horticultural Science was formed and was concerned with the application of science to horticulture. Emphasis was placed first upon fruits; next, beginning about 1920, upon vegetables; and then, beginning about 1930, upon ornamentals and nursery crops.

The commercial application was the force initially responsible for the introduction of modern science to horticulture. Later, however, horticultural research institutions, given good financial backing, began to support much fundamental work in the theoretical plant sciences.

Among some of the applications of science to horticulture may be mentioned: *photoperiodism*—in which chrysanthemums, typically flon-ering during the short days of autumn, are induced to flower at any month of the year by prolonging day length with artificial lighting and shortening day length with black cloth, as desired (see FLOWER: *Commercial* Flower *Growing*); photosynthesis—in which it has been found that lime-sulfur sprays reduce photosynthetic activity in comparison with the milder, wettable sulfur sprays; carbolzydrate-nitrogen relation—in which the relation of carbohydrates to nitrogenous compounds within the plant is correlated with vegetative growth and with fruiting; *genetics* and plant breeding—in which varieties are produced to meet desired specifications, such as season of fruit ripening and disease resistance. Further applications of scientific findings derive from studies of: developmental morphology—explaining the changes which occur in developing fruits and the relation of these changes

to commercial fruit culture; mineral deficiencies — including the correction of internal corking of apples by the use of boron and the control of rosette of citrus by zinc; *hormones*—including the use of such growth-regulating substances as indoleacetic acid, indolebutyric acid, naphthaleneacetamide and others to promote the setting of fruits without fertilization, to thin blossoms, to hasten the rooting of cuttings, to increase fruit size, to prevent preharvest fruit drop and to prolong dormancy; *physiology of* storage — including storage of fruits and vegetables in atmospheres of relatively high concentrations of carbon dioxide; and physiology *of* ripening — involving the ripening of bananas under controlled temperatures, colouring of oranges with ethylene gas, removal of leaves from rose plants in storage by ethylene gas, ripening of pears at controlled temperatures and use of chemicals to prevent decay and to regulate rate of ripening. (*See* PLANTS AND PLANT SCIENCE.)

1. Research Agencies. — Horticultural research is conducted for the most part by public institutions, though private support is supplied to some degree by organizations dealing in such commercial crops as pineapples, flower seeds and roses, which support their own research workers and laboratories. Further, support is provided to established public institutions through private endowments and grants-in-aid, usually to work upon some special problem which is of importance to the donor. In most countries, horticultural research is a part of a larger research organization, yet the relative emphasis placed upon horticultural crops by some has made them outstanding in the field.

In the U.S., horticultural work is conducted at the various state experiment stations and land-grant colleges throughout the country, supported in part by state funds and in part by federal funds. Among these, the following stations may be specially mentioned for their interest in horticultural work: Massachusetts (pomology); New Jersey (pomology, peach breeding, floriculture); New York, at Ithaca (pomology, vegetable crops, floriculture, ornamental horticulture), at Geneva (systematic pomology, truck crops, fruit breeding, rootstocks); Ohio (pomology, vegetable crops, floriculture, ornamental horticulture); Michigan (pomology, fruit breeding, floriculture, ornamental horticulture, vegetable crops); Indiana (pomology, vegetable crops); Minnesota (fruit breeding); Iowa and South Dakota (breeding of hardy fruits); Oregon (pomology); Washington (pomology); California, at Davis (pomology, vegetable crops), at Riverside (citrus); Hawaii (tropical fruits, pineapple); Pennsylvania (pomology, floriculture, vegetable crops); Illinois (fruit breeding, floriculture, vegetable crops); Louisiana (vegetable crops); Texas (citrus); and Puerto Rico (vegetable crops). The U.S. department of agriculture expanded its work in horticulture markedly after 1930. Its research centre at Beltsville, Md., is linked with branch stations and works in co-operation with state institutions in all parts of the country.

In England, important contributions have been made on storage and transportation of horticultural crops at the Low Temperature Research station at Cambridge university. The Cheshunt Experimental and Research station has carried on experimental work with greenhouse crops such as tomatoes, cucumbers and chrysanthemums. The East Malling Horticultural Research station has made important contributions in general pomology, pathology, pest control and hop culture, and is internationally recognized for the standardization and propagation of rootstocks for fruit trees. The John Innes Horticultural institution has concerned itself largely with genetics and plant breeding. The Long Ashton Agricultural and Horticultural Research station, University of Bristol, which began as the National Fruit and Cider institute, has expanded its endeavours to include general fruit culture, and has made notable contributions on cider making, fruit nutrition and pathology. At the trial grounds of the Royal Horticultural society at Wisley valuable work has been done on general horticultural problems.

Research stations doing horticultural work are also maintained in China, Japan, India, the U.S.S.R., Israel, Egypt, Argentina, New Zealand, Australia, South Africa and Canada. The Canadian experimental work is centred at the Dominion Experimental farms at Ottawa, Ont., and is linked with branch farms and stations located in the various provinces, as Kentville, N.S.; Vineland, Ont.; and Summerland, B.C.

2. Horticultural Education and **Organization.**—Horticulture is a recognized subject for a degree at many colleges and universities. In the U.S. and Canada, the development of horticultural courses and institutions has been very rapid. High schools employ teachers of vocational agriculture who give courses in horticulture. In addition, there are state and county schools of agriculture in some states (New York, California, Wisconsin) where horticulture is taught.

The land-grant colleges and state universities have developed special departments of horticulture and often special departments of pomology, vegetable crops, floriculture and ornamental horticulture. They maintain extensive orchards, greenhouses and laboratory facilities and affiliated substations in the more intensive commercial horticultural areas where students may work, study and supplement academic training with practical experience. The B.S. degree is given upon completion of the course and some institutions offer the M.S. degree and the Ph.D. degree.

Among institutions which have well-developed specialized courses in horticulture offering advanced degrees are: the University of Massachusetts, Amherst; Cornell university, Ithaca, N.Y.; Ohio State university, Columbus: University of Maryland, College Park, Md.; Michigan State university, East Lansing; Rutgers university, New Brunswick, N.J.; University of Illinois, Urbana; Iowa State University of Science and Technology, Ames; Purdue university, Lafayette, Ind.; University of Missouri, Columbia; University of Wisconsin, Madison; University of Minnesota, Minneapolis; University of California, Davis; Washington State university, Pullman; Oregon State college, Corvallis; Ontario Agricultural college, Guelph; University of British Columbia, Vancouver; and MacDonald college of McGill university, Ste. Anne de Bellevue, Que. In addition, the basic sciences, such as botany, chemistry, geology and zoology, in many leading universities have been oriented so as to attract students seeking a basic scientific training which may be applied in the horticultural field. Among such institutions are Harvard university, Columbia university, The University of Chicago, University of Toronto, and McGill university, Montreal, Que.

In Great Britain, horticultural courses for degrees are given at the universities of Leeds, London (Wye college), Cambridge and Reading. Horticultural work toward advanced degrees is offered by the Long Ashton Agricultural and Horticultural Research station, the East Malling Horticultural Research station, and by other similar centres in affiliation with accredited colleges and universities. Horticultural courses are given at the Midland Agricultural college, East Anglian institute, Chelmsford and at the farm schools of many county councils. The Royal Horticultural society has a school at the horticultural gardens at Wisley. Each British county council employs one or more skilled horticulturists to teach in the village. Kew gardens, Surrey, has an international reputation in the training of gardeners.

In France, Belgium, the Netherlands and Europe generally, the land and agricultural schools give special courses in horticulture, and a well-developed trade school and apprentice system has been established, as at the École Nationale d'Horticulture de Versailles in France.

Public Parks and Arboretums. — Public parks and arboretums are no longer merely recreational areas and botanical collections. The trend has been toward horticultural treatment. Low spots may be accentuated by groupings of low plants, and high spots by arrangements which accentuate height. Certain formal areas may be devoted to lilac plantings or to rose gardens, a rocky wall may become walled with rhododendrons, slopes may be covered with shrubs, one area may be devoted to flowering magnolias, and another area may be devoted to conifers. Trials are held of flowering plants such as roses, irises, gladioluses, dahlias, peonies, tulips and narcissuses.

Most large cities and many of the smaller ones have attractive parks which show this horticultural influence, including Boston, New York, Washington, D.C., Philadelphia, Rochester, N.Y.,

Chicago, San Francisco, Edinburgh, London, Paris, Vienna, Berlin, Ottawa, Montreal, Sydney and Melbourne.

The Arnold arboretum at Jamaica Plain, Mass., is world renowned. Highland and Durand-Eastman Park arboretum at Rochester, N.Y., is recognized for its displays of lilacs, rhododendrons and azaleas. Golden Gate park in San Francisco presents a wide display of excellent horticultural plant material. Other outstanding parks and arboretums showing the horticultural touch are Morris arboretum, Philadelphia, Pa.; Morton arboretum, Lisle, Ill.; the Brooklyn Botanic garden, Brooklyn, N.Y.; the New York Botanical garden, New York city; Longwood gardens, Kennett Square, Pa.; and Kingwood Center, Mansfield, O. As populations increase, the trend is for individuals to develop small private gardens, which are supplemented by an increasing number of large public gardens and arboretums. (*See* ARBORETUM; BOTANICAL GARDEN)

Horticultural Organizations. — Horticultural organizations, through meetings, publications and trial grounds, are of great importance in horticultural education. These are of three main types, namely, general, official and trade. The general organization takes the form of national horticultural societies with numerous smaller, local affiliated societies. The Royal Horticultural society, London, founded in 1804, has more than 35,000 fellows and associates. Similar national bodies exist in most European countries. In the U.S. there is no general organization of this kind; instead, there are more than 1,500 local societies based upon geography and upon particular crops, as the Vegetable Growers Association of America, the Massachusetts Fruit Growers' association and the American Rose society.

International horticultural congresses have been held from time to time under arrangements made by international committees consisting of members nominated by various governments, as follows: Paris, 1889; Chicago, 1893; Paris, 1900; Paris, 1905; Brussels, 1910; Ghent, 1913; Amsterdam, 1923; Vienna, 1927; London, 1930; Paris, 1932; Rome, 1935; Berlin, 1938; London, 1952; The Hague-Scheveningen, 1955; and Nice, 1958. An International Society for Horticultural Science was formed in 1958 with permanent headquarters at The Hague.

Trade associations are numerous and are concerned with protecting and informing their memberships as the International Apple association, American Association of Nurserymen and the Society of American Florists and Ornamental Horticulturists.

(*See* HORTICULTURE AND BOTANY, SOCIETIES OF.)

Publications. — Journals and periodicals of special horticultural interest are: American Fruit Grower; American Nurseryman; American Vegetable Gardener; Blue Anchor (California); Florist's Exchange and Horticultural Trade World (U.S.); Fruit World (Australasia); Gardeners' Chronicle (England); Gartenbauwissenschaft (Germany); Horticulture (U.S.); Journal of Horticultural Sciences (England); Journal of the Royal Horticultural Society (England); Proceedings of the American Society for Horticultural Science; Revue Horticole (France); reports and bulletins of research institutions, government agencies, colleges and experiment stations; transactions and proceedings of special subject societies and local horticultural societies as the American Rose society, Northern Nut Growers association, New York State Horticultural society, Pennsylvania Horticultural society, Massachusetts Horticultural society and Minnesota Horticultural society.

HORTICULTURE AND BOTANY, SOCIETIES OF.

Only strictly botanical and horticultural societies and their dates of founding, together with their publications, are listed below. Museums, botanic gardens and educational institutions publishing botanical or horticultural journals are not included. Academies of science within the various countries are not usually included.

Many of the following societies do not have permanent addresses; they are centred where their editors and officers are located. For up-to-date locations see the latest editions of The World of Learning and (especially for the U.S. and Canada) Union List of Serials.

BULGARIA: Botanicheskiya Institut, Bulgarska Akademiya na Naukite (1947), Izvestiya na Botanicheskzya Institut (Botanical institute, Bulgarian Academy of Sciences, Bulletin of the Botanical institute); Bulletin de l'Institut.

HORUS (Egyptian HOR), an Egyptian sky-god in the form of a falcon whose eyes were the sun'and the moon. The falcon therefore was sacred to him, and Horus' name was usually written with the figure of this bird  . Originating probably in the delta of the Nile. the cult of Horus spread in prehistoric times over the whole of Egypt. Thus there arose several distinct falcon gods, particularly at Nekhen (Gr. Hierakonpolis, "falcon-town"), which was the capital of the upper Egyptian kingdom before the country was unified and the site of which is opposite the modern el-Kab; and at Edfu (Egyptian Behdet), where Horus, called there "the Behdetite," assumed the form of a winged sun disk. At Nekhen the conception arose that the reigning king was an incarnation of Horus and, after Egypt had been united by the kings from Nekhen, this conception became a generally accepted dogma. The first of the Egyptian king's five names was the Horus name; *i.e.*, the name which identified him with Horus.

With the god Setekh of Ombos in upper Egypt Horus lived in peace during the first dynasties as a partner in a joint incarnation of the king; Setekh remained the representative of upper Egypt, while Horus represented lower Egypt. Not later than the end of the 5th dynasty, however (*c.* 2425 B.C.), the cult of Osiris spread over Egypt, and Horus was introduced into the Osiris cycle. The deceased king having been by then identified with the god Osiris and the living and reigning king being an incarnation of Horus, Horus became the son of Osiris and of the goddess Isis, Osiris' sister-wife. As such he now became an opponent of Setekh, the murderer of Osiris and the contestant of Horus' heritage. the royal throne of Egypt. According to the myth Horus defeats Setekh, thus avenging his father and assuming the rule. In the fight his left eye (*i.e.*, the moon) was damaged—this being the mythological explanation of the moon's phases—and was healed by the god Thoth. The figure of the restored eye (zrdjat-eye) became a powerful amulet. After the battle, Horus mourned Osiris and conducted his funeral rites.

In later times Horus appeared as a local god in many places and under different names and epithets: as Harmachis (Har-em-akhet, "Horus in the horizon"); as Harpocrates (Har-pe-khrad, "Horus the child"); as Harsiesis (Har-si-Ese, "Horus, son of Isis"); at Kom Ombo as Haroeris (Har-wer, "the elder Horus" as distinct from "Horus the child"); at Dendera as Harsomtus (Har-sem-tow. "Horus, the unifier of the Two Lands"); and as Harendotes (Harend-yotef, "Horus, protector of his father"). Horus was identified by the Greeks with Apollo, and Edfu was called Apollinopolis ("Apollo's town") in the Greco-Roman period. Horus harpooning his enemy Setekh in the form of a crocodile was a potent magical figure and seems to have served as the model for St. George killing the dragon.

See S. A. B. Mercer, ***Horus,*** *Royal God* of *Egypt* (1942). (J. ČÝ.)

HOSANNA. A word cried in salutation of Christ when He entered Jerusalem (Mark xi, 9 *sq.;* Matt. xxi, 9, 15; John xii, 13). We find in Ps. cxviii, 25, *Hōshī'āh nā* ("Save, Oh!") and in Ps. lxxxvi, 2, the shortened form *Hōsha'*. In Zech. ix, 9, the Messiah is said to be *nōsha'* ("saved" or "victorious") and thus to enter Jerusalem on an ass. Perhaps the multitudes, and certainly the primitive Christians (Matt. xxi, 5, 9), connected the cry of Hosanna with this. In John xii, 13, it may have to do with the palm branches in the hands of the multitude who went out to meet Him. For the term Hosanna is used (Bab. Talmud *Sukka* 30 b) of the festive posy (*lulab*, a palm shoot, myrtle and willow) carried with a citron (*ethrog*) on the Feast of Tabernacles, and possibly at the original Feast of the Dedication (II Macc. x, 7). The origin of this custom is unknown and perhaps goes back to a primitive celebration in nature worship. (A. L. W.)

HOSEA, BOOK OF is one of the Old Testament books of the Latter Prophets, and the first of the Book of the Twelve or Minor Prophets (Hosea [Osee in the Douai version], Joel, Amos, Obadiah, Jonah, Micah, Nahum, Habakkuk, Zephaniah, Haggai, Zechariah and Malachi). Ch. i is the account of Hosea's marriage to Gomer and the birth of his three children. Ch. iii is generally taken as the story of the prophet's remarriage to Gomer after he had divorced her, symbolizing the reconciliation of Israel after the judgment. The rest of the book consists of oracles of judgment on Israel, primarily for its religious apostasy, with occasional predictions of redemption and restoration and pleas to repent.

Times and Life of the Prophet.—Hosea began to prophesy during the prosperous reign of Jeroboam II of Israel (*c.* 786–746 B.C.), when Israel's borders extended from Lebo-hamath (Revised Standard Version: "the entrance to Hamath") in Syria to the Sea of the Arabah (the Dead sea; *see* II Kings xiv, 23–27). Ch. i–ii (iii) come from this period. Ch. iv ff. come from the period of confusion and regicides that followed (*cf.* iv, 1–3; vii, 7). Jeroboam's son, Zechariah, reigned only six months, and his murderer, Shallum, only one month. Hosea may have continued to prophesy through the reigns of Menahem and Pekahiah into the reign of Pekah, whose alliance with Rezin of Damascus brought Tiglath-pileser III of Assyria against Israel, *c.* 734–732 B.C. (*see* v, 8–11, *13*; compare II Kings xv, 29; xvi, 5–9). Hosea was thus a contemporary of Amos and Isaiah.

In contrast with the meaning of his own name, Hosea ("Deliver" or "Save") began with a message of judgment, evidenced in the names he gave his children—Jezreel, Not pitied and Not my people. He was a native of the kingdom of Israel and perhaps did most of his prophesying at the Bethel sanctuary, as did the Judean prophet Amos. Much obscurity surrounds his marriage. To dramatize Israel's apostasy (harlotry), Hosea married Gomer, "a

woman of harlotry" (a cult prostitute?), and gave symbolic names to the children. Variant answers are given to the following questions raised by ch. i–iii: (1) Was Gomer a harlot before her marriage? (2) Was Gomer faithless to Hosea after her marriage? (3) Was Hosea the father of the children? (4) Does the Lord's divorce of his faithless wife Israel in ii, 2 imply that Hosea had divorced Gomer? (5) Is Gomer the adultress bought by the prophet for a price in ch. iii? (6) Is ch. iii a sequel to ch. i, or is it the prophet's own account of his marriage, in contrast with the biographer's account in ch. i? (7) Does ch. iii refer to Gomer's life of shame before her marriage? (8) Does ch. iii recount a second marriage of Hosea? (9) Is ch. i or ch. iii an allegory, not an actual incident? (10) Is ch. iii a postexilic allegory, the editor using autobiographic style (cf. Jer. xvii, 1 ff., also editorial)? (11) Should iii, 1 be translated, "And the Lord said to me again, 'Go, love a woman . . .'"? Most scholars assume that in divorce and remarriage Hosea learned or expressed the love of God for wayward Israel. The data remain inconclusive.

Themes of the Book of **Hosea.**—*Judgment* From a God of Love.—The historic love of God for Israel is a central premise of the prophet. When Israel was a child, the Lord loved him, carrying him in his arms, leading him with cords of compassion, with bands of love (xi, 1–4). The names of Hosea's children, Not pitied and Not my people, imply an earlier time when the Lord was compassionate and regarded Israel as his people. Israel, as the Lord's wife, had been showered lavishly with the good things of the earth (ii, 8). Israel was to him like the cherished first fruits of the fig tree, like grapes in the desert (ix, 10). Only reluctantly the Lord brings judgment; he is pained that Israel forced him to bring retribution, for he would prefer to be Israel's healer (vi, 4, 11b; vii, 1, 13). The God of love is naturally prominent in the oracles of hope: the Lord loves the people of Israel despite their sins and will take Israel to himself (iii, 1–3), speaking tenderly to her and bethrothing her to himself forever (ii, 14, 19–20); his compassion grows warm and tender, and his sons will return to their homes, and he will love them forever (xi, 8–11; xiv, 4).

But judgment must come on faithless Israel. The Lord had warned Israel but received only bitter provocation (xii, 10–14). He cannot ransom or redeem them from their deserved fate, and compassion is now hidden from his eyes (xiii, 14). He will no longer have pity and will love them no more (i, 8; ix, 15). Repentance comes too late (v, 6; vi, 1–4). The Lord will be as a moth or dry rot to Israel (v, 12), as a lion rending its prey (v, 14), as a lion or leopard lurking by the road, as a bear robbed of its cubs (xiii, 8). He will catch them like birds in his net (vii, 12). He will drive them from his house (ix, 15). The land will be devastated of its produce (ii, 9, 12; viii, 7; ix, 2, 6, 16). The trumpet of war will sound against Israel and the sword rage against its cities (v, 8; xiii, 16). Israel's kings will be killed and the kingdom come to an end (i, 4; vii, 7; x, 15). Israel will return to slavery in Egypt and eat unclean food in Assyria (vii, 16; viii, 13; ix, 3, 6; xi, 5; xii, 9). Israel is destined for prey, bereavement and exile (ix, 12–16). The sanctuaries will be devastated and abandoned (x, 2, 8; xii, 11), and the calf image at Bethel will be carried into exile (viii, 5; x, 5, 6).

Apostasy of *Israel.*—Whereas Amos (*q.v.*) was concerned primarily with Israel's disobedience of the ethical requirements of the covenant, the injustice and oppression in the social order, Hosea's chief care was Israel's worship of pagan gods and the licentious fertility cult practices. In Hosea the term harlotry designates both the apostasy of Israel, the wife of the Lord, and participation in the cult prostitution rites. The worship of Baal, the Canaanite god of rain (ii, 8; vii, 16; ix, 10; xiii, 1), and the Baals, the various Canaanite deities (ii, 13, 16; xi, 2), is harlotry. The calf image at Bethel, although part of the cult of the Lord, is condemned as idolatry (viii, 5–6; x, 5–8). Israel (Ephraim) was joined to idols (iv, 17). Wine flowed too freely at the sanctuaries (iv, 11, 18). The shrines flourished, but the Lord took no pleasure in the sacrifices (vi, 6; viii, 11–13; ix, 4; x, 1–2). Guilty priests misled the people (iv, 4–10; v, 1; vi, 9), and the prophets were corrupted (ix, 7–8). Israel had transgressed the law and broken the covenant (viii, 1). There was no true knowledge of the Lord (iv, 1, 6; v, 4; vi, 6; viii, 2; xi, 3). Ethical evils also are condemned, including lying, killing, stealing, adultery, empty oaths, false balances and land grabbing by the princes (iv, 2, 13; v, 10; vi, 9; vii, 1, 4; xii, 7). The wicked kings are called to account (v, 1; vii, 3–7; viii, 4; x, 7; xiii, 10, 11). Like the later prophets, Hosea decried dependence on foreign alliances for the salvation of Israel (v, 13; vii, 8–12; viii, 9–10).

Forgiveness and Restoration.—The message of the Book of Hosea culminates in its picture of reconciliation and restoration of Israel. Israel will return to her husband (ii, 14–23; iii, 1–5; cf. Isa. 1, 1–2). The exiles will come back from the lands of the Dispersion (xi, 10–11). As in Deutero-Isaiah the return from Exile is pictured as a second Exodus (ii, 14–15; cf. Isa. xliii, 16 ff.; xlviii, 20–21; li, 9 ff.). A covenant will be made with wild animals, birds and creeping things (ii, 18). War will be abolished (ii, 18; cf. Isa. ii, 4), and the land will be fruitful (ii, 21–23; xiv, 4–7). The government will be in the hands of the Davidic Messiah (i, 11; iii, 5). There will be no more reliance on foreign help or idols (xiv, 3, 8). In the style of wisdom literature, a separate editorial addition at the end of the book admonishes him who is wise to understand these things, for the ways of the Lord are right.

Literary History.—By the time the Book of the Twelve took its final form in the late postexilic period, the prophetic writings had undergone expansions, additions and changes. The literary form of the book of Hosea suggests it is a compilation; ch. i is biographical, ch. ii, iv–xiv a collection of poetic oracles and ch. iii autobiographical. The superscription (i, 1), giving data about the prophet, is editorial. Other editorial activity was in part an adaptation of the prophet's message to the needs and ideals of the postexilic community. It is found largely in the oracles of hope and restoration, some of which seem out of context and reflect more obviously than others the background and diction of the later period. A few scholars consider most or all of such passages to be late. Editorial activity may also be seen in the references to Judah, extending Hosea's message to include Judah or excluding Judah from some of Hosea's bitterest condemnations; in v, 12–14; vi, 4; viii, 14 Judah has been substituted for an original Israel or Ephraim. The Hebrew text is often corrupt, but the Greek and Syriac versions particularly give some help in its reconstruction. See also BIBLE.

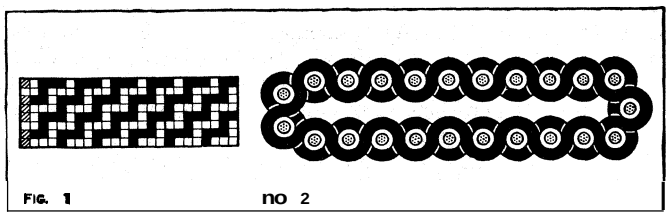
HOSE-PIPE, or simply "hose," the name given to flexible piping by means of which liquid (generally water but occasionally petrol, etc.) may be conveyed. One end of the pipe is connected to the source of the water, while the other end is free, so that the direction of the stream of water which issues from the pipe may be changed at will. The method of manufacture and the strength of the materials used depend naturally upon the particular use to which the finished article is to be put. Simple garden hose is often made of india-rubber or composition, but the hose intended for fire brigade and similar important purposes must be of a much more substantial material. The most satisfactory material is the best long flax, although cotton is also extensively used for many types of this fabric.

The flax fibre, after having been carefully spun into yarn, is boiled twice and then beetled; these two processes remove all injurious matter, and make the yarn soft and lustrous. Several threads may be twisted together to secure uniformity and strength, and then the compound yarns are wound on to large bobbins, and made into a chain or warp; the number of threads in the chain depends upon the size of the hose, which may be anything from half

an inch to 15 in. or even more in diameter. When the chain is warped, it is beamed upon the weaver's beam, and the ends—either double or triple—are drawn through the leaves of the cambs, healds or heddles, passed through the reed and finally tied to the cloth beam. The preparation of the warp for any kind of loom varies very little, but the weaving may vary greatly. In all cases the hose fabric is essentially circular, although it appears quite flat during the weaving operation.

There are very few hand-made fabrics that can compete with the machine-made article, but the very best type of hose-pipe is



FIGS. 1 AND 2.—COMMON DESIGNS IN WEAVING SEAMLESS HOSE-PIPES
Point-paper design (left) and (right) diagrammatic section of cloth

certainly one of the former class. The cloth can be made much more cheaply in the power-loom than in the hand-loom, but, up to the present, no power-loom has been made which can weave as substantial a cloth as the hand-loom product; the weak part in all hose-pipes is where the weft passes round the sides from top to bottom of the fabric or vice versa, that is, the side corresponding to the selvages in an ordinary cloth; the hand-loom weaver can draw the weft tighter than is possible in the power-loom, hence the threads at the sides can be brought close together, and by this means the fabric is made almost, but not quite, as perfect here as in other parts; in addition, the ends of weft can be made to overlap in hand-loom weaving—thus preventing a weak spot. It is essential that the warp-threads be held tightly in the loom, and to secure this, they pass alternately over and under three or four back rests before reaching the heddles or cambs, which are almost invariably made of wire. Although the warp yarn is made very soft and pliable by boiling and beetling, the weaver always tallows it in order to make it work more easily.

Structure of Fabric.—The commonest type of hose-pipe is made on the double-plain principle of weaving, the cloth being perfectly plain but woven in such a manner that the pipe is without seams of any kind. Fig. 1 is a design showing two repeats or eight shots in the way of the weft, and six repeats or 24 threads in the way of the warp, consequently the weave is complete on four threads, or leaves, and four picks. Fig. 2 illustrates the method of interlacing the threads and the picks: this figure shows that 23 threads only are used, the first thread—shown shaded in fig. 1—having been left out. It is necessary to use a number of threads which is either one less or one more than some multiple of four—the number of threads in the unit weave. The sectional view (fig. 2), although indicating the crossing of the warp and the weft, is quite different from an actual section through the threads: the warp is almost invariably two, three or more ply, and in addition two or more of these twisted threads pass through the same heddle-eye or mail in the camb; moreover, they are set very closely together—so closely, indeed, that the threads entirely conceal the weft; it is, therefore, impossible to give a correct sectional view with satisfactory clearness, as the threads are so very rank, but fig. 3 gives some idea of the structure of the fabric. This view shows ninety-nine threads and one complete round of weft; this round is, of course, equal to two picks or shots—one pick for the top part of the cloth and one for the bottom part. A comparison of this figure with fig. 2 will, perhaps, make the description clearer. The weft in fig. 3 is thinner than the warp, but, in practice, it is always much thicker, and may consist of from two to seventy threads twisted together.

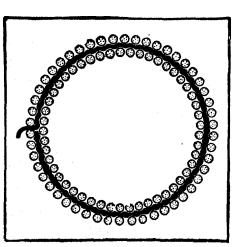


FIG. 3.—SECTION THROUGH WARP OF HOSE-PIPE SHOWING 99 THREADS AND ONE COMPLETE ROUND OF WEFT

Hose-pipes are also woven with the three-leaf twill on both sides, and occasionally with the four-leaf twill. These pipes, woven with the twill weaves, are usually lined with a pure rubber tube which is fixed to the inside of the cloth by another layer of rubber after the cloth leaves the loom. Such pipes have usually, but not invariably, a smoother inner surface than those which are unlined, hence, when they are used, less friction is presented to the flow of water, and there is less tendency for the pipe to leak. They are, therefore, suitable for hotels, public buildings and similar places where their temporary use will not result in undue damage to articles of furniture, carpets and general decoration.

The greatest care must be observed in the weaving of these fabrics, the slightest flaw in the structure rendering the article practically useless. After the cloth has been woven, it is carefully examined, and then steeped in a chemical solution which acts as an antiseptic. The cloth is thus effectively preserved from mildew, and is, in addition, made more pliable.

Finally the hose-pipe is dried artificially, tested for strength and resistance to pressure of water, and finally, fitted with the necessary couplings and nozzles.

HOSHANGABAD, a town and district in the Jubbulpore division of Rfadhya Pradesh, India. Pop. (1951) 14,989.

Founded by Hoshang Shah, a Malwa king, in the 15th century, the town came to prominence after its capture by Bhopal in 1720. Between then and 1818, when it came under British rule, it was the scene of many conflicts between the Marathas and the Bhopal rulers. It has never been a big trading centre but has enjoyed some importance as the district headquarters. and its position on the left bank of the Narbada river and on the Western railway (Indian Midland section) is a favourable one. It is 40 mi. S.S.E. of Bhopal city.

HOSHANGABAD DISTRICT (5,864 sq.mi.; pop., 1951, 847.898) lies in the Narbada valley between the Vindhyas on the north and the Satpura range on the south. The central plain contains rich black soil, wheat being the principal crop. The Western railway from Bombay to Jubbulpore runs up the valley, and at Itarsi, near Hoshangabad, two branches take off, the northern to Delhi through Bhopal and Gwalior, the southern to Nagpur across the Satpuras. The district had a wheat boom in 1888, and in 1891 its population was 493,000, but bad years followed by plague and influenza caused a serious temporary decline; the people later, however, became prosperous. Cotton is grown in the west. and in the poorer tracts in the south and east there are millets and oilseeds. Apart from these it is one of the principal wheat-growing districts of the state.

Wheat, cotton and oilseeds are largely exported. Dyeing, brasswork and weaving are the chief local industries. There is a large area of government forest on the south, and the Bori teak forests are very valuable.

The town of Harda, in the west, had a population of 18,640 in 1951.

HOSHEA (Heb. for "deliverance"), the last king of Israel, in the Bible. The attempt of his predecessor, Pekah, to take Jerusalem with the help of his ally Rasun (Rezin) of Damascus was frustrated by the intervention of Tiglath-Pileser III *(see* AHAZ), who attacked Gilead, Galilee and the north frontier and carried off some of its population (*cf.* I Chronicles v, 26). Pekah's resistance to Assyria led to a conspiracy in which he lost his life. and Hoshea the son of Elah became king (II Kings xv, 27–30). The Assyrian king held him as his vassal (and indeed claims to have set him on the thronej and exacted from him a yearly tribute. After the death of Tiglath-Pileser, Israel regained confidence (Isaiah ix, 8–x, 4) and took steps to recover its independence. Its policy vacillated—"like a silly dove" (Hosea vii, 11)—and at length negotiations were opened with the Egyptian So, possibly Shabaka or one of the Delta princelets. The annual payment of tribute ceased, and Shalmaneser V (who began to reign in 727 B.C.) invaded Israel, imprisoned Hoshea and laid siege to Samaria, which fell at the end of three years (722 B.C.). The achievement is claimed by his successor: Sargon. The land was again partly de-

populated and a governor appointed (II Kings xviii, 9–12; cf. xvii, 1 et seq).

For other allusions to this period see HOSEA; ISAIAH.

HOSHIARPUR, a town, tehsil (subdivision) and district in Punjab, India. Pop. (1951) 45,291. The town. 40 mi. N. of the railway centre of Ludhiana, was founded, according to tradition, about the early part of the 14th century. In 1809 it was occupied by Ranjit Singh. There are manufactures of cotton goods. inlaid woodwork, lacquered ware, shoes and copper vessels. The town contains three colleges of Panjab university.

HOSHIARPUR TEHSIL (572 sq.mi.) had a population in 1951 of 274,126.

HOSHIARPUR DISTRICT has an area of 2,227 sq.mi.; pop. (1951) 1,091,986. It falls into two nearly equal parts of hill and plain country. Between the two chains of hills on the east stretches a valley of uneven width, known as the Jaswan Dun. Its upper part is crossed by the Sohan torrent, while the Sutlej sweeps into its lower end through a break in the hills and flows in a southerly direction till it turns the flank of the central range and debouches westward upon the plains. This western plain consists of alluvial formation, with a general westerly slope as a result of the deposit of silt from the mountain torrents in the submontane tract. Rice is largely grown in the marshy flats along the banks of the Beas. Religious fairs are held at Anandpur, Mukerian and Chintpurni which attract an enormous concourse of people. Cotton fabrics are manufactured. and sugar, rice and other grains, tobacco and indigo are produced.

The country around Hoshiarpur formed part of the old Hindu kingdom of Katoch in Jullundur. The state was eventually broken up, and the present district was divided between the rajas of Ditarpur and Jaswan.

They retained undisturbed possession of their territories until 1759, when the rising Sikh chieftains began a series of encroachments upon the hill tracts. By the end of 1818 the whole country from the Sutlej to the Beas had come under the government of Lahore. and after the first Sikh war of 1845–46 it passed to the British government.

HOSIERY. Hosiery is a covering for the legs and feet. (In Great Britain the word "hosiery" is used to include all types of knitted fabrics, whereas in the United States hosiery is restricted to mean socks, stockings, and other coverings for the legs and feet.) Hosiery is made to fit the feet and legs of all ages, short hose for children being known as socks, long hose, as women's stockings, while stockings for men are known as half-hose. Hosiery, almost without exception, is formed of looped fabric, of which there are two generic types — weft fabric and warp fabric. In weft fabric, as shown in fig. 1, the yarns of which the loops are formed extend crosswise of the fabric, whereas in warp fabric the yarns of which the loops are formed cross at an angle, as shown in fig. 2. Generally speaking, all the loops of a given area of weft knitted fabric are formed of one yarn, while in warp fabric many yarns are used as each vertical series of loops is formed of a separate yarn. In the fabric diagram shown in fig. 1, the front of the fabric is uppermost, with the last course formed at the top and the needle wales ending at the top of the figure as loops. Additionally, there are combination warp and weft fabrics in which all, or certain of the loops of the warp type are superimposed over the weft fabric loops. This type of fabric is usually produced for design purposes, the warp loops overlying the weft loops thereby producing the design, which most often is in a contrasting colour.

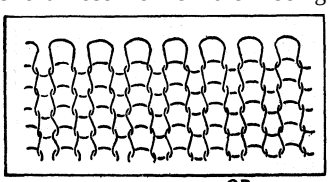

FIG. 1.—WEFT LOOP OR PLAIN FABRIC

Looped knitted fabric is used for hosiery, because it is elastic, weft fabric usually being used, as its elasticity or stretch is mainly crosswise or coursewise of the fabric and so provides better fitting hosiery, for varying sizes or parts of the leg. The fact that weft fabric has little vertical or walewise elasticity is an advantage in hosiery, as the few length variations required can be met by knitting a greater or lesser number of courses.

Warp fabric has been used for hosiery, but as its elasticity is less than that of weft fabric and is apt to be in both directions, it is not usually so used. Further, it is more difficult to produce warp fabric wider or narrower in the same piece as more or fewer warp threads must then be used and additionally, due to the many yarns used in warp fabrics, any of which may vary slightly in size or tension, undesirable streaks are much more difficult to eliminate than in weft fabric, which can be produced with only one yarn.

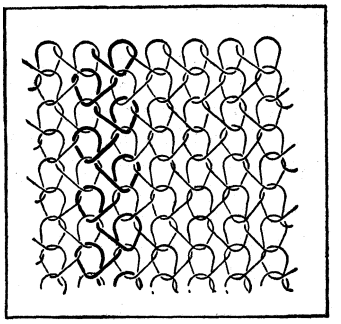

FIG. 2.— WARP FABRIC

Hand Knitting. — While hosiery today is usually produced on machines, all types can be, and even today sometimes are produced by hand knitting. The weft type is either produced on two or more thin, straight, hookless needles by a hand manipulation of the yarn, or in more recent years on a long, thin, hookless, flexible needle which can be readily bent into a circle for taking loops from one of the pointed ends and forming new loops one by one, by manipulating the yarn and the other pointed end.

Warp fabrics can be produced by hand crocheting; a single, simple hooked needle is used to draw a loop through an adjacent loop, thereby forming a chain of loops joined to adjacent loops, either vertically or at an angle to each other, as may be desired. The art of forming weft looped fabrics, either by hand or machine, is known as knitting, while the art of forming warp looped fabrics by hand is known as crocheting and when a machine is used, as warp knitting.

Fabric Characteristics. — A11 knitted fabrics have a back and a face side which differ somewhat in appearance, more particularly weft fabric, in which the back has ridges running crosswise of the fabric and a space between these ridges known as a course. The face of the fabric is distinguishable from the back by vertical lines known as wales, which present alternate raised and depressed lines, the former being known as needle wales, due to this portion of the loop being formed by the needles, while the depressed lines are known as sinker wales, due to this portion of the loop being formed by implements known as sinkers, which in machine-formed fabrics are located between each needle to kink the yarn against the needle shanks.

The horizontal ridges on the back of the fabric are the result of the intertwining of the sinker and needle wale loops. The back of the fabric is not as smooth as the face, so the face is usually visible when the stocking is being used, although some people wear their stockings inside-out and so take advantage of the rougher inner surface.

Warp fabrics differ as regards the face and back, only to the eye of an expert. Both sides can be made to show relatively distinct horizontal, vertical, or angular lines depending upon the way the chains of loops are connected to adjoining wales, but the difference between courses, needle wales, and sinker wales is never so distinctly noticeable as in weft fabrics.

Hosiery Knitting Machines. — Hosiery today is usually produced by machinery, of which there are three basic types. The machines usually used for producing the best quality of women's stockings are known as Cotton's system flat full-fashioned knitting machines.

The circular knitting machine can be used for knitting infants' socks, men's half-hose, or women's stockings, but as the quality of the fabric produced by these machines is inferior to the fabric

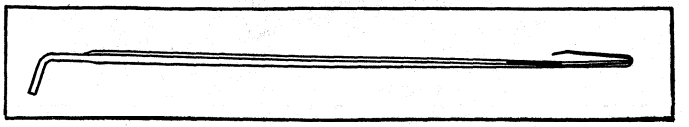

FIG. 3.—SPRING BEARD NEEDLE

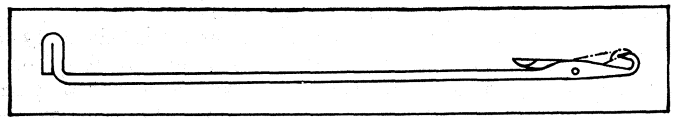

FIG. 4.— LATCH NEEDLE

produced on flat machines of the type hereinbefore referred to, only the cheaper grades of women's stockings are knitted thereon, but as the circular machine can produce fabric more rapidly than flat machines, the great majority of men's half-hose and infants' stockings are knitted thereon, as quality, perfect fit and appearance apparently are not so important in men's and infants' stockings as in women's stockings. Additionally, it is only in women's stockings that extreme sheerness is in demand, and sheer fabric of even appearance is most readily produced on Cotton's spring beard needle machines.

The third generic type, and the least common of the three, is known as the Lamb machine. This is a straight-bar machine having two sets of needles and while excellent fitting hosiery can be knitted thereon, its structural characteristics cannot be readily adapted for the production of sheer hosiery, so that only relatively coarse. heavy stockings are produced thereon.

Knitting Needles.—The needles used for producing hosiery fabrics are of two types—the spring beard needle and the latch needle. The former was probably invented by William Lee of Calverton, England, about 1589. A modern needle of this type, as shown in fig. 3, consists of a long shank with a right-angle bent butt at one end and a long flexible hook at the other. This latter is known as a beard. It is formed with a groove (or eye), into which the tip of the beard can be pressed and buried and so close the hook. In forming loops with this type of needle, the new yarn, kinked around the needle shank below the open needle beard, slides by the open beard toward the hook, while the previously formed fabric loop, which rests somewhat below the tip of the beard, likewise slides upwardly after the beard is closed over the new yarn. The previously knitted fabric loop thereby passes over the beard and so can be moved toward the hook, with the result that the new yarn in the hook is drawn through the previously formed loop, which is thereby cast off the needle as the new loop is formed. This new loop then slides down the shank of the hook, past the now open beard of the needle and below its tip, ready for the next loop-forming operation.

The latch needle, which was invented by Matthew Townsand of Leicester, England, about 1847, is constructed as shown in fig. 4, the shank of this needle being made as long as necessary, with a butt formed at right angles to the shank at the lower end. In forming a loop with this type of needle, the previously formed loop—at the time the new yarn is engaged by the hook—is on the needle shank somewhat below the open latch. As the needle moves downward with the new yarn in its hook, the previously formed loop contacts the open latch and swings it on its pivot into the closed dotted position shown in the figure, so that the previously formed loop can be cast off over the closed hook, with the new yarn formed into a loop by the needle hook. Thereafter, this new loop slides down, thereby opening the latch, and by continued downward movement the loop finally slides off the lower end of the open latch on to the shank of the needle.

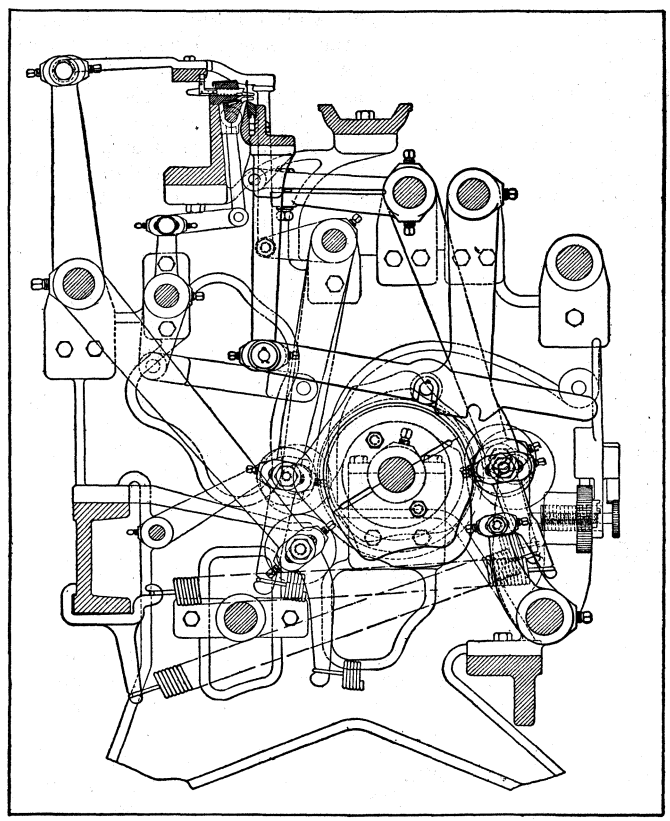
FIG. 5.— COTTON'S SYSTEM FULL-FASHIONED HOSIERY MACHINE

Cotton's Machine.—The Cotton system flat full-fashioned knitting machine, invented by William Cotton about 1864, was an improvement on the original flat knitting machine built by William Lee about 1589. The machines in common use, which produce practically all of the women's quality stockings in all countries of the world, are a refinement of Cotton's machine. These present-day machines are 50 to 60ft. long and produce from 20 to 32 pieces of flat hosiery fabric at once. Such a machine is shown in fig. 5; fig. 6 shows an end view of the knitting elements and their operating parts. In these machines the original Lee and Cotton basic principles are retained, although of course they are fitted with many refinements and so produce very much finer, sheerer fabric and operate at about 72 courses per minute. Additionally, there are a small number of modern single-section machines in use today.



FROM "KNITTING FULL-FASHIONED HOSIERY" BY MAX C. MILLER

FIG. 6.— COTTON'S MACHINE. END VIEW

The long machine is divided into what are known as sections, each of which produces a hosiery blank on a bar some 14in. long, in which there are rigidly fastened about 400 needles, the exact number depending upon the number of needles to each inch of bar.

The gauge of the machine depends upon the number of needles per inch, the gauges in use today being 39, 42, 48, 51, 57, 60, 66, the most common of which is 42-gauge. To determine the number of needles per inch when the gauge is known, divide the gauge number by three and multiply by two. The needles stand vertically and go through a quite complicated movement roughly resembling a figure eight. Between each pair of needles and sliding to and from the needle shanks at right angles thereto, are elements known as jack sinkers, which are notched at the end that goes between the needles to kink and position the newly fed yarn. Means is provided to project successively the sinkers between the needles when the latter are in a position with the tip of the needle beard somewhat above the sinker notch or throat, the inward coming of these sinkers being progressive; that is, they are moved between the needles in a wave-like motion, closely following the yarn that is being traversed to the beard side of the needles, with the result that at each traverse, yarn is successively kinked around each pair of needles, twice as much yarn being kinked as

is required for each loop. Another group of elements known as dividers is also provided, alternating with the jack sinkers. These are also fitted with yarn kinking notches and are projected en masse between each needle of the jack sinker pair of needles, after the successive kinking action of the jack sinkers, with the result that a kink is then formed around the shank of each needle. All this is done while the needles are standing in their highest position, so that the yarn can be kinked against the needle shanks somewhat below the tip of the beards. Slightly under each sinker and divider and projecting between each needle, are elements known as knockover bits, the fabric and the previously formed course on the needles lying on top of these bits and dnder the sinkers. After the yarn kinking operation, all the needles are drawn downward en masse, until the tips of their open beards are below the newly kinked yarn and slightly above the previously formed course lying on the knockover bits. Thereafter, the needles are moved bodily a slight distance, lengthwise of the fabric, that is, further between the sinkers which are still retaining a kinked yarn and which move in the same direction, so that the kinks can be maintained without straining. In this movement, the lower ends of the needle beards contact a fixed edge of the machine and thereby the open ends of the beards are closed by being pressed into the eyes of the needles, this closing taking place slightly above the previously formed loops. Thereafter, the needles continue to move downward, the sinkers retreat to release the newly kinked yam, which is drawn by the now closed needle hooks through the previously formed loops, a fabric tension assisting in the casting off of these previously formed loops ana holding same to the back side of the needles, as they rise to again be in position to have a new yarn kinked around them by the sinkers. **A** selvage is formed at each edge of the fabric by the successive back and forth traverse of the yarn.

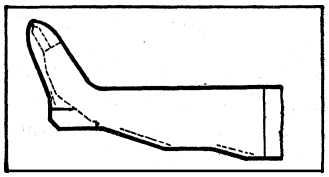


FIG. 7.—WOMEN'S FULL-FASHIONED STOCKING

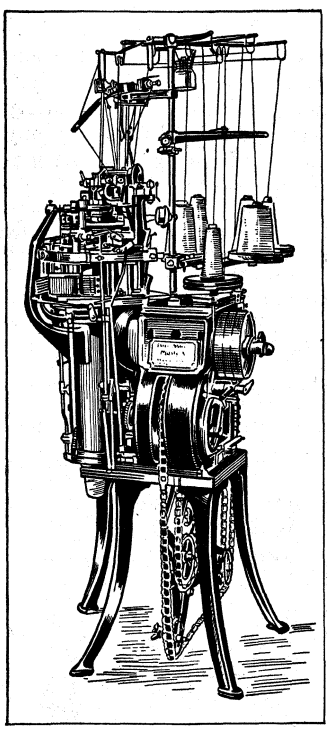
Cotton's Shaping.— In order to shape the stocking blanks, each section of the machine is provided with automatically operating grooved points, which are caused to engage with the needle eyes, and by an en masse combined movement of the points and needles, about 20 selvage loops are lifted off outer needles and deposited inwardly on adjacent needles. This operation, known as narrowing, is repeated throughout the leg, heel, foot, and toe of the stocking and in this manner the blank is given the desired shape.



FURNISHED BY COURTESY OF SCOTT & WILLIAMS, INC., NEW YORK, N.Y.

FIG. 8.— CIRCULAR HOSIERY MACHINE

The top of women's hosiery is usually formed of doubled fabric known as the welt. Until recently, this folding and topping of the fabric was done by hand, but devices have recently been applied to the machines for doing it mechanically.

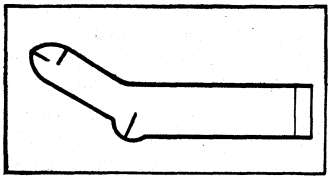
Cotton's Carriers. — Additionally, the machines are fitted with various traversing yarn carriers, usually eight to ten, so that a different quality or size of yarn can be knitted into different portions of the stockings. A more recent improvement is the feeding of three yarns in sequence, so that each yarn only recurs in each third course. This is known as 3-carrier ringless knitting and is done to make possible the production of reasonably even, translucent, sheer fabric, as it was found that unavoidable variations in the fine silk yarn usually used, when the same yarn recurred in each course, resulted in very noticeable thin and thick areas, called shadow bands.

These machines are also fitted with additional mechanisms for reinforcing for wear, or for producing ornamental thickened areas, known as splicing, at and around the heel, sole, and toe. These machines can also be arranged to produce rib, open mesh, lace or petinet, plated, reverse plated, striped, checked, tucked, spread loop, drop-stitch, anti-run, inlay, including elastic inlay, fleece or plush, reinforced designs, split and warp thread or warp shaped and design fabrics.

While the full-fashioned flat knitting machine was invented and first put into commercial operation in England, the labour guilds interfered with its use and the early builders were exiled first to France and later to Germany. Consequently, the evolution of this type of machinery was no longer an English monopoly, with the result that each company developed its own forms of this type of machinery and the Germans for a great number of years retained a monopoly on exports. This continued until the World War (1914–18), which gave the machine builders in the United States an opportunity to enter this field, so that by 1940 a great majority of the machines used in the United States are built there and the machines used in other leading industrial countries are either produced in such countries or bought from German machine builders.

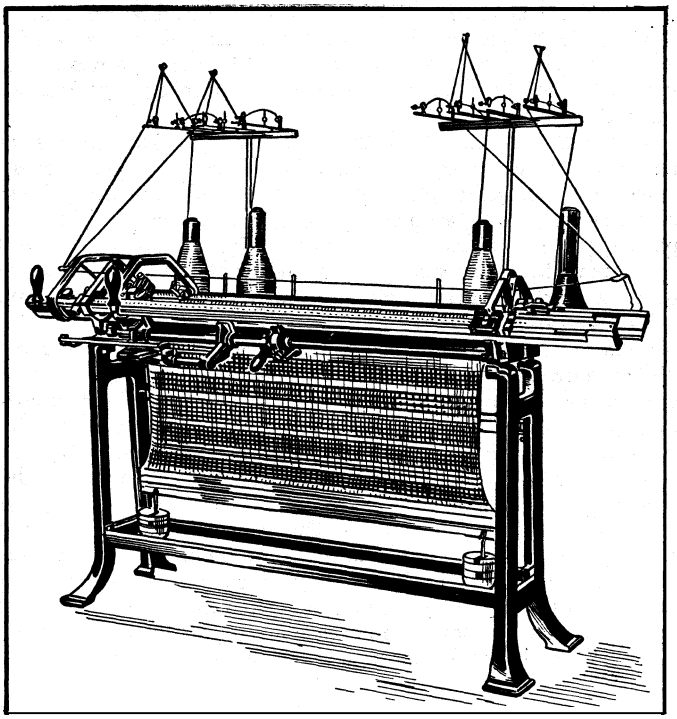
The evolution since 1925 has been largely in the direction of increasing the number of sections, so that one operator can readily attend the increased number of sections. While many refinements as regards gauge and speed have been introduced, up to 1940, the only step toward automaticity has been the evolution of automatic welt apparatus, which, however, still leaves a great number of manual movements to be made by the operator. Generally speaking, the down-time of modern machines without automatic welt apparatus is about 33%; when welt apparatus is used the down-time is reduced to about 8%. As in the past, it is still necessary to have one skilled operator in attendance at each machine and the effort of the industry is to bring about complete automaticity, so that one relatively unskilled operator can attend more than one full-fashioned machine.

Full-Fashioned Hosiery.— The stocking blank is usually knitted in two pieces on two machines. One machine, known as the legger, produces the welt, leg, and heel blanks, which are manually transferred to a footing machine. The footer is similar to the legging machine, except that it is especially organized to properly shape and produce the feet and toes of hosiery. Various types of machines have been evolved for producing the entire stocking on one machine, or combination machines in which the leg, foot, and toe are produced by a continuous process on one machine and the heels on another; or the leg, heels, foot, and toe may all be produced on one machine in a continuous operation. Regardless of how full-fashioned hosiery blanks are formed, they are all looped on a looping machine at the toe end and heel bottom and then seamed between the toe and heel bottom and up the back of the leg to and including the welt. The result is shown in fig. 7 and is known as women's full-fashioned hosiery, the distinguishing characteristics of which are sheerness, even-appearing wales, and excellent fit. Readily distinguishable features of full-fashioned hosiery are the interknitted welt, the narrowing marks spaced parallel to the seam line and a short distance inside thereof, the square heel, narrowed at the bottom, the narrowed foot with its fashioning marks, the diamond side-gored toe, the properly selvaged high splice above the heels and the similarly formed spliced soles. These machines have also been built to produce many other types of selvage fabric.



FROM "PRINCIPLES OF KNITTING" BY MAX C. MILLER

FIG. 9.—WOMEN'S SEAMLESS STOCKING



FROM THE GROSSER KNITTING MACHINE CO., NEW YORK, N.Y.

FIG. 10.—LAMB MACHINE

Circular **Hosiery** Machines.—Circular knitting machines are also used to produce hosiery, and while machines of this type have been used, fitted with spring beard needles, the machines of this type in universal use are fitted with latch needles of the type described above. These needles are mounted to slide individually in a vertical cylinder, additional implements functioning between the needles to assist in forming the loops. Small cams act on the needle butts to cause them individually and successively to move up and down, the cylinder being stationary with the cams revolving, or vice versa. With the former construction, the yarns used must revolve; with the latter construction, the yarns are stationary—the more common arrangement, especially in small machines producing seamless hosiery. **A** well-known machine to produce seamless hosiery is shown in fig. 8.

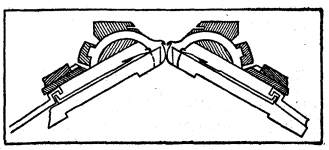
Circular Hosiery.—The stockings produced on the machine described above are coarser than those usually produced on full-fashioned flat machines, due to the fact that the latch needles used cannot be made as fine as spring beard needles, so that fewer needles can be placed in each circumferential inch of the cylinder. The fabric is not only coarser, but the opening and closing of the latches produce more irregular wales than when spring beard needles are used. The stockings are tubular and seamless and have the same number of wales at the ankle as they have at the top. They cannot be properly shaped to fit the varying circumferences of the heel and leg except by varying the size of the loops. This is the reason why the best quality of women's stockings cannot be produced thereon, since these stockings usually cover the limb well above the knee and so, in order to fit properly, the top of the stocking, as an example, should have a far greater number of loops than the ankle. Circular machines have never been able to knit the well fitting ankle, heel, and toe of full-fashioned hosiery. The resultant stocking is shown in fig. 9.

The major reason for using circular machines to produce hosiery is that their circular knitting action enables them to knit much more fabric in any given time than is possible on flat machines; also fewer finishing operations are required, and the latch needle lends itself to the simple production of a great variety of design fabrics, which will be explained below.

Circular Rib **Machines.**—Circular rib hosiery machines are also in use. In these a dial with needles or an additional cylinder is mounted over the other, with double hook latched needles that can be slid from one cylinder to the other so that either ribbed or plain fabric can be selectively produced, as for instance, the ribbed top of half-hose or entire ribbed stockings. This system does not lend itself as yet to anything but relatively coarse latch needle gauges. This type of machine has also been evolved to produce shaped, seamless, rib fabrics. Rib fabrics will be discussed below.

Lamb Machines.—Lamb type flat machines are also used for knitting hosiery. While this type of machine has used spring beard needles to a limited extent, it commonly uses latch needles, thereby producing fabric having the inherent latch needle advantages and disadvantages noted above. These machines can, however, produce fashioned fabrics either of the flat type with selvages or they can produce seamless fashioned hosiery or other garments. **A** machine of this type is shown in fig. 10.

Such machines carry their latch needles in parallel grooved beds placed at an acute angle to each other, the needles of one bed crossing the needles of the other bed near their hook ends, with the fabric passing down between the two beds. The needles are cammed up and down individually, so that their hook ends may engage with the feeding yarn successively, implements being interposed between the needles to assist in forming the loops. This process is similar to the system used in circular machines. **A** cross section of the fabric producing parts of this type of machine is shown in fig. 11.



FROM "PRINCIPLES OF KNITTING" BY MAX C. MILLER

FIG. 11.—CROSS-SECTION LAMB MACHINE

When these machines are to form seamless fabric, the carrier, which is traversed back and forth lengthwise of the needle series, feeds yarn first to one bed of needles and then to the other, producing tubular fabric which can be made wider by adding empty needles at one or both ends of the series. They have also been fitted with loop-lifting implements, so that the tubular fabric can be narrowed. When they are to produce flat selvaged, widened blanks, only one set of needles is used and empty needles are brought into action at either or both ends of the series. If the blanks are to be narrowed, loop-lifting implements can be used to shift the loops inwardly. These machines can also be used to produce flat selvaged rib fabric by feeding the yarn to both sets of needles simultaneously. Machines of this type have also been evolved to produce tubular, fashioned rib fabrics by using four sets of needles, and, too, they can produce perfect fitting heels and toes when equipped with loop transferring elements. It is obvious from all the above that with the Lamb machine, a greater variety of hosiery—seamless, flat, and rib—can be knitted than with any other type of machine. The difficulty has been to build the machines so that spring beard needles of fine gauge can be used.

Warp Hosiery.—Machines to produce warp fabric stockings have met with little success, mainly for the reason that it is mechanically difficult to increase and decrease the number of warp threads used. This is necessary when fabric of varying widths is to be produced. **A** limited quantity of stockings are produced of warp fabric, however, by resorting to cutting the shaped blanks required out of wide warp knitted cloth and seaming the various parts together. Such stockings have objectionable bulky seams; if sheer, they are elastic in both the horizontal and vertical directions—the latter being objectionable—and it is difficult to eliminate vertical or diagonal streaks.

Knitted Garments.—All the machines that have been described can also be used to produce other garments, such as those for outerwear and underwear, in which the stretch inherent in knitted fabrics is desirable. In some, the warp fabric horizontal and vertical stretch is wanted; in others, only the weft horizontal stretch is found desirable.

Warp machines and, to a limited extent, weft machines can both produce what is known as inlay fabric, in which unkinked and unlooped yarns are interknitted into the fabric by the knitted loops, thereby thickening the fabric and/or making it nonelastic in either or both directions. Such knitted cloth

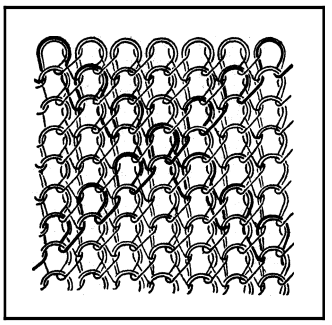


FIG. 12.—MILANESE FABRIC

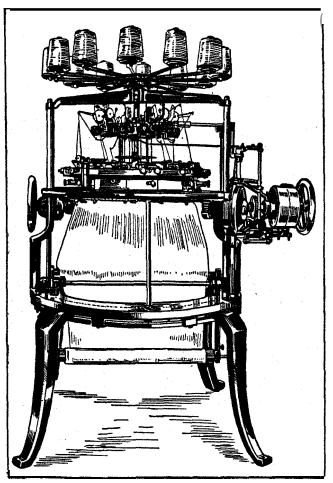
is usually used for women's outer garments, men's suiting and overcoats; and if this inlay thread is made of rubber or has a rubber core, garments with greater elasticity than those knitted of non-elastic yarn, such as women's girdles, surgical stockings, etc., can be produced.

Milanese Machines.— Another type of flat machine used to a limited extent is the Milanese warp machine, with which it is possible to produce the type of warp fabric shown in fig. 12. They are usually built as flat machines up to 20ft. wide, using latch or spring beard needles, with the warp yarns running diagonally through the fabric in opposite directions. The two groups of warp yarns used are shifted step-by-step, in opposite directions, across the machine. Each warp yarn, as it reaches the end of the machine, moves step-by-step backwards across the machine again by the use of very ingenious mechanism, the warp threads being mounted on spools which are gradually traversed around an endless chain under or over the machine. More modern machines, which can operate 600 times per minute, and in which the thread traversing motion is very much simplified, are just becoming available. As is common in plain warp machines, Milanese warp fabrics are especially adapted to produce diagonally designed fabrics by making use of coloured warps, and the stretch of the fabric is likewise in both directions. While circular plain warp, as well as circular Milanese warp machines are not used to any great extent, they are available and are naturally high producers, because of their rotary motion. The needles in these machines are either of the latch or spring beard needle type, usually the latter, and are individually movable or operate en masse, usually the latter.

Circular Body Machines.— Circular weft looped fabrics, used for the cut-up garment trade, are produced on circular machines which range from the smallest to 8oin. in diameter, usually from 12in. to 36 inches. The machines used are of the individually and successively movable latch or spring beard needle type, depending upon the quality of fabric that is required. If the best quality of plain fabric is desired, spring beard needles should be used, but if anything but very simple fancy fabric is wanted, latch needles should be used. These machines are known as circular body machines, a well-known type being shown in fig. 13. They are either of the revolving or stationary needle cylinder type.

Sinker Wheel Machines.— Another method of producing tubular fabrics is with sinker wheel circular machines in which spring beard needles are used, mounted rigidly in a vertical ring or horizontal disc. These machines use various types of bladed wheels, fixed at an angle to act between the needles to kink the yarn, press the needle beards and slide the loops as they are formed up and down on the needle shanks as is required. A diagrammatic view with vertical needles shows these loop element forming parts in fig. 14, fig. 15 showing a partial view of a circular fixed needle machine, in which the needles are horizontal. These machines have also been fitted with warp yarn feeding implements, so that combination warp and weft fabrics can be produced. They can also produce many types of designs, including lace fabrics, the latter through the use of notched wheels, which bring two or more needles together and so permit loops to be shifted from one needle to the other or spread same over more than one needle.



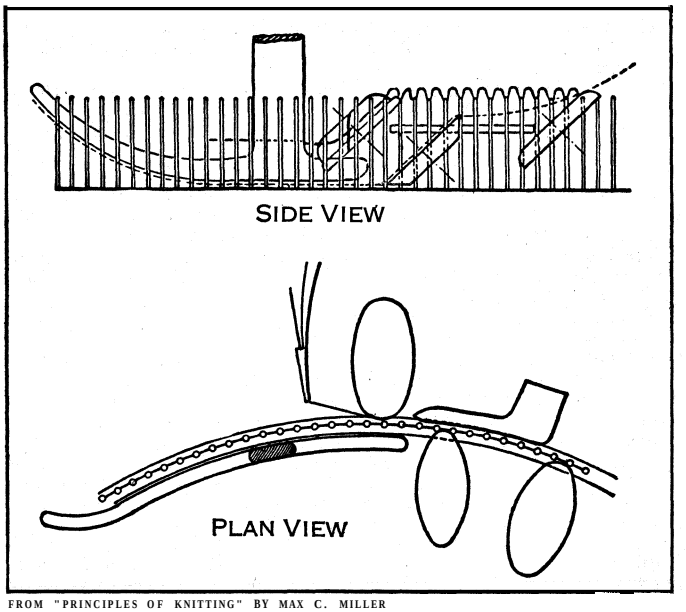
BY COURTESY OF WILDMAN MFG. CO., NORRISTOWN, PA.

FIG. 13.— CIRCULAR BODY MACHINE

Lace Fabrics.— Spring beard needles can readily be adapted to producing lace and spread-loop fabrics, the former being shown in fig. 16 and the latter in fig. 17, and while implements have been added to sinker-wheel circular spring beard needle machines to make these patterns. they are produced in the simplest manner on flat machines by means of grooved pointed loop-lifting implements known as lace points. These are caused to engage with the needle eyes and either take loops completely from the needles and transfer them to adjacent needles, or spread loops over more than one needle. Cotton's system full-fashioned knitting machines have been especially adapted to make such fancy fabrics, either in a simple repeated pattern or by controlling the points with Jacquards or pattern tapes.

Links-and-Links Fabric.— Fabric known as links-and-links, shown in fig. 18, can be produced on both circular and flat machines, more usually the latter. Machines of this type use needles with a hook at each' end, more usually latch needles which are caused to slide from one bed of the machine to the other, so that they are individually caused to draw loops through the fabric, first in one direction and then in the other. The stretch of this fabric greatly resembles that of ordinary weft knitted fabric and is usually used for outer garments such as sweaters. If individual needles are selected to slide from one bed to the other, patterns in the loop structure can readily be produced.

Rib Fabric.— Rib fabrics are produced on either circular or flat machines, including Lamb machines, a one-and-one rib fabric being shown in fig. 19. To produce this type of fabric, latch needles are usually used, although spring beard needles have beeh used to a limited extent. Regardless of the type of machine or needles used, alternate wales of this fabric are drawn in opposite directions, so that the needles near their hook end must cross each other and the yarn must be fed simultaneously to both sets of needle hooks. In circular machines, the rib needles are usually mounted in a horizontal dial, with



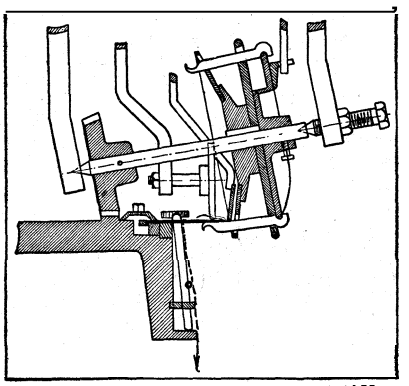
FROM "PRINCIPLES OF KNITTING" BY MAX C. MILLER

FIG. 14.— CIRCULAR MACHINE WITH FIXED VERTICAL NEEDLES

the other needles mounted in a vertical cylinder, all needles being individually and successively movable, although machines are in use in which one, the other, or both sets of needles are mounted in conical cylinders. To produce one-and-one rib fabric, alternate needles draw their loops in opposite directions, but any desired combination of ribbed wales can be produced by causing more of the needles to draw in one direction than in the other. Rib fabric is much more elastic than other knitted fabrics, as the tendency is for the two kinds of wales to draw the fabric together like an accordion. One-and-one rib, therefore, is more elastic than two-and-one, or broad-rib combinations.

Rib fabric formed with latch needles is not as elastic as spring needle rib fabric, for the reason that the yarn, having to open and close the latches during the knitting, permits the needle wales to have much more yarn than the sinker wales, instead of getting the springy effect of both the needle and sinker wale loops, as is the case in spring needle fabric. In rib fabric, only the needle wale loops open and close as the fabric is stretched.

Cotton's system flat machines can also be arranged to produce ribbed fabric by adding a series of horizontally positioned spring beard needles under the sinkers of the plain machine. Beautiful, plain, highly elastic fabric, as well as vertical striped designs of two or more colour effects can then be produced, the latter by feeding and knitting yarn of one colour to one set of needles, floating same over the other needles and then feeding and knitting yarn of another colour to the other needles and floating it over the first set.



PROM "PRINCIPLES OF KNITTING," BY MAX C. MILLER

FIG. 15.— CIRCULAR MACHINE WITH FIXED HORIZONTAL NEEDLES

Patterned Fabrics.— It is possible to produce an endless variety of patterns in knitted fabrics, especially by hand knitting, and a very large range of patterns is possible with the machines hereinbefore described, although each type is best adapted for producing certain patterns and certain machines are better adapted to produce a greater variety of fancy fabrics than others.

Horizontal Stripes.— Horizontal coloured stripes are readily produced on any type of weft knitting machine, as all that is required is a sufficient number of yarn carriers.

To produce such stripes on warp machines is very difficult, but warp machines are readily capable, however, of producing vertical and/or

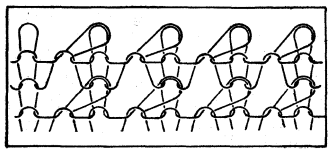


FIG. 16.— LACE FABRIC

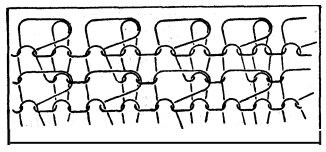

FIG. 17.— SPREAD LOOP FABRIC

diagonal stripes, due to the individual wale construction. Such stripes are with difficulty produced on weft machines, more particularly on fixed needle machines.

Plated Fabrics.— Plated fabrics, in which two or more yarns are simultaneously fed into the machine at one feeding point and a selection is made as to which of these yarns is to appear on the surface, can be produced on any knitting machine, but in other than its simple unpatterned fabric form it is best produced with individually movable latch needles, although simple designs, especially vertical stripes, have been produced on circular and flat fixed spring beard needle machines.

Circular latch needle hosiery machines especially have been developed to produce an endless variety of patterns by the plating and reverse plating method, although the same sort of designs could be made on circular latch needle body machines.

Vertical Stripes.— Vertical striped patterns can best be produced by reverse plating on circular latch needle machines, although spring beard needle machines, both fixed needle, flat, and circular, can produce the simple forms. Float thread vertical striped fabrics can likewise be knitted on all types of machines, but in a simpler manner on latch needle machines by feeding two threads at one point, one of which is selectively fed to the hook side and the other to the back of the needles, the latter thereby producing the floats. This system of striping is often combined in circular machines with reverse plating.

Tucked Fabrics.— In tucked fabrics, the design is produced by not casting off the loops on selected needles for a number of courses, thereby producing a multiple series of loops at the pattern positions. While tucked loops can be formed on any knitting machine, latch needles are best adapted for them, since all that is necessary to produce a latch needle tuck is to prevent the finished loops from moving below the open latch.

Tuck designs are often made in combination with drop-stitch, float, and reverse plated fabrics.

Weft and Warp Patterned Fabrics.— A great variety of patterns can be produced on combination warp and weft machines, the warp threads usually forming the pattern of a different colour from the underlying weft fabric. These machines have in more recent years been known as wrap thread machines and have been developed most thoroughly for the circular seamless hosiery business. Flat and circular spring beard needle machines have also been fitted with thread wrapping implements for design purposes, but the difficulty of properly applying these additional parts has restricted their use. The implements for wrapping the yarns are known as eye-needles and they are similar to those used in any warp fabric machine. These implements are flat, thin blades, with a hole for the individual yarn at the lower end. They are in all instances moved between the needles from the hook side to the back, then shifted one or more needle indexes and again brought through the needles.

Anti-Run Fabrics.— Various looped fabrics and machines for making them have been evolved to mitigate one great fault inherent in weft knitted fabric. This fault is known as a laddering or drop-stitching and results from a broken loop which permits the preceding as well as the following loops of the broken wale or wales to unravel, more particularly the following loops. Some of these loop structures make use of separate tying or locking loops; others make use of the loop-shifting or spread loop idea and others transpose loops to adjacent wales and/or into adjacent courses, and others make use of the weft and warp loop in combination; and while such fabrics do mitigate the laddering difficulty and do meet some of the other requirements of a good fabric, they all, to a greater or lesser extent, give an undesirable pattern effect to the fabric and in many cases increase the cost of material and/or restrict the natural elasticity.

Rib or Links-and-Links Patterned Fabrics.— All the patterns referred to above can be produced in ribbed and links-and-links fabrics, with the additional possibility of producing an embossing effect by

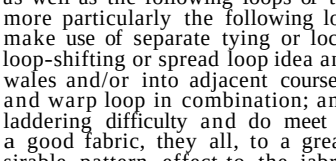

FIG. 18.— LINKS-AND-LINKS FABRIC

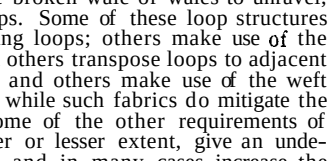

FIG. 19.— RIB FABRIC

forming a pattern of raised and depressed areas by drawing loops to the back or face of the fabric, instead of having each needle always draw its loops in one direction. These machines can also knit rib fabric with selvages, by causing every other needle, or a group of needles alternating with other groups, to remain in one or the other needle bed and draw their loops in consecutive courses in one direction or the other. If a variation in the ribbed wales (for example, when producing fancy ribbed fabrics) is wanted, a Lamb, links-and-links, or double cylinder circular machine may be used and the number of needles—single or in groups—in any one bed are caused to function in the other bed and so draw their loops in the other direction. Circular machines of the two needle cylinder type are often used to produce rib fabric. By changing the relationship of the number of needles in the wales, circular rib fashioned hosiery can be produced.

Spliced and Split Designs.— Still other types of design fabrics can be produced, more readily on flat fixed spring beard needle machines, by splicing. that is, feeding a second thread to selected needles under plating conditions, thereby producing thickened design areas which may be in contrasting colours. Still another effect can be produced by split fabric knitting; again, this is most readily possible on flat fixed spring beard needle machines by using the number of carriers the design calls for and traversing each carrier simultaneously with the other carriers over the restricted number of needles of a pattern and lapping the two yarns at the edge of the pattern by knitting a suture. Circular hosiery machines are also used, in which a part, as for instance the sole of the foot, is split and joined during the knitting to the instep fabric. This makes it possible to form the sole of yarns differing from the yarn used in the instep. Such machines reciprocate when producing split fabric and must be fitted with two feeds.

Machine Speed.— Circular machines, especially those of larger diameter, can be and are usually provided with more than one yarn feeding position. For each revolution, therefore, more than one course of loops can be formed.

As an example, a 24in. machine can readily be rotated at 40 revolutions per minute.

Cotton's system flat machines, having a 14in. needle series, usually form about 72 courses per minute. It would take, consequently, about 8½min. to produce a 12in. piece of 42-gauge fabric having 50 courses per inch. Modern high speed warp machines, which operate up to boo courses per minute, could produce the same fabric in one minute, while a 24in. circular body machine with 12 feeds, at 40 r.p.m. would produce it in a little more than a minute. Modern circular hosiery machines, which are from 2½in. to 4in. in diameter and usually fitted with only one feed, are operated at about 300 r.p.m. and so would produce 600 courses in two minutes. It is to be understood that the production capacity referred to is only average and will necessarily vary with gauge, yarn quality, and as to whether the best or mediocre fabric is to be produced.

BIBLIOGRAPHY.—Max C. Miller, *Principles of Knitting* and *Knitting Full-Fashioned Hosiery*. (M. C. MI.)

HOSIUS or **OSIUS** (*c.* 257–*c.* 359), bishop of Cordova, was born probably at Cordova. He was elected to that see before the end of the 3rd century and narrowly escaped martyrdom in the persecution of Maximian (303–305). In 305 or 306 he attended the council of Illiberis or Elvira, and upheld its severe canons concerning the treatment of the lapsed and clerical marriages. In 313 he appears at the court of Constantine, and 10 years later, as the bearer of Constantine's letter to Bishop Alexander of Alexandria and Arius his deacon, bidding them cease disturbing the peace of the church. He was present at the council of Nicaea in 325, and powerfully influenced the judgment of the emperor in favour of the orthodox party. Hosius presided in 343 at the fruitless synod of Sardica, which showed itself so hostile to Arianism; and afterwards he supported Athanasius in such a way as to bring upon himself a sentence of banishment to Sirmium (355). From his exile he wrote to Constantius II. a letter now his only extant composition. Under pressure, he signed the formula adopted by the second synod of Sirmium in 357, which involved communion with the Arians but not the condemnation of Athanasius. He was then permitted to return to his diocese, where he died in 359.

See S. Tillemont, *Mémoires*, vii. (1700); Hefele, *Conciliengeschichte* (2nd ed., 1873, etc.), vol. i.; H. M. Gwatkin, *Studies of Arianism* (1882, 2nd ed., 1900); A. W. W. Dale, *The Synod of Elvira* (1882); Duchesne, *Histoire ancienne de l'Eglise* (1908), and Herzog-Hauck, *Reatencyktopadie* (3rd ed., 1900).

HOSIUS, STANISLAUS (1504–79), Polish cardinal, was born in Cracow on May 5, 1504. He studied in his native town, in Padua and Bologna, and, entering the church, became in 1549 bishop of Kulm, in 1551 bishop of Ermland, and in 1561 cardinal. Hosius had Jesuit sympathies and actively opposed the Protestant reformation, his *Confessio fidei christiana catholica* being adopted by the synod of Piotrkow in 1557. He was, however, supreme as a diplomatist and administrator. Besides carrying through

many difficult negotiations in Brussels, Prague and Vienna, he founded the lyceum of Braunsberg, which still exists. He died at Capranica near Rome on Aug. j. 1579.

The best edition of his works appeared at Cologne in 1584. Hipler has published separately his letters (1879, fol.) and his sermons (1885). See his *Life* by A. Eichhorn, 2 vol. (1854).

HOSKINS, JOHN (d. 1664/5), English miniaturist, perhaps a pupil of Isaac Oliver, and father of John Hoskins junior. He is believed to have been born in the 1590s; a John Hoskins made a will in 1662 and was buried in St. Paul's, Covent Garden, on Feb. 22, 1664/5, but it is uncertain whether the father or the son made that will and died at that date. Samuel Cooper (d. 1672), the great miniaturist and nephew of Hoskins senior, bequeathed money to his cousin John Hoskins; it is possible that a third John Hoskins, son of John II, is involved. Signed miniatures by the eldest Hoskins date from about 1620; the latest date on a Hoskins miniature, be it by the father, the son, or by both in collaboration, is 1664.

With Nicholas Hilliard. Isaac Oliver and Samuel Cooper, whom he trained, John Hoskins senior is in the front rank of English miniaturists.

His early work is in the Hilliard-Oliver tradition; his later shows the influence of the oil portraiture of Van Dyck, D. Mytens and Cornelius Johnson. He and his son copied subject pictures by old masters.

See Graham Reynolds, English Portrait Miniatures (1952).

(C. H. C. B.)

HOSMER, HARRIET GOODHUE (1830–1908), U.S. sculptor, was one of the leading American women sculptors working in Rome and perhaps the only woman sculptor of the Roman group to win complete financial independence by her work as a sculptor. Born at Watertown, Mass., on Oct. 9, 1830, she early showed an aptitude for modeling, and studied anatomy with her father, a physician, and afterward at the St. Louis medical college. She then studied in Boston until 1852, when she went to Rome with her friend the actress Charlotte Cushman. From 1853 to 1860 she was the pupil of the English sculptor John Gibson. She lived in Rome until a few years before her death.

Among her works were "Puck" (1855), which she copied for the prince of Wales, the duke of Hamilton and others; "Oenone" (1855), in the St. Louis (Mo.) Museum of Fine Arts; "Beatrice Cenci" (1857) for the Mercantile library of St. Louis; a bronze statue of Thomas H. Benton (1868) for Lafayette park. St. Louis; bronze gates for the earl of Brownlow's art gallery at Ashridge hall; and a siren fountain for Lady Marian Alford. She died at Watertown, Mass., on Feb. 21, 1908.

See Albert T. E. Gardner, Yankee *Stonecutters* (1945). (A. T. G.)

HOSMER, JAMES KENDALL (1834–1927), U.S. author and librarian, was born in Northfield, Mass., on Jan. 29, 1834. He graduated from Harvard university in 18jj and continued to study theology for four additional years: after which he took a ministry (1860) at the Unitarian church in Deerfield, Mass. During the American Civil War, he served with the 52nd Massachusetts volunteer infantry from 1862 to 1863.

Hosmer's wartime journal, based on his experiences during that time, was published the following year as *The* Color-Guard and won him wide recognition in the United States and in England.

Although Hosmer returned to Deerfield after his regiment was mustered out, he did not resume his ministry but turned to teaching instead.

He became professor of rhetoric and English literature at Antioch college. Yellow Springs. 0. (1866–72), then taught at the University of Missouri in Columbia (1872–74) and at Washington university in St. Louis (1874–92), where he was professor of English and German literature.

Thereafter he accepted the post of librarian at the Public Library in Minneapolis. Minn. (1892–1904), spending most of the remainder of his life in that city. In 1902 he was president of the American Library association.

Hosmer's literary output was extensive. Apart from numerous articles and short fictional pieces which appeared in newspapers and periodicals, his writings included: A Short History of *German* Literature (1878), The Story of the Jews (Story of the Nation Series [1885]), Samuel Adams (American Statesmen Series [1885]), A Short *History* of Anglo-Saxon Freedom (1890), The History of *the* Louisiana Purchase (1902), *The Appeal* to Arms, *1861–63,* 2 vol. (1907) and *Outcome* of the Civil War, *1863–65* (American Nation Series [1907]).

Hosmer also wrote two novels and, in 1912, a book of reminiscences titled The Lust Leaf.

He died on May 11, 1927.

HOSPICE, the name frequently given to the guesthouses established for the reception of pilgrims and travelers within the precincts or upon the property of religious houses.

It is specially associated with the hospices of the Great and Little St Bernard passes in the Alps; but the word hospitium, as used in the middle ages, had no exclusively religious connotation, and was applied to any kind of lodging or inn, not only to houses of public entertainment, but to the "inns" or mansions of noblemen, prelates and bodies of lawyers in London and on its outskirts.

HOSPITAL, a place where sick and injured persons receive medical care of such nature that some patients are required to utilize a bed during part or all of their stay. A hospital may be contrasted with a "clinic" or "dispensary" for ambulatory patients who return to their homes after each visit; also. with a "home" for aged, infirm or indigent persons in which little or no medical service is provided.

The word hospital is derived from the Latin hospitium, a place where guests (kospes) were received, and the adjective hospitalis. Related forms are hospice, *hôpital,* hotel, *spital* and hostel. Modern English emphasizes the word hospital, with occasional use of hospice or hostel to signify a home.

The word hotel has become synonymous with inn (see INNS AND INNKEEPERS and for early history see HOTEL) as a place for travellers or guests, but in French the term *hôtel-Dieu* indicates a public hospital.

History of Hospitals.— Medical treatment has always been associated with religious service and ceremony. Early priests were also physicians or medicine men, ministering to spirit. mind and body. Pre-Christian religions identified certain of their deities nith healing as early as 4000 B.C. Temples were specially dedicated to Saturn. Aesculapius, or Hygieia, and they served as both medical school for practitioners and resting place for patients under observation or treatment. Historical records indicate the existence of such edifices in Greece, Egypt, Babylonia and India.

The Christian era emphasized the hospital as an asylum for travellers and victims of disaster. By the 4th century AD.. Christian church members in the Roman empire had established hospitals for lepers, cripples, the blind and the sick poor. The Hôtel-Dieu of Lyons. France. mas founded in A.D. 542, and hospitals of the Arabian kingdom existed throughout Spain, north Africa and western Asia.

Religious communities emphasized care of the sick. and sisterhoods and brotherhoods devoted much of their time to nursing, with hospitals constructed adjacent to the monasteries. The first solely nursing order is considered to be the St. Augustine nuns, organized about 11j5.

The work of physicians and surgeons was separate from hospitals during the mediaeval period. Even by the time St. Bartholomew's hospital was established in London in A.D. 1123, the physicians, apothecaries, and blood-letting surgeons practised their professions in home or office. with only hopeless and homeless cases finding their way to hospitals. The Renaissance period emphasized science in the healing arts, and the Reformation saw the beginnings of secular support of hospitals when Henry VIII endoned St Bartholomen's hospital in London European explorers of the 16th and 17th centuries aided religious brotherhoods to create institutions for the homeless and sick poor of the western world.

The Hospital of Jesus of Nazareth, founded in Mexico. 1524, is the oldest institution with continuous service in the Americas. Missionaries. aided by well-to-do citizens in France and

Canada established the Hôtel-Dieu, Quebec, in 1639, and the Hôtel-Dieu, Montreal, 1644.

During the 18th century scientific advances in Europe ultimately were reflected in the treatment of hospital patients, with vaccination against smallpox in England, 1796; and the unshackling of mental patients in France, 1798. The Philadelphia Almshouse in the United States was founded by the Society of Friends (Quakers), 1713. It was later used for insane patients and ultimately became the Philadelphia General hospital. The Pennsylvania hospital, Philadelphia, established 1751, was the first hospital constructed solely for sick and injured persons in the United States. Other early institutions were the New York hospital. 1773; the Massachusetts General hospital, 1816; and the New Haven hospital, 1826.

The 19th century witnessed important developments in the United States. State-owned hospitals were constructed for the insane; local government facilities were opened for the aged, infirm, the sick poor and for victims of contagious disease. These trends also characterized English and continental European institutions. The church hospitals established in the 19th century were primarily for underprivileged persons. Self-supporting patients were treated in private dwellings or "nursing homes" conducted by individual medical practitioners.

Military Hospitals. — Military activity has greatly influenced the history of hospitals and medicine. Hospitals were established along the routes of the crusades in the mediaeval period as resting places for the wounded as well as centres of religious influence. The treatment of wounds provided the opportunity and need for new surgical procedures, and conditions of combat stimulated the grouping of patients in hospitals for treatment by military physicians and their assistants. Military hospitals became frontiers in medical knowledge and skill, as well as nursing and custodial procedures. (See MEDICAL SERVICES, MILITARY.)

During the Crimean War, 1853, Florence Nightingale, a volunteer nurse with the British army, achieved the first effective coordination of scientific medicine and humanitarian care of patients in hospitals. Her theories and principles were rapidly applied throughout the world, and in the United States, her birthday, May 12th, has been celebrated as National Hospital day since 1924. The Red Cross (*q.v.*) since 1856 has conducted hospital service programs for disasters and emergencies, such as fire, flood, famine or military occupation.

World Wars I and II resulted in further contributions to hospital expansion and management. Among the specific advances were: (1) the discovery that good medical care can he provided in improvised facilities, including such varied structures as tents in the theatre of operations, public buildings, private homes, ships, barges, trains, ambulances, aeroplanes and even submarines; (2) development of the "mobile" hospital, with physicians, nurses and supplies following the movement of troops for emergency treatment; (3) the mass movement of convalescent patients for distances and by means previously considered impossible; (4) the control of contagious diseases by large-scale methods later adapted to civilian practice.

Classification of Hospitals. — The two major bases of classification are by type of control and type of service. As to "control," hospitals are: governmental (national, state, provincial or local); nongovernmental, including the proprietary, conducted for private gain and the voluntary conducted on a nonprofit basis by churches, fraternal orders, or independent associations.

Most hospitals throughout the world are under government control, except in the United States. But every country contains a number of small proprietary institutions, usually with a capacity of fewer than 50 beds, owned by one or two physicians for the care of well-to-do patients. In continental Europe they are called "clinics"; in England, "nursing homes." They provide less than 5% of the total bed capacity of the world.

The term voluntary to describe private nonprofit institutions arose in England, where hospitals were administered by religious groups or secular associations, and were supported by voluntary contributions from the general public. Patients also made some voluntary financial contributions, and physicians served without monetary reward. Members of the royal family and aristocracy sponsored drives for funds by specific hospitals. The King Edward's Hospital fund, London, was developed in 1897 for contributors who wished to support voluntary hospitals as a group.

In the United States, the term voluntary is applied to any hospital conducted by a Catholic or Protestant church or religious order, a fraternal society or an independent nonprofit association. Such institutions are available for use by the entire population. The affairs of voluntary hospitals are controlled by trustees who serve without pay in these capacities, and who are responsible for designating the medical staffs, for employment of the administrator, and for the professional and financial policies of the institution. Typically, the medical staff serves free and part-free patients without remuneration, but charges fees to private patients under personal care and supervision in the hospitals.

As to type of service, hospitals may be general or special. A general hospital accepts all types of medical or surgical cases, usually concentrating upon acute illnesses requiring short-term care, including maternity service and the care of children. A special hospital is one which limits service primarily to single classes of patients or types of illnesses, particularly mental and tuberculosis cases and those requiring isolation because of contagious conditions. Special hospitals for short-term cases are less common than formerly, with a tendency for hospitals for children, maternity, cancer, crippled, etc., to become affiliated with general hospitals in order to improve quality of service and economy of administration. Since 1940, special sections for mental, tuberculosis and contagious cases have been established in many general hospitals.

World Distribution of Hospitals. — Statistics of hospitals and their bed-capacity have not been authoritatively assembled for all nations. Such data were particularly unreliable after World War II, but in 1950 the International Hospital federation, London, and the Pan American Sanitary bureau, Washington, D.C., were compiling directories of hospitals, facilities and services. The number of hospitals does not necessarily indicate the adequacy of services in a country, since institutions vary widely in bed-capacity, character of facilities provided, and types of cases accepted. The table signifies, however, the widespread nature of hospital service.

Estimated Number of Hospitals in Certain Countries at Mid-zofth ***Century****

Country	No. of hosp.	Country	No. of hosp.
Algeria	116	Italy	523
Argentina	1,050	Jamaica	31
Australia.	1,727	Japan	3,121

		Venezuela	206

*These data were obtained from the office of foreign trade, United States department of commerce, except for Canada. Great Britain and the United States, as indicated in the text of this article. Not all countries of the world are included. The figures apply to years 1947 to 1950, depending upon the availability of data in the respective countries.

British Hospital Service. — Hospital care in Great Britain became part of the national social security program, which included

physicians' services, dentistry, drugs and convalescent care. The various voluntary hospitals were originally directed by boards of governors selected from civic, industrial and professional leaders of their communities. Such boards were continued as hospital committees and were co-ordinated under the National Health act, which, July 4, 1948, vested the title of all acceptable voluntary hospitals in the national minister of health. The local committees are no longer responsible for raising funds to finance the hospitals. Their function primarily is to advise with the hospital administrator (house governor or secretary) in budgeting and expenditure of monies received from the national exchequer.

Patients are accepted for care in British hospitals without direct cost to themselves, after consultations with the medical specialists who serve the hospitals on a full-time or part-time salary basis. There is no private medical practice in hospitals under the National Health act, but some well-to-do patients elect to be cared for in nursing homes at which they pay fees for hospital care as well as to the attending physician or surgeon. The services provided under the National Health act are financed in part by equal contributions from each adult person, established in 1948 at four shillings, eightpence weekly. The balance of the costs are met from other forms of national taxation.

At mid-20th century, there were 1,126 general hospitals, bed capacity 110,845. Of this number, 181 hospitals were located in London, 746 were in the English and Welsh provinces, 136 in Scotland and 63 in Northern Ireland. The growth of facilities in the city of London may be indicated by the following data: in 1913 there were 106 general hospitals with 9,171 beds; in 1924 there were 118 hospitals with 13,460 beds; by 1948 there were 181 hospitals with 23,680 beds.

Hospitals in the United States. — In 1948 there were 6,335 registered hospitals with 1,423,520 beds, an average of 9.8 per 1,000 population. In 1872 the ratio of beds per 1,000 persons was 1.9; by 1928 it had risen to 7.4..

Government hospitals comprise 30% of the institutions and 70% of the beds, but they account for only 26% of the annual admissions. They include nearly all the bed facilities for mental and tuberculosis cases, the former group remaining in the hospital approximately three years on the average, the latter about ten months. In sharp contrast, the nongovernmental hospitals dominate hospital service for general medical and surgical cases, including maternity. The nongovernmental general hospitals contain 24% of all beds, but receive 70% of all in-patients annually. The average length of stay in nongovernment general hospitals was 8.2 days in 1948.

Many government hospitals are very large. The state mental hospitals and the federal hospitals for veterans usually exceed 2,000 beds, as do certain local government institutions for medical and surgical cases, notably Bellevue hospital, New York city, Philadelphia General hospital, Cook County hospital, Chicago, St. Louis City hospital and Los Angeles County hospital.

The 4,435 nongovernment hospitals, in 1948, included 3,084 voluntary institutions with 403,753 beds, and 1,351 proprietary with capacity of 50,781 beds. The voluntary group comprised 1,068 Catholic and Protestant church hospitals and 2,016 controlled by independent nonprofit associations. The nongovernment hospitals reported 2,336,740 births, as compared with 457,541 for the government hospitals. In the United States 88% of all recorded births occurred in hospitals, with the rate exceeding 98% in some larger cities.

More patients are using hospitals than ever before and their length of stay is briefer, for all types of institutions. The average length of stay in nongovernment hospitals was reduced from 13.2 days in 1934 to 9.3 days in 1948; for government hospitals the periods of stay were 109 and 77 days, respectively.

Advances of medical science permit early ambulation of patients with resulting shorter convalescence. The preventive value of hospital insurance, such as Blue Cross, prompts patients to seek hospital care promptly when care is required. Consequently, hospitals are able to serve more patients with the same plant and equipment. In 1934, the annual admissions per bed in nongovernment hospitals was 15.1; in 1948 the number was 30.1.

Hospital Finance. — The replacement value of hospitals in the United States was approximately $7,500,000,000 or about $50 per inhabitant in 1948. More than 98% of the money had been furnished by public investment, equally divided between governmental taxation and private contributions.

The annual hospital bill for the United States in 1948 exceeded $2,500,000,000 or about $17 per person. There were 939,000 professional and institutional employees with an annual pay roll of $1,163,000,000. General hospitals for short-term cases maintain full-time personnel of approximately 1 6 persons per occupied bed.

Government hospital expenses in 1949, including all services of physicians and surgeons, were approximately $1,200,000,000, paid almost exclusively from taxation. Nongovernment hospitals involved expenses of approximately $1,300,000,000 in 1948 of which 90% was paid by patients, 7% came from governmental agencies for the care of public charges and 3% from current contributions or endowment income. Contrary to popular impression, very few hospitals are heavily endowed. Less than 300 of the 3,084 voluntary hospitals registered in 1948 possessed as much as $100,000 endowment capital, the minimum amount required, at 4%, to finance care continually in one bed in a general hospital treating acute illness.

The annual expenses of nongovernment hospitals quoted above do not include fees to attending physicians, surgeons and obstetricians, who attend private patients, although the patient's hospital bill would ordinarily cover the medical service involved in such procedures as radiology (X-ray), anaesthesia, pathological examinations, physiotherapy and electrocardiography.

An important factor in the finances of voluntary hospitals and patients is the payments by Blue Cross, nonprofit hospital insurance plan, which had enrolled 40,000,000 persons by 1950, at which time there were also 20,000,000 policyholders in commercial and industrial health insurance plans. These plans remove the uncertainty of sickness costs from the potential patients, and stabilize the income of nongovernment hospitals, which might otherwise have been forced to seek government assistance for their maintenance expenses.

Out-Patient Service. — Hospitals do more than serve bedridden patients. The number of out-patient visits greatly exceeds the number of in-patient in urban communities. For the year 1948, the hospitals in the United States received 45,400,000 visits from outpatients who did not occupy bed facilities. In that year a total of 108 hospitals in New York city, with 38,034 beds, reported 793,364 in-patient admissions (plus 116,716 births) and 5,209,884 outpatient visits. In the metropolitan area of Philadelphia, 66 hospitals, with 16,505 beds, admitted 343,854 in-patients (plus 62,225 births) and received 2,090,372 out-patient visits during the year 1949.

In London, 1946, there were 269,510 patients admitted for bed care to 159 general hospitals and 1,879,574 treatments in the outpatient departments. Data for Canada in 1948 listed 537 hospitals of all types with bed capacity of 113,083, and annual inpatient admissions of 1,353,448, and total out-patient visits of 2,122,024.

Co-ordinated Hospital Systems. — Many small hospitals correlate their work with the services of medical specidlists in large institutions, thereby avoiding the necessity of duplicate professional personnel and scientific apparatus and equipment. In 1946, congress encouraged the principle of co-ordinated hospital systems in states and regions through the Hospital Survey and Construction act, which appropriates $150,000,000 annually for surveys and construction of necessary facilities, particularly in rural areas. The states and local communities are required to provide from one-third to one-half the total costs.

The American Hospital association, organized 1899, is the national organization of hospitals. It conducts information and coordination services for the improvement of hospital administration, including institutes or short courses on such subjects as nursing, accounting, personnel, purchasing, laundry management, public relations, etc. Collegiate training for hospital administration has been developed, the first course being offered at the University of Chicago in 1934.

Hospitals are the training centres for medical and nursing education throughout the world. In the United States, medical education in hospitals is supervised by the Council on Medical Education and Hospitals of the American Medical association. (See also MEDICINE.) In 1948, one or more registered hospitals were directly affiliated with each of the 77 recognized medical schools, 795 were used for the training of internes, and 1,187 offered residency training in the various medical specialties. There were also 1,153 accredited schools for the training of professional nurses (see NURSING) in the hospitals of the United States.

The Hospital Council of Philadelphia, established in 1946, exemplifies a trend in large cities toward the co-ordination of hospital service, research in administration, contacts with public bodies, nursing education, joint-purchasing, uniform accounting and relations with the medical profession. Such groups are financed by membership dues from hospitals and contributions from philanthropic sources.

The United Hospital fund of New York city, organized in 1879, conducts annual campaigns on behalf of 86 voluntary hospitals in the area.

Hospital Management and Operation.— The modern hospital is a complex institution engaged in a variety of activities. Design and construction have changed to reflect trends in medical science. Important trends from 1925 to 1950 include the following: (1) patients' rooms contain fewer beds, from four to six beds maximum in new institutions; this permits greater flexibility in use by patients of different age, sex, or medical condition; (2) air conditioning has offset the disadvantages of cold or warm climates, and reduced dangers of infection during treatment or convalescence; (3) buildings are higher, to reduce construction costs, utilize land space, and conserve time of nursing employees (the first hospitals to exceed 15 stories in the United States were St. Luke's, Chicago, 1925; Jefferson, Philadelphia, 1927; Hahnemann, Philadelphia, 1928; Presbyterian, New York city, 1928; New York hospital, 1931; many other "skyscraper" hospitals have been erected since that period); (4) outpatient facilities are expanding in order to utilize effectively the various types of scientific diagnostic apparatus; (5) group medical practice is developing in hospitals, with many part-time or full-time physicians using offices provided by the institutions; (6) schools of nursing are being provided with special facilities and quarters; (7) departments of social service (*q.v.*) are supplementing medical science by emphasis on personal and environmental problems; (8) public health services (*q.v.*), particularly visiting nursing, are providing convalescent home care for hospital patients.

Hospital care involves a high degree of readiness-to-serve costs, inasmuch as certain administrative, professional, and household personnel must be employed regardless of the number of in-patients or out-patients served. Accordingly, great emphasis is now placed upon professional or administrative practices which will achieve a high degree of utilization of the beds and scientific apparatus. One incidental result has been the virtual disappearance of hospital-owned ambulances in large cities, where emergency patients are more promptly transported by private automobiles, police or fire department ambulances, or commercial ambulances owned by taxicab companies.

The hospital of mid-20th century differed widely from the place of custody or isolation in early times, and from the last refuge for the sick poor in 1850. Patients enter a hospital with confidence, knowing that chances of recovery are greater than elsewhere and that every phase of medical knowledge and skill will be devoted to restoring them to health and normal life. The modern hospital became the logical centre for all preventive and curative health services.

HOSPODAR, a term of Slavonic origin meaning "lord" (Russ. gospodar). It is a derivative of gospod, "lord," and is akin to gosudar, which primarily means "sovereign." In Little Russian the title hospodar is specially applied to the master of a house or the head of a family. The rulers of Walachia and Moldavia were styled hospodars from the 15th century to 1866. At the end of this period, as the title had been held by many vassals of Turkey, its retention was considered inconsistent with the growth of Rumanian independence. It was therefore discarded in favour of domn (dominus, "lord"), which continued to be the official princely title up to the proclamation of a Rumanian kingdom in 1881.

HOST. (1) One who provides another with lodging and entertainment (Lat. *hospes,* a guest or host). In biology, an animal or plant upon which a parasite lives. (2) An army and generally any multitude (Lat. *hostis,* a stranger or enemy). In biblical use the word is applied to the company of angels in heaven or to the sun, moon and stars. (3) The sacrifice of Christ's body and blood in the eucharist, the consecrated wafer used in the service of the mass in the Roman Church (from Lat. hostia, a victim or sacrifice). (See EUCHARIST.)

HOSTA, a genus of popular garden perennials of the family Liliaceae (*q.v.*), comprising ten species, all from China and Japan, as well as several horticultural varieties, grown for ornament under the name of plantain lily or funkia. They have tuberous rhizomes, basal, plantainlike leaves and attractive clusters (racemes) of drooping, funnel-shaped, blue, white or lilac flowers. They are much grown for edging and in borders, and are of the easiest culture, most of them doing well in partial shade. Propagation, which is easy as they are prolific growers, is accomplished by division.

HOSTAGE, in war, a person handed over by one of two belligerents to the other, or seized as security for the carrying out of an agreement or for preventing violation of the law of war. The practice of taking hostages is very ancient and has been used in cases of conquest, surrender and armistice. The Romans often took the sons of tributary princes and educated them at Rome, thus holding a security for the continued loyalty of the conquered nation, and also instilling a possible future ruler with ideas of Roman civilization. The British adopted this practice in the early period of the occupation of India, as did the French in their relations with the Arab states of north Africa. Hostages were detained as prisoners of war until the negotiations or treaty obligations were carried out. In ancient times they were punished or put to death in case of treachery or refusal to fulfill promises. The practice of taking hostages as security for the carrying out of a treaty between civilized states became obsolete in the 18th century. The last occasion was at the treaty of Aix-la-Chapelle in 1748, when two British peers were sent to France as hostages for the restitution of Cape Breton to France.

In modern wars, hostages have been taken as a measure of reprisal to assure observance by the enemy of the law of war in respect to such matters as the treatment of prisoners and the sick and wounded. The Geneva convention of 1949 forbade reprisals against prisoners of war, and persons taken as hostages are entitled to the treatment of prisoners of war. Vicarious punishment of enemy individuals for war crimes committed by other enemy persons is not favoured by the modern law of war. Even more doubtful is the practice of taking hostages to assure observance by the civilian population of regulations imposed in occupied territory for the security of the occupant's forces and communications and for the payment of contributions. This practice was extensively resorted to by the Axis powers during World War II, but war crimes tribunals after the war found the execution of hostages taken for these purposes to be a war crime except, in the opinion of one tribunal, under very exceptional circumstances.

(O. W.)

HOSTE, SIR WILLIAM, BART. (1780–1828), British naval officer, born on Aug. 26, 1780, of a Norfolk family, neighbours to the Nelsons. He joined the "Agamemnon" as Horatio Nelson's follower in 1793 and served with him in four other ships. He was promoted commander after the battle of the Nile and post captain in 1802. Although commanding a frigate under Nelson in 1805, he missed the battle of Trafalgar. All his active service thereafter was in the Adriatic, where he served with distinction until the peace of 1814, after which he saw no further service of note. His most notable achievement took place on March 13, 1811, off Lissa (*q.v.*), when, commanding a squadron of three frigates and a sloop, he engaged three French and three Venetian frigates (with five smaller vessels). The British ships proved more than a match for their inexperienced opponents; two of whose frigates were taken and one destroyed. Hoste was made a baronet in 1814 and a K.C.B. in 1815 He married Lady Harriet Walpole in 1817. He died on Dec. 6, 1828.

See Lady Harriet Hoste, *Memoirs and Letters of Captain Sir William Hoste, Bart.,* 2 vol. (1833).

(C. N. P.)

HOSTEL, the old name for an inn *(see* HOSPITAL, *ad init.);* also employed at Oxford and Cambridge to designate the lodgings which were in ancient times occupied by students of the university. In some of the English public schools the "hostel" system provides the lodging accommodation under separate masterships.

HOSTIUS, Roman epic poet, probably flourished in the 2nd century B.C. He was the author of a *Bellum Histricum* in at least seven books, of which only a few fragments remain. The poem is probably intended to celebrate the victory gained in 129 B.C. by Gaius Sempronius Tuditanus (consul and himself an annalist) over the Illyrian Iapydes (Appian *Illyrica,* 10; Livy, *epit.* 59).

Hostius is supposed by some to be the "doctus avus" alluded to in Propertius (iv, 20, 8); the real name of Propertius' Cynthia, according to Apuleius *(Apologia* x) and the scholiast on Juvenal (vi, 7). being Hostia (perhaps Roscia).

Fragments in E. Bahrens, *Fragmenta poetarum Romanorum* (1884); A. Weichert, *Poetarum Latinorum reliquiae* (1830).

HOSUR, town in Salem district, Madras state, India, 24 mi. S.E. of Bangalore. Pop (1951) 8,712. It contains an old fort, frequently mentioned in the history of the Mysore wars. Close by is a large remount depot.

HOT BLAST. The apparently insignificant idea, introduced by James Neilson in 1828, of sending hot air instead of cold into a blast furnace created a revolution in smelting practice, for it enabled a much greater quantity of ore to be smelted for a given amount of fuel, while furnaces could be made of larger size than hitherto.

The air temperature employed was at first low but later ranged from about 650° F. to 1,500° F. Hot-blast stoves for the heating were originally fired with coal, but later the waste gases from the furnaces were utilized by means of combustion chambers in the stoves. These are of regenerative type, tall structures containing a mass of brick checkerwork.

Stoves vary considerably in regard to the interior arrangement. *(See* IRON AND STEEL.)

HOTCHPOT or HOTCHPOTCH, in common law the name given to a rule of equity whereby a person, interested along with others in a common fund and having already received something in the same interest, is required to surrender what has been so acquired into the common fund, on pain of being excluded from the distribution.

The same principle is to be found in the *collatio bonorum* of the Roman law: emancipated children, in order to share the inheritance of their father with the children unemancipated, were required to bring their property into the common fund. It is also found in the law of Scotland.

HOTEL. The word hotel is of ancient origin (Med. Lat. *hospitale,* Old French *ostelerie*). But its use in English for a house of entertainment for travellers is recent. As late as the 1820s it was regarded as pretentious.

The hostellers of London are, however, mentioned in 1327 and in 1446 they made regulations for the government of their craft. In 1473 they took the name of innholders (the word hostler or ostler having come to mean merely an inn servant). As innholders they were chartered in 1514, their company being recognized as 32nd in order of precedence among the livery companies of the City of London. In this article the word inn (of Anglo-Saxon origin and used in this connection since *c.* 1400) is used for a house of entertainment until the period *c.* 1800, when hotel became fashionable. The Methuen Arms, Corsham, became a "hotel" *c.* 1805; the Acorn, Birmingham, became the Imperial hotel, on rebuilding, as late as 1879.

Early History. — From the earliest days of travel inns of one kind or another must have existed. W. C. Firebaugh *(see* below, *Bibliography)* gives the major classical references. There are also several possible mentions in the Old Testament (Exod. v, 24; Jos. ii, 1; Judges xvi, 2; and Gen. xlii, 27). In the New Testament the outstanding mentions are Luke ii, 7 and x, 34. The biblical inn was however rather a khan or caravanserai than an inn in any modern sense of the word.

There were inns in Britain along the main Roman roads, but the English inn in its present form cannot be traced any farther back than the middle ages. As a rule, when an English inn claims an origin earlier than *c.* 1400 its claims have no substance. There is, however, some substance in the claims to antiquity of the Angel, Grantham (1213), of the Angel, Blyth, and of the George and Dragon, Speldhurst (both 1270), and of the King's Head, Aylesbury (shortly after 1386). The Luttrell psalter, *Piers Plowman,* the *Canterbury Tales* and William Caxton's *The Game and Playe of Chesse* all provide indisputable evidence of the existence of major inns in the later middle ages. Chaucer's Tabard especially has all the essential features of a modern hotel—a sign, a host, a staff of servants, a table-d'hôte meal and a reckoning.

In mediaeval times the inn seems to have developed first in the larger towns, though even there in the earliest inns the wayfarer was expected to supply his own food, fuel and bedding. Elsewhere wayfarers depended largely on the hospitality of manorial lords and of religious houses. In the countryside many inns developed after the dissolution of the monasteries (1536–39). Some English inns flourishing to this day indisputably began as monastic *hospitia:* for instance the New Inn in Gloucester and the Georges at Glastonbury, at Norton St. Philips and at Winchcombe.

The earliest flattering accounts of the English inn date from this period. Thus in 1577 the Rev. William Harrison said in his *Description of England* "Those townes that we call thorowfaires have great and sumptuous innes builded in them · · · verie well furnished with naperie · · · Ech commer is sure to lie in cleane sheets, wherein no man hath beene lodged since they came from the laundresse. . .there is no greater securitie anie where for travellers than in the gretest ins of England." Forty years later, in 1617, Fynes Moryson describes the inn "ordinary," the inn servants who take the guest to his room, kindle his fire and pull off his boots and the host or hostess who waits on him "taking it curtesie to be bid to sit downe." "The World," he says, "affoords not such Innes as England hath."

Probably the development of the inn in late mediaeval and early Tudor times must be related to the improvement in the internal security of the country; it was safe to travel. It was connected also with the growth of the middle classes: the rising *bourgeoisie* were both able and willing to pay for their accommodation when they were away from home, and innkeepers found profit in catering for their needs. Before the middle of the 16th century the inn plan had developed the conventional form which it retained until the coming of the railways. The heart of the premises was an enclosed cobbled courtyard, often with an imposing arched entrance from the main street, with the kitchen and public rooms occupying the main structure. Other rooms were in a galleried structure fronting two sides of the courtyard, with stables and outbuildings along the fourth side. Sometimes in very large

inns the outbuildings surrounded a second subsidiary courtyard opening from the main one. A few such inns survived in part (*e.g.*, the New Inn, Gloucester, and the Golden Cross, Oxford), though usually the gallery was long ago built in. It remained at the Bull, Dartford, the George, Huntingdon, the George, Winchcombe, the White Hart, Chipping Norton, the White Horse, Romsey, etc.

It is in the 16th century that we find the first statutory reference to inns—as apart from mere alehouses, which appear in the laws of Aethelbert of Kent (560–616) and of Ine of Wessex (688–726). The act is 5 and 6 Ed. VI c. 25 (1551–52), which orders that the magistrates are to take sureties from innkeepers, as from alehouse-keepers, for the maintenance of good order in their houses. The act was repealed in 1828, but its basic principles still form part of English law. By 1618 the surety taking had developed into the exacting of elaborate recognizances with specific conditions imposed by the justices in accordance with privy council orders and with the royal proclamation of 1618.

In 1603–04 (1 Jac. I c. 9) the distinction was clearly made between alehouses and inns, since "the ancient and principall True use of Innes and Victuallinge Houses was for the Receipte, Relief and Lodginge of wayfaring people travellinge from place to place." Therefore the innkeeper was given at once duties and privileges such as the mere alehouse-keeper did not possess. Both the duties and the privileges survive in a modified form to this day.

The legal definition of an inn is still unsatisfactory. An inn is said to be a "house where the traveller is furnished with everything he has occasion for while on his way"; or "house the owner of which holds out that he will receive all travellers and sojourners who are willing to pay, and who come in a situation in which they are fit to be received"; or "premises having a full excise licence and containing accommodation for permanent and casual guests." In the mid-1950s there was still no specific inn or hotel licence, the licence granted being one to sell beer (and tobacco) and, in the usual "fully licensed" house, also wines and spirits. It has been said that "English law regards the highest class of hotel as little more than an inn, and little less than a disorderly house."

From the 17th century there are many literary references to individual inns, both in general literary works and in the journals and diaries of travellers in England. Thus Samuel Pepys gives a graphic account of the George, Salisbury, and of the Hart, Marlborough, and a still better one of the house (unnamed) on Salisbury plain, where his party "made merry" on discovering that the beds were lousy. John Taylor, the Water Poet, gives an interesting account of the Rose and Crown at Nether Stowey. Richard Brathwait (Drunken Barnaby), whose amorous alcoholic peregrinations took him four times on horseback from Oxford or London to Kendal in the years c. 1610–30, wrote particularly entertaining accounts of the beer and the hostesses at such inns as the Bull, Rotherham, the Bell, Leicester, and the Cock, Budworth.

The Age of Coaching.— Stagecoaches are first mentioned in 1637, and by the middle years of the 1650s the beginnings of the public stagecoach system had appeared. The system developed throughout the 18th century and lasted until the coming of the railways in the 1840s. For these 200 years the development of road transport had close connections with that of innkeeping. Many coach services were first established by innkeepers, anxious to attract custom to their houses; and to the end of the coaching era coach termini and "stages" were almost invariably at inns. Old inns were now rebuilt (or often refronted), and new inns too were built, especially, of course, on the great trunk roads radiating from London. Thus the Rose and Crown, Saffron Walden, was refronted in 1748; the White Hart, Salisbury, an enormous inn covering nearly an acre, with a very fine classical portico, was completely rebuilt in 1800; and the County, Taunton, was refronted in 1820. The Blue Boar, Maldon, was refronted in sombre gray brick c. 1800, but a wing containing some untouched 15th-century work remained visible from the yard. Some of the greater coaching inns of this period were designed to serve many of the purposes of a modern railway junction station—with booking offices, waiting rooms and through bookings along a whole network of routes centring at the inn. A good example of an inn of this kind, with a total of 23 passenger services centring there, is the Royal, Cheltenham.

Often 18th-century features still survive in inns built or reconstructed in this period. A common one in a town inn is the assembly room—sometimes now partitioned into bedrooms but originally designed as the centre of social activities in the town. The Lion, Shrewsbury, has a very fine Adam assembly room (1777); and the Cups, Colchester, has another, rather later but almost equally beautiful. Sometimes, when the assembly room occupies the first floor front, it has a balcony, which may serve to this day as a rostrum for public speakers (*e.g.*, at the White Hart, Salisbury). One survival of the coaching period is at the George, Stamford, where the 18th-century dining-room doors north and south are still labelled respectively "Edinburgh" and "London." An older custom (not specifically connected with coaching) is that of giving rooms names, not numbers: the original labels "Rose," "Crown," "Star" and "Sun" survive at the Royal Fountain, Sheerness; and the custom was revived (*e.g.*, at the Shakespeare, Stratford).

Roadside Hotels in the 19th and **20th** Centuries.— With the development of the railways in the decades from 1825 onward, through traffic for some time almost vanished from the roads. By the 1840s coach services had virtually disappeared. The railways, however, preserved the sites and sometimes the very signs of the coaching inns that they were superseding, and a few remain to this day as railway district goods and parcel offices; in London the railway office in Aldersgate street preserves the memory of the Elizabethan Castle and Falcon; 65 Gresham street is a vestigial survival of the Swan With Two Necks (recorded from 1556); and the office at 138 Borough High street is the lineal successor to the Catherine Wheel (ante 1534).

The general effect of the advent of railways upon the older, established English hotels was disastrous, as they naturally reduced the time that travellers had to spend on their journeys. Many hotels went out of business or were substantially reduced in size, much of their accommodation being let off in tenements or allowed to go to ruin. Many once-famous inns became for the time little more than mere public houses. Examples include the Bell, Holborn, the Bull's Head, Meriden, the Castle, Marlborough, the Lion, Dunchurch, the Pelican, Speenhamland, and the Swan, Ferrybridge. While a few hotels were built in holiday and show towns and in health resorts, for instance the Randolph, Oxford (1864–66), and the Wellington, Tunbridge Wells (?1870), the Victorian era was in general a time of neglect and even of decay for many hotels of the older kind. (For the railway hotels and the great London hotels, see below).

At the end of the 19th century, however, with the invention of the safety bicycle and still more with the rapid development of the motorcar, traffic came back to the roads. Many old hotels were reopened, to become thereafter more imposing and more prosperous than ever. The renaissance of the English roadside hotel dates from the 1890s.

Four organizations did much to influence it, two representing consuming, two producing interests. In 1878 was founded the Cyclists' Touring club, which long maintained a register of inspected and approved (licensed and other) hotels. The Royal Automobile club (1897) similarly registers and indicates hotels. The effect of this registration and recommendation influenced charges and facilities in hotels generally. Two other institutions which had an influence on hotelkeeping out of proportion to the number of houses that they controlled were the People's Refreshment House association, founded in 1896 by F. F. Jayne, 33rd lord bishop of Chester, and the various county Trust companies, founded from 1904 onward under the inspiration of the fourth Earl Grey and mostly later absorbed into P.R.H.A. or into Trust Houses Ltd. (dating in its present form from 1919). The aim of these associations was the reform of the English public house (the word being used in its widest sense to include hotels, inns, taverns and alehouses). In fact the great majority of their properties are fully licensed hotels. Their policy is centralized control with inspection of local managers, fixed and reasonable prices, no tie for alcoholic refreshments, the encouragement of catering of

all kinds and the provision of residential accommodation. Most of the properties sponsored by these organizations are hotels in the ordinary sense of the word; and these include many of the oldest and most interesting ones in England—the Angel and Royal, Grantham, the Dolphin, Southampton, the King's Head, Aylesbury, etc. Of the remainder, a few are "free houses," not tied to any brewery company. These vary in excellence, the best being very good indeed. Other hotels in Great Britain (apart from a few hundred residential ones in pleasure resorts, spas, seaside towns, etc.) are almost always owned or leased by a brewery company.

Dawson, *The Nation's Hosts* (New York, 1937); H. P. Part, *The Art and Practice of Innkeeping* (London, 1922). (W. E. T.)

Railway Hotels.—The earliest railway lines ran short distances only so that the return journey could be made on the same day as the excursion. With the opening of the London and Birmingham railway, however, accommodation for long-distance travellers became an obvious necessity. The first major railway hotel, founded at Euston station in 1838 (originally in two parts, the Euston and the Victoria, which were not joined together until 1881) was an object of amazed admiration, being described by R. S. Surtees as constituting two towns or a city. It should be stated, however, that throughout the 19th century the railway companies often encountered considerable opposition to their hotel enterprises on the grounds that the acts of parliament under which they worked did not authorize them to build hotels. At Preston, for example, though we find the North Union company considering the erection of a hotel in 1835, the Park was not opened till 1882.

Of the numerous London terminal hotels built after Euston we may cite the Great Western Royal at Paddington (1854), the Charing Cross (1863) and the St. Pancras (architect Sir George Gilbert Scott, 1865). In the terminal cities outside London, moreover, no less than in London itself. there was often more than one railway hotel, for instance, the St. Enoch and the Central in Glasgow and the North Western (Lime Street, 1871–1933), the Exchange and the Adelphi in Liverpool. All these hotels, however, though magnificent by the standards of the time, were constructed with the utilitarian purpose of accommodating travellers going about their business and so must be distinguished from the later country hotels built by the railway companies, for instance, those at Gleneagles and at Turnberry, which were designed t~ attract holidaymakers, sportsmen and tourists (as was also the case with the Welcombe, at Stratford-on-Avon, as late as 1931).

London Hotels From 1880.—The great period of the railway hotels' predominance may be regarded as conterminous with the early and middle Victorian period. With the 1880s came the rise of the luxury hotels of London, symptomatic of the spirit that was to characterize the Edwardian age. The impresario Richard D'Oyly Carte (1844–1901) opened the Savoy hotel, off the Strand, in 1889, with what was then the distinction of having 70 bathrooms, 6 lifts and electric lighting throughout; and it was he who brought César Ritz (1850–1918) to London. Within ten years the directors of the Savoy had acquired not only Claridge's (reopened 1898) and the Berkeley (originally the Gloucester coffeehouse, terminus of the mail coaches from the west country) in Mayfair, but also the Grand hotel in Rome. Ritz left the Savoy in 1897 to go to the Carlton; his own Ritz hotel was opened in 1906, on the site of the former Walsingham house, in Piccadilly by the Green park.

Contemporaneous with this enterprise was the development of the large but more modest hotels north of Holborn. Harold Walduck first rebuilt the Bedford (where there had been a coffeehouse in 1800) in 1900 and founded the Imperial in 1907; by the middle of the 20th century his company. Imperial London Hotels, Ltd., was controlling nine hotels, including the Tavistock (1951), the first new hotel to be opened in London after World War II.

The Dorchester, the great luxury hotel in Park lane, built on the site of the former U.S. embassy (old Dorchester house) by Sir Robert Macalpine and Sons in association with Gordon Hotels, Ltd., was opened in 1931; Macalpines acquired entire control of it in 1936. (X.)

UNITED STATES

A hotel is generally thought of in the United States as an establishment which provides lodging and usually food for transient or permanent guests.

There is no nationally accepted definition of a hotel, but it is usually characterized by most if not all of the following attributes: it is licensed by the state or recognized by the community as a hotel; its front doors are open and unlocked 24 hours a day; and it provides switchboard, bellboy, maid, watchman and mail and package receiving services, linen service and the laundering of linens, utilities and the upkeep of furniture and fixtures.

Hotels in the United States range in size from 10 or less to 3,000 rooms, but the average hotel has only 96 rooms. Seventy per cent of all hotels have 100 rooms or less, 24% have from 100 to 299, 4% have from 300 to 499, and only 2% have more than 500 rooms.

History.—America's first hotels were seaport inns and converted farmhouses along the stagecoach routes. When railroads succeeded the stagecoaches as the principal means of transportation, the wayside inns gave way to larger hostelries built near the railroad depots. As the cities grew, new hotels arose in the centres of business and theatrical districts. And as the commercial traveller became increasingly important to hotels, he demanded and got more luxurious accommodations. Americans learned to take for granted a standard of hotel comfort and convenience unknown in Europe.

The industry's growth was moderate but continuous until World War I, which put a temporary stop to hotel construction. But the war was followed by a period of prosperity for hotels. This led to an era of overbuilding which resulted in disaster when depression swept the country in 1929. On a national average, four out of every five hotels went bankrupt or passed through some sort of financial reorganization. Widespread rate cutting resulted, so when World War II again raised occupancy levels, the ceiling prices imposed on room rates were geared in most cases to the rates which prevailed during the dog-eat-dog competition of the 1930s.

The shortage of labour and materials that lasted throughout the war forced curtailment of normal maintenance and rehabilitation operations in most hotels. When normal operation again became possible, the industry embarked upon what was expected to be a $1,600,000,000 program of rehabilitation and modernization. By the time this was completed, in late 1952, its cost had mounted to more than $2,500,000,000. Much of this amount was invested in new facilities and services for motor travellers (motels) and travelling family groups.

American travel habits went through a major upheaval after World War II. Development of vast turnpike systems led travellers away from the railroads and out onto the highways. Many of the new turnpikes skirted the cities, so the motor traveller often had to go out of his way to patronize a downtown hotel.

With motels springing up along the highways, many downtown hotels faced a serious loss of business. However, the hotel industry took stock of its collective problems and assets and mapped plans to cope with the new trends.

Types of Hotels.—The three main categories of hotels in the United States are transient, resort and residential. By far the most common are transient hotels, which sell their accommodations on a day-to-day basis and in nhich the average guest's stay is less than three days. Included in this category are working men's (and women's) hotels, which provide relatively modest accommodations at the most economical rates possible; and community hotels. which differ from other transient hotels only in that they are financed largely through the support of organizations and individuals in the communities they serve, in order to fill a

need in the communities.

Resort hotels are designed to serve guests whose principal requirements are pleasure or relaxation and who visit such hotels to enjoy the recreational facilities or the scenery of the surrounding areas. Some resort hotels operate on American plan rates, which include the cost of meals in the charge for the room, while others operate on the European plan, under which the rate covers only the room and the guest makes his own arrangement for meals. Many resort hotels operate only during that portion of each year in which near-by recreational facilities can be enjoyed, but there is a continuing trend toward extension of resort seasons.

Residential hotels accept guests by the month and many serve their guests as permanent homes. Guests often are required to sign leases, and in some cases are allowed to use their own furniture and even prepare their own meals in their premises.

(A. J. P.)

HOTEL DE VILLE, the town hall of a French municipality. The most ancient example, which was still preserved perfectly in modern times, was that at St. Antonin (Tarn-et-Garonne) dating from the middle of the 12th century.

Other fine town halls are those of Compiègne, Orléans, Saumur, Beaugency and St. Quentin. The Hôtel de Ville in Paris, built in the 16th century, burned by the Commune in 1871, has since been rebuilt on an extended site, the central portion of the main front being a reproduction of the old design. There is only one town hall in a French town, those erected for the mayors of the different *arrondissements* in Paris being called *mairies.* (See GOVERNMENTAL ARCHITECTURE.)

HOTEL DIEU, the term applied in France to any hospital in the middle ages, now reserved to those whose history goes back to mediaeval times. Many examples from the Gothic period still remain, notably that of Angers (1153–84), the so-called *salle* des morts at Ourscamps (early 13th century) and that of Tonnerre (*c.* 1300).

In all of these, the most important feature is a vast hall in which were placed the beds for the sick. In the two earliest the hall is divided into three aisles by pillars and vaulted so that four rows of beds on either side of the pillars were possible. At Tonnerre the great hall, nearly 60 ft. wide and 300 ft. long, was roofed with wooden trusses and had a wooden barrel vault ceiling. The beds were in little chambers along the sides, open to supervision from a gallery that ran continuously around the side walls immediately below the window sills.

At Beaune the *Hôtel Dieu,* founded in 1443, is of quite different character, occupying three sides of a courtyard, in two stories. In addition to the halls for the sick, various other rooms for the use of the nuns were furnished. The whole is a picturesque Gothic timber construction.

HOTHAM, WILLIAM HOTHAM, 1ST BARON (1736–1813), British admiral born on April 8, 1736, the third son of Sir Beaumont Hotham (7th baronet), entered the navy in 1751 and was commissioned while serving under Sir Edward Hawke in 1755. He was promoted captain in 1757. In the "Melampe" (36 guns) he took the French frigate "Danae" in 1759. With this brilliant beginning and with the influence that found employment for him in the years of peace following the Seven Years' War, his future distinction seemed assured. In the War of American Independence, however, after good service under Lord Howe, he failed to save from the French a large convoy that he was escorting from St. Eustatius to England in 1780. He was promoted to flag rank in 1787 and made vice-admiral in 1790. With the beginning of the French Revolutionary Wars, he went to the Mediterranean as second-in-command to Lord Hood. Hood unexpectedly relinquished command and Hotham was left to command a fleet, having never hitherto commanded even a squadron. He fought an indecisive action against the French fleet in March 1794 and was content with two prizes and a nominal victory. Offered an even better opportunity soon afterward, he again proved unequal to the responsibility of high command. He mas replaced by Sir John Jervis in 179j and never employed again. He was created a baron, however, in 1797. He died on May 2, 1813. (C. N. P.)

HOTHO, HEINRICH GUSTAV (1802–1873), German historian of art, born in Berlin in 1802, was affected for two years during his boyhood with blindness, but he recovered his sight and took his degree at Berlin in 1826. After a year of travel spent in visiting Paris, London and the Low Countries, he studied for a higher examination and passed as docent in aesthetics and art history.

In 1829 he was made professor at Berlin university. In 1833 he became an assistant in the museum of the Prussian capital and in 1858 the director of the print room.

Hotho divided his time between official duties and literature, his published works being generally confined to the history of the schools of Germany and the Netherlands. In 1842–43 appeared his account of German and Flemish painting. From 1853 to 1858 he revised and published anew a part of that work, which he called "The School of Hubert van Eyck, With His German Precursors and Contemporaries.!'

He died in Berlin on Dec. 25, 1873.

Hotho's development of Hegel's theories was his important contribution to the history of aesthetics. He was deficient, however, in knowledge of Italian painting.

HOTHOUSE: see GREENHOUSE.

HOTIN or KHOTIN, a town of Ukrainian Soviet Socialist Republic, U.S.S.R., in Bessarabia on the right bank of the Dniester. Hotin manufactures leather, candles, beer, shoes and bricks and does an export trade in local products. but its main importance has always been as a military post defending a much-frequented crossing of the Dniester.

The town was a medieval Genoese colony; it has been held by Moldavians, Poles. Austrians. Russians. Turks and Rumanians. The population of Hotin is mainly Ukrainian. Rumania ceded the town to the U.S.S.R. in June 1940 but regained it in 1941 during the invasion of the Soviet Union. In 1944 it was returned to the U.S.S.R.

HOTMAN, FRANÇOIS, SIEUR DE VILLIERS SAINT-PAUL (latinized as FRANCISCUS HOTOMANUS) (1524–1590), French jurist and one of the most learned of humanist scholars who took a leading part in the legal, political and religious controversies of his time, was born on Aug. 23. 1524 in Paris of a family of Silesian origin. He took his doctorate in law at Orléans and practised law in Paris where, in 1546, he became professor of Roman lam. In 1547 he was converted to the Reformed Church and went to teach law successively at Lyons. Geneva. Lausanne and Strasbourg where John Calvin went to hear him. In 1563 he returned to France and taught at Valence and, after 1567, at Bourges, then the foremost law school in Europe, where he succeeded Jacques Cujas. In 1572, after the massacre of St. Bartholomew, he fled to Geneva and taught again there, and later at Basle, where he died on Feb. 12. 1590.

Hotman made important contributions to the work of the French school of Romanists who, in opposition to the Italian commentators, sought to restore the tests of classical Roman law. In his *Anti-Tribonian* (1567) he combined an attack on the compilators employed by Justinian with a plea for codification of French law on the basis of native custom and experience and without borrowing excessively from Roman law. In *Franco-Gallia* (1573), which became his most influential work, Hotman showed that there was no historical foundation, other than the absolutist tendency of Roman lawyers, for the growth of royal absolutism in France which was used to prevent religious reform. In these and numerous other writings, published collectively by J. Lectius (1599–1601). Hotman sought to advance the cause of humanist learning, of religious freedom and of government by consent.

HOT SPRINGS NATIONAL PARK, a city, spa and tourist resort of central Arkansas, U.S., and seat of Garland county, is located at the eastern gateway to the scenic Ouachita mountains (*q.v.*), 52 mi. S.W. of Little Rock. The springs, probably visited by Hernando de Soto in 1541, were explored in the 1600s, frequented by Spanish and French health seekers in the 1700s, analyzed, routed and mapped in 1804 by the William Dunbar-George Hunter expedition under orders of Pres. Thomas Jefferson.

Warring Indian braves regarded the valley as neutral ground and bathed there together to strengthen their belief that the waters were a therapeutic boon of the "Great Spirit" to all his children. Permanent settlement dates from 1807; the town was incorporated in 1876, and in 1921 was renamed Hot Springs National Park to correspond with the change in nomenclature when Hot Springs reservation was established as a national park. However, the city operates under its own municipal and state laws and is independent of the federal government.

The roadnays, hiking trails, bridle paths and picnic areas of the park are easily accessible from the city's main thoroughfare, The park (about 1,000 ac.), including the 47 thermal springs, denied to private ownership in 1832, was one of the first areas set aside for national conservation. There are 20 hydrotherapeutic institutions (a number on Bathhouse row and the rest in hotels and hospitals) and the Physical Medicine centre, all under federal regulation. Accommodations range from luxury hotels to trailer parks. The climate is mild and nearby lakes with about 1,300 mi. of shore line afford year-round water sports and fishing. The annual schedule of events includes a 31-day horse-race meet. Adjacent Ouachita National forest offers camping, swimming and hunting in season. For comparative population figures see table in ARKANSAS : *Population.* (M. D. Hu.)

HOTTENTOT, a generic term embracing culturally differentiable divisions of peoples known as the Hottentots, the Korana and the Nama located in South-West Africa, living either in European settlements or on official reserves. Most Hottentots (numbering about 24,000 in the latter 1950s) are either Nama or "Orlams," the latter term denoting remnants of the Cape Hottentots together with many of hybrid descent. The main Nama concentrations are the Bondelswarts, Rooinasie, Swartboois and Topnaars; the Orlams groups are the Witbooi, Amraal, Berseba and Bethanie. Physically, true Hottentots closely resemble the Bushmen. the Hottentots' slightly taller stature and decidedly longer and narrower head form being the only marked differences. (See BUSHMAN.)

Traditional Hottentot economy and social organization (see I. Schapera, *Khoisan* Peoples of South Africa (1952) has changed drastically. Formerly, they practised a herding, hunting and gathering economy. While some independent families still lead a nomadic pastoral life, the majority have settled and live by selling their labour, adopting the material equipment, dress, language and general mode of living of their Europeanized rural environment. It is claimed that most Hottentots have become Christian. The former nomadic unit, the patriarchally organized group of related families, now finds expression as the ward of a village. The clan tribes to which persons were affiliated by descent and within which interclan affairs were administered by a council of clan heads, have given way to reserve groups, which are administered as political units by chiefs and headmen, loyalty to whom defines tribal membership.

BIBLIOGRAPHY.—J. A. Engelbrecht, The *Korana* (1936) ; A. Hoernli, "The Social Organization of the Nama Hottentots," Amer. Anthrop., vol. xxvii (1925). (V. G. J. S.)

LANGUAGE

Hottentot is the European name for the Nama, !Kora and other languages comprising 14 or 15 subdivisions of the main Hottentot speech Of these, the Nama is the most important and will be used for illustration. See also BUSHMAN LANGUAGES.

The Hottentot tongue has the five vowels a, e, *i,* o, u. They are long or short and appear also in reduced form. The consonants are *p,* t, k, *ɜ, s, x, h,* r, m, *n, t', k'.* Nasalized vowels are marked by ~ uritten above them. The outstanding characteristics of the Hottentot language are: (1) the presence of clicks (q v.); (2) the partly monosyllabic nature of the vocabulary; and (3) the presence of tones. The clicks are dental, palatal, cerebral and lateral. These clicks are initial and begin a large percentage of the Hottentot words. The languages are remarkably regular. Word building is simple and regular; gender is marked by suffixes or sex determinatives. Nouns have singular, dual and plural forms; they undergo declension for objective and vocative cases only. Adjectives are not inflected and can be formed from nouns.

Numeration is decimal; the form disi for ten is not I.Eu. **dékm̥* "ten," except in outward appearance and by mere coincidence.

The languages are rich in pronouns and have suffixed forms in singular, dual and plural, in masculine, feminine and common genders. The verb is simple and has present, past, perfect, pluperfect, future and future perfect tenses; subjunctive and optative moods; emphatic and inverted forms (verb first). Derivation of nouns from verbs, of verbs from nouns and of secondary verbal forms (iterative. causative; passive) is wide spread.

Adverbs, prepositions, conjunctives and interjections are not declined. Adverbs of manner are largely derived from adjectives.

HOTTINGER, JOHANN HEINRICH (1620–1667), Swiss philologist and theologian, was born at Zurich on March 10, 1620. He studied at Geneva, Groningen and Leiden. In 1642, after visiting France and England, he was appointed professor of church history in his native town. The chair of Hebrew at the Carolinum was added in 1643, and in 1653 Hottinger was appointed professor ordinarius of logic, rhetoric and theology. He gained such a high reputation as an oriental scholar that the elector palatine in 1655 appointed him professor of oriental languages and biblical criticism at Heidelberg.

In 1661, however, Hottinger returned to Zurich, where in 1662 he was chosen principal of the university. In 1667 he accepted an invitation to succeed Johann Hoornbeck (1617–66) as professor in the University of Leiden, but was drowned, with three of his children, when their boat upset while crossing the Limmat river on June 5, 1667. His chief works are *Historia ecclesiastica Nov.* Test (1651–67); *Thesaurus* philologicus *sive clavis scrip*turae (1649; 3rd ed., 1696) ; Etymologicon *orientale,* sive lexicon *harmonicum* heptaglotton (1661). He also wrote a Hebrew and an Aramaic grammar.

HOUBRAKEN, JAKOB (1698–1780), Dutch portrait engraver, was born at Dort on Dec. 25, 1698. In 1707 he settled in Amsterdam. He commenced the art of engraving by studying the works of Cornelis Cort, Suyderhoef, Gerard Edelinck and the Visschers. Among his best works are scenes from the comedy of De Ontdekte Schijndeugd, executed in his 80th year, after Cornelis Troost, who was called by his countrymen the Dutch Hogarth. He died on Nov. 14, 1780.

HOUDENC or HOUDAN, **RAOUL DE,** 12th-century French *trouvère,* takes his name from his native place, generally identified with Houdain (Artois), though there are other places bearing the name in one or other of its variants. It seems probable that he followed the trade of jongleur and recited his chansons in the houses of the great. He seems to have spent a great part of his life in Paris. His undoubted works are *Le* Songe d'enfer, La *Voie* de *paradis,* Le Roman des eles (printed by A. Scheler in *Trouvères belges,* new series, 1897) and the romance of *Méraugis* de *Portlesguez,* edited by M. Michelant (1869) and by M. Friedwagner (Halle, 1897). Houdenc was an imitator of Chrétien de Troyes; and Huon de Méri, in his *Tournoi* de *l'antéchrist* (1226), praises him with Chrétien in words that seem to imply that both were dead.

BIBLIOGRAPHY.—Gaston Paris in *Hist. litt.* de *la* France, vol. xxx, pp. 220–237; W. Zingerlé, *Über* Raoul de Houdenc und seine *Werke* (Erlangen, 1880) ; and O. Boerner, Raoul de Houdenc. Eine stilistische Untersuchung (1885).

HOUDETOT, a French noble family, taking its name from the lordship of Houdetot, between Arques and St. Valéry. Louis de Houdetot went with Robert, duke of Normandy, to Palestine in 1034, and the various branches of the family trace descent from Richard I de Houdetot (*fl.* 1229) who married Marie de Montfort.

Charles Louis de Houdetot received a marquisate in 1722, and on his son Claude Constance César, lieutenant general in the French army, was conferred the hereditary title of count in 1753.

His wife *(see* below) was the Madame de Houdetot of J. J. Rousseau's *Confessions.*

Their son Cesar Louis Marie François Ange, comte de Houdetot (1749–1825), was governor of Martinique (1803–09) and lieutenant general (1814) under the empire. His son Frederic Christophe, comte de Houdetot (1778–1859), was director-general of indirect imposts in Prussia after Jena and prefect of Brussels in 1813. He acquiesced in the Restoration but had to resign from the service after the Hundred Days. He became a peer of France in 1819, and under the Second Empire he was returned by the department of Calvados to the *corps législatif.*

HOUDETOT, ELISABETH FRANÇOISE SOPHIE DE LA LIVE DE BELLEGARDE, COMTESSE DE (1730–1813), married the comte de Houdetot *(see* above) in 1748. In 1753 she formed with the marquis de Saint Lambert (*q.v.*) a connection which lasted till his death. Mme. de Houdetot has been made famous by the chapter in J. J. Rousseau's *Confessions* in which he describes his unreciprocated passion for her. When questioned on the subject, she replied that he had much exaggerated.

A view differing considerably from Rousseau's is to be found in the *Mémoires* of Mme. d'Épinay, Mme. de Houdetot's sister-in-law.

See Bussenoir, *La Comtesse d'Houdetot* (1901).

HOUDINI, HARRY (1874–1926), U.S. magician who was famous for his sensational escapes, was born in Appleton, Wis., on April 6, 1874. The son of a rabbi who had emigrated from Hungary, Houdini, whose real name was Ehrich Weiss, became a trapeze performer at an early age. In 1894 he was married to Wilhelmina Rahner, who thereaiter as Beatrice Houdini served as his stage assistant.

By the early 1900s Houdini earned an international reputation for his theatrical tricks and daring feats of extrication from shackles, ropes and handcuffs and various locked containers.

In his article on conjuring in the 13th edition of *Encyclopædia Bvitannica* (1926), Houdini attributed his success partly to his "great physical strength and the fact that he is slightly bow-legged."

In a typical act he was shackled with irons and placed in a box which was locked, roped and weighted. The box was submerged from a boat, to which he returned after freeing himself under water. In another outdoor exhibition he allowed himself to be suspended, head down, about 75 it. above the ground, in which position he freed himself from a strait jacket.

Houdini campaigned against mind readers, mediums and others who claimed supernatural powers. He argued that they were charlatans who produced all of their effects through natural means and various tricks. His *Miracle Mongers and Their Methods* was published in 1920 and *A Magician Among the Spirits* four years later.

Houdini and his wife; however, agreed to conduct an experiment in spiritualism: the first to die was to communicate with the survivor. Houdini died in Detroit, Mich., on Oct. 31. 1926; his widow declared the experiment a failure before her death in 1943.

Houdini. who named himself after the French magician Robert-Houdin (Jean Eugène Robert, 1805–71), published *The Unmasking of Robert-Houdin* in 1908.

See Harold Kellock, *Houdini: His Life Story* (1928); Beryl Williams and Samuel Epstein, *The* Great *Houdini* (1950); Walter B. Gibson and Morris N. Young (eds.), *Houdini on Magic* (1953).

HOUDON, JEAN ANTOINE (1741–1828), French sculptor, achieved such pre-eminence in portraiture that the list of his portraits is a roster of great names of the late 18th century. Not the importance of his sitters, however, but the vividness with which he expressed physiognomy and personality has sustained his reputation as one of the great portrait sculptors of all times.

Houdon was born on March 20, 1741, at Versailles where his father was in domestic service. He underwent the long training prescribed by the Académie Royale, and climaxed it by winning the Prix de Rome in 1761. At the French Academy in Rome. from 1764 to 1768, Houdon established his reputation by a large marble statue of St. Bruno (S. Maria degli Angeli, Rome) and an *écorché,* an anatomical study of a standing man, which served later as the basis for replicas widely used for instruction.

In avoiding the extremes of the decorative emphasis of the preceding generation and the new passion for all that ancient Roman sculpture seemed to stand for, Houdon was following his inclination toward first-hand study of nature. In 1770, two years after his return to Paris, he presented a reclining figure, "Morpheus," as his reception piece for membership in the Academie Royale (marble version. 1777, Louvre).

GIRAUDON

VOLTAIRE BY JEAN ANTIONE HOUDON AT THE COMÉDIE FRANÇAISE, PARIS

Houdon exhibited in almost all the biennial Salons from 1771 to 1814. Among the early portraits shown were: Diderot. 1771; Duke Ernst II von Sachsen-Gotha (nhose extensive patronage of Houdon accounts for the important collection of the sculptor's works in the Gotha museum), 1773; Catherine II of Russia (not from life), 1773; the marquis de Miromesnil, the composer Gluck and the singer Mlle. Arnould as Iphigenia, 1775.

Houdon created four different busts of Voltaire besides the renowned seated figure at the Comédie Française, for which he made first studies shortly after the death of the aged philosopher in May 1778. Five weeks later. on hearing of the death of Jean Jacques Rousseau, Houdon hastened to Ermenonville and took a cast of the dead man's face. From this he developed the bronze bust in the Louvre. In 1785, at the instance of Thomas Jefferson and in company with Benjamin Franklin. Houdon crossed the .Atlantic to carry out a commission for a statue of George Washington. Several weeks at Washington's home at Mount Vernon sufficed for his studies, which he took back to France. The marble statue, signed and dated 1788, was set up in the Virginia state capitol at Richmond in 1796.

Houdon modeled his sculpture in clay; subsequent versions might be of marble, bronze, plaster or clay. A skilled technician in all of these mediums. Houdon either took full charge of repetitions or limited himself to finishing touches upon his assistants' work. He avoided a high finish that would conceal toolmarks; the sense of freshness in execution accorded with his concern for a characteristic pose and for the effect of a direct and vivid glance.

The most celebrated of Houdon's mythological works is the "Diana." first shown in 1777, although not at the Salon (possibly to avoid questions of propriety regarding the artist's frank treatment of the liie-size undraped figurej. The goddess steps forward on her left foot with head erect and turned to her right. a bow in her left hand and an arrow in her right. Versions of this supple, elegant work are in the museums of Tours and Gotha, the Louvre, the Hermitage (Leningrad) and the Huntington Library and Art gallery (San Marino, Calif.).

At the Salon of 1791 Houdon exhibited busts of La Fayette, Franklin. Bailly, Necker and Mirabeau. The turbulence of the Revolution did not prevent him from working. and several charming portraits of his young daughters come from this period. His prestige continued during the Napoleonic era when he portrayed the emperor and received the legion of honour.

He was a professor at the Ecole des Beaux-Arts and a member of the Institute. In 1814 a portrait of Alexander I was his final Salon exhibit. He survived, a figure of the past, until July 1j, 1828.

See G. Giacometti, *La vie et l'oeuvre du sculpteur J.-A. Houdon* (1929). (Js. W. F.)

HOUFFALIZE, a small town nearly 1.100 ft. above sea level in the extreme southeast of the province of Luxembourg, Belg. It is a summer resort with fine bracing air. There are the ruins of an old castle. and some remains of the still older abbey ot Val des Ecoliers.

The parish church dates from the 13th or 14th century. Houffalize is on the eastern Ourthe and is connected by tramway with Bourcy on the line of Libramont to Bastogne, Spa and Liège. Pop. (1955 est.) 1,272.

HOUGHTON, ALANSON BIGELOW (1863–1941), U.S. diplomat, was born at Cambridge, Mass., on Oct. 10, 1863. He was educated at Harvard (B.A., 1886), subsequently studying at Gottingen and Berlin, Ger., and Paris, Fr. He associated himself with the Corning Glass works, N.Y., in 1889 becoming successively vice-president and president and, in 1918, chairman of the board of directors. He was elected a member of congress in 1919 and re-elected in 1921, resigning in 1922 on his appointment by Pres. Warren G. Harding as U.S. ambassador to Germany, a position which he held until 1925. From 1925 to 1929 he was ambassador to Great Britain in succession to F. B. Kellogg. In 1928 he was nominated Republican candidate for senator of the state of New York. He died Sept. 16, 1941.

HOUGHTON, ARTHUR BOYD (1836–1875), English illustrator and engraver, was the leader of a group of artists who drew their inspiration from the pre-Raphaelite movement in its second period. The bulk of his work is in black and white, although he also painted. He was the son of Capt. M. Houghton.

He is among the first British artists to give a vivid and colourful interpretation of the mystery and poetry of the east. His line is delicate, direct and sure and his illustrations full of dramatic power and imagination. From boyhood he had the sight of one eye only, and he suffered considerably from the weakness of the other. In spite of this disability he was a quick and tireless worker, drawing invariably straight upon the wood with a wonderful knowledge of the engraver's technique. The British Museum and the Art gallery of Melbourne each possess one engraved wood block.

The Victoria and Albert museum contains one oil picture, "Don Quixote," and two water colours, "An Oriental with Performing Monkeys" and "The Transformation of King Beder"; also a number of drawings. The Tate gallery has an oil picture, "Punch and Judy."

See *Arthur Boyd Houghton, A Selection from* His *Work in Black and White,* with introduction *by* Laurence Housman (1896).

HOUGHTON, RICHARD MONCKTON MILNES, 1ST BARON (1809–1885), English poet and man of letters, son of Robert Pemberton Milnes of Fryston hall, Yorkshire, and the Hon. Henrietta Monckton, daughter of the 4th Lord Galway, was born in London and educated privately and at Trinity college, Cambridge. There he became a member of the famous "Apostles" club, which then included Alfred, Lord Tennyson, Arthur Henry Hallam, Richard Trench and others. After taking his degree, Milnes travelled in Germany, Italy and Greece. He returned to London in 1837 and was in that year elected M.P. for Pontefract. In the house he interested himself particularly in the question of copyright and the conditions of reformatory schools. He left Sir Robert Peel's party over the corn law controversy and joined Palmerston. at whose instance he nas made a peer in 1863. His chief title to remembrance rests on the part he played in moulding public opinion on literary matters and on the assistance he gave to young writers. He secured a pension for Tennyson, helped to make Ralph Waldo Emerson known in Great Britain and was one of the earliest champions or' Algernon Charles Swinburne. He helped David Gray and wrote a preface for The *Luggie.* Milnes married in 1851 the Hon. Annabel Crewe (d. 1874). He died at Vichy, Fr.. on Aug. 11, 1885. His son, the 2nd Baron Houghton, was created earl of Crewe (*q.v.*) in 1895.

See Sir T. Wemyss Reid, *The Life, Letters and Friendships* of *Richard Monckton Milnes, First Lord Houghton* (1890).

HOUGHTON, WILLIAM STANLEY (1881–1913), English playivright. nas born at Ashton-upon-Mersey, Cheshire, on Feb. 22, 1881, and was educated privately and at the Manchester grammar school.. He became a cotton broker, employing his leisure in dramatic criticism for the *Manchester Guardian* and in writing plays, *The Dear Departed* was played in Manchester on Nov. 2, 1908, and afterward in London. In 1912, with the success of *Hindle Wakes,* which had a long run in London, he leit his business career and went to London, settling in Paris in the following year. His other plays include *The Younger Generation* (1910), *The Master oj the House* (1910), *Trust the People* (1911), *Fancy-Free* (1911). Houghton died in Manchester, Dec. 11, 1913. His work belongs to the realistic: Ibsen tradition.

HOUGHTON-LE-SPRING, a market town and urban district in the Houghton-le-Spring parliamentary division of Durham, Eng., 6½ mi. N.N.E. of the city of Durham. Pop. (1951) 30,676. Area 7.9 sq.mi. It lies below limestone hills at the head of a tributary of the Wear, and the main road from Durham to Sunderland passes through a cutting in the limestone 80 ft. deep. St. Michael's church is an Early English and Decorated building. with a rectory embattled in the 15th century. Bernard Gilpin (*q.v.*) was rector from 1558 to 1583 and founded the grammar school in 1574; it ceased to be used in 1922. Houghton hall, of the late 16th century, is now a social club.

The population is mainly dependent on the neighbouring collieries and on agriculture.

HOULTON, a township and port of entry in northeastern Maine, U.S., about 2 mi. W. of the Canadian border at New Brunswick; the seat of Aroostook county. It is a shipping centre for a large potato-raising region.

The town was settled in 1805 by a group of men from New Salem, Mass., and was named for one of them, Joseph Houlton. It was incorporated in 1831 and was from 1828 to 1847 the site of a U.S. government military station that was nationally prominent for a brief time in 1838-39 during a disturbance over the border between New Brunswick and Maine. A truce was arranged and the border dispute, known as the Aroostook War, was settled by the Webster-Ashburton treaty of 1842. In 1939 Houlton adopted a council-manager form of government, Houlton is the seat of Ricker college (1848).

For comparative population figures *see* table in MAINE: *Population.*

HOUMA, a city of southeastern Louisiana, U.S., on Bayou Terrebonne and the Gulf Intracoastal waterway, about 50 mi. S.W. of New Orleans; the seat of Terrebonne parish. Industries include oil and natural-gas production from the fields which surround the city; commercial fisheries, including oysters, shrimp and shellfish; and the processing of fish and seafood. Houma is also an agricultural centre, with sugar cane and potato crops predominating. Founded about 1810, Houma was incorporated in 1848 and became a city in 1911. The name comes from the Houma Indians, who formerly lived there, and means "red." For comparative population figures see table in LOUISIANA: *Population.*

HOUND, a dog; now used only of dogs of the chase, and especially of foxhounds. Other breeds have a defining word prefixed; *e.g.,* boarhound, staghound, etc. (*See* DOG.)

HOUND'S-TONGUE (*Cynoglossum*), a widely distributed genus of the family Boraginaceae, including several species native to North America and Great Britain. The common hound's-tongue or gypsy flower (*C. officinale*), a native of Europe and Asia and found in waste grounds in the British Isles, is widely naturalized as a weed in eastern North America. It is an erect biennial, 1½ ft. to 3 ft. high, with large, oblong, pointed leaves, purplish-red flowers, ¼ in. across, and a conspicuous burlike fruit which splits into four prickly nutlets. The wild comfrey (*C. virginianum*) or dog bur, native to woods in the southeastern U.S., is a similar but more slender plant with blue flowers. The western hound's-tongue (*C. grande*), a perennial with blue flowers, grows in woods from California northward to Washington. (*See* BORAGINACEAE; FLOWER.)

HOUNSLOW, a town in the borough of Heston and Isleworth (*q.v.*), Middlesex, Eng., 10 mi. W.S.W. of Hyde Park corner, London, by road. It is a residential suburb of London at the junction of two great roads to the west and was an important coaching station, the manure from the stables being used to convert the borders of the heath into market gardens. A priory of the Brethren of the Holy 'Trinity for the Redemption. of Captives was founded at Hounslow in the 13th century; the present parish church stands where the chapel stood. Hounslow heath had an

area of 6.7 sq.mi. in 1546, but only a small portion survives near the Crane. Prehistoric and Roman remains have been found there, and up till the 19th century it was a resort of highwaymen and there were many gibbets on it. In 1784 the base line of the first trigonometrical survey in England was laid down on the heath.

HOUR, the 24th part of a civil day, a space of time of 60 minutes' duration. The word is derived through the O.F. *ure,* from Lat. hora, Gr. ὥρα, season (see CALENDAR).

HOUR ANGLE, the angular distance of a heavenly body from the meridian, as measured around the celestial pole. It is equal to the angle at the pole between the hour circle through the body and the meridian, but is usually expressed in time.

HOURGLASS, a device for measuring intervals of time, also known as sandglass, and as log glass when used in conjunction with the common log for ascertaining the speed of a ship. It consists of two pear-shaped bulbs of glass, united at their apexes and having a minute passage formed between them. A quantity of sand (or occasionally of mercury) is enclosed in the bulbs, and the size of the passage is so proportioned that this sand will completely run through from one bulb to another in the time it is desired to measure; *e.g.*, an hour or a minute. Instruments of this kind, which have no great pretensions to accuracy, were formerly common in churches. In the British house of commons, as a preliminary to a division, a two-minute sandglass is still turned, and while the sand is running the "division bells" are set in motion in every part of the building, to give members notice that a division is at hand.

HOURI, the term for a beautiful virgin who awaits the devout Mohammedan in paradise. The word is the French representative of the Pers. *huri,* Arab. *hawra,* a black-eyed virgin, from *hawira,* to be black-eyed, like a gazelle.

HOURS, CANONICAL, certain portions of the day set apart by rule (canon) of the church for prayer and devotion. The Jewish custom of praying three times a day, *i.e.*, at the third, sixth and ninth hours, was perpetuated in the early Christian church (Acts ii. 15; iii, 1; x, 9), and to these were added midnight (when Paul and Silas sang in prison) and the beginning of day and of night. Ambrose, Augustine and Hilary commended the example of the psalmist who gave praise "seven times a day" (Ps. cxix, 164). The seventh (Compline, Completorium) was added by Benedict. These hours were adopted especially in the monasteries as a part of the canonical life, and spread thence to the cathedral and collegiate chapters. Since the 6th century the number and order of the hours have been fixed thus: matins, lauds, prime, terce, sext, none, vespers, compline. See BREVIARY.

HOURS OF LABOUR. Although precise distinction is not always easy, it is both conventional and convenient to divide a person's day, week or lifetime into so many hours of work or labour and so many of leisure. There is no general presumption that a person is more active physically while at work than when at leisure; for office workers whose recreation is athletic activity such presumption would be obviously false, and for others its accuracy depends upon circumstances. Statistics referring to the number of hours of work usually refer to the number of hours the person is presumed to spend at his job, irrespective of how much work he actually performs. The remainder of his time is considered leisure, though the time consumed in traveling to and from work might merit some other designation.

In most discussions of hours of labour it is daily or weekly hours that are considered. But it is also necessary to consider annual and even lifetime hours of work. The increase in years spent at school, with the attendant delay of entry into the labour force, involves a reduction in hours worked over a person's lifetime. Advancing the age of retirement also reduces lifetime hours, and increasing the number of holidays reduces hours worked per year. Because the fraction of life spent outside the labour force—either at school or in retirement—has tended to rise since 1900, the statistics of the decline in average weekly hours worked tend to understate the rise in lifetime hours of leisure relative to lifetime hours spent at work.

Economic Cost of Leisure.—In general, the more work performed by an individual or a community, the greater the resulting production and real income. Therefore, reducing the daily or weekly hours of labour involves risk of sacrificing real income produced per worker. However, economic progress tends to raise the hourly productivity of workers, creating the possibility of getting either more output (per worker) per day, or the same output with fewer working hours, or some combination of both. In most countries of the western world, the economic progress since the mid-19th century has been used partly to increase real output per worker per year and partly to reduce the average work week. However, the question of how to divide the fruits of progress between work and leisure has been a subject of bitter dispute.

In the late 1950s the average length of the work week in the United States was about 40 hours; in Great Britain and on the continent of Europe it was between 45 and 50 hours. These figures represented a very substantial decline from the levels of a century earlier.

A shorter working day was a major demand of trade unions in most countries during the latter part of the 19th century and throughout the first half of the 20th. In a number of countries legislation was enacted requiring or at least encouraging the adoption of fewer weekly hours.

Despite this pressure, the length of the work week declined only slowly prior to 1920, partly because of employer resistance. The economic reason for such resistance is not hard to discover. In the 19th century, capital equipment was scarce and expensive relative to labour. Competition was keen and, save for occasional depressions, employers used their equipment as intensively as possible. This practice meant running it to the limit of its physical capacity; that is, running it whenever there was a market for the product and the machines did not require repair. Competitive pressure in product markets kept selling prices and wage rates down and, because hourly wages were low, workers needed to work long hours to make enough for subsistence. Put differently, wages were so low that leisure for any purpose other than sleeping and eating was a luxury workers could not afford.

Conditions in the early 19th-century factories were extremely unhealthful, especially for women and children, and those in mines were even worse. It is doubtful that long hours and bad working conditions were conducive to profits; the larger and more successful employers. of whom Robert Owen (*q.v.*) was an outstanding example in Great Britain, generally offered better wages and working conditions than the average. (However, the best of conditions in 19th-century factories would be judged intolerable by 20th-century standards.) But many small employers simply could not afford the modest capital outlay necessary to provide tolerable working conditions, and there was a wide though not universal failure to appreciate the adverse effect of long hours and bad conditions upon worker productivity.

Basically, however, working conditions were poorer and hours longer in the 19th century, as compared with the 20th, because labour was cheaper relative to capital and was therefore used more carelessly. After the turn of the century, as an hour of labour became increasingly more valuable, pressure was placed on employers to use it more effectively. This pressure was reflected in the trend toward "scientific management." which, although it centred in the United States, affected management practice in all developed economies. One of the early findings of the "scientific managers" was that comfortable surroundings enhance worker productivity and that excessively long hours tend to reduce it. These views secured increasingly wide acceptance in the years after World War I, partly because of empirical findings that hourly productivity was severely reduced by unduly long work periods. For example, one investigator found that reducing a longer working day to ten hours would so increase a worker's hourly production as to lead usually to an increase in his daily output as well. This investigator also found that reducing daily hours from ten to eight sufficiently increased hourly output to leave daily production unaffected.

Later studies emphasized that the relation between worker productivity per hour and the number of hours worked per day or per week is not simple. For example, it is possible to increase sharply the number of weekly hours without adversely affecting hourly

productivity, provided that the longer hours are worked for only a few weeks. It is now agreed also that hourly output varies considerably with workers' interest in their jobs, with the pace of work and with the age and health of the workers as well as with daily and weekly hours. However, despite these complications, it is generally accepted that in manual occupations weekly hours in excess of 48 (and in some cases even in excess of 40–42), if long continued. seriously reduce hourly productivity. It also seems clear that there is some work week of probably no more than 60 hours (and possibly less) at which weekly output reaches an upper limit.

The spread of beliefs such as these lessened employer resistance to appeals for a shorter work week, and in many cases, especially in the United States, it led employers voluntarily to reduce weekly hours during the 1920s.

Work Week and Unemployment. — The only valid economic reason for opposing a shorter work week was the fear that it would imply a sacrifice of production. Empirical studies have shown that this fear was greatly exaggerated, if not completely groundless. when the work week was over 50 hours. However, the same studies also have shown that when the work week is less than 48 hours reductions tend to lower weekly output even though hourly productivity may rise somewhat. This means that reducing the work week below six eight-hour days is likely to involve a sacrifice of potential output. This has not in any way lessened the demand for reducing the work week to 40 and even fewer hours. The proponents of a shorter work meek have never rested their case upon the contention that it would not lower potential output; they have argued that the increases in potential annual output per worker are sufficiently large that part of them should be diverted to provide leisure for workers. This argument has appealed to economists and humanitarian reformers.

It is not, however, the only argument offered by trade unionists (and their sympathizers) in support of shorter hours. They have argued also that shorter hours would spread available employment opportunities among a larger number of workers and thereby reduce unemployment. This argument, before the 1930s, was rejected by a great majority of economists, who denied the implication that there was usually a shortage of employment opportunities. But the great depression of the 1930s brought an overwhelming demand from almost all quarters that scarce opportunities for gainful employment be shared. As a result, the trade-union view of the relations between working hours and employment opportunities became the view of virtually the whole of society. Further, the developments in economic theory that culminated in the publication in 1936 of Lord Keynes's *General Theory of Employment, Interest and Money* swung a large body of economists to the view that a shorter work week served to convert full-time unemployment for some workers into a combination of jobs and leisure for a larger number.

This attitude was partly responsible for the decline in the work week in the United States during the 1930s. To a considerable extent the decline resulted from the voluntary action of employers, trying to ration and distribute more or less equally a diminished amount of work. But there was also considerable pressure in the same direction from trade unions. and in some countries, notably the United States and France. there was legislation to limit the weekly hours of labour.

Choice Between Work **and** Leisure After 1940. — Scarcity of employment opportunities ended with World War II, and in advanced countries widespread unemployment had not reappeared on a large scale by the late 1950s. This caused no appreciable lengthening of the work week. though neither was there any material reduction. In all belligerent countries during the war years the average work week rose appreciably, but the additional hours were usually paid at overtime (premium) wage rates. This continued to be the case after 1945, and in some occupations workers came to count upon overtime pay as part of their regular meekly earnings.

In the mid-1950s the attitude of workers toward shorter hours varied from one country to another. In all countries workers presumably would like shorter hours if obtaining them involved no sacrifice of either actual or potential weekly earnings. However, such a sacrifice is required, and the willingness to bear it differs from one country to another and among different groups of workers within a given country.

In the United States a number of unions in the mid-1950s called for reductions in the length of the scheduled work week from 40 to 35 hours. This mas prompted. in good part, by fear that technical progress would soon create a shortage of employment opportunities in the industries affected.

However, the appeal for a shorter work week was opposed by the leaders of a number of other unions who claimed that their members wanted more income rather than less work. It was also pointed out that in most unions workers fight for their share of overtime work rather than avoid such work. Furthermore, by the mid-1950s many workers were taking advantage of the short work week to take extra jobs.

In western Europe, including Great Britain. the scheduled work week after 1945 tended to average between 45 and 50 hours, with overtime being fairly common. The labour movements of a number of countries urged the desirability of a shorter work week, but the need for income seemed to outweigh the desire for added leisure.

The average work week of a country tends to vary roughly with its level of development or its per capita income. Poorer countries, such as Japan, China, Latin-American countries. etc., tend to have relatively long work weeks, and economically more advanced countries to have shorter ones, as may be seen from Table

TABLE I.—Average Weekly Hours Worked in Manufacturing in Selected Countries in 1954

Country	Hours	Country	Hours
United States	39.7	France	44.5
Canada	40.6	Federal Republic of Germany	48.6
Ceylon	48.0	Italy	48.7
Formosa	50.5*	Netherlands	48.8
India	48.0†	United Kingdom	46.3
Japan	49.8		

*For males only, 1953. †Figure assumed because (in 1953) 85.1% of all workers worked between 4 j and 48 hours per week.
Adapted from International Labour Office, *Yearbook of Labour Statistics, 1955*, Table 13, pp. 124–125 (Geneva, 1955).

TABLE II.—Average Weekly Working Hours in the United States, 1850–1953

Year	Weighted average	Nonagriculture	Agriculture
1850	69.8	65.7	72.0
1860	68.0	63.3	71.0
1870	65.4	60.0	70.0
1880	64.0	58.8	69.0
1890	61.9	57.1	68.0
1900	60.2	55.9	67.0
1910	55.1	50.3	65.0
1920	49.7	45.5	60.0
1930	45.9	43.2	55.0
1940	44.0	41.1	54.6
1945	46.4	44.6	54.4
1950	40.0	38.8	47.2
1953	40.1	39.2	48.0

I. Table II shows that in the United States the average work week has declined with the growth of per capita income, a fact that supports the preceding statement, and a similar trend has occurred in other advanced countries. There are, however, important qualifications to these statements. In the mid-20th century underdeveloped countries aimed to achieve the working hours and conditions of more advanced countries as quickly as possible. Consequently they did not tolerate the very long work weeks characteristic of 19th-century Europe and America, and the intercountry differences in work weeks were proportionately less than the differences in per capita income.

Economic progress has tended to narrow the intracountry differences in income, and especially in hours, among occupations. Thus in the late 1950s in advanced countries there was little difference between the work weeks of white-collar and factory workers. Such differences are much more likely to exist in backward areas, where skilled workers of all kinds are scarce and enjoy relatively greater advantages in working conditions (as well as greater wage premiums) than are usually found in more advanced countries. The differences in hours and working conditions among

occupations tend to be especially great when occupational boundaries coincide with racial or caste distinctions.

The differences between socialist and capitalist economies have not affected the work week so much as might be thought. In the Soviet Union, in 1934–35, the average work week in manufacturing and mining was 35.7 hours, less than in other European countries. In the following years, however, the work week was lengthened substantially. and by 1940 it was 48 hours in Russian manufacturing. This was still the standard week in 1950, though overtime work was less common than it had been during the nar.

Meaning of Work and Leisure.— Some workers clearly want overtime work; others would rather have leisure. There are individual and occupational differences, but in general it is the workers over 50 years of age who prefer leisure, and younger men with family responsibilities who prefer extra income and work.

In interpreting workers' attitudes toward reduced hours of labour it is important to bear in mind that in economically advanced countries the normal working day no longer is so long as to be physically burdensome to a man in the prime of life and in good health. An additional daily hour of leisure is of questionable utility to him, and he might well prefer extra holidays with pay or longer paid vacations or sick leave to a further shortening of the uorking day. After World War II there was a trend toward more generous provision for paid holidays and vacations. observed in a number of countries but especially marked in the Cnited States. As a result, annual hours worked tended to decline more than weekly hours.

Table I indicates that the United States worker has a shorter work week than any of his European counterparts, but it is widely believed that Americans work harder than Europeans. Whether this opinion is valid is not important here; it serves to indicate that there is more than one dimension — number of hours — to the quantity of work performed.

Economic progress has accompanied a reduction in weekly, annual and lifetime hours of work; it has also involved a reduction in the amount of muscle power that the "typical" worker must exert to perform his task. But these blessings may have been offset, in part. by an increase in the intensity with which the worker must tend his increasingly expensive and complicated machine.

If this is true then it may be that the shorter hours of U.S. workers are partly an offset to the faster pace at which they work. Though this subject has been much speculated about, there is little reliable information upon it.

The idea that leisure may be had at the place of work as well as elsewhere should be borne in mind in interpreting statistics on the hours worked by farmers as compared with those in industry (see Table II). Agricultural hours are always longer, a fact that sometimes causes farmers (and others) to comment adversely upon the easy life of the factory worker. In agriculture, however, the worker has far more opportunity to set his own pace, take a rest when he is tired, etc., than is the case in industry. In other words, intensity of factory work is usually greater than that on farms,

Defining the length of the work week involves difficult problems of separating gainful employment from leisure. For example, there is the time necessary for donning uniforms, for cleaning up, for traveling to and from work, etc. In one sense, classifying the time spent on such activities as work or leisure is merely a verbal matter. However, in collective bargaining negotiations, unions sometimes give up wage increases or other benefits in order to get employers to include, in working time paid for, time spent on such activities. This has the effect of disguising actual declines in the work week; because of this, the work week in the United States probably declined more after 1945 than the figures show.

Higher Wages and Shorter Hours.—*Labour's* Share.— Advocates of shorter hours have usually had mixed motives. Shorter hours have been wanted not only as a means to leisure but also as a method of raising wages. As a 19th-century American rhyme put it,

> Whether you work by the piece
> Or work by the day,
> Decreasing the hours
> Increases the pay.

Other things equal, reducing daily hours per worker reduces total labour supply and therefore tends to raise hourly wage rates. There might well be a reduction in weekly wages, however, despite the rise in hourly pay, for once daily or weekly hours fall below certain maximums further reductions cause output to fall below what otherwise would be obtainable. This has the effect of reducing the community's income of which wages is one share, and thus militates against any increase in labour income. It is sometimes argued that, despite the decrease in total income, reducing the hours of labour will so increase the share of wages in the total as to raise the weekly income of the workers involved. The significance of this argument lies in its implication that reducing hours of work increases the weekly (or yearly) wage incomes of the workers concerned. Where this applies, the fruits of "labour monopoly" are a combination of greater leisure and higher incomes for those benefiting.

The validity of this contention, however, depends upon the group of workers and the time period considered. If the workers whose weekly hours have been reduced can be replaced only with great difficulty; if their wages are only a small part of the total cost of production; and if the demand for the product is very inelastic, then the decline in output resulting from a reduction in hours will lead to a marked rise in product price and a consequent rise in wage rates sufficient to increase weekly earnings despite fewer hours. However, these conditions are far from being satisfied everywhere. In general, they are more likely to be satisfied for short periods than for longer intervals in which employers can find ways of replacing high-priced workers.

For the economy as a whole, it is very difficult to judge whether reducing weekly hours will increase labour's share of the national income. Most economists would deny that there is sufficient knowledge upon which to make a sound judgment.

Significance of Overtime Payment.— In most countries provision is made for permitting work in excess of the prescribed number of hours. Such overtime work must usually be compensated at premium hourly rates, or overtime rates. The significance of requiring premium rates for overtime varies with the state of the labour market. When there is a great deal of unemployment, premium rates penalize employers for employing any one worker more than the standard week and thereby encourage sharing of available work. But when labour becomes scarce and overtime hours must be hired, the effect of premium rates is to provide an automatic device for raising weekly earnings.

The different effects of overtime pay in periods of unemployment and of labour scarcity caused the United States Fair Labor Standards act of 1938 to have quite unanticipated consequences. This law provides that 1½ times the standard rate of hourly wages shall be paid for all weekly hours in excess of 40. This was frankly intended to discourage the employment of any one person for more than 40 hours per week, in order to create additional jobs. Soon after the law took effect, however, the labour shortage of World War II replaced the unemployment of the 1930s. As a result, the overtime provisions brought substantial increases in weekly wages to workers during the war years, and to a lesser — though still appreciable — extent after 1945. This outcome had not been envisaged by either the advocates or the opponents of the law.

Why Employers Have Resisted Shorter Hours.— At the present time, in economically advanced countries workers, through their unions, have substantial control over the length of their work week. It is not that employers are powerless to resist, but that to a considerable extent they are indifferent as to how long workers choose to work, provided they do not work so long as to undermine their efficiency. This partial indifference to the length of the working day results from the fact that the employer if he wishes usually can compensate for an inconveniently short day by having his employees work overtime, use extra shifts, or both. Of course, overtime work and multiple shifts involve extra costs, and employers take them fully into account in bargaining with unions. A union that genuinely wants a reduction in the standard work week, however, usually can obtain it by sacrificing potential wage increases or other benefits.

This is not to suggest that employers can alter technological processes to suit workers' leisure preferences. Often, these processes require continuous work. The number of shifts used to operate a process, however, usually can be varied within very wide limits, though at some cost.

In the 19th century employers were generally far less pliable about the length of the working day than they became in the middle years of the 20th.

There are a number of possible explanations for this change in attitude, but the most important is the fact that in the 19th century long hours were a method of cutting hourly wages, when daily wages were close to a subsistence minimum and could scarcely be reduced further. That is, the employers' resistance to shorter hours was primarily resistance to the accompanying demand for no reduction in daily pay.

History of the Shorter Hours Movement.—Before *1860.*—The "shorter hours" movement began almost with the formation of unions. In the United States in 1791 the carpenters of Philadelphia resolved that a day's work should not exceed 12 hours. In the decade 1825–35, especially in 1835, there were numerous ten-hour-day strikes in the seaboard cities, some of which succeeded. These strikes involved primarily building tradesmen, though others were also involved. Despite some temporary success, this embryonic trade-union movement was destroyed in the depression of 1837. Its only permanent legacy was the ten-hour day in federal government work, which was achieved in 1840 after prolonged agitation.

These early unions were organizations of artisans. Etiective unionism in the factories of New England did not arise until much later. By the 1840s hours and working conditions in the New England textile mills had become so bad as to cause a demand that hours be regulated by law, and in the decade following 1847 eight states enacted maximum hour legislation for women. These lams, however, were mere declarations of public policy, unenforceable and unenforced.

During the first half of the 19th century the movement for shorter hours in Great Britain was concerned primarily with factory employment, especially in textile mills. The development of the factory system in the first quarter of the century had led to the employment of women and children for more than 12 hours per day, under unhealthful conditions. As a response to this, a series of Factory acts was passed regulating various hours and working conditions of women and children. The first of these acts, passed in 1802, merely limited the hours of apprentices to 12 per day. Subsequent acts imposed increasingly severe restraints upon the hours of women and children. Legislation had to be enacted over a determined laissez-faire opposition, however, and it was not until 1847 that an effective limit of ten hours per day was placed upon factory employment of women and children.

Confining legislation to women and children was a concession to laissez-faire sentiment, which objected to impairing the freedom of contract of adult males. However, it was generally understood that regulating the hours of children would effectively control the hours of the men whom they assisted.

1850–90.—Massachusetts, although it was the most important manufacturing state in the United States prior to 1880, did not limit hours of work until 1874. Its maximum-hour law mas the first one to be genuinely enforceable, but its example was not rapidly followed; though in the 1880s and 1890s a number of states enacted maximum-hour statutes, only three of these contained provision for enforcement.

During this period the eight-hour day became a union battle cry. Agitation began in the 1860s, and by the 1880s the eight-hour day had become a characteristic demand of labour unions. In 1884 the Federation of Organized Trades and Labor Unions, forerunner of the American Federation of Labor, made it one of its dominant issues. It mas resolved that after May 1. 1886. workers should refuse to work more than eight hours per day. Although the full implications of this were not explained, the resolution suggested to many that a general strike for the eight-hour day be called on May 1, 1886. Though a general strike was impractical, about 300.000 men demonstrated and 190,000 actually did strike on that day; of these, perhaps 42,000 obtained shorter hours. Another 150,000 obtained some reduction in the working day without resorting to strike action. Most of these gains were soon lost through employer counterattack or offset by wage cuts.

The American Federation of Labor did not abandon the drive for the eight-hour day but changed its approach to supporting individual unions in rotation. On May 1. 1890, the Carpenters' union struck for the eight-hour day and over 23,000 carpenters obtained it; 32,000 more gained a nine-hour day.

In the years following, the various unions chosen to head the drive were too weak for the task, though the Typographical union persisted in its campaign and eventually, in 1906, achieved substantial success. Despite the great union agitation. however, there was no substantial reduction of the work week during this period.

In Great Britain, the factory legislation that had been enacted in the first half of the century was extended in the 1860s and 1870s to a wide variety of industries and also to workshops. Furthermore, in 1874, a (maximum) nine-hour-day law was enacted. As a result of this, by the mid-1870s, working hours for adults had been reduced to an average of about 55 per week. Save for improvements in the hours of the sweated trades, they remained at roughly this level (when work was available) until the end of World War I. This contrasts very favourably with the development in the United States, where weekly hours (outside agriculture) did not fall to 56 hours until 1900.

The slower decline in weekly hours in the United States reflected, among other things, the less effective and extensive regulation of hours by the government, and also the comparative weakness of the American unions.

A few London craft unions achieved the ten-hour day before 1830, but it was not until the 1850s that the "new model" trade unions (especially the Amalgamated Society of Engineers and the builders' unions) began to push for shorter hours. After many vicissitudes in the '50s and '60s, by the early '70s the nine-hour day had been established in a large number of trades. The nine-hour law of 1874 was primarily a means of enabling the textile operatives to catch up with what the other skilled trades had already achieved.

During the 19th century Australia was well ahead of Great Britain and the United States in achieving the eight-hour day. Because of the general labour shortage unions were very successful, and the eight-hour day was established in the skilled trades by the 1850s. In 1874 in the colony of Victoria the eight-hour day was made mandatory for women employed in factories; a few years later a law to the same effect was applied to both men and women working in mines. These laws were later developed and extended, and by the end of the century the 48-hour week had become nearly universal in Australia.

On the continent of Europe there was strong eight-hour-day sentiment, but the unions were generally too weak to limit the working day and the little that was accomplished came through legislation. The French revolutionary government of 1848 decreed 10 hours per day to be the legal maximum in Paris, for both men and women. and 11 hours elsewhere. Later the same year, the law was amended to permit no more than 12 hours of work per day. This law remained formally in effect throughout the second empire, but it became largely inoperative through poor enforcement and numerous exemptions. After 1880 the French Socialist parties began to agitate for the eight-hour day. and in 1890 there were a number of unsuccessful eight-hour-day strikes.

In Germany there was some legislation in the '70s and '80s restricting the working hours of women and children, but the laws were poorly enforced. It was not until the end of the 1880s that unionized artisans and miners began to make some headway in limiting the working day.

1890–1918.—The era from the turn of the century to the beginning of World War I saw a marked extension of hours legislation in the United States. Between 1856 and 1917, 27 states passed laws imposing maximum hours on women's work, and most of these were enforced. The lams themselves tended to broaden in coverage as time went on. At the beginning of the period they usually imposed only ten-hour maximums, but toward the end they often

prescribed eight-hour days. There was also a strong tendency to restrict or forbid night work. The restriction on women's hours was paralleled by a movement to limit child labour or abolish it outright. During 1909–14, when this wave of legislation was at its height, the percentage of manufacturing workers with full-time weeks in excess of jj hours fell from 69% to 49%. It is likely that the aforementioned legislation made a sizable contribution to this result.

In addition to passing laws governing women's hours, a number of states made declarations of public policy regarding men's hours on public works. These laws, which also applied to government contractors, usually limited the working day to eight hours.

Apart from legislative activity, the decline of the work week moved slowly prior to 1914. The American Federation of Labor's eight-hour drive, which had bogged down in the 1890s, was never started again on a large scale. The general failure of unions to invade the manufacturing industries greatly limited union influence.

In the relatively few unionized manufacturing industries, the average standard work week declined from 54 hours in 1890 to fewer than 49 in 191j, a drop of about 10%, compared with a 6% decline in the hours of nonunionized manufacturing workers (from 62 to 58). From 1890 to 1915 the building trades, where unionism was strong, cut standard weekly hours from 51 to fewer than 45 (about 13%), but "all industry" workers' scheduled weekly hours dropped only 5 hours (from 58.4 to 53.5). or 9%. Though causal relations are obscure, the association of unionism with shorter hours in the period 1890–1915 is clear.

In the period 1915–20 the reverse was the case. Under the pressure of the wartime labour shortage, unionized and nonunionized industries alike were compelled to reduce weekly hours in order to retain their workers. In this period. the eight-hour day was a demand for which higher wages were not an adequate substitute. As a result, labour market competition compelled nonunion manufacturers to reduce average weekly hours more than unionized manufacturers did. Furthermore, the building tradesmen, whose weekly hours had been fewer than 45 in 1915, reduced them during this period by an average of only about one hour, or roughly one-quarter of the decline in the hours of nonunion factory uorkers.

World War I was the period when the eight-hour day, six-day week became standard in U.S. factories. In 1914 only 11 8% of all factory workers worked a standard week of 48 hours or less; by 1919, 48.776 worked 48 hours per week or less, and by 1921 this was true of 51.7%. The coal miners also achieved a 48-hour week during this period. and in 1916 the federal government passed the Adamson act establishing a basic eight-hour day. with compensation for overtime. on railroads. This law was the culmination of a prolonged campaign by the railway unions and was enacted to forestall an imminent major rail strike.

In Great Britain hours of work were not greatly altered between the mid-1870s and 1918, despite a campaign for the eight-hour day that began in the 1880s. In 1909 parliament passed an eight-hour-day law for coal mines, but otherwise little change was made until the beginning of 1919. At that time the engineering and shipbuilding trades renewed their prewar demands for a shorter work week and succeeded in reducing it to about 47 hours. The cotton operatives, iron and steel workers and most other unionized workers also obtained approximately a 48-hour week during the first half of 1919.

Although the 48-hour week had become practically universal in Australia by the end of the 19th century, the unions continued to push for still further reductions in hours. In 1913 the building tradesmen were awarded, through arbitration, a 44-hour week. This opened the way for a general drive toward the 44-hour week, which continued through the war and after. During the 1920s there was slow but steady progress toward a general 44-hour week, with both state legislation and awards of the Federal Arbitration tribunal playing major roles. It is worth noting, hoaever, that in the '20s and '30s Australian workers lost the very substantial advantage over others, with respect to hours, that they had enjoyed at the turn of the century.

1921–29.—The 1920s saw only moderate changes in weekly hours in the United States and none at all in Great Britain. In the depression of 1920–21, U.S. unions lost many members, and some employers tried to withdraw the newly achieved 44- or 48-hour week. While the more strongly unionized trades successfully resisted this campaign, the work week of many manufacturing workers was lengthened during the decade of the 1920s. Between 1921 and 1929 the percentage of manufacturing workers having a standard work week of 48 hours or fewer decreased from 51.5% to 45.5%. There were cross-currents, however; for the more fortunate workers, notably in the building trades, the five-day week had become common by the end of the 1920s, and very long weeks of 60 hours and over diminished. The outstanding case of the latter was the abandonment by the steel industry in 1923 of the 12-hour day and the "13 out of 14 days" work schedule; this was replaced by the basic eight-hour day, with payment for overtime.

During the 1920s most European countries made substantial gain toward achieving the 48-hour week. Prior to 1914 the 60-hour week or longer was common on the continent. In the social upheavals that followed World War I, most of the newly created countries, as well as France and Germany, adopted eight-hour-day laws in 1919.

Many of these countries also signed the international convention, sponsored by the newly formed International Labour organization, which declared the eight-hour day or 48-hour week to be a standard at which to aim. (In 1935 the International Labour organization adopted a convention embodying the principle of the 40-hour week, but as this convention was ratified only by New Zealand it never went into force.) Enforcement of the eight-hour lans in Europe was poor, and the exceptions permitted were numerous. It was not till the end of the 1920s that the 48-hour week became widespread, and in 1930 many exceptions still existed, especially in France.

1930–39.—The depression that began in 1929 caused a drastic decline in the weekly hours worked in all countries. This did not have any major effect upon full-time hours in Great Britain or Germany. but it caused a drastic and permanent reduction in the standard work week in the United States. During the early 1930s the advocates of shorter hours encountered little opposition to their argument that technological progress had destroyed millions of jobs and that it was necessary to "share the work." This philosophy was found in the various codes of "fair competition" adopted under the National Industrial Recovery act of 1933, codes typically requiring a 40-hour, five-day week. Although the law was declared unconstitutional in 1935, its hours' provisions remained a part of standard U.S. labour practice. In part, this was attributable to the fact that in the years 1935–39 employers had no strong incentive to lengthen the work week; labour was plentiful.

Another factor was the growth of unions in the manufacturing industries in 1936–38; had employers attempted to lengthen the work week during those years, it mould only have helped the unions' organizing campaigns. Still another, though minor, reason was the existence of a 40-hour requirement for government suppliers imposed by the Walsh-Healey act of 1936.

Whatever employers might have done eventually to lengthen the work week was effectively blocked by the Fair Labor Standards act (FLSA) of 1938, which replaced the invalidated National Industrial Recovery act. Among other things it virtually prohibited child labour, established minimum wage rates, and required that all hours in excess of 40 per week should be compensated at 1½ times the standard rate. The law applies to the major part of the economy, though such important sectors as retail trade and agriculture remain practically uncovered.

The Fair Labor Standards act does not establish a maximum work week of 40 hours; it merely imposes a financial penalty upon employers who hire workers for more than 40 hours, which has the effectof deterring the use of overtime without prohibiting it. Because of the overtime pay requirement, some workers who would wish to work more than 40 hours per week at straight-time rates are prevented from doing so on their "main" job, but after 1940 it was usually possible for such persons to get extra jobs to earn extra income.

In France the popular front government of 1936 enacted a law establishing the 40-hour week with no change in weekly wages. As a result of this law the government by decree set wage levels and the 40-hour week for individual industries. One result of the law was to make 40 hours the effective work week in France; its further repercussions cannot be considered here.

Conclusion. — The long-run trend in the hours of labour has been downward. Despite the spectacular developments connected with legislation and union activity, the prolonged growth of per capita real income has been the major force behind this trend. That is, as workers' incomes have risen they have come to want more leisure in which to enjoy it.

The demands of unions, sometimes for higher wages, sometimes for shorter hours, and the related pressure exerted upon legislatures to limit daily or weekly hours, ultimately reflect the choices of individuals within and without unions, and are not separate forces. Union bargaining power and legislative enactment at times accelerated the decline of weekly hours, but it is unlikely that over a period of a half-century their influence has been predominant.

HOUSE, EDWARD MANDELL (1858–1938), American statesman and diplomat. was born at Houston, Tex., July 26, 1858, the seventh son of Thomas William House and Mary Elizabeth Shearn. His father, who had left England as a boy, came to Texas when it formed part of Mexico, joined the revolution, helped to free it and bring it into the Union. The younger House was educated at the Hopkins grammar school and Cornell university, and returned to Texas in 1880, where he lived for more than 30 years as planter. His chief interest, however, was public affairs. He took an influential part in the successful campaigns of Governors Hogg, Culberson, Sayers and Lanham, and during the period 1894–1904 his political influence in Texas was regarded as decisive.

He refused invariably to become a candidate for office himself, but acted as the intimate adviser of the several governors named. Although frequently urged to participate in national politics he remained aloof from the disastrous Democratic campaigns that followed the Bryan candidacy of 1896; but in 1912 he played a major rôle in securing the nomination of Woodrow Wilson, and at the time of the election Wilson had come to put full trust in him, offering him a choice of cabinet positions. Following his custom, House refused any office, but politically as well as personally he remained closer to the President than any member of the official family. It was upon his recommendation that Wilson chose a number of his cabinet; after the inauguration both President and cabinet utilized his wide knowledge of men and his shrewd estimate of political effects to help them in meeting legislative and administrative problems; he exercised a great influence in the framing of the Federal Reserve Act and also played an important part in the organization of the original Federal Reserve Board. Wilson spoke of him as his "independent self."

House's chief interest lay in foreign affairs, and through close contact with American ambassadors abroad and his intimacy with European statesmen, as well as the confidence of the President, he was able to influence the course of American foreign policy. In 1913 he helped to tide over the crisis in relations with Great Britain over the Panama tolls exemption until Wilson secured the repeal of the exemption. In 1914 he undertook informal negotiations with the diplomatic representatives of Argentina, Brazil and Chile, which led to the drafting of a pan-American pact designed to guarantee peace in the Western Hemisphere. In the spring of 1914, House, apprehensive lest war should break out in Europe, sailed for Germany to offer the assistance of the United States in reaching some arrangement between England and Germany which might avoid war. He talked with high officials of the civil Government, the army and navy, and had a conference with the Kaiser, in which he received some encouragement. William II. later said:—"The visit of Colonel House to Berlin and London in the spring of 1914 almost prevented the World War." At London he found Sir Edward Grey ready to entertain any feasible plan to preserve peace. This, House wrote to the Kaiser on July 7, 1914. The murder of the Archduke Francis Ferdinand, however, precipitated war before the plan could be developed.

Returning to the United States, House maintained close intimacy with the British and German ambassadors and thus helped to smooth American relations with the belligerents. In Jan. 1915 Wilson sent him abroad to study the possibility of American mediation. He suggested the principle of the "Freedom of the Seas," after visits to London, Berlin and Paris, as a possible step towards a compromise; but the sinking of the "Lusitania" ruined all chances of success. In the autumn, House proposed that Wilson suggest to the Allies that a peace conference should be summoned; if Germany refused the conference or rejected terms calculated to ensure a just settlement, the United States would enter the war on the side of the Allies to enforce such terms. House left for Europe again in Dec. 1915, visited England, Germany and France, and finally made the aforesaid offer to the British, the substance of which was incorporated in a memorandum drafted by Grey and himself. The Allies, however, refused to take advantage of it.

In the summer and autumn of 1916 House took an influential part in the campaign which led to Wilson's re-election. After the United States entered the war, he kept in close touch with the chiefs of the war-making agencies, and was in consultation with the special envoys of the Allies: Balfour, Northcliffe, Tardieu, Reading. In the autumn of 1917 Wilson named him chief of the special American mission designed to co-ordinate Allied war needs, especially the problems of finance, supply, tonnage and man-power. The conferences in London and Paris which he attended proved to be the turn of the tide. After his return he was intimately concerned in Wilson's drafting of the Fourteen Points, and at the request of the President he drafted a tentative covenant for a League of Nations, which formed the basis of Wilson's later plan. In Oct. 1918 Wilson sent him to Paris to represent the United States at the Allied Council, which granted an armistice to Germany.

After some difficulty, House succeeded in pledging the Allies to Wilson's Fourteen Points as a programme for peace. He had previously organized "the Inquiry," a body of experts for collecting authentic data for the use of the Peace Conference. House was one of the U.S. peace commissioners signing the Treaty of Versailles, and although ill at the opening of the conference he played an important rôle by reason of his intimacy with European statesmen. He was a member of the commission that drafted the League of Nations' Covenant, and ultimately most of the details connected with the formation of the League were settled with his co-operation. In July and Aug. 1919 he represented the United States in the organization of the Mandates system. After his return to the United States he urged President Wilson, by letter, to compromise with the Senate so as to secure ratification of the Versailles Treaty and the entrance of the United States into the League. A serious illness, coming at the same time as the physical breakdown of Wilson, combined with other factors to interrupt the close relations between the two men which had persisted since 1911.

Col. House had won a reputation for such sagacity and disinterestedness that his advice was continually sought by political leaders even after the overthrow of the Democratic Party in

1920. He continued his interest in international questions and maintained close relations with the chief statesmen of Europe.

In 1912 House published, anonymously, a political romance, *Philip* Dru; in 1921 he edited (with Charles Seymour) *What Really Happened at Paris*, a series of essays on the peace conference written by members of the American delegation. He also wrote, after 1920, a number of articles upon contemporary politics and political leaders for the *Philadelphia Public Ledger, Foreign Affairs, Harper's* and *Encyclopedia Britannica.*

See *The Real Colonel House,* by *A D.* Howden Smith (1918), a brief but accurate biography covering House's career to 1918, and *The Intimate Papers of Colonel House,* arranged as a narrative by Charles Seymour (1926–28). (C SEY.)

HOUSE, HOMER DOLIVER (1878–1949), **C.S.** botanist, was born at Oneida, N.Y., on July 21, 1878. He graduated at Syracuse university in 1902 and pursued further study at Columbia university, from which in 1908 he received the degree of doctor of philosophy. He was professor of botany and bacteriology at Clemson (S.C.) Agricultural college (1906–07) and associate director and dendrologist of the Biltmore (N.C.) Forest school in 1908–13. In 1913 he became assistant state botanist and from 1914 to 1948 was state botanist of New York.

Besides numerous papers, his writings include *Wild Flowers of New York* (1918), illustrated with colour plates; *Annotated List of the Ferns and Flowering Plants of New York State* (1924); and *Wild Flowers* (1934).

House died on Dec. 21, 1949, at Loudonville. N.Y.

HOUSE, in this article, refers to a human habitation; its origins can only be surmised. It is obvious that Stone Age man, at least in the temperate climates, dwelt frequently in natural caves. There are evidences, also, that forest-dwelling tribes and those in tropical countries early developed some sort of hut construction, probably by planting sticks in the ground in a circle, binding their tops together to form a cone and covering the framework with thatch or leaves. At some ancient time the primitive cave dweller discovered that his cave could be enlarged and strengthened by constructing in front of it a wall of piled rocks, and roofing the space between the cave and the wall with logs or skins. Growing skill in this type of construction led to the development of elaborate cave dwellings such as those found on certain river banks in the southnest of the United States. Viollet-le-Duc (*Histoire de l'habitation humaine* [1875]) hypothecated similar combinations of cave and masonry dwellings as one of the universal primitive forms of Aryan houses. Thus the hut is the parent form of all timber houses, and the cave dwelling of those of masonry. Most of these houses nere of one room but, with the development of a more complex civilization, subdivision became necessary and the plan was articulated. At first this seems to have been accomplished by merely combining several hut units within a single enclosure.

Many remains of floors and foundations of such groups of round huts, probably of straw in some cases and of unbaked brick in others, dating from the Neolithic Age, have been found throughout the Aegean world. Later, elliptical forms with subdividing partitions appeared about 2000 B.C.

Another form of development characterized late Stone and Bronze Age villages of northern and central Europe — the so-called lake dwelling, in which many rectangular houses, some of two or more rooms, were built upon a pile-supported platform over a lake. In European lake dwellings, not only did primitive frame construction, a development of the hut type, appear, but also the use of crossed logs overlapping at the corners — the typical log cabin construction. (*See* DWELLINGS, PRIMITIVE.)

Egypt and Western Asia. — In the vicinity of the Aegean, two types of house plan made their appearance. The first was the block house, with all of the rooms under one roof and in a compact block; the second was the house with a court, in which the rooms opened onto a court with or without a colonnade or open corridor. Egyptian models of houses dating back to the early empire show both types, but in Egypt the court type seems never to have been developed as it was in Europe and China; and the court appeared most frequently as a garden or stable yard enclosed by walls on two or more sides, with the house proper often forming an L-shaped mass on the other two sides. Often, outside stairs led to a flat roof, and houses of two or more stories were common in the cities. In the larger houses of the country-dnelling aristocracy, a central residential block, with or without a colonnaded court, was surrounded by a formal garden, around whose enclosing walls were built the stables and storehouses. There was much use of large windows, columns, awnings and a great luxuriance of decoration; the construction seems to have been largely of clay or unburned brick reinforced with a framework of timber or reeds.

In the Aegean culture, both court houses and those in a single block are found. The great palaces had a court as their most important feature. but the plan of the town of Gournia was simply a maze of crowded, close-built rooms. Moreover, many paintings and terra-cotta plaques show Cretan houses as cubicle blocks, often in two stories, with flat roofs and many windows.

The early Mesopotamian house, which remained fairly constant in form over at least 2,000 years, was of three types. The first was a development of the conical hut, constructed, apparently, in unburned brick, and consisted of a tall, narrow, dome form, sometimes set on a small square base. The second, probably a country residence, was a rectangular building or group of buildings with flat roofs, battlemented parapets, arched doorways and many long, low windows close to the roof, subdivided by colonnettes. The third type, the city house, consisted of an assemblage of long narrow rooms. with walls of immense thickness arranged around one or more courts. Some of these rooms may have been barrel-vaulted in brick. Architectural decoration was of the simplest. What richness they possessed must have been produced by a lavish use of textiles.

The most complete idea of early Semitic houses is given in the description of Solomon's palace in the Bible (I Kings, vii). Timber was much used. Flat roofs were universal, and in the larger chambers they were supported by rows of wooden columns. Decoration was by means of *repoussé* metal work applied to the wooden surfaces.

Classical. — In both classic Greece and Rome, the court type of house was brought to its highest point of development. The house consisted of a group of rooms around a central colonnaded court or peristyle. In some there was an upper story. In the larger houses there was frequently a gallery across the front. There are only few evidences of the division between the men's and women's quarters; either the women's apartments were on the second floor, or else the division was only architecturally expressed in the largest houses through the existence of two or more courts. The most important position, at the end of the court opposite the entrance. was reserved for the reception room and the chief bedroom or the *thalamos*, the official centre of the house life.

In the Roman house the court idea was superimposed upon an earlier tradition of a single room dwelling with a hole in the centre of the roof for the emission of smoke — the primitive atrium (*q.v.*). In the historic period, the atrium had already become primarily a court, with the living rooms around it; and the excavations at Pompeii have proved that by the 2nd century B.C., at least in southern Italy, the typical Roman house comprised a colonnaded court as well.

In the imperial period, the atrium, with its surrounding rooms, was reserved for business and official functions. Family life centred in the peristyle.

Variant types of Roman houses were the great country houses or villas. Remains of such buildings are found frequently throughout the Roman empire. Another type was the farmhouse, such as that at Boscoreale, in which barns, oil and wine presses, storage rooms and the house proper were in one building around one main court. A vast provincial farm establishment in north Africa, that of the Laberii at Uthina (dating from various periods from the 1st to the 4th centuries), was a palatial central residence with many wings to take advantage of the view and prevailing minds, and separate small buildings for the farm. Another variant form was the great apartment house of several storys which was the

usual residence of the poorer free classes, not only in Rome, but in many of the more crowded centres. Indications on the marble plan of Rome which was prepared under Septimius Severus suggest that these structures frequently surrounded a court in nhich was placed the stair tower that gave communication to the various storys. The fronts of these buildings were surprisingly modern in appearance; usually there were shops on the ground floor and rows of simple windows, often with projecting balconies above. The whole was usually faced with brick, unstuccoed, with the mouldings, etc., worked on the face of the brick itself. Other interesting provincial derivations from the Roman stem were the stone houses of Syria, vast numbers of which exist, dating from the 3rd to the 7th centuries, nhen the villages and towns seem to have been suddenly abandoned at the time of the Moslem conquest. These Syrian houses were sometimes roofed in stone, and all of them were remarkable in the extent to which stone was used, not only for walls, but for doors. railings, screens. etc. There was generally an enclosing wall around a forecourt, with the house in a block at the rear. fronted with a colonnaded gallery.

Medieval. — In Europe the growth of towns and villages during the 11th and 12th centuries produced a new development of house planning. Country-house design, on the other hand, outside of feudal castles and manors (see CASTLE), remained almost stagnant; as far as is known, the serfs' dnellings were mere huts with low walls, perhaps of masonry or banked with earth and sods, and with the roughest kind of thatched roofs. This type, evidently once common, persisted into the 19th century in the huts of transient workers (like charcoal burners or bark peelers) in England. and in the sod house or dugout of the western plains of the U.S. By the 13th century this condition was beginning to change, at least in France, and the hut was replaced by stone farmhouses and cottages. often divided into two or more rooms. with chimneys and fireplaces. and with roofs sometimes of slate and sometimes of thatch. The further feudalism retreated, the more the country house developed; by the late Gothic period. all over north Europe, the wealthier peasants lived in highly developed farms, usually taking the form of a rectangular enclosure. entered by a gateway and bordered by barns, storage sheds and the house proper, which was often in two storys and well finished with windows and chimneys. In France such buildings were usually of stone, but in Switzerland, Germany and Scandinavia wood was the common material, either in half-timber work (*q.v.*) or in "log cabin" or chalet (*q.v.*) construction. In towns the smallness of the lots forced an early development of compact planning in several storys.

In general standard of comfort, the houses of the 12th and early 13th centuries compare well with any built during the next 500 years. and it is noteworthy that the development during the 13th, 14th and 15th centuries was merely one of increased size and greater elaboration of the facade.

In Italy, where cities were more highly developed, town houses were even further advanced, and it was during this period that the typical north Italian city palace, built around an arcaded court, with enormously high storys and many small coupled windows, and frequently with a projecting battleinented parapet, took form. In all Italian examples, and in most of those in France, the main living floor was one story above the entrance, and the ground floor was reserved for shops and service rooms. In north Europe, in the 14th and 15th centuries, more and more houses, both city and country, were being built of half timber, so that although stone or brick seemed to predominate in the 13th-century town, it nas half timber which predominated in the 15th-century town, as may be seen in portions of Rouen, Beauvais, Strasbourg, Hildesheim and Chester. The same period, moreover, saw the origin of the great burgher or wealthy free peasant's house, and the development of types for the nobility which were no longer mere castles or châteaux but, like the English manor houses, designed primarily for comfort. In these there was a growing subdivision of the areas to give greater privacy and to separate the various functions of eating, sleeping and social life. The planning was still, however, embryonic, with no grasp of corridor circulation and many stairs.

The same subdivision and the same struggle for convenience and privacy characterizes the entire history of the English house from 1400 to 1700. At first merely a great hall (*q* v.) with service rooms at one end and private rooms at the other, the house rapidly developed into a plan which in all main respects was modern, with parlours, dining rooms, sleeping rooms, etc., all carefully differentiated The beautiful manor of Compton Winyates (c. 1520) shons the type; Kirby hall, by John Thorpe (begun 1570), and Hardwick hall, Derbyshire (early 17th century, John Smithson architect), show the complexity and growing symmetry of the English plan as well as the introduction of Renaissance ideas; and Speke hall. near Liverpool (17th century). shows the similar type treated in half timber. In all of these. lavishness of interior finish, by means of plaster and wood paneling, is a noteworthy feature.

The Renaissance. — The Renaissance house throughout Europe was a compromise between two conflicting influences: the traditional development of convenient plan ideas and the desire for classic symmetry. In Italy, where the medieval large house had always been designed on monumental lines, the conflict was not strong, but in north Europe late Gothic plans were definitely asymmetrical, and the conflict was bound to lead to compromise. The best of the compromises was that achieved by the English during the late 17th and 18th centuries under the influence of Inigo Jones. In France, through the craze for classicism and the influence of the court, convenience markedly suffered, so that there the average large 14th- or 15th-century house had infinitely more real comfort than that of the 17th or 18th century. There mas, however, a corresponding gain in elegance; and individual staircases and rooms reached a rare standard of excellence. There was also an enormous ingenuity in planning; a groning elimination of waste space; and a remarkable integration of interior arrangement and exterior effect.

The greater number of these large houses, or *hôtels,* which give character to so many French tonns, were built between the street and a large garden, nith an impressive gateway leading to a courtyard and the house rooms beyond.

In America, different conditions were developing from English precedent a slightly different type of house, more compact and usually less monumental. In the north, the house of a single block, with two or four rooms to the floor and a central chimney, or the larger houses with end chimneys became the accepted type. In the south, where social conditions were more like those in England, the houses more closely resembled those of the mother country. Thus, Mt. Airy, Va. (1758), of cut stone, and Westover, Va. (*c* 1730), could be almost duplicated in many English counties, and George Washington's home at Mt. Vernon, Va., with its multitude of service outbuildings. slave quarters, etc., was but a version in wood of a common English type. Close contact with France during and after the American Revolution, French architects working in America (*e.g.,* Pierre l'Enfant), and the fact that many early U S. architects traveled widely in France (*e.g.,* Charles Bulfinch) led to the development in America of the French monumental house plan.

Modern. — The industrial revolution produced a synchronous revolution in house design all over the western world, especially in towns and cities. The influences at work were confused— increased land values because of sudden city growth; congestion of population; and a generally rising standard of comfort, with the additional facilities provided by the coincident development of plumbing, lighting systems, etc. Up to the middle years of the 19th century the house of western civilization had been but a development in a direct line going back to the 12th century. After the industrial revolution ideals and aims were totally different. In general, the area for each family diminished, while the number and differentiation of rooms increased. An inevitable result was the complete alteration of the appearance of modern cities because apartment or tenement dwellings, to a large extent, replaced the individual house. Equally significant was the development of suburbs.

In the design of houses, as well as in the industrial housing surrounding many factories and in the larger country houses of the more well-to-do, there was a general advance. Waste spaces were reduced, and the problem of furnishing adequate communi-

cation uhile at the same time preserving privacy was to a great extent solved. Moreover, the service arrangements were simplified and perfected so that every possible waste of time might be avoided in serving meals or caring for the house. The lack of an inhibiting tradition in much of the United States remarkably aided this development; and, more and more, such originally U.S. ideas as a multiplicity of bathrooms, the use of a central heating system and the evolution of space-saving kitchens and kitchenettes appeared in newer houses in all parts of the world. In the absence of any standardization of architectural treatment, however, a chaos of varying styles was evidenced.

(T. F. H.; X.)

HOUSEBOAT. In its simplest form a houseboat consists of a cabin of one or two rooms built on a flat-bottomed scow, drawing only from 12 to 24 in. of water and usually with a platform or porch at either end. In the eastern hemisphere, the houseboat is an established institution as the residence for a number of inhabitants, because of overcrowding. In the west such boats are found in great numbers on small rivers or streams, especially where there is good fishing and shooting, on the shallow waters of inland lakes and on the numerous harbours along the coasts. When used as summer homes, houseboats have been developed into quite elaborate craft, having four or more rooms, with a broad porch or veranda on top protected by awnings, the hull construction still retaining the characteristics of a flat-bottomed scow, having great stability. In this form the boats have no motive power and have to be towed from place to place when it is desired to change their position.

With the introduction of the internal-combustion engine, power houseboats were developed and became popular because they could be moved from place to place easily and combined the 'roominess and comfort of the houseboat with the convenience of the power cruiser.

They are for the most part screw-driven and range in length from 45 ft. to 100 ft. or more. Being of shallow draft, they have living quarters in the superstructure, with large windows giving plenty of light and ventilation; they also have broad decks, making ideal summer homes.

In the United States many of these power houseboats are used in northern waters during the summer months and taken south under their own power, to be used in Florida or along the Gulf coast during the winter months. (H. L. ST.)

HOUSE DESIGN, in this article, refers to the process through which a single-family dwelling is planned and built. Information about the fundamental principles of building will be found in ARCHITECTCRE. The reader will also find relevant information in INTERIOR DECORATION and LANDSCAPE ARCHITECTURE.

GENERAL CONSIDERATIONS

The Site.—A house must be attached to a piece of land, and the decision as to which piece of land is as important as the design of the house itself. The design of the house can only determine the environment within the house walls: the environment outside the walls is determined by the neighbourhood. A family about to build or buy a house will want to evaluate both the present and the future character of the neighbourhood. The relation of the neighbourhood to other parts of the city is an important consideration. The orderly and controlled development of residential building may be greatly influenced by zoning and planning regulations; their absence should be regarded as a danger signal. Regulations will have a great effect on the surrounding neighbourhood, as well as on the particular house to be built. Schools, churches, paved roads and highways are obviously of fundamental importance. Water, electricity and sewage disposal should be available at the house site; long connections may be subject to future assessments. Local government and fire and police protection affect the value of property. Taxes should be examined and the probable annual tax bill estimated.

In evaluating the particular piece of land to be built on, soil conditions are important. Building lots with rock or water below grade can cause additional expense and hardship in a building operation. Subsurface conditions can be determined by investigating neighbouring building operations. If there is a water problem, the possibility of economical drainage by gravity should be considered. Clay- and water-bearing shale which hold water instead of carrying it off are potential hazards. If there is rock below grade, money may be saved by shifting the position of the house on the site or by reducing the size of a cellar. Soil conditions must be known before the house is designed to avoid unexpected expenses. If there is any question about subsurface conditions, test pits should be dug or borings made; their cost is not great and may be recovered many times over.

The character of the site will in part determine whether a cellar should be built. Cellars have been prevalent in northern climates and were virtually a necessity when gravity heating was used. However, the storage space in a cellar can usually be more advantageously placed above grade. There is little reason for building a cellar today, unless the site makes it easy.

An accurate survey of the property is essential for legal purposes, for the design and for construction operations. The survey forms an important adjunct to the deed. It should be made by a legally recognized surveyor. If there is any easement (*q.v.*) on the property it should be noted. For example, an easement may have been granted to an electric light company to string power lines over the property, and a house would have to be built so as not to interfere with them. Another example is that known as ancient lights (*q.v.*) in England, involving rights to natural light. Some New England farms have easements for roads over which wood from back lots was carried.

If the house site is at all irregular in surface the survey should indicate the differences in level. Levels are measured at regularly spaced points over the property; the points are plotted and those of identical height are connected with contour lines. Differences in ground level can be deceptive to the eye. On simple sites a few readings with an eye level will suffice, but it is important to know exactly what slopes there are on the property. A well-designed house will belong to the land; by working with natural contours the architect can build a house of character and distinction. An irregular site can insure an interesting design; changing the particular characteristics of a site often results in banality and stiffness. Economy is another welcome result of taking advantage of the inherent possibilities of the site.

The Program.—Before the site is selected, and certainly before any active design work proceeds, a program should be drawn up of the particular requirements and tastes of the family who will occupy the house. Even within one locale there are wide differences of income, family size and way of life. A designer must understand the needs and preferences of a family before he can explore ways of satisfying them.

The program starts with a statement of space needed and funds available. These two factors often conflict, but they should be clearly stated. The space needed, especially the number of bedrooms, will relate directly to the number of members of the family, but, in large part, size will be determined by amenities. Therefore, the way of life should be analyzed and set down; it may have been largely unconscious until the writing of the program.

The program should state the members of the family, how they live, and how they expect to live. Children grow up and parents develop new interests, but houses are made of rather unyielding materials. Families differ in the degree of formality with which they live; tastes vary widely. These should be stated. The program for the house will almost invariably need disciplining, a necessary step when ideas are translated into bricks and mortar. But it is well in writing a program to start with ideal objectives; some are bound to come through and add distinction to the final results. The program will have to state whether the living room is to include dining space; the kitchen must be characterized and needed equipment listed. Number and sizes of bedrooms, closets, baths, storage spaces, and special spaces for family vocations and avoca-

tions should be listed.

There will be elements in the program which will not have to be listed since they are common to well-designed houses in a particular area. Local climatic conditions have considerable influence on design, as do availability of materials and craftsmen. These are important parts of the program, though they do not have to be spelled out in each case. A well-thought-out program will help produce satisfactory results as much as the careful selection of the site. Both are necessary before the house can be planned.

Planning. — It is well to work with floor plans before turning to such photogenic architectural details as doorways. porches and fireplaces. A well-organized plan can result in satisfactory appearance as well as efficient use. Although there are many books and magazines full of house plans, there never has been a perfect one. But good plans result from careful study of various solutions to a clear program; with study, the preferred solution emerges.

The great change that has taken place in house planning during the 20th century is in the openness of the plan. Small northern European or New England houses of traditional style were compact; they had an inward look and the rooms were distinctly separate. The contemporary house throughout the world is more loosely articulated; interior spaces open into one another. A distinct outward look is obtained through the use of larger areas of glass between indoor and outdoor living spaces. With houses of modest size simple, economical forms such as rectangles are still used. But however small the units. the contemporary trend is expressed by joining the living and dining areas into a single space or by relating the kitchen and dining areas.

There are two important factors in considering the size of interior spaces. A space has to be large enough for use; a well-designed room will take furniture well and allow for movement. If linear dimensions of walls are kept to multiples of four-foot units. there are some savings on construction where modular building materials are used. Experience and ingenuity in planning are required if floor areas are to be kept within reason; the interior of a trailer is perhaps the ultimate in space planning. The second requirement of living spaces is that they be visually satisfying. It has become increasingly important as rooms have become smaller that they appear as spacious as possible. Economic pressures, the trend toward built-in iurniture and the transposition of many activities from the home to automobiles or public places have contributed to the reduction in room size. Living rooms, for example, on utilitarian grounds now need to be only a fraction of the size that was considered a decent minimum at the beginning of the 20th century. But contents that are adequate for use can leave our visual needs unsatisfied. Screen walls that let the surfaces of ceiling and floor run visually uninterrupted do much to capture within limited volume the satisfaction of adequate space. Interior spaces. though densely planned and compact. are further enhanced visually by running the line of vision through glass-wall areas, reaching from floor to ceiling into the garden. Rooms should be both efficient and visually satisfying; the openness of contemporary planning is a tool for the accomplishment of both.

Kitchen planning has received much attention in the U.S. The kitchen has changed from an ample ice box inconveniently disposed. to a streamlined galaxy of gadgetry; the housewife has been studied thoroughly, and every conceivable labour-saving device has been offered her. There is little to do in planning this portion of the house except to evaluate what is offered and decide how much is wanted.

Templates of furniture, cut to scale and manipulated on proposed floor plans. are very useful. Beds should be free of windows and doors, and with room around three sides for the daily round of bed making. The extent of built-in cabinets must be determined. Drawers and shelves can oiten be concealed behind walls, freeing valuable floor space. Circulation spaces such as halls, vestibules and corridors can be kept at a minimum through a careful study of relationships. Living and circulation space should be distinctly separated. The area around a fireplace should be kept clear of passageways; doors should be located so as not to encourage traffic through spaces furnished for sitting, conversation or quiet.

The site must be studied and determined in conjunction with the planning of the house proper. Topography, garden location, outlook from windows and the points of the compass are important factors in the design of the house. Zoning regulations may limit the percentage of the lot to be built on and may state minimum setbacks from property lines.

Throughout the planning process, projection of floor plans into the third dimension will be desirable. Often a simple model will be of value, built of cardboard or plasticine. The design process consists of continual adjustments made during the various stages.

Finally, it is important that the best professional advice be sought in the design and construction of the house. The cost of such service. when competently given, can be recovered several times over in reduced construction costs, and greater satisfaction results from the use of a well-designed house.

Appearance. — Most people start thinking about a house with a definite picture in mind, and the purpose of the design process is to arrive at a house that properly reflects the dweller's likes and dislikes. Houses in a specific historical style such as Georgian or Tudor are seldom designed today. The character of the present time is achieved by using the past for inspiration rather than imitation.

Proportion. material and colour are the fundamental factors in appearance, good or bad. The over-all proportions of the house are naturally related to room dimensions and ceiling heights. There are no universally accepted formulas for these relationships. Dimensions for projected rooms should be compared with existing rooms whose measurements are known and whose visual impact can be observed. Interiors are most satisfactory when spaces are clear and simple. Too many corners indicate bad planning and result in visual confusion and increased cost. There is a constant relationship between a clear program, clean planning. aesthetic satisfaction and financial economy.

Small rooms can be made to appear larger by a number of devices. Properly scaled furniture and not too much of it. placed in a room designed with the furniture in mind, is the best way of achieving this effect. With open planning and the use of screen walls. rather than solid walls with doors. the eye can look beyond the limits of the immediate room; visual awareness of adjoining spaces gives a feeling of increased space.

Colour selection is important, not only for its own effect. but also for its effect on space. Colour is greatly affected by both form and lighting. The same pigment will look different on a wall opposite a strong light such as comes from a large window, than on a wall in shade. Colour has an important effect on apparent size. In general we can say that light, cool colours enhance apparent size, and strong, warm colours reduce it.

If the earlier planning stages in house design have been logically and carefully undertaken, the house will tend naturally and easily toward good appearance. Unfortunately, this tendency is not quite automatic and there is a constant need for modification until satisfactory appearance is attained. The mass of the house and its component spaces should be pleasing. The over-all impression is greatly affected by the relationship of the heights of walls to each other and to their lengths. Also rooi pitches and projections. such as porches or sun shades, greatly affect the appearance of the mass.

The placing and sizing of openings is another critical consideration. The windows and doors must look well from the interior as well as irom the exterior. Satisfactory functioning is also involved; windows must be sized and located for the best possible lighting and ventilation, and to provide good wall space for furniture. The pattern of light and shade created on the interior is of obvious importance. Size, shape and character are dependent on climate, orientation and structure.

In a world where news flashes almost instantly around the world, we are quickly aware of what is being built everywhere, and there is a constant urge to copy what we like, too often without understanding it. The special qualities that are indigenous to particular regions are lost in this way. Local materials, local customs and local climates are factors that add distinction to houses. Indigenous materials such as stone or lumber that are quarried or cut in the vicinity add a special quality, particularly when they have had the

refining influence of long tradition. The architectural expression of a way of life in California or New Mexico properly characterized as a ranch house is anomalous when built in a New England village nhich has its own tradition. Climates vary enormously throughout Europe and throughout the United States; a large glass area that is reasonable in the northern latitudes will tend to turn a house into an oven if used on the west side of a house in a southern area.

Details should be consistent in scale. Too many materials on one house should be avoided: this admonition applies also to colours. Simplicity is important: emphasis of detail should be concentrated. Chimneys usually are made larger for visual reasons than they need be. In the last analysis, appearance is a product of taste. In building, good appearance comes from good taste that is trained and disciplined.

Estimating — Unlessthere is a constant and clear understanding of what designs under consideration may cost, a great deal of time and study can be wasted. It is important that there be an early and continuing consideration of this factor.

As a rule of thumb. a unit cost per cubic foot can be assumed and then multiplied by the cubic contents of the projected house in its various design stages. Such unit costs are available as a result of local experience. With the tendency to reduce or eliminate cellars and attics, it can be understood that a cubic figure unit becomes less valid. By changing from a pitched to a flat roof and thereby eliminating a large attic. the cubic contents of a house would be materially reduced. while the cost of the house, which would still have the same amount of living space, would not be proportionately changed.

A better method is to estimate on the basis of floor space. with a unit price per square foot. This method probably comes closer to reality. since floor space is what has most value. A price per square foot will vary with quality of construction. type of design and locale, but it is generally available as a yardstick in most communities where building goes on. It may be well to use it for the house proper and to add lump sums for elements such as garages and porches. As the design becomes more precise, so can estimates; a firm price or controlling estimate may be secured before construction.

To the estimated cost of construction of the house, allowances are added for cost of land, utilities. legal fees, cost of financing and architect's fee. Landscaping and finished grading have to be provided for as do any other special requirements.

Financing. — A house usually represents the greatest capital expenditure that a family ever makes and it is customarily paid for in major part through mortgage loans. A useful and comparatively simple home mortgage finance structure has been established in the U.S., largely through the operations of the Federal Housing administration. The FHA was established as an agency of the federal government to insure mortgage loans made by lending institutions such as banks. insurance companies, and building and loan associations. It also establishes standards and supervises the quality, location and marketability of houses on which insured loans are made.

The general practice on mortgage loans, whether FHA insured or not, is to limit financing to a single loan, not exceeding a maximum percentage of the value of property. Monthly payments. within the capacity of the family's income, are mandatory regularly over a period of years. The provisions are sound for the borrower as well as the lender. In order to equalize the payments over the time of the mortgage, the amount of each payment for the repayment of the loan is less during the earlier stages while interest is high, but it becomes greater as interest payments decrease on the diminishing balance.

The cost of the house during the amortization period, sometimes called a rental equivalent, includes interest and amortization of the mortgage. taxes, insurance, maintenance and repairs. It is generally accepted as sound principle that the total of these charges should not exceed one quarter, or preferably one fifth. of the family income. Another rule of thumb for use in preliminary budgeting is that the cost of the house, including land and all other capital charges, should not exceed much more than twice the annual income of the family. This is a flexible rule, due to variations in interest rates, amortization periods and construction costs.

The development of house design has been discussed primarily from the point of view of a family building its own house, but the statements also apply to the development builder who is designing houses to sell or to rent. It is not always wise or expedient for a family to build or to own a house, and in many instances rental will be preferable. Furthermore. there are desirable types of housing other than single-family residences, such as attached row houses. garden apartments and multistory apartment buildings, Similar principles of good design procedure apply to all these.

Professional Services. — The design and construction of houses is an intricate process requiring competent professional advice. Most countries and all the states in the United States have laws licensing and regulating the practice of architecture. It is often very difficult to apply the professional services of the architect to a single small house. This can be indirectly done through the development builder who is able to portion the time and cost of architectural services to a number of houses which are sold or rented individually. Often the services of an architect can be made available for the builder of a single small house on a limited basis. But whatever the procedure. the design of a house is a science and an art. It requires practical experience, technological understanding and visual sensibility.

STRUCTURAL ELEMENTS

Materials. — Technology has produced a multitude of building materials that were unknonn only a few decades ago. The home builder is deluged with a wealth of choices for almost every element of the building.

The structure of the house is not a complicated engineering problem. Loads are modest, spans are seldom great and two or three stories is the limit for height except for apartments. Bearing walls of masonry. such as brick, stone or concrete block, and framed walls of studs. usually of lumber but sometimes of steel, are the two basic alternatives.

Masonry walls are economical where the materials are indigenous. since they are too heavy to ship long distances. In northern or wet climates they should be furred between masonry wall and interior finish to prevent passage of dampness. Stone requires the greatest amount of labour. Brick can look well painted; concrete block needs to be well made and carefully laid. Masonry bearing walls are the almost universal method in Europe and Latin America and are widely used in the U.S.

The development in the U.S. of the balloon and platform type of lumber frames followed the earlier post and lintel construction used by the settlers. Frame construction is remarkably strong. Lumber of a nominal two-inch thickness (actually finished to one and five-eighths inches) and a nominal width of four inches is usually used for studs, and a depth from six to twelve inches for floor joists and roof rafters. The basic module for spacing is usually sixteen inches. At all framing points it is important to have an equal depth of wood at right angles to the grain. since wood does shrink in that direction and shrinkage can cause uneven settlement, cracks in walls and bumps in floors. The frame was traditionally sheathed on the outside with one-inch boards and plastered on the inside. There are now various sheet materials to take the place of sheathing and plaster. (See CARPENTRY.)

Gypsum, which is used in plaster. is made into paper-faced sheets of gypsum board. usually four feet wide and at least eight feet long. By masking the recessed joints with tape and filler, a dry wall interior finish that is economical and satisfactory is obtained. The elimination of the great quantities of water needed for plaster, together with the saving of labour and time: has led to wide use of this and other dry sheet materials such as plywood for interior finish.

Plywood (*q.v.*), made from wood veneers glued together with the grain alternately at right angles, is strong and durable. Considerable structural strength in relation to weight is characteristic of plywood made from Douglas fir, and considerable beauty can be obtained with the use of a variety of woods. Plywood finishes in-

clude exotic grains from the far east, hardwoods such as oak and walnut from Europe and the Appalachian regions in the U.S. and mahogany from Central America.

Gypsum board can be waterproofed and used for exterior sheathing. as can plywood. Plywood for exterior finish is made with waterproof glues. Boards of cellular fibres pressed into rigid sheets have structural value for wall sheathing and interior finish, as well as insulation value against heat transmission.

Wood flooring is available in oak and other traditional hardwoods, in addition to composition floor materials, including rubber tile, asphalt tile. cork composition and linoleum. Ceramic tile is available for floors and walls. Sheets of synthetic resins (plastics), having various properties, are available for floors and walls, as well as for counter tops and trim.

For exterior finish, brick veneer over wood framing is highly satisfactory, sometimes giving better insulating value and weather protection than solid brick masonry. Wood clapboards and shingles, flush boarding and asbestos siding are other possibilities. Asbestos siding is made of lapped strips of asbestos cement board, which is also available in large sheets. This fire resistant material is made of portland cement reinforced with asbestos fibres. There is also a process by which wood is ground and pressed into a hard board of good finish and strength. A variety of sheet materials of good properties have been made from waste wood products.

Roofing materials include the traditional wood shingles, slate and tile, as well as the newer asphalt and asbestos shingles. Asphalt shingles are made of asphalt impregnated felt, surfaced with slate or ceramic granules to give colour and protection. Aluminum, copper, stainless steel and galvanized steel are available for roofs as well as for leaders, gutters and flashings. For roofs that are flat, or practically so, built-up layers of felt in asphalt or tar, surfaced with gravel, are the standard. Walking surfaces of tile are available.

The trend in building materials is toward larger, lighter and stronger building units which can be efficiently assembled at the job site. Building units the size of bricks are being supplanted by building units the size of wall board.

Factory Fabrication. — The building industry was traditionally one of handicraft operations. Technological change has not been swift in comparison with many manufacturing industries, but it has been steady. Craft operations at the building site are being replaced by mechanized operations at the factory. and houses are increasingly becoming assemblages of factory-made elements. Windows and doors, once made and fitted by carpenters at the site, now arrive from a factory, fitted and finished with hardware and glass, ready to be set in place.

Modular design (*i.e.*, design in which the elements are dimensioned in combinations of a fixed unit) has led to standardization of elements, interchangeability of parts and increased possibilities for mass production, with resultant economies. A wide variety of mass-produced elements from which substantial portions of the house can be assembled are now available. Examples are kitchen cabinets and mechanical equipment and window and door units. Entire house assemblages are available from manufacturers and are being used to an increasing extent.

Doors and Windows. — Flush doors of plywood veneers are gradually replacing the older paneled doors. A sliding door eliminates the floor area necessary for the swing of a hinged door. Glazed double doors can be used effectively for wide exterior openings; glazed sliding or folding exterior doors are often desirable in joining interior to exterior living space. Since correlation with hardware is important for smooth operation, these units are usually factory assembled. (See DOOR.)

The traditional types of window are double hung and casement. Originally made in wood, they are now also in various metals. The double-hung window is economical, easy to operate and excellent for use in wood-framed houses, since it adjusts itself to shifts in the house due to lumber shrinkage. To insure easy raising and lowering of sash, good hardware is important. Double-hung windows are easily screened.

The casement sash has the advantage of providing a complete opening, but it is more likely to warp if made of wood. Therefore it is usually made of metals which do not warp if properly treated. Steel sashes finished for long life without painting. and aluminum alloy sashes are widely used. Casement sashes are more easily made weathertight if they swing outward, but this requires inside screening, with under-screen operators.

In addition to double-hung and casement windows, there are top-pivoted sash windows, which have the advantage of shedding the rain when open. They are made in groups with a common operator. Sashes that are centrally pivoted, either horizontally or vertically, are available, but offer screening problems. Sliding sash windows are simple to operate, particularly when made in metal. *(See* WINDOW.)

Window screens are made of copper, aluminum, stainless steel, plastics and galvanized steel. They can be replaced during the winter with prefitted storm sash.

It is well to watch thickness of glass in relation to size when installing large areas of fixed glass. Various types of double glazing with an air space between help to reduce heat losses. Consideration should be given to both outlook and to orientation. The picture window is of doubtful visual value when facing the neighbour's clothesline, and it can act as a heat trap in summer if placed, for example, on a west wall.

Considerable information is available about the relationship of house design to climate. Houses are, in one sense, filters between human beings and climate. The design of a house should be such as to take advantage of some climatic impacts such as the heat of the sun on a cold day or a prevailing breeze in hot weather. On the other hand, during hot weather it is desirable to keep the sun off glass areas. This can be accomplished by orienting the house properly in relation to latitude, by placing glass areas on walls which the sun does not reach until low, and by using various shading devices. A canvas awning is an obvious shading device, but projections can be built as projecting cornices or porch roofs.

Since the angle of the sun's rays to the earth is greater in summer than in winter, houses can be designed to shade glass areas when the sun is high in warm weather and to let in the lower winter sun. The maximum benefit from sun and wind can be derived from proper design. The design of a house in Massachusetts will, of course, be quite different from that in Florida, in shape and orientation and in the size and location of openings. Working with natural forces substantially reduces heating bills in the north and the cost of air conditioning in the south. *See* ORIENTATION.

Heating and Air Conditioning. — Man is usually most comfortable when the air about him has a temperature of 70° F. and a relative humidity of 50%. To obtain this condition within a house is the purpose of heating equipment in cold weather and air-conditioning equipment in hot weather. A source of heat has to be provided, generally in the form of a furnace which burns either coal, oil or gas. It should be centrally located to minimize circulation runs. To distribute the heat from the furnace so as to balance temperatures throughout the house requires ducts or pipes. A simpler heat source is, of course, a stove or fireplace.

In a warm-air system the air is heated by passing over a heat chamber surrounding the burning fuel and carried through ducts to outlets in rooms. Warm air naturally tends to rise and if the furnace is below the outlets or registers, the circulation of air can work by gravity, a most dependable source of energy. This requires, however, ducts that are constantly rising and of considerable size. By forcing the air with an electrically driven blower, ducts can be reduced in size and more control gained over the system. Filters are installed in the duct system to eliminate dust, and the air can be humidified. In warm-air systems the heat is transmitted largely by convection.

Radiation is another method of heating. The sun heats by radiation and, in a lesser way, so does any object the sun has heated, such as a stone bench at noon. Hot-water or steam-heating systems utilize this principle; radiators are usually placed under cold glass areas and hot water or steam is piped to them from the furnace. A steam system maintains a temperature high enough to change water into steam. The steam enters the radiators where it cools while giving off heat and returns to the furnace as water to repeat

the cycle. A hot-water system operates at a lower temperature; hence it is an easier, more pleasant heat than steam, but it requires larger radiators. If the water can be pumped, higher temperatures are possible, with quicker response, and pipes may be inclined downward.

Radiators heat by convection as well as radiation, since air passes over the radiators and circulates in a warmer state. Radiators can take the form of continuous elements between walls and floor (baseboard radiation). While radiators usually are made of a heavy, heat-holding material such as cast iron, the steam or hot water may be passed through elements with copper fins, known as convectors. The fins accelerate the emission of heat, largely through the movement of air across them. Convector type radiation equipment can be recessed in the wall in less space than cast iron radiators.

It is widely held that a true radiant heating system is the most satisfactory physiologically, resembling as it does the action of the sun. It is accomplished by circulating hot water through heating pipes embedded in floors, walls or ceilings, thus heating large surfaces to relatively low temperatures. The large surfaces emit heat gently in contrast with the more intensive. concentrated sources of other systems. Radiant heat makes possible a lower air temperature without discomfort.

Radiant heating was used by the Romans in their baths, with warm air in floor cavities as the heating agent. It has been used in England for many years. Its possibilities are now enhanced because low-temperature hot water can be circulated by pumps, making for quicker response to temperature changes. Any one of the automatic heat sources can be used. Piping can be either iron, steel or copper. There are alternatives as to the location of the radiant surface. If the pipes are in the floor, a concrete slab on grade acts as a substantial, heat-holding agent. It is important that the slab be insulated from the ground around the perimeter. An advantage of pipes in the ceiling is that they permit higher temperatures, and therefore quicker responses. Reflective insulation, such as aluminum foil, should be placed over the ceiling pipes. Where there are large glass areas, auxiliary pipes in nalls are sometimes necessary. *(See* HEATING AND VENTILATION.)

The cooling of houses in warm climates can be greatly simplified by proper design. Where mechanical means are used, the choice lies between a central system with ducts and separate wall units. If a warm-air heating system has been installed the ducts can be used for cooling. A central unit can be conveniently installed in an attic. *(See* AIR CONDITIONING.)

Proper insulation of a house adds greatly to comfort and reduces fuel bills. The roof is probably the most important place for insulation. Double glazing of windows, most economically through storm sash, is desirable in cold climates. A warm floor is essential to comfort. Rigid insulation board can serve both as structure and insulation. Loose insulation is formed of rock wool, glass fibres, wood fibres or other porous combinations. It is vital that such insulations have vapor seals on the warm side, since the vapour in warm air condenses when it reaches a cooler point inside the insulation. This renders the insulation ineffective, and the moisture has a detrimental effect on structure and finish. Reflective insulations, such as aluminum foil, are efficient and act as vapour barriers themselves. (See INSULATING MATERIALS.)

Fireplaces. — The fireplace was an important element of early houses that has survived in all forms of modern ,planning. Although inefficient in its heat output, it is a symbol that has a remarkably strong power. It is usually placed along one wall of a room, but it can also be located between two spaces, opening on both sides, or even in the centre of a room. Great care should be given to adequate chimneys since flue sizes should bear a definite relationship to the size of fireplace openings to provide good draft.

Plumbing. — The kitchen and bathroom should be located as close as possible to each other in order to economize on supply and waste lines. Code requirements will set the standards in most communities. If the house is built outside any such jurisdiction it is well to follow the code of a nearby town or city. Venting is important. Care should be taken to avoid back syphonage when a supply faucet contacts waste material in a basin or tub. The service line from the street, of generous size, should be placed below the frost line in cold localities. It is well to know the degree of hardness and acidity of the local water. If unusually hard, allowance should be made for some future constriction from calcium deposits within pipes. Water-softening devices can control this.

Supply lines to and within the house are generally of copper tubing. There may be local conditions which would indicate other materials. Waste lines have generally been made of galvanized steel and iron, with heavier lines of cast iron. Copper is used because it can be shop fabricated and it takes up less room in walls and floors than cast iron, which has projecting hubs and must be caulked and soldered on the job.

Great technological advances have been made in plumbing. There is no valid objection to standardization in the design and arrangement of the three basic bathroom fixtures. Much progress has been made with respect to standardization and production of the elements of kitchen equipment. The same principles are being applied to factory fabrication and assemblage of supply and waste connections. *(See* PLUMBING.)

Electricity. — The electric load of most houses has increased enormously as standards of lighting rose and mechanical and household equipment multiplied. Wiring can soon become obsolete so it is well to provide for future increase of electric load. The power should come into the house at a convenient but inconspicuous point where the meter is installed. From the entry switch and panel box a network of wiring leads to the fixtures and equipment. The wiring is occasionally run in rigid conduit, but more often consists of steel-armoured or plastic-covered cable.

The network of wiring throughout the house is divided into circuits, each of which is connected to the panel box. which in turn is tied to the service line from the power main in the street. The panel box has circuit breakers which shut off power to any line which is overloaded or develops trouble. It is important to provide plenty of convenient outlets throughout the house into which lamps and electric appliances can be plugged. There should not be too many outlets to a circuit, to avoid overloading, but outlets should be available at all wall spaces where they might be needed. A tangle of extension cords is hazardous.

Kennedy, *House and the Art of Its Design* (1953); Victor and Aladar Olgyay, *Application of Climatic Data to House Design* (1953); John H. Callender, *Before You Buy a House* (1953). (R. W. M.)

HOUSEFLY *(Musca domestica)*, a two-winged insect belonging to the family Muscidae of the order Diptera *(q.v.)*, common in dwellings and practically cosmopolitan, being found wherever man has established himself. It is most abundant during the hotter parts of the year, and in Europe and North America attains its greatest numbers from July to September. Its chief breeding place is in accumulations of horse manure, but it also utilizes various kinds of fermenting animal and vegetable matter, including the contents of ash bins, etc., where the eggs are laid and the larval life is passed.

A single female usually lays 600–1,000 eggs in her lifetime. The cycle, from egg to fly, varies in different parts of the world with temperature and other factors.

In cold regions the flies disappear during the winter although a few may survive in heated buildings. The housefly is of extreme importance in human welfare since it may be a carrier of typhoid fever, dysentery, cholera, yaws, anthrax, some forms of conjunctivitis and possibly jaundice. During wars preceding World War I (1914–18), more troops died of fly-borne diseases than from wounds, but proper sanitary practices have greatly reduced the menace.

The reduction in the number of horses in cities and towns and frequent disposal of garbage contribute to the reduction in the number of houseflies, but they remain a menace in rural areas. In manure the larvae can be killed by spraying it occasionally with 1 lb. of hellebore to 20 gal. of water, using 1 gal. per cubic foot, or by dusting powdered borax at the rate of 1 lb. per 16 cu.ft.; but this latter treatment must not be repeated. Garbage should be disposed of at least twice a week. Flies inside buildings may be destroyed by sprays containing rotenone or pyrethrum.

A spray of DDT (2,2-bis[parachlorophenol] 1,1,1-trichloroethane) in oil on walls and screens kills flies for many weeks.

More than 50 species of *Musca* are known from various parts of the world, most of them having habits similar to *M. domestica; M. vicina* is a tropical representative of *domestica,* differing in having the front of the male a little narrower; *M. sorbens* or *nebulo* is common in Africa, the orient and on the Pacific islands; *M. vetustissima* is the commonest Australian species.

The related *Muscina stabulans* is almost cosmopolitan and sometimes enters houses; its larva is found in decaying vegetation, and is probably predaceous; it has been reared from larvae of the American tent caterpillar and may be important in its control.

The related M. *assimilis* is known as the squash root maggot in Europe.

The biting housefly, or stable fly, *Stomoxys calcitrans,* is a serious pest in rural districts and on beaches; it inflicts a very painful bite and is most persistent. It may play a part in the transmission of poliomyelitis.

The larvae live in decaying vegetation, particularly straw and piles of weeds, and in manure in which an abundance of straw is present. It is more robust than the housefly and can be recognized by its long, shining proboscis.

The horn fly: *Haematobia stimulans,* is so named because of its habit of feeding in large numbers near the base of the horns of cattle; it is smaller than the stable fly, and the palpi are elongate.

See C. G. Hewitt, *The House-Fly* (1914); *W.* B. Herms, *Medical Entomology* (1939). (C. H. CN.)

HOUSEHOLD, THE ROYAL, or CURIA REGIS. In all the mediaeval monarchies of western Europe the general system of government sprang from, and centred in, the royal household. The sovereign's domestics were his officers of state, and the leading dignitaries of the palace were the principal administrators of the kingdom. The royal household itself had, in its turn, grown out of an earlier and more primitive institution. It took its rise in the *comitatus* described by Tacitus, the chosen band of *comites,* or companions, who, when the Roman historian wrote, constituted the personal following, in peace as well as in war, of the Teutonic chieftain. In England before the Conquest the *comitatus* had developed or degenerated into the thegnhood, and among the most eminent and powerful of the king's thegns were his dishthegn, his bowerthegn and his horsethegn, or staller. In Normandy at the time of the Conquest a similar arrangement, imitated from the French court, had long been established; and the Norman dukes, like their overlords, the kings of France, had their seneschals, or stewards, their chamberlains and their constables.

After the Conquest the ducal household of Normandy was reproduced in the royal household of England; and since, in obedience to the spirit of feudalism, the great offices of the first had been made hereditary, the great offices of the second were made hereditary also, and were thenceforth held by the grantees and their descendants as grand-serjeanties of the crown. The consequence was that they passed out of immediate relation to the practical conduct of affairs either in both state and court or in one or the other of them.

The steward and chamberlain of England were superseded in their political functions by the justiciar and treasurer of England, and in their domestic functions by the steward and chamberlain of the household. The marshal of England took the place of the constable of England in the royal palace, and was associated with him in the command of the royal armies. In due course, however, the marshalship as well as the constableship became hereditary, and, although the constable and marshal of England retained their military authority until a comparatively late period, the duties they had successively performed about the palace had been long before transferred to the master of the horse.

In these circumstances the holders of the original great offices of state and the household ceased to attend the court except on occasions of extraordinary ceremony, and their representatives either by inheritance or by special appointment have ever since continued to appear at coronations and some other public solemnities, such as the opening of parliament or trials by the house of lords.

The materials available for a history of the English royal household are somewhat scanty and obscure. The earliest record relating to it is of the reign of Henry II and is contained in the *Black Book of the Exchequer.* It enumerates the various inmates of the king's palace and the daily allowances made to them at the period at which it was compiled. Hence, it affords valuable evidence of the antiquity and relative importance of the court offices to which it refers, notwithstanding that it is silent as to the functions and formal subordination of the persons who filled them. In addition to this record we have a series of far later, but for the most part equally meagre, documents bearing more or less directly on the constitution of the royal household, and extending, with long intervals, from the reign of Edward III to the reign of William and Mary. Among them, however, are what are known as the *Black Book of the Household* and the *Statutes of Eltham,* the first compiled in the reign of Edward IV and the second in the reign of Henry VIII, from which a good deal of detailed information may be gathered concerning the arrangements of the court in the 15th and 16th centuries.

The *Statutes of Eltham* were meant for the practical guidance merely of those who were responsible for the good order and the sufficient supply of the sovereign's household at the time they were issued.

But the *Black Book of the Household,* besides being a sort of treatise on princely magnificence generally, professes to be based on the regulations established for the governance of the court by Edward III, who, it affirms, was "the first setter of certeynties among his domesticall meyne, upon a grounded rule" and whose palace it describes as "the house of very policie and flowre of England"; and it may therefore possibly, and even probably, take us back to a period much more remote than that at which it was actually put together. Various orders, returns and accounts of the reigns of Elizabeth, James I, Charles I, Charles II and William and Mary throw considerable light on the organization of particular sections of the royal household in times nearer to our own.

Moreover, there were several parliamentary inquiries into the expenses of the royal household in connection with the settlement or reform of the civil list during the reigns of George III, George IV and William IV.

But they add little or nothing to our knowledge of the subject in what was then its historical, as distinguished from its contemporary, aspects. So much, indeed, is this the case that, on the accession of Queen Victoria, Edward Chamberlayne's *Present State of England,* which contains a catalogue of the officials at the court of Queen Anne, was described by Lord Melbourne, the prime minister, as the "only authority" which the advisers of the crown could find for their assistance in determining the appropriate constitution and dimensions of the domestic establishment of a queen regnant.

The royal household of modem times is a modification of its mediaeval prototype; even Burke's act of 1782 did not destroy continuity.

Two of the three chief departments, the lord chamberlain's and the lord steward's, are direct links with the past. while the third, that of the master of the horse, claims importance from Tudor days and descent from a mediaeval minor office.

HOUSEHOLD APPLIANCES: *see* HOME EQUIPMENT.

HOUSEHOLD TROOPS: *see* GUARDS AND HOUSEHOLD TROOPS.

HOUSEKEEPING. The care and maintenance of a home includes: (1) providing sufficient and suitable food for all mem-

bers of the household; (2) care and cleaning of the house, its equipment and furnishings; (3) care and cleaning of the clothing of household members; (4) personal care of members of the family, including care of children and invalids; (5) responsibility for heating and lighting the house and sometimes for its repair; (6) control of household expenditures; (7) engaging and supervising household employees; (8) purchasing food. supplies, equipment, furnishings and clothing; (9) maintaining relations with other families and with organizations in the community; (10) taking part in and sponsoring such civic activities of the community as garbage disposal, water supply, good markets inspection street cleaning, smoke and dust elimination or any community housekeeping projects which have bearing on personal housekeeping problems; and (11) making suitable provision ior the comfort of family members and guests.

Housekeeping is one of the most comprehensive occupations that a woman can undertake. Few other careers demand a knowledge of such widely varied subjects. It is work of the highest order to manage a household methodically and efficiently. It takes the same sort of organizing ability and persistent effort which running any successful business does and should command equal respect whether the work is done by the housekeeper herself, with or without a salary, or by helpers whom she directs. Success in this work is important for all the family members and for the community as a whole.

The quality of the nation's housekeeping has great influence on the health, the morale and the general standard of living of all its people.

TIME AND WORK MANAGEMENT

The actual work of running the home should not consume so much of the housewife's time and energy that she has none left for anything else. Housework should be a means to an end, rather than an end in itself. To keep the housework in proper relation to other things, a plan is essential. It need not be a hard and fast schedule, but the housekeeper who gets the most out of the time and energy she puts into her housekeeping is bound to follow a well thought-out plan, one that is individual to her family and her home, its equipment and to her way of working. There is no cut-and-dried plan which will fit any two homes exactly. Just as the families, houses, localities and personal standards differ, so will the housekeeping and the plans for carrying it on. The homemaker must determine what the standards in the home shall be and how to attain them.

How to **Plan** Work.--Make a list of the tasks that must be done every day. Make a second list of the tasks that need doing once a week, noting special days if these are best done on a given day of the week. Make a third list of the tasks which need doing less often. Make out a chart with the days of the week listed across the top and the time or parts of the day listed at the left. Fill in this chart, first, with tasks from the daily list, in the order and at the time most convenient to do them, allowing some time for tasks from the other two lists. Next assign the weekly tasks to the proper day's schedule, and finally place the tasks from the less-often list on the chart. Try this plan out for a week or longer, at least until you have had a chance to become somewhat familiar with the routine. If work doesn't go well, it is then time to check over the schedule and made adjustments. Use the check list below to help find the trouble. It includes common errors in planning:

Too much crowded into one day.
Inefficient, hard-to-use tools such as dull knives, dented and burned pots and pans.
A too-low or too-high sink and work counters.
Unsuitable, inefficient methods of work and equipment.
Badly arranged kitchen.
Poor working light.
Heavy iurniture without casters, hard to move for cleaning.
Standards of housekeeping too high.
Too much time spent on a given job.

Skeleton Housework Schedules.—The tables below show forms for making work schedules for one and for two workers. There should be definite, separate schedules for each person having a part in the housework, covering whatever part of the day she works. It should be based on a careful division of work and responsibilities. Table I shows the method of setting up an entire week's work plan for one worker. Table II shows a form for a day's schedule for two workers. The actual time is not given in either. This will vary with the rising time, other family habits and the speed of the norkers. The order of work is more important than the actual hour, and it is often wiser to begin a work plan by lining up work in the order in which it should be done than by assigning actual time for work. Times can be added as the schedule progresses and the workers become accustomed to it. Chart I shows a concise form for recording a complete 24-hour schedule, with actual time used.

TABLE I.—Week's Schedule for One Worker*

Time	Monday	Tuesday	Wednesday	Thurs-day	Friday	Satur-day (4)
a	rearinga	s i n r e s t				
Forenoon	General pickup. Light clea	ning of rooms—	/	/	/	→
	(1) Washing if done at home; if not, send laundry out	Marketing (2) or iron-ing (3)	Specific jobs such as silver polishing, shopping, sewing or something to be carried on throughout the day	Thor-ough clean-ing of rooms	Thor-ough clean-ing of rooms Mar-keting (2)	Special food prepa-ration for neek end
Noon	Preparing foods for lunch and dinner. Lunch, dishes, cleaning up kitchen					→
Early after-noon (until 2)	Finish wash-ing (1)	Finish iron-ing (3) Put away ironing. Marketing (2) if not done in morning				
Late after-noon	Rest, relaxa-tion, corre-spondence, reading, personal care, etc. — Final din-ner prepara-tion					→
Evening	Washing dishes					→

*Adapted from *America's Housekeeping Book*, published by Charles Scribner's Sons.
(1) Many homemakers still prefer to wash on Monday; others find Tuesday more convenient; and some prefer to stretch the work over the entire week.
(2) The bulk of marketing should be done on a day when local stores offer special prices. Often Friday and Saturday are bargain days.
(3) If washing is done on Tuesday, ironing is put forward to Wednesday.
(4) Careful planning may keep Saturday free for recreation.

TABLE II.—Daily Schedule for Housewife and One Helper*

Monday

Time	Household Helper	Homemaker
8:00– 8:15	Prepares family breakfast.	
8:15– 8:30	Eats own breakfast	
8:30–11:30	Does washing Cleans laundry floor Assembles ironing equip-ment (such as ironer, ironing board) for afternoon use.	Washes breakfast dishes. Checks supplies. Makes beds. Does necessary light cleaning. Makes advance preparations for dinner. Prepares lunch.
11:30–12:00	Assists with lunch.	
12:00– 1:00	Eats own lunch and washes dishes	
1:00– 4:00	Irons clothes.	Answers doorbell and telephone.
4:00– 6:00	Rests and dresses for dinner.	Prepares dinner.
6:00– 6:30	Sets table and finishes with din-ner preparations.	
6:30– 7:45	Serves dinner, eats own dinner and washes dishes.

Time Required for Housekeeping.—The time housekeeping requires varies in different homes. It is influenced by size of family, ages and health of family members, kind of house and its equipment and furnishings, the climate and seasons, amount of

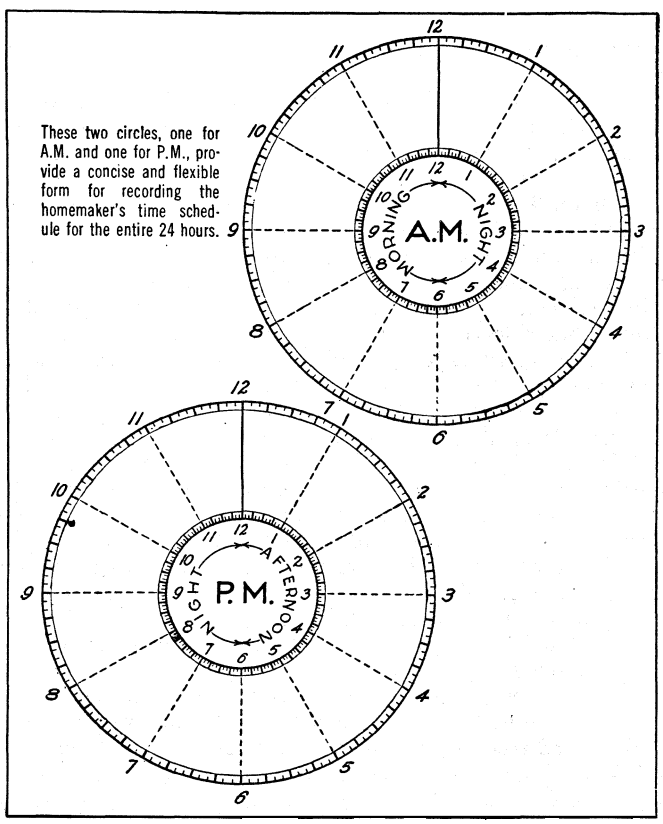
housework done at home, the health and speed of the housewife worker. Studies show that on the whole, farm women spend more time at housework than town and city women and that in homes where there are children under 15 years of age the housewife averages longer hours of work than in families with only older children or adults. According to one report, the average time spent in major housekeeping jobs by farm homemakers was 52 hr. per week[1], divided as follows:

Purchasing and management	2.2 hr.	Care of house	9.6 hr.
Care of family	3.9	Laundering	5.3
Preparing meals	15.2	Mending	1.5
Clearing away meals	7.6	Sewing	4.0
		Other homemaking	2.3

These figures give a general idea of the time required for the average household tasks. Shorter hours are the rule in some homes. Longer work hours are frequently necessary, as when there is a small baby to be cared for—5 to 7 hr. per day is one estimate of the time for this—or when there is illness in the family. At special times total work hours are long, as during harvesting, in canning season or when there are guests for any length of time. At such times some of the routine housework can often be omitted or put off. On the whole, housekeeping though very demanding is very flexible in its time requirements, as compared with most other work.

THE ROUSE

The plan and design of a house, its furnishings and equipment, are important factors in the time and effort required to do the housework in it. Work is easier and living pleasanter in a house planned with such room relationships that people can move about the house without interfering with one another. Space enough so that the house does not seem crowded or cluttered with either furnishings or people is essential to comfort and efficient working conditions. But rooms should not be too spacious if work is to be easy. Ease of passage between rooms is important. To avoid confusion, and to ensure individual privacy and convenience, there should be access from every bedroom to the bathroom and to the house entrance without passing through another room. There should be rooms or space set apart for carrying on the various activities, such as studying, sewing, dining, games, hobbies, etc., which the family members engage in.



ADAPTED PROM FORM DESIGNED BY BUREAU OF HOME ECONOMICS, U.S. DEPARTMENT OP AGRICULTURE

Rooms and furniture which can do double or triple duty or be changed in use entirely as the family activities change help keep a house easy to work in as well as to live in. Individual bedrooms can be used for study, play and entertaining as well as for sleeping. Often the kitchen or dining room can be used for entertaining or for study. The laundry can frequently be used as a hobby room, a sewing room or for other activities if it is dry, warm and well lighted.

When space requirements for living are met, the home is not cluttered and housework can run smoothly. Simple, easily cleaned and handled rugs, draperies and furniture are essential in saving work. Smooth surfaces without decoration save in dusting time. R'oodwork that is smoothly finished catches a minimum of dust. Unnecessary mouldings and cornices and tarnishable metal should be avoided to save uork. Glass, plastic and porcelain fittings are great cleaning time-savers where they are feasible. Strong, comfortable furniture need not be so excessively heavy that moving it for cleaning is a burden. Smoothly finished floors with small rugs, in much used rooms, are more readily kept clean than carpeted ones. Where carpets and heavy rugs are used there should be a vacuum cleaner and allowance should be made in the budget for occasional professional rug cleaning. which is not readily done at home. Washable wall coverings—paint, coated fabric. linoleum, washable wallpaper—are important especially in service and children's rooms.

Washable, color-fast, non-shrinkable materials for curtains and slip covers, and the soil-resisting finishes available in various household accessories, can play a big part in cutting down time required for house care.

But most important of all in saving the housewife's time and energy is labour-saving equipment—a washing machine, vacuum cleaner, ironer, etc.—and a well-planned kitchen and laundry.

The Kitchen.—The average housewife spends more than half her working hours in the kitchen. Today's labour-saving appliances have lessened these hours and made them far easier than they used to be, but without a proper organization and arrangement of equipment and utensils a large part of their value is lost. The best equipment ever invented can become a major menace in a house not planned for its effective use. Before a new appliance is purchased a plan should be made for using it efficiently and for storing it conveniently. In this way labour-saving equipment can speed up the tempo of work without speeding its tension.

Points on *Arrangement*.—The actual time required for work done in the kitchen is directly related to the arrangement of the major pieces of equipment and to the size of the work area. Work time can be cut down one-third to one-half by efficient arrangement of equipment in a work space not over 10 x 12 or 14 ft. in size. Where a room is larger. grouping the equipment in a part of it is often possible. The following points are a brief guide to making an efficient kitchen plan.

1. Work space and storage space should stand beside each piece of equipment ahich needs it.

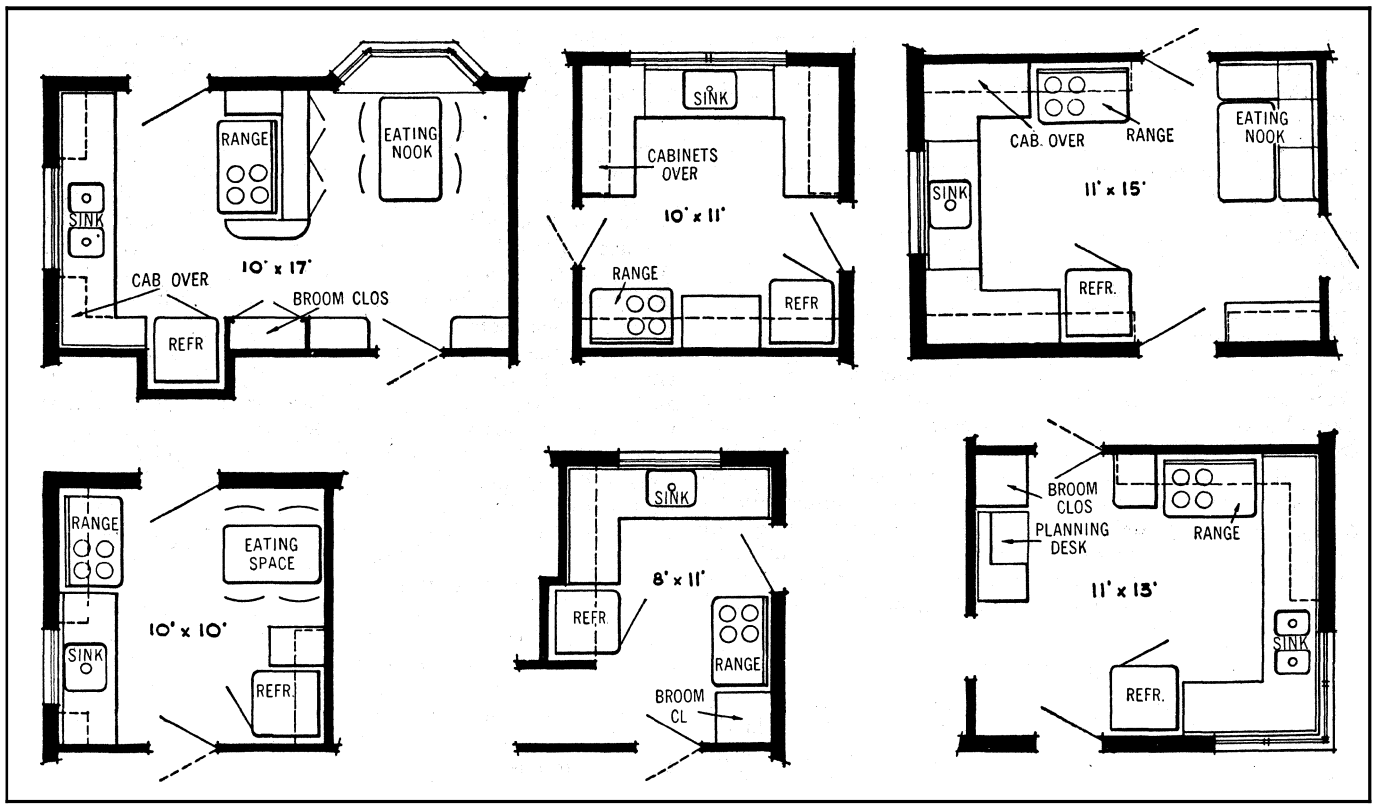
2. The main work cabinet (which must include a work surface) and refrigerator should stand together, with the refrigerator door opening toward the cabinet.

3. The sink is most convenient when it is placed between the range and the refrigerator, or equidistant from both and not more than 4 ft. from either. It should have drainboards on both sides.

4. The space between the kitchen work centres should never be so arranged that the traffic lane through the room cuts across it.

5. A U-shaped arrangement, not over 10 ft. wide, with the sink at the base of the "U," is a very convenient plan for a one-worker kitchen. With good division of work it can easily be used by two workers 4 broken "U" with the passage to a dining space between the sink and the range is also very convenient But this passage must not become a traffic lane through the kitchen

[1]Adapted from data supplied by Hildegarde Kneeland, Economics Division, Bureau of Home Economics, U. S. Department of Agriculture.



BY COURTESY OF THE PEOPLES GAS LIGHT AND COKE COMPANY

ARRANGEMENTS OF KITCHENS OF VARIOUS SIZES. FOR EFFICIENCY OF WORK. CONVENIENCE AND APPEARANCE

or much convenience will be sacrificed.

6. An L-shaped arrangement gives an "open-feeling" room. It is especially good where more than one person usually uses the kitchen and where work other than food preparation is regularly done in the kitchen.

7. The two-wall plan is convenient if the work space is not a passage and if the work areas on either side are not too widely separated *(4* ft. is satisfactory).

8. The one-wall kitchen is likely to require too many steps except in very small apartment-sized kitchens. This type of kitchen is apt to have insufficient work and storage space for preparing average family meals, but supplemented by a sizeable, well-placed table it can be made workable.

Work Space.[1]—Work surfaces should be easy to clean. Linoleum, composition materials, pressed wood, stain-resistant porcelain-enamel, monel metal, stainless steel, plastic material and hard wood such as maple suitably finished to withstand heat and moisture all are satisfactory. The amount of work space needed depends chiefly upon the number of persons for whom work is being done. A good allowance at each work point is the following. The right-hand drainboard of the sink, where soiled dishes are stacked, should be *32* to *36* in. long and *24* in. wide. The left-hand drainboard, which holds the dish drainer, should be at least 20 in. long and *24* in. wide. The working surface at the food preparation centre should be *36* to *60* in. long and 22 to *27* in. wide. and at least 15 in. below any overhanging cabinet. A pull-out pastry board located at this point should be *24* to *30* in. wide. Toe space **3** in. high and 33 to *4* in. deep should be provided at the base of all cabinets built to the floor, before which a worker stands. Clearance space between work centres should be allowed as follows:

Space between two opposite work centres—48 in.

Width of passage past sink, range and preparation centre—36 in.

Space in front of sink—27 in.

Space in front of refrigerator—32 in. (this allows for a 3-in. safety margin when the door is open).

Space in front of range—36 in. (this allows for room to pass when the oven door is open).

Working Heights.--The height of work surfaces is important to save discomfort and energy expenditure. According to one authority it requires $4\frac{1}{2}$ times as much energy to work at a table or sink that is too low as at one of the correct height. Studies have shown that no one height is correct for every woman nor is one height ideal for one person for every kind of work.

For instance, beating a cake is most easily done at a surface *2* to *4* in. lower than one best used for cutting bread. Ideal working conditions would mean having work surfaces placed at three or more levels in every kitchen and their actual heights determined according to the worker using them. Usually such a plan is not practical. The work counter used commonly today, which is continuous throughout the work area, makes this impossible. Fortunately a compromise in height works reasonably well for the majority of women. Electrical appliances have lessened the amount of work done where work heights are most important. Work counters placed at 33 to *34* in. are satisfactory for most work for the majority of women. The bottom of the sink should be lower—32 in. is a suitable average for this unless the sink is more than *4* in. deep, bringing the drainboards over *36* in. in height. The sink should be lowered to *30* inches in such cases. A compromise is always necessary here. Shallow sinks are best from a working height point of view.

Where kitchen work counter height can be fitted to the worker, determine the best average height to use as follows: have the worker stand erect in front of a table, with arms reaching down and forward toward the table surface, elbows straight and palms flat. If the hands rest easily on the table the surface usually will be of satisfactory height for most work. If the hands are above the table, build up a surface to the hands to determine the correct working height. If the elbows bend when the worker's hands rest on the table the surface is too high. Lower the surface, or raise the worker by placing her on books or boards, until the right work counter height is determined, then adjust the height accordingly.

Laundering Space.—The fact that some laundry work is done

[1]Adapted from *America's Housekeeping Book,* published *by* Charles Scribner's Sons.

in almost every home should be recognized, and provision should be made for doing this work conveniently. Space for washing can be arranged in a 4 x 6 area but more space is essential if complete laundry equipment is to be installed and used conveniently, A separate room is desirable uhere any large amount of washing is done at home, but the limited space in many modern houses makes this impossible. Convenient laundry centres can often be arranged in other rooms. The important thing is to group the equipment and have the necessary water and drain connections. When a separate room is available it can often be a combination room to be used for laundry work and also other work or activities such as sewing, canning, flower arranging or hobbies.

The laundry should be light, dry and easily kept clean. When space permits, a first floor laundry is better than a basement location, though a dry, well-lighted basement area can be satisfactory. A well-planned laundry provides space and equipment for sorting clothes and removing stains, for washing, for ironing and for drying. Frequently drying is done out of doors. When laundry work must be done in the kitchen. a washing machine with its own water supply and drain is the ideal. When this is not possible, plan to store the equipment where it can be used with as little moving as possible. Filling and draining the machine with a hose or pump eliminates the hardest part of washing — lifting the water.

Sewing Space. — In some homes a great deal of sewing is done, such as making or remodelling clothes. slip covers for furniture, curtains, draperies, etc., in others very little; but since some sewing, especially mending, is frequently necessary in every home, it is important that supplies and equipment be kept easily and quickly available. If there is no separate room for sewing where it is easy to keep material and equipment handy, some special place should be allotted for this. The minimum essentials require very little space.

Minimum Equipment Needed

Needles, thread, dressmaker pins, thimble, snaps, hooks and eyes, slide fasteners, buttons, etc., scissors, tape measure.

Other Equipment for a Complefe Sewing Outfit

Cutting board or table	Pinking shears
Sewing machine and attachments	Darning "egg"
Dress form	Tracing wheel
Full-length mirror	Patterns and fashion magazines
Ironing board	Materials
Electric iron	Trimmings
Ruler	Bindings
Yardstick	Scrap bag
Hem gauge	Tailor's chalk

Place **for** Children. — It has been estimated that children spend from 50% to 95% of their time in the house. If the children are to be happy, the adults' lives free from confusion and orderly housekeeping possible, there must be space provided and furnished definitely for children and their activities.

If possible, a child should have a room of his own where he keeps his clothing and toys and where he plays much of the time. Furnishings should be simple, easily cleaned and of suitable size. It as important that walls and floors have washable or easily cleaned surfaces. The room should be sunny and cheerful. But a child likes and needs company and some provision should also be made for him to spend part of his time with his playthings in a corner of the family living quarters.

Lighting. — The right lighting is as essential for working efficiency in a home as it is in a shop or other place of business. In addition, light rightly handled adds tremendously to the attractiveness of the home. Three requirements for good lighting are: (1) enough light for clear, easy vision; (2) absence of glare; (3) a practical combination of general lighting and local illumination.

Quality of light is important. It must be free from glare, for glare is very trying to the eyes and the entire nervous system. To eliminate glare, light must be filtered or diffused. It is filtered through fabric, special glass or plastic. It is diffused by being reflected from the ceiling or other reflecting surfaces. Several styles of lamps which provide sufficient light without glare have been made according to Illuminating Engineering society specifications. These bear an identifying I.E.S. tab. Many other lamps can be fitted with adapters to give similar results. General light in a room is essential in addition to light at work and reading centres, to avoid sharp contrasts which tire the eyes. General illumination can be provided by a central fixture, torchieres or by floor or table lamps if these are properly equipped. I.E.S. approved lamps give general as well as locaiized light. Table 111 gives the lighting levels for the home as approved by the I E S. Light is measured in foot candles with a light meter — a special device made for this purpose. Many lighting companies offer a service of checking home lighting adequacy, with this light meter.

TABLE *111.1—Lighting Levelsfor the Home as Approved by the Illuminating* **Engineering Society**

	Foot candles
Reading	
Prolonged periods with fine type	20–50
Ordinary reading	10–20
Sewing	
Fine needlework on dark goods	100 or more
Prolonged average sewing	50–100
Prolonged sewing on light goods	20–50
Ordinary sewing on light goods	10–20
Writing (ordinary)	10–20
Card playing	5–10
Children's study table	20–50
Dining room (when used for ordinary reading or writing)	10–20
Kitchen	
General	5–10
Local at work counters and sink	10–20
Bedroom	
General	2–5
Bed light	10–20
Dresser, vanity and dressing-table mirrors	10–30
Sewing machine	20–50
Bathroom mirror	10–30
Children's playroom	
General	5–10
Local	10–20
Stairways and stair landings	2–5
Workbench	10–30
Ironing machine, ironing board and laundry trays	10–20

House Heating. — The fuel and the type of heating equipment used makes a tremendous difference in the amount of time and energy required for housecleaning. A modern automatic air conditioning system reduces cleaning to a minimum the year round. Unfortunately only a small percentage of houses have this equipment. Nor can most housewives choose fuels or equipment on the basis of cleanliness.

The fuel choice is usually determined by availability of fuel, its costs and the equipment at hand. But whether gas, electricity, coal, wood or oil is used, good management and proper care of the heating and cooking systems will affect greatly their efficiency and effectiveness and the cleanliness of their operation.

It is always important to know exactly how to handle and care for the particular equipment used. The details are available from service departments of local dealers or from manufacturers of heating equipment.

MONEY MANAGEMENT

Like handling time and energy, handling the family income is an important part of home management. A definite basic plan for

[1]Adapted from ***America's*** *Housekeeping* Book, published by Charles Scribner's Sons.

spending is needed to ensure a proper balance in using the income. Each family must have its own individual plan to fit its own particular needs. Spending patterns which give amounts or percentages of income to be spent for certain purposes are useful as a guide in making or checking one's own plan. but they should never be followed literally, for the needs of no two families will be alike nor should the proportion of income spent for any one item be the same at all times in the same family.

Plans must be flexible and be changed as family needs change. As children come along, grow up, are sent to college and leave home, spending plans must be changed. When costs for school are high and income does not increase, those at home often must wear clothes longer, live in houses costing less rent, make other sacrifices. In a year when there is serious illness. adjustments must be made. It will be easier to compensate for an extravagant vacation or an unexpected expense if all the family members know why sacrifices are necessary. The budget or spending plan may be the means of making children understand that money for a football game or music lessons is going to be available only if daily movies or between-meals ice cream and candy are sacrificed. The same principle works with adults. They soon learn that using the street car consistently instead of a taxi, for instance, may make concerts or week-end vacations possible.

How to Make a Spending Plan.--A constructive approach to the spending plan is made by first setting up the family's long range aims and ambitions for such things as study. travel, future security and planning definitely for them. These objectives are a better approach to money control than the negative one of saving for an indefinite "rainy day." the common approach of early budget-makers. Such definite aims and ambitions will help to encourage careful spending and an understanding attitude toward economies. Without a goal ahead much money is apt to be spent in small ways that bring comparatively little real satisfaction.

How many of these long range ambitions can be met depends upon the money available after essential living costs have been met. Listing these in detail is an important step in budget-making. Start with the "fixed expenses"—those which can't be altered quickly—like rent—(interest on mortgage and taxes and insurance to the home owner)—commutation to business, payments on indebtedness, contributions toward support of relatives. church pledges, dues, etc. Many of these will be yearly payments. so total them for a year and divide this amount into monthly or weekly amounts. Next list the more flexible expenses—food. clothing, expenses of running the house, papers and magazines, doctor and dentist, amusements. personal allowances. If these amounts are not known. make a careful estimate of them or keep an accurate account of money spent for a week or longer before going further with the spending plan.

This estimate of expenses plus the amount to be saved toward the family's ambitions must of course come within the income available. If it does not, each expense item must be studied carefully to see where to cut. Perhaps the amount for "ambitions" must be revised. Families on the lower incomes must spend a disproportionate amount for food. An adequate diet[1], not a percentage of income, should be the guide in food buying. As incomes rise, the proportion needed for food will grow less.

Rents in some areas are excessively high if children are to have sunshine, fresh air. suitable schools and play areas. Clothing is more important in some families than in others. Climate as well as living standards and social obligations influence many expenses. The budget must steer a sane course between all these demands, picking out spots where spending must be high in proportion and where it can wisely be cut.

Suggested spending percentages[2] recommended by budget authorities are given below as a guide only:

Rent (if heat is included)	25% of income
Rent (if heat must be supplied by tenant)	20% of income

(If you are buying a home or already own it. "rent" is the total of interest on mortgage, taxes, insurance, upkeep and repairs, which should not ordinarily exceed 1/8 to 1/10 of income, if payments on principal are included.)

Clothes	15% of income
Operating expenses	10 to 15% of income
Food	20 to 35% of income
Advancement	15 to 20% of income
Savings other than life insurance	10% of income
Life insurance—face of policies should amount to 2 or more years' income.	

Keeping Accounts.—Records of expenses must be kept to be sure the spending plan is being followed. Suggestions on how to handle the details of these can be obtained from numerous sources—the bureau of home economics in Washington, D.C., the Home Economics Extension services in each state, insurance companies and savings banks.

Household account books may be purchased in stationery stores, department stores and in j and 10 cent stores. Adequate account books can be ruled up in the simplest notebook. Often these will fit individual needs better than ready-made books. But a record book should be used. Records on odd bits of paper should not be depended on. Whether the homemaker or the man of the house keeps these records should depend upon which one can do it most easily and which one has most time for it.

The homemaker does most of the buying as a rule. She must take responsibility for many of the choices involved and must know the details of the spending plan. In many cases she is the logical one to carry the details of account-keeping. An important part of account-keeping is making the monthly and yearly summaries. These must be checked against the spending plan. It is from study of these two that the spending plan can be changed from time to time to provide advantageously for the family needs. Not only should this study of expenses be made regularly but it should be done at a family council if possible so that all members of the family share in plans.

Buying **for** the Home.—The housewife, who according to statistics spends over 85% of the nation's income, has a great responsibility for her family's standard of living. Her skill and judgment as a buyer are most important factors in how well-fed, well-clothed and well-housed her family will be. This is especially true in low-income families. She must know a great variety of goods well enough to choose good value for money spent—the qualities and quantities which will serve her needs best. Qualities in many goods are not as easily judged as they used to be. New materials are constantly appearing, new uses are being made of old materials, so that values in many goods are not easily detected.

Hidden to the average purchaser, these values can only be determined by laboratory tests not practical for the housewife to make. Hence she must depend upon brand names, labels, statements made by stores, the data from independent testing agencies and the reliability of the manufacturer and dealer. She musb be able to interpret the information given on labels in terms of her needs. The facts she needs are far too numerous to keep in mind. Records of past purchases and knowledge of where to find other facts are both essential aids to her buying. There are many sources of information for the housewife who wishes to keep herself informed as a purchasing agent on the wide variety of goods she buys. There are local home demonstration agents sponsored by the extension services of each state college or university, and there are occasionally good consumer centres where much may be learned. Books and pamphlets supplied by government and state agencies and by schools and colleges give valuable information on the quality of goods. Magazines, advertising, the daily papers, provide particularly up-to-date facts.

[1]Minimum standards for good nutrition for a low-cost diet high in calories have been set up by a national committee on nutrition as follows:

Approximate number of servings of different foods needed per person for a day or week are: milk, 3 to 4 cups daily for each child; 2 to 3 cups for adults. Potatoes or sweet potatoes twice daily. Dry beans or peas or nuts 4 times a week. Tomatoes, citrus fruit or other vitamin C-rich food, 5 servings a week. Leafy, green and yellow vegetables, 6 servings a week. Other vegetables and fruit, 6 servings a week. Eggs, 3 or 4 a week. Lean meat, fish and poultry, j to 6 small servings a week. Other foods: cereal once a day, bread in some form at every meal. Dessert about once a day if desired.

[2]Adapted from *America's Housekeeping Book*, published by Charles Scribner's Sons.

HOME SAFETY

It is an appalling fact to consider that approximately one-third of all fatal accidents occur in the home. In addition, a tremendous number which are nonfatal occur there. Analysis by the National Safety council has shown that most accidents are the result of carelessness, indifference to risk or ignorance of danger, and that most could be prevented. Housewives are by and large responsible for most of the conditions which cause these accidents. Greater efficiency in home management would prevent them.

Proper care of rubbish, care in use and storing of matches, gasoline and kerosene, immediate attention to defective heating equipment or electrical connections, avoiding slippery floors. scatter rugs at the top and bottom of stairs. makeshift arrangements for reaching high shelves. are examples of points where the homemaker's care and attention can prevent many home accidents.

HOUSEHOLD EMPLOYMENT SITUATION[1]

In the majority of homes in America the housewives do all their own work except possibly laundering. which is sometimes or regularly sent out. A statement has been made that as many as 95% of the housewives in the United States do ali their own work. In some homes there is help part of the time—a few hours a week or part days. In comparatively few is there a full-time worker or more than one In spite of this fact the market for household employees remained tremendous. The number of U.S. domestic workers totalled 2,240,000 in 1940 and 1,923,000 in 1950. There was a further decline, the total being 1,786,000 in April 1952; 98% of these workers were women.

Household labour is largely unorganized, unstandardized and has an extremely high turnover. This is wasteful for employer and employee and society as a whole. It is a condition for which homemakers themselves must take a large share of the blame. The four chief causes are: overwork, underpay, poor living conditions, social stigma. Working hours for domestic workers who "live in" may range as high as 70 to 80 a week. According to reports to the U.S. bureau of old-age and surtivors insurance, wages of covered household workers averaged about $80 a month during 1951. The median annual earnings of private household workers totalled $296 in 1939 and $448 in 1950. Many household employees were employed at irregular intervals and some received in addition meals. payment for transportation to work, if necessary, or were provided with living quarters.

Generally speaking, state wage and hour laws do not apply to domestic employees. In 1950 the Social Security act. however, amended to cover various categories of workers, included regularly employed domestic workers.

It has been recognized for some time by a rapidly expanding number of persons throughout the Gnited States that many conditions and attitudes must be changed if household employment is to become an attractive and dignified occupation.

In 1928 the women's bureau of the United States department of agriculture, the national board of the Young Women's Christian association and certain private organizations called a conference in Washington to discuss how household employment could be improved as an occupation for women. Out of this conference there developed the National Council on Household Employment (disbanded in 1942), which drew up proposals for a voluntary agreement in household employment, given here in part:

Working Agreement.—A definite written agreement between employer and employee should be made at the time of employment. It may be signed or unsigned and should be subject to periodic review to meet changing conditions. Such an agreement is based on the following considerations.

Duties.—Regular duties shall be clearly defined, based on an analysis of the job to be done within the hour limit agreed upon. A high standard of work snall be expected in return for good wages and satisfactory working conditions.

Hours.—1. Actual working hours shall be defined as hours of duty during which the employee is not free to follow her own pursuits.

2. Total actual working hours shall not exceed 60 hours within the week A schedule of less than 60 hours is desirable.

3. Time on call is that time when the employee is not free to leave the house but may rest or follow her own pursuits and is available for emergencies. Two hours on call shall be equivalent to one hour of working time. Overtime may be adjusted by extra time off or extra payment on a per hour basis. Frequent overtime should be avoided.

4. Time off shall include two part-time days each week beginning not later than 2 P.M. on week-days and immediately after the midday meal on Sundays or one uhole day each week, or its equivalent. In the 60-hr. week some evenings will be free. Four out of eight holidays shall be given during the year and some adjustment made for church attendance. Free time shall be defined as hours when the employee is free from all responsibility to the employer. Mealtime cannot be considered an employee's free time if the telephone must be answered.

Vacation.—One week with pay shall be given after one year of service. two weeks with pay after the second year.

Termination of Services.—Notice of one week or one week's pay shall be given on termination of service by the employer—one neek's notice by the employee.

Wages.—For full-time employment the scale of wages will be the minimum for the unskilled worker, with a rising scale for increasing skill and experience on a wage scale comparable to that paid in the local industries. Payment should be made weekly or biweekly on the day due. If the employee wishes a monthly wage, 4 and $\frac{1}{3}$ weeks should be calculated as one month.

Living conditions.—Comfortable living conditions include: (1) adequate food; (2) private room or one shared by another employee, if necessary; (3) access to bath; (4) adequate heat and light; (5) a place to entertain friends. The national council also urges that local councils on household employment shall be organized and that these councils experiment with and include in their community-wide agreement the following:

1. Health certificates for employees in line with state laws for workers handling food.
2. Benefits of accident compensation to employee and employer and the relation of accident insurance to the state system of industrial accident compensation.
3. Sick leave.
4. Good equipment chosen in relation to skill of workers.

As a result of these recommendations made by the National Council on Household Employment and other developments, local community councils are developing rapidly in many communities throughout the United States and all wide-awake women are affiliating with these groups and helping in this nation-wide movement to improve this important industry. These groups are developing along at least four different lines:

1. A training school for domestic employees.
2. A placement service for graduates.
3. A consultation service for employers, covering all types of household problems.
4. Discussion groups for members.

Briefly, the responsibilities of employers in establishing better conditions in this particular labour market are:

1. To raise the status of a domestic employee to a position of dignity through decent wages, shorter hours and better working and living conditions.
2. To establish a better relationship between employer and employee by raising the employee's morale through sympathetic guidance, appreciation of work well done and dignified and courteous treatment at all times.
3. To maintain a smoothly run household through careful planning and explanation of work to be done.

On the other hand, the employer has the right to expect a good return on her investment, and she should have a clear picture of what is to be expected from the superior employee.

HOUSEKEEPING IN EUROPE

The details of housekeeping differ in different countries because

[1]Adapted from ***America's Housekeeping Book***, **published** *by* Charles Scribner's Sons.

of climate, tradition, social customs. economic and industrial conditions. One of the greatest differences between housekeeping in America and that elsewhere is in the number of servants employed in the home.

The average American housewife does all or most of her own work. The European woman in a similar status in normal times has help. Families on the same economic level as those employing one paid helper in America would employ two or more in Europe. Household help is plentiful and cheap in nonindustrialized countries. In these less industrialized countries. housework is harder work physically, because of the lack of labour-saving devices and because many houses are without the conveniences which are common in America. Hence it takes more hands to carry on a home satisfactorily. As countries become industrialized and factory work becomes available to women and girls, they are less interested in housework, and housewives must do more of the work themselves, as has been the case in the United States.

From colonial times the problem of paid help in the household has been greater in the Cnited States than in older countries since opportunities for work other than domestic have been more numerous. In older countries with their more plentiful household help the urge has not been so strong for labour-saving appliances and houses easy to care for as it has been in the United States. But changes similar to those in the United States were gradually taking place in many countries before World War II put a stop to all such progress.

HOUSEHOLD TECHNIQUES]

Housekeeping requires the repeated performance of a great variety of tasks. Knowing exactly how to do them well and quickly is an important part of every housekeeper's job whether she does them herself or directs others in this work. The following suggestions contain some of the facts housewives need to refer to frequently.

How to Avoid Moths.—Moth damage is done by the moth larva, not by the moth which flies about. The moth lays eggs on woolen materials, preferring dark places and soiled materials. These produce the larvae, sometimes in four to eight days in warm weather. These feed upon wool, feathers, felt, fur or hair. Garments which have no moth eggs or larvae on them and which are kept away from the moths are safe. Dry cleaning, washing, sunning and brushing, if thorough, will rid garments of both eggs and larvae.

If stored in a sealed package clean garments will be safe. The point is to be sure of the thoroughness of the cleaning and completeness of the seal of the packages. Such substances as paradichlorobenzene or naphthalene flakes will kill moth larvae if used in sufficient concentration. Place the garments to be stored in a tight closet or box, tightly sealed. Add the chemicals. Any moth larvae inside will be killed. Use 1 lb. to each trunk to ensure protection—less will do under some conditions.

What to Use on Common Stains.—Stains on nonwashable materials are best taken to a good dry cleaner. For home treatment try carbon tetrachloride It will be effective on most. Precaution: On washable materials try the following, remembering that a bleach can be used only on white cotton or linen materials —never on silk or wool.

Fruit stains.—Pour boiling water from 2 or 3 ft. above the material (note bleaching precaution above).

Blood.—Soak in cold water, wash or sponge in warm suds. Rinse well.

Candle wax.—Scrape off excess with a dull knife. Put stained area between white blotters and press with warm iron. If stain remains, sponge with carbon tetrachloride.

Chewing gum.—Scrape off excess. Sponge with carbon tetrachloride.

Coffee.—Pour boiling water through the stain from 2 or 3 ft. above. Launder. Old stains, use chlorine bleach (note bleaching precaution above).

Grass.—Rub with heavy suds. If stain remains, use chlorine bleach (note bleaching precaution above).

Greasy foods.—Scrape off excess. Sponge with carbon tetrachloride.

Automobile grease.—Rub lard into the spot. Scrape off and launder.

Lipstick.—Sponge with carbon tetrachloride. If stain remains use chlorine bleach (note bleaching precaution above).

Iodine.—Fresh stains will usually wash out. Old stains, sponge with alcohol or diluted ammonia.

SPECIAL LAUNDERING PROBLEMS

Bluing.—1. Bluing does not whiten clothes. It merely corrects the yellow tinge nhich white articles sometimes acquire through age or poor laundering. Therefore bluing is unnecessary unless the articles are yellowed, and it may even impart a grayish tinge if used too often.

2. Never use bluing that contains Prussian blue, or rust spots may appear on the clothes if all the soap has not been rinsed out. Ultramarine and aniline blue do not cause this trouble.

3 Bluing is manufactured in many forms, liquids, solid balls, cubes, powder and in combination with soap flakes. Bluing-soap flakes are used in the wash water; all others are added to the final rinse water. Follow package directions for the kind you choose, and mix it thoroughly with the water, to prevent streaking.

Bleaching.—White cottons and linens may need to be bleached occasionally. Cse a bottled chlorine bleach and follow directions carefully as to the quantity.

1. Mix the bleach thoroughly with the first rinse water.
2. Rinse at least twice after the bleach is used. If any bleach is left in the fabric it may weaken it seriously.
3. Be careful not to spatter the undiluted bleach on other clothes: it will remove color and weaken fibres.
4. Sunshine is a natural bleach and clothes always dried out-of-doors in the sun may need nothing more. Extra moisture left in the clothes after the final rinsing increases the bleaching action of sunshine.

White silks or delicate cottons and linens that have yellowed may be whitened with one of the "stripping compounds" sold by dye manufacturers for removing color from silks. Follow directions on the package.

Stripping compounds will not injure any fabric that is not harmed by boiling water. Never use a chlorine bleach on silk or wool.

Starching.—The use of the correct amount of starch improves the appearance and finish of many articles. Starched pieces also shed soil more rapidly. Accurate measuring, careful cooking and the right method all are essential to successful making of starch.

General Directions.—I. Hard water should never be used in making starch. Use borax to soften water that is naturally hard. Never use washing soda, because it tends to make the starch yellow.

2. Read the manufacturer's directions carefully and follow specific directions for specific purposes.
3. Wring rinsed clothes as dry as possible. Shake out each garment thoroughly and turn it inside out before immersing in starch mixture.
4. Use enough starch mixture to cover garments.
5. Dipping is not enough; immerse garment and press between hands to force starch through.
6. If a fine finish is desirable, rub and pat the starch mixture evenly into the fabric.
7. Remove excess starch by wringing. If wringing is done by machine, use thicker starch, since more is removed than when clothes are wrung by hand.
8. Hang starched clothes to dry immediately to prevent mould.
9. When garments are thoroughly dry, turn right side out and sprinkle, unless garments are to be ironed on the wrong side.
10. Iron starched dark-colored garments on the wrong side.

[1]Adapted from ***America's Housekeeping Book,*** published Charles Scribner's Suns.

Many factors affect the stiffening quality of starch, and it is almost impossible to give exact proportions for various fabrics. Personal preferences vary, also. However, the following basic starch recipe will serve as a guide:

Basic Starch

½ cup starch or 14 starch cubes
½ cup cold water 2½ quarts boiling water

Mix starch and cold water to a smooth paste. Add boiling water gradually, stirring constantly. Cook over low heat, stirring constantly, until clear (about 5 min.) or cook over hot water, stirring frequently, until clear (about 15–20 min.). Strain through very fine strainer or cheesecloth.

Troubles and Remedies

Sticking

1. Insufficient cooking.
2. Careless straining.
3. Allowing "skin" to form on starch after cooking (keep starch closely covered to prevent skin from forming).
4. Iron not hot enough.
5. Excess starch on surface of garment.

Limpness

1. Garment not wrung dry before starching.
2. Drying in moderate or strong wind.
3. Freezing on clothesline.
4. Drying in damp atmosphere.

General Rules for Washing Woollens, Rayons, Silks.—DO not soak material, and use lukewarm, never hot, water. Use mild soap only and be sure it is completely dissolved. Squeeze; don't rub or twist. Rinse gently and thoroughly. Squeeze dry—do not twist. Roll in a heavy turkish towel and press out moisture with the hands. Wool garments should be dried on forms or pinned into shape. Dry quickly in a warm place but not near stove or radiator.

CLEANING EQUIPMENT

A place to store cleaning equipment is lacking in many houses. It will be time well spent to fit up a closet or wall space to take care of these tools. To arrange this area, collect all the cleaning tools and materials at the location to be used. With the help of a second person and a piece of chalk work out a plan for placing them.

First set the tools requiring floor space in position—the vacuum cleaner. carpet sweeper, mop pail. Next have the helper hold in position the tools that are to be clipped to the wall. while they are outlined in chalk—which can be erased if a better position is found. Place the tools used most often in the most accessible positions. After every tool has been assigned a place, put the necessary holders or hooks in place. Always return equipment to the right places after each use.

*Essential Cleaning **Equipment** and **Supplies***

Vacuum cleaner and attachments
Carpet sweeper
1 corn or fibre broom
1 dust mop
1 wet mop (string, sponge rubber or cellulose sponge) and 2-compartment pail
1 scrub brush (long handle preferred)
1 dust pan (long handle preferred)
Toilet bowl brush
Radiator brush (if not included with vacuum cleaner attachments)
Whisk broom or upholstery brush
2–4 treated dustcloths
6 cheesecloth squares (24" x 24")
2 flannel polishing cloths
3 cellulose sponges (for kitchen, bathroom and cleaning basket)
2 floor cloths (for kitchen and bathroom)
Wax (paste. liquid or self-polishing)
Metal polish
Silver polish
Turpentine (flammable)
Lemon oil
Mild scouring powder or whiting
Ammonia (household)
Toilet bowl cleaner
Fuller's earth or other absorbent
Rottenstone
Carbon tetrachloride
Household disinfectant
Mild soap (chips. flakes, beads, grains)
Paint cleaner (commercial or homemade)
Art gum eraser.

How to Clean Painted Surfaces.—Dust frequently to avoid washing. When washing is necessary wash a small inconspicuous area first to see the effect on the paint. Mild soap and water will clean lightly soiled surfaces. Always avoid strong soaps, harsh scouring powders and powerful cleansing solutions. If painted surface is heavily soiled, try one of the following solutions:

1. ½ oz. trisodium phosphate to 2 gal. of warm water.
2. 1 tsp. tetraphosphate compound to 1 gal. of warm water.
3. Sodium hexametaphosphate compound used according to manufacturer's directions.
4. ***Whiting** cleaner:* Dissolve 2 tbsp. white soap flakes in 10 tbsp. lukewarm water. Cool until jellied and stir in 1¼ cups of whiting. Apply with a damp cloth or sponge.

Follow this procedure in washing walls:

1. Dust walls thoroughly.
2. Start at the bottom and work up to avoid streaks from water running down.
3. Apply chosen cleaning solution to a small area with a soft cloth or sponge, using a circular motion. On textured surfaces use a stiff brush.
4. Rinse the clean area with clear water.
5. Wipe with soft cloth wrung nearly dry out of clear water, using the up and down stroke.
6. Wash a new area, starting well within the cleaned area.

Liquid Window Cleaners.—These may be purchased in bottles equipped with sprays. They are extremely easy to use. Merely spray the surface and wipe it at once. Then polish with a dry cloth or newspaper. Never work in sunlight. To make a liquid cleaner:

1. 2 tbsp. of household ammonia added to 2 qt. of warm water.
2. ½ cup of denatured alcohol in 2 qt. warm water. Use the latter solution for washing in freezing weather.

Paint or Varnish Spatters on Window Panes.—If possible remove while fresh, using a cloth dampened with turpentine. If old, soften with turpentine or paint remover, then scrape off with a putty knife or razor blade held in a handle. Purchase latter at 5 and 10 cent stores.

Putty Smears on Window Panes.—Remove with household ammonia.

Window Sills and Frames.—These need constant care if they are to be kept from getting grimy. A coat of wax—any variety—makes this task easier and saves the surface beneath the wax.

HOUSELEEK, common name for *Sempervivum,* a genus of ornamental succulent plants, also called "hen-and-chickens," belonging to the family Crassulaceae. About 50 species are known, some of which are hardy perennial herbs and grow well in dry or rocky situations; the others are evergreen shrubs or undershrubs, fit only for cultivation in the greenhouse or conservatory.

The genus *Sempervivum* is distinguished from the nearly allied *Sedum* by having petals in multiples of six or more, whereas *Sedum* has petals in multiples of six. The common houseleek, S. *tectorum,* is often met with in Great Britain on roofs (where it is sometimes planted to keep slates in position) and wall tops, but is not a native.

Originally Eurasian, it became widely dispersed in Europe, and was introduced into America.

The leaves are thick, fleshy and succulent, and are arranged in the form of a rosette, lying close to the soil. The plant propagates itself by offsets on all sides, so that it forms after a time a dense cushion or aggregation of rosettes. The flowering stalk, which is of rather rare occurrence, is about one foot high, reddish, cylindrical and succulent, and ends in a level-topped cyme, recurved at the circumference, of reddish flowers, which bloom from June to September.

Sedum acre (stonecrop) is styled the little houseleek. S. *arachnoideum,* the cobweb houseleek, is often cultivated for ornament. *S. arboreurn* is employed in Cyprus, the east and northern Africa as an external remedy for malignant ulcers, inflammations and burns.

HOUSE OF ISSUE, an investment banking house which underwrites, advertises and undertakes the sale of an issue of stocks or bonds for a corporation. It is known as the house of issue to distinguish it from other banking houses which may be merely participants in the disposal of the securities.

HOUSE OF REPRESENTATIVES: *see* CONGRESS, UNITED STATES

HOUSE SPARROW *(Passer domesticus),* a bird characterized by its attachment to human habitations; it destroys noxious insects, but in part counterbalances this by its ravages on crops. It breeds in most of Europe and parts of Asia, with allied species in northwest Africa, Italy, etc. It is not a finch but belongs to the weaverbird family, Ploceidae. First introduced in the United States at Brooklyn, N.Y., in 1851, about 200 were released in 1860–66 to combat insect pests in New York (where they were soon called English sparrows), where they established themselves and began to spread.

The house sparrow thereafter found its way to every state and much of Canada. It was introduced by Sir W. Buller to New Zealand to combat a plague of caterpillars. It was also introduced into Australia and has multiplied immensely in both countries. The tree sparrow (P. *montanus),* distinguished by a brown cap, takes the place of the house sparrow in cities in part of Europe and Asia. (G. F. Ss.)

HOUSING. This article is divided into four broad sections dealing with the principal aspects of housing and the development of housing policies and programs in the United States and in Great Britain and western Europe. For additional information *see* POVERTY; PUBLIC HEALTH; SOCIAL SERVICE. Planning and zoning programs are discussed in CITY PLANNING; ZONING; and GARDEN CITY.

Population trends which affect housing needs are treated in the articles BIRTH RATE and POPULATION. The program of the Farmers Home administration is described in the article AGRICULTURAL ECONOMICS: *Agricultural Credit Systems.* For additional information on specific aspects of housing *see* SAVINGS AND LOAN ASSOCIATION; HOUSE.

Following are the main divisions and subdivisions of this article:

I HOUSING: A PERSPECTIVE

In its most general sense housing means shelter, or the means of providing shelter. Increasingly, however, it has come to signify the particular problem of providing an adequate supply of dwellings for human habitation, at suitable price levels, and of a quality to meet acceptable modern standards.

A. HOUSING AND THE FAMILY

Home is the place where people care for most of their bodily needs, rear their children, keep their possessions, seek quiet and privacy, entertain their friends and in general fulfill the basic domestic and personal functions of family life. Physical and mental health, working efficiency, emotional security and social status are all likely to be influenced by housing conditions. Specialization, mass production and the network of communal services make the individual household less self-sufficient, physically and socially, than it was formerly. But many labour-saving devices tend to strengthen its independence, and such inventions as radio and television probably increase the amount of leisure time spent at home. Housing and household equipment are normally a major item of consumer expenditure, often larger than food, and when a family buys a house it is likely to be the biggest single financial commitment it ever makes. A suitable home is vital to the modern family, but the average family cannot produce such a home on its own initiative.

B. Housing and the Community

Housing is also of direct significance to the community and the nation even apart from its importance to the individual family. The largest single use for urban land is for residence, and most of the value of urban real estate is in residential property. Services for home protection and convenience are a major item in the municipal economy. while the neighbourhood social pattern created by housing practice may be a dynamic factor in class and race relations. Moreover, since each dwelling is a base point in the web of urban activity, traffic and transportation are primarily a problem of communication between homes and other facilities Insanitary, obsolete, ugly, overcro ded or inefficiently located residential districts not only affect the lives of the occupants but are also a burden and a threat to the rest of the community.

At the national level. housing is important not only because it affects health and welfare and is closely related to such political principles as "equal opportunity" and "minimum standards," but also because it is a vital factor in the national economy. A large number of workers are dependent on residential construction for employment, directly or indirectly, and housing credit is an important aspect of both the investment market and fiscal policy. Housing problems are continuously created by population movements of all kinds, and the location of housing and industry is a factor in national defense.

C. Emergence of a Problem

Housing emerged as a major problem and public issue because of dissatisfaction with existing conditions. The standard of demand was rising or changing in many respects, and the supply failed to keep up with it. Deficiencies in the home production mechanism were almost universally evidenced in western countries by (1) the enforced occupancy of an enormous number of dwellings seriously substandard by accepted criteria; (2) the rapid spread of physically and economically blighted areas, undermining civic amenity and efficiency; (3) the frequent recurrence of severe housing shortages, causing overcrowding and an inflexible or exploitive housing market; (4) a narrow "effective market" for new dwellings constructed by ordinary private enterprise. often limited to upper income families; (5) the inadequate planning and design of much new housing; and (6) extreme fluctuations in the rate of home production endangering the national economy.

As a result of these deficiencies a strong movement for housing reform gradually took shape, beginning in mid-19th-century England as an offshoot of the public health movement. Specific emphasis varied in different situations, but the over-all trend was remarkably continuous and consistent. The housing movement became international in scope, attacking common problems, and working toward more or less common goals.

There were numerous private efforts to reduce costs and improve quality. A long series of experimental community developments demonstrated new standards of design, often gradually adopted in general practice. Building and loan societies endeavoured to make cheaper capital available on a more responsible basis, primarily for individual home purchase in the United States and England, more particularly for large-scale rental housing on the continent. Co-operative initiative was encouraged to eliminate speculative profits. Technical research sought, via rationalization and prefabrication, to lower costs by increased efficiency. There was a fairly steady trend toward standardized building units and larger-scale operations.

But progress by private initiative alone was inadequate to meet the demand, and housing became an important chapter in the political modification of the laissez-faire system for social ends. The history of the housing movement is primarily the history of expanding public responsibility — restrictive standards applied to new and old construction in the interests of health and welfare; rent control in periods of shortage, financial aid of all kinds to private housing, subject to various conditions; direct public construction of homes; subsidies for the clearance of slums and blighted areas; guidance on the location of new housing; and lans and policies against racial or other types of discrimination. In the United States quite as much as in Europe, home building and ownership became a thoroughly "mixed" enterprise in terms of public and private participation. Throughout Latin America, Asia and Africa, as a result of rapid urbanization and rising social demands after World War II, housing conditions have increasingly become a major issue.

Along with the trend toward large-scale operations and public intervention, the movement for housing reform is inevitably related to the broader land use and social economic problems of cities and regions. In addition to signifying a necessary but troublesome physical commodity, "housing" has come to mean a basic instrument for community planning and civic development and redevelopment. (C. B. Wu.)

II. TRENDS IN WORLD HOUSING

In all countries housing is prominent among the factors affecting the level of living. It plays a multiple role in creating or retarding employment and economic growth, in maintaining health and social stability and in preserving the values of decent family life. Housing constitutes the physical environment in which society's basic unit, the family, develops. The improvement of that physical environment represents a concrete and visible rise in the general level of living.

From the family's perspective, "housing" is not shelter alone but comprises services, facilities and utilities which link the individual and the family to the community. These include such amenities as easy access to schools, medical facilities, shopping, recreation and cultural institutions; and a reasonable time for travel to and from work. Because of the complexity of the problems involved, approaches to housing in the second half of the 20th century emphasize regional and national programs — instead of local housing projects — and comprehensive community planning in order to prevent a further haphazard gronth of cities. Housing standards also are changing, from establishing minimum requirements of habitable area and space, or of materials, to controlling overcronding and promoting better sanitation, greater safety and more privacy. As a rule they provide for high levels of community services. facilities and utilities even in cases where the family's income does not allow for high levels of shelter accommodations. Governments thus promote adequate levels of community activity when for reasons of etonomy shelter standards must be set temporarily at relatively lower levels. High community standards promote in such cases the realization of suitable patterns for the development of urban and rural communities in accordance with anticipated economic and social advances and the improvement of dwellings as family incomes rise.

1. The General **Problem.**—By the second half of the 20th century the world's population had reached 2,500,000,000, increasing at a rate that indicated it might swell to as much as 6,000,000,000 by the end of the century. Progressive industrialization will most probably have to be relied on for the livelihood of most of this added population, expected to be concentrated in urban areas. An explosive growth of cities has been in the past and is expected to be in the future a direct result of the rapid transformation of a fundamentally rural and agricultural mode of life into an essentially urban society.

Technological advances in construction, transportation and utilities have been notable but they have not been applied at a sufficient rate in urban development. Economic imbalances have grown out of this situation. Their outward physical symptoms are poor housing and inadequate community services; choked-up city traffic and excessive travel time to work; and filth, squalor and disease. Gang activity, juvenile delinquency, crime and vice are the more conspicuous social problems of economic disorganization and the physical decay of the city. These conditions affect an evergrowing number of people but primarily they involve newcomers in the lower-income groups who become slum dwellers and squatters in the communities to which they migrate.

The problems of housing and urban reconstruction have grown into major political issues in most countries. Governments have assumed increasing responsibility for the planning and financing of housing and community improvement programs and separate governmental departments or agencies for housing and urban de-

velopment have been established. In order to facilitate the execution of housing and urban development programs separate financial, loan and banking institutions of a public or semiprivate character have also been organized, and great efforts have been made by governments to stimulate private financing of housing. Individual ownership in the United States covers nearly 70% of all households; and in the U.S.S.R. and the other socialist countries more than 50% of all dwellings are built for individual or co-operative use. At the same time maintenance and management of a steadily growing housing stock have become serious problems for public authorities. Special agencies therefore have been established to take care of social aspects of housing, urban redevelopment, slum clearance and squatting.

The share of the family budget spent for housing varies considerably. However, low-income families in most countries find it more and more difficult to obtain adequate accommodations without jeopardizing other essential needs. To overcome the serious gap between the "economic" and the "social" rent (that is, between the cost of construction and maintenance of acceptable housing accommodations and the amount families are able and willing to pay for them) governments directly or indirectly subsidize builders, as well as householders in the lowest-income groups. These measures are sometimes supplemented by rent controls to ensure (1) an adequate security of tenure; (2) rents within a reasonable proportion of the family budget; and (3) the maintenance of existing housing accommodations. While rent controls have tended to disappear in the high income countries there has been a growing interest in this measure in the developing countries.

2. Urbanization. — In most parts of the world more people already live in cities and industrial centres than can be supported by employment opportunities in existing industries. The levels of living of the migrant population are therefore declining both in terms of physical and social environment and from the point of view of family income.

Measures are being instituted in town and country to discourage the transplanting of rural poverty into the urban environment. In this context housing and community services and facilities play a crucial role. However, the progressive concentration of people, a scarcity of resources, the rising cost of building and a growing shortage of suitable land in urban and industrial areas retard improvement. Economic development programs have tended to intensify urban-rural differences, and to stimulate migration when insufficient attention has been paid to a corresponding development of agriculture and the improvement of rural life. Rural residents generally, and large sections of the urban population, have failed to benefit from economic progress; living conditions in the villages continue to deteriorate and growing numbers of people continue to drift into towns. Thus the demand on national resources for housing and urban development has greatly increased at the time when large investments are also required to create the many jobs needed for the employment of new city dwellers.

3. Housing Needs. — In 1950, when every fifth inhabitant of the world already lived in a city with a population of more than 20,000, studies indicated that within 25 years between 280,000,000 and 540,000,000 persons would be added to the populations of such cities in Asia. In Latin America 62 metropolitan cities (with over 100,000 inhabitants each) accounted for some 40% of that continent's population and a group of 11 among them had reached a level of employment in industry comparable to that of New York, Paris and London, namely about 39%. In Africa the population was expected to grow from nearly 200,000,000 to more than 330,000,000 by 1975 with urban population showing the highest rate of increase. The studies showed that 70,000,000 people would be added to North America's population by 1975, practically all of whom would have to live in cities and work in industry, commerce, transport and various services. The same was true for the 177,000,000 people who would swell Europe's population (including that of the U.S.S.R.) during the same period.

Although the second half of the 20th century was characterized by the greatest technological advances in man's history, there was no cocntry without a housing problem. With very few exceptions the supply of housing for the lower-income families was in fact worsening, especially in the less developed countries.

Physical congestion and blight are atiecting many areas, and they are presenting seemingly insoluble problems of reorganization, reconstruction and financing. It has been estimated for India, for instance, that considering only cities with more than 100,000 inhabitants, during the 25 years ending in 1975 housing and site improvement for new dwellers would require 60,000,000,000 to 110,000,000,000 rupees (or U.S. $12,000,000,000 to $22,000,000,000). The Organization of American States estimated that a yearly investment of U.S. $1,400,000,000 was required in Latin America over a period of 30 years to wipe out the housing deficit, to replace obsolescent dwellings and to provide new homes for new households. These examples assume an ominous significance against world-wide needs. According to rough estimates by the United Nations, as many as 150,000,000 families in the less developed countries required more adequate homes in better physical surroundings; and in the industrially advanced countries, there was a deficit of more than 30,000,000 units.

4. National Policies. — In the countries that have legislation controlling rents (eastern Europe for instance) families pay on the average less than 5% of their incomes for rent. In some Asian countries a 10% share of family income is considered to be a reasonable allowance for rent. Among the more highly industrialized countries, between 15% and 20% is regarded as normal (in western European countries), while 25% and more is customary in North America. The interplay of needs, resources, rights and habits has produced a variety of housing policies corresponding to varying conditions. The general trend has been toward establishing national policies for housing and urban development on a comprehensive scale; to enact requisite legislation including the appropriation of necessary public funds to supplement private and co-operative resources; to set up the organizations required at the central, regional and local levels for the planning and execution of these programs; and to institute corresponding research and training activities. The methods applied in different countries to facilitate the financing of housing and urban development programs are influenced by their general economic and social policies. Thev include such measures as tax concessions, state-guaranteed mortgages, granting of loans, capital subsidies. direct subsidies to householders and building of rental housing with public funds. In addition some countries plan and finance with public funds the provision of certain community services and facilities and the acquisition and development of land required for new neighbourhoods or residential communities.

In most countries the housing requirements exceed the capacity of the building industry and the supply of readily available building materials. At the same time rural residents transplanted to urban communities do not usually have facilities to build their own homes as they often did in the country. Furthermore, the qualitative standards of urban dwellings continue to rise so that they have come to include many amenities usually not found in rural homes. Thus the cash cost of urban dwellings rises while the ability of the householder to contribute labour or building materials decreases. The desire to bring the cost of housing within the reach of low-income families underlies the policy of public aid for the development of building and building-materials industries and the growing practice of using the householders' own savings and labour in the financing and execution of urban and rural housing programs.

5. Mobilization of Resources. — The use of the future householder's own labour or of cash and his potential savings represented a way of reducing the burden of financing housing programs from public sources. In most countries the establishment of suitable credit facilities and of savings and loan mechanisms created a sufficient incentive for mobilizing the residents' own financial means for home building. In a number of countries with strong inflationary tendencies a special device was used to attract private savings. In addition to the normal interest rates an "index clause" was introduced which provided for an allowance for any rise in home building costs as reflected in the fluctuations of a specified price index, such as the cost of construction or of some basic building material.

All societies have traditionally used self-help and mutual aid for building family shelters and community facilities. Organized versions of these methods are applied with enthusiasm in villages and small towns throughout the world under the guidance of community development workers: in Scandinavian cities under the *egnahem* (one's own home) arrangement; in squatters' resettlement and slum clearance projects carried out by a number of municipalities; in the newly established industrial communities of the U.S.S.R. under the leadership of labour unions; and in North America by enthusiasts of the do-it-yourself movement. The motivating force may vary, but the general principle is the same: the people concerned contribute their own labour to reduce the required capital outlay for the building of homes and community facilities; or governments use this method to obtain for housing construction labour which may be in short supply in situations of full employment.

In Africa, Asia and Latin America self-help and mutual aid have often been means for improving the physical environment and health and general living conditions in villages and towns through the construction of public works. In these instances efforts to better one aspect of the community environment have often led to improvement in others, as evidenced by pilot projects in Nigeria, Haiti and India; by cultural missions in Mexico which used as their main vehicle a suitable system of education; by fundamental education programs in village reconstruction projects in Egypt; and by rural centre projects in Africa and the Caribbean which demonstrated in a practical way what rural families can do for themselves. In Ceylon, Indonesia, Jamaica and the Philippines self-help projects have been developed in connection with broad programs of rural resettlement; and in Puerto Rico self-help and mutual aid were applied also in urban resettlement and slum-clearance projects. These latter included the transfer of families from slums or squatters' camps to new communities in which they were granted building lots and supplied with basic utilities.

In Greece thousands of homes were cheaply and quickly constructed after World War II, despite a shortage of building materials and skilled labour, through a "materials-in-aid" plan. The new town of Faridabad in India proved that 40,000 ordinary persons could erect homes for themselves, largely with their own labour. It was possible to build the new town in about two years, and the cash outlay per house was at the same time drastically reduced. As many as 500 dwellings a month were produced without elaborate mechanical devices.

Because of the steady influx of immigrants into Israel about 100,000 persons were at one time sheltered in tent colonies. shacks and abandoned army camps. As a solution to the restiveness of the immigrants and to the waste of potentially productive labour the work village. or *maabarot* plan, was developed. Under this plan teams of immigrants built their own permanent homes. In most cases they also built the factory in which they eventually were employed.

In Ghana a self-help program of great promise was developed. Home ownership has such appeal that many people there invest their savings in cement blocks for future building. The government in 1956 also started a program under which persons who had built their homes up to the roof level were provided roofing materials and doors and windows on credit. A similar arrangement was tried out with success in Burma. It involved five-year loans for aluminum roofing for rural dwellings, for structures for agricultural uses and for communal buildings such as schools, community centres and health clinics.

The rehabilitation of areas stricken by disasters such as earthquakes, floods or hurricanes has offered opportunities for effective co-operation. The National Reconstruction board in Lebanon (established in 1956 following an earthquake) is financed by a special tax on imports, an entertainment tax and a postal tax. Some 300 villages affected by earthquake were rebuilt initially through paid labour and ultimately by using self-help and mutual aid methods.

The urban housing program known as *egnahem* is used in Stockholm. Swed. The municipality supplies the building components, provides technical advice and negotiates contracts for skilled jobs such as plumbing and electricity. The neighbourhood is planned as an urban residential unit with all needed facilities and services. House construction is financed by a single government loan at 3½% for 40 years. This scheme combines saving through industrial prefabrication of elements of the house with the savings achieved through self-help labour of the householder, his family and friends. In the Soviet Union another approach was used. Participants were paid full wages by the labour union or other organization sponsoring the project, with the government subsidizing any difference between wages in the factory and wages earned by the householder as temporary construction worker. Industrial communities in the Gorki region built after 1957 about 60% of the state housing plan for that area. Such housing projects are financed through a fund constituting 1% to 6% of anticipated productivity of the industrial community thus created and from savings due to lower production costs. Larger deductions of from 20% to 50% are obtained from production in excess of that anticipated. In large enterprises the assembly-line method is applied and local building materials are used as much as possible, including industrial waste products.

In the United States the future householder's labour (his "sweat equity") has in some instances been accepted in place of the down payment in cash required by law in connection with mortgages guaranteed by the government. The do-it-yourself method is widely employed for improving or finishing one's own home and large industry exists to supply tools and materials. In a number of other countries, from Morocco and Tunisia to the Congo, Indonesia and Poland, self-help and mutual aid have been applied with varied success. Projects combining the contribution of the people's own labour with the technical skills and equipment provided by public or private construction enterprises have proved to be most productive. In France and Sweden savings in cash through contributed labour have been estimated at about 10% and savings in the cost of building materials through bulk purchase accounted for another 20% to 30%. In less developed countries, where construction is generally simpler and more unskilled labour can be used, savings amounting to as high as 60% have been reported.

6. The Building Industry. — The backwardness of the building industry with respect to design, technology and organization has been one of the major causes of the relatively high costs of housing in comparison with other industrial products. The lack of a stable market and the seasonal character of the building industry are partly responsible for the high outlays required for dwellings and for other structures. The major causes remain the lack of integration of the different phases of building and the uneven application of technological improvements and innovations in the factory and on the site. Thus most of the remarkable but isolated improvements in house building in the 20th century have not reached the general consumer in the form of lower rents or lower monthly payments for his home and related services. The building and building-materials industries are consequently under pressure to reorganize. In some countries this is being done with state aid, aiming at a higher output of better structures at lower cost. The first step in this process usually is the assembly (or prefabrication) of structures in shops. However, the costs of transporting the materials to the shop and the prefabricated house or its parts to the site are higher when this method of building is used. Reduction of weight and bulk is, therefore, a prerequisite for factory built housing, which also implies a high degree of standardization of materials, accessories and structural elements as well as modular co-ordination of products and designs. The more interchangeable the structural elements are and the more their dimensions are co-ordinated the greater the economy in their erection and the flexibility in their use.

The modern house is composed of two functionally distinct parts: the shell and partitions enclosing. dividing and connecting the built-in space, and the mechanical equipment (primarily utility systems) controlling and conditioning that space. Rising housing standards are reflected in the ever growing share of mechanical equipment in the total cost of building. Integrated utility systems, however, are "naturals" for prefabrication and can be used

in existing and in new urban and rural homes.

The availability of local materials, wages, transport costs, regional customs and building codes continues to determine the extent to nhich shell elements are prefabricated but, the use of local building materials in combination with elements fabricated on the site or in the factory encourages economies and variety in design.

7. Housing in the National Economy. — Expenditure on residential housing amounts to at least 1% to 2% of the gross national product of most countries; in rapidly developing countries it is 4% or more. Residential construction has constituted at least 12%, and frequently more than 25%, of all capital formation.

Housing competes for investment funds with other fields of development. The comparatively low ratio of returns in the housing field in the high-income countries and the general shortage of capital in the low-income countries heighten this competition. Also. large housing programs have tended to stimulate inflationary pressures when they mere not accompanied by appropriate counteracting measures (for instance. control of credit facilities and allocation of scarce materials and manpower). While it is generally recognized that the financing of housing must come largely from domestic sources, external financing becomes necessary, particularly in the less developed countries, where resource development projects also involve a certain amount of housing, community facilities and utilities. The problem of obtaining foreign exchange to pay for imported materials. equipment and services for such programs is particularly acute in countries in which the building and building-materials industries are insufficiently developed. If it is well planned, external financing is directed toward programs that will develop the country's own building industry.

Housing, together with education and health, belongs to the category of so-called "social overhead" projects which are basic to economic development They can be compared with the "economic overhead" projects such as transport, communications and power, which are also generally considered to be requisite for effective economic development. Overhead projects, whether social or economic, usually provide few if any direct financial returns in the short run. their benefits are derived from the more balanced development of economic activities that they make possible.

Provision of adequate housing and community facilities should accompany, if not precede. resource development in order to avoid serious obstacles to economic activity and high social costs of haphazard urbanization. But there appears to be a considerable area of conflict, in the sphere of national policy formulations in the developing countries, between the "economic" and the "social" approach The housing enthusiast seeks prompt fulfillment of housing needs; the development enthusiast sees the problem of economic development in terms of scarce capital resources which should be diverted to "more productive" tasks. Housing finance therefore involves determining the share of investment funds which a country can and should allot to housing and community improvement programs in the interest of balanced economic growth and stability.

Housing is deeply involved in the process of saving and investment. it is a type of capital formation that both encourages and strengthens long-term patterns of saving. Persons will save for better housing who would not otherwise make their savings available for capital formation. As the shortage of savings is a severe obstacle in the developing countries, this additional mobilization of capital makes an important contribution to their economic and social growth

8. Major Issues. — The principal issue in the developing countries remains the assessment of an appropriate share of national resources that must be devoted to the financing of housing and urban development programs in relation to over-all economic development. In several of the highly industrialized countries. however, part of the problem may be to determine what resources should be invested in housing and urban reconstruction to obtain and maintain full employment; for example, in a situation of reduced armament production or as a consequence of automation and other technological advances in agriculture and industry. At the same time the financing of housing for people in the lower-income groups continues to be a critical problem. New ways of stimulating the flow of private capital and of individual savings into the housing and urban development fields need to be evolved, preferably from sources not previously used.

In the highly developed countries a major issue is the development of a house-building industry that is highly integrated and capable of translating the benefits of higher productivity into lower costs to the consumer. In the less industrialized countries, honever. a two-front attack is needed: large sections of the population nhich are still living in rural areas require assistance in adjusting the use of local materials and building methods to the progress that has been made in engineering, chemistry and technology without undue additional cash outlays. The use of stabilized earth and bamboo preservation are examples of this approach. At the same time, a highly productive building industry must be developed to provide the required volume of house construction in congested urban areas at a cost attainable to lower-income families.

A growing volume of resources will be required merely to maintain the present levels of living in addition to providing new jobs for the 50,000,000 to 75,000,000 people being added every year to the world's urban population. Suitable planning on a regional scale (territorial planning) may help to guide urbanization and internal migration so that they facilitate rather than impede development. Such planning could first of all help to strengthen the economic bases of the existing urban agglomerations (thus fully utilizing the "external economies" present there); and secondly, it could create alternative centres of attraction for the movement of rural people to the cities, the brunt of which has been borne almost entirely by large metropolitan centres. Judicious location of new industries within a region and the development of transport in a more rational and perhaps also a more decentralized pattern could facilitate the creation of these new centres.

The world-wide problems of housing and urbanization represent an area in which the role of the social scientist comes into sharp focus, not only in the realm of theory and planning but especially in the realm of action. In view of the growing concentration of people in urban areas, failure to plan for and guide the growth of cities would inevitably deprive a very substantial part of humanity of the right to a decent living in a decent environment. Three types of research and surveys may be useful in this connection. For the determination of national policies and broad, regional development programs a general but true picture of social and economic trends may suffice. More precise data are necessary for action at the local level in connection with community planning and land use. Finally, a specific project for a residential community or neighbourhood must be based on definite knowledge of a multitude of economic, social. cultural, physical and other facts. By means of suitably designed surveys the social scientist can provide an appropriate basis for a continuing evaluation of the social implications and consequences of various development programs. (ET. W.)

III. HOUSING IN THE UNITED STATES

A. Growth of a Problem

During the first two centuries of building in the United States, houses were erected without being regarded as a public problem. In the atmosphere of an expanding frontier economy, home-financing facilities available to the individual were meagre as more lucrative investment attracted capital into other fields. Investment in land and rental housing located in commercial and later in industrial centres became highly profitable and speculative ventures. Heavy waves of immigration accelerated the growth of housing need.

Throughout the 19th century housing as a problem of urbanization grew in proportion to the expansion of the urban population. Between 1320 and 1840 the urban population trebled. A sanitation report of 1834 called attention to the effects of bad housing conditions on health in New York city. At later dates similar reports for Boston, Mass., Philadelphia, Pa., and Washington, D C., focused attention of sanitation authorities on prevailing bad housing conditions. As population and industry moved westward, in-

land cities had like experiences.

With the spread of industrialization and the corresponding commercial expansion, urban growth brought governmental action to regulate city housing construction in the interest of public health and safety. Through the second half of the 19th century and the first three decades of the 20th century, however, this action was confined almost exclusively to the exercise of police powers in the various states to enforce certain minimum criteria for residential construction. The first action of this type was taken in Sew York city in 1866 and 1867 with the establishment of a board of health and the adoption of the New York city tenement house law.

While the institution of municipal and state building regulations in the latter half of the 19th century prohibited the more flagrant housing practices injurious to public health and safety, it did little or nothing of a positive nature to alleviate the causes of bad housing. However, some private measures had been undertaken to help meet the housing needs of the modest-income, urban industrial population A report made in 1836 on conditions in Lowell, Mass., indicated that New England manufacturers in some instances as a function of management, provided housing accommodations for their labourers. The building association movement, which started in Philadelphia, Pa., in 1831, spread rapidly during the following years to provide a sounder basis for home purchase by moderate-income workers.

By the turn of the century a number of employers had sought to relieve the housing problems of their workers. The Pullman experiment in Chicago, Ill., much discussed during the 1890s, was wrecked on the rock of paternalism. The Boston Cooperative was started in 1871. The Philadelphia Octavia Hill association. uhich repaired and managed old houses, dated from 1896. The Washington Sanitary Improvement company and the New York City and Suburban Homes company, both with voluntarily limited dividends were of the same period. The spreading awareness of housing troubles resulted in wide-scale enactment of state and local housing laws, some of which nent considerably beyond others in requirements as to open space and modern improvements.

The relatively high cost of housing, the inadequacies of credit and the costly and hazardous forms of home mortgage finance used throughout the 19th century had been major obstacles to onnership Of the 10 275.000 nonfarm dwellings occupied in 1900. nearly tno-thirds were rented The increase in ouner-occupied homes which occurred during the subsequent years, from 36% in 1900 to about 60% by the 1960s, reflected the influence of many factors, including increased purchasing power, the greater availability of home mortgage credit and improvements in the form and structure of mortgage debt.

In the boom of 1919 after World War I. the volume of housing increased rapidly, only to fall back the following year in the face of competition from other types of construction for manpower and materials which priced many buyers out of the market; a shortage of mortgage credit further restricted activity. Following the readjustment of prices, however, the volume of new home building rose rapidly. reaching a new annual peak in 1925 of 937,000 nonfarm units started

Except as home-loan amortization was required by savings and loan associations and other scattered institutional lenders, most of the home financing in the 1920s. as before, involved the straight type of mortgage. due in full amount upon maturity. Also, housing loans in general involved a low-ratio first mortgage of but a few years' term with the frequent use of second and third mortgages—the junior lien loans bearing higher interest rates and short terms However, the general rise of prosperity coupled with a long-term upward trend in property values tended to conceal whatever defects there were in the home-financing structure.

B. The Government's Role in Home Financing

1. Beginnings. — At the turn of the 1930s, spreading unemployment and declining incomes abruptly narrowed the market for homes. The volume of housing started fell off rapidly. In the five years 1930 through 1934 home-building volume barely equaled that reached in a single year in the mid-1920s. At the same time the forces of deflation brought on a wave of home mortgage foreclosures.

The Federal Home Loan bank system was created in 1932 to strengthen home-financing institutions of the nonbank type. The system was designed to divorce its membership from complete dependence upon commercial bank credit for their borrowings, through reserve credit functions financed by the sale of Federal Home Loan bank securities on the open market. The system was also intended to assure a better geographic distribution of funds for home-financing purposes. Its establishment marked the beginning of a series of federal programs in housing designed to aid and supplement private enterprise in this field.

Although it was apparent that fundamental long-range approaches were needed, the severity of the crisis demanded emergency action in housing as it did in other fields. The Home Owners' Loan corporation (HOLC) was established as a temporary emergency operation in 1933 to relieve distressed homeowners and increase the solvency of credit institutions By that time the rate of home loan foreclosures had risen to about 1,000 a day. HOLC purchased the loans of more than 1,000.000 homeowners in its three-year period of rescue refinancing and recast these loans on a monthly payment basis with amortization over terms as long as 15 years. Subsequently, in 1939 HOLC was authorized to extend the terms of the loans it held, where necessary, to as long as 25 years. By 1951 HOLC had liquidated its total investment of about $3,500,000,000, with a profit of $14,000,000 to the government

The Home Owners' Loan act also authorized the chartering and supervision of federal savings and loan associations by the Federal Home Loan Bank board (FHLBB) to assure an adequate geographic distribution of housing credit facilities. This latter authorization constituted the second application of federal government powers to meet the long-range requirements of the housing sector of the national economy.

As the nation devoted greater attention to its economic health, special importance was attached to the stimulation of increased private building. particularly private residential construction. The National Housing act of 1934 authorized establishment of the Federal Housing administration (FHA) to undertake a nationwide system of home loan insurance. The same act provided for creation of the Federal Savings and Loan Insurance corporation (FSLIC) to provide protection of savings in insured home-financing institutions of the savings and loan type up to $5.000 per investor. In 1950 the extent of this coverage was increased to $10,000 per investor. These two programs represented the third and fourth long-range positive applications of federal government powers to strengthen the housing industry.

The Federal Housing administration was created to provide a system of mutual mortgage insurance. applicable to mortgage loans financing the purchase of both new and existing one- to four-family structures and to afford protection on repair and modernization loans for housing and on loans financing rural housing and nonhousing construction. Capitalizing on the experience of the past. the FHA system of mortgage insurance provided an economical means of home financing under liberal private credit terms with first mortgage loans as high as 80% of property valuation, the principal amount of the loan being reduced through regular monthly payments including payments for interest. property taxes and insurance. FHA-mortgage insuring authority was extended to afford safe, economical financing methods for large-scale private-rental housing projects. By the latter part of the 1930s there also evolved the application of special mortgage insurance provisions under the mutual provisions of title ii to encourage production of lower-cost housing, particularly for owner occupancy.

Another significant purpose of the FHA program was to establish and promote, through its mortgage insurance requirements. sound minimum standards of construction, design, location and neighbourhood for housing for families of moderate means. Its influence on the improvement of housing standards and subdivision development extended beyond its own operations to the general field of house construction and development and of consumer demand.

From 1935 through 1939 the volume of home building almost

doubled that for the preceding five years. Of the 1.782.000 dwellings constructed in the 1935–39 period, a great majority (96%) were built by private investment

The 1930s ended with limited federal assistance in home building a generally accepted fact, but with the extent and nature of the government's future role in the field under debate.

The FHA-mortgage insurance program, skeptically received by the industry at the outset. developed into a commonly used method of financing, so that by the end of 1939 FHA had insured 497.000 mortgages for the purchase of new and existing homes, in addition to insuring lenders against loss on 2,346,000 home repair and modernization loans. The membership of the Federal Home Loan bank system included 3,920 home-financing institutions, of which 3,870 were savings and loan associations. The HOLC was no longer needed to refinance distress loans and continued only to administer and liquidate its holdings. The federally aided public-housing program (see *Housing Problems and Programs* below) was just getting under way.

2. Wartime and Postwar Programs.— The president declared a national defense emergency on Sept. 8, 1939. By the middle of 1940 rising prices and sharply mounting housing requirements in the defense centres, where workmen and their families were migrating in large numbers, produced problems that could not effectivelybe met through the normal peacetime operations of the industry. The government intervened initially by converting its existing housing aids to defense-housing purposes.

Low-rent public housing under construction or not yet started was diverted to wartime housing uses; the war and navy departments received appropriations to build housing for defense purposes; congress in the Lanham act. authorized federal funds to finance defense housing. This act became the basic measure for construction of federally owned wartime housing.

After the attack on Pearl Harbor on Dec. 7, 1941, housing, along with other major segments of the production economy, was swiftly brought under complete mobilization for war purposes.

The first housing action, in Feb. 1942, was to set up the National Housing agency (NHA) as a war emergency operation and to consolidate in it nearly all the nonfarm housing functions of the government. Price and rent controls were instituted at the end of Jan. 1942. affecting building materials and existing housing. By March the NHA and War Production board (WPB)had worked out the main lines governing new housing production under WPB conservation order L41. The broad outlines of the arrangements were as follows: The WPB issued priorities only in accordance with NHA programing schedules; KHA programed housing only for additional necessary in-migrant war workers who could not be housed in existing housing; new housing was limited to essential in-migrant war workers; the size of new dwellings was limited, the amount of critical materials was reduced and a $6.000 ceiling was put on sales price. New rental housing was covered by rent control.

Through this program, plus the controls on manpower and prices, the government developed effective control over housing construction, private and public, during World War II. Private builders were encouraged to build as much of the new housing as possible. Direct federal financing was used where the housing could not be suitably provided by private industry in time to meet the need.

As war requirements mounted and materials and labour became more scarce, an increasing proportion of the federally financed wartime housing built was of a temporary type. As war production needs shifted, a substantial amount of temporary housing nas moved and re-erected for use in other locations in order to conserve materials and labour. Nevertheless, two-thirds of the wartime housing program was carried out directly through private home builders, thereby employing a substantial core of the industry to serve war needs and maintaining the basis for rapid expansion to meet the tremendous demand for housing that developed at the war's end

The postwar housing problem became a matter of early concern. In June 1944 congress enacted the Servicemen's Readjustment act, including home loan guarantees for veterans up to $4.000, or 50% of the loan, whichever was less; later increased to $7.500 or 60%. As the peak of war housing construction passed, the NHA, to ease the housing situation, gradually expanded the authority to build homes to include hardship needs as well as in-migrant war workers. Following the end of the war WPB on Oct. 15, 1945, lifted its conservation order L41, to release materials for peacetime construction. The heavy backlog of demand for materials for new factories, for deferred commercial, educational and community construction and similar needs quickly outbid home builders for the limited supply of materials. (See *Housing* Supply *and Demand,* below.)

3. Permanent Housing Agency Established.— In 1947 the president issued reorganization plan no. 3, which replaced the temporary grouping of federal housing agencies in the National Housing agency with a permanent organization, the Housing and Home Finance agency (HHFA). The HHFA was created with an office of the administrator and three constituent agencies: the Federal Home Loan Bank board, the Federal Housing administration and the Public Housing administration (PHA). The office of the administrator co-ordinated the activities of the constituent agencies and supervised activities under the Lanham act, which remained in effect. The FHLBB operations were responsible primarily for providing a credit reserve for home building and insurance for savings of investors in home-financing institutions. The FHA administered the home-mortgage insurance programs and underwrote modernization and repair loans. The PHA administered the low-rent public-housing program and remaining wartime housing activities.

In the course of the following decade certain additional functions of the government in relation to housing were recognized and included under the administrative responsibility of the HHFA By the mid-1950s these included the Federal National Mortgage association (FNMA), the Urban Renewal administration and the Community Facilities administration. Meanwhile, in 1955, the Federal Home Loan Bank board was removed from the HHFA and made an independent agency.

4. Government's Changing Role.—Guidelines for the government's role in housing in the 1950s were initially laid donn in the Housing act of 1949: continued support of privately financed housing under FHA-mortgage insurance and Veterans administration (VA) guarantees and a new and expanded role in community assistance both in public housing for low-income families and in community assistance to clear and redevelop slum areas. Other acts added special types of aids, such as direct loans to meet expanded housing needs at colleges and universities and special FHA-mortgage insurance for housing of military personnel at permanent posts in the enlarged post-World War II military establishment. The Korean emergency which arose in 1950 temporarily curtailed development of these programs.

Under the Housing act of 1954, based upon the recommendations of an advisory committee appointed by President Eisenhower to examine housing policies and programs, all existing housing programs were continued except the one for housing research. A number of important modifications in the basic statutes were made and new or broadened programs were introduced.

To meet higher cost levels and to broaden the mass market. FHA-mortgage terms have been continuously liberalized. both for new construction and for existing housing. By the end of 1960 the FHA had insured a total of about $67,400,000,000 in mortgages on more than 5,800,000 homes and 900,000 apartment dwelling units. In addition, the FHA had undernritten a total of $24.000,-000,000 in short-term home-improvement loans. The home-loan guarantee program of the Veterans administration also continued to provide an important source of home financing. From its inception in June 1944 the VA had guaranteed more than 5.000 000 home loans with a total mortgage amount of nearly S50.000.000.-000 Under both FHA and VA programs defaults and foreclosures continued to be low.

Through purchase of mortgages backed by the FHA and VA nearly $7,000,000,000 in government credit had been channeled into the mortgage market by the Federal National Mortgage association: The government continued, moreover, to supply funds to

purchase certain types of special mortgages, such as those for urban renewal, military housing and housing for the elderly. In addition the Voluntary Home Mortgage Credit Extension committee was established in 1954, under private direction but with the government providing administrative costs, to find private mortgage lenders for persons in small towns or for minority groups unable, though otherwise qualified, to get loans from local institutions.

Savings and loan operations, representing about 40% of the nation's home-mortgage financing, continued to expand rapidly with the support of the Federal Home Loan bank system. Other government aid programs that were continued or expanded included FHA-insured co-operative housing; liberalized terms for FHA-insured loans for home repair and modernization; and special FHA-mortgage terms for multifamily housing and home purchases for a new field of special housing needs, that of the elderly.

Housing policies became more closely geared to over-all fiscal and economic conditions. Interest rates varied depending on the supply of and the demand for mortgage money. FHA and VA maximum interest rates were increased in 1953 to 4½% as money costs began to rise. In 1955 limited cutbacks were imposed to restrain the housing boom. In 1961 FHA maximum rates went up to 5½% for home mortgages and 5¼% for most multifamily unit mortgages. The VA rate was increased in 1959 to 5¼%.

5. The Housing Economy. — The construction of more than 1.000.000 dwelling units a year during the 1950s was made possible by the ready availability of funds for mortgage investment and resulted in a tremendous increase in mortgage debt. At the end of 1950 the total estimated mortgage debt on nonfarm dwellings was $53,600,000,000 By the end of 1960 it was $160,500,000.000. Of the total debt the FHA-insured segment was 20%, the VA-guaranteed mortgages constituted 19% and the conventional loan segment 61%--mortgages held by savings and loan associations, mutual savings banks, life insurance companies, commercial banks and others.

C. Housing Problems and Programs

1. Slums and Slum Clearance. — Slums are residential areas that are physically and socially deteriorated and in which satisfactory family life is impossible. Bad housing is a major index of slum conditions. By bad housing is meant dwellings that are lacking in light and air, without adequate toilet and bathing facilities; that are in bad repair, damp and improperly heated; that do not afford opportunity for privacy in family living; that are subject to fire hazard: and that are overcrowded on the land, leaving no space for recreational use. Such in varying combinations are the characteristics of slum housing. To these one may add other indexes of slum conditions. They are to be found in congestion of population, both on land and in dwellings, high death and morbidity rates from contagious and chronic diseases, high infant mortality, a general prevalence of destitution, deteriorated or even degenerating neighbourhood conditions, the lack of adequate municipal or social services and a high incidence of dependency, child delinquency and crime. It should always be noted that slums involve people as well as buildings.

The growth of slums became an acute problem in cities of the eastern seaboard of the United States, especially in New York city, with the heavy immigration that began with the Irish about the middle of the 19th century. The problem spread westward as successive waves of immigrants colonized in urban areas, taking over housing accommodations that had been abandoned by former residents, that were already deteriorated, and which quickly became slums.

Besides immigration, other factors contributing to the development of slums may be cited as follows: low wages and poverty, preventing people from paying for decent dwellings; the invasion of business and commerce into residential areas, leading to the neglect and abandonment of dwellings; the haphazard, uncontrolled growth of cities; leniency toward the owners of dilapidated property in the matter of tax assessments. and in the toleration of low standards in the remodeling of old dwellings; racial or other restrictions limiting the location or quality of housing available to certain groups; and municipal government that neglects the adoption and enforcement of regulations with respect to sanitation and safety. Finally should be mentioned a general apathy regarding the menace of slums.

Initial efforts in the late 19th century and the first three decades of the 20th century to halt the growth of slums and improve housing standards sought unsuccessfully to correct conditions through the exercise of the police powers of the states (see *Growth* of a *Problem,* above).

2. Early Federal Programs. — Much that was undertaken in housing in the 1930s was motivated at least in part by the desire to stimulate private business and employment or to provide work relief. In 1932 the ne ly created Reconstruction Finance corporation (RFC) was authorized to finance low-rent housing and slum reclamation operations undertaken by limited-dividend corporations. Only two projects, however, were financed under this authority.

The inauguration of federal work relief programs in 1933 brought with it the direct application of federal funds to the construction of housing. Under the program of the Public Works administration (PWA), 21,600 dwellings in 50 public low-rent housing projects were built in 37 cities. In addition 15.000 dwelling units were built with relief funds as subsistence homesteads for rural and suburban nonfarm workers, rural farm-resettlement projects and in three green belt towns, built as models in land planning and suburban development for salaried workers. Also, direct loans from relief funds were made to seven limited-dividend corporations for the construction of 3,065 dwellings.

The development of these programs of federal assistance brought to light the meagerness of knowledge in the housing field. As a remedy to this situation a real-property inventory was undertaken in the last half of the 1930s in more than 200 areas, mainly by local authorities working in co-operation with state and federal works projects administrations, and mas financed through emergency relief funds. One of the most important contributions of the real-property inventory was the documented substantiation of the need for effective measures to improve the housing conditions of low-income families.

3. Local Responsibility. — Experience indicated that direct federal building of low-rent housing, although it served a housing purpose, did not contain the best approach to the housing of low-income families, largely because it by-passed local responsibility in this field. The Housing act of 1937 introduced a decentralized approach to this problem through a program of federal loan and subsidy aids to local public bodies building and operating low-rent public housing for low-income families. The Housing act placed upon the states and their localities the responsibility for chartering local housing authorities. These authorities in turn were required to study the low-income housing needs of their respective communities and to apply to the federal government for loan assistance to finance project construction and for subsidy aids to make possible the operation of projects at low-rent scales within the economic grasp of low-income families. Under this program and the earlier program of direct federal construction a total of more than 191,000 low-rent public-housing units was erected by the end of World War II, part of it being built initially to serve as wartime housing but converted to low-rent use after the war.

4. Comprehensive Survey. — The first comprehensive national survey of housing was authorized as part of the decennial census for 1940. This census reported a total of 37,325.000 dwelling units in the nation. of which 21,616,000 were classified as urban, 8,066,000 as rural nonfarm and 7,642,000 as farm. Of the urban units, 5,735.000 were reported to be lacking indoor running water, bath or toilet or to be in need of major repairs, or both, Of the rural nonfarm units, 4,892,000 were deficient in these respects, and 6,605,000 of the farm units were similarly deficient.

By the time the census results were available, however, long-range considerations of housing were eclipsed by the immediate needs of the war.

5. Later Programs. — After World War II exhaustive congressional investigations of housing led to enactment of long-range legislation in the Housing act of 1949. This act marked a significant extension of government responsibility in housing beyond the

previously established aids to private home financing. In addition to expanding the earlier public-housing program it added three new fields of activity—slum clearance and urban redevelopment, housing research, and farm housing (under a program to be administered by the department of agriculture)—and stated a basic national housing policy to be applied to all government housing operations. Private enterprise was to be encouraged, and local bodies encouraged and assisted, in the direction of remedying "the serious housing shortage, the elimination of substandard and other inadequate housing through the clearance of slums and blighted areas, and the realization as soon as feasible of the goal of a decent home in a suitable living environment for every American family . . ."

In addition to providing for the continuance, on liberal terms, of the FHA and other peacetime home-financing aids, the Housing act of 1949 set up a new attack on slums, under which the federal government would pay to communities up to two-thirds of the net cost of acquiring. clearing and disposing of slum areas for any type of approved new uses, and would make loans to finance the execution of such projects. New state legislation was also enacted in most of the states in a short time to extend the power of eminent domain to local agencies carrying out such programs, and the use of such powers for clearance of slum areas was later upheld by most state courts and the U.S. supreme court.

The new area approach to slum clearance succeeded the earlier method of replacing slums with low-rent public housing. The 1949 act, however, also provided for an enlarged public housing program for low-income families, authorizing a total of 810,000 additional units to be built at the rate of not more than 135,000 units a year in the following six years.

6. Growth of Urban Problems and Programs.—The decennial census of 1950 provided the basis for detailed analysis of the national housing supply, the adequacy of existing programs and, to a large extent, the further development of federal, state and local legislation and programs. The housing supply had increased 23% since 1940, despite the lean war years, to a total of 45,983.000 units, of which 29,569,000 were urban, 10,056,000 rural nonfarm and 6,358.000 (a 17% decline) farm. Measured by structural condition and provision of essential sanitary facilities. the proportion of substandard units to the larger total was smaller, but the number of such units remained about the same. The census showed that 64% or nearly two-thirds of the population lived in urban areas, ranging from small towns and suburban communities to swelling metropolitan areas that were literally merging with one another to form continuous stretches of urban life. Housing and living standards were inseparably intertwined with this complex of forces underlying urban and industrial expansion.

The most significant new development in government activity related to housing lay in the field of the redevelopment and renewal of urban areas. The country's rapid urbanization accelerated by the war had enlarged many growing urban problems, including those of modern traffic, community facilities needed in the rapidly expanding suburban sections, expansion room for business and commerce and the preservation of the values of existing homes and neighbourhoods being lost in the spread of blight.

The Housing act of 1954 carried the area approach to urban replanning and redevelopment instituted by the Housing act of 1949 to its broader and logical conclusion by setting up a basis for combined local action with federal aid. The objective was not only to clear slums but also to prevent their continued growth by planned action in the whole range of urban problems, along with the rehabilitation of areas afflicted with blight, but not badly enough to require clearance, and the conservation of areas not yet so attacked.

A key part of this new program was the requirement that a locality have a comprehensive "workable program" for the prevention and cure of slums and blight, covering: sound codes and enforcement; planned public works and thoroughfare development; a master plan for the community's future growth; and an analysis of neighbourhoods to guide the clearance, rehabilitation and conservation activities under the new program. New federal aids were added, and most of these were made available only to communities with acceptable workable programs, reflecting the objective of requiring greater local initiative and responsibility in connection with federal assistance.

Two new types of FHA-mortgage insurance were enacted to implement the new urban renewal program. One of these, sec. 220 of the National Housing act, extended FHA-mortgage insurance to the financing of new or rehabilitated housing in urban-renewal areas. The other, sec. 221 of the act, provided FHA-mortgage insurance up to 100% of value for new or rehabilitated housing for lower-income families displaced by urban renewal or other government activities. Federal grants were also authorized to assist planning activities by small communities and metropolitan regions and to carry out demonstration projects in the urban-renewal field.

Under the expanded urban-renewal program 780 communities had active workable programs by the end of 1960. Federal grant reservations and contracts had been approved for 870 projects in 475 communities for a total of $1,900,000,000. Public housing, still the most controversial of the housing programs, continued at a reduced rate after 1953 compared with the 135,000 units annually authorized by the 1949 act. The annual authorization varied from 35,000 to 45,000 units. These were also more closely tied to the rehousing needs resulting from slum clearance and other governmental activities.

Locally the urban-renewal and public-housing programs are administered by separate authorities or by city departments. The number of such agencies grew from 17 in 1935 to more than 2,000 in 1960. Closely related to these programs is the enforcement of minimum standards of housing usually set forth in housing codes which, in large part due to federal requirements and stimulation, were adopted by many communities.

The trend in federal housing legislation after 1932 was toward increasing scope and comprehensiveness. Another major step in this direction was taken by the passage of the Housing act of 1961. Existing programs are continued and in some cases expanded with increases in housing and over-all community development. The mortgage insurance program of the Federal Housing administration was continued and further liberalized. An additional 100,000 dwelling units were authorized for low-rent public housing. For urban renewal an additional $2,000,000,000 in capital grant funds were approved. Authorizations for urban planning, college housing, community facilities and housing for the elderly were increased. New activities included FHA insurance for loans for home improvements up to $10.000 for up to 20 years at an interest rate not to exceed 5%; expansion of "Section 221" program to include moderate income families generally and 100% mortgages for financing of multifamily projects at the market interest rate. The expansion of the scope of the programs administered by the Housing and Home Finance agency was marked by the authorization of $50,000,000 for grants to local public bodies for aid in the acquisition of open land for recreational and other purposes. The act also provided for grants for comprehensive planning for urban mass transportation, for demonstration projects for its improvement and for loans for transportation facilities.

7. Minority Groups.—Incomes and employment opportunities of minority groups have greatly increased during and after World War II. This was reflected in improvement of housing occupied by nonwhite families. Home ownership by this group increased by 46% in the 1950–1960 period as compared with the over-all rate of increase of 39%. The number of units occupied by nonwhites that were dilapidated or lacked certain sanitary facilities declined by 500,000 during the decade. In spite of this improvement 20% of all homeowners' units lacking some or all plumbing facilities and more than 30% of the corresponding rental units were occupied by nonwhites.

The differences in housing conditions of white and nonwhite families are partly due to such factors as education and occupation and partly to patterns of residential segregation. The U.S. Commission on Civil Rights was created in 1957 to find facts which might subsequently be used as the basis for legislation or executive action. It reported that "in the past decade 17 states and numerous cities have taken legislation and administrative action to eliminate racial discrimination in housing, but the Federal Government has not acted meaningfully in this connection," *i.e.*, "to insure that

all people have equal access to the housing benefits it offers." (U.S. Commission on Civil Rights *Report* 4: Housing, p. 139, Government Printing Office, 1961.)

D. Housing Supply and Demand

1. Background.——With the removal of wartime restrictions on building and the rapid demobilization of men and women in the armed forces at the end of World War II. the shortage of housing to meet the suddenly released civilian and veteran demand became acute throughout the country. An emergency program was put into effect in 1946 designed to speed production of construction materials. increase the supply of construction labour and channel it as far as possible into housing construction and to give returning veterans priority in the rental and purchase of new housing. Under the forced draft of these measures, production of both materials and housing advanced steadily as bottlenecks were overcome in key materials and labour. For the year 1946. 670.500 new permanent nonfarm units were started, compared with 209,300 the preceding year. In addition. several thousand units of war housing barracks, trailers and other types of structures provided temporary housing to ease the suddenly swollen demand for additional shelter.

During the next four years housing production continued to expand. The number of new nonfarm units reached 849,000 in 1947, 931.600 in 1948, 1,025,100 in 1949 and a record high of nearly 1,396,000 in 1950.

Satisfaction of the most pressing needs for new shelter during the final years of the decade effectually marked the end of the war and postwar eras and provided an orderly transition of the housing economy from one of emergency techniques to one of long-range programs for sustaining housing production at a high level.

Before housing could settle down to this new prospect of peacetime prosperity. however, it had to weather another crisis following the Korean outbreak in June 1950. Home building, however, continued to exceed 1,000,000 units annually during the next decade.

Housing through the 1950s was dominated by large market demands resulting from rising incomes and standards of living. The home-building industry expanded rapidly to meet these demands. The problems in the housing field shifted away from the limited productive capacity that existed after the war to the ability of credit resources to satisfy the housing market, along with other increased consumer and capital demands, without inflationary strain on the credit system. It was a period of prosperous expansion in which concern centred more on the dangers of too much too soon rather than too little too late.

In addition, residential urban expansion outran the confines of developed areas in the suburban areas, creating record demands for new community facilities and services and simultaneously adding burdens to the already congested and deteriorating central areas of the urban structure. The problems of community needs and growth became an inseparable part of housing growth.

2. The Housing Market.—In the first years of the 1950s the most urgent needs resulting from the curtailment of construction during the defense and war period had been met. The major demands now arose from the changes in size of families, their improved economic status. increases in and shifts of population, and changes in the population structure.

In the decade from 1950 to 1960 the total population increased by 28.000.000 or 18.5%. Of this increase nearly 85% occurred in the metropolitan areas. These areas increased by 26%. However, the total increase in the central cities was only 1.5% if annexations are disregarded. More than one-fourth of the central cities lost population during the decade while the population of the suburban rings increased by nearly 50%. With the construction of approximately 15,000.000 units during this period, the housing supply increased more rapidly than the population. As a result the number of persons per room declined as well as the number of persons per dwelling unit. The change in the supply and demand situation was also reflected in the changing vacancy rates. During the war the number of nonfarm units available for sale or rent dropped to less than 1% of all units. By 1950 it had increased to 1.6% and by 1960 to 3.2%. The vacancy rate for available rental units only rose from 1.101, in 1950 to 2.6% in 1960.

In the early years of the decade households increased rapidly because many families that had been doubled up during the housing shortage found housing units of their own to live in. As this need was met the annual increase of households declined from about 1,500.000 to about 900,000 by the 1960s, when the trend again changed as the babies born during the 1940s began to reach marriageable age and establish families of their own. During the 1950–60 decade the population of the country grew most rapidly in both the younger and the older groups: the population of 65 and over increased by 34.7%; the population under 18 increased by 36.7%: and the population between these two age groups grew by only 7%.

An additional demand for housing beyond that due to population increase results from the continuing high mobility rate. Every year one out of every five persons in the United States moves to a different home, many across county and state lines, in search of better employment opportunities or improved living environments. This has been a major factor in the growth of the suburban rings in the metropolitan areas and in the increase of the population of such states as Florida (95%) and California (53%) and such cities as Phoenix and Tucson. Ariz. (over 300%), and .Houston, Tex., (56%) during the decade.

The continuing rise in the average level of incomes also had a considerable impact on the volume of residential construction. The median income increased from $3,000 in 1947 to $5.600 in 1960 or from $4,000 to $5,600 in terms of 1960 dollar purchasing power.

Another factor of increasing importance stemmed from the decrease of the existing housing supply through demolition due to governmental programs such as urban renewal, public housing, highway construction and stricter enforcement of municipal codes, and because of losses from fire, floods and other disasters.

In spite of the substantial improvement in housing quality which occurred during the 1950s there were still 11.000,000 dwelling units in 1960 which were dilapidated or lacked private toilet or bath or hot-water facilities. A large part of this segment of the housing supply represented additional potential demand for new construction or for extensive rehabilitation as incomes and housing standards continued to rise.

Other factors sustaining the demand for housing included financial arrangements facilitating home ownership and the stimulation of the flow of mortgage funds by Federal Housing administration and Veterans administration programs discussed above.

3. Cost Trends.—The trend toward larger and better houses is indicated by cost data. In 1950 the average cost of permanent privately owned one-family units mas $8.674 (exclusive of cost of land and site improvements, architectural and engineering fees, selling cost, profit, etc.). The average cost increased yearly after 1950. and by 1960 it had reached $13,050, an increase of 50%. Since the construction cost index of identical units went up by 30% during this same period. it is clear that the average quality and size of single-family residences had increased substantially on the average. This was confirmed by studies on characteristics of new units which showed substantial increases in the percentage of new one-family homes having a floor area of 1.000 sq ft. or more. of those having more than one complete bath and of those with three or more bedrooms.

Another aspect of this trend toward greater quality and space was the increase in one-family dwelling units. In the 1920s about 60% of new construction was in such structures. In the early post-World War II period construction ranged between 80% and 89%; by the mid-1950s it had risen to 91%; but by 1960 it had declined to 77% as the volume of apartment house construction began to increase again.

4. Home-Building Industry.—In 1938 the US. bureau of labour statistics found in a study of 72 cities that 63.8% of builders of single-family houses constructed only one house a year and that 86% of all builders erected no more than 4 houses a year. The U.S. residential building industry functioned not as an independent industry but rather as a sporadic aggregation of elemental groups

drawn together generally for the purpose of producing one or several houses. While there was a growing number of builder organizations consisting of relatively stable and permanent groupings of architects, real-estate brokers, general and subcontractors. a labour staff, etc., in the over-all industry, these were the exceptions rather than the rule.

A series of functions must be performed in order to bring additional housing into use. It includes the selection and acquisition of suitable land, the preparation of land for residential use, the planning and design of the structure, the financing of construction, the acquisition of materials, the erection of the structure and the financing and the marketing of the completed housing. In practice the erection of the structure is further subdivided into a series of operations including the excavation for foundations and basement, the laying of the foundation. the framing of the structure, masonry work, installation of plumbing, heating and electrical equipment, lathing and plastering, flooring, painting, flashing and tinsmithing, roofing, glazing and landscaping.

During the 1950s the home-building industry was able to take advantage of, or to develop more rapidly, various technological and management improvements. In 1959 a study conducted by the National Association of Home Builders indicated that 59% of all single-family homes were constructed by 10% of the home builders. This top group averaged over 350 housing units per year. Also, one-half of all the home builders in this study accounted for 92% of the total number of new residential units that were constructed

5. Mobile Homes.—A mobile home is a movable or portable dwelling designed for year-round living and built on a chassis without a permanent foundation but connected to electric and other utilities. Mobile homes commonly are referred to as trailers or house trailers and sites developed for their location are known as trailer parks. There are more than 16.000 such parks in the United States, with more than 500.000 spaces. Large mobile homes are towed to their sites by truck tractors and are moved infrequently; expandable-type units feature living rooms that will expand from 10 to 20 ft. in width.

Mobile homes since about 1930 have provided an increasing number of primary dwelling units to the total housing supply. In 1960 it was reported that more than 3,000,000 people lived in such units. The increasing number of mobile homes and the growth of mobile-home parks, however, created additional problems for many communities in relation to the provision of community services and facilities, schools and city and country planning, zoning and taxation.

6. Farm Housing.—Since farm housing is an integral part of the source of income and employment and is not readily separable from the farm as a whole as security, the nonfarm housing programs have generally not been applicable to farm housing problems. Farm housing, therefore, has been dealt with chiefly as an agricultural matter, the principal government program having been the farm ownership loan program under the Farmers Home administration in the U S. department of agriculture.

The Housing act of 1949 set up in the department of agriculture a sizable but still experimental program of loan and grant assistance and technical advice for farm housing and other farm buildings in an effort to provide a practical method of bringing assistance to farm housing comparable to that available for nonfarm housing. However, in 1951 the necessary funds to continue the grant program were discontinued and this part of the program was discontinued.

Data on farm housing have been particularly inadequate. However. greater farm prosperity in the war and postwar years was reflected in substantial improvement in the condition of occupied farm housing. Highway expansion in farm areas and the spread of electrification accelerated improved standards of housing and housing activities. (R. M. FY.; A. MACD. C.; D. E. MA.)

IV. GREAT BRITAIN AND THE BRITISH COMMONWEALTH

A. GREAT BRITAIN

There probably has been a housing problem in Great Britain, as elsewhere, for as long as there has been a settled population, in the sense that a proportion of the people has always had to live at a standard below what was technically possible and desirable at any particular date. The 20th-century housing problem. however, had its more immediate origin at the end of the 18th century. After the mid-19th century the movement for housing reform endeavoured to improve conditions in three ways: by overcoming shortage; by replacing and improving slums and obsolete dwellings; and by raising standards of accommodation and amenity. A brief survey of progress made through the agencies of philanthropic effort, state intervention and private enterprise will provide a background to an assessment of the housing situation and the outstanding problems after the mid-20th century.

1. Housing Conditions in the 19th Century.—The population of England and Wales was estimated at about 6.000.000 in 1750. By 1801 it was nearly 9.000.000, and in less than two generations it had doubled itself, a process which was to be repeated before World War I, by which time the population was ovkr 36,000,000.

It was not alone the increase in population which so radically altered the whole aspect of the country but the fact that the industrial revolution was concentrating the population in towns, so that places such as Liverpool, Manchester. Birmingham and Sheffield, which were small country towns of from 4,000 to 10,000 inhabitants at the beginning of the 18th century, had increased from five- to tenfold by 1800 and continued a steady and rapid growth up to, and in most cases even after. World War I.

Hands were needed for the new factories and families could no longer maintain a livelihood in the countryside; this created a sudden and enormous demand for accommodation in the cities. Such accommodation had to be within walking distance of the main centres of employment and it had to be cheap since wages were low. There was as yet no appreciation of the danger to public health from the crowding of population into towns or from the lack of proper water supply, town sewerage and house drainage. It is not surprising that employers of labour in mine or factory, who were often prepared to allow men, women and children to work under inhuman conditions, should show no concern for the conditions under which they lived. Town landlords were interested only in obtaining the maximum rent at least cost, and local and central authorities were frequently ignorant, indifferent or corrupt. Thus the only accommodation which the town labourer, and even the better skilled artisan who had become a factory hand, could afford or obtain was little more than the bare essentials for shelter.

Evidence of the resulting conditions is contained in reports of mid-19th-century inquiries, the warnings of medical officers and sanitarians and in the novels and other writings of such authors as Charles Dickens, who thus supported a reform movement. For the most part the dwellings of the English urban poor were of two stories, built in terraces, sometimes back-to-back so that each house had only one outside wall and sometimes around narrow courts opening from the main thoroughfares. Their construction was shoddy, walls were not damp proof and floors were frequently the bare earth. There was no paving or drainage and the cesspool, if such existed, could often only be built under the house itself. Outside toilets and pumps were shared by many households, and in many districts people had to beg or steal water. Overcrowding was rife. Thus all these circumstances, together with the prevailing poverty and often poor working conditions. resulted in appallingly low standards of health. Cholera epidemics swept through the country. The general death rate was 22 per 1,000 of the population in 1838, and death rates from epidemics among the industrial population mere three times as high as among the gentry. Eventually the relationship between public health and living conditions was realized, and an indifferent public was persuaded of the need for reform.

2. Period of Sanitary Reform.—The first efforts at housing reform started in the countryside, when enlightened landlords repaired and improved their tenants' cottages; however, in the newly overgrown cities where there was as yet no tradition of civic responsibility, and where local government was still inefficient and

negligent. it was some time before the reform movement could make any headway. Sir Edwin Chadnick (*q* v), a pioneer of sanitary reform. without which slum conditions could not be improved. norked together with others for the cleansing and paving of streets, the provision of water and drainage and the proper construction and ventilation of dwellings, thus preparing the ground for the Public Health act of 1875 and the building bylaws which enforced a minimum standard of building and ensured adequate drainage and ventilation. This led to a rather more open layout. Terrace houses with through ventilation, aligned along streets of the minimum width by law, took the place of the back-to-back cottage and congested court.

During this time also the first philanthropic trusts were set up to provide model dnellings for working people. The Society for Improving the Conditions of the Labouring Classes was first established in 1830 and was followed by similar model-dwellings companies and charitable trusts, the latter endowed by their founders to build dwellings to let at low rents, any financial return being reinvested to provide further dwellings In 1851, at the Great exhibition, a block of dwellings was erected under the auspices of the prince consort, as an example to enlightened landlords.

With the example of the philanthropists and the support of a growing public opinion, reinforced by reports from the poor-law commissioners and later the royal commission on the health of towns, housing reform became the concern of parliament. In 1848 the first Public Health act was passed, and a central health department was established for a limited period, but not until 1871 was a permanent local government board set up to become the direct predecessor of the ministry of housing and local government.

3. Octavia Hill and the Growth of the Housing Management Profession. — An independent contribution to housing reform which mas to have far-reaching results was started by Octavia Hill (*q.v.*) when, in 1865. John Kuskin bought for her three houses in a court in Marylebone. uhere she was to try out an experiment in housing management. Having come into contact at an early age with the London poor and their housing conditions, and believing that "you cannot deal with people and their houses separately." she set out to show that, if landlord and tenant honoured their responsibilities to each other for the right use and maintenance of dwellings, not only would the physical environment of working-class tenants be improved. but their whole standard of living mould be raised. By training "fellow-workers" in her methods, Octavia Hill initiated a new profession of housing management for women, which had spread to the Netherlands and Sweden before her death in 1912.

4. Beginning of Housing Legislation. — During the second half of the 19th century housing legislation proper first reached the statute book, and the basis of housing law uas already laid down before 1900 on principles which remained in force in the second half of the 20th century. In 1851 the Labouring Classes Lodging Houses act and the Common Lodging Houses act (the Shaftesbury acts) were passed. The first gave power to local authorities to build lodginghouses, including housing accommodation of a type suited to the labouring classes, whether single men and women or families. The second enabled local authorities to inspect and regulate common lodginghouses. Toward the end of the century, philanthropic enterprise entered this field when Lord Ronton endoaed the building of lodginghouses with a separate cubicle for each occupant.

The Artisans and Labourers Dwellings act, 1868 (the Torrens act), gave local authorities powers for the demolition or improvement of insanitary dwellings and so started legislation for slum clearance In 1879 an amending act empowered local authorities to build houses with state loans to replace those closed or demolished and to charge a rate (local property tax) up to 2d. in the £1 toward the cost. The Artisans and Labourers Dwellings Improvement act (the Cross act), 1875, amended four years later, provided for the improvement and clearance of large areas. Although powers were thus enacted for the whole range of housing activity — that is, for the inspection and closing or demolition or improvement of existing dwellings, the clearance and improvement of unhealthy areas and the provision of new accommodation as a public service — little nas done to put them into practice. The acts were complicated and permissive only and, especially in respect of compensation for the compulsory purchase of property. costly to operate. The Housing of the Working Classes act, 1890, which clarified and consolidated existing legislation, was designed to ease these difficulties and to encourage further clearance and building by local authorities.

Nevertheless, private enterprise was still regarded as the main source of supply of houses of all kinds. and local authorities built only about 5% of all dwellings up to World War I. The royal commission on housing. which reported in 1885. had taken evidence from many uho uere genuinely concerned about housing improvement but nho opposed subsidized municipal housing on the ground that it would pauperize the tenants. The prevailing political philosophy regarded the operation of a free economy as adequate incentive to ensure that supply mould meet demand.

However, by 1914 a great improvement had taken place in the condition of towns. Wages had increased, standards were rising and public health legislation had probably had more influence than the housing acts themselves As a result new residential districts were being built to a better standard. Frequently they were monotonous and ugly. and the minimum of the bylaws became the maximum of practice; but at least they were more sanitary, and the houses were better built and ventilated and received more daylight.

5. Town Planning and the Garden City Movement. — Already during the 19th century a few idealistic and humanitarian industrialists, anxious to improve the living conditions of their workers. sought to create for them a better environment by providing new homes within a planned community. Such new towns or villages were to be experiments in social improvement as well as in better housing conditions. By the end of the 18th century, Robert Owen was attempting something of the kind at New Lanark. Scot.. and James Silk Buckingham published an elaborate project for a new town in 1849. The first to go further in practice was Sir Titus Salt (*q.v*), a self-made Bradford woolen manufacturer. who built first a new mill and then new dwellings and community buildings around it for his labourers between 1853 and 1876. Near the turn of the century George Cadbury at Bournville, W. H. Lever at Port Sunlight and Joseph Rowntree at New Earswick were building new communities. In 1898 Ebenezer Howard published his book *Tomorrow:* a *Peaceful Path to Real Reform,* setting out the theory of the garden city, self-contained. with its own diverse industries and separated from other towns by a green belt. He and his friends propagated the idea through the Garden Cities association. Letchworth Garden city, founded by them in 1903, was the first practical result. (*See* also GARDEN CITY.)

As cheap passenger-transport services were developed. towns were able to extend at their fringe, and to secure that such development should be properly planned. the first Housing and Town Planning act was passed in 1909 Its main feature was the town planning section, which empowered local authorities to make a plan to ensure good layout of any land in course of development or likely to be used for building purposes Low-density development of houses at about 12 to the acre, as advocated by the garden-city movement. became the accepted standard.

6. Private Enterprise Houses and the Building Society Movement. — Although the lower-paid wage earner and casual labourer had to rely on rented housing. the needs of the rising lower middle class and skilled artisans could to an increasing extent be met by the purchase of houses for owner occupation. The growth of the building society movement helped the man with a little capital to acquire a house on mortgage. The Small Dwellings Acquisition act of 1899 empowered local authorities to make advances on favourable terms to assist individuals to purchase a house for occupation. These powers were later amended to keep pace with changing conditions.

7. World War I and the Beginning of Rent Control. — At the outbreak of war in 1914, in spite of the general improvement

in standards, house production had not kept pace numerically with need. The Rent and Mortgage Interest Restriction act, 1915, was passed to control the exploitation of the shortage of houses, particularly in the industrial touns and in centres of munitions manufacture, by fixing rents and giving tenants security against eviction. It also prevented increases in the rate of interest on mortgages and the calling in of mortgages.

During the war building ceased while the population continued to increase. But at the same time standards rose and popular opinion demanded better conditions for returning ex-servicemen.

8. The Interwar Period.—Housing Standards.—There had been little conscious attempt to set a standard for working-class housing before World War I, but a committee was appointed by the local government board in 1917 under Sir John Tudor Walters. Raymond (later Sir Raymond) Unwin, the architect and town planner, was a member, as mas Barry Parker of Letchworth Garden city. In a pamphlet, *Nothing* Gained by *Overcrowding*, and in his practice, Unwin advocated better layouts which took account of contours and natural features and used the cul-de-sac in place of gridiron planning; and these principles were embodied in the committee's report.

The Tudor Walters report also laid down standards of room sizes below which it was not considered desirable to build, and discussed plans for two-story houses with over-all floor areas varying from 755 sq ft. to 1,150 sq.ft. These standards were interpreted generously at first, and the building of parlour-type houses with two living rooms downstairs was encouraged immediately after the war.

Housing Subsidies.—The problem facing the postwar coalition government was how to provide dwellings quickly and cheaply at a time of high interest rates and high building costs with a disorganized and inadequate building industry. Rent restriction was prolonged by two acts of parliament in 1919 and 1920, which extended control to houses of higher ratable values but allowed a limited increase in rents.

Private enterprise could not compete on an economic basis with controlled rents, and for the first time government subsidies were made available to stimulate house building. The Housing and Town Planning act. 1919 (the Addison act), made local authorities responsible for supplying houses to meet the need in their areas. A subsidy was offered amounting to the whole of the annual loss on approved schemes or houses less the product of a penny rate—generous but leaving no inducement to local economy. Under this arrangement 176,000 houses were built, but costs rose and efforts to find more labour and alternative forms of construction largely failed. When the slump came two years later this subsidy was repealed and replaced by one limited to a fixed sum per house, although the amount was varied by acts of parliament in 1923 and 1924. Assistance was given in the form of a block grant for small houses built by private enterprise. Furthermore, by a "treaty" with labour in 1924, which convinced the building-trades unions that there would be a long-term program of house building. John Wheatley, minister of health in the Labour government. was able to encourage more men to enter the trade.

But prices had remained high and, with interest rates at about 5%, only skilled workers could afford the rents. Subsidies were regarded as one cause of high prices, and an attempt was made to remove them when unemployment in the building trade began to increase. They were, however, reinstated by a Labour government in 1929 in an attempt to bring rents down to what the lower-paid workers could afford. They were finally withdrawn for general-purpose housing in 1933 when costs had fallen, leaving only the slum clearance and overcrowding subsidies introduced in 1930 and 1935 respectively (see below).

Housing Societies.—Soon after the armistice of 1918, some societies were originated to provide new housing for the working classes or to improve or convert existing houses. These societies (legally termed associations) were recognized under the Housing acts provided that they conformed to certain rules, including the limitation of dividends on borrowed capital. They were in the tradition of the older charitable trusts and model-dwellings companies, some of which also undertook new building. Although not responsible for a numerically significant contribution to house production, they have frequently led the way in experimental work and have provided for special categories of persons, including large. poor families, families with a bad health record, old people, single people, etc.

Slum Clearance and the *Abatement* of Overcrowding.—Slums or, more precisely, dwellings unfit for habitation, although to be found mostly in the great cities, also exist in smaller towns, in rural communities and even among scattered cottages. They are houses in which the structure, accommodation and convenience are of an insufficient standard or which fall below the accepted minimum in respect of at least one of these requirements: houses which by reason of their layout are inadequately lit or ventilated; and houses which, while primarily suitable in themselves, have become slums through being let out in separate tenements without adaptation so that, for example, what was originally a dwelling for one family has come to be occupied by as many as four, five or more.

Although sanitary authorities had powers for dealing with unfit houses and unhealthy areas, by 1914 only 182 of them had taken any action, and their combined efforts from 1890 to 1913 inclusive produced 13,810 new dwellings. During World War I it was estimated that, in order to replace slums, 796,246 houses were needed in England and Wales and 115.565 in Scotland. Slum-clearance legislation passed soon after the war mas somewhat cumbersome and expensive to local authorities, and housing effort mas concentrated on the production of additional dwellings to overcome the shortage. The Housing act, 1930 (the Greenwood, or Slum Clearance, act), in order to encourage local authorities to clear slums and rehouse slum dwellers, provided a subsidy at a fixed rate per person rehoused, with special additional financial help for agricultural workers and for rehousing in flats on expensive sites.

The economic crisis in 1931 held up progress with slum clearance under this new act for the first year or two, but public opinion was by now again aroused. In 1929 the National Housing and Town Planning council had published its Policy for the Slums, and in 1931 a group of voluntary societies held the first New Homes for Old exhibition, presenting the facts about slum conditions. The Housing centre was inaugurated as a permanent organization for housing propaganda and information. In 1933, the minister of health initiated the antislum campaign with a five-year program for local authorities to clear 280,000 insanitary houses and replace them with nearly 300 000 dwellings. The program was extended to some 464,000 dwellings by 1938.

In 1935 the Overcrowding act was passed, setting a penal standard beyond which persons per room were not to be crowded and providing a subsidy for dwellings to abate such overcrowding. A national survey in 1936 showed 341,554 houses overcrowded out of nearly 9,000,000 inspected according to this standard, which was by no means a high one. In some boroughs and districts, particularly in northeast England, 20% and more of the dwellings inspected were overcrowded as compared with the national average of 3 8%. The London average was 7% and 9 out of the 28 metropolitan boroughs had between 10% and 17%. Orders making overcrowding a punishable offense were brought in to cover almost the whole country by 1939.

In 1938 the slum-clearance and overcrowding subsidies were brought into line with one another and paid on the basis of a fixed sum per dwelling, with a higher rate for flats.

Rural *Housing* and Reconditioning.—The Overcrowding act was the first act to offer a special subsidy for houses for agricultural workers, although previously local authorities had had powers under the Housing (Rural Workers) act, 1926, to give grants for the reconditioning of obsolete but structurally sound rural cottages. These grants remained in operation until after World War II although they were not extensively used.

House Production.—After World War I, house production was slow to get under way but was stimulated by the subsidies. It reached a peak in the year ending March 31, 1928, when 239.000 houses were built, of which 104,100 were subsidized houses built by local authorities and 74.600 were subsidized houses built by private enterprise. Production fell after 1928, and output by local

authorities did not again reach the 100.000 mark until the year before World War II.

Low building costs and interest rates, and a wide extension of lending by building societies giving favourable terms for house purchase by the owner-occupier, enabled private enterprise to increase production until by 1934 it was well over 200,000. Local authorities also increased their production as the antislum campaign gained momentum. Total annual production varied between 325,400 and 347,000 for the five years before the outbreak of war in 1939.

Altogether. between 1918 and 1939 about 4,000,000 new houses were built, of which about 1,500,000 were built by local authorities for letting and about 2,500,000 were built by private enterprise and sold mainly to owner-occupiers.

Although between World Wars I and II the shortage of houses had been reduced. the supply of dwellings to let at rents which the lower-paid tenant could afford was still insufficient to enable the Interdepartmental Committee on Rent Control. reporting in 1937, to recommend further general decontrol of rents, except of the more expensive rents of houses already subject to decontrol on vacant possession.

The majority of houses built by local authorities between World Wars I and II were of the three-bedroom non-parlour type with a superficial area of about 760 sq.ft., reductions in standards occurring in the 1920s and again during the economic depression early in the 1930s to meet the needs of tenants with a low rent-paying capacity, particularly those rehoused as a result of slum clearance. Nevertheless, the provision of a fixed bath was stipulated, and in 1924 it was laid down that this should be in a bathroom.

In London. Liverpool. Leeds and other big towns some rehousing took place in blocks of flats at comparatively high densities, most blocks being five stories high and without elevators. Such blocks were often laid out around asphalt courtyards and were dreary and barracklike. Nevertheless, experiments were made in providing amenities such as central hot water, water-borne refuse disposal, facilities for drying clothes, baby-carriage sheds, private balconies, clubrooms and children's playgrounds.

Town *Planning.*—This building activity, although relieving the housing shortage and improving general conditions, was called into question on the count that the new developments lacked urbanity and coherence. Sporadic, unplanned development round big cities resulted in waste of agricultural land, spoliation of natural beauties and danger from traffic. Closely associated with the physical shortcomings of housing estates were their social inadequacies. They were collections of houses, not communities; and many, although the size of small towns, were at first almost totally without churches, schools, shops and clubs.

Although another Town and Country Planning act had been passed in 1932. and a Restriction of Ribbon Development act in 1935, they were not very effective. London attempted to acquire a green belt of open land. and planning projects were drawn up to control development in many areas, but the cost of compensation where land had to be acquired for public purposes, or where development was adversely affected, restricted the effective operation of town planning proposals. The second garden city had been started at Welwyn in 1921 by E. Howard. and the city of Liverpool at Speke and the city of Manchester at Wpthenshawe had developed housing estates which were to varying degrees self-supporting in social amenities. But these were isolated examples The great cities, and particularly the London region, continued to attract population and industry, and the extension of electric suburban railways and motor traffic enabled more and more people to seek better living conditions on the periphery. Most local authorities built estates for rehousing slum dwellers on the edge of the built-up area, because redevelopment of the original sites at lower densities meant that feuer persons could be accommodated on them. The daily journey to work was costly and time-nasting and kept workers so long away from their homes that these outlying residential areas became mere dormitories.

9. Wartime and Immediate Postwar Policy.—On the outbreak of World War II rent control was again promptly imposed and covered almost all dwellings other than the most expensive (those of over £100 ratable value in London and of over £75 elsewhere) and nearly all those owned by local authorities. Civil building was generally stopped, and only some special housing and lodgings for key workers in war industry and agriculture were built during the next six years. Billeting (of civilian war workers, bombed-out families or women and children evacuated to safe areas) was relied upon to cope with the shifts in population caused by the war. Compulsory powers were available.

The situation in 1945 was not unlike that in 1919, and again the need and the popular demand was for additional houses for those who had lost their homes through the war or who had never had an opportunity of setting up homes. About 200,000 houses were totally destroyed by air raids, but about this number had been built during the six years of war. About 3,000,000 had received some war damage and 250,000 were so badly damaged as to be uninhabitable. The number of new households was estimated at about 550.000. The actual shortage in 1945 was estimated at between 750.000 and 1,000,000 dwellings, but this did not take account of any rise in standard, which in fact led to a much greater demand than had been expected.

The first attempt to meet the shortage was the mass production of temporary prefabricated bungalows, financed by and remaining the property of the state but managed by local authorities. By requisitioning and adapting empty houses, also as agents of the central authority, local authorities in badly war-damaged areas were able to add a little to the pool from which they could allocate tenancies. Both projects were someuhat costly to the exchequer. and neither could have any long-term effect. 'The first project was finished by the end of 1948, after 125,000 emergency bungalows had been provided. Requisitioning powers were brought to an end in 1955.

10. **The** Post-World War **II** Period.—For the main long-term contribution to post-World War II housing, national policy looked to local authorities to produce houses to let.

Between 1945 and 1952 control of all civil building was secured by a licensing system which gave priority to work considered to be of urgent national importance and restricted the building of houses by private enterprise according to number, size and price. Local authorities were provided with an allocation related to the resources of their area and the central authority was thus able to regulate output.

Subsidies.—By the Housing (Financial and Miscellaneous) Provisions act, 1946. subsidies were again made available to local authorities at higher rates to meet postwar costs, in the form of a fixed annual amount per dwelling borne three parts by the exchequer and one part by the rates. Although the amounts of subsidy were later varied somewhat, this form of financial assistance was adhered to until 1956, when the rates contribution was made optional

Under the Housing Subsidies act. 1956, the minister had power to vary or to abolish subsidies; thus by the end of that year the subsidy for general-purpose houses was withdrawn, but a reduced subsidy was retained for one-bedroom dwellings with the object of encouraging local authorities to build dwellings suitable for old persons. Subsidies were retained in respect to dwellings built for slum clearance or redevelopment and to accommodate overspill population from overcrowded and congested areas. Additional subsidies on a sliding scale were available for dwellings in blocks of flats of four or more stories or on expensive sites and for some other special cases. These provisions were consolidated in the Housing (Financial Provisions) act, 1958.

Nontraditional House *Construction.*—To counteract the shortage of skilled labour and of traditional building materials. alternative forms of building were sought. A number of these systems. using various concrete and steel constructions, were approved for local-authority housing work, and several hundred thousand dwellings of permanent nontraditional construction were completed. Some Swedish timber houses were imported and allocated to local authorities mainly in Scotland and northern England. There was a severe postwar shortage of building timber, and the amount used per house was rationed for a considerable period.

This led to the development of solid (concrete) ground floor constructions and systems which largely dispensed with soft wood. However, as supplies became normal, new systems of construction could not compete either economically or in popularity with the traditional brick two-story house.

Allocation of *Dwellings*.—In the first postwar years the local authorities were responsible for the letting of about four out of every five new permanent dwellings built and for the allocation of the licence for the other one. The ministry of housing advised local authorities when allocating to consider such things as the housing conditions of the family (*e.g.*, overcrowding, sharing, condition of dwelling); the number of dependent children; any special health needs; war service; etc. Authorities who introduced differential renting (see below) found it easier to observe these principles when letting their own dwellings. Also, in 1949 the Labour government removed the term "working-classes" from the Housing acts, thus making them apply to all sections of the population.

Houszng Management.—Already between World Wars I and II, as the number of council houses increased, more local authorities employed professional housing managers. The Society of Housing Managers (basing their training on the principles initiated by Octavia Hill and at first training only women) and the larger Institute of Housing together had by the 1960s about 1,500 qualified members, both men and women, trained to take responsibility for lettings, rent collection, repairs, supervision of estates and housing welfare and to advise on local housing needs and programs.

Private Enterprise and *Owner-Occupation*.—After 1952 a Conservative government gradually relaxed the licensing restrictions, and the proportion of private enterprise to local authority houses rose until in 1958 the former had outstripped the latter. In 1954 a joint-guarantee plan between the ministry, the local authorities and the building societies was designed to encourage owner-occupation of small houses. Local authorities were empowered to sell council houses to tenants in appropriate cases, but few authorities were in a position to reduce the numbers of houses available for letting in this way. The House Purchase and Housing act, 1959. made exchequer funds available to approved building societies with the object of encouraging the purchase and improvement of older houses for owner-occupation. Local authorities who already had been empowered to make bigger advances for house purchase by owner-occupiers were enabled by this act to lend even more freely. The sale by private enterprise of flats for owner-occupation also became popular.

During the 1930s, when the building of small houses by private enterprise for speculative sale had also enjoyed a boom period, some builders had been criticized for low standards of layout, design and construction. Before World War II the National House Builders' Registration council had been formed among reputable firms prepared to conform to a minimum standard. After the war awards made by the minister of housing for good design and layout of both private and municipal housing projects, in order to encourage the wider employment of architects for estate housing and a higher standard of taste among purchasers, contributed to better design.

Housing Societies.—During the immediate postwar years housing societies were discouraged by rent control from undertaking extensive new building. Nevertheless, several societies were set up in association with industry to build for key workers, and several self-build societies were formed, mainly among ex-service men, the members and their families working on the construction of a group of houses until sufficient numbers were completed to accommodate each member household.

Several large societies, sponsored by the government before World War II to supplement the work of local authorities in Scotland and the northeast of England, greatly increased their output. The Northern Ireland government set up a similar trust in 1945.

After 1954, when recognized housing associations were exempted from rent control, many undertook new programs, especially of new building and conversions for the elderly. Societies were eligible for the same subsidies from the exchequer as local authorities when they carried out housing for recognized purposes.

The Second Slum Clearance Program.—After World War II extensive slum clearance was again postponed until the acute shortage of dwellings had been met. Meanwhile the older dwellings, after minimum permissible maintenance during the war, deteriorated further. Repair costs had increased threefold, which, with the control of rents at 1939 levels, made adequate maintenance uneconomic. However, by 1954 nearly 2,000,000 new dwellings had been built and the shortage was easing in some areas. It was adjudged time for a shift in housing policy similar to that which had taken place in 1930. The Housing Repairs and Rents act, 1954, to encourage the replacement and improvement of old houses and the raising of standards of repairs, modified procedure regarding slum clearance and required local authorities to submit a preliminary five-year program. In 1955 returns showed 847,112 houses scheduled as slums, of which local authorities estimated that they could deal with 375,484 within five years. The 1954 act also made provision for the acquisition and temporary repair of slum and obsolete property for deferred demolition by local authorities.

Under the Housing acts as consolidated in the Housing act, 1957, which became the principal act, no dwelling may be let unless it is in all respects fit for habitation. There are four main types of procedure open to local authorities for securing the closure or demolition of unfit houses and the clearance and redevelopment of slum areas. (1) They may require a landlord, in the case of a single dwelling, to carry out specified work and in his default they may do the work and recover the cost. If it is deemed that the dwelling cannot be made fit at reasonable expense and no offer by the owner to do necessary repairs is made or accepted, the local authority must order the closing or demolition of the dwelling. (2) A whole area may be declared a "clearance" area if the dwellings in it are unfit or dangerous and unhealthy by reason of their bad arrangement, and if these conditions can be most satisfactorily remedied by the demolition of all the buildings. (3) A "redevelopment" area must contain a certain proportion of norking-class dwellings, at least one-third of which must be overcrowded or unfit, and the site must be redeveloped according to the local authority's plan, substantially for rehousing purposes. (4) "Comprehensive development" procedure, which allows for urban renewal on a wider scale, may be used to designate any area for *redevelopment* as a whole in order to deal satisfactorily with extensive war damage. obsolete development or any other purpose of the development plan drawn up by the planning authority under the Tonn and Country Planning act, 1947 (see Town Planning After *World War* **11**, below). Any person affected may appeal against these procedures. Compensation for compulsory acquisition of an unfit dnelling is normally payable for the site value only. plus an allowance for certain classes of owner-occupiers or business-occupiers. The local authority is responsible for rehousing tenants displaced by slum clearance and an exchequer subsidy is available toward the cost of new dwellings for this purpose.

Improvements and Conversions.—The Housing act, 1949, provided grants to landlords, owner-occupiers, local authorities and housing associations for the improvement, other than repair, of houses to bring them up to modern standards or for the conversion of larger houses or other buildings into two or more dwellings.

The House Purchase and Housing act, 1959, introduced new "standard" grants for the provision of standard amenities to improve old dwellings. These grants covered half the cost up to a maximum fixed figure in respect to a fixed bath or shower in a bathroom. a handbasin or lavatory, a hot-water supply, a water closet and food storage facilities, and could be claimed as of right under stated conditions.

Rents.—Between 1939 and the passing of the Housing Repairs and Rents act, 1954, there had been virtually no increase in permitted rents in spite of a more than threefold increase in repair costs The 1954 act allowed an increase of rents of rent-controlled houses up to a maximum figure related to ratable values, with the proviso that the landlord had to prove the expenditure of an

appropriate sum on repairs. Certificates of disrepair, which could be obtained from the local authority by the tenant of a badly maintained house, enabled him to withhold the original 15% rent increase allowed by the act of 1920 in respect to repair costs. The Labour party opposed the relaxation of rent control and proposed the compulsory acquisition of all rented dwellings by the local authorities; however, during 1957 a Conservative government passed a new Rent act introducing decontrol of higher rated dwellings and of all dwellings in vacant possession, and allowing for gradual increases in rents of all controlled houses within limits related to ratable values and conditions of tenancy. The effect of this act was delayed in some respects because landlords were encouraged to give three-year agreements to sitting (occupant) tenants and, by 1960, when the majority of such agreements expired, the shortage of higher-rented accommodation had been somewhat relieved except in London and several other large cities. To minimize exploitation in such areas the minister of housing approved compulsory purchase by the local authority of dwellings where exorbitant rents were being imposed.

After 1930 local authorities had powers to pool the subsidies which they received under different acts and provisions in a single housing revenue account, and to use them to fix rents according to the individual financial needs of the tenant. Some authorities introduced such projects during the 1930s to enable them to rehouse families with low incomes and a number of dependent children, who otherwise would have been unable to afford the rents of new houses. After 1945 full employment, children's allowances and other forms of welfare assistance greatly improved the rent-paying capacity of many tenants, but high building and maintenance costs, high interest rates and, after 1956, the withdrawal of the normal-needs subsidy resulted in high rents. Council houses had been let to tenants uith widely varying incomes according to housing rather than financial need. Local authorities were now therefore encouraged to rationalize their rents in order to avoid too wide a gap between prewar and postwar rents, and between rents of houses built with and without subsidy and at different periods when different interest rates prevailed. Many also introduced new differential rent plans based on a proportion of the income of the head of the household. income from other wage earners, lodgers, etc., and the number of dependent children.

11. Town Planning After World War 11,—The close association between housing and town planning had been realized when interwar town planning acts were passed to attempt to control the overgrowth of the great cities. National and regional planning of physical environment including the right location of new or existing industry were regarded as the key to the problem of the unplanned sprawl of the big towns. The reports of the Barlow commission on the Geographical Distribution of the Industrial Population (1940), of the Uthwatt committee on compensation and betterment and of the Scott committee on land utilization in rural areas (both 1942) together set up the principles for a national planning policy which was partially accepted as a basis for legislation.

The Town and Country Planning act, 1944, gave special assistance for the reconstruction of war-damaged areas. In 1947 a comprehensive Town and Country Planning act introduced a new principle to deal with the problem of compensation and betterment made necessary by town-planning action. This involved the acquisition of development rights of all land on behalf of the community and made all development subject to permission by the local planning authority. This act also required the preparation of development plans covering the whole country. Thus postwar housing development, wherever it took place, was subject to town planning control. The financial provisions covering development rights were, however, repealed in 1953, on the general grounds that they constituted a hindrance to development.

New Towns and Town Expunsion.—Even more significant in relation to housing policy was the New Towns act, 1946. empowering the minister to appoint development corporations and to designate sites for development as New Towns, with finance from public funds (see NEW TOWNS). During World War II an advisory plan for central London by J. H. Forshaw and Sir Patrick Abercrombie, and a plan of Abercrombie for the greater London region, both recommended the development of New Towns, for which sites were suggested. By the early 1960s development was well under way in 15 New Towns, 8 of them being in the London region, 3 in Scotland, 1 in Wales and 1 in the midlands. Further New Towns for the relief of towns in the north and midlands were under consideration.

By Dec. 1960 the New Towns in England and Wales had completed about 80.000 dwellings, but London and the big cities were still crying out for sites where surplus population could be settled. At the same time many small country towns, finding it difficult to maintain the standards expected of a modern community. could well absorb families from congested areas. Under the Town Development act, 1952, agreements could be made by means of which a large, overgrown local authority could promote housing development in another authority's area and could provide financial and technical assistance. The exchequer could make grants toward major expenditure on water and sewerage services; the county council could also assist. The higher rates of subsidy for rehousing overflow population from congested areas were continued after the repeal of the general housing subsidy in 1956, and exporting authorities could make a rates contribution in respect of applicants nominated by them as tenants of such town expansion programs.

In spite of this decentralization, employment opportunities, particularly in office work, multiplied in the big conurbations, which became increasingly congested with traffic. Town planners looked to comprehensive redevelopment to rehabilitate obsolete urban areas. London, Birmingham and other big towns undertook construction of many such projects. The redevelopment of the Barbican area in the City of London, with housing, amenity open spaces, offices and community buildings and with segregation of traffic, was an outstanding example.

12. Design of Dwellings and Neighbourhood Planning.—After World War II the standards of accommodation and design for council houses were based on recommendations of a government advisory committee (the Dudley committee) in their report, The Design of Dwellings, published in 1944, which advocated larger, better-built and better-equipped houses and flats. In spite of several economies made to prevent greatly increased building costs there was a marked improvement in postwar dwellings, and particularly in their heating and hot-water systems and kitchen and sanitary fittings. Many tenants could also afford better furnishings; and some installed their own modern cookers, washing machines, refrigerators, etc., often by means of hire purchase, or installment buying.

Most postwar housing took the form of two-story single-family houses of about 900 sq.ft., in pairs or terraces, although later more multistory flats and maisonettes, or apartment buildings, were used, especially for central area redevelopment, frequently in conjunction with two-story houses and four-story maisonettes for larger families and even with bungalows for old persons.

Before the war town planners had evolved a theory of neighbourhood planning. somewhat obscure in origin, but brought into prominence in England by the analysis of existing communities in the two London advisory plans and the suggestions made in them for new development. The size and space requirements of neighbourhoods were analyzed also in the Dudley report, and this principle was adopted as a guide in most postwar residential areas.

During the interwar years, a movement for the provision of community centres in residential areas had arisen to counteract the lack of social and cultural facilities in the new districts. Although immediately after World War II licences for such building were severely restricted, more estates were planned with local centres and interesting experiments were made in providing for social and communal services.

The increase in the use and ownership of motorcars concentrated attention on garaging, parking and traffic considerations in the design of layouts. Pedestrian shopping precincts and groups of dwellings planned with footpath access segregated from traffic became experimental features in some new towns and redevelop-

ment areas. Some authorities planned for one car to each household, even on low-cost estates.

Greater attention was also paid to the landscaping of housing areas and the provision of play space for children.

13. **New** Problems. — The *1951* census showed an excess of households over dwellings of about *1,169.000.* Despite the building of 2,478,000 new dwellings in the next *10* years, bringing the total of dwellings in Great Britain to about *15,750,000* by *1961,* it was estimated that *1,500.000* dwellings would still be needed within the next *20* years to provide for new households. The *1961* census showed that overcrowding had decreased markedly and it was a serious problem only in a few areas and in isolated cases. The fragmentation of the population into small households, and the economic and social conditions which enabled the large number of aged to live as separate households, increased the demand for small dwellings suited to their needs. The movement of people within the country and to a lesser extent immigration from overseas concentrated pressure for accommodation disproportionately on the London and southeastern regions and to some degree on other big city regions.

About *4,000,000* dwellings were enumerated in *1951* as being without certain amenities and it has been estimated that over *4,000,000* existing dwellings had been built before *1881.* Between *1945* and *1960, 350,000* unfit houses were cleared and more than 1,000,000 persons rehoused. The rate of slum clearance increased after *1956* and *60,000* dwellings were cleared in *1960.* More than *318,000* dwellings were improved or converted with assistance under the Housing acts between *1945* and *1960,* by which time work under the *1959* act was just beginning to gather momentum.

Total production between *1945* and *mid-1961* was about *3,835,000* new permanent dwellings, *2,569,000* erected by public authorities and *1,266,000* by private enterprise.

The rise in income levels and full employment reduced the number of housing difficulties due to poverty except in a hard core of problem families. But old persons, too. found difficulty in meeting the rent of a modern dwelling out of an old age pension or small fixed income, despite supplementary pensions in aid of rent, which assisted many. This meant that the aged were often left behind in low-rent slum areas, so that small. suitable dwellings were especially needed when redevelopment took place.

Several social surveys emphasized the interdependence of different members of the extended family, particularly that of mothers and daughters. Young couples moving to newly developed areas missed the practical and moral support of their parents in the early years of marriage and the bringing up of children. Conversely these young persons were anxious about elderly parents left behind in the old central areas.

Until after World War II Britain was predominantly a country of single-family dwellings of two or at most three stories. The greater space requirements for the redevelopment of overcrowded central areas after *1945* necessitated the building of multistory blocks of flats and maisonettes with elevators besides the rehousing of part of the population outside these areas. The high flats created certain new social problems, in particular that of providing for children's play.

Large old houses in obsolete districts often fell into the hands of landlords who exploited them. In large industrial centres, particularly, immigrant workers frequently obtained lodgings in such houses at scarcity rents which they could ill afford. with the result that the houses became overcrowded. Provisions for ensuring proper management of houses in multiple occupation were included in the Housing act of *1961.*

By *1960* local authorities were building mainly for slum clearance. overspill population and for old-age pensioners; and private enterprise was increasing the output of houses and flats for owner-occupation. There was still a need for modern dwellings for those in the middle-income range. including those better-off single and elderly persons who neither needed nor qualified for subsidized accommodation but who were unable or unwilling to purchase. The Housing act of *1961* envisaged the expansion of the housing-association movement, and provided a special government loan to finance the building of dwellings to let at economic rents to meet the needs of such persons.

This act also introduced a new principle for allocating subsidies to local authorities. Those authorities with limited financial resources for housing would receive subsidy at a higher rate than those whose potential income from rents was already high. It was hoped that this would encourage authorities to introduce differential rent systems, so that those households most in need would benefit to a greater degree from the subsidies.

B. British Commonwealth and Republics of South Africa

In the earlier years of European settlement in most of the British Commonwealth countries, the traditional single-family house was adapted to local conditions. For the most part densities were low, as there was no shortage of land. Urbanization and increasing populations led to the need for planned housing policies during the 20th century; thus in the larger towns of Canada, Australia and New Zealand more flats were built. Government agencies in these countries provided mortgages to assist owner-occupiers. Low-rental public-housing developments, particularly in relation to slum clearance, began mainly after World War II.

In Africa the influx of native workers into urban areas to obtain employment in mines, factories, etc., led to the mushroom development of shanty towns which rapidly deteriorated into slums owing to the temporary nature of the buildings and the lack of adequate services. In some territories housing authorities were set up to build simple dwellings for renting and to provide financial assistance to encourage home ownership and self-build programs. Extensive building was undertaken in the Republic of South Africa after World War II to house detribalized African workers in segregated communities.

In India. after independence, five-year programs envisaged the building of modern housing units. The second program included *1.000.000* such units in assisted projects and *800,000* in private projects.

Pakistan. with its housing situation aggravated by large-scale immigration of displaced persons. also planned for the settlement of refugees on agricultural Iand and for a number of satellite towns.

In Singapore and Hong Kong, where the need was extremely urgent, housing trusts and authorities produced large estates of multistory dwellings. Similar trusts or government agencies in the West Indies and other smaller communities built for letting, or gave assistance toward home ownership.

In many cases officers were appointed who had had experience in public-housing administration in Britain. The management principles of the Society of Housing Managers and of the Institute of Housing were adapted to the needs of overseas development and native workers were trained to take over in the fields of administration. management, town planning and building.

Methods of house construction varied widely according to the climate and indigenous materials of the different territories. In comparatively temperate areas, such as parts of Canada, Australia and New Zealand, more or less traditional constructions were used (although including more timber than in the United Kingdom); however, dwellings in Africa were very simple structures, sometimes of concrete blocks. and with special attention paid to the need for ventilation. In Hong Kong, where an enormous population was concentrated in a limited area and immigration had been very rapid, density standards even of new dwellings were among the highest in the world. (M. C. Br.)

V. OTHER EUROPEAN COUNTRIES

The housing situation in continental Europe varies widely in quantitative and qualitative aspects. Housing shortage and overcrowding result in the first place from the failure of house building to keep pace with growing populations and the rate of urbanization. Urban housing levels, compared with the other essential components of standards of living. are lower in those countries which were industrialized earlier and which have a high proportion of obsolete dnellings in industrial areas. Nevertheless, taking Europe as a whole, rural areas have a higher proportion of sub-

5. Housing at Crawley, Sussex, England, one of the areas around London designated as a new town to relieve industrial overcrowding in London
6. Le Corbusier's "Vertical Community" in Marseille, France. It was designed to house more than 1,500 persons and included community centres, shops, playgrounds and a post office

standard dwellings lacking in amenities than do the towns.

Public responsibility for housing standards and production developed in most western and central European countries toward the end of the 19th and the beginning of the 20th centuries. In some countries the principal agencies for home building for the lower income groups have been co-operatives or housing associations, for example in the Scandinavian countries, the Netherlands. Belgium and Germany. In others, for instance in Austria between World Wars I and II, municipalities built and rented dwellings. Private enterprise also played a big part both in building for owner-occupation and for renting, mainly for the higher-income groups, and has sometimes been assisted by special tax concessions, mortgage guarantees and similar measures.

Between the two wars, in most continental cities in western and central Europe, low-cost housing was built in flats and although the popularity of the single-family house was marked, living in flats was accepted as normal. Nevertheless, development of low-density housing on garden-city lines took place extensively. Much thought was also devoted to the development of low-cost flats at fairly high densities. In Austria the municipality of Vienna erected blocks of dwellings, at first arranged around large central courtyards, provided with facilities such as laundries, nurseries, schools, etc. In France a water-borne system of refuse disposal was first used and after World War II the French architect Le Corbusier received world-wide acknowledgment for the bold conception of one large high building containing dwellings and communal facilities designed to a standard module; this first "United Habitation" was erected outside Marseilles. German layouts generally took the form of slab blocks, orientated to give the best aspect to every dwelling and allowing greater openness than the earlier courtyard layouts. In Scandinavia almost all building by the co-operatives was of flats, although Sweden developed a self-build program for smaller houses. particularly in the suburbs of Stockholm where many single-family timber houses were built (*see* also *Trends in World Housing,* above). These countries were also pioneers of the tower block.

A survey by the United Nations Economic Commission for Europe of the housing situation, published in 1956, gave a general picture of housing shortage, including some information about the condition and equipment of dwellings. This same survey attempted some classification according to basic services, such as electricity. inside running water and bath, showing a generally higher standard in the Scandinavian countries, the United Kingdom, Ireland, Switzerland, western Germany and the Netherlands, although an assessment of obsolescence among dwellings showed that France and the United Kingdom contained a higher proportion of obsolescent housing than other European countries for which information was available.

In spite of greater interwar activity, no European country could boast a fully adequate housing stock at the outbreak of World War II. All suffered from the lack of building during the war years, and war damage resulted in great losses in some countries and districts.

By 1955 the over-all housing situation had improved, and since then in most countries in northern and central Europe the rate of output has been stabilized at approximately prewar levels.

HOUSING AND BUILDING LAWS. The object of housing lams is to protect the health and safety of the community by fixing minimum standards for the construction and maintenance of buildings.

Housing laws, as distinguished from building laws, are concerned with prescribing standards for buildings used for habitation. Such laws apply to existing buildings and require that they con-

form to minimum standards of sanitation, maintenance and habitation, even though the structure as originally built did not conform to this standard.

Building laws are designed to achieve minimum standards in new construction as well as in the alteration of existing buildings. These laws apply not only to housing but to industrial and commercial buildings as well. In general, they deal with basic construction, electric and plumbing installations, and fire prevention. Housing and building laws are not mutually exclusive, and their provisions may overlap.

Historically, building regulation may be traced back to the rudimentary fire-protection ordinances of the Romans, with a succession of similar legislation such as the English regulations of Henry Fitz-Elwyne, dating from about 1189, the several statutes in the 17th and 18th centuries pertaining to the City of London and the early ordinances in New Amsterdam in 1648. Modern building laws reflect the impact of the great urbanization of the 19th century which focused attention on the need for legislation to assure the preservation of safety and health.

United States.—Housing Laws.—The growth of cities in the U.S. brought about a concentration of population, swelled by the large immigration of the 19th century. With this concentration came the tenements, and with the tenements came the squalor so vividly portrayed by Jacob Riis in How the Other Half Lives (1890). Then came the New York Tenement House law of 1901—a pioneer effort to meet the onslaught of the slums.

In their modern context, housing laws are one element in the over-all attack against urban blight sought to be achieved by total community planning. The National Housing act of 1949, as amended, has stimulated an eagerness by communities to adopt housing laws. This eagerness derives from the need to meet the requirements under the act for a "workable program" to eliminate slums and thereby be eligible for federal grants and loans (42 *U.S.C.*, sec. 1451(c), as amended).

Though there are instances of state-wide housing laws (*e.g.*, Michigan and New York), normally such legislation is the product of the local municipal government. The general pattern is to define those dwellings falling within the ambit of the law; to fix standards for such matters as space and occupancy, sanitation, safety, heating and electricity; and to provide procedures for enforcement. Definitions are important in that the specific standards applicable to different types of occupancy must be clearly stated. Because of the special problems regarding transient accommodations such as hotels, lodginghouses, rooming houses and boarding houses, these are often given special treatment, including provision for licensing. Standards for space and occupancy are designed to avoid the overcrowding of dwelling units. An illustration of this type of regulation is the requirement prescribing the minimum floor area and air space lor sleeping units, depending upon the number of occupants and their ages.

Sanctions for enforcement vary from fines and imprisonment to demolition in the case of dwellings unfit for habitation or dangerous for occupancy. As to the latter, enforcing officers are authorized to order the building to be vacated and also to order the making of repairs as well as the demolition of the building, with power to carry out the order if it is not obeyed.

These rights of the enforcing officer derive from the legal doctrine of nuisance and the power of the sovereign authority to abate nuisances (Miller v. Foster, 244 Wis. 99, 153 A.L.R. 845). A necessary element in enforcement procedure is the power to make inspections of buildings, a provision usually found in housing laws.

In U.S. law, with the constitutional requirement of due process (*q.v.*), the legal justification for regulatory measures dealing with housing derives from the police power of the state to enact legislation for the common welfare. "At the point where economic self-interest ceases to be a sufficiently potent force for the promotion of the general welfare, or, indeed, becomes a force which may actually injure the general welfare, the Legislature may intervene and require that buildings intended for use as . . . multiple dwellings shall conform to minimum standards which may reasonably be regarded as essential for safe, decent, and sanitary dwelling places" (Adamec v. Post, 273 N.Y. 250, 255). Furthermore, singling out existing buildings for special treatment (*e.g.*, new fire regulations for lodginghouses though they complied with the law when originally constructed) does not necessarily transgress constitutional guarantees against deprivation of property without due process of law or necessarily create an invidious distinction that is contrary to the constitutional guarantee of equal protection of the laws; there may be ample justification in the facts for such special treatment (Queenside Hills Realty Co., Inc. v. Saxl, 328 U.S. 80).

Building Laws.—These laws, commonly called codes, though prescribing standards for new construction and embracing nondwelling structures as well as those used for dwellings, are as important a component as housing laws in the workable program for the control of blight.

The general pattern of administration and enforcement is to require the approval of building plans before beginning construction; to provide for the issuance of a permit allowing the project to go forward if the plans are found to comply with code requirements and for the inspection of the work during the period of construction; to sanction the issuance of "stop-orders" if inspection reveals violations; and to authorize the issuance of a certificate of occupancy upon final completion in accordance with code requirements. These preventive measures are usually coupled with punitive sanctions for willful violations of the code.

On the substantive side, the code may describe the particular materials or construction that are to be employed in a given situation. Alternatively, in accord with the modern trend, the code may use the so-called functional principle and indicate a standard of performance to be achieved, thus allowing greater flexibility in the use of new materials made available by technological advances. An illustration of a functional requirement would be that a certain column shall have a fire-resistance rating of not less than a certain number of hours in accordance with a recognized testing procedure. The use of recognized standards reduces the necessity of manufacturing several items serving the same function in order to satisfy the rigid requirements of different codes. As standards are changed or new ones developed, it is important that there be no lag between the sanctioned procedures of the community and those that have been accepted by disinterested groups. These legislative lags, however, are an ever-present problem, particularly where the functional principle is not employed.

There are several complete codes that have been prepared by private groups as models for enactment by local municipalities, and several states have enacted legislation which permits municipalities to adopt such codes by reference. This practice relieves a municipality from complying with any state law requirement that makes publication of a proposed ordinance a prerequisite for its enactment—a costly procedure, considering the bulkiness of most codes; in the absence of state legislation allowing such adoption by reference there may be questions under state law regarding the legality of this procedure.

The question of legality may arise, however, wherever the adoption by reference includes the possibility of amendments to the code that may be made by the municipality in the future (City of Tucson v. Stewart, 45 Ariz. 36, 96 A.L.R. 1492). A few states (*e.g.*, New Jersey, New York and Connecticut) have initiated their own programs for a model code available for adoption by municipalities within the state.

England.—Legislation respecting housing that is unfit for habitation is covered in the Housing act, 1957, which enumerates the particular matters to be taken into account in determining fitness. These embrace collectively, safety, plumbing and sanitation, and facilities for storage and the preparation of food, with a special part of the act devoted to overcrowding. Local authorities are required to make periodic inspections to ascertain if houses are unfit for habitation.

Similar to G.S. housing laws, provision is made for ordering repairs and for the demolition and closing of houses. If, upon appeal to a court or judge, it is determined that a repair which has been ordered cannot be made at a reasonable expense the local authority, if so empowered by the minister of housing and local government, may compel the owner of the house to sell it

to the authority, in which event the latter must carry out the repairs. There are similar provisions for compulsory sale in lieu of a demolition or closing order if it appears that the house "can be rendered capable of providing accommodation which is adequate for the time being . . ." (s. 17).

By the Public Health act, 1936, local authorities outside of London may adopt building bylaws which, together with the act itself, control the construction and alteration of buildings. The matter of adopting bylaws is not wholly optional; the minister of housing and local government may require a local authority to make bylaws, and if it fails to do so after a lapse of three months, the minister himself may make such laws. Bylaws must include certain matters specifically set forth in the act; these cover, in general, items of construction and items pertaining to sanitation. Bylaws cease to have effect after ten years unless extended by the minister of housing and local government. Model bylaws issued by the ministry of housing and local government adopt the functional principle described above in connection with U.S. codes. Local authorities, in addition to the right to take measures for the collection of fines, may require an owner to remove any construction that contravenes a bylaw or to make appropriate alterations. In addition to the Public Health act of 1936, the planning requirements of the Town and Country Planning act. 1947, also has an impact on building operations. The administrative county of London is governed in the matter of building not by the Public Health act, 1936, but by a series of acts collectively known as the London Building acts, 1930–1939, with their appropriate bylaws.

Scotland.—By the Building (Scotland) act, 1959, local authorities have a uniform building code. Provision is made for building standards to be established by regulations of the secretary of state after consultation with the building standards advisory council. The standards may employ the functional principle. Certificates of completion are provided for, similar in function to the certificate of occupancy in U.S. codes.

Canada. — Building codes are matters within the jurisdiction of the provincial and municipal governments. A National Building code. issued under the auspices of the associate committee on the national building code (National Research council, Ottawa) is purely advisory. The code includes a part devoted to housing accommodations. with standards for heating, room heights: plumbing and windows.

A survey of several local U.S. housing laws is contained in *Provisions of Housing Codes* (Urban Renewal Bulletin No. 3, Housing and Home Finance Agency, Urban Renewal Administration, 1956). For a description of the "workable program" under the National Housing act of 1949, as amended, see *Program for Community Improvement* (Housing and Home Finance Agency).) (B. H. G.)

HOUSMAN, ALFRED EDWARD (1859–1936), English scholar and poet, best known as a writer of lyrics expressing an elegiac pessimism in strikingly simple form, was born on March 26, 1859. at Fockbury, Worcestershire. He was educated at Bromsgrove school (1870–77) and was a scholar (1877–81) and afterward honorary fellow of St. John's college. Oxford. After leaving Oxford he held a post in H.M. patent office till he was appointed professor of Latin at Cniversity college. London, in 1892. In 1911 he was made a fellow of Trinity college. Cambridge. and professor of Latin in that university. His chief publications. besides many papers in classical journals (see *A* List of *Adversaria,* Cambridge, 1926) are editions of *Juvenal* (1905), *Manilius* (I. 1903; II, 1912; III. 1916; IV, 1920; V, 1930) and *Lucan* (1926); two volumes of lyrics. A *Shropshire* Lad (1896) and Last Poems (1922); and a lecture. The *Name* and *Nature* of Poetry (1933).

As a scholar Housman invites comparison with Richard Bentley for learning. ingenuity and controversial vigour. He led the attack on superstitious fidelity to the "best manuscript" and "palaeographicalprobability," and brought to the defense of common sense in scholarship an armoury of sarcastic wit which helped to make him the most widely feared of contemporary scholars. It was not these powers, however, nor the range. depth and unfailing accuracy of his learning, but the strength and keenness of his intellect, that gave to his work its quality of greatness and to him his claim to pre-eminence in the world of scholarship.

As a poet Housman appealed to a larger public. The popularity of *A Shropshire* Lad grew slowly but so surely that *Last Poems* had an immediate success greater than that of any other book of poetry published in England during the century. The poems are enjoyed by those readers whose interests are not literary because the language is simple and the verse melodious and the thought is easily understood; they are admired by critics because they are flawless in taste and execution and possess a quality both in their form and in their feeling which it is equally vain to imitate and to seek elsewhere in literature: they are as romantic as ballads. as classical as the Greek anthology. The poems number little more than 100; about a third are written in the character of a country boy exiled in London; they deal with the vicissitudes of friendship, the passing of youth, the beauty and the cruelty of nature, and the vanity of human wishes.

Housman died on April 30. 1936. By his will he permitted his brother. Laurence. to publish such of his unpublished poems as appeared not inferior in merit to his other works; and in Oct. 1936 a volume appeared under the title *More Poems*. These verses did not alter, for better or worse, Housman's reputation as a poet; but, like two books of reminiscences by his brother—*A. E. H.* (1937)—and his publisher, Grant Richards—*Housman 1897–1936* (1941)—they partially threw aside the veil of reserve which had hidden Housman's personality during his lifetime. The best account of Hcusman's life and his work is that contained in A. S. F. Gow's *A.* E. Housman (New York, Cambridge, 1936).

HOUSSAY, BERNARDO ALBERTO (1887– (J. Sp.)), Argentine physiologist and Nobel laureate, was born on April 10, 1887, in Buenos Aires. Houssay was a precocious child: he enrolled in the Colegio Británico at the age of 9 and was an intern in a hospital at 13. Appointed to the faculty of the University of Buenos Aires in 1907, he was given the chair of physiology of the faculty of medicine in 1919. He was dismissed for political reasons in 1943, and although he was reinstated shortly afterward, he was asked to resign in 1946. He founded the privately endowed Institute of Biology and Experimental Medicine in Buenos Aires in 1944 and served as its director. In 1955 he was again appointed professor and director of the physiological institute of the university.

Houssay's researches demonstrated that the hormone secreted by the anterior lobe of the pituitary gland prevents the metabolism of sugar, and that the injection of pituitary extract induces symptoms of diabetes. His work in this area won him. jointly with C. F. and G. T. Cori, the Nobel prize for physiology in 1947. In addition to hundreds of .research reports, he wrote a comprehensive text of physiology, Human Physiology (1951).

HOUSTON, SAM or SAMUEL (1793–1863), American general and statesman, of Scotch-Irish descent, was born near Lexington, Va., on March 2, 1793. His father, who had fought in the Revolutionary War, died in 1806, and soon afterward Samuel moved with his mother to the frontier in Blount county, Tenn. When he was about 15 his elder brothers obtained for him a place

as clerk in a trader's store, but he ran away and lived with the Cherokee Indians of east Tennessee for nearly three years. On his return he opened a country school, and later attended a session or two of the academy at Maryville. During the War of 1812 Houston served under Andrew Jackson against the Creek Indians

In 1817 he was appointed subagent in managing the removal of the Cherokees from east Tennessee to a reservation in what is now Arkansas, but he was offended at a rebuke from John C. Calhoun, then secretary of war, for appearing before him in Indian garments, as well as at an inquiry into charges affecting his official integrity, and he resigned in 1818. He entered a law office in Nashville. and was admitted to the bar. From 1823 to 182; Houston represented the 9th district of Tennessee in congress, and in 1827 was elected governor of the state by the Jackson Democrats.

He married Eliza Allen in Jan. 1829. His wife left him three months later, and he resigned his office of governor, again took up his residence among the Cherokees. who were at this time about to remove to Indian territory, and was formally adopted a member of their nation.

In 1830 and again in 1832 he visited Washington to expose the frauds practised upon the Cherokees by government agents. Commissioned by President Jackson, Houston went to Texas in Dec. 1832 to negotiate treaties with the Indian tribes there for the protection of American traders on the border. He decided to remain in Texas, and was elected a delegate to the constitutional convention which met at San Felipe on April 1. 1833, to draw up a memorial to the Mexican congress. This memorial asked for the separation of Texas from Coahuila, in which the anti-American party was in control, and framed a constitution for the commonwealth as a new member of the Mexican republic. In Nov. 1835, soon after the outbreak of the War for Texan Independence, he was chosen commander in chief of the Texan army. On April 21, 1836, while in command of 743 raw troops, he met on the bank of the San Jacinto about 1.600 Mexican veterans led by Santa Anna and completely routed them; on the next day Santa Anna was taken prisoner.

Texan independence was won by this victory and Houston was elected president of Texas, Sept. 1, 1836. His term expired in Dec. 1838; he was elected again in 1841 and served until 1844. During his first term a newly founded city was named in his honour and this was the seat of government in 1837–39 and in 1842–45. Texas having been admitted as a state of the American union in 1845, Houston was elected one of its first two U S. senators. He served as a stalwart Union Democrat from 1846 until 1859; he opposed the Kansas-Nebraska bill in an able speech and spoke frequently in defense of the rights of the Indians. In 1859 he aas elected governor of Texas and tried to prevent the secession of his state. Upon his refusal, in March 1861, to swear allegiance to the Confederacy he was declared deposed. He died at Huntsville, Tex., on July 26, 1863.

Houston was an able soldier, wary, intrepid and resolute; and was a legislator of rare foresight, cool discrimination and fearless candour.

Creel, *Sam Houston, Colossus in Buckskin (1928)*; *M*. James, *The Raven: the Life of Sam Houston* (1929).

HOUSTON, an inland port city of southeastern Texas, U.S., and seat of Harris county, is located on the Gulf coastal plain and linked by the Houston Ship channel to the Gulf of Mexico, 52 mi. S.E., at Galveston (*q.v.*). One of the nation's principal industrial cities and a world port, Houston is a leading oil and petrochemical centre, manufacturer of oil-field equipment and the focal point for networks of pipelines carrying natural gas. Its corporate limits of 352 sq.mi. surround 14 of 23 cities in Harris county, its standard metropolitan statistical area. Its principal suburbs are Bellaire. Pasadena, West University Place (*qq.v.*) and Galena Park. Annual normal rainfall is 45.37 in. and annual normal temperature is 70° F. The climate is mild but humid. Houston's average altitude is 54 ft.

History. — Houston was planned as a real-estate promotion. Harrisburg. which became part of Houston in 1926, was laid out in 1826 for John Richardson Harris, who is believed to have named the town for Harrisburg, Pa. (which was founded by and named for his great-grandfather) as well as for himself. Mexican forces burned Harrisburg five days before the battle of San Jacinto (April 21, 1836) in which Gen. Sam Houston led Texans to victory and independence from Mexico. Land speculators, among them Augustus C. and John K. Allen. eyed the Harrisburg area with interest. It mas early seen that Buffalo bayou, a tidewater stream extending through the present site of the city about 45 mi. E. to the San Jacinto river. would become valuable as a means of access to the rich agricultural lands along the Brazos.

The Allens tried to buy the Harrisburg property, but its title was involved in fraudulent claims against the estate of Harris, who had died in 1829; therefore. they chose a site 12 mi. farther up the bayou at the most interior point of navigation in Texas. Harrisburg was rebuilt after the battle of San Jacinto and although its site was in some ways superior to Houston's it lacked promoters with the Allens' skill. The brothers bought the Houston town site on Aug. 24 and 26, 1836, and shrewdly named the town for the flamboyant Texas hero. Four days later they advertised their proposed town using the phrase "One Million Dollars." in capital letters, in the advertisements. But it was not until October that Moses Lapham, a surveyor, staked out the town.

In October also! when Houston was still an unoccupied town site, John Allen made a proposal to the congress of the Republic of Texas (of which he was a member) meeting at Columbia to move the seat of government to Houston, and he promised to build a capitol. The Texas congress voted accordingly to move the capital temporarily to Houston and the Allens, having made their site the republic's capital before the town existed, began building in fact what had succeeded in fancy. They sold the first lots in Jan. 1837; the government moved to Houston in May of that year before the building to house it was finished; and the city was incorporated in June.

Houston was the capital of the republic until Jan. 1810. and was briefly the capital again in 1842. Muddy and beset by recurring epidemics of yellow fever, the town grew slowly until the Civil War. When the Civil War began. its citizens voted overwhelmingly for the secession of Texas from the United States. The town became a lair for blockade runners and on Jan. 1. 1863, using two small vessels fortified with bales of cotton. an amphibious attack was mounted by Houstonians down Buffalo bayou to help recapture Galveston Island which had been seized by Federal forces three months earlier. In the same year Houston became the headquarters for the Confederate district of Texas, New Mexico and Arizona. The period of Reconstruction lasted from June 20. 1865, when Houston was occupied by Federal troops, until Jan. 1874. Houston's growth between Reconstruction and World War I came largely as a result of its importance as a railroad centre.

Houston's beginnings arose from the battle of San Jacinto. Though its people suffered to some extent from the Civil War and much more from the period of Reconstruction. Houston prospered and grew for the first time into a substantial municipality. It took a decisive lead in its long competition with Galveston after the Galveston flood and tidal wave of Sept. 8, 1900, in which an estimated 6.000 lives were lost and nearly half of the city was destroyed. The greatest proportional growth of the city's population, 111.4%, came in the 1920s largely as a result of the impetus given by World War I, and the most important period in its history was the decade following World War II.

Industrial and Commercial Growth. — Houston owes its remarkable growth in the 1940s and 1950s to its industrial complex. This consists of the ship channel, abundant natural resources (petroleum. natural gas. sulfur, lime. salt and water) and the fact that the product of one chemical plant is often the raw material of another. This combination. created on the banks of the ship channel, is one of the world's greatest concentrations of petrochemical industries which are dependent on the by-products of

oil refining. By the 1960s Houston became a pre-eminent example of the new urban U.S. caused by the economic impetus of World War II and the increased postwar migration of rural people to cities.

The shift in the city's character is shown by two contrasting popular names: the first was current between Reconstruction and the depression of the 1930s: the second in the period following o r l d War 11 Houston called itself the "Magnolia city" until the 1920s, when industry had effaced the magnolias and other natural beauty on Buffalo bayou, the lower part of which became the ship channel. After World War II. but not from its own conception, the city was called the "Land of the Big Rich." This name, which became a liability, was a fanciful allusion to Houston's supposed prevalence of oil millionaires.

No period in the city's history approaches the importance of the World War II era prior to which Houston was an ambitious medium-sized city. A few years afterward, its former hopes lying in the shadow of sudden and preposterous growth, the city was altered in character, aspirations and appearance. Since the 1920s Houston has given the impression of being continually new; nothing old was allowed to exist for long. No historic structures were preserved except the Noble house, built in the 1840s. The city showed little concern for its history until 1954 when a society was formed to preserve any remaining evidence of the past. Houston is a restless city spread across grazing land, and is one of the largest cities in the U.S. without a zoning ordinance, a notable lack caused by the individualism of its people.

The metropolitan area alone, which has seven oil refineries, was producing nearly 80,000 bbl. of oil daily in the late 1950s. when oil rigs were within a few yards of South Main street and the city was receiving oil royalties from wells drilled at the city garbage dump. Two major oil companies and hundreds of small ones have headquarters in Houston. most of whose downtown skyscrapers were either built by petroleum or banking interests. The city is the geographic and financial centre of the Texas Gulf coast region. In the 1960s most of the nation's sulfur deposits. nearly 7% of its petroleum reserves and about 11% of its refining capacity were located in a 19-county area surrounding Houston. An estimated three-quarters of the nation's petro-chemical production was also coming from the Texas Gulf coast area. Shipbuilding, an integrated steel mill, tool and oil-field equipment. paper mills. synthetic rubber, cement; grain elevators: tile milling. cottonseed oil. paints, furniture. breweries and food processing are other important aspects of Houston's industry. In 1961 the National Aeronautics and Space administration established a research. development and astronaut-training centre near Houston.

It was a paradox that Harris county. which is hundreds of miles from the state's chief cattle-raising areas. and despite the great industrial and commercial expansion of the Houston metropolitan area. had more cattle than any other county in Texas in the 1950s. Irrigation made the county a rice producer of importance; about 28% of the nation's rice is grown within a 100-mi, radius of Houston, and the city is one of the world's leading spot cotton markets.

The *Port of Houston and* the *Houston Ship* Channel.—The histories of the port, which is virtually devoid of the colour and romance of most U.S. ports, and the ship channel are one. In 1837 the first steam vessel of size succeeded in reaching a boat landing at Houston. Within two years steamboats were making daily runs between Houston and Bolivar roads at the entrance to Galveston harbour. The improvement of the Buffalo bayou channel was begun in 1839 with funds raised by public subscription and lotteries. The first local dock was built in 1840 and the Port of Houston was established by city ordinance in 1841. Widening and deepening of the channel was begun in 1869 and continued in the 1960s. by which time the minimum depth of the channel was 36 ft. and the minimum width was 300 ft: The port handles more than 50,000,000 tons of foreign. coastwise and internal canal shipping annually and is linked with the Gulf Intracoastal waterway.

Population.—Though the reality of Houston is obscured by the myth of its millionaire legend, it is primarily a city of working people. They came in mass during World War II—40,000 to the shipyards alone—and most remained. Unlike the state, whose population growth was mainly due to natural increase, Houston grew more from people moving in from the rest of Texas and from other states. Its population differs from that of most U.S. urban areas, having proportionally fewer industrial craft workers and more professional, technical and white-collar workers. The difference is caused by automation and the technical nature of three of the four dominant industries: processing oil, natural gas and petrochemicals. These, especially the latter, require fewer but more highly-trained workers than other industries. The proportion of total employment to capital investment in making chemicals is small compared, for example, with making steel or automobiles. The comparatively high pay received by workers in the three industries has caused Houston to have fewer apartments and more houses than older U.S. cities of comparable size.

Germans, immigrating to Texas in great numbers in the 19th century, once dominated Houston's population and continue to be a major element. In 1960, one-fifth of the population was Negro and nearly one-twelfth was Mexican. Many traders, scientists and executives were drawn to the city from other countries, first by cotton and later by oil and chemicals. Though the city's heritage is southern, the southwest gradually became dominant in its character in the first half of the 20th century. Houston's gusto in the 1950s was epitomized by "M Day," as July 3, 1954, was called. Statisticians divined ahead of time that the city's metropolitan population would reach 1,000,000 on that date and a festival was staged to welcome the millionth citizen. Houston's population was 2,396 at the first federal census of 1850, 16,513 in 1880, 44,633 in 1900, 78.800 in 1910, 138,276 in 1920, 292,352 in 1930 and 384,514 in 1940; in 1950 (of city), 596.163 (of standard metropolitan statistical area), 806,701; in 1960 it was 938,219 and 1,243.158 respectively.

Culture.—The chief aspects of the city's cultural life were the Houston Symphony orchestra (1913), a grand opera company, three chamber music groups of distinction, a contemporary music society (founded by Leopold Stokowski), three professional theatres operating the year round and two art museums. The older museum, the Houston Museum of Fine Arts, became an example of architectural excellence when a new wing, designed by Ludwig Mies van der Rohe, was opened in 1958. The city is notably lacking in parks, but the nearness of the Gulf of Mexico. the bay shore area and Lake Houston make it a centre of sailing, boating and fishing. The principal colleges are Rice university (nonsectarian. 1912). the University of Houston (1934), Texas Southern university (Negro, 1947), University of St. Thomas (Roman Catholic, 1947). Baylor university college of medicine and the University of Texas school of dentistry. Except for one hospital, the site of the Texas Medical centre was a forest within the city in 1946. At a cost of more than $50.000.000. most of which was paid by oil and cotton philanthropies, one of the nation's leading medical, research, educational and hospital centres was established there.

The San Jacinto battleground on the banks of the ship channel is a state park 22 mi. S. of Houston. It is the site of the San Jacinto monument, 570 ft. high, and the permanent berth of the battleship "Texas."

The city's most gifted leader was Will C. Hogg, a son of former Texas Gov. James Stephen Hogg, who in 1926 organized the Forum of Civics. Hogg, an altruist and a man of great wealth, died too soon to fulfill his dreams for the city. The city's most effective leaders in the first half of the 20th century were Jesse H. Jones, secretary of commerce and head of the Reconstruction Finance corporation under Pres. Franklin D. Roosevelt, and Oscar F. Holcombe. mayor for 11 two-year terms between 1920 and 1956.

See George Fuermann, *Houston: Land of the Big Rich* (1951).

(G. M. F.)

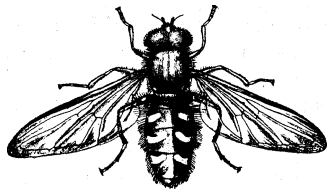
HOVE, a municipal and parliamentary borough in East Susses, Eng.. adjoining Brighton (*q.v.*) on the west. Pop. (1961) 72.843. Area 6.2 sq.mi. During the 19th century Hove became the most exclusive toun on the Sussex coast and the lawns on the sea front were among the most fashionable parade grounds in England. It

is a well laid out residential and seaside holiday town with the Sussex county cricket ground in its centre.

The name seems to be connected with an Old English word *hufe* meaning "shelter" and a settlement existed at Hove at the time of the Roman invasion.

HOVER FLY, any member of the family Syrphidae of the order Diptera (*q.v.*); one of the largest and most populous families of. flies, distinguished by the presence of a spurious vein between the third and fourth longitudinal veins. They are of great importance in the control of aphids and the pollination of flowers; a few are injurious. Other names are flower flies, sweat flies, sweat bees. syrphids and drone flies. They mostly visit flowers, but a few genera, such as *Microdon*—the larvae of which live in the nests of ants and termites—rarely do and they are poor fliers. Almost all others are able to hover for long periods. The larvae of many genera are predaceous upon aphids or plant lice, mealy bugs, etc., often destroying several hundreds during their brief existence; there may be several generations each year; larvae of *Pipiza* and allies attack woolly aphida. and in England feed upon American blight (*Eriosoma lanigerum*), which was introduced on the roots of American elm and causes serious damage to apple trees.

The larvae of some species of Cheilosinae feed under the bark of living trees; the most injurious species is the bulb fly, *Merodon equestris,* which pores into the bulbs of various cultivated flowers. It originated in Europe and is now common in parts of North America.



FROM c H CURRAN INSECTS OF THE PACIFIC WORLD" (THE MACMILLAN COMPANY)

A species of *Syrphus,* the larvae *dl* which are predaceous in Aphids

The lesser bulb flies (*Citabaena* or *Eumerus*), also of European origin, are found in various bulbs and corms of cultivated plants, including onions. but they are secondary and cause no damage. The truly aquatic larvae have a long, telescopic breathing tube which they extend to the surface of the water; the semiaquatic ones, living in tree holes and wet decaying vegetation, have a short, stout posterior breathing tube; some live under bark and may be predaceous. A few live in garbage, others in cacti; still others in pollen collected in the axils of leaves of corn, etc. *Volucella* bombylans lives in the nests of bumblebees, other species live in the nests of other bees and wasps. Many of the adults are banded with yellow and both resemble and act like wasps. even going through the stinging motion; the sweat bees are a small, banded species that are attracted by perspiration; they do not sting or bite. The long, slender species of Baccha like wooded and garden areas. The drone fly resembles honeybees, as do many others, and it was believed by the ancients to be one; it is almost cosmopolitan. More than 200 species occur in the British Isles. some of which are quite rare, others very common; they come out on the first warm days of spring and fly until frost.

See G. H. Verrall, British *Flies,* vol. viii (1901); P. Sack, "Syrphidae" in Lindner, *Fliegen Palaerkt.* Reg. *(1928--32).* (C. H. CN.)

HOWARD, the name of a famous English family of which the duke of Norfolk, premier duke and hereditary earl marshal of England, is head, while the earls of Suffolk, Carlisle and Effingham and the Lord Howard of Glossop and Lord Stafford represent in the peerage its younger lines.

The founder of the family was a lawyer, William Howard or Haward of East Wynch, Norfolk, who was summoned to parliament as a justice in 1295 and appointed a justice of the common pleas in 1297. William Howard's eldest son. Sir John Howard. served in Edward II's wars in Scotland and Gascony. was sheriff of Norfolk and Suffolk and governor of Norwich castle. When he died in 1331 he was seised of many Norfolk manors. His son and heir, another Sir John, admiral of the king's navy in the north, was a banneret who displayed his banner in the army that laid siege to Calais. By the admiral's wife Alice, sister and heir of Sir Robert de Boys, the Howards had the Boys manor of Fersfield, near Diss, which is still among the possessions of the dukes of Norfolk. His son Sir Robert Howard, who had married a daughter of Sir Robert Scales (Lord Scales), died before his father in 1388. From Sir John Howard, the only son of Sir Robert, two branches of the house of Howard sprang. The elder line was soon extinct. By his first wife, Margaret, daughter and heir of Sir John Plays, Sir John Howard had a son who died before him, leaving a daughter who married John de Vere, 12th earl of Oxford, and through whom descended to their issue, the Veres. earls of Oxford, the ancient Norfolk estates of the Howards at East Winch and elsewhere with the lands of the houses of Scales. Plays and Walton, brought in by the brides of her forefathers. By'his second wife, heir of the Tendrings of Tendring, Essex, he had a second son, Sir Robert Howard, a knight who fought under Henry V in France, and died, like his half-brother, before the old knight's career ended in 1436 in Palestine.

Robert Howard married Margaret Mowbray, daughter of Thomas Mowbray, 1st duke of Norfolk. Their son John (c. 1430–85) eventually, on the death of the 4th duke's daughter Anne, inherited the lion's share of the Mowbray estates and by a patent of June 28, 1483, was created duke of Norfolk and earl marshal of England with a remainder to the heirs male of his body (see NORFOLK. EARLS AND DUKES OF; MOWBRAY).

The eldest of the cadet branches of the ducal house has its origin in William (c. 1510–73), eldest son of the 2nd duke by his second marriage (see HOWARD OF EFFINGHAM, WILLIAM HOWARD, 1st Baron). William's eldest son, Charles (1536–1624), was lord high admiral and commanded the fleet which defeated the Spanish Armada (see NOTTINGHAM, CHARLES HOWARD, 1st Earl of). On the death of the 3rd earl of Nottingham in 1681 Sir William Howard of Lingfield. younger brother of the great admiral, carried on the Effingham line, his great-grandson succeeding to the barony on the extinction of the earldom. Francis, 7th Lord Howard of Effingham, was created earl of Effingham in 1731, a title extinct in 1816 with the 4th earl, but revived again in 1837 for the 11th baron. who had served as a general officer in the Peninsular campaign. Henry (1540–1614), eldest son of Henry Howard, earl of Surrey, and brother of the 4th duke of Norfolk, was created earl of Northampton in 1604, but the title died with him (see NORTHAMPTON, EARLS AND MARQUESSES OF).

Thomas (1561–1626), son of the 4th duke of Norfolk's marriage with the daughter and heir of 'Thomas, Lord Audley of Walden, founded the line of the present earls of Suffolk and Berkshire and of the extinct Lords Howard of Escrick. His barony of Howard of Walden has descended to his heirs general. Another son. Lord William Howard, married in 1577 one of the three co-heirs of the Lord Dacre of Gillesland. His great-grandson Charles Howard was created. in 1661, earl of Carlisle. Viscount Howard of Morpeth and Baron Dacre of Gillesland, titles which are still held by his descendants (*see* CARLISLE, EARLS OF). From Sir Francis Howard, a Cavalier colonel and a younger son of "bauld Willie," come the Hon-ards of Corby Castle in Cumberland, a branch without a hereditary title.

William Howard (1614–80), Viscount Stafford, was the fifth son of Thomas, earl of Arundei. Marrying the sister and heir of the 5th Lord Stafford. who died in 1637, he and his wife were created Baron and Baroness Stafford by a patent of 1640. with remainder, in default of heirs male, to heirs female. A grant of the precedence enjoyed by the bride's father being held illegal. he was in 1640 created Viscount Stafford. Roger Stafford, cousin of the 5th Lord Stafford and heir of the ancient Staffords, had been forced to surrender his barony in 1639. The viscount, accused by Titus Oates. was sent to the Tower in 1678 and beheaded in 1680. He was beatified in 1929. In 1688 his widow was created countess of Stafford for life, and his eldest son, Henry, had the earldom of Stafford. with special remainder to his brothers. This earldom ended in 1762. but the attainder was reversed by an act of 1824 and in the following year Sir George Jerningham, the heir general, established his claim to the Stafford barony of 1640.

See G. Rrcnan and E. P. Statham, *House of Howard;* 2 vol. (1907).

HOWARD, BRONSON CROCKER (1842–1908), U.S. playwright, considered during the last years of his life the leading U.S. dramatist! was born in Detroit, Rich., Oct. 7, 1842, the son of the Detroit mayor, Charles M. Howard. After schooling in

Detroit and at Russell's institute in New Haven, Conn., he began his career as a playwright with *Fantine* in 1864. In New Uork city. between 1865 and 1870, Howard worked on various newspapers while striving to have his plays produced. *Saratoga* was produced in 1870 by Augustin Daly at the Fifth Avenue theatre and was an immediate success, having a run of 101 nights. In 1873 *Lillian's Last Love* was unsuccessful in Chicago, but, rewritten and produced as *The Banker's Daughter* at Palmer's Cnion Square theatre, New Uork, in 1878, it enjoyed a good run. After another success, *Young Mrs. Winthrop* (1882), his *One* of Our *Girls* (1885) began a run of 200 nights at the Lyceum theatre. *The Henvietta,* a melodrama of business tycoons, ran 68 weeks at the Union Square theatre, beginning in 1887. Howard's most popular play was *Shenandoah,* on a Civil War theme, written in 1888. Produced under Charles Frohman's direction in New York, it was popular for years throughout the Cnited States and Europe.

Bronson Howard wrote few plays. concentrating on quality. He founded and was first president of the American Dramatist's club! which later became the Dramatists' guild of the Authors' League of America. He led a successful campaign to overhaul the national copyright laws. He died Aug. 4, 1908. (S. W. H.)

HOWARD, CATHERINE: *see* CATHERINE (Catherine Howard).

HOWARD, JOHN (1726–1790), English philanthropist and prison reformer, was born at Hackney, London, probably on Sept. 2, 1726. Howard inherited considerable property on his father's death and decided to travel. He was on his way to Portugal in 1754 when the ship was taken by a French privateer, the crew and passengers being carried to Brest, France, where they were treated with great severity. Howard was permitted to return to England on parole to negotiate an exchange. He settled at Cardington, Bedford, interesting himself in meteorological observations, and was admitted a member of the Royal society in 1756. In 1773 he became high sheriff of Bedford and paid visits to the jail. Howard found it, like all the prisons of the time, wretchedly defective in its arrangements; neither the jailer nor his subordinates were salaried officers, but were dependent on fees from prisoners. He found that persons were detained in prison for months for no reason except that they could not pay the fees of jail delivery. His prompt application to the justices for a salary to the jailer in lieu of his fees mas met by a demand for a precedent in charging the county with an expense, but he could find no precedent. In 1774 he gave evidence before a committee of the house of commons, and almost immediately an act was passed which provided for the liberation, free of all charges, of every prisoner against whom the grand jury failed to find a true bill, giving the jailer a sum from the county rate in lieu of the abolished fees. This was followed by another act requiring justices of the peace to see that the walls and ceilings of prisons were scraped and whitewashed once a year at least; that the rooms were regularly cleaned and ventilated; that infirmaries were provided for the sick, and proper care taken to get them medical advice; that the naked should be clothed; that underground dungeons should be used as little as possible; and generally that such courses should be taken as would tend to restore and preserve the health of the prisoners. In 1777 appeared *The State of the Prisons in England and Wales, with Preliminary Observations, and an Account of Some Foreign Prisons.* One result was the drafting of a bill for the establishment of penitentiary houses, where, by means of solitary imprisonment accompanied by well-regulated labour and religious instruction, the object of reforming the criminal and inuring him to habits of industry might be pursued. New buildings were manifestly necessary; and Howard volunteered to go abroad and collect plans. He first went to Amsterdam (1778) and carefully examined the spinning houses and rasp houses, where prisoners were set to useful work; next he traversed Prussia, Saxony, Bohemia, Austria and Italy. The information he thus obtained was presented to parliament, and a bill was passed for building two penitentiary houses; Howard was appointed first supervisor, but he resigned the post before anything practical had been achieved. In 1780 he had published an appendix to his *State of Prisons,* and in 1784, a second appendix. The remaining years of his life were devoted to researches on the means for prevention of the plague and for guarding against the propagation of contagious diseases in general. He inspected prisons of the United Kingdom in 1787, and prepared his *Account of the Principal Lazarettos in Europe* (1789). In 1789 he traveled to St. Petersburg and Moscow, visiting the principal military hospitals that lay on his route. At Kherson he contracted a disease and died on Jan. 20. 1790.

See publications of the Howard League for Penal Reform.

HOWARD, OLIVER OTIS (1830–1909), U.S. soldier, was born in Leeds, Me., on Nov. 8, 1830. He graduated from Bowdoin college, Brunswick, Me., in 1850, and from the U.S. military academy in 1854. At the beginning of the Civil War he resigned to become colonel of a Maine volunteer regiment and at the first battle of Bull Run was in command of a brigade. He served in the Peninsular campaign, and at the battle of Seven Pines (Fair Oaks) he was twice nounded, losing his right arm. On his return to active service in Aug. 1862, he took part in the Virginian campaigns of 1862–63; at Antietam he succeeded Sedgwick in command of a division, and he became major general of volunteers in March 1863. In the campaign of Chancellorsville *(see* WILDERNESS) he commanded a corps which was routed by "Stonewall" Jackson, and in the first day's battle at Gettysburg he was for some hours in command of the Union troops. Howard's corps was transferred to Tennessee after Rosecrans' defeat at Chickamauga, and formed part of Hooker's command in the victory of Chattanooga. When Sherman prepared to invade Georgia in the spring of 1864 Howard was placed in command of a new corps, and took part in the actions of the Atlanta campaign, receiving another wound at Pickett's mills. On the death in action of Gen. James B. McPherson, Howard was selected to command the army of the Tennessee in July 1864. In this position he took part in the "March to the Sea" and the Carolinas campaign.

Howard served as commissioner of the bureau of refugees, freedmen and abandoned lands from 1865 until 1874; in 1872 he was special commissioner to the hostile Apaches of New Mexico and Arizona; in 1874–81 he was in command of the department of the Columbia and conducted the campaign against Chief Joseph in 1877 and that against the Bannocks and Paiutes in 1878. In 1886 he was promoted to major general, and in 1894 he retired. Howard was deeply interested in the welfare of the Negroes; and the establishment by the U.S. government in 1867 of Howard university, at Washington, D.C., especially for their education, was largely due to him; it was named in his honour, and from 1869 to 1873 he presided over it. In 1895 he founded for the education of the "mountain whites" the Lincoln Memorial university at Cumberland Gap, Tenn. He died at Burlington, Vt.. Oct. 26, 1909. He wrote, among other works, *Donald's Schooldays* (1877); *Chief Joseph* (1881) ; a life of Gen. Zachary Taylor (1892) in the "Great Commanders Series"; *Isabella of Castile* (1894) ; *Fighting for Humanity* (1898); *Henry in the War* (1898); papers in the "Battles and Leaders" collection on the Atlanta campaign; My *Life* and *Experience Among our Hostile Indians* (1907); and *Autobiography of O O. Howard* (1907).

HOWARD, PHILIP (in religion THOMAS) (1629–1694), cardinal of Norfolk, a Dominican who restored the English province of the order, was born in London on Sept. 21, 1629, into the ducal house of Norfolk. He was brought up a Roman Catholic, although the head of the house had been an Anglican since 1613, and became a Dominican at Cremona, Italy, at the age of 16 against the wishes of his family. Thereafter he directed all his energies to reconverting England to the Roman Catholic Church and to restoring the English Dominican province.

Howard was ordained priest in 1652, and in 1673 he became prior of the new Dominican house he had founded at Bornem, Flanders, to house the remnant of the former English province then exiled on the continent. In the reign of Charles II he was made grand almoner to the queen, Catherine of Braganza, but an outbreak of Puritan violence drove him back to Flanders. After being created cardinal by Clement X in 1675, he lived in Rome, where his cardinalitial church was Sta. Maria sopra Minerva. In 1679 he was made cardinal protector of England and Scotland. He died in Rome on June 18, 1694.

His literary remains consist of letters, which are of no small interest to historians. These were edited by B. Jarrett in *Publications of the Catholic Record Society,* vol. xxv (1925).

HOWARD, SIR ROBERT (1626–1698), English dramatist, sixth son of Thomas Howard, 1st earl of Berkshire, was born in 1626. He was knighted at the second battle of Newbury (1644) for his signal courage on the Royalist side. Imprisoned in Windsor castle under the commonwealth, his loyalty was rewarded at the Restoration, and he eventually became auditor of the exchequer. His best play is a comedy, *The Conzmittee, or the Faithful Irishman* (1663; printed 1665), which kept the stage, long after its interest as a political satire was exhausted, for the character of Teague, said to have been drawn from one of his own servants. He was an early patron of Dryden, who married his sister, Lady Elizabeth Howard; and in the *Indian Queen,* a tragedy in heroic verse (1664; printed 166j), Howard had assistance from Dryden, although the fact was not made public until the production of Dryden's *Indian Emperor.* The magnificence of the spectacle made a great sensation. In 1665 Howard published *Foure New Plays,* in the preface to which he opposed the view maintained by Dryden in the dedicatory epistle to *The Rival Ladies,* that rhyme was better suited to the heroic tragedy than blank verse. Howard made an exception in favour of the rhyme of Lord Orrery, but by his silence concerning Dryden implicated him in the general censure. Dryden answered by placing Howard's sentiments in the mouth of Crites in his own *Essay on Dramatic Poesy* (1668). The controversy continued, but Dryden worsted his adversary in the 1668 edition of *The Indian Emperor.* Howard died on Sept. 3, 1698.

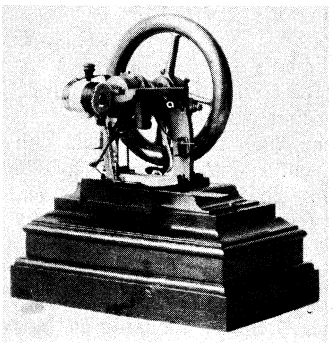
HOWARD, SIDNEY COE (1891–1939), U.S. playwright and author, was born in Oakland. Calif., on June 26, 1891. He graduated from the University of California, Berkeley, in 191j and during the next year worked under George Pierce Baker at Harvard university. During World War I he served with the American ambulance corps and was later a captain in the U.S. air corps. He served on the editorial staff of *Life,* 1919–22, and in 1923 was a feature-story writer for Hearst's *International Magazine.* In 1922 he was married to Clare Eames. the actress. Among his plays are *Swords* (1921); *Casanova* (1923); *They Knew What They Wanted* (1924), which won a Pulitzer prize in 1925; *Lucky Sam McCarver* (192j); *The Silver Cord* (1926); *The Late Christopher Bean* (1932); *Alien Corn* (1933); *Yellowjack* (1934); an adaptation of Sinclair Lewis' novel *Dodsworth* (1934); and *Madam, Will You Walk* (1939). He died in an accident at Tyringham, Mass., Aug. 23. 1939, at a time when he was dramatizing Carl Van Doren's *Benjamin Franklin.* He translated and adapted European dramas and published a volume of stories. *Three Flights Up* (1924).

HOWARD OF EFFINGHAM, CHARLES HOWARD, 2ND BARON: *see* NOTTINGHAM, CHARLES HOWARD, 1ST EARL OF.

HOWARD OF EFFINGHAM, WILLIAM HOWARD, 1ST BARON (*c.* 1510–1573), English lord high admiral, was the son of the 2nd duke of Norfolk (d. 1524). At Anne Boleyn's coronation he was deputy earl marshal. In 1541 he was charged with abetting his relative Queen Catherine Howard and was convicted of misprision of treason, but pardoned. In 1552 he was made governor of Calais, and in 1553 lord high admiral, being created Baron Howard of Effingham in 1554 for his defense of London in Sir Thomas Wyat's rebellion against Queen Mary. He befriended the princess Elizabeth, but his popularity with the navy saved him from Mary's resentment; and when Elizabeth became queen he filled various important posts. His son, the and baron, the victor over the Armada, was created earl of Nottingham (*q.v.*); and from a younger son the later earls of Effingham were descended.

HOWE, ED(GAR WATSON) (1853–1937), U.S. editor, novelist and essayist, was born at Treaty, Ind., on May 3, 1853. He went to work at the age of seven on his father's homestead near Bethany, Mo. An apprentice printer at 12, he worked at the trade in Missouri, Iowa, Nebraska and Utah (1867–72). At 19 he was publisher of the *Golden* (Colo.) *Globe* and in 1877 founded the *Atchison* (Kan.) *Daily Globe,* made famous by frequent reprinting of his paragraphs throughout the U.S. His first and most successful novel, *The Story of a Country Town* (1883), was the first realistic novel of midwestern small-town life. He published and edited *Howe's Monthly* (1911–33) and wrote essays, travel books and an autobiography, *Plain People* (1929). He died Oct. 3, 1937.

HOWE, ELIAS (1819–1867), U.S. sewing-machine inventor, was born in Spencer, Mass., on July 9, 1819. As a boy he worked on his father's farm and in his gristmills and sawmills, taking particular interest in the machinery. After learning the machinist's trade he conceived the idea of a sewing machine and for five years spent all his spare time in its development. In Sept. 1846 a patent for a practical sewing machine was granted to him; and Howe spent the following two years (1847–49) in London, employed by William Thomas, a corset manufacturer, to whom he had sold the English rights for £250. Years of disappointment and discouragement followed before he was successful in introducing his invention, while several other machines, particularly that of Isaac Merrit Singer (*q.v.*), had already been introduced and were widely used. Howe's rights were established after much litigation in 1854, and thereafter until the expiration of his patent in 1867 he received royalties on all sewing machines made in the U.S. He died in Brooklyn, N.Y., on Oct. 3, 1867.



BY COURTESY OF SMITHSONIAN INSTITUTION

ONE OF THE EARLY SEWING MACHINES INVENTED BY ELIAS HOWE. IN THE U.S. NATIONAL MUSEUM, SMITHSONIAN INSTITUTION, WASHINGTON, D.C.

(W. E. HD.)

HOWE, HENRY MARION (1848–1922), U.S. metallurgist, whose *Metallography of Steel and Cast Iron* (1916) was the most learned and authoritative work on the subject up to that time, was born in Boston, Mass., on March 2, 1848. The son of Samuel Gridley Howe and Julia Ward Howe, he attended Boston Latin school, Harvard college and Massachusetts Institute of Technology. His industrial experience covered the years 1872–85 in the copper and the steel industries. Four of his books, *Copper Smelting* (1885), *The Metallurgy of Steel* (1890), *Metallurgical Luboratory Notes* (1902) and *Iron, Steel and Other Alloys* (1903), written during his academic career as lecturer at M.I.T. (1883–97) and professor of metallurgy at Columbia university (1897–1913), brought him awards and honours from German, French, Swedish, British, Russian and United States scientific and technical societies and from the French and Russian governments. He was the author of many technical papers and the consulting metallurgist for the national bureau of standards and took an active and leading part in the affairs of technical societies. He died at Bedford Hills, N.Y., on May 14, 1922. (F. B. F.)

HOWE, JOHN (1630–1706), English Puritan minister, was born on May 17, 1630, at Loughborough, Leicestershire, where his father was vicar. He studied at Christ's college, Cambridge, became fellow and chaplain of Magdalen college, Oxford, and held a Devonshire curacy. In 1657 Howe became domestic chaplain to Cromwell. In this position his conduct was such as to win the praise of even the bitterest enemies of his party. Without overlooking his fellow Puritans, he was always ready to help pious and learned men of other schools. Seth War (afterward bishop of Exeter) and Thomas Fuller were among those who profited by Howe's kindness, and were not ashamed subsequently to express their gratitude for it. On the resignation of Richard Cromwell, Howe returned to Great Torrington, to leave it again in 1662 on the passing of the Act of Uniformity. For several years he led a wandering and uncertain life, until he found a home with Lord Massereene, of Antrim castle, Ireland, with whom he lived for five or six years as domestic chaplain. Here he produced the most eloquent of his shorter treatises, ***The*** *Vanity of Man as*

Mortal, and On Delighting in God, and planned his best work, The Living *Temple.* In 1676 he became joint pastor of a nonconformist congregation at Haberdashers' hall, London; and in the same year he published the first part of *The* Living Temple, entitled Concerning God's Existence and his *Conversableness with Man:* Against Atheism or *the Epicurean* Deism.

For five years after his settlement in London Howe enjoyed comparative freedom, and was on not unfriendly terms with many eminent Anglicans, such as Stillingfleet, Tillotson. John Sharp and Richard Kidder; but in 168j he left England with Philip, Lord Wharton. In 1656 he determined to settle for a time at Utrecht. where he officiated in the English chapel. Among his friends there was Gilbert Burnet, who introduced him to William of Orange. In 1687 Howe returned to England. He died in London on April 2, 1706. Richard Cromn ell visited him in his last illness.

HOWE, JOSEPH (1804–1873), Canadian statesman, was born at Halifax. Nova Scotia. on Dec. 13 1804. the son of John Howe (1752–1835), a United Empire Loyalist who was for many years king's printer and postmaster general for the Maritime Provinces and the Bermudas. In 1827 he started the Acadian, a weekly nonpolitical journal, but soon sold it, and in 1828 purchased the *Nova* Scotian, which later became amalgamated nith the Morning Chronicle. In 1836 he was elected member for Halifax in the provincial assembly, and during the next twelve years agitated for responsible government for Nova Scotia. This brought him into conflict with the lieutenant governor. Lord Falkland (1803–1884), whom he forced to resign. Responsible government was finally conceded in 1848 by the imperial authorities. In 1850 he was sent to England on behalf of the Intercolonial railway, for which he obtained an imperial guarantee. In 1854 he resigned from the cabinet, and was appointed chief commissioner of railways.

From 1860 to 1863 he was premier of Nova Scotia. Though his eloquence had done more than anything else to make practicable a union of the British Korth American provinces, he opposed confederation, but finally entered (on Jan. 30, 1869) the cabinet of Sir John Macdonald as president of the council. In May 1873 he was appointed lieutenant governor of Nova Scotia, but died suddenly on June 1 of the same year.

His Letters and Speeches were published in 1858 in Boston, Mass., in 2 vols., edited nominally by William Annand, really by himself. See also Public Letters and *Speeches* of Joseph Howe (Halifax, 1909). The Lije and Times by G. E Fenety (1896) is poor The Life by the Hon James W Longley (Toronto, 1904) is dispassionate, but otherwise mediocre. Joseph Howe, by George Monro Grant (reprinted Halifax, 1904), is a brilliant sketch.

HOWE, JULIA (nie WARD) (1819–1910), U.S. author and lecturer. best known for her "The Battle Hymn of the Republic," was born in New York city, May 27, 1819. and died in Newport, R.I.. Oct. 17, 1910. The daughter of Samuel Ward, New York banker, she was educated by private tutors in music and languages, continuing these studies during her long life. In 1843 she married Samuel Gridley Howe of Boston, Mass., reformer and teacher of the blind. The "Battle Hymn" was first published in the Atlantic *Monthly,* Feb. 1862. Moved by the economic plight of Civil War widows, Mrs. Hotve worked for equal education, professional and business opportunities for women. She was the author of travel books, biography, drama and verse and a composer of songs for children. She combined social gifts with executive ability, was a founder of women's clubs and equal suffrage organizations. Widowed in 1876, she contributed to the support of her children by lecture tours.

See Laura E. Richards and Maud Howe Elliott, Julia Ward Howe; *1819–1910* (1916); Louise Hall Tharp, Three Saints and a Sinner (1956). (L. H. T.)

HOWE, RICHARD HOWE, EARL (1726–1799), British admiral who commanded the channel fleet at the battle of the First of June (*q.v.*) was born in London on March 8, 1726. He entered the navy in 1740, saw much active service and was rapidly promoted. In 1755 he went with Edward Boscawen to North America as captain of the "Dunkirk" (60 guns), and his seizure of the French "Alcide" (64) was the first shot fired in the war. From that date till the peace of 1763 he served in the English channel in various more or less futile expeditions against the coast of France, with a steady increase of reputation as a firm and skillful officer. On Nov. 20, 1759, he led Hawke's fleet as captain of the "Magnanime" (64) in the victory of Quiberon.

By the death of his elder brother, killed near Ticonderoga on July 6. 1758, he became Viscount Howe—an Irish peerage. In 1762 he was elected M.P. for Dartmouth. During 1763 and 176j he was a member of the admiralty board, and from 1765 to 1770 mas treasurer of the navy. In that year he was promoted rear admiral, and in 1775 vice-admiral. In 1776 he was appointed to the command of the North American station. The rebellion of the colonies was making rapid progress, and Howe was known to be in sympathy with the colonists. He had sought the acquaintance of Benjamin Franklin, and it was perhaps because of his known sentiments that he was joined in commission with his brother, Gen. Sir William Howe, to make a conciliatory arrangement. A committee appointed by the Continental Congress conferred uith the Howes in Sept. 1776 but nothing was accomplished. The appointment of a new peace commission in 1778 offended the admiral deeply, and he sent in his resignation. Before it could take effect France declared war, and a powerful French squadron was sent to America under the Count d'Estaing. Being greatly outnumbered, Howe had to stand on the defensive, but he baffled the French admiral at Sandy Hook, and defeated his attempt to take Newport in Rhode Island by a fine combination of caution and calculated daring. On the arrival of Adm. John Byron from England with reinforcements. Howe left the station in September. Until the fall of Lord North's ministry in 1782 he refused to serve, assigning as his reason that he could not trust Lord Sandwich. He considered that he had not been properly supported in America, and was embittered both by the supersession of himself and his brother as peace commissioners, and by attacks made on him by ministerial writers in the press.

On the change of ministry in March 1782 he was selected to command in the English channel, and in the autumn of that year he carried out the difficult operation of the final relief of Gibraltar. The French and Spaniards had in all 46 line-of-battle ships to his 33, and his ships were ill-equipped and manned. He was, moreover, hampered by a great convoy carrying stores. But Howe handled his ships well, the enemy was awkward and unenterprising and the operation was brilliantly successful. From Jan. 28 to April 16. 1783, he was first lord of the admiralty, and again from Dec. 1783 until Aug. 1788, in William Pitt's first ministry.

On the outbreak of the French Revolutionary War in 1793 he was again named to the command of the channel fleet. In 1794 he won the epoch-making victory of the First of June (see FIRST OF JUNE). Though Howe was then nearly 70 and had been trained in the old school, he displayed an originality not usual with veterans, and not excelled by any of his successors in the war, not even by Kelson, since they had his example to follow and were served by more highly trained squadrons than his. In 1797 he was called on to pacify the mutineers at Spithead, and he showed great influence with the seamen. He died on Aug. j, 1799, and was buried in his family vault at Langar.

In 1782 he was created Viscount Howe of Langar, and in 1788 Baron and Earl Howe. In June 1797 he was made a knight of the garter. His nickname of "Black Dick" was given because of his swarthy complexion, and the portrait by Thomas Gainsborough shows that it was apt.

The standard Life is by Sir John Barrow (1838). Interesting reminiscences will be found in the Life of Codrington by Lady Bourchier. Accounts of his professional services are in Charnock's *Biographia Navalis,* vol. 457, and in Ralf's Naval Biographies, i, 83. See also Beatson's Naval and Military Annals, James's Naval History, and Chevalier's *Histoire* de la *Marine française,* vol. i and ii.

HOWE, SAMUEL GRIDLEY (1801–1876), U.S. educator and first director of the Perkins School for the Blind, was born at Boston, Mass., on Nov. 10, 1801. He attended Harvard medical school and was admitted to practice, but abandoned the medical field to take part in the Greek revolution. After six years with the Greek army, acting as fighter and surgeon and helping in reconstruction of the devastated country, he returned to the United States and in 1831 received a proposal to direct the establishment

of a New England asylum for the blind at Boston. Howe set out at once for Europe to investigate the problem. There he was temporarily diverted from his task by becoming involved in the Polish revolt, suffering arrest and imprisonment. Returning to Boston in July 1832, he began receiving a few blind children at his father's house in Pleasant street, the beginning of what was to become the Perkins school. One of his notable successes was in teaching Laura Bridgman (*q.v.*).

In 1843 he married Julia Ward (see HOWE, JULIA WARD) and with her made a prolonged European trip. Upon return to the United States. Howe interested himself in the condition and treatment of mentally defective children. He uas also an ardent abolitionist and a member of the Free Soil party. He died on Jan. 19, 1876, at Boston.

HOWE, WILLIAM HOWE, 5TH VISCOUNT (1729–1814), British general, was the younger brother of George Augustus. 3rd viscount. killed in the Ticonderoga expedition of 1758. and of Richard. 4th viscount and afterward Earl Home, the admiral. He entered the army in 1746. In Wolfe's expedition to Quebec he distinguished himself greatly at the head of a composite light battalion. He led the advanced party in the landing at Wolfe's Cove and took part in the battle of the Plains of Abraham which followed. He commanded his own regiment in the defense of Quebec in 1759–1760, led a brigade in the advance on Montreal and took part on his return to Europe in the siege of Belleisle (1761). He was adjutant general of the force which besieged and took Havana in 1762, and at the close of the war had acquired the reputation of being one of the most brilliant of the junior officers of the army. He mas made colonel of the 46th Foot in 1764 and lieutenant governor of the Isle of Wight four years later. From 1758 to 1780 he was M.P. for Nottingham. In 1772 he became major general, and in 1774 he was entrusted with the training of light infantry companies on a new system.

Shortly after this he was sent out to North America. He did not agree with the policy of the government toward the colonists, and regretted in particular that he was sent to Boston, where the memory of his eldest brother was still cherished, and General Gage, in whom he had no confidence. commanded in chief He was the senior officer after Gage, and led the troops actively engaged in the storming of Bunker Hill, he himself being in the thickest of the fighting. In the same year Howe was made a K.B. and a lieutenant general, and appointed. with the local rank of general, to the chief command in the seat of war. For the events during his command see AMERICAN REVOLUTION. He retained it until May 1778—on the whole with success. He resigned because he thought the home government had not afforded the proper support, and after his return to England. he and his brother engaged in a heated but fruitless controversy with the ministers. In 1782 Howe was made lieutenant general of the ordnance; in 1790 he was placed in command of the forces organized for action against Spain, and in 1793 he was made a full general. He held various home commands in the early part of the French revolutionary war, in particular that of the eastern district at the critical moment when the French established their forces on the Dutch coast. When Earl Howe died in 1799, Sir William succeeded to the Irish viscounty. He had been made governor of Berwick-on-Tweed in 1795, and in 1805 he became governor of Plymouth, where he died on July 12, 1814. With his death the Irish peerage became extinct.

HOWEL DDA ("the Good") (d. 950). prince of Deheubarth (south central Wales) before 915, and king of Wales from 943 to 950, was the grandson of Rhodri Mawr (the Great), who had united practically the whole of Wales under his supremacy. As Idwal Voel succeeded his father Anarawd, the elder son of Rhodri, as lord of Gwynedd in 915, so Howel at some time before that date succeeded Rhodri's younger son Cadell as prince of Deheubarth. Howel married Elen, daughter of the last king of Dyfed, and also added Kidweli and Gwyr to his dominions, while on the death of Idwal, who was slain by the English in 943, he took possession of Gwynedd Both these princes had done homage to the English kings, Eduard the Elder and Aethelstan, in 922 and 926, and we find that Howel attended the witans of the English kingdom and witnessed about ten charters between the years 931 and 949. He was secure, therefore, from attack on the eastern side of his kingdom, and it is not certain whether he was engaged in any of the battles recorded during these years in Wales, either in Môn 914, at Dinas Newydd 919 or at Brun 93;. To the peaceful character of his reign is probably due the high place which he holds among the Welsh princes. From 943 to 950 Howel Dda was probably ruler oi all Wales except Powys (apparently dependent on Mercia), Brecheiniog, Buallt, Gwent and Morgannwg. With Morgan Hen, king of Morgannwg, Howel had a dispute which was eventually settled in favour of the former at the court of the English king. Howel died in 950, and such unity as he had preserved at once disappeared in a war between his sons and those of Idwal Voel. The code of laws attributed to this prince is perhaps his chief claim to fame He is said to have summoned four men from each cantref in his dominions to the Ty Gwyn (perhaps Whitland in Carmarthenshire) to codify existing custom. Three codes, accordingly called T'enedotian, Demetian and Gmentian, are said to have been written down by Bleggwryd, archdeacon of Llandaff (*see* WELSH LAWS).

See Sir John Rhys and Brynmor-Jones, *The Welsh People* (1900); and Aneurin Owen, *Ancient Laws and Institutions of Wales (1841).*

HOWELL, JAMES (c. 1594–1666), English writer, is known for his *Epistolae Ho-Elianae,* an early and lively example of essays written in the form of letters and in most cases intended for publication. Howell came of an old Welsh family and was born probably at Abernant, Carmarthenshire. From the grammar school at Hereford he went to Jesus college, Oxford. and then traveled abroad, becoming a versatile linguist and, as he himself said, "a true cosmopolite." Minor posts in government service and election (1627) as M.P. for Richmond, Yorkshire, added to his many acquaintances in literary and public life. From 1643 until 1651 he was held in the Fleet prison, whether principally on account of unpaid debts or royalist opinions is uncertain, and was there obliged by necessity to make writing his profession. At the Restoration the post of historiographer royal was created for him. He was buried in the Temple church, London, on Nov. 3, 1666. His writings include translations, dictionaries, imaginative works, political pamphlets and the Epistolae Ho-Elianue, 4 vol. (1645–55). Howell plagiarized freely and added fictitious dates so that. notwithstanding their vivid impressions of contemporary events and opinions. the letters live for their qualities as essays rather than as reliable reporting. The standard edition is edited by J. Jacob, 2 vol. (1890–92).

HOWELLS, WILLIAM DEAN (1837–1920), **U.S.** novelist and critic, spokesman of realism in American fiction, was born at Martin's Ferry, O., March 1, 1837. From his father, a printer-journalist, the boy acquired equalitarian ideas, and from the family reading of Swedenborg a persisting ethical bent. Howells spent his formative years in Jefferson and Columbus, O., as typesetter. reporter and editor with various newspapers, teaching himself Spanish and German, reading Cervantes, Heine and Shakespeare and writing poetry late into the night. They were years at times shadowed by sleeplessness, overwork and youthful recurring fears of hydrophobia and insanity. Writing his campaign biography of Lincoln (1860) became a turning point in Howells' life, for it financed the journey to New England during which he met James Russell Lowell and the established American writers, and led to his appointment as U.S. consul at Venice, his marriage to Elinor Mead and the Italian years (1861–65), in which he completed his education as a writer.

With the publication of Venetian Life (1866) he entered upon a period of influence and renown as assistant editor and then editor of the Atlantic *Monthly* (1866–71; 1871–81). Howells transformed the Atlantic into a national magazine, introducing new features, making the style more colloquial and enlisting the aid of writers as different in all but talent as Henry James and Mark Twain. Meanwhile he was adapting his skill in writing sketches of travel to creating travel novels, Their Wedding Journey (1872) and *A* Chance Acquaintance (1873), and international novels contrasting European and American manners, A Foregone Conclusion (1875). The Lady of the Aroostook (1879) and Indian Summer (1886). He was also beginning to write plays, and without much success to lay siege to the theatre.

Howells' leaving Boston for New York in 1888 signalized an expansion of his intellectual and imaginative horizons. In the essay, "Henry James, Jr." (1882), he had unconsciously precipitated an international controversy over realism by asserting that "The

art of fiction has become a finer art in our day than it was with Dickens and Thackeray." and in the "Editor's Study" of *Harper's Magazine* he carried the battle to the romantic critics for six years, 1886–92. Tolstoy's art and ethics and the social ferment of which Laurence Gronlund, Henry George and Edward Bellamy were a part stirred Howells mightily. In 1887 he risked both livelihood and reputation, as he thought, by writing an open letter asking clemency for the Chicago anarchists involved in the Haymarket riot, on the ground that they had been convicted for their political beliefs. The effect of these experiences appears in the broader scope of *The Minister's Charge* (1887), *Annie Kilburn* (1889), *A Hazard of New Fortunes* (1890) and *A Traveler From Altruria* (1894).

The death in 1889 of his elder daughter, Winifred, a talented girl long an invalid. set in Howells for the rest of his life the conviction that material gain and personal happiness were secondary or even delusory human aims. Thus in the 1890s he was championing new writers like Hamlin Garland. Stephen Crane, H. B. Fuller and Frank Norris, and collected a portion of his polemical "Editor's Study" in *Criticism and Fiction* (1891). Thus at the turn of the century he played an active role in the anti-imperialist movement with Mark Twain. Honours accrued to him thereafter as the dean of American letters and his official reputation increased; but the number of his readers began to dwindle. and before his death on May 10, 1920, he knew, as he said, that he had become "comparatively a dead cult with my statues cut down and the grass growing over them in the pale moonlight."

His **Value** as Critic.—Howells is distinguished in American history and literature as the editor and friend of Henry James and Mark Twain, the most influential critic of his day and a prolific, able novelist. Though he undervalued criticism he was himself a lifelong practising critic, whose reviews and articles evinced a taste both catholic and sensitive and interpreted the work of three generations of writers. He was an admiring, rather uncritical interpreter of Lowell, Longfellow and Holmes *(Literary Friends and Acquaintance,* 1900) partly because he was their heir: Lowell had first accepted his poems, and the three Brahmins with J. T. Fields had made him editor of the *Atlantic*. Walt Whitman's apparent formlessness put Howells off, though he thought Whitman's best poems were "stellar." Hawthorne he greatly admired. But the remote Emerson, with his idea that the vulgar tongue is the true language of poetry and that the "familiar; the common, the low" are proper poetic matter, probably influenced Howells most, among Americans.

Howells judged his own contemporaries with great shrewdness. From the beginning he valued the stories of Henry James, Jr., predicted that James would have to create his own audience. and during his writing life helped to create that audience by publishing his work. reviewing his books, and even at times acting as his agent. Similarly, he was the first critic consistently to acknowledge Mark Twain's powers as satirist and storyteller, and to gauge the "depth of fury" beneath his fun; he was Mark Twain's trusted editor; and in their collaborative failures the two writers enjoyed "gaudy times'! together. In the 1890s Howells praised discriminatingly both Emily Dickinson's metaphysical verse and Thorstein Veblen's sardonic analysis of leisure class behaviour. This breadth of taste was due in part to his knowledge of European literature. With T. S. Perry, he persuaded Americans to read Turgenev, Bjornson, Ibsen, Zola, Pérez Galdós and Verga, as well as Jane Austen, George Eliot, Hardy and Shaw. Tolstoy was his great modern writer.

Howells' practical criticism, then, was very often just and penetrating. His critical theory was simple. He classified fiction, for example, historically and qualitatively as novel, romance and romanticistic novel (an inferior kind), and formally as autobiographical (first-person novel), biographical (point-of-view novel) and historical (omnipotent-author novel, the primal or epic form). More generally Howells held that the writer should (1) render with scrupulous honesty his own impressions of life; (2) create a perspective in his work, wherein men and events might be seen in true "proportion and relation"; (3) present motives in their manifold, recondite, "God-given complexity": (4) treat action dramatically, without comment, subordinating it to character; (5) by fulfilling these artistic standards, achieve the aim of "dispersing the conventional acceptations by which men live on easy terms with themselves and obliging them to examine the grounds of their social and moral opinions."

Novels.—Three general phases may be distinguished in Howells' career of 40 years as a novelist:

1. After publishing two popular stories of travel, he wrote his first true novel in *A Foregone Conclusion,* a study of misunderstandings between an American girl and a Florentine priest, her tutor, who falls in love with her. The tale ends on a note of pathos with the death of the disillusioned priest. *Indian Summer,* the culminating novel of the first phase, is almost pure comedy. Yet both of them, like *The Lady of the Aroostook* and *A Fearful Responsibility* (1881) are *nouvelles* presenting only three or four characters dramatically and intensively. in the manner of Turgenev or Hawthorne. The action is antiromantic, and arises out of sectional or international differences. The setting is finely drawn and often symbolically shaded, as in the Italian fountain and garden scenes. The tone tends to be ironic and witty. From 1875 to 1886. in short, Howells, like James, became famous as the creator of novels in which "the American girl," innocent, beautiful, willful and morally strong, was portrayed against a splendid, often sombre European background.

2. Howells consciously abandoned his international romances, for he did not intend to compete any longer with James, and he was increasingly drawn to a new field, the depicting of American social conflicts. Thus *The Undiscovered Country* (1880), which initiates the second period, takes as its motive spiritualism replacing religious faith in New England. *Dr. Breen's Practice* (1881) imagines a woman in medicine with the same quietly satirical detachment. *A Modern Instance* (1882) became Howells' "strongest novel" as he thought because he had in it a "great but simple" theme—love turned to indifference and to hatred. Inspired by Euripides, he produced a new Medea and Jason whose New England marriage of passion ends in an Indiana divorce court. In *The Rise of Silas Lapham* (1885), his best-known novel, Howells at once touched American experience and imagination with the nenly rich Lapham's effort to rise into Boston society, Silas' financial ruin and. in spite of tempting evasions, his preserving his integrity in the end. The last novel of the period, *The Minister's Charge* (1887), recounted the failure of Lemuel Barker. a country boy, to succeed in Boston. In general, the novels of 1880–87 are full length. They may be told in part from a central character's point of view. Certain figures like the Rev. Mr. Sewell or Bromfield Corey tend to reappear. The novels deal with social problems rather than nith manners. and nearly all of them represent a provincial character in Boston who is defeated by the city.

3. In the third phase. 1888–94, Howells' social and economic views tended to become more explicit. The Tolstoyan doctrine of complicity, the belief that a man is ultimately responsible for the poverty or misery or criminality of any other man, first touched on in *The Minister's Charge,* was here fully explored. Howells drew his characters from varied social. racial and political groups, multiplied their number and rendered his background in closely realistic fashion, with less symbolic reference than in the early novels, New York replacing Boston. A strongly prolabour novel embodying a plea for justice rather than charity, *Annie Kilburn* (1888), marked the beginning of the period. *Tlze Quality of Mercy* (1892), in which he shows the far-reaching effect of a banker's defalcation upon others, and *The World of Chance,* the haphazard world of book publishing. preceded Howells' most formulated criticism of contemporary capitalism in the utopian novel, *A Traveler From Altruria* (1894). But it was A *Hazard of Sew Fortunes* (1890) that Howells rightly considered the "most vital" of his fictions, dramatizing and picturing the teeming competitive life of Yew York city by means of a representative group of characters struggling to establish a magazine there. They range from the ignorant and aggressive backer. a millionaire in natural gas, to his opponent, the German socialist exile of 1848 who had lost an arm in the American Civil War, and who is killed in a trolley strike as the novel ends.

This three-phase schematization of Howells' more than 40 volumes of fiction does not, it must be noted, account for the experimental novel. *The Shadow* of *a Dream* (1891), a study of psychotic jealousy: or the ghostly tales; or the late ironic novels of courtship like *April Hopes* (1888) or *Fennel* and *Rue* (1908). With his last major novel. *The Landlord at Lion's Head* (1897), Howells partially reverted to his earlier manner, coming to believe that "fiction can deal with the facts of finance and industry and invention only as the expression of character."

In the 1920s, reacting against his long-held primacy. H. L. Mencken and Sinclair Lewis damned Howells' realism as genteel, his treatment of love as namby-pamby and his "optimism" as unjustified. Critics of the depressed 1930s revised this judgment somewhat by praising his political and economic views. though they largely ignored other essential aspects of his thought and literary accomplishment. Still later. critics distinguished his best work from the dated or mediocre. and reappraised the nature and the extent of his influence. A number of readers as well rediscovered the style and humour which charmed his contemporaries, the truth of his characters and the moral vein of iron in his best novels.

Cady, *William Dean Howells, Dean of American* Letters *1837–1920,* 2 vol. (1958). (W. M. GN.)

HOWLAND ISLAND, a coral atoll in the central Pacific ocean (latitude 0° 48' N., 176° 38' W.), about 1,620 mi. S.W. of Honolulu. It is low and flat, about 2 mi. long and ½ mi. wide. Discovered in 1842 by Capt. George E. Netcher of New Bedford, Mass., it was taken into possession by the American Guano company in the name of the United States in 1857. American, British and German interests worked the guano deposits until 1890. A small U.S. colony was established there in 1935, and on May 13, 1936, Pres. Franklin D. Roosevelt placed it under the jurisdiction of the department of the interior. An airfield was constructed in 1937 for Amelia Earhart's round-the-world flight. She took off from New Guinea for Howland on July 2, 1937, but disappeared. The Japanese attacked the island on Dec. 8, 1941, killing two of the four colonists. The two survivors were evacuated by a U.S. destroyer on Jan. 31, 1942, and the colony was not re-established after World War II. (J. H. K.)

HOWLER, a name applied to the members of the genus *Alouatte* of tropical American monkeys. These monkeys, which are of large size. with thick fur, red or black in colour, are characterized by the inflation of the hyoid bone (which in the males supports the tongue) into a large shell-like organ communicating with the windpipe. and giving peculiar resonance to the voice. The muzzle is projecting. and the profile of the face slopes regularly backward. The long tail is prehensile. thickly furred, with the under surface of the extremity naked, to secure a better grip, Howlers dwell in companies, and in the early morning and evening make the woods resound with their cries, which are often continued throughout the night. They feed on leaves. and are in the habit of sitting on the topmost branches of trees. When on the move they progress in order. led by an old male.

"Howler" is also a slang term for conspicuously absurd blunders.

HOWRAH, a city and district in the Burdwan division of West Bengal. India. The city is opposite Calcutta. with which it is connected by a cantilever bridge. Pop. (1961) 514,090. Since 1881 the population has been more than doubled, owing to the great industrial development that has taken place.

Howrah is the terminus of the Eastern and South-Eastern railways; also of two light railways which run to Amta and Sheakhala. Further. it is the centre of the jute-manufacturing industry, with many jute mills and presses. The botanic garden, established in 1786 and the Bengal engineering college (Calcutta university). which occupies the buildings of the bishop's college, originally a theological college founded in 1824. are in the suburb of Sibpur. Four other colleges of Calcutta university are in Howrah.

HOWRAH DISTRICT extends southward down the right bank of the Hooghly to the confluence of the Damodar river. Its area is 575 sq.mi.; pop. (1961) 2,043,225. In addition to the railways, the district is crossed by the high-level canal to Midnapore, which communicates with the Hooghly at Ulabaria. The district is densely populated (2.802 persons per square mile). Manufacturing industries of Howrah extend beyond the city, but a large part of the district is rural in character. Drainage schemes affecting 320 sq.mi. have been constructed through marshy areas.

HOY (Norse *Haey,* "high island"), the second largest island of the Orkneys, county of Orkney. Scotland. Pop. (1951) 957; area 53 sq.mi. It is situated 2 mi. S.W. of Pomona, from which it is separated by Hoy sound. It is a lofty island and its shore line is much broken; Long Hope forms a good natural harbour.

Off the eastern coast lie the islands of Graemsay. Cava, Risa, Fara. Flotta and Switha. while the peninsula of South Walls. forming the southern side of the harbour of Long Hope. is almost cut off by the sea. Red sandstone cliffs, sometimes more than 1,000 ft. in height, stretch for 10 to 12 mi. on the Atlantic front. The detached pillar called the Old Alan of Hoy (450 ft.) is a landmark to sailors and a remarkable example of sea denudation. The only break in this remarkable run of rocky coast is at Rackwick in the bight below the head of Rora. In the interior, Ward hill (1,565 ft.) is the loftiest summit in either the Orkneys or Shetlands while the Cuilags reach 1,420 ft. and the Knap of Trewieglen 1,308 ft. Between Ward hill and the ridge of the Hamars to the southeast is the famous Dwarfie Stone. an enormous block of sandstone. with associations with Scandinavian folklore and signs of ancient habitation. The island is thought to be the most southerly point in the British Isles where the great skua breeds.

HOYLAKE, a seaside town and urban district in the Wirral parliamentary division of Cheshire. Eng.. near the mouth of the Dee estuary. 7½ mi. W. of Birkenhead. Pop. (1961) 32.265. Area 9.4 sq.mi. The district. entirely residential. includes West Kirby. The Royal Liverpool golf links lie along the estuary and there are 4 mi. of sandy sea front.

HOYLAND NETHER, an urban district in the Penistone parliamentary division of the West Riding of Yorkshire. Eng., 10 mi. N. of Sheffield, by road. Pop. (1961) 15,707. Area 3.1 sq.mi. Coal mining, foundries and clothing are the industries.

HOYLE, EDMOND (1672?–1769), first systematizer of the laws of whist, and author of a book on games. His birthplace is unknown. For the use of his pupils in whist he drew up a *Short Treatise* (1742). The laws of Hoyle continued to be regarded as authoritative until 1864, after which they were gradually superseded by the new rules adopted by the Arlington and Portland clubs in that year (*see* WHIST). The weight of his authority is indicated by the phrase "according to Hoyle." which, doubtless first applied with reference to whist, has gained currency as a proverb. Hoyle died in London on Aug. 29. 1769.

HRABANUS, or RABANUS MAGNENTIUS MAURUS (*c.* 776–856). archbishop of Mainz. was born of noble parents at Mainz, and educated at Fulda and Tours under Alcuin, who in recognition of his ability surnamed him Maurus, after St. Maur the favourite disciple of Benedict. In 803 he became director of the school at Fulda. which under him acquired great fame. He was ordained priest in 814 but shortly afterward, apparently on account of disagreement with Ratgar, he withdrew from Fulda, and made a pilgrimage to Palestine. He returned to Fulda on the election of a new abbot (Eigil) in 817, upon whose death in 822 he himself became abbot. After an efficient and successful tenure of office. he retired in 842, but five years later, succeeded Otgar in the archbishopric of Mainz, where he remained for eight years.

Hrabanus died at Winkel on the Rhine, on Feb. 4. 856.

In politics, Hrabanus gave his support to Louis the Pious against his rebellious sons, and after the death of the emperor sided with Lothair, the eldest son. In theology and philosophy, a sphere in which he came into conflict with Gottschalk, he was one of the most learned men of his time. Besides his extensive commentaries on the Bible, his chief works were the encyclopaedic dictionary *De Universo,* the *Glossaria Latino-Theodiscn* and the pedagogical treatise *De Institutione clericorum.*

HRADEC KRÁLOVÉ (German KÖNIGGRÄTZ), town of Czechoslovakia. at the confluence of the Orlice with the Elbe. Pop. (1957 est.) 55.257. It is the natural market centre of a fertile region. the "Golden Road." where settlement has existed from prehistoric time. Hradec Králové was one of the dower towns of

Elizabeth of Poland. the wife of King Wenceslas II of Bohemia, and was the first town to declare for the national cause in the Hussite Wars. It is famous for the decisive battle of Sadowa in the Austro-Prussian War of 1866. The growth of the modern town is across the Elbe toward the railway and the industrial centre of Kukleny. There are engineering works, tanneries and sawmills. Other industries include soap, candles. confectionery and pianos.

HRDLIČKA, ALEŠ (1869–1943), U.S. physical anthropologist, an expert on early man in America, was born at Humpolec, Bohemia, on March 29, 1869. His early education was received in Bohemia. He studied at the New York Eclectic, Homoeopathic and Xllopathic colleges, graduating in medicine in 1892 and 1894. In 1894 he joined the New York state service and in 1896 became associate in anthropology in the state pathological institute.

In 1898 Hrdlička was given charge of physical anthropology in the Hyde expedition to Mexico and the southwestern United States, in connection with the American Museum of Natural History of Kew York. In 1903 he was called as assistant curator to organize the division of physical anthropology at the U.S. National museum, Washington, D.C.. becoming curator in 1910. He retired in 1942 and served as associate in anthropology at the Smithsonian institution. He died Sept. 5. 1943.

Hrdlička was an early exponent of the theory, later accepted, that the North American Indian is of Asiatic origin; he also proposed that the cradle of man's development was not in Asia but in Europe and that the Neanderthal man was not a separate species of man but only a phase of his evolution. He was the founder (1918) and editor of the *American Journal of Physical Anthropology* and the founder (1929) and first president of the American Association of Physical Anthropologists. His works include *Ancient Man in North America* (1907); *Ancient Man in South America* (1912); *Old Americans* (1925); *Anthropology of the American Indian* (1927); *The Skeletal Remains of Early Man* (1930); *Practical Anthropometry* (1939).

HRÓLFR KRAKI, perhaps the most famous of the Danish kings of the heroic age. In *Beowulf,* where he is called Hrothwulf, he is represented as reigning over Denmark in conjunction with his uncle Hrothgar, one of the three sons of an earlier king called Healfdene. In the Old Norse sagas Hrólfr is the son of Helgi (Halga), the son of Halfdan (Healfdene). He is represented as a wealthy and peace-loving monarch similar to Hrothgar in *Beowulf,* but the latter (Hróarr, or Roe) is quite overshadowed by his nephew in the Northern authorities. The chief incidents in Hrolfr's career are the visit which he paid to the Swedish lung Aðils (Beowulf's Eadgils), of which several different explanations are given, and the war, in which he eventually lost his life, against his brother-in-law Hiörvarðr. The name Kraki (pole-ladder) is said to have been given to him on account of his great height by a young knight named Vöggr, whom he handsomely rewarded and who eventually avenged his death on Hiörvarðr. There is no reason to doubt that Hrólfr was an historical person and that he reigned in Denmark during the early years of the 6th century.

HROSVITHA (rōs-vēth'ą) (ROSWITHA, properly HROTSUIT) (*c.* 935–*c.* 1002), German dramatist and chronicler. Some time before 959 she entered the Benedictine nunnery of Gandersheim, a foundation highly favoured by the Saxon dynasty, and lived there until her death about the turn of the century. She wrote eight narrative religious poems, in leonine hexameters or distichs, dealing with the Nativity of the Virgin (from the apocryphal gospel of St. James, the brother of our Lord), the Ascension and a series of legends of saints (Gandolph, Pelagius, Theophilus, Basil, Denis, Agnes). Her comedies are six in number, being doubtless in this respect intended to recall their nominal model, the comedies of Terence. They are written in prose, with an element of something like rhythm, and an occasional admixture of rhyme. Founded upon legends of the saints, and exhibiting a knowledge of the Fathers and of Christian philosophers, they nevertheless contain many elements of comedy and even of farce, though they were written to glorify virginity. How far Hrosvitha's comedies were an isolated phenomenon of their age in Germany is uncertain, but in the history of the drama they form the bridge between the few earlier attempts at utilizing the forms of the classical drama for Christian purposes and the miracle plays.

The third group of the writings of Hrosvitha contains her versified historical chronicles. At the request of the abbess Gerberga, she composed her *Carmen de gestis Oddonis*, an epic attempting to follow the great Roman model. It was completed by 968, and presented by the authoress both to the old emperor and to his son (then already crowned as) Otto II. Unfortunately only half of it remains; the part treating of the period from 953 to 962 is lost with the exception of a few fragments, and the period from 962 to 967 is summarized only. Subsequently, in a poem (of 837 hexameters) *De primordiis et fundatoribus coenobii Gandersheimensis,* Hrosvitha narrated the beginnings of her own convent, and its history up to 919.

HROZNY, FRIEDRICH (BEDRICH) (1879–1952), Czech archaeologist who succeeded in deciphering the Hittite language, was born on May 6, 1879, at Lysa nad Labem, Bohemia. He studied in Prague, Vienna, Berlin and London. In 1904 he took part in the Seelin excavations in Ta'anuk (north Palestine), on the basis of which he wrote *Die Keilschrifttexte von Ta·annek* (1904) and *Die neugefundenen Keilschrifttexte von Ta'annek* (1906). In 1905 he was appointed professor at Vienna, and in 1919 professor of cuneiform research and ancient oriental history at the Charles university in Prague. Hrozny left the solution of the Hittite hieroglyphics to chance, proceeded to work on the basis of Hittite documents from the Bogazkoy archives written in cuneiform script and, in 1915, deciphered the language, proving it to be an Indo-European tongue. His solution was attacked from many quarters, but he substantiated his claim by the success with which he read and translated a number of documents, among others a Hittite legal code (published in Paris, 1922, under the title *Code Hittite provenant de l'Asie Mineure, I Partie: Transcription, traduction française*). In 192S excavations for the purpose of further research were made under his direction by a Czech scientific expedition to Asia Minor. He died on Dec. 18, 1952, in Prague. *See* HITTITES, THE.

HSIANG-T'AN (SIANGTAN), industrial city in Hunan province, China, on the Hsiang river, 20 mi. S.S.W. of Ch'ang-sha (*q.v.*), the provincial capital. Hsiang-t'an is situated on the Hunan-Kweichow railroad, begun in 1958. The city trades in rice, tea, tung oil. textiles and paper. After 1949, it became an important industrial centre, producing electrical goods, cotton textiles, wire, machine tools, cement and ammonium sulfate fertilizer. As a result of industrial development, the city's population more than doubled in the first four years under Communist rule, rising from an estimated 80,000 in 1949 to 183,600 (1953 census). (T. SD.)

HSI CHIANG (SI KIANG), main river system of south China, rising in the Yiinnan-Kweichow plateau, at an elevation of more than 6,000 ft., and flowing 1,200 mi. E. to the Canton delta on the South China sea. The name Hsi Chiang, which means "West river," is applied only to its lower course. The headwaters consist of a number of major branches. The principal headstreams are the Nan-p'an Chiang and Pei-p'an Chiang (South Pan and North Pan rivers) which join on the Kweichow-Kwangsi border to form the Hung-shui Ho. The Hung-shui flows through the deeply dissected karst-type landscape of western Kwangsi, dropping rapidly to an elevation of about 600 ft. At Shih-lung, the Hung-shui receives the Liu Chiang on the left, thus forming the Ch'ien Chiang. The Liu Chiang is formed near Liu-chou by the junction of two other headstreams — the Jung Chiang (Pei-liu Ho) and the Lung Chiang, both of which rise in southeastern Kweichow.

The Ch'ien Chiang flows through a rapid-strewn gorge, extending for 20 mi. between Wu-hsiian (Mosiin) and Kuei-p'ing (Kweiping) and forming an obstacle to navigation. At Kuei-p'ing, the Ch'ien Chiang receives a major tributary on the right, the Yü Chiang, to form the Hsüan Chiang. The Yü Chiang is formed near Nan-ning by the junction of two headstreams, the Yu Chiang and the Tso Chiang (Li Chiang), which rise in the uplands of North Vietnam and easternmost Yunnan. The Hsuan Chiang flows past T'eng-hsien (Tengyun) where it receives the Jung Chiang on the right, and then past Wuchow, where it receives the Kuei Chiang on the left.

It is only below Wuchow that the river is strictly the Hsi Chiang, the name by which the river system is generally known. At San-shui (Samshui), the Hsi Chiang joins the Pei Chiang (North river) to form the vast Canton delta, which is also joined from the east by the Tung Chiang (East river).

The Hsi Chiang is the great commercial waterway of south China, linking Hong Kong, Canton, Macao and other delta centres with Wuchow and the interior. In flood time. the river is navigable for vessels drawing 16 ft. as far as Wuchow. At ordinary times, the same city can be reached by vessels drawing 6 ft. or more. The headstreams are navigable in part for shallow-draft junks. (T. Sd.)

HSIN-CHU (SIN-CHU), a city of Taiwan (Formosa), pop. (1956) 125,814, is on the main north-south railroad 38 mi. S.W. of T'ai-pei and three miles inland from Formosa strait. The capital of Hsin-chu county, the city is located near sources of natural gas, coking coal, glass sand, stone and both hard and soft timber. It is a major tea and citrus marketing centre.

Hsin-chu lies at the junction of three railway routes. It is a growing industrial centre, producing fertilizers, wood products, electric light bulbs, matches, glass, cosmetics and hand-carved furniture. Hsin-chu became the nuclear research centre of Taiwan in the late 1950s. (N. S. G.)

HSUAN TSANG (c. 605–664), Chinese traveler and collector of the narratives of Chinese Buddhists, who traveled to India to visit the sites consecrated by the history of Sakya Muni, to study at the great convents and to collect books, relics and other sacred objects. Two Chinese works, translated into French by Stanislas Julien, relate to his works: the *Ta-T'ang-Si-Yu-Ki* ("Memoirs on Western Countries Issued by the T'ang Dynasty") compiled under Hsuan Tsang's supervision; and a biography by two of his contemporaries. Born in the Keu-Shi district near Honan-Fu about 605, he was a grave and studious child. He adopted the monastic life. After traveling over China, teaching and studying, for several years, he settled at Ch'ang-gan (now Sian) and won a great name for learning.

In August 629 he started alone for India, plunging into the desert of the Gobi. After great suffering he reached Igu, the seat of a Turkish principality, skirted the southern foot of the Tien Shan and crossed by a glacier pass. He reached the basin of the Upper Oxus, passed Bamian, crossed Hindu-Kush, went down to Nagarahara and thence to Peshawar. He spent two years (631–633) studying in the convents and visiting the many monuments of his faith. He traveled further, making a tour of the most famous sites of Buddhist and ancient Indian history. At Nalanda, the most famous and learned monastery and college in India, he spent nearly two years in mastering Sanskrit and the Buddhist philosophy. Traveling again, he went down the banks of the Ganges, turned east into what is now Assam, passed the great ports and reached Kanchipara (Conjeeveram) about 640. Then he turned north, ultimately recrossing the desert to Kwa-chow, from which he had plunged into the waste 15 years before. He carried with him great collections of books, precious images and relics, and was received (April 645) with public and imperial enthusiasm. The emperor T'ai Tsung ordered the compilation of the *Ta-T'ang-Si-Yu-Ki* and asked Hsuan Tsang to abandon the monastic life and serve the state. He declined the latter request and settled down to the supervision of the compilation and to the translation of the books he had brought back with him from India. The compilation was completed in 648. In 664 Hsuan Tsang died in a convent at Ch'ang-gan.

On the approach of death he caused one of his disciples to frame a catalogue of his good works, of the books he had translated or caused to be transcribed, of the sacred pictures executed at his cost, of the alms that he had given and of the living creatures that he had ransomed from death.

HSUAN T'UNG (1906–), last emperor of China, or, more correctly, the Ch'ing emperor. At a meeting of the grand council held on Nov. 13, 1908, under the presidency of the empress dowager Tzu-Hsi, in anticipation of the death of the emperor Kuang Hsu, Pu Yi, the infant son of Prince Ch'un, was selected to succeed his uncle, under the style of Hsuan T'ung. The emperor died on Nov. 14 and the empress dowager on Nov. 15, whereupon Prince Ch'un became regent for his son. The reign lasted for three disturbed years during which the demand for reforms grew in intensity to a point when on Feb. 12, 1912, a decree of abdication was issued. The boy was permitted to retain his title of emperor and to reside in the imperial palace, a subsidy being voted for the maintenance of the imperial family. In July 1917, during the presidency of Li Yuan-hung, an attempt by Gen. Chang Hsun to restore the emperor was frustrated by Tuan Chi-jui after a few days' nominal "reign." The emperor's education was upon modern lines and included the services of an English tutor. In 1922 he married a daughter of Jung Yuan, a Manchu noble. The ceremony took place with every symbol of imperial magnificence. He then cut off his queue and resumed his personal name, Pu Yi. In Nov. 1924, during the occupation of the capital by the Kuomentang, or Nationalist army, he left the palace under duress, to reside in the Japanese concession at Tientsin. On March 9, 1932, he was installed as president, and from 1934 to 1945, was emperor of the state of Manchoukuo (Manchuria), holding the title Kang Teh.

HSUN-TZU (3rd century B.C.), Chinese philosopher, is the third member in the great Confucian triumvirate of Chinese antiquity which includes Confucius himself and Mencius (*qq.v.*). His surname was Hsun, his personal name K'uang, and he bore the honorary cognomen of Ch'ing, so that he may be called either Hsun K'uang or Hsun Ch'ing. Most commonly, however, he is known simply as Hsun-tzu, "the Master Hsun" (*tzu* being an honorific suffix attached to the names of many philosophers of his time).

Hsun-tzu's exact dates are unknown; and little is known of his life save that he was a native of the state of Chao (in modern Shansi province, north central China), that he belonged for some years to the Chi-hsia academy of philosophers maintained in Ch'i by the ruler of that eastern state and that, later, because of slander, he moved south to the state of Ch'u, where he became magistrate of a small district and later died in retirement.

The position of Confucius, Mencius and Hsun-tzu in Chinese thought has been likened to that of Socrates, Plato and Aristotle in the west. Hsun-tzu exceeded his predecessors in erudition and was the first of the three to express his ideas not merely by means of the sayings and conversations recorded by disciples, but also in the form of well-organized essays written by himself. The book today known as the *Hsun-tzu,* in 32 chapters, is regarded as being in large part from his own hand.

Hsun-tzu's most famous dictum is that "the nature of man is evil; his goodness is only acquired training." What Hsun-tzu preached was thus essentially a philosophy of culture. Human nature at birth, he maintained, consists of instinctual drives which, left to themselves, are selfish, anarchic and antisocial. Society as a whole, however, exerts a civilizing influence upon the individual, gradually training and molding him until he becomes a disciplined and morally conscious human being. Of prime importance in this process are the li (ceremonies, rules of social behaviour, traditional mores) and music (which Hsun-tzu, like Plato, regarded as having a profound moral significance).

Hsun-tzu's view of human nature was, of course, radically opposed to that of Mencius, who had optimistically proclaimed the innate goodness of man. Both thinkers agreed that all men are potentially capable of becoming sages, but for Mencius this meant that every man has it within his power to develop further the shoots of goodness already present at birth, whereas for Hsun-tzu it meant that every man can learn from society how to overcome his initially antisocial impulses. Thus began what became one of the major controversies in Confucian thought.

The difference between Mencius and Hsun-tzu is metaphysical as well as ethical. T'ien (Heaven) for Mencius, though definitely not an anthropomorphic deity, constituted an all-embracing ethical power; therefore it is inevitable that man's nature should be

good, since it is what he receives from Heaven at birth. For Hsun-tzu, on the other hand, T'ien embodied no ethical principle and was simply the name for the functioning activities of the universe (somewhat like our word Nature). These activities he conceived of naturalistically and almost mechanistically. Moral standards, therefore, have no metaphysical justification but are man-made creations.

One may ask how, if man is born "evil" (by which Hsun-tzu really meant uncivilized), it is possible for him to create the higher values of civilization. Hsun-tzu's reply was that man differs from other creatures in one vital respect: besides his instinctual drives, he also possesses an intelligence which enables him to form co-operative social organizations. Hence the sages, realizing that man cannot well survive in a state of anarchy, used this intelligence to formulate the social distinctions and rules of social behaviour (li), which would check the encroachments of one individual upon another and thereby insure sufficiency for all. In this utilitarian explanation of the creation of social institutions, Hsun-tzu shows probably indebtedness to the non-Confucian thinker Mo Ti (*q.v.*).

Hsun-tzu's denial of supernaturalism led him into a sophisticated interpretation of popular religious observances and "superstitions." These were merely poetic fictions, useful for the common people because they provided an orderly outlet for human emotions, but not to be taken as true by educated men. There Hsun-tzu inaugurated a rationalistic trend in Confucianism which has been congenial to scientific thinking. At the same time, however, Hsun-tzu's distrust of "nature in the raw" caused him to warn men to shun the investigation of natural phenomena and to keep to humanistic studies; his own conception of the universe, moreover, was a static and antievolutionary one, in which past and present are the same and the many are like the one. In these respects, therefore, Hsun-tzu's influence was decidedly hostile to scientific development.

Hsun-tzu nevertheless made important contributions to psychology, epistemology and dialectic, yet his primary interest in dialectic was as a tool for exposing the "fallacies" of rival schools; and he bitterly lamented the need for dialectic in the absence of a centralized political authority that could impose ideological unity from above. Hsun-tzu, indeed, was an authoritarian who formed a logical link between Confucianism and the totalitarian Legalists; it is no accident that among his students were two of the most famous Legalists, the theoretician Han Fei-tzu (c. 280–233 B.C.) and the statesman Li Ssu (c. 280–208 B.C.). Hsun-tzu himself remained Confucian in his firm rejection of the amoral philosophy and compulsive techniques of the Legalists, and his insistence on Confucian morality as the basis for society.

For several centuries after Hsun-tzu's death, his influence remained higher than that of Mencius. This is indicated, for example, by the borrowings from Hsun-tzu found in such ritualistic compilations as the Li *Chi* ("Book or Record of Rites") (*see* CHINESE CLASSICS). Only with the rise of Neo-Confucianism (9th century A.D. onward) did his influence wane, and it was not until the 12th century that the triumph of Mencius was formalized through the inclusion of the Mencius among the Confucian classics. *See* also CONFUCIANISM; CHINESE PHILOSOPHY.

School of Oriental and African Studies*, vol. xv, pp. 541–565 (1953). (D. BE.)

HUAI HO (HWAI HO), river of eastern China, between the Yellow river and the Yangtze, rises in Honan province in the northern foothills of the Ta-pieh Shan (Huai-yang-shan) and flows eastward for 800 mi. past the cities of Huai-nan (Hwainan) and Pengpu (Pang-fou) through Anhwei and Kiangsu provinces to the lake Hung-tse Hu. In the 11th century the Huai Ho ran directly into the Yellow sea, but after one of the frequent course changes of the Yellow river, the Huai Ho was diverted into the lake. From there its waters passed through the Grand canal (Yün Ho) to the Yangtze and finally to the sea. The absence of a direct outlet to the sea has resulted in floods affecting most of the 60,000,000 inhabitants of the area. The Communists, after 1949, embarked on an ambitious flood-control program. Old river dikes were repaired, new dikes built and silted channels dredged. A 105-mi. canal was dug in 1952 from Hung-tse Hu to the Yellow sea, providing a direct outlet for the flood waters. Storage reservoirs were built on many tributaries. (T. SD.)

HUANCAVELICA, a department in central Peru, bounded by Junin on the north, by Ayacucho on the east and south and by Ica and Lima on the west. Area 8,830 sq.mi.; pop. (1958 est.) 368,237. It is a rugged mountain region, with a high-level surface of gentle relief about 15,000 ft. above sea level, surmounted by a few clusters of ranges of very high mountains and cut by deep canyons, chief of which is the Mantaro. Huancavelica city (pop. 1958 est. 11,895), the departmental capital, is located about 50 mi. S. of Huancayo and 140 mi. S.S.E. of Lima. The city is connected with Lima by rail and an all-weather highway. The chief products of the department include wheat, barley, maize and potatoes. It is a source of meat for Lima and also of some wool for local use. Silver, lead and mercury are mined.

Huancavelica was made famous by its mercury deposits, which were of great importance during the colonial period. The Santa Bárbara mine, some 2,000 ft. above the town, was acquired by the Spanish crown in 1570. Mercury was essential in the extraction of silver from the native ore; and with the decline of silver mining in the 19th century, mining of mercury also decreased. Mining was resumed by the Fernandini interests after the railroad gave access to a shipping port in 1926, but the Huancavelica mines were high-cost producers at mid-20th century.

See A. P. Whitaker, *Huancavelica Mercury Mine* (1941). (P. E. J.)

HUANCAYO, a city of central Peru (pop. 1958 est. 47,486), capital of the department of Junin (*q.v.*). It lies at 10,690 ft. above sea level on a plain watered by the Mantaro river, and has a temperate climate. The city, founded by the Spaniards in 1538 on an old Inca highway, became an important centre for mining and agriculture. Mineral resources of the surrounding region include copper, silver and coal; wheat, barley, maize and potatoes are cultivated there. Of greatest interest to the tourist are the renowned Sunday market, attended principally by Indians from nearby areas; the Carnegie Magnetic observatory (now a facility of the Peruvian government); the Saturday fair at Chupaca; and the convent of Ocopa. Huancayo is situated 77 mi. S.E. of La Oroya and may be reached by the central highway from Lima to Cusco and by the central railroad. The distance from Lima is 195 mi., (J. L. TR.)

HUANUCO, a central sierra department of Peru (pop. [1958 est.] 381,669; area, 13,635 sq.mi.), bounded north by La Libertad and San Martin, east by Loreto, south by Junin, west by Lima and Ancash. The department, forming a saddle between the central and eastern cordilleras, is watered by the Ucayali, the Huallaga and the Marañón rivers. It is crossed by the trans-Andean highway extending from Lima to Pucallpa on the Ucayali, a distance of 522 mi.

The city of Huánuco (pop. 1958 est. 19,087), the departmental capital, is a popular overnight stop on the two-day journey. It lies at 6,271 ft. above sea level on the upper Huallaga. Founded in 1539 by Gómez de Alvarado, Huánuco city is situated in a beautiful valley, and the climate is referred to as "perpetual spring." Crops cultivated in the region include fruits, cereals, maize, potatoes, coffee, sugar, cotton, tobacco and coca. Cattle, sheep and hogs are bred extensively. Important mineral resources of the department are gold, silver, mercury, coal, iron, copper and petroleum. The population is chiefly Indian and mestizo. Tingo Maria, located in the montaiia, lies 83 mi. N.W. of Huánuco city. (J. L. TR.)

HUASTEC, a native people of the Atlantic coast of Mexico, south of Tampico and the lower Panuco river. They form an isolated offshoot of the great Maya family of Yucatan and Guatemala, but decisive evidence is lacking as to whether Huastec

speech represents an archaic form of the Mayan language and the people a remnant left behind in an ancient southward migration of the stock, or the reverse.

Culturally the Huastec belong rather in the Toltec-Aztec than in the Maya province, although their lowland habitat brought with it many differentiations. They formed the northeastern frontier of the higher civilization of ancient Mexico. About 20,000 Huastec-speaking Indians survive.

HUBAY, JENO DE (1858–1937), Hungarian composer and violinist, sometimes known as Eugen Huber, was born at Budapest Sept. 15, 1858. His first teacher was his father, who was a professor of the violin, and conductor of the Hungarian national opera. From 1871 to 1875 he studied in Berlin under Joseph Joachim, and later, on the recommendation of Franz Liszt, gave successful violin recitals in different countries including England. While in Paris he was associated with Henri Vieuxtemps and Jules Massenet. In 1882 he succeeded Henri Wieniawski as professor of the violin at the Brussels conservatoire, and in 1886 was appointed to a similar post at the Budapest academy, of which he was the director from 1919 on. His pupils included many eminent violinists, among them Vecsey, Jelly d'Aranyi and Joseph Szigeti. Hubay wrote a number of operas *(The Violin Maker of Cremona, Anna Karenina, Alienor, Die Maske, Moosröschen, Lavottas Liebe,* etc.) as well as symphonies, violin concertos, smaller instrumental works and songs.

Hubay died March 12, 1937.

HUBBARD, ELBERT GREEN (1856–1915), U.S. author, editor and publisher, was born in Bloomington. Ill., on June 19, 1856. He founded his Roycroft press at East Aurora, N.Y., on the model of William Morris's (*q.v.*) communal Kelmscott press, which he had visited in England. Beginning in 1894 he monthly issued the famous "Little Journey" booklets, pleasant biographical essays in which fact mas interwoven with comment and satire. and *The Philistine,* an avant-garde magazine. In an 1899 number of *The Philistine* "A Message to Garcia" appeared. the most famous single piece he wrote (the importance of perseverance was drawn as a moral from a Spanish-American War incident).

In 1908 Hubbard began to edit and publish a second monthly, *The Fra.* His printing establishment in time expanded to include furniture and leather shops, a smithy and an art school, the aim being to create articles of the fine craftsmanship that had prevailed before the Industrial Revolution. He died in the sinking of the "Lusitania" on May 7, 1915.

Hubbard's writings contain a bizarre mixture of radicalism and conservatism. He apotheosized work and efficiency in a vigorous, epigrammatic style. His works include *Time and Chance* (1899); *So Here Cometh White Hyacinths* (1907); *The Man of Sorrows* (1908); and the *Roycroft Dictionary* (1914). Valuable collections are "Little Journeys" (14 vol., 1915), and "Selected Writings" (14 vol. 1923). His *Scrap Book* (1923) and *Note Book* (1927) were published posthumously.

HUBBLE, EDWIN POWELL (1889–1953), U.S. astronomer, who, working with the large telescopes of the Mount Wilson and Palomar observatories, accumulated a wealth of significant data, which was fundamental in character and important to the theories of cosmology. Hubble was born Nov. 20, 1889 in Marshfield, Mo. Following undergraduate study at The University of Chicago, he attended Oxford as a Rhodes scholar. He returned to Chicago and in 1917 received the Ph.D. degree. After a period of research at the Yerkes observatory (1914–17), he enlisted in the U.S. army and served with the American expeditionary force in France. In 1919 he joined the astronomy staff of the Carnegie Institution of Washington's Mount Wilson observatory, where he remained until his death, Sept. 28, 1953, in San Marino, Calif.

Huhhle's discovery in 1923 of a distance-indicating Cepheid variable star in the Andromeda nebula furnished the first certain evidence that extragalactic nebulae were situated far outside the boundaries of our own galaxy; in fact, were independent stellar systems. He surveyed nebulae to very faint limits and found the large-scale distribution approximately uniform in all directions with numbers increasing at a constant rate as fainter limits were reached. From a study of several thousand photographs he derived the first significant classification system for extragalactic nebulae. He announced in 1929 his important finding that velocities (red shifts) of nebulae increase in a linear manner with distance. The relation, $H = 180$ km./sec. per 10^6 parsecs, is known as "Hubblc's law of the red shifts" or "Hubble's constant."

Other important research results appear in papers on extragalactic nebulae as stellar systems, novae in nebulae, distribution of luminosity in elliptical nebulae, nebulous objects in the Andromeda nebula identified as globular clusters, angular rotations of spiral nebulae, the luminosity function of nebulae and the direction of rotation in spiral nebulae.

In addition to Hubble's long scientific bibliography, are the Silliman lectures at Yale University published under the title of "The Realm of the Nebulae"; reference should be made also to the Rhodes Memorial Lectures given at Oxford, England, entitled "The Observational Approach to Cosmology." (M. L. HN.)

HUBER, JOHANNES (1830–1879), German philosophical and theological writer, and one of the original leaders of the Old Catholics (*q.v.*) in Germany, was born in Munich, Aug. 18, 1830. He became professor of philosophy there in 1864. He strongly opposed the growing influence of the Jesuits and of scholasticism in the Roman Catholic Church, but was also a vigorous adversary of such writers as Darwin and D. F. Strauss with their apparent threat to the foundations of faith. Huber wrote many works, but his quarrel with the church dated from the publication in 1859 of *Die Philosophie der Kirchenväter,* which was placed on the Index the following year. In 1869 he joined Dollinger (*q.v.*) in the "Janus" letters, a series of newspaper articles criticizing the Vatican council, later published as *Der Papst und das Konzil.* He was also joint author with Dollinger of the *Romische Briefe vom Konzil.* Huber died in Munich, March 20, 1879.

See E. Zirngiebl, *Johannes Huber* (1881).

HUBER, LUDWIG FERDINAND (1764–1804), German playwright, critic and newspaper editor; the husband of Thérèse Huber (1764–1829), a notable woman of her time who was one of the first to recognize Goethe's significance. Huber was born in Paris; the exact date is uncertain. He was brought up in Leipzig, where he became the friend of Christian Korner and of Schiller. From 1787 to 1792 he was secretary to the Saxon legation at Mainz. There he conceived a passion for Thérèse, wife of the naturalist Georg Forster, and married her after Forster's death in 1794. From 1798 to 1803 he edited the *Allgemeine Zeitung.* He died in Ulm, Dec. 24, 1804. Huber wrote plays (*e.g., Das heimliche Gericht,* 1790) as well as political commentary. His criticism may be found in his *Vermischten Schriften* (2 vol., 1793). The stories published under his name were by Thérèse, who published his works with a biography (4 vol., 1806–19).

See L. Geiger, *T. Huber* (1901); *F.* Ernst, *Essays,* vol. 2 (1946).

HUBERT, SAINT (d. 727), the "Apostle of the Ardennes," succeeded St. Lambert as bishop of Maastricht in 7oj after Lambert's murder. He had Lambert's remains buried at Liege, then only a village, in a church which Hubert built at the site of the murder and made his cathedral church, transferring to Liege the see of Maastricht. Hence Hubert is regarded with great devotion in Belgium as the founder of the city and diocese of Liege. Most of the incidents related of him—such as his conversion while hunting on Good Friday by the miraculous appearance of a stag bearing between its horns a cross or crucifix surrounded by rays of light—first occur in lives written in the 12th and 14th centuries. Because of that legend he is regarded as the patron of hunters; he is also invoked against rabies. His feast day is Nov. 3.

(J. N. G.)

HUC, ÉVARISTE RÉGIS (1813–1860), French missionary traveler, was born at Toulouse, on Aug. 1. 1813. He entered the congregation of the Lazarists at Paris, and shortly after receiving holy orders in 1839 went out to China. At Macao he spent some 18 months in the Lazarist seminary, preparing himself for the regular work of a missionary. He at first superintended a Christian mission in the southern provinces, and then perfected his knowledge of the language at Peking, eventually settling in the Valley of Black Waters or He Shuy. just within the borders of Mongolia. There, beyond the Great Wall, a large, scattered

population of native Christians had found refuge from the persecutions of Kia-King, to be united half a century later in an apostolic vicariate. Huc studied the dialects and customs of the Tatars, translated various religious works, and in 1844, at the instigation of the vicar apostolic of Mongolia, undertook an expedition to Tibet.

Accompanied by his fellow-Lazarist, Joseph Gabet, and a young Tibetan priest who had embraced Christianity, he set out from Dolon Nor. To escape attention the little party assumed the dress of lamas or priests. Crossing the Hwang-ho, they advanced into the sandy tract known as the Ordos desert. After terrible sufferings they entered Kansu, having recrossed the flooded Hwang-ho, and in Jan. 1845 reached Tang-Kiul on the boundary. There they waited for eight months, and studied the Tibetan language and Buddhist literature, residing for part of the time in the Kunbum lamasery, which was reported to accommodate 4,000 persons. Toward the end of September they joined a returning Tibetan embassy from Peking, which comprised 2,000 men and 3,700 animals. Crossing the deserts of Koko Nor, they passed the lake of that name, with its island of contemplative lamas, and, following a difficult and tortuous track across snow-covered mountains, they at last entered Lhasa on Jan. 29, 1846. Favourably received by the regent, they opened a little chapel, but the Chinese ambassador interfered and had the two missionaries conveyed back to Canton, where they arrived in October of the same year. For nearly three years Huc remained at Canton, but Gabet, returning to Europe, proceeded thence to Rio de Janeiro, and died there shortly afterward. Huc returned to Europe in shattered health in 1852. He died in Paris on March 31, 1860.

His writings comprise, besides numerous letters and memoirs in the *Annales de la propagation de la foi,* the famous *Souvenirs d'un voyage dans la Tartarie, le Thibet, et la Chine pendant les années 1844–1846* (2 vol., 1850; Eng. trans. by W. Hazlitt, 1851, abbreviated by M. Jones, 1867); its supplement, crowned by the Academy, entitled *L'Empire chinois* (2 vol., 1854; Eng. trans., 1859); and an elaborate historical work, *Le Christianisme en Chine, etc.* (4 vol., 1857–58; Eng. trans., 1857–58).

HUCBALD (HUGBALDUS, HUBALDUS, UBALDUS) (*c.* 840–930?), Benedictine monk and writer on music, was born at the monastery of Saint Amand near Tournai. He studied at the monastery, where his uncle Milon was head of the school. Hucbald's success in music is said to have excited his uncle's jealousy and to have made it necessary for him to leave Saint Amand. In 860 he was at Saint Germain d'Auxerre, bent upon completing his studies, and in 872 he was back again at Saint Amand as successor to his uncle, to whom he had been reconciled in the meantime. Between 883 and 900 Hucbald went on several missions of reforming various schools of music, including that of Reims, but in 900 he returned to Saint Amand, where he died on June 25, 930, or, according to other chroniclers, on June 20, 932.

The only work which can positively be ascribed to him is his *De harmonica institutione.* The *Musica Encheiriadis,* published with other writings of minor importance in Gerbert's *Scriptores ecclesiastici de musica,* and containing a complete system of musical science as well as instructions regarding notation, dates from the close of the 10th century. This work, formerly assigned to Hucbald, is celebrated chiefly for an essay on a new form of notation described in modern times as *Daseian notation.* The author of the *De harmonica institutione* wrote numerous lives of the saints and a curious Latin elegy on the death of Charles the Bald in which every work begins with *c* for *calvus* ("bald").

See G. Reese, *Music in the Middle Ages* (1941).

HUCH, RICARDA (1864–1947), German poetess and historical novelist, was born at Brunswick on July 18, 1864, and educated in Brunswick and Zürich. She was appointed secretary of the library in Zürich and married first Ermano Ceconi, and later her cousin Richard Huch, a lawyer. She spent much time in Italy before she finally settled in Munich. She wrote a number of romantic and imaginative novels marked by a fine psychological sense and a plastic style, in the manner of C. F. Meyer, among which may be mentioned *Erinnerungen von Ludolf Ursleu dem Jüngeren* (1893, Eng. trans. *Eros Invincible,* 1931); *Aus der Triumphgasse* (1901); *Vita somnium breve* (1902). Her most important historical works are *Blütezeit der Romantik* (1899); *Ausbreitung und Verfall der Romantik* (1902); *Aus dem Zeitalter des Risorgimento* (1908); *Der grosse Krieg in Deutschland* (1912–14); *Das Römische Reich deutscher Nation* (1934). In 1919 appeared a volume of reflections, *Der Sinn der heiligen Schrift,* which reveal a profound knowledge of psychology. One of the leaders of the revolt against naturalism, Ricarda Huch attained at her best a high degree of musical rhythm and romantic beauty. She died on Nov. 17, 1947, at Frankfurt-on-Main.

Baum, *Leuchtende Spur. Das Leben Ricarda Huchs* (Tübingen and Stuttgart, 1950); Ricarda Huch, *Frühling in der Schweiz* (reminiscences; Zürich, 1938).

HUCHOW (HU-CHOU, formerly WU-HSING or WUHING), a Chinese city in northern Chekiang province, lying south of Tai Hu (lake). Pop. (1953) 62,700. The T'iao Ch'i (river) runs through the city, which lies about 40 mi. N. of Hangchow and 120 mi. W.S.W. of Shanghai. Huchow was the last stronghold of the T'ai-p'ing rebellion (1864). Its *hsien* or district is the centre of the Yang-tzu delta silk region where mulberry bushes are cultivated. To the east is the small town of Nan-hsin, a silk and salt mart which is linked to Huchow by a canal that continues eastward into the Grand canal (Yün Ho). Southwest of the district rises the beautiful forested mountain and noted resort of Mo-kan-shan. Although competition from Shanghai, Wu-shih and Hangchow prior to World War II had decreased its silk industry, Huchow retained many silk filatures which processed most of the local cocoons, while it exported cocoons as well as raw silk.

(H. J. Ws.)

HUCHOWN "of the Awle Ryale," a poet who lived, if he lived at all, in the 14th century. The only reference to him is in Andrew of Wyntoun's *Oryginale Chronykil of Scotland* (*c.* 1420):

> He made a gret Gest of Arthure,
> And the Awntyr of Gawane,
> The Pistil als of Suet Susane.
> He was curyousse in his stille,
> Fayr of facunde and subtile,
> And ay to pleyssance hade delyte. . .
>
> (Cott. Ms. V. 11, 4308 ff.)

Of the three poems here attributed to Huchown, the third is the only one which can be identified with certainty. *The Pistill of Susane,* a version of the story of Susannah and the Elders in 13-lined alliterative stanzas, survives in five manuscripts: Add. Ms. 22283 (*c.* 1390) and Ms. Cott. Caligula A II (*c.* 1430) in the British museum, London; Vernon Ms. (*c.* 1375) in the Bodleian library, Oxford; and two others privately owned (ed. by D. Laing, *Select Remains* [1822]; E. Horstmann in *Anglia,* vol. i [1877]; F. J. Amours, *Scottish Alliterative Poems,* for the Scottish Text society, 2 vol. [1892, 1897]).

The "Gest of Arthure" has been reasonably identified as the *Morte Arthure,* a romance based on Geoffrey of Monmouth's *History,* in more than 4,000 unrhymed alliterative lines, and surviving in the Thornton Ms. in Lincoln Cathedral library (ed. by E. Brock for the Early English Text society [1871]; *see* E. Trautmann in *Anglia* [1877]).

The identity of the "Awntyr of Gawane" is disputed; suggestions include *The Awntyrs of Arthure at the Terne Wathelyne,* a romance in 13-lined romance stanzas surviving in the Thornton Ms. and in two others (ed. by D. Laing and by F. J. Amours, as above). Taking account of these attempts to identify the poems mentioned by Wyntoun, common authorship is unlikely; and it is probable that Wyntoun was misled by the chance contiguity of the three in a single manuscript.

It has been assumed from Wyntoun's reference that Huchown was a Scottish poet. But the *Pistill of Susane* shows no linguistic traces of Scottish origin; the extant copies are English, and it is very unlikely that a Scottish poem could be taken south early enough for an anglicized copy of it to occur in a southern manuscript written before 1400 (*see* W. A. Craigie in *The Proceedings of the British Academy,* xxviii [1942]). There is only the interest

of misdirected ingenuity in the attempts to identify Huchown with Syr Hew of Eglintoun (d. 1377), justiciary of Lothian, and perhaps lamented in Dunbar's *Timor mortis conturbat me* but otherwise unknown as a poet *(see* G. Neilson, *Sir Hew of Eglintoun and Huchown* [1901] and *Huchown of the Awle Ryale* [1902]). Henry Bradley thought Huchown of Cumbrian origin *(Collected Papers,* [1928]); S. O. Andrews in *The Review of English Studies,* vol. v (1929) places him in the northwest midlands. But he remains a shadow. (J. Ky.)

HUCHTENBURGH (HUGTENBURG), **JAN VAN** (1647–1733), Dutch painter of hunting and battle scenes, was born in Haarlem, where he studied under Thomas Wijck. As a youth he traveled to Italy, where he joined his elder brother, the landscape painter Jacob van Huchtenburgh (1640/43–1675), in Rome. In 1667 he was in Paris, where he was employed as a tapestry designer at the Gobelins factory under Charles Le Brun and A. F. van der Meulen. In 1670 he was back in Haarlem and was married there in the same year. He worked in Haarlem and Amsterdam (where he died in July 1733), and in 1708–09 went to Italy in the service of Prince Eugene of Savoy. The style and subject matter of his pictures derive from Philips Wouwerman and Van der Meulen, progressing from hunting scenes, robber encampments and cavalry skirmishes to large-scale battle pictures. Many of these are in the major European galleries, including a series, depicting Eugene's battles, in the Turin (Italy) gallery. (R. E. W. J.)

HUCKABACK, the name given to a type of cloth used for towels. For this purpose it has perhaps been more extensively used in the linen trade than any other weave. One of the chief merits of a towel is its capacity for absorbing moisture; plain and other flat-surfaced cloths do not perform this function satisfactorily, but cloths made with huckaback, as well as those made with the honeycomb (*q.v.*), and similar weaves, are particularly well adapted for this purpose. The body or foundation of the cloth is plain and therefore sound in structure, but at fixed intervals some of the warp threads float on the surface of the cloth, while at the same time a number of weft threads float on the back. Thus the cloth has a somewhat similar appearance on both sides. (T. W.)

HUCKLEBERRY, the popular name in the northeastern United States of the genus *Gaylussacia* (family Ericaceae), small branching shrubs resembling in habit the English bilberry (*Vaccinium*), to which it is closely allied, and bearing a fleshy fruit with ten nutlike seeds, differing in this respect from the blueberry. The common huckleberry of the northern states is *G. baccata;* while *G. brachycera* and *G. dumosa* are known respectively as box and dwarf huckleberry. The name *Gaylussacia* commemorates the famous French chemist J. L. Gay-Lussac (*q.v.*).

HUDDE, JOHAN VAN WAVEREN (1628–1704), Dutch mathematician and statesman, who promoted Cartesian geometry and philosophy in Holland, was born at Amsterdam on April 23, 1628 and died there on April 15, 1704. He is regarded as the first to take literal coefficients in algebra as indifferently positive or negative. Two of his discoveries, dating from 1657–58, are known as Hudde's rules: (1) If r is a double root of the polynomial equation $a_0x^n + a_1x^{n-1} + \ldots + a_{n-1}x + a_n = 0$, and if $b_0, b_1, \ldots, b_{n-1}, b_n$ are numbers in arithmetic progression, then r is a root also of $a_0b_0x^n + a_1b_1x^{n-1} + \ldots + a_{n-1}b_{n-1}x + a_nb_n = 0$; (2) if the polynomial $a_0x^n + a_1x^{n-1} + \ldots + a_{n-1}x + a_n$ takes on a relative maximum or minimum value for $x = a$, then a is a root of the equation $na_0x^n + (n-1)a_1x^{n-1} + \ldots + 2a_{n-2}x^2 + a_{n-1}x = 0$. These were published in *Geometria a Renato Des Cartes,* edited by Frans van Schooten (2nd ed., vol. i, 1659). Hudde anticipated the power series expansion (1656) for $ln\ (1 + x)$ and the use of space co-ordinates (1657).

Born of a patrician family, Hudde served 19 times as burgomaster of Amsterdam, and in 1672 he directed the work of inundating Holland to obstruct the advance of the French army. He corresponded with Christiaan Huygens on prohlems of canal maintenance, probability and life expectancy; and Leibniz reported that Hudde's manuscripts, never published, contained many excellent results.

See for bio-bibliographical details the article "Johannes Hudde, heer van Waveren en Sloterdijk" in *Nieuw Nederlandsch Biografisch Woordenboek,* vol. i, columns 1172–76 (1911). (C. B. Br.)

HUDDERSFIELD, a municipal, county and parliamentary borough in the West Riding of Yorkshire, Eng., 15 mi. S.W. of Leeds and 184 mi. N.N.W. of London by road. Pop. (1961) 129,302. Area *22.1* sq.mi. The town is on slopes of the Pennines where they merge, to the east, in the Lower Coal measures, and on the left bank of the Colne river, a tributary of the Calder. It has connections by rail and road with all the important towns of industrial northern England, and the Sir John Ramsden's canal links it with the Calder navigation.

Though there are traces of prehistoric and Roman occupation, Huddersfield *(Oderesfelt* in Domesday Book) rose to importance only after the introduction of the woolen trade in the 17th century; the suburb of Almondbury, where the Tudor Woodsome hall is now a golf club, was probably the original settlement. On Castle hill is an ancient British encampment. After the Conquest, William I granted the manor to Ilbert de Lacy. It passed to Thomas Plantagenet, duke of Lancaster, through his marriage with Alice de Lacy, and so to the crown. In 1599 Elizabeth I sold it to William Ramsden, whose descendants held it until 1920, when it was bought by the corporation. It contained 4,300 ac., mostly in the centre of the town. By the beginning of the 18th century Huddersfield had become a "considerable town," chiefly because of the manufacture of woolen kersies, which was aided by good local water; and toward the end of the same century. trade was increased by two events — the opening of navigation on the Calder in 1780 and the completion of the cloth hall or piece hall, built and given to the town by Sir John Ramsden in 1784. Originally erected as a clothiers' emporium, it was demolished in 1930 and partly re-erected at Ravensknowle park, Dalton.

The town is almost entirely modern, with great warehouses and business premises, built principally of gray gritstone. The market hall, on the site of the old Shambles, dates from 1878. The parish church of St. Peter was rebuilt in 1836–37 and occupies a site which has carried a church since the 11th century. There are a public library and art gallery, and a local history museum in Ravensknowle. The technical college. affiliated to the University of Leeds in 1905, started as a small society in 1841. The Huddersfield Choral society, the Glee and Madrigal society and the Association football team are well known. Huddersfield is the chief seat of the West Riding woolen and worsted industry, and rayon and cotton as well as wool yarns are made. Dyeing and textile machinery making are two of the many industries auxiliary to wool, and there are iron foundries and engineering works.

The town was incorporated in 1868 and created a county borough in 1888. It was made a parliamentary borough in 1832 and returns two members.

HUDLESTON, JOHN (1608–1698), English Roman Catholic priest and Benedictine monk, one of those who helped King Charles II after the battle of Worcester, reconciled the king to the Roman Catholic Church on his deathbed. He was born at Farington Hall in Lancashire on April 15, 1608, and educated at Great Blencow in Cumberland, at St. Omer and at the English college in Rome. In 1651 he was living at Moseley in Staffordshire as chaplain to the Whitgrave family; there, during the night of Sunday, Sept. 7, King Charles was brought in disguise. Two days later soldiers came to search the house, and the king and Hudleston were shut away in the priest's hiding hole; however, the troops were persuaded to leave without a search. After the Restoration Hudleston became chaplain to the queen. On Feb. j, 1685, between 7:00 and 8:00 P.M., the duke of York brought Hudleston to the dying king. Hudleston heard his confession and gave him absolution, extreme unction and the viaticum. He left an account of the scene in his own words, *A Brief Account of . . . the Happy Death of Our Late Sovereign* (1688). Hudleston died in 1698 and was buried on Sept. 13 in the churchyard of St. Mary le Strand.

See T. Blount, *Boscobel* (1660). (J. D. A.)

HUDSON, GEORGE (1800–1871), English railway financier, who by 1844 controlled more than a thousand miles of railway, was born in York in March 1800. He rose from apprenticeship in the drapery business to partnership in the firm and, on receiving

a £30,000 bequest in 1827, invested it in North Midland railway shares. He helped to secure the passage of an act of parliament to raise capital for the York and North Midland railway and was subsequently appointed chairman of that company. In that year the mania for railway speculation was at its height, and no man was more courted than the "railway king." Deputy-lieutenant for Durham and thrice lord mayor of York, he was returned as a Conservative member of parliament for Sunderland in 1845. He was suddenly ruined by the disclosure of the Eastern Counties railway frauds, losing influence and fortune at a single stroke. The rest of his life was spent mainly in litigations and attempts to operate financially abroad. He died in London on Dec. 14, 1871.

See R. S. Lambert, *The Railway King* (1934). (W. H. D.)

HUDSON, HENRY (d. 1611), English navigator and explorer, made four voyages seeking a short route to China by way of the Arctic ocean. His first voyage was made for the Muscovy company in 1607. Sailing to east Greenland, he traced the boundary of sea ice eastward to Spitsbergen, reaching a previously unknown portion of the coast in approximately 80° N. lat. On the homeward voyage he discovered an island in about lat. 71° which he named Hudson's Tutches, now called Jan Mayen (*q.v.*). His reports led to the establishment of the English whale fisheries at Spitsbergen.

On April 22, 1608, the Muscovy company dispatched Hudson to seek a northeast passage to China between Spitsbergen and Novaya Zemlya. He scoured Barents sea, vainly seeking a passage. Before docking at Gravesend on Aug. 26, Hudson's mind had already turned to a search for a northwest passage.

Later that year Hudson was invited to Amsterdam to consider undertaking explorations for the Dutch. With a Dutch and English crew, Hudson sailed from the island of Texel, North Holland, in the "Half Moon" on April 6, 1609, for his third exploration. By May 5 he was in Barents sea, encountering ice off Novaya Zemlya. Some of his men becoming mutinous, he offered to go either to Lumley inlet or to seek a passage through Virginia in about 40° N. lat. The latter plan was adopted, and on May 14 Hudson set his face toward the Chesapeake. On Sept. 3 he entered New York harbour. After ascending the river which bears his name some 150 mi. to the vicinity of the present Albany, parleying with the Indians, surveying the country and trying the stream above tidewater, he concluded that this channel did not lead to China. On Oct. 4 the "Half Moon" left for the Texel and on Nov. 7 arrived at Dartmouth, where she was detained by the English government. Hudson and the other Englishmen aboard were commanded henceforth to serve their own country. The voyage exploded the myth that near 40° N. lat. only a narrow isthmus, like the isthmus of Panama, separated the Atlantic and Pacific oceans.

A new company was formed to support Hudson in another attempt on the northwest passage, the principal promoters being Sir Thomas Smythe, Sir Dudley Digges and John Wolstenholme. Hudson determined to carry out his old plan of searching for a passage up Davis strait. Sailing from London in the ship "Discovery" (55 tons) on April 17, 1610, Hudson entered the strait which bears his name about mid-June. He reached Hudson bay on Aug. 3 and spent three months examining the eastern shore of the bay. On Nov. 1 the "Discovery" went into winter quarters in the southwest corner of James bay, being frozen in a few days later. After the ship broke out of the ice in the spring, Hudson was accused of unjust distribution of rations. A young protégé of Hudson's, Henry Greene, incited part of the crew against him. Hudson, his young son and seven others were put in a small boat on June 22, 1611, and set adrift. Robert Bylot was elected master. During the voyage home Greene and several others were killed in a fight with the Eskimos. A portion of the remnant that reached England, in September, were later brought to trial, but mere adjudged not guilty. Nothing was ever heard of the deserted'men. An expedition sent out the next year failed to find them. The remains of a structure found in 1631–32 may have been built by Hudson's party.

The three great geographical landmarks which keep Hudson's memory alive—Hudson bay, strait and river—had repeatedly been visited and even drawn on charts before he set out on his voyages; but he carried his discoveries beyond the limits of his predecessors. The fisheries of Spitsbergen and the fur industry of the Hudson bay region were the immediate fruits of his labours.

BIBLIOGRAPHY.—G. M. Asher (ed.), *Henry Hudson, the Navigator,* Hakluyt Society *(1860)*; T. A. Janvier, *Henry Hudson* (1909); L. Powys, *Henry Hudson* (1928). (J. E. CL.)

HUDSON, WILLIAM HENRY (1841–1922), British naturalist and writer, was born at Quilmes, near Buenos Aires, Arg., on Aug. 4, 1841, and remained on the pampas until 1874, when he went to England. Thereafter the greater part of his life was spent in poverty and marked by frequent ill health. His wife, Emily, long kept a boardinghouse in London, where Hudson too lived, known to only a small circle of appreciative friends. A civil list pension granted in 1901 aided him somewhat, but he relinquished this when belated success reached him. He died in London on Aug. 18, 1922, and was buried at Broadwater, Sussex. Hudson called himself a field naturalist, and though the charms of wild life made a pre-eminent appeal to his sincere observing mind, he was not without an understanding of simple human joys and sorrows. This versatility of his sensitive nature is well instanced in his last work, *A Hind in Richmond Park,* published posthumously in 1922.

His other writings include the memorable pictures of the South America of his youth, such as *The Purple Land* (1885), *A Crystal Aga* (1887), *El Ombú* (1902), *Green Mansions* (1904) and *Far Away and Long Ago* (1918); of the English countryside, such as *Afoot in England* (1909), *A Shepherd's Life* (1910) and *Dead Man's Plack* (1920); ornithological works, as his collaboration with P. L. Sclater in *Argentine Ornithology* (1888), his own *British Birds* (1895), *Birds of La Plata* (1920) and many pamphlets for the Society for Protection of Birds.

A bird sanctuary with a decoration by Jacob Epstein was erected to Hudson's memory in Hyde Park, London, in 1925.

HUDSON BAY, a large gulf or inland sea in northeastern Canada, is an extension of the Atlantic ocean separating Baffin Island from mainland Canada. In this broad sense it includes Hudson bay proper, James bay, Foxe channel, Fose basin, Hudson strait and Ungava bay. Its area is about 480,000 sq.mi. (Hudson bay proper, 250,000 sq.mi.). The length of the mainland coast line alone exceeds 4,400 mi. Islands, including Baffin itself and island groups—Foxe basin, Southampton, Hudson strait, Belcher, and James bay—increase this total by at least 70%. It is bordered by Quebec on the east and by Ontario, Manitoba and the Northwest Territories on the west and south, its islands comprising a part of the latter.

Most of Hudson bay proper has depths of between 120 and 600 ft., increasing to 846 ft. in a submarine valley extending from about 61° N. to 88° W. toward Hudson strait. The strait itself is mostly 600–1,200 ft. deep, though a depth of 2,886 ft. occurs at the eastern end. Ungava bay and Foxe channel are generally shallower than 420 ft.; Foxe basin and James bay, shallower than 180 ft.

The waters of Hudson bay are cold, being chiefly of Arctic origin; they have low salinity values because of dilution by numerous tributary rivers. Having been funneled southeastward through Fury and Hecla strait, the Arctic sea water develops major counterclockwise circulations in Foxe basin and in Hudson bay proper, finally discharging eastward along the south side of Hudson strait. Minor counterclockwise circulations also prevail in James and Ungava bays. Hudson strait's north shore is dominated by an inflow of mild, saline water from the Labrador sea, which, however, recurves southwards and eastwards to join the main Hudson bay outflow.

Most of the Hudson bay system, which is situated between 65° and 95° W. and 52° and 70° N., is covered with floating ice from January until May. In Hudson bay proper there is usually a strip of fast ice along the shore, separated from a vast central ice mass by a strip of open water. The central mass is relatively thin, smooth and unbroken. Beginning late in May, melting and disintegration spread northward from James bay, and by mid-September Hudson bay proper is entirely free of ice. In Foxe basin and Foxe

channel open leads may occur anywhere during wintertime; the ice is much older, thicker and rougher than in Hudson bay proper. This northern ice is slow to melt in summer: large masses of it persist in the eastern part of Foxe basin; other masses float through Foxe channel to western Hudson strait, where their progress is impeded by Nottingham, Mill and Salisbury islands. Usually no serious ice jam develops there, but navigation of the bottleneck is liable to be difficult in cool years. The main part of Hudson strait is never completely ice-covered because of the frequency of winter storms; by late summer it is usually ice-free.

Hummocky or, locally, hilly rocks of the Canadian shield form the coast around the greater part of Hudson bay, but limestone plains occur on the south coast, on Southampton, Coats and Mansel islands and around Foxe basin. The whole region lies north of the tree line, except for southern James bay. Spruce, balsam and poplar grow to a fair size as far as the northern limit of James bay. Caribou, musk ox and other animals are found in large numbers, and there is an abundance of feathered game — ducks, geese, loons and ptarmigan; hunting and fishing form the chief occupation of the Indians and Eskimo who live in scattered bands near the shore. The bay abounds with fish, of which the chief are cod and salmon. Whales were formerly pursued by American whalers, whose destructive methods greatly depleted the supply.

Completion of a railway from Saskatchewan to Churchill in 1931 led to the development of a shipping route through Hudson strait to Europe (the first shipment being made in 1931), for the distance from Edmonton to Liverpool via Churchill is almost 1,000 mi. less than via Montreal. Despite this advantage the Hudson route long suffered from high insurance rates, chiefly because accurate ice distribution and forecast data were lacking. By the second half of the 20th century, however, Churchill was handling 50–60 cargo vessels a year, exporting 18,000,000–20,000,000 bu. of wheat, and importing manufactured goods.

Another railway, to Moosonee at the head of James bay, was completed in 1932. Other economic developments include those at Rankin inlet (nickel mining), Richmond gulf (iron and lead mining), Wakeham bay (nickel mining), Coral harbour (airfield) and Hopes Advance bay (iron mining and concentrating). Settlements providing trading centres for Indian and Eskimo trappers exist at Fort Chimo, Port Harrison, Chesterfield Inlet, Igloolik and many other places.

Hudson strait may have been discovered by the Cabots as early as 1498, but no deep westward penetration was achieved until 1610, when Henry Hudson traced the Canadian mainland coast from Ungava bay to James bay. Two years later Sir Thomas Button mapped the west coast of Hudson bay proper. In 1631 Captain Thomas James traced much of the south coast, and Luke Foxe discovered Foxe channel. The west coast of Foxe basin was not mapped till 1821–23 by Sir William Parry; Prince Charles, Air Force and Foley islands, near the east coast, were not charted until 1948.

See also RUPERT'S LAND; HUDSON'S BAY COMPANY.

(H. R. TN.)

HUDSON RIVER, situated entirely within the state of New York, originates in several small, postglacial lakes in Essex county near Mt. Marcy, the highest point in the state. For about 108 mi. it pursues a winding course, flowing generally southeast to Corinth in Saratoga county and then northeast to Hudson Falls at the northern end of what is called the Hudson valley. From there it flows without significant gradient almost directly south for nearly 200 mi. to the Battery at the head of New York's Upper bay. As it descends from the Archean (Pre-Cambrian) Adirondack province to the younger Hudson-Champlain trough it drains an area of 13,370 sq.mi. For 150 mi. from its mouth, the Hudson is a drowned valley and as such is an arm of the sea. Tides are felt as far north as the federal dam at Troy, where the mean tidal range is 4.7 ft., with a maximum record after freshets of 33.4 ft. In width, the Hudson ranges from ¾ mi. at its mouth to 3 mi. at Haverstraw bay (between Harmon in Westchester county and Haverstraw in Rockland county), with the section to the south of this, called Tappan Zee, almost attaining this width. Upstream of Haverstraw bay to the head of navigation at Waterford, it narrows unevenly from about 1 mi. to a few hundred feet. Along its final 17 mi., where it is called North river, it forms part of the eastern boundary of New Jersey. Total river length is 306 mi.

Navigation **and** Commerce. — The most important tributary of the Hudson is the Mohawk, which enters at Waterford, north of Troy. Together these constitute one of the world's major waterways—a passage of such shallow gradient that it has long been the principal route through the Appalachian barrier. Improvement of the Hudson began in 1797, at first by the state, then jointly with the federal government and, since 1892, by the latter alone. Canalization of the Mohawk proceeded simultaneously. The controlling depth of the Hudson is 27 ft. at Albany and 14 ft. from Albany to the mouth of the Mohawk, a distance of about 155 mi. This is sufficient for deepwater navigation to Albany and for through tug-barge traffic to the Great Lakes via the canalized Mohawk and the New York state barge canal. The lower river is open year-round; and to Albany the navigation season is 12 months for ocean-going ships and 8 months for barges. Principal items in the tonnage of river-borne commerce are sand, gravel and crushed rock; petroleum and its products; coal and lignite. Passenger service has dwindled to a few excursion boats, largely because of the efficiency of parallel transportation, both highway and rail, including the New York state thruway, which follows the Hudson-Mohawk depression to Buffalo.

The addition of bridges also has led to the abandonment of ferries in many places. Important bridges south of Albany are the Rip van Winkle (1935) at Catskill; the Kingston-Rhinecliff (1957); the Mid-Hudson (1930) at Poughkeepsie; the Bear Mountain (1924) near Peekskill; the Tappan Zee (1956) at Tarrytown; and the George Washington (1931) at New York city. Two vehicular and tno rail tunnels under the river also connect New York city uith northern New Jersey.

Although the Hudson valley is famous for its scenery and is used mainly for dairying, fruitgrowing, recreation and travel, industry and commerce are noteworthy north of the New York metropolitan area in such cities as Kyack, Tarrytown, Haverstraw, Ossining, Peekskill, Newburgh, Beacon, Poughkeepsie, Kingston, Saugerties, Catskill. Hudson, Albany, Troy, Cohoes and Glens Falls.

History. — The Florentine navigator Giovanni da Verazzano sailed a short distance up the Hudson in 1524, but the river rightly bears the name of Henry Hudson, who explored it in 1609. Dutch settlement of the valley began in 1629, but for over 200 years tenants were denied title to the land under an aristocratic patroon system, which created along the river a series of large and elegant estates. The region possessed a serene scenic beauty that formed a background to the stories of Washington Irving and inspired the Hudson River school of art and architecture.

In the Revolution the Hudson was a strategic waterway and was the site of many historic events; including the decisive victory over Burgoyne at Saratoga and the naval battle of Tappan Zee, during which an enormous chain was stretched across the river between Gee's point and Constitution Island to prevent the passage of British ships. Benedict Arnold, while military commander of the forts in this locality, planned to surrender them to the British. He made his escape from his quarters on the east bank near the site of the village of Garrison to a British ship anchored in the river below. Washington made his headquarters at Newburgh in 1782 and later disbanded the Continental armies from there.

During the 19th century the Hudson traffic flourished, particularly after the opening of three canals — the Erie, the Delaware and Hudson and the Champlain — that linked New York city with the Great Lakes and with the Delaware and lower St. Lawrence valleys. The waterway was thus a key factor in the growth of New York city. (See also ERIE CANAL.) Practical American steam navigation was begun on the Hudson by Robert Fulton in 1807, and the river rapidly gained in importance as a highway for passengers and goods. Its main towns owed their early prosperity to the whaling trade, but later they became home ports for interocean merchant fleets. Local industries other than whale-processing included brickmaking, leather fabricating, lumbering, fishing, ice storage, quarrying and the excavation of native cement.

Many of the Hudson river estates have become schools or insti-

tutions, and the colourful paddle wheelers and sailing ships are things of the past; but the magnificence of Hudson valley scenery, especially in its lower portion, remains one of the great natural attractions of North America.

HUDSON'S BAY COMPANY, or "the Governor and Company of Adventurers of England trading into Hudson's Bay," a corporation formed for the purpose of importing into Great Britain the furs and skins which it obtained, chiefly by barter, from the Indians of British North America.

In 1670 Charles II granted a charter to Prince Rupert and 17 other noblemen and gentlemen, incorporating them as the "Governor and Company of Adventurers of England trading into Hudson's Bay." and securing to them a monopoly of the trade of all lands watered by streams flowing into Hudson bay. Besides the complete lordship and entire legislative, judicial and executive power, the corporation received also the right to "the whole and entire trade and traffic to and from all havens. bays. creeks. rivers; lakes, and seas into which they shall find entrance or passage by water or land out of the territories, limits, or places aforesaid." The first settlements in the country thus granted, which was to be known as Rupert's Land, were made on James bay and at Churchill and Hayes rivers; but it was long before there was any advance into the interior. for in 1749, when an unsuccessful attempt was made in parliament to deprive the company of its charter on the plea of "nonuser." it had only some four or five forts on the coast. with about 120 regular employees. Although the commercial success of the enterprise was from the first immense. great losses were inflicted on the company by the French. After the cession of Canada to Great Britain in 1563. numbers of fur traders spread over that country and began even to encroach on the Hudson's Bay company's territories. These individual speculators finally combined into the North-West Fur Company of Montreal. In the competition which arose between the companies the Indians were demoralized, body and soul, by the abundance of ardent spirits with which the rival traders sought to attract them to themselves; the supply of furs threatened soon to be exhausted by the indiscriminate slaughter. even during the breeding season. of both male and female animals; and the worst passions of both whites and Indians were inflamed to their fiercest (see RED RIVER SETTLEMENT). At last, in 1821. the companies amalgamated. obtaining a licence to hold for 21 years the monopoly of trade in the vast regions lying to the west and northwest of the older company's grant. In 1838 the Hudson's Bay company acquired the sole rights for itself. and obtained a new licence. also for 21 years. On the expiry of this it was not renewed! and since 1859 the district has been open to all.

The licences to trade did not of course affect the original possessions of the company. Under the terms of the deed of surrender, dated Nov. 19, 1869, the Hudson's Bay company surrendered all its rights of government, subject to certain terms and conditions, including the payment to the company by the Canadian government of a sum of £300,000 sterling on the transfer of Rupert's Land to the Dominion of Canada, the retention by the company of its posts and stations, with a right of selection of a block of land adjoining each post in conformity with a schedule annexed to the deed of surrender; and the right to claim in any township or district within the fertile belt in which land is set out for settlement, grants of land not exceeding one-twentieth part of the land so set out. The boundaries of the fertile belt were fixed as follows: "On the south by the United States' boundary; on the west by the Rocky Mountains; on the north by the northern branch of the Saskatchewan; on the east by Lake Winnipeg, the Lake of the Woods. and the waters connecting them." In 1872 it was agreed that the one-twentieth of the lands in the fertile belt reserved to the company under the terms of the deed of surrender should be taken by "allotting in every fifth township two whole sections of 640 acres each, and in all other townships one section and three-quarters of a section each."

From this time little was done to develop the company until just before the outbreak of World War I. During the period 1914–18 one part of the company with 300 steamers was engaged in food and munition transport for the French and Belgian governments. From the end of the war the company began to develop rapidly; the annual reports showed a steady increase in business done. and the company opened new offices in territories previously untouched. Large stores were completed in Winnipeg, Saskatoon, Calgary, Edmonton, Vancouver, and Victoria. and agreements were made with the Cnited States for the importation of furs to special centres.

An experiment in reindeer farming in Baffin's Land failed; but efforts were made elsewhere.

See G. Bryce, *Remarkable History of the Hudson's Bay Company* (1900); and *A.* C. Laut, *Conquest* of *the great Northwest; being the story of the adventurers of England known as Hudson's Bay Co.* (1909); *Canadian Progress* (an annual publication), and the annual reports of the Hudson's Bay Company. HUE (officially THUA-THIEN), capital of Thua-thien province, Vietnam. on the Hué river. about 8 mi. from the China sea. Pop. (1958 est.) 90.682. Hué was for several centuries capital of the Annamite empire, covering much of modern Indochina. Hills on three sides and a river not navigable by large vessels made it relatively inaccessible. which was desired by the emperors, but after construction of the Saigon-Hanoi railway and highway Hué was no longer isolated. Flat paddy lands, traversed by streams and canals, surround the town. Glass and ivory became

BY COURTESY OF THE GOVERNOR AND COMMITTEE OF THE HUDSON'S BAY COMPANY

FACSIMILE OF A PORTION OF THE FIRST SHEET OF THE CHARTER GRANTED MAY 2. 1670. BY KING CHARLES II TO "THE GOVERNOR AND COMPANY OF ADVENTURERS OF ENGLAND TRADING INTO HUDSON'S BAY." THE FIVE-PAGE CHARTER GAVE POWER TO THE COMPANY TO RULE WITHIN ITS TERRITORY ACCORDING TO ENGLISH LAW

the basis of a thriving handicraft industry, but no large-scale manufacturing was developed. A frequent service of steam launches connected the town with Thuan-an, at the mouth of the river, and with Tourane 60 mi. to the southeast. The city walls enclose the former emperor's palace. Outside the walls is the business district. Tombs of many past emperors remind the visitor of Hué's past glory. (J. R. A.; X.)

HUE AND CRY, a phrase employed in English law to signify the old common law process of pursuing a criminal with horn and voice. It was the duty of any person aggrieved, or discovering a felony, to raise the hue and cry, and his neighbours were bound to turn out with him and assist in the discovery of the offender. In the case of a hue and cry, all those joining in the pursuit were justified in arresting the person pursued, even though it turned out that he was innocent. A swift fate awaited any one overtaken by hue and cry, if he still had about him the signs of his guilt. If he resisted he could be cut down, while, if he submitted to capture, his fate was decided. Although brought before a court, he was not allowed to say anything in self-defense, nor was there any need for accusation, indictment or appeal. Although regulated from time to time by writs and statutes, the process of hue and cry continued to retain its summary method of procedure, and proof was not required of a culprit's guilt, but merely that he had been taken red-handed by hue and cry. The various statutes relating to hue and cry were repealed in 1827 (7 and 8 Geo. IV, c, 27). The Sheriffs act, 1887, re-enacting 3 Edw. I, c, 9, provides that every person in a county must be ready and apparelled at the command of the sheriff and at the cry of the county to arrest a felon, and in default shall on conviction be liable to a fine. (See also HARO, CLAMEUR DE.)

For the early history, see Pollock and Maitland, *History of English Law,* vol. ii; *W*. Stubbs, *Select Charters.*

HUEHUETENANGO, a town in northwestern Guatemala, capital of the province of the same name, 106 mi. N.W. of Guatemala city. It is overwhelmingly Indian in population and is an important centre of the Guatemalan area known as *los altos* (the highlands). Pop. (1950) 6,187. Huehuetenango is on the river Salega, and lies at an altitude of 6,200 ft. It enjoys a semi-tropical climate and is surrounded by a fertile agricultural country raising wheat, maize, potatoes, beans, melons, fruits, etc. Sheep graze on the hills, and there is a considerable production of hand-woven woollens in ancient patterns used by the local villagers for their typical costumes and also in conventional tweed patterns which are sold in Guatemala city. Coffee, cacao, sugar cane and tropical fruits are grown in neighbouring valleys. Huehuetenango is reached by automobile from San Felipe, the nearest railway station, and from Quetzaltenango (*q.v.*) and, via the latter city, from Guatemala city. The name, Huehuetenango means "Place of the Ancients" and the town is located close to the ruins of an ancient Indian centre called Zaculeu. In Spanish times, the Dominican missionaries penetrated to Huehuetenango, and near by, at Chiantla, had a monastery richly equipped from the returns of a silver mine owned by the Dominicans and worked by the Indians; it was at one time one of the wealthiest religious communities in Central America. It was taken over by the government in 1873, and the mines were abandoned.

HUELVA, a maritime province of southwestern Spain, formed in 1833 of districts taken from Andalusia, and bounded on the north by Badajoz, east by Seville, south by the Gulf of Cadiz and west by Portugal. Population (1950 census) 369,722; area 3,907 sq.mi. The northern district is highland traversed in a southwesterly direction by the Sierra Morena, there known, in its main ridge, as the Sierra de Aracena. The south is a lowland maritime strip with flat wastelands (Las Marismas) in the southeast around the mouth of the Guadalquivir. The lower reaches of the Guadalquivir and Guadiana are navigable and form respectively for some distance the southeastern and southwestern boundaries. The Odiel and the Tinto both fall into the Atlantic by navigable *rias* or estuaries. Huelva has a mild and equable climate, with abundant moisture and a fertile soil. In the northern highlands there are many oaks, pines, beeches, cork trees and chestnut, while the lowlands afford excellent pasturage. But agriculture and stock-breeding are there less important than in most Spanish provinces, although the exports comprise large quantities of fruit, oil and wine, besides cork and esparto grass. The headquarters of the fishing trades, which include the drying and salting of fish, are at Huelva, the capital, and Ayamonte on the Guadiana. There are numerous brandy distilleries, but the great local industry is the mining of copper manganese and iron. The well-known Rio Tinto copper mines, near the sources of the Tinto, like those of Tharsis, 30 mi. N.N.W. of Huelva, were exploited from very early times and later by the Carthaginians, and Romans. Saline and other mineral springs are common throughout the province. Huelva is the principal seaport, with railway connections with Seville and Mérida, while a network of narrow-gauge railways leads to the chief mining centres. Insurgents occupied Huelva early in the civil war of 1936–39. *See* ANDALUSIA.

HUELVA (the ancient Onuba, Onoba or Onuba Aestuaria), the capital of the Spanish province of Huelva, about 10 mi. from the Atlantic ocean, on the left bank of the river Odiel, and on the Seville-Huelva, Mérida-Huelva and Rio Tinto-Huelva railways, the last-named being a narrow-gauge line. Population (1950) 58,058. Huelva is built on the western shore of a triangular peninsula formed by the estuaries of the Odiel and Tinto, which meet below the town. Huelva was originally a Carthaginian trading station, and afterward a Roman colony. The colossal statue of Columbus was erected in 1892 to commemorate the fourth centenary of his voyage which began and ended in the village of Palos de la Frontera on the Tinto. Columbus resided in the neighbouring Franciscan monastery of Santa Maria la Rábida after his original plans for the voyage had been rejected by King John II of Portugal in 1484. The present town is modem in appearance, and owes its prosperity to a transit trade in copper and other ores, for which it is the port of shipment. After 1872, when the famous Rio Tinto copper mines were for the first time properly exploited, it progressed rapidly in size and wealth. Besides exporting copper, manganese and other minerals, Huelva is the headquarters of the sardine, tunny and bonito fisheries, and of a trade in grain, grapes, olives and cork. The bulk of the imports, which consist chiefly of coal, iron and steel and machinery, ordinarily comes from Great Britain. Foodstuffs and Australian hardwood are also imported. Franco's Nationalist forces captured Huelva early in the civil war of 1936–39.

HUÉRCAL OVERA, a town of southeastern Spain, in the province of Almeria, on the Lorca-Baza railway, and between two branches of the River Almanzora. Pop. (1950) 14,020 (mun.). Huércal Overa is the chief town of a thriving agricultural district, largely dependent on the lead mining carried on among the surrounding highlands.

HUESCA, a frontier province of northern Spain, formed in 1833 of districts previously belonging to Aragon; and bounded on the north by France, east and southeast by Lérida, southwest and west by Saragossa, and northwest by Navarre. Population (1950) 237,681; area 5,849 sq.mi. The entire northern half of Huesca belongs to the mountain system of the Pyrenees, which there attain their greatest altitudes in Aneto, the highest point of the Maladetta ridge (11,168 ft.), and in Monte Perdido (11,007 ft.). The southern half forms part of the rugged and high-lying plateau of Aragon, with the Sierra de Alcubierre on the southwestern border. The whole province is included in the basin of the Ebro, and is drained by four of its principal tributaries—the Aragon in the northwest, the Gallego in the west, the Cinca in the centre, and the Noguera Ribagorzana along part of the eastern border. These rivers rise among the Pyrenees, and take a southerly course; the two last-named unite with the Segre before joining the Ebro. The Cinca receives the combined waters of the Alcanadre and Isuela on the right and the Esera on the left.

The climate is influenced locally by the cold winds of the snow-capped Pyrenees and the continental conditions of the interior plateau.

Agriculture is facilitated by a fairly complete system of irrigation, by means of which much wasteland has been reclaimed, although large tracts remain useless. There is good summer pas-

turage on the mountains, where cattle. sheep and swine are reared. The mountains are richly clothed with forests of pine, beech, oak and fir; and the southern regions, wherever cultivation is possible, produce abundant crops of wheat and other cereals, vines, mulberries and numerous other fruits and vegetables. The mineral resources include small quantities of argentiferous lead, copper, iron and cobalt, with salt, lignite, limestone, millstone, gypsum, granite and slate. The minerals are of little commercial value and there are many transport difficulties. Mineral springs are numerous. Timber, millstones, cattle, leather, and some brandy and wine are exported to France. The manufactures of Huesca are of little importance.

The Saragossa-LCrida-Barcelona railway traverses the province, and gives access, by two branch lines, to Jaca, by way of Huesca, the provincial capital, and to Barbastro. Jaca is connected with Pau (France) by rail. Huesca and Jaca are episcopal cities. Fraga was a residence of the kings of Aragon; there is a fine 12th century church and a ruined Moorish citadel. Monzon is a town on the lower Cinca, with the ruins of a Roman fortification, and of a 12th century castle of the Knights Templar. The province was contested by insurgents and loyalists until its occupation by the former in 1938. *(See* also ARAGON.)

HUESCA (anc. *Osca),* the capital of the Spanish province of Huesca, 35 mi. N.N.E. of Saragossa, on the Tardienta-Huesca-Jaca railway. Pop. (1950) 20,003 (municipio). It occupies a height near the right bank of the river Isuela, overlooking a broad and fertile plain. Strabo (iii. 161, where some editors read Ileosca) describes Osca as a town of the Ilergetes, and the scene of Sertorius's death in 72 B.C.; while Pliny places the Oscenses in *regio Vescitania.* Plutarch calls it a large city. Julius Caesar names it Vencedora; and the name by which Augustus knew it, Urbs victrix Osca, was stamped on its coins, and is still preserved on its arms. In 1096 Pedro I. of Aragon regained it from the Moors, after winning the battle of Alcoraz. Huesca is an episcopal see and has an imposing Gothic cathedral, begun in 1400, finished in 1515, and enriched with fine carving. In the same plaza is the old palace of the kings of Aragon, formerly given up for the use of the now closed Sertoria (the university), so named in memory of a school for the sons of native chiefs, founded at Huesca by Sertorius in 77 B.C. (Plut. *Sert.* 15). Huesca manufactures pottery, bricks, cloth and leather; but its chief trade is in cereals, wine, fruit and vegetables. Much fighting took place in and around Huesca in the civil war of 1936–39.

HUET (HUETIUS), PIERRE DANIEL (1630–1721), bishop of Avranches, French scholar, was born at Caen. He was educated at the Jesuit school of Caen, and also received lessons from the Protestant pastor, Samuel Bochart. In 1652 Samuel Bochart took Huet with him to Stockholm. This journey, in which he saw Leyden, Amsterdam and Copenhagen, as well as Stockholm, resulted in the discovery, in the Swedish royal library, of some fragments of Origen's *Commentary on St. Matthew,* which gave Huet the idea of editing Origen, a task he completed in 1668. He eventually quarrelled with Bochart, who accused him of having suppressed a line in Origen in the Eucharistic controversy. In Paris he entered into close relations with Chapelain. During the famous dispute of Ancients and Moderns Huet took the side of the Ancients against Charles Perrault and Desmarets. Among his friends at this period were Conrart and Pellisson. His taste for mathematics led him to the study of astronomy. He next turned his attention to anatomy, and, being himself short-sighted, devoted his inquiries mainly to the question of vision and the formation of the eye. In this pursuit he made more than 800 dissections. He then learned all that was then to be learned in chemistry, and wrote a Latin poem on salt. All this time he was no mere book-worm or recluse, but mas haunting the salons of Mlle. de Scudéry and the studios of painters; nor did his scientific researches interfere with his classical studies, for during this time he was discussing with Bochart the origin of certain medals, and was learning Syriac and Arabic under the Jesuit Parvilliers. He also translated the pastorals of Longus, wrote a tale called *Diane de Castro,* and defended, in a treatise on the origin of romance, the reading of fiction.

On being appointed assistant tutor to the Dauphin in 1670, he edited with the assistance of Anne Lefèvre, afterward Madame Dacier, the well-known edition of the *Delphin Classics.* This series was an edition of the Latin classics in about 60 volumes, and each work was accompanied by a Latin commentary and verbal index. Huet was admitted to the academy in 1674 He issued one of his greatest works, the *Demonstratio evangelica,* in 1679. He took holy orders in 1676, and two years later the king gave him the abbey of Aulnay, where he wrote his *Questiones Aletuanae* (Caen, 1690), his *Censura philosophiae Cartesianae* (1689), his *Nouveau mémoire pour servir à l'histoire du Cartésianisme* (1692), and his discussion with Boileau on the Sublime. In 1685 he was made bishop of Soissons, but after waiting for installation for four years he took the bishopric of Avranches instead. He exchanged the cares of his bishopric for what he thought would be the easier chair of the Abbey of Fontenay, but there he was vexed with continual law-suits. At length he retired to the Jesuits' House in the Rue Saint Antoine at Paris, where he died in 1721. His great library and manuscripts, after being bequeathed to the Jesuits, were bought for the royal library.

In the *Huetiana* (1722) of the abbé d'Olivet will be found material for arriving at an idea of his prodigious labours, exact memory and wide scholarship. Another posthumous work was his *Traité philosophique de la faiblesse de l'esprit humain* (Amsterdam, 1723). His autobiography, found in his *Commentarius de rebus ad eum pertinentibus* (1718), has Seen translated into French and into English.

See de Gournay, *Huet, évêque d'Avranches* (1854).

HUFELAND, GOTTLIEB (1760–1817), German economist and jurist, was born at Danzig on Oct. 19, 1760. He studied at Leipzig, Göttingen and Jena, and in 1788 was appointed to an extraordinary professorship at Jena. Five years later he was made ordinary professor. He lectured on natural law, developing with great acuteness and skill the formal principles of the Kantian theory of legislation. In 1803 Hufeland removed to Wiirzburg, and then to Landshut. From 1808 to 1812 he acted as burgomaster in his native town of Danzig. He died at Halle on Feb. 25, 1817.

Hufeland's works on the theory of legislation are marked by precision of statement and clearness of deduction. They form on the whole the best commentary upon Kant's *Rechtslehre,* the principles of which they carry out in detail, and apply to the discussion of positive laws. In political economy Hufeland's chief work is the *Neue Grundlegung der Staatswirthschaftskunst* (2 vols., 1807–13), the second volume of which has the special title, *Lehre vom Gelde und Geldumlaufe.* Hufeland was the first among German economists to point out the profit of the *entrepreneur* as a distinct species of revenue with laws peculiar to itself.

See Roscher. *Geschichte der National Ökonomik in Deutschland.*

HUGEL, FRIEDRICH VON, BARON (1852–1925), Catholic theologian, son of Karl Von Hugel (1775–1870), baron of the Holy Roman Empire, was born on May 5, 1852 at Florence. In 1867 the family moved to England, and settled at Torquay. Von Hugel later became one of the most sympathetic, resourceful and persuasive religious teachers of his age. But while he possessed a generous sympathy for all seekers after truth, he held the Catholic Church to possess the fullest, richest and deepest realization of religion. He accepted the papacy, but thought that Church government was overcentralized, believing that this tendency could be counteracted by the healthy interaction of energy between the head and the members of the whole body of believers. His relations with the Higher Criticism resulting from his Biblical scholarship led him to be classed with the Modernists, but when the crisis of Modernism was over he made it clear that he could not follow the Modernists who revolted from Rome, and that he rejected their theory of belief.

In 1873 Von Hugel married Lady Mary Herbert, a daughter of Sydney Herbert (Lord Herbert of Lea). He died in London on Jan. 27, 1925, leaving his library to St. Andrews university.

His works include: *The Mystical Element of Religion as studied in St. Catherine of Genoa and her Friends* (1908, new and rev. ed. 1923); *Eternal Life, a Study of its Implications and Applications* (1912, 2nd ed. repr. 1913); *The German Soul in its Attitude towards Ethics and Christianity; The State and War* (1916); *Essays and Addresses on the Philosophy of Religion* (1921).

HUGGINS, SIR WILLIAM (1824–1910), English astronomer who revolutionized observational astronomy by applying the spectroscopic method to the determination of the chemical constitution of stars and by his use of photography in stellar spectroscopy. He was born in London on Feb. 7. 1824, and was educated at the City of London school and under private tuition. He built a private observatory at Tulse Hill, London, in 1856 and began to apply G. R. Kirchhoff's discoveries in spectrum analysis to astronomy; this work was independent of nearly contemporary researches by L. M. Rutherfurd in the U.S. His results on the chemical constitution of the stars, obtained in collaboration with W. A. Miller, were presented to the Royal society in 1863 in a note on the "Lines of the Spectra of some of the fixed stars." In 1864 Huggins discovered the gaseous nature of the so-called "unresolved" nebulae, previously considered to be aggregates of stars too remote to be resolved by existing instruments. On May 18. 1866, in the first spectroscopic examination of a nova, he observed, superimposed on a solar-type spectrum, a number of bright hydrogen lines, suggesting that the outburst was accompanied by the emission of a shell of gas at a temperature higher than that of the star's surface. In 1868 he proved incandescent carbon vapours to be the main source of cometary light and in the same year applied Doppler's principle to the detection and measurement of stellar velocities in the line of sight. Huggins was made knight commander of the Order of the Bath in 1897, was an original member of the Order of Merit (1902) and president of the Royal society from 1900 to 1905. His *Atlas* of *Representative Stellar Spectra,* prepared conjointly with Lady Huggins (who actively cooperated in her husband's work), was published in 1899.

Huggins died in London on May 12, 1910.

See *The Scientific Papers of Sir William Huggins* (1909).

(O. J. E.)

HUGH, called THE GREAT (d. 956), duke of the Franks and count of Paris, son of King Robert of France (d. 923) and nephew of King Odo or Eudes (d. 898), was one of the founders of the power of the Capetian house in France. Hugh's first wife was Eadhild, a sister of the English king, Aethelstan. At the death of Raoul, duke of Burgundy, in 936, Hugh was in possession of nearly all the region between the Loire and the Seine, corresponding to the ancient Neustria, with the exception of the territory ceded to the Normans in 911. He took a very active part in bringing Louis IV. (d'Outremer) from England in 936, but in the same year Hugh married Hadwig, sister of the emperor Otto the Great, and soon quarrelled with Louis. Hugh even paid homage to Otto, and supported him in his struggle against Louis. When Louis fell into the hands of the Normans in 945, he was handed over to Hugh, who released him in 946 only on condition that he should surrender the fortress of Laon. At the council of Ingelheim (948) Hugh was condemned, under pain of excommunication, to make reparation to Louis who had made an alliance with Otto. It was not, however, until 950 that the powerful vassal became reconciled with his suzerain and restored Laon. But new difficulties arose, and peace was not finally concluded until 953. On the death of Louis IV. Hugh was one of the first to recognize Lothair as his successor, and, at the intervention of Queen Gerberga, was instrumental in having him crowned (Nov. 12, 956). In recognition of this service Hugh was invested by the new king with the duchies of Burgundy (his suzerainty over which had already been nominally recognized by Louis IV.) and Aquitaine. But his expedition in 955 to take possession of Aquitaine was unsuccessful. In the same year, however, Giselbert, duke of Burgundy, acknowledged himself his vassal and betrothed his daughter to Hugh's son Otto. At Giselbert's death (April 8, 956) Hugh became effectivemaster of the duchy, but died soon afterwards, on June 17, 956.

HUGH CAPET (*c.* 938–996), king of France and founder of the Capetian dynasty, was the eldest son of Hugh the Great by his wife Hadwig. When his father died in 956 he succeeded to his numerous fiefs around Paris and Orleans, and his cousin, the Frankish king Lothair, recognized him somewhat reluctantly as duke of the Franks. Many of the counts of northern France did homage to him as their overlord, and Richard I., duke of Normandy, was both his vassal and his brother-in-law. His authority extended over certain districts, south of the Loire, and, owing to his interference, Lothair was obliged to recognize his brother Henry as duke of Burgundy. Hugh supported his royal suzerain when Lothair and the emperor Otto II. fought for the possession of Lorraine; but chagrined at the king's conduct in making peace in 980, he went to Rome to conclude an alliance with Otto. Laying more stress upon independence than upon loyalty, Hugh appears to have acted in a haughty manner toward Lothair, and also towards his son and successor Louis V.; but neither king was strong enough to punish this powerful vassal. When Louis V. died without children in May 987, Hugh and the late king's uncle Charles, duke of Lower Lorraine, were candidates for the vacant throne, and in this contest the energy of Hugh's champions, Adalberon, archbishop of Reims, and Gerbert, afterwards Pope Sylvester II., prevailed. Declaring that the Frankish crown was an elective and not an hereditary dignity, Adalberon secured the election of his friend, and crowned him, probably at Noyon, in July, 987.

The authority of the new king was quickly recognized in his kingdom, which covered the greater part of France north of the Loire with the exception of Brittany, and in a shadowy fashion he was acknowledged in Aquitaine; but he was compelled to purchase the allegiance of the great nobles by large grants of royal lands, and he was hardly more powerful as king than he had been as duke. Moreover, Charles of Lorraine was not prepared to bow before his successful rival, and before Hugh had secured the coronation of his son Robert as his colleague and successor in December 987, he had found allies and attacked the king. Hugh was worsted during the earlier part of this struggle, and was in serious straits, until he was saved by the wiles of his partisan Adalberon (*q.v.*) bishop of Laon, known as Asselin, who in 991 treacherously seized Charles and handed him over to the king. This capture virtually ended the war, but one of its side issues was a quarrel between Hugh and Pope John XV., who was supported by the empire, then under the rule of the empresses Adelaide and Theophano as regents for the young emperor Otto III. In 987 the king had appointed to the vacant archbishopric of Reims a certain Arnulf, who at once proved himself a traitor to Hugh and a friend to Charles of Lorraine. In June 991, at the instance of the king, the French bishops deposed Arnulf and elected Gerbert in his stead, a proceeding which was displeasing to the pope, who excommunicated the new archbishop and his partisans. Hugh and his bishops remained firm, and the dispute was still in progress when the king died at Paris on Oct. 24, 996.

Hugh was a devoted son of the church, to which, it is not too much to say, he owed his throne. As lay abbot of the abbeys of St. Martin at Tours and of St. Denis he was interested in clerical reform, was fond of participating in religious ceremonies, and had many friends among the clergy. His wife was Adelaide, daughter of William III, duke of Aquitaine, by whom he left a son, Robert, who succeeded him as king of France. The origin of Hugh's surname of Capet, which was also applied to his father, has been the subject of some discussion. It is derived undoubtedly from the Lat. *capa, cappa,* "a cape," but whether Hugh received it from the cape which he wore as abbot of St. Martin's, or from his youthful and playful habit of seizing caps, or from some other cause, is uncertain.

Lavisse, *Histoire de France,* tome ii (1903–05).

HUGH DE PUISET (*c.* 1125–1195), bishop of Durham, was the nephew of Stephen and Henry of Blois; the latter brought him to England and made him an archdeacon of the see of Winchester. Hugh afterward became archdeacon and treasurer of York. In 1153 he was chosen bishop of Durham, in spite of the opposition of the archbishop of York; but he obtained consecration only by making a personal visit to Rome. Hugh remained neutral, as far as he could, in the quarrel between Henry and Thomas Becket, but he at least connived at the rebellion of 1173 and William the Lion's invasion of England in that year. After the

failure of the rebellion the bishop was compelled to surrender Durham, Norham and Northallerton to the king. In 1179 he attended the Lateran council at Rome, and in 1181 by the pope's order he laid Scotland under an interdict. In 1184 he took the cross.

At the general sale of offices with which Richard began his reign (1189) Hugh bought the earldom of h'orthumberland. The archbishopric of York had been vacant since 1181. This vacancy increased Hugh's power vastly, and when the vacancy was filled by the appointment of Geoffrey he naturally raised objections. This quarrel with Geoffrey lasted till the end of his life. Hugh aas nominated justiciar jointly with William Longchamp when Richard left the kingdom. But Longchamp soon deprived the bishop of his place (1191), imprisoned him and forced the surrender of his castle, his earldom and hostages. Hugh was compelled to acknowledge Geoffrey of York as his .ecclesiastical superior in 1195. Combining in his own hands the palatinate of Durham and the earldom of Northumberland. Hugh held a position not much dissimilar to that of the great German princes, a local sovereign in all but name.

See Kate Norgate's *England* under *the Angevin Kings* (1887).

HUGHES, CHARLES EVANS (1862–1948), U.S. jurist and statesman who narrowly missed election to the presidency of the United States; twice a member of the United States supreme court. he led that tribunal as chief justice through its greatest crisis in the first half of the 20th century.

Hughes was born at Glens Falls, N.Y., on April 11, 1862, the only son of the Rev. David Charles Hughes and Mary Catherine Connelly Hughes. He was educated at Madison (now Colgate) university, Hamilton, K.Y. (1876–78), and at Brown university, Providence, R.I., where he was graduated (B A.) in 1881. After teaching for a year at Delhi, N.Y., and studying law in his spare time. he entered Columbia law school in 1882. Two years later he was graduated with an LL.B. degree and a three-year prize fellowship. Passing the bar examination with a mark of 99½, he began his practice in New York city. For two years (1891–93) he served as professor of law at Cornell university, Ithaca, N.Y.. and then resumed his practice in New Uork city.

Early Career. — Hughes's nork as counsel for the Stevens committee investigating the gas and electric lighting industries of Sew York in 1905 first brought him public recognition. His success in that venture resulted in his employment by the Armstrong legislative committee to investigate the corruption in which many Sew York life insurance companies had become involved, Though his methods were fair, his conscientious digging brought sensational disclosures which led to extensive life insurance reforms and to his nomination for the governorship of New York by the Republican party acting under the influence of Pres. Theodore Roosevelt. After a turbulent campaign Hughes won by 57,897 votes over William Randolph Hearst. He was re-elected in 1908. By appealing to the people over the heads of the party bosses, he succeeded in establishing two of the first public service commissions in the country. His administration was also notable for its progressive labour and welfare legislation, its administrative reforms, and for enforcement of the constitutional prohibition of race-track gambling.

Associate Justice and Presidential Candidate. — Pres. William Howard Taft named Hughes associate justice of the U.S. supreme court in 1910, and he soon emerged as an eminent judge, especially in the fields of civil rights and railaay rate regulation. In 1912 he flatly refused to be a candidate for the presidency; in 1916 he again repudiated all work in his behalf, but, uith Europe at war and the Republican party split between William H. Taft and Theodore Roosevelt, he was drafted by the Republican national convention and immediately resigned from the court. Though he campaigned vigorously as candidate of both the Progressive and the Republican parties, he lost by 277 to 254 electoral votes to Pres. Woodrow Wilson, aho was widely credited aith having kept the United States out of the war in Europe When the country was drawn into World War I in the early months of Wilson's second term. Hughes offered his services to the president and became chairman of the draft appeals board of New Uork city in 1917 and special assistant to the U.S. attorney general to investigate the sluggish aircraft industry in 1918. Between his official assignments, he again practised law in New York.

Secretary of State. — Hughes put aside suggestions that he become a presidential candidate again in 1920, partly because of the death of his daughter Helen. When Pres. Warren G. Harding was inaugurated on March 4, 1921, however, Hughes became secretary of state. His behind-the-scenes struggle to take the United States into the League of Nations. nithout art. x of its covenant, was blocked by the "Irreconcilables" in the senate. Unable to save any part of the treaty of Versailles, he negotiated a separate peace with Germany. In a spirited contest with Japan, he insisted on keeping the mandated islands of the Pacific open to international inspection.

Hughes was the chief planner of the Washington arms conference of 1921–22. His dramatic speech proposing a formula to end the naval race, aith drastic reductions in the capital ships of the United States, Britain and Japan, was applauded throughout the world and adopted with little change. Likewise he succeeded in breaking up the Anglo-Japanese alliance and substituting for it a four-power pact designed to keep the peace in the Pacific. Among the seven treaties which the conference produced were also a nine-power pact guaranteeing the integrity of China and a settlement of the Shantung controversy between Japan and China. *(See* WASHINGTON CONFERENCE.)

Secretary Hughes continued the Wilson policy of refusing to recognize the Communist government of the U S.S.R., but he applied steady pressure on Japan to end the postwar occupation of Siberia and Sakhalin. In Latin America his policy was one of removing causes of friction and of "liquidating imperialism." His patience and fairness brought about settlement of several boundary disputes between Latin-American countries and contributed greatly to the ultimate settlement of the Tacna-Arica controversy between Chile and Peru. Alarmed by mounting economic chaos in Europe, he tried to induce France to agree to an expert investigation of Germany's capacity to pay reparations. The French repeatedly refused. and the situation worsened. Finally he made his suggestion publicly in a speech at New Haven, Conn., in Dec. 1922, and after much pulling and hauling this led to the scaling down of reparations through the Dames plan. (See REPARATIONS.)

Hughes's efforts to take the United States into the world court were no more successful than his fight for the League had been. Because he was a moderate internationalist at a time of extreme isolationism, some of his favourite projects were thwarted. After his retirement in the 1940s, however. Secretary of State Cordell Hull secretly consulted him in regard to international organization to keep the peace and some of his ideas found expression in the charter of the United h'ations. His policies as secretary of state made a substantial impact on the course of international events; he pursued his principles of justice and peace with remarkable skill.

When Hughes returned to the bar on March 4, 1925, he was acknowledged to be the country's leading attorney. Yet he found time for extensive public service. In 1925–26 he headed the New York state reorganization commission, which strengthened the poners of the governor, created an executive budget system and consolidated nearly 180 bureaus and agencies into 18 departments. In 1928 he went to Havana, Cuba, as chairman of the U.S. delegation to the sixth Pan American conference. His dramatic speech in defense of the U S. occupation of Nicaragua convinced the delegates that the U.S. had no aggressive intent. A year later he again represented the U.S. at the Pan American Conference on Arbitration and Conciliation. In the same year he served as a judge of the Permanent Court of International Justice at The Hague.

Chief Justice. — Hughes let it be known that he would not accept nomination for the presidency in 1928 because he was too old, but tao years later (Feb. 3, 1930) he did accept nomination to the chief justiceship of the United States at the age of 67. The nomination was confirmed only after a spirited fight in the senate. Sen. George W. Norris and others had been seeking an opportunity to denounce some of the court's conservative opinions and to embarrass Pres. Herbert Hoover, who made the appoint-

ment. They unleashed all their fury against Hughes, but to no avail. He was confirmed by a vote of 52 to 26.

On the bench Hughes confounded his critics by a series of liberal opinions further buttressing civil rights against encroachment by the states. He also took a broad view of the power of congress to regulate interstate commerce and thus control the national economy. Though he held to the concept of a "marching" constitution, he believed that the court was obligated to hold invalid statutes for which no constitutional backing could be found.

In the dark years of the great depression of the 1930s the court ruled that congress had exceeded its powers in passing several recovery measures sponsored by Pres. Franklin D. Roosevelt. The National Recovery administration, the Agricultural Adjustment administration and the Guffey Coal act went down. The court also upset the New York minimum wage law, thus curbing state as well as national power. Its extreme conservatism brought frequent dissents from Hughes and other justices. However, it upheld the more carefully devised New Deal statutes.

In 1937 Roosevelt asked congress to give him authority to name six new members of the court if the justices over 70 did not retire. A letter from Hughes to the senate judiciary committee riddled the president's contention that this would enhance the court's efficiency. It is sometimes said that the court further contributed to defeat Roosevelt's "court-packing" bill by upholding the Wagner Labor Relations act and the Social Security acts and by changing its mind on state minimum wage laws. But Hughes always insisted that the bill had no effect on the court's rulings and that the later New Deal laws were upheld because they had been enacted with greater care. His skillful defense of the court's work and the restraint of his opinions were powerful factors in the final defeat of the bill. In 1941 he retired and on Aug. 27, 1948, he died at Cape Cod, Mass., at the age of 86.

Hughes delivered numerous addresses subsequently reproduced in pamphlet form. In addition, he published *Addresses and Papers* (1908); *Public Papers of C. E. Hughes, Governor, 1907–1910* (1910); *Conditions of Progress in Democratic Government,* Yale lectures (1910); *Addresses 1906–16* (1916); *Foreign Relations* (1924); *The Pathway of Peace* (1925); *The Supreme Court of the United States: Its Foundations, Methods and Achievements* (1928); and *Pan American Peace Plans* (1929).

See M. J. Pusey, *Charles Evans Hughes,* authorized biography, 2 vol. (1951). (M. J. Py.)

HUGHES, DAVID EDWARD (1831–1900), Anglo-American electrician, was born on May 16, 1831, in London, but the earlier part of his life was spent in America, whither his parents emigrated when he was about seven years old. In 1850 he became professor of music at the college of Bardstown, Kentucky, and soon afterwards teacher of natural philosophy at the same place, but resigned in 1854. In 1855 he took out a patent in the United States for his type-printing telegraph instrument. Its success was immediate and in 1867 Hughes brought it over to Europe. In the succeeding ten years it came into extensive use all over Europe, gaining for its inventor numerous honours and prizes. Hughes played an important part in the development of telephony; his microphone was the forerunner of the various forms of carbon transmitter in general use. Continuing his experiments with his microphonic joints, Hughes discovered the phenomena on which depends the action of the so-called "coherers" used in wireless telegraphy. Hughes, who is also known for his invention of the induction balance and for his contributions to the theory of magnetism, died in London on Jan. 22, 1900.

HUGHES, SIR EDWARD (c. 1720–1794). British admiral, entered the Royal Navy in 1735, and four years later was present at Porto Bello. In 1740 he became lieutenant, and in that rank served in the Cartagena expedition of 1741, and at the indecisive battle of Toulon (1744). From that time he was almost continuously employed on active service. He was with Boscawen at Louisburg and with Saunders at Quebec. As Commodore he commanded in the East Indies from 1773 to 1777. It was not long before he returned to the East as a rear-admiral, with an overwhelming naval force. On his outward voyage he retook Goree from the French. In 1782 he stormed Trincomalee a few days before the squadron of Suffren (*q.v.*) arrived in the neighbourhood. Five fiercely contested general actions were fought by the two fleets, neither of them gaining a decisive advantage. Hughes died at Luxborough, Essex, in 1794.

HUGHES, HOWARD ROBARD (1905–), American aviator, was born in Houston, Tex., on Dec. 24, 1905, and was educated at Rice Institute in Houston and at the California Institute of Technology. After several years in the production of motion pictures in Hollywood he built an aeroplane factory and began his career as a speed flyer. In 1935 he set a world's speed record for land planes (352 m.p.h.) and in 1937 he flew eastward across the continent in the record time of 7 hours, 28 minutes. On July 14, 1938, he completed, with four companions, his record flight around the world in 3 days, 19 hours, 8 minutes.

HUGHES, HUGH PRICE (1847–1902), British Nonconformist divine, was born at Carmarthen on Feb. 8, 1847, the son of a surgeon. He established in 1887 the West London mission. He had started in 1885 the *Methodist Times,* and rapidly made it a leading organ of Nonconformist opinion. He was a born fighter, and carried the fire and eloquence he showed on the platform and in the pulpit into journalism. He supported W. T. Stead in 1885, as he had earlier supported Mrs. Josephine Butler in a similar cause; he attacked the trade in alcohol; was an anti-vivisectionist; he advocated arbitration; and his vehement attacks on Sir Charles Dilke and Charles Stewart Parnell originated the phrase the "Nonconformist conscience." He differed strongly from a large section of Nonconformist opinion in his defence of the South African War. In 1898 he was president of the Wesleyan Conference. His energies were largely devoted to co-operation among the various Nonconformist bodies, and he was one of the founders and most energetic members of the National Council of the Evangelical Free Churches. He died in London on Nov. 17, 1902.

See his *Life* (1904) by his daughter, Dorothea Price Hughes.

HUGHES, JOHN (1677–1720), English poet and miscellaneous writer, was born at Marlborough, Wiltshire. He died on the night of the production of his most celebrated work, *The Siege of Damascus,* Feb. 17, 1720. Hughes wrote some of the libretti of the cantatas (2 vols., 1712) set to music by Dr. John Christopher Pepusch. Others of his pieces were set to music by Ernest Galliard and by Handel. In the masque of *Apollo and Daphne* (1716) he was associated with Pepusch, and in his opera of *Calypso and Telemachus* (1712) with John E. Galliard. Hughes's version of the *Letters of Abelard and Heloise* . . . (1714) is notable as the basis of Pope's "Eloisa to Abelard" (1717).

His *Poems on Several Occasions, with some Select Essays in Prose* . . . were edited with a memoir in 1735, by William Duncombe, who had married his sister Elizabeth. *See* also *Letters by several eminent persons* (2 vols., 1772) and *The Correspondence of John Hughes, Esq. . . . and Several of his Friends* . . . (2 vols., 1773), with some additional poems.

HUGHES, JOHN (1797–1864), American Roman Catholic divine, was born in Annaloghan, county Tyrone, Ireland, on June 24, 1797. He followed his father to Chambersburg, Pa., and was ordained deacon in 1825 and priest in 1826. He opposed the lay trustee system in Philadelphia where he served in several churches. In the New York diocese he was consecrated coadjutor to Bishop Dubois in 1838, bishop in 1842, and first archbishop in 1850, and worked against the lay trustee system and for State support for parochial schools. At all times he constituted himself a defender of his faith against miscellaneous attacks of Protestant clergy and the "Native American" and "Know-Nothing" agitations of 1844 and 1854. He was equally ready, however, to denounce sources of weakness within the Church as is shown by his attack in 1856 on three classes of Roman Catholic papers which he considered injurious. During the Civil War his ardent attachment to the Union resulted in his going to France to counteract the influence of the Slidell mission and was productive of good feeling towards the North both in Rome and Ireland. The establishment of St. John's college (now Fordham university) in 1841 largely with funds collected by him in Europe is one of his most constructive achievements. He died in New York city on Jan. 3, 1864. His reputation as a member of the Church militant he himself explained on the

ground that "the circumstances by which I have been surrounded, and the character of the country and people with whom I had to deal, did not allow me to use, at all times, that meek and apostolic spirit which is so appropriate and beautiful."

His works were edited by Laurence Kehoe (1864–65). Good biographies were prepared by J. G. Hassard (1865) and H. A. Brann (1892).

HUGHES, SIR SAM (1853–1921), Canadian soldier and politician, was born at Darlington, Ont. on Jan. 8, 1853. In the Fenian raids of 1870 he served with the Canadian volunteer militia, and in 1873 was gazetted to the 45th Regiment. Educated at Toronto University, he lectured at a Toronto collegiate institute until 1885, when he took up journalism, being editor and proprietor of the Lindsay *Warder*, 1885–97. In 1892 Hughes was elected to the Dominion parliament, but service in the South African War interrupted his political career. Returning to Canada after the coronation of King George V. in 1911, he became minister of militia and defence, and was chiefly responsible for the creation of the overseas force which sailed for Europe in 1914. In 1915 Hughes was created K.C.B. and promoted major-general; but in the following year disagreements with Sir Robert Borden resulted in his resignation. Hughes criticized severely the strategy and leadership of Sir Arthur Currie. In July 1921 he announced his intention of retiring from parliament, and he died at Lindsay, Ont., on Aug. 24, 1921.

HUGHES, THOMAS, English dramatist, a native of Cheshire, entered Queens' college, Cambridge, in 1571, and became a member of Gray's Inn. He wrote *The Misfortunes of Arthur, Uther Pendragon's son reduced into tragical notes by Thomas Hughes,* performed at Greenwich in the queen's presence on Feb. 28, 1588. Nicholas Trotte provided the introduction, Francis Flower the choruses of Acts I. and II., William Fulbeck two speeches, while three other gentlemen of Gray's Inn, one of whom was Francis Bacon, undertook the care of the dumb show. The argument of the play, based on a story of incest and crime, was borrowed, in accordance with Senecan tradition, from mythical history, in this case Geoffrey of Monmouth's *Historia Britonum.* Dr. *W. J.* Cunliffe has proved that Hughes's memory was saturated with Seneca, and that the play may be resolved into a patchwork of translations, with occasional original lines.

The Misfortunes of Arthur was reprinted in J. P. Collier's supplement to Dodsley's Old *Plays;* and *by* Harvey Carson Grumline (Berlin, 1900) who points out that Hughes's source was Geoffrey of Monmouth's *Historia Britonum,* not the *Morte D'Arthur.*

HUGHES, THOMAS (1822–1896), English lawyer and author, second son of John Hughes of Donnington Priory, editor of *The Boscobel Tracts* (1830), was born at Uffington, Berks. He was educated at Rugby school under Dr. Arnold, and at Oriel college, Oxford. He was called to the bar in 1848, became Q.C. in 1869, a bencher in 1870, and was appointed to a county court judgeship in the Chester district in July 1882. While at Lincoln's Inn he came under the dominating influence of his life, that of Frederick Denison Maurice. In 1848 he joined the Christian Socialists, under Maurice's banner, among his closest allies being Charles Kingsley. In Jan. 1854 he was one of the original promoters of the Working Men's College in Great Ormond Street, of which he became principal after Maurice's death. Hughes sat in parliament from 1865 to 1874, and introduced a trades union bill which, however, only reached its second reading. On one of his visits to America in 1879 he planned a co-operative settlement, "Rugby," in Tennessee, which involved him in money losses. In 1848 Hughes had married Frances, niece of Richard Ford, of Spanish *Handbook* fame. They settled in 1853 at Wimbledon, and there was written his famous story, *Tom Brown's School Days* (1857) "by an Old Boy." *Tom Brown* did a great deal to fix the English concept of what a public school should be. Hughes also wrote *The Scouring of the White Horse* (1859), *Tom Brown at Oxford* (1861), *Religio Laici* (1868) and *Life of Alfred the Great* (1869). He died at Brighton on March 22, 1896.

HUGHES, WILLIAM MORRIS (1864–1952), Australian statesman, was born on Sept. 25, 1864, in London, Eng. At the age of 20 he went to Australia. There he drove sheep and cattle across New South Wales and Queensland, worked on farms and cooked for harvesting gangs, became a sailor on coasting steamers, prospected for gold, tramped from station to station doing odd jobs, taught children in remote settlements, walked hundreds of miles organizing for the Australian Workers' union, and in the end drifted back to Sydney and gravitated to politics. He formed the Sydney waterside workers into a militant organization and entered the New South Wales parliament in 1894 as member for the Lang division of Sydney.

As a member of the Opposition Hughes was an effective debater, and devised the Labour party's caucus system of settling all internal dissensions outside the House and presenting a united front in parliament. Then in 1901 came federation, and as member for West Sydney in the first House of Representatives Hughes found wider scope for his political genius. In 1904 J. C. Watson formed the first Labour ministry, and Hughes, who in the midst of his industrial and political work had found time to qualify as a barrister, became minister for external affairs. The ministry was short-lived, but thenceforth it was clear to friends and foes alike that a new force had entered Australian politics. During the years that followed Hughes became a powerful orator, and his courage, energy, intellectual gifts and dominating personality made his succession to Mr. Fisher almost inevitable.

Hughes was attorney-general in the Fisher ministry of 1908, and revealed a breadth of view and a warm Imperialism hardly to be looked for in a party which, not so many years before, had toyed with the idea of "cutting the painter." He promoted the scheme of compulsory military service, and he was heart and soul with his leader when Fisher, who had returned to office after the Liberal defeat of 1913, made his historic offer in 1914 of Australia's last man and last shilling. In 1915 Fisher went to London as high commissioner, and Hughes succeeded him as prime minister. Hughes, by his driving force and faculty of kindling enthusiasm, gave an immense stimulus to the raising and maintenance of the Australian Expeditionary Forces; and with equal energy he set to work to eradicate German commercial influence from Australia. He secured legislation annulling German contracts, transferred control of output to the newly established Australian Metal Exchange, prevented trading with the enemy, and disinherited enemy shareholders in commercial enterprises of every kind.

In 1916 he visited England and preached a renaissance of the British race based upon a greater development of the empire's resources and a closer-knit economic system. Returning to Australia he attempted to introduce conscription. On this issue the Labour party split, and Hughes formed a Coalition Government composed of the Liberals and that section of the Labour party which followed him on the conscription issue. The conscription referendum, on which the Government was defeated, was marked by great bitterness, and there followed a period of industrial and political strife without parallel in Australia's history. Hughes was hotly attacked for his autocratic methods, for his excursions into State shipowning and shipbuilding, and for his policy of concentrating power in his own hands by means of the War Precautions Act, the establishment of boards to control industry, and the appointment of special tribunals to settle industrial disputes over the head of the Arbitration Courts. But so long as the War lasted there was no acceptable alternative leader, and the prime minister left to attend the Peace Conference with his prestige higher than ever. His assertion of Australia's right to proclaim something rather like a Monroe Doctrine for the Pacific awakened Americans and the world to the importance of Australasia; and at Versailles his dogged advocacy of the Commonwealth's right to a mandate over the former German colony of Papua, helped to make history. His quarrel with President Wilson, embittered by mutual dislike, gave rise to some of the most piquant passages in the annals of the conference.

In Australia, on his return, Hughes found grave industrial troubles disturbing a country already weighed down by an immense load of debt and the problem of reabsorbing 400,000 men into civil life. But he could not prevent discontent revealing itself in the secession of certain Liberal-Nationalists and the formation of a new Country party, and in Feb. 1923 he resigned. Offices he

later held included vice-president of the executive council, 1934–35 and 1937–38; minister for external affairs, 1937–39; and minister for the navy, 1940–41. His works include *The Price of Peace* (1934) and *Policies and Potentates* (1950). He died at Sydney on Oct. 27, 1952. (G. C. DI.; X.)

HUGH OF LINCOLN, ST. (*c.* 1140–1200), bishop of Lincoln, was born of a noble family at Avalon, in Burgundy. He entered the canons regular at Villard-Benoît and about 1160 was appointed prior of a dependent cell. Later, however, he joined the monks of the Grande Chartreuse, and rising to the important office of procurator, he acquired a reputation for energy and tact which led Henry II. of England to request his assistance in establishing at Witham in Somersetshire the first English Carthusian monastery. Hugh became the first prior, and under him the Charterhouse, a copy of the Grande Chartreuse, was completed. In 1186 Henry procured his election to the see of Lincoln There he let neither royal nor ecclesiastical influence interfere with his conduct, but fearlessly resisted any infringement of the rights of his church or diocese. Though himself an ascetic, he was noted for his kindness to the poor, to lepers and to Jews. In 1200 Hugh revisited his native country and on the return journey was seized with an illness, of which he died at London on Nov. 16, 1200. He was canonized by Honorius III. and his feast is celebrated on Nov. 17.

The *Magna vita S. Hugonis* was edited (1864) by J. F. Dimock, who also edited a *Metrical Life of St. Hugh of Avalon* (1860) and *a Vita* by Giraldus Cambrensis (1877). *See* the *Vie de St. Hugues, évêque de Lincoln* (1140–1200) *par un religieux de la Grande Chartreuse* (Montreuil, 1890, Eng. trans by H Thurston, S J , with valuable notes 1898); C. L. Marson, *Hugh, bishop of Lincoln* (1901); R M. Woolley, *St. Hugh of Lincoln* (1927). *A* complete bibliography is given in U. Chevalier, *Bio-bibliographie* (1905); *see* also A. Potthast, *Bibliotheca med. aev.*, 1380.

Another ST HUGH OF LINCOLN was a child about ten years old when he was found dead on premises belonging to a Jew. It was said that the boy had been scourged and crucified in imitation of the death of Christ, and many Jews were punished. The incident is referred to by Chaucer in the *Priorerses Tale* and by Marlowe in the *Jew of Malta*.

See J. Jacobs, *Little St. Hugh of Lincoln* (1884).

HUGH OF ST. CHER (*c.* 1200–1263), French cardinal and Biblical commentator, was born at St. Cher, near Vienne, and, while a student in Paris, became a Dominican in 1225. Later, as provincial of his order, he won the confidence of the popes Gregory IX., Innocent IV. and Alexander IV., who charged him with several important missions. Created cardinal-priest in 1244, he played an important part in the council of Lyons in 1245, contributed to the reform of the Carmelites (1247), and the condemnations of the *Introductorius in evangelium aeternum* of Gherardino del Borgo San Donnino (1255), and of William of St. Amour's *De periculis novissimorum temporum*. He died at Orvieto on March 19, 1263. He directed the first revision of the text of the Vulgate begun in 1236 by the Dominicans; this first "correctorium," vigorously criticized by Roger Bacon, was revised in 1248 and in 1256, and forms the base of the celebrated *Correctorium Bibliae Sorbonicum*. With others of his order he edited the first concordance of the Bible, *Concordantiae Sacrorum Bibliorum* or *Concordantiae S Jacobi*. His *Postillae in sacram scripturam juxta quadruplicem sensum, litteralem, allegoricum, anagogicum et moralem* was published frequently in the 15th and 16th centuries, and his exegetical works appeared at Venice in 1754 in 8 vols.

HUGH OF ST. VICTOR (1096–1141), mystic philosopher and theologian, was born at Hartingam, Saxony. After spending some time in a house of canons regular at Hamersleben, in Saxony, where he took the habit, he went to the Abbey of St. Victor in Paris. There he rose to be canon, in 1125 *scholasticus,* and perhaps even prior, and it was there that he died on March 11, 1141. Hugh initiated that mysticism of the school of St. Victor which filled the whole of the second part of the 12th century; but in reaction to the theories of Roscelin and Abelard, his mysticism was the orthodox system of a subtle and prudent rhetorician. In theology, he paved the way for the great *Summae* of the 13th century by his excellent dogmatic synthesis, entitled *De sacramentis:* Creation and restoration are the critical events in the history of the world. By the former the world was constituted, by the latter it regains its lost glory. The work of creation can be known by a study of the profane sciences; that of restoration is revealed in Holy Scriptures. His sacramental teaching clarified many points later adopted by his successors. Hugh did not profess the contempt for the profane sciences which his followers the Victorines expressed. His division of these sciences into theoretical, practical, mechanical and logical, and his moderate realism occupy a subordinate position to his interest in psychology. Like Augustine, he starts from consciousness of the self, which he believes bears witness to the existence, the substantiality, and the spirituality of the soul. Knowledge of the self is the fruit of introspection, knowledge of the external world is the fruit of the zealous exercising of natural talent, and knowledge of God the fruit of contemplation. For Hugh the existence of God is provable both from internal and from external experience, especially that of the changeability of creatures.

Besides the *De Sacramentis*, Hugh's chief works are the encyclopaedic *Didascalion*, the *De Unione corporis et spiritus*, the mystical treatises *De arca Noë morali, De arca Noe mystica, De vanitate mundi, De arrha animae, De amore sponsi ad sponsam,* etc., the commentaries on Scriptural books and on the *Celestial Hierarchy* of the Pseudo-Dionysius.

The 1648 Rouen edition of his *opera* was reprinted in Migne's *Patrol. Lat.*, vols. 175–177. *See* B. Hauréau, *Les Oeuvres de Hugues de St. Victor* (1859; 2nd ed., 1886); article by H. Deniffe in *Archiv fur Literatur und Kirchengeschichte dcs Mittelalters,* iii. (1887); A. Mignon, *Les Origines de la Scholastique et Hugues de St. Victor* (1895); J. Kilgenstein, *Die Gotteslehre des Hugo von St. Victor* (1898); Ostler, *Die Psychologie des Hugo von St. Viktor* (1906); Pourrat, *La Theologie sacrammentaire* (1907); M. Grabmann, *Die Gesch. der Scholast. Methods* (1909–11), and complete bibliography in Überweg, *Gesch. der Philosophie* (Bd. ii. 1928).

HUGO, GUSTAV VON (1764–1844), German jurist, was born at Lörrach in Baden, on Nov. 23, 1764. He became extraordinary professor of law at Göttingen in 1788, ordinary professor in 1792. In the preface to his *Beiträge zur zivilistischen Bücherkenntnis der letzten vierzig Jahre* (1828–29) he gives a sketch of the condition of the civil law teaching at Göttingen at that time. He was the founder of that historical school of jurisprudence which was continued and further developed by Savigny. His *magna opera* are the *Lehrbuch eines zivilistischen Kursus* (7 vols., 1792–1821), in which his method is thoroughly worked out, and the *Zivilistisches Magazin* (6 vols., 1790–1837). He died at Göttingen on Sept. 15, 1844.

See Eyssenhardt, *Zur Erinnerung an Gustav Hugo* (1845).

HUGO, VICTOR MARIE (1802–1885), French poet and novelist, was the third son of Captain (subsequently General) Joseph Léopold Sigisbert Hugo by his wife Sophie, daughter of M. Trébuchet of Nantes. In the autobiographical notes which the poet dictated to his wife and which were published in 1863 under the title *Victor Hugo raconté par un témoin de sa vie,* a wholly apocryphal account of the origins of the Hugo family is given. History discloses only that the poet's grandfather, Joseph Hugo, was a carpenter at Nancy, that his great grandfather was a peasant-farmer in the Vosges. His mother's family were of Breton, and indeed Celtic origin, and the fact that Victor Hugo was thus "d'un sang bréton et lorrain à la fois," may account for the curious blending in his character of imagination and insensitiveness, of recklessness and caution, of extravagance and parsimony. At the time of the poet's birth his father, who was suspected by Bonaparte of being a supporter of Moreau, had been relegated to the command of a battalion at Besançon. It was here, in the Maison Barette on the Place St. Quentin, that Victor Hugo was born on Feb. 26, 1802.

Victor Hugo's life divides itself into seven distinct though

unequal periods. There is his exciting Napoleonic childhood (1802–15); his infant-prodigy period in Paris (1815–22); his royalist period (1822–27); the three turbulent years of the romantic crusade (1827–30); the 1 j successful years under Louis Philippe (1830–45); his political period, and his 18 years of exile (1852–70); and the final apotheosis when he lived on as the bard and prophet of the Third Republic (1870–85).

Childhood (1802–1815).—The events of Hugo's childhood are important and must be recorded in some detail. It was an exaggeration on his part to say that:—

> Parmi les chars poudreux, les armes Cclatantes
> Une muse des camps m'emporta sous les tentes . . .

but it is a fact that his early years were inflamed by many journeys and excitements, and that his whole subsequent attitude towards life was much affected by the contrasts and vicissitudes, by the actual flash and jingle, of the Napoleonic era. His father had attached himself to Joseph Bonaparte and accompanied that monarch first to Naples and then to Madrid. Of the Italian journey, undertaken at the age of five, little remained for Hugo beyond some faint memories of Rome and Naples, of the snow and sledges upon the Mont Cenis, of the nut-trees among the rocks at Avellino. The Spanish journey of 1811 left an infinitely deeper impress. General Hugo was by then a count of the Empire. He was governor of Madrid, and King Joseph's confidential adviser: he was count of Cifuentes and marquis of Siguenza: he Possessed on paper large properties in Castile and a fortune of one million réals. There was no limit to the honours or prosperity which such a father could obtain, and the Spanish journey was thus undertaken in a blaze of anticipation and with all the conveniences and attentions accorded to highly important personages, Such glories left an indelible impression, but they were not of long duration. Victor and his brother Eugene were sent to the College of Nobles in Madrid, where they were supposed to consort with the Spanish aristocracy. The latter, however, regarded them as foreigners and invaders, whereas the Jesuits who were in charge of the college imagined that they were Protestants and eyed them askance. It was not a happy period; and it produced in Hugo an aristocracy-complex, a love-hatred of aristocracy, which, working on his persistent egoism, became one of the many constituents of his later demagogics. For the moment, however, his vanity reacted to these humiliations only in the form of national arrogance:—

> Chez dix peuples vaincus, je passais sans défense
> Et leur respect craintif étonnait mon enfance . . .
> Quand je balbutais le nom chéri de la France
> Je faisais pâlir l'ttranger.

By the spring of 1812 the French position in Madrid, in spite of the pallor of the inhabitants, became insecure: General Hugo felt it safer to send his wife and children back to Paris.

In the intervals of these Italian and Spanish expeditions, Mme. Hugo educated her children in Paris. She was a hard and stingy woman,——imperious, independent and cold. Her politics were anti-Bonapartist, she was royalist and Vendéenne. Her religion was Voltairean, inclining to deism. Her influence upon her children was immense and she succeeded for many years in imposing upon them her dislike of Napoleon, her very acute dislike of their own father. They were happy there, in the large garden of No. 12 Impasse des Feuillantines, where they climbed the trees, and played with little Adkle Foucher, and had pleasant discursive lessons from Père de la Rivière, and listened to the long stories of General Lahorie, an aged conspirator whom their mother was hiding from the police. With the fall of Napoleon the fortunes of the Hugo family declined suddenly: their many castles in Spain melted into the air: General Hugo was interned on an allowance of £40 a year at Blois, where he established an alternative Mme. Hugo, and became thereafter for his sons "le brigand de la Loire." Mme., no longer countess, Hugo found herself in reduced circumstances: she left the Feuillantines and took a small flat in the rue Bonaparte. And Victor Hugo, for his part, was sent to the Pension Cordier, rue Marguérite, to prepare for the Ecole Polytechnique. These circumstances of his early years have been recorded in some detail since their grandeur and their instability help to explain many outstanding faults in Hugo's genius and character. His intermittent education, the constant disagreements between his father and mother, the contrast between the splendours of his father's prospects and the meagre squalor of the result, the violent tawdriness of the whole Napoleonic system, account in their several ways for the superficiality of his knowledge and convictions, for his flashy exaggerations, for his passion for contrast, for the actual vulgarity of his character and mind. For the first 13 years of his life he was continually in a dramatic, and therefore in a false, position: a twist was thereby given to his egoism which developed into a foolish, and subsequently an embittered, form of conceit.

The Infant Prodigy (1815–1822).—His three years at the Pension Cordier, the lectures which he attended simultaneously at Louis-le-Grand, were important to Hugo as constituting the only systematic or thorough education that he ever obtained. He was excellent at mathematics, superficial in his classical studies, and a voracious reader. The tragedies of Voltaire which had hitherto been his main source of reading, were now supplemented by Ossian, by Calderon, by Chateaubriand. On July 10, 1816 we find him writing "I wish to be Chateaubriand or nothing." His literary ambition was thus aroused at the age of 14 and during his school-boy years he composed all manner of verses, odes, satires, acrostics, riddles, epics and madrigals. There was a tragedy, *Irtamène,* in the manner of Voltaire: a long poem on the flood: a melodrama entitled *Inez de Castro:* a comic opera: and a series of translations from Ossian and the classics. In 1817 he obtained an honourable mention from the Académie Française for a poem on the theme of "Happiness procured by study and application," and, thus encouraged, he embarked upon his first novel *Bug-Jargal,* which dealt with a blood curdling episode in the negro revolt at San Domingo. In 1819 he was accorded by the Academy of the Jeux Floraux at Toulouse the first prize for a poem on the restoration of the statue of Henry IV., and it was on this occasion that Chateaubriand is said to have called him "l'enfant sublime." His eldest brother Abel Hugo had by then begun to edit a short-lived journal entitled *Le Conservateur Littéraire.* To this journal Victor Hugo contributed not only the text of his novel *Bug-Jargal,* but a great mass of valueless prose and verse which poured precociously from his teeming brain. He was already secretly engaged to his early playmate Adèle Foucher; the death of his mother in June 1821, and his refusal to accept any money from his father, brought him face to face with actual penury: for a whole year he existed on 700 francs in an attic in the rue du Dragon, an experience which he subsequently exploited in the person of Marius in *Les Misérables:* and during these months he wrote with dogged perseverance, with that self-confidence which throughout his life never failed him.

The Royalist Period (1822–1827).—In June 1822, at the age of twenty, Victor Hugo published his first volume of poetry under the title *Odes et Poksies diverses.* Apart from some sentimental verses addressed to Adele Foucher (*le Vallon de Chérizy, A toi, le Regret)* the pieces collected in this volume were designed to catch the ear of the court. This design succeeded. Fifteen hundred copies were sold in four months. The little volume reached the hands even of Louis XVIII. who with tears in his eyes read the stilted odes on the death of the Duc de Berry or on the birth of the Duc de Bordeaux. Victor Hugo was accorded a pension of £40 from the privy purse, a salary which in the following year was doubled. He felt justified in pressing his suit on Adele Foucher: the parents consented: the marriage took place at St. Sulpice on Oct. 14, 1822: Victor Hugo was reconciled with his father who thereupon ceased to be the "brigand de la Loire" and became "ce héros au sourire si doux": and Eugkne Hugo, who was also in love with Adkle, went mad during the wedding and had to be confined in an asylum, where he died in 1837. Money was required to support Hugo's wife and impending family. Early in 1823 he published a second "tale of horror" under the title *Han d'Islande* and in 1824 he founded. the *Muse française.* The contributors to this journal formed the *Cénacle,* a literary club which met in the rooms of Charles Nodier, librarian of the Arsenal, and of which the leading members were Hugo, Alfred de Vigny,

Nodier, Soumet, Emile Deschamps and Delphine Gay. Of these young writers it was Nodier only who was frankly revolutionary and romantic. The others hedged: Victor Hugo himself, who had just been made a Chevalier of the Legion d'Honneur and who had personally been invited to attend the coronation of Charles X. at Rheims, was again in a false position. The year *1825,* however, marks the first definite break on his part with the classic traditions of the restoration court. He came more and more under the influence of Nodier; he visited Switzerland in the company of that romantic; he visited Lamartine at St. Pont: he read German ballads. In *1826* he published *Bug-Jargal,* and to a new edition of the *Odes* which appeared the same year he added the *Ballades* in which the transition from classicism to romanticism is clearly adumbrated. His early admiration of Chateaubriand bore a comparatively tardy fruit.

The Romantic Crusade (1827–1830).—It must be remembered that Hugo was a cautious man, and one who would have hesitated to put himself at the head of the new romantic movement had he not been assured not only of leadership but also of success. By the end of *1826* the originators of the French romantic movement, Chateaubriand and Lamartine, had retired into political life; a second and more vigorous wave of romanticism was about to overwhelm French literature; Hugo was quick to realise the tidal force of this new movement and quick to determine that he himself should ride upon its crest. The great decisions of Hugo's life were always taken under the impulse of an inspired opportunism. His convictions were adjusted rapidly to the new formula, and into the expression of this formula he flung the irresistible force of his imagination and his rhetoric. The influence of the *Cdnacle,* the influence of Nodier, the far more forceful and encouraging influence of Sainte-Beuve, all contributed to this new orientation: the affectionate relations which he now established with his father revived the excited Bonapartism of his early years: and, no less importantly, the success of Weber's *Freischütz* in *1826,* and the still greater success of Miss Smithson's Shakespearean season in *1827,* convinced him that the Parisian public were ready for something exciting, for something explosive, for something which had nothing whatever to do with complimentary odes to Charles X. His break with the court was signalized by the publication in the *Ddbats* of his *Ode à la Colonne,* a fine diatribe in uhich he championed Napoleon's marshals against the insults which had been offered them by the Austrian ambassador. By Feb. *1827* he had already written the first draft of *Cromwell,* and during the months that followed he was engaged on writing the preface to that play which constituted the "declaration of rights" of the romantic movement. The essence of this manifesto is its wholly justified attack upon the stagnation which had come over French literature owing to the tyranny of the classical formula and the rigid rules of Boileau. With impassioned rhetoric Hugo argued that art was evolutionary and dynamic, that the old formula stood only for rigidity and decay. "The object," he wrote, "of modern art is not beauty but life." This famous preface, which was published in Oct. *1827,* at once rendered Hugo the prophet and protagonist of the new school. It was less difficult, however, to formulate these new conceptions than to put them into practice. *Cromwell* itself was not suited for the stage, and an adaptation of Scott's *Kenilworth* which he produced under a pseudonym early in *1828* with the title of *Amy Robsart* was a ghastly failure. With his quick sensitiveness to public opinion Hugo abandoned drama for the moment, and adopting the then popular theme of the Greek War of Independence he composed and published *Les Orientales,* a series of poems on the Levant which, while they reflected no personal experiences, were yet so beautifully cadenced and designed that they at once achieved an immediate popularity. This volume in which he had the insight, thanks to Sainte-Beuve, to revive the forgotten metres of Ronsard and his imitators, was issued in Jan. *1829,* one of the most active, and certainly one of the most important years of Hugo's life. In this year he produced *Les Orientales, Le Dernier jour d'un Condamné,* and *Marion de Lorme*: and he wrote the whole of *Hernani,* a great portion of *Nôtre Dame de Paris* and most of the lyrics which were subsequently included in the *Feuilles d'Automne. Marion de Lorme* was banned for political reasons by the censor, but on Feb. 2j, 1830 *Hernani* was produced at the *Théatre Français* with Mlle. Mars in the part of Doña Sol. The 45 representations of this eloquent melodrama are known in French literary history as "Les batailles d'Hernani." It may be questioned whether the opposition of the classics was as determined as has been represented: but there can be no question regarding the violence of the *claque* which Hugo, Mme. Hugo and Théophile Gautier had organized. Sainte-Beuve, who was already in love with Mme. Hugo, disapproved of all this self-advertisement. "Je suis blasé," he wrote, "sur Hernani." But Hugo for his part had achieved not fame only, but fortune: the play brought him 15,000 francs: he was acclaimed by Chateaubriand as "the rising sun": he had opened the flood-gates of romanticism to Alexandre Dumas, to Alfred de Vigny, and to George Sand: and he moved with his wife and children to a larger house near the Champs Elysées. Unfortunately, however, the Revolution of July momentarily distracted public attention from Victor Hugo.

Success (1830–1845).—With the advent of the monarchy of July, under the sly complacency of Louis-Philippe, we leave the *Sturm und Drang* period of Hugo's life and pass into a phase of 15 years' success. He published *Nôtre Dame de Paris* in April of *1831* and acquired thereby great popularity in circles where poetry was unread and where controversial drama was not appreciated. In December of that year he again, and rightly, aroused the admiration of the intellectuals by his *Feuilles d'Automne.* Fortune smiled upon him: his four children, Léopoldine, Charles, Francois-Victor and Adèle were living depositaries of sentimentality: he was surrounded by friends and disciples, by de Musset, de Nerval, Alexandre Dumas and Petrus Borel: he was sufficiently in opposition to Louis Philippe to be regarded as a martyr while not actually becoming one: and he moved into another and more romantic apartment, now the Musée Victor Hugo, in the Place des Vosges. In Nov. *1832,* he produced *le Roi s'amuse,* which would have been a failure had it not been banned by the censor on the second night. On Feb. *2, 1833* he gave *Lucrezia Borgia* at the Porte St. Martin, and was accorded a public ovation: the part of Princess Negroni was taken by Juliette Gauvain, known, under the name of Juliette Drouet, as a leading courtesan. Hugo decided to redeem this woman, and for several years he confined her in a little flat which he alone was allowed to visit; she is the heroine of his most lovely lyrics and she remained his mistress for more than 50 years. Mme. Hugo, who was not allowed any similar indulgence in regard to Sainte-Beuve, acquiesced unhappily in this arrangement. *Lucrezia Borgia* was the last but one of Hugo's successes on the stage; *Marie Tudor* and *Angelo* both failed in *1833;* for a moment the triumph of *Ruy Blas* in *1838* recalled the days of *Hernani,* but a final end was put to the romantic drama by the complete collapse of *Les Burgraaes* in *1843.*

During these years, however, his reputation as one of the greatest of French lyric poets was firmly established. The *Feuilles d'Automne* of *1831* was succeeded by the *Chants du Crépuscule* of 1835, by *Les Voix intérieures* of *1837,* and *Les Rayons et les Ombres* of 1840. In 1836 Hugo presented himself for election to the French Academy: Emmanuel Dupaty was selected in his place. In *1839* he again stood as a candidate, but Count Molé was chosen. The third time, in 1840, Pierre Flourens and not Victor Hugo was elected. It was only at his fourth attempt, on June *3. 1841,* that he secured admission. These years of popular, if not official. success and adulation were not good for Victor Hugo: his temperamental egoism increased, and his former austerity was succeeded by a period of indulgence which provoked frequent scandals. The year *1843* was marked by a double tragedy: the failure of *Les Burgraves* was complete and crushing: and in the autumn of the same year his daughter Léopoldine, who had just married, was drowned in the Seine. In later years, this tragedy echoed for Victor Hugo in what are perhaps the finest of all his lyrics *(Trois Ans Après* and the Villequier series in the second volume of *Les Contemplations),* but for the moment he was stunned. He abandoned poetry for politics, and in *1845* he was created a peer of France.

Politics and Exile (1845–1870).—Victor Hugo, unlike Cha-

teaubriand or Lamartine or Byron, was not good at politics. In the tribune of the House of Peers he ranted and raved and indulged in phrases of such bombastic rhetoric that even his brother peers failed to take him seriously. After the revolution of 1848 he stood for the presidency of the Republic but obtained only a very few votes. During the *coup d'état* of December 1851, he made a scene in an omnibus, and he addressed the troops in the Place de la Bastille from a four-wheeler. He was a member of the committee of Insurrection and behaved during the two days of December with courage but without good sense. He was rescued by Juliette Drouet, and finally on Dec. 14, 1851 he escaped to Brussels in the disguise of a workman. In Aug. 1852 he proceeded to Jersey, where he lived at Marine Parade ("la roche oh j'ai ployé mon aile") and from where he published *Napoléon le Petit* (1852) and *Les Chdtiments* (1853) which, whatever its weakness and exaggeration as a satire, contains some of the most marvellous of his metrical triumphs. In 1855 he moved to Guernsey where, the next year, he bought Hauteville House. Here he resided, revelling in his martyrdom, for 17 years. In 1856, at the age that is of 54, he published *Les Contemplations* which contain what is perhaps the most durable section of his lyric verse, and two years later he composed the first section of the *Le'gende des Sidcles.* In 1862 he published *Les Misérables,* and in 1866 *Les Travailleurs de la Mer* and in 1869 *L'homme qui rit.* The last years of his exile had been saddened by the desertion of his family: his wife went to live in Brussels where she died in 1868: his daughter Adèle ran away with an English officer; only Mme. Drouet, in her cottage next to Hauteville House, remained faithful to the veteran egoist. The establishment of the Republic released Victor Hugo from exile. He returned in triumph to Paris in Sept. 1870.

Last Years (1870–1885).—His re-entry into the political life of his country was not of long duration. He was elected to the National Assembly but resigned on being unable to obtain a hearing. During the Commune he moved to Brussels where his offer to house the communist exiles led to a riot and his expulsion by the Belgian Government. On his return to Paris he was elected to the Senate, but took no part in the debates. It was easier and safer for him to remain in his house in the Avenue d'Eylau and to watch while one by one the beacons of his apotheosis were lit around him. His fame was universal: his faculties undimmed by age. In his 80th year he published those still fresh and lovely verses of the *Quatre Vents de l'Esprit:* he attended the triumphant jubilee of *Hernani;* and on his 80th birthday he was acclaimed by six hundred thousand of his fellow citizens. Juliette Drouet, faithful to the end, died in 1883: and on May 31, 1885 Victor Hugo himself was buried in the Panthéon. His body, in accordance with his last behest, had been placed in a pauper's coffin; for a night it lay in state under the Arc de Triomphe; the pomp and drama of his funeral was symbolic of his strangely histrionic mind.

The output of his last years was, in quantity if not in quality, amazing It can be catalogued as follows:—Actes *et Paroles* (1872); *L'Année Terrible* (1872); *Quatre-vingt-treize* (1874); *Le'gende des Sidcles* (second series 1877); *L'Art d'être grand-pkre* (1877); *L'Histoire d'un crime* (1877); *Discours pour Voltaire* (1878); *Le Pape* (1878); *La Pitié suprème* (1879); *L'Ane* (1880); *Religions et Religion* (1880); *Les Quatre Vents de l'Espit* (1881); *Torquemada* (1882); *Ldgende des Sidcles* (3rd series 1883). Of the many posthumous works published by his friends Paul Meurice and Auguste Vacquerie the most interesting is the volume of autobiographical notes entitled *Choses vues,* and the collection of poetry published under the name of *Toute la Lyre.* The other posthumous collections served only to harm the poet's reputation.

The idolatry with which Victor Hugo was acclaimed by his worshippers has produced an inevitable reaction. Under the influence of this reaction his bad qualities—his vulgarity, his bombast, the tenuity of his thought and feeling, his sheer blatant egoism—have obscured his remarkable gifts. It is possible perhaps to make a juster estimate. From the historical point of view Victor Hugo is unquestionably one of the greatest figures in French literature. His influence was not only very deep but also extremely wide: it is possible to find in Hugo's work the germ of practically every subsequent movement, whether Parnassian, Symbolist or Decadent; such diverse figures as Baudelaire, Verlaine and even Rimbaud owe him heavy debts; he was without doubt the greatest literary influence in 19th century France. It is true that this influence bore almost wholly on technique, but technique in French poetry is of primary importance. Victor Hugo was not quite the revolutionary ("le démagogue horrible et débordé") that he pretended: but he *did* re-introduce the lovely metres and cadences of the 16th century, he *did* break the tyranny of Boileau, and he *did* render the French ear sensitive to the delicate vowel changes and balances in which their language is so rich. Thus although his drama is dead, and his novels can scarcely be compared with those of Balzac, Sand or even Dumas, yet the great mass of his verse, whether lyric, satiric or narrative, will always retain, not only its beauty but its strength. Most of Hugo's boasts about himself, about that "ego Hugo" who was the centre of all his thoughts, are not only insufferable, but inaccurate: he was right, however, and absolutely right, when he described himself as placed "au centre de tout comme un écho sonore." His receptive faculty was unlimited: his interpretive faculty was of a high standard: it was his selective faculty which was at fault. The fact that he could, with dangerous facility, cast into beautiful and convincing form what the average person of 1840–80 felt inarticulately, accounts not only for his unequalled popularity, but for his own unfortunate conviction that he was the prophet of his country and his age.

> "Moi," he exclaims in a characteristic passage:—
> "Moi, qui me crus apôtre . . .
> "La France, dans sa nuit profonde
> "Verra ma torche flamber."

Interpretation and melody, however, are not enough. Victor Hugo possessed a trivial character and an uninteresting mind. A high quality of either mind or character are not perhaps essential to the finest poetry, but the absence of both must always reduce a poet to the second category. Hugo was a master of language: he was a great literary figure: he might perhaps have been a great mystic had he been less worldly: but as it is, when asked who was the greatest French poet of the 19th century we must reply, in the words of a recent French cynic, "Unfortunately, Victor Hugo." (H. Nr.)

HUGUENOTS, the name given from about the middle of the 16th century to the Protestants of France. According to Henri Estienne, the word is a nickname. The Protestants at Tours, he says, used to assemble by night near the gate of King Hugo, whom the people regarded as a spirit. A monk, therefore, in a sermon declared that the Lutherans ought to be called *Huguenots,* as kinsmen of King Hugo, inasmuch as they would only go out at night as he did. This name became popular from 1560 onward.

The French reform movement has often been regarded as an offshoot of Lutheranism, and up to the middle of the 16th century its adherents were known as Lutherans. But as early as 1512 Jacobus Faber (*q.v.*) of Étaples published his *Santi Pauli Epistolae xiv . . . cum commentariis,* which enunciates the cardinal doctrine of reform and justification by faith, and in 1523 appeared his French translation of the New Testament. In 1525 Jacques Pavannes and, shortly afterward. Louis de Berquin were burned at the stake. But no persecution could stop the Reform movement, and on the walls of Paris there were found placards condemning the mass (1534). On Jan. 29, 1535, an edict was published, ordering the extermination of the heretics and resulting in a general emigration. Three years later the first French Protestant church, composed of 1,500 refugees, was founded at Strasbourg. Of all those exiles the most famous was John Calvin (*q.v.*),

the future leader of the movement, who fled to Basel. The first Protestant community in France was that of Meaux (1546), organized on the lines of the church at Strasbourg, of which Calvin was pastor.

Persecution, however, became more rigorous. The Waldenses of Cabrières and Mérindol had been massacred in 1545, and at Paris was created a special court in the *parlement* for the suppression of heretics, a court which became famous in history as the *chambre ardentc* (1549). The church at Paris was founded in 1556, and in spite of persecution the reformers increased in numbers. In 1j58 at Poitiers it was decided that all the Protestant churches in France should formulate by common accord a confession of faith and an ecclesiastical discipline. The church at Paris was commissioned to summon the first synod, which, in spite of the danger, was convened on May 25, 1559. The synod of Paris derived its inspiration from the constitution introduced by Calvin at Geneva, which has since become the model for all the Presbyterian churches. Ecclesiastical authority resides ultimately in the people, for the faithful select the elders who are charged with the general supervision of the church and the choice of pastors. The churches are independent units, and there can be no question of superiority among them; at the same time they have common interests, and their unity must be maintained by an authority capable of protecting them. The association of several neighbouring churches forms a local council (*colloque*). Over these stands the provincial synod, on which each church is equally represented by lay delegates and pastors. Supreme authority resides in the national synod, composed of representatives, lay and ecclesiastic, elected by the provincial synods. The democratic character of this constitution of elders and synods is particularly remarkable in view of the early date at which it began to flourish.

The synod of 1j59 was the beginning of a remarkable increase in the Reform movement; at that synod 1j churches were represented; later, in 1561, the number was 2,150—an increase which carried the struggle into the arena of national politics.

The conspiracy of Amboise, formed with the object of kidnaping the king (March 1560), resulted in the death of the plotters and was followed by the proclamation of the Edict of Romorantin, which laid an interdict upon the Protestant religion. But the reformers had become so powerful that Coligny, who was to become their most famous leader, protested in their name against this violation of liberty of conscience. For a moment, at the colloquy of Poissy (Oct. 1561), at which Roman Catholic and Protestant divines were assembled together, it seemed as though a *modus vivendi* would be established. The attempt failed, but by the edict of Jan. 1562 religious liberty was assured to the Huguenots. This, however, was merely the prelude to civil war, the signal for which was given by the Guises, who slaughtered a number of Huguenots assembled for worship in a barn at Vassy (March 1, 1562); and the duke of Guise, entering Paris in triumph, transferred the court to Fontainebleau by a daring *coup d'état* in defiance of Catherine de' Medici, the queen regent. It was then that Condé declared there was no hope but in God and his arms, and, with the Huguenot leaders, signed at Orléans (April 11, 1562) the manifesto in which, having declared their loyalty to the crown, they stated that as good and loyal subjects they were driven to take up arms for liberty of conscience on behalf of the persecuted saints. Until the end of the century the history of France is that of the struggle between the Huguenots upholding "the Cause" and the Roman Catholics fighting for the Holy League. The leading events only are related here (see also FRANCE: History). The war lasted, with intermissions in 1563 and 1568, until 1569, when, after the defeat of the Huguenots at Jarnac, Condé was assassinated. But Jeanne d'Albret renewed the courage oi the vanquished by presenting to them her son, Henri de Bourbon, the future Henry IV; and Coligny, whose heroic courage rose with adversity, collected the remnants of the Protestant army and by a march as able as it was audacious moved on Paris. The Peace of St. Germain followed, on Aug. 8, 1570.

Peace seemed to be assured, when, on the night of Aug. 24, 1572, there occurred the Massacre of St. Bartholomew (*q.v.*), in which Coligny and all the leading Huguenots were slain. The Paris massacre was repeated throughout France, and the Protestants were slain in thousands. The survivors resolved upon a desperate resistance. A Huguenot political party was formed at Milhau in 1573, definitely constituted at La Rochelle in 1588 and lasted until the peace of Alais in 1629. The delegates selected by the churches bound themselves to offer a united opposition to the violence of the enemies of God, the king and the state. It is a mistake to suppose that they desired to overthrow the monarchy. But it is true that among themselves they formed a kind of republic, which, according to the historian J. A. de Thou, had its own laws dealing with civil government, justice, war, commerce, finance. They had a president called the protector of the churches, an office held first by Conde and afterward by the king of Navarre up to the day on which he became king of France as Henry IV (1589). The fourth religious war, which had broken out immediately after the Massacre of St. Bartholomew, was brought to an end by the pacification of Boulogne (July 16, 1573), which granted a general amnesty. The recollections of the horrors of St. Bartholomew's night had hastened the death of Charles IX, the last of the Valois. Under Henry III, the war broke out anew. It lasted, with one briei intermission in 1576, until March 22, 1594, when Henry of Navarre entered Paris as Henry IV, successor of Henry III, who had been assassinated by a monk in 1589. The league was utterly deieated. Thus the Huguenots, after 40 years of strife, obtained by their constancy the promulgation of the Edict of Nantes (April 13, 1598), the charter of religious and political freedom. (See NANTES, EDICT OF.)

Twelve years aiterward, on May 14, 1610, Henry was assassinated. During the minority of Louis XIII, power resided in the hands of counselors who favoured the Catholic party. The Huguenots once more took up arms under the leadership of Henri de Rohan (*q.v.*). Richelieu had entered the king's council on May 4, 1624; the destruction of the Huguenots was his policy, and he pursued it to a triumphant conclusion. On Oct. 28, 1628, La Rochelle, the last stronghold of the Huguenots, was obliged to surrender, after a siege rendered famous for all time by the heroism oi its defenders and of its mayor. The peace of Alais, which was signed on June 28, 1629, marks the end of the civil wars.

Louis XIV.—The Huguenots had ceased to exist as a political party and, assured that liberty of conscience would be granted them, showed themselves loyal subjects. On the death of Louis XIII, the declaration of July 8, 1643, had guaranteed to the Protestants "free and unrestricted exercise of their religion," thus confirming the Edict of Nantes. The Roman Catholic clergy, however, had never accepted the Edict of Nantes, and all their efforts were directed to obtaining its revocation. As long as Mazarin was alive the complaints of the clergy were in vain, but when Louis XIV attained his majority there commenced a legal persecution which was bound in time to bring about the ruin of the Reformed Churches. The Edict of Nantes, mhich was part of the law of the land, might seem to defy all attacks, but the clergy found means to evade the law by demanding that it should be observed with literal accuracy, disregarding the changes which had been produced in France during more than half a century. The clergy in 1661 successfully demanded that commissioners should he sent to the provinces to report infractions of the edict, and thus began a judicial war which was to last for more than 20 years. All the churches which had been built since the Edict of Nantes were condemned to be demolished. All the privileges which were not explicitly stated in the actual text of the edict were suppressed. More than 400 proclamations, edicts or declarations attacking the Huguenots in their households and their civil freedom, their property and their liberty of conscience were promulgated during the years which preceded the revocation of the Edict of Nantes. In spite of all sufferings which this rigorous legislation inflicted upon them they did not cease to resist, and in order to compel them to accept the "king's religion," the dragonnades (1683–86) were organized, which effected the iorcible conversion of thousands of Protestants who gave way under the tortures which were inflicted upon them. It was then that Louis XIV declared that "the best of the larger part of our subjects, who formerly held the so-called reformed religion, have embraced the Catholic religion, and therefore the Edict of Nantes has become unnecessary." On Oct. 18, 1685, he pronounced its revocation. Thus under the influence of the clergy was committed one of the most flagrant political and religious blunders in the history of France, which in the course of a few years lost more than 400,000 of its inhabitants. Many emigrated to England or Prussia and became very useful citizens of their adopted countries.

Persecution had succeeded in silencing, but it could not convert the people. Despair armed the Cévennes, and in 1702 the war of the Camisards broke out, only to end in the defeat of the insurgents (see CAMISARDS and CAVALIER, JEAN). The Huguenots seemed to be finally conquered. On March 8, 1715, Louis XIV announced that he had put an end to all exercise of the Protestant religion; but on Aug. 21 there assembled together at Monoblet, in Languedoc, under the presidency of Antoine Court (*q.v.*), the "Restorer of Protestantism," then only 20 years of age, a conference devoted to the re-establishment of the church. This was the first "synod of the desert."

Year by year the churches became more numerous. In 1756 there were already 40 pastors; several years later, in 1763, the date of the last "synod of the desert," their number had increased to 6;. As the 18th century advanced, public opinion began to revolt from the persecution of the Huguenots. The torture of Jean Calas caused general indignation, of which Voltaire became the eloquent mouthpiece, and the edict of Nov. 1787, in spite oi the opposition of the clergy. renewed the civil rights of the Huguenots by recognizing the validity of their marriages. Two years later the Declaration of the Rights of Man affirmed the liberty of religion. By the law of 18 Germinal year X, the legal standing of the Protestant church was recognized, but it was denied the character of a free church, which it had claimed.

The Protestants, on the day on which liberty of conscience was restored, could measure the full extent of the misery which they had

endured. Of this people, which in the 16th century formed more than one-tenth of the population of France, there survived only a few hundred thousand. In 1626 there were 809 pastors in the service of 751 churches; in 1802 there were only 121 pastors and 171 churches; in Paris there was only a single church mith a single pastor. The church had no faculty of theology, no scho'ols, no Bible societies, no asylums, no orphanages, no religious literature. Everything had to be created afresh, and this work was pursued during the 19th century with energy and faith.

Later History.—At the fall of the empire (1815) the reaction of the White Terror once more exposed the Protestants to outrage, and again a number Red from persecution and sought safety in foreign countries. Peace having been established, attention was then focused on religious questions, and the period mas marked in Protestantism by a remarkable awakening. On all sides churches were built and schools opened. During that period were founded the great religious societies: Société biblique (1819), Société de l'instruction primaire (1829), Société des traités (1821), Société des missions (1822). On the other hand, the old union of the Reformed Churches had ceased to exist since the revolution of July. Ecclesiastical strife broke out and never entirely ceased. A schism occurred first in 1848, owing to the refusal of the synod to dram up a profession of faith. The cornte de Gasparin and the pastor, Frédéric Monod, seceded and founded the Union des Églises Evangéliques de France, separated from the state. Under the second empire (1852–70) the divisions between the orthodox and the liberal thinkers were accentuated and resulted in a separation, which followed on the reassembly of the national synod, authorized in 1872 by the government of the third republic. The old Huguenot Church mas thus separated into two parts, having no other link than that of the Concordat of 1802, and each possessing its own peculiar organization.

The law of Dec. g, 1905, which separated the church from the state, was accepted by the great majority of Protestants as a legitimate consequence of the reform principles, and its application caused no difficulty with the state. In 1907 the National Gnion of the Reformed Churches of France, consisting of ten regional unions, was founded in Paris; these unions are combined with others in the Protestant Federation of France, which convenes a general assembly of all affiliated churches every five years. The restoration of Alsace and Lorraine to France involved the inclusion oi the Lutheran and Reformed Churches of those provinces in the main body of French Protestants, increasing the membership to nearly one million. These churches are established and supported by the French state, in accordance mith the régime existing before the Franco-German War oi 1870–71.

HUGUET, JAIME (c. 1415–1492), Spanish painter, the last important master of Catalan Gothic painting, was established in Barcelona in 1448. With the aid of assistants he produced many large composite altarpieces. The most important surviving examples are the retable of SS. Abdon and Sennen (Tarrasa). the retable made for the constable of Portugal (S. Agueda, Barcelona) and that of St. Xugustine in the Barcelona museum, where many other productions of his workshop are to be seen. His style, reflecting French, Italian and Flemish influences, is distinguished by a combination of highly individualized heads and a purely decorative treatment of costume and background, ornamented with patterned and embossed gold. He had many followers.

See C R Post, *A History of Spanish Painting,* vol. vii, part i (1938).

(E. Hs.)

HUHEHOT (formerly Kuei-sui. Kweihwa, Kuku Khoto), former capital of Suiyüan province. China; since 1954 capital of the Inner Mongolian Autonomous Region. The city lies at the northeastern end of the Kuei-sui plain, a fertile irrigated basin of the Hei river on the eastern shoulder of the Yellow river bend, and south of a break in the 4,500 ft. high Yin-Shan scarp of the Mongolian plateau. In the 11th century the city became a frontier mart. where Chinese tea and manufactures were exchanged for Mongolian horses, skins and wool. Huhehot (meaning "blue city") was more Mongol than Chinese and prior to 1664 housed the Mongolian dalai lama. Increased Chinese control eventually resulted in the erection of an administrative city one mile northeast of the old Mongol settlement, an influx of Chinese farmers in 1928. the completion of the Peking-Suiyüan railway to Pao-t'ou, go mi. W., and increased manufacture of local wares, such as rugs, clothing and leather goods. Since 1954, under the city's status of regional capital. industry has grown and plants have been built for making brick and tile. farm tools. woolen textiles, and sugar from sugar beets. It is the location of the Inner Mongolian Medical college and has six secondary technical schools. The city is go mi. W. of Chi-ning. connecting point for the railway to Ulan Bator, a location that is advantageous to its flourishing as a supply centre for the rapidly growing Chi-ning and of the new heavy industry centre. Pao-t'ou. Pop. (1953) 148,400. (Te. H.)

HUICHOL. This Indian tribe of the inaccessible Sierra Madre mountains of northern Jalisco and Nayarit is notable in modern Mexico for the degree to which its members have preserved their aboriginal speech (a Uto-Aztecan language), religion (especially the peyote cult) and customs (corn-beans-squash agriculture, selection of political officials by dreaming, curing of illness by shamans, etc.). They are closely related in language and culture to the neighbouring Cora. The Huichols number somewhat more, and the Cora somewhat fewer. than 3,000.

Bibliography.—Carl Lumholtz, *Unknown Mexico* (1902), *Symbolism of the Huichol Indians* (1900); R. M. Zingg, *The Huichols: Primitive Artists* (1936).

(E. Z. V.)

HUILA, a department in the south central part of the republic of Colombia drained by the upper reaches of the Magdalena river. Pop. (1951) 293.692; area 7,656 sq.mi. Created in 1905 from Tolima, it is named for the snow-capped Nevado del Huila (18,701 ft.) in the central cordillera, which dominates much of the landscape. Since the colonial period this part of the upper Magdalena valley has been primarily a stock-raising area, but with the improvement of irrigation facilities. agriculture (especially cotton) became increasingly important. The capital; Neiva, is the terminus of a railroad that links it to Bogotá, Girardot and Ibagué. The San Agustín archaeological zone: with its mysterious giant stone figures, lies in the southernmost part of the department. The impressive Cuevas de los Guácharos (caves of the oilbirds) are 12 mi. S. of Pitalito, east of San Agustin. (Js. J. P.)

HUI TSUNG (1082–1135), Chinese emperor of the Sung dynasty, was famous for his calligraphy and his exquisitely com-

posed paintings. Paintings by court academicians, greatly advanced by his patronage, eventually gave rise to a new school, outstanding in art history. Politically, his reign (1101–25) was fatal to the Northern Sung dynasty. A brief attempt to reunify the bureaucracy failed to resolve the bitter factional strife between the conservatives in opposition and the postreformers who claimed to follow the new policies which had originated with the great reformer Wang An-shih. Probably disillusioned with state affairs, Hui Tsung sought comfort and pleasure in promoting Taoism (*q.v.*) at the court. in arts. in amorous affairs and in enjoying a new extravagant palace garden. His requisition of colourful stones. precious plants and exotic pets caused great hardship among the people. The administration was for many years left to Ts'ai Chin. With the persecution of the conservatives, the bureaucracy became submissive; with manipulation and corrupt practices, it became abusive. Favourite eunuchs also gained unprecedented power, including military command. The victory over the Liao in north China brought about by the alliance with the Chin Tatars from Manchuria was entirely illusory, for the Chin turned out to be the real menace. In mounting crisis. Hui Tsung abdicated in favour of his son. Ch'in Tsung. In 1127 the Chin invaders ended the Northern Sung dynasty, and both emperors suffered captivity and exile in the north under miserable conditions till their deaths. See also CHINESE PAINTING: *History: Sung Dynasty.* (J. T. C. L.)

HUITZILOPOCHTLI, the supreme being in the religions of ancient Mexico and also the god of war. He was the mythic leader and chief divinity of the Aztecs. dominant tribe of the Nahua nation. As a hummingbird Huitzilopochtli was alleged to have led the Aztecs to 3 new home. His idol was a huge block of basalt (still thought to be preserved in Mexico), on one side of which he is sculptured in hideous form, adorned with the feathers of the hummingbird.

The ceremonies of his worship were of the most bloodthirsty character. and hundreds of human beings were sacrificed annually beiore his shrine, their limbs being eaten by his worshipers. When the temple of Huitzilopochtli was dedicated in 1486. it is traditionally reported that 70.000 persons were killed.

HU-K'OU (HUKOW), a town in northern Kiangsi province, China. on the south hank of the Yangtze river. 20 mi. E.S.E. of Chiu-chiang (*q.v.*). Hu-k'ou, whose name means "lake mouth," is situated on a short canal that provides an outlet from the P'o-yang Hu (lake) to the Yangtze. In the days when Chinese waterways played a dominant role in inland transportation, Hu-k'ou was a major transportation huh and transshipment centre. Shallow-draught lake junks transferred their goods to or from the larger ocean-going vessels that plied the middle and lower course of the Yangtze. With the coming of the railroad era to China, Hu-k'ou began to decline. Its functions were largely taken over by the rising commercial centre of Chiu-chiang, linked by a railroad with Nan-ch'ang, the provincial capital of Kiangsi. (T. SD.)

HULDA, in Teutonic mythology. goddess of marriage, a beneficent deity. patroness and guardian of maidens (*see* BERCHTA).

HULL, CLARK LEONARD (1884–1952), U.S. psychologist, the most influential theoretical psychologist of the period 1930–50, was horn near Akron. N.Y., on May 24, 1884. Poliomyelitis interrupted his education in mining engineering, and studies at the University of Michigan (A.B., 1913) directed him to psychology. His doctoral dissertation (University of Wisconsin, 1918) pioneered the experimental analysis of concept formation. He remained at Wisconsin until called in 1929 to the Sterling professorship of psychology at Yale university. He died there on May 10, 1952.

By 1930 Hull had produced two research programs that resulted in the classical books *Aptitude Testing* (1928) and *Hypnosis and Suggestibility* (1933). His influence, however, resulted largely from many articles arid two books (*Principles of Behavior* [1943] and *A Behavior System* [1952]), in which he developed an explicit, quantitative theory of simple and complex forms of learning and behaviour. His theory proved to he remarkably suggestive of, and responsive to. experimental data.

Hull's autobiography appears in *History of Psychology in Autobiography,* \-01. iv (1952), and evaluations of him may be found in *American Journal of Psychology,* vol. lxv (1952) anti *Psychological Review,* vol. lix (1952). (A. W. MN.)

HULL, CORDELL (1871–1955), U.S. statesman and Nobel prize winner. was born in Overton county (now Pickett), Tenn.. on Oct. 2. 1871. He was admitted to the Tennessee bar in 1891 and elected to the house of representatives in 1893 and to a judgeship in 1903. He served in the U.S. house of representatives from 1907 to 1921—when he mas active in developing the income and inheritance taxes—and from 1923 to 1931. In 1931 he was elected to the senate. but in 1933 he was appointed secretary of state by Pres. F. D. Roosevelt, continuing in that position until he resigned Nov. 27. 1944. Hull was awarded the 1945 Nobel peace prize for his part in organizing the United Nations organization. He died at Bethesda. Md., July 23. 1955.

HULL, ISAAC (1773–1843), commodore in the C.S. navy, whose claim to fame came from his exploits in the War of 1812, was born at Derby, Conn., on March 9, 1773. Going to sea at 14 as a cabin boy on a coaster. he was master of a ship at 19. In 1796–97 he was twice captured by French privateers in the West Indies. He was commissioned fourth lieutenant of the frigate "Constitution" on March 9, 1798. In the naval war with France he distinguished himself by cutting out the French privateer "Sandwich" in the harbour of Puerto Plata, Santo Domingo. Commanding the brig "Argus" during the Tripolitan War, he gave naval support to William Eaton, C.S. navy agent for the Barbary regencies. in the capture of Derna. Hull was promoted to captain April 23, 1806, and became commander of the "Constitution" on June 1;. 1810. After taking U.S. minister Joel Barlow to France and delivering $28,000 in specie to Holland. he returned a few months beiore hostilities began between the U.S. and England.

Theodore Roosevelt regarded Hull's actions in the War of 1812 as placing him "above any single ship captain of the war." Encountering a British squadron in July 1812, off Egg Harbor, N.J., in a dead calm. Hull escaped after three days and nights in one of the most remarkable chases in naval history. On Aug. 19 the "Constitution" met the British frigate "Guerrière." In fewer than 30 minutes of close and violent action the enemy ship was dismasted and at Hull's mercy. Considered the most important single victory in U.S. naval annals, the defeat of the "Guerriere" united the nation behind the war effort and smashed forever the legend of British naval invincibility. In this fight the "Constitution" won the name of "Old Ironsicles." Relieved of his command at his own request, Hull commanded harbour defenses at New York city. Hull was one of the first three members of the board of naval commissioners and was commandant at navy yards at Portsmouth. N.H., Boston. Mass., and Washington, D.C. He was commodore of the C.S. squadron in the Pacific (1824–27) and Mediterranean (1839–41). He died at Philadelphia, Pa.. on Feb. 13, 1843.

BIBLIOGRAPHY.—Theodore Roosevelt, *The Naval War of 1812* (1882); Gardner W. Allen (ed.), *Paper of Commodore Hull* (1929); Bruce Grant, *Isaac Hull: Captain of Old Ironsides* (1947). (B. GT.)

HULL, a city and railway junction of the province of Quebec, Can., located on the north bank of the Ottawa river, opposite Ottawa, Ont., is the county seat of Hull county and chief administrative and business centre in southwest Quebec. Pop. (1961) 56,-929; 90% French in origin. Abundant hydroelectric power and timber resources support large pulp. paper and match factories; other industries include portland cement. meat packing, foundries, clothing and iurniture. A large government printing plant has been established there.

Samuel de Champlain described the site in 1613. The community began as a lumber settlement. The first settler (1800) was Philemon Wright from Massachusetts, who named it after Hull. Eng.. from which his parents had emigrated. It was incorporated as 3 city in 1875. (GN. C. M.)

HULL (officially KINGSTON UPON HULL). a city and county of a city. municipal, county and parliamentary borough and seaport in the East Riding of Yorkshire, Eng., at the junction of the river Hull with the Humber, 22 mi. from the open sea and 166 mi. N. of London by road and ferry. Pop. (1961) 303,268. Area 22.4

sq.mi. The town stands on a level plain so low as to render embankments necessary to prevent inundations. The older portion is completely enclosed by the river Hull on the east. the Humber on the south. by docks on the west and by public gardens, known as the Queen's gardens (the site of the city's first enclosed dock) on the north.

The first mention of any town on the site occurs under the name of Wyke upon Hull in a charter of about 1160–80 by which Maud, daughter of Hugh Camin, transferred it to the monks of Meaux, who in 1279 obtained a licence to hold a market every Thursday and a fair on the eve. day and morrow of Holy Trinity and 12 days following. Shortly afterward, Edward I, seeing its value as a port. obtained the town from the monks in exchange for other lands. The king in 1293 renamed the town Kingston upon Hull. granting its first charter in 1299, making it a borough freed from the manorial system of government but under the governance of a warden appointed by the king: giving the burgesses freedom from certain tolls throughout the realm and according other privileges, including the right to hold two weekly markets. Tuesday and Friday. and a fair lasting 30 days. namely. on the day of St. Augustine and for 29 days next following. Edward III, in 1331, granted the burgesses the right to hold the borough with fairs. markets. free customs at a fee farm rent of £70 and with power to choose from among themselves to keep the borough, in lieu of a warden as previously. a mayor and four bailiffs each year. In 1440 the constitution of the borough was again altered. a charter of that year incorporating the borough, the corporate body comprising 13 aldermen elected for life. all being justices and one being annually elected the mayor. By the same charter the county of the town was created by virtue of which a sheriff was. and still is. annually elected. In 1541 the town was visited by Henry VIII, who ordered a castle and other places of defense to be built. Edward VI granted the manors of Hull. part of Sutton and of Tupcoates with Myton to the burgesses in 1552. A charter. commonly called the governing charter. was granted in 1661. and other grants of note were the conferring of the title of city in 1897 and that of lord mayor instead of mayor in 1914.

During the Civil War. although the majority of the inhabitants were said to be royalist. Kingston upon Hull was garrisoned by the parliamentarians and Charles I was refused admission by the governor. Sir John Hotham. In 1643 it was besieged for six weeks, and the new governor. Ferdinando Fairfax, 2nd baron Fairfax, obliged the royalist army to retreat by opening the sluices and flooding the surrounding country.

Holy Trinity church is one of the largest English parish churches, with Decorated style transepts and choir and a Perpendicular nave. The choir is an unusually early example of the use of brick in English ecclesiastical architecture. The church of St. Mary. Lowgate, was founded in the 14th century. Among the principal public buildings are the guildhall in Lowgate and the Feren's Art gallery (1927). The ancient grammar school was reendowed in 1485, and among its students was said to be Andrew Marvell. the poet, who represented the town in parliament from 1659 until his death in 1678; another student was William Wilberforce (1759–1833). The latter is commemorated by a column and statue at the east end of the Queen's gardens and by a museum in the house of his birth. The city hall and the first municipal art galleries were opened in 1910. The Transport museum (now restored) was partly destroyed by enemy action in World War II, when the old Charterhouse hospital was badly damaged and a great deal of the town laid flat.

With its university. grammar schools. the Hymers college and other educational establishments. the Trinity House Marine school (founded in 1787) and technical and art schools. Kingston upon Hull is the educational centre for the East Riding. The university college. founded in 1927 by the Rt. Hon. T. R. Ferens and opened in 1929, was raised by royal charter to the status of a university in 1954.

Charities and benevolent foundations are numerous. Trinity house. a charity for seamen of the merchant service. was founded by the Trinity House guild (instituted in 1369), and the present building was erected in 1; j3. It contains a noteworthy collection of paintings and a museum. The Charterhouse belongs to a foundation for the support of the old and feeble and was established in 1384 by Sir Michael de la Pole. afterward earl of Suffolk.

The corporation owns the telephone system.

The original harbour occupied that part of the river Hull which faced the old town, but in 1774 an act was passed for forming a dock on the west bank of the river. This became known as Queen's dock (now the Queen's gardens), and with Prince's and Humber docks it completed the encirclement of the old town. The small Railway dock opens from Humber dock. East of the Hull lies the Victoria dock, and west of the Humber dock basin and parallel to the Humber lie Albert and William Wright docks. Others are Alexandra dock and the St. Andrew's fish docks. The port was enlarged in 1914 by the opening of the King George dock, having a large grain silo. fine equipment and covering an area of 53 ac. with provision for future extension to 8j ac. The docks are owned by the British Transport commission and cover a water area of 200 ac. with 12 mi. of quays.

Kingston upon Hull, the third port in the kingdom, has commerce with all parts of the world. It is one of the principal ports for the handling of the manufactures of Lancashire and Yorkshire and has direct communication by canal and rail with its hinterlands. Softwood is imported from the Scandinavian countries and the Baltic, and hardwood and grain from the various sources of supply. Passenger steamship services run to the principal European ports and a ferry serves the Lincolnshire shore of the Humber. Kingston upon Hull was an early seat of the whale fisheries. and sea fishing is extensively carried on. There is a large number of trawlers in the fishing fleet which did valuable service during World Wars I and II. Kingston upon Hull is one of the two largest fishing ports in the United Kingdom.

The numerous industries include iron founding, ship repairing and engineering, the manufacture of chemicals, vegetable oils, colours, cement, starch, soap, industrial alcohol and its derivatives, surgical dressings and household requisites, tanning and brewing.

Kingston upon Hull was early represented in parliament and has sent members since 1304. The parliamentary borough returned two members until 1885, three until 1918, when it was divided into four constituencies returning one member for each constituency; but in 1954 it was again reduced to three constituencies, East, North and West.

Kingston upon Hull has a bishop suffragan attached to the diocese of York. (E. H. Bk.)

HUMACAQ, a town, founded in 1790, and municipality in the eastern part of Puerto Rico. Urban pop. (1960) 8,009; mun. 34,417.

Located at the end of a valley which opens to the sea 6 mi. E., Humacao has a delightful climate. The town is connected by excellent highways with Fajardo, Caguas and San Juan. Sugar is grown in the surrounding rural area and many small farms in the nearby foothills produce a variety of tropical fruits. The Ryder Memorial hospital is located there. The local government was successful in encouraging the establishment of several industries in the town. (T. G. Ms.)

HUMANE SOCIETIES. During the 18th century humanist; claimed that animals had rights which should be recognized. The old English common law was completely indifferent to the protection of animals from cruel treatment.

Jeremy Bentham (1748–1832), English jurist, was the first to assert the rights of animals with authority. He believed legislation should agree with the principles of private morals. and was a strong advocate for the enactment of laws to protect animals from cruel and inhuman treatment. He also claimed that if humanity to animals — the sentiment of benevolence — were inculcated in the minds of children, it would tend toward the prevention of crimes of violence.

In 1811 Lord Erskine (1750–1823), in a speech before the house of lords, portrayed the cruelties inflicted on animals at that time in Britain, and asked for legislation to protect them. In 1822 Richard Martin of Galway, a member of parliament, procured the passage of the Ill-Treatment of Cattle bill, commonly known as Martin's act. This act prohibited the cruel and improper treatment of cattle, and for persons who wantonly and cruelly beat, abused or ill-treated any horse, mare,

gelding, mule, ass, ox, heifer, steer, sheep or other cattle provided fines of not more than £5 or less than 10s., or imprisonment not exceeding three months. It was the first law to prosecute offenders for acts of cruelty to cattle and beasts of burden. The English Society for the Prevention of Cruelty to Animals was organized on June *16, 1824,* to make this law operative. Through its agency brutal sports as well as other types of cruelty were prohibited or abated. In *1840,* by command of Queen Victoria, the society was honoured with the prefix "royal."

UNITED STATES

After its establishment in Britain the movement for animal protection spread rapidly. Societies were organized in all parts of Europe and other countries. In *1866* the American Society for the Prevention of Cruelty to Animals was founded by Henry Berrh. who became its first president. This was the first society of its kind in the United States. Laws for the prevention of cruelty to animals enacted by the legislature of the state of New York were the first on the subject in the United States and were based on English law.

In *1868* George T. Angell of Boston, Mass., organized the Massachusetts Society for the Prevention of Cruelty to Animals. Other societies were organized in Pennsylvania, New Jersey and California in the same year. In *1869* Illinois and Minnesota organized societies. Laws similar to those of the parent society were enacted in these states. Details of legislation were refined and amplified until today there is not a state or territory without some statutory provision for animal protection.

Protection of Children. — Organized activity in the prevention of cruelty to children grew out of the similar work for animals and was a part of the same rising wave of humane sentiment and activity. There were no similar laws in existence for the prevention of cruelty to children. The old English common law in force in the U.S. gave no protection to children except in extraordinary cases of cruelty.

In *1874* in New I'ork a case known as the Mary Ellen case directed attention to the necessity for legislation to protect children from cruelty. A nine-year-old child was brutally beaten by her foster mother, and complaints by neighbours to the police and other law-enforcing agencies were of no avail as there seemed to be no law under which they could rescue the child and prosecute the foster mother for cruelty. The laws for the prevention of cruelty to animals were used to rescue this child on the theory that a child was an animal. The child was rescued by an officer of the Society for the Prevention of Cruelty to Animals and the foster mother prosecuted and sent to prison for one year.

Immediately after this case, steps were taken by Elbridge T. Gerry, counsel for the American Society for the Prevention of Cruelty to Animals, to have laws enacted for the protection of children from cruelty in the state of New York. After the enactment of these laws in 1875, the New York Society for the Prevention of Cruelty to Children was organized — first of its kind in the world. The society was formed to rescue children from vicious and immoral surroundings and to prosecute offenders, to prevent the employment of children for mendicant purpose or in theatrical or acrobatic performances and to provide for the enforcement of all laws for the protection of minors from abuse. Similar laws were passed and societies were organized in other states following the lead of the New York society. These societies all adopted the New York model, as did other local societies later.

From *1870* to 1877 the Illinois society had been rescuing so many children from conditions of cruelty and neglect, in addition to their work for the prevention of cruelty to animals, that the society deemed it advisable to change its name to the Illinois Humane society. This was the first society in the world to take the name "humane," indicating the dual work of prevention of cruelty to children and to animals. Other societies engaged in this dual work were later organized in the United States under the name humane societies.

In 1877 the leading U.S. societies met at Cleveland, O., and organized the International Humane society to deal with the question of the maltreatment of animals in transit between the east and the west. This society in *1878* changed its name to the American Humane association. On March 3, *1901,* it was incorporated in the District of Columbia.

Societies known as humane education societies were organized to carry humane education in all possible ways into American schools and homes.

The Juvenile Court act enacted in Illinois in *1899* was the first law of its kind, relating to children who are or may become dependent, neglected or delinquent, to define these terms and to provide for the treatment, control, maintenance, adoption and guardianship of the persons of such children. The juvenile court movement developed rapidly thereafter.

GREAT BRITAIN

In 1849 the Cruelty to Animals act had provided that "If any person shall from and after the passing of this Act cruelly beat. ill-treat, overdrive, abuse or torture, or cause or procure to be cruelly beaten, ill-treated, over-driven, abused or tortured any animal, every offender shall for every such offense forfeit and pay a penalty not exceeding five pounds." This act and the Cruelty to Animals act of *1854* contained substantially the working laws on the subject of cruelty to animals, upon which later laws were founded as they applied to domestic animals generally.

The Cruelty to Animals act of *1876* was enacted to regulate vivisection or the practice of making experiments upon living animals for scientific purposes, by extending the law relating to cruelty to animals to the cases of animals which for medical, physiological or other scientific purposes are subject, when alive, to experiments calculated to inflict pain.

In *1884* England followed the United States in enacting laws protecting children from cruel treatment, and the National Society for the Prevention of Cruelty to Children was organized. The Royal Scottish Society for Prevention of Cruelty to Children was organized in the same year and similar societies were organized in other countries.

The Wild Animals in Captivity Protection act was passed in 1900. Whereas the Cruelty to Animals acts of *1849* and *1854* protected only domestic animals, this act included almost every act of cruelty to any other animal.

(G. A. H. S.)

HUMANISM, the attitude of mind which attaches primary importance to man and to his faculties, affairs, temporal aspirations and well-being (from Latin *humanus,* "human"; *cf. homo,* "man," *homines,* "mankind"), often regarded as the characteristic attitude of the Renaissance (*q.v.*) in western Europe. The Greek and Roman classical writers regularly distinguished the human, or humane. on the one hand from the bestial and on the other from the divine; but in making the latter contrast they usually stressed some pathetic aspect of the human. such as mortality or fallibility. Medieval Christianity, however, suggested that man's life on earth was significant only in so far as it affected his soul's expectation of God's mercy after death, and it was against this belittling of his natural condition that the humanists of the Renaissance asserted the intrinsic value of man's life before death and the greatness of his potentialities. As ecclesiastical influence waned, the protest of humanism was turned against secular orthodoxies that subordinated man to the abstract concepts of political or biological theory.

In the 20th century some new senses were given to the word humanism. F. C. S. Schiller (1864–1937) took it as the special name of his own version of pragmatism (*q.v.*), maintaining that all philosophic understanding stems from human activity and reaffirming Protagoras' contention that "Man is the measure" against what he called the "intellectualist" philosophies, whether represented by Plato, by Hume or by the idealists of his own time. The humanism of Irving Babbitt (*q.v.*) was very different, being a reaction in favour of classical order against romanticism and naturalism, not only in their literary but also in their wider aspects. *(See* also **AMERICAN LITERATURE.)**

HUMANITIES, a group of educational disciplines distinguished in content and method from the physical and biological sciences and, if less decisively, from the social sciences. The group includes language and literature in each of their principal examples (ancient and modern), the fine arts other than literature, philosophy, at least in its more traditional divisions, and, to a less clearly defined extent, history, where the boundary between the social sciences and the humanities is most debatable. These are the core of the humanities and are sometimes organized as a school or division in the modern university.

The humanities are studies which centre attention on the life of man. But this does not by itself serve to distinguish them from biology, a natural science, if it directs its attention to man; or from politics, a social science (for man, as Aristotle said, is a political animal); or even from religion (for man, as Edmund Burke added. is a religious animal). It is true, however, that as early as William Caxton (1422–91), humanity was distinguished from divinity, as the one dealt with man on the merely human level (or in the order of nature), and the other embraced the whole scheme of revealed religion (or the order of grace); and this distinction remains significant. Though the humanities stand committed to no particular philosophy or creed, they assume the possibility of distinguishing with some sharpness between man and the rest of nature, and between the human and the supernatural. These two facts, taken in conjunction, mean that at different times or by different schools the humanities may be brought into some relation with naturalism (as in the more pagan forms of Renaissance and subsequent

humanism) or with religion (as in the Christian humanists of the same and succeeding periods). Cicero's use of the term *humanitas* leads to the question of meaning in another way. In its most general sense *humanitas* signified for him the qualities, feelings and inclinations proper to mankind and was from the first not descriptive only, but normative in function. From the general it developed two special senses. It came to connote humane feelings and the conduct toward others which they dictated: gentleness, consideration, good manners — in a word, much that was to be incorporated in the ideal of the gentleman and to become, thereby, the second aim of a liberal education as formulated by John Henry Newman (*q.v.*) in *Idea of a University* (1852). *Humanitas* also came to connote intellectual cultivation and the training that produced it, or (in the language of Newman) the process and primary end of liberal education. Since: for Cicero, education reached its goal in the production of the orator, the principal acquisition and instrument of training was literature in a wide sense, and the outcome of intellectual culture was weight, precision and effectiveness of utterance. *Humanitas* was coupled with literature or study or came to stand for them, in such phrases as *literae humanitatis* and *in omni recto studio atque humanitate versari* ("to be versed in all true study and humanity"). No wonder *inhumanitas* was for Cicero a synonym for *barbaria.* For the humanists of the Renaissance, humanity, partly through the direct influence of Cicero, retained these connotations; and since for them, as for him, Greek and Latin literature was the great source of knowledge, wisdom and eloquence, the humanities meant the languages and literatures of ancient Greece and Rome (literature including of course philosophy, history and oratory, as well as belles-lettres)—the meaning preserved in such phrases as *literae humaniores* (Oxford) and professor of humanity (*i.e.,* Latin) at Edinburgh. All the meanings discussed here have left their mark on the term humanities as applied to the group of disciplines listed at the outset. The extension and differentiation of studies and the emergence of new methods, since the 17th century, have also had their influence.

In European universities language has ceased to mean Greek, Latin and the ancient languages of the near east; it has come to include the modern languages, with (as is natural) special attention to the mother tongue of the student, and has extended its territory to take in the Slavic and the far-eastern language groups. The historical and comparative study of languages and general linguistics have approximated in their aims and methods natural science and, further, have discovered common ground with such social sciences as psychology, anthropology and sociology. But in another department, the study of language continues to be treated not as science merely, but as the art of expression; and here the tradition of the humanities and the emphasis on a normative function clearly persist. The cumbersome framework of ancient rhetoric has been largely abandoned (to be replaced by new techniques), but something of the underlying belief survives that effective expression depends on a trained and cultivated intellect and sensibility and is their ultimate sign and seal.

Literature. — Literature, which is still, as all the more conservative definitions suggest, the core of the humanities, has kept pace nith the extension of the field in language since added languages have given access to additional literatures of greater or less value; and here, too, new methods of study and new affinities with other disciplines have been discovered and applied. But it is remarkable how many of the essential methods of literary study were already foreshadowed in the De *Ratione Studii* of Erasmus in the 16th century. And indeed the traditional pattern set by the study of the classics has continued to exercise its pervasive influence: in the wide definition of literature centring on, but extending beyond, belles-lettres (as in Matthew Arnold's "Literature and Science"); in the concentration upon major authors and acknowledged masterpieces so that, in one view, what extension meant was to add Dante to Virgil, Milton to Homer, Racine to Sophocles, Gibbon to Thucydides, Bacon to Aristotle, Burke to Cicero; and in the connection, fairly steadily maintained, of literature and language — sometimes reduced to the dry analysis of the grammarian but capable of being reinvigorated, as often in contemporary criticism. The training ground in literature as such has increasingly shifted from the classics to modern literature, and especially to whichever is for the student the literature of his mother tongue: with this last (which of course betokens some decline in linguistic studies, despite the extension of their range and methods) may be associated courses in ancient and modern foreign literature in translation. Such courses while sacrificing the connection with language do at least bear witness to the centrality of literature itself, as also does that other experiment of basing a liberal education, in whole or in part, on a systematic study of "great books" of literature in its widest extent, including the classics of philosophy, history, politics and even theology and science. Literature thus conceived (that is, as requiring only that it shall be addressed to the general reader and shall manifest a certain significance of content and distinction of expression) becomes a great meeting place of subject matters.

In its stricter definition as belles-lettres, literature long provided the principal or only representative of the aesthetic in liberal education. There has been added the academic (*i.e.,* the critical and historical) study of the fine arts, and especially of painting and music. The latecomers have immensely strengthened the humanities on the aesthetic side, have supplemented and reinforced the study of literature and have been able in measure to apply some of the methods of which literature has been the proving ground.

Philosophy and History. — The two remaining divisions of the humanities, philosophy and history, possess their own appropriate subject matters but are unique in also providing distinctive methods mhich can be applied to other subjects. For a century and a half, historical method has increasingly dominated all branches of humanistic study and research, though, especially in literary criticism. there is some reaction against it based on an avowed desire to contemplate the work in itself and therefore in isolation. One may question how effective and lasting this reaction can prove, since so many of the materials of humanistic study belong to the past and demand their historical settings and explanations. Historical method has, of course, been applied outside the humanities and especially in the social sciences where history, because its special subject rnatter has so often been political, holds also an important place. But history in other of its departments has close affinities with the humanities: historical biography may be regarded as a form of literature, historiography as part of the theory of literature and indeed of knowledge, and the philosophy of history, from Hegel to Arnold Toynbee, as a branch of philosophy.

In the subdivision of subjects and distinction of disciplines, philosophy has lost psychology to the social (or perhaps, rather, to the natural) sciences and has come to share the theory of government with political science and the history of ideas with literature; but a large and vastly important territory remains its undisputed possession, including metaphysics, ethics and the history of philosophy in general. Moreover, philosophy has manifold contracts nith other disciplines. Like history it includes, as well as a subject matter, a method applicable to a wide range of subjects mhich it can thus. in a sense, appropriate. Commanding as it does the theory of knowledge in general, it deals on the theoretic level with aesthetics and the kind of knowledge involved in the arts and also with logic and the kind of knowledge involved in the sciences and social sciences.

Finally, philosophy, and it alone, is equipped to synthetize, still on the theoretic level, data supplied by all the other departments of the humanities and by the sciences and the social sciences as well. There is in the modern university a need, more often recognized than adequately met, for giving to the nonspecialist some insight into the philosophy and history of science, and such a course of instruction evidently requires the techniques of both philosophy and history or, in other words, the co-operation of the humanities, since its real subject would be the bearings of science on the life and thought of man.

Well into the 19th century the humanities, still mainly represented by Greek and Latin, constituted with mathematics the staple of liberal education. The 19th century, which witnessed a great

expansion of and within the humanistic disciplines, also witnessed the inevitable loss of their monopoly before the advance of the sciences and social sciences. These disciplines have indeed brought within the scheme of formal education knowledge essential to an understanding of the world we live in and useful for various practical ends; but (as Matthew Arnold observed in "Literature and Science") science is apt to content itself with the steady accumulation of knowledge, while the humanities have failed unless, in addition, they bring some accession of wisdom, some recognizable cultivation of intellect, imagination and sensibility, and some preparation for what the Greeks called the good life. This conception of the humanities and their role is true to the tradition from Cicero onward; but it sometimes invites misapprehension.

There has been a widespread feeling in the 20th century that the retreat of the humanities in education may have gone too far and fresh demands have been made upon them. Schemes of "general education" in some C.S. universities have apportioned time and effort between the humanities, the sciences and the social sciences as distinctive areas and forms of knowledge. In these schemes there has been perhaps a tacit assumption, little supported by the tradition of the humanities, that their concern is wholly with man as an individual and not at all with man as a social being. Nor do their varied subject matters easily lend themselves to an effort of united presentation, under what is in effect a new academic subject, designated "Humanities." Though not without its possible uses in general education, this effort is also a departure from the tradition of the humanities and carries some threat to the integrity of the separate subjects.

The gravest danger in the demands made upon the humanities, and the opportunities opening before them, lies in the possible misapprehension regarding their role, hinted above, and what that role entails. This misapprehension, in a word, is to suppose that the humanities can reach their end by indoctrination concealed as intellectual discipline. If the humanities are indeed normative, if they mold the mind and sensibility of the student and bring an accession of wisdom, it is by virtue of their subject matter, of the ideas which they present or evoke and the experiences to which they give him entry; and these ideas and experiences achieve their full effect only as they are examined critically, evaluated, and by the student made his own. See also EDUCATION, HISTORY OF; HIGHER EDUCATION: UNIVERSITIES. (A. S. P. W.)

HUMAN NATURE. Man has a nature, widespread and persistent, that is obviously characteristic of his kind and notably different from the natures of other living things. Yet there is no generally acceptable account including all principal aspects of this nature as one whole. The nature of man is familiar, impressively unique and almost indescribable. Common experience meets it daily; every considered system of thought or action declares or implies some view of it; none of the scholarly or scientific disciplines presents it in terms of all that common sense recognizes in it.

Different meanings have been attached to the phrase "human nature." Most commonly it refers to an original, inborn nature characteristic of all men or of this particular man or these particular men. So understood, "human nature" is man's special form of that which is biologically inherited in any and all species. It is, of course, an abstraction or inference, for very early it combines with "environment." and from the effects of experience becomes something else. This original, inborn, never directly observed nature has been variously conceived: as composed of distinguishable dispositions to specific behaviour (reflex and instinct); as powers or faculties of the mind; as something greatly or even infinitely plastic, or empty and formless.

Of those who see man's inborn nature in this last way, some have come to identify "human natures[x]—now plural—with the particular unique manifestations of mankind in local groups; each traditional group, or culture, has its own human nature, and no nature true of all peoples in this view can be asserted.

Similar to this conception in its identification of "human nature" with what is acquired through experience is that conception which, in contrast to the foregoing, asserts the reality of an acquired nature that is widespread or even universal. "Human nature" is then taken to be a resultant of man's characteristic experiences in any and all societies so far. Everynhere he lives and has lived in groups with similar basic necessities and activities, has known intimate and personal relationships, has recognized differences between people close to him and of his own kind, and other people farther away and of another kind. And so on. Those who so think of man's nature attempt to describe the states of mind and feeling that underlie the great local differences and that are everywhere similar.

Of these three principal ways of conceiving man's nature—as defined or vague inborn potentiality or necessity; as knowable only in its locally developed special forms; as a nature universally acquired or developed and common to all—various combinations can and have been made. For example, the Freudian view of man combines the first and third.

The view adopted as to what man is, essentially and generally, is connected with the thinker's moral judgments and with his position as to the possibilities and the methods of action and reform. He who strongly believes in the power of education or of learning or of conditioned response conceives of original nature as very modifiable. He who takes a pessimistic view as to the elimination of such man-caused evils as war and crime is likely to think of these mischiefs as rooted in particularities of an unalterable inborn nature.

In the everyday experience of the ordinary person the nature of man presents itself as states of mind and feeling, and as characteristic action, in or by the people he meets and deals with. He comes to know human nature through the persons he knows, their characters and conduct. Behind what they do he comes to recognize qualities that often do not surprise him. they are what he comes to expect of other human beings and not of cows or horses. People are proud, sensitive, eager for recognition or admiration. often ambitious, hopeful or despondent, selfish or capable of sacrifice of self. They take satisfaction in their achievements, sometimes feel guilt or shame, have within them a something called a conscience, are loyal or disloyal. The common-sense view of human nature sees it not as innate and inferable from certain behaviour, but as present, however originating, in the conduct of grown people all the time. This is that kind of human nature from which Walt Whitman turned away when he said he would live with the animals because

> They do not sweat and whine about their condition;
> They do not lie awake at night and weep for their sins;
> They do not make me sick discussing their duty to God:
> Not one is dissatisfied—not one is demented with the mania of owning things;
> Not one kneels to another, nor to his kind that lived thousands of years ago. . . .

This is the common conception of human nature that has given rise to ideas—however differently defined—of the inhuman and the superhuman. It implies a probable range of conduct that is "just what you expect" of people; conduct beyond that range is held to violate or exceed the normal expectancy.

These common attributions of man's nature as human are variously made so as to include or exclude some people but not others. More remote and exotic peoples may be denied full inclusion: they are "really not quite human." On the whole, persons who have experience and acquaintance with man's nature as seen in customs and institutions very unlike their own tend to recognize in such alien peoples a humanity common with their own. On the whole. in the course of history, the popular category "human beings" has widened, including more and more people, and recognizing local variants as nevertheless only variants of common humanity.

This view of man's nature is that which is developed and deepened through experience with persons and their conduct. The acquaintance and understanding are gained in part through imaginative works of the mind: biography, letters, novels, drama. Literature is the great storehouse from which to draw experience of the human. It provides a variety and scope that direct experience cannot. In meeting human beings in literature the reader encounters that same question as to the local and special, and the widespread or universal, about which the systematic thinker,

disciplined in a science or in philosophy, feels he must consider. Do the people presented in the Greek tragedies have the same human nature as those shown us by Shakespeare? In reading *War and Peace* and *The Tale of Genji,* we seem to see a human nature that is both different and the same. Though such impressions as to the universality and the variability of humanity do not submit to the procedures of a behavioural science, for those who think about them they seem to deepen and refine opinions, however imperfectly definable, as to the nature of man.

BRITANNICA ARTICLES ON MAN

The conception of man's nature discussed in the paragraphs above, a conception robust, full of content, ill-defined, is not the conception that is presented in this encyclopaedia. For the fragmentation of knowledge as it touches on the subject "man!' appears to have gone very far. This has often been remarked: "We have discarded eternal man and cut mutable man into pieces to be enquired into by different sciences. each of which claims autonomy. The pieces fit into one another less and less. A relatively immutable remnant, called human nature. is left to the care of a biology that speaks the language of physics and chemistry, In this language the animal we call Man is meaningless to himself." (Kurt Riezler. *Man, Mutable and Immutable,* p. vii. Henry Regnery Company. Chicago; 1951.) For the most part *Britannica's* articles present knowledge as it has got itself organized in science. scholarship and the arts. The formal disciplines—and here the scientific disciplines are especially in mind—have come to deal with those aspects of man's nature which lend themselves to organized method and more or less precise formulation. The subject matter "man" is not presented to the reader in any one article that would presume to say all that is important about that topic. but in many and separated articles relating to man, most of which approach that topic in that special way in which some discipline. more or less scientific, has found itself able to deal with it. Each such article presents some aspect of man, or conceives of man, for the purpose of the work of seeking knowledge that it performs, as if man corresponded to what that discipline has found it necessary or convenient to abstract from man as a whole. Many of these articles are less concerned with telling the reader of the nature of man. even as so specially conceived, than with telling him how that science thinks and talks and perhaps observationally or experimentally acts as to that aspect of man. Thus, ANTHROPOLOGY tells mostly of the kinds of questions asked by anthropologists in doing their work and of the ways of work of anthropologists. PSYCHOLOGY is largely concerned with the fields, schools and practical applications of that science or group of sciences. The article on PHILOSOPHY AND PHILOSOPHICAL STUDIES is not a source of information on the nature of man but of information as to what philosophers have thought and said. The kind of abstraction of man made by economists is set forth in ECONOMIC MAN. Such articles are about disciplines that have something to do with man; they do not directly describe the nature of man. Even articles that by their titles suggest discussions of some perhaps characteristically human quality or activity will be found not to be such. IKTROSPECTION deals with the use of that kind of mental activity in psychological research. IXTUITION distinguishes among meanings attached to that word in the discourse of philosophers. "Reason" is mentioned in many articles telling what particular philosophers thought of reason.

The nature of man is presented in *Britannica* as aspects of it appear in one organized way or another of studying and describing some component or aspect of that nature. Cnderstanding this, one may group articles according to the component or abstraction of man's nature that is chosen or emphasized. Emphasizing numerability, and disregarding everything characteristically human in favour of a few qualities that lend themselves to sorting people in very inclusive categories, such as age, sex and marital condition, one kind of specialist achieves orderly knowledge of POPULATION. But POPULATION ECOLOGY is little concerned with man. DEMOGRAPHY briefly defines a discipline concerned with more than population—with the statistics of the life conditions of man. Related articles are BIRTH RATE; DEATH RATE; DEATH (BIOLOGICAL) ; MIGRATIOK ; VITAL STATISTICS.

The largest single grouping of articles is that of articles which attend to those aspects of man's nature which he shares with the animals: his nature as a biological organism. Various parts of the somatic (body) or neural structure underlying that nature are described in ANATOMY, GROSS; SKELETON, VERTEBRATE ; NERVE; NERVOUS SYSTEM; BRAIN; EMBRYOLOGY, HUMAN ; HORMONES; and in articles mentioned in PHYSIOLOGY. The development of the species *Homo sapiens* is the subject of MAN, EVOLUTION OF; the methods of research used in reaching knowledge of this topic are indicated in ANTHROPOLOGY. The biological varieties into which man has come to be subdivided are described in RACES OF MANKIND.

These articles, in short, present man as biological structures and functions. So are animals seen for the most part. More widely, animal or man may be seen as behaviour: as types of activity visible to the observer and describable without reference to introspection or consciousness. The article BEHAVIOURISM presents this view in the science of psychology. ANIMAL BEHAVIOUR indicates that as observation of animals from this prevailing or necessary viewpoint has proceeded, investigators have come to see in animal behaviour some kinds previously associated with man; as symbolic behaviour and insight. But other psychologists recognize consciousness and make use of introspection in studying man as mental activity: the common subject matter of psychologists often otherwise widely differing. Many of the articles about psychology deal with methods of study used by psychologists (PSYCHOLOGICAL TESTS AND MEASUREMENTS; CONDITIONING), but others identify components of human mental behaviour that may or may not be shared by animals (CONCEPT FORMATION, PSYCHOLUGY OF; EMOTION; HABIT; LEARNISG; MEMORY; SENTIMENT; INTELLIGENCE; UNCONSCIOUS; THINKISG AND PROBLEM SOLVING, PSYCHOLOGY OF). The assemblage of such particulars of mental life into a kind of portrait of mankind is not attempted in these articles. One might look for it in PERSONALITY, the concept "which embraces all the functions of the individual." but this article is concerned largely with the ways in which particular personalities are studied or classified. A generalized description of the human personality, as contrasting with whatever personality may be ascribed to, say, chimpanzees, is perhaps not possible. Yet common sense recognizes a characteristic difference.

In most of these psychological articles the "man" in view is a developed adult. especially such as psychologists encounter in their laboratories of the west. Alan is also conceivable as a characteristic course of development, a "human career" from birth to death. Such a conception is implied in CHILD PSYCHOLOGY AXD DEVELOPMENT (where again it is a western child and a western society that tend to define the generalizations reached). The place of the universal human experiences in shaping man's nature is not, however; really presented in this or in other articles; DEATH (LEGAL ASPECTS), for example, refers only to the legal aspects of that event.

From man seen as a kind of mental life, consideration may move to man conceived as the forms of thought and feeling which widely occur and characterize him everywhere. This would yield some formulation of those impressions of man which common experience with people and conduct. and literature also, suggests. Such a possible formulation is barely suggested in SENTIMENT! hinted at in SOCIAL ANTHROPOLOGY and more fully indicated, but not achieved, in ETHICS and in ETHICS! COMPARATIVE (an evolutionary treatment of men's systems of values or principles of conduct).

Man's nature—thinking of it again as something developed in the usual course of experience—may also be thought of in terms of the usual or universal products of his nature and the usual or universal arrangements of his life. There is, however, no article on society or on community although almost all men live in societies and' communities, but some principal societal forms of man (social organization, marriage, kinship. social control, etc.) are discussed in FAMILY; MARRIAGE; CITY; KINSHIP; CLASS; and are briefly distinguished in SOCIAL AXTHROPOLOGY. Accounts of particular total arrangements of human life in cultures or civilizations can

hardly find room in an encyclopaedia; meanings of these terms are discussed in CIVILIZATION AND CULTURE. Other articles that deal from specialized points of view with aspects of collective human life that are widespread or universal have something to say as to those aspects: RELIGION presents a generalized primitive religion besides a separate account of the higher religions; ART tells first of western and then of oriental art. On the whole, such articles represent or take as a basis of comparison human productions in the western world.
