Margate was originally known as St. John's. Thanet, and the church of St. John the Baptist, founded in 1050, contains some portions of Norman architecture and many brasses. The port was an ancient and senior noncorporate member of Dover, and at the time of the siege of Calais it contributed 15 ships of small tonnage. A pier existed before 1500 but, the amount of corn shipped being small, the *droits* were insufficient to keep it in repair. In 17jo Margate became known as a bathing place with beautiful sands and in 1777 the pier was rebuilt. The present stone pier was badly damaged in the storms of 1952 when the lighthouse (1829) was destroyed. In 1835 the town was still a liberty of Dover and no right of citizenship could be acquired. In 1857 it was incorporated and in 1935 the borough was extended to include the resorts of Westgate-on-Sea, Birchington, Cliftonville and the parish of Garlinge. The early 15th-century gateway of the manor house of Daundelyon, or Dent de Lion, remains between Margate and Westgate. The foundation of a Roman villa was discovered at Tivoli, south of Margate, in 1924.

MARGAY (*Felis wiedii),* an American cat found from far southwestern Texas to Paraguay, east of the Andes. It is 2 ft. long, with tail 18 in., resembling the larger ocelot in colour, but with more elongate spots and a longer tail. The head is more rounded. The name tiger cat is applied loosely to the margay and several other American wildcats. (J. E. HL.; X.)

MARGGRAF, ANDREAS SIGISMUND (1709–1782), German chemist whose name is especially associated with the discovery of sugar in beetroot, was born at Berlin, March 3, 1709. He studied chemistry at Berlin and Strasbourg, medicine at Halle, and mineralogy and metallurgy at Freiberg, and returned to his native city in 1735 as assistant to his father, who was chief apothecary at the court. In 1738 he was elected to the Berlin Academy of Sciences, which in 1754 put him in charge of its chemical laboratory and in 1760 appointed him director of its physics class. He died in Berlin, Aug. 7, 1782. Marggraf's discovery of beet sugar in 1747 led to development of the beet sugar industry. He introduced the microscope as an aid to chemical inquiry and used this instrument to detect the presence of minute sugar crystals. In another research dealing with the nature of alum, he showed that one of the constituents of that substance, alumina, is contained in comtnon clay, and that it is quite distinct from lime. He explained and simplified the process of obtaining phosphorus from urine, and made some observations on phosphoric acid; but though he noted the increase in weight that attends the oxidation of phosphorus he remained an adherent of the phlogistic doctrine. For his time he was a skilful chemical analyst.

His papers were presented to the Berlin academy, and with the exception of a few of the latest were collected in two volumes of *Chynzische Schriften* in 1761–67.

MARGHILOMAN, ALEXANDRE (1854–1925), Rumanian statesman, was born at Buzeu on July 4, 1854. In 1884 he was elected a deputy as a member of the Conservative party, of which he became leader in 1914. Marghiloman was convinced that economic reasons demanded close relations between Rumania and Germany and Austria-Hungary. At the beginning of World War I, he advocated Rumania's neutrality and when in 1916 Bratianu offered him a portfolio in his cabinet, Marghiloman refused on the ground that he could not assume the responsibility of an insufficient military preparation. He remained in Bucharest under the German occupation, where he organized relief work, but rejected the proposals of the German commander to form a government for the purpose of concluding a separate peace. In March, 1918, Marghiloman went to Jassy and formed a government which signed the separate peace with the Central Powers. This treaty was never ratified.

When the war ended Marghiloman ceased to play any part in Rumanian politics and died in Buzeu on May 10, 1925.

MARGIN, a term in finance meaning the amount by which the value of collateral provided as security for a loan exceeds the amount of the loan. This excess represents the borrower's equity contribution in a transaction that is partly financed by borrowed funds; thus it provides a "margin" of safety to the lender over and above the collateral that is pledged. The size of the margin which is required varies with the type of collateral, the stability of its market price, expectations with regard to its future price and the credit standing of the borrower.

The term margin is used especially in connection with transactions in securities and commodity futures. When securities are purchased "on margin" the buyer supplies only a percentage, or margin, of the purchase price and borrows the remainder from his broker. pledging the security as collateral for the loan. A fall in the price of the security subsequent to the purchase reduces the margin available to the lender and the customer may be called upon to restore his margin to a prearranged level. This level is determined by the lending broker, but may not be below minimum levels stipulated by the organized exchange in which the transaction takes place.

In addition, minimum initial margin requirements on loans made for the purpose of purchasing securities are required by the federal reserve, board under authority granted by the Securities Exchange act of 1934. Since 1934 the board's requirement has varied between 25% and 100%. (EA. S.)

MARGOLIOUTH, DAVID SAMUEL (18j8–1940), British Arabic scholar, was born in London on Oct. 17, 1858, the son of a missionary. Educated at Winchester and New College, Oxford, he devoted himself to Arabic studies, in which he obtained a European reputation. In 1889 he became Laudian professor of Arabic at Oxford. He took an active part in the Royal Asiatic society. was awarded its triennial gold medal in 1928 and was its president 1934–37. He held many other honours. In addition to several works on the history of Mohammedanism he edited and translated many important Arabic texts, including the *Letters of Abu'l-'Ala* (Oxford, 1898), Yakut's *Dictionary of Learned Men, 6* vol. (Leyden and London, 1907–27), and (with H. F. Amedroz) *The Eclipse of the 'Abbasid Caliphate,* 7 vol. (Oxford, 1920–21j.

See the *Proceedings of the British* ***Academy,*** vol. xxvi (London, 1940).

MARGRAVE (Ger. *Markgraf*), A German title meaning "count of the March." The margraves had their origin in the counts established by Charlemagne and his successors to guard the frontier districts of the empire. and for centuries the title was always associated with this function. In the 12th century the margraves of Brandenburg and Austria (the north and east marks) asserted their position as tenants in chief of the empire; with the breakup of the great duchies the others did the same; and the margraves henceforward took rank with the great German princes.

The title of margrave very early lost its original significance, and was borne by princes whose territories were in no sense frontier districts; *e.g.,* by Hermsnn. a son of Hermann, margrave of Verona, who assumed in 1112 the title of margrave of Baden.

MARGUERITE, the popular name for the plant known botanically as *Chrysanthentum frutescens* (family Compositae), a shrubby perennial with smooth leaves cut pinnately into narrow segments and flower heads two or three inches across produced singly in summer and autumn on slender erect stalks. The white ray-florets surround a yellow disk. It is a native of the Canary isles, and a favourite for decoration and for greenhouse cultivation, window boxes and open ground in the summer. The yellow marguerite has somewhat larger pale yellow flowers and glaucous leaves. The plant is propagated from cuttings taken in autumn from old plants and placed in sandy loamy soil in cold frames. By pruning the shoots in autumn the plants rnay be grown into very large specimens in the course of a few seasons.

The African subshrub, *Felicia amelloides* (family Compositae) known in cultivation as blue daisy, is also called blue marguerite.

MARGUERITE D'ANGOULÊME (1492–1549), queen of Navarre, was the daughter of Charles d'Orléans, count d'Angoulême and was born in Angoulême on April 11, 1492. She was two years older than her brother Francis I. She was betrothed early to Charles, duke d'Alençon, and married him in 1509 She was not very fortunate in this first marriage, but her brother's accession to the throne made her, next to their mother, Louise of Savoy, the most powerful woman of the kingdom. She became a widow in 1525, and married in 1527 Henri d'Albret, titular king of Navarre. Navarre was not reconquered for the couple as Francis had promised, but ample apanages were assigned to Marguerite, and at Nérac and Pau miniature courts were kept up, which yielded to none in Europe in the intellectual brilliancy of their frequenters. hfarguerite was at once one of the chief patronesses of letters that France possessed, and the chief refuge and defender of advocates of the Reformed doctrines. Round her gathered C. Marot, Bonaventure Des Périers, N. Denisot, J. Peletier, V. Brodeau, Boaistuau. Le Maçon and many other men of letters, while she protected Rabelais, E. Dolet and others. For a time her influence with her brother prevailed. but latterly political rather than religious considerations led him to uage a fierce persecution against both Protestants and freethinkers, a persecution which drove Des Périers to suicide and brought Dolet to the stake. Marguerite's own inclinations seem to have been rather towards a mystical pietism than towards dogmatic Protestant sentiments. Marguerite died in Odot-en-Bigorre on Sept. 21, 1549. By her first husband she had no children, by her second a son who died in infancy, and a daughter, Jeanne d'Albret, who became the mother of Henry IV. She does not, from the portraits which exist, appear to have been regularly beautiful, but as to her sweetness of disposition and strength of mind there is universal consent.

Her literary work consists of the *Heptame'ron,* of poems entitled *Les Marguerites de la marguerite des princesses,* and of *Letters.* The *Heptame'ron,* constructed, as its name indicates, on the lines of the *Decameron* of Boccaccio, consists of 72 short stories told to each other by a company of ladies and gentlemen who are stopped in the journey homewards from Cauterets by the swelling of a river. It was not printed till 1558, ten years after the author's death, and then under the title of *Les Amants fortunés.* Internal evidence is strongly in favour of its having been a joint work, in which more than one of the men of letters who composed Marguerite's household took part. It is a delightful book, and strongly characteristic of the French Renaissance. The *Letters* are interesting and good. The *Marguerites* consist of a very miscellaneous collection of poems, mysteries, farces, devotional poems of considerable length, spiritual and miscellaneous songs, etc. The *Dernières poésies,* not printed till 1896 (by M. A. Lefranc), are interesting and characteristic, consisting of verse-epistles, *comédies* (pieces in dramatic form on the death of Francis I., etc.), *Les Prisons,* a long allegorical poem of amorous-religious-historical tenor; some miscellaneous verse chiefly in dizains, and a later and remarkable piece, *Le Navire,* expressing her despair at her brother's death.

BIBLIOGRAPHY.—Of the other works, never yet completely edited, the best editions are, for the *Heptaméron,* Leroux de Lincy (1855); for the *Lettres,* F. Genin (1841); and for the *Marguerites,* F. Frank (1873). English translation of the *Heptame'ron;* A. Machen (1887), with introduction by A. M. F. Robinson (Mme. Darmesteter), and an anonymous translation (1894) with introduction by G. Saintsbury. The religious poem, *Le Miroir de L'Âme Pécheresse,* was translated *by* Queen Elizabeth. *See* also V. Durand, *Marguerite de Valois et la Cour de François Ier* (1848); F. Lotheissen, *Königin Margarethe von Navarra* (188;); *H.* de la Ferrière, *Marguerite d'Angoulême* (1891); Edith Sichel, *Women and Men of the French Renaissance* (1901); *P.* Courtault, *Marguerite de Navarre* (1904); **A.** Lefranc, *Grands écrivains de la renaissance* (1914).

MARGUERITE (MARGOT) DE VALOIS (1553–1615), queen of Navarre, was born on May 14, 1553, daughter of Henry II. by Catherine de' Medici. Famous for her beauty, her learning, and the looseness of her conduct, she was married, after a liaison with the duke of Guise, to Henry of Navarre, afterwards Henry IV., on the eve of St. Bartholomew's day. There were no children of the marriage. Marguerite was established in the castle of Usson in Auvergne, and after the accession of Henry the marriage was dissolved by the pope. But Henry and Marguerite still continued friends; she still bore the title of queen; she visited Marie de' Medici on equal terms; and the king frequently consulted her on important affairs, though his somewhat parsimonious spirit was grieved by her extravagance. Marguerite died in Paris on March 27, 1615. She left letters and memoirs the latter of which are admirably written, and rank among the best of the 16th century. She was the idol of Brantôme, and is the "Reine Margot" of anecdotic history and romance.

BIBLIOGRAPHY.—The *Mémoires, Poésies et Lettres* were edited *by* F. Guessard (1842), L. Lalanne (1858), C. Caboche (1860). The chief of many lampoons against her was the famous *Divorce satirique,* variously attributed to Agrippa d'Aubigné, Palma Cayet and others. *See* L. de Saint Poncy, *Histoire de Marguerite de Valois* (1887); C. Merki, *La Reine Margot et la fin des Valois* (1905); *A.* Savine, *La Vraie Reine Margot* (1908); *H.* N. Williams, *Queen Margot* (1907, 2nd ed. 1911); J. H. Mariéjol, *La Vie de M. de Valois* (1928).

MARGUERITTE, PAUL (1860–1918) **AND VICTOR** (1866–1942), French novelists, both born in Algeria, were the sons of General Jean Xuguste Margueritte (1823–70). Paul Margueritte, born Feb. 1, 1860, who has given a picture of his home in Algiers in *Le Jardin du passe'* (1895), was sent to the military school of La Flèche for the sons of officers, and became in 1880 clerk to the minister of public instruction. His earlier novels include: *Amants* (1890), *La Force des choses* (1891), *Sur le retour* (1892), *La Tourmente* (1893), *Ma grande* (1892), *Âme d'enfant* (1894) and *L'Eau qui dort* (1896). From the time of his collaboration with his younger brother Victor Paul Margueritte's work gained in colour and force.

Among the books written in common by the brothers, the most famous is the series known under the collective title, *Une Époque,* dealing with the events of 1870–71, and including the novels *Le De'sastre* (1898), *Les Tronçons du glaive* (1900), *Les Braves gens* (1901), *La Commune* (1904). They also collaborated in an *Histoire de la guerre de 1870–1871* (1903). These books were founded on documentary and verbal information, amassed with great care and arranged with admirable art; the authors were, in this case, historians rather than novelists. La *Commune* is a bold indictment of the methods adopted by the victorious party. The novelists also attacked the laws governing marriage and divorce and the abuses entailed by the dowry demanded from the bride, in pamphlets and in the novels, *Femmes nouvelles* (1899), *Les Deux vies* (1902), and *Le Prisme* (1905). One of the best is the child story Poum (1898). Their literary partnership was dissolved in 1907. Paul Margueritte was one of the original members of the Académie de Goncourt. He died on Dec. 30, 1918.

After World War I Victor Margueritte wrote other novels, the most famous of which is *La Garçonne* (1922), and entered political controversy with two books on the question of responsibility for the war; *Les Coupables* and *Appel Aux Consciences,* both written in 1925. He died March 23, 1942.

MARÍA CRISTINA, the name of two queens of Spain.

MARÍA CRISTINA I (1806-1878). queen consort of Ferdinand VII from 1829 to 1833 and queen regent from 1833 to 1810. was born at Naples on April 27, 1806. the daughter of Francis I. king of the Two Sicilies. Spanish liberals hoped that her marriage to Ferdinand would moderate the persecution to which they were subject, and this hope was in fact realized whenever the queen exercised political power. In 1830. the queen being pregnant, Ferdinand VII confirmed the *pragmática* issued in 1789. which re-established the right of females to succeed to the throne in default of male heirs. This was opposed by supporters of the claims to the succession of the king's brother. Don Carlos (1788–1855). Within a few days of the death of Ferdinand VII (1833). when Maria Cristina mas named regent during the minority of her daughter Isabella. the first Carlist War began. The war was only terminated by the convention of Vergara in 1839 and by this time Maria Cristina had lost much support because of her morganatic marriage with Fernando Muñoz. She resigned her regency in 1840 and went to Marseilles, but returned to Spain in 1843, after Gen. Ramón Narváez's *coup d'état*. Isabella II was then declared of age and María Cristina again took part in political life, but she was forced to go into exile again in 1854, She died at Saint-Adresse in France on Aug. 23, 1878. (R. S. Ll.)

María Cristina II (1858–1929), queen consort of Alfonso XII from 1879 to 1885 and queen regent from 1885 to 1902, was born at Gross Seelowitz on July 21, 1858, the daughter of the archduke Charles Ferdinand of Austria. She married Alfonso XII on Nov. 29, 1879. He died on Nov. 26, 1885, leaving her two daughters and a posthumous son, born on May 17, 1886, who immediately succeeded to the throne as Alfonso XIII, under the regency of his mother. Maria Cristina discharged her long and difficult regency with a tact and dignity that won general respect, even though the war of 1898 against the United States was a disaster for Spain. She contributed greatly to the strengthening of the monarchy, to the appeasement of political struggles and to the steady, though slow progress of Spain from the lowest point of its decadence. After Alfonso XIII's coming of age (May 17, 1902), Maria Cristina devoted the remainder of her life to social and charitable work. She died in Madrid on Feb. 6, 1929. (R. M. N.)

MARIANA, JUAN DE (1536–1624), Spanish historian and Jesuit, was born at Talavera. In 1561 he went to teach theology in Rome, reckoning among his pupils Robert Bellarmine, afterwards cardinal; then passed into Sicily, and in 1569 was sent to Paris, where his expositions of the writings of Thomas Aquinas attracted large audiences. He returned to Spain in 1574.

Mariana's great work, *Historiae de rebus Hispaniae,* first appeared in 25 books at Toledo in 1592; ten books were subsequently added (160j), bringing the work down to the accession of Charles V in 1519, and in a still later abstract of events the author completed it to the accession of Philip IV in 1621. It was so well received that Mariana was induced to translate it into Spanish 1601–23. Though in many parts uncritical, the work is justly esteemed for its research, accuracy, sagacity and style. Of his other writings the most interesting is the treatise *De rege et regis institutione* (1599; English translation by G. A. Moore, *The King and The Education oj The King,* 1948).

The question whether it is lawful to overthrow a tyrant is answered in the affirmative, a circumstance which brought much odium upon the Jesuits, especially after the assassination of Henry IV of France, in 1610.

See Cirot, *Etudes sur les historiographes espagnols: Mariana, historien* (Bordeaux, 1905); John Laures, *The Political Economy of Juan de Mariana* (1928).

MARIANA or LADRONE ISLANDS: *see* Pacific Islands.

MARIANAO, a suburb of Havana, Cuba, about 1,500 ft. above the sea; it is a separate municipality. It possesses a pleasant climate. The population in 1953 was 219,278. On the coast below is Marianao beach, a popular watering place.

MARIANAS or MARANHAS, a tribe of South American Indians on the river Jutahy, north-western Brazil. They wear small pieces of wood in their ears and lips, but are not tattooed. Marianas were found on the upper reaches of the Putumayo across to the Yapurá.

MARIANUS SCOTUS (1028–1082 or 1083), chronicler (who must be distinguished from his namesake Marianus Scotus [d. 1088], abbot of St. Peter's, Regensburg), was an Irishman by birth, and called Moelbrigte, or servant of Bridget. He was educated by a certain Tigernach, and having become a monk he crossed over to the continent of Europe in 1056, and his subsequent life was passed in the abbeys of St. Martin at Cologne and of Fulda, and at Mainz. He died Dec. 22, 1082 or 1083.

Marianus wrote a *Chronicon,* which purports to be a universal history from the creation of the world to 1082. The *Chronicon* was very popular during the middle ages, and in England was extensively used by Florence of Worcester and other writers. It was first printed at Basle in 1559, and has been edited with an introduction by G. Waitz for the *Monumenta Germaniae historica. Scriptores* (Bd. v.).

MARIA STELLA, the self-styled legitimate daughter of Philip, duke of Orleans. According to her, Louis Philippe was not the son of Philip duke of Orleans, but a supposititious child, his father being one Lorenzo Chiappini, constable at the village of Modigliana in Tuscany. The story is that the duke and duchess of Orleans, travelling under the incognito of Comte and Comtesse de Joinville, were at this village in April 1773, when the duchess gave birth to a daughter; and that the duke, desiring a son in order to prevent the rich Penthièvre inheritance from reverting to his wife's relations in the event of her death, bribed the Chiappinis to substitute their newly-born male child for his own.

Maria Stella, the supposed daughter of Chiappini, went on the stage at Florence and married, at thirteen, the first Lord Newborough, after whose death she married the Russian Count Ungern-Sternberg. In 1830 she published *Maria Stella ou un échange d'une demoiselle du plus haut rang contre un garçon de plus vile condition* (reprinted 1839 and 1849). This coincided with the advent of Louis Philippe to the throne, and her claim became a weapon for those who wished to throw discredit and ridicule on the "bourgeois monarch." She died in poverty in Paris on Dec. 23, 1843.

See R. P. Gallwey, *Mystery of Maria Stella, Lady Newborough* (1907); M. Vitrac, *Philippe-Égalité et M. Chiappini* (1907), which is based on unpublished material in the *Archives nationales,* and destroys Maria Stella's case.

MARIA THERESA (1717–1780), archduchess of Austria, queen of Hungary and Bohemia, and wife of the Holy Roman emperor Francis I., was born at Vienna on May 13, 1717, eldest daughter of the Emperor Charles VI. (*q.v.*) and Elizabeth of Brunswick-Wolfenbüttel. On Feb. 12, 1736 she married her cousin Francis of Lorraine (*q.v.*), then grand duke of Tuscany, and afterwards emperor. Five sons and eleven daughters were born of this marriage. From the date of her father's death on Oct. 20, 1740, till her own death in 1780, Maria Theresa was one of the central figures in the wars and politics of Europe. But unlike some sovereigns, whose reigns have been agitated, but whose personal character has left little trace, Maria Theresa had a strong and in the main a noble individuality. There was no affectation in her assumption of a becoming bearing or in her picturesque words. The common story, that she appeared before the Hungarian magnates in the diet at Pressburg in 1741 with her infant son, afterwards Joseph II., in her arms, and so worked on their feelings that they shouted *Moriamur pro regina nostra Maria Theresia,* is only mythically true. But during the delicate negotiations to secure the support of the Hungarian nobles she undoubtedly did appeal to them with passionate eloquence, and with a pardonable sense of the advantage she obtained from her youth, her beauty and her sex. Maria Theresa was especially preoccupied with her position as heiress of the rights of the house of Austria. Therefore, when her inheritance was assailed by Frederick of Prussia, she fought for it with the utmost determination, and for years cherished the hope of recovering the lost province of Silesia. Her practical sense showed her the necessity of submitting to spoliation when she was overpowered. She accepted the peace of Berlin in 1742 in order to have a free hand against her Bavarian enemy, the emperor Charles VII. (*q.v.*). When Frederick renewed the war she accepted the struggle cheerfully, because she hoped to recover her own. Down to the peace of Aix-la-Chapelle in 1748 she went on fighting for Silesia or its equivalent. In the years following the peace she applied herself to finding allies in France and Russia who would help her to recover Silesia. Here, as later in the case of Poland, she subordinated her feelings to her duty to the state. Though she denied that she had ever written directly to Madame de Pompadour, it is certain that she allowed her ministers to make use of the favourite's influence over the French king. When fate decided against her in the Seven Years' War she bowed to the inevitable, and was thenceforward a resolute advocate of peace.

In internal government she worked to promote the prosperity of her people, and to give more unity to an administration made up by the juxtaposition of many states and races with different characters and constitutions. Her instincts, like those of her enemy Frederick and her son Joseph II., were emphatically absolutist. She suspended the meetings of the estates in most parts of her dominions. She was able to do so because the mass of her subjects found her hand much lighter than that of the privileged classes who composed these bodies. Education, trade, religious toleration, the emancipation of the agricultural population from feudal burdens—all had her approval up to a certain point. She would favour them, but on the distinct condition that nothing was to be done to weaken the bonds of authority. She took part in the suppression of the Jesuits, and she resisted the pope in the interest of the state. Her methods were those of her cautious younger son, Leopold II, and not of her eldest son'and immediate successor, Joseph II. She did not give her consent even to the suppression of torture in legal procedure without hesitation, lest the authority of the law should be weakened. Her caution had its reward, for whatever she did was permanently gained, whereas her successor in his boundless zeal for reform brought his empire to the verge of a general rebellion.

In her private life Maria Theresa was equally the servant of the state and the sovereign of all about her. She was an affectionate wife to her husband Francis I.; but she was always the queen of Hungary and Bohemia and archduchess of Austria, like her ancestress, Isabella the Catholic, who never forgot, nor allowed her husband to forget, that she was "proprietary queen" of Castile and Leon. She married her daughters in the interest of Austria, and taught them *not* to forget their people and their father's house. In the case of Marie Antoinette (*q.v.*), who married the dauphin, afterwards Louis XVI., she gave an extraordinary proof of her readiness to subordinate everything to the reason of state. She instructed her daughter to show a proper respect to her husband's grandfather, Louis XV., by behaving with politeness to his mistresses, in order that the alliance between the two courts might run no risk. The signing of the peace of Teschen, which averted a great war with Prussia, on May 13, 1779, was the last great act of her reign, and so Maria Theresa judged it to be in a letter to Prince Kaunitz; she said that she had now finished her life's journey and could sing a Te Deum, for she had secured the repose of her people at whatever cost to herself. The rest, she said, would not last long. Her fatal illness developed in the autumn of the following year, and she died on Nov. 28, 1780. When she lay painfully on her deathbed her son Joseph said to her, "You are not at ease," and her last words were the answer, "I am sufficiently at my ease to die."

See A. von Arneth, *Geschichte Maria Theresas* (Vienna, 1863–79) and J. F. Bright, *Maria Theresa* (1897); *M.* Gael, *Maria Theresa* (1900); also AUSTRIA, EMPIRE OF.

MARIAZELL, a town in Styria, Austria, situated in the valley of the Salza, near Lake Erlauf and surrounded by peaks of the north Styrian Alps, grows in importance as a summer resort and as a centre for winter sports. It possesses a 12th century miracle-working image of the Virgin enshrined in a special chapel of the 14th century church, which is visited by over 150,000 pilgrims each year. Population (1961) 2,134; annexed to Germany from 1938 to 1945.

See O. Eigner, *Geschichte des aufgehobenen Benedictinerstijtes Mariazell* (Vienna, 1900).

MARIBOR, a town of Slovenia, Yugoslavia, the German *Marburg*. Pop. (1961) 82,387, mainly Slovenes. It is a popular summer resort and tourist centre, picturesquely situated on the Drave, here spanned by a magnificent iron bridge. There was a settlement at Maribor in Roman times, but the present town arose in the 10th century; in the 12th and 13th centuries the town ruled a vast district. The principal buildings are the Cathedral, dating from the 12th century, but with many later additions, among them a 17th century tower 136 ft. high; and the 15th century castle, famous for its sculptures. Maribor, served both by rail and first class roads, and in the midst of a fertile fruit and wine-growing district, has a large trade in wine and grain, and especially in timber from the surrounding forests. Its industrial products are leather, boots and shoes, iron and tinware, liqueurs and sparkling wine, oil refining and milling and it has a weekly market for pork, poultry and eggs. Near by is the village of hlariast, the church of which is a popular place of pilgrimage. Maribor became part of Yugoslavia in 1918, but was occupied by Hungary in 1941, after Yugoslavia's dismemberment.

MARICOPA, a Yuman tribe living near the Pima on Gila river, Arizona; originally no doubt driven out from the lower Colorado by intertribal warfare, like the Halchidhoma and Kohuana whom they absorbed in the 19th century. The date of the hfaricopa removal is not known.

MARIE, queen of Rumania (1875–1938), was born at Eastwell Park, Kent, on Oct. 29, 1875, the eldest daughter of Alfred, duke of Edinburgh, second son of Queen Victoria. On Jan. 10, 1893 she married Prince Ferdinand, afterwards king of Rumania. From this marriage six children were born: Prince Charles, who married Princess Helen of Greece, Princess Elizabeth, married to the ex-king George of Greece, Princess Marie, later queen of Yugoslavia, the princes Nicolas and Mircea (d. 1916) and Princess Ileana. The queen was a Protestant, but the children, in accordance with the Rumanian constitution, were brought up in the Orthodox faith. Queen Marie took a great interest in the development of her adopted country. Red Cross and charity organizations were formed at her initiative, and during World War I she saw active service as a Red Cross nurse. She devoted much of her time to writing, and her published works include *The Lily of Life* (1913), *My Country* (1916), and *Ilderim* (1925). With King Ferdinand, Marie was crowned at Alba Julia on Oct. 15, 1922. She visited America in 1926. The following year King Ferdinand died, and she retired from active politics. Queen Marie died at the royal summer residence in Sinaia, July 18, 1938, and was buried at Kurtea de Argesch.

MARIE AMELIE THERESE (1782–1866), queen of Louis Philippe, king of the French, was the daughter of Ferdinand IV., king of Naples, and the archduchess Maria Carolina. She was born at Caserta, on April 26, 1782, and received a pious education. Her girlhood was spent in exile. She married Louis Philippe in November 1809. Returning to France in 1814, the duke and duchess of Orleans had barely established themselves in the Palais Royal in Paris when the Hundred Days drove them into exile. Marie Amélie took refuge with her four children in England, where she spent two years at Orleans House, Twickenham. Again in France in 1817, her life at Neuilly until 1828 was the happiest period of her existence. Her attention was absorbed by the care and education of her numerous family, even after the revolution of 1830 had made her queen of the French, a position accepted with forebodings of disaster justified by her early experience of revolutions. During her second exile, from 1848 to her death on March 24, 1866, she lived at Claremont.

See A. L. Baron Imbert de St. Amand, *La Jeunesse de Marie Amélie* (1891), *Marie Amélie au Palais Royal* (1892), *Marie Amdlie et la cow de Palerme* (1891), *Marie Amdlie et la cour des Tuileries* (1892), *Marie Amélie et l'apogée de règne de Louis Philippe* (1893), *Marie Amélie et la société française en 1847* (1894), and *Marie Amélie et la duchesse d'Orleans* (1893).

MARIE ANTOINETTE (1755–1793), queen of France, ninth child of Maria Theresa and the emperor Francis I., was born at Vienna, on Nov. 2, 1755. She was brought up under an austere régime and educated with a view to the French marriage arranged by Maria Theresa, the abbé Vermond being appointed as her tutor in 1769. Her marriage with the dauphin, which took place at Versailles on May 16, 1770, was intended to crown the policy of Choiseul and confirm the alliance between Austria and France. This fact, combined with her youth and the extreme corruption of the French court, made her position very difficult. Madame du Barry, whose influence over Louis XV. was supreme, formed the centre of a powerful anti-Choiseul cabal, which succeeded in less than a year after the dauphin's marriage in bringing about the fall of Choiseul and seriously threatening the Austrian alliance. Thus the young princess was surrounded by enemies both at court and in the dauphin's household, and came to rely almost entirely upon the Austrian ambassador, the comte de Mercy-Argenteau, whom Maria Theresa had instructed to act as her mentor, at the same time arranging that she herself should be kept informed of all that concerned her daughter, so that she might at once advise her and safeguard the alliance. Hence arose the secret correspondence of Mercy-Argenteau, an invaluable record of all the details of Marie Antoinette's life from her marriage in 1770 till the death of Maria Theresa in 1780.

Marie Antoinette soon won the affection and confidence of the dauphin and endeared herself to the king, but her position was precarious, and both Mercy and Maria Theresa had continually to urge her to conquer her violent dislike for Madame du Barry.

The accession of the young king and queen on the death of Louis XV (May 10, 1774), was hailed with great popular enthusiasm. But her first steps brought Marie Antoinette into open hostility with the anti-Austrian party. She was urgent in obtaining the dismissal of d'Aiguillon, and did all in her power to secure the recall of Choiseul, though without success. Her impatience of the cumbrous court etiquette shocked many people, and her taste for pleasure led her to seek the society of the comte d'Artois and his young and dissolute circle. But the greatest weakness in her position lay in her unsatisfactory relations with her husband. The king, though affectionate, was cold and apathetic, and it was not until seven years after her marriage that there was any possibility of her bearing him an heir.

The end of the period of mourning for the late king was the signal for a succession of gaieties, during which the queen displayed a passion for amusement and excitement which led to unfortunate results. Being childless, and with a husband whom she could not respect, her longing for affection led her to form various intimate friendships, above all with the princesse de Lamballe and the comtesse Jules de Polignac, who soon obtained such an empire over her affections that no favour was too great for them to ask, and often to obtain. In frequenting the salons of her friends the queen not only came in contact with a number of the younger and more dissipated courtiers, but also fell under the influence of various ambitious intriguers whose interested manoeuvres she was induced to further by her affection for her favourites. Thus she was often led to interfere for frivolous reasons in public affairs, sometimes with serious results, as in the case of the trial of the comte de Guines (1776), when her interference led to the fall of Turgot. At the same time her extravagance in dress, jewellery and amusements (including the gardens and theatricals at Trianon which was opened in May 1780 and of the cost of which exaggerated reports were spread), and her presence at horse races and masked balls in Paris without the king gave rise to scandal. At this critical period her brother, the emperor Joseph II, decided to visit France. As the result of his visit he left with the queen a memorandum in which he pointed out to her in plain terms the dangers of her conduct. For a time the emperor's remonstrances had some effect, and after the birth of her daughter, Marie Thérèse Charlotte (afterwards duchesse d'Angoulême), in Dec. 1778, the queen lived a quieter life. The death of Maria Theresa (Nov. 29, 1780) deprived her of a wise friend, and by removing all restraint on the rashness of Joseph II was bound to increase the dislike of the Austrian alliance and cause embarrassment to Marie Antoinette. Her position was much strengthened by the birth (Oct. 22, 1781) of a dauphin, Louis Joseph Xavier François; and on the death of Maurepas, which left the king without a chief minister, she might have exerted great influence in public affairs. But personal motives alone would lead her to interfere in public affairs, especially when it was a question of obtaining places or favours for her favourites and their friends. The influence of the Polignacs was now at its height, and they obtained large sums of money, a dukedom, and many nominations to places. But, in response to Mercy's and Joseph II's urgent representations. Marie Antoinette exerted herself on behalf of Austria in the affairs of the opening of the Scheldt (1783–1784) and the exchange of Bavaria (1785), in which, though she failed to provoke active interference on the part of France, she succeeded in obtaining the payment of considerable indemnities to Austria.

Two more children were born to her: Louis Charles, duke of Normandy, afterward dauphin, on March 27, 1785, and Sophie Hélène Beatrix (d. June, 19, 1787), on July 9, 1786. In 1785–1786 the affair of the Diamond Necklace (*q.v.*) revealed the depth of the hatred which her own follies and the calumnies of her enemies had aroused against her. The public held her responsible for the bankrupt state of the country which was the immediate cause of the revolution.

The year 1789 was one of disaster for Marie Antoinette; on March 10 her brother Joseph II died and on June 4 her eldest son. The same year saw the assembling of the states-general, the taking of the Bastille, and the events leading to the terrible days of Oct. 5 and 6 at Versailles and the removal of the royal family to Paris. Then began the negotiations with Mirabeau, whose high estimate of the queen is well-known. But the queen was violently prejudiced against him and he never gained her full confidence. She was naturally incapable of seeing the full import of the revolution. She dreaded the thought of civil war; and even when she had realized the necessity for decisive action the king's apathy and indecision made it impossible. for her to persuade him to carry into effect Mirabeau's plan of leaving Paris and appealing to the provinces. Her difficulties were increased by the departure of Mercy for The Hague in Sept. 1790, for Montmorin, who now took his place in the negotiations with Mirabeau, had not her confidence to the same extent. Feeling herself helpless and almost isolated in Paris, she now relied chiefly on her friends outside France — Mercy, Count Axel Fersen and the baron de Breteuil; and it was by their help and that of Bouillé that after the death of Mirabeau, on April 8, 1791, the plan was arranged of escaping to Montmkdy, which ended in the flight to Varennes (June 21, 1791).

After the return from Varennes the royal family were closely guarded, but they still found channels of communication with the outside world. The king being sunk in apathy, the task of negotiation devolved upon the queen; but in her inexperience of affairs and the uncertainty of information from abroad, it was hard for her to follow any clear policy. Her courageous bearing during the return from Varennes had greatly impressed Barnave, and he now approached her on behalf of the constitutional party. For about a year she continued to negotiate with them, forwarding to Mercy and the emperor Leopold II letters and memoranda dictated by them, while at the same time secretly warning them not to accept these letters as her own opinions, but to realize that she was dependent on the Constitutionals. She agreed with their plan of an armed congress, and Fersen left Brussels on a mission to the emperor to try to gain his support and checkmate the *émigrés,* whose rashness threatened the queen's plans.

As for the constitution (Sept. 1791), "tissue of absurdities" though the queen thought it, she considered that in the circumstances the king was bound to accept it in order to inspire confidence. Mercy was also in correspondence with the Constitutionals, and in letter after letter to him and the emperor, the queen, strongly supported by Fersen, insisted that the congress should meet as soon as possible, her appeals increasing in urgency as she saw that Barnave's party would soon be powerless against the extremists. But the congress was continually postponed. On March 7, 1792, Leopold II died and was succeeded by the young Francis II. Marie Antoinette's actions were now directed entirely by Fersen, for she suspected Mercy and the emperor of sacrificing her to the interests of Austria. The declaration of war which the king was forced to make (April 20) threw her definitely into opposition to the revolution and she betrayed to Mercy and Fersen the plans of the French generals. She was now certain that the life of the king was threatened, and the events of June 20 added to her terrors. She considered their only hope to lie in the armed intervention of the powers, and endorsed the suggestion of a threatening manifesto which should hold the national assembly and Paris responsible for the safety of the king and royal family. Immediately after Brunswick's manifesto followed the storming of the Tuileries and the removal of the royal family to the temple (Aug. 10). During all these events and the captivity in the temple Marie Antoinette showed an unvarying courage and dignity, in spite of her failing health and the illness of her son. After the execution of the king (Jan. 21, 1793) several unsuccessful attempts were made to rescue her and her children, and negotiations for her release or exchange were even opened with Danton; but as the allied armies approached. her trial and condemnation became a certainty. She had already been separated from her son, the sight of whose ill-treatment added to her sufferings;

she was now parted from her daughter and Madame Elizabeth, and removed on Aug. 1, 1793 to the Conciergerie, where she was under the closest guard and subjected to the most offensive espionage.

On Oct. 14 began her trial. Her noble attitude, even in the face of the atrocious accusations of Fouquier-Tinville, commanded the admiration even of her enemies, and her answers during her long examination were clear and skilful. The following were the questions finally put to the jury:—

(1) Is it established that manoeuvres and communications have existed with foreign powers and other external enemies of the republic, the said manoeuvres, etc., tending to furnish them with assistance in money, give them an entry into French territory, and facilitate the progress of their armies?

(2) Is Marie Antoinette of Austria, the widow Capet, convicted of having co-operated in these manoeuvres and maintained these communications?

(3) Is it established that a plot and conspiracy has existed tending to kindle civil war within the republic, by arming the citizens against one another?

(4) Is Marie Antoinette, the widow Capet, convicted of having participated in this plot and conspiracy?

The jury decided unanimously in the affirmative, and on Oct. 16, 1793 Marie Antoinette was led to the guillotine, leaving behind her a touching letter to Madame Elizabeth, known as her "Testament."

As to the justice of these charges, we have seen how the queen was actually guilty of betraying her country, though it was only natural for her to identify the cause of the monarchy with that of France. To civil war she was consistently opposed, and never ceased to dissociate herself from the plans of the *émigrés,* but here again her very position made her an enemy of the republic. All her actions had as their aim—firstly, the safeguarding of the monarchy and later, when she saw this to be impossible, that of securing the safety of her husband and her son.

BIBLIOGRAPHY.—M. Tourneux, *Marie Antoinette devont l'histoire. Essai bibliographique* (2nd ed., Paris, 1901); id. *Bibliogr. de la ville de Paris . . .* (vol. iv, 1906), nos. 20980–21338; also *Bibliogr. de femmes célèbres* (Turin and Paris, 1892, etc.). The most important material for her life is to be found in her letters and in the correspondence of Mercy-Argenteau, but a large number of forgeries have found their may into certain of the collections, such as those of Count Paul Vogt d'Hunolstein and F. Feuillet de Conches, while most of the works on Marie Antoinette published before the appearance of Arneth's publications (1865, etc.) are based partly on these forgeries. For a detailed examination of the question of the authenticity of the letters *see* the introduction to *Lettres de Marie Antoinette. Recueil des lettres authentiques de la reine, publié pour la société d'histoire contemporaine, par M. de la Rochetérie et le marquis de Beaucourt* (2 vols., Paris, 1895–1896). Of the highest importance are the letters from the archives of Vienna published by Alfred von Arneth and others: A. von Arneth, *Maria Theresia und Marie Antoinette. ihr Briefwechsel 1770–1780* (Paris and Vienna, 1865); *Marie Antoinette, Joseph II und Leopold II ihr Briefwechsel* (Leipzig, Paris and Vienna, 1866); id. and A. Geffroy, *Correspondance secrète entre Marie-Thérèse et le comte de Mercy-Argenteau* (3 vols., Paris, 1874–75); id. and J. Flammermont, *Correspondance secrète du comte de Mercy-Argenteau avec Joseph II et le prince de Kaunitz* (2 vols., Paris, 1889–1891); for further letters *see* Comte de Reiset, *Lettres de la reine Marie Antoinette à la landgrave Louise de Hesse-Darmstadt* (1865); id. *Lettres inédites de Marie Antoinette et de Marie-Clotilde, reine de Sardaigne* (1877). *See* also *Correspondance entre le comte de Mirabeau et le comte de la Marck, 1789–1791, recueillie . . . par F. de Bacourt* (3 vols., Paris, 1857), and R. M. de Klinckowström, *Le Comte de Fersen et la cour de France* (2 vols., Paris, 1877–1878). The chief memoirs are: Mme. Campan, *Mémoires sur la vie privée de Marie Antoinette* (5th ed., 2 vols., Paris, 1823, Eng. trans., 1824), the inaccuracy of which is demonstrated by J. Flammermont in *Etudes critiques sur les sources de l'histoire du xviii^e siècle: Les Mémoires de Mme. Campan,* in the *Bulletin de la Faculté des lettres de Poitiers* (4th year, 1886, pp. 56, 109); J. Weber, *Mémoires concernant Marie Antoinette* (3 vols., London, 1804–1809); Eng. trans., 3 vols., London, 1805–1806); *Mémoires de M. le baron de Besenval* (3 vols., Paris, 1805); *Mémoires de M. le duc de Lauzun* (2nd ed., 2 vols., Paris, 1822); E. Bavoux, *Mtms. secrets de J. M. Augeard, secrétaire des commandements de la reine M. Antoinette* (Paris, 1866); Mme. Vigée-Le-Brun, *Mes souvenirs* (2 vols., Paris, 1867); *Mémoires de Mme. la duchesse de Tourzel,* ed. by the duc de Cars (2 vols., Paris, 1883); *Mémoires de la baronne d'Oberkirch* (2 vols., Paris, 1853). M. Tourneux *(op. cit.)* discusses the authenticity of many of the memoirs.

GENERAL WORKS:—A. Sorel, *L'Europe et la Rév. fr.* vol. ii (1885–1904), contains a good estimate of Marie Antoinette. *See* also P. de Nolhac, *Marie Antoinette* (Paris 1936); which gives good descriptions of Versailles, Trianon, etc.; M. de la Rocheterie, *Histoire de Marie Antoinette* (2 vols., Paris, 1890); G. Desjardins, *Le Petit-Trianon* (Versailles, 1885). For her trial and death, *see* E. Campardon, *Marie Antoinette à la Conciergerie* (1863). *See* also A. Vuaflart and H. Bourin, *Les Portraits de Marie Antoinette* (1909); A. Cabanès. *La Princesse de Lamballe intinze* (1922); P. M. de Ségur, *Marie Antoinette* (1921; Eng. trans., 1927); John G. Palache, *Marie Antoinette* (1929); Emile Baumann, *Marie Antoinette et Axel Fersen* (Paris, 1931); Katharine Anthony, *Marie Antoinette* (1933); Marjorie Coryn, *Marie Antoinette and Axel de Fersen* (London, 1938); J. MARIE DE FRANCE (*fl.* c. 1175–1190), French poet and fabulist. In spite of her own statement in the epilogue to her fables: "Marie ai num, si suis de France," generally interpreted to mean that Marie was a native of the Île de France, she seems to have been of Norman origin, and certainly spent most of her life in England. Her language, however, shows little trace of Anglo-Norman provincialism. Like Wace, she used a literary dialect which probably differed very widely from common Norman speech. The manuscripts in which Marie's poems are preserved date from the late 13th or even from the 14th century, but the language fixes the date of the poems in the second half of the 12th century.

The *lais* are dedicated to an unknown king, who is identified as Henry II. of England; and the fables, her *Ysopet,* were written according to the *Epilogus* for a Count William, generally recognized to be William Longsword, earl of Salisbury. Marie lived and wrote at the court of Henry II., which was very literary and purely French. Queen Eleanor was a Provençal, and belonged to a family in which the patronage of poetry was a tradition. There is no evidence to show whether Marie was of noble origin or simply pursued the profession of a *trouvère* for her living.

The origin of the *lais* has been the subject of much discussion. Marie herself says that she had heard them sung by Breton minstrels. Gaston Paris (*Romania,* vol. xv.) maintained that Marie had heard the stories from English minstrels, who had assimilated the Celtic legends. In any case the Breton lays offer abundant evidence of borrowing from Scandinavian and oriental sources.

The *lais* which may be definitely attributed to Marie are *Guigemar, Equitan, Le Frêne, Le Bisclavret* (the werewolf), *Les Deux amants, Laustic, Chaitivel, Lanval, Le Chèvrefeuille, Milon, Yonec* and *Eliduc.* The other similar lays are anonymous except the *Lai d'Ignaure* by Renant and the *Lai du cor* of Robert Biket, two authors otherwise unknown. They vary in length from some 12,000 lines to about 100.

Marie's *Ysopet* is a collection of fables translated from an English original which she erroneously attributed to Alfred the Great, who had, she said, translated it from the Latin. Another poem attributed to her is *L'Espurgatoire Seint Patriz,* a translation from the *Tractatus de purgatorio S Patricii* (c. 1185) of Henri de Salterey, which brings her activity down almost to the close of the century.

See *Die Fabeln der Marie de France* (1898), ed. by Karl Warnke with the help of materials left by Eduard Mall; and *Die Lais der Marie de France* (2nd ed., 1900), ed. by Karl Warnke, with comparative notes by Reinhold Kohler; the two works being vols. vi. and iii. of the *Bibliotheca Normannica* of Hermann Suchier; also J. Bédier in *Revue des drux mondes* (Oct. 1891); Alice Kemp-Welch in *Nineteenth Century* (Dec. 1907); and Winkler, "Marie de France" in *Sitzengber. d. Wiener Akad,* vol. 183, 1918. For an analysis of the *Lais* see *Revue de philologie française,* viii. 161 *seq.;* Karl Warnke, *Die Quellen der Esope der Marie de France* (1900). The *Lais* were first published in 1819 by B. de Roouefort. *L'Espurgatoire Seint Patriz* was edited by T. A. Jenkins (Philadelphia, 1894). Some of the *Lays* were paraphrased by Arthur O'Shaughnessy in his *Lays of France* (1872).

MARIE DE' MEDICI (1573–1642), queen consort and queen regent of France. daughter of Francis de' Medici, grand duke of Tuscany, and Joanna, an Austrian archduchess, was born in Florence on April 26, 1573. She married Henry IV of France in October 1600. Her eldest son, the future Louis XIII, was born at Fontainebleau in September of the next year; the other children who survived were Gaston duke of Orleans; Elizabeth queen of Spain; Christine duchess of Savoy; and Henrietta Maria queen of England. During her husband's lifetime Marie de' Medici showed little sign of political taste or ability; but after his murder in 1610 when she became regent, she devoted herself to affairs with unfailing regularity and developed an inherited passion for power. She gave her confidence chiefly to Concini, afterwards maréchal d'Ancre, the husband of Leonora Galigaï, a friend of her childhood. Under the regent's lax and capricious rule the princes of the blood and the great nobles of the kingdom revolted; and the queen, too weak to assert her authority, consented at Sainte Menehould (May 15, 1614) to buy off the discontented princes. In 1616 Richelieu entered her councils. Louis XIII., who was now 16 years old, threw off the tutelage of his mother and Concini. By his orders Concini was murdered, Leonora Galigai' was tried for sorcery and beheaded, Richelieu was banished to his bishopric, and the queen was exiled to Blois.

After two years of virtual imprisonment she escaped in 1619 and became the centre of a new revolt. Louis XIII. easily dispersed the rebels, but through the mediation of Richelieu was reconciled with his mother, who was allowed to hold a small court at Angers, and resumed her place in the royal council in 1621. For a single day, the *journée des* dupes, Nov. 12, 1630, she seemed to have succeeded against the minister; but the triumph of Richelieu was followed by her exile to Compikgne, whence she escaped in 1631 to Brussels. From that time till her death at Cologne on July 3, 1642 she intrigued in vain against the cardinal

See A. P. Lord, *The Regency of Marie de Médicis* (1904); L. Batiffol, *La Vie intime d'une reine de France au XVIIe siècle: Marie de Médicis* (1931; Eng. trans., 1908).

MARIE FEODOROVNA (MARIE SOPHIA FREDERIKA DAGMAR) (1847–1928), empress of Russia, second daughter and fourth child of King Christian IX. of Denmark, was born Nov. 26, 1847. Originally betrothed to Nicholas, eldest son of Alexander II., tsar of Russia, on his death she married, on Nov. 9, 1866, the Grand Duke Alexander Alexandrovitch, his younger brother, heir-apparent to the Russian throne, and was known thenceforward as Marie Feodorovna. The grand duke succeeded to the Russian throne as Alexander III., in 1881, on the assassination of his father by revolutionaries. The empress's home life was a happy one, and she took no part in politics. Her husband was for many years in danger of his life and every precaution was taken for his safety. There was on his accession a tendency to reaction, and on the advice of Pobiedonoszeff, Alexander III. refused to accept the Constitution prepared by his father. As his accession to the throne had never been expected, he had been trained as a soldier, and had little political knowledge or ability. The empress interested herself particularly in philanthropy and education, and as head of the "department of the institution of the empress Marie" greatly extended the work of the institution, establishing new schools, hospitals and relief centres of various kinds. She endeared herself to the people of Russia by her personal interest as well as by her wide philanthropic activities. She was trained as a nurse during the Russo-Turkish war, and greatly developed the Russian Red Cross organization, of which she was the head. From the death of Alexander III., in 1894, she lived in retirement in the Anitchkov palace in St. Petersburg (Leningrad), visiting Denmark and England where she was staying on the outbreak of the World War. She returned to Russia, in spite of an attempt in Berlin to send her back to England, and worked actively for the Russian Red Cross. Her attempts to warn her son, Nicholas II., against the influence of Rasputin were unsuccessful. Three months after Rasputin's murder the revolution broke out and the emperor abdicated. The empress Marie, who was at Kiev, met him for the last time at Mohilev. She was permitted, with other members of the royal family, to live in the Crimea, under close guard. When the Crimea came under German occupation she was given the opportunity of returning to Denmark through Germany, but refused, and only left for England after the armistice in April 1919. During her later years she lived at Hvidore, in Denmark; she died at Copenhagen on Oct. 13, 1928.

The empress had five children, Nicholas, who became emperor as Nicholas II.; George, who died at the age of 23; Xenia, who married the Grand Duke Alexander Mikhailovitch; Michael, who was tsarevich from 1881 until the birth of a direct heir to the throne in 1904; and Olga, whose marriage with Prince Peter Oldenburgsky was dissolved during the war.

MARIE GALANTE, an island in the French West Indies. Pop. (1940) 23,124. It lies in 15° 55′ N. and 61° 17′ W., 16 mi. S.E. of Guadeloupe, of which it is a dependency. It is nearly circular in shape and 58 sq mi. in area A rocky limestone plateau 675 ft. high occupies the centre of the island, and from it the land descends in a series of well-wooded terraces to the sea. The shores are rocky, there are no harbours, and the roadstead off Grand Bourg is difficult of access, owing to the surrounding reefs. The climate is healthy and the soil rich; sugar, coffee and cotton being the chief products. The largest town is Grand Bourg (pop. 13,833) on the southwest coast. The island was discovered by Columbus in 1493, and received its name from the vessel on which he was sailing. The French who settled here in 1648 suffered numerous attacks both from the Dutch and the British, but since 1766, except for a short period of British rule in the early part of the 19th century, they have held undisturbed possession.

MARIE LESZCZYNSKA (1703–1768), queen consort of France, was born at Breslau on June 23, 1703, being the daughter of Stanislas Leszczynski (who in 1704 became king of Poland) and of Catherine Opalinska. During a temporary flight from Warsaw the child was lost, and eventually discovered in a stable; on another occasion she was for safety's sake hidden in an oven. In his exile Stanislas found his chief consolation in superintending the education of his daughter. Her marriage with Louis XV. took place at Fontainebleau on Sept. 5, 1725. Marie's one attempt to interfere in politics, an effort to prevent the disgrace of the duke of Bourbon, was the beginning of her husband's alienation from her; and after the birth of her seventh child, Louise, Marie was practically deserted by Louis, who openly avowed a series of liaisons. She died at Versailles on June 24. 1768.

See H. Gauthier Villars, *Le Mariage de Louis XV. d'après des documents nouveaux* (1900), P. de Nolhac, *La Reine Marie Leczinska* (1900) and *Louis XV. et Marie Leczynska* (1900); P Boyé, *Lettres du roi Stanislas à Marie Leszczynska 1754–66* (Paris and Nancy, 1901); and C Stryienski's book on Marie Joséphs de Saxe (*La Mère des trois derniers Bourbons,* 1902).

MARIE LOUISE (1791–1847), second wife of Napoleon I., was the daughter of Francis I., emperor of Austria, and of the princess Theresa of Naples, and was born on Dec 12, 1791. It is probable, though not quite certain, that the first suggestions of a marriage between Napoleon and Marie Louise emanated secretly from the Austrian chancellor, Metternich. The prince de Ligne claimed to have been instrumental in arranging it., In any case the proposal was well received at Paris both by Napoleon and by his ministers; and the difficulties respecting the divorce of Josephine, were surmounted. The marriage took place by proxy in the church of St. Augustine, Vienna, on March 11, 1810. The new empress was escorted into France by Queen Caroline Murat, for whom she soon conceived a feeling of distrust. The civil and religious contracts took place at Paris early in April, and during the honeymoon, spent at the palace of Compikgne, the emperor showed the greatest regard for his wife "He is so evidently in love with her," wrote Metternich, "that he cannot conceal his feelings, and all his customary ways of life are subordinate to her wishes" His joy was complete when on March 20, 1811, she bore him a son who was destined to bear the empty titles of "king of Rome" and "Napoleon II." Before the campaign of 1812 she accompanied the emperor to Dresden; but after that scene of splendour misfortunes crowded upon Napoleon In January 1814 he appointed her to act as regent of France (with Joseph Bonaparte as lieutenant-general) during his absence in the field.

At the time of Napoleon's first abdication (April 11, 1814), she succeeded in spite of the efforts of Joseph and Jerome Bonaparte in reaching her father, the emperor Francis, while Napoleon was on his way to Elba. She, along with her son, was escorted into Austria by Count von Neipperg, and refused to comply with the entreaties of Napoleon to proceed to Elba; and her alienation from him was completed when he ventured to threaten her with a forcible abduction. During the Hundred Days she remained in Austria, and manifested no desire for the success of Napoleon in France. At the Congress of Vienna the Powers awarded to her and her son the duchies of Parma, Piacenza and Guastalla, in conformity with the terms of the treaty of Fontainebleau (March, 1814); in spite of the determined opposition of Louis XVIII. she gained this right for herself owing largely to the support of the emperor Alexander, but she failed to make good the claims of her son to the inheritance. (*See* REICHSTADT, NAPOLEON FRANCIS JOSEPH CHARLES.) She proceeded alone to Parma, and had to acquiesce in the title "duke of Reichstadt" accorded to her son.

Long before the news of Napoleon's death reached her she was living in intimate relations with Neipperg at Parma, and bore a son to him not long after that event. Napoleon on the other hand spoke of her in his will with marked tenderness, and both excused and forgave her infidelity. Neipperg became her morganatic husband; and they had other children. In 1832 she visited the duke of Reichstadt at Vienna when he was dying. Her rule in Parma, conjointly with Neipperg, was characterized by a clemency and moderation which were lacking in the other Italian states in that time of reaction. She preserved some of the Napoleonic laws and institutions; in 1817 she established the equality of women in heritage, and ordered the compilation of a civil code which was promulgated in January 1820. On the death of Neipperg in 1829 his place was taken by Baron Werklein, whose influence was hostile to popular liberty. In 1831 Marie Louise had to take refuge with the Austrian garrison at Piacenza; on the restoration of her rule by the Austrians its character deteriorated, Parma becoming an outwork of the Austrian empire. She died at Vienna on Dec. 18, 1847.

Durand Méneval and Metternich; and Max Billard, *The Marriage Ventures of Marie Louise*, English version by Evelyn, duchess of Wellington (1910); D. Masson, *L'impératrice Marie Louise* (1902); Cuthell, *An Imperial Victim* (1912); Gachot, *Marie Louise intime* (1912); C. de Clary-et-Aldringen, *Souvenirs* (1914).

MARIENBAD (Czech *Marianské Lázně*), a watering-place in the region of Karlovy Vary, Czech., on the southeastern outskirts of the Císařský Les at an altitude of 2,093 ft., enclosed on all sides except the south by gently sloping hills clad with pine forests intersected by lovely walks. Pop. (1950) 9,178. Although its mineral springs have been known for centuries and are mentioned in a document dated 1341 as belonging to the abbey of Tepl, they attracted few people until Josef Nehr, the doctor of the abbey, demonstrated their curative properties during the period 1779–1820, and the town did not receive a charter until 1868.

After this date it grew in popularity and became one of the most frequented spas in Europe. The waters are cold and varied in composition, some, like those of Carlsbad, being alkaline-saline but of greater strength, others being rich in iron, and are used in the treatment of liver troubles, gout, diabetes and obesity. Most are used for bottling and drinking but the cure also involves a carefully regulated diet; the water is also bottled and exported in large quantities. In addition to the springs there are peat baths very rich in iron. The town is small and well-built, most of its hospitals, bathing establishments and other public buildings being quite modern.

In the vicinity lie many places of interest, *e.g.,* the rock of Podhorn (2,776 ft.), about 3 mi. E., with extensive views of the Böhmer Wald and Erz Gebirge, and, about 7 mi. E., the old abbey of Tepl, founded in 1193, though the present building dates from the 17th–18th centuries and has a fine library and collection of rare manuscripts; and, to the northeast, the small spa of Königswart. In 1938 Marienbad, as part of the Sudetenland, came under German rule. The area again became part of Czechoslovakia after World War II.

MARIENBURG (Polish, MALBORK), a town in former East Prussia, province of Gdansk, Pol., 30 mi. by rail to Danzig, on the right bank of the Nogat, a channel of the Vistula, here spanned by bridges. Pop. (1950) 16,500. The castle of the Teutonic order here was originally founded in 1274 as the seat of a simple commandery against the pagan Prussians, but in 1309 the headquarters of the grand master were transferred hither from Venice, and the "Marienburger Schloss" soon became one of the largest and most strongly fortified buildings in Germany. In the middle of the 15th century the castle passed into the hands of the Poles, by whom it was allowed to fall into neglect and decay. It came into the possession of Prussia in 1772 and was carefully restored at the beginning of the 19th century. It consists of three parts, the Alt- or Hochschloss, the Mittelschloss and the Vorburg, and is built of brick, in a style of architecture peculiar to the Baltic provinces. Marienburg manufactures agricultural machinery and sugar and has saw-mills. It carries on a considerable trade in grain, wood and flax and is the seat of cattle and horse markets. In the old market place, many of the houses of which are built with arcades, stands a Gothic town hall dating from the end of the 14th century.

MARIE THÉRÈSE OF AUSTRIA (1638–1683), queen consort of France, was born on Sept. 10, 1638, at the Escorial, the daughter of Philip IV of Spain and Elizabeth of France. The treaty of the Pyrenees in 1659 stipulated for her marriage with Louis XIV, Marie renouncing any claim to the Spanish succession. Marie Thérèse was married in June 1660, when Philip IV with his whole court accompanied the bride to the Isle of Pheasants in the Bidassoa, where she was met by Louis. She died on July 30, 1683, at Versailles, not without suspicion of foul play on the part of her doctors. Of her six children only one survived her, the dauphin Louis, who died in 1711.

See the funeral oration of Bossuet (1684); E. Ducéré, *Le Mariage de Louis XIV d'après les contemporains et des documents inédits* (1905); Dr. Cabanès, *Les Morts mystérieuses de l'histoire* (1923); M. Duclos, *Madame de La Vallière et Marie Thérèse d'Austriche* (1904); and the literature dealing with her rivals Louise de la Vallière, Madame de Montespan and Madame de Maintenon.

MARIETTA, a city of Georgia, U.S., the seat of Cobb county, is located 20 mi. N.W. of Atlanta, in the Blue Ridge foothills at an altitude of 1,118 ft. Founded in 1833, when Cobb county was formed from Cherokee land, it was chartered as a city in 1852.

The state-owned Western and Atlantic railroad, completed from Atlanta to Marietta in 1845, and subsequent railroad connections stimulated the town's growth.

In 1942 an aircraft-manufacturing plant was located 3 mi. S., where B-29s (the Superfortresses of World War II) were fabricated; the plant was reopened in 1951. As many as 15,000 workers have been employed there in the manufacture of jet aircraft.

Adjacent are the Atlanta naval air station and Dobbins air force base, centre for U.S. southeastern air defenses. A variety of small industries including furniture, textiles and stone antedated aircraft.

The Kennesaw Monument National Battlefield park, 2½ mi. N.W., which marks the site of an important American Civil War battle, is situated at Kennesaw mountain (1,809 ft.). On June 27, 1864, entrenched Confederate forces under Gen. Joseph Eggleston Johnston repulsed a frontal assault by invading Federal troops under Gen. William Tecumseh Sherman. Federal losses exceeded 2,500. A flanking movement finally forced a Confederate retreat across the Chattahoochee river into the environs of Atlanta. More than 10,000 Federal soldiers are buried in the Marietta National cemetery.

For comparative population figures *see* table in GEORGIA: *Population.* (J. C. WA.)

MARIETTA, a city of southeastern Ohio, U.S., the seat of Washington county, is located on the Ohio river, at the mouth of the Muskingum, 45 mi. S.E. of Zanesville. Its history dates from 1785, when Ft. Harmar was constructed there. Permanent settlement, the first in Ohio, began April 7, 1788, with the arrival of Gen. Rufus Putnam (*q.v.*) and his pioneer group, the Ohio Company of Associates, and was named in honour of Queen Marie Antoinette of France. On July 15, 1788, Arthur St. Clair was installed there as first governor of the Northwest territory. The first years were difficult, because of the Indian War of 1791–95. For many years thereafter Marietta was noteworthy in the flatboat trade in agricultural produce down river to New Orleans. During the steamboat era it was a typical river town. For a generation after the American Civil War it was the centre of an important oil and gas area.

There was still a considerable production in the 1960s, mostly on a secondary-recovery basis. Certain favourable peculiarities of soil and climate contributed to the growth of truck farming in the surrounding countryside, but much of the best land has been taken over for industry or housing. The chief products of the local and nearby factories are chemicals (especially plastics), metal alloys and office equipment.

Marietta is the seat of Marietta college (related to the Congregational Christian Church and chartered in 1835), the library of which has the original records of the Ohio company and the 20.000-volume Rodney M. Stimson collection relating chiefly to the Ohio and Mississippi valleys. Worthy of note are Conus, a large and perfect Indian mound in the Mound cemetery; "The Start Westward of the United States," a memorial in Muskingum park, dedicated by Pres. Franklin D. Roosevelt in 1938; and the Campus Blartius museum. operated by the Ohio Historical society The museum houses the land office of the Ohio company, the home of Rufus Putnam, a "river museum," and the Charles Goddard Slack collection of prints and autographs. A great tourist attraction, the "W. P. Snyder, Jr.." a river towboat of a type long obsolete, which is moored in the Muskingum river, also belongs to the museum

For comparative population figures *see* table in OHIO: *Population*. (R L. J.)

MARIETTE, AUGUSTE FERDINAND FRANÇOIS (1821–1881), French Egyptologist, was born on Feb. 11, 1821, at Boulogne. where his father was town clerk. Entrusted with a government mission for the purpose of seeking and purchasing Coptic. Syriac, Arabic and Ethiopic manuscripts for the national collection. he started for Egypt in 1850; and soon after his arrival he discovered the ruins of the Serapeum and the subterranean catacombs of the Apis bulls. His original mission being abandoned, funds were non advanced for the prosecution of his researches, and he remained in Egypt for four years, excavating, discovering and dispatching archaeological treasures to the Louvre, of ahich he was on his return appointed an assistant conservator. In 1858 he accepted the position of conservator of Egyptian monuments to the former khedive Ismail Pasha, and moved with his family to Cairo

The museum at Bula was founded immediately. The pyramid fields of Memphis and Sakkara and the necropolis of Meydum. and those of Abydos and Thebes, were examined; the great temples of Dendera and Edfu were disinterred; important excavations were carried out at Karnak, Medinet-Habu and Deir el-Bahri; Tanis (the Zoan of the Bible) was partially explored in the Delta; and even Gebel Barkal in the Sudan The Sphinx was bared to the rock level, and the famous granite and alabaster monument miscalled the "Temple of the Sphinx" was discovered Mariette was raised successively to the rank of bey and pasha. He died at Cairo on Jan. 19, 1881.

His chief published works are: *Le Sérapéum de Memphis* (1857 *et seq.); Dendérah,* 5 folios and 1 quarto (1873–75); *Abydos,* 2 folios and 1 quarto (1870–80); *Karnak,* folio and quarto (1875); *Deir el-Bahari,* folio and quarto (1877); *Listes géographiques des pylônes de 'Karnak,* folio (1875); *Catalogue du Musée de Boulaq (6* ed., 1864–76); *Aperçu de l'histoire d'Égypte (4* ed., 1864–74, etc.); *Les Mastabas de l'ancien empire* (ed. by Maspero) (1883).

See EGYPT: *Archaeology.*

MARIGNAN, BATTLE OF, fought on Sept. 13 and 14, 1515, between the French army under Francis I and the Swiss. The scene of the battle—which was also that of a hard-fought engagement in 1859 *(see* ITALIAN WARS)—was the northern outskirts of the village of Melegnano (in French, *Marignan*), on the river Lambro, 10 mi. S.E. of Milan, It. The young king of France had gathered an army about Lyons, wherewith to overrun the Milanese; his allies were the republics of Venice and Genoa. The duke of Milan, Maximilian Sforza, had secured the support of the emperor, the king of Spain and the pope and also that of the Swiss cantons, which then supplied the best mercenary soldiers in Europe. *(See* SWITZERLAND: *History.)* The practicable passes of the Alps and the Apennines were held by Swiss and papal troops. Francis boldly crossed the Col de l'Argentière (Aug. 1515) by paths that no army had hitherto used, and Marshal de la Palisse surprised and captured a papal corps at Villafranca near Pinerolo, whereupon the whole of the enemy's troops fell back on Milan. The king, then marching by Vercelli, Novara and Pavia, joined hands with Bartolomeo Alviano, the Venetian commander, and secured a foothold among the Milanese. But in order to avoid the necessity of besieging Milan itself, he offered the Swiss a large sum to retire into their own country. They were about to accept his offer, not having received their subsidies from the pope and the king of Spain, when a fresh corps of mercenaries descended into Italy, desirous both of gaining booty and of showing their prowess against their new rivals, the French and Lower Rhine lansquenets *(landsknechts),* and against the French *gendarmerie.* The French took up a position at Melegnano, facing about 30,000 Swiss, who had only ten small guns to oppose the 72 big ones under the command of Galiot de Genouillac. But the marshy ground was unfavourable to movement by the French cavalry.

The king's army was grouped in front of the village, facing in the direction of Milan, with a small stream separating it from the oncoming Swiss. On either side of the Milan road was a large body of *landsknechts,* a third being in reserve. The French and Gascon infantry (largely armed with arquebuses) was on the extreme right; the various bodies of *gendarmerie,* in the centre. In front of all was the French artillery. The battle opened on the afternoon of Sept. 13. As the Swiss advanced in three huge columns, the French guns fired into them with terrible effect, but the assailants reached the intersected ground bordering the stream and, thus protected from the rush of the French *gendarmerie,* debouched on the other side and fell upon the *landsknechts.* The crowd of combatants, the gathering darkness and the dust prevented any general direction's being given to the battle by the leaders of either side. Francis himself at the head of 200 gendarmes charged and drove back two large bodies of Swiss, which were pressing the *landsknechts* hard. The battle went on by moonlight till almost midnight, when the Swiss retired a short distance. Both sides spent the rest of the night on the battlefield, reorganizing their broken corps. Francis and his gendarmes were the outpost line of the French army and remained mounted all night, lance in hand and helmet on head. Next morning at sunrise the battle was renewed. The Swiss now left their centre inactive opposite the king and with two strong corps attempted to work round his flanks. The one on the left made for the French baggage but found it strongly guarded by *landsknechts,* who drove them back. The nearest French *gendarmerie* joined in the pursuit, but a detachment from the Swiss centre fell upon these and destroyed them. This detachment in turn followed up its advantage until as Francis himself expressed it, "the whole camp turned out" to aid the *landsknechts* and "hunted out" the Swiss. Meantime, the Swiss left attack had closed with the French infantry bands and the *aventuriers* (afterward the famous corps of Picardy and Piedmont), who were commanded by the famous engineer Pedro Navarro. It was in the main a struggle of arquebus against pike, but it was not the arquebus alone, or even principally, that gave the victory to the French. When the Swiss ranks had been disordered, the short pike and the sword came into play; and, aided by the constable de Bourbon with a handful of the *gendarmerie,* the French right more than held its own until Alviano with the cavalry from Lodi rode on to the field and completed the rout of the Swiss. In the centre, meanwhile, the two infantries stood fast for eight hours, separated by the brook, while the artillery on both sides fired into it at short range. But the *landsknechts,* animated by the king, endured it as well as the Swiss; and at the last, Francis, leading a final advance of his exhausted troops, forced the Swiss to give way and flee. Only 3,000 Swiss escaped out of about 25,000 who fought. On the French side probably 8,000 were killed or died of wounds. The battle lasted 28 hr. Its tactical lesson was the efficacy of combining two arms against one. The French *gendarmerie*, burning to avenge the insult of "hares in armour," made more than 30 charges by squadrons; and they were admirably supported by their light artillery, which played havoc with the Swiss pikemen, whom the mounted charges had brought to a halt. Marignan was thus a landmark in the power of the new arm and at the same time the last and greatest triumph of the armoured lancer.

MARIGNOELI, GIOVANNI DE' (*fl.* 1338–1357), a Franciscan. one of four ecclesiastics appointed by Pope Benedict XII as his legates to the court of the great Khan, was born, probably before 1290. in Florence. His family is long extinct, but a street near the cathedral (Via de' Cerretani) formerly bore the family name.

The Catholic mission left Avignon in Dec. 1338 and joined the Tatar envoys at Naples. The combined embassies traveled via Constantinople and the Black sea to the court of Mohammed Uzbeg, khan of the Golden Horde, at Sarai on the Volga. He entertained them during the winter of 1339–40 and sent them across the steppes to Armalec, Almalig or Almaligh (*i.e.*, Kuldja, 44° 00′ N., 81° 00′ E.), the northern seat of the house of Chaghatai. There the legates built a church and baptized several persons. Leaving Armalec in 1341 they reached Peking in May or June 1342. They were well received by the reigning khan, the last of the Mongol dynasty in China. There Marignolli stayed for three or four years, leaving via Zayton or Amoy in Dec. 1347. He reached Columbum (Kollam or Quilon in Malabar) in Easter week, 1348, and found there a Catholic church (probably founded by Jordanus of Severac). He visited the shrine of St. Thomas (near Madras), the kingdom of Saba (which he identified with the Sheba of the Bible, but which seems to have been Java) and Ceylon where he was detained. From Ceylon, his route appears to have been by Ormuz, Baghdad, Mosul, Aleppo, Damascus and Jerusalem. In 1353 he reached Avignon and delivered a letter from the great khan to Pope Innocent IV. In 1354, the emperor Charles IV made Marignolli one of his chaplains. Shortly afterward he became bishop of Bisignano. In 1356 he was an envoy to the pope from Florence, and in 1357 he was at Bologna. The date and place of his death are unknown.

Marignolli inserted notes of his Asian travels in his *Annals of Bohemia,* compiled for Charles IV. These fragments were not noticed until they were included by Father G. Drobner in *Monumenta historia Bohentiae nunquam antehac edita* (1768). *Fontes rerum bohemicarum,* ii, 49–604 (1882) contains'the best text.

MARIGNY, ENGUERRAND DE (1260–1315), French statesman, was born at Lyons-la-Forkt in Normandy. Equerry to Hugues de Bonville, he became in 1298 chief bread bearer to the queen, who helped him attain higher positions. After the death, of Pierre Flotte and Hugues de Bonville at the battle of Courtrai in 1302, he became Philip IV's grand chamberlain. In 1306 he was sent to preside over the exchequer of Normandy. He received numerous gifts of land and money from Philip as well as a pension from Edward II of England. He was an able instrument of Philip's policy, and shared the popular odium which Philip incurred by debasing the coinage. He obtained rich appointments for many of his relatives and secured increased revenue for the king. His power was at its highest in 1313–14, when he was prime minister, supervising the whole of the royal finances and controlling the *chambre des comptes*. His peace with the Flemings in 1314 disappointed the princes of the blood. He was accused of receiving bribes, and Charles of Valois denounced him to the king himself; but Philip stood by him. After the death of Philip IV on Nov. 30, 1314, the feudal party turned on his ministers and chiefly on his chamberlain. Enguerrand was arrested. and 28 articles of accusation, including charges of receiving bribes, were brought against him. He was refused a hearing; but his accounts were correct, and Louis was inclined to spare him anything more than banishment to the island of Cyprus. Charles of Valois then brought forward a charge of sorcery. Enguerrand was condemned at once and hanged on the public gallows at Montfaucon, France.

MARIGOLD, a common name given to several plants, of which the following are the best known: *Tagetes erecta,* the African marigold; T. *patula,* the French marigold; *Calendula officinalis,* the pot marigold; and *Chrysanthemum segetum,* the corn marigold. These all belong to the family Compositae, but the marsh marigold (*q.v.*), *Caltha palustris,* belongs to the Ranunculaceae (buttercup family). (*See* also ICE PLANT, often called the fig marigold.)

To the gardener the name marigold most commonly indicates species of the genus *Tagetes* and especially the developed varieties of T. *erecta* and *T. patula.* Contrary to the origins indicated by their common names, these are native to America, from Mexico to the Argentine. These hardy annuals. from the tiny (one to one and one-half foot) French types to the giant (three to four feet) Africans, have finely cut strong-scented foliage. except for a few later-developed unscented varieties. Besides the above species, T. *lucida,* sweet-scented marigold, and T. *tenuifolia,* striped marigold, are grown. The flowers of yellow, orange and red to red-brown are popular in the garden in beds, borders and massed groups, and are excellent as cut flowers. Seed sown in the spring in any garden soil—poor to average. met or dry—in sun or partial shade will give a profusion of blooms from midsummer to frost. The plants require little attention and transplant readily.

J. HORACE MCFARLAND CO

POT MARIGOLD (CALENDULA OFFICINALIS)

The pot marigold, *Calendula officinalis*, a familiar garden plant up to two feet in height, with unscented foliage and orange-coloured blossoms is probably not known in the wild state. Single and double varieties have been in cultivation for at least 300 years; John Gerard in his *Herball* (1597) mentions a proliferous form, the "fruitful marigolde," in which small flower heads proceed from beneath the circumference of the flower. He remarks that it is called *Calendula* "as it is to be seene to flower in the calends [first] of almost everie moneth." *Calendula officinalis* is one of the easiest of annuals to grow; seed sown in spring in any average soil in full or partial sun will produce flourishing plants which bloom from late spring to frost. Smaller plants, cut back in fall and potted, will bear flowers indoors for several weeks.

The Eurasian *Chrysanthemum segetum,* the corn marigold. is a weed common in fields in England and throughout the eastern part of North America. The cape marigold (*Dimorphotheca aurantiaca*) is a South African perennial, much cultivated for ornament.

MARII (officially MARI), an Autonomous Soviet Socialist republic in the Russian Soviet Federated Socialist republic, U.S.S.R., created Dec. 5, 1936, with Ioshkar-Ola (Joshkarol) (formerly Krasnokokshaisk and Tsarevokokshisk) as its main town. Area 8,958 sq.mi. Pop. (1959) 647,630. The surface consists of a plain sloping south to the Volga river. with higher ground in the east forming the watershed between the tributaries of the Volga and the Vyatka. The chief rivers are the Volga. which flows through part of the southwest, and after passing through the north of the Chuvash A.S.S.R. forms the southeastern boundary of the Marii region, the Greater and Lesser Kokshaga and the Vetluga, tributaries of the Volga. The area lies in the taiga forest zone and about 64% of it is covered with coniferous forest, pine and fir predominating. Timber and wooden wares provide a large source of income. the nearness of the Volga being a great asset for export. A railway was constructed in 1923 from Kazan to Ioshkar-Ola (pop. 88,000, 1959), the administrative centre. Kozmodemiansk, on the Volga, became a great timber centre. The soils are not favourable for agriculture, consisting mainly of sands, clays and forest earths. Chalk was worked in the north and there are extensive peat beds. Small glass and flour-milling enterprises were established. Facilities for the production of resin and turpentine were also established. and industries based on lumber, such as paper and cellulose manufacturing, sawmilling, furniture and prefabricated houses, were introduced.

The population consisted in 1947 of Marii 51%, Russians 44%, with some Tatars and Chuvashes. The Marii were called by the Russians Cheremis. They speak a Finnish dialect akin to Mordvinian and Permian, but are much more dolichocephalic and it has been suggested that they are connected with the neolithic dolichocephalic population of the shores of Lake Ladoga. They inhabited a region farther to the west than their present habitat up to the 11th century, but moved eastward into the marsh and forest region when Slav colonization began, and were settled in their present home in the 14th century. Moscow annexed the region in the 16th century but the Marii remained separate from the Russian colonists and retained their language and customs.

See also FINNO-UGRIAN.

MARIJUANA (MARIHUANA). Marijuana, an intoxicating excitant drug, used illegally in the United States and elsewhere usually in cigarette form, is obtained from the top leaves and flowers of the Indian hemp plant. Cannabis *sativa*, which grows in most parts of the world. Since ancient times people have used its products for stimulation and intoxication. (See HASHISH and HEMP.) Abusive use of it is a serious medical and social problem in various countries. Many emotionally unstable persons known to be associated with major crimes prove to be marijuana users. Marijuana intoxication may be accompanied by such physical and psychic manifestations as thirst, hunger. craving for sweet foods. nausea. dizziness, abdominal pain, droasiness, irritability. delusions of grandeur or persecution, uncontrollable hilarity, talkativeness, apprehension, mental confusion, prostration, depression, inarticulate speech and delirium. Mental dullness ordinarily increases with continued use of marijuana and psychoses may develop. Some persons have suffered most disagreeable effects a short time after smoking one marijuana cigarette.

Withdrawal of marijuana causes no such physical abstinence symptoms as opiate withdrawal does. Addiction to heroin or morphine (*qq.v.*) commonly follows use of marijuana, especially among young persons.

Marijuana, considered to have no medical value, was removed from the United States pharmacopoeia. The federal Marihuana Tax act of 1937 prohibited its use. It was placed under international control because of its increased abuse throughout the world. The World Health organization undertook a project to develop a strain of the hemp plant devoid of intoxicating resins.

MARILLAC, SAINT LOUISE DE (1591–1660), cofounder with St. Vincent de Paul (*q.v.*) of the Daughters of Charity, better known as Sisters of Charity of St. Vincent de Paul, was born either in Paris or Ferrières on Aug. 12, 1591, and educated by Dominican nuns at Poissy and in a lay boarding school in Paris. Her delicate health, which proved lifelong, prevented her from joining the strict order of Poor Clares, and in 1613 she married Antoine le Gras, secretary to Queen Marie de Medicis, by whom she had a son before his death in 1625. Vincent de Paul, whom she had chosen as her spiritual guide, moderated her zeal and encouraged her to undertake charitable works. Receiving into her home a few country girls sent by him, she trained them in the spiritual life and taught them to assist the Ladies of Charity in visiting, feeding and nursing sick poor. Their number increased, and in 1633 Vincent founded the Daughters of Charity with Louise as their superior. He would not have them called nuns or have them enclosed. He thus pioneered in bringing religious women into the service of God and man outside the cloister. The rest of Louise's life was uneventful. She died in Paris on March 15, 1660. She was canonized in 1934, and her feast day is March 15.

See biographies by Alice Lady Lovat (1916) and Sister Bertrande Meyers (1956). (J. LD.)

MARIMBA, a musical instrument which consists of a series of sticks of wood, cut and shaped so that each stick when struck produces a musical tone of definite pitch. As used in modern orchestras, it is placed on a base and played by striking with a variety of sticks or mallets to produce different effects. It usually has a range of five octaves. A liquid tone is secured by the use of metal tubes as resonators, or even by gourds.

The marimba is of ancient origin, known in South Africa and Central America. It is commonly used in popular, especially Spanish-American, dance music, but has occasionally been used by classical composers. *See* also XYLOPHONE.

MARIN, JOHN (1872–1953), U.S. painter, whose great contribution was a dynamic expression of vivid perceptions, best known for his water colours, was born in Rutherford, N.J., on Dec. 23, 1872. (His full name, never used, was John Cheri Marin III.) His mother died a few days after he was born, and he was brought up by her relatives. After some practice of architecture, Marin studied painting at the Pennsylvania academy in Philadelphia and the Art Students league in New York. In 1905 he went to Europe for six years and returned permanently to the United States in 1911. In Europe he was influenced by Whistler in both etching and water colour; there, too, commenced his association with Alfred Stieglitz, so important to them both. Marin's technical experimentation found direction after seeing European work at Stieglitz's "291" gallery and at the New York Armory show (1913). In 1914 he married Mary H. Hughes, who died in 1945. Their permanent home was at Cliffside, N.J.

Marin's financial success was achieved through Stieglitz's handling of his output; his artistic stature was established for the general public by the retrospective exhibition at the Museum of Modern Art, New York, in 1936. His technique in water colour by 1920 was brilliant, as in "Lower Manhattan" (privately owned). Eventually he attained an equivalent intensity in oil. In 1948 he received the Fine Arts medal of the American Institute of Architects. He died at Addison, Me., on Oct. 1, 1953.

MARINDUQUE, an island and, together with several offshore islets, a province of the Philippines, located south of central Luzon and east of Mindoro. Area 355 sq.mi. Pop. (1959) 105,140. Over 30% of the total land is in farms. Coconuts, for copra production, and rice are the leading crops. The provincial capital is Boac (pop. [1959 est.] 24,117). An iron mine at Mogpog, 3 mi. north of Boac, provides employment for about 500 persons and is the leading nonagricultural industry.

(R. E. HE.)

MARINE BIOLOGY is the science that deals with organisms that live in the sea. It also deals with certain air-borne and terrestrial forms that depend directly upon the sea for food and other necessities of life. In the broadest sense it attempts to describe all vital phenomena pertaining to the myriads of living things that dwell in the vast oceans of the world. Some of its specialized branches concern natural history, taxonomy, embryology, morphology, physiology, ecology and geographical distribution. Marine biology is closely related to the science of oceanography because of the relationship of the physical features of the oceans to the living organisms that dwell in them. It aids in the understanding of marine geology through the study of those organisms which contribute their skeletal remains to the floors of the oceans, or elaborate the vast coral reefs of the tropic seas.

Knowledge of marine biology is essential to certain aspects of human welfare. Intelligent regulation of the commercial marine fisheries would be impossible without a thorough understanding of the biology of commercial fishes. The prevention of fouling of ships depends on the knowledge of factors that interfere with biological processes of fouling organisms. Survival at sea by means of life rafts and lifeboats often depends on the utilization of various kinds of marine life for both food and water. The rapid increase in the human populations of the world has indicated a need for greater use of the marine products. which may be made more easily available through contributions of the knowledge gained in the study of marine biology.

The Marine Environment. — The great oceans and adjacent seas comprise approximately 70% of the surface of the earth, with a volume of more than 1,000,000,000 cu.km. The greater part of this vast marine environment is suitable for the existence of large numbers of living organisms; and no part has been discovered completely devoid of life. The upper layers of the oceans are effectively illuminated with sunlight to depths as great as 200 m., so as to permit the existence of pigmented plants which elaborate primary food materials by photosynthesis. Mineral salts are available for the use of living material during growth, the relative concentration of these salts approximating those of the body fluids of most marine organisms. Oxygen is present in concentrations sufficient for respiration in all but a few zones of the oceans; and even these oxygen-deficient zones are inhabited by organisms that exist by anaerobic respiration.

The temperature ranges of —2° C. to 30° C. are well within the limits required by living organisms. In addition the density and viscosity of sea water are such that it affords an ideal floatation medium for the myriads of organisms, large and small, that dwell within it.

Kinds of Organisms in the Sea.—The sea contains a vast assortment of living things including the smallest and the largest that inhabit the world. Submicroscopic bacteriophages have been isolated from the coastal waters: and at the other end of the scale, the great blue whale has been recorded, which attains a length of 34 m., and a weight of 294,000 lb. The invertebrate animals range from tiny protozoa, just visible under the highest powers of the microscope, to the giant deep sea squid. Architeuthis, which has a total length of 11 m. The smallest living vertebrate is the tiny fish, Schzndlerta, found in the South Pacific seas, which matures when 1 j mm. long and weighs less than 5 mg.

Bacteria. — There are many bacteria in the sea which perform the important function of decomposing the dead bodies of larger organisms to release their elementary substances as primary nutrients for plant growth. These bacteria are generally scant in the open waters, but become numerous near the coast lines where organic matter is abundant, and also on the surface of the sea bottoms where detritus accumulates. Terrestrial bacteria, especially those of human origin, often become abundant in bays and estuaries. These bacteria are not marine in the strict sense because they are unable to grow and reproduce in the marine environment. However, since they are able to survive in the sea for long periods of time, and are continually replenished in large supply from the land, they are given an important place in the marine community.

Marine Plants. — Most of the marine plants belong to the primitive group, Thallophyta, which is characterized by the absence of a vascular system, and by a reproductive mechanism which does not require the formation of flowers and seeds. The largest and most diverse group of plants consists of microscopic unicellular forms which abound everywhere in the illuminated upper waters of the oceans where they synthesize the greater part of the primary food supporting marine life. Reproduction is accomplished by simple cell division. When conditions are unfavourable, resting spores are formed which germinate when the situation improves. The rate of reproduction of this group of plants depends to a large extent on the availability of nutrient salts of nitrogen and phosphorus which, however, are found in most abundance in the deep unlighted waters where they cannot be utilized. Consequently, the greatest production of unicellular plants occurs where hydrographic factors cause upwelling of the deep nutrient-rich water; and therefore the primary food synthesized in these localities often provides the basic supply for prosperous commercial fisheries.

The macroscopic marine plants are represented by the red, green and brown algae, with flowering plants being represented by the eelgrasses and the saltmarsh grasses. The three groups of algae are generally anchored to the bottom or some solid structure by rootlike holdfasts which perform the sole function of attachment and do not extract nutrients from the soil as do the roots of the higher plants. Representatives of red, green and brown algae often form dense accumulations in shallow water; but their restricted zonation along the margins of the seas where the depth is 50 m. or less detracts from their importance as primary food producers.

One group of red algae, the Corallinacae, performs an important function in the formation of coral reefs. Members of this group form resistant encrustations on the seaward surfaces of reef corals, and inhibit mechanical wear by cementing loose corals with their skeletons of calcium and magnesium carbonate. A green alga, Halimeda, also contributes to the formation of coral atolls by depositing its platelike calcareous skeleton on the floors of lagoons.

The eelgrasses and saltmarsh grasses, marine representatives of the angiosperms, have true roots, and obtain their nutrients from the mud and sand in which they grow. Both groups reproduce by forming true flowers which are pollinated and produce seeds. These grasses have an important effect on the formations of geological structures in bays and estuaries where they entrap waterborn sediments, forming mud flats, sand bars and marsh banks. Marsh grasses, growing at or near the high water level on coasts where the sea level is constantly rising, build up layers of peat, some of which are several metres thick.

It is curious that few animals browse directly upon the larger marine plants. However the sea hare, *Tethys,* some other gastropods, and a few kinds of fishes, feed on macroscopic algae, while the manatees or sea cows eat other large plants. In general the importance of the larger plants in the marine communities depends upon their providing hiding places and means of attachment for sessile organisms during life. After death their contribution to the organic content of the sea is measured as detritus.

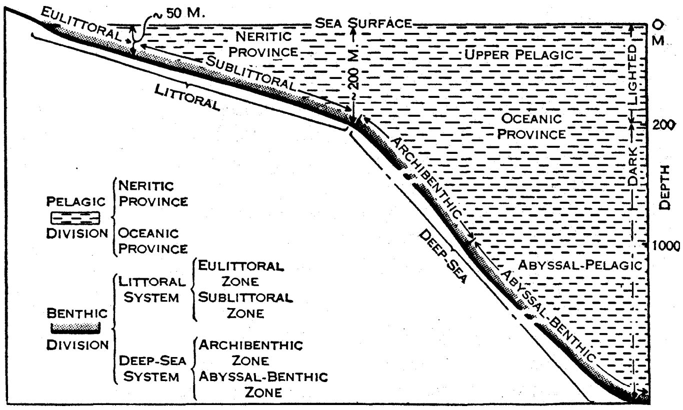
Animal Kingdom. — The animal kingdom presents a spectacular array of forms and sizes in the sea. It is represented by all the major divisions (phyla) of which five are exclusively marine; *i.e.,* the Ctenophora (comb jellies), the Echinodermata (starfish, urchins and sea cucumbers), the Chaetognatha (arrow worms), the Brachiopoda (lamp shells) and the Phoronida (tufted tube worms).

Approximately 44% of the recognized classes of animals are limited to the marine habitat and representatives of about 94% of all known classes occur somewhere in the sea. All classes of vertebrates except the Amphibia are represented. The marine fishes are numerous and diverse. The reptiles include the true sea snakes and turtles. Certain birds such as the penguins have no power of flight and spend the major part of their lives swimming in or waddling near the sea. Others, such as the albatross, soar over the oceans for long periods of time and only return to land to nest. The fish-eating cormorants are powerful underwater swimmers that pursue their prey to considerable depths below the surface of the sea. The principal mammals which are exclusively marine are the whales, porpoises and sea cows. These are so specialized for the aquatic environment that they cannot leave the sea at any time. Others, including the seals, sea lions, and sea otters, normally live in the sea, but are able to move on land for breeding purposes.

The forms and modes of life of the marine invertebrates are so diverse as to defy brief description. The mud and sand of the ocean's bottom teem with burrowing worms, molluscs and crustaceans. The surface of the sand may be covered with starfish, brittle stars, sea urchins and sand dollars where conditions are favourable. Certain groups including the Coelenterates and the Bryozoa contain members that form vast colonies which attach to solid surfaces or are free-floating. Extreme specialization occurs in the siphonophores with individual members of the colony modified for such diverse tasks as swimming, floatation, food catching, ingestion and reproduction. The gigantic coral reefs of the tropical seas are, to a large degree, formed from the skeletal secretions of colonial coelenterates.

The Crustacea are probably the most numerous and diverse group in the marine habitat. The vast majority swim freely in the upper waters feeding on phytoplankton and organic detritus; and form the primary source of food for such pelagic fishes as the herrings and mackerels. One group, comprised of crabs, lobsters and crayfish, inhabit the bottom as scavengers, feeding on dead organisms. Another group, the barnacles, has adopted a completely sedentary mode of life in the adult condition and has become firmly cemented to solid surfaces. Their legs are modified as food-gathering organs which sweep the adjacent waters for organic detritus and small organisms.

Zonation of Marine Life.—The marine environment is divided into arbitrary zones for means of convenience (see diagram); and the organisms are classified into categories determined by habitat and locomotory behaviour. The two main divisions of the sea are the benthic and the pelagic, the former comprising the entire sea bottom and the latter, all the overlying water. All organisms that burrow through the mud, attach to solid surfaces, or crawl on the bottom are classified as living in the benthos. Organisms inhabiting the pelagic division are classified as nekton if they are strong, active swimmers and as plankton if weak swimmers or passive drifters. Planktonic plants such as diatoms, photosynthetic dinoflagellates and other floating algae are known as phytoplankton. Planktonic animals which include a host of drifting forms comprise the zooplankton.



FROM SVERDRUP, JOHNSON AND FLEMING, "THE OCEANS" (PRENTICE HALL, INC.)

THE MAIN DIVISIONS OF THE MARINE ENVIRONMENT

The benthic division is divided into a littoral system that extends from the shore to a depth of 200 m. and a deep sea system extending down to the greatest depths. The littoral system is further subdivided into a eulittoral zone extending from the high tide mark to the 50-m. contour; and a sublittoral zone, to seaward. The 50-m. depth is chosen because it represents approximately the greatest depth at which attached plants can grow. The kinds of things that grow in the littoral system depend to a considerable extent on the type of bottom and on the degree of exposure to wave action. Exposed sandy coasts generally develop sparse populations, especially between the tide lines. Also the few organisms inhabiting wave-swept rocky shores are generally firmly cemented to the substratum. Protected bays and inlets often develop rich populations. Protected rocky shores are generally covered with seaweeds, mussels, barnacles, etc., with various kinds of crabs and worms crawling among them. Sandy and muddy bottoms teem with burrowing molluscs, worms and echinoderms in localities where headlands and projections protect the environment from violent wave action. The sublittoral zone, which receives a considerable amount of organic matter from the shoreward area and from the waters above, is particularly rich in animal life, and therefore it is there that the important ground fisheries are located.

More than 90% of the ocean bottom is included in the deep-sea system. A detectable amount of light penetrates the shallower (archibenthic) zone, but it is in such reduced amounts that no plant growth can occur. Beyond the 1,000-m. contour the abyssal benthic zone remains in perpetual darkness. The entire deep-sea system depends on food produced in the upper lighted zones, which drifts downward in limited quantities, restricting the numbers and kinds of animals depending upon it for existence. Most deep sea animals are small and inconspicuous although a large sea spider (Pycnogonida) has been photographed at a depth of 1,800 m.

The pelagic division is divided into the neritic province that overlies the littoral benthic area, and the oceanic province which occurs over the deep sea benthic system. The entire neritic province receives solar radiation and may develop rich blooms of phytoplankton, aided by contributions of nutrient salts from the nearby land and the shallow bottom beneath. The zooplankton which feeds on the phytoplankton is characterized by the presence of a number of temporary forms including the larval stages of benthic animals derived from the populations inhabiting the bottom beneath. These are scarce in the oceanic province because of their distance from adult populations in the littoral benthos and because of the scarcity of such animals in the deep-sea system.

The upper illuminated section of the oceanic province is termed the upper pelagic. There the phytoplankton may develop in abundance in places where oceanographic features bring up nutrient salts from the deeper waters below. Animal life may become so abundant that important tuna and other pelagic fisheries may be profitably pursued. In the unlighted abyssal pelagic section, the animal populations become sparse. The fishes of this region are generally small, dark in colour and often equipped with light-producing organs.

Life Histories of Marine Organisms.—In the plant kingdom the marine bacteria and microscopic algae reproduce by simple cell division. Favourable conditions may increase the rate of reproductions to such an extent that dense local accumulations known as blooms may occur. Abnormal blooms of certain poisonous dinoflagellates are not uncommon in the warmer seas where vast quantities of fish are killed by their toxic secretions These substances are of such virulence that shore resorts are made uninhabitable since respiratory irritations result when these poisonous substances are transferred on the air by breaking waves. The macroscopic algae typically reproduce by spores which germinate into inconspicuous male and female plants, called the gametophyte generation. Fertilization then takes place and the new sporophyte generation is produced.

Marine Animals.—The life histories of marine animals are remarkably varied. Most sedentary forms reproduce sexually by liberating eggs and sperm into the water where fertilization takes place. Typically this is followed by a larval stage with the swimming larva quite unlike the adult. After a free swimming existence which extends over a period of days or weeks, the larva undergoes metamorphosis and assumes the adult form. Fertilization is internal among the majority of the crustaceans. The young grow by moulting or shedding their shells, and pass through a number of successive larval stages before the adult form is attained.

As a rule, the reproductive and developmental patterns of marine animals fall into one of three general categories: (1) internal fertilization with parental protection of the early stages of development, the offspring numbering in the hundreds or less; (2) internal or external fertilization with some provision for the early helpless stages, the offspring numbering in the thousands; and (3) external fertilization with no provision for protection during the early stages, the offspring numbering in the millions. The particular category determines to a considerable degree the way in which populations of any animal may fluctuate from time to time. Certain snails lay small numbers of eggs in resistant capsules which protect the embryos until they become well enough developed to cope with their environment. Populations of such snails tend to remain relatively constant with only gradual fluctuations over long periods of time. Many of the bottom-dwelling crustaceans fertilize the eggs internally and attach the fertilized eggs to special appendages. The eggs are then carried on the mother through the early stages of development and are finally hatched as free swimming larvae in an advanced stage. To insure some survival in the subsequent precarious free-swimming existence, the eggs usually number in the hundreds to tens of thousands. Populations of animals with this kind of life history fluctuate to a considerable extent, depending on how the conditions of the environment favour survival during the free-swimming period. Most molluscs. echinoderms and many commercial species of fish produce millions of eggs per female. These are fertilized externally and then are abandoned to fend for themselves, through a prolonged period of helpless developmental stages. Survival during this period depends on the presence or absence of predators, the strength and direction of currents. and the suitability of the physical and chemical factors of the environment. So many factors or combinations of factors may influence the survival of each generation that populations of organisms with this mode of reproduction tend to exhibit extreme variations from one year to the next. Occasionally circumstances may permit such a high degree of survival of a single generation that its constituents may outnumber all other members of the population for several years. Such a generation is known as a dominant year class and is of considerable importance in the commercial fisheries.

Physiology of Marine Organisms. — The principles of general physiology of marine organisms are essentially the same as those that apply to fresh water and terrestrial organisms. All living things extract substances from their surroundings to provide materials for growth and for energy to maintain the living processes. In the majority of cases the food consists of compounds of carbon,.the energy being derived from oxidation of these compounds. In addition, the composition of living matter must be maintained within narrow limits with respect to the water content and to the concentration of various mineral salts. The problems of maintaining the required composition is accomplished by marine organisms in a number of ways.

Most naked or thinly-covered marine organisms have little difficulty in coping with their environment because the composition of their blood approximates that of sea water with respect to the major salts. They are thus able to carry out their living processes without expending large amounts of energy in concentrating or eliminating water and mineral substances. The blood of many of the fishes, however, is less concentrated (hypotonic) than sea water, and special mechanisms are necessary to prevent loss of water through the body membranes by osmosis. In most fishes the walls of the digestive tract are permeable to solutions of mineral salts so that sea water with its salts ingested by these species may pass into the blood stream. Special organs on the gills extract the excess mineral salts from the blood and excrete them into the waters outside the body. The salt concentration of the blood is thus reduced to an optimal level. Certain species of elasmobranchs (sharks, skates and rays) accomplish the task of regulating their salt concentrations in a different fashion. Instead of expending energy in secreting salts against the osmotic gradient, they conserve their nitrogenous wastes in the form of urea which is retained in the blood in concentrations sufficient to make it the osmotic equivalent of sea water. A number of crustaceans that invade the variable dilute waters of the estuaries are faced with the problem of surviving in a medium that is less concentrated than their blood. Consequently water flows into their bodies by osmosis. These forms are generally protected over most of the body surface by impermeable shells; and the excess water entering through the reduced permeable area is eliminated with considerable expenditure of energy by means of special kidney-like organs.

The cellular fluids of many marine plants differ considerably from the surrounding sea water in their relative concentrations of sodium and potassium. In effect, these plants appear to concentrate potassium, and in doing so must eliminate sodium in order to maintain the total salt concentration of the cellular fluid at a level equal to that of sea water. The elimination of excess sodium is accomplished by means of a "sodium pump" that operates in some unknown manner but which may be stopped by substances that inhibit the organism's utiiization of energy-supplying substances.

Organisms that live between the tide lines, such as clams and oysters, are periodically deprived of oxygen-bearing water at each low tide. The end products of metabolism, formed during this period of anaerobiosis, are acidic. These are temporarily prevented from injuring the organism by being neutralized by the calcium carbonate of the shell at which time the organism incurs an "oxygen debt." This temporary condition is paid off by an increase in oxygen consumption when the oxygen-rich waters flow over the organism at high tide, the accumulation of metabolic products thus being eliminated by oxidation.

Certain tidal organisms exhibit rhythms in behaviour, or rates of metabolism, which correspond to tidal periods. These peculiarities persist even when the organisms are transferred to situations where there is no tide. The oxygen consumption of some molluscs varies as much as tenfold with the phases of the tide. This variation continues in a rhythmic manner even when the organisms are maintained under constant conditions in laboratory aquariums. Such organisms collected from separate localities where the phases of the tide differ will maintain their intrinsic rhythm in correspondence with those of the tides at their original habitats. Fiddler crabs which live in the intertidal zone and alter their colour patterns as the tides rise and fall, for example, continue to exhibit the same rhythmic colour variations under constant conditions in the laboratory.

Brittle stars, sea cucumbers and other voracious animals dwell on the sea bottom in dense accumulations. They require such enormous quantities of food that each generation of immature food organism would be entirely exhausted if eaten immediately after settling to the bottom. To make efficient use of their food supply, the brittle stars and cucumbers enter a quiescent stage during the period when the food organisms are settling, and maintain their metabdic activities at a low rate until the food organisms have increased in volume through growth. In this way the food supply is extended, eliminating the starvation.

A number of fishes are equipped with gas-containing organs called swim bladders that aid in maintaining the hydrostatic balance. Several of these fishes inhabit the depths of the oceans where the gas must be secreted into the swim bladders against a pressure of several atmospheres. The swim bladders are equipped with vascular organs which are presumed to perform the function of gas secretion. However, no physiological mechanism had been described by the 1950s that explained how free gasses could be secreted against the enormous pressure that occurs at the great depths of the oceans.

Geographical Distribution of Marine Organisms. — The flora and fauna of the oceans and adjacent seas differ from place to place because few organisms can tolerate the entire range of physical features that exist in the marine habitat. (See DISTRIBUTION OF ANIMALS.) Temperature has been found to be the principal factor governing the distribution of organisms but other physical qualities are known to be influential, particularly in the shallow water zones. For convenience, the marine habitat has been divided into a number of provinces, each with a characteristic fauna and flora. The main divisions are the arctic, boreal (north temperate), tropic, antiboreal (south temperate) and antarctic. Each of these is subdivided into a number of provinces with characteristic endemic floras and faunas.

The distribution of shallow-water sedentary forms has been analyzed exhaustively because of the great importance of these forms in connection with the fouling of ships, dockyard installations and aids to navigation. The edible mussel, many species of barnacles, and other troublesome fouling organisms occur on both coasts of the Atlantic and Pacific oceans. The north-south distributional pattern of each species is determined by combinations of seasonal extremes in temperature which affect either survival or the ability to reproduce.

The four types of combinations of extremes in the northern hemisphere are as follows:

Type of Distribution	Northern Limit	Southern Limit
1	too cold in winter	too warm in summer
2	too cold in summer	too warm in winter
3	too cold in summer	too warm in summer
4	too cold in winter	too warm in winter

Organisms whose ranges are determined by the first type of distribution are generally susceptible to extremes of temperature in the adult condition. Winter-killing occurs north of the ranges and the highest summer temperatures are lethal south of the ranges.

In the second type of distribution seasonal extremes affect both survival and propagation. No organisms can survive north of the zone where the highest summer temperatures are too cold.

On the other hand, winter temperatures south of the range never fall low enough to permit reproduction. Similarly organisms that fall in the third type of distribution find the warm summer temperatures too high for survival beyond their southern extreme, with the northern boundary determined by the lowest summer maximum that will stimulate spawning. The fourth category includes organisms that are resistant to all but the coldest winter temperatures at the northern boundary of the range, the southern boundary being limited by winter temperatures that are too warm for reproduction.

The Cycle of Life in the Sea.—The marine environment is essentially a closed system in which life proceeds in a cycle determined by the nutritional requirements of the various kinds of organisms. The primary foods are produced by the photosynthetic pigmented plants which have the ability of absorbing energy from solar radiation and of utilizing this energy to combine carbon dioxide with water to form carbohydrates. The carbohydrates synthesized in this manner are the organic frameworks from which all other living substances are derived, This is accomplished by rearrangement of the molecular structure and by the addition of nitrogen, phosphorus, sulphur and certain trace elements. The plants undergo continual grazing by hordes of herbivorous animals. Since the bulk of the plant material produced in the sea is included in the phytoplankton. the majority of the herbivorous animals are filter feeders. endowed with special structures for straining the tiny plants out of the water. The planktonic Crustacea possess filter nets of closely spaced setae on the appendages adjacent to the mouth. Clams, oysters and mussels strain their food out of the water by means of their gills. Some worms employ mucus nets which are capable of extracting particles of extremely minute size from the water. These herbivorous animals, which perform the important function of converting plant materials into animal substance. are in turn subject to predation by the primary carnivores. This group includes a vast array of forms from the tiny arrow worms which snap at individual organisms with their formidable jaws to the great baleen whales which filter their food en masse by means of their whalebone plates.

Beyond the primary carnivores, there are successive levels of carnivorous forms ending with the top predators. When those die they are decomposed by bacteria, thus releasing the elementary substances for the use of the photosynthetic plants, and completing the food cycle.

Within this general cycle of life there are a number of events which make the system complex. Death and decomposition occur at every phase of the cycle. Phytoplankton drifting down into the deep. unlighted zones of the oceans may die and decompose. Their elementary substances are then beyond the reach of their photosynthetic relatives until such time as turbulence or upwelling may return the nutrients to the illuminated water. Shrimp, fishes and other forms dying from causes other than direct predation may sink to the bottom to be eaten by scavengers such as crabs and worms before bacterial decomposition is completed. Incomplete decomposition of any dead organism may result in the production of organic detritus, which is particulate matter of indeterminate nature, included in the diet of many filter-feeding species. Lastly. the general system is made complex by the fact that the metabolic activities of all organisms continue to release elementary substances through respiration and excretion, thus helping to maintain the supply of basic nutrients for the photosynthetic plants.

The great demands for energy made by living organisms, in order to maintain the fundamental living processes, necessarily limit the amount that is available to be transferred from one step to the next in the food cycle. In general every organism uses 90% or more of its food intake to sustain its metabolic activities and transfers less than 10% into its own substance during growth. Thus the rate of production of marine life depends upon the position of a particular species in the cycle with respect to the primary source of supply which is provided by the photosynthetic plants. In the pelagic division, the herbivorous copepods and euphausid shrimps are produced at a rate fast enough to support the feeding requirements of the baleen whales.

Mussels, clams and oysters, which are also herbivorous, have proved to be a dependable source of food for coastal peoples throughout the ages.

In the field of commercial fisheries, the bulk of the world's catch consists of certain pelagic species, including the herrings, mackerels, and menhaden, all primary carnivores, which subsist on small crustaceans and other similar organisms. At the other extreme, the very large fishes and other top predators seldom reproduce and grow at a rate fast enough to permit catches of such a size as to approach those of the herrings and mackerels.

Marine Sources of Human Food.—Man has depended on the sea for part of his food supply since prehistoric times. Human preferences have tended toward the larger fishes because they are relatively easy to capture by means of both primitive and advanced types of fishing gear. However, these larger fishes are generally one or more levels removed from the primary source of food and are therefore produced at a reduced rate. As a typical example, it has been shown that the yield of a singie population of haddock to the commercial fisheries represents less than one-thousandth of the total quantity of living material synthesized by the plants growing in the waters over the fishing grounds.

The increasing need for human food has stimulated interest in making more efficient use of the productivity of the oceans. Preliminary estimates showed that the yearly production of primary food materials approximated three tons per acre when measured as dry plankton. However, two major difficulties prevented extensive use of this enormous production for human food. The vast majority of the photosynthetic plants and the herbivorous zooplankton which subsist on them are exceedingly minute—seldom more than of microscopic size. The problem of separating, such organisms from the waters is vastly more complicated than that of netting even such small fishes as sardines or anchovies. In addition, the cycle of life in the sea proceeds at such a rapid rate that the phytoplankton are consumed by the zooplankton about as fast as they grow. The herbivorous zooplankton in turn are limited constantly by the continual predation by larger forms. The final result of this rapid turnover is a low standing abundance of the groups of organisms that are produced at the highest rate. It thus appears that man must continue to depend on the larger carnivorous fishes even though they represent an infinitesimal fraction of the total amount of food produced in the sea.

Some progress was made during World War II in the use of zooplankton as an emergency source of food for survivors on lifeboats and rafts. Various kinds of zooplankton were tested as to their nutritive value and palatability. The results of these tests indicated that the commonest forms would sustain life for some time and that the taste and consistency is generally acceptable.

Considerable attention has been given to the possibility of increasing the production of such herbivorous molluscs as mussels, clams and oysters, by modifying local conditions to favour the desired species. These species are so close to the primary source of food that their production, in limited localities, surpasses that of any other kind of edible animal material. Oysters and mussels have been farmed for centuries by providing suitable surfaces for attachment and by eliminating predators and competitors. (See also Food Supply of the World.)

In a few instances it has been possible to apply principles of marine biology to the deep sea fisheries in order to locate new supplies and to regulate the degree of exploitation which would maintain the optimal sustained yield. Knowledge of the hydrographic features along the borders of the equatorial currents of the Pacific ocean has made it possible to discover productive tuna populations. An understanding of the population dynamics of Pacific halibut has made it possible for the interested nations to regulate the total catch by international agreement and thus to prevent the wide fluctuations in the availability of this species that result from overfishing. Similarly, a number of nations whose fishermen depend on the haddock resources of the northwest Atlantic agreed to regulate the size of the mesh of the trawls employed in this fishery. In this way the young haddock are allowed to escape so that they may grow to marketable size in greater numbers. This regulation was enacted after years of study of the biology of the haddock, the extent of the resource and the effect of fishing methods.

Marine Biological Methods.—During the last half of the 19th century, when emphasis was placed mainly on the collecting and cataloguing of marine organisms, the methods employed in marine biology were directed toward the capture and preservation of specimens for study. Various kinds of dredges and trawls were used to collect specimens from the bottom; and hoop nets of different sizes were employed in securing pelagic specimens. The vast multitude of marine species has made it necessary to continue to employ such methods up to modern times. The first half of the 20th century, however, saw a shifting of the emphasis toward quantitative and dynamic aspects of the science, for which refined methods and the use of more complex tools were required.

Equipment to determine the physical features of the marine environment was developed with a considerable degree of precision. Reversing thermometers were devised to determine the temperature at any desired depth, and containers which close automatically enabled investigators to bring water samples to the surface for analysis. New volumetric and colorimetric methods made possible immediate analyses for salinity, oxygen, nutrient salts, and plant pigments on shipboard. The penetration of light may be accurately determined by means of photoelectric devices that are lowered into the water; and a variety of coring instruments are available for collecting bottom sediments to a considerable depth.

Even the collecting apparatus underwent a high degree of refinement. Qualitative hoop nets gave way to quantitative samplers that may be lowered in a closed position to any desired depth, opened, towed and closed again. The exact amount of water filtered through the fine silk netting is accurately determined by propellers and counters. Continuous sampling is accomplished by a filtering device whereby a band of fine netting is moved across an opening, and then is rolled up in a tank of preservative. Such samplers may be towed long distances behind commercial vessels and re'quire only a small amount of attendance by unskilled personnel.

Direct observation of marine organisms in their natural habitats has been made possible by underwater cameras, television and improved diving equipment. Cameras have been devised that function in the greatest depths by means of light produced by commercial photographic flash bulbs or xenon gas discharge tubes. Underwater television provides the observer with a continuous picture of events that occur within the field of his submerged camera. The development of simple diving apparatus in the form of the aqualung by Jacques Yves Cousteau made it possible for the investigator to inspect personally marine organisms in their natural habitat in depths as great as 70 m.

The rate of production of primary foods by the photosynthetic plants is determined by dark and light bottle experiments and by the use of radioactive isotopes of various elements. Dark and light bottles filled with sea water of known oxygen concentration and containing a normal population of organisms are suspended in the sea for a given time. Photosynthesis which occurs in the light bottles is determined by the increase in oxygen. A comparison is made between the oxygen concentration in the water in the light bottle, determined after a finite time, with that of the water at the time of filling; the result gives an indication of the amount of food produced. Corrections for losses of oxygen by respiration are determined from the oxygen content of the dark bottle. More direct determinations of this primary productivity are made with the aid of radioactive isotopes. Light bottles filled with water containing normal populations are supplied with small quantities of salts of radioactive carbon and suspended in the sea. After a period of photosynthesis, the organisms are filtered off and the amount of carbon fixed in their bodies is determined by Geiger-Miiller counters.

The properties of isotopes have also been used to determine climatic conditions in paleoecology. It was discovered that the ratio of oxygen-16 to oxygen-18 in the calcium carbonate of shell-forming organisms is influenced by the surrounding temperature at the time of the formation of the shell. Therefore the climate in which a number of prehistoric organisms lived has been determined by the analysis of their fossil remains.

Morphological and taxonomic studies of marine organisms are generally performed on preserved materials in connection with the work in museums and universities. Physiological and embryological investigations requiring the use of living material are generally pursued at biological stations. These are situated on the sea coast, thus facilitating the rapid transfer of specimens to the laboratory where they may be maintained in seawater provided by special circulating systems.

MARINE ENGINEERING, the branch of engineering that is concerned with the design, construction and administration of machinery installations afloat. The title marine engineer usually designates the men ashore who are occupied with such installations in technical or administrative capacities. It does not normally refer to the activities of the officers and crew who are responsible for the daily operation of their vessel's machinery; they are usually called engineer officers and engineers to distinguish them from deck officers and deck hands.

Marine engineering and naval architecture are often used together to comprehend the entire engineering function involved in design and construction of ships. The demarcation between the responsibilities of the naval architect and the marine engineer is not rigid, but in general the primary responsibility of the marine engineer is the propulsion machinery of the ship, while her form and structure are in the hands of the naval architect. Auxiliary machinery of various kinds may be assigned to either one or the other, and in some shipyards and design offices the electrical installations are the province of an electrical engineer who is not responsible directly to either the marine engineer or the naval architect.

As in other disciplines of engineering, those who practise the profession of marine engineering may have prepared themselves either by formal university-level training or by practice and experience. The number of those who have been formally educated as marine engineers in the English-speaking countries is not large. In Great Britain, marine-engineering education has been mainly a branch of mechanical engineering. In the United States it has usually been administered as part of a program called naval architecture and marine engineering in the few institutions that offer courses in this field.

In any case, the core of the professional area of the specialty is the main propulsion machinery of the ship. Most installations in large ocean-going vessels transform the energy delivered by the power plant to thrust by means of one or more screw propellers at the stern of the ship. The propellers may be connected with the driving engine by direct lines of shafting, by mechanical gearing or, less commonly, by electrical transformation. The number of shafts is usually determined primarily on the basis of maximum unit engine power which can be produced and handled. In general, the smaller the number of screws the higher the propulsive efficiency.

Propulsive efficiency is the efficiency with which power delivered by the shafting (shaft horsepower, s.h.p.) is transformed into the power absorbed by the ship in uniform forward motion alone under towed conditions; *i.e.,* without the disturbances caused by the propellers (effective horsepower, e.h.p.). Single-screw propulsion may give propulsive efficiencies of 70%–80%, while quadruple-screw propulsion may show only 55%–60%. Operating costs will generally be lower with single-screw installations largely because fewer man-hours are required for operation at sea and for upkeep. However, conditions other than efficiency may favour multiple-screw propulsion. Even when the total power required for propulsion could be delivered by a single unit, the corresponding propeller diameter may be too large for the geometry of the stern. Vulnerability to damage of a single-engine shaft and screw favours the multiple-screw installation. A lesser consideration, except in special circumstances, is the feature of maneuverability, which clearly favours multiple screws.

TYPES OF POWER PLANTS

For large ocean-going vessels the two principal types of conventional power plants are the diesel engine and the steam turbine. Each type has a variety of forms and applications. The diesel installation may be connected directly to the propellers, or it may transmit power through mechanical gears or electrical transmission; the steam turbine, because of its high inherent speed, is always connected to the propellers through mechanical or electrical speed reduction. Nuclear propulsion has proved entirely feasible from the engineering standpoint and has displaced the conventional power plant in some special types of ships. The gas turbine, operated either with a conventional combustion system or with free-piston gasifiers, has also attracted considerable attention as a marine power plant.

The choice of power plant for a specific ship depends on many factors. Because of the obvious conditions of use, the factor of reliability is always paramount. Other factors, some or all of which may be governing in any particular design, are: power requirements and the availability and first cost of a power plant of proven form and size to meet these requirements; weight and space characteristics; fuel economy; maintenance costs; noise, vibration, personnel requirements, auxiliary compatibility and other special features.

First cost is seldom a deciding consideration. Both the older conventional types have survived in active competition with each other, and their costs do not differ greatly. But availability of a proven plant may often decide the issue. After the decision to build a ship has been made, there is seldom time to develop completely new designs of machinery to fit her. In large vessels, bulkhead arrangements dictated by other considerations usually make space requirements a secondary matter, except in very fast, high-powered ships.

Weight characteristics, expressed usually in pounds of machinery weight per shaft horsepower, vary widely. In smaller powers the diesel usually has the advantage; in large powers, such as are needed for high-speed liners or most naval vessels, the geared turbine usually offers weight advantage. Fuel economy is related to fueling ports on the proposed itinerary of the vessel, to the proportion of time at which full power will be used and to the proportion of time spent in stand-by condition. Most merchant vessels operate normally at or near full power; naval ships cruise normally at only a fraction of full power. For continued operation at or near full power the diesel usually offers fuel-economy advantages in all sizes. Maintenance costs are determined by the estimated reliability of the plant and the cost of labour for maintenance work. The latter factor has sometimes placed the diesel at a disadvantage in American vessels, where labour costs have been much higher than elsewhere, because the diesel usually requires more maintenance than a steam plant.

Numberless other factors may influence the choice of a particular type of power plant. The experience of the proposed owners, tradition and past practice exert powerful influences. European owners have shown preferences for diesel installations in circumstances where American owners have chosen steam turbines, and the proportion of diesel installations in ocean-going vessels has accordingly been higher in European practice than in American.

DIESEL-ENGINE DRIVE

Engine Types.—Diesel engines for marine use are divided into two general types, the four-stroke and the two-stroke, sometimes called the four-cycle and the two-cycle. In the four-stroke engine the cycle of events required for operation is completed in four strokes of the piston or in two revolutions of the crankshaft. The events are: compression on the first upstroke; combustion and expansion on the first downstroke; exhaust on the next upstroke; and aspiration or induction of air on the last downstroke.

The two-stroke cycle, as its name implies, is completed in one revolution of the crank, and, usually, the revolution is divisible into three approximately equal periods, *viz.,* compression, combustion and expansion, and exhaust and scavenge. Fig. 1 shows the sequence of events diagrammatically. Only insignificant fractions of the expansion and compression strokes are lost, because the exhaust and scavenge periods occur and are completed as the piston is approaching and leaving the bottom dead centre. Every downstroke of the main piston is a power stroke. Scavenging air is supplied by a blower, mechanically or independently driven; and the cylinder may be scavenged longitudinally, transversely or in a looped direction.

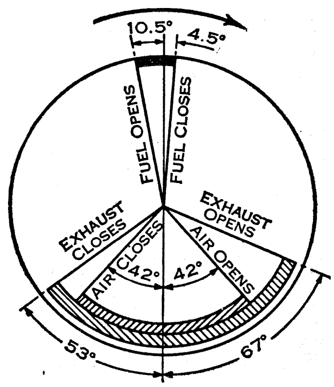

FIG. 1.—SEQUENCE OF EVENTS IN TWO-STROKE CYCLE ENGINE

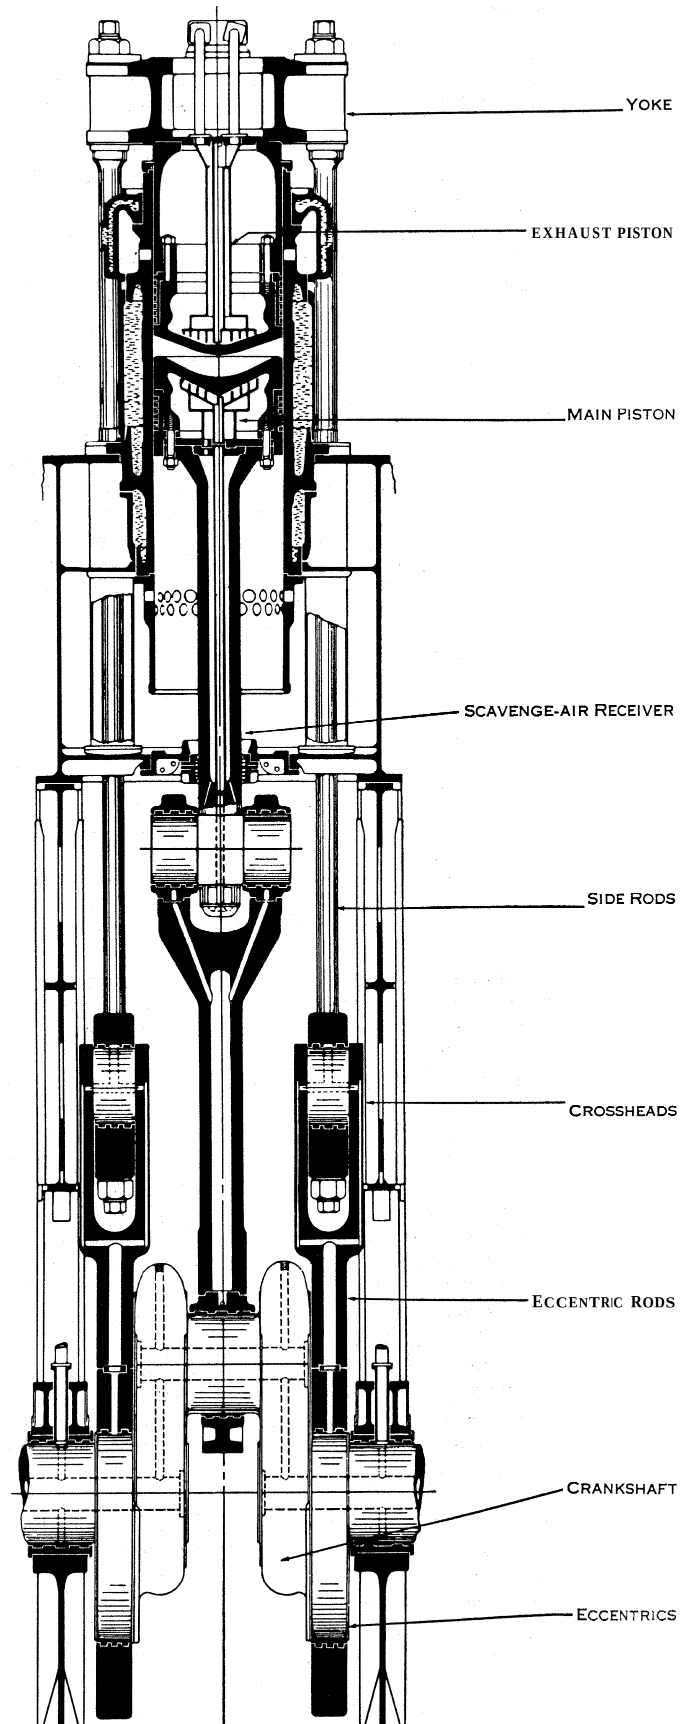
Engines are of the trunk-piston or crosshead types. In the first the crank is connected to the piston directly through the connecting rod, so that reaction to the horizontal force component of the rod results in side pressure against the cylinder wall. To reduce unit value of this side pressure the piston is elongated, or trunked, and from this derives the name trunk-piston type. Alternatively a piston rod connects the piston to a crosshead, which in turn is connected to the crank by a connecting rod, so that the horizontal force component is resisted by the crosshead pressure on its guide, which is connected to the engine frame.

Engines are characterized as single-acting or double-acting, depending on whether a pressure cycle is operative on only one end of the piston or on both ends alternately. A further distinction arises when the exhaust valves are arranged as pistons returning energy to the crankshaft. Such an arrangement is called an opposed-piston engine. When air is forced into the cylinder under pressure instead of being aspirated in at atmospheric pressure, the engine is referred to as being pressure-charged or supercharged.

During the first 15 years of marine application, the most successful engine type was the four-stroke, single-acting, crosshead design. The transverse-scavenged, two-stroke single-acting engine was next in popularity. As a pressure-charged unit the four-stroke single-acting engine persisted for many years more. In the mid-1920s the double-acting four-stroke engine was introduced for higher-powered vessels, but, after a few years, it was discarded as being too complicated for ready overhaul. At this time the double-acting, two-stroke uniflow-scavenged engine followed. The design was very successful in service, but the time and labour needed in port for overhaul precluded its wide acceptance.

Out of this long period of evolutionary activity in several countries and as the result of the independent experience of many builders, the pressure-charged, longitudinally scavenged, single-acting two-stroke engine has emerged as a widely favoured type.

Fig. 2 shows a section through a cylinder of such an engine, made by Harland and Wolff in powers from 3,000 to 8,000 brake horsepower. The bore and stroke of the cylinders are fixed in conjunction with the number of cylinders, ranging from four to eight per engine. The crankcase is isolated from the cylinder, a feature which is important when burning heavy fuels of high sulfur content. There are two pistons in each cylinder, and the scavenging



HARLAND & WOLFF LTD., BELFAST

FIG. 2.— LONGITUDINAL SECTION THROUGH ONE CYLINDER OF A HARLAND AND WOLFF SINGLE-ACTING TWO-STROKE ENGINE

is longitudinal; *i.e.,* on the so-called uniflow principle. The lower, or main, piston controls the admission of the scavenging air through tangential ports arranged near the bottom of the cylinder liner; the upper, or exhaust, piston controls the egress of the combustion gases through radial ports located near the top of the cylinder liner.

Each exhaust piston is operated by a pair of eccentrics, located one on each side of the associated crank. Each eccentric is connected to a crosshead through an eccentric strap and rod, and each crosshead is connected by two rods to a cast-steel yoke bolted to the skirt of the exhaust piston. Although, as its primary function, the exhaust piston controls the exhaust periods, it also contributes to the engine output; the working stroke is, in fact, the crank stroke plus the eccentric stroke. Scavenge air is supplied to the cylinders, in a normally aspirated engine, by two rotary blowers that are chain-driven from the crankshaft. The advantages of the eccentric-type engine are its compactness and simplicity. The crankshaft is short and stiff; there are no "criticals" to be avoided in the running range.

For certain types of ship, crosshead engines are not suitable, chiefly for reasons of height and weight, and trunk-type engines are installed. The first cost of a trunk engine is less than that of an equivalent crosshead engine, but a telling factor against the trunk engine is its higher consumption of lubricating oil.

Geared Diesel Engines.—The claims made for the geared drive are as follows: (1) It is more reliable because it has more than one engine per screw. (2) One or more engines can be shut down when the ship is running light, the others being operated at their most efficient rating. (3) Maintenance is easier because the engines are of more manageable size. (4) Engines can be overhauled. one after the other, at sea. (5) The machinery of a fleet of vessels of different powers can be standardized upon a single cylinder size.

For the geared diesel engine to be in a strong competitive position the engines should run at four times the propeller revolutions; they should be of crosshead design and be able to burn heavy fuel oil successfully.

Elastic Couplings.—An elastic coupling is provided between engine and gearing to serve as a cushion that will prevent the transmission of detrimental torque pulsations from engine to gearing; to function as a quick-disconnecting clutch, when maneuvering; and to limit the transmissible torque to about 1.5 to 2.5 times its normal value, thus obtaining a measure of protection if there should be a seizure in one of the engines. Such a coupling may be mechanical, electrical, hydraulic or pneumatic.

The electromagnetic coupling in wide use resembles an electric motor in construction and operation. It consists of two rotating members, axially aligned, with one inside the other, one connected to the engine, the other to the pinion shaft of the gear system. The outer member consists of a spider connected to the pinion shaft, with salient field poles projecting inwardly from the rim. Direct current from the ship auxiliary supply activates the field windings of these pole pieces, consuming about 1% of the transmitted power. Inside the field is the inner member, with squirrel-cage winding comparable to the rotor of an induction motor, connected to the engine crankshaft. The air gap between the two parts may be from 0.2 to 0.4 in. The field when actuated causes the two members to rotate together! with only a small slip between the two. The r.p.m. of the pinion shaft is always the same as that of the engine shaft less the slip, which normally should not be more than 1% for large powers, or 2% for smaller powers.

Reduction Gearing.—The gearing is always single reduction and usually double helical. The ratio of reduction is frequently 2.5:1 or 2:1; occasionally it is as low as 1.5:1. The efficiency of the energy transmission from diesel engine to propeller hub is approximately 92% for a geared installation; for direct-coupled engines it is about 97%. Between the crankshaft and the tunnel shafting there is a loss both in revolutions and in torque. The slip in revolutions between engine and pinion must be taken into account when determining the gear ratio, and the loss of torque at the gearing in computing the powers.

Fig. 3 shows a typical two-engine geared arrangement. Sometimes four engines are coupled to one gear-wheel shaft, with two units forward of the gearbox and two abaft of it.

Diesel-Electric Drive. — The claims for the diesel-electric drive are similar to those for the geared diesel drive: (1) Reliability is increased by having several engines. (2) Maintenance is easier, the engines being of relatively small size, with interchangeable parts. (3) One or more engines can be shut down at sea for overhaul. (4) With the ship running slowly or in ballast, the necessary units can generate power at their most efficient load. (5) The total installation weight is less, and the engine-room height is much reduced. (6) The propeller and engine revolutions can be made to suit the respective requirements. (7) By varying the number of cylinders per engine and engines per ship, one or two cylinder sizes can cover the range of likely powers.

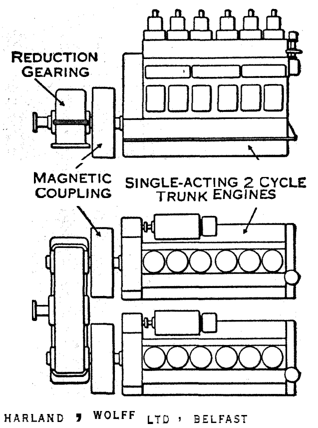


FIG. 3.—GEARED DIESEL ENGINE ARRANGEMENT

Certain additional claims are made for alternating-current drive: (1) Power distribution is flexible, because any number of engines per shaft can be installed. (2) The engines can be located anywhere, the motors being arranged aft. (3) The engines are nonreversible. (4) Complete bridge control can be obtained. (5) A quicker turn-round in port can be arranged, based upon a system of running overhauling.

The operating excellence of a diesel-electric drive utilizing direct current cannot be gainsaid. Notwithstanding the varying requirements of ship speed and power, the engines rotate steadily under the most favourable conditions; maneuvering and reversing affect only the propulsion motor; being nonreversible, the engines are spared the wear and tear which normally occur during maneuvering. But, except for small powers, direct-current machinery is too heavy and expensive to compete with other types. Alternating current and high voltages, however, are accompanied by certain problems. The diesel engines must always run in synchronism. For steady running this is not difficult to achieve, as speed governing within close limits is possible; also the alternators, being electrically linked, can drag the engines into synchronism. But, when maneuvering, the engine revolutions must rise and fall with those of the propeller, and at the same time synchronism must be maintained among the engines. In reversing, the engine revolutions are reduced to their minimum and then, immediately before reversing the propulsion motor, the load is completely taken off the engines. Immediately afterward, when the load is restored, the back torque transmitted from the propeller to the propulsion motor—caused by the way on the ship—may much exceed what the engines are capable of at the low speed at which they may be running at the moment.

STEAM TURBINES AND BOILERS

There is much more scope for variation in design with steam installations than there is with internal-combustion engines. The variables include: levels of steam pressure and temperature; capacity, number and type of steam generator; superheater arrangements; number and kind of turbines; reduction gear ratios and assembly; arrangements for economizers, air preheaters, feed heating, water distillation; and so on. The economics of a steam plant are relatively more in evidence and receive more attention because, at all points, decisions must be based on careful equating of thermal gains against monetary outlay.

Pressures and Temperatures — During World War II, steam conditions in most merchant vessels were in the range of 450–600 lb. per square inch (p.s.i.) and 750°–825° F.; a few vessels operated with more advanced conditions of 850 p.s.i. and 910° F. In the years following World War II there was a general tendency to increase both pressures and temperatures, and there were many installations in the 600 p.s.i., 800° F.; 600 p.s.i., 850° F.; and 850 p.s.i., 850° F. ranges, as well as some in the 650 p.s.i., 1,025° F. and 925 p.s.i., 1,000° F. categories. The bulk-cargo steamship "Hugo Stinnes," delivered in 1957 by the Nordseewerke, Emden, Ger., was equipped with a notable post-World War II turbine installation, employing steam at 1,200 p.s.i. and 950° F.

Steam Generators. — From about 1860 to the early 1900s the Scotch boiler was in common marine use and represented the optimum development of the fire-tube boiler. In this type, the water space was pierced by many tubes through which the combustion gases passed, transferring their heat to the water. For marine propulsion such boilers were almost entirely superseded by the watertube boiler, though the Scotch boiler persisted in some auxiliary boilers for special marine use. In the watertube boiler, water circulated within the tubes; combustion gases were outside. Two general types of such boilers were in common use in the marine field, the sectional-header and the drum (express) type.

The sectional-header boiler had certain fundamental advantages. The tubes were straight and of only a few sizes. Each tube was accessible for inspection and replacement independently of any other tube. Maintenance costs were inherently less than with the drum-type boiler, and inspection procedures were easier. However, the headers, the elements of the boiler into which the tubes fitted, limited design pressures to about 850 p.s.i., since the increased thickness required for higher pressures increased the spacing between tubes in adjacent headers.

Compared with the header type, the drum type offered the important advantage of reduction in weight and space requirements. Such a boiler is shown in fig. 4. The drum type was particularly suitable for high-powered naval vessels and fast merchant ships, where power plants of large horsepower had to be installed in minimum space and where weight was of special importance. Its design pressure was not generally subject to practical limitations with welded drums and radial tube holes. However, the tubes were usually bent and were of many different lengths. The tubes

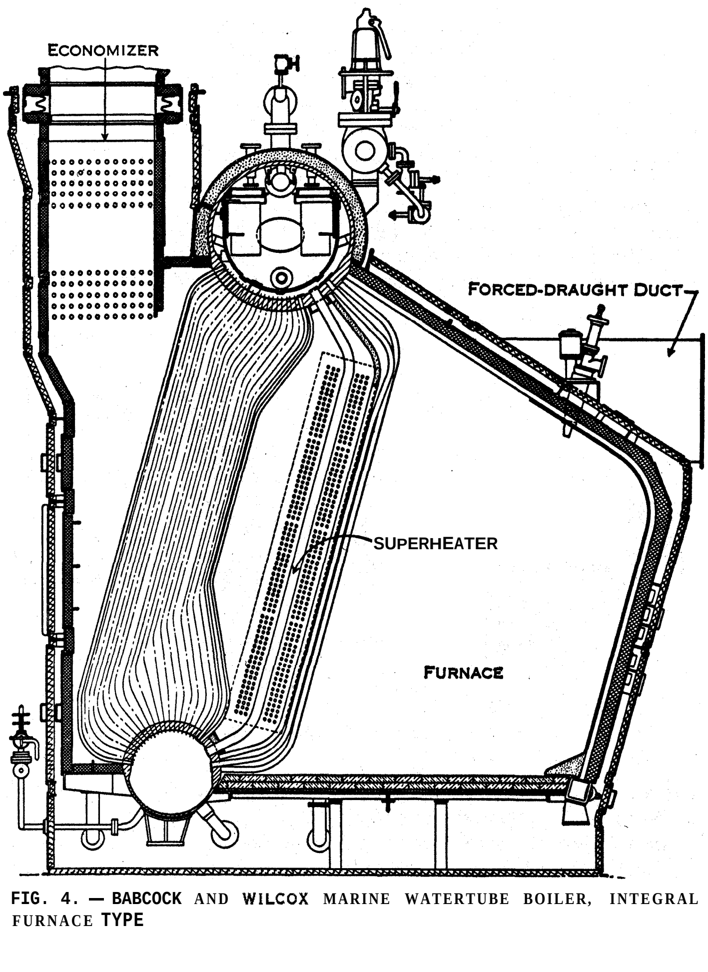

FIG. 4. — BABCOCK AND WILCOX MARINE WATERTUBE BOILER, INTEGRAL FURNACE TYPE

could not be independently removed nor easily inspected. Drum-type boilers could not be located with the longitudinal axis of the drums athwartship because of possible tube failure during a roll; header-type boilers did not suffer from this limitation.

Steam Turbines. — The earliest geared turbines were of all-reaction design. Later the high-pressure turbine embodied an impulse wheel, reducing its length. For powers of about 6,000 s.h.p. per screw and above, the standard unit became a three-turbine arrangement, in which the high-pressure turbine was impulse reaction, with end-tightened blading; the intermediate-pressure and low-pressure turbines were all-reaction; the high-pressure and low-pressure astern turbines of impulse design were respectively fitted to the intermediate-pressure and low-pressure ahead turbines; the gearing was single reduction. The astern power was nominally 60%–65% of the ahead power.

In due course, higher turbine revolutions and double-reduction gearing brought about a further improvement in the steam-consumption rate. Under the influence of land practice, all-impulse high-pressure turbines superseded impulse-reaction designs. The standard arrangement became a two-turbine set, with an all-impulse high-pressure turbine and an all-reaction low-pressure turbine; the preferred form for the latter became a double-flow design, wherein the steam entered the turbine at mid-length and flowed toward each end, reducing the low-pressure blade lengths. The high-pressure astern turbine was overhung on the high-pressure ahead turbine, and a low-pressure astern turbine was incorporated in the low-pressure ahead turbine. Many single-screw designs had only one astern turbine, which was arranged on the low-pressure ahead turbine, the astern power being nominally 40%–50% of the ahead power.

The next evolutionary step was the introduction of the single-cylinder impulse turbine. For powers between about 1,000 s.h.p. and 10,000 s.h.p. per shaft this single-casing turbine was very satisfactory, being simple and reliable. The ahead and astern turbines were arranged on a common rotor, using a single pressure casing for both turbines, with steam entering near the middle of the casing and exhausting outward.

Gearing. — Double-reduction gearing arrangements are classified as articulated, interleaved or locked train. Fig. 5 shows the principle of the articulated gear. The high-pressure and low-pressure turbines drive separate pinions, which mesh respectively with separate primary wheels, driving the secondary pinions through quill shafts. The secondary pinions mesh with the main wheel, driving the propeller. Articulated gearing has advantages over the interleaved type, which is shown in Fig. 6. A much stiffer gear case is obtained; the flexible quills between the first and second reduction trains reduce the inertia forces on the secondary pinion teeth, which arise from inaccuracies in gear cutting; and

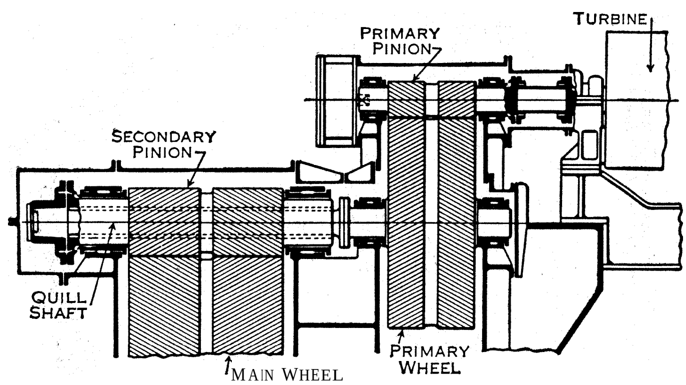

FIG. 5.—DOUBLE REDUCTION GEARING; ARTICULATED TYPE

the accurate mutual alignment required by all gearing is confined to pairs.

In the locked-train arrangement the pinion meshes with two primary wheels which are bolted at their aft ends to quill shafts; the quills pass through the secondary pinions and drive them through fine-tooth couplings. The power is transmitted from the

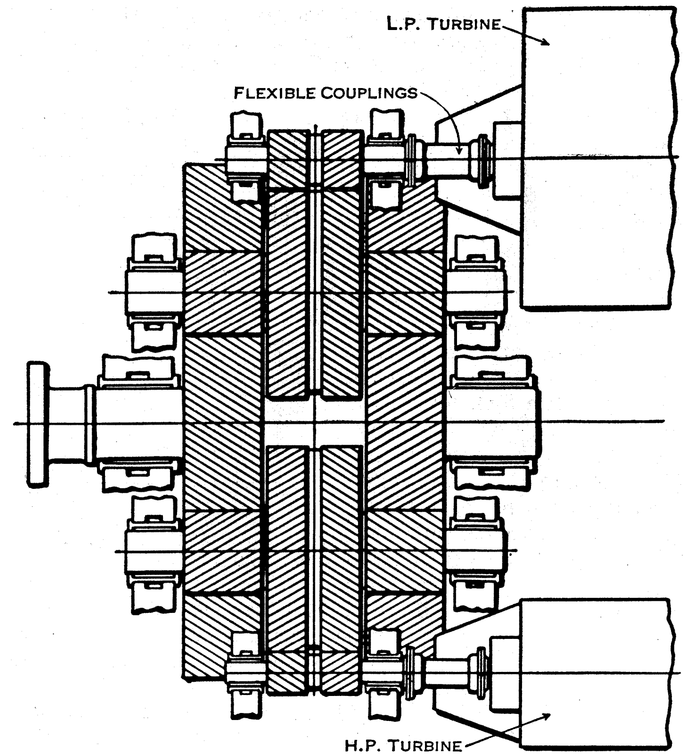

FIG. 6.—DOUBLE-REDUCTION GEARING: INTERLEAVED TYPE

secondary pinions to the main wheel. Great care is necessary in setting up locked-train gearing, to ensure the proper sharing of tooth loads.

In the single-reduction geared turbine the ratio of reduction may be from 12:1 to 20:1, if the best over-all results are to be obtained; *i.e.,* if there is to be an efficient, slow-moving propeller at one end of the line and an economical, fast-moving turbine at the other end.

For double-reduction gearing the usual ratio of reduction for the high-pressure turbine may be approximately 40:1 and, for the low-pressure turbine, 30:1; but the high-pressure turbine ratio can be as high as 60:1. All gearing teeth are of involute form. For primary pinions and primary wheels the teeth are 6/10 in., and for secondary pinions and main wheels they are 8/10 in. The propeller revolves usually about 110–120 r.p.m. for twin-screw ships and 95–100 r.p.m. for single-screw vessels.

Turbo-Electric Drive. — The turbo-electric drive presents fewer problems than the corresponding diesel-electric arrangement. The greatest power required for one propeller is obtainable from a single turbo-alternator. For a twin-screw installation each propeller motor is driven by its turbo-alternator normally, but at reduced power only one turbo-alternator need be used, the current being divided between the motors. Turbo-alternators can be run at much higher rotational speeds than geared turbines; being non-reversible, they can be simpler.

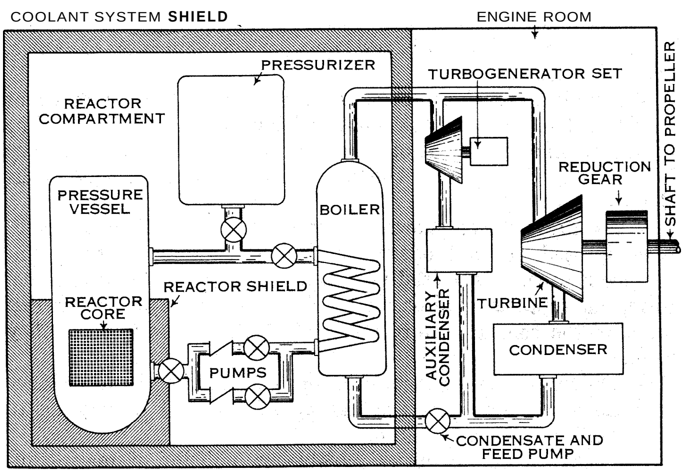
NUCLEAR POWER

From the standpoint of the marine engineer, nuclear power means utilizing the process of nuclear fission in a reactor as the source of heat, with nuclear fuel replacing conventional fuel. The differences in fuel weight are enormous. One pound of U^{235} produces as much heat as 2,300 tons of coal or 300.000 gal. of fuel oil. The weight of the nuclear fuel itself is an almost inconsequential part of the weight of a nuclear power plant. The amount of energy that may be released within a reactor is almost unlimited, and thus the power produced is approximately independent of the size of the reactor. Any amount of power within very wide limits may be produced from any size reactor if the energy can be removed from it. The limitations on the power of the reactor are, consequently, those imposed by the engineering problems in the heat-removal process.

A large number of reactor types have been studied and analyzed from the standpoint of suitability for mobile marine use. The installation in the first nuclear submarine, the U S.S. "Nautilus," and the plant developed and engineered for the first commercial nuclear merchant ship, the N.S. "Savannah," were both based on the pressurized water, heterogeneous, enriched fuel, thermal reactor type. These terms are used to identify the principal features of the system. Pressurized water describes the type of coolant-moderator material. Other coolants proposed or used include boiling nater, organic liquid, gas and sodium. Heterogeneous indicates the physical separation of fuel, coolant and moderator elements, in contrast to the homogeneous type in which they are mixed. Enriched fuel means that the natural uranium, which contains only o 7% U^{235}, the remainder being U^{238}, is enriched in the U^{235} isotope for use in the plant. In a thermal reactor the neutrons are greatly sloned from their initial high energy by a moderator, while if no moderator is used the reactor is called fast.

The submarine thermal reactor plant installed in the U.S.S. "Nautilus" consisted of a reactor in which U^{235} fissioned as a result of the absorption of thermal neutrons into the nucleus. Heat was transferred from the reactor into the steam generator or boiler by ordinary water (primary coolant) under pressure high enough to prevent boiling. This primary coolant water was circulated through the reactor and boiler in a closed loop by canned-rotor-type pumps. The boiler, essentially a shell and tube heat exchanger, utilized ordinary boiler feed water on the shell side at considerably lower pressures, producing steam delivered to a conventional marine-turbine condensing propulsion system. (See fig. 7.)

In the N.S. "Savannah," as designed under the auspices of the U.S. Maritime administration and the U.S. Atomic Energy commission, the primary system consisted of two loops with one steam generator and two main circulating pumps in each loop. The steam generators were of the natural circulation type, with bent-tube U-shell-type boilers that could supply both the main turbines and the auxiliary turbogenerator units simultaneously or independently. The main circulating pumps were driven by canned-rotor constant-speed motors with two-speed windings. The major portion of the reactor system was enclosed within a sealed and shielded containment capable of containing the products of any possible rupture in the reactor system during operation.



FROM SYAME TRANSACTIONS (1957); REPRODUCED BY PERMISSION OF THE SOCIETY OF NAVAL ARCHITECTS AN3 MARINE ENGINEERS

FIG. 7.— SCHEMATIC DIAGRAM OF A TYPICAL PRESSURIZED NUCLEAR-PROPULSION PLANT. RELATIVE SIZES NOT INDICATED

The power plant of the "Savannah" was designed to operate at a steam pressure of 480 lb. per square inch absolute (p.s.i.a.) with $\frac{1}{2}$ in. Hg vacuum, delivering 22.000 s h.p. to a single propeller. It comprised high- and low-pressure main turbines and reduction gear, main and auxiliary condensers, feed water system, turbine generators and the usual auxiliaries. The estimated gross weight of the complete plant was as follows:

Propulsion system	1,150 long tons
Reactor system	600 " "
Containment and shielding	1,900 " "

A conventionally powered ship of the same dimensions would carry about 2,500 tons of fuel oil instead of the reactor system and containment, would deliver the same s.h.p., could carry about 500 tons less cargo and would be limited to 13,000 mi. without refueling. The nuclear-powered ship would have a corresponding radius of 350,000 mi. before renewal of fuel became necessary.

GAS TURBINE PROPULSION

The gas turbine system, eliminating steam as a transfer medium and leading the exhaust products from a combustion system direct to a turbine, obviously has interesting possibilities for marine propulsion. The gas-turbine ship "John Sergeant," converted from a Liberty ship in 1956, was the first ocean-going vessel to be propelled by a single-unit, mechanical-drive gas turbine. The gas turbine installed was an open-cycle, two-shaft regenerative machine with a 14-stage axial-flow compressor, a combustion system, a single-stage high-pressure turbine driving the compressor, and a single-stage low-pressure turbine driving a controllable-pitch propeller through a reduction gear. Maximum rating was 6,600 s.h.p. at a propeller r.p.m. of 114. The vessel on trial easily developed 7,500 s.h.p. A fuel rate of 0.523 lb./s.h.p.-hour at normal power was attained.

In the free-piston, gas-turbine type of propulsion, a bank of free-piston engines constitutes both the combustion system and the compressor system for a gas-turbine drive. The free-piston engine, or gassifier, is essentially an opposed-piston, two-stroke, uniflow diesel engine. Each piston is composed of a power piston and a compressor piston. Firing is by compression ignition. There is no crankshaft, the pistons being free to oscillate except for a connecting linkage to maintain phase relationship.

A free-piston engine was conceived and built in the early 1920s, but it was not until World War II when the German navy employed free-piston air compressors in submarines that the type achieved operating success. By 1957 over 100 free-piston gassifiers of approximately 1,000 brake horsepower (b.h.p.) each were in service throughout the world in various applications. Two small French coasters, the "Cantenac" and "Merignac", each employing two such units, went into service in 1953 between Bordeaux and Hamburg. They achieved a high degree of reliability and economy. The first British ship designed with free-piston machinery was the ore carrier of the Ormsary class. The conversion of the Liberty ship "William Patterson" to free-piston, gas-turbine drive was completed under the auspices of the U.S. Maritime administration in 1957 and the vessel placed in trans-Atlantic service. The plant consisted of six free-piston gassifiers connected in parallel to two turbines which were connected to a single propeller shaft through reduction gearing. See NAVAL ARCHITECTURE; SHIPBUILDING (MERCHANT AND NAVAL).

(C. C. P.; H. A. SE.)

MARINE INSURANCE. Marine insurance is the insurance of interests—property and earnings—that may be imperilled in a maritime adventure. These two groups of interest include such as (1) ship and goods, (z) freight and passage money. Marine insurance is also a protection against certain liabilities such as shipowner's liability for collision damages, and carriers' responsibility for goods, and against losses occasioned by sacrifices for the general safety of an adventure. (See AVERAGE.) It is transacted in all nations having trade which necessitates transport, even those which have no seaports, and is the safeguard of the shipowner, merchant, banker, mortgagee, and of any who risk their property, money, or credit in commercial or financial enterprise and of those who have occasion to send valuable objects from one place to another. Primarily marine insurance is concerned with sea transport, but it is adapted to the insurance of transport of any kind, and frequently policies concerning goods for overseas transport include a certain amount of risk on shore. *See* also LLOYDS.

Practice. — In practice marine insurance is a complicated business transacted for the most part through the medium of brokers who, by their expert knowledge, can select the best market in which to place their clients' risks, and obtain the terms most suitable for the adventure to be insured. So far as the hulls of ships are concerned, sailing vessels are generally insured for each voyage, while steamers are insured for periods of time, generally 12 months. The risks against which the hulls of ships are insured by the full (with average) policy. are the perils of the seas, and similar perils covered by the traditional marine policy in common use, including sacrifices made in "general average" *(see* AVERAGE).

It is also customary to add, by the use of clauses, insurance against liability for damage done by collision and certain other liabilities and perils. It is also customary in Great Britain to exclude war risks from the marine policy, these being insured separately, or covered on a mutual basis by associations formed for that purpose among shipowners. During World War I the amount to be covered on both ships and cargo against war risks was so great that the British government instituted a war risk bureau which functioned simultaneously with the open market, and this system of a national war risk insurance office was also adopted by other countries, including some of those which remained neutral. So far as marine perils are concerned, the hulls of ships are also insured under policies which do not include the risk of particular average, and also under policies which cover total loss, general average (other than damage to ships), salvage charges and collision liabilities, these being known as "free of damage absolutely" insurances. Another form of insurance is the "free of particular average" policy which does not pay particular average unless the vessel has been stranded, sunk, on fire, or in collision. "Particular average" is partial loss caused by a peril insured against, and which is not general average. In connection with hull insurances, shipowners also insure their freight, their insurance premiums, and an indefinite interest known as "disbursements," the amount of which represents the financial loss over and above the actual value of the vessel which a shipowner incurs when his vessel is totally lost.

Goods and merchandise, valuables, securities and other concrete transportable interests are insured under the traditional marine form of policy, risks being added by means of clauses, of which the principal are the "with average" and "free of particular average" clauses of the Institute of London Underwriters. The "with average" clauses cover practically every fortuitous accident which may occur during transit, while the "free of particular average" clauses cover total loss, general average and certain other liabilities, but do not cover particular average unless the vessel has been stranded, sunk, on fire or in collision. These clauses also extend the risk of sea transit to cover the goods from the time they leave the warehouse at the port of shipment, until delivery at the consignee's or other warehouse at the destination named in the policy, or until the expiry of fifteen days from midnight of the day on which the discharge of goods from the overseas vessel is completed, whichever may first occur. Extension of the risk to 30 days from the completion of discharge is made when the destination to which the goods are insured is without the limits of the port of discharge.

Legislation. — In Great Britain, marine insurance was the subject of sporadic legislation up to the end of the 19th century. In the reign of Elizabeth an Act was passed (43 *Eliz. c. 12)* setting up a Court of Policies of Insurance to arbitrate in cases of dispute. The Act of 1720 incorporating the Royal Exchange Assurance and London Assurance, has already been mentioned. In 1745 an Act (*19 Geo. 2. c.* 37) prohibited the issue of wagering policies, and also policies of re-insurance, and although this Act was not finally repealed until the passing of the Act of 1906, its provisions with regard to re-insurance became obsolete. From the passing of this Act, until the Act of 1906 there appears to have been no legislation of importance dealing with marine insurance, other than certain finance acts dealing with policy duties, but during that period case law, mainly owing to the efforts of Lord Mansfield, had created precedents on practically every point likely to be raised on marine policy, and the Act of 1906 (6 *Edw.* 7 *c. 41*) was largely a codification of this case law, although certain provisions with regard to the prohibition of gambling policies were embodied in it. These provisions were amplified by the Marine Insurance (Gambling Policies) Act of 1909.

The Act of 1906, while codifying the existing law, did not, however, do away with litigation over points not previously decided. It is by no means as comprehensive as some of the continental codes, and while its provisions have proved singularly free from ambiguity since they have seldom been the subject of litigation, there still arise questions outside its scope which have to be decided in courts of law. It is, nevertheless, to the Marine Insurance Act of 1906 that reference may best be made on points arising out of marine insurance questions, especially where matters of principle and not of detail are concerned.

The Policy. — Reference has already been made to the marine policy, which, in Great Britain, is invariably based upon the traditional form which has been evolved from the early policies mentioned in the historical review. The Marine Insurance Act gives a form of policy which may be used, but which is not compulsory. This form is based on the traditional policy, and is, in fact, almost identical with the form adopted by Lloyd's underwriters in 1779 *(see* LLOYD'S). The custom is, however, to supplement the policy by a clause excluding war risks, while since 1919, as a result of the case of *British and Foreign Marine Insurance Co.* v. *Sanday (Times L.R. 266 and* 374) it has become customary to add the *frustration clause* which prevents underwriters from being held liable for loss due to loss of market caused by the frustration of a voyage owing to arrests, restraints or detainments of kings, princes or peoples.

This policy, archaic in form, and described by Justice Buller as an "absurd and incoherent document," has been so explored in the course of time, by means of legal action, that there remains very little, if any doubt as to the legal interpretation of any of its clauses.

It has already been shown, however, that the policy, by itself, is rarely used, and in modern practice the contract of marine insurance is usually expressed in a policy based upon the traditional form, but supplemented or modified by clauses in which the real terms of the contract are to be sought, rather than in the policy itself.

All policies of marine insurance must be stamped in accordance with the Stamp Act 1891 (54 *and* 55 *Vict. c.* 39) if they are to have validity in Great Britain.

The scale of stamp duties payable on policies of marine insurance is that of the Finance Act, the current scale in 1928 being that of the Act of 1920 (*10 and 11 Geo. 5* c. 18 *s. 41*).

The provisions of the Act, together with those of the schedule, prevent any insurance being effected for more than twelve months, but to meet the cases of vessels insured for time which are at sea or in distress at the time the policy expires, the Act of 1901 provides that a policy of sea insurance may contain a continuation clause, and shall not be invalid on the ground only that by reason of the clause it may become available for a period of more than twelve months. A policy with a clause of this nature is chargeable with a stamp duty of sixpence in addition to that otherwise chargeable, and the "Institute time clauses" under which the majority of British vessels are insured, contain a continuation clause which is in conformity with the provisions of the Finance Act of 1901.

The Revenue Act 1903 (3 *Edw.* 7 *c. 16)* allows marine policies on building risks to run for periods longer than twelve months, and to be stamped as voyage policies.

The Contract. — From the Marine Insurance Act it is learnt that a contract of marine insurance is one whereby the insurer undertakes to indemnify the assured in a manner and to the extent thereby agreed, against marine losses. It may, by express terms, or by usage of trade, be extended so as to protect the assured against losses on inland waters or on any land risk which may be incidental to any sea voyage. It is to be noted, however, that subsequent litigation, Muller v. *l'Union* Maritime (*Ll.L.* Rep. *KB.17. 90.CA.18.* 339. *HL.* 20.90) throws doubt on whether the contract is identical, with regard to the risk on land, to that with regard to the risk on sea.

The Act defines "maritime perils" as "perils consequent on or incidental to, the navigation of the sea, that is to say, perils of the seas, fire, war perils, pirates, rovers, thieves, captures, seizures, restraints and detainments of princes and peoples, jettison, barratry and any other perils either of the like kind or which may be designated by the policy." Before the Act was passed, case law had decided that "all other perils" meant only perils *ejusdem generis* with those of the sea, but even now it cannot be said that the end of dispute as to what is, or what is not covered by the policy has been reached, although precedents exist on all the main points. In practice, however, the marine cargo policy is frequently extended by clauses (the express terms of the Act) to cover perils not strictly those of the seas, such as, for instance, theft, the risk of "thieves" in the policy meaning "robbery with violence, or breaking in." Insurances on the hulls of vessels are also extended by clauses, the principal addenda being the indemnification of the assured against liability for collision done to any other ship or vessel; loss or damage due to accident in loading or discharging, or through the negligence of the master, mariners, engineers or pilots, and loss or damage due to the bursting of boilers, or through latent defects in the machinery or hull.

These clauses are, so far as Great Britain is concerned, mostly those issued by the "Institute of London Underwriters," a body composed of representatives of the marine insurance companies.

Insurable Interest. — The Act, after stating that every contract of marine insurance by way of gaming or wagering, is void, proceeds to define what an insurable interest is. A person has an insurable interest when he stands in any legal or equitable relation to the adventure, or to any insurable property at risk therein in consequence of which he may benefit by the safety or due arrival of the insurable property, or may be prejudiced by its loss, or by damage thereto, or by the detention thereof, or may incur liability in respect thereof. He must, however, be interested in the subject matter insured at the time of loss, though he need not be when the insurance is effected. An example of the application of this is when goods are sold in transit, and the insurance is transferred to the purchaser. An assured cannot, however, acquire interest subsequent to a loss by any act or election after he is aware of the loss.

Insurable Value. — Subject to the express provisions or valuation of the policy, the insurable value of ship, freight goods, and other subject matter is laid down by the Act. Broadly speaking, this is the value of the interest at the inception of the risk plus incidental charges, including insurance. It is now the almost invariable practice to insert the value in the policy, in which case that value becomes the basis of all claims and adjustments.

Disclosure and Representation. — The Marine Insurance Act states that "a contract of marine insurance is a contract based upon the utmost good faith, and, if the utmost good faith be not observed by either party, the contract may be avoided by the other party." This is the basis of the whole of the business of marine insurance, which, in Great Britain, is largely transacted by means of verbal representations by the assured or his broker to the underwriter, and this being so, the importance of the observance of the principle of good faith is apparent. According to the Act, the assured must disclose to the insurer, before the contract is concluded, every material circumstance which is known to the assured, who is deemed to know every circumstance which, in the ordinary course of business, ought to be known by him. Failure to make such disclosure voids the contract. The Act also states that every circumstance which would influence the judgment of a prudent insurer in fixing the premium, or determining whether he will take the risk, is material, but no circumstance need be disclosed which is known or presumed to be known to the insurer. Every material representation made by the assured or his agent to the insurer during the negotiations for the contract, and before the contract is concluded, must be true, or the insurer may void the contract. Representations as to matters of expectation or belief must be made in good faith, but representations may be corrected or withdrawn before the contract is concluded. The contract of marine insurance is deemed to be concluded when the proposal of the assured is accepted by the insurer, whether the policy be then issued or not: and for the purpose of showing when the proposal was accepted, reference may be made to the slip, or covering note, or other customary memorandum of the contract, although it be unstamped. To appreciate the meaning of this provision it is necessary to explain that in Great Britain marine insurance is generally transacted by making a brief memorandum of the essential details of a risk on a slip, upon which the insurer writes the amount he will accept on that risk, appending his initials. The contract thus expressed cannot be legally enforced, but when a stamped policy is prepared embodying its terms, the slip may be produced as evidence of the intentions of the parties to the contract. A covering note is a memorandum issued by the insurer, or by a broker, to the assured, stating that the risk is covered, the terms on which the insurance has been effected, and the premium to be paid.

Measure of Indemnity. — According to the Act, the sum which the assured can recover in respect of a loss is, in the case of an unvalued policy, the full extent of the insurable value, or in the case of a valued policy, the full extent of the value fixed by the policy; this, however, is subject to any express provisions of the policy. In the event of total loss the measure of indemnity is the sum fixed by the policy, in the case of a valued policy, or in an unvalued policy, the insurable value of the subject matter insured. In the case of partial loss of a ship, the measure of indemnity is the reasonable cost of repairs, less the customary deductions, but not exceeding the sum insured in respect of any one casualty. The customary deductions are for depreciation, *i.e.,* since new material is substituted for old when repairs are effected, but in the case of steamships it is generally expressly agreed that no deductions shall be made. In the case of freight, the measure of indemnity is such proportion of the sum fixed by the policy, in the case of a valued policy, or the insurable value in the case of an unvalued policy, as the proportion of the freight lost by the assured bears to the whole freight at the risk of the assured under the policy.

In the case of partial loss of goods, the measure of indemnity, in the case of a valued policy, is such proportion of the sum fixed by the policy as the insurable value of the part lost bears to the insurable value of the whole, ascertained as in the case of an unvalued policy. In the case of an unvalued policy, the measure of indemnity for partial loss is ascertained as in the case of total loss, *i.e.,* the insurable value of the subject matter insured. In the case of goods arriving damaged by a peril insured against, the measure of indemnity is such proportion of the sum fixed by the policy in the case of a valued policy, or of the insurable value in the case of an unvalued policy, as the difference between the gross sound and damaged values at the place of arrival, bears to the gross sound value. In the case of general average and salvage charges, the measure of indemnity (subject to the provisions of the policy) is the full amount of the contribution, if the subject matter liable for contribution is insured for its full contributory value, but if it is not so insured, or if only part be insured, the indemnity payable by the insurer must be reduced in proportion to the under-insurance, and where there has been a particular average loss which constitutes a deduction from the contributory value and for which the insurer is liable, the amount must be deducted from the insured value in order to ascertain what the insurer is liable to contribute. Where the assured has effected an insurance in express terms against any liability to a third party the measure of indemnity, subject to any express provision in the policy, is the amount paid or payable by him to such third party in respect of such liability. An instance of this is insurance against collision liability, where it is customary for the insurer to cover only three-fourths of the risk, leaving one-fourth to be borne by the assured. The practice has arisen, however, of covering the assured's one-fourth mutually in associations of shipowners formed for that purpose.

In cases not specifically provided for in the Act, the principle enunciated in the provisions of the Act is to be applied.

Warranties. — In marine insurance a "warranty" is some particular thing that the assured undertakes shall, or shall not be done—an undertaking that some condition shall be fulfilled; or the affirmation or negation of the existence of a particular state of fact. Warranties must be complied with exactly, whether they be material to the risk or not; or the insurer is discharged from liability as from the date of the breach of warranty.

Examples of warranties are where the assured warrants that a vessel is in good safety on a certain date; where he warrants that a vessel shall not proceed on certain voyages; or where he warrants that he is uninsured for a specified proportion of the amount at risk.

These are "express warranties," and must be included in, or written upon, the policy, or must be contained in some document incorporated by reference into the policy.

There are also "implied warranties" as, for instance, that the vessel shall be seaworthy at the commencement of the voyage, but there is no implied warranty of seaworthiness in a policy for a period of time; nor, in the case of goods, that the goods are seaworthy. Breach of warranty is excused, under the Marine Insurance Act, when, by change of circumstance, the warranty ceases to be applicable to the circumstances of the contract, or where compliance with the warranty is rendered unlawful by any subsequent law. A breach of warranty may be waived by the insurer; and in practice it is customary, in the case of some warranties, to make provision in the policy to the effect that in the event of breach, the risk is "held covered" either at a specific premium, or at a premium "to be arranged." According to the Act, when an additional premium is to be arranged in a given event, but no arrangement is made, then a reasonable additional premium is payable.

Where a warranty is broken, the assured cannot avail himself of the defence that the breach has been remedied, and the warranty complied with, before loss.

Double Insurance. — Where two or more policies are effected by or on behalf of the assured on the same adventure and interest, or any part thereof, and the sums insured exceed the indemnity allowed by the Marine Insurance Act, the assured is said to be over-insured by double insurance. In such circumstances he may according to the Act, claim payment from the insurers in such order as he may think fit, unless the policy otherwise provides, but he is not entitled to receive any sum in excess of the indemnity allowed by the Act. Where, however, the policy is a valued policy, the assured must give credit as against the valuation for any sum received by him under any other policy without regard to the actual value of the subject matter insured. Where the policy is unvalued, he must give credit, as against the full insurable value, for any sum received by him under any other policy, and where the assured receives a sum in excess of the indemnity allowed by the Act, he is deemed to hold such sum in trust for the insurers, according to their right of contribution amongst themselves.

The insurers, on their part, are bound, by the Act, to contribute rateably to the loss in proportion to the amount for which they are liable under their contracts, and if any insurer pays more than his proportion of a loss, he is entitled to maintain an action for contribution against the other insurers. Where the assured has over-insured under an unvalued policy, a proportionate part of the premium is returnable, but if the policies have been effected at different times, and the earlier policy has, at any time, borne the entire risk, or if a claim has been paid on the policy in respect of the full sum insured, no premium is returnable in respect of that policy; nor is any premium returnable when a double insurance is effected knowingly by the assured.

Subrogation. — Where there is a loss either partial or total, the insurer becomes entitled to the advantage of every right of the assured in respect of the subject matter of the loss. A good example of this is where there has been a total wreck, and the underwriter has paid a total loss, since he then becomes entitled to the proceeds of the sale of the wreck. On broad lines, the assured must account to the insurer for any diminution of the loss. A very general application of this right of subrogation is where the insurer pays a loss and then proceeds against a third party to recover; for his own benefit, but in the name of the assured; in respect of a liability that third party may have incurred.

Re-Insurance. — Re-insurance is the indemnification of one insurer by another in respect of liabilities that the former has incurred in the course of business, and the Marine Insurance Act of 1906 gives the re-insured an insurable interest in his risks, but stipulates that unless the policy provides, the original assured has no right or interest in respect of such re-insurance. Re-insurance may be either facultative, which is the re-insurance of specified individual risks, or by treaty. A treaty of re-insurance is an agreement by one insurer to accept a stated proportion of the whole, or any specified part of, the business accepted by another, it being customary to place limits as to the maximum amount that may be given off under the treaty. In connection with these treaties an anomalous situation has arisen concerning their validity under British law, for while they are undoubtedly contracts of marine insurance, the fact that they cover no specified amount makes it impossible to pay duty on them in accordance with the provisions of the Stamp Act so that it would seem that they are unenforceable in law. The leading legal decision on this point is that of the House of Lords *In re National Benefit Assurance Co., Ltd.* (31 *Ll. L. Rep.* 321). In practice, however, legal difficulties are not likely often to arise, since most treaties provide that stamped policies shall be issued in respect of the risks accepted under the contract, and in the event of dispute arising, legal action can be taken on these policies.

Institutions. — In marine insurance, the institutions which exist for the purpose of furthering and protecting the interests of underwriters play a very prominent part. In Great Britain the oldest of these institutions is the Liverpool Underwriters Association, founded in 1802, but the leading body is the Institute of London Underwriters, founded in 1884, and composed of the majority of the companies transacting marine business in London, including the London branches of companies in Liverpool and other provincial cities. This body formulates and issues the clauses to which reference has already been made, and a special feature of its work in this connection is the drafting of special sets of clauses for the insurance of trades. These clauses are drafted after consultation with the Trade Associations interested in the commodities to be insured, and are therefore acceptable to both parties to the contract of insurance. Examples of these clauses are the "London Jute Associations Clauses" and the "London Corn Trade Associations Clauses." The institute has established various sub-committees, of which the most important is the "Technical and Clauses Committee," the title of which explains its functions, and which keeps in close touch with various trade associations with a view to maintaining clauses in accordance with the requirements of the trades those associations represent. An important committee which sits under the auspices of the institute, is the "Joint Hull Committee," on which Lloyd's Underwriters and the Liverpool market are represented, and which deals with such matters as the framing of agreements with regard to hull rates and values, the drafting of "warranties," governing voyages and seasons, and similar matters.

Lloyd's Underwriters Association is another important market institution, to which practically all the active underwriting members of Lloyd's belong, and which works in close collaboration with the Institute of London Underwriters on matters of principle, and sometimes on matters of practice. Lloyd's Brokers Association is a body representative of the brokerage side of the business at Lloyd's while the Corporation of Insurance Brokers represents brokers in all parts of Great Britain. The Chartered Insurance Institute, largely educational in function, holds examinations in marine insurance, and there are local institutes in connection with the Chartered Institute.

Market Institutions in Other Countries.—Elsewhere there are, in most markets, local or national institutions concerned with the regulation and government of business, such as the Central Underwriters Association of Norway, the Association for the Improvement of Marine Insurance in Holland, the "Verband" or Union of Underwriters in Germany, and the "Union des Syndicats" in Paris. These are similar, in many respects to the Institute of London Underwriters, and are in constant communication with that body and each other. There is also the "International Marine Insurance Union" with headquarters in Berlin, in which the majority of national markets are represented by the leading companies. This institution holds an annual conference at which matters of common interest are discussed, and has been the means of promoting a number of international agreements, the principal of which is the "dangerous drugs" agreement, by which underwriters are pledged to incorporate in all policies on drugs a clause making it imperative that all claims shall be accompanied by a certificate from the government of the country of origin authorizing the shipment in respect of which the claim is made. This agreement made in the first place at the instance of the British Foreign Office, has proved effective in checking the trade in opium, cocaine, and other drugs scheduled in the International Opium Convention.

UNITED STATES

Marine insurance business in America as in Great Britain, is transacted for the most part through the medium of brokers. Sailing vessels are generally insured for each voyage, and steamers are insured for periods of time, generally 12 months. The risks against which the hulls of ships are insured are about the same in the United States as in Great Britain. Goods and merchandise are insured against various risks and on various terms and conditions dependent on the nature of goods, voyage, trade customs, etc.

The various States all have their insurance laws for the licensing and regulation of the companies and the activities of agents and brokers, and all the states also have a so-called insurance department as a branch of the state administration. For many years, there was no uniformity in the laws of the various states dealing with marine insurance. There was some effort to bring about uniformity and the District of Columbia, New York, Pennsylvania and New Jersey passed laws bringing about uniformity as to regulation and taxation. There is no federal act similar to the Marine Insurance act of 1906 which codified the laws of England, and most of the states have no such code.

The law and practice governing the contract, and regarding insurable interest, insurable value, disclosure and representation, measure of indemnity, warranties, double insurance and reinsurance are substantially the same as in Great Britain. There are some variations and among them is the rule of law as to what constitutes a constructive total loss and the extent of the insurers' liability in the case of general average and salvage charges where the contributory value of the interest is in excess of the insured value. As regards an implied warranty of seaworthiness in a policy for a period of time the law of the United States is not as broad and as favourable to the assured as the English act. In the United States many, if not most, double insurance policies provide how losses and premiums shall be dealt with in such cases. The most common clause provides that resort shall first be had to the policy of earlier date for collection of a loss or a claim, and that only the excess of the whole loss or claim over the amount recoverable under the policy of earlier date shall be recovered under the policy of later date, and that the premium attaching to the excess of the amount insured over the insurable interest in the policy of later date shall be refunded.

Regarding subrogation, in the United States, on payment of a loss the insurers acquire the rights of the owners in respect of and to the extent of the amount paid.

The American Institute of Marine Underwriters suggests policy forms and acts on behalf of underwriters in matters affecting the general welfare of the business but does not deal with rates. Practically all the U.S. and various foreign companies admitted to do business in the United States are members of this organization. The United States Salvage association, participated in by most U.S. companies, supplies services for the survey and inspection of hulls. The American Marine Insurance syndicate, composed of most U.S. and a large percentage of the foreign admitted companies, issues joint policies on the hull, disbursements and earnings of steamers. It has become the chief market for the insurance of these risks on U.S. steamers.

The Board of Underwriters of New York, formed in 1820, is composed of the principal U.S. and foreign admitted companies. Its principal functions are the reporting of casualties, handling of losses, surveying of cargo, handling of proceeds, stowage of cargo, inspection of the loading and discharging of vessels, arbitrations, salvage awards, examination of adjustments, reports on maritime inventions and the appointment of commissioners of pilots. (W. N. D.)

See S. B. hckerman, *Insurance* (1939).

MARINE RAILWAY: see SLIPWAY.

MARINES are troops specially recruited, trained and organized for service at sea and in land operations incident to naval campaigns. The use of marines goes far back in history. Herodotus and Thycydides refer to *Epibatai*, or "heavy-armed sea soldiers" in the Greek fleets. while Polybius describes *milites classiarii* ("soldiers of the fleet"), a category of Roman soldier organized and specially armed for duty aboard warships, usually the quinqueremes. During the middle ages, ordinary soldiers were frequently embarked aboard ship to provide a fighting backbone, but it was not until the naval wars of the 17th century that the distinct and organized role of marines was almost simultaneously rediscovered by the British and Dutch, who raised the first two modern corps of marines, in 1664 and 1665. The U.S. marine corps, organized in 1775, was originally patterned on the British model. It has retained many of its inherited characteristics but has evolved along independent lines to become the most famous organization of its kind.

U.S. MARINE CORPS

The U.S. marine corps is a military service within the department of the navy. Side by side with the navy, the marine corps comes directly under the secretary of the navy. Its commaridant, a four-star general, is responsible to the secretary of the navy for the readiness, administration and performance of the corps as a whole. The commandant also sits as a member of the joint chiefs of staff (*q.v.*) when matters of concern to the marine corps are under consideration.

The primary missions of the marine corps are to provide fleet marine forces of combined arms, including aviation, for seizure and defense of advanced bases; to conduct land operations incident to naval campaigns; and to develop the doctrines, tactics, techniques and equipment for U.S. landing forces in amphibious operations. In addition, the marine corps is responsible for providing detachments for service aboard battleships, large aircraft carriers, cruisers and certain amphibious ships (including assault helicopter carriers), as well as security forces for naval shore stations and for United States embassies and consulates. Finally, the corps is required by law to be instantly ready to perform such other duties as the president may direct.

The two fleet marine forces are the expeditionary part of the corps, and are required by law to be maintained at a minimum strength of three combat divisions, three air wings and supporting units. One fleet marine force is assigned to the Atlantic fleet and the other to the Pacific fleet. To provide and support the marine operating forces. the marine corps supporting establishment includes on each coast of the United States. one recruit depot. one major ground base, one supply centre and one or more air stations. Officer training, and all marine development activities, are centralized at marine corps schools. Quantico, Va. Marine corps headquarters is in Washington, D.C. The marine corps reserve, upon which the corps draws to augment its strength in time of large-scale emergency, embraces units and individuals in more than 150 cities. The peacetime strength of the regular marine corps does not usually exceed 200.000.

Marine aviation is primarily trained and equipped to render close air support and to conduct expeditionary operations. In addition, it reinforces naval carrier-based aviation. Since marine assault concepts demand the closest air-ground teamwork, marine aviation is integrated in every possible way with the corps as a whole.

Ranks of marine officers are the same as those of the U.S. army, but certain of the noncommissioned officer titles have varied traditionally and are distinctive to the marine corps. (See INSIGNIA, MILITARY.) Young men between the ages of 17 and 28 who are physically and mentally qualified may enlist in the marine corps for three, four or six years. Although the corps was compelled to accept draftees during the two World Wars and the Korean war, it is traditionally made up only of volunteers. Every marine recruit undergoes 12 weeks of rigorous but carefully supervised recruit training at Parris Island, S.C., or San Diego, Calif., followed by 4 more weeks of advanced training in infantry weapons and tactics at Camp Lejeune, N.C., or Camp Pendleton, Calif. The corps obtains officers from a wide variety of sources, including the naval academy, military academy, civilian colleges, the marine aviation cadet program and meritorious noncommissioned officers. With a few special exceptions, newly commissioned marine officers, regardless of source or previous training, are sent through the marine corps basic school, Quantico. Va.

The marine corps includes women marines, both regular and reserve. In peacetime approximately 2.000 women—2% of the authorized strength of the corps—serve as U.S. marines at posts in continental United States and the Hawaiian Islands, as well as in Europe. Women marines perform such duties as personnel administration, communications, aerology, food services, photography and disbursing. The director of women marines, a colonel, supervises the women marines and is on the commandant's staff at marine corps headquarters.

Single young women of good character who are physically and mentally qualified and between the ages of 18 and 30 are eligible for the marine corps. Women recruits undergo ten weeks' training at Parris Island, while women officer candidates (who must be college graduates or equivalent) train for 18 weeks at marine corps schools, Quantico, Va. Although women were not authorized as a permanent regular component of the corps until 1948, they were first enlisted for war service in World War I as "Marinettes," and in World War II as women reservists.

History and Traditions.— On Nov. 10, 1775, the date usually given for the origin of the U.S. marine corps, the Continental Congress ordered that two battalions of marines be raised for service as landing forces with the fleet. For an infant maritime power this was a natural requirement which has continued to exist. In addition to projecting naval power ashore, however, it has also been a recognized function of the marine corps to provide mobile, immediately ready, professional military units to serve as national forces-in-readiness. The first commandant of the corps was Capt. Samuel Nicholas of Philadelphia.

Marines have participated in all wars of the United States, being in most instances first, or among the first, to fight. In addition, marines have executed more than 300 landings on foreign shores and served in every major U.S. naval action since 1775.

The marines' first battle was the expedition against Nassau, in the Bahamas, in 1776. After the American Revolution, the marines, together with the navy, were inactivated; on July 11, 1798, congress re-established the marines as a separate corps. During the following century marines fought in the naval war with France (1798–1801), Tripolitan War (1801–05), War of 1812, Creek and Seminole wars (1836–42), Mexican War (1846–48) and the Civil War (1861–65). During the Civil War, marines fought at Bull Run, on the Mississippi and in all amphibious landings of the U.S. navy along the Confederate coast. The Confederacy organized its own marine corps on March 16. 1861; this was a smaller but virtually identical copy of the U.S. marines, and the Confederate marines—largely officered by a few former C.S. marine officers of southern birth—performed similar duties throughout the nar.

Between wars in the 19th century, marines landed in the South seas, China, Japan. Korea, Panama, Uruguay, Paraguay, Egypt, Mexico, Cuba, the arctic, Formosa, Argentina, Chile, Greenland, Haiti. Nicaragua and Samoa.

Following the Spanish-American War (1899) the corps entered an era of professional development and expansion. It saw active service in the Philippine insurrection (1899–1902), Boxer uprising (1900), Cuba (1906–09), Nicaragua (1912), Vera Cruz (1914), Haiti (1915–34) and Santo Domingo (1916–24). After the United States entered World War I, the marine brigade in France fought at Belleau wood, Soissons, St. Mihiel, Blanc Mont and the Meuse-Argonne. Meanwhile, the corps carried on expeditionary duties in Haiti, Santo Domingo, Cuba, the Azores and the Mexican border.

In 1921, foreseeing the eventuality of a naval war in the Pacific, the marine corps began its development of modern amphibious warfare. For the next two decades, uith a strength that never exceeded 18.000, it worked closely with the navy to evolve the amphibious assault doctrines ultimately used by the United States in World War II. These doctrines were proven by marines on Guadalcanal (first American offensive in World War II), Bougainville, Tarawa, Roi-Namur, Eninetok, New Britain, Saipan, Tinian, Guam, Peleliu, Iwo Jima, and Okinawa. By 1945 the marine corps included six divisions, four air wings and supporting troops. Its top strength in World War II was 485,113, of whom more than 90% served overseas in combat.

Immediately after the war, the marine corps became convinced that the challenge of modern weapons, especially the atom bomb, required a far more flexible, widely dispersed and rapid landing attack than had been possible in the past. Between 1946 and 1950, the marine corps therefore developed an amphibious "vertical envelopment" concept using assault helicopters—pioneered by the corps—as landing craft, and aircraft carriers as transports. This was subsequently adopted, like the earlier marine concepts of the 1920s and 1930s, as standard U S. navy and marine doctrine.

After outbreak of war in Korea (1950), marines were the first reinforcements dispatched from the United States to the aid of the U.S. forces retreating on Pusan. Here the corps flew helicopters in combat for the first time in history. Subsequently marines executed the Inchon landing and carried out the epic winter withdrawal from Chosin reservoir down to the sea. From 1951 to 1953, marine ground and aviation units played a major part in the hard-fought but indecisive battles along the 38th parallel. (See KOREAN WAR).

The marine corps emblem is the western hemisphere superimposed on a fouled anchor and surmounted by a spread eagle. The corps motto is *Semper Fidelis* ("Always Faithful"). which is also the title of the corps march, composed by John Philip Sousa when he was leader of the U S. marine band. Perhaps even more familiar is "The Marines' Hymn" beginning with the words, "From the Halls of Montezuma to the shores of Tripoli . . ." The marine band, the oldest musical organization in the C.S. armed forces, is known as "The President's Own" because of its privilege of performing at all state functions at the White House. The official colours of the corps are scarlet and gold, but forest green enjoys semiofficial recognition. The distinctive dress blue uniform of marines, with its standing collar, is well known, whereas the forest green service uniform bespeaks the original status of the corps as light infantry (see UNIFORMS). From the standing collar—descended from the tall leather neckpiece of the 18th- and 19th-century uniform—comes the traditional nickname for marines of "leathernecks"; the equivalent slang term for British marines, from the same origin, is "boot-necks." In naval formations, marines have the privilege of forming on the right of line or at the head of column, the traditional places of honour and seniority.

ROYAL MARINES (GREAT BRITAIN)

The Royal Marines were founded by an order in council on Oct. 26. 1664, as the duke of York and Albany's maritime regiment of foot—1.200 "land Souldgers prepared for sea service." administered by the admiralty. The modern Royal Marines remain under the admiralty, and the commandant general, Royal Marines, a lieutenant general, reports to the board of admiralty. His headquarters, the Royal Marine office, is in London. A member of the royal family serves as captain general of the corps.

The missions of the Royal Marines are to: (1) supply detachments for her majesty's ships; (2) provide bands for the navy: (3) man minor landing craft; (4) provide commando (amphibious raiding) units; (5) serve as a link between the navy and the army during landing operations. Since World War II, the peacetime strength of the Royal Marines has approximated 10.000.

The marine establishment in the U.K. is divided into the Portsmouth and Plymouth groups. each under a major general. Portsmouth group, with headquarters at Royal Marine barracks, Eastney. directs the seagoing training of the corps, as well as the amphibious school at Poole, Dorset, which operates in conjunction with the Joint Services School of Amphibious Warfare at the same place. Plymouth group. with headquarters at Stonehouse barracks, Plymouth, co-ordinates the military training of Royal Marines. Plymouth group's two most important subordinate activities are the commando school, Bickleigh, Devon, and the infantry training centre. Lympstone, Devon. The latter also includes the Officers' School Royal Marines, where subalterns receive basic instruction. Recruits are trained at Deal, Kent. While women serve with the Royal Marines. they are assigned from the Women's Royal Naval service (WRENS).

Aside from ships' detachments, the commando brigade—Britain's permanent commando force—is the principal operating unit of the corps. After World War II, when marines assumed the commando role, the brigade served in Hong Kong, Palestine, Malaya and Cyprus. At Suez (1956) the brigade formed the amphibious spearhead; one unit conducted its assault on Port Said by helicopters landed from an aircraft carrier in accordance with the U.S. marine helicopter concept.

History and Traditions.—From 1664 until 1755 the various marine regiments went through reorganizations! disbandments and fluctuations between army and admiralty control. The most distinguished episode of the period was the capture and subsequent defense of Gibraltar by marines in 1704–05, for which the corps still bears on its colours the single battle honour, *Gibraltar*. In 1755 the corps of marines was reorganized into 50 independent companies under complete admiralty control, and grouped into three "divisions" at Portsmouth, Plymouth and Chatham, an organization which, with slight changes, lasted until 1947.

Marines served in the Seven Years' War (1756–63), American Revolution (1775–81). and Napoleonic Wars (1792–181j), winning the designation. "royal." in 1802. Three years later a fourth division was established at Woolwich, and an artillery company was added to each existing division. In 1855, the infantry companies were designated "Royal Marines, light infantry." and, in 1862, the artillery companies were grouped as "Royal Marine artillery." This separation continued until 1923, when the corps was reconstituted as the Royal Marines.

In World War I, marines saw service widely at sea. as infantry, and as artillery. The most notahle action of the corps was its raid on Zeebrugge in 1918. In World War II, the corps initially organized one marine division and two mobile naval base defense organizations, and attained a top strength of 78,000. A reorganization in 1944 converted most of the Royal Marines into commandos and landing craft detachments. Outstanding among many feats of the corps in the war were the defense of Crete (1941) and assault on Walcheren (1945). One commando was sent to Korea in 1950 and served with the U.S. 1st marine division thoughout the Changjin reservoir campaign.

The Royal Marines' badge is the globe (conferred in 1827 by King George IV), surrounded by a laurel wreath won in 1761 for the storming of Belle Isle. surmounted by the lion and crown of a royal regiment, and an anchor. *Per Mare, Per Terram* ("By Sea and by Land") is the corps motto, and the corps colours are yellow, scarlet, green and blue. The uniforms of Royal Marines are not unlike those of the U.S. marine corps.

OTHER MARINES

In addition to the United States and Great Britain, 19 other nations maintain marines or units which perform similar duties. Oldest of these is the Royal Netherlands *korps mariniers*, established on Dec. 10, 1665, as part of the Netherlands navy. The *korps mariniers* saw immediate action against England, France and Spain, and played a conspicuous part in the Dutch amphibious raid up the Medway (1667). Subsequently the corps was mainly employed to police and protect the Dutch empire. During World War II it was reorganized and trained by the U.S. marine corps. The motto of the corps is *Qua Patet Orbis* ("To the Ends of the World").

Other countries having marines or some type of "naval infantry" are: Argentina. Brazil, Cambodia, Chile, Colombia, France, Indonesia. Iran, Mexico, Nationalist China. Philippine Republic, Republic of Korea, Spain, Thailand, U.S.S.R., Venezuela, Vietnam and Yugoslavia.

MARINETTI, FILIPPO TOMMASO (1876–1944), Italian writer, the founder. of the literary Futurist movement, was born at Alexandria. Egy., Dec. 22. 1876, and educated in Paris. He published the original Futurist manifesto in the Paris *Figaro* on Feb. 20, 1909. His most characteristic work was the *Mafarka le futuriste* (1910). In 1914 he wrote the extraordinary *Zang-tumb-tuum* on the Balkan War. His *Guerra sola igiene del mondo* (191j) advocated Italian intervention in World War I. In *Futurismo e fascismo* (1924) he expressed support of Fascism, under which he enjoyed official backing.

Marinetti described himself as a "mystic of action"; but his technical devices (*e.g.*, "words in their freedom") and noisy agitations were essentially sterile. His war against all forms and patterns of ideas of the past. though expressive of a revulsion against literary tradition, created a rhetoric of its own. His Futurism also numbered Italian painters among its followers, with some success. Marinetti died at Bellagio, Dec. 2. 1944. (U. L.)

MARINO (MARINI), **GIAMBATTISTA** (1569–1625), Italian poet, the foremost of the *secentisti* (*see* ITALIAN LITERATURE). was born at Naples on Oct. 18. 1569. After a riotous youth, he secured the powerful patronage of Cardinal Piero Aldobrandini. whom he accompanied from Rome to Ravenna and to Turin. His early poems, *Le rime,* were published in 1602, and under the title *La lira,* in 1608 and 1614. At Turin (1608–1j) he enjoyed the duke of Savoy's protection, but Marino eventually had to leave Italy because of resentment at his satirical writing and at his disorderly life. He then took refuge in Paris (1615–23) where he was favourably recognized by Marie de' Medici and by Louis XIII.

Marino died at Naples on March 25, 1625.

Marino's *Adone* (1623; new ed. by R. Balsamo-Crivelli, 1922) tells the story of Venus and Adonis, with many digressions, in 45,000 lines. The poem contains many passages that still impress by their brilliance and shows a consummate mastery of technique; but it remains episodic, failing to come to life as a whole.

Marino's avowed purpose as a stylist was novelty at all costs. in order to dazzle the reader; and his licence. extravagances and conceits impressed his contemporaries and led many to imitate him. "Marinism" was the Italian manifestation of that cult of artifice and ornament which characterized western European literature in the 17th century.

Other publications by Marino include *La strage degli Innocenti* (1632; Eng. trans., by R. T., *The Slaughter of the Innocents*, 1675); *Lettere* (1627; critical ed. by A. Borzelli and F. Nicolini *Epistolario;* 1912). Selections of his works were published in *Poesie varie*, ed. by B. Croce (1913), *Le più belle pagine di Giambattista Marino*, ed. by R. Balsamo Crivelli (1925) and *Prose e poesie*, ed. by C. Culcasi (1930).

See G. F. Damiani, *Sopra la poesia del cavalier Marino* (1899) ; C. Culcasi, G. B. *Marino* (1932). (U. L.)

MARINUS, the name of two popes.

MARINUS I, (d. 884), pope from 882 to 884, a Tuscan, succeeded John VIII in Dec. 882. He had been deacon and treasurer of the Roman church and bishop of Caere and had been sent on missions to Constantinople by Nicholas I, Adrian II and John VIII. Marinus carried on the discussions with Photius begun under Nicholas. Owing to the researches of F. Dvornik it is now widely doubted that Marinus ever condemned Photius.

Marinus died on May 15, 884. He is sometimes mistakenly called Martin II.

MARINUS II, (d. 946). pope from 942 to 946, a worthy man of whom little is known except that he was ruled by Alberic, prince and senator of the Romans. He died in April or May 946. (C. P. L.)

MARINUS, Neoplatonist philosopher, came from Neopolis (Shechem) in Samaria and was a convert from Samaritan Judism to the old Greek religion. He succeeded Proclus as head of the Neoplatonic school at Athens in A.D. 485. His thought like that of his predecessor and teacher, was a strange mixture of sober scholarship, acute reasoning (he was keenly interested in mathematics) and fantastic superstition.

Marinus' chief surviving work is a biography of Proclus. ed. by J. F. Boissonade (1814), Eng. trans. in L. J. Rosan, *The Philosophy of Proclus* (1949). (A. H. AG.)

MARIO, GIOVANNI, COUNT OF CANDIA (1810–1883), Italian singer, the most famous tenor of the 19th century, son of General di Candia. was born at Cagliari on Oct. 17, 1810. While serving as an officer in the Sardinian army he was imprisoned at Cagliari and on his release fled to Paris. There his success as an amateur vocalist produced an offer of an engagement at the Opéra. He studied singing for two years under L. A. Ponchard and G. M. Bordogni, and made his debut in 1838 in Meyerbeer's *Robert le Diable*. In 1840 he joined the company of the Théâtre Italien, which then included Maria Felicita Malibran, Henriette Sontag, Fanny Persiani and Giulia Grisi. Giovanni Rubini, Antonio Tamburini and Luigi Lablache. In a short time he won a European reputation in Italian opera, and sang regularly in Paris and London. His voice; though less powerful than that of Rubini or that of Enrico Tamberlik, had an unrivalled softness and richness. On the stage he retained the grace and charm of youth long after his voice had begun to show signs of decay. He created very few new parts, that of Ernesto in *Don Pasquale* (1843) being perhaps the only one deserving of mention. Among his best parts were Otello in Rossini's opera of that name. Gennaro in *Lucrezia Borgia*, Almaviva in *Il Barbiere di Siviglia*, Fernando in *La Favorita* and Manrico in *Il Trovatore*. In 1856 he married Giulia Grisi, the famous soprano, by whom he had three daughters, Mario left the stage in 1871. He died in Rome in reduced circumstances on Dec. 11, 1883.

MARION, FRANCIS (1732–1795), American soldier. was born in 1732 at Winyah, near Georgetown. S.C., of Huguenot ancestry. In 1761 he served in a campaign against the Cherokees. In 1775 he was a member of the South Carolina provincial congress. Commissioned a captain, Marion took an active part in the defense of Ft. Moultrie in Charleston harbour (1776) and in the unsuccessful siege of Savannah (1779). In 1780 the British captured Charleston and overran the state. Made a brigadier general by Gov. John Rutledge, Marion showed his genius in organizing a band of guerrilla volunteers; he gained recruits and trained them to be fearless riders and good marksmen, and "Marion's brigade" became known far and wide for its successful exploits against the British.

His sudden attacks often resulted in the capture of superior numbers and intimidated the Tories. Col. Banastre Tarleton was sent to capture him, but soon despaired of finding "the old swamp fox." who eluded him by following swamp paths. His men united with Gen. Nathanael Greene's forces for important engagements at Georgetown, Ft. Watson, Ft. Motte and Eutaw Springs. For a skilful rescue of Colonel Harden's men, hemmed in by a superior British force which he defeated at Parker's Ferry, he received the thanks of congress.

In 1782 his brigade deteriorated during his absence; and there was a conspiracy to hand him over to the British. From 1782 to 1790 Marion served in the state senate where he opposed harsh treatment of the Tories. He was made commander of Ft. Johnson with a salary of £500 per annum, in recognition of his services. He died on his estate in Berkeley county on Feb. 27. 1795. As a soldier he was quick, resourceful and calm, a great partisan leader.

See W. D. James, *Life of Francis Marion* (1821); M. L. Wiems, *Life of Francis Marion* (1833) ; W. G. Simms, *Life of Francis Marion* (1844) ; E. McCrady, *History of South Carolina in the Revolution* (1901–02).

MARION, city and seat of Grant county, Ind., U.S., is located 65 mi. N.E. of Indianapolis on the Mississinewa river.

In the 1880s and 1890s it experienced booms in gas and oil, supplies of which failed after the turn of the century. Its industry, rapidly expanding by mid-20th century, is diversified but tends toward automotive parts domination. Other products include plastics, glassware: castings, television tubes, paper products, wire and cable. electrical parts and dairy products. Corn, oats and pigs are important in the local economy. Wheat and beef and dairy cattle are also produced and the county ranks high in soybean and tomato production.

A veterans administration hospital cares for about 1,650 psychiatric patients in more than 60 buildings. Taylor university (1846) is at nearby Upland. Matter park includes a zoo and historical museum. U.S. troops fought Miami Indians nearby at the battle of Mississinewa in 1812. The community was founded in 1831 as the county seat, chartered in 1889, and named for Gen. Francis Marion (*q.v.*). For comparative population figures *see* table in INDIANA: *Population.* (R. S. SI.)

MARION, a city of Ohio, U.S., and seat of Marion county, is located 44 mi. N. of Columbus in the midst of fertile farming and grazing lands. Laid out in 1821 (or 1820) on a natural travel route between Columbus and Lake Erie, the site first was called Jacob's Well after Jacob Foos, who had dug for water just south of the original plat (now within the city limits). The settlement was officially named for Gen. Francis Marion (*q.v.*) of Revolutionary War fame, in 1822; it was incorporated as a village in 1830 and became a city in 1890.

The city's location and transportation facilities contributed to its prosperity, and its pre-eminence in the manufacture of excavating machinery earned for it the sobriquet "Shovel City." Other major industries include road-construction machinery, home laundry dryers, metal products, refrigeration equipment, racing sulkies, brass bushings, burial vaults and oyerhead garage doors.

At Marion are the Harding house and museum and the Harding memorial, honouring the nation's 29th president, Warren G. Harding (*q.v.*). The city is also the location of a U.S. army engineer storage depot. For comparative population figures *see* table in OHIO: *Population.* (J. S. ST.)

MARIONETTES: *see* PUPPETS AND MARIONETTES.

MARIOTTE, EDME (*c.* 1620–1684), French physicist, codiscoverer of Boyle's lam, (*q.v.*), which is known by Mariotte's name in France, spent most of his life at Dijon, where he was prior of St. Martin-sous-Beaune. He was one of the first members of the Academy of Sciences founded at Paris in 1666. He died at Paris on May 12, 1684. The first volume of the *Histoire et mémoires de l'Académie* (1733) contains many original papers by him upon a great variety of physical subjects, such as the motion of fluids, the nature of colour, the notes of the trumpet, the barometer, the fall of bodies, the recoil of guns and the freezing of water.

His *Essais de physique,* four in number, of which the first three were published at Paris between 1676 and 1679, are his most important works, and form, together with a *Traité de la percussion des corps,* the first volume of the *Oeuvres de Mariotte* (2 vol., 1717). The second of these essays (*De la nature de l'air*) contains a statement of Boyle's law, which Mariotte discovered independently.

MARIPOSA LILY (*Calochortus*), the name given to a genus of beautiful plants of the lily family (Liliaceae), comprising about 40 species native to western North America, about 25 of which are found in California. They are tuliplike perennials. with simple or somewhat branched stems, one-half foot to four feet tall, rising from coated corms and bearing a few narrow leaves and showy white, yellow, lilac or bluish flowers, often spotted or marked in the centre. The three large broad petals, one to two inches long, usually bear a conspicuous basal gland. Several species are in cultivation.

See SEGO LILY.

MARIS, JACOB (1837–1899), Dutch landscape painter,. the eldest of three brothers all of whom became artists. was born at The Hague on Aug. 25, 1837 He first studied at the Antwerp academy, and subsequently in Antoine Hébert's studio in Paris from 1865 till 1871. He is best known for his scenes from the Netherlands countryside, of bridges and windmills, old quays, massive towers and level banks. against misty skies or chasing clouds. In all his works, whether in water or oil colour, and in his etchings, the subject is always subordinate to the atmospheric effect.as in the "Grey Tower, Old Amsterdam," "Landscape Near Dordrecht," "Sea-weed Carts, Scheveningen," "A Village Scene" and numerous other pictures.

Jacob Maris died at Karlsbad on Aug. 7, 1899.

MATTHEW MARIS (1839–1917), younger brother of Jacob, was bdrn at The Hague on Aug. 1;. 1839. He received a royal subsidy and for some time lived and worked with his brother Jacob, on whom his more spiritual and mystical nature had a refining influence. There is a touch of medievalism in many of his figures. "Souvenir of Amsterdam," "Bride of the Church," "The Four Mills" and "Girl Feeding Chickens" are among his most successful works. In 1885 he went to London to design windows.

Matthew Maris died there Aug. 1;, 1917.

WILLIAM (WILLEM) MARIS (1844–1910), youngest of the brothers, was born at The Hague, Feb. 18, 1844. He developed under the influence of Jacob and Matthew and lived for the greater part of his life in London. His paintings of cattle grazing, the most famous of which is "Cows Beside a Ditch," are modern in treatment and have charm of colour and feeling.

William Maris died in London in 1910.

MARITIME ADMINISTRATION, U.S., an agency of the federal government established in May 1950, along with the federal maritime board, to replace the United States maritime commission. The Maritime administration was made a part of the department of commerce. Both the board and the administration were established to foster the growth of a U.S. merchant marine sufficient to meet the needs of national defense and of foreign and domestic commerce. The guiding principles for their operation remained those set forth in the Merchant Marine act of 1936.

The Maritime administration is responsible for administering shipbuilding, shipping, port development and related programs authorized by law. It determines the ocean services, routes and lines needed for the nation's foreign and domestic commerce. and the types of ships required to provide adequate service. It recommends the terms of subsidy contracts to be awarded by the federal maritime board to U.S. shipping companies and shipyards. The Maritime administration provides insurance on private loans and mortgages for ship construction, arranges for war risk insurance and pays the cost of national defense features added to ships. It conducts a research and development program to improve the efficiency and economy of operations of the U.S. merchant marine, including study of nuclear-powered ships such as the U.S.S. "Savannah." It maintains a national defense reserve fleet of some 2,000 government-owned ships. maintains four shipyards in inactive condition for use in a national emergency, and operates five warehouses for the storage of marine equipment that might be required in an emergency. It also operates three radar training schools and the C.S. Merchant Marine academy at Kings Point, N.Y.

The federal maritime board is composed of three members appointed by the president by and with the advice and consent of the senate. One of the three members is designated as chairman of the board and also ser-ves as head of the Maritime administration. The board is a regulatory agency and as such is independent of the secretary of commerce. Its functions include the regulation of rates, services, practices and agreements of common carriers by water. It may enter into subsidy contracts relating to construction and operating costs to help U.S. shipyards and shipping companies meet the competition of foreign countries. It makes its determinations with regard to such contracts in accord with the provisions of the Merchant Marine act of 1936.

By 1960, 15 U.S. shipping companies operating on 31 world trade routes that were considered essential to the nation's commerce and defense held subsidy contracts with the government. These lines were engaged in the nation's largest peacetime shipbuilding effort to replace, at a cost of $4,600,000,000, more than 300 passenger and dry-cargo ships, representing the nucleus of the U.S. maritime fleet.

The history of efforts by the federal government to develop and maintain a strong merchant marine and to regulate water carriers in foreign and interstate commerce goes back many years. In 1916 the U.S. shipping board was established with these goals in mind. It played an important role in World War I but during the postwar years the U.S. merchant fleet was in a far from healthy state. The Shipping board was abolished in 1933 and in 1936 new legislation created the U.S. maritime commission. The 1936 act authorized new types of subsidies to help U.S. shipping firms meet competition from low-wage countries which also offered subsidies to their merchant marines.

See also SHIPPING INDUSTRY: *World Merchant Fleets.*

(M. S. BL.)

MARITIME LAW, or admiralty law, is the body of legal rules, partly substantive, partly procedural, which has grown up around the shipping industry. As transportation of goods and passengers by water on some kind of floating structure is one of the earliest forms of commercial activity of which there is record, references to the law of the sea abound in the sources which have come down from antiquity and, after the revival of a commercial society in Europe, from the middle ages. It is easy to exaggerate both the completeness of the ancient and medieval sea codes and their relevance to modern law. The 6th-century Byzantine compilation known as the Digest of Justinian includes a mass of references which are often confused and contradictory, obscure in meaning and of uncertain date, authority and integrity. The largely mythical body of law attributed to the Rhodian mariners has been constructed from a few scattered references in the Digest. A number of medieval collections of local maritime customs have survived. the earliest extant editions or copies going back to the 13th and 14th centuries; the best known of these are the *Consolat de Mar* or "Consulate of the Sea!' (Barcelona, 1494), the Laws of Oléron and the Laws of Visby (or Wisby), which are of uncertain date. Many of these medieval sea codes, so-called, were reproduced in the influential 17th-century French treatise by Cleirac. *Les Us ef Coutumes de la mer* (1647). The great 19th-century collections were made by Pardessus, *Collection des lois maritimes antérieures au XVIIIe siècle* (6 vol., 1828–45) and by Sir Travers Twiss in his edition of the *Black Book* of *the Admiralty* (4 vol., 1871–76).

Development of English Admiralty Jurisdiction. — All of this material is of great historical interest but is irrelevant to a discussion of modern maritime law. The law in any field renews itself generation by generation; as the conditions of life and commerce change, so, of necessity, do the legal rules which do not so much regulate as reflect them. Each major change in the technology which underlies the shipping industry has meant a major change in the inarticulate bases of maritime law. Furthermore, in England. the United States and the other English-speaking countries whose legal systems derive from the English common law, a peculiar event in the history of the English court system contributed to a decisive break with the medieval tradition.

It appears that, by the end of the 16th century. the English courts of admiralty had come to exercise an extremely wide jurisdiction. reaching far beyond salt-water transportation into many areas of commercial law. These courts were closely allied with the import and export trade that was so vital to English industrial development and enjoyed the full confidence of the mercantile community. But during the first half of the 17th century the judges of the common-law courts succeeded in divesting their competitors in the admiralty of their commercial jurisdiction and in restricting them to the adjudication of "things done upon the sea." This transfer of jurisdiction was accomplished through writs of prohibition issued by the common-law courts under the vague authority of a series of long-ignored statutes, the earliest of which was dated in the reign of Richard II (13 Rich. II c.5 [1389]). The common-law courts do not seem to have had, or to have won, the confidence of the merchants; there ensued a hiatus of nearly 200 years in the development of English commercial law during which mercantile disputes were rarely settled in court. During the second half of the 18th century, under the vigorous leadership of Lord Mansfield. the common-law courts, stimulated, no doubt, by the novel needs of a society in full course of industrialization, proceeded to fashion a new series of legal rules for dealing with mercantile disputes. Meanwhile, the courts of admiralty, cut off from the main streams of commercial activity and of legal thought, eked out a precarious and obscure existence. Pepys, writing as early as 1662, left a vivid description of the admiralty judges contriving, with much solemnity, to make a little business go a long way. Not until the 19th-century reorganization of the English court system was there re-established by statute (3 & 4 Vict. c.65 [1840]; 13 & 14 Vict. c 26 [1850]; 23 Vict. c.10 [1861]) a court of admiralty with extensive jurisdiction over the problems peculiar to the shipping industry. It is only from the time of this restoration of jurisdiction that modern English admiralty law can be said to date. In the organization of the English court system that prevailed by the middle of the 20th century the admiralty court was a part of the high court of justice, forming with probate and divorce a division of that court; certain county and other inferior courts were also to some degree invested with admiralty powers.

American Developments.— The development in the American colonies followed a different line. During the pre-Revolutionary period vice-admiralty courts exercised, without successful challenge, a jurisdiction much wider than that left to the English admiralty courts. The judges of the vice-admiralty courts were appointed by the crown and, following the tradition of the royal or prerogative courts, sat without juries; for these reasons, and perhaps because of their unsympathetic attitude toward smuggling offenses, the vice-admiralty courts were not popular during the period of ferment which preceded the American Revolution.

Article III of the federal constitution, which defines the "judicial power of the United States," provides in Sec. 2 that "the judicial power shall extend . . . to all Cases of admiralty and maritime Jurisdiction. . . ." Little is known of the genesis of this notably obscure provision, whose meaning was left to be supplied by congress and the courts. In the Judiciary act of 1789 congress translated the constitutional ambiguity into an equally glaring statutory ambiguity by providing that "the [federal] district courts . . . shall also have exclusive original jurisdiction of all civil causes of admiralty and maritime jurisdiction . . . saving to suitors, in all cases, the right to a common law remedy, where the common law is competent to give it. . . ." Several times amended, most recently in connection with the revision of the Judicial code in 1948, the substance of the act of 1789 now appears, in slightly different language but with, apparently, no change in meaning, as Sec. 1333 of Title 28 of the United States code.

At the outset, the congressional enactment, far from clarifying the situation, served merely to introduce an additional element of confusion; the riddling words of the second branch of the jurisdictional provision came to be known as "the saving-to-suitors clause." The courts, and particularly the U.S. supreme court, were therefore charged with the task of determining the scope of the jurisdictional grant ("all civil causes of admiralty and maritime jurisdiction") as well as that of figuring out a meaning for the saving-to-suitors clause.

The resolution of the saving-to-suitors clause question furnished one of the distinctive features of U.S. admiralty practice. The judicially determined meaning of the clause was this: although a cause of action is within the "admiralty and maritime jurisdiction" and thus (under the first branch of the statutory provision) within the "exclusive original jurisdiction" of the federal courts (sitting "in admiralty"), the same cause of action may be sued on in a nonadmiralty court (that is, a state court or a federal court sitting, not "in admiralty." but as a civil court of law and equity). What developed therefore was not a body of law, federally created and administered exclusively by the federal courts, but a body of law administered and to some degree inspired by both state and federal sources. State courts developed systems of admiralty law which were quite independent of general or federal maritime law and the legislatures of many states enacted comprehensive maritime codes. This process was brought to a halt by the supreme court's decision in the case of The Moses Taylor (71 U.S. [4 Wall.] 411 [1867]), holding unconstitutional a state statute which authorized an in *rem* proceeding against a vessel in a state court. Such a proceeding, it was held, could be brought only in the federal court in admiralty and was not a "common-law remedy" under the saving-to-suitors clause. The *Moses* Taylor decision made it clear that to some extent admiralty was an exclusively federal domain, but it continued to be thought that in actions brought outside the admiralty court under the saving-to-suitors clause, state courts would apply their own rules of substantive law (for example, that plaintiff's contributory negligence bars an action in tort) even where those rules were inconsistent with the "general maritime law" (under which plaintiff's contributory negligence may cause damages to be divided or apportioned but is not a bar to the action). Considerable doubt was cast on the principle that state courts apply their own law in maritime causes of action by Southern Pacific Co. v. Jensen (244 U.S. 205 [1917]), in which the supreme court, holding a state workmen's compensation statute unconstitutional as applied to a longshoreman engaged in work aboard ship, included in its opinion language which suggested that state law is invalid if it "works material prejudice to the characteristic features of the general maritime law or interferes with the proper harmony and uniformity of that law in its international and interstate relations." Thereafter, in a series of cases decided during the 1940s and 1950s the supreme court seemed to be elaborating what might be called a theory of maritime-law supremacy. The supremacy theory was expressed principally in cases involving actions by seamen and other maritime workers for death or personal injuries. The court was closely divided on these issues and shifts in its membership in the late 1950s led to a series of decisions (*e.g.,* The Tungus v. *Skovgaard,* 358 U.S. 588 [1959]) which indicated that the supremacy theory might be confined within its present limits if not curtailed.

Jurisdiction of Admiralty Courts.—In addition to their civil jurisdiction, admiralty courts in England and the United States have long exercised a jurisdiction over crimes committed on shipboard The general theory is that a national court has jurisdiction to try crimes committed in its own territorial waters as well as crimes committed by its own nationals or citizens or on ships flying the national flag on the high seas or within the territorial waters of another nation. (United States v. *Flores,* 289 U.S. 137 [1933].) Applicable principles of international law and comity will determine the extent to which a national court is entitled to assert, or will assert, jurisdiction over crimes committed on foreign ships within its territorial waters.

For several centuries the law of prize was a distinctive feature of the practice of admiralty courts. An enemy ship captured in time of war could be brought into port and, if adjudicated as lawful prize by the local admiralty court, mould be sold by the court with the proceeds being divided among the lucky captors. The hope of fat profits in prize money no doubt stimulated the patriotic efforts of the daring privateers who in earlier days sailed as semiofficial adjuncts to the regular naval fleets and who seem to have had with those fleets the same sort of uneasy relationship which the "private eye" is said to have with the official police force in contemporary detective novels. As, during the 19th century, battleships became bigger, more expensive and more destructive, the opportunity for amateurs to turn a state of war into a profitable commercial venture on the high seas was lost and naval warfare became a grim, professional business. With the change of style in warfare at sea, the institution of prize gradually fell into disuse and in the 20th century disappeared.

In both Great Britain and the United States the admiralty courts exercise a limited jurisdiction over maritime causes of action. Only admiralty courts have power to entertain a proceeding ***in rem*** against a ship and to execute maritime liens. The admiralty courts sit in civil cases without juries, except that in the United States a special statute confers a right of jury trial in Great Lakes cases; they have traditionally followed a simple: flexible and nontechnical procedure. Since access to these specialized courts, with their special powers, depends on the existence of a maritime cause of action, much attention has been given to the dividing line between what is, in a legal sense, maritime and what is nonmaritime. In general, British and U.S. lam are in substantial agreement on the demarcation; indeed, to a considerable degree this body of law is supranational and world-wide.

One basis of admiralty jurisdiction is territorial: the occurrence on navigable waters of some event of a maritime nature which relates to a vessel or to her cargo. Under this branch of the jurisdiction fall crimes (including piracy) and torts such as collisions, injuries to crew members and passengers, and damage to cargo. In England the jurisdiction was territorially restricted to the high seas and tidal waters. In the United States, no doubt because of the great economic importance of the inland waterway system, the English limitation was eventually abandoned (The *Genesee Chief* v. *Fitzhugh,* 53 U.S. [12 How.] 443 [1851]); all inland waterways, whether they be lakes, rivers or canals, which are in fact navigable in interstate or foreign commerce, are within the jurisdiction. The requirement that some kind of floating structure which constitutes a "vessel" be involved leads to occasional litigation about odd objects which, by accident or design, find their way into navigable waters. The older cases, both English and American, took the vessel limitation seriously with the result that such things as navigation beacons and dry docks which had broken loose from their moorings were held not to be subject to the maritime rules of salvage (*q.v.*). Recent cases have taken a less restrictive approach.

The other principal basis of admiralty jurisdiction is contractual: a dispute arising out of a contract which is considered to be maritime in nature. It was this branch of the jurisdiction which was withdrawn from the English admiralty courts during the 17th century, as noted above, and restored by statute toward the middle of the 19th century.

In the United States a broad contractual jurisdiction was at all times maintained, following the precedents of the colonial vice-admiralty courts. Justice Joseph Story, who was at all times an apostle of federalism. was the most influential exponent of the concept of a broad admiralty jurisdiction; his learned opinion in *De Lovio* v. *Boit* (7 Fed. Cas. 418 [C.C.D. Mass. 1815]), holding a contract of marine insurance within the jurisdiction, became the classic statement of that approach.

The line between maritime and nonmaritime contracts was eventually drawn to include within the admiralty jurisdiction most contracts which would be popularly thought of as closely connected with the business of shipping: contracts for transporting passengers or cargo, for chartering ships, for services and materials furnished to a ship (supplies, repairs, towage, pilotage, wharfage, etc.), for maritime employment, for marine insurance, and so on. There were, however, some strange exclusions: contracts to build or sell ships are nonmaritime and. apart from statute: so are mortgages of ships. In lieu of mortgages, maritime law recognized two security interests known as bottomry bonds and respondentia bonds. Bottomry was a loan on the security of a ship, respondentia on the security of a cargo. The peculiar and, from a lender's point of view, unattractive feature of both bottomry and respondentia was that if the ship or the cargo failed to complete the voyage (having been, for example, lost at sea) the lender lost not merely his security but his right to repayment of the loan. Any attempt to give the lender a claim which would survive the loss of the ship or cargo was held to convert the bond into a nonmaritime mortgage. Bottomry and respondentia have long since passed out of use and in both Great Britain and the Gnited States statutes have conferred maritime status on ship mortgages which comply with the rather complex requirements which the statutes impose.

Liens.—Most types of maritime claims, whether based on contract or arising from tort, give rise to maritime liens against the ship or its cargo. In admiralty terminology, the pleading which initiates a proceeding is known as a libel. A libel may be brought either in personam, against the shipowner. or ***in rem,*** against the ship or cargo. Under an in personam libel the decree, if the libelant is successful, is a money judgment against the shipowner. When a ship is libeled *in rem* the ship is arrested and kept in the custody of the court unless the owner secures her release by posting a bond for indemnity. If judgment goes for the libelant in an *in rem* action, the ship will be sold by order of the court or there will be recovery on the bond. The sale of a ship by an admiralty court acting ***in rent*** is said to divest or "execute" all liens against the ship—not merely those liens which may have come into the proceeding in which the ship was sold but all liens everywhere in the world. (By way of contrast, the holder of an in personam judgment against a shipowner can. like any judgment creditor, have the ship sold on execution. But such a sale, unlike the admiralty sale *in rem,* does not execute existing liens; the ship, in the hands of the purchaser at the execution sale, remains subject to all existing liens.) Thus, the libel in *rem* has decisive advantages over the libel in personam and these advantages become even more striking when the shipowner is insolvent or when, typically following some maritime disaster, the aggregate of claims far exceeds the value of the offending ship. Possession of a claim with maritime lien status has a taofold importance: (1) with some statutory exceptions in Great Britain, only the holder of a maritime lien may bring an action ***in rem;*** (2) when funds are distributed following judgment in an *in rem* action in which several parties have filed libels or have been allowed to intervene, maritime lien claims are paid in full, with priority over claims which are maritime but do not have lien status as well as over-all nonmaritime claims.

All maritime torts for which a ship is responsible give rise to liens. Examples of such torts are collisions due to negligent navigation, and injuries to persons or damage to property caused by the negligence of the ship's personnel or by the ship's unseaworthiness. The breach of most types of maritime contracts also gives rise to liens: contracts of affreightment or passage; charter parties; employment contracts of officers and crew; contracts for repairs, supplies and various types of maritime services such as towage, pilotage and wharfage. Breach of a contract, however, gives a lien only when at the time of breach the contract has been to some degree executed or performed—as by delivery of cargo on board ship or by delivery of a ship under a charter party. Breach of a contract while it is wholly executory—for example, the refusal of a ship to accept cargo which it has agreed to carry or to receive a passenger to whom a ticket has been sold, or the failure to deliver a ship under a charter—creates a maritime claim, but such a claim does not enjoy lien status. A few types of concededly maritime claims have at one time or another, usually for no discernible reason, been denied lien status; examples are the claim of an insurance company for unpaid premiums on a marine insurance policy and the claim of a general agent for advances.

Maritime liens are also given for several types of peculiarly maritime transactions or services. Among these are the liens which arise from bottomry and respondentia bonds, liens for salvage and for contributions made to a general average ***(see*** AVERAGE).

The ship may have a lien against the cargo. Typically the lien against cargo is asserted for nonpayment of freight, but it could support a claim for damage caused the ship by the cargo. For enforcement of such a lien the cargo may be libeled *in rem* and sold by the admiralty court, just as in cases of *in rem* actions against ships. The peculiarity of the lien against cargo is said to be that it depends on possession and is lost by a voluntary delivery of goods to the consignee.

Under general maritime law there is a complex hierarchy of maritime liens; that is to say, in a proceeding which involves distribution of an inadequate fund to a number of lien claimants, liens of a higher rank will be paid in full in priority over liens of a lower rank. Liens are ranked according to two quite different criteria: the time when they arise and the nature of the transaction or event which gives rise to the lien.

With respect to the time of accrual the general rule is that liens rank in inverse order of creation; that is, existing liens are subordinated to liens subsequently created. Various theories have been advanced to explain this rule which, at first blush, seems to fly in the face of reason. The priority given to the most recent contract lien has been said to rest on the fact that the lienor's services presumably benefited the ship and enabled her to get on with the voyage. Reasonable as that may be, it does nothing to explain the priority given to the most recent tort lien, and the inverse order rule appears to be even more rigorously applied to tort liens than to contract liens. An alternative theory, which does little more than describe the result, suggests that all existing lienors become in a sense "co-owners" of a ship and, by allowing it to proceed on a voyage, voluntarily subordinate their claims to the contingencies of the voyage. The practical result of the inverse order rule is that the lienor must assert his claim promptly or take the risk of subordination to later claims.

The strict inverse order rule is usually qualified to the extent that liens are ranked not hour by hour or day by day but voyage by voyage; that is, liens of the same class which accrued on the most recent voyage all share equally and all enjoy priority over the liens which accrued on the preceding voyage, and so on back. In the United States, in the case of coastal shipping, liens are ranked by the calendar year and, in the case of Great Lakes shipping, by the season (on the Great Lakes ice makes navigation impracticable during approximately four months of each year). Furthermore, a few special rules are applied to harbour shipping: in New York harbour, for example, liens which accrue within 40 days from the date of the initiating libel outrank all prior liens, which share equally. It has been suggested that the several rules reflect the normal periods of credit which are extended by suppliers; from this it has been argued that the voyage rule, which was developed during the 19th century when a transoceanic voyage was a matter of weeks or months instead of days, should be replaced by a calendar year or season rule which would allow lienors to delay enforcing their claims for a reasonable credit period without running the risk of subordination. This argument has not, however, as yet prevailed (*The City* of *Athens*, 83 *F.* Supp. 67 [D.Md. 1949]).

Liens are ranked not only by time of accrual but by class. With respect to ranking by class, it is safe to say that the highest priority goes to seamen's claims for wages: these are, it was once colourfully said, "sacred liens, and, so long as a plank of the ship remains, the sailor is entitled, against all other persons, to the proceeds as a security for his wages." (*The John* G. *Stevens*, 170 U.S. 113 [1898]). Not far behind come claims for salvage, and there is even some authority for the proposition that a salvage lien will outrank liens for wages earned before the salvage. Apart from wages and salvage, the general rule is that tort liens outrank contract liens; a perhaps desirable flexibility is introduced into the structure by the fact that it has never been clear whether liens for damage to cargo are on the tort side (because of negligence in stowing or caring for the goods) or on the contract side (under the contract of carriage).

Since liens are ranked according to two quite different criteria—time and class—it is obvious that clarity and predictability in the law are, even theoretically, impossible of achievement. Indeed, for a hundred years past commentators have regularly bemoaned the extraordinary degree of confusion which marks the question of lien priorities. From the fact that the confusion has been allowed to persist, it may be concluded that clarity and predictability have not been found to be essential and that a certain vagueness or formlessness in the legal categories, which leaves ample room for judicial maneuver, meets the needs of the situation. Without much exaggeration, it can be said that a trial judge, in decreeing the distribution of an inadequate fund among competing lien claimants, can find authority and precedent for almost any distribution which appears to him to be reasonable. Furthermore, appeals from decrees of distribution are rarely taken, so that. in the absence of authoritative statements by appellate courts, the law becomes progressively more unsettled and parochial. This phenomenon is by no means unexampled in the law, although it is offensive to the purist, the black-letter man and, most of all, to the nonlawyer. Evidently the industry most immediately concerned has found it possible to live with the confusion and there is no sign in the case law that any progress will be made toward a neat, tidy and rigid formulation of priorities.

Limitation **of** Liability.—A distinctive feature of maritime law is the privilege accorded to a shipowner under certain circumstances to limit his liability, in respect to both tort and contract claims. to the value of his investment; *i.e.*, the value of the ship. The basic condition of the shipowner's privilege is that he must be free from "privity or knowledge"; this formula (which is common to the limitation law of all maritime countries) means, roughly, that the shipowner is not liable for losses caused by faulty navigation but may be liable for losses caused by the ship's unseaworthiness which could have been corrected before it broke ground for the voyage. In a sense the limited liability of shipowners may be compared to the limited liability which any investor may now achieve by incorporating his enterprise. However, the limited-liability idea in maritime law long antedates the emergence or invention of the modern corporation or limited company; its early appearance in maritime law may be taken as a recognition of the extraordinary hazards of sea-borne commerce and the need to protect the adventurous shipowner, before even the most primitive forms of insurance became available, from a crushing burden of liability. Modern commentators have often suggested that the peculiar features of maritime limitation of liability have outlived their usefulness; the development of insurance has radically altered the conditions out of which the shipowner's privilege originally grew. Although no maritime country has yet gone to the length of abolishing limitation of liability, shipowning interests appear to have become concerned about the possibility of such a development. The Brussels convention of 1957 on the Limitation of Shipowners' Liability proposes a limitation fund substantially larger than that previously available in many countries. The convention was promptly adopted in Great Britain by the Shipping act of 1958, and it has been suggested that British sponsorship of the convention was motivated by fears on the part of shipowners that parliament was in any case disposed to proceed unilaterally to revise the law in a manner adverse to their interests. In the United States it has been suggested that it would be unwise to submit any kind of limitation legislation to congress on the ground that, once the subject was opened, the result might quite possibly be the abolition of limitation entirely.

In most maritime countries the principle of limitation of liability was considered to be a part of the general maritime law. As it developed in continental Europe the idea, generally stated, was that a shipowner entitled to limitation could satisfy his liability by abandoning the ship (and its pending freight) to claimants. Since the privilege of limitation was, and is, typically invoked following a large-scale maritime disaster, the abandonment theory meant that claimants got the value of the ship as it was following the disaster. If the ship had sunk or was a total loss with no freight pending, the claimants got nothing. This theory was carried over into the law of many South American countries.

A number of the principal European countries, as well as Brazil, adopted a modification of the abandonment theory proposed by the Brussels convention of 1922. Under the convention the owner retains the privilege of abandoning his ship in full satisfaction of claims but may, as an alternative, retain the ship and limit his liability to £8 per ton of the ship's registered tonnage (plus an amount for freight) in respect of property claims, with additional provision being made for death and personal injury claims. The convention was described as a happy compromise between British and continental theories of limitation but was. in fact, more favourable to the shipowner than either the British system or the previous continental system.

Great Britain and the United States were the only maritime countries that refused to admit the principle of limitation as part of the general maritime law. In both countries, however, the competitive needs of the shipping industry compelled its reintroduction by statute.

The first British limitation act was passed in 1734 (7 Geo. 2 c. 15) and was thereafter many times amended. Until after the middle of the 19th century, English limitation law, much less favourable to shipowners than the continental abandonment theory, set the limitation figure at the value of the ship at the beginning of the relevant voyage—i.e , before the disaster—plus pending freight. In 1854 (17 & 18 Vict. c. 184) it was provided that in case of death and personal injury claims the value of the ship should be taken as not less than £15 per ton. Thereafter in 1862 the actual value of the ship was abandoned as a measure of liability, and limitation was fixed in all cases at £15 per ton in cases of death and personal injury and £8 per ton in cases of property damage alone. These provisions were incorporated in the Merchant Shipping act of 1894 (57 & 58 Vict. c. 60) and remained in force until displaced by the Shipping act of 1958. The £8 per ton figure was no doubt a rough average of ship values in 1862 when it was adopted; in the 20th century, particularly after the end of World War II, soaring costs deprived the £8 figure (or even the £15 figure) of any relation to reality.

U.S. shipowners apparently did not become concerned about the question of limitation of liability until the middle of the 19th century. The Limitation of Liability act of 1851 was closely modeled on the British statute then in force and was supported in congress as a measure designed to restore U.S. shipowners to a position of competitive equality with British shipowners. The act fixed the maximum liability of a shipowner entitled to limitation at the value of the ship plus pending freight, but gave no indication whether that value was to be calculated after the disaster (the European "abandonment" theory) or before (the English theory under the statute then in force). The legislative history of the act suggested that it should be construed according to British law but the U.S. supreme court eventually decided (Norwich *&* N.Y. *Transportation* v. Wright, 80 U.S. [13 Wall.] 104 [1871]) that the principle of limitation was a part of the general maritime law, which the act had merely restored to vitality, and elected to follow the European theory. Thereafter the court decided that a shipowner entitled to limitation could keep for his own benefit any insurance recovery and did not have to put that money into the limitation fund (Tlze Czty of Norwich, 118 U.S. 468 [1886]). These holdings left U.S. limitation law at the end of the 19th century in a state much more favourable to the shipowning interests than was the corresponding British law. However, as ship values continued to increase, the U.S. formula, in cases where the ship was not a total loss, opened the way to recoveries substantially larger than were available under the British formula, tied to the increasingly unrealistic £8 per ton figure of 1862.

The U.S. act of 1851, consistent with its purpose to restore the U.S. mercantile fleet to a position of equality with the British fleet, had excluded from its coverage vessels used on the inland waterways; in 1886, however, the act was extended to "all vessels used on lakes or rivers or in inland navigation."

Until 1935 the U.S. Limitation act made no special provision for death and personal-injury claims. Public indignation was aroused in 1934 when the owners of the steamship "Morro Castle," which burned off the New Jersey coast with large loss of life, petitioned to limit their liability to $20,000. The following year congress added to the Limitation act provisions, modeled on those of the British act, requiring that a special fund in the amount of $60 per ton be set up to satisfy death and personal-injury claims. The loss of life provisions apply only to "seagoing vessels."

The Brussels convention of 1957 on Limitation of Shipowners' Liability adopts the structure of British limitation law, setting the limitation fund at an amount closer to actual ship values than the obsolete figures of £8 and £15 which had prevailed in Britain since 1862. The convention figures are stated in terms of the gold content of Poincaré francs and convert into U.S. dollars (1958) at $140 per ton for death and personal-injury claims exclusively with another $67 per ton to be shared ratably by such claims and property claims.

In general, the limitation law of any country will be applied by its own courts in favour of foreign shipowners as well as of citizens. From the point of view of shipowning interests, however, a major weakness of limitation law has been the fact that decrees of limitation (unlike in *rem* decrees of admiralty courts) are not given international recognition (The Titanic, 233 U.S. 718 [1914]). That has meant that a shipowner whose ships move in international trade could find himself sued in several countries, as a result of one disaster, and forced to set up limitation funds in each country (although in Britain an owner who paid claims in foreign proceedings was allo ed to credit those amounts against the British limitation fund). The Brussels convention of 1957 purports to make limitation decrees delivered by admiralty courts in ratifying countries internationally effective; that is, a shipowner could be required to set up only one limitation fund, out of which all claims would be paid, no matter in how many countries proceedings might be instituted against him. Thus the convention, which increases the liability of shipowners in most countries, does offer in return this considerable advantage to the small group of shipowners whom the present rule affects adversely.

Marine Insurance.—An appreciation of the part played by marine insurance (*q.v.*) is essential to an understanding of the shipping industry and the special law which governs it. With the exception of claims for death and personal injury and claims of seamen for wages, substantially all claimants are themselves insured. The shipowner carries hull insurance on his own ship and protects himself against claims by third parties under a variety of arrangements. Water-borne cargo is almost universally insured against the perils of the seas. It is impossible in a brief outline such as this to go into any of the special intricacies, which are many. of marine insurance law. The point to be borne in mind is that any case of property damage, to a ship or its cargo or to ships in collision, resolves itself into a settlement between insurance carriers. Proposals for reform of the maritime law must always be evaluated against this background of universal insurance coverage. Abolition of the shipowner's privilege to limit his liability or of the peculiar maritime rules of general average or an increase in ship's liability to cargo would all mean not much more than that insurance now taken out and paid for by A would be taken out and paid for by B, who would pass on the additional cost of his insurance in the rates or prices charged to his customers. Since the same insurance carriers write both hull and cargo insurance, the end result of such reforms would be merely a redistribution of business among their several departments. Except for litigation involving death and injury claims, there appears to have been during the 20th century a notable decrease in maritime litigation of all sorts. It is reasonable to suppose that this decrease is related to the increasing availability of all-risk insurance; insurance carriers notoriously, and commendably, prefer settlement or arbitration to litigation, even when a given carrier does not find itself in the position of having insured both parties.

Marine insurance is the oldest form of insurance that is known. Indeed, the institution of general average, under which the participants in a maritime venture contribute to losses incurred by some for the benefit of all, may itself be looked on as a primitive form of self-insurance. Marine insurance in a discernibly modern form made its appearance in the middle ages; many of the medieval sea codes contained regulatory provisions, and a special court for trying marine insurance cases was established in England in 1601 (43 Eliz. c. 12). Modern hull-msurance policies still reproduce the language, which has come to seem quaint and archaic, of the so-called Tiger policy, written in London in 1613. Marine insurance seems to have grown up in the interstices, so to say, of existing maritime law and to have adapted itself to that framework. Until the 20th century it was a characteristic of marine insurance that a substantial number of risks could not be covered, and this remains to some degree true in cargo policies customarily written to exclude losses under stated percentages (the so-called F.P.A. or "free of particular average" clauses — "average" meaning a loss and a "particular average" meaning a loss not made good in a general average contribution). The theoretical basis for exclusion of certain risks is often said to be the furnishing of an inducement to the owner of property to look after it himself. as in the case of the "deductible!' feature in the familiar automobile collision-insurance policy. However that may be, the pressures from shipowners for comprehensive insurance coverage have gradually led to the inclusion of almost all risks: "collision and running down" clauses, war risk riders, so-called "disbursements" policies and "P. and I." (protection and indemnity) insurance.

The British Marine Insurance act of 1906 (6 Edw. 7, c. 4) codified British law and was of great influence in the development of U.S. marine-insurance law. The U.S. supreme court has consistently insisted on the need for international uniformity in this field. with the result that both the British codification and British cases have been recognized as authoritative. (*E.g., Queen* Insurance Co. of America v. Globe *& Rugers* Fire Insurance Co., 263 C.S. 487 [1924].) Nevertheless, certain differences have grown up between British and U.S. practice; for example, in cargo policies variant clauses are in use in the two countries with respect to the risk covered in cases of stranding or collision (the clauses are referred to as F.P.A.E.C. and F.P.A.A.C.—Free of Particular Average, English Conditions; Free of Particular Average, American Conditions). The case of *Wilburn* Boat Co. v. Fireman's Fund *Insurance* Co. (348 U.S. 310 [1955]), which held that a state statute controlled the decision whether a policy on a houseboat kept on an inland lake was void for breach of warranty, led some commentators to speculate that the supreme court had abandoned its long-held policy of uniformity in the marine-insurance field.

Nature **of** Maritime Law. — Maritime law is often thought of as being a species of private international law—ius *gentium*—rather than a branch of domestic or municipal law. It should not be denied that the international aspect of maritime law gives it a distinctive flavour; in doubtful cases courts of one country will often look to the precedents or statutes of another country for inspiration or guidance, and a relaxed attitude toward the principles of the law of conflict of laws is customary on the ground that the rules of maritime law are world-wide in scope. The supranational nature of maritime law was emphasized in an opinion written by Justice Robert H. Jackson of the U.S. supreme court in 1953: "[C]ourts of this and other commercial nations have generally deferred to a non-national or international [maritime] law of impressive maturity and universality. It has the force of law, not from extraterritorial reach of national laws, nor from abdication of its sovereign powers by any nation, but from acceptance by common consent of civilized communities of rules designed to foster amicable and workable commercial relations." (Lauritzen v. Larsen, 345 U.S. 571 [1953].) Traditionally the interplay between British and U.S. courts in this field has been close and continuous.

It is, however, very easy to overstate the degree to which maritime law is a branch of the law of nations. Justice Oliver Wendell Holmes pointed out long ago: "The maritime law is not a corpus *juris*—it is a very limited body of customs and ordinances of the sea." (Southern Pacific Co. v. Jensen, 244 C.S. 205 [1917].) In all countries there is discernible a progressive tendency to codify maritime law, and the nature of national statutes is such as to preclude reference to outside sources of law. It is undoubtedly true that maritime law in mid-20th century was much more a creature of nationalism than it had been 100 years earlier.

Countervailing pressures of an internationalist kind have not been without influence. Since the late 19th century the Comité Maritime International has produced a series of international conventions. While many of these conventions have failed of widespread ratification, others have been highly successful: the Salvage convention of 1912, the Safety of Life at Sea convention of 1929, the convention on the Carriage of Goods by Sea of 1922 have all been adopted, either by ratification or by the passage of parallel legislation, by the principal maritime countries of the world, including Great Britain and the United States. The international rules of navigation. most recently revised as the result of recommendations of the Safety conference held at London in 1948 and adopted by statute in many countries including Great Britain and the United States, are in effect an international code of navigation on the high seas; these rules of the road are of the greatest importance in determining fault in ship collision. (*See* RULE OF THE ROAD AT SEA.)

In other fields much has been accomplished to ensure international uniformity through private agreements voluntarily adhered to by affected interests; the York-Antwerp Rules of General Average. first promulgated in 1890 and most recently amended in 1950, are the best-known example of such agreements which, although they do not technically have the force of lam. nevertheless, by incorporation in charter parties and bills of lading, determine the shape of the law as effectively as any statute. It may also be that the widespread submission of international maritime disputes to arbitration, where the informality of the procedure facilitates escape from aberrant national rules, reflects the stubbornly international bias which has characterized the shipping industry from earliest times.

MARITIME PROVINCE, a former province of Russia, in east Siberia; see FAR EASTERN AREA.

MARIUPOL (ZHDANOV), a seaport of the Ukrainian Soviet Socialist Republic, U.S.S.R.. at the mouth of the Kalmius river, in 47° 6' N. lat. and 37° 35' E. long. The population was 284.000 in 1959. The harbour is 4 mi. S.W. of the city. Known as Mariupol until 1948, the city was renamed Zhdanov in honour of a Soviet politician, Andrei Zhdanov. The place is said to have been inhabited in remote times under the name of Adamakha. The modern town was built only in 1779, by Greek emigrants from the Crimea. Zhdanov became an industrial centre and a metallurgical institute was founded there. Manufactures include steel pipes, machinery and chemicals. Fishing and shipbuilding industries were also established. It was linked by rail with the north.

MARIUS, GAIUS (155–86 B.C.), Roman general, of plebeian descent, the son of a small farmer of Cereatae (mod. *Casamare,* "home of Marius") near Arpinum. He served first in Spain under Scipio Africanus, and rose from the ranks to be an officer. In 119 as tribune he proposed a law intended to limit the influence of the nobles at elections. This brought him into conflict with the aristocratic party, who prevented him from obtaining the aedileship. When about forty years of age he married a lady of patrician rank. Julia, the aunt of Julius Caesar. Praetor in 115, he subdued Further Spain. In the war with Jugurtha (109–106) he came to the front as lieutenant of the consul Quintus Caecilius Metellus Numidicus. He came home in 108 to stand for the consulship, was elected, and proceeded to upset all precedent by over-ruling the Senate on the question of his command, and getting the war with Jugurtha assigned to him by the Assembly. He then raised a large army by another unconstitutional departure, enrolling the classes without property (capiti censi), probably the most momentous step he ever took. He superseded his old commander Metellus, and took with him as quaestor L. Sulla. who commanded the cavalry. Between them they brought the war to a triumphant issue, and Marius passed two years in his province of Numidia, which he thoroughly subdued and annexed. The surrender of the person of Jugurtha to Sulla gave rise to the view that he, not Marius, had really ended the war, and so laid the foundation of the subsequent enmity between the two leaders.

Marius was next appointed to the command against the Cimbri and Teutones, who had destroyed two Roman armies near the lake of Geneva. Marius, out of unpromising materials and a demoralized soldiery, organized a well-disciplined army, with which he inflicted on the invaders two decisive defeats, the first in 102 at Aquae Sextiae (Aix), 18 m. north of Marseilles, and the second in the following year near Vercellae *(Vercelli),* about midway between Turin and Milan. In 101 Marius was elected consul a fifth time (previously in 107, 104, 103, 102), hailed as the "saviour of his country," and honoured with a triumph.

The glorious part of his career was now over. A very able soldier, as a politician he on the whole failed, though he retained the confidence of the popular party almost to the last. But he unfortunately associated himself with the demagogues Saturninus (*q.v.*) and Glaucia, in order to secure the consulship for the sixth time (100). Later their excesses forced him to turn against them, and this cost him his popularity. So he left Rome for Asia, where he endeavoured to provoke Mithridates to hostilities. On his return he served as legate in the Social War (90), and defeated the Marsi on two occasions. In 88 war broke out with Mithridates, and Sulla was appointed by the senate to the chief command. While Sulla was at Nola with the army, the tribune Sulpicius Rufus started a program of revolutionary legislation which included the transfer of the command to Marius. Sulla marched on Rome, crushed the revolution, and outlawed Marius, who fled with a price on his head. After a picturesque series of incidents which included a frustrated attempt to land at Carthage, he settled for the time in Cercina. No sooner had Sulla left for the east, than Cinna's revolution started. Marius joined Cinna, forced his way into Rome and entered on a reign of terror in which senators and nobles were slaughtered wholesale. He had himself elected consul for the seventh time, in fulfilment of a prophecy given to him in early manhood. Less than three weeks afterward he died of fever, on Jan. 13, 86.

He carried out to their logical conclusion the processes begun by Rufus, and under the new organization the soldier was a man who had no trade but war. He did not himself use the army as a political weapon, but under the new order the great general was bound to become the ruler of the State.

For Marius the original sources are numerous passages in Cicero's works, Sallust's *Jugurtha,* the epitomes of the lost books of Livy, Plutarch's *Lives* of Sulla and Marius, Velleius Paterculus, Florus and Appian's *Bellum civile. See* F. D. Gerlach, *Marius und Sulla* (Basel, 1856); I. Gilles, *Campagne de Marius dans la Gaule* (1870); W. Votsch, *Marius als Reformator des romischen Heerwesens* (with notes and references to ancient authorities) 1886; A. H. J. Greenidge, *History of Rome,* vol. i. (1904); also ROME: *Ancient History: The Republic.*

MARIVAUX, PIERRE CARLET DE CHAMBLAIN DE (1688–1763), French novelist and dramatist, was born at Paris on Feb. 4, 1688. His father became director of the mint at Riom in Auvergne, and Pierre was brought up there and at Limoges. Marivaux began his literary career by writing plays, admirable and graceful comedies, of which the most famous are *Le jeu de l'amour et de l'hasard* (1730), *Les Fausses Confidences* (1736), *Le Legs* (1736) and *L'Epreuve* (1740). If they lacked something in depth and characterization, they were full of witty dialogue, much of it about trifles, but exquisite in its way. This dialogue gave a new word to the French language, *marivaudage;* the style perfectly reflects the gallantry and the *sensibilité* which is the subject matter. Simultaneously Marivaux conducted two or three short-lived periodicals, in the *Spectator* style: *Le Spectateur français* (1722–23), *L'indigent Philosophe* (1727), and *Le Cabinet du philosophe* (1732).

In 1731 Marivaux published the first two parts of his best and greatest work, *Marianne,* a novel of a new and remarkable kind. The eleven parts appeared in batches at intervals during a period of exactly the same number of years, and, after all, it was left unfinished. In 1735, another novel, *Le Paysan parvenu,* was begun, but this also was left unfinished. *Marianne* is an extremely important step in the legitimate development of the French novel — legitimate, that is, in opposition to the brilliant but episodic productions of Le Sage. Its connection, and that of *Le Paysan parvenu,* with the work not only of Richardson but of Fielding is also an interesting though a difficult subject. The subject matter of Marivaux's peculiar style has been generally, and with tolerable exactness, described as the metaphysics of love-making. His characters, in a happy phrase of Crébillon's, not only tell each other and the reader everything they have thought, but everything that they would like to persuade themselves that they have thought. He was elected a member of the Academy in 1742. He survived for more than 20 years, contributing occasionally to the *Mercure* and writing plays. He died on Feb. 12, 1763, aged 75 years.

Marivaux was, though a great cultivator of *sensibilité*, on the whole decent and moral in his writings, and was unsparing in his criticism of the rising *Philosophes.* This last circumstance, and perhaps jealousy as well, made him a dangerous enemy in Voltaire. He had good friends, not merely in the rich, generous and amiable Helvétius, but in Mme. de Tencin, in Fontenelle, and even in Mme. de Pompadour, who gave him, it is said, a considerable pension, of the source of which he was ignorant.

The best and most complete edition of Marivaux is that of 1781 in 12 vol. reprinted with additions 1825–30. The plays had been published during the author's lifetime in 1740 and 1748. There are modern editions by Paul de Saint Heylli Victor (1863), by G. d'Heylli (1876) and by E. Fournier (1878), while issues of selections and separate plays and novels are numerous. Of works concerning him J. Fleury's *Marivaux et le Marivaudage* (Paris. 1881). G. Larroumet's *Marivaux, sa vie et ses oeuvres* (1882; new ed, 1894), the standard work on the subject, and G. Deschamps's *Marivaux* (1897), in the *Grands écrivains français,* are the most important.

MARJORAM, aromatic herbs or undershrubs, belonging to the genera *Origanum* and *Majorana* (family Labiatae). Wild marjoram (*O. vulgare*), a perennial native to Europe and Asia, is common in dry copses and on hedgebanks in England and is naturalized in the eastern United States. It has many stout stems 1 to 3 ft. high, bearing short-stalked somewhat ovate leaves and clusters of purple flowers. Sweet marjoram, M. *hortensis,* and pot marjoram, M. *onites,* are cultivated for the use of their aromatic leaves, either green or dry, for culinary purposes; the tops are cut as the plants begin to flower and are dried slowly in the shade. *See* FLAVOURINGS.

MARK, SAINT, evangelist, an apostle of first-generation Christianity and the traditional author of the second Gospel (*see* MARK, GOSPEL ACCORDING TO SAINT). His symbol, therefore. has become the lion. the second animal at the throne of God (Ezek. i. 10: *see* Rev. iv.' 7). In the New Testament. Mark is mentioned several times, but even an uncritical combination of this information produces only a very fragmentary picture. Furthermore, critical investigation has raised serious doubts about the historicity of most of the given data.

The only unquestionably reliable information is to be found in Philem. 24, where a certain Mark is mentioned as one of Paul's fellow workers who sends greetings from Rome to the Christians at Colossae. But there is no indication there as to the identity of this person. The information in Col. iv, 10, that the Mark of Paul's company was a cousin of Barnabas, may also be authentic, although the Pauline authorship of Colossians is not beyond doubt.

Acts xii, 12, 25; xv, 37 speaks about "John whose other name was Mark," and xiii, 5, 13 simply says "John;" but elsewhere in the New Testament he is known by his Latin surname Mark (a name related to that of the god Mars). Acts also relates that his mother's house in Jerusalem was a centre of Christian life (xii, 12), and that Barnabas and Paul took him along to Antioch (xii, 25) whence he became their assistant on a mission journey (xiii, 5). When they arrived at Perga in Pamphylia, however, Mark left them and returned to Jerusalem (xiii, 13). According to Acts, this was the reason why Barnabas and Paul later separated, because Barnabas insisted on giving Mark another chance, while Paul declined (xv, 37–39). Subsequently, Mark sailed to Cyprus with Barnabas, never to be mentioned again in Acts.

The dependability of the Acts account is highly questionable. The writer of Acts is particularly interested in finding a reason for the breach between Paul and Barnabas, and probably introduces the rather colourless figure of John Mark for this very reason; but in so doing, he contradicts Paul's own account (Gal. ii, 11–14). What did the author of Acts actually know about Mark?

Apparently he had only the information contained in the Pauline Epistles; *i.e.*, he knew about a Mark who was mentioned among Paul's company as a relative of Barnabas.

II Tim. iv. 11, which pictures a forsaken Paul requesting Timothy to bring Mark "for he is very useful in serving me," is almost certainly a pseudepigraphic synthesis of data from Acts and Colossians. Greetings from "my son Mark" are included in I Pet. v, 13, which was written from Rome ("Babylon"), and a close relationship between Mark and Peter also is suggested by Papias' presbyter tradition, which identifies Mark as the interpreter of Peter and thus the author of the Petrine Gospel. But this seems to be a wishful identification aimed at giving the Gospel greater authority. If I Peter is spurious, as many scholars are convinced. its mention of Mark is a part of the device of pseudonymity which only proves that the tradition connecting Mark with Peter and Rome goes back to the end of the 1st century A.D.

Later tradition assumes that Mark mas one of the Seventy (Luke x, 1), and identifies him with the young man fleeing naked at Jesus' arrest (Mark xiv. 51 f.). The tradition first mentioned in Hippolytus (Refutation, vii. 30, 1) metaphorically calls Mark "shortfingered," since his Gospel is the shortest of all Gospels. Mark also was claimed by the Egyptian church as its founder, and from the 4th century A.D. the Alexandrian see has been called cathedva Marci. Dependent on the tradition that connected Mark with Peter and Rome, the church of the once important city of Aquileia (north Italy) traced its origin back to Mark. After the destruction of Aquileia by Attila in A.D. 452, its refugees founded Venice. of which Mark became the patron saint (a fantastic legend tells how Venetian merchants stole Mark's remains from Alexandria), and Venice's glory and predominance gave Mark's winged lion widespread fame throughout the middle ages. St. Mark's feast day is April 25.

(H. H. KO.)

MARK, a word of which the principal meanings are in their probable order of development—boundary, an object set up to indicate a boundary or position; hence a sign or token, impression or trace. (See MARK SYSTEM.) Mark, in the monetary sense, was formerly the name of a German silver coin. and as such is probably a distinct word and not of Teutonic origin; it is found in all Teutonic and Romanic languages. Latinized as *marca* or *marcus*. The mark was originally a measure of weight (varying during the middle ages, but *c.* 8 oz.) for gold and silver only and was common throughout western Europe. In England the "mark" was money of account only, and apparently came into use in the 10th century through the Danes. (See MONEY, MEDIAEVAL.)

The modern German mark was adopted in 1873, and first issued in 1875, as the standard of value and the money of account. It was of the value of 6.146 grains of gold, 900 fine, and was equal to English standard gold of the value of 11.747*d.* (in New York 23.821 cents). After the collapse of the mark (see BANKING; GERMANY) the mark was replaced in 1923 by the rentenmark, issued by the newly founded Rentenbank, and in 1924 by the reichsmark, issued by the Reichsbank. After World War II the reichsmark collapsed and was replaced by the deutschemark.

MARK, GOSPEL ACCORDING TO SAINT, in canonical order the second of the four Gospels of the New Testament. As the earliest of the three so-called Synoptic Gospels it was used as a source by the others, Matthew and Luke (see GOSPEL). Since Mark also was probably the first Gospel ever written, its outline of the life and ministry of Jesus can be considered as the first attempt to present the whole tradition of Jesus in a continuous "story."

Composition.—The core of Mark's Gospel is the Passion narrative, which Christian tradition already had formulated on the basis of the actual order of events in Jesus' trial, Passion and death. This comprises about 40% of Mark (in Luke, it is only 20%). To this core, the author of Mark added other traditional materials (mainly narratives), thereby extending the Passion narrative backward into a life of Jesus. The term Gospel, which originally meant the oral preaching about Jesus' death and resurrection, was used for the first time in Mark as the leading motif for a literary composition concerning the entire story of Jesus. Since in Mark this term occurs exclusively in editorial sentences, it was clearly the author of Mark himself who applied the word Gospel to tradition that previously had not been so designated. Therefore, the author of Mark may justly be called the creator of the early Christian literary form, Gospel.

The outline of the Gospel of Mark is certainly more primitive than that of Matthew and Luke, but it is nevertheless largely the result of the author's own editorial work and reflects his own theological understanding of Jesus. The framework of the Gospel contains very little reliable historical information. Only a few geographical references and personal names already were associated with the narratives used by Mark; *e.g.*, Capernaum (i, 21; ii, 1), the Sea of Galilee (i, 16, etc.), Dalmanutha (viii, 10), Caesarea Philippi (viii, 27), John the Baptist (i, 4–11; vi, 14–29, which also includes Herod) and Peter (viii, 27–29). Especially in the Passion narrative, persons and places are original elements of the tradition.

But beyond these few instances, the framework of Mark is an artificial device by which originally isolated stories are combined and some kind of chronological sequence is established (see, for example. the common phrase "from there he went to . . ."). Some scenery is always at Mark's disposal to give life to the picture, as "the sea" (ii, 13, etc.), "the other side of the sea" (v, 1, 21), a "lonely place" (i, 35; vi, 32), "hills" (iii, 13, etc.) or the "synagogue" (i, 21 ff., etc.). Seldom is a direct chronological connection made except during the Passion week narrative. The persons pictured in the Gospel are partly the author's own editorial work, partly already presented in the tradition. The "crowd" (ii, 13 ff., etc.) serves as the background for Jesus' acts and preaching, and is artificially introduced and quickly forgotten; the opponents appear abruptly whenever they are necessary for a controversy; the disciples frequently are nothing more than a foil for Jesus' miraculous power, belonging to Jesus' company as a matter of course, but scarcely anywhere acting as independent personalities.

Mark is not, however, simply a mechanical compilation by means of such technical devices, but both in its essential structure and in its details it is thoroughly governed by theological principles. These are most evident first in the arrangement of the traditional material, second in the short comprehensive summaries of Jesus' activity inserted by the author himself (i, 32–34; iii, 7–12; vi, 53–56), and finally in the introductions and conclusions he has added to many traditional stories.

Outline.—Mark's Gospel deals with the following:

i, 1–13:	"Beginning of the Gospel" (the Baptist)
i, 14–viii, 26:	the Galilean ministry
i, 14–iii, 35:	first disciples, healings and controversies
i, 14–ii, 12:	activity around Capernaum
ii, 13–iii, 12:	first conflicts
iii, 13–35:	first crisis and separation (calling of the Twelve, Beelzebul controversy, true brethren)
iv, 1–viii, 26:	around the Sea of Galilee
iv, 1–34:	mystery of the parables
iv, 35–v, 43:	the great miracles (tempest, Gadarene [Gerasenesl demoniac, Jairus' daughter)
vi, 1–56:	the great events (Nazareth, death of John the Baptist, sending of the Twelve, feeding of 5,000)
vii, 1–viii, 26:	the great controversy (clean and unclean, healings and feeding of 4,000, discourse on signs and leaven)
viii, 27–x, 52:	from Galilee toward the Passion in Jerusalem
viii, 27–30:	confession of Peter
viii, 31–ix, 29:	the right understanding of discipleship (transfiguration)
ix, 30–x, 31:	problems of discipleship (discussions about greatness, offense, marriage, the rich young man)
x, 32–52:	Christ and the disciples on their way to Jerusalem (the sons of Zebedee)
xi, 1–xv, 41:	the Jerusalem ministry and the Passion
xi, 1–xiii, 37:	the closing ministry
xi, 1–11:	first day: entry into Jerusalem
xi, 12–19:	second day: cleansing of the Temple

xi, 20–xii, 44: third day: Jesus' authority—the wicked husbandmen; controversy with Jerusalem's leaders (tribute to Caesar, great commandment, David's son)
xiii, 1–37: mystery of the future ("the Little Apocalypse")
xiv, 1–xv, 41: Passion of Jesus
xiv, 1–42: the preparation (anointing, betrayal, Last Supper, Gethsemane)
xiv, 43–xv, 20: the trial of Jesus
xv, 21–41: crucifixion and death
xv, 42–xvi, 8: conclusion (burial and empty tomb)
(xvi, 9–20: spurious ending: the appearance of the Risen Lord)

Themes.—The introduction makes it clear that the "Gospel" means not only Passion and Resurrection but the entire Jesus event. The story of Jesus' temptation (i, 12–13) shows symbolically the meaning of Jesus' activity. It is the eschatological battle between God and Satan in history.

The first main section of the Gospel depicts this struggle in a strange way. Jesus' ministry is limited to Galilee, nhich He leaves only occasionally (Decapolis, Tyre), but never for Jerusalem. Almost all of the Marcan miracle stories are found in these first eight chapters, and except for the parable chapter (iv) this section contains almost no sayings and few discourses. Thus the "Galilean ministry" is concerned with the revelation of Jesus' messiahship in His mighty works. But this is at conflict with another motif found in Mark's editorial comments—the "Messiah secret": (1) Jesus repeatedly forbids public announcement of His messiahship (i, 34. 44. etc.); (2) he speaks in parables in order to prevent the crowd from understanding the message (iv, 10–12. 33–34); (3) even the disciples appear to be completely blind and without understanding of Jesus' messiahship (vi, 52; viii, 14–21). Without any doubt such a description of Jesus' ministry contradicts both the historical reality and the tendency of the already messianized narrative traditions used by Mark. But in extending the primitive Gospe' (that the Messiah has paradoxically overcome the Satanic powers in His suffering and death) to include Jesus' life. Mark is primarily interested in the theological comprehension of that life. Accordingly, the Marcan edition of Jesus' life emphasizes His *mysterious* struggle for power with Satan in history. For Llark. the fact that the Messiah had to suffer necessarily implies that Jesus' ministry had to be described as concealed revelation.

Peter's confession (viii. 27–30) is an exemplary description of one acknowledging Jesus as the Christ. but it is rebuked since it does not also include the recognition that the Messiah has to win His battle through suffering and death. This becomes the theme of the central part of the Gospel. where both Jesus' messiahship and the anticipation of suffering are disclosed to the disciples. Miracle stories are incidental to this section (only ix, 14–29 and x, 46–52). Instead, Mark assembles stories and discourses that are concerned with the disciples' facing suffering. Predictions of the Passion run through these chapters like an unbroken thread (viii, 31; ix, 31; x, 32–34), not as a recollection of the actual psychological preparation of the disciples for the Passion. but as a presentation of those traditions which Mark considers to be the very centre of Jesus' message for the church. In contradistinction to the other Gospels (Matthew and Luke) Mark does not portray Jesus primarily as preaching the coming of the Kingdom, but as calling His "disciples" (i e., the church) to participate in His own eschatological struggle with Satan.

The last part of the Gospel presents Jesus's ministry in a strikingly different way. The location is restricted to Jerusalem; miracle stories are totally lacking; Jesus' action is now pictured as attack and victory much more than before (see especially the great discussion with Jerusalem's leaders in xii, 13–44); and the motif of concealment is missing. The entry into Jerusalem and cleansing of the Temple present Jesus in the open display of His messiahship. The so-called Synoptic Apocalypse (xiii). a purposeful arrangement and interpretation of (partly Jewish) apocalyptic traditions, stresses that the church will have to continue Jesus' fight in history until the Second Coming and the final consummation. The first fruits of the victory are Jesus' Passion and death, and the church can only follow her master with fear and trembling into the ongoing battle (x, 32; xvi, 8). Despite the fact that the disciples were aware that. paradoxically, suffering was the victory, their behaviour during Jesus' Passion was complete failure (xiv, 27–31, 32–42, 50–52. 66–72). Thus Mark depicts Jesus' Passion and death as a continuing "scandal" for those to whom the secret of the Messiah already has been disclosed in the Resurrection (ix, 9; xvi, 1–8).

Literary History.—The last verse of the authentic text of Mark is xvi, 8. The verses that follow (9–20) in many Greek manuscripts and in almost all Bible translations are missing in some of the best manuscripts and are clearly a summary compiled later. Their originality already mas doubted in the ancient church (Eusebius, Jerome). A shorter alternative ending contained in certain manuscripts is likewise spurious. Scholars are divided about whether the peculiar last sentence of the authentic text ("for they were afraid") was intended to be the original ending, whether Mark was perhaps prevented from completing the Gospel, or whether he wrote another ending that is now lost.

The related question, whether Mark is preserved in its original form at all, has led to several attempts either to reconstruct a Proto-Mark (*Urmarkus*) or to discover extensive written sources that provided the pattern and most of the material for the present Mark. Although none of these attempts has found wide acceptance, the problem of the "original Mark" admits to no facile solution. The hypothesis that the present Gospel is a Greek translation of an Aramaic original is to be rejected. Certainly it contains some Semitisms, often caused by the originally Aramaic traditions used by Mark; nor is its Greek style that of a well-educated Hellene, since it contains many colloquialisms; but it cannot be doubted that its original language was Greek. It is equally sure that Matthew and Luke used a Greek text of Mark. although there is some evidence that their edition of Mark was not identical with ours. Neither Matthew nor Luke contains anything to correspond nith Mark iv, 26–29; viii. 22–26; xiv, 51–52. and there are a few minor "common omissions' (e g., Mark xi. 10a) Matthew and Luke also seem to preserve a more original wording in certain common synoptic pericopes. But if such instances suggest the existence of an "original Mark," it is also clear that it was only slightly different from the present text.

The questions of authorship, date and place of the Gospel are still debated. The use of Mark by Matthew and Luke establishes a date earlier than about A.D 80. All attempts have failed to establish a close connection betneen the Neronian persecution (A.D. 64) or the Jeuish War (A.D. 66–70) and the writing of Mark. A time shortly before A.D 70. but certainly after Paul, would be possible, unless Mark xiii, 2, 14 is to be taken as "prophecy arising from the event" (i e., formulated after the destruction of the Temple in Jerusalem); if this is true, the years A.D. 70–80 would fit best. The earliest information about Mark is a presbyter tradition in Papias, bishop of Hierapolis (about A.D. 140, quoted by Eusebius in his *Church* History):

> Mark, who had become the interpreter of Peter, wrote accurately the things said or done by the Lord, though not in the right order. For he had neither heard the Lord, nor had he been his follower, but later, as I said, he had followed Peter, who composed the teachings for his needs, but not as if making a composition of the sayings of the Lord. Therefore Mark committed no sin in writing certain things just as he remembered. For he had only one concern: to leave out nothing of what he had heard nor to include anything false.

Some consider this tradition to be a trustworthy indication of the Petrine basis (and perhaps also Roman origin) for the Gospel. But the picture of Peter traveling with an interpreter for his "courses of instruction" is as questionable as the suggestion that the "recollection of the Apostles" and their followers was the connecting link between Jesus and the written Gospels. Furthermore the statement about the disorder of Mark's Gospel is plainly wrong, and the role of Peter in the Gospel does not suggest the specifically Petrine origin of its material; nor does its character in general indicate that the Gospel was written by someone like Mark. who is mentioned in the New Testament as a personal companion of the Apostles (see MARK, SAINT). Papias' statement springs from a desire to establish the authorship of an

Apostle, or at least of a direct follower, for certain writings used by the church, and is therefore not reliable. This leaves us almost completely in the dark about the author of Mark, and about the place of origin as well. That the *Shepherd* of Hermas (Rome A.D. 100–150) used Mark cannot be substantiated. It is not impossible that Justin knew it. But until Tatian, who composed a harmony of the four Gospels in Syriac (about A.D. 170), and Irenaeus, who values Mark as one of the four canonical Gospels, there is virtually no trace of Mark's being used, except in other Gospels (Matthew, Luke and the apocryphal Gospel of Peter). Later evidence comes from Rome, but this does not imply anything about the place of Mark's origin a century earlier (nor do Mark's Latinisms strengthen the argument for its Roman origin). It is just as reasonable to hold that Mark was written somewhere in the Greek-speaking church in the east (Syria or Asia Minor), where Matthew and Luke found and used it.

MARKET. The word "market" or some similar one derived from the Latin *mercatus* appears in most European languages, and always refers to the place or method of contact between buyer and sellcr. The contact may be relatively simple, direct and personal: as in a market place, meat market, or farmer's roadside market. It may be a highly organized institution such as those for securities, cotton, or grain; or it may be almost an abstraction, such as the "labour market."

Historically the word usually meant a place at which a number of buyers and of sellers met at fairly frequent recurrent fixed times to do business, under certain rules and regulations, in one or at most a few kinds of goods. Meetings at such long intervals as three, six, or twelve months were called fairs; while business conducted by peddlers or in private retail stores or warehouses or by personal orders was not regarded as taking place in the market proper.

In ages when the volume of trade was small and transportation difficult it was good for sellers to know that if they took their wares to a certain spot on an appointed day they would find buyers gathered there. This knowledge centralized supply and demand, saved time and stimulated production for sale. Produce which became available only at certain seasons—wool, grain, cotton, furs, young livestock, etc.—could be disposed of at the end of the productive period in an annual fair. Commodities which were being produced the year round—butter, cheese, eggs, fish, handicraft wares, cloth, etc.—would need to be sold meekly at a market. Further, while a producer of seasonal commodities would not mind a long trip to a remote fair once a year, the seller of goods which were produced continuously needed some nearby market since he could not afford to spend more than one day a week taking his goods to market, selling them, buying what he required, and then returning home.

While fairs were, therefore, located relatively wide apart, markets had to be thickly sprinkled over settled areas. If, however, they became too numerous, the supply of goods or of buyers in each might be inadequate or uncertain, and the owner of the market would suffer a severe decline in the income he received from tolls, stall dues and other charges. During the rapid expansion of the western European economy in the 13th century the supply of markets seems to have outrun the demand to such an extent that strong efforts were made to prevent new ones from being set up wherever they might injure existing ones. Lawyers urged that markets should be at least two leagues (six miles) apart. This figure was probably quite reasonable and acceptable; it was near to the seven-mile radius which even in the early 19th century protected the markets in London from excessive competition; and it emphasized the essentially local character of the business transacted in the market.

Some markets remained general in character, and were chiefly devoted to the exchange of farm produce for urban manufactures. John Ramsay M'Culloch, in his *Dictionary of Commerce and Commercial Navigation* (1835 edition), defined a market as "a public place in a city or town where provisions are sold." Producer and consumer met there face to face. But if an area specialized in some staple product, middlemen would flock there to obtain their supplies for a wider national or foreign market. One classic illustration of this condition was the cloth markets of Yorkshire and other textile areas. To them small producers residing over a radius of not more than five or six miles brought their weekly output of one or tuo pieces of cloth, and sold it to merchants, commission agents or factors. Held at first in a main street or market place for a fixed period of time on the regular market day, they were eventually transferred indoors when large "cloth halls" were built, often sponsored and financed by the merchants who bought the fabrics. Larger producers did not rely on such local outlets, but sent their wares in bulk to the central market at Blackwell hall in London.

Similar developments took place in many continental markets. In Bruges, Belgium, the large open market place had by 1240 become flanked on one side by a *halle* in which cloth was sold on three days each week. By 1300 a second hall (the *Waterhalle*) was built astride a small river so that goods could easily be unloaded, and was open every day. A third hall, the *Cruudhalle* (Spice Hall) appeared, to serve as market centre for Spanish wool, drugs, spices and other goods from the Mediterranean.

Legally a market was the property and source of income of the person on whose land it was held or to whom it had been granted. In feudal society subordinate lay or religious landowners sought from their superiors the right to hold a fair or market; and in modern states the same rule may prevail that the right has to be obtained from the state. The charter which granted the mediaeval franchise gave the owner power to collect tolls on goods sold—or even on all goods displayed, and fees for the use of stalls; it protected his clients from competition by restricting sales in stores on market day; occasionally it conferred the right to operate a mint. In return it explicitly or by implication imposed the obligation to see that the king's peace or the peace of God prevailed, and to preserve law and order in the market's operations. This involved the provision of a market court to deal promptly with disputes concerning sales, disorder, or violations of the regulations touching weights and measures, price, quality, forestalling, etc. A clerk of the market had to be provided to approve all weights and measures, and a steward to preside over the court.

Some markets passed eventually into the hands of the towns in which they were located; but private or corporate persons continued to seek permission to establish markets well into modern times, as for example the grant of Covent Garden market to the Duke of Bedford in 1670.

With the rise of large towns, factory production, and intensified commercial activity in the 19th century the need for public markets increased in some respects and declined in others. Where production of manufactured articles passed into the hands of fewer larger units, private buying and production to fill orders caused the cloth halls and similar markets to shrink in importance and finally disappear. At the same time the maintenance of direct contact betneen large bodies of urban consumers and the rural food producers became well-nigh impossible because of the vast number of the former, the need for obtaining supplies from a wider national or international area, and the call for large storage facilities.

The development of large-scale rapid transportation, bulk handling, refrigeration and local or terminal produce warehouses bridged the physical gap so far as the commodities were concerned; but the commercial transactions involved the expansion of the class of intermediaries, whether purchasers or commission agents, wholesalers or retailers. In addition they led to an increase in the importance of private sales, wholesale markets, or auction sales, in which the consuming public played little or no part as buyer, but relied for its supplies on the storekeeper who bought his goods in the wholesale market, often at an hour when most of his customers were fast asleep.

The history of most expanding European cities reveals the efforts made by civic or private enterprise to expand the accommodation for both wholesale and retail purchases. For instance, Leeds, a Yorkshire cloth centre, more than trebled its population between 1801 and 1851. In 1801 it had a weekly market for grain, cattle and hogs, and a twice-weekly one for cloth and provisions. By 1851 it had added a fortnightly fair for cattle and sheep, and eight periodical leather fairs each year; it had removed the markets for provisions and livestock from the narrow main street, created a large open "free market" area for use by farmers, and set up a meat market with an underground slaughterhouse. Meanwhile groups of investors had erected buildings for a bazaar, a meat and fish market, a central provision market, a corn exchange, leather fairs and a stock exchange.

On the continent private and municipal markets were expanded as populations became more dense. The municipal *Halles Centrales* in Paris eventually covered ten acres in the middle of the city, and the customers were retailers and consumers alike. Yet they could not handle all the needs of the metropolis, and other markets, therefore, had to be created or expanded.

In North America the European type of market developed naturally, rather than as the result of charter grants, to meet similar requirements, and in its most simple form can still be seen in operation in the market squares or halls of some of the older United States and Canadian towns. The expectation of getting fresher or cheaper produce from a farmer still takes customers there in spite of the lavish array of retail stores. Of larger markets to supply retailers as well as consumers, the Fulton fish market in New York city or the Faneuil Hall market in Boston are examples. Rapid urbanization and the rising cost of living after 1900 stimulated interest in efficient and economical marketing and led to considerable activity in providing city markets. Private enterprise, especially by the railroads, began to establish terminal markets at which country produce is unloaded and displayed for sale. But in most of the public markets the customer is rarely the consumer. The spread of suburban stores, the extension of chain stores, the congestion of traffic around public markets, and possibly the American consumer's lack of interest in the possibility of saving a few cents by taking a trip to the big market, have all made that institution a minor part in the system of distribution. ECONOMIC THEORY

In economic theory the term "market" means the general conditions under which buying and selling are conducted.

In the theory of the market several types are distinguished. At one end of the scale is the perfectly competitive market, at the other end is perfect monopoly, and there are many intermediate forms. It may be said that perfect competition and perfect monopoly are limiting cases rarely to he found in practice, and that most actual markets fall into the intermediate forms known as "imperfect competition." A perfectly competitive market is characterized by the following conditions: (1) the number of buyers and sellers in effective contact must be large enough so that the action of any one of them has no appreciable effect on the price. That is to say, the operations of each individual buyer or seller are so small a proportion of the total, that each can buy or sell as much as he wishes at the prevailing price. (2) The commodity involved must be homogeneous in the sense that each buyer does not care from whom he buys, and each seller does not care to whom he sells, as long as the standard commodity is involved in the transaction. In a perfectly competitive market any price differences between different parts of the market will be equal to the costs of transport of the commodity from one part to the other. This conformity of prices is effected through the operation known as arbitrage, *i.e.,* by operators buying in the "cheap" place (which will raise the price there) and selling in the "dear" place (which will lower the price there). The equilibrium price in a competitive market is that which "clears the market," *i.e.,* the price at which the quantity of the commodity offered for sale is equal to the quantity which people are willing to buy. If the price is above this level, more will be offered for sale than buyers can be found to accept, and the fear of being left without a buyer will induce sellers to lower their prices. If the price is below that level, less will be offered for sale than people are willing to buy, and buyers will raise their prices for fear of not finding a seller.

The closest approach to the perfectly competitive market is to be found in the organized commodity and security exchanges, such as the grain and cotton markets, the metals markets and the stock markets. Such markets tend to arise wherever men deal in exchangeables that are homogeneous and simple enough to be bought and sold by description. Such markets are characterized by great flexibility of prices, and also by short-run speculative price movements which may be caused by the temporary emotional states of the marketers rather than by any basic underlying factor. The organized markets in different centres are closely connected by telegraphic communication and by specialized "arbitrageurs" who operate in many centres, so that in peacetime there is a world market for many of the standard raw material commodities and for many securities.

When the commodity is not homogeneous enough to be graded and sold by description, a common form of market is the auction. Wool, livestock, eggs, meat and vegetables are frequently sold in this manner. When the commodities sold by auction are fairly homogeneous, the results of this form of market are not very different from those of perfect competition. The price lies somewhere between the highest price which the most eager buyer and the second most eager buyer will pay.

At the other extreme to perfect competition stands monopoly. A monopolist may be defined as a seller whose product is different from that of any other seller. A seller is in a situation of perfect monopoly if, in addition, the demand for his product does not depend upon the price or sales policy of any other individual seller or small group of sellers. Whereas the seller in a perfectly competitive market can sell as much as he wishes at the prevailing price, a monopolist must either lower his price or increase his selling cost in order to expand sales. The relationship between price, selling costs and sales is sometimes known as the "market" of an individual seller. In perfect competition the seller has a "perfect market," and there are no selling costs! for if the seller can sell as much as he wants at the prevailing price, obviously there is no need for him to advertize. The existence of a sales problem is a sign of monopoly.

Probably most firms operate under some form of "imperfect competition" exhibiting both monopolistic and competitive elements. Three main types may be distinguished. Monopolistic competition is a situation where there is a large cluster of sellers (firms) selling similar but not identical products, and where firms are free to enter the cluster or to withdraw from it. The fact that the products are not identical (*i.e.,* there is "differentiation of the product") means that each firm is to some extent in a position of monopoly in that it has an imperfect market; it can have a price and sales policy, for if it lowers its price it will attract only a finite amount of business from its competitors, and if it raises its price it will not lose all its business to its competitors, the products of different firms not being perfect substitutes. On the other hand the ability of new firms to enter the cluster makes it impossible in the long run for the firms in it to make abnormal (monopoly) profits, for if the firms in the cluster are making abnormally high profits, other firms will be attracted into it, and the competition of the products of the new firms will lower the demand for the product of each of the other firms, and so will lower profits. This process will go on until profits are normal; *i.e.*, are at a level at which on balance no firms are attracted or repelled. It can be shown that the end result of monopolistic competition is that firms operate at a level of output which is below the optimum efficiency.

Virtually the whole retailing industry, and the great part of the manufacture of consumers goods, are carried on under monopolistic competition. Thus, if a single retail store raises its prices without neighbouring stores raising their prices, it will not lose all its business, since it has a certain clientele that will stay by it for reasons of convenience or of personal preference even if its prices are relatively higher. Similarly the manufacturer of a single breakfast food could raise his price without losing all his sales to other breakfast foods, since the different breakfast foods are not perfect substitutes. Nevertheless, these elements of monopoly probably do not enable retailers, or most manufacturers, as a group to enjoy abnormal profits, because if profits are high new firms will be attracted to that locality or to the production of a similar commodity. It is probable also that most retailers, and many manufacturers, could produce more efficiently if their sales were higher; they are prevented from expanding sales, however, by the limited (*i.e.*, monopolistic) nature of their market.

Another form of imperfect competition is called oligopoly, this being a situation where there are few sellers. If the product of each seller is perfectly substitutable for that of any other the situation is known as perfect oligopoly. In such a case any price change by one firm will be immediately followed by a similar price change by the other firms. It can be shown that this condition is likely to result in price leadership by one firm. This is a common phenomenon in industries producing fairly standardized products; *e.g.*, steel, cement, sugar. If there are few sellers in a cluster producing products which are highly but not perfectly substitutable, a situation known as imperfect oligopoly may develop. In this condition a cut in price by one firm will not be imitated immediately by others. Hence, price-cutting, or "cut-throat competition," may arise, and a highly unstable situation ensue. There is, therefore, a strong tendency for firms in oligopoly to come to some agreement on division of markets or on price policy: the "basing point system" found in the steel and cement industries is a case in point, also the market-sharing arrangements of cartels. The possible varieties of oligopoly are many, as many different plausible assumptions about the behaviour of firms under these circumstances may be made.

The market forms which have been described above also apply to buying markets: thus we may have monopsony (a single buyer), oligopsony (few buyers), in various forms! and so on. Various forms of selling markets may be combined with various forms of buying markets in almost infinite variety. A very important market situation is bilateral monopoly, in which a single buyer faces a single seller. All cases of collective bargaining (*e.g.*, between labour unions and employers associations, or between milk producers and milk distributors) fall into this category. The price (or wage) then depends, within certain limits, on the relative bargaining power of the two parties. The "strike" (a temporary failure to effect a bargain) is a characteristic feature of bilateral monopoly. It should be noted that the above classifications are rough divisions only, and that in practice one market form shades imperceptibly into another.

Triffin, *Monopolistic Competition and General Equilibrium Theory* (Cambridge, Mass., London, 1940); K. E. Boulding, *Economic Analysis*, ch. 30 (Ken- York, 1955). (K. E. B.)

MARKET GARDENING: see HORTICULTURE.

MARKET HARBOROUGH, a manufacturing and market town and urban district in the Harborough parliamentary division of Leicestershire, Eng., on the Welland river, 15 mi. S.E. of Leicester by road. Pop. (1951) 10,400. Area 7.5 sq.mi. The church of St. Dionysius (*c.* 1250), has one of the finest broach spires. The grammar school, founded in 1614, occupies modern buildings, but the original half-timbered building, raised upon pillars of wood, remains. Industries include rubber, textile goods, corsets, light engineering, patent foods, accumulators and shoe heels. As the market town for a large agricultural area, the cattle and general markets have been held without break on Tuesdays since about 1200. It is also an important fox-hunting centre. Dingley hall ($2\frac{1}{2}$ mi. E.) is Elizabethan and later and has a fine gatehouse.

MARKET INDEX, a term used, in marketing and economics, with two possible meanings. In one sense, it refers to an indicator of business activity in one or more industries. The Dow-Jones daily average of the prices of 30 selected industrial stocks became perhaps the leading example of a market index of stock-market activity. Similarly, the Federal Reserve index of industrial production can be interpreted as a market index of activity in U.S. mines and factories. Electric power output, regional income analysts, expenditures on new construction and life insurance sales are further examples of market indexes in this sense.

In its second and more restricted sense, a market index measures the actual or potential capacity of the population, or a segment thereof, to buy an article or service offered for sale. Some market indexes limit the scope of the term in this sense to the allocation of sales among territories, in which case the market index becomes a series of percentages, each estimating the proportion of total sales that should be made in a particular region. Others, however, extend the term to cover forecasting of total sales, thereby using it more or less synonymously with "sales forecast" and "sales potential."

In some cases, a single indicator, such as retail sales, or a general index, such as the Sales *Management* estimates of effective buying income, is considered sufficiently representative of product sales to be used as the "specific" market index for the product. More often than not, however, the specific market index is derived as a composite of the main factors believed to affect sales of the product. These may include variables measuring national business conditions, as well as those of industry, and even company, factors.

There are at least two main methods of approach for deriving the index in such a case. One method involves modifying actual sales figures on the basis of a rule-of-thumb judgment (sometimes supplemented by field surveys) as to the effect and relative importance of other relevant factors (population, prices, sales of competing products, etc.) and deriving forecasts by extrapolation. The other method seeks to derive an equation reflecting the numerical effect of each of the main relevant variables on product sales. Thus, the sales of Company Y's gas refrigerators in a given year may be found to depend on national income in that year, availability of natural gas, number of families, number of sales-... representing the company and the company's advertising expenditure. With the aid of statistical (correlation) analysis, an equation can be set up reflecting the extent to which these variables affect sales. Sales estimates or regional sales allocations for a future period are then obtained by making assumptions as to the probable values of these variables in that period and substituting these values in the equation.

Whatever the method used, the result provides an index of the possible (or potential) market for the product and thereby aids the firm in evaluating past operations and in planning future operations. It enables sales quotas to be set by territories and/or predictions to be made of the effect on sales of such changes as a 10% increase in advertising expenditure or of a given percentage rise in population.

A market index is usually reliable only as a measure of past performance, and often possesses major limitations even in this sense. Experience showed that market indexes are more accurate in estimating territorial distribution of sales than in forecasting their total amount. Their use as a forecasting tool is invariably predicated on the implicit extrapolation of past relationships into the future. Faulty judgment regarding the future course of the variables incorporated in the market index is another serious source of error in forecasting Over-all market forecasts tend to be most accurate when product sales continue in the same direction as in the recent past, but are likely to err considerably when business activity changes direction.

BIBLIOGRAPHY —Richard D Crisp, *How to Reduce Distribution Costs* (1948) ; H H Maynard and H C Nolen, *Sales Management*, rev ed. (1950), D M Phelps *Sales Management Policies and Procedures* (1951) ; D. J Luck and H G Wales, *Marketing Research* (1952) (Ro F)

MARKETING. Marketing consists of those activities which effect transfers in the ownership of goods and services and provide for their physical distribution. In the broadest sense, marketing covers not only dealings in merchandise, but in a wide variety of services and in such intangibles as insurance, stocks and bonds. Normally, however, the term marketing is limited to tangible commodities other than real estate.

As commonly used in business terminology, distribution is broadly synonymous with marketing; however, it is sometimes used in a more restricted sense to describe the buying and selling functions of marketing and the institutions and methods which implement them.

Although the term merchandising is almost always used to describe only certain activities or phases of marketing, there is no universal acceptance of just what these activities are. The committee on definitions of the American Marketing association defined merchandising as "the planning involved in marketing the right merchandise or service at the right place, at the right time, in the right quantities and at the right price." Merchandising is also used synonymously with sales promotion, which has been defined broadly as "the coordination of publicity (including advertising) and personal salesmanship"

The Marketing Process and Functions. — The ultimate objective of all marketing activities is to place goods in the hands of consumers. The machinery for doing this is built around three major processes — the concentration, dispersion and equalization of goods. The methods of concentration and dispersion vary greatly from product to product. For example, some farm products are concentrated in large markets and then dispersed without processing toward the household consumer. Other farm products are concentrated as raw materials, then are processed and dispersed as manufactured products. In the marketing of most manufactured goods, concentration is of minor importance, but dispersion assumes large importance.

Production and consumption are often seasonal, demand may change frequently and neither the amounts nor the quality of goods as they come from individual producers may meet the needs of those who wish to use them. Thus there arises the need for a third process. equalization, consisting broadly of all the activities by which the supply of goods ready for sale is adjusted to the demand.

In the marketing processes of concentration, dispersion and equalization certain specific functions must be performed Although there is no unanimity among marketing authorities as to how many or which services should be designated marketing functions, the folloning classification has wide acceptance: the functions of exchange (buying, selling) ; the functions of physical supply (transportation, storage) ; the facilitating and managerial functions (standardization and grading, financing, risk taking, and collection, interpretation and dissemination of market information).

This classification emphasizes the major aspects of getting goods from producers to consumers; *i.e.*, the transfer of ownership of goods. the physical distribution of goods and management of these activities. The transfer of ownership involves the complementary functions of selling and buying. Physical distribution is accomplished through the transportation service of moving goods to the place of consumption and the storage function of holding products from the time of their production until the time of their purchase. The facilitating functions are the activities or services which must be performed to aid in effecting transfers in ownership of goods and in providing for their physical distribution. Management plans and organizes the marketing activities.

UNITED STATES

Farm Products. — Although some farm products are sold by the farmer directly to ultimate household consumers or to manufacturers or processing plants, indirect marketing methods predominate. The marketing problems of farmers are complicated by the following factors: small-scale and scattered production; a concentrated market at great distance from the producing areas; seasonal production with the resultant peak load on marketing facilities; variations in quantity and quality grown from year to year because of changing weather conditions; bulkiness and perishability; lack of marketing knowledge and need of immediate funds on the part of many farmers. Because of these and other difficulties, the services of middlemen are required.

The first step in the concentration of products from a number of farmers is carried out in local markets. These markets, close to the areas of production. provide a convenient place at which the grower can sell his product; they also facilitate the collection of products from the surrounding growers in sufficient quantities for economical shipment. Although some sales are made in these markets by the farmer directly to the household consumer or to local processing plants, a far greater number is made to local middlemen who have established business relations with middlemen and manufacturers in outside markets to whom they ship the products assembled in small lots from individual farmers.

From the local markets or directly from the larger growers, farm products are frequently concentrated into a small number of large central wholesale markets. These large markets serve as a source of supply for the raw materials used in the food factories of the central market's metropolitan area; some products are also sold to jobbers and retailers for local consumption. However. a large proportion of the products concentrated in central markets is reshipped to other cities for sale to mills or factories, or for sale without further processing through jobbers and retailers to reach the ultimate consumer.

Co-operative Marketing of Farm Products. — Although there were some earlier attempts by farmers to market collectively. the development of co-operative marketing is commonly dated from about 1865. The first period of marked growth in co-operative marketing associations came during the 1870s, and especially during the depression years of 1873–77. The Grange (Patrons of Husbandry) movement of this period was one of the important factors that gave impetus to the growth.

Beginning in the period 1895–1900, the number of co-operative associations began to increase at a rapid rate, and the movement continued to grow until the early 1920s. After 1900 independent local associations federated into state, district and national organizations and central-market selling activities developed. After the early 1920s changes in the co-operative marketing movement were much less marked than in the earlier period. There was a decline in the number of associations but an increase in the average membership and volume of products handled per association.

By the 1950s there were more than 10,000 co-operative marketing and purchasing associations with a total estimated membership of 6,000,000 and a volume of business of about $9,000,000,000. Of these associations, approximately two-thirds were engaged primarily in the marketing of farm products. The other farmers' co-operative groups were primarily engaged in purchasing farm supplies.

Consumers' Goods.—The most common methods of marketing consumers' goods are: (1) manufacturer to retailer to consumer; (2) manufacturer to wholesale merchant (who takes title to the goods) to retailer to consumer; (3) manufacturer to an agent middleman (who does not take title) to wholesale merchant to retailer to consumer; and (4) manufacturer to consumer.

The bulk of consumers' goods is purchased from retailers. The manufacturer may elect to sell directly to the retailer. Automobiles, major appliances, furniture, women's apparel, men's clothing, shoes and hats are familiar examples of products sold in this manner. On the other hand, many manufacturers reach the retailer through selling to wholesalers, commonly called jobbers. This manufacturer-wholesaler-retailer-consumer channel of distribution is often called the orthodox, or regular, method for marketing such staples as groceries, hardware, drugs and dry goods to small and medium-size retailers. Larger retail organizations. such as chain stores, mail-order sellers and department stores tend to buy directly from manufacturers, in some cases operating their own warehouse in which they perform wholesale tasks.

Another method of marketing consumers' goods includes an agent middleman who represents the manufacturer. This middleman does not own the product but sells it on a commission basis for the manufacturer; he may sell either to a wholesaler or the retailer. Most commonly he operates between the manufacturer and wholesaler, and the channel of distribution then becomes manufacturer-agent-middleman-wholesaler-retailer-consumer. Many textile and some grocery and hardware products are sold in this way.

The three general means by which a manufacturer may sell directly to the consumer are by mail, through the use of house-to-house salesmen and through his own retail stores. Well-known examples of direct sale by the manufacturer are house-to-house selling of brushes, electric sweepers and hosiery; and the sale of candy, shoes and clothing through manufacturers' stores. Direct sale, however, accounts for only a small share of the total volume of consumers' goods.

Manufacturers often use a combination of marketing methods. For example, they may decide to sell directly to retailers in larger cities, but may consider it wise to use wholesalers to distribute to retailers in smaller cities. A variety of channels may also be used to reach different trades, for example, direct sales to certain types of retailers such as electrical appliance dealers and sale through hardware wholesalers to obtain distribution through hardware stores. Some manufacturers may use agent middlemen for some products and wholesalers for other products while still other products are sold directly to retailers. These various combinations of marketing methods illustrate the alternatives available because of the variety of middlemen operating in the market.

Manufacturers also have various alternatives presented because of the division of tasks they may develop between themselves and middlemen. Thus a manufacturer may undertake a portion of the sales task by using his own salesmen to supplement the sales activities of wholesalers. Or he may establish regional stocks and thereby assume a portion of the warehousing task. The most common way for the manufacturer to supplement the sales activities of middlemen, however, remains direct advertising to consumers.

Industrial Goods.—The three common methods of marketing manufactured products to industrial or business users are: (1) direct sale to the users by the manufacturer's sales headquarters or by his own sales branch; (2) through agent middlemen (who do not take title to the goods), such as manufacturers' agents and brokers, to the users; and (3) through merchant wholesalers (who take title to the goods), commonly known as industrial distributors, to the users.

Although the extent of use of these three methods varies with the product and the nature of the market, most manufactured industrial goods are sold directly from manufacturer to user. The relatively great importance of direct marketing of industrial goods as contrasted with that of consumers' goods, is largely because there are limited numbers of buyers, who are often highly concentrated geographically or organizationally, and who make large individual purchases. Technical considerations are also important; buying on a specifications, or made-to-order, basis often makes close and constant contacts necessary.

Many manufacturers, however, use agent middlemen in marketing industrial products; these manufacturers are generally smaller ones who are financially unable to sell directly to the consumer, and ones who are attempting to reach relatively widely scattered markets. The major services of these agent middlemen centre in the selling, including the locating of buyers, negotiation of sales and the furnishing of marketing information.

The third main channel of distribution for manufactured industrial goods is from manufacturer to industrial distributor to user. Broadly, industrial distributors include all wholesale merchants in the industrial-goods field, such as mill-supply firms which sell a wide line of equipment and supplies to many different types of industrial buyers, and those firms which specialize in a particular line (*e.g.*, steel jobbers) or which specialize according to industry (*e.g.*, oil well-supply firms and barber-supply houses). The common characteristic of this group of middlemen is that goods are purchased outright from manufacturers, to be stored until purchased by industrial-user customers.

Manufacturers of industrial goods, perhaps more than manufacturers of consumers' goods, often use both direct and indirect methods of marketing. They may sell directly in areas where customers are highly concentrated and use agent middlemen and industrial distributors to sell prospects in other areas. They may sell directly to large-volume buyers when such action seems desirable from the point of view both of cost and of their customers' preferences, leaving smaller buyers to be supplied by middlemen.

Wholesaling Institutions.—In the marketing channels or methods previously described, all sales made to those who buy for resale or for industrial or business use are broadly called wholesaling transactions, as contrasted with retailing transactions which include all sales to ultimate, or household, consumers. The census data on wholesale trade, however, are gathered on an establishment basis and thus include only those places of business that are primarily engaged in wholesaling. Consequently, wholesaling transactions of a producer are included as a part of the wholesale trade totals only if carried on in a separate establishment devoted to wholesaling, such as a manufacturer's sales branch.

The 1954 *Census* of *Business* reported that there were 252,000 wholesale establishments in the U.S., with a sales volume of about $235,000,000,000. In 1948, the last previous census reported 216,000 wholesale establishments, with a sales volume of about $180,000,000,000. Thus from 1948 to 1954 the number of wholesalers increased almost 17% and the sales volume more than 31%. As measured both by number of establishments and sales, merchant wholesalers were the most important; in 1954 they numbered about 165,000 and accounted for 43% of total wholesale trade in the U.S. All of these wholesalers are alike in that they buy and sell on their own account; but, on a basis of services or functions performed, they are classed as service wholesalers or limited-function wholesalers. The service wholesalers usually carry relatively complete stocks, use salesmen to call on customers, extend credit, make delivery and perform other services. The limited-function wholesalers do not perform all the usual functions of the service wholesaler, as, for example, a cash-and-carry wholesaler.

Manufacturers' sales branches and sales offices, owned and operated by manufacturers apart from their plants, accounted for the second largest share of wholesale trade in 1954. Their share of total trade in that year—30% compared with 28% in 1948, 25.9% in 1939 and 24.2% in 1929—indicated the trend on the part of many manufacturers toward more direct marketing.

Petroleum bulk plants and terminals are classified separately by the U.S department of commerce because of their special storage and distributing facilities (on railroad or other transportation lines) for gasoline, oil and other bulk petroleum products. In 1954 they accounted for almost 7% of the total volume of wholesale trade.

Agents and brokers negotiate sales or purchases or both but usually do not take title to the merchandise. They may represent either buyers or sellers and they are paid on a fee or commission basis. This group, including such types of operation as auction companies, merchandise brokers, commission merchants, export and import agents, manufacturers' agents and selling agents, accounted for about 17% of wholesale trade in 1954.

The assemblers type of wholesale establishment consists of wholesalers primarily engaged in assembling farm products and sea foods at local producing points and in the cities of producing regions. They are engaged primarily in the concentration phase of marketing, while most other wholesalers are engaged mainly in the dispersion phase.

Status of the Service *Wholesaler*.—Although the disappearance of the service wholesaler had been predicted for a number of years, he continued in the mid-1950s to be an important factor in distribution. He faced increasingly difficult competition, however, in the form of: (1) increasing attempts by manufacturers to assume the wholesaler's functions and to distribute directly to the retailer; (2) the increase in co-operative buying groups formed by retailers; (3) the growth of limited-function wholesalers; and (4) the use by manufacturers of agent middlemen in place of the service wholesaler. The tendency of manufacturers to sell more of their output through their own wholesale branches or branch offices and directly to retailers arose because of: (1) dissatisfaction with the use of the service wholesaler as a marketing method; (2) the development of marketing facilities, such as public warehouses and central-market display marts. which make direct sale more convenient for the manufacturer; and (3) factors in the retailing field favourable to direct purchase from the manufacturer, such as the growth of large retail organizations.

Because of these changed competitive conditions, the service wholesaler's share of the total volume moving from manufacturer to consumer decreased. How far this trend would continue depended upon the wholesaler's ability to adapt his organization and methods to new conditions and new competitors. There was increasing evidence in the mid-1950s that the service wholesaler was adapting to these changed conditions through such efforts as the following: (1) improvement of his own internal efficiency; (2) development and active merchandising of his own private brand; (3) development of aids for the small retailer; (4) formation of voluntary chains of retailers: (5) formation or purchase of retail chain stores; and (6) development of a cash-and-carry or other limited-function department to compete with the limited-function wholesaler.

Retailing Institutions.—The 1954 Census of Business reported 1,721,650 retail establishments in the U.S. with total sales of almost $170,000,000,000. In 1948 the *Census* reported 1,668,-479 retail establishments. with total sales of almost $129,000,000,-000. Thus from 1945 to 1954 the number of retailers increased but 3% while the sales volume increased 32%—the percentage increase in retail sales and wholesale sales being almost identical. From 1939 to 1954 there was little change in the number of retail establishments but sales volume quadrupled: taking into account price rises the physical volume almost doubled.

Types *of* Retailers.—Retail establishments may be classified on many ditierent bases, depending upon the purpose of the classification. On the basis of kind and variety of merchandise handled, there are general stores. general-merchandise stores and single-line or limited-line stores. General stores carry a limited assortment in a wide variety of products including groceries and dry goods, are not generally departmentized and are usually located in rural communities. General-merchandise stores also handle a variety of lines but usually in much wider assortment and. in some types (*e.g.*, department stores and limited-price variety stores) are highly departmentized. A single-line store, such as a food, hardware or clothing store, tends to specialize in handling some one line or general type of merchandise.

A second common method of classifying stores is by type of operation—independents, chain stores or other types; *e.g.*, mail-order houses. house-to-house establishments, commissary or company stores, consumer co-operative stores and establishments selling through coin-operated vending machines. Independent retail stores in the mid-1950s comprised approximately 90% of the total number of stores and accounted for about 70% of total sales. Chain stores accounted for about a fourth of total retail sales.

Among the other types at mid-century. mail-order selling was well known largely because of the large mail-order sales volume of Sears, Roebuck and Co. and Montgomery Ward & Co.. Inc. (although their sales through their chains of retail stores made up more than half their total volume). However. mail-order retail establishments accounted for only a small share of total retail sales.

House-to-house selling accounted for a very small share of total retail trade. Automatic vending also was relatively unimportant in terms of its share of total retail sales, but its use was growing rapidly. In addition to the adaptation of automatic vending to a constantly wider variety of products, there was experimentation with stores restricted to the use of vending machines. Shortage of labour. increasing labour costs and the need to cut selling expense in retailing were factors that worked toward the expansion of automatic vending, just as they had stimulated the strong trend toward self-service in retail stores.

Consumer Co-operative Stores.—Another type of retail operation is the consumer co-operative store, which is owned and managed by a group of ultimate consumers not to make profits from the enterprise as such, but primarily to obtain lower prices for the members in their purchases.

Although experiments in consumer co-operation date back to the second half of the 18th century, the modern consumers' co-operative movement was begun in England in 1534. (See CO-OPERATIVES.)

In the U.S. it was a weak, minor movement, with little indication of becoming a dominant factor in marketing. The definite increase in consumers' co-operation after the middle 1920s was mostly in purchasing co-operatives to provide farmers with supplies (industrial-goods purchases rather than ultimate consumers' purchases!. Even if the sales of farmers' purchasing groups were combined with those of consumer co-operative stores, the total volume probably represented less than 1% of total U.S. retail sales by the mid-1950s.

Among the reasons advanced to explain the failure of consumers' co-operative stores to progress more rapidly in the U.S. are the following: (1) absence of social solidarity on the part of large groups: (2) a more mobile population; and (3) the widespread development of large-scale retailing institutions, particularly the chain store, which made it possible for the U.S. consumer to obtain considerable price reductions matching or exceeding the savings that might be obtained through belonging to a consumers' co-operative.

Small-Scale Retailing.—Although "mass" type retailers were increasing their proportion of total retail trade in the mid-1950s, the most common type of retail enterprise was still the small independently owned store. In many lines that type of store still accounted for the largest share of total volume. The most common type of small-scale retailing is the single-line independent store, but many stores handling a general merchandise line are small-volume stores independently owned and operated.

Among the advantages of the small independent retailer are his freedom of action or flexibility of management, incentive of ownership, close relationship with his employees, often a personal relationship with his customers and a resulting friendly atmosphere, and often relatively low operating expenses. Among his disadvantages are limited buying power (which many have attempted to solve by joining co-operative chains), limited trading area and. frequently, poor management.

As each type of large-scale retailing developed—the department store, the mail-order house. the chain store and the supermarket —the ruin of the independent merchant mas predicted. However, although the small independent retailer had declined in relative importance, in the mid-1950s he was still the predominant type of retailer.

Large-Scale Retailing.—The rise of the department store (*q.v.*) began after the Civil War, but the period of most rapid growth was from about 1900 to 1920. Although department stores made up only a fraction of 1% of the total stores in the U.S. in the mid-1950s, they accounted for more than 6% of retail sales volume.

The mail-order house gained a prominent place in large-scale retailing during 1900–15. Mail-order volume declined in relative importance during the depression years following 1930, but later regained its former position in the system of retail distribution. Mail-order houses did 1% of retail volume in 1954. Starting in the last half of the 1920s, Sears. Roebuck and Co. and Montgomery Ward & Co., Inc., the two giants of the mail-order field, started establishing chains of stores, and by mid-century the volume from these stores exceeded mail-order sales. (See MAIL-ORDER BUSINESS.)

The origin of the modern chain-store system is commonly dated from 1858, in which year the first unit of what was to become the Great Atlantic & Pacific Tea company was established. Many other chains were established before 1900 and had shown a fair rate of growth by that time. The volume of business increased more rapidly from 1900 to 1920 and tremendously from 1920 to 1930. From 1929 to the mid-1950s the proportion of total retail sales made by chains varied between 20% and 25%. The proportion varied widely for different kinds of business. as, for example, from more than 85% in limited-price variety stores to less than 5% in hardware stores and for motor-vehicle dealers.

After 1929 the number of chain-store units decreased while the number of independent stores increased substantially. At the same time the chains maintained or increased their proportion of retail sales, The reason was that many chains had strengthened and consolidated their positions by weeding out the poorer stores and replacing many smaller stores with a few larger ones. (See CHAIN STORE.)

The independent retailer in his competition with the chains learned to make use of various chain-store techniques, such as development of contract, or co-operative, chains. These are groups of independent retailers acting co-operatively, either by themselves or with a wholesaler, to obtain advantages in buying, advertising or other retailing activities. Although the earliest known organization of this type, the New York Consolidated Drug company, was organized in 1887, the movement developed slowly until the 1920s, when the rapid growth of regular corporate chains greatly affected the position of the independent retailer and gave a great impetus to the growth of co-operative. or contract, chains. Their growth was remarkable after 1925, particularly among grocery retailers and also among retailers of drugs, variety goods, dry goods and hardware. In general these groups improved the merchandising methods of the independent merchant and enabled him to meet competition more effectively.

A newer type of large-scale retailing was the supermarket, which developed rapidly and attracted wide attention during the depression years of the early 1930s. There is great variation in size, appearance and location of the stores called supermarkets, but, in general, they are large departmentized retail stores dealing in a wide line of food products (and sometimes other lines of products) on a self-service or highly limited service basis. Other common characteristics are emphasis upon the sale of goods at low prices and mass displays of merchandise which are readily accessible for the buyer's inspection. Most of the earlier supermarkets were owned by independent retailers, but by the mid-1950s chain store supermarkets were doing a much larger share of the sales volume.

The supermarket had a profound impact upon food retailing, particularly because of its great expansion of the self-service idea and its relatively low operating costs. The movement of population to suburban areas, the increase in the number of automobiles and their wide use in shopping, and higher labour costs all contributed to the growth of the supermarket. This type of large-scale retailing increased its proportion of total retail trade both as a result of the establishment of new supermarkets and as a result of old stores increasing their sales by adding many additional lines of products (many were nonfood). Also, certain features of supermarket operation, particularly self-service, spread to other retail fields. (See RETAILING.)

The discount house became more important as a type of retail establishment in the 1950s. By offering well known goods at discounts from prices customary at conventional retailers, discount houses were able to attract patronage despite inconvenient locations and the elimination of some services. They had special impact on the market for electrical appliances, radio and television sets, furniture and house furnishings, jewellery and other higher value lines. A market opportunity for discount selling in these lines arose because consumers had confidence in the quality of the products and the reputation of the manufacturers and because conventional retailers continued to charge margins higher than current market conditions required. The growth of such retailers was seen as forecasting a new type of retail outlet, or forcing changes in the margins and methods of selling some commodities.

Governmental Relationships to Marketing.—Governmental activities that bear directly on marketing can be conveniently divided into two broad classes: (1) those designed to preserve the competitive system and to improve its efficiency; and (2) those designed to restrict the competitive system; *i.e.*, to substitute some degree of central governmental direction in place of complete reliance on a competitive system. Although all governmental activities and regulations do not fall clearly or neatly into one or the other of these two groups, it is a useful grouping for the purposes of understanding the basic policy back of regulatory activities, particularly of the federal government.

Governmental Activities to Maintain Competition.—Prior to 1929 the regulatory activities of government were based on a belief in competition as a regulating force in U.S. economy. Thus, the desire to maintain competition among businessmen and make the competitive system work effectively was a basic consideration in legislative policy and governmental activities as they related to marketing. These various efforts to maintain an effective competitive system may be grouped into three classes: (1) those designed to restrict monopoly and monopolistic tendencies; (2) those designed to limit unfair competitive practices and control the plane of competition; and (3) those designed to promote efficiency in marketing. Again, these classifications are not mutually exclusive. The first is well illustrated in both federal and state antitrust acts, particularly the Sherman Anti-Trust act of 1890. Although it was desirable to maintain competition, it became apparent that competition itself might lead to unfortunate results unless competition was on a proper plane. Thus, the later Clayton Anti-Trust act (1914) and more particularly the Federal Trade Commission act (1914), through emphasis upon unfair methods of competition, represented to a considerable extent legislation designed to control the plane of competition. Other examples of governmental efforts to control monopoly and monopolistic tendencies were the Interstate Commerce Commission act (1887) and state acts regulating public utilities. On the other hand, such efforts as pure food, drug and cosmetic acts, control of weights and measures, restriction of unfair trade practices and the investigation of business practices by legislative and administrative bodies were primarily attempts to control the plane of competition.

The third broad group of government efforts to make competitive economy work better are all those activities designed to aid business and promote efficiency in marketing. The establishment and enforcement of such standards as weights and measures, standard bills of lading and commodity standards may be considered as falling at least partially into this group. Other examples are the research and statistical work of the bureau of the census, the bureau of foreign and domestic commerce, the bureau of agricultural economics and many other governmental agencies.

Governmental *Efforts* Restricting Competition.—In the 1930s the activities of the federal government with respect to marketing indicated a decided turning away from reliance upon competition as the regulating force in U.S. economy. Many regulations and activities were primarily attempts to establish some degree of central governmental direction rather than rely entirely on the price mechanism of a competitive economy. Examples were the various legislative acts and related activities to control agricultural marketing.

State legislation permitting resale price maintenance contracts (Fair Trade laws) and prohibiting sales below cost (Unfair Practice acts) illustrate laws intended to limit price competition or to protect competitors. Federal legislation was also enacted to facilitate the use of resale price maintenance contracts. Although the Robinson-Patman amendment to the Clayton act ostensibly controls the plane of competition by prohibiting discriminatory pricing its effect appears to be in the direction of restricting competition.

There was a marked expansion during World War II in governmental efforts to establish central direction of marketing activities in such ways as allocation of materials, rationing of many commodities and price control. Although most of these efforts were discontinued after the war, the so-called garrison-state economy of the mid-1950s with its heavy demands on materials and manpower and its problem of serious inflation again added to the growth of efforts to substitute central governmental direction for much of the working of the competitive system.

Marketing Costs and Efficiency.—Although costs vary widely for different products, and for the same product at different times, evidence for specific commodities lends support to estimates that marketing costs on the average make up more than half of the price paid by the consumer.

The costs of marketing different products vary because of differences in the conditions which affect the cost of performing the marketing functions. Among the more important of these conditions are: (1) degree of perishability, physical or commercial; (2) seasonality of supply and demand; (3) extent and kind of selling effort; (4) relation between bulk and value, which affects particularly the cost of performing the physical distribution functions of transportation and storage; (5) size of the unit sale; (6) degree of standardization; (7) extent of need for mechanical servicing; and (8) need of retailing operations. For example, most farm products sold as raw materials to factories are less perishable than farm products used as consumers' goods with little or no change in form. In addition, they are often handled in carloads from local shipping points to the factory; and they do not go through the retailing operations which constitute the most expensive phase of marketing. Largely as a result of these differences, the cost of marketing farm raw materials to the factory is much lower than the cost of marketing farm products as consumers' goods. Those raw materials that are processed into manufactured consumers' goods, however, are then sold to ultimate consumers through wholesale and retail channels. Thus, the total cost of marketing them from farm to factory to consumer may be fully as great as the 50% or more of the consumer's dollar normally going for marketing costs in the case of nonprocessed farm products.

The cost of marketing manufactured products is likewise high, with estimates for different products ranging roughly from one-third to two-thirds of the price paid by the consumer.

During the first half of the 20th century a growing proportion of U.S. labour supply was involved in performing marketing functions and, as pointed out, the total cost of these services and other marketing costs accounted for more than half the price the consumer paid for goods. As a result, marketing costs frequently were condemned as too high and the entire marketing system rated as inefficient.

Undoubtedly there were many marketing inefficiencies which added to the cost of getting goods to the consumer; but most of the high cost of marketing was the result of the necessity of performing expensive services or functions. The increase in costs was largely caused by fundamental changes in the economic organization which placed an increasingly heavy burden on the marketing structure. Among these changes were the transfer of many production operations from the home to the factory; development of specialized production both on an individual or company basis and by areas; growth of cities; the increasing variety of new products and the need for selling them; more frequent buying; the trend toward smaller packaging; the increased importance of fashion in many fields; and consumers' demand for more services.

The division of the consumer's dollar between production and marketing costs is a reflection, in general, of the character of the economy and, in particular, of the production and marketing conditions of any specific commodity. The important question is not "What share of the consumer's dollar goes for marketing costs?" but rather "What combination of production and marketing costs will result in the consumer's receiving the most goods and services for his dollar?"

GREAT BRITAIN AND OTHER COUNTRIES

In the modern age, there are many forms of marketing. The simplest is a direct sale from producer to consumer, such as the sale of eggs and produce by a smallholder to his neighbours. More complicated forms demand the intervention between producer and consumer of one or more wholesalers, or retailers, or a combination of both. When trade between different countries is concerned, there are the problems of export, transport and import to be interposed in the marketing chain; and the place of interposition largely depends on the product to be sold.

Allied to any marketing process is the advertising of it: the smallholder may put up a notice on his gate advertising his products, the large manufacturer or retailer may spend considerable sums in advertising by every means at his command.

In export marketing European countries took the lead. In the middle ages these countries were—and still are—far from self-sufficient in raw materials and they freely traded with each other and with the Asian and African continents as means of communication with these territories developed. When the Industrial Revolution came to Britain there was a clamour for its industrial products and, in return, the United Kingdom took increasing quantities of produce in payment from its overseas customers. Some of this produce was sold to other countries and thus the commodity markets developed in London, which soon acquired an unrivalled knowledge of commodities and of international exchange operations. Specialist commodity markets also developed in provincial centres such as the cotton exchanges in Liverpool and Manchester and the wool exchange in Bradford. Parallel markets developed in Amsterdam and other European centres and by degrees the primary exporting countries also developed their own markets such as the wool auctions in Sydney, the cotton market in Alexandria, the tea auctions in Ceylon and the grain and livestock markets in Chicago. Once consumer goods have arrived in the country of their consumption, marketing usually conforms to the following pattern: (1) the wholesaler or industrial consumer buys, often at auction, from the importer; (2) the wholesaler sells either to regional wholesalers, to smaller manufacturers, to large retailers or to chain stores; (3) the regional wholesaler sells to the smaller retailers; (4) the retailer sells to the consumer. Goods such as wool, fish, fruit, meat, tea, pepper, spices are marketed in this manner.

Futures.—In many commodities used for industrial purposes and particularly in cotton, cocoa, coffee, hides, grain, rubber and metals there is an extensive business in what is known as "futures." A speculator, or importer in the manufacturing country, will undertake to sell to a manufacturer, or other speculator, a given quantity of merchandise for delivery in, say, three months time at a certain price. When making the contract the seller may not have already bought, or contracted for, any of the particular commodity but from his specialized knowledge of the market he feels confident that he will be able to buy before the specified date at a price which mill give him a profit on the transaction. This confidence is not always justified and sometimes the merchandise has to be bought at a loss at the last possible moment to enable the contract to be fulfilled. A futures market enables manufacturers to proceed with their manufacturing free from day-to-day worries about fluctuating raw material prices. They have also no worries about storing considerable stocks and the consequent tie-up of capital as they can stagger their "futures" purchases for delivery as required.

Retailing.—It is alleged that Napoleon once called Britain a nation of shopkeepers and a study of the 1951 census of distribution, details of which were published by the board of trade in 1953–54, strongly supports this description. The census disclosed that in 1950, when the population of Great Britain was a little more than 49,000,000, there were nearly 685,000 retail and service trades establishments. Of these about 530,000 were retail establishments divided as follows (round figures): grocery, food, tobacco, news agents 320,000; clothing 90,000; hardware 30,000; chemists and photographers 17,000; furniture 16,000; jewellery, leather, sports, toys 14,000; others 43,000. In 1950 the total sales of these establishments amounted to about £5,000,000,000 and this figure had grown to about £7,500,000,000 by 1955. Food accounted for about half the sales. From the monthly index figures published by the board of trade it was calculated that independent shops handled about 60% of all sales, the multiples (defined as an organization with ten or more branches) 22%, the co-operatives 13% and the department stores 5%.

Export Marketing. — When World War II ended in 1945, the United Kingdom found itself almost denuded of realizable overseas resources and investments. The industrial mechanism was geared to wartime production, and to effect a rehabilitation of its mode and standard of living, a great increase in the prewar volume of United Kingdom export trade was necessary. The government assisted by increasing commercial diplomatic representation abroad, by giving improved services through the board of trade and by developing the facilities of the Export Credits Guarantee department. In 1953 the volume of U.K. exports was estimated to be about 70% higher than in 1938 and the increase continued.

In export marketing, different methods are employed according to the nature of the product and the size of the firm producing it. For the large firm it is usual to have overseas branches directed by personnel from the parent company. Many of these branches carry local stocks. Where the volume of business (actual or potential) is insufficient to justify a wholly owned branch, the firm will generally operate through a local merchanting house to whom the manufacturer may send one of his own specialists to co-operate in the marketing of the company's products. For the smaller firm the normal procedure is to appoint a local selling agent in the different centres of interest, usually on a commission basis, and the agent books orders for direct delivery from the U.K. exporter to the buyer, who may be either an industrialist, a wholesaler or a retailer. Most enterprising export firms have travelling representatives who visit such overseas agents at regular intervals. It is an advantage when a principal of the exporting firm can visit his overseas agents and customers. Thus he can better understand any adaptations which are required for his products to satisfy conditions different from his own. He can better decide the need for a more extensive advertising campaign and possibly for a change to a more enterprising agent.

In most leading importing centres some of the larger import houses prefer to have their own buying organization in the manufacturing countries. By this means they can always keep in touch with new developments or products suitable for their own market. On a lesser scale, some smaller importers use what is known as a London confirming house. The confirming house will buy any product on the instructions of the overseas buyer and it will also advise him as to where he can buy the best, or the cheapest, product. Usually the confirming house will pay cash for the goods in the United Kingdom and grant its customers an appropriate amount of credit. These services are usually rendered for quite a small commission. Similarly also, colonial or commonwealth governments or public authorities often make purchases in the United Kingdom through the "crown agents." This government organization, known in full as the crown agents for overseas governments and administrations, maintains an expert staff in London that is fully aware of colonial needs and conditions and has also a wide knowledge of appropriate British manufacturers; products and prices. The crown agents often invite tenders for larger contracts. They also keep an eye on the manufacturing process and inspect the finished article before shipment.

Before 1914 trade between countries was comparatively simple, the main obstacle in general being import tariffs. Most currencies were fixed in relation to gold and any country which ran a deficit in its overseas trading usually settled it in the end by a transfer of gold. World War I, by eliminating the reserves of many countries, destroyed this system of economic freedom and a regime of increasing tariffs and quota restrictions was gradually built up in the interwar years. Countries also entered into bilateral trade treaties under which Country A agreed to send Country B a given quantity of its own products in exchange for an equivalent value in B's products, generally without the need for any transfer of currencies. This system greatly complicated overseas marketing. Under Adolf Hitler, the financier Hjalmar Schacht made Germany foremost in methods of barter trade. Germany was also active during this period in building up an elaborate system of multiple exchange rates, which was extensively copied in many countries after World War II. Experience showed, however, that these devious marketing and financial methods in the end restricted trade rather than developed it. Under a bilateral trading system Country A can only export as much as Country B can pay for. Where there are strict reciprocal quotas the tendency is for trade to stabilize at the lowest level for either commodity, a level which is usually lower than it would have been under an international multilateral system. Accordingly after World War II the more enlightened economic countries did what they could to educate their less advanced economic brethren by such means as the European Payments union—a practical example of limited multilateralism which showed that multilateral trading could still be practised to the benefit of all in spite of a weakness in internal financial reserves. In addition, the United Kingdom, the Federal Republic of Germany and the Netherlands later agreed to multilateralism among themselves in their commercial relations with certain South American countries and with Egypt.

Co-operative Societies. — The co-operative system in its retailing form started in Rochdale, Lancashire, in the 19th century. The theory behind it is that consumers by banding together and purchasing in bulk can buy more cheaply than they do by buying individually; profits are shared by means of dividend on turnover among the participating members. The movement grew considerably, particularly in Scotland and in many other countries. According to Co-operative Union statistics there were in Great Britain in 1955 more than 964 retail co-operative societies. These employed about 280,000 people and had a sales turnover of more than £790,000,000. The societies also manufacture many of their own food and clothing products.

Sellers of produce also banded together on similar lines to sell their products on a co-operative basis, particularly in the egg and poultry trades. Such co-operation of producers became extensive in Denmark, the Netherlands, Israel and other food-producing countries.

Empire Marketing Board. — To develop the marketing of British empire products in the United Kingdom an Empire Marketing board was set up in 1926 with the proviso that the "empire should have a preference over foreign countries as regards that part of the home market which cannot be supplied by the home producer." The board came to an end in 1933 largely owing to lack of interest by the dominions in its work. However successor bodies were later formed to take over similar functions in relation to the colonial territories and since World War II many ambitious research, development and marketing schemes in the colonies have been undertaken by the Colonial Development corporation.

(ED. B.)

MARKET PLACE, the mediaeval descendant of the Greek agora and the Roman forum (*qq.v.*); an open space, generally approximately rectangular. It was usually placed near the centre of the town, as in the market cross of Chester! at the intersection of the two main streets. The town hall (see GOVERNMENTAL ARCHITECTURE) was frequently built on the market place, and occasionally its ground floor was open and served as additional market space. A market cross was a monument topped by a cross, situated in the market place; or the market place itself, so-called from the monument.

MARKETS, PRIMITIVE: see TRADE, PRIMITIVE.

MARKHAM, SIR CLEMENTS ROBERT (1830–1916), C.B. (1871), K.C.B. (1896), English geographer and historical writer, son of the Rev. David F. Markham, canon of Windsor, was born on July 20, 1830 at Stillingfleet, near York, and went to Westminster school. He entered the navy in 1844 and passed for a lieutenant in 1851. In 1850–51 he served on the Franklin search expedition in the arctic regions, under Captain Austin. He retired from the navy in 1852, and then travelled in Peru and the forests of the eastern Andes. In 1853 Markham entered the civil service, and in 1854 was appointed on the board of control of the East

India company. He visited South America again in 1860, in order to arrange for the introduction of the cinchona plant into India, a service of the highest value. In 1865 he visited Ceylon and India, to report upon the Tinnevelly pearl fishery and the cinchona plantations. From 1867–77 the geographical section of the India office was under his charge. On the Abyssinian expedition of 1867–68 he served as geographer, and was present at the storming of Magdala. He was elected F.R.S. in 1873. In 1875 he accompanied the arctic expedition under Sir George Nares as far as Greenland. In later years Sir Clements Markham travelled extensively in western Asia and the United States. He was secretary to the Hakluyt society from 1858–87, and its president from 1889–1909. From 1863–88 he acted as secretary to the Royal Geographical society, and was elected president in 1893, retaining office for the unprecedented period of 12 years. He was president of the International Geographical congress, which met in London in 1895. It was almost entirely because of his exertions that funds were obtained for the National Antarctic expedition under Capt. Robert Scott, which left England in the summer of 1901. After his retirement from the India office, he continued to devote himself to geographical research and travelled widely. He died in London on Jan. 30, 1916.

Sir Clements Markham conducted the *Geographical Magazine* from 1872–78, when it became merged in the *Proceedings of the Royal Geographical Society*. Among his many publications may be mentioned: *Peru* (1880); *The War between Chili and Peru* (1879–81; 3rd ed., 1883); *Life of John Davis the Navigator* (1889) ; a *Life of Richard III.* (1906) ; also lives of *Admiral Fairfax, Admiral John Markham, Columbus* and *Major Rennel;* a *History of Peru;* editions with introduction of 20 works for the Hakluyt society, of which 14 were also translations; about 70 papers in the Royal Geographical society's *Journal*. *The Lands of Silence,* an important history of arctic and antarctic exploration, was completed posthumously by H. H. Guillemard and published in 1921.

MARKHAM, EDWIN (originally CHARLES EDWARD ANSON MARKHAM) (1852–1940), U.S. poet, author of "The Man With the Hoe," was born in Oregon City. Ore., on April 23, 1852, the youngest son of pioneer parents. He grew to manhood on an isolated valley ranch in the Suisun hills in central California, attended the California State Normal school at San Jose and later graduated from the Christian college at Santa Rosa. He subsequently became a high school principal and superintendent at various places, and finally headmaster at the Tompkins Observation school, Oakland, connected with the University of California. Markham abandoned school administration in 1899, after his poetry had won favour, and devoted himself to writing and lecturing. In that year he gained national fame with the publication in the *San Francisco Examiner* of "The Man With the Hoe," his most widely known poem. Icspired by Millet's painting, Markham made the French peasant the symbol of the exploited classes throughout the world. The poem so well expressed the economic and social mood of the time that it was reprinted in nearly every newspaper of the country and was the subject of wide editorial comment. His first book of verse, *The Man With the Hoe and Other Poems* (1899), was followed in 1901 by *Lincoln and Other Poems,* the dignified title piece of which found almost as much favour as "The Man With the Hoe." His succeeding volumes—Shoes *of Happiness* (1915), *Gates of Paradise* (1920), *New Poems: Eighty Songs at Eighty* (1932) and *The Star of Araby* (1937)—have the commanding rhetoric but lack the passion of the early works. On March 7, 1940, Markham died at Staten Island, N.Y., where he had made his home since 1901.

BIBLIOGRAPHY.—W. L. Stidger, *Edwin Markham* (1933), and an article by G. R. Grose in the *Personalist* (1936). A useful checklist of Markham's writings may be found in S. Shields, *Edwin Markham, A Bibliography* (19j3).

MARKHAM, GERVASE (or JERVIS) (1568?–1637), English poet and writer, third son of Sir Robert Markham of Cotham, Nottinghamshire, was born probably in 1568. He was a soldier of fortune in the Low Countries, and later was a captain under the earl of Essex's command in Ireland. He was acquainted with Latin and several modern languages, and had an exhaustive practical acquaintance with the arts of forestry and agriculture. He was a noted horse breeder, and is said to have imported the first Arabian horse. Very little is known of the events of his life. The story of the murderous quarrel between Gervase Markham and Sir John Holles related in the *Biographia Britannica* (*s.v.* Holles) has been generally connected with him, but in the *Dictionary of National Biography* Sir Clements R. Markham, a descendant from the same family, refers it to a contemporary of the same name. Gervase Markham was buried at St. Giles's, Cripplegate, London, on Feb. 3, 1637.

Markbarn's writings include: *The Most Honorable Tragedie of Sir Richard Grinvile, Knight* (1595), reprinted (1871) by E. Arber; *The Poem of Poems, or Sions Muse* (1595), dedicated to Elizabeth, daughter of Sir Philip Sidney; *Devoreux* (1597) ; *The Teares of the Beloved* (1600) and *Marie Magdalens Lamentations* (1601), long and rather commonplace poems on the Passion and Resurrection of Christ, both reprinted by A. B. Grosart in the *Miscellanies of the Fuller Worthies' Library* (1871). *The True Tragedy of Herod and Antipater* (1622) was written with William Sampson, and with Lewis Machin he wrote a comedy called *The Dumbe Knight* (1608). *A Discourse of Horsemanshippe* (1593) was followed by other popular treatises on horsemanship and farriery. *Honour in His Perfection* (1624) is in praise of the earls of Oxford, Southampton and Essex, and the *Souldiers Accidence* (1625) turns his military experiences to account. He edited Juliana Berners' *Boke of Saint Albans* under the title of *The Gentlemans Academie* (1595), and produced numerous books on husbandry, many of which are catalogued in Lowndes's *Bibliographer's Manual,* Bohn's ed. (1857–64).

MARKHOR (CAPRA FALCONERI)

MARKHOR ("snake-eater"), a large Himalayan wild goat *(Capra falconeri)*, characterized by its spirally twisted horns and long shaggy winter coat. From the Pir-Panjal range of Kashmir the region of the markhor extends westward into Baltistan, Astor, Hunza, Afghanistan and the trans-Indus ranges of the Punjab. The twist of the horns varies locally.

MARKIRCH: *see* STE-MARIE-AUX-MINES.

MARKO KRALYEVIĆ, Serbian hero, was a son of the Serbian king or prince, Vukašin (d. 1371). Chagrined at not himself becoming king after his father's death, he headed a revolt against the new ruler. Later he took service with the sultan, and was killed in battle about 1394. Stories of strength and wonder have gathered round his name. He is supposed to have lived for 300 years, to have ridden a horse 150 years old, and to have used his enormous physical strength against oppressors, especially against the Turks. He is a great figure in Serbian poetry, and his deeds are also told in the epic poems of the Rumanians and the Bulgarians. One tradition relates how he retired from the world owing to the advent of firearms, which, he held, made strength and valour of no account in battle.

MARKOV, ANDREI ANDREEVICH (1856–1922), Russian mathematician, was the first to give a complete and strict proof of the so-called central limit theorem. Markov passed through the academic grades at the University of St. Petersburg; he was appointed ordinary professor in 1886 and ordinary member of the Academy of Sciences in 1896. The earlier part of his work was devoted to number theory and analysis, notably to continued fractions, the limits of integrals, the approximation theory, and the convergence of series. From about 1900, he was mainly occupied with probability theory. Under fairly general assumptions, he proved the central limit theorem, which states the asymptotically normal (gaussian) distribution of the sum of a large number of independent random variables. Markov then turned to study mutually dependent variables, introducing the important notion of chained events (Markov chains). A sequence x_1, x_2, . . . of mutually dependent random variables constitutes a Markov chain if, roughly speaking, any prediction about x_{n+1}, . . ., knowing x_1, . . ., x_n may without loss be based on x_n alone. He extended several classical results concerning independent events to certain types of chains. Markov's work is one of the starting points of the modern theory of stochastic processes. A selection of Markov's works in number theory and probability theory, including a biography and a bibliography, was published in Moscow in 1951. (G. Eg.)

MARKOVA, ALICIA (Alicia Marks). (1910–), is an English ballerina noted for the ethereal lightness and poetic delicacy of her interpretations of Giselle, Les *Sylphides,* Swan Lake and other ballets. Born in London, Dec. 1, 1910, she studied with Seraphima Astafieva and Enrico Cecchetti. Phenomenally gifted, she made her debut with the Diaghilev Ballet at 14, and was soon dancing leading roles. Alicia Markova has appeared as ballerina of Ballet Rambert, Sadler's Wells Ballet. Ballet Russe de Monte Carlo, Ballet Theatre, and as guest artist with the Metropolitan Opera. With Anton Dolin, she headed the Markova-Dolin Ballet (1935–38), and Festival Ballet (1949–52). (Ln. Me.)

MARK SYSTEM. At the middle of the 19th century, the opinion prevailed widely among scholars that throughout the Germanic world society tended to be organized in communities whose members claimed kinship with each other, cultivated their lands in common, and administered justice in their own assemblies. It was held that these communities were known as "Marks," from the march, or boundary, which separated each from its neighbours, and that traces of their existence still survive in the numerous place names containing the element *-ing,* which are found in all regions of Germanic settlement. Later research proved that early Germanic society was far more complicated than the framers of this theory had realized, and demonstrated a strong element of individualism in primitive Germanic law. On the philological side it has been shown that the element *-ing* bore a far wider sense than that of kindred alone, that, for example, the original *Readingas* of Reading are as likely to have been the free and unfree dependents of *Read* as his actual or reputed kinsmen. The Mark theory, in fact, was much too simple an explanation of the complex phenomena of primitive society, but it still deserves respect as one of the great constructive generalizations which have determined the direction of research into the problems of social history. (F. M. S.)

MARL, an earthy mixture of fine-grained minerals. The term is applied to a great variety of sediments and rocks with a considerable range of composition. Calcareous marls grade into clays by diminution in the amount of lime, and into clayey limestones. Greensand marls contain the mineral glauconite, which is a complex silicate of alumina, iron and potassium. The greensand marls are widely distributed along the Atlantic coast in the United States and in Europe. Similar deposits occur in New Zealand. Because of their base-exchange properties the glauconitic marls are used in water-softening units. (See also Greensand; Glauconite.)

Both marine and fresh-water marls are most commonly earthy and of a white, gray or brownish colour. However, red and black marls are found. In calcareous marine marls some lime is present in the form of shells (as in the Coralline crag of East Anglia, the Oligocene marls of the Isle of Wight, etc.); in others it is a fine impalpable powder mixed with clay and siliceous silt. Fresh-water marl may be similar in composition to marine marl. Much of the calcium carbonate in lake deposits is precipitated by bacteria and by algae such as the stoneworts. However, some lake marls contain numerous fragments of the shells of fresh-water snails and bivalves. Large deposits of fresh-water marl which contain from 80% to 90% of calcium carbonate and less than 3% of magnesium carbonate have been used as the calcareous material required in the manufacture of insulating material and portland cement. Marl also is used as a liming material and in making bricks. (G. A. T.)

MARLBOROUGH, EARLS AND DUKES OF. The earldom of Marlborough was held by the family of Ley from 1626 to 1679. James Ley, the 1st earl (c. 1550–1629), was lord chief justice of the King's Bench in Ireland and then in England; he was an English member of parliament and was lord high treasurer from 1624 to 1628. In 1624 he was created Baron Ley and in 1626 earl of Marlborough.

In 1689 John Churchill was created earl and in 1702 duke of Marlborough (see below). After the death of his only son Charles in 1703 an act of parliament was passed in 1706 settling the duke's titles upon his daughters and their issue; from them the present family is descended.

The 7th duke of Marlborough, John Winston Spencer-Churchill (1822–83), a prominent Conservative, was lord-lieutenant of Ireland 1876–1880, and when marquess of Blandford (the courtesy title borne by the duke's eldest son in his father's lifetime) was responsible for the act of 1856 called the "Blandford Act," enabling populous parishes to be divided for purposes of Church work.

MARLBOROUGH, JOHN CHURCHILL, 1st Duke of (1650–1722), English soldier, was born on May 26, 1650, in the small manor house of Ashe, in Musbury, Devonshire, the son of Sir Winston Churchill of Wootton Glanville, Dorset. He went to St. Paul's school from 1664 to 1665. When 15 he became page of honour to the duke of York. About the same time his sister Arabella became maid of honour to the duchess and eventually mistress of the duke. These events contributed greatly to the advancement of the Churchills. In 1667 John received through the influence of his master a commission in the guards. Soon afterward he left England for service at Tangier but returned home in 1670. For a short interval he remained in attendance at the court, and it was during this period that his natural carefulness was shown by his investing in an annuity a present of £5,000 given him by the duchess of Cleveland.

When the Third Dutch War broke out, his first active service was aboard the fleet and after the battle of Sole bay, in May 1672, he was promoted to captain. In the following December he went to the continent with the English troops sent to assist Louis XIV against the Dutch. He served under the duke of Monmouth at the siege of Maastricht in June 1673 and there won the praise of Louis XIV. In 1674 he acted as colonel of an English regiment under Turenne, who warmly commended his conduct at the battle of Enzheim (October). He then returned to England and for the next few years was at court or engaged on minor diplomatic missions. Some time during the winter of 1677–78 he married Sarah Jennings (b. June 5, 1660), the favourite attendant on the princess Anne, younger daughter of the duke of York. In Dec. 1682 he was created a Scottish peer as Lord Churchill of Eyemouth and in Nov. 1683 he became colonel of the royal regiment of dragoons.

On the accession of James II the Churchills received a great increase in fortune, and for his services on a special mission from the new monarch to Louis XIV John Churchill was made in May 1685 Baron Churchill of Sandridge in Hertfordshire. When Monmouth attempted his ill-fated enterprise in the western counties, the second position in command of the king's army was bestowed on Lord Churchill, and in July 1685 he was raised to the rank of major general. Through his energy at the battle of Sedgemoor (July 6) the king's side was victorious. After the death of Monmouth he withdrew as far as possible from the administration of public business. While on his embassy to the French court he had declared that if the king of England should change the religion of the state he would leave his service, and Churchill was one of the first to send overtures of obedience to the prince of Orange, to whom he had gone on a mission in 1678. Although he continued in a high position under James and drew the emoluments of his places, he promised William of Orange to use every exertion to bring over the troops to his side. James had been warned against him, but the warnings were in vain, and on the landing of the Dutch prince at Torbay Churchill was promoted to be lieutenant general (Nov. 7, 1688). When the royal army had advanced to the downs of Wiltshire and a battle seemed imminent, James was dismayed to find that at night his general had gone to the opposite camp.

After the revolution Churchill was sworn as a privy councillor in Feb. 1689 and in April became earl of Marlborough. In May 1689 he was sent with an English force to the Netherlands. In the next year he was commander in chief of the forces in England and one of the council of nine which helped Mary to govern the country during William's absence in Ireland. In the autumn, after William's victory at the Boyne, Marlborough planned and executed the highly successful expedition that resulted in the rapid capture of Cork and Kinsale. Gradually, however, he lost favour with William. The growth of an estrangement between Anne and the court, and Marlborough's active loyalty to the princess, intensified William's suspicions. In May 1692 he was thrown into the Tower on an accusation of treason. Though the evidence against him was flimsy, and he was soon released, there is no doubt that Marlborough was. like most leading Englishmen of the time, corresponding with the exiled king at St. Germain. The accusation that he even went so far as to disclose, in May 1694, to his late master the intention of the English to attack Brest rests, however, upon somewhat doubtful evidence. During the Fenwick plot of 1696 he was charged again with treason, but William ignored the accusation.

During the last years of William's reign Marlborough once more was placed in positions of responsibility. Higher honours came on the accession of Anne in March 1702. He was appointed a knight of the Garter, captain general of the English troops both at home and abroad, and master general of the ordnance. On May 4, 1702, the War of the Spanish Succession began with declarations of war by England, the Netherlands and Austria against France. Marlborough was soon afteruard made commander in chief of the united armies of England and the Netherlands, but throughout the war his plans were impeded by the jealousy of the commanders who were nominally his inferiors and by the opposite aims of the allied countries. He himself wished to penetrate into the French lines; the anxiety of the Dutch was for the maintenance of their frontier and for an augmentation of their territory: the desire of the Austrian emperor was to secure that his son the archduke Charles should rule Spain. Nevertheless, in the first year of the campaign it was shown that the armies of the French were not invincible. Several fortresses which Louis XIV had seized upon surrendered to the allies. Kaiserswerth on the Rhine had surrendered in June, and the capture of Venlo in September and Liège in October cleared the line of the Meuse. For these brilliant exploits Xarlborough was raised (Dec. 14, 1702) to be duke of Marlborough and awarded £5,000 per annum for the queen's life. His only surviving son. the marquess of Blandford, was seized with smallpox while at King's college, Cambridge, and died on Feb. 20, 1703.

The result of the campaign of 1703 inspired the French king with fresh hopes. The plans of Marlborough were frustrated by his Dutch colleagues. When he wished to invade the French territory they urged him to besiege Bonn, and he was compelled to give way. It surrendered in May, whereupon he returned to his original plan of attacking Antwerp; but because of the incapacity of the Dutch leaders, the French surprised one Dutch force in June and inflicted on it a loss of many thousands of men. Marlborough was forced to abandon his enterprise, and all the compensation which he received was the capture of the insignificant fortresses of Huy and Limburg. After a year of comparative failure for the allies, Louis XIV entered upon an offensive movement against Austria; and Rlarlborough, smarting under the misadventures of 1703, was eager to meet him. The French king sent Marshals Camille de Tallard and Ferdinand de Marsin to join the elector of Bavaria and to march by the Danube to seize Vienna. Marlborough divined their intention and, drawing the duc de Villeroi's forces from the Netherlands after him by feints of attacks on the Moselle and in Alsace, led his troops into Bavaria. On Aug. 13 (N.S.) he brought Tallard, Marsin and the Bavarians to battle near the village of Blenheim on the left bank of the Danube. The early part of the fight was in favour of the French. Three times the troops led by Prince Eugilne against the Bavarians on the enemy's left wing were driven back in confusion; but Marlborough concentrated superior forces on the enemy's centre and, after hard fighting, broke through there. In the end the victory of the allies was conclusive. Nearly 30,000 of the French and Bavarians were killed and wounded, and 12,000 of the French who had been driven down to the Danube were forced to surrender. Bavaria fell to the allies, and on his way back to the Netherlands Marlborough also took Trilves and Trarbach on the Moselle. Poets and prose writers were employed to do Marlborough honour. The manor of Woodstock, which was transferred by act of parliament from the crown to the duke, was a reward more after his own heart. Blenheim palace was built in the park at the royal expense, and £240,000 of public money was spent on the buildings. Marlborough was also created a prince of the empire, and the principality of Mindelheim was formed in his honour.

During the following year Marlborough was hampered by tedious formalities at The Hague and by jealousies at the German courts. The armies of the French mere again brought up to their full standard, but the generals of Louis were instructed to entrench themselves behind earthworks and to act on the defensive. On a July night Marlborough broke through the famous "lines of Brabant" near Tirlemont. and the French were forced to shelter in Louvain. The duke in vain urged an attack, and when 1705 had passed away the forces of the French king remained unbroken. This tempted Villeroi in the next spring into meeting the allies in an open fight. But through the superior tactics of Marlborough the battle of Ramillies (May 23 [N.S.], 1706) ended in the rout of the French and caused the transference of nearly the whole of Brabant and Flanders to the allies. Five days afterward the victor entered Brussels in state, and the inhabitants acknowledged the rule of the archduke. Antwerp, Ostend, Menin and Termonde soon surrendered. Again a year of triumph was succeeded by a period of depression. During 1707 fortune inclined to the other side, with the result that in July 1708 Ghent and Bruges returned to the allegiance of the French, and Marlborough, fearing that their example might be followed by other cities, advanced toward Oudenarde. The battle, which raged on the high ground above Oudenarde. ended in defeat of the French (July 11 [S.S.], 1708).

Marlborough then wished to advance on Paris, but he was overruled. The allied army invested the town of Lille, and after nearly four months and a loss to the combatants of 30,000 men the citadel surrendered in December. By the end of the year Brabant was again subject to the allies. The French king sued for peace, and the marquis de Torcy, his minister, endeavoured by promises of large sums to obtain the support of Marlborough for his proposals. These attempts were vain. and when the winter passed a French army of 110,000, under the command of Villars. took the field. In Sept. 1709 Marlborough and Eugilne took Tournai and led their forces to Mons. For the last time during the protracted war the two armies met in fair fight at Malplaquet, on the south of Mons (Sept. 11 [N.S.], 1709). The fight was long and doubtful; although the French ultimately retreated. it was in good order, and their losses were less than those of their opponents. The campaign lasted for two years after this, but it was not signalized by any such "glorious victory" as Blenheim. The French concentrated on the construction of fresh lines of defense, and Marlborough, despite a successful campaign in 1711, was not able to force the contest to a final decision before his own downfall at the end of that year.

For all these victories had not prevented the position of Marlborough from being undermined by intrigues at home. In the early part of Anne's reign his political friends were among the Tories, and the ministry under Sidney Godolphin was chiefly composed of members of that party. After a year or two. however. the more ardent Tories withdrew. and two younger adherents of the same cause, Robert Harley and Henry St. John. were introduced in May 1704 into the ministry. The duchess, partly through the influence of her son-in-law. the earl of Sunderland. who came into office against the queen's wish in Dec. 1706, and partly through the opposition of the Tories to the French war, pressed Whig views on the sovereign with more vehemence than discretion; and the love of the two friends changed into hate. Sunderland and Godolphin were the first to fall (June-August 1710); a few months later the duchess was dismissed from her offices, and the fall of Marlborough himself came on the last day of 1711. He went to the continent in Dec. 1712 and remained abroad until the death of Anne (Aug. 1, 1714).

Then he once more returned to England and resumed his old military posts, but he took little part in public affairs. He died on June 16, 1722, at Cranbourn lodge. near Windsor. His remains were deposited in Westminster abbey, in the vault at the east end of King Henry VII's chapel, but they now rest in a mausoleum in the chapel at Blenheim. His widow, to whom must be assigned a considerable share both in his rise and in his fall, survived until Oct. 18, 1744. To William Pitt she left £10,000 and to Lord Chesterfield twice that sum and a reversionary interest in her landed property at Wimbledon.

Marlborough's successes were attributable not only to his military genius and diplomatic skill but also to his attention to detail and his care for the welfare of his troops. Alike in planning and in execution he took infinite pains. Nothing escaped his observation, and in the hottest moment of the fight the coolness of his intellect was conspicuous.

BIBLIOGRAPHY.—Marlborough's *Letters and Despatches* were edited by Sir George Murray, 5 vol. (London, 1845). *See* also F. Taylor, *The Wars of Marlborough, 1702–09,* 2 vol. (Oxford, 1921); C. T. Atkinson, *Marlborough* and *the Rise of the British Army* (New York, London. 1921); and, above all, Winston Churchill, *Marlborough, His Lifr and Times,* 4 vol. (London, 1933–38). (R. B. WM.; X.)

MARLBOROUGH, a municipal borough and market town in the Devizes parliamentary division of Wiltshire, Eng., 25 mi. N. of Salisbury. Pop. (1951) 4,557. It is northwest of Savernake forest and in the valley of the river Kennct in the Downs.

The antiquity of Marlborough is shown by the Castle mound. an earthwork which local legend makes the grave of Merlin; and the name of Marlborough has been regarded as a corrupt form of Merlin's berg or rock. Near the site of the modern Marlborough (Merleberge, Marleberge) was originally a Roman *castrum* called Cunetio. and later there was a Norman fortress in which William I cstahlished a mint. In Domesday it was royal demesne. The castle, built under Henry I by Roger, bishop of Salisbury. was held for Matilda against Stephen. and became a favourite residence of Henry II, Savernake being a royal deer park. In 1267 Henry III held his last parliament there, at which the Statute of Marlborough was passed. Marlborough was captured by the royalists in 1612 and partly burned. The town was constituted a suffragan see by Henry II. Henry Sacheverell, the politician and divine. was born there in 1674. In 1652, 1679 and 1690 the town was nearly destroyed by fire, after which an act was passed forbidding the use of thatch.

The first charter was granted by John in 1204 and conferred a guild merchant. together with freedom from all pleas except pleas of the crown and from all secular exactions by sea and land. Later charters were obtained from Henry IV in 1407 and from Elizabeth I in 1576. The former granted some additional exemptions. while the latter incorporated the town under the title of mayor and burgesses of Marlborough. Marlborough returned two members to parliament until 1867 when the number was reduced to one. In 1885 the representation was merged with the county.

The church of St. Peter and St. Paul, a Perpendicular building. was the scene of the ordination of Thomas Wolsey in 1498. The church of Preshute. largely rebuilt but preserving its Norman pillars, has a curious piscina and a large black basalt font dating from 1100–50. There is a 16th-century grammar school. Marlborough college was opened in 1813, originally for the sons of clergymen. Trade is mainly agricultural. and light industries include engineering and the making of puppets. tiles and ropes.

MARLIN, common name for several large sea fishes of the billfish family (Istiophoridae), which includes also sailfishes. They are among the most prized of big game fishes. The upper jaw is prolonged into a rounded spear: ventral fins are present and the dorsal fin: unlike that of the sailfishes, is not prominently enlarged to form a saillike superstructure. They occur in the warm parts of all oceans and seasonally visit temperate regions in the northern hemisphere as far north as Nova Scotia and in the southern hemisphere as far south as Chile and the Cape of Good Hope. They are generally found traveling alone, in pairs or in small groups. The white marlin sometimes schools. Marlins feed on all kinds of smaller fishes that swim near the surface, such as mackerel, mullet and sardines, and on larger invertebrates, such as squids.

Because ichthyologists have had difficulty in obtaining enough specimens for comparative studies, there is considerable uncertainty regarding the number of species. Among those best known is the striped marlin (*Makaira audax*), ranging from southern California to northern Chile and westward into the Indian ocean and attaining 700 lb.; the blue marlin (*M. ampla*), widely distributed in the warm parts of the Atlantic and Pacific oceans and attaining over 1.600 lb.; and the white marlin (M. albida). ranging in the Atlantic from Brazil to Nova Scotia, in the Mediterranean and off the coast of Portugal and attaining hardly more than 160 lb.

The black marlin (Istiompax *indicus*) is the largest species, growing to over 15 ft. and near to 2,000 Ib. It ranges over tropical and temperate waters of the Pacific and Indian oceans. Another genus of marlins, *Tetrapturus,* is distinguished from *Makaira* in having pectoral fins that are not much if at all longer than the lower jaw and a spear that is hardly longer than the deepest depth of the body. *Tetrapturus* species range in the warm parts of the Atlantic and Indian oceans and in the Pacific as far east as Hawaii. See also FISHES. (L. A. WD.)

MARLOW, an urban district in the Wycombe parliamentary division of Buckinghamshire, Eng., 31 mi. W. of London by road. Pop. (1951) 6,481. Area 2.6 sq.mi. At Marlow the Thames is crossed by an iron suspension road bridge, built by W. Tierney Clark in 1831. connecting Berkshire with Buckinghamshire. All Saints' parish church. built in 183j on the site of a 12th-century church. stands by the bridge on the river bank and contains interesting monuments from the former church. A weir and lock separate two reaches of the river. Lying on a pretty stretch of the Thames with the wooded Chilterns behind, Marlow is a residential town much frequented for boating and fishing. A one-day regatta is held every June. The only large industry is brewing (since 1758), but it mas famous for fine needlework (with a school of needlework) and lacemaking until the 19th century. Of many old houses the earliest is the Old Parsonage, dating from the 14th century, which was probably part of the manor house. A 17th-century house contained the Royal Military college from 1802 until 1812 when it was moved to Sandhurst; in the house opposite the poet Shelley lived from 1817 to 1818, and close by is the Borlase school (now state-controlled) founded in 1624 by Sir William Borlase to teach 24 boys to read, write and keep accounts and 24 girls to make bone lace. The council offices and a museum share an 18th-century house.

MARLOWE, CHRISTOPHER (1564–1593). English dramatist, the father of English tragedy and instaurator of dramatic blank verse; the eldest son of a shoemaker. was born in Canterbury on Feb. 6, 1564. He was christened at St. George's church. Canterbury. on Feb. 26, 1563/4, two months before Shakespeare's baptism at Stratford-on-Avon. His father. John Marlowe, is said to have been the grandson of John Morley or Marlowe, a substantial tanner of Canterbury. The father. who survived by a dozen years or so his illustrious son, married on May 22, 1561, Catherine, daughter of Christopher Arthur. at one time rector of St. Peter's. Canterbury. who had been ejected by Queen hfary as a married minister. The dramatist had as fellow pupils at the King's school, Canterbury. Richard Boyle, afterward earl of Cork, and Will Lyly, the brother of the dramatist. He matriculated at Benet (Corpus Christi) college, on March 17, 1571, taking his B.A. degree in 1554 and that of M.A. three or four years later.

Francis Kett, the mystic, burned in 1589 for heresy, was a fellow and tutor of his college, and may have had some share in developing Marlowe's opinions in religious matters. Marlowe's classical acquirements were of a kind which was then extremely common, being based for the most part upon a minute acquaintance with Roman mythology, as revealed in Ovid's *Metamorphoses.* His spirited translation of Ovid's *Amores* (printed 1596) mas at any rate commenced at Cambridge. His translation of "The First Book of Lucan," printed posthumously in 1600, belongs to the last years of his short life. The famous lyric "Come Live With Me and Be My Love" was first printed in its entirety in *England's* Helicon (1600). Hero and *Leander*, based on hfusacus, also belongs to the last years. Before 1587 he seems to have quitted Cambridge for London; of his life there, apart from his four great theatrical successes and his connection as a dramatist with the Lord Admiral's and Strange's companies, hardly anything is known; but he evidently knew Thomas Kyd, who shared his unorthodox opinions. Nash criticized his verse, Greene affected to shudder at his atheism; Gabriel Harvey maligned his memory.

On the other hand, Marlowe was intimate with the Walsinghams of Scadbury, Chiselhurst, kinsmen of Sir Francis Walsingham: he was also the personal friend of Sir Walter Raleigh, and perhaps of the poetical earl of Oxford, with both of whom, and with Walter Warner and Robert Hughes the mathematicians, Thomas Harriott the astronomer, and Matthew Royden, the dramatist is said to have met in free canverse. He seems at least to have been associated with what was denounced as Sir Walter Raleigh's school of atheism, and to have dallied with opinions which were then regarded as putting a man outside the pale of civilized humanity. In October 1588 Marlowe gave bail for his appearance for an unspecified offence. Serious charges were brought in 1593. As the result of some depositions made by Thomas Kyd under the influence of torture, the Privy Council were upon the eve of investigating some charges against Marlowe when his career was abruptly terminated. Thanks to the researches of Dr. Hotson, it is now established definitely on the evidence of documents in the Public Record Office, that Marlowe was killed by a companion of his, one Ingram Frizer, at an inn at Deptford on May 30th, 1593. Frizer and Marlowe, together with two friends named Robert Poley and Nicholas Skeres, had repaired to the inn to dine and sup. A quarrel arose about paying the bill; Marlowe in a sudden fit of temper attacked Frizer from behind. Frizer in the ensuing struggle stabbed Marlowe, who died instantly. Frizer was subsequently pardoned, as having killed Marlowe in self-defence. A full account of the documentary evidence which supports these facts is given in Dr. Hotson's book, *The Death of Christopher Marlowe* (1925). Dr. Hotson points out that it is important to note that Ingram Frizer was, in the relevant documents, described as "gentleman" and did not forfeit the good graces of his employers, the Walsinghams, who were friends of the man whom he slew.

Thus the various stories of Marlowe's death, as retailed by Thomas Beard *(The Theatre of God's Judgments)* in 1597, Francis Meres in his *Palladis Tamia* (1598), Anthony à Wood in his *Athenae Oxonienses* (1691) and repeated by later writers, may be dismissed as mere legend.

Marlowe was buried on June 1, 1593, at Deptford.

Marlowe's career as a dramatist lies between the years 1587 and 1593, and his four great plays are *Tamburlaine the Great,* an heroic epic in dramatic form divided into two parts of five acts each *(c.* 1587, printed in 1590); *Dr. Faustus* (1588, entered at Stationers' Hall 1601); *The Famous Tragedy of the Rich Jew of Malta* (dating perhaps from 1589, acted in 1592, printed in 1633); and *Edward the Second* (printed 1594). The very first words of *Tamburlaine* sound the trumpet note of attack in the older order of things dramatic:—

From jigging veins of riming mother wits
And such conceits as clownage keeps in pay
We'll lead you to the stately tent of war,
Where you shall hear the Scythian Tamburlaine
Threatening the world with high astounding terms
And scourging kingdoms with his conquering sword.

It leapt with a bound to a place beside Kyd's *Spanish Tragedy,* and few plays have been more imitated by rivals (Greene's *Alphonsus of Aragon,* Peele's *Battle of Alcazar, Selimus, Scanderbeg)* or more keenly satirized by the jealousy and prejudice of out-distanced competitors. Other plays in which Marlowe is said to have had a share are *The Massacre at Paris* (1593), printed in his name; *Dido, Queen of Carthage* (1593), with Nashe; *Lust's Dominion* (*c.* 1600), the original draft of which may have been by Marlowe; and the lost play, *The Maiden's Holiday,* in the list of plays burnt by Warburton's cook. Some critics have traced his hand in other plays, among these being the Shakespearian *Titus Andronicus, Henry VI.,* and *Richard III.* The following notes on the plays and on the poems are taken from the article written by Swinburne for the 9th ed. of the *Encyclopædia Britannica.* *(T. S.; X.)*

Estimate on the Plays.—With many and heavy faults, there is something of genuine greatness in *Tamburlaine the Great;* and for two grave reasons it must always be remembered with distinction and mentioned with honour. It is the first poem ever written in English blank verse, as distinguished from mere rhymeless decasyllabics; and it contains one of the noblest passages, perhaps indeed the noblest, in the literature of the world, ever written by one of the greatest masters of poetry in loving praise of the glorious delights and sublime submission to the everlasting limits of his art.

The just and generous judgment passed by Goethe on the *Faustus* of his English predecessor in tragic treatment of the same subject is somewhat more than sufficient to counterbalance the slighting or the sneering references to that magnificent poem which might have been expected from the ignorance of Byron or the incompetence of Hallam. What most impressed the author of *Faust* in the work of Marlowe was a quality the want of which in the author of *Manfred* is proof enough to consign his best work to the second or third class at most. "How greatly it is all planned!" the first requisite of all great work, and one of which the highest genius possible to a greatly gifted barbarian could by no possibility understand the nature or conceive the existence.

Tamburlaine is monotonous in the general roll and flow of its stately and sonorous verse through a noisy wilderness of perpetual bluster and slaughter; but the unity of tone and purpose in *Doctor Faustus* is not unrelieved by change of manner and variety of incident. In the vision of Helen, for example, the intense perception of loveliness gives actual sublimity to the sweetness and radiance of mere beauty in the passionate and spontaneous selection of words the most choice and perfect; and in like manner the sublimity of simplicity in Marlowe's conception and expression of the agonies endured by Faustus under the immediate imminence of his doom gives the highest note of beauty, the quality of absolute fitness and propriety, to the sheer straightforwardness of speech in which his agonizing horror finds vent.

It is now a commonplace of criticism to observe and regret the decline of power and interest after the opening acts of *The Jew of Malta.* This decline is undeniable, though even the latter part of the play (the text of which is very corrupt) is not wanting in rough energy; but the first two acts would be sufficient foundation for the durable fame of a dramatic poet. In the blank verse of Milton alone—who perhaps was hardly less indebted than Shakespeare was before him to Marlowe as the first English master of word-music in its grander forms—has the glory or the melody of passages in the opening soliloquy of Barabbas been possibly surpassed.

In *Edward the Second* the interest rises and the execution improves as visibly and as greatly with the course of the advancing story as they decline in *The Jew of Malta.* The scene of the king's deposition at Kenilworth is almost as much finer in tragic effect and poetic quality as it is shorter and less elaborate than the corresponding scene in Shakespeare's *King Richard* **II.**

Of *The Massacre at Paris* (acted in 1593, printed 1600?) it is impossible to judge fairly from the garbled fragment of its genuine text which is all that has come down to us. To Mr. Collier, among numberless other obligations, we owe the discovery of a noble passage excised in the piratical edition which gives us the only version extant of this unlucky play.

In the tragedy of *Dido, Queen of Carthage* (completed by Thomas Nashe, produced and printed 1594), a servile fidelity to the text of Virgil's narrative has naturally resulted in the failure which might have been expected from an attempt at once to transcribe what is essentially inimitable and to reproduce it under the hopelessly alien conditions of dramatic adaptation.

The Poems—One of the most faultless lyrics and one of the loveliest fragm ts in the whole range of description and fanciful poetry would have secured a place for Marlowe among the memorable men of his epoch, even if his plays had perished with himself. His *Passionate Shepherd* remains ever since unrivalled in its way—a way of pure fancy and radiant melody without break or lapse. The untitled fragment, on the other hand, has been very closely rivalled, perhaps very happily imitated, but only by the greatest lyric poet of England—by Shelley alone. Marlowe's poem of *Hero and Leander* (entered at Stationers'

Hall in September 1593; completed and brought out by George Chapman, who divided Marlowe's work into two sestiads and added four of his own, 1598), closing with the sunrise which closes the night of the lovers' union, stands alone in its age, and far ahead of the work of any possible competitor between the death of Spenser and the dawn of Milton.

The place and the value of Christopher Marlowe as a leader among English poets it would be almost impossible for historical criticism to over-estimate. To none of them all, perhaps, have so many of the greatest among them been so deeply and so directly indebted. Nor was ever any great writer's influence upon his fellows more utterly and unmixedly an influence for good. He first, and he alone, guided Shakespeare into the right way of work; his music, in which there is no echo of any man's before him, found its own echo in the more prolonged but hardly more exalted harmony of Milton's. He is the greatest discoverer, the most daring and inspired pioneer, in all our poetic literature. Before him there was neither genuine blank verse nor a genuine tragedy in our language. After his arrival the way was prepared, the paths were made straight, for Shakespeare. (A. C. S.)

Marlowe's fame, so finely appreciated by Shakespeare and Drayton, was obscured from the fall of the theatres until the generation of Lamb and Hazlitt. Collected editions are by A. Dyce (1858, 1865, 1876); A. H. Bullen (3 vols., 1884–85); "Best Plays" in the Mermaid series by Havelock Ellis with an Introduction by J. A. Symonds (1887–89). The best modern text is that edited by C. F. Tucker Brooke (Oxf. Univ. Press, 1910). *See* J. G. Lewis, *Marlowe, Outlines of his Life and Works* (1891); J. H. Ingram, *Christopher Marlowe and his Associates* (1904); H. Jung, *Das Verhältnis Marlowes zu Shakespeare* (1904). For further information the reader should consult the histories of the stage by Collier, Ward, Fleay, Schelling and E. K. Chambers, and the studies of Shakespeare's predecessors by Symonds, Mezières, Boas, Manley, Churton Collins, Feuillerat and J. M. Robertson. *See* also Verity's *Essay on Marlowe's Influence* (1886); *Mod. Lang. Rev.* iv. 167 (M. at Cambridge); Swinburne, *Study of Shakespeare* (1880); C. F. T. Brooke, *The Marlowe Canon* (Baltimore 1922), and *Marlowe's Versification and Style* (1922); E. Seaton, *Marlowe's Map* (1924); and the separate editions of *Dr. Faustus, Edward II.*, etc. The main sources of Marlowe were as follows: for *Tamburlaine*, Pedro Mexia's *Life of Timur* in his *Silva* (Madrid, 1543), Anglicized by Fortescue in his *Foreste* (1571) and Petrus Perondinus, *Vita Magni Tamerlanis* (1551); for *Faustus:* a contemporary English version of the Faust-buch or *Historia von D. Johann Fausten* (Frankfort, 1587), and for *Edward II.*, the *Chronicles* of Fabyan (1516), Holinshed (1577) and Stow (1580).

MARLOWE, JULIA (SARAH FRANCES FROST) (1866–1950), U.S. actress, was born near Keswick. Eng., on Aug. 17, 1866, and at an early age went with her family to the United States. Her first formal appearance on the stage was in New York in 1887, although she had before that traveled with a juvenile opera company. Her first great success was as Parthenia in *Ingomar,* and her subsequent presentations of Rosalind, Viola and Julia in *The Hunchback* confirmed her position as a "star." In 1894 she married Robert Taber, an actor, with whom she played until their divorce in 1900. Subsequently, she had great success as Barbara Frietchie in Clyde Fitch's play of that name, and in other dramas. For many years, beginning in 1904, she acted with E. H. Sothern (*q.v.*)—to whom she was married, Aug. 17, 1911—in a notable series of Shakespearian plays, as well as in modern drama.

In 1924 she retired from the stage. She died in New York city on Nov. 12, 1950.

MARLY-LE-ROI, a village of northern France in the *département* of Seine-et-Oise, 5 mi. N. by W. of Versailles by road. Pop. (1954) 3,681.

Marly-le-Roi owes its celebrity to the Chbteau built towards the end of the 17th century by Louis XIV, and now destroyed. The remains now consist of a large basin, the park and a small forest. Near Marly-le-Roi is the hamlet of Marly-la-Machine, where, in 1684, an immense hydraulic engine, driven by the current of the river, was erected; it raised the water to a high tower, where the aqueduct of Marly began (700 yds. in length, 75 in height, with 36 arches) carrying the waters of the Seine to Versailles.

MARMALADE, a preserve originally made of quinces, but now commonly of Seville or other tart oranges, or of other citrus fruit. The term is sometimes (improperly) used for jams. A standard recipe for marmalade is: Two lemons. 12 Seville oranges, slice thin, remove pips, cover and steep for three days in cold water, allowing three pints water to each lb. of fruit. Then boil in a preserving pan till tender, let cool and add 1 lb. of sugar for each lb. of fruit. Boil, skimming well and cook until the mixture stiffens quickly when dropped on a cold plate.

MARMANDE, a town of southwestern France, capital of an *arrondissement* in the *département* of Lot-et-Garonne, 35 mi. N.W. of Agen, on the Southern railway from Bordeaux to Cette. Pop. (1954) 8,536. Marmande was a *bastide* founded about 1195 and its position on the Garonne made it an important place of toll. It soon passed into the hands of the counts of Toulouse, and was three times besieged and taken during the Albigensian crusade, its capture by Amaury de Montfort in 1219 being followed by a massacre of the inhabitants. It was united to the French crown under Louis IX. A short occupation by the English in 1447, an unsuccessful siege by Henry IV. in 1577 and its resistance of a month to a division of Wellington's army in 1814, are the chief events in its subsequent history. Marmande is situated on the Garonne at its confluence with the Trec. The Garonne is here crossed by a suspension bridge. Public institutions include the sub-prefecture, and tribunals of first instance and commerce. Apart from the administrative offices, the only building of importance is the church of Notre-Dame, which dates from the 13th, 14th and 15th centuries. Among the industries are iron-founding, steam sawing, manufacture of woollens and brandy-distilling.

MARMONT, AUGUSTE FREDERIC LOUIS VIESSE DE, DUKE OF RAGUSA (1774–1852), marshal of France, was born at Chbtillon-sur-Seine on July 20, 1774, the son of an ex-officer in the army. He studied mathematics at Dijon with a view to entering the artillery, and there met Bonaparte, with whom he later served in Toulon. Marmont became Bonaparte's aide-de-camp, remained with him during his disgrace, and accompanied him to Italy and Egypt, being promoted to general of brigade. He returned to Europe in 1799, organized the artillery for the expedition to Italy, and was made general of division for his services at Marengo. In 1801 he became inspector-general of artillery, and in 1804 grand officer of the Legion of Honour, but was not made marshal. In 1805 he fought at Ulm, and then became for five years governor of Dalmatia, where his beneficent régime was long remembered. In 1808 he became duke of Ragusa, and in 1809 Napoleon summoned him to take part in the closing operations of the Austrian War, and made him governor-general of the Illyrian provinces of the empire. In July 1810 Marmont succeeded Masséna in command in the north of Spain, and was wounded at Salamanca. He was hardly cured when, in April 1813 Napoleon gave him the command of a corps with which he served throughout the defensive campaign of 1814, until the last battle before Paris, from which he drew back his forces to the commanding position of Essonne, where he had 20,000 men. Marmont then took upon himself a political role which has been stigmatized as treasonable, concluding a secret convention with the enemy. This act was never forgiven by Marmont's countrymen, and although made a peer of France and a major-general of the royal guard at the Restoration, he was never trusted. In July 1830 he was ordered to put down any opposition to the ordinances, and although opposed to the court policy he only gave up the attempt to suppress the revolution when it became clear that his troops were outmatched. The duc d'Angoulême ordered him under arrest, fearing further treachery, but Marmont went into exile with the king, forfeiting his marshalate. He finally settled in Vienna, and became tutor to the duke of Reichstadt. He died at Venice on March 22, 1852. Marmont's *Memoires* are of great value for the military history of his time.

His works include *Voyage en Hongrie, etc.* (4 vols. 1837); *Voyage en Sicile* (1838); *Esprit des institutions militaires* (1845); *Mémoires* (8 volumes, 1856).

MARMONTEL, JEAN FRANÇOIS (1723–1799), French writer, was born at Bort (in Cantal), on July 11, 1723. After studying with the Jesuits at Mauriac, he taught in their colleges at Clermont and Toulouse; and in 1745, acting on the advice of Voltaire, he set out for Paris to try for literary honours. From 1748 to 1753 he wrote a succession of tragedies which, though only moderately successful on the stage, secured the admission of the author to literary and fashionable circles. He wrote a series of articles for the *Encyclopédie;* also the libretti of several comic operas, among others Sylvain (1770) and *Zémire* et *Azore* (1771). In the Gluck-Piccini controversy he was an eager partisan of Piccini with whom he collaborated in *Didon* (1783) and *Pénélope* (1785). In 1758, through Madame de Pompadour, he obtained a place as a civil servant, and the management of the official journal Le *Mercure,* in which he had already begun the famous series of Contes moraux. The merit of these tales lies partly in the delicate finish of the style, but mainly in the graphic and charming pictures of French society under Louis XV. The author was elected to the French Academy in 1763. In 1767 he published a romance, *Bélisaire,* which incurred the censure of the Sorbonne and the archbishop of Paris for a chapter on religious toleration. Marmontel retorted in *Les* Incas (1778) by tracing the cruelties in Spanish America to the fanaticism of the invaders.

He was appointed historiographer of France (1771), secretary to the Academy (1783), and professor of history in the Lycée (1786). Marmontel retired in 1792 to Evreux, and soon after to a cottage at Abloville in the department of Eure. To that retreat we owe his *Mémoires d'un père* (4 vols., 1804, new ed. by M. Tourneux, 3 vols., 1891), giving a picturesque review of his whole life, a literary history of two important reigns, a great gallery of portraits extending from the venerable Massillon, whom more than half a century previously he had seen at Clermont, to Mirabeau. He died on Dec. 31, 1799 at Abloville.

The *Contes Moraux* were early translated into English, and many editions of them exist. A summary of the best of them is given by G. G. Saintsbury in *Hist.* of the French Novel, vol. i. (1917).

See also C. A. Sainte-Beuve, Causeries *du lundi,* iv.; S. Lenel, *Un* Homme de *lettres au XVIII. siècle, Marmontel* (1902).

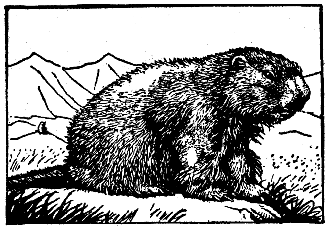
MARMORA (anc. Proconnesus), an island in the sea of the same name. (See below.) Originally settled by Greeks from Miletus in the 8th century B.C., Proconnesus was annexed by its powerful neighbour Cyzicus in 362. The island has at all times been noted for its quarries of white marble which supplied the material for many of the buildings of Constantinople.

See C. Texier, Asie mineure (1839–49); M. I. Gedeon, Προκόννησος (Constantinople, 1895); an exhaustive monograph by F. W. Hasluck in Journ. Hell. Stud., xxix. (1909).

MARMORA, SEA OF, the small inland sea which (in part) separates the Turkish dominions in Europe from those in Asia, and is connected through the Bosporus with the Black Sea (*q.v.*) and through the Dardanelles with the Aegean. It is 170 m. long (E. to W.) and nearly 50 m. in extreme width, and has an area of 4,500 sq.m. Its greatest depth is about 700 fathoms, the deepest parts (over 500 fathoms) occurring in three depressions in the northern portion—one close under the European shore to the south of Rodosto, another near the centre of the sea, and a third at the mouth of the Gulf of Ismid. There are several considerable islands, of which the largest, Marmora, lies in the west, off the peninsula of Kapu Dagh, along with Afsia, Aloni and smaller islands. In the east, off the Asiatic shore between the Bosporus and the Gulf of Ismid, are the Princes' Islands. The Sea of Marmora is the ancient *Propontis,* Turk. Marmara *Denizi.*

MARMOSET, the name of any of the small tropical American monkeys classed in the family Callithricidae. Marmosets are not larger than squirrels and present great variation in colour; all have long tails, and many have the ears tufted. They differ from the other American monkeys in having one pair less of molar teeth in each jaw. The common marmoset, or ouistiti, is *Callithrix jacchus.* See PRIMATES.

MARMOT, a large, thickly built, burrowing Alpine rodent allied to the squirrels, and typifying the genus *Marmota,* of which there are numerous species ranging from the Alps through Asia north of the Himalaya, and in North America. All these may be included under the name marmot. In addition to their stout build and thickly haired tails, marmots are characterized by the absence of cheek-pouches. Europe possesses two species, the Alpine or true marmot (*M. marmota*), and the more eastern bobac (M. bobac); and there are numerous kinds in Central Asia, one of which, the red marmot (M. caudate), is a larger animal, with a longer tail. Marmots inhabit open country, either among mountains, or in the plains; and associate in large colonies, forming burrows, each tenanted by a single family. During the daytime the hillock at the entrance to the burrow is frequently occupied by one or more members of the family. In the winter when the ground is deep in snow, marmots retire to the depths of their burrows, and the winter sleep is probably unbroken. From two to four is the usual number of young in a litter. There are three species in North America, the most widespread of these known as woodchucks (*q.v.*); two other species occur in the western mountains.



THE ALPINE MARMOT. A RODENT RELATED TO THE GROUND SQUIRRELS

The red-bellied marmot (M. *flaviventris* ranges from New Mexico and southern California to British Columbia, while the hoary marmot or whistler (M. caligata) is found from Alaska to the high mountains of Idaho. (See RODENTIA.)

MARNE, a department of north-eastern France, made up from Champagne-Pouilleuse, Rémois, Haute-Champagne, Perthois, Tardenois, Bocage and Brie-Pouilleuse, districts formerly belonging to Champagne, and bounded west, by Seine-et-Marne and Aisne, north by Aisne and Ardennes, east by Meuse, and south by Haute-Marne and Aube. Pop. (1936) 410,238. Area 3,168 sq. miles.

The western half of the department is hilly (920 ft. near Reims) with Tertiary rocks of the Paris basin deeply cut by Marne, Vesle and Suippe. From beneath the eastward-facing scarp edge of these rocks the chalk emerges to floor the eastern half of the department (Champagne Pouilleuse), the surface of which rises eastward up the dip slope of the rock to the forested scarp (860 ft.) of the Lower Chalk, again facing east. From beneath this, in turn, emerge the impervious Lower Cretaceous rocks of La Champagne humide, drained by the upper Aisne, which runs northward, parallel to the scarp.

Marne has the temperate climate of the Seine region; the annual mean temperature is 50°, the rainfall about 24 in. Oats, wheat, rye and barley, lucerne, sainfoin and clover, and potatoes, mangold-wurzels and sugar-beet are the principal agricultural crops, and choice vegetables are grown. The raising of mixed merino sheep and of other stock and bees is profitable The vineyards on the hill slopes of Reims, Épernay and Chblons produce the best Champagne. Pine woods are largely planted in Champagne-Pouilleuse. The department produces peat, fire-clay, millstones and chalk.

Reims has an old-established woollen industry. The manufacture of wine-cases and other goods for the wine trade is carried on. There are also small metalworks. Besides these there are glassworks, whiting and oil works. The chief imports are wool and coal; exports are wine, grain, live-stock, stone, whiting, pit-props and woollen stuffs. Communication is afforded chiefly by the river Marne and by the Eastern railway. There are four arrondissements—namely those of Chblons (the capital), Épernay, Reims, and Vitry-le-Franqois—with 33 cantons and 662 communes. The department belongs partly to the archbishopric of Reims and partly to the see of Chblons. Châlons is the headquarters of the VI. army corps (Metz). Its educational centre and court of appeal are at Paris. Tbe principal towns are Chblons-sur-Marne, Reims, Bpernay and Vitry-le-François, Ay and Sézanne.

MARNE, a river of northern France, 328 m. long, rising on the Plateau of Langres, 3 m. S. of Langres, flowing in a wide valley across the Jurassic and Cretaceous rocks of the Paris basin and uniting with the Seine at Charenton, an eastern suburb of Paris. Leaving Langres on the left the river flows northward, passing Chaumont, as far as St. Dizier, where it turns west, receives the Blaise (left), passes Vitry-le-François where it receives the Saulx (right), Chblons and Epernay, where it enters picturesque and undulating country of Tertiary rocks. It passes Chateau-Thierry and Meaux and is joined by the Petit-Morin (left), Ourcq (right) and Grand-Morin (left). It is canalized from Paris to Dizy beyond which it is accompanied by a lateral canal which connects with the Saône. It is also connected by canal with the Rhine and the Aisne.

MARNE, THE FIRST BATTLE OF THE (Sept. 6–9, 1914), the first great turning point in the World War. A strategically decisive victory for the Allies, it brought the rapid and apparently resistless advance of the German hosts through Belgium and France to a halt and forced them to retire northwards. The French reckon in the battle only the Armies west of Verdun, thus excluding Dubail's and de Castelnau's Armies[1] in Alsace-Lorraine; the Germans include the whole front from Belfort round to Paris, and, as they attacked on this with all their seven Armies and the fighting east of Verdun formed an important part of their plan, their definition is followed here.

After the "Battles of the Frontier" in the later part of August and the retreat of the French and British forces, Gen. Joffre attempted to lengthen his line to the westward and prevent envelopment of the Allied left flank by collecting near Amiens on the left of the British Expeditionary Force a new army, under Gen. Maunoury, formed of divisions drawn from other parts of the line. Before this Army could be completely organized, its leading divisions came into contact with the enemy and became involved in the general retirement.

At this period the B.E.F., under Field-Marshal Sir John French, consisted of:—

I. Corps (Lieut.-Gen. Sir D. Haig)
 1st Division (Maj.-Gen. S. H. Lomax),
 2nd Division (Maj.-Gen. C. C. Monro).
II. Corps (General Sir H. L. Smith-Dorrien),
 3rd Division (Maj.-Gen. H. I. W. Hamilton),
 5th Division (Maj.-Gen. Sir C. Fergusson).
III. Corps (Maj.-Gen. W. P. Pulteney),
 4th Division (Maj.-Gen. T. D'O. Snow), with 19th Infantry Brigade attached.

The Cavalry Division (Maj.-Gen. E. H. H. Allenby), of 4 cavalry brigades, and the 5th Cavalry Brigade.

The Royal Flying Corps (Brig.-Gen. Sir D. Henderson) of 5 squadrons.

Lines of Communication troops.

The German Movements and Orders Before the Battle.—As the German pursuit proceeded, Gen. von Kluck, commanding the German I. Army on the extreme west of the line, which had fought at Mons and Le Cateau and occupied Amiens, came to the conclusion that the B.E.F. and Maunoury's troops were routed and practically dispersed, and that Gen. Lanrezac's Army on the right of the British was in consequence the left of the French line. The action of Lanrezac in attacking at the battle of Guise (Aug. 29–31), without assistance on his left, confirmed him in these views. In conjunction, therefore, with Gen. von Bülow (II. Army), instead of continuing the advance in order to cross the Seine below Paris, as ordered, Kluck on Aug. 31 wheeled south-eastwards past the northern front of the French capital, with the object of striking the supposed French flank. After some of his advanced troops and his cavalry corps had been roughly handled by the British on Sept. 1, he turned south, but subsequently resumed his south-eastward course. The German Supreme Command at first accepted Kluck's views, but on Sept. 4 Gen. von Moltke, the Chief of the General Staff and virtual Commander-in-Chief, became alarmed. Information reached him that the French were passing divisions from east to west, and that there were considerable assemblies of troops near Paris. On the evening of the 4th he despatched to the seven German Armies, warning messages, which he consolidated into a formal operation order on the 5th. This order brought to an end the great wheel that was to sweep the French into Switzerland, and substituted for it a plan by which the Paris forces were to be held off by the I. and II. Armies, whilst the other five armies attacked and enveloped what remained of the French forces. The supreme command operation order, the only one issued in regard to the battle, is of such importance that the greater part of it is quoted:—

"The enemy is bringing up new formations and concentrating superior forces in the neighbourhood of Paris to protect the capital and threaten the right flank of the German Armies.

"The I. and II. Armies must therefore remain (sic) facing the east front of Paris. Their task is to act against any operations of the enemy from the neighbourhood of Paris and to give each other mutual support to this end.

"The IV. and V. Armies are still operating against superior forces. They must maintain constant pressure to force them south-eastwards . . . Whether by co-operating with the VI. and VII. Armies they will then succeed in forcing any considerable part of the enemy's forces towards Swiss territory cannot yet be foreseen.

"The VI. and VII. Armies will continue to hold the enemy in position in their front, but will take the offensive as soon as possible against the line of the Moselle between Toul and Epinal, securing their flanks against these fortresses.

"The III. Army . . . will be employed as the situation demands either . . . to support the I. and II. Armies or to co-operate . . . in the fighting of our Armies on the left wing."

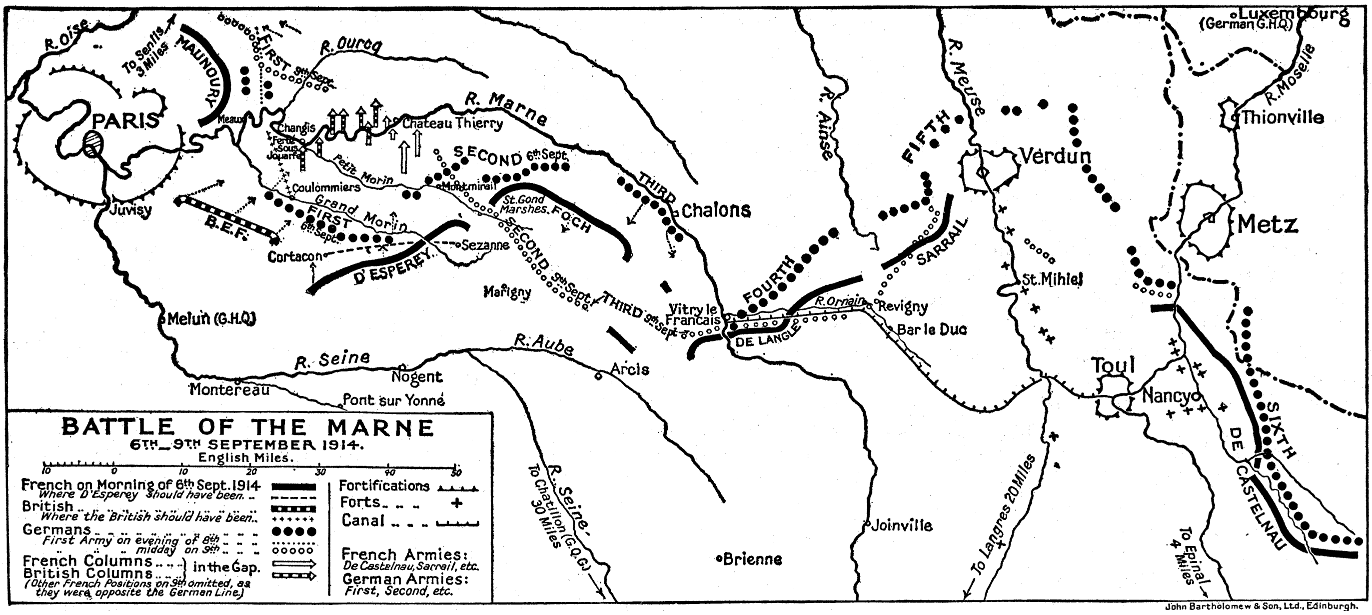
Regardless of the fact that the I. Army was beyond the Marne going south, it was ordered to remain, facing west, between the Oise and the Marne, and the II. Army, not yet across the Marne, was ordered to remain between that river and the Seine. The II. Army took immediate steps to obey this order; Bülow ordering his right corps as pivot to halt and the remainder to wheel forward so as to change front from south to west. The first stage of the wheel, to be carried out on the 6th, was to be to the line Montmirail–Marigny, a position not quite reached by the II. Army when the battle came to an end on the 9th. The I. Army continued its advance on Sept. 5 towards the Seine, Kluck reporting that he considered it best to settle with the French armies in the field first and then invest Paris. He, however, began preparatory steps for facing west, and when, in the afternoon, the representative of the supreme command, Lieut.-Col. Hentsch arrived, he approved of the preparations, but added that "the movement to face west might be made at leisure; no special haste was necessary." Thus on the afternoon of September 5 four corps of the I. Army were across the Grand Morin, with two cavalry corps ahead of them; but there was only a weak flank guard, the IV. Reserve Corps (3 infantry brigades) and the remains of the 4th Cavalry Division (smashed up by the British on Sept. 1) in échelon behind its right flank. The II. Army was a day's march behind the I., still facing south; the other German Armies were acting in conformity with their orders.

The French and British Movements and Orders.—The change of direction, to the south-east, of the German I. Army had been observed and reported by British aviators on the morning of Sept. 3, and they added at 5 P.M. that it was crossing the Marne. At 7 P.M. Maunoury reported that there were no German troops west of a line Paris–Senlis; at 8:45 P.M. the British found that there was only one German corps (IV. Reserve) left in the Ourcq valley All this information was fully confirmed on the 4th. Gen. Joffre, however, did not at once change his plans. Three days previously on Sept. 1, by instruction No. 4, sent out by officers in motor cars at 2 P.M., he had provisionally fixed as the limit of the retirement the moment when his armies were situated as follows:—

"Sarrail's army north of Bar de Duc;
De Langle's army, behind the Ornain east of Vitry;
Foch's army behind the Aube, south of Arcis;
Lanrezac's army, behind the Seine, south of Nogent."

On the 2nd, at 11:40 P.M., he had by a note changed this limit and put the general line on which his forces as a whole should establish themselves considerably farther back on the right. It was defined by Joinville, Brienne, Arcis, Nogent and Pont sur Yonne.

[1]For the sake of clearness, the French Armies are called by the names of their commanders; the Germans by their numbers.



The British were to be behind the Seine, close to Paris, from Melun to Juvisy, their left in touch with Maunoury's Army, now part of the garrison of the entrenched camp of Paris. The Military Governor of Paris, Gen Galliéni, who had been warned on Sept. 3 (apparently about 8 A.M.) that his troops in the eventual offensive would be required to act in the direction of Meaux, seems to have been the first to realize that there was no time to lose in taking advantage of the tremendous opportunity that the Germans were offering by their flank march past Paris. At 9 A.M. on the 4th he proposed to Gen. Joffre by telephone to use his forces at once to attack from north of Paris eastwards against the German flank. The French commander-in-chief replied at noon by telegraph approving of the idea, but preferring that the attack should be made south not north of the Marne, which meant postponement and loss of time. Joffre then set about ensuring the co-operation of the B E.F., and about 4 P.M. received through the mission at Sir John French's headquarters at Melun, to which Galliéni had paid a visit, a definite assurance of the fullest support. Meantime he had been in communication with d'Esperey—now in command, vice Lanrezac of the V. Army—as to the condition of his troops and when they could attack. Between 5 P M. and 8 P.M. two telegraph messages arrived from d'Esperey—the exact hour cannot be fixed, the times of receipt are not marked, but they are between letters received at 5 P.M. and 8 P.M. In these he stated that he could not attack before the 6th, and that Gen. H. Wilson, the sub-chief of the general staff of the British army, who was with him, agreed that the B.E.F. could be on the line Coulommiers–Changis on that date. Gen. Joffre had meantime fixed on the 7th. In the evening, however, Galliéni on return from British G.H.Q. again telephoned personally to him informing him of the measures taken for the eastward march of the Army of Paris and urging him that there was not a moment to be lost, with the result that Joffre definitely informed Galliéni that the general attack would take place on the 6th, and that he might attack north of the Marne as he wished, and gave him a summary of his orders, in which the destination of the B.E.F. as mentioned above was specified. Orders were then prepared, and telegraphed in cypher timed 11:15 P.M. on Sept. 4, to Maunoury and d'Esperey, 11:50 P.M. to Foch and Galliéni, and 12:10 A.M. on the 5th to British headquarters. Duplicates were sent by motor car

General Joffre's orders directed the forces on the left of his line to take up positions during Sept 5 ready to attack on the front and flank of the German I and II. Armies on the morning of the 6th. Maunoury was to be north-east of Meaux, ready to cross the river Ourcq eastwards in the direction of Château Thierry; the B.E.F. to advance to the line Coulommiers–Changis, ready to move north-eastwards; d'Esperey to fall back to the line Sezanne-Courtacon, and then attack northwards; Foch was to cover the right of d'Esperey by holding the exits of the Marais de St. Gond.

In order to profit by the coolness of the night the troops of Foch, d'Esperey and Sir J. French had marched off before the orders arrived. Galliéni received his copy at 2:35 A.M., but, knowing Joffre's intentions after his telephone conversation, which closed before 10 P.M., had already passed the information on to Maunoury. Foch, whose headquarters were nearest to the Grand Quartier-Général, then at Chatillon, received his at 1:30 A.M. and between 5 and 6 A.M. he was able to stop the retirement of his corps. D'Esperey was not so fortunate; what time he received the telegram is not recorded, but his orders founded on it are timed 6 A.M. His corps, having moved off at midnight to continue their retirement, he could not do more than modify the halting places of some of them; his centre arid left passed the line defined by Joffre, and the right detained by rear-guard fighting with the enemy did not reach it. The B.E.F. was in worse case. The orders carried by motor reached G.H.Q. before the telegram, at 3 A.M., and the corps had already started southwards, one of them five hours earlier. Thus the British made a march farther to the south than Joffre counted on, and had two marches to the front to reach the place assigned, instead of one. It was in all probability a fortunate circumstance that the B.E.F. was not in a position to obey and try to reach the line Coulommiers–Changis on the 5th. For if it had done so its five divisions and one cavalry division cut off from all help would have come isolated into collision with the greater part of eight divisions of the German I. Army and four cavalry divisions. Early on Sept. 5, Joffre issued orders to his centre: to de Langle to stay his retreat and attack northwards; to Sarrail to attack westwards against the German flank presented to the troops near Verdun.

Sept. 5: The First Contact.—The Germans, the exponents of envelopment, by thrusting forward between Verdun and Paris, had placed themselves in a position exposed to envelopment on both flanks. They had completely misunderstood the situation, over-estimated their initial successes and under-estimated the fighting powers of the Allies. Gen. von Kuhl, Kluck's chief of the staff, has written:—

"Neither the supreme command nor I. Army headquarters had the remotest idea of an immediately imminent offensive of the whole French Army. The continuation of the French retreat was accepted as settled. There was only a question of our flank being threatened from Paris. . . . The great offensive on the whole front of the forces came as a complete surprise. No sign, no prisoner's statement, no newspaper tattle had given warning of it."

But this was not the end of their mistakes. By Moltke's orders of the evening of Sept. 4, the I. and II. Armies were to face towards Paris. This might guard the flank of the German army as a whole, but would expose their own particular left flank in the new position to the oncoming French, and would leave an enormous gap in the original front towards the south. Yet this extraordinary order Biilow was proceeding to carry out, although Kluck was in no hurry to do so, seeing no necessity to be frightened at the "Paris bogey." Events of the 5th, however, were to scare the latter commander out of his optimism. Pressing on south-eastwards with four corps and taking no precautions to investigate the situation on his flank either by cavalry or aeroplane, his flank guard came in contact about 1:30 P.M. with an advanced guard of Maunoury's army, north-west of Meaux, and was forced back. This began the battle of the Ourcq. Owing to bad staffwork, or an attempt to conceal a defeat, news of this disaster—which meant that his right, now 6m. south of Meaux was completely uncovered—did not reach Kluck until "shortly after midnight." At last he set hurriedly about obeying the supreme command's orders to take position between the Marne and the Oise. But even now only partially. Early on the 6th he sent first the II. Corps (his right) and then the IV. back across the Marne to the assistance of his flank guard, leaving his other two corps with Biilow. Before dealing with the fighting on the Ourcq and in the British sector of the battle, where the decision fell, the events on the eastern flank and centre, where practically deadlock set in, will be summarized.

The Battle on the Eastern Flank and in the Centre.—The German VII. and VI. Armies, under Crown Prince Rupprecht, were "to attack against the Moselle between Toul and Epinal." That is, they were required to force the fortress line of the French eastern frontier. Yet it was to avoid the uncertainties and difficulties of this very task that the German Government had taken the momentous decision to allow their Armies to enter Luxembourg and violate Belgian neutrality. Until Moltke had "watered down" the plan of his predecessor, Field-Marshal Graf Schlieffen, it had been intended to enter Netherlands territory also. The enterprise proved beyond the powers of the Germans. Met by the stout defence of Dubail's and de Castelnau's armies, Rupprecht's armies were unable to make any progress and lost heavily, so that on Sept. 8 he stopped the offensive in order to spare the troops, and was ordered "to prepare to occupy a rear defensive position at once."

The German V. and IV. Armies did no better. Pushing on past the west side of Verdun, the V. (crown prince of Prussia) had to face eastwards towards the fortress. It prevented Sarrail from making any attempt to roll up the German line, but suffered most severely from French artillery fire and for three days was pinned to the ground. A diversion by small forces east of Verdun had no effect. At 2 P.M. on the 9th the Crown Prince, in desperation, ordered a night attack in the hope of capturing the French guns that were killing his men. This operation, owing to short notice, was a complete fiasco, the Germans firing on each other.

The German IV. Army, assisted by half of the III. Army, encountered de Langle, who stood on the defensive and then counter-attacked. After severe fighting on his flanks (actions of Revigny and Vitry), the Germans failed to make ground. By the morning of the 9th, the Germans were reduced by the French artillery fire to seeking what shelter they could in trenches and dead ground. Thus on the eastern half of the battlefield, where the Germans were the attackers, they had the worse of the fighting and there was no decision.

The II. Army (Biilow) and the other half of the German III. Army co-operating with it were at the opening of the battle facing nearly south, half-way between the Seine and Marne. Opposite them were Foch's army and the right of d'Esperey's. The former general—owing to his having received Joffre's orders of Sept. 4 in time to act on them—was actually in contact with the enemy. Severe fighting at once ensued near the Marais de St. Gond. But it was not Biilow's object to break through. He was merely pivoting on his centre so as to change from facing south to facing west towards Paris, between the Seine and the Marne, endeavouring to reach the line Montrnirail-Marigny. Thus heavy pressure was brought on Foch, and he was forced back and had to call on d'Esperey for help. But, with the assistance of the X. Corps lent by d'Esperey and of the XVII. Corps sent by Joffre to fill the gap between his army and de Langle's, Foch was able to remain in the line and fulfil his task of guarding the flank of Joffre's main attack of the left wing—d'Esperey, French and Maunoury.

The Allied Left Wing.—It has been seen how on the morning of the 6th Kluck (I. Army) had withdrawn the II. and IV. Corps to succour his flank guard threatened by Maunoury on the Ourcq. This left in front of d'Esperey and French the right half of the German II. Army (the pivot of Biilow's wheel), the IX and III. Corps of the I. Army, rear guards of the II. and IV. Corps, and two cavalry corps. During the day d'Esperey made no progress but the B.E.F. gained ground against a weakening opposition, about 5m. on the right, which had to wait for the French, and 12m. on the left. Maunoury also made an advance, and so dangerous did it appear that on the morning of the 7th Kluck summoned the IX. and III. Corps from their place in the line next to the II. Army, and sent them also back across the Marne to join the rest of his army on the Ourcq. These two corps were thus marching on the 7th and 8th, and were wasted so far as the battle went; for they only appeared opposite Maunoury on the 9th. In the great gap, some 30m. wide, left in the German front by the removal of the I. Army were now only two cavalry corps (which contained five Jager battalions and extra machine-gun companies) and some infantry detachments, and no one was appointed to take command of them as a whole.

The way through the German front appeared almost open: the Germans themselves had created a gap in their front such as, in the succeeding years of trench warfare, each side strove in vain to batter through its opponent's line. Unfortunately Gen. Joffre's plan, like the famous Plan XVII. with which the campaign had been opened, took no account of ground. In Aug. 1914 the French were committed to an offensive into the defiles of the Vosges and the forests of the Ardennes, where they were ambushed by the enemy. Now the advance of d'Esperey and the B.E.F. was confronted by a series of transverse rivers, the Grand Morin, the Petit Morin and the Marne, all passable only at the bridges, some of which had been destroyed by the French in the retreat. Nevertheless, in very hot, dry and dusty weather, the Allies forced the passage of the Grand Morin on the 7th and of the Petit Morin on the 8th. The German resistance in the gap was practically broken, and there was every chance of cutting off Kluck and falling on his rear, although he hastily despatched first a composite brigade and then the 5th Division to stop the British. On the evening of the 8th Sir John French's five divisions were close up to the Marne. D'Esperey, having farther to go, was not within reach of the river; but his right had driven back the right of the German II. Army and widened the gap. Maunoury's army (of seven divisions, only two of which were active troops, the rest being reserve), had ceased to make any progress against the six divisions of the German I. Army, to reinforce which four more were now on the way.

Sept. 9th: The Passage of the Marne.—Early on Sept. 9 the British cavalry, driving off the Germans, seized two bridges over the Marne below Château Thierry; the 6th Infantry Brigade secured another, and by 7:30 A.M. the I. Corps (Haig), the right of the B.E.F. was beginning to cross the river. In the centre, the II. Corps (Smith-Dorrien) found two bridges intact and undefended, and by 9 A.M. the vanguards of both its divisions were across. Reports were now received from the Flying Corps that there were large masses of Germans north of Château Thierry (actually the German jth Cavalry Division and infantry attached to it), and the I. Corps, as there were no French troops across the river on its right, halted and began to entrench to secure itself against a counter-stroke. As the French historian, Gen. Palat, has written, "our Allies were very notably ahead of Conneau's Cavalry Corps, which itself was bound to outpace the V. Army (d'Esperey)." The head of the jth Division, the left of the II. Corps, met with considerable resistance after crossing from a German composite brigade, and the 3rd Division, learning this and finding the I. Corps on its right at a standstill, also halted.

On the left, the 4th Division (Snow) had started at 4:45 A.M. with the intention of crossing at La Ferté sous Jouarre. It found both bridges over the Marne, there nearly a hundred yards wide and very deep, broken (they had been blown up by the French in the retreat); the enemy were holding the farther bank at all likely points of passage. About 1 P.M., two battalions, followed later by a third, managed to cross by a weir a mile above La Ferté, and another battalion crossed at a railway viaduct 3m. above. But by this time, 2:30 P.M., the Germans had abandoned the defence of the passages, and were making off. Conneau's cavalry on the British right did not begin crossing the Marne at Azy just below Château Thierry until 1 P.M. (Palat), and did not get up level with the British I. Corps until the latter had halted for the night. Meanwhile, farther east, Foch was again heavily attacked, particularly on his right, but d'Esperey was making good progress, driving back Bülow's right, so that he was able to lend Foch a division. The latter therefore withdrew Grossetti's division from his left in order to restore the combat on his right by counter-attack.

On the British left, Maunoury's left was being forced back on the exterior defences of Paris, for he had against him the additional weight of the greater part of Kluck's III. and IX. Corps, which had now reached the battlefield, and also the fourth brigade of the IV. Reserve Corps which had appeared from Antwerp on his outer flank. But the farther the German I. Army advanced from the Ourcq the more it suffered from the fire of the heavy guns of the Paris defences, which had been brought into the field, and had already taken heavy toll of it in the previous three days' fighting. Where, therefore, the enemy seemed to be advancing—opposite Foch's right and against Maunoury—further progress was unlikely and a decision impossible. Kuhl goes even farther, and says:—

"Even a victory over Maunoury could not prevent us [I. Army] from having our left flank enveloped by superior force, and from being driven away from the main army. The I. Army stood isolated."

At this crisis, at 1 P.M., the Germans began their retirement from the battlefield.

The German Retirement.—What happened on the German side was the subject of a special enquiry in 1917, after Hindenburg had become chief of the general staff; numberless books have been written in Germany on the battle, and a strenuous endeavour has been made to show that the German retreat was unnecessary. One school would attribute it to a misunderstanding—the I. Army (Kluck) and the II. Army (Bülow) retiring because each thought the other was doing so. The German official history and an official monograph entitled *Das Marnedrama* issued by the *Reichsarchiv* take the view that the retreat was ordered by Lieut.-Col. Hentsch as the representative of the Supreme Command with full powers for the purpose. The monograph sums up the matter in the words:—

"Thanks to the initiative of the German Army and corps commanders, thanks to the ability of the regimental leaders right down to platoon and section leaders, thanks to the valour of the troops, the battle ended with the victory of the German arms at the decisive point. . . . Then the forces on the Western Front were called back from the victory they had won by the word of the representative of the supreme command."

This view does not, however, seem to be borne out by admitted facts. Gen. von Bülow (subsequently promoted to Field-Marshal) definitely claimed to have ordered a retirement of his army, and thereby to have saved the situation. The committee of enquiry found that Bülow came to this decision "independently." At 9 A.M. on the 9th he received definite air reports that six columns (five British and one French cavalry) were approaching the Marne, and, no news of any success of the I. Army reaching him, by 11 A.M. he had issued orders for the retreat to begin at 1 P.M. and so informed the I. Army; the movements took place accordingly, and the III. Army conformed to them.

What happened at I. Army (Kluck) headquarters is not quite so clear. There are two distinct versions, those of Lieut.-Col. Hentsch, the emissary of the supreme command. and Gen. von Kuhl, Kluck's chief of the staff. Hentsch had been despatched by Gen. von Moltke at midday on the 8th to visit the V., IV., III., II. and I. Armies in succession, a round trip of 400m. According to the court of enquiry, the proceedings of which Ludendorff promulgated to the general staff, Hentsch was given full powers to co-ordinate a retreat, "should rearward movements have been initiated"—and he was despatched by Moltke in full expectation that such movements had been begun. Hentsch found none had taken place in the V., IV. and III. Armies, and then spent the night of the 8th–9th at II. Army headquarters, where he observed a spirit of depression and pessimism. He left early on the morning of the 9th, before definite orders for the retreat had been given, but apparently convinced that they would soon be given. Owing to blocks and panic on the road, it was past midday when he arrived at I. Army headquarters, taking seven hours to go 60m.; he did not see Gen. von Kluck, dealing only with Kuhl. Hentsch states that he found orders for retirement had already been issued. Kuhl denies this, but admits that such orders had gone out by telephone owing to the overzeal of a subordinate officer, since dead, who had misunderstood him. What, according to Kuhl, had been ordered at 11:30 A.M., and was in course of execution in view of the British advance, was a wheel backwards of the left only of the I. Army. Thus Kuhl's contention is that Hentsch, in view of the situation of the II. Army, ordered the I. to retreat and quoted his full powers given for the purpose of co-ordinating a retirement. Hentsch's statement is to the effect that the retirement had been decided on, and that he merely gave Kuhl the direction in which the I. Army was to retire, north-eastwards, so as to join up with the II. Army. The court of enquiry accepted Kuhl's view, adding, however, that Hentsch was justified "as the case provided for in his instructions, the initiation of rearward movements, had arisen." A curious feature of the events at German I. Army headquarters is that Kuhl, by his own account, accepted Hentsch's verbal instructions without requiring that so important a decision should be in writing, and without taking him to see Kluck, the army commander. In one of the books that he has written on the battle he has admitted that:—

"The break-through of the British and the French V. Army which was threatening brought about the decision in the battle of the Marne."

At 2 P.M. the retirement of the I. Army in the general direction of Soissons was begun. Its preliminary movements having brought it from facing west to facing south-west, and all the roads having been cleared by sending back the transport and trains, it was a comparatively easy matter. But, owing to the direction of the British advance, the I. Army could not incline inwards towards the II. Army and retreated due north, still leaving a gap in the German line. The German withdrawal, covered by rear guards, was not immediately obvious. It was not until 3 P.M. that the British I. Corps resumed its advance, and then owing to its fatigue only a short one was made to a line 5m. from the Marne. The left (5th) division of the II. Corps remained in contact with the enemy until dusk. It was not until 9 P.M. that the 4th Division on the extreme left was able to begin a bridge over the Marne at La Ferté, ten of its 16 battalions (including the 19th Brigade) being then still south of the river. Conneau's Cavalry Corps had crossed the Marne at Château Thierry, and now came up alongside the I. Corps but none of d'Esperey's infantry had reached the Marne. In Foch's Army Grossetti's division brought from the left to counter-attack arrived too late to follow the enemy except with a few shells. It was not until 5 P.M. that Maunoury, after a hard day's fighting in which he had been reinforced by every man that Galliéni could send from the Paris garrison, was able to report that the Germans were in retreat, covered by their artillery.

The evening reports from the air confirmed that everywhere along the battle line retrograde movements of the enemy were taking place; but, his main bodies having got a good start during the day, and his rear guards being able to slip off in the darkness, there was no pursuit until next day. and then Joffre's instructions to Maunoury were to gain ground to the left and endeavour to envelop the enemy's right; the order to head the columns off by flanking them from the west was not issued until the 13th. The

German I. and II. Armies were thus able to pursue their way practically undisturbed back to the Aisne, there to make another stand. The gap between them was then filled by fresh troops released by the capitulation of Maubeuge. At 5 P.M. on the 10th orders were sent by the supreme command to the IV. Army to retire, and at noon on the 11th to the V. Army. The VI. and VII. Armies had ceased their attacks on the 9th and retired to a selected line.

The Victory. — At 8:15 P.M. on the 9th Sir John French's orders changed the word "advance" of the previous days to "pursuit"; Gen. d'Esperey, in an order issued from the historic field of Montmirail on the same evening, accurately summarized the battle:—

"Held on his flanks, his centre broken, the enemy is now retreating towards the east and north by forced marches."

The Germans had entered Belgium and France with 78 divisions, excluding cavalry divisions. Of these they only managed to bring 44 divisions on to the great front between Verdun and Paris, 22 divisions being engaged on the Alsace-Lorraine front, four sent back to East Prussia and eight (XV., III. Reserve, IX. Reserve Corps) kept from the battle at the investments of Antwerp, Maubeuge, etc. The French, with 23 divisions in Alsace-Lorraine against 22 German, had 51 divisions and five British divisions on the Verdun-Paris front. Thus there were 56 Allied divisions against 44 German. The French Reserve divisions were not up to the standard of the German Reserve formations, but all the Allied divisions in falling back had received reinforcement, whilst the Germans hampered by the destruction of the railways and handicapped by the very rapidity of their advance, had not been able to get up drafts to fill the gaps in their ranks, so that as regards actual combatants, numbers were still more in favour of the Allies. Neither the French nor the Germans have yet published their losses, but the Allies captured 38,000 prisoners and 160 guns besides other trophies including colours.

The moral effect of the victory both on the Allies and on the Germans was immense, for the legend of German invincibility was broken. That the material and tactical results were not more important is due partly to the immense fatigue of the Allies after the earlier battles, the long retreat of 13 days and a four-day battle in summer heat. But it would seem to be partly due to the direction of the main Allied attack having been frontal and across the courses of several rivers. Greater success would no doubt have been achieved had Maunoury's flank attack, between the rivers, been made stronger. Possibly his army would have done better even if it had been no stronger but composed of better troops; for it consisted of only two active divisions (7th and 14th), badly mauled in the frontier fighting, an Algerian division and four Reserve divisions shaken by fighting near Amiens. Had some of the 14 British Territorial Force Divisions and 14 mounted brigades with the 6th Division, still in England, been landed at the Channel coast ports to fall on the German communications and rear, a decisive tactical result might have been obtained and the war finished. In any case, with such addition to their forces, the Allies would have been better placed to have obtained a decision in the "Race to the Sea," in which actually they were always "an army corps too few and 24 hours too late."

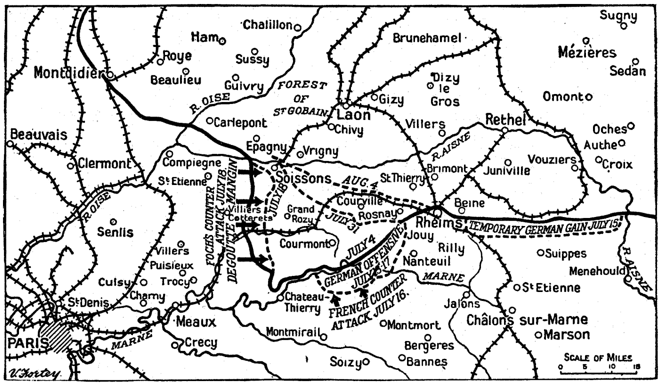
MARNE, SECOND BATTLE OF THE. This marked the turning of the tide in the final year of World War I (*q.v.*). On July 15, 1918, the Rheims district was the scene of the last German offensive on the Western Front, and three days later, when this was stemmed, the ebb began under pressure of the great Allied counterstroke. It was thus composed of two acts, which require separate analysis.

I. THE GERMAN OFFENSIVE IN CHAMPAGNE

This opened on July 15, 1918, and the German plan was to attack on either side of Rheims, the principal effort being made by the German I. and III. Armies towards Châlons, while the VII. Army sought to cross the Marne near Dormans and to converge with the main advance in the region of Épernay. But although this day marked the last German bid for victory, the actual attack was by no means the Germans' supreme effort, nor had it the decisive aims popularly ascribed to it at the time. For Ludendorff still adhered to his guiding idea that the British, severely shaken in the great battles of March and April, should be the target for his decisive blow and that their front in Flanders should be the stage on which he would produce his final drama of victory.



FROM BUCHAN, "HISTORY OF THE GREAT WAR" (THOS. NELSON & SONS)

PLAN OF SECOND BATTLE OF THE MARNE, WHICH DEVELOPED BETWEEN JULY 15 AND AUGUST 4, 1918

The attack on May 27 (*see* CHEMIN-DES-DAMES, BATTLE OF THE, 1918) across the Aisne had been conceived merely as a diversion to draw the Allied reserves away from Flanders. So also with the June 9 attack, less bountiful in its fruits, that had been launched near Compiègne to break down the buttress of Allied territory that lay between the huge salients created by the German attacks of March and May. When, instead, this German attack was broken off by Ludendorff, with little gained but his own reserves still further drained, he considered "the enemy in Flanders still so strong that the German army could not attack" there yet. So he planned a further diversion—to be made by forty-seven divisions attacking on either side of Rheims.

But the sands of time were slipping out for the Germans, and American reinforcements, like the sands of the shore in potential number, were slipping in to become a cement for the Allied line of battle. Appreciating this, Ludendorff intended his Flanders attack, once more towards the nodal point of Hazebrouck, to follow on the 20th, only five days after the Rheims diversion. On July 16 actually, as soon as the Rheims attack was under way, artillery and aircraft were sent off by train to the Flanders front, and Ludendorff himself moved to Tournai to supervise the preparations.

But preparation was never to be completed by execution. For the Rheims diversion had not even the opening success of its predecessors, and on July 18 the Allied counterstroke so jeopardized the Germans' situation that Ludendorff felt compelled to postpone, if not yet to abandon, the fulfilment of his dream. One reason of the failure of the July 15 attack was that east of Rheims it was met by an "elastic defence" in face of which the German onslaught lost its momentum before it reached the real position of the French resistance. Much misplaced praise has been lavished on this "Gouraud manoeuvre." For this ascription of its origin is yet another of the many war legends. The manoeuvre was actually due to Pétain, that cool, unemotional military economist who, called to be commander-in-chief after the Nivelle fiasco of 1917, had systematically worked to rebuild the French army and to restore the stability of its man-power and moral, previously undermined by the extravagant offensives of 1914–1917. One illuminating illustration of the damage done is that cases of desertion alone had risen from 509 in 1914 to 21,174 in 1917.

Not content merely to reorganise, Pétain had set himself to insure against a recurrence of the trouble by tactics that should be an economy both of force and of the nervous force of the combatant. To this end, one method was an elastic defence in depth, to allow the initial shock and impetus of the enemy's attack to be absorbed by a thinly held forward position, and then to await him on a strong position in rear, when the enemy's troops would be beyond the range of the bulk of their supporting artillery. This method Pétain had sought to apply against the attack of June 9, but, although it was partially successful, its full effect was lost through the reluctance of the local commanders, still clinging to their old offensive dogmas, to reconcile themselves to a voluntary yielding up of a few square miles of worthless ground. And before July 15, when the coming German attack was definitely expected, a week's argument was required before Pétain could persuade the lion-hearted Gouraud, in command of the French IV Army east of Rheims, to adopt this elastic manoeuvre. It was finally decided to leave nothing along the line of outposts (constituted by the Monts de Champagne) but "islands" of resistance, which would be required to sacrifice themselves for the purpose of dissipating the enemy attack and keeping it under the well-controlled fire of the main position established in the rear.

But even when we have ascribed it to the right source, the accumulation of historical error is not fully corrected. For the method was not the revolutionary innovation that it has been termed. The Germans, in fact, had used it on Sept. 25, 1915—nearly three years before—to discomfit the great French autumn offensive in Champagne. And the underlying idea can be traced back another 2.000 years—to Cannae, where Hannibal applied it against the Romans in a distinctly more subtle and decisive way. But it sufficed,even in the mild way of 1918, to thwart the German attack east of Rheims, where its effect was immeasurably strengthened by the German failure to achieve such a surprise as had marked their earlier offensives of 1918. Even the exact hour was discovered by an evening raid on July 14 which brought in 27 prisoners who, on being questioned, revealed the fact that the German attack was to be launched next morning, the artillery preparation being timed for 12.10 A.M. Before it began. the French counter-preparation and counter-battery fire opened on the whole of the enemy front Between 4.15 and 5.30 A M., the already shaken German infantry advanced to the attack on a 50 mile front, from Chbteau-Thierry to Massiges (leaking out the Rheims Salient). To the east of Rheims the enemy infantry was broken up by French artillery fire and decimated by the machine-guns distributed along the outpost line before even reaching the main line of resistance, which, in spite of repeated assaults, they failed to break at a single point. To the west of Rheims the situation was less favourable for the French.

German Success at Dormam — But the dramatic nature of this repulse east of Rheims has obscured the fact that it was not the whole battle. West of Rheims the front had only been stabilised for a month since the last German thrust, and the newly improvised position was a handicap to the execution of the elastic method by commanders who were slow to grasp it. In front of the French V. Army (Berthelot) the Germans made some progress between the Marne and the Ardre in the direction of Épernay, and the French centre (V. French Corps and II. Italian) was thrown back on the second position along the line Pourcy-Belval-Reuil-sur-Marne. Lastly, the right of the VI Army (Degoutte) was not able to stop the attackers from crossing the Marne on either side of Dormans. between Jaulgonne and Verneuil. The VII. German Army thus established a bridgehead south of the river, in front of the V. Army's left and the VI. Army's right; it also regained touch with the I. German Army on the slopes of the hlontagne de Reims. Thus here the German attack had deepened the corner of the great bulge made in May, and not only pushed across the Marne but behind Rheims, so that it threatened to cut under this pivot of the Allied resistance. If the threat had an important influence on the French plan for the counter-stroke, its physical progress was stopped on July 16. The German attack had degenerated into local actions, disconnected and therefore useless. By vigorous counter-attacks the French had even recaptured some of the lost ground, while their artillery and aircraft, by bombarding the Marne crossings, made it increasingly difficult for the Germans to obtain supplies. The only progress in the attack—to the south-west of Rheims between the Vesle and the Marne, on July 16—remained fruitless, for it had cost the enemy too dear for him to repeat such sacrifices. Next day a queer hush of expectation spread over the whole battlefield. The stage was set for the great "revanche."

II. THE COUNTER-OFFENSIVE

The Allied counter-offensive under Pétain's direction comprises two phases: (1) the first extends from July 18–25, and includes the victorious battles of Fayolle's main group of armies in the Soissonnais and on the Ourcq, and the closing stage of the defensive battle of Champagne and Rheims during the same period, in which the centre group under Maistre re-established its front and passed to the attack. This first phase, again, comprised three successive manoeuvres: the breaking of the enemy positions by the Reserve group of armies on July 18 and 19; the re-occupation of Château-Thierry and the south bank of the Marne by the centre group of armies, in combination with the right of the Reserve group, on July 20 and 21; and the co-ordination of the advance of the two groups of armies on both banks of the Ourcq in the general direction of Arcy-Sainte-Restitue and Fère-en-Tardenois on July 23 and 24. (2) The second phase, sometimes called the battle of Tardenois, July 29 to Aug. 4, which included the recapture of Soissons and the push towards the Vesle.

French Preparations.—Acting upon Pétain's instructions, Fayolle, commanding the Reserve group of armies, had prepared a counter-offensive against the west flank of the great German salient which protruded between Soissons and Rheims towards the Marne. These preparations were continued with the utmost secrecy while the centre group of armies (Maistre) were checking the last enemy offensive (July 15 and 16) and (from the 17th) arranging a riposte. This was entrusted to two armies, the V. and the EX.—which adjoined the right of the Reserve group of armies. The V. Army (Berthelot), which had been so heavily attacked at Rheims, had eight divisions in first line (including the Italian 3rd Div.), and one infantry and two cavalry divisions in second line. The British 51st and 62nd Divisions were on the move to reinforce it. The IX. Army (de Mitry) had five divisions, including the American 3rd Division in first line, one division in second line, and two reserve divisions, including the American 28th Division.

The Reserve group was to operate with the X. and VI. Armies. The X. Army, under Gen Mangin, who was responsible for the principal attack, had 10 divisions in front line, including the American 1st and 2nd Divisions, placed on the flanks of the Moroccan Division in the centre of the army, and six divisions in second line, making a total of 16 infantry divisions—besides three cavalry divisions. In the rear of the army the British 15th and 34th Divisions were in reserve. In addition, the army was given a large number of tanks and strong artillery reinforcements. The task which Mangin set before his troops was "to break through the enemy front between the Aisne and the Ourcq and push straight on in the direction of Fère-en-Tardenois in *liaison* with the offensive of the VI. Army." On his right the VI. Army, commanded by Degoutte, whose own right was engaged in the defensive battle, had only seven divisions in front line—among them the American 4th and 26th Divisions (American I Corps)—and one division in second line. Degoutte was to attack with his own resources only, reinforced, however, by tanks and by British bombing aircraft.

The attack had been prepared with infinite precautions for maintaining secrecy. The reinforcing divisions were only brought up to the front during the last two days, their movement being carried out by night, between July 14 and 16, the mounted elements marching and the unmounted carried by motor transport. A violent storm which burst during the night of the 17th–18th intensified the darkness and made movements in the woods difficult; but it was favourable to surprise and by 4 A.M. the attacking divisions of the X and VI. Armies were in position and ready to move without any sign of uneasiness having been shown by the enemy. At 4.35. without a single preliminary round, the whole of the artillery opened fire from the Aisne to the Marne, and 16 front line divisions moved forward with the tanks, while all the air squadrons went up. In the X. Army the infantry and tanks advanced without an artillery preparation behind a rolling barrage, turning the enemy's strong defensive positions and quickly gaining a footing on the plateau north-east of the forest of Villers-Cotterets. In the VI. Army, on the contrary, the attacking divisions continued their artillery preparation against the enemy's defensive position for $1\frac{1}{2}$ hours, and only attacked at 6:15 A.M.

The Attack. — The surprise was complete, and along the whole front the enemy lost practically all his advanced units and batteries. His resistance was only effective in two localities--one on the front of the XI. Army Corps, which had no tanks, the other on that of the II. Corps, which came under oblique fire from the heights of Chouy. Mangin received information of the first results achieved towards 8 o'clock, and exploited them without delay by the judicious use of his reserves. Robillot's Cavalry Corps, however, had experienced extreme difficulty in debouching from the forest of Villers-Cotterets, as it was encumbered with troops and baggage, and could as yet operate only with dismounted squadrons. On the first day the enemy lost 12,000 prisoners and 250 guns. The battle raged throughout the night and the next day. The two French armies made substantial progress, even in the difficult region of Louatre-Chouy-Neuilly-Saint-Front, where the XI. and II. Corps combined their attacks to subdue the enemy resistance. The bombing aircraft attacked the Marne crossings and the enemy concentrations at Oulchy-le-Chbteau and Fère-en-Tardenois.

Meanwhile the centre group was preparing to clear the south bank of the Marne. But its units were exhausted by resisting the German attacks of July 15–18, and to reinvigorate them the British XXII. Corps (51st and 62nd Divs.) was brought in to relieve the Italian Corps. Pétain took care to insist that it was not a question of a simple relief. "It will be carried out on the move — that is to say, it will take the form of a surprise attack, carried out with the co-operation of the French units on either side." Nevertheless it was not until the 20th that the Centre group was able to push forward. On that day its IX. Army reached the south bank of the Marne, evacuated by the enemy during the night, while in the V. Army the British XXII. Corps was heavily engaged in the Courton wood.

The fighting continued to be severe throughout July 21 and 22. On the two extreme wings the Germans offered a stubborn resistance to the attacks of the X. and V. Armies which pressed on their flanks. It was clear that they were seeking to gain time to evacuate the material and troops that had been pushed into the Marne "sack." On July 21 the French 30th Division reoccupied Chbteau-Thierry, and the 'American 3rd Division crossed the Marne to the east of the town, and entered the Barbillon wood. In the VI. Army the American I. Corps and the French VII. and II. Corps advanced on the plateau of Etrepilly and Latilly, and on the 22nd, at noon, the VI. Army re-established its communications by way of Château-Thierry. On the same evening fractions of the V. and IX. Armies gained a footing north of the Marne.

The interest of the battle came to be focussed on the heights dominating the Ourcq valley from the north--Orme du Grand Rozoy and Butte Chalmont. Once these heights were captured the Germans could not hope to hold on to the line of the Ourcq. A pause occurred for the relief of tired divisions and the redistribution of the forces. The IX. Army was withdrawn from the front, and the convergence of the advance had so shortened the front that the IX. Army was withdrawn, and even the VI. Army, now reinforced by the fresh American 42nd division, closed up.

Advance Checked at **Fère-en-Tardenois.**—Some progress was made on July 27 and 28: the VI. Army reached the Ourcq and gained a foothold in Fère-en-Tardenois; the V. Army re-occupied its positions on July 15. But from the 28th at noon, the VI. and V. Armies met with a stubborn resistance that was solidly established from Fère-en-Tardenois to Ville-en-Tardenois. The II. Corps was unable to debouch from Fère. The American I. Corps, which had advanced as far as Sergy, was violently counter-attacked there by a Guards Division. The village was taken and retaken four times and finally held by the American 42nd Division, though only at the cost of heavy losses.

In the centre, therefore, the situation remained practically ~ n - changed on July 29 and 30. Only the right of the X. Army made definite progress. On the 28th the XI. Corps took Butte Chalmont, and on the 20th the XXX. and XI. Corps with the British 34th Division occupied Grand Rozoy; but the divisions in line had reached the limit of their powers after several days of incessant fighting.

The Germans had solidly maintained their flanks as a safeguard to cover their line of retreat towards the Vesle. All that could be done was to hasten their retreat by convergent action against the plateaux of the Tardenois. The French counter-offensive had at least cleared the Marne valley and the Paris-Avricourt railway line. The second phase was now to begin, and the French armies, on July 29, received fresh instructions from Pétain. The VI. Army, reinforced by the III. Corps and charged with the main effort was to "push vigorously, and without stopping, in the general direction of Fismes and Bazoches with its whole front, its left to establish itself in the region of Saponay so as to facilitate the debouching of the right wing of the X. Army towards Cramaille." The X. Army was, by successive actions starting from its right (the south), to press in the general direction of Braine. The V. Army was to support the right wing of the VI. Army.

Reliefs were carried out within the armies. The VI. Army put considerable American forces into line: the 42nd and 32nd in the first line, the 4th and 28th in second line, while the 26th and 3rd were being reconstituted in the Marne valley. On the 31st the American 28th, 32nd and 4th Divisions entered Cierges and the Meuniitre wood. In this way the enemy's attention was drawn to the centre on the evening of the 31st, while the next morning (Aug. 1), at 4:45, the right of the X. Army attacked in its turn and, after severe fighting, occupied the whole crest that extends from L'Orme du Grand Rozoy to Saponay inclusive. On the same day the VI. Army, though it succeeded in capturing the Meunière wood, failed before Saponay on account of the extreme fatigue of its attacking divisions.

German Retirement to the **Vesle.**—But at dawn on Aug. 2 the three French armies found themselves facing void. The enemy had fallen back on the Vesle, where he intended to establish himself firmly. On the 3rd, the left of the X. Army, which had reoccupied Soissons unopposed the previous evening, reached the Aisne. Its right, together with the VI. and V. Armies, arrived in the immediate vicinity of the Vesle. Contact was re-established everywhere. All along the front the German artillery and machine-guns were active. On Aug. 4 and 5 the Allied troops aligned themselves along the banks of the Vesle, the American 32nd Division entered Fismes and the advanced guards succeeded in crossing the river at some points. But the enemy counter-attacked vigorously, and in view of this well-organized resistance and of the impending Allied operations elsewhere (see AMIENS, BATTLE OF, 1918, and WORLD WAR I), Foch decided to suspend the offensive. (B. H. L. H.)

MARNIX VAN SINT ALDEGONDE, PHILIPS VAN (1540–1598), Flemish nobleman, statesman and author, one of the earliest Calvinist uriters in the Netherlands. Born in Brussels in 1540, he studied at Louvain, Paris and Dôle. He intended to take orders but while staying in Italy became a Calvinist and studied at Geneva, 1560–61. Returning to the Netherlands, he took an active part in the Reformation, but fled to Germany, where he wrote his famous and influential satire, *Biencorf* der H. *Roomsche Kercke* (1569; German trans. by J. Fischart, 1580), apparently defending the Church of Rome but in reality ridiculing it. In 1571 he entered the service of William of Orange. He went on a mission to England, 1581–82; took part in the settlement of the Pacification of Ghent (1576); requested help for the Netherlands at the diet of Worms (1578); and in 1583 was made burgomaster extraordinary of Antwerp, which he had to surrender in 158j to the duke of Parma. Disheartened, he retired to his castle. West-Souburg, in Walcheren, **a** here he revised his fine translation of the Psalms from the Hebrew (1st ed. 1580; 1591). In 1594 he was entrusted nith the translation of the Bible, but only completed Genesis and the Psalms. He also adapted his *Biencorf* as a *Tableau dcs Différends de la Religion* and wrote essays on politics and religious polemics. The words of the *Wilhelmus,* the Dutch national anthem, are attributed to him. but his authorship has not been proved. He died in Leyden on Dec. I j, 1598.

MARONI (Dutch: MAROWIJNE), a river forming the boundary between Dutch and French Guiana. South America, rises in the Tumuc-Humac mountains and flows 450 mi. mostly through tropical forest to reach the Atlantic about 18 mi. below Alhina and Saint-Laurent. Its upper course is called the Itani in French and Litani in Dutch and its middle course the Aoua or Lawa. Moderate-sized vessels can reach Saint-Laurent. Gold placer mining is conducted on a small scale along the Lawa but the basin is otherwise undeveloped. The river's chief tributary is the Tapanahoni from the southwest. (G. LN.)

MARONITES (AL-MAWARINAH), Roman Catholics following the Syro-Antiochene rite, form the most numerous religious community of the republic of Lebanon (*q.v.*). Their immediate spiritual head under the pope is the Maronite patriarch, residing in Bkirki near Beirut, the capital of the republic; his title is "patriarch of Antioch and. all the east." The name of the group derives from two historical figures, the first an influential Syrian solitary of the late 4th and early 5th centuries, called St. Maron id. *c.* 423). At his tomb a monastery was built near Apamea on the Orontes. Because of persecution from the Jacobites, the monks transferred the monastery to more remote Lebanon. where it becaine the dynamic religious centre of the region. According to Maronite legend, a later monk of this community. St. John Maron, became patriarch of Antioch in 68j–jo; and the father of the Maronite nation. The tradition is uncritical. though St. John Maron may well have been an energetic patriotic bishop of Lebanon. The Maronites, hardy, martial mountaineers, have always valiantly preserved their liberty and folkways. The Moslem empire could not absorb them. and two Omayyad caliphs paid them tribute. Under John Maron they became a fully independent people after routing the invading Byzantines of Justinian II in 694.

According to Maronite tradition. the Maronites were always orthodox Christians in union with the Roman see, but the best evidence indicates that for centuries they were Monothelites (*q.v.*), following the heretical doctrine of Sergius, patriarch of Constantinople. who affirmed that there was a divine but no human will in Christ. According to the medieval bishop William of Tyre, the Maronite patriarch sought union with the Latin patriarch of Antioch in 1182. .kt this time the Maronites were certainly close friends and allies of the French crusaders, and an unstable union with Rome at this early date is most probable. At a1l events: a definitive consolidation of the union came in the 16th century, thanks in great part to the work of the Jesuit John Eliano. In 1584 Pope Gregory XIII founded the Maronite college in Rome, which still flourishes under Jesuit administration. In this centre great scholars and leaders were trained. of whom the most distinguished were the four Assemani (al-Sam'ani), two brothers and their two nephews. who worked in the 18th century.

During the days of the Ottoman empire the Maronites, largely unhampered because of their isolation. maintained their religion and customs under the protection of France. In the 19th century the Turkish government incited the neighbouring Moslem sect, the Druzes (*q.v.*), to harass the blaronites. This policy culminated in the great Maronite massacre of 1860, and as a result of this tragedy the Maronites achieved formal autonomy within the Turkish empire under a nonnative Christian ruler. After the downfall of the Ottoman empire, the Maronites of Lebanon along with Syria became self ruling in 1920 under French protection. In 1944 the fully independent republic of Lebanon was established. Other religions in addition to that of the Maronites, exist in the republic, but the president is always a Maronite.

The language of the Maronites is Arabic but their liturgical tongue is West Syriac. The Maronite cultural centre is the University of St. Joseph, conducted by French Jesuits at Beirut. According to the 1952 census there are 392,656 Maronites in Lebanon and Syria. In addition some 15,000 live in Egypt and Palestine.

Cnder the pressure of the persecutions of the 19th century, the Maronites began to emigrate from the near east in great numbers, and as many as 475,000 can be found in the lands of southern Europe and in Sorth and South America. The *émigrés* keep their own liturgy and have their own clergy (some of whom are married?, but are subject to the local Latin-rite bishops who work in collaboration with the Maronite patriarch, who remains the true head of the dispersed congregations.

MAROT, CLÉMENT (1496–1544), French poet, was born at Cahors. the capital of the province of Quercy, some time during the winter of the year 1496–1497. His father, Jean Marot ic. 1463–1523), whose name appears as des Mares. Marais or Marets. was a Korman, a poet of considerable merit, and held the post of *escripvain* (apparently uniting the duties of poet laureate and historiographer) to Anne of Brittany. Clitment appears to have been educated at the university of Paris, and to have then begun the study of law. Jean Marot took great pains to instruct his son in the fashionable forms of verse-making, after the complicated rules of the *rhétoriqueurs.* Clément himself practised with diligence this poetry (which he was to do more than any other man to overthrow), and he has left panegyrics of its coryphaeus Guillaume Crétin, the supposed original of the Raminagrobis of Rabelais, while he translated Virgil's first eclogue in 1512.

Clément became page to Nicolas de Neuville, seigneur de Villeroy, and this opened to him the way to court life.

As early as 1514, before the accession of Francis I, Clément presented to him his *Judgment of Minos,* and shortly afterwards he was either styled or styled himself *facteur* (poet) *de la reine* to Queen Claude.

In I j19 he was attached to the suite of Marguerite d'Angoulême, the king's sister, the great patron of letters. He was also a great favourite of Francis himself, attended the Field of the Cloth of Gold in 1520, and celebrated it in verse.

In 1524, Marot accompanied Francis on his disastrous Italian campaign. He was wounded and taken at Pavia, but soon released, and he was back again at Paris by the beginning of 1525. His luck had, however, turned. Marguerite for intellectual reasons; and her brother for political, had hitherto favoured the double movement of *Aufklärung,* partly humanist, partly Reforming, n-hich distinguished the beginning of the century. Formidable opposition to both forms of innovation, however. was manifested. and Marot. who was at no time particularly prudent, was arrested on a charge of heresy and lodged in the Chbtelet, February 1526. A friendly prelate. acting for Marguerite, extricated him before Easter. His imprisonment is described in a vigorous poem entitled *Enfer.* His father died about this time, and Marot appears to have succeeded to his place of valet de chambre to the king. He was certainly a member of the royal household in 1528 with a stipend of 250 livres, besides which he had inherited property in Quercy. In 1530, probably, he married.

Sext year Marot was again in trouble. not it is said for heresy, but for attempting to rescue a prisoner, and was again delivered; this time the king and queen of Navarre seem to have bailed him themselves.

In 1532 he published (it had perhaps appeared three years earlierj, under the title of *Adolescence Clémentine,* the first printed collection of his works. Of the many editions of this work Dolet's edition of 1538 is believed to be the most authoritative. Unfortunately, Marot was implicated in 1535 in the affair of

"The Placards,"[1] and this time he was advised or thought it best to fly. He passed through Béarn, and then made his way to Renée, duchess of Ferrara. At her court he wrote his celebrated *Blasons* (a descriptive poem, improved upon mediaeval models), which set all the verse-writers of France imitating them. But the duchess Renée was not able to persuade her husband, Ercole d'Este, to share her sympathy with the Reformers, and Marot had to quit the city. He then went to Venice, but before very long the pope Paul III. remonstrated with Francis I. on the severity with which the Protestants were treated, and they were allowed to return to Paris on condition of recanting their errors. Marot returned with the rest, and abjured his heresy at Lyons. In 1539 Francis gave him a house and grounds in the suburbs.

It was at this time that his famous translations of the psalms appeared. The powerful influence which the book exercised on contemporaries is not denied by anyone. The psalms were sung in court and city, and they materially advanced the cause of the Reformation in France. Indeed, the vernacular prose translations of the Scriptures were in that country of little merit or power, and the form of poetry was still preferred to prose. At the same time Marot engaged in a literary quarrel with a bad poet named Sagon, who represented the reactionary Sorbonne. Half the verse-writers of France ranged themselves among the Marotiques or the Sagontiques. The victory, as far as wit was concerned, naturally rested with Marot, but probably a certain amount of odium was created against him, which may have had something to do with his subsequent misfortunes.

The publication of the psalms gave the Sorbonne a handle, and the book was condemned by that body. In 1543 it was evident that he could not rely on the protection of Francis. Marot accordingly fled to Geneva; but he had, like most of his friends, been at least as much of a freethinker as of a Protestant, and the austere city of Calvin was no place for him. He had again to fly, and made his way into Piedmont, and he died at Turin in the autumn of 1544.

In character Marot seems to have been a typical Frenchman of the old stamp. cheerful. good-humoured and amiable enough, but probably not very much disposed to elaborately moral life and conversation or to serious reflection. With other poets like Mellin de Saint Gelais and Bordeau, with prose writers like Rabelais and Bonaventure Desperiers, he was always on excellent terms.

His importance in the history of French literature is very great. and was long rather under- than overvalued. Coming immediately before a great literary reform—that of the Pléiade—Marot was both eclipsed and decried by the partakers in that reform. In the reaction against the Pléiade he recovered honour; but its restoration to virtual favour, a perfectly just restoration, again unjustly depressed him. Marot was a reformer, and a reformer on perfectly independent lines, and he carried his own reform as far as it would go. His early work was couched in the *rhétoriqueur* style, the distinguishing characteristics of which are elaborate metre and rhyme, allegoric matter and pedantic language. In his second stage he entirely emancipated himself from this, and became one of the easiest, least affected and most vernacular poets of France. In these points indeed he has, with the exception of La Fontaine, no rival, and the lighter verse-writers ever since have taken one or the other or both as model. In his third period he lost a little of this flowing grace and ease, but acquired something in stateliness, while he lost nothing in wit.

The most important early editions of Marot's *Oeuvres* are those published at Lyons in 1538 and 1544. In the second of these the arrangement of his poems which has been accepted in later issues was first adopted. In 1596 an enlarged edition was edited by François Mizière. Among modern editions are those of P. Jannet (1868–72; new ed., 1873–76); and of G. Guiffrey, only vols. ii and iii (1875–81) of which were issued. For iniormation about Marot himself *see* the section concerning him in G. Saintshury's *The Early Renaissance* (1901); *A.* Tilley, *Literature of the French Renaissance,* vol. i, ch. iv (1904); P. Villey, *Recherches sur la Chronologie des oeuvres de Marot* (1921); *P. A.* Becker, *Clément Marot, Sein Leben und Seine Dichtung* (1926).

[1]These "placards" were the work of the extreme Protestants. Pasted up in the principal streets of Paris on the night of Oct. 17, 1534, they vilified the Mass and its celebrants, and thus led to a renewal of the religious persecution.

MAROT, DANIEL (1661–1752), architect, engraver and decorative designer, was trained under his father, Jean Marot (*q.v.*), in his native Paris. He was a Protestant and retired to Holland in 1684, thereby anticipating the revocation of the Edict of Nantes. He entered the service of the stadholder, the prince of Orange, for whom he designed the audience chamber at The Hague (1686), as well as apartments and gardens at the new palace of Het Loo (c. 1692); he also worked for private Dutch clients. In 1694 he followed his master. now William III. to England and henceforward often introduced the royal arms and cipher into his engraved designs. In the frontispiece to his collected works he is styled Arclzitecte de *Guillaume III,* but if he received any official appointment it was as intendant of the royal gardens only. He certainly provided several designs for the east parterre at Hampton court, and was probably consulted about the interior decoration and furniture also. though his pay seems to have been borne on Dutch, not English, funds. A group of delftware tulip vases, milk pans and tiles bearing the royal insignia, some of which survive, appear to have been made for Hampton court after his designs, and a state coach for William III was constructed at The Hague to Marot's design. He returned to Holland about 1698 and until his death (at The Hague. June 4, 1752) continued to work for the stadholder's family, notably at Slot Oranienstein, in Friesland, and in the Huis ten Bosch. His later work for private patrons at The Hague included the houses of the Fagel, Van Schuylenburch and Van Wassenaar families, the present royal library and the Portuguese synagogue.

His numerous engraved designs for furniture, silver, .textiles, interior decoration, etc., in an opulent and often fantastically elaborate style, exercised a widespread influence. As a record of contemporary fashions. particularly of the beginnings of the European taste for oriental motifs, they are invaluable. Although Marot's style derives in some degree from Jean Lepautre and J. Bérain (*q.v.*) it contributed nothing to the formation of the Louis XIV style in France itself, but is rather a Dutch variant of that style.

Millar, "The William and Mary Exhibition,"*Burlington Magazine,* p. 234 (Aug. 1950). (F. J. B. W.)

MAROT, JEAN (c. 1619–1679), French architect and engraver, was one of a large family of Parisian craftsmen and artists. He was architect of various private houses, including the Hôtels de Pussort, de Mortemart and de Monceau, but he is chiefly renowned for his two great series of architectural engravings known as "Le Petit Marot" and "Le Grand blarot," essential for the study of French 17th-century architecture. In addition he engraved a large number of ornamental designs for chimneys, ceilings, etc., a practice in which he was followed by his son Daniel Marot (*q.v.*).

Jean Marot died in Paris, Dec. 15, 1679. (F. J. B. W.)

MARPRELATE CONTROVERSY, a war of pamphlets waged in 1588 and 1589 between a puritan writer who employed the pseudonym "Martin Marprelate" and defenders of the established church. Martin's tracts are characterized by violent and personal invective against the Anglican dignitaries, and by a plain and homely style combined with pungent wit. The special point of his attack was the episcopacy. The pamphlets were printed at a secret press established by John Penry, a Welsh puritan. After three tracts had been issued, it appeared to some of the ecclesiastical authorities that the only way to silence Martin was to have him attacked in his own railing style, and accordingly certain writers of ready wit, among them John Lyly, Thomas Nashe and Robert Greene, were secretly commissioned to answer the pamphlets. Among the productions of this group were *Pappe With* an Hatchet (1589), probably by Lyly, and ***An*** Almond for a *Parrat* (1590), which. with certain tracts under the pseudonym of Pasquil. has been attributed to Nashe (*q.v.*).

Meanwhile, in July 1589, Penry's press, now at Wolston near Coventry. produced two tracts purporting to be by "sons" of Martin. but probably by Martin himself, namely, Theses *Mar-*

tinianae by Martin Junior, and *The Just Censure of Martin Junior* by Martin Senior The press was seized; Penry. however was not found, and in September issued from Wolston or Haseley *The Protestation of Martin Marprelate,* the last work of the series. though several of the anti-Martinist pamphlets appeared later Penry then fled to Scotland. but nas later apprehended in London. charged nith inciting rebellion and hanged (May 1593).

BIBLIOGRAPHY.—*See,* for list and full titles of the tracts, related documents and discussion of the authorship, E. Arber's *Introductory Sketch to* the *Martin Marprelate Controversy* (1880), which. however, gives no connected account of the matter. *See* also articles on Penry and Job Throckmorton in *Dict. of Nat. Biography.* The more important tracts have been reprinter1by Petheram in his series of *Puritan Discipline Tracts* (1842–60), in Arber's *English Scholar's Library* (1879–80), in *R.* W. Bond's edition of Lyly and in the editions of Nashe.

MARQUESAS or MENDAÑA **ISLANDS.** The island of Fatu Hiva in the Marquesas archipelago, discovered by Alvaro Mendaña in 1595, was the first of the islands of French Polynesia to be made known to the outside world. He gave the archipelago the name Islas Marquesas de Mendoza in honour of the wife of the viceroy of Peru, who was the patron of his expedition. The name was shortened by the French to Marquesas. Comprising an archipelago of 11 islands between 8° and 11° S. latitude and 138" and 140° W. longitude, they are the archipelago of French Polynesia nearest the equator. Their total area is 385 sq.mi. They are of volcanic origin. Ua Pou Island having been formed the most recently. All of them are the tops of a high submarine chain of mountains, the peaks of some of which are at elevations of more than 3,000 ft. Radiating from them are secondary chains between which are valleys that terminate on the shore in deep hays. Knife-edged ridges, separating most of the valleys on the larger islands, isolated the original Polynesian inhabitants into a number of hostile communities. These people occupy the only cultivable and hahitable areas. Streams! made torrential by frequent rains. course through the islands over high cascades between vertical walls. Subterranean watercourses debouch at the shore, and even ofishore, where a native fisherman can get fresh water by plunging into the sea with hall a coconut shell fastened to his breast.

These islands, near the equator, have a hot climate. The mean annual temperature at sea level is about 78° F., and the range from the coldest month (August) to the warmest month (November) is only 4°. The rainfall, subject to great fluctuations, varies from 30 to 100 in. Prolonged droughts which injure the breadfruit trees sometimes cause famines. There are only small areas of level land near the coast where wet-land taro can be raised. Ripe breadfruit is preserved in storage pits for times of scarcity. Thirty-three varieties of this tree have been identified in the islands.

The vegetation of the larger, higher islands, typically oceanic, is classified in zones from sea level to the high elevations. In the lower areas are found the breadfruit. pandanus, hibiscus. guava. chestnut, coconut and many herbaceous plants. In the intermediate zones there are dense thickets of hibiscus, many ferns and coarse grasses. The higher zones. often shrouded in clouds, have dense rain forests of tree ferns and other evergreen trees and, in the gulches. wild bananas and bamboo.

The Marquesans, a handsome and charming people of excellent physique. are among the taller and lighter-skinned Polynesians. They fell prey to many diseases introduced by Europeans in the middle of the 19th century. The population steadily decreased from about 100,000 at the time of their discovery to 3.936 (1956). The more common diseases in modern times are filariasis, yaws, tetanus and especially tuberculosis. The livestock of the indigenous population includes pigs and cattle. Pork is the main food at all ceremonial feasts. Wild cattle roam on extensive plateaus on some islands. The natives also raise horses. The land belongs to the French government, but any land available for colonization is accessible with difficulty, and several attempts at settlement proved unsuccessful.

The Marquesas, like the other islands in French Polynesia. are divided into districts; they were placed under the authority of a physician representing the governor. Of the more important islands, the northern district comprises Nuku Hiva (capital Tiaohae). Ua Huka. Ua Pou and Hanae. The southern district includes Hiva Oa (capital Atuona), Motane, Tahuata and Fatu Hiva.

See also PACIFIC ISLANDS. (J. W. CR.)

MARQUESS or MARQUIS, a title and rank of nobility. Etymologically the word has the same meaning as margrave (*q.v.*), denoting a count or earl holding a march or mark, that is. a frontier district; but this original significance has long been lost.

In England the Late Latin term *marchiones* (plural) was early applied to the lords of the Welsh marches *(see* MARCH, EARLS OF) ; but it was there used in a sense descriptive only of their lordships' location near the frontier without implying that they were superior to other earls. On Dec. 1. 1385, however. Robert de Vere. 9th earl of Oxford. was created marquess of Dublin with precedence between dukes and earls; the other earls resented this creation. and the patent of the marquessate was revoked on Oct. 13. 1386, after its holder had been created duke of Ireland. John Beaufort, earl of Somerset: a legitimated son of John of Gaunt. was created marquess of Dorset on Sept. 29, 1397, but degraded to his former earldom on Nov. 3. 1399; and when the commons petitioned for his restoration to the marquessate in 1402, he objected because "le noun de Marquys feust estraunge noun en cest Koialme." On June 24, 1443, honever, his son Edmund Beaufort was raised to be marquess of Dorset, after which the title retained its place in the peerage. As earlier creations became extinct or were raised to dukedoms, the premier marquessate of England in the 20th century was that of Winchester, created on Oct. 11, 1551.

A marquess has precedence next after a duke, is "most honourable" and is styled "my lord marquess"; his mantle of parliament is scarlet. with three and a half double linings of ermine; his coronet is worn at coronations.

In western Europe the Carolingian *marchiones* or margraves had been royal officials whose duty of defending a frontier might justify an exception's being made to the normal rule that no count should hold more than one countship or county. Their authority was thus not much less than that of a duke (*q.v.*); indeed the term *Markherzog* is occasionally iound instead of *Markgraf.* But as conditions on the frontiers or the frontiers themselves were changed, the special importance of the old marches diminished.

In France, as the great feudatories' power grew at the expense of the king's, the old *marquisats* were practically lost in the great duchies or countships. Then, with the multiplication of little fiefs, minor counts holding several such lordships took to assuming the style of marquis to distinguish themselves. The kings indeed were very chary of erecting *marquisats;* that of Trans in Provence, raised from *baronnie* in 1505 for Louis de Villeneuve. is reckoned as the *premier marquisat de France.* Moreover the rank of marquis. always inferior to that of a duke, was in a controversial relation to that of a count. Sometimes a count's nobility was better established and his fief greater than that of any marquis; sometimes a marquis with a royal patent should obviously have precedence.

These ambiguities served to bring the title into disrepute in the 17th and 18th centuries. as being too often self-made or pretentious; and after the Revolution had abolished it Napoleon did not see fit to revive it. Louis XVIII, reviving it after the Restoration, gave its holders definitive precedence between dukes and counts.

In Italy the mark (*marca,* plural *marche*) long survix-ed as a major territorial unit, though the original Carolingian demarcations were considerably altered. By the 14th century. however, barons and *signori* had begun to erect their fiefs into *marchesati,* after which the title gren· to have much the same fate as the French *marquisat.*

In Spain the remnant of the original Marca Hispanica was merged in the countship of Barcelona. The first Castilian *marquesado* was that of Villena (on the Valencian frontier). created for Don Alonso of Aragon in 1376: the Pacheco family. who acquired it from the cron-n in 1445, subsequently became dukes of Escalona. The next senior *marquesado* was that of Santillana (1445).

MARQUETRY (Fr. *marqueterie,* from *marqueter,* to inlay, literally to mark, *marquer),* an inlay of ornamental woods. ivory. bone, brass and other metals, tortoise-shell, mother-of-pearl, etc., in which shaped pieces of different materials or tints are combined to form a design. It is a later development of the ornamental inlays of wood known by the name of Intarsia, and though in the main the latter mas a true inlay of one or more colours upon a darker or lighter ground, while marquetry is composed of pieces of quite thin wood or other material of equal thickness laid down upon a matrix with glue, there are examples of Intarsia in which this mode of manufacture was evidently followed. In order to gain greater relief the wood was shaded or tinted. A combination of tortoise-shell and metal, the one forming the ground and the other the pattern upon it, which may be classed as marquetry also appears in the 17th century. The subjects of the *intarsiatori* are generally arabesques or panels with elaborate perspectives, either of buildings or cupboards with different articles upon the shelves seen through half-open doors. The later *marqueteurs* used a freer form of design for the most part, and scrolls and bunches of flowers appear in profusion, while if architectural forms occur they are generally in the shape of ruins amid landscape. The greater portion of the examples in England are importations, either from Holland (in which country very fine work was produced during the latter half of the 16th and 17th centuries) or from France. The reputation of the Dutch *marqueteurs* was so great that Colbert engaged two, named Pierre Gole and Vordt, for the Gobelins at the beginning of the 17th century. Jean Macé of Blois, the first Frenchman known to have practised the art, who was at work in Paris from 1644 (when he was lodged in the Louvre), or earlier, till 1672, as a sculptor and painter, learned it in the Netherlands. His title was "menuisier et faiseur de cabinets et tableaux en marqueterie de bois"; but as early as 1576 a certain Hans Kraus had been called "marqueteur du roi." Jean Macé's daughter married Pierre Boulle, and the greatest of the family, André Charles Boulle (*q.v.*), succeeded to his lodging in the Louvre on his death in 1672. The members of this family are perhaps the best known of the French *marqueteurs*. Their greatest triumphs were gained in the marquetry of metal and tortoise-shell combined with beautiful ormolu mountings. The names of Roentgen, under whom the later German marquetry perhaps reached its highest point, Riesener and Oeben, testify to their nationality. A good deal of marquetry was executed in England in the later Stuart period, mainly upon long-case clocks. cabinets and chests of drawers, and it is often of real excellence. Marquetry in a shallower form was also extensively used in the latter part of the 18th century. The most beautiful examples of the art in Italy are mainly panels of choir stalls or sacristy cupboards, though marriage coffers were also often sumptuously decorated in this manner. With the increase in luxury and display in the 17th and 18th centuries in France and Germany cabinets and escritoires became objects upon which extraordinary talent and expenditure were lavished. In south Germany musical instruments, weapons and bride chests were often lavishly decorated with marquetry. In modern practice as many as four or even six thicknesses are put together and so cut. When all the parts have been cut and fitted together face downwards, paper is glued over them to keep them in place and the ground and the veneer are carefully levelled and toothed so as to obtain a freshly worked surface. The ground is then well wetted with glue at a high temperature and the surfaces squeezed tightly together between frames called "cauls" till the glue is hard. There are several modes of ensuring the accurate fitting of the various parts, which is a matter of the first importance if the artistic effect is to be secured. *(See* INLAYING.)

MARQUETTE, JACQUES (1637–1675), French Jesuit missionary and explorer, codiscoverer (with Louis Jolliet) of the Mississippi river, was born at Laon, France, went to Canada in 1666 and was sent in 1668 to the western end of Lake Superior. In 1672 he was ordered to accompany Jolliet in the exploration of the Mississippi, of which the French had gained some knowledge from various Indians living near the Great Lakes. In the spring of 1673. the expedition left St. Ignace. Mich. The route taken lay up the northwest side of Lake Michigan, up Green bay and the Fox river, over the portage to the Wisconsin river and down the latter into the Mississippi river, which was descended to within 700 mi. of the sea, near the confluence of the Arkansas river.

Having entered the Mississippi on June 17, Marquette and his companions turned back at the end of July and returned to Green bay (by way of the Illinois river): passing through the Chicago portage at the end of Sept. 1673. After the journey, Marquette fell ill of dysentery, and a fresh excursion which he undertook to plant a mission among the Indians of the Illinois river in the spring of 1675 proved fatal.

Marquette died on his way home to St. Ignace, at Ludington. Mich., near the lesser and older Marquette river (May 18, 1675).

The state of Wisconsin has placed his statue in the capitol at Washington, D.C. His name has been given to a railroad, to a town and to a diocese.

BIBLIOGRAPHY.—*Récit des voyages et des découvertes du P. Jacques Marquette,* ed. by Claude Dablon, first published in abridged form in Melchissédech Thévenot's *Recueil de voyages* (1681) and published in full in J. G. Shea's *Discovery and Exploration of the Mississippi Valley* (1852); F. B. Steck, *The Jolliet-Marquette Expedition*, 1673 (1928); J. MARQUETTE, a city and port of the upper peninsula of Michigan. U.S., and seat of Marquette county, surrounded by rugged hills, is located on Lake Superior in a summer and winter resort area. about 400 mi. N. of Chicago.

Established in 1549 as Worcester. it was the first shipping point on the lake for the iron ore, pig iron and lumber of the region. It was renamed in 1850 for Father Jacques hiarquette. the Jesuit missionary-explorer, incorporated as a village in 1859. was largely destroyed by fire in 1868 but rapidly rebuilt, and chartered as a city in 1871.

A city commission form of government was established in 1914 and a city-manager form was adopted in 1946.

Marquette is still an important ore shipping centre with railroad shops and impressive docks. Other industries include chemicals, foundry products, mining machinery, wood products and foods. It is the home of Northern Michigan college (1899, state supported) and Michigan State Branch prison (1885), and is a Roman Catholic diocesan centre (St. Peter's cathedral). Presque Isle. within the city. is a 328-ac. natural park deeded to Marquette by the U.S. government in 1886. Sugar Loaf mountain. K. I. Sawyer air force base and Cherry Creek fish hatchery are nearby. For comparative population figures *see* table in MICHIGAN: *Population.* (K. B.)

MARQUIS, DON (DONALD ROBERT PERRY MARQUIS) (1878–1937), U.S. poet and playwright, creator of Archy and Mehitabel, was born in Walnut, Ill., July 29, 1878, and educated at Knox college, Galesburg, Ill.

Marquis worked as a reporter on several newspapers and assisted Joel Chandler Harris in editing the *Uncle Remus* magazine. From 1912 to 1922 he conducted a column, "The Sun Dial," in the *New York Sun,* and in it first appeared that extraordinary pair of creatures. Archy the cockroach and Mehitabel the cat. Archy's poetic reflections on the world as seen "from the under side," and Mehitabel's racy misadventures, were combined in a unique record, part whimsical, part bitter, wholly philosophical. Among Marquis' published collections of humorous poetry, satirical prose and plays are *Danny's Own Story* (1912), *Dreams and Dust* (1915), *Hermione* (1916), *The Old Soak* (1921), *Sonnets to a Red Haired Lady* (1922), *The Dark Hours* (1924), *Out of the Sea* (1927) and *Archy and Mehitabel* (1927).

Marquis died at Forest Hills, N.Y., on Dec. 29, 1937, after a long illness.

MARR, CARL (1858–1936), U.S. painter, was born at Milwaukee, Wis., on Feb. 14, 1858. He was a pupil of Henry Vianden in Milwaukee, of Schauss in Weimar, of Gussow in Berlin, and of Otto Seitz, Gabriel and Max Lindenschmitt in Munich. His first work, "Ahasuerus, the Wandering Jew," received a medal in Munich. One of his pictures, "Germany in 1806," received a gold medal in Munich and is in the Eichendorfschule of Konigsberg. A large canvas, "The Flagellants," in the Milwaukee Auditorium building, received a gold medal at the Munich exposition in 1889. Another canvas, "Children's Party," in the Phoebe Hearst collection at the University of California, Berkeley, was exhibited in Munich.

Marr became a professor in the Munich academy in 1893, and in 1895 a member of the Berlin academy of arts.

MARR, NIKOLAI JAKOVLEVICH (1865–1934), Soviet linguist, archaeologist and philologist was born on Jan. 6, 1865, at Kutais. In 1930, he nas elected vice-president of the Academy of Sciences of the U.S.S.R. Marr's substantial achievements in Caucasian archeology and philology have been obscured by his notorious linguistic theories. He postulated a stage development (corresponding to Marxist economic stages) of all the aorld's languages from an original word stock of four elements: *sal, ber, yon* and *rosh.*

Marr died on Dec. 20, 1934, at Leningrad

See L. L. Thomas, The Linguistic Theories of *N.* Ja. Marr, vol. 14 (1957). (L. L. T.)

MARRAKESH (erroneously MOROCCO or MAROCCO CITY), southern capital of Morocco. It lies in a spacious plain — Blad el Hamra, "The Red" — about 15 mi. from the northern underfalls of the Atlas, and 96 mi. E.S.E. of Safi, at a height of 1,500 ft. Ranking during the early centuries of its existence as one of the greatest cities of Islam, Marrakesh has long been in a state of grievous decay, but it is rendered attractive by the exceptional beauty of its situation, the luxuriant groves and gardens by which it is encompassed and interspersed, and the magnificent outlook which it enjoys toward the mountains. Open spaces of great extent are numerous within the walls. Tabiya or rammed concrete of red earth and stone is the almost universal building material, and the houses are consequently seldom more than two stories in height. The great square, Djemaâ-el-Fna, situated in the middle of Marrakesh, is crowded daily; the very extensive suks are situated on the edges of the square. The palace of the sultan covers an extensive area, and beyond it lie the imperial parks of Agudal, 2 mi. long and about 5,000 feet wide, planted with fruit trees of all sorts; the palm grove which surrounds Marrakesh stretches as far as the Tensift; it covers 32,000 acres and contains 90,000 palm trees.

The ramparts of Marrakesh are pierced by monumental gateways; the most beautiful is the Kasba gate, Bab-Aguenaou. The chief religious buildings are the mosque of Koutoubiya, or Mosque of the Scribes (12th century), with its monumental tower 221 ft. high, the most beautiful monument of Marrukesh; the mosque of Kasba or Djama-Moulay-Yazid, near to which are the tombs of the Sa'adi sharifs, fine monuments in which are buried the sovereigns of the last-but-one Moroccan dynasty (16th–17th centuries); Djama-el-Mouasine; Djama-Bab-Doukkala, the sanctuary of Sidi-ben Slimane-el-Djazouli, that of Sidi-bel-Abbés, patron of Marrakesh; the medersa Ben-Youssef (16th century). There are three beautiful monumental fountains, those of El-Mouasine, of Sidi-el-Hassan or Ali and of Sekkaia Echrob ou-Chouf. The palace of Bahia, built from 1894 to 1900, serves as a residency.

A European town was built 1½ mi. from the original one, at the foot of the hill of Gueliz (1,728 ft.), which is crowned by a military camp. Founded in 1913, it is traversed by wide avenues bordered with trees. The pop. (1960) of Marrakesh was 243,134. The natives are a mixture of the descendants of Andalusian Moors of original Rehemna of the neighbouring plains, of Chleuh mountaineers and of Sahara Draoua.

Marrakesh is the chief town of the province of Marrakesh, the residence of a khalif of the sultan and the centre of action of the grand Kaid Glaoui. It is connected by good roads with Mazagan, Mogador, Safi Taroudant, Warzazat and Casablanca; a broad-gauge railway (56.7 inches), finished in 1928, joins Marrakesh to Casablanca (158 miles).

Marrakesh, designated Morocco by the old European authors, was founded in 1062 by Youssef-ben-Tachfin, founder of the dynasty of the Almoravides. It was from Marrakesh that Abd-el-Moumen, the first sovereign of the dynasty of the Almohades, set out to conquer all northern Africa, and it was that town that he made the capital of his empire (1147). From 1184 to 1198, the sultan Yakout-el-Mansour built there the mosque and the tower of Koutoubiya, at the same time that he caused to be built the Giralda at Seville and the mosque of the tower of Hassan at Rabat, the most famous monuments of the Almohade period and the best built of the Maghreb. The Merinide sultans preferred Fez to Marrakesh, but the Saadi sharifs again made it the chief Moroccan capital. The Alaouite sharifs of the reigning dynasty, from time to time, stay there for more or less prolonged periods. After a violent combat at Sidi-bou-Othman, where he put to flight the bands of the insurgent El-Hiba, Col. Mangin entered Marrakesh with the French troops on Sept. 7, 1912.

An important airport was constructed there in 1940 which was subsequently greatly enlarged by the U. S. army after the North Africa landings in Nov. 1942.

See A. Chevrillon, Marrakesh *dans les palmes* (Paris, 1919); Z. and I. Tharaud, Marrakesh ou *les* seigneurs de *l'Atlas* (Paris, 1919).

MARRAM GRASS (Ammophila breviligulata), an important sand-binding grass, called also beach grass and sea marram, native to sandy seacoasts of Europe and North America from North Carolina northward and to the shores of the Great Lakes. It is an erect somewhat coarse perennial, with hard, tough, scaly, creeping rootstocks; long involute leaf blades; and a pale dense spikelike flowering panicle. Marram is employed in Europe to hold in place the barrier dunes along coasts, as in the Netherlands; also with like success on Cape Cod, Mass., and at San Francisco, Calif.

MARRANO, a derisive name meaning "swine." applied to crypto-Jews in Spain and Portugal who accepted baptism to escape massacre or expulsion, but practised Judaism secretly.

In the late 14th century Spanish Jewry was threatened with extinction at the hands of mobs. Thousands of Jews accepted death, but tens of thousands found safety at the baptismal font. The number of "saved" converts is moderately estimated as over 100,000. By the mid-15th century the persons who had been bsptized but continued to practise Judaism in secret — marranos — formed a compact society. The marranos began to grow rich and to rise to high positions in the state, the royal court and the church hierarchy. They intermarried with the noblest families of the land. The hatred directed against them by the old Christians, ostensibly because they were suspected of being untrue to their converted faith was, in fact, directed indiscriminately against all *conversos,* even those who became denunciators of Judaism and persecutors of Jews and marranos.

In hlarch 1473 riots broke out in Córdova, with pillage and carnage lasting for three days. The massacres spread from city to city. instigated by fanatical priests. The one institution that seemed adequate to deal with the marranos was the Inquisition, but so strong was the opposition to it that it was not until 1480, under the strong rule of Ferdinand and Isabella, that the Inquisition was finally introduced. In its first year, over 300 marranos were burned, their estates reverting to the crown. The number of victims grew into tens of thousands.

To the Jews, the marranos were pitiful martyrs. They were not renegades but *anusim,* "forced converts," Jews at heart, nho could be trusted to escape from intolerable religious duplicity at the first opportunity. At grave danger to themselves. the Jews maintained religious bonds nith the marranos and kept strong their faith in the God of Israel. By giving religious comfort to the *conversos,* honever, the Jens also came under the surveillance of the Inquisition, which was finally convinced that only the total expulsion of the Jews could end the alliance Purity of faith became the national policy of the Catholic sovereigns. and thus came about the final tragedy. the edict of expulsion of all the Jews from Spain on March 31, 1492 Portugal promulgated an edict of expulsion in 1497 and Navarre in 1498.

A considerable minority of Jews saved themselves from expulsion by baptism, thus adding strength and numbers to the marranos, but the mass of Spanish Jens nent into exile. The physical separation of the marranos from their spiritual sympathizers, however, did not make them more amenable to inquisitorial discipline. The

Jewish religion remained deeply rooted in their hearts and they continued to transmit their beliefs to the succeeding generations.

In Portugal, where the Inquisition was established in 1497, the same process was repeated. The Inquisition also followed the marranos to the Spanish and Portuguese dependencies in Latin America. It is difficult to estimate accurately the number of marranos who settled in Latin America in the centuries following the expulsion of the Jews from Spain and Portugal. A fair estimate of those who died at the stake in the Americas would be approximately 2,000; in addition, a far larger number was sentenced to whipping, incarceration or the galleys. It may be assumed that there was considerable assimilation of Jews in the general population; intermarriage with Indians was particularly noticeable in Mexico.

The more fortunate marranos emigrated to safer countries in North Africa and, on the European continent, to Holland and to Italy as temporary stations on the way to the Ottoman Empire. In Amsterdam the marranos openly avowed Judaism and established there a notable cultural centre. Other smaller marrano centres were established in Bordeaux, Hamburg and London. The first Jewish group that settled in North America (New Amsterdam, 1654) were religious refugees from the Portuguese colony of Brazil.

The decreasing number of marrano trials at the tribunals of the Spanish Inquisition during the 17th and 18th centuries indicates that marranism died out gradually and virtually disappeared a century before the Inquisition tribunals were abolished early in the 19th century. This was not the case in the Balearic Islands. where marrano descendants known as Chuetas ("swine'!) still persist as an isolated stigmatized community.

Marrano communities continue to linger in Portugal. Having been isolated from the Jews and the stream of living Judaism for centuries. they developed strange customs and religious beliefs. many of them alien to the faith of their fathers. Many Portuguese marranos still adhere to their rites and customs and resist the efforts of Jewish communities to educate them in the traditional tenets of Judaism. See also INQUISITION, THE.

MARRIAGE.

MARRIAGE. Human beings, like all higher animals, multiply by the union of the two sexes. But neither conjugation, nor even the production of offspring, is as a rule sufficient for the maintenance of the species. The further advanced the animal in the order of evolution, the longer the immaturity and the helplessness of the young and the greater the need for prolonged parental care and training. It is thus the combination of mating with parenthood which constitutes marriage in higher animals, including man. Even in its biological aspect, "marriage is rooted in the family rather than the family in marriage" (Westermarck).

1. **The Biological Foundations of Human Mating.**—In human societies, however, there are added to the sexual and parental sides of marriage other elements: marriage is given the hall-mark of social approval; it becomes a legal contract; it defines the relations between husband and wife and between parents and children, as well as the status of the latter; it imposes duties of economic co-operation; it has to be concluded in a public and solemn manner, receiving, as a sacrament, the blessings of religion and, as a rite, the good auspices of magic.

Human marriage also appears in a variety of forms: monogamy, polygyny and polyandry; matriarchal and patriarchal unions; households with patrilocal and matrilocal residence. Other forms, such as "group-marriage," "promiscuity," "anomalous" or "gerontocratic" marriages have been assumed by some writers as an inference from certain symptoms and survivals. At present these forms are not to be found, while their hypothetical existence in prehistoric times is doubtful; and it is important above all in such speculations never to confuse theory with fact.

Marriage again is in no human culture a matter of an entirely free choice. People related by descent or members of certain classes are often debarred from marrying each other, or else they are expected to marry. The rules of incest, of exogamy, of hypergamy and of preferential mating form the sociological conditions of marriage. To these are added in certain societies such preparatory arrangements and conditions as initiation, special training for marriage, moral and economic tests, which have to be satisfied before marriage can be entered upon. The aspects, the forms and the conditions of marriage have to be discussed in turn, though it is not possible to draw a sharp line of division between these subjects.

2. Love and Marriage.—Love and marriage are closely associated in day-dreams and in fiction, in folk-lore and poetry, in the manners, morals and institutions of every human community —but marriage is more than the happy ending of a successful courtship. Marriage as an ideal is the end of a romance; it is also the beginning of a sterner task, and this truth finds an emphatic expression in the laws and regulations of marriage throughout humanity.

Love leads to sexual intimacy and this again to the procreation of children. Marriage on the whole is rather a contract for the production and maintenance of children than an authorization of sexual intercourse. The main reason why marriage has not been regarded as establishing an exclusive sexual relationship lies in the fact that in many human societies sexual relations have been allowed under certain conditions before marriage, while marriage did not necessarily exclude the continuance of similar relations.

Marriage, however, remains the most important form of lawful intercourse, and it dominates and determines all extra-connubial liberties. In their relation to marriage the forms of licence can be classified into prenuptial liberty, relaxations of the marriage bond, ceremonial acts of sex. prostitution and concubinage.

3. Prenuptial Intercourse.—In the majority of savage tribes unmarried boys and girls are free to mate in temporary unions, subject to the barriers of incest and exogamy and of such social regulations as prevail in their community. But there are other tribes where chastity of the unmarried is regarded as a virtue, especially in girls, and any lapse from it severely censured or even punished. Many of the lowest savages, such as the Veddas, Fuegians, Kubu of Sumatra, Senoi and other Malayan negritos, do not tolerate sexual intercourse before marriage. Among the Bushmen and the Andamanese instances of prenuptial unchastity do occur, but they are not condoned, still less provided for by custom and moral approval. The Australians, however, allow prenuptial freedom, except perhaps a few of the South-eastern tribes.

On a higher level we find considerable variety in this respect. All over the world, in Oceania, in Asia, in Africa and in both Americas, examples could be quoted of peoples who demand continence more or less stringently, and of their neighbours who allow full freedom. In a few cases only can we find the demand of chastity expressed in very definite usages, which physically prevent incontinence, such as infibulation, practiced among the N.E. African, Hamitic and Semitic peoples and reported also from Siam, Burma and Java. The testing of the bride by a publicly exhibited token of defloration, which forms part of certain marriage ceremonies and which expresses the value of virginity, is carried out more or less thoroughly and naturally lends itself to deception and circumvention. It is found sporadically throughout the world, in the noble families of Oceania (Tonga, Samoa, Fiji), in Asia (Yakuts, Koryaks, Chuwash, Brahui of Baluchistan, Southern Celebes), in America (Chichimec of Mexico), in Africa (Mandingo, Kulngo, Ruanda, Yoruba, Swahili, Morocco, Algeria and Egypt) and likewise among many Semitic and Hamitic peoples. In other parts of the world we are merely informed that chastity is praised and prenuptial intercourse censured (Bantu, Kavirondo, Wa Giyama, Galla, Karanga, Bechuana of Africa; Dobu, Solomon Islanders, of Melanesia; Omaha, Mandan, Néz-Pércé, Apache, Takelma of N. America; Canelas and Kanaya of S America, Bódo and Dhimál of Indo-China, Hill Dyaks of Borneo).

Freedom to mate at will may be fully allowed and even enjoined and provided for by such institutions as the mixed houses for bachelors and girls (Trobriand Islanders, Nandi, Masai, Bontoc

Igorot). In some communities prenuptial intercourse is not meant to lead to marriage, and there are even cases (as among the Masai, Bhuiya and Kumbi of India, Guaycuru and Guana of Brazil), where two prenuptial lovers are not supposed to marry. Elsewhere prenuptial mating is a method of courtship by trial and error, and it leads gradually into stable unions, and is finally transformed into marriage. Thus among the Trobriand Islanders "sexual freedom" is considerable. It begins very early, children already taking a great deal of interest in certain pursuits and amusements which come as near sexuality as their unripe age allows. This is by no means regarded as improper or immoral, is known and tolerated by the elders and abetted by games and customary arrangements. Later on, after boys and girls have reached sexual maturity, their freedom remains the same, with the result that there is a great deal of indiscriminate mating. In fact, at this age both sexes show a great deal of experimental interest, a tendency to vary and to try, and here again a number of arrangements and customs play into the hands of these juvenile lovers. As time goes on, however, and the boys and girls grow older, their intrigues naturally and without any outer pressure, extend in length and depth, the ties between lovers become stronger and more permanent. One decided preference as a rule develops and stands out against the lesser love affairs. It is important to note that such preferences are clearly based on genuine attachment resulting from real affinity of character. The protracted intrigue becomes a matter of public notice as well as a test of mutual compatibility, the girl's family signify their consent and marriage is finally concluded between the two lovers. (Malinowski). Similar forms of prenuptial selection are found in other tribes (Igorot of Luzon, Akamba of E. Africa, Munshi of N. Nigeria).

In no instance, however, is prenuptial liberty regarded by the natives as a negation or substitute for marriage. In fact it always is in such communities in the nature of a preliminary or preparation to marriage; it allows the young people to sow their wild oats, it eliminates the cruder forms of sex impulse from matrimonial selection and it often leads youths and girls to exercise a mature choice based on attraction of personality rather than on sexual appeal.

4. The Principle of Legitimacy.—Perhaps the most important fact in the consideration of prenuptial unchastity is the rule that freedom of sexual intercourse does not generally extend to freedom of procreation. One of the symptoms of this is that in all communities where chastity is demanded and enforced, the lapse from it entails more censure on girls than on boys, while prenuptial pregnancy is penalised much more severely than mere wantonness. But even where prenuptial unchastity becomes an institution not merely condoned but enjoined by tribal law, pregnancy is often regarded as a disgrace.

Among the aristocratic fraternities of Polynesia, the *areoi* of Tahiti and the *ulitao* of the Marquesas, licence between the men and the women was universal, but children of such unions were killed, unless adopted by a married couple. Among the Melanesian communities of New Guinea and the adjacent archipelago which allow of full sex liberty before marriage the occurrence of pregnancy under such circumstances is a grave disgrace to the mother and entails disabilities on the child. The Masai punish a girl for prenuptial pregnancy, although with them the free unions of unmarried boys and girls are an institution. A similar combination of prenuptial full licence with severe punishment of illegitimate childbirth is recorded from several African tribes (Wapore, Bakoki, Banyankole, Basoga, Akikuyu, Nandi, Beni Amer), from America (Indians of Brit. Guiana, Guaycuru and Guana of Brazil, Creeks and Cherokees), from Asia (Lisu of Burma, Nias Islanders of Malay Archipelago), from Melanesia (Mekeo and N. Solomon Islanders) and from Siberia (Aleut). In all such cases pregnancy is no doubt prevented by contraceptive practices, which however have been reported from very few savage tribes by trustworthy informants; or by abortion, which is far more frequent; or expiated by a punishment of the mother, and sometimes also of the father.

The main sociological principle embodied in these rules and arrangements is that children should not be produced outside a socially approved contract of marriage. In several tribes, the remedy for the disgrace of a prenuptial child consists therefore in an obligation of the presumptive father to marry the girl (S.E. Bantu, Madi, Bavuma, Kagoro of Africa; Tepehuane and Hupa of America; Kacharis, Rabhas, Hajongs and Billavas of India and Assam; Kayans and Punans of Borneo). In some cases again a child of a free union is desired and expected to come, indeed it is a condition to marriage, which is concluded upon its arrival (Sea Dyak, Hill Dyak, Iruleas, Moi, Bontoc Igorot of Asia; natives of Bismarck Archipelago; Lengua, Guarayos and Pueblo Indians of America; R'olofs and Bambata of Africa). Such cases, although they are in a way the opposite of those in which a prenuptial child is a disgrace, involve the same principle: the provision of a father for the child, that is the elimination of illegitimate offspring. As a matter of fact, in all instances where a prenuptial pregnancy is welcomed, the reason for it is that children are regarded in that community as an advantage. The father consequently need not, be forced to marry the mother, he does so of his own accord because fruitful marriage is desirable. Thus in all human societies a father is regarded as indispensable for each child, *i.e.,* a husband for each mother. An illegitimate child—a child born out of wedlock—is an anomaly, whether it be an outcast or an unclaimed asset. A group consisting of a woman and her children is a legally incomplete unit. Marriage thus appears to be an indispensable element in the institution of th family. (See Malinowski, Sex and Repression, pp. 212–217.)

5. Relaxations of the Marriage Bond.—Among tribes where chastity is demanded from unmarried girls and youths, marital fidelity is also usually enjoined. As a rule adultery is regarded as a grave offence and more severely penalised than prenuptial incontinence, though exceptions to this rule do exist. In many communities where freedom is granted before marriage, once the matrimonial knot is tied both partners or the wife at least are bound to remain faithful, under more or less serious penalties (Trobrianders, Mailu, Nukuhiva, Maori of Oceania; Land and Sea Dayaks, Kukis, Hajongs, Saorias, Ceramese of Indonesia; Botocudos and Guarayos of S. America: Illinois, Comanche, Iroquois, Pawnee, Californian Indians of N. America; Timne, Ashanti, Konde, Zulu, Kafirs and Thonga of Africa). The penalty inflicted upon an adulterous wife is invariably much graver than upon an unfaithful husband, and considerable differences obtain according to the circumstances of the offence, the status of the third party, the husband's anger and his attachment to his wife.

There are, however, a number of communities in which the marriage bond is broken as regards the exclusiveness of sex with the consent of both partners and with the sanction of tribal law, custom and morality. In some societies the only occasion on which the wife is allowed connection with other men, nay, has to submit to their embraces, is at the very beginning of marriage. This custom has apparently been known in mediaeval Europe under the name of "ius primae noctis." It certainly exists in many savage cultures (Brazilian Indians, Arawaks, Caribs, Nicaraguans, Tarahumare of S. and C. America; Ballante, Bagele, Berbers of Africa; Bánaro and S. Massim of Melanesia; Aranda, Dieri and other Australian tribes). Such customs are to be regarded not so much as the abrogation of matrimonial exclusiveness, but rather as expressing the superstitious awe with which sexual intercourse, and above all defloration, is regarded by primitive peoples (Crawley, Westermarck). As such they should be considered side by side with the numerous instances in which girls are artificially deprived of their virginity, without the intercourse of any man; with prenuptial defloration by strangers; with temporary prostitution of a religious character, and with sexual intercourse as a puberty rite.

A greater encroachment upon sexual exclusiveness in marriage is found in the custom of wife-lending as a form of hospitality. This is very widely distributed over the world (see the comprehensive references in Westermarck, History of *Human Marriage,* vol. 1, pp. 225–226). It must be realised that this practice is not an infringement of the husband's rights, but rather his assertion of authority in disposing of his wife's person. Very often indeed a man will offer his sister, daughter, slave or servant instead, a fact which indicates that this custom is not so much the right of another man to infringe upon the matrimonial bond as the right of the head of the household to dispose of its female inmates.

Very often sexual hospitality is exercised in anticipation of future reciprocal benefits, and must be considered side by side with the custom of wife-exchange (Gilyak, Tungus, Aleuts of N. E. Asia; Bangala, Herero, Banyoro, Akamba, Wayao of Africa; various Himalayan and Indian tribes; S. Massim of Melanesia; Marquesas, Hawaii, Maori of Polynesia; and various Australian tribes). At times there is an exchange of wives at feasts, when general orgiastic license prevails (Araucanos, Bororo, Keres of S. America; Arapahos, Gros Ventres and Lower Mississippi tribes of N. America; Dayaks and Jakun of Indonesia; Bhuiyas, Hos, Kotas of India; Ashanti, Ekoi and various Bantu tribes of Africa; Kiwai Papuans). On such festive and extraordinary occasions not only are the sexual restrictions removed, and the sexual appetite stimulated, but the ordinary discipline is relaxed, the normal occupations abandoned and social barriers over-ridden, while at the same time people indulge in gluttony, in desire for amusement and social intercourse. Sexual license, as well as the other relaxations, liberties and ebullitions at such feasts fulfils the important function of providing a safety-vent which relieves the normal repressions, furnishes people with a different set of experiences, and thus again tends to safeguard ordinary institutions.

These cases where wives are exchanged for sexual intercourse only must be distinguished from the less frequent instances of prolonged exchange. with common habitation, more or less legalised. Among the Eskimo of Repulse Bay, "If a man who is going on a journey has a wife encumbered with a child that would make travelling unpleasant, he exchanges wives with some friend who remains in camp and has no such inconvenience. Sometimes a man will want a younger wife to travel with, and in that case effects an exchange, and sometimes such exchanges are made for no special reason, and among friends it is a usual thing to exchange wives for a week or two about every two months" (Gilder, Schzantka's Search, p 251). Analogous forms of prolonged exchange are found among certain tribes of S. India, while among the Siberian Chukchi a man will often enter on a bond of brotherhood with those of his relatives who dwell in other villages, and when he visits such a village his relative will give him access to his wife, presently returning the visit in order to make the obligation mutual; sometimes cousins will exchange wives for a prolonged period.

Again, among the Dieri, Arabana and cognate tribes of C. Australia, a married woman may be placed in the so-called pirrauru relationship to a man other than her husband. Such a man may, with the husband's permission, have access to her on rare occasions. Or if the husband be absent and give his consent the woman may join her paramour for some time at his camp, but this is apparently rare. In order to lend his wife in this way a man must wait until she is allotted by the tribal elders as the pirrauru to another man. Then he may consent to waive his marital rights for a short time, though we are expressly told he is under no constraint to do so. Circumstances, jealousy, even the disinclination of the woman are obstacles all of which must make the carrying-out of pirrauru rights extremely rare. This custom has been adduced as a present-day occurrence of group marriage, but this is obviously incorrect. It is always a temporary and partial surrender of marital rights consisting of a long and permanent connubium with occasional rare episodes of extra-marital liaison.

It is important to remember that we have come to regard marriage as defined primarily by parenthood. Now social parenthood in native ideas, behaviour, custom and law is not affected by these various forms of relaxation just described. The children are reckoned as belonging to the legal husband, and in this as in many other ways—economic, legal and religious—these temporary relaxations do not seriously disturb the marriage relationship. It must be realised with regard to fatherhood that even where the main principles of physiological procreation are known, savages do not attribute an undue importance to actual physiological paternity (see KINSHIP). It is almost always the husband of the woman who is considered the legal father of her children, whether he be their physiological father or not..

6. Concubinage.—This can be defined as a legalised form of cohabitation, which differs from marriage in that it implies a considerably lower status of the female partner and her offspring, than that enjoyed by the legal wife. It is a terminological confusion to speak of concubinage, when there is temporary access to a woman, or exclusively sexual rights in her. On primitive levels of culture real concubinage does not exist. Some similarity to it can be found in the institution of subsidiary wives. In certain polygynous communities there is one principal wife and the subsidiary ones have a much lower status, as is the case among the Guarani, Central Eskimo, Araucanians. Apache, Chippewa (America); Chukchi, Koryak, Yakut (N.E. Asia); Marquesas Islanders, Tongans, Tahitians, Maori, Marshall Islanders (Polynesia); Awemba, Wafipa, S E. Bantu, Herero, Nandi, Yoruba, Ewhe (Africa); Ossetes, Kadaras, Khambis (India); Battas, Bagobo, Kulaman (Indonesia).

It is not correct to regard the institutions of temporary and limited partnership described above, such as the pirrauru of C. Australia or the protracted exchange of partners among the Eskimo, as concubinage.

7. Prostitution.—The institution of commercial eroticism or prostitution has a very limited range among primitive peoples It has been reported from Melanesia (Santa Cruz, Rossel Island), Polynesia (Line Islands, Caroline Islands, Easter Island, Hawaii), Greenland, N. America (Omaha), S. America (Karaya, Uitoto, Boro), W. Africa, E. Africa (Banyoro). In its relation to marriage it begins to play a very important part only in higher cultures (see PROSTITUTION). On the one hand it provides an easy satisfaction for the sexual appetite to unmarried men or those who for some reason cannot cohabit with their wives. It thus constitutes an institution complementary to marriage. On the other hand, in certain communities, of which Ancient Greece is a notable example, *i.e.*, "hetairism," prostitution in a higher and more refined form, allowed some women to devote themselves to cultural pursuits and to associate with men more freely than was possible to those legally married.

On the whole it is rather a subsidiary institution than either a relaxation or a form of sexual preparation. Unlike the other forms of sexual licence, prostitution is neither directly correlated with marriage nor does it affect its integrity so seriously as do the forms of matrimonial relaxation which involve both husband and wife.

8. The Economics of the Household and Family.—We are thus led at all stages of our argument to the conclusion that the institution of marriage is primarily determined by the needs of the offspring, by the dependence of the children upon their parents. More specially, the mother since she is handicapped at pregnancy and for some time after birth, needs the assistance of a male partner. The rôle of male associate and helpmate is almost universally played by the husband exclusively, though in some extremely matrilineal societies the wife's brother shares with the husband in some of the responsibilities and burdens of the household. The economic as well as the biological norm of a family is thus mother, child and husband—or exceptionally both the husband and the wife's brother.

In the vast majority of human societies the individual family, based on monogamous marriage and consisting of mother, father and children, forms a self-contained group, not necessarily however cut off from society. Within the household there is a typical scheme of division in functions, again almost universal. By virtue of natural endowment the wife has not only to give birth to and nourish the children, but she is also destined to give them most of the early tender cares: to keep them warm and clean. to lull them to sleep and soothe their infantile troubles. Even in this the husband often helps to a considerable degree, prompted by natural inclination as well as by custom. This latter often imposes upon him duties and ritual manifestations such as taboos during the pregnancy of his wife and at childbirth, and performances at the time of confinement, of which the couvade (*q.v.*) is the most striking example. All such obligations emphasize the father's responsibility and his devotion to the child. Later on in the education of offspring both parents have to take part, performing their respective duties, which vary with the society and with the sex of the children.

Apart from the special task of producing and rearing the children, the wife normally looks after the preparation of the food, she almost invariably provides the fuel and the water, is the actual attendant at the hearth or fireplace, manufactures, tends and owns the cooking-vessels, and she is also the main carrier of burdens. In the very simplest cultures the woman also erects the hut or shelter and looks after camp arrangements (Australians, Bushmen, Andaman Islanders). The husband is the protector and defender of the family, and he also performs all the work which requires greater strength, courage and decision, such as hunting game, fishing, heavy building of houses and craft, and clearing the timber.

The division of labour between husband and wife outside the household follows the line of men's and women's occupations which differ with the community, but on the whole make fighting, hunting, sailing, metal work purely male occupations; collecting, agriculture, pottery, weaving predominantly female; while fishing, cattle-tending, making of clothing and utensils are done by one sex or the other according to culture.

The division of labour outside the household does not mean merely that husband and wife collect food and manufacture goods for their family each in a different manner.' It means also as a rule that each has to collaborate with other members of the community of the same sex in some wider collective enterprise, from which the family benefits only partially and indirectly. In spite of repeated theoretical assertions as to the existence of the "closed household economy" or even of individual search for food among primitive peoples, we find in every community, however simple, a wider economic collaboration embracing all members and welding the various families into larger co-operative units (*cf.* B. Malinowski, "Primitive Economics of the Trobriand Islanders," *Econ. Journal,* 1921; "Labour and Primitive Economics," *Nature,* December, 1925).

The fuller our knowledge of relevant facts, the better we see on the one hand the dependence of the family upon the rest of the community, and on the other hand the duty of each individual to contribute not only to his own household but to those of others as well. Thus in Australia a great part of a man's yield in hunting has to be divided according to fixed rules among his relatives, own and classificatory. Throughout Oceania a network of obligations unites the members of the community and overrules the economic autonomy of the household. In the Trobriand Islands a man has to offer about half of his garden produce to his sister and another part to various relatives, only the remainder being kept for his own household, which in turn is supported substantially by the wife's brother and other relatives. Economic obligations of such a nature cutting across the closed unity of the household could be quoted from every single tribe of which we have adequate information.

The most important examples however come from the communities organised on extreme mother-right, where husband and wife are in most matters members of different households, and their mutual economic contributions show the character of gifts rather than of mutual maintenance.

9. The Split Household Under Matrilocal Mother-right.—Most of what has been said so far refers to the marriage based on a united household and associated as a rule both under father-right and mother-right with *patrilocal* residence. This means that the bride moves to the husband's community, when she either joins his family house or camp, or else inhabits a house built for the new couple and owned in the husband's name. Patrilocal marriages are by far the most prevalent all over the world.

Matrzlocal marriage consists in the husband's joining the wife's community, taking up residence in her parents' house and often having to do some services for them. Matrilocal residence may be permanent; or it may be temporary, the husband having to remain for a year or two with his parents-in-law, and having also possibly to work for them. (Eskimo, Kwakiutl, Guaycuru. Fuegians of America; Bushmen, Hottentots, Bapedi, Bakumbi, Nuer of Africa; negrites of Philippines; Ainu of Japan.) (*See* also Westermarck, *History of Human Marriage,* vol. ii., 360–364; Briffault, The *Mothers,* vol. i. pp. 268–302.)

In a few cases which might be regarded as the extreme development of mother-right combined with matrilocal conditions, the wife remains at her mother's residence and the husband does not even take up a pernianent abode there, but simply joins her as a frequent and regular but still temporary visitor (Menangkabau Malays of Sumatra, Pueblo and Seri Indians of N. America, Nairs of Malabar). Such extreme cases of mother-right are an exception. They are the product of special conditions found as a rule at a high level of culture and should never be taken as the prototype of "primitive marriage" (as has been done by Bachofen, Hartland and Briffault).

The most important fact about such extreme matriarchal conditions is that even there the principle of social legitimacy holds good; that though the father is domestically and economically almost superfluous, he is legally indispensable and the main bond of union between such matrilineal and matrilocal consorts is parenthood. We see also that the economic side can have a symbolic, ritual significance—the gift-exchange functions as token of affection—it marks thus a sociological interdependence, while it has hardly any utilitarian importance.

10. Marriage as an Economic Contract.—This last point, together with the foregoing analysis of the household and family economics, allows us to frame the conclusion that while marriage embraces a certain amount of economic co-operation as well as of sexual connubium, it is not primarily an economic partnership any more than a merely sexual appropriation. It is as necessary to guard against the exclusively economic definition of marriage as against the over-emphasis of sex. This materialistic view of marriage, to be found already in older writers such as Lippert, E. Grosse, Dargun, appears again in some recent important works. Criticising the exaggeration of sex, Briffault says about marriage: "The institution, its origin and development, have been almost exclusively viewed and discussed by social historians in terms of the operation of the sexual instincts and of the sentiments connected with those instincts, such as the exercise of personal choice, the effects of jealousy, the manifestations of romantic love. The origin, like the biological foundation, of *individual marriage being essentially economic,* those psychological factors are the products of the association rather than the causes or conditions which have given rise to it." And again: "Individual marriage has its *foundation* in *economzc* relations. In the vast majority of uncultured societies marriage is regarded almost *exclusively* in the light of *economic* considerations, and throughout by far the greater part of the history of the institution the various changes which it has undergone have been *conditioned by economic causes." (The Mothers,* vol. ii., p. 1; the italics are those of the present writer.)

This is a distortion of a legitimate view. Marriage is not entered upon for economic considerations, exclusively or even mainly; nor is the primary bond between the two parties established by the mutual economic benefits derived from each other. This is best shown by the importance of matrimonial bonds even where there is neither community of goods nor co-operation nor even full domesticity. Economics are, like sex, a means to an end, which is the rearing, education and dual parental influence over the offspring. Economic co-operation is one of the obligations of marriage and like sexual cohabitation, mutual assistance in legal and moral matters it is prescribed to the married by law and enjoined by religion in most cultures. But it certainly is not either the principal end or the unique cause of marriage.

11. "Marriage by Purchase."—As erroneous as the over-emphasis on economics and its hypostasis as the *vera causa* and essence of marriage is also the tearing out of some one economic trait and giving it a special name and thus an artificial entity. This has been done notably with regard to the initial gifts at marriage, especially when given by the husband. More or less considerable gifts from the husband to his wife's family at marriage occur very widely (*see* the comprehensive list of references In Westermarck, *History of Human Marriage,* vol. II., chap. xxiii.).

The term "marriage by purchase" applied to such gifts usually serves to isolate them from their legal and economic context, to introduce the concept of a commercial transaction, which is nowhere to be found in primitive culture as a part of marriage, and to serve as one more starting point for fallacious speculations about the origin of marriage.

The presents given at marriage should always be considered as a link—sometimes very important, sometimes insignificant—in the series of services and gifts which invariably run throughout marriage. The exchange of obligations embraces not only the husband and the wife, but also the children, who under mother-right are counted as one with the mother while under father-right they take over the father's obligations. The family and clan of the wife, and more rarely of the husband, also become part of the scheme of reciprocities. The presents offered at marriage by the husband are often made up of contributions given him towards this end by his relatives and clansmen (Banaka, Bapuka, Thonga, Zulu, Xosa, Bechwana, Madi of Africa; Toradjas, Bogos of Indonesia; Buin, Mekeo, Roro, Trobrianders of Melanesia), and are not all retained by the girl's parents but shared among her relatives and even clansmen (Achomawi, Delaware, Osage, Araucanians of America; S.E. Bantu, Swahili, Pokomo, Turkana, Bavili, Ewhe, Baganda, Masai, Lotuko of Africa; Ossetes, Samoyeds, Aleut, Yakut, Yukaghir of Siberia; Koita, Mekeo, S. Massim, Buin of Melanesia). The giving of presents is thus a transaction binding two groups rather than two individuals, a fact which is reflected in such institutions as the inheritance of wives, sororate, levirate, etc. A correct understanding of the initial marriage gift can be obtained only against the background of the wider economic mutuality of husband and wife, parents and children, maternal and paternal families and clans.

Another type of marriage gift is the *lobola* found among the patrilineal and patrilocal communities of the S.E. Bantu, who live by combined agriculture and cattle-raising. The wife and children are here regarded as a definite economic and sociological asset. The wife is the main agricultural and domestic worker, while the children are valuable because the boys continue the line and the girls bring in wealth at marriage. Marriage is concluded by the payment of cattle, the amount varying greatly according to tribe, rank and other considerations from a couple of head to a few score. These cattle are known as *lobola,* or "bride-price," as is the current but incorrect anthropological expression. The *lobola* in fact is not the motive for the transaction, nor is there any bidding on any market, nor can the cattle be disposed of at will by the receiver, *i.e.,* the girl's father. Some of them have to be distributed by him according to fixed tribal custom among particular relatives of the girl; the rest he has to use for the provision of a wife for his son, *i.e.*, the girl's brother, or else, if he has no male heir, he contracts another wife for himself, in order to obtain the desired male descendants. In case of divorce the marriage gift has to be returned as the identical cattle given and not merely in an equivalent form. The *lobola* is thus rather a symbolic equivalent representing the wife's economic efficiency, and it has to be treated as a deposit to be spent on another marriage.

In Melanesia the husband's initial gift at marriage is a ritual act, and is always reciprocated by the wife's family. This is the case also among certain American tribes (Tshimshian, Coast Salish, Bellacoola, Delaware, Ojibway, Navaho, Miwok); in Siberia (Mordwin, Ainu, Buryat, Samoyed, Koryak), and in Polynesia (Samoa). This return gift may take the form of a dowry given to the bride by her father or parents or other relatives but also directly or indirectly benefiting her husband (Greenlanders, Brazilian aborigines, Yahgans of America, Ibo, Ovambo, S.E. Bantu, Banyoro, Masai of Africa; Buryat, Yukaghir, Samoyed of Siberia; Toda of India; Banks Islanders, Buin, Maori of Oceania). In some communities the balance of gifts is so much in favour of the husband that instead of wife purchase we could speak of buying a husband for the girl (N. Massim; coast tribes of Br. Columbia; Tehuelches of Patagonia; Yakut). Both concepts, however, that of "wife purchase" and "husband purchase" are obviously inadmissible.

12. Property and Inheritance Within **Marriage.**—As a rule, whatever the manner of economic inauguration of marriage, and whatever the mutual services exchanged between the partners, the latter have not only their own sphere of activity but their own possessions. The wife usually claims the title and right of disposing of her articles of apparel, of the domestic utensils and often of the special implements and fruits of her pursuit. The importance of woman's work in agriculture, her social influence due to this and her specific claims to the agricultural produce —not the ownership of the land, which is generally vested in man—have given rise to the economic theory of mother-right (see below, 13 and 14).

Very often the possessions of the husband and wife are inherited by their respective kindred, and not by the surviving partner. The inheritance of the wife by the husband's brother (the custom of levirate *q.v.*), which is known from the Old Testament, but has a fairly wide range of distribution (see the extensive lists given by Westermarck, *loc. cit.* vol. iii., pp. 208–210; Briffault, The Mothers, vol. i., pp. 767–772) is not to be regarded as an economic transaction. Like the inheritance of a widow under mother-right and like the custom of killing the widows and the suttee of India, it is the expression of the matrimonial bonds outlasting death, and defining the widow's behaviour afterwards (see below, 20).

13. Marriage as a Legal Contract.—Marriage is never a mere cohabitation, and in no society are two people of different sex allowed to share life in common and produce children without having the approval of the community. This is obtained by going through the legal and ritual formalities which constitute the act of marriage, by accepting in this the obligations which are entailed in marriage and the privileges which it gives, and by having later on to submit to the consequences of the union as regards children.

The legal side of marriage is therefore not made up of special activities, such as constitute its sexual, economic, domestic or parental aspect. It is rather that special side in each of these aspects, which makes them defined by tradition, formally entered upon, and made binding by special sanctions.

First of all, the whole system of obligations and rights which constitute marriage is in each society laid down by tradition. The way in which people have to cohabit and work together is stipulated by tribal law: whether the man joins his wife or vice versa; whether and how they live together, completely or partially; whether the sexual appropriation is complete, making adultery in either partner an offence, or whether, subject to certain restrictions, there may be waiving of the sexual rights; whether there is economic co-operation and what are its limits. The details and the typical rules and variations of all this have already been discussed, as well as, incidentally, the ways in which the rules are enforced. But it must be added that in no other subject of anthropology is our knowledge so limited as in the dynamic problems of why rules are kept, how they are enforced, and how they are evaded or partially broken. (Cf. B. Malinowski, Crime and Custom in Savage Society, 1926.)

Only on one or two points are we habitually informed by ethnographic observers, as to what penalties attach to a breach of law and custom and what premiums are set on their careful and generous observance. Thus, we are often informed how adultery is dealt with, though we usually get exaggerated accounts of the severity of the law on this point Again, to anticipate, incest and exogamy are usually surrounded with definite sanctions, some social and some supernatural. The manners and morals of daily contact within the household are usually laid down and enforced by that complicated and imponderable set of forces which governs all human behaviour in its everyday aspects and makes people distinguish between "good" and "bad form" in every human society. The validity of the economic duties of husband and wife are as a rule based on the fact that the services of the one are conditional on the services of the other, and that a very lazy or unscrupulous partner would eventually be divorced by the other.

14. Divorce.—This brings us to the subject of the dissolution of marriage. Marriage is as a rule concluded for life—at times

beyond death, as mentioned above. It is questionable whether the short period "marriages" reported from isolated districts (Eskimo of Ungava district, some tribes of the Indian Archipelago, Arabia, Persia, Tibet) deserve the name of marriage, *i.e.,* whether they should not be put into a different sociological category; but our accounts of them are too slight to allow of deciding this question. In some tribes we are told that marriage is indissoluble (Veddas, Andarnanese, certain tribes of the Indian Archipelago and Malay Peninsula). The general rule, however, is that divorce (*q.v.*), is possible, but not easy, and entails damages and disabilities to both partners. Even where divorce is said to be easy for husband and for wife, we find on further enquiry that a considerable price has to be paid for the "liberty to divorce," that it is easy only to exceptionally powerful or successful men and women, and that it involves in most cases loss of prestige and a moral stigma. Often also divorce is easy only before children have been born, and it becomes difficult and undesirable after their arrival. In fact the main ground for divorce, besides adultery, economic insufficiency or bad temper, is sterility in the wife or impotence in the husband. This emphasizes the aspect of marriage as an institution for the preservation of children.

The threat of divorce and of the disabilities which it entails is one of the main forces which keep husband and wife to their prescribed conduct. At times the husband is kept in check by the payment he gave at marriage and which he can reclaim only when the union is dissolved through no fault of his. At times the considerable economic value of the wife is the motive of his good and dutiful conduct.

15. The Status of Husband and Wife.—The duties of the wife towards the husband are apparently in some communities enforced to a considerable extent by his personal strength and brutality, and by the authority given him by custom. In others, however, husband and wife have an almost equal status. Here again, unfortunately, we find too often in ethnographical accounts generalities and stock phrases such as that "the wife is regarded as the personal property of the husband," as "his slave or chattel," or else again we read that "the status of the wife is high." The only correct definition of status can be given by a full enumeration of all mutual duties, of the limits to personal liberty established by marriage, and of the safeguards against the husband's brutality or remissness, or, on the other hand, against the wife's shrewishness and lack of sense of duty. It is often held that mother-right and the economic importance of woman's work, especially in agricultural communities, go with a high social status of the wife, while in collecting, nomadic and pastoral tribes her status is on the whole lower (E. Grosse, in *Die Formen der Familie und die Formen der Wirtschaft;* Schmidt and Koppers, in *Völker und Kulturen).*

Marriage not only defines the relations of the consorts to each other, but also their status in society. In most tribes, marriage and the establishment of an independent household are a condition for the attainment of the legal status of full tribesman in the male and of the rank and title of matron in the woman. Under the system of age grades the passage through certain initiation rites is a condition of marriage and this is as a rule concluded soon after it is permitted *(cf.* Webster, *Primitive Secret Societies;* Schurtz, *Altersklassen und Mannerbunde).* In all tribes, however, all normal and healthy tribesmen and women are married, and even widows and widowers remarry if they are not too old, under the penalty of losing some of their influence. The attainment of a full tribal status is always a powerful motive for marriage.

16. The Laws of Legitimate Descent.—Marriage affects not only the status of the consorts and their relations, but imposes also a series of duties on the parents with regard to children, and defines the status of children by reference to the parents.

As we know already in virtue of the universal principle of legitimacy, the full tribal or civil status of a child is obtained only through a legal marriage of the parents. Legitimacy is at times sanctioned by penalties which devolve on the parents, at times by the disabilities under which illegitimate children suffer, at times again by inducements for the adoption of children or for their legitimisation by the presumptive father or some other man.

In connection with this latter point it is necessary to realise that the children have invariably to return in later life some of the benefits received earlier. The aged parents are always dependent on their children, usually on the married boys. Girls at marriage often bring in some sort of emolument to their parents and then continue to help them and look after them. The duties of legal solidarity also devolve on the children, uniting them to father or mother according to whether we deal with a matrilineal or a patrilineal society.

One of the most important legal implications of marriage is that it defines the relation of the children to certain wider groups, the local community, the clan, the exogamous division and the tribe. The children as a rule follow one of the parents, though more complex systems are also in existence, and the unilateral principle of descent is never absolute. This however belongs to the subject of Kinship (*q.v.; cf.* also MATRIARCHY).

17. Modes of Concluding Marriage. — In studying the legal aspect of marriage, it is extremely important to realise that the matrimonial contract never derives its binding force from one single act or from one sanction. The mistake has often been made in discussing the "origin of marriage," of attributing to this or that mode of concluding it a special genetic importance or legal value. Marriage has in turn been derived from mere subjugation by brutal force (the old patriarchal theory); from appropriation by capture in foreign tribes (McLennan's hypothesis); from feminine revolt against hetairism (Bachofen); from economic appropriation or purchase (the materialist interpretation of early marriages); from pithecanthropic patriarchy (Atkinson, Freud); and from *matria potestas* (Briffault). All these views overstate the importance of one aspect of marriage or even of one element in the modes of its conclusion; some even invent an imaginary state or condition.

In reality marriage is the most important legal contract in every human society, the one which refers to the continuity of the race; it implies a most delicate and difficult adjustment of a passionate and emotional relationship with domestic and economic co-operation; it involves the cohabitation of male and female, perennially attracted and yet in many ways for ever incompatible; it focuses in a difficult personal relationship of two people the interest of wider groups: of their progeny, of their parents, of their kindred, and in fact of the whole community.

The validity of the marriage bond derives its sanctions from all these sources. This expresses one of the most important truths concerning marriage. The complexity of motives for which it is entered, the utility of the partners to each other, their common interest in the children's welfare, last, not least, the interest which the kindred and the community have in the proper upbringing of the offspring—these are the real foundations of marriage and the source of its legally binding character.

All this finds an expression in the modes of contracting marriage. These always contain the element of public approval; the collaboration of the families and the kindred of each partner; some material pledges and securities; some ritual and religious sanctions; last, not least, the consent of the parties concerned.

In the old manuals and statements concerning marriage an important place is usually taken by the classical list of the various "modes of concluding" it: marriage by capture, by purchase and by service, by infant betrothal, elopement, exchange, mutual consent, and so on (cf. even such an excellent and recent account as the article on "Marriage," by Rivers, in Hastings' *Enc.* of *Religion and Ethics).*

This classification is unsatisfactory. It exaggerates as a rule one aspect out of all proportion, and attributes to this one aspect an overwhelming influence upon the whole institution which it never possesses. "Marriage by purchase" we have already dismissed as a crude misnomer, while "service" is but a detail in the economics of certain marriages. "Marriage by capture," which has played such a prominent part in speculation and controversy from McLennan onward, never could have been a real institution: though a man may occasionally wed a woman captured by force in a war, such an occurence is always an exception; it never was a rule, still less a "stage in human evolution?' Tribal endogamy (see below, 22) is the universal rule of mankind. Ceremonial fights and ritual capture occur at wedding ceremonies over a wide area (see Westermarck, History of Human *Marriage,* ii., 254–277; Crawley, ii., 76–100; Briffault, ii., 230–250). They are capable of interpretation in terms of actual psychology and of existing social conditions (Westermarck, Crawley, Briffault, Havelock Ellis). To regard them as survivals of "marriage by capture" is erroneous, and on this point there is now an almost universal agreement. Capture and violence, as well as purchase from other tribes, or on the slave-market, lead to concubinage, and at times supply prostitutes, but only very rarely legal wives.

Like the contract itself, so also the modes of concluding it contain a great variety of binding and of determining factors. But a real and relevant distinction can still be made between those marriages which are contracted primarily by rules of tradition; those which are arranged for by the families or the kindred of the consorts; and those which arise from free and spontaneous choice of the mates. In no type of marriage is any of these three elements — tradition, arrangement by families or their consent, and free choice--completely absent. But one or other may be conspicuously predominant.

The most usual type of traditionally prescribed union is cross-cousin marriage (see COUSIN MARRIAGE), with a wide distribution, practised very extensively all over Oceania, Australia and S. India, and sporadically in Africa, N. America and Asia. The marriage of parallel cousins is less frequent, and found notably among Semitic peoples (cf. Frazer, Folk-Lore in the Old Testament, vol. ii., pp. 145 *sqq.;* B. Z. Seligman, "Studies in Semitic Kinship," Bull. School *Oriental* Studies, 1923–24). Even less common are marriages prescribed between other classes of relatives, *e.g.,* between a man and his brother's daughter (N. Australia, some parts of Melanesia), or his sister's daughter (S. India), or his father's sister (certain parts of Melanesia, Dene of N. America). Another type of prescribed marriage is by inheritance, of which the levirate and sororate (*q.v.*) are the most notable.

Besides such traditionally defined unions, there are also marriages recognised as convenient and desirable by the respective families and arranged for by them. Infant betrothal (prevalent in Australia and Melanesia), where a definite claim is established; or infant marriage (reported especially from India), where the bond is effectively concluded, are two of the most usual forms of these. The main motive for infant unions is the determination of the families to secure a convenient union. In Australia, where an infant is often allotted to a mature male, the power of old men and their keenness to secure young wives, are at the root of this institution. Whether similar conditions existed, or even still survive in Africa, is an interesting problem (see B. Z. Seligman, "Marital Gerontocracy in Africa," *Journal* of the *Royal* Anthropological Institute, 1924).

In many communities, including some advanced nations of Europe, marriage is mainly determined by social or financial considerations, and in this the parents of bride and bridegroom have as much to say as the two people directly concerned. In some primitive tribes two brothers exchange sisters (Australia), or a man's matrilineal uncle or patrilineal aunt has some say (Melanesia). Where the initial payments are very heavy and where they are used to secure a wife for the bride's brother, marriage is usually also a matter for an arrangement rather than free choice.

With all this free choice still remains the most important element. Very often an infant betrothal or some other form of arranged union is broken by one of the people directly affected, and marriage by elopement, with the subsequent consent of family and kindred, overrules all other considerations. Invariably in all communities the majority of unions come from the initiative of the partners. Marriage by free personal choice is the normal marriage, and the choice is mainly determined by personal attraction, which does not mean merely a sexual or erotic attraction. In general the physical appeal combines with compatibility of character, and such social considerations as suitability of rank and of occupation and of economic benefits, also influence the choice. Here again the nature of marriage entails a complexity of motives, and its stability has always to be secured by a suitable compromise between conflicting interests.

18. The Religious and Ceremonial Side of **Marriage.**— The sanctity of the marriage bond is not found merely in the Christian religion, nor is it a prerogative of the higher cultures. The supernatural sanction, derived from a solemn, publicly celebrated, spiritually as well as ethically hallowed ceremony, adds to the binding forces of mere law. Marriage is valid as a legal contract in so far as its breach is visited by worldly retributions and its generous fulfilment carries worldly benefits. As a sacrament, marriage in primitive and civilised societies alike, is protected by spiritual powers, rewarding those who observe matrimonial duties meticulously and piously, and punishing those who neglect them.

The religious aspect of marriage is therefore closely akin to the legal, in that it adds to the validity and sanctity of other functions, rather than establishes new ones. It finds expression in the acts of establishment and those of dissolution: religious rites are to be found at betrothal and wedding, while divorce is often religiously defined and qualified, and at death the breach of the bond finds its spiritual expression in the duties, observances and ceremonies incumbent on the surviving partner. Besides these ceremonial manifestations in which the bonds of marriage are religiously tied or dissolved, religious ethics establish those rules of matrimonial conduct which are sanctioned supernaturally or felt binding through their appeal to moral sense rather than to self-interest.

19. **Ceremonies of** Betrothal and Wedding. — Betrothal can be defined as an act preliminary to marriage, establishing mutually presumptive claims. The period between betrothal and marriage varies, and where it is short, it is often difficult or even impossible to decide whether we deal with an act of betrothal or an inaugural wedding rite. It is also unprofitable to draw a very sharp line of distinction between infant betrothal and infant marriage. Where betrothal imposes real obligations and a valid tie, the rites then observed usually fulfil in their religious bearing the same function as thos: of marriage, and consist of the same or similar actions, both as regards ritual technique and symbolic meaning. It will be best therefore to discuss the binding rites of marriage and betrothal together.

These rites and ceremonies cover a very wide range, from the simplest act, such as a meal openly taken in common, to complex and elaborate tribal festivities, extended over a considerable period of time. But in every human society marriage is concluded by a ritual enactment. It might be disputed whether such rites in their simplest form present a genuine religious character; but most sociologists would agree that they always possess some religious elements in that they are solemn and public; in their more developed form and in higher cultures they become definitely religious. It will be best in discussing the nature of wedding rites not to draw too pedantic a distinction between their legal and religious aspects, since the two often merge or shade into each other imperceptibly.

"The most general social object" of a wedding rite is "to give publicity to the union" (Westermarck). By this the legal as well as the religious sanction of the union is established. The contract is made binding in that all the members of the community bear witness to it; it is hallowed in that the two mates solemnly and openly declare before man, God or other spiritual powers that they belong to each other.

20. The Symbolism of Marriage Ritual. — A marriage rite is as a rule also a ritual act with a symbolic significance, and as such it is often conceived to possess a magical efficacy, it contains a moral precept or expresses a legal principle.

A. Biological Symbolism. — Thus the fundamental purpose of marriage, the continuity of the race, is indicated in wedding ceremonies by ritual, intended to make the union fruitful, to obviate the dangers associated with sexual intercourse, especially with defloration, and to facilitate the various stages of the process of generation from the first act to delivery. Among the fertility rites a prominent place is taken by the use of fruit or grain or other cereals, which are sprinkled over the newly-wedded couple or on or round the nuptial bed, or handed to them or brought into contact with them in some other way. Rites, such as the accompaniment of the bride by a little child, the use of various symbols of generation, and the direct offering of prayers and sacrifices, are all intended to make the union fruitful. The breaking of some object at the wedding serves to avert the dangers of defloration and to facilitate the consummation of the union. The undoing of knots and laces, found in many wedding rites, makes for easy delivery at childbirth. In all these acts we see the ritual expression of the biological nature of marriage.

B. Marriage as a *Crisis*.—As an official and public recognition of a biological fact, as the most important contract ever entered by two individuals, and as the act which creates a new social entity, the family, marriage is a crisis. Now a crisis in human life is always surrounded by powerful emotions: forebodings and hopes, fears and joyful anticipations. Innumerable wedding rites are in existence which are obviously intended to remove the dangers associated with the crisis of marriage.

Dangers apprehended in subjective forebodings are usually conceived in the form of evil agencies: demons or ghosts or malevolent spirits, forces of black magic, mysterious concatenations of ill-luck. These have to be kept at bay or counteracted, and we find innumerable rites intended to avert ill fortune and bring happiness and good chance to the new household. Among these are the avoidance of certain days and places as unlucky, or on the other hand the selection of certain days as being of good omen; the shutting out of evil influences from the place where the wedding is being celebrated; the making of noises, the firing or brandishing of some weapon; the bathing or washing of bride and bridegroom or sprinkling them with water; the lighting of fires and waving of torches; the circumambulation of the bridegroom's tent or of the church; the beating of the bridegroom's tent, and the observance by the bride and bridegroom of various kinds of abstinences with regard to action and eating. Other forms in which bad luck can be side-tracked are: the disguising of the real actors, who may dress in the clothes of the opposite sex, cover themselves, or paint their faces.; the substitution for them of effigies; marriage by proxy; and the contracting of mock marriages with trees or animals or inanimate objects. Finally an important antidote against all supernatural dangers is the state of spiritual invulnerability which is achieved by moral purity and the observance of those mixed ethical and ritual rules which in primitive culture often surround important acts of human life. The most important tabu of this kind, in connection with marriage is obviously the tabu of serf-continence. The principle that the bride and the bridegroom have to abstain from intercourse for some time after the wedding, is known all over the world from primitive savagery to the most refined ethics of the Christian church, from Australia to the New World (cf. Westermarck, II., 547–564), while on the wedding night there are occasionally other minor abstinences.

It is characteristic that while the bride and the bridegroom are often considered in a state dangerous not only to themselves but also to others, they are at the same time a source of blessing and of beneficent influences. Thus certain rites are supposed to influence favourably the welfare of other persons even independently of their relations to the principals; joining in at a wedding is sometimes believed to produce benefit; a wedding is looked upon as a potential cause of other weddings; while good luck is often expected from contact with the bride or bridegroom or something worn by them.

C. *Marriage* as a Sociological *Change*.—Marriage is a crisis not merely in the spiritual sense. It is also an actual sociological transition from one state to another, both partners forsaking their old families to form a new one. The rupture with the parental family, clan, local community or tribe is expressed in a number of interesting wedding rites. Sham fighting between the bridegroom or his party and the bride's family, or some other kind of resistance made by the latter; the barring of the wedding procession; weeping and other ritual expressions of grief and unwillingness on the part of the bride and her relatives; and the mimic enactment of capture or abduction of the bride—these are mostly the dramatic expression of the fact that the bride has to be torn from her old home, that this is a violent and critical act, a final one.

D. Marriage as a New Bond.—But the most important type of wedding rite is that which lays down that marriage is a sacramental bond. Here again the symbolism is wide and varied, from the most direct expression of union by the joining of hands or of fingers, the tying of garments, the exchange of rings and chains, to complicated dramatic enactments of the separation and union. An important symbolism of the new ties to be established consists in the performance of some act which in future will constitute one of the normal duties or privileges of married life. Such acts in a way define the nature and exclusiveness of marriage by anticipation in ritual performances. Among them, naturally the most important are the ceremonial performance of the sexual act and the ceremonial participation in a common meal. In certain ceremonies the symbolism lays down the relative domains of marital influence. Thus in some cases the assertion of the husband's power is prominent: he is presented with a whip, or he boxes the bride's ears, or mimically beats her, and so on. In others again the wife may attempt by similar acts to mark her independence and her power over her husband. The economic aspect of marriage is often also expressed in some magical act, intended to ensure prosperity to the future household, *e.g.*, by the smearing of butter and honey by the bride over the pole of the tent to ensure abundance of staple food. Again, the division of economic functions is expressed in other rites, as where the wife tends the fire, prepares and cooks food for her husband, etc.

E. *The* General *Function* of Wedding Symbolism.—These examples cover the most important though by no means all the ideas expressed in wedding rites. It is easy to see that the symbolism is extremely rich and varied, and that it embraces almost all the aspects of marriage. There are rites which bear directly upon sex and upon gestation; there are rites with a clear domestic and those with an economic significance; there are rites referring to emotional attitudes at marriage and to moral ideas as to its ends. In technique they are all legal, magical or religious. In short, the ceremonial of marriage covers and expresses all the relevant sides of the institution of marriage, and as such it has been a most fruitful and revelatory subject of anthropological study. It also has been the main source of errors and pitfalls.

In order to avoid them it is important to realise that all ritual symbolism is necessarily vague. Speaking of the marriage ceremonies, Professor Westermarck rightly lays down that "Anthropologists are often apt to look for too much reasoning at the bottom of primitive customs. Many of them are based on vague feelings rather than on definite ideas" (History of *Human Marriage*, II., 563). The ritual symbolism at marriage also expresses as a rule mixed and compound meanings in most of the acts. Thus the spilling of corn over the couple may mean fecundity, prosperity, good husbandry as well as union, and probably it vaguely expresses all these elements. Sham fights and captures, tree marriages or marriages by proxy have obviously a plurality of meanings.

Nor is the function of symbolism exhausted by its direct and literal meaning. A ritual act, fixed by tradition, defining the relevant manner of concluding a contract, impresses by pomp and circumstance its social importance and its binding force in the moral sense. The ethical rules and tabus which usually go hand in hand with ritual add to this spiritualising function of wedding ceremonies. The public and official nature of the marriage act, often marked by the presence of an officiating priest, ruler or magician; heralded by banns and public announcements; sealed by witnesses and documents; enhanced by the sacredness of place and of time constitutes the widest and most general function of the rite, and that is to make marriage public, binding, sacred and morally impressive.

21. The Dissolution of Marriage in Ritual.—The binding forces of the marriage contract, and its ritual and moral character, are expressed as clearly at the dissolution by divorce or death as at its inception. Unfortunately our information is so defective on this point that a brief survey only can be given.

Divorce in higher cultures is a religious matter, to be carried out under the supervision of the church, and with the observance of certain formalities which express and safeguard the sanctity of the sacrament. From lower cultures we find only a few examples of divorce rites, where such symbolic acts as the breaking of a rod, the tearing of a leaf, or the casting away of some object are publicly performed (Kacharis, Hajongs, Khasis of N.W. India; Bagobo of Mindanao; Tumbuka of C. Africa; certain Canadian Indians; Maori of New Zealand).

Far more material is at our disposal referring to the persistence of the matrimonial bonds at death. They are never dissolved automatically by the decease of either partner, and their tenacity is greater for the widow than for the widower. But in either case the death of one consort imposes a number of ritual and moral observances on the other, the fulfilment of which is an essential part of the marriage contract.

The widow, or widower, usually plays the most prominent part among all mourners. Thus among certain peoples the widow has to perform various duties, extending over a more or less considerable period, at the grave of her husband. She has to sleep beside or over it; to supply it with provisions; to keep a fire burning there perpetually (Takulli, Kutchin, Mosquito, Pima Indians of America; Minas, Nsakara, Baganda of Africa; Pentecost Islanders and certain Papuans of Oceania; Kukis of India). Even more telling are the long series of tabus and duties to be observed by the widow before she is allowed to remarry: she must remain chaste, refrain from bathing or renewing her garments, avoid certain foods, etc. (Omaha, Stlathlumh, Creek, Chickasaw, Algonkin, Iroquois, Dakota, Eskimo of N. America; Angoni, Bakoba, Baya, Bawele, Baganda, Akamba, Herero, BaThonga, Zulu of Africa; Amoor tribes and Kukis of India; Bontoc Igorot of the Philippines; Maori of New Zealand; Ainu, Yakuts, Kamchadal of N.E. Asia).

Similar regulations prevent the widower from entering into a new alliance immediately after he has been set free by his wife's death. Thus among many peoples (Greenlanders, Eskimo, Aleut; Dakota, Omaha, Shawnee of N. America; Herero, Bushmen, BaThonga, Zulu of Africa; certain Papuan tribes; the Bontoc Igorots and the Ainu) the surviving husband has to live single for a time during which he is subjected to various restrictions and observances, such as refraining from sexual intercourse.

The most definite affirmation of the persistence of marital bonds is found among those people who completely forbid remarriage to widows (Tikopians, Rotumans, Marquesans, Line Islanders in Polynesia; Chinese; Ainu of Japan; Formosans; Brahmans of India) or to widowers (Ainu, Formosans, Biduanda Kallang of Malay Peninsula).

Even this is overshadowed by the institution of suttee, the sentence of death passed by religious tradition over the widow at her husband's death so that her spirit might follow his into the next world. This institution is found not only in India, from where we have borrowed its name, but also among the Comanche, Cree and certain Californian tribes of N. America; in Dahomey and among the BaFiote of Africa; in the New Hebrides, Fiji, Solomon Islands, Pentecost Island and New Zealand of Oceania.

22. **The** Social Conditions of Marriage. Endogamy.—With this we have finished the analysis of the various aspects of marriage, biological, domestic, economic, legal and religious. It will be necessary still briefly to consider marriage in relation to other modes of grouping, and to discuss certain barriers to and qualifications for matrimony, connected with membership in wider groups.

Marriage is never free in the sense that any man would be at liberty to marry any woman. Natural and physical impediments obviously do not come here under consideration, since we are only concerned with social rules. Thus it is clear that in order to marry, two people must come into contact with each other, and under primitive conditions this is possible only when they belong to the same tribe, or to tribes who meet in peaceful commerce or in warfare. Tribal or natural endogamy (*q.v.*), is thus the first condition of marriage, but it is of secondary interest to the sociologist, and must be distinguished from strict, endogamy.

Endogamy *proper* is the rule which allows marriage only between members of a section of a tribe and forbids unions between members of two sections. Strict endogamy is rare. It occurs mainly in India where members of the same caste only are allowed to marry (see Caste *and Endogamy*). In other parts of India we find a system called *hypergamy* (*q.v.*) in which a man is allowed to marry a woman of a lower section in his caste. He may also marry a woman of the same section if other conditions allow this. But a woman may not marry a man of a lower section on penalty of loss of status of her whole family. In some communities there is competition to secure husbands of high sections.

In primitive communities endogamy is not very widespread. It occurs in tribes where there is a degraded class of artisans or else stratification by rank (Polynesia; Korea, Japan; Trobriand Islands of Melanesia; Algonkin, Salish of N. America; Masai, Banyankole, Karanga and other tribes of E. and S. Africa). In such cases we often find endogamy in what might be called an approximate form. Indeed such approximate endogamy, as a tendency to marry within the profession, class or rank, is, as an unwritten law, well-nigh universal in primitive and civilized communities.

Another type of endogamy which is widespread is that associated with religion. In few religions is marriage outside the group of the faithful permitted. Islam, Judaism, Christianity and Hinduism are cases in point. Primitive religion as a rule need not be intolerant as regardsmixed marriages, because there the tribal barriers and lack of communication act with sufficient stringency.

23. The Prohibition of Incest.—The most widely spread and most rigidly enforced qualification to marriage is the set of rules which prohibit unions between the members of the same family. These are known as the rules of incest (*q.v.*), and play a great part in the constitution of the family (*q.v.*) and in the regulation of primitive kinship (*q.v.*). Incest has become also of great importance in modern psychology through the speculations of Freud and the psychoanalytic school (see also PSYCHOANALYSIS).

Although incestuous unions between near relatives are universally abhorred and prohibited, the rules differ greatly from one society to another as regards the prohibited degrees as well as the stringency and character of the sanctions. Marriages between mother and son and between father and daughter are universally prohibited by law, custom and moral sentiment. Statements can be quoted, it is true, of tribes among whom more or less irregular unions between parents and children do occur. Thus marriages between mother and son have been reported from the Caribs, Eskimo, Pioje, Tinne of America; Minahassa of Celebes and Kalang of Java; New Caledonians; and the Banjoro of Africa. Again unions between father and daughter are said to occur among the Minahassa of Celebes, Karens of Burma, and in the Solomon, Marshall and Pelew Islands of Oceania. Even better attested are the marriages between brother and sister (Marshall Islands and Hawaii; ancient Irish, Egyptian and Inca royal families).

When we go beyond the family group, the prohibitions of marriage between uncles and nieces, aunts and nephews, first and second cousins, and so on, vary greatly. In some communities certain of these unions are explicitly encouraged and regarded as desirable; in others forbidden. About preferential marriages between relatives we have already spoken (see above, 17). Extensive prohibitions of marriage between distant kindred exist. besides the Western Christian civilizations also among a number of other tribes and cultures (Salish, Eskimo, Pipites of Salvador, Aztecs, Araucanians, Abipones, Ona, Yahgan of America; Koryak, Yukaghir, Kalmuck of N.E. Asia; Torres Straits Islanders, Mekeo. Polynesians of Oceania; S.E. Bantu of Africa).

24. Exogamy.—This is the system under which far larger groups of people are regarded as related to each other and their members forbidden to intermarry. It is found mainly in association with the classificatory nomenclature of kinship terms and the clan organisation (see also EXOGAMY; KINSHIP; KINSHIP TERMINOLOGY). Whether exogamy is genetically connected with incest, *i.e.*, whether it is an extension of the tabu on intercourse and marriage nithin the family, or an independent institution, is a

debated question (*see* Westermarck, *H.H.M.*, II., pp. 192–218; Frazer, *Totemism and Exogamy*, vol. IV., *passim;* Malinowski, *Sex and Repression in Savage Society*, part *IV.).*

Exogamy embraces the widest number of people, where it is based on the dual organisation and debars from intercourse or marriage one half of the tribesmen and tribeswomen (*cf.* DUAL ORGANIZATION). Normally exogamy is an attribute of clan, *i.e.*, of the group of people who trace their descent to a common ancestor, have in most cases the same totem, and fulfill a number of functions together (*see* CLAN, TOTEMISM, KINSHIP). The clans are sometimes a subdivision of the tribe, based numerically on the dual principle, as where we have two, four or eight clans. At times there is an odd and more or less considerable number of clans, and exogamy is enforced only within each of these divisions. The prohibitions as a rule apply unilaterally (Iroquois, Huron, Lenape, Mohegan, Miami, Shawnee, Creek, Sauk, Fox, Kickapoo, Blackfoot, Dakota, Seminole of N. America; Arawak and Goajiro of S. America; Tungus, Yakut, Samoyed, Ostyak, Tartars of N.E. Asia; various aboriginal peoples of India; Torres Straits Islanders, Papuans, Melanesians, Polynesians and Micronesians of Oceania; Hottentot, S.E. Bantu, Anyanja, Wayao, Awemba, Makololo, Akonde, Masai, Akamba, Baganda and other E. African tribes; Ashanti and other W. African tribes). Only in a few cases has exogamy to be observed with regard to the clans of both parents (Omaha, Osage of N. America; certain Naga tribes of Assam; S. Massim of Melanesia; Herero, Lango of Africa).

A specially complex set of conditions prevails in the tribes of central Australia, where there is a twofold division into: (a) totemic clans, which are not strictly exogamous; and (b) matrimonial classes, which strictly correspond to kinship divisions, and which are not only exogamous but regulate marriage to the extent that a member of one of them has to marry into one and one only of the remaining three or seven classes, as the case may be.

25. The **Forms** of Marriage. — From the foregoing description it will be clear that there is a considerable range within which the constitution of marriage can vary. For as we have seen there can be many different arrangements in the domestic, legal, economic and ceremonial sides of marriage, and each of their manifold combinations constitutes a distinct form of marriage.

The term "form of marriage" has been as a rule applied to what might be called the *numeric variation* in marriage, *i.e.*, the variation according to the number of consorts united to each other; and the main "forms of marriage" usually listed are monogamy, polygyny, polyandry and group-marriage. To deal with this classification adequately it is necessary to distinguish hypothetical assumptions from actually existing social arrangements. From this point of view we can at once eliminate "group-marriage," since our previous analysis (*see* above, 5) has shown that the *pirrauru* relationship of Australia and similar institutions among the Eskimo and in Siberia can not in their parental, economic, legal or religious functions be regarded as a form of marriage.

26. Polyandry. — This is the name given to a union in which several men are legally bound in marriage to one woman. Polyandry is the rarest of the numeric varieties of marriage, and unfortunately the one on which, in spite of its great theoretical importance. we possess but very meagre and inadequate information. Polyandry is not found among any of the more primitive peoples, and its distribution is almost completely confined to the highlands of S. India and C. Asia, with isolated exceptions, such as one African tribe (Bahima) and some Eskimo, among whom it occurs, but infrequently.

In Tibet and the adjacent countries there exists polyandry of the fraternal type, *i.e.,* several brothers share the wife in common. All the husbands live together with their common wife as members of the same household, and cohabit successively with her. Children born of these marriages are sometimes regarded as the legal descendants of the eldest brother-husband only; in other cases it appears that when a child is born it is attributed to him by whom the mother asserts that she has conceived it.

Among the Nayars of S W India there is a so-called form of polyandry which has played an important though rather deceptive part in the theories of marriage. A girl goes through a form of marriage with a man, but then really consorts with a number of men who need not be related to one another. She lives apart from her partners, who cohabit with her successively by agreement among themselves. Owing to the matrilineal institutions of this people, the children of such marriages inherit from their mother's brother, but the social importance of fatherhood is seen in the fact that the woman, when pregnant, always nominates one or other of the men as the father of the child, and he is obliged to provide for it and to educate it.

Another account is that by Dr. Rivers, of the Toda polyandry, which can be taken as the representative of the simpler type of this institution in S. India. Among the Toda, several men, usually two or three brothers, share the wife, but it is the rule that they cohabit with her in succession. Again, the children are not owned in common by the husbands, but each child is allotted individually to one, not with reference to any presumption of physical paternity, but in virtue of a ritual act performed by the man over the child, an act which establishes social paternity and confers legitimate descent on the child (*see* above, 4).

Polyandry is thus a compound marriage, in which cohabitation is usually successive, and not joint, while children and property are not shared by the husbands.

27. **Polygyny.**—This is a form of marriage in which several wives are united to one man, each having the status of legal consort, while her offspring are regarded as the legal descendants of the husband. As an institution polygyny (*q.v.*) exists in all parts of the world. There are very few primitive tribes about whom we are informed that a man is not allowed, if he can, to enter into more than one union. Many peoples have been said to be monogamous, but it is difficult to infer from the data at our disposal whether monogamy is the prevalent practice, the moral ideal, or an institution safeguarded by sanctions. It must be remembered at once that polygyny is never practised throughout the community: there cannot exist a community in which every man would have several wives, since this would entail an enormous surplus of females over males (*cf.* however the important contribution to this subject by G. Pitt-Rivers, *The Clash of Cultures and the Contact of Races*, 1927). The second important point with regard to polygyny, which is seldom brought out clearly, is that in reality it is not so much a form of marriage fundamentally distinct from monogamy as rather a multiple monogamy. It is always in fact the repetition of a marriage contract, entered individually with each wife, establishing an individual relationship between the man and each of his consorts. As a rule each relationship is little affected legally or economically by the others.

Where each wife has her separate household and the husband visits them in turn, polygynous marriage resembles very closely a temporarily interrupted monogamy. In such cases there is a series of individual marriages in which domestic arrangements, economics, parenthood as well as legal and religious elements do not as a rule seriously encroach on each other. The polygyny with separate households is more universally prevalent Among the great majority of the Bantu and Hamitic peoples of Africa, where the number of wives, especially in the case of chiefs is often considerable, each wife commonly occupies a separate hut with her children, and manages an independent household with well-defined legal and economic rights. Where, on the other hand, as among many N American tribes, two or more wives share the same household, polygyny affects the institution of matrimonial life much more deeply.

In most cases the motive for polygyny is economic and political. Thus in the Trobriand Islands (Melanesia) the chief's income is due to his wives' annual endowment. In many African communities the chief derives his wealth from the plurality of his wives, who by means of the produce of their agricultural labour enable him to exercise the lavish hospitality upon which so much of his power rests. A multitude of wives, however, may increase not only a man's wealth but also his social importance, reputation and authority, apart from the influence of the number of his children. Hence we find in many Bantu communities of Africa that the desire to have many wives is one of the leading motives in the life of every man; while the fact that in many Melanesian and Polynesian communities polygyny is a prerogative of the chief testifies to the social prestige attaching to it.

28. Monogamy.—Monogamy is not only the most important form of marriage, not only that which predominates in most communities, and which occurs, statistically speaking, in an overwhelming majority of instances, but it is also the pattern and prototype of marriage.

Both polyandry and polygyny are compound marriages, consisting of several unions combined into a larger system, but each of them constituted upon the pattern of a monogamous marriage. As a rule polygamous cohabitation is a successive monogamy and not joint domesticity; children and property are divided, and in every other respect the contracts are entered individually between two partners at a time.

Monogamy as the unique and exclusive form of marriage, in the sense that bigamy is regarded as a grave criminal offence and a sin as well as a sacrilege, is very rare indeed. Such an exclusive ideal and such a rigid legal view of marriage is perhaps not to be found outside the modern, relatively recent development of Western Culture. It is not implied in Christian doctrine even. Apart from such isolated phenomena as the recent Church of Latter Day Saints (Mormons) and the heretical sect of Anabaptists (16th century), polygyny was legally practised and accepted by the Church in the middle ages, and it occurs sporadically as a legal institution accepted by Church and State as recently as the middle of the 17th century (Westermarck, H.H.M., III., 50–51).

Monogamy as pattern and prototype of human marriage, on the other hand, is universal. The whole institution, in its sexual, parental, economic, legal and religious aspects, is founded on the fact that the real function of marriage—sexual union, production and care of children, and the co-operation which it implies—requires essentially two people, and two people only, and that in the overwhelming majority of cases two people only are united in order to fulfil these facts.

Conjugation necessarily takes place only between two organisms; children are produced by two parents only, and always socially regarded as the offspring of one couple; the economics of the household are never conducted group-wise; the legal contract is never entered upon jointly; the religious sanction is given only to the union of two. A form of marriage based on communism in sex, joint parenthood, domesticity, group-contract and a promiscuous sacrament has never been described. Monogamy is, has been and will remain the only true type of marriage. To place polygyny and polyandry as "forms of marriage" co-ordinate with monogamy is erroneous. To speak about "group-marriage" as another variety shows a complete lack of understanding as to the nature of marriage.

29. Theories of Marriage.—The last conclusions reveal once more the important truth of scientific method that a full knowledge of facts cuts the ground from under most hypothetical speculations. The theories of human marriage have mainly been concerned with its "origins" and "history," and attempts were made at ranging the various "forms of marriage" into an evolutionary series. Once we come to recognise that marriage is fundamentally one, and that its varieties correspond not to stages of evolution, but are determined by the type of community, its economic and political organisation, and the character of its material culture, the problem becomes one of observation and sociological analysis, and ceases to move on the slippery plane of hypothesis.

The view that marriage originated in "promiscuity," "hetairism" or "matrimonial communism," and that monogamy is a product of gradual development through a multitude of stages, has been advanced by Bachofen, Morgan and McLennan; has found whole-hearted or partial support by a number of eminent writers (Lord Avebury, Fison, Howitt, Tylor, Spencer and Gillen, Post, Kohler, Kovalevsky, Lippert, Schurtz, Frazer and others); and has been criticised and combated by Darwin, Westermarck, Lang, Grosse and Crawley.

The writings of Morgan's school suffer from an over-emphasis of the sexual aspect, often coupled with prudish reticences; from a misinterpretation of linguistic evidence; from a neglect of the parental and economic aspect of marriage. They are full of fantastic and meaningless concepts such as "promiscuity," "group-marriage," "primitive communism," which as a rule are not even laid down with sufficient concrete details to give hold to our imagination and remain mere words on paper. The German writers of this school, who have contributed a voluminous output, especially in the *Zeitschrift* fur *vergleichende Rechtswissenschaft,* have certainly not neglected the legal side of marriage, but in applying to primitive societies the dry legal formalism of modem jurisprudence, and in ruthlessly forcing all facts into the cut and dried scheme of "marriage stages," they have contributed but little which will have lasting value.

The recent advocates of Morgan's and Bachofen's view, notably Sumner, Rivers, Keller, Briffault, have given a much better and more concrete outline of the hypothetical early stages of marriage. But even this last stand of the "group-marriage" theory is based on an inadequate analysis of the institution and an unwarranted assumption of early sexual and economic communism as well as of group-motherhood

Modern theories of marriage follow closely the lead of Darwin on the biological side, of Westermarck in his sociological analysis, and of Crawley in some of his psychological suggestions. Such writers as Lowie, Kroeber and Howard in America; Thurnwald, W. Schmidt and Koppers in Germany; A. R. Brown, Malinowski, and Pitt-Rivers in Great Britain, both in their theories and in their field work show a far greater interest in the sociological analysis of marriage, in its relation to the family, in the correlation of its aspects, in the sociological working of sexual customs, whether these be tabus, relaxations or excesses, in their reference to marriage.

Some new light on marriage has been thrown by those psychoanalysts, notably J. C. Flügel, who are prepared to give serious consideration to facts in their bearing upon the Freudian doctrine (cf. Malinowski, Sex and Repression in Savage Society). Finally important contributions to the theory of marriage have been made by those students who approach the problem in its practical applications: the eugenists (see Eugenics Review): students of population (see Raymond Pearl's Journal of Human Biology); and scientific aspects of social hygiene (American J. of Social Hygiene).

Marriage like most problems of anthropology is ceasing to be a subject of speculation and becoming one of empirical research.

MARRIAGE, LAW OF. Marriage may be defined either as the act, ceremony or process by which the legal relationship of husband and wife is constituted; or as a physical, legal and moral union between man and woman in complete community of life for the establishment of a family.

While the consent of parties is universally deemed one of the conditions of a legal marriage, all the incidents of the relationship constituted by the act are absolutely fixed by law. The jurist has to deal with marriage insofar as it creates the legal status of husband and wife. It should be added that, while marriage is generally spoken of by lawyers as a contract, its complete isolation from all other contracts is invariably recognized. Its peculiar position may be seen at once by comparing it with other contracts giving rise to continuous relationships with more or less indefinite obligations, like those of landlord and tenant, master and servant, etc. In these the parties may in general make their rights and duties what they please, the law only intervening when they are silent. In marriage every resulting right and duty is fixed by the law.

Inferior Forms of Union.—Besides true marriage, inferior forms of union have from time to time been recognized, and may be briefly noticed here. These have all but disappeared from modern society, depending as they do on obsolete matrimonial restrictions.

The institution of slavery is a fruitful source of this kind of debased matrimony. In Roman law no slave could contract marriage whether with another slave or a free person. The union of male and female slaves (contubernium) was recognized for various purposes; a free woman entering into a union with a slave incurred under the S.C. Claudianum the forfeiture of her own liberty; but the bondwoman might be the concubine of a freeman. In the United States. where slavery was said to be regulated by the principle of the civil law. the marriage of slaves was so far recognized that on emancipation complete matrimony took effect and the children became legitimate without any new ceremony.

In Roman law no legal marriage could be contracted unless there was connubium between the parties. Originally there was no connubium between plebs and patricians, and in later times between the Latini and Peregrini, unless it had been expressly conferred. The Lex Julia et Papia Poppaea introduced restrictions depending on the condition of the parties which later legislation extended and perpetuated. Senators under that law were forbidden to marry freedwomen or women of inferior rank, and the husband of a freedwoman on becoming a senator was set free from his marriage. In the canon law new restrictions were developed. The order of the clergy were forbidden to marry. Disparity of faith was recognized by the early church as a bar to matrimony; *e.g.,* between Christians and pagans and between orthodox and heretics.

Concubinage, which such restrictions tended to develop, is noticed under a separate heading. In the left-handed or "morganatic" marriages of the German royal families is the nearest approach ever made by concubinage to true marriage, the children being legitimate, but neither they nor the wife acquiring any right to the rank or fortune of the husband. The marriage of persons of different religions frequently requires the intervention of the law as to the faith of the children, more particularly in Europe as between Roman Catholics and Protestants. English law gives the father, except under special circumstances, the right to dictate the faith of his children. The practice on this point varies in Europe—the question being ignored in French law, Germany following in some parts the same rule as England, in others giving effect to antenuptial stipulations. In Ireland mixed marriages (*i.e.,* between Roman Catholic and Protestant) were by 19 Geo. II c. 13 null and void if celebrated by a Roman Catholic priest. This act was repealed by 33 & 34 Vict. c. 110, which permits mixed marriages to be validly celebrated by an Episcopalian or Roman Catholic clergyman, subject to conditions set forth in s. 38.

Roman Law.—The three primitive modes of marriage were *confarreatio, coemptio in manum* and *usus,* all of which had the effect of placing the woman in the "power" (*manus*) of her husband, and on the same footing as the children. The first was a religious ceremony before ten witnesses, in which an ox was sacrificed and a wheaten cake broken and divided between the spouses by the priest. *Coemptio* was a conveyance of the woman by *mancipatio,* and might be described as a fictitious sale per *aes et libram. Usus* was the acquisition of the wife by prescription, through her cohabiting with the husband for one year, without having been absent from his house three continuous nights. But a true marriage might be concluded without adopting any of these modes, which all fell into desuetude and with them the subjection of the wife to the *manus.*

Marriage without *manus* was contracted by consent, without writing or formality of any kind. The restrictions as to age, relationship by consanguinity and affinity, previous marriage, etc., were in the main those which have continued to prevail in modem Europe with one important exception. The consent of the paterfamilias to the marriage of the children under his power was essential.

Canon Law.—The canon law of marriage is based partly on the Roman law, the validity of which the church from the first recognized, partly on the Jewish law as modified by the new principles introduced by Christ and his apostles, developed by the fathers of the church and mediaeval schoolmen and regulated and defined by popes and councils. The most important of these principles was that of the indissolubility of marriage, proclaimed by Christ without qualification according to Mark x, 11, 12, and with the qualifying clause "saving for the cause of fornication" according to Matt. v, 32. This lofty view of marriage, according to which man and wife are made "one flesh" by the act of God ("What therefore God hath joined together, let no man put asunder," Mark x, 9), was later modified by the heretical idea of the consummating act of marriage as in itself something unholy, a result of the fall. Christ himself, evidently, did not teach this. It is to St. Paul that the idea of marriage as a sacrament is to be traced, in the mystic comparison of the relations of husband and wife to those of Christ and his church. (Eph. v, 23–32.) Marriage. from being no more than a terminable civil contract, became a thing holy. a sacrament. a mystic union of souls and bodies never to be divided; valid, indeed, but not spiritually complete, without the public blessing of the church (Tertullian, *Ad uxorem,* lib. ii, cap. 9).

Remarriage (bigamy) was only allowed after many struggles, and then only to the laity; St. Paul had laid down that a "bishop" must be "the husband of one wife," and to this day the priests of the Orthodox Eastern Church may not remarry. Clerical celibacy, at first a counsel of perfection, was soon to become the rule of the church, though it was long before it was universally enforced in the west; in the east it still applies only to monks, nuns and bishops. *(See* CELIBACY). The marriage of the laity was hampered by the creation of a number of impediments. The few and definite prohibitions of the Roman and of the Jewish law (Lev. xviii, 6–18; xx) in the matter of marriage between kindred were indefinitely extended until in 506 the Council of Agde laid it down that any consanguinity or affinity whatever constituted an impediment. Moreover, man and wife being "one flesh," the church raised relationship by affinity into equal importance with that of consanguinity as an impediment to matrimony; and finally, to all this, added the impediments created by "spiritual affinity"; *i.e.,* the relations established between baptizer and baptized, confirmer and confirmed, and between godparents, their godchildren and their godchildren's relatives.

All this resulted in confusion and uncertainty, and it was early found necessary to modify it. Thus Pope Gregory I limited the impediment to the seventh degree of relationship inclusive (civil computation), which was afterward made the law of the empire by Charlemagne.

Later still Innocent III, by a decree (fourth Lateran council), permitted marriages between a husband and the relations of his wife, and vice versa, beyond the fourth degree inclusive (canonical computation). This remains the canonical rule of the Roman Catholic Church. Impediments resulting from spiritual affinity were limited by the Council of Trent to the relation of the baptizer and baptized; the baptizer and the parents of the baptized; the baptizer and the godfather and godmother; the godparents and the baptized and its parents; *i.e.,* a godfather may not marry the mother of the child he has held at the font, nor the godmother the father of such child.

In the fully developed canon law impediments to marriage are of two kinds, public and private. Near relationship, for instance, is a public impediment; impotence and force are private impediments.

Impediments are further divided into separating or merely suspensive. To the first class belongs, *e.g.,* a previous marriage not dissolved by death, which involves the nullification of the marriage even where through ignorance the crime of bigamy is not involved; to the second belongs the case of one or both of the contracting parties being under the age of puberty. Impediments, moreover, are absolute or relative. Near relationship, for instance, is an absolute impediment; difference of religion between the parties a relative impediment.

In addition to consanguinity and affinity, impuberty and existing marriage, the canon law lays down as public and absolute impediments to marriage the taking of holy orders and the vows of chastity made on entering any of the religious orders approved by the Holy See. In these impediments the canon law further distinguishes between those which are based on the law of nature (jus *naturae*) and those which are based on the law of the church (*jus* ecclesiae).

From impediments based on the law of nature, or of God, there is no power even in the pope to dispense; *e.g.,* marriage of father and daughter, brother and sister, or remarriage of husband or wife during the lifetime of the wife or husband of another marriage, which is held to be a violation of the very nature of marriage as an indissoluble union. From impediments arising out of the law of the church dispensations are granted, more or less readily, either by the pope or by the bishop of the diocese in virtue of powers delegated by the pope. (See DISPENSATION.)

Thus dispensations may be granted for marriage between persons related by consanguinity in any beyond the second degree and not in the direct line of ascent or descent; *e.g.,* between uncle and niece (confined by the Council of Trent to the case of royal marriages for reasons of state) and between cousins-german, or in the case of marriage with a heretic. In this latter case a dispensation is now (*i.e.,* since the papal decrees *ne* temere of Aug. 2, 1907, which came into force at Easter 1908) only granted on condition that the parties are married by a Catholic bishop or a priest accredited by him, that no religious ceremony shall take place except in a Catholic church and that all the children shall be brought up in the Roman Catholic faith.

In the absence of any impediment a marriage is according to the canon law completed between baptized persons by the facts of consent and consummation; the principle is still maintained that the parties to the marriage. not the priest, are the "ministers of the sacrament." From the first, ho ever, the church, while recognizing the validity of private contracts, enjoined the addition of a public religious ceremony (1 Tim. iv, 5). Tertullian (de *pudicitia*, cap. iv) says that clandestine marriages, not professed in the church, were reckoned among Christians as all but fornication, and he speaks of the custom of seeking permission to marry from the bishop, priests and deacons (De monogamia, cap. xi). This latter precaution became increasingly necessary as impediments were multiplied, and Charlemagne, in a capitulary of 802, forbade the celebration of a marriage until "the bishops, priests and elders of the people" had made diligent inquiry into the question of the consanguinity of the parties. This was the origin of the publication of banns which, long customary in France, was made obligatory on the whole church by Pope Innocent III. In the Eastern Church the primitive practice survives in the ceremonial blessing by the priest of the betrothal, as distinguished from the marriage ceremony. The ecclesiastical recognition of clandestine marriages, however, survived until the crying evil was remedied by a decree of the Council of Trent (Sess. xiv, de *matrim.*), which laid it down that for a valid marriage it was at least necessary that consent should be declared before a priest and in the presence of three witnesses.

Divorce. *i.e.*, the annulment of marriage for any cause but an impediment which makes the marriage *ipso* facto void: is unknown to the Roman Catholic Church. Separation a *vinculo matrimonii* is only possible under the canon law by a judicial decree of nullity (*annullatio matrimonii*), which implies, not the severing of the ties of a real marriage, but the solemn declaration that such marriage has never existed. There may, however, be a "separation from bed and board" (a *thoro* et mensa), even perpetual. which does not, however, give either party the right to remarry during the lifetime of the'other. But, marriage not being regarded as a sacrament until consummated, it may be dissolved, if nonconsummation be proved, by one or both parties taking the religious vows or by papal dispensation. The Roman Catholic Church claims exclusive control over marriage, and the Council of Trent anathematized the opinion held by Luther and other reformers, that it mas properly a subject for the civil courts (si quis dixerit causas *matrimoniales* non *spectare* ad judices ecclesiastic anathema sit, Sess. xxiv, cap. 2). This attitude became of extreme political importance when even in Catholic countries the codes established civil marriage as the only legally binding form.

(X.)

ENGLAND

Generally speaking, marriage as understood in England can well be described as "the voluntary union for life of one woman and one man to the exclusion of all others" (Lord Penzance in Hyde v. Hyde, 1866 L.R. 1 P. & D.).

In England, therefore, no union will qualify as a marriage unless it is monogamous in nature. A marriage which is contracted in a Christian country will be recognized provided there is that exclusiveness which is the essential feature in a Christian marriage. For example, if a man domiciled in England marries in Japan a Japanese girl according to the local forms there. it will be recognized when proof is given that the Japanese law of marriage is monogamous in nature. Further. marriage, although in some ways it can be regarded as contractual, in fact, because of its canon law origin and the fact that it gives the status of husband and wife, has effects in law not limited to those of an ordinary civil contract.

In England a valid marriage can be contracted except:

1. If either party is already married; or where a period must elapse after a decree of divorce before a party can remarry, a marriage which purports to have been celebrated during this period being null and void.

2. If either party is a certified lunatic (Marriage of Lunatics act, 1811).

3. If either party is under 16 years of age (Age of Marriage act, 1929).

4. If the ceremony of marriage is invalid (see below).

5. If the parties are within the prohibited degrees of consanguinity, (relationship by blood) or affinity (relationship by marriage). These are laid down in the Book of Common Prayer and are in part i of the first schedule of the Marriage act, 1949, between the ascending and descending lines in *infinitum* and collateral to the third degree; in part ii of this schedule 20 statutory exceptions are laid down and these include deceased wife's sister, deceased brother's wife, brother's deceased son's wife, etc. It is interesting to note that these exceptions do not, of course. modify the prohibition as regards a divorced spouse's relations. for whom the position is still the same as that laid down in the Book of Common Prayer, and that the relationships within the prohibited degrees include a half-blood and illegitimate relation.

6. If either party is coerced into marrying, or is fraudulently misled as to the identity of the other party or as to the nature of the ceremony. To invalidate a marriage there must be a fundamental lack of consent. Thus if a man were so drunk that he did not know what he was doing at the time of the ceremony. his consent would be vitiated and there would not be a valid marriage. If, on the other hand, a woman were to make a mistake as to the fortune of the other party, the marriage would be valid.

Void and Voidable Marriages.—The distinction between a void and voidable marriage is most important. If a marriage is a void one, strictly speaking no decree of the court is necessary because the marriage is deemed never to have existed and a decree of nullity in this case is of a declaratory nature only and may therefore be obtained after the death of one of the spouses. Subject to certain qualifications outlined in this article, a marriage is void on the grounds of: (1) invalid ceremony (but see below); (2) nonage, *i.e.,* if either of the parties is below the age of 16; (3) consanguinity; (4) bigamy; (5) insanity at time of marriage; (6) lack of consent; (7) impotence (canonical disability).

On the other hand, a voidable marriage is one which exists and is valid for all purposes until the court pronounces a decree, which it can do only on the grounds laid down in s. 8 of the Matrimonial Causes act, 1950, which are: (1) wilful refusal to consummate the marriage; (2) insanity, mental deficiency or epilepsy at the time of marriage; (3) venereal disease at the time of the marriage; (4) pregnancy by a person other than the husband at the time of marriage.

For these purposes, both parties must be alive when the petition is heard and for the purposes of (2), (3) and (4) the petitioner must satisfy the court that at the time of the marriage he was ignorant of the facts alleged, that proceedings were instituted within one year from the date of the marriage and that marital intercourse had not taken place since the discovery of the grounds for the decree.

Procedure. — The Marriage act, 1823, as re-enacted in the Marriage act, 1949, regulates marriage within the Church of England. It requires either the previous publication of banns or a licence from the proper ecclesiastical authority. As to banns, the rule of the rubric, so far as not altered by the statute, is required to be observed. They must be published on three successive Sundays at morning service after the second lesson, in the church of the parish in which the parties dwell; the bishops may, however, authorize the publication of banns in a public chapel. Seven days' notice must be given to the clergyman of the names of the parties, their place of abode and the time during which they have lived there. If either party is under age, the dissent of the parents or guardian expressed at the time of publication of banns renders such publication null and void.

Licence in lieu of banns may only be granted by the archbishop, bishop or other authority, for the solemnization of a marriage within the church of the parish in which one of the parties shall have resided for 15 days before. Before a licence can be granted an oath must be taken as to the fact of residence and, when either party is under 21, that the necessary consent has been obtained in the case of persons under that age. The father or lawful guardian is the proper person to consent to the marriage of a minor and the place of any such person if incapacitated mentally is taken by the lord chancellor. The absence of such consent does not, however, avoid a marriage once solemnized. But if persons wilfully intermarry (unless by special licence) in a place not being a church or public chapel, or without due publication of banns or proper licences, or before a person not in holy orders, the marriage is null and void to all purposes. Marriage must be celebrated within three months after banns or licence, and between the hours of 8 A.M. and 6 P.M.

The Marriage act of 1836 as re-enacted in the Marriage act, 1949, lays down alternative ways of being married. It permits marriage to be solemnized in two additional ways: (1) by certificate of the superintendent registrar of a district without licence and (2) by such certificate with licence. As far as the first way is concerned, notice must be given to the registrar of the district or districts within which the parties have resided for seven days previous, which notice is inscribed in a marriage notice book, open to public inspection at all reasonable times and thereafter suspended for 21 days in some conspicuous place in the registrar's office. Any person whose consent is necessary to an ecclesiastical licence may forbid the issue of a certificate but in default of such prohibition the certificate will issue at the end of 21 days. The marriage may then take place on any day within three months of the entry of notice and in one of the following ways: (1) in a certified place of religious worship registered for the solemnization of marriage; in that case a registrar of the district and two witnesses must be present and the ceremony must include a mutual declaration of assent by the parties and a disavowal of any impediment; (2) at the superintendent registrar's office, with the same declaration but with no religious service; (3) according to the rites of the Church of England; (4) according to the usages of the Jews and Quakers. (The place of marriage must in all cases have been specified in the notice and certificate.)

In the second case, when it is desired to proceed by licence, notice must be given to the registrar of the district in which one of the persons resides, together with a declaration that he or she has resided for 15 days therein, that there is no impediment and that the necessary consents, if any, have been obtained. The notice is not exhibited in the registrar's office and the certificate may be obtained at the expiration of one whole day after entry, together with the licence. No registrar's licence can be posted for a marriage in an Anglican church or one according to the form of the Church of England.

The effect of a default in the formalities of a marriage will depend on the nature of the defect and on the parties' knowledge of it. The following defects in the celebration of the marriage will not invalidate it:

1. Noncompliance with conditions as to residence under the Marriage act, 1823, s. 26., and the Marriage Registration act, 1856, s. 17 (now re-enacted in the Marriage act, 1949).

2. Failure to obtain parents' consent where one or both parties are under age, see R. v. *Birmingham Inhabitants* (1828 813 & C. 29) and Marriage and Registration act, 1856, s. 17, now re-enacted in the Marriage act, 1949.

3. Marriage not celebrated in front of two people.

4. Misdescription of the parties as to name, address, age and condition only invalidates a marriage which is solemnized after publication of banns and then only if the misdescription is fraudulent and is known to both parties of the marriage before the ceremony.

5. Other defects in the formalities rendered necessary by statute, or described above, invalidate a ceremony only if both parties are aware of the defect, for example, if a ceremony were solemnized in a church where the banns were not published, or not before a clerk in holy orders, etc.

The form and ceremonies of entering into a contract of marriage are regulated by the place where the marriage was celebrated but the essentials of a marriage depend on the law of the country in which the parties are domiciled at the time of the marriage and in which the matrimonial residence is contemplated. Foreign law is assumed, until the contrary is shown, to be the same as English.

Royal marriages have been subject to special laws. The Royal Marriages act, 1772, laid down that no descendant of George II who is under 25 shall be able to marry without the consent of the sovereign, under the Great Seal. If such a descendant is over 25, and his intended marriage is disapproved of by the sovereign. then he should give 12 months' notice in writing of it and after that time, unless both houses of parliament disapprove, the marriage can be validly solemnized.

In the Sussex Peerage case it was held that the language of the act was sufficiently strong to invalidate such a marriage contracted by such a descendant where no consent had been given, even though the local law required no consent, thus making the consent required by the act an essential of a valid marriage. (It is interesting to contrast the case of the consent of a parent to a marriage of a child under 21, where the courts have held, in the so-called Gretna Green cases, that this consent is only formal and that a marriage of English persons in Scotland, where until the Marriage (Scotland) act, 1939, no such consent was needed, was valid even though the necessary consent according to English law had not been obtained.)

It is a criminal offense to solemnize a marriage in contravention of the provisions of the Marriage act, 1823 (s. 2), the Marriage act, 1836 (s. 39), and the Royal Marriages act, 1772 (s. 3).

Legal **Effects** of Marriage. — Until the Law Reform (Married Women and Joint Tortfeasors) act, 1935, a husband could in certain circumstances be held liable in tort for his wife's wrongful acts. but since that act a woman is in the position of a feme sole and her husband is exempt from liability unless it can be shown that the wife was in fact an employee or agent. Similar considerations apply to the law of contract.

A husband is not liable for obligations contracted by his wife unless it can be shown that she acted as an agent of necessity. This position is said to arise when a husband wrongfully expels his wife from the matrimonial home without giving her a reasonable allowance, in which event she is deemed to have authority to pledge his credit in respect of necessaries requisite to maintain her in her station of life.

Marriage has the following effect upon the disposition of a spouse's property upon his death. If he or she leaves no will, then under the Administration of Estates act, 1925, a surviving spouse, whether husband or wife, is entitled on an intestacy of the other to: (1) the personal chattels absolutely (this includes furniture, houses, cars, plate, books. etc.); (2) £5,000 absolutely, free of duty and costs, with interest thereon at the rate of 5% per annum from the date of death until payment (this sum was £1,000 in the 1925 act but was amended to £5,000 by the Intestates' Estates act, 1952); and (3) a life interest in half of the residuary estate if the deceased left issue, and in the whole of the estate if the deceased left no issue.

Further, under the provisions of the Inheritance (Family Provision) act, 1938. where a person dies domiciled in England having (1) a wife or husband or (2) an unmarried daughter or a son or daughter who by reason of disability is unable to maintain himself or herself or (3) an infant son, then if a court on application by any of these dependents is of opinion that the will does not make reasonable provision for such dependent, an order making such provision may be made, provided the application is made within six months of death and provided the testator has bequeathed less than two-thirds of such estate where there is a spouse and other dependents or one half where there is only a spouse. This act of 1938 is by the Intestates' Estates act, 1952, extended to cases of intestate persons where the laws relating to intestate succession make insufficient provision for intestate person's dependents.

OTHER COUNTRIES

Scotland. — For the law of marriage in Scotland see SCOTS LAW.

France. — In France articles 144–226 of the Code Civil, as amended by several acts, prescribe the qualifications and conditions of marriage. The man must be 18 and the woman 15 years of age. A son or daughter under 21 cannot marry without consent of the father and mother, or of one of them (act of July 17, 1927) if they disagree or have been divorced or of the survivor if one is dead. If both parents are dead, the grandfather and grandmother or one of them take their place. If the grandparents are also dead the consent of the family council, deciding by a majority, must be given. Between the ages of 21 and 30 the parties are quite qualified and do not have to obtain the consent of their parents but must make a "respectful and formal act" before a notary when consent is failing (act of Feb. 2, 1933). Adoptive children under 21 cannot marry without consent of their adoptive parents (act of July 29, 1939). These rules apply to natural children when affiliated. Those not affiliated require the consent of a tutelage council. The act of July 29, 1939, created such a council in every canton, provided by the justice of the peace and deciding like a family council.

Marriage is prohibited between all ascendants and descendants in the direct line. and between persons related by marriage in the same line, between brother and sister, between uncle and niece, aunt and nephew. between adopter's and adoptive children and between adoptive children. In the collateral line, the act of July 1, 1914, suppressed the prohibition between brother-in-law and sister-in-lam unless the marriage producing the affinity has been annulled by divorce.

Before the solemnization of marriage, a publication notice must appear on the door of the town hall for a period of ten days. The notice contains the names, Christian names, occupations, domiciles or residences of the parties and the place where marriage is to be celebrated. Since the act of Aug. 9, 1919, the notice has contained nothing about the parents. According to an act of Nov. 2, 1945, the parties must give a less than two months' old medical certificate to the civil officer. If the marriage cannot be celebrated during the year, a fresh notice must be put up. The marriage is celebrated, in the parish to which one of the parties belongs, by the civil officer or registrar. He reads over to the parties the various necessary documents, with the chapter of the code relating to husband and wife, receiving from each a declaration that they take each other for husband and wife and drawing up the act of marriage. 411 this must be done in the presence of two witnesses. Marriages contracted abroad between French subjects or between French subjects and foreigners are valid in France if celebrated according to the forms of French law, before French competent consuls, or according to the forms of the foreign law provided the French conditions as to consent of parents have been observed.

(J. M.-M. L.)

Germany. — The law of marriage and divorce is laid down uniformly for all parts of Germany by the Control council Marriage law of 1946; this law took over the Marriage law of 1938, with the exception of typical National Socialist provisions. The law recognizes only marriage concluded before the registrar; *i.e.,* civil marriage. Church marriage may only take place afterward. Since 1947 foreigners may be married in Germany before diplomatic or consular representatives according to their own laws.

A man may not contract a marriage before he has completed his 21st year (his 18th in the Democratic Republic and east Berlin); a woman before she has completed her 16th. With special permission, both may marry earlier.

Legally incapable persons may not contract marriages, and those of limited legal capacity only with the permission of their legal representative.

After public notice is given, the marriage is concluded when the contracting parties personally and in the presence of each other and before the registrar declare, in answer to the question put to them individually, that they wish to marry each other. Two witnesses should be present and the registrar should enter the marriage in the register.

Marriages are particularly forbidden and, when celebrated, are void, between ascendants or descendants or full or half brothers and sisters, or if one of the parties is already married. Also forbidden and void (unless special permission is given before or after the marriage) are marriages between relations by marriage in a direct line; and between a person divorced for adultery and the person with whom the adultery was committed.

Marriages should not be contracted (although such marriages are not therefore void) by persons between whom there is an adoption relationship; by a woman whose former marriage has ended less than ten months previously; where no certificate can be produced from the guardianship court regarding the property settlement made for children of a former marriage; and by foreigners without a certificate from their own country stating that there is no impediment to the marriage.

Marriages are also void where, at the time of the marriage, one of the parties was legally incapable. or where the essential form of the ceremony was infringed. In these cases marriages are. however, valid if the parties have lived together for a certain time. After 1945 formally invalid "free" marriages between persons persecuted on racial or political grounds, displaced persons and refugees were under certain conditions recognized by law.

Void marriages count as being so from the beginning; but this effect only comes into operation once a court decision has been given. Children of such marriages count as legitimate if they would have been so had the marriage been valid. The disposition of the property of the partners is regulated according to the divorce rules if at least one partner is ignorant of the nullity.

A marriage can only be declared null by the court for grounds existing at the time when the marriage took place: lack of consent by legal representative; an error over the marriage ceremony, the person or the person's essential characteristics; wilful deceit; and threats. The marriage only becomes invalid when the court dissolves it (before 1938 it counted as invalid from the beginning).

Special grounds of divorce are: adultery; guilty disruption of the marriage by a serious violation of the duties of marriage; and cessation of domestic companionship for three years, together with a complete disruption of the marriage. The consequences of divorce (particularly whether the wife may use the husband's name, alimony, custody of children) are decided in different ways according to whether divorce is granted because of the guilt of one or both parties (adultery, serious violation of marriage duties) or on other grounds.

Being a law of the Control council the Marriage law is not affected by the principle of the equal rights of man and woman which came into force in Germany after World War II. The principle does, however. operate in essentials in general matrimonial matters and in property rights, which are regulated by the Civil Code of 1900. (G. K.)

The **U.S.S.R.**—The basic law governing marriage in the U.S.S.R. was passed on Dec. 31, 1917, and established that from that time only civil marriages would be recognized by the state. Marriage in church was "a private affair." It was then sufficient for two unmarried persons of marriageable age to record their intention to marry at the local registrar's office for the marriage to become legally effective. A marriage could be annulled on the petition of both or one of the parties to the local court. Subsequent legislation was aimed at increasing respect for the marital state and making divorce more difficult. A law of Nov. 1926 confirmed the basic principles and established the marriageable age at 18 for both sexes. In June 1936 the divorce law was amended to "combat an irresponsible attitude toward the family and family obligations." It increased the fees payable for divorce proceedings and required both parties to be present at the hearing of the case. A law of July 1944 required that marriages should in future be recorded in the parties' passports and that divorce proceedings were to be heard by the local courts in public. These proceedings were made appreciably more difficult in that the courts were instructed to inquire more closely into the reasons for the petition and to try to reconcile the parties. Only a higher court could annul a marriage. Steps were taken to make the marriage ceremony a more "solemn procedure." Marriage between relatives in the direct line, full and half brothers and sisters and the insane has always been prohibited by Soviet law. (D. Fd.)

UNITED STATES

The fundamental principle of U.S. marriage law, a subject wholly regulated by state rather than national law, is simply that a man and a woman, each possessed of the requisite capacity, may become married by mutual consent. Although a statute may require that a judge or a clergyman officiate at a wedding, the status of marriage is truly created by assent of the parties themselves. It follows that a marriage is not valid if consent is obtained by fraud or duress nor if the ceremony was not intended to be a real wedding. Thus marriage is frequently referred to as a contract albeit a very special kind of contract.

The statutes of every state make provision for the issuance of marriage licences. Many states, however. recognize common-law marriages; *i.e.*, informal marriages without a licence or a solemnizing official. In those states the licencing laws are interpreted as merely providing one. but not the only, way of marrying. In some common-law marriage states the marriage takes place by the parties expressing their present intention to be married, in others by holding themselves out to the community as husband and wife. In the mid-1950s in 30 states a marriage under a licence could take place only after a waiting period of from one to five days.

A formal marriage demands no particular ceremony although statutes frequently require that a marriage be solemnized by a clergyman or some public official. A valid marriage may take place under a licence improperly issued provided the parties have the capacity to be married.

Capacity to marry turns on various factors determined by the law of the several states. Of course, a person presently married cannot marry again without an intervening divorce. The parties must have attained a certain age to be married. At common law, marriages below the age of 12 for girls and 14 for boys were void. These ages have been raised in almost every state. Typically, a state forbids the marriage of girls below 15 or 16 and of boys below 18. Whether the marriage of a person below the statutory age is absolutely of no effect (void) or is effective until nullified (voidable) depends upon the special facts of each case and upon the particular law of each state. Usually, males under 21 and females under 18 must obtain the consent of their parents before a licence can be issued. However, if the parties are actually married without parental consent the marriage is valid. Persons may not intermarry if there is between them a close relationship by blood (consanguinity) or by marriage (affinity). In general, a marriage is incestuous if one attempts to marry an ancestor, a descendant, an aunt (uncle), a sister (brother) of the whole or the half blood or any of their respective spouses. In the mid-1950s, 29 jurisdictions prohibited marriages between first cousins, 7 jurisdictions forbade marriage to a grandneice (grandnephew) and 6 prohibited marriage to a first cousin once removed. Several states, principally in the south and west, prohibitea persons of different races from marrying. In 1948 the California supreme court held the state statute prohibiting miscegenation unconstitutional as a violation of the 14th amendment to the constitution of the United States.

To an increasing extent U.S. marriage law takes into account the physical condition of the parties. particularly as that condition may be transmitted to offspring. Regulations respecting marriage of insane, epileptic or diseased persons are found in most of the states. At common law incurable impotency and insanity or idiocy were grounds for annulment—the first because the proper purpose of marriage was frustrated and the second because the required consent could not be given. In 1895 Connecticut prohibited the marriage of epileptics and since that time several other states have followed suit. Three states prohibited the marriage of persons having tuberculosis and three others sought to prevent the marriage of persons having any transmissible disease. Wisconsin pioneered in 1913, requiring a medical certificate showing that the male was free from venereal disease before a licence could be issued. The requirement was imposed in more than 40 states by the 1950s and generally upon both parties. A Massachusetts statute of 1943, perhaps reflecting medical progress. provided only that the parties be informed of the existence of the disease. (M. G. Pn.)

MARRIAGE RATE. In its most usual form, the marriage rate is expressed as the number of marriages occurring in a community during a calendar year per 1,000 of total population living in the community in that year. For example, it is estimated that there were 1,667,231 marriages in the United States during 1950. Since the total population for that year was 150,697,361, the number of marriages per 1,000 of population was 11.1. This rate would be doubled if the number of persons marrying, instead of the number of marriages, were related to the total population. By expressing annual marriages of communities in terms of a common unit, *i.e.*, per 1,000 of population, it is possible to make comparisons between communities of different size, or in the same community over different periods of years. However, the marriage rate computed in this way is not entirely satisfactory as a measure for comparison; for example, two communities may differ in their marriage rates simply because one of them happens to have a larger proportion of its total population within the marriageable ages than the other. Even if two communities had the same proportion of their total populations at the marriageable ages, the marriage rates computed in the manner indicated above might differ markedly if one of them should have a greater proportion of single, widowed or divorced marriageable persons than the other. The chances of marriage, according to studies made in the United States, are, age for age, greatest for the divorced. next best for the widowed and least for the single. Furthermore, the marriage rates are influenced by the ratio of the number of marriageable men to the number of marriageable women in the cotnmunity. Obviously, if a community had very few marriageable men, the marriage rate would be very low. For these reasons, marriage rates have on occasion been computed on bases other than total population, such as total population at ages 15 and over, single population at ages 15 and over and total females comprised within the ages from 15 to 45 years. Unfortunately. these more refined bases are not in common use and it therefore becomes necessary to make some allowance for the foregoing factors in comparing marriage rates based upon total population.

Allowance should also be made for the limitations of the statistics. Some nations keep more accurate and complete records of marriages than others, and there are differences in the definition of a legal marriage. For instance, some communities recognize common-law marriages as legal, while others do not. The low marriage rates of certain Latin-American countries: among others, are to be explained in part by the large Indian population whose marriages, if not performed according to the civil or religious requirements of the state, are not recorded as legal marriages.

International Comparisons.—The marriage rate for the United States is high compared with that for most other countries of the world for which records are available. None of the European countries listed in Table I, except Hungary. Poland and Yugoslavia, had marriage rates as high as the United States, where the rate was 10.j in 1950–52.

Of the European countries listed in Table I, Ireland had the lowest marriage rate of all, namely 5.4 per 1,000 population during 1950–52. Lower rates are shown only for certain countries of South America, namely, Peru and Venezuela. The highest rate shown is that of 12.5, for Israel.

Trend.—The marriage rates for the United States, England and Wales and the countries of continental Europe do not show the marked trends toward lower levels exhibited in their birth rates and death rates. In fact, the marriage rate is a relatively stable figure, and notable variations from the usual marriage rates for each country appear only during great wars or in periods of economic depression.

The United States, for the period 1901–40, had a comparatively stable marriage rate, not varying far from 10 per 1,000 (see Table II). The decade of the 1940s saw the average rate raised to 12.7, although in the early 1950s the rate again varied around 10. The level of the marriage rates in England and Wales during the half century from 1851 to 1900 was not appreciably below that for the half century from 1901–50, when it fluctuated around 8 per 1,000. The same is true for France, except that the average rate for the century (7.7) was a little lower than that for England and Wales (8.1). For Germany the average rate for 1851–1950 was 8.3, and for Sweden, 7. However, the Swedish rate, which averaged 6.5 for the eight decades from 1851–1930, rose to 8.6 for the period 1830–50.

Factors Influencing the Marriage Rate.—War.—The outbreak of World War II in 1939 resulted in declines in the marriage rates for France and Germany. In France the rate fell from a prewar average of 6.j per 1,000 in 1936–39 to 4.4 in 1940. In World War I the drop was even greater, to a low point of 2.3 in 1915. The decline in Germany was not so pronounced, from an average rate of 9.7 in 1936–39 to 7.2 in 1941. In 1915 and 1916 the rate in Germany dropped to 4.1. Italy did not enter World War II until 1940 and its low rate of 4.8 came in 1943 and 1944. The situation in England and Wales and in the United States was not as severe as in other countries. The marriage rate in England and Wales actually rose to a record peak of 11.2 in 1940 before falling back gradually to a low of 7.0 in 1943. In the United States the marriage rate rose from an average of 10.8 for 1936–38 to 13.2 in 1942, the first full year of participation by the United States in World War II, before dropping to 10.9 in 1944, the low point for the war period. After the war, in 1946, the rate rose to an all-time high of 16.4 in the United States and 12.8 in France because of the accumulation of several years of postponed marriages and the unusual economic prosperity.

Table I.—Average Annual Marriages in Certain Countries

Country	Marriages per 1,000, 1950–52	Country	Marriages per 1,000, 1950–52
North America		Europe (continued)	
United States	10.5	Ireland	5.4
Canada	9.0	Italy	7.2
Mexico	6.0	Netherlands	8.5
South America		Norway	8.3

†Data for Germany through 1943 are for territory of 1937; *i.e.*, including the Saar; data for 1943–53 are for the German Federal Republic.

Business.—The marriage rate is very sensitive to fluctuations in the business cycle. A study of U.S. marriage rates for a group of industrial states (Connecticut, Massachusetts, Michigan and Rhode Island and the city of New York) in relation to an index of business failures for the period from 1868 to 1935 established a remarkably close correspondence between the two series. Years of economic depression—1878, 1884, 1893, 1896, 1907–08, 1921–22 and 1932—were also years of low marriage rates. The phenomenon noted for this group of states has also been observed in other countries.

Social Factors.—Several European countries introduced measures to stimulate the marriage rate in an effort to stem a rapid decline in birth rates. These measures are usually in the form of marriage loans, extra taxes on bachelors and preferential employment to married men. A factor of some importance in influencing the marriage rate in the United States is the high divorce rate. Remarriages following divorce bolster the marriage rate, but do not increase the proportion of married persons in the population.

In practically all countries there is a marked seasonal incidence in the marriage rate. In the United States and Canada, June is the predominant month. The fall seems to be preferred by agricultural countries. Greek Orthodox countries prefer February, before Lent, while Roman Catholic countries have high marriage rates in April, after Lent. The influencing factors in the seasonal distribution of marriages seem to be climate, religious customs and occupation.

The marriage rate is a highly significant phenomenon. Marriage is always a great event in the life of any person and has much to do with his future happiness and career. All other things equal, a high marriage rate probably bolsters sexual morality. Married persons in general live longer, have fewer mental breakdowns and commit fewer crimes than the unmarried.

Marriage Rate and Birth Rate.—An examination of data for New York state from 1919 to 1937 showed that, in any three-year period, an increase in the marriage rate from the first year to the second was followed, in turn, by an increase in the birth rate of first children from the second year to the third year. Similarly, a decrease in the marriage rate was followed by a corresponding decrease in the birth rate of first children. This correspondence is not usually found when birth rates in which all children are included are compared with marriage rates.

MARRUCINI, an ancient tribe which occupied a small strip of territory round about Teate (mod. Chieti), on the east coast of Italy. It is first mentioned in history as a member of a confederacy with which the Romans came into conflict in the second Samnite War, 325 B.C., and it entered the Roman Alliance as a separate unit at the end of that war (*see* PAELIGNI). The language of the Marrucini is known from an inscription called the "Bronze of Rapino," which belongs to about the middle of the 3rd century B.C. It is written in Latin alphabet, but in a dialect which belongs to the North Oscan group (*see* PAELIGNI). The name of the city or tribe which it gives us is *touta marouca,* and it mentions also a citadel with the epithet *tarincris.* Several of its linguistic features, both in vocabulary and in syntax, are of considerable interest. The earliest Latin inscriptions are of Ciceronian date.

The form of the name shows the suffix -NO- superimposed upon the suffix -CO-, a change which probably indicates some conquest of an earlier tribe by the invading Safini (or Sabini, *q.v.*).

For further details as to Marrucini inscriptions and place-names *see* R. S. Conway, *The Italic Dialects,* p. *253 et seq.*

MARRYAT, FREDERICK (1792–1848), English sailor and novelist, born at Westminster on July 10, 1792, was the grandson of Thomas Marryat (physician, author of *The Philosophy of Masons,* and writer of verse), and son of Joseph Marryat, agent for the island of Grenada, who wrote pamphlets in defence of the Slave Trade. Young Marryat ran away to sea more than once; at 14 he entered the navy. He served with great distinction in many parts of the world until his retirement in 1830.

Marryat brought ripe experience and unimpaired vivacity to his work when he began to write novels. *Frank Mildmay, or the Naval Officer,* was published in 1829, and *The King's Own* followed in 1830. The freshness of the new field which was opened up to the imagination—so full of vivid lights and shadows, light-hearted fun, grinding hardship, stirring adventure, heroic action, warm friendships, bitter hatreds—was in exhilarating contrast to the world of the historical romancer and the fashionable novelist. Moreover Marryat had an admirable gift of lucid, direct narrative, and an unfailing fund of incident, and of humour, sometimes bordering on farce. Of all his portraits of adventurous sailors, "Gentleman Chucks" in *Peter Simple* and "Equality Jack" in *Mr. Midshipman Easy* are the most famous, but he created many other types which take rank among the characteristic figures in English fiction. He went on, through a quick succession of tales, *Newton Forster* (1832), *Peter Simple* (1834), *Jacob Faithful* (1834), *The Pacha of Many Tales* (1835), *Japhet in Search of a Father* (1836), *Mr. Midshipman Easy* (1836), *The Pirate and the Three Cutters* (1836), till he reached his high-water mark of constructive skill in *Snarley-yow, or the Dog Fiend* (1837). The best of his books after this date are those written expressly for boys, the especial favourites being *Masterman Ready* (1841); *Percival Keene* (1842); *Monsieur Violet* (1842); *The Settlers in Canada* (1844), and *The Children of the New Forest* (1847). Among his other works are *The Phantom Ship* (1839); *A Diary in America* (1839); *Olla Podrida* (1840), a collection of various papers; *Poor Jack* (1840); *Joseph Rushbrook* (1841); *Privateer's Man* (1844); *The Mission, or Scenes in Africa* (1845); *The Little Savage* (1848–49), published posthumously; and *Valerie,* not completed (1849). His novels form an important link between Smollett and Fielding and Charles Dickens.

Captain Marryat had retired from the naval service in 1830, becoming equerry to the duke of Sussex. He edited the *Metropolitan Magazine* from 1832 to 1835, and some of his best stories appeared in that paper. He spent a great part of his time in Brussels. He visited Canada during Papineau's revolt and the United States in 1837, and gave a disparaging account of American institutions in a *Diary* published on his return to England. In 1843 he settled at Langham Manor, Norfolk. He indulged in costly experiments in farming, so that in spite of the large income earned by his books he was not a rich man. He died at Langham on Aug. 9, 1848, his death being hastened by news of the loss of his son by shipwreck.

His daughter, Florence Marryat, herself a novelist, published his *Life and Letters* in 1872. *See* also David Hannay, *Life of Marryat* (1889).

MARS, MLLE. [ANNE FRANÇOISE HYPPOLYTE BOUTET] (1779–1847), French actress, was born in Paris on Feb. 9, 1779, the natural daughter of the actor-author Monvel (*q.v.*), and Mlle. Mars Salvetat. In 1799, after the rehabilitation of the Comédie Française, she and her sister (Mars *aînée*) joined that company in which she remained for 33 years. She was incomparable in ingénue parts, and equally charming as the coquette; she was for many years the darling of Parisian audiences and a favourite with Napoleon I. She retired in 1841; she was then inspectress of dramatic studies at the Conservatoire. She died in Paris on March 20, 1847.

See R. de Beauvoir, *Mémoires de Mlle. Mars,* 2 vol. (1849) and *Confidences de Mlle. Mars,* 3 vol. (1855).

MARS (MAVORS, MAMAR, MARSPITER or MASPITER), after Jupiter the most important deity of the Roman state. He was commonly identified with the Greek Ares (*q.v.*), but was never so much affected by foreign influences as to lose his essentially Roman and Italian character. The importance of this deity throughout central Italy from the earliest times is reflected in the fact that Alba Longa, Falerii, the Hernici, Aricia, Tusculum, Lavinium, the Aequiculi, the Peligni and the Sabines all had months named for him. At Rome, Martius (March) was the first month of the old calendar.

ALINARI

MARS

In battle array, depicted in sculpture at the Museo Capitolino, Rome

In spite of his importance little is known of the original character of the Italian deity, and what is known (chiefly from the cult at Rome) is variously interpreted. It is clear that by historical times he has developed into a god of war (hence his connection with Ares [*q.v.*]), and in Roman literature he is protector of Rome, a nation proud in war, which traced its founding back to a son of Mars, Romulus. There are at least three tenable views, however, of his ultimate origin: (1) that he was originally a war god whose functions were extended to the physical and hence the spiritual protection of the fields and crops; (2) that he was originally a deity connected with the fertility of the soil, of chthonian nature and thus a god of death and war; and (3) that he was originally a high god of the Italic peoples who were both warlike and agrarian and thus he reflects their interests. The problem probably cannot be solved for evidences of all three possibilities are found in his cult.

Mars's festivals at Rome occurred in the spring and the fall, embracing both the agricultural and the military seasons. The month of March was, as might be expected, especially filled with festivals wholly or partially in his honour. The Feriae Marti, March 1, was New Year's day in the old Roman calendar; the second Equirria, "horse races," occurred on March 14 (the first Equirria, Feb. 27); the Quinquatrus on March 19 was originally a festival of Mars which eventually was extended over a five-day period and became a festival of Minerva (*q.v.*); and the Tubilustrium, a purification of the war trumpets, occurred on March 23. All these have a connection with the initiation of the war season. Significant also is the role played through this period up to March 23 by the ancient priesthood of the Salii (*q.v.*), particularly associated with Jupiter, Mars and Quirinus, who came out several times during the month to dance their ceremonial war dance in old-fashioned armour and chant a hymn to the gods. Again at the end of the season. October mas an important month for Mars. The festival of the October horse on Oct. 15 was marked by a two-horse chariot race in the Campus Martius, one of the winning pair being sacrificed to Mars. On Oct. 19 the Armilustrium marked the purification of the arms of war and their storage for the winter; and again there were dances of the Salii.

Certain features in the Mars cult, however, make it probable that the god was connected in early times at least with agriculture: and some of the features of the festivals already enumerated can be explained equally well as of agricultural origin. Thus Mars was invoked in the ancient hymn of the Arval brothers (*q.v.*), whose religious duties had as their object to keep off enemies of all kinds from crops and herds, and in this his association with the Lares (*q.v.*) would suggest that he is not regarded as a war god who could avert the raid of an enemy. Likewise in Cato's description of the annual lustration of his land by the Roman farmer (*de Agricultura*, 141), where pure Italian cult might be expected to be reflected, Mars (with the cult title Silvanus) is invoked to ward off disease, calamity, dearth and infertility with no mention of his war function. Cato describes the ritual in detail, with the procession around the field, the recitation of the prayer to Mars after libations to Janus and Jupiter and the sacrifice of the pig, sheep and ox (*suovetaurilia*), representing the farmer's most valuable stock. This description has been taken to be a miniature of the state rite in the lustration of the *Ager Romanus* which, if true, would make Mars the principal deity worshiped at the Ambarvalia (*q.v.*).

The festival of the October horse, mentioned above, an undoubtedly primitive rite. has definite associations as a harvest fertility ceremony. Although the animal sacrificed was a war horse, the head was cut off and decked with cakes as an object having the power to procur fertility. Thus the festival may equally mark the end of the harvest as well as the end of the war season. Even Quirinus (*q.v.*), who is associated with Mars as a war deity, is not without agricultural connections, for it mas his *flamen* who sacrificed the victims at the Robigalia on April 25, when the spirit of the mildew (Robigus) was invoked to spare the grain.

Until the time of Augustus, Mars had but two temples at Rome. One of these, originally only an altar, was in the Campus Martius, the exercising ground of the army. The other was outside the Porta Capena and there each year the Equites met in order to start in procession through the city. Each of these sites was outside the *pomerium,* and this has been explained to mean that the war god "must be kept at a distance" (J. B. Carter, *Religion* of *Numa,* p. 19). But in the heart of the city there was a *sacrarium* of Mars in the *regia,* originally the king's house, in which the sacred spears of Mars mere kept. or rather, Mars in spear form (Mars Hasta); for on the outbreak of war the consul had to shake these spears, saying as he did it, *"Mars vigila"* ("Mars, wake up!"). If the spears moved of themselves the omen was bad and called for expiation.

Under Augustus the worship of Mars at Rome gained a new impetus; not only was he traditional guardian of the war affairs of the Roman state but as Mars Ultor he became the personal guardian of the emperor in his role as avenger of Caesar. The temple of Mars Ultor vowed at Philippi nas not dedicated until 2 B C, but then it dominated the magnificent Forum of Augustus. occasionally referred to as the Forum of Mars His worship at times rivaled that of Capitoline Jupiter and about A D. 250, Mars became the most prominent of the *di militares* worshiped by the Roman legions.

In literature and art he is hardly distinguished from the Greek Ares.

(R. B LD.)

MARS, in astronomy, is the fourth planet in order of distance from the sun. and the next outside Earth. To the naked eye it appears as a bright star of a decidedly reddish or lurid tint, nhich contrasts strongly with the whiteness of Venus, the second planet from the sun. At opposition (*i.e.,* when it is on the opposite side of Earth from the sun) it is brighter than a first magnitude star, sometimes outshining even Sirius, the brightest star in the heavens. By virtue of its position Mars is the most favourably situated of all the planets for observation from Earth. The eccentricity of its orbit, 0 0934, is greater than that of the other planets except Mercury and Pluto. The result is that at an opposition near perihelion (the point of the orbit of a planet where it is nearest the sun) Mars is markedly nearer to Earth than at an opposition near aphelion (the point of the orbit of a planet where it is farthest from the sun). the one distance being about 35,000,000 mi., the other 63,000,000. These numbers express only the minimum distances at or near opposition, and not the distances at other times. The time of revolution of Mars is 686.98 days. The mean interval between oppositions is 2 years $49\frac{1}{2}$ days. but because of the eccentricity of the orbit, the actual excess over 2 years ranges from 36 days to more than 2 3 months. The planet's period of rotation is 24 hr. 37 min. 22 6 sec.

TABLE I.—General Date on Mars

Mean distance from sun	141,700,000 mi.
Least (perihelion) distance from sun	128,470,000 mi.
Greatest (aphelion) distance from sun	154,940,000 mi.
Velocity at perihelion	16.46 mi /sec.
Velocity at aphelion	13 6_ mi /sec.
Eccentricity of orbit	0.0034
Equatorial diameter	4,265 mi.
Polar diameter	4,243 mi.
Mass	0.108 (Earth = 1)
Density	3.84 (water = 1)
Density	0.70 (Earth = 1)
Surface gravity	0.37g
Inclination of equator to orbit	24°
Position oi north pole	R.A.317°.3,Dec. + 53°.9(1905)
Velocity of escape	3.1 mi /sec
Sidereal rotation period	24 hr. 37 min. 22.6679 sec.
Visual albedo	0.148
Mean colour index at opposition	1.30
Pressure of aneroid barometer at surface	go millibars
Probable composition of atmosphere (% by vol.)	
Nitrogen	98.5
Argon	1.2
Carbon dioxide	0 24
Water and oxygen	0.1
Probable depth of atmosphere	do mi.

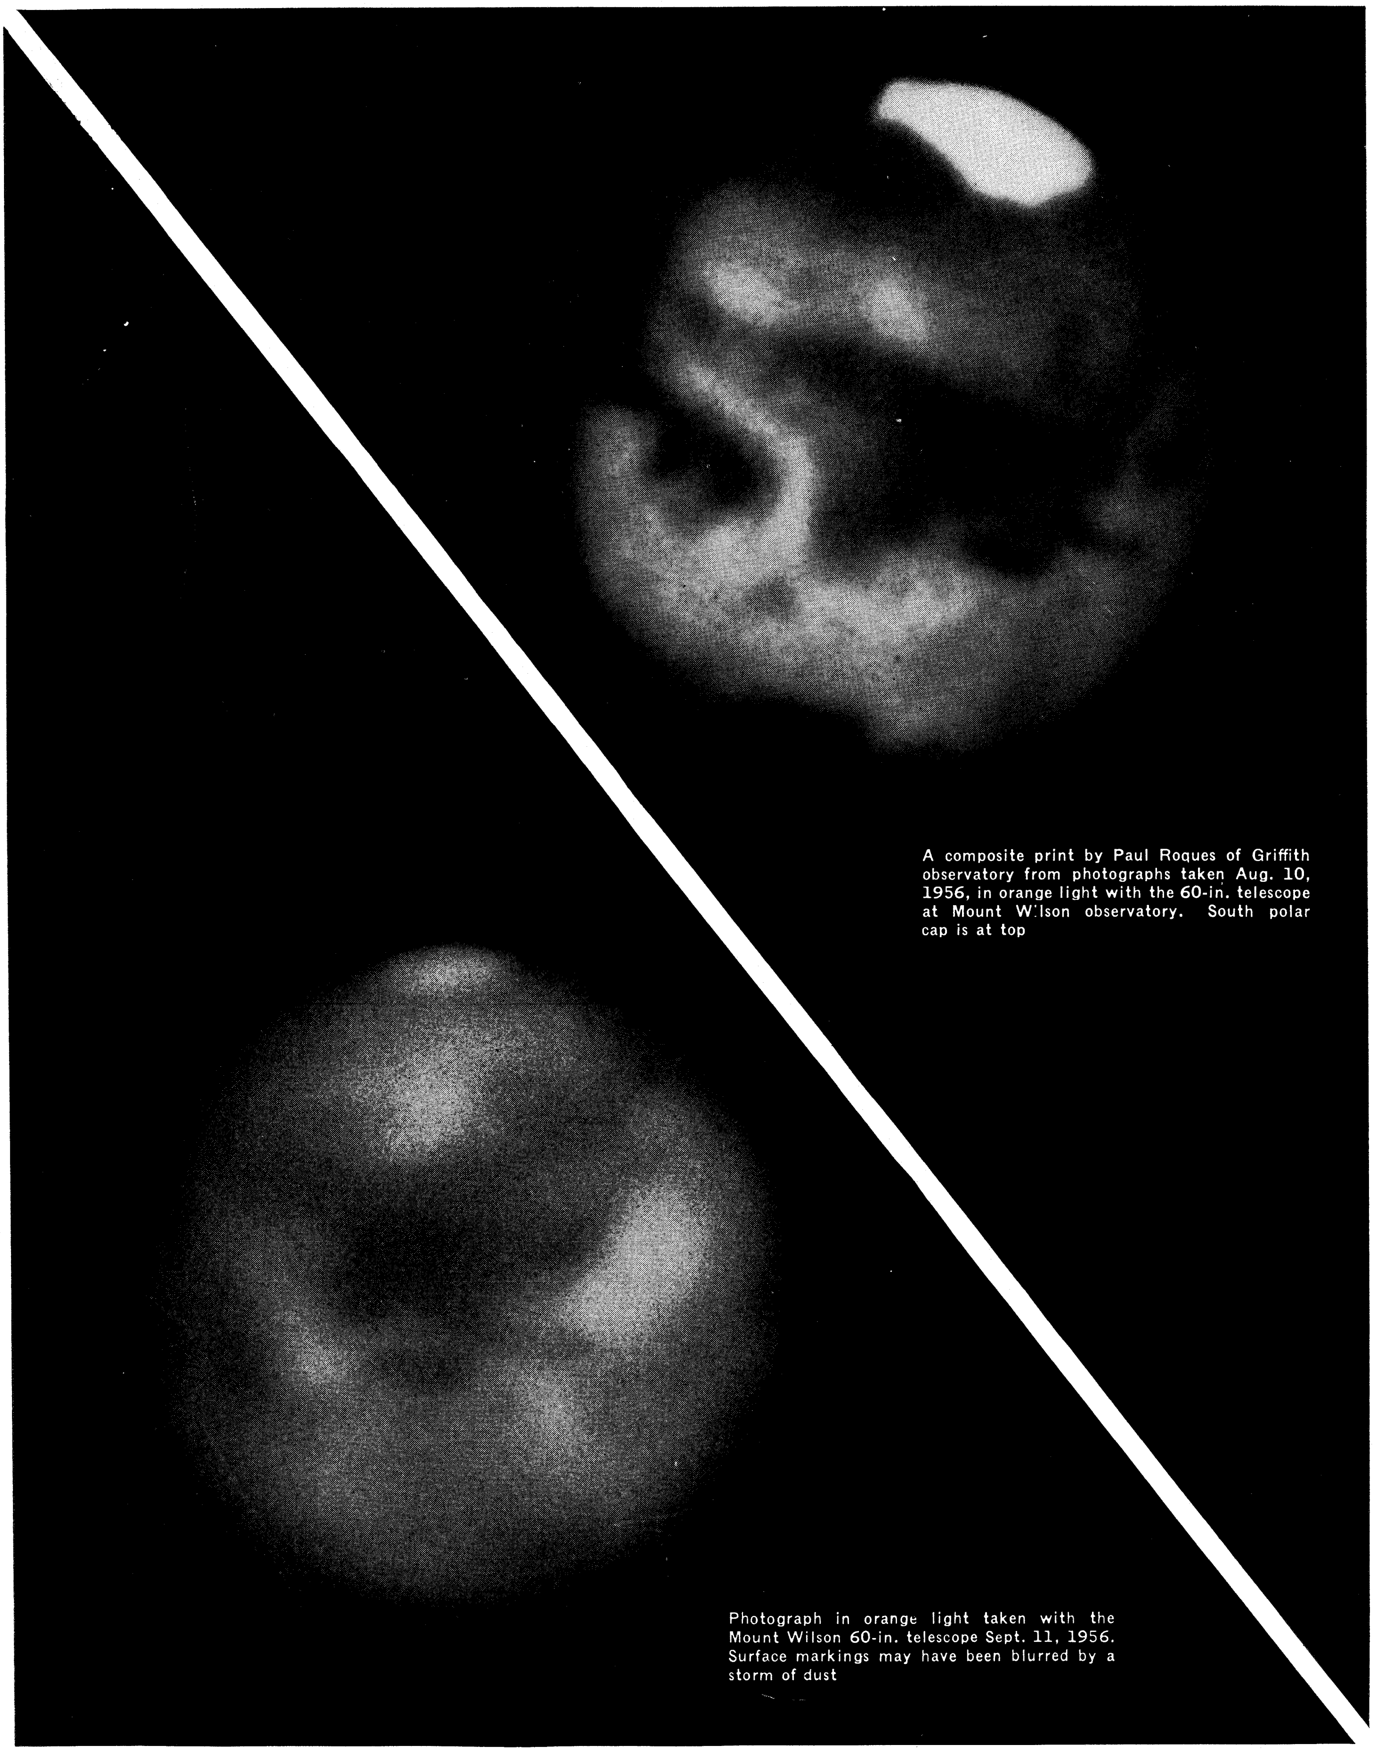
Note: Figures pertaining to the orbit of Mars may be accepted with confidence. Figures pertaining to the planet are subject to continual revision as better values become available.

This article is divided into the following sections:

I MOTIONS

The accompanying diagram (fig. 1) illustrates the order in which the oppositions of the planet follow each other. The outer circle represents the orbit of Mars, the inner circle that of Earth. Around the inner circle, representing Earth's orbit, are marked the months during which Earth passes through the different parts of the orbit. It mill be seen that the distance of Mars at the time of any opposition depends upon the month in which opposition occurs. The least possible distance would occur in an opposition about the end of August, a little before Mars reached the perihelion, because the eccentricity of Earth's orbit throws that planet a little farther from the sun and nearer the orbit of Mars in July than it does in August. From the diagram it is seen that the points of opposition travel around the orbit in about 16 years, so that oppositions near perihelion, when Mars is therefore nearest Earth, occur at intervals of 15 or 17 years.

The axis of rotation of the planet is inclined between 23° and 24° to the pole of the orbit, and the equator of the planet has the same inclination to the plane of the orbit. The north pole



A composite print by Paul Roques of Griffith observatory from photographs taken Aug. 10, 1956, in orange light with the 60-in. telescope at Mount Wilson observatory. South polar cap is at top

Photograph in orange light taken with the Mount Wilson 60-in. telescope Sept. 11, 1956. Surface markings may have been blurred by a storm of dust

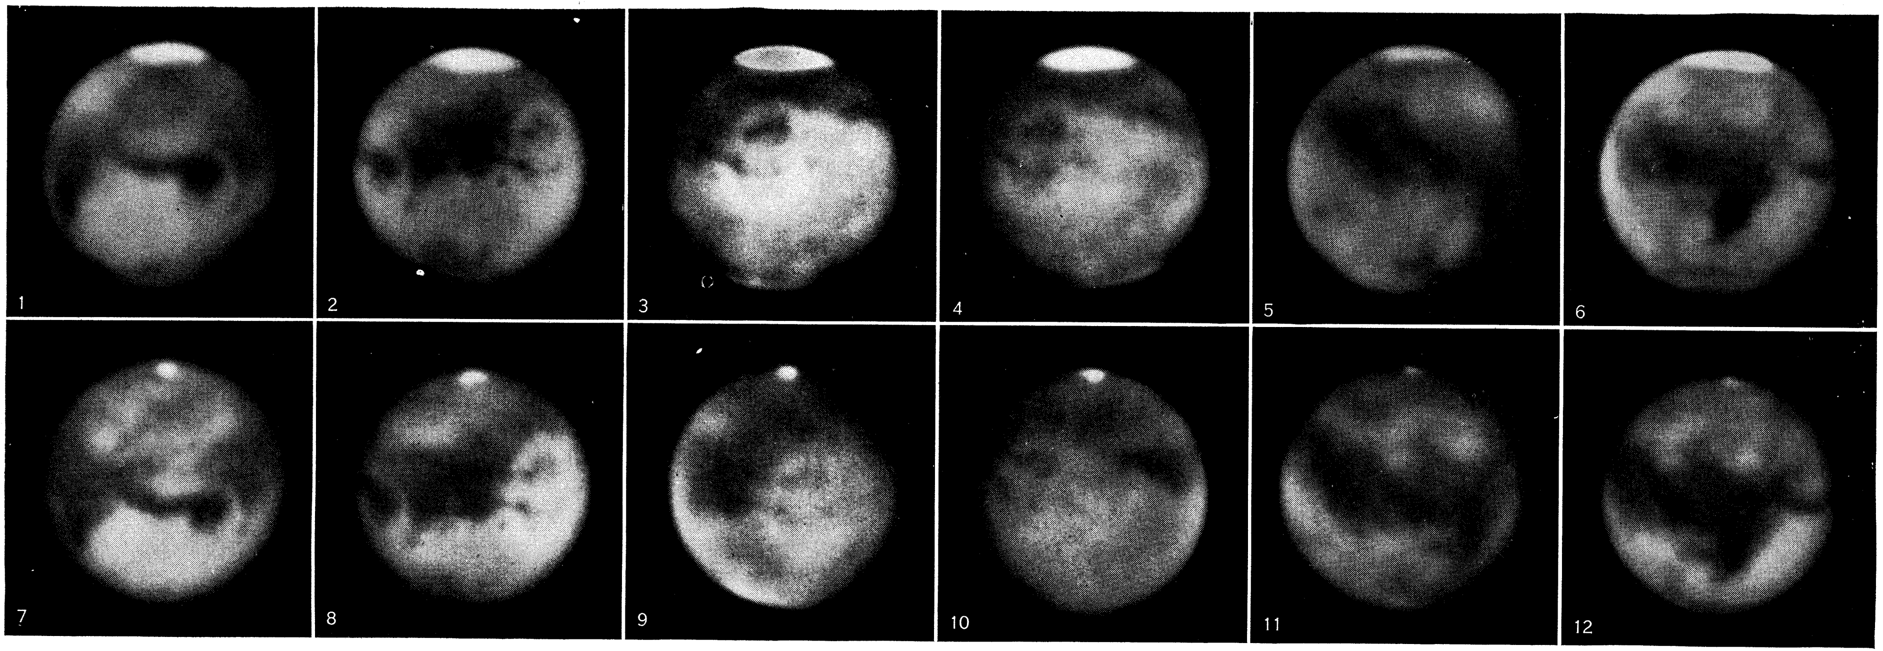
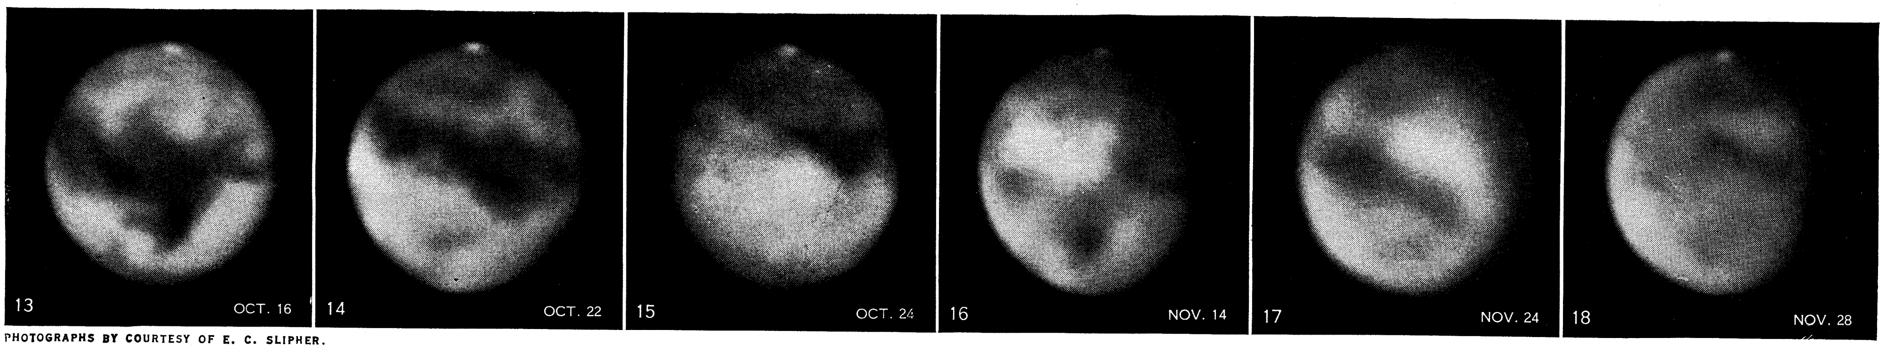
PHOTOGRAPHS OF MARS



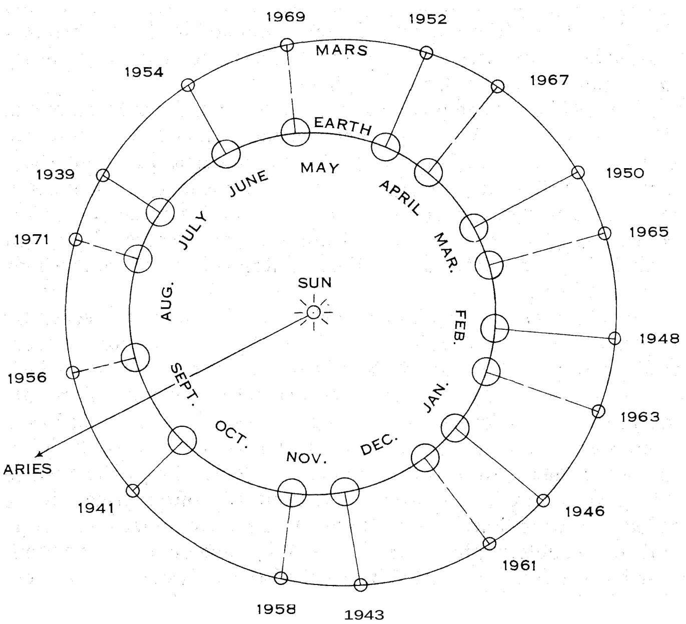
CLOUDS ON MARS



PHOTOGRAPHS BY COURTESY OF E. C. SLIPHER.

1-12. Photographs of Mars, showing various faces of the planet in **1939** (upper row figs. **1-6**) and the same faces in **1941** (beneath figs. **7-12**). In **1939** the southern hemisphere was in its springtime, in **1941** in its summer. (The **1939** photographs were made at Lamont-Hussey observatory, Bloemfontein, South Africa, the others at Lowell observatory)

13-18. Clouds on Mars. Photographs in **1941** displaying rare examples of widespread cloudiness in the atmosphere of Mars obscuring the familiar dark markings. Figures **13, 14, 15,** show the planet normally clear, figures **16, 17, 18,** taken within a few weeks of the same face of the planet, display the cloudy condition. Such Martian storms are often observed to move across the surface, but generally dissipate in a day or so is directed toward a point in longitude 355°, in consequence of which the projection of the planet's axis upon the plane of the ecliptic is nearly parallel to the line of Earth's equinoxes. The aspect of the planet at opposition, especially the hemisphere which is visible, varies with the month of opposition, the general rule



FROM "EARTH, MOON AND PLANETS," BY FRED L. WHIPPLE (THE BLAKISTON COMPANY)

OPPOSITIONS OF MARS FROM EARTH (1939—1971)

Relative distances are shown by straight lines joining the orbits. Mars is north of the equator for oppositions from September to March

being that the northern hemisphere of the planet is entirely seen only near aphelion' oppositions, and therefore when farthest from Earth, while the southern hemisphere is best seen near perihelion oppositions. The distances of the planet from the sun at aphelion and at perihelion are nearly in the ratio 6:5. The intensity of the sun's radiation on the planet is as the inverse square of this ratio. It is therefore more than 40% greater near perihelion than near aphelion. It follows from all this that the southern hemisphere is subjected to a more intense solar heat than the northern, and must therefore have a warmer summer season. However, the length of the seasons is the inverse of this, the summer of the northern hemisphere being longer and the heat of the southern hemisphere shorter in proportion.

II. TEMPERATURE

The only practical means of determining the temperature of a body (such as a planet) millions of miles from Earth is indirect: by measuring the heat or radiant energy it transmits to Earth. The hotter a body is. the more heat it radiates, and the amount of heat received at any point depends upon the distance from the source of radiation. The heat of a candle, for example, can be felt a few feet away. On the other hand, the sun's radiation is perceptible even at a distance 93,000,000 mi. away. If one can measure the amount of heat a body radiates per unit area of surface, one can calculate the temperature of the body from the laws of radiation. The absolute temperature is proportional to the fourth root of the energy radiated. The heat radiated from a planet is exceedingly weak but can be measured by sensitive detectors placed at the focus of a large telescope.

Radiation received from a planet is of two kinds: the sunlight reflected from its surface and the true planetary radiation resulting from the temperature of the emitting surface. The two kinds of radiation are widely separated in wave length: reflected radiation lies mostly in the visual region of the spectrum while low-temperature planetary radiation is in the far infrared region. The two kinds of radiation can be separated by interposing a suitable filter in the beam that is being measured. The sensitive receiver upon which the radiation falls is so small that the temperature of various parts of the surface of the planet may be measured individually.

Measures of the radiation from Mars were made in 1924 and 1926 by Seth B. Nicholson and Edison Pettit at the Mount Wilson observatory, and by W. W. Coblentz and C. O. Lampland at the Lowell observatory, Nicholson and Pettit found that the temperature of the south polar cap of Mars was about −70° C., that of the sunset edge about −13° C. and that of the point directly under the sun about 10° C. Coblentz and Lampland obtained somewhat higher values but the two sets of results were in remarkable agreement, considering the difficulties of the measurements. Since Mars never shows more phase than the moon when about three days from full, the radiation from the surface at midnight cannot be measured directly. But the minimum night temperature on Mars was estimated by Gerard P. Kuiper as −100° C.

Radiometric measures were made on Mars in 1954 with the 200-in, telescope at the Palomar observatory by John Strong and William M. Sinton. They found that the temperature at the equator reaches 2j° C., while the sunrise temperature on the equator is at least as low as −50° C. They also found that the maximum temperature occurs about 12:30 P.M., instead of about 3:00 P.M., as on Earth. This slight lag. they concluded. results mainly from thermal conduction into the ground. This "greenhouse effect" is produced by the blanketing effect of water vapour and carbon dioxide in the Martian atmosphere, and is consistent with the theory that the surface of the planet is covered with dust. They estimated the average night-time temperature as −70° C.

Observations by C. H. Mayer, T. P. McCullough and R. M. Sloanaker, made in Sept. 1956 with the 50-ft. radiotelescope of the Naval Research laboratory indicated that Mars has a black-body temperature of −5juC. (See BLACK BODY.) Radiometric measures of blars made with an optical telescope give an average temperature for the whole disk of −13° C. These observers considered it probable that the radio measurements referred to a slightly deeper and cooler level beneath the surface of Mars. since the longer wave length radio radiation would be expected to pass easily through the planetary crust.

III. ATMOSPHERE

That Mars has an atmosphere of some sort is evident from casual observations made when the planet is close enough to the earth for its surface features to be easily discerned. That these features are often obscured or dimmed as if by mists or clouds, was noted as early as 1784 by Sir William Herschel.

Valuable information concerning the atmosphere of Mars has been obtained from photographs of the planet made in light of different colours. Blue and violet light have slight ability to penetrate an atmosphere because they are strongly scattered by fine particles. Yellow, orange and red light, because of their longer wave lengths, are not so easily scattered and therefore are more penetrating. The effect is conspicuous on terrestrial photographs of distant objects. On photographs taken in violet light a distant landscape appears dim and flat or is wholly invisible, but the landscape generally stands out sharply on photographs taken in red light.

Attempts were made to photograph Mars even before the beginning of the 20th century, and several observers were successful in obtaining images of good quality at the close approach of Mars in 1909. Not until the opposition of 1924, however, was photography in light of different colours applied to Mars with conspicuous success by W. H. Wright at the Lick observatory, and by E. C. and V. M. Slipher at the Lowell observatory These photographs shoned the same effects as those exhibited by the terrestrial landscape. Thus photographs of Mars in visual light (yellow. orange and red) penetrated the atmosphere and revealed the surface markings. The polar cap is an inconspicuous feature on such images. In blue light the planet usually shows only a flat featureless disk except for the polar cap, nhich appears much larger than on the photographs taken in visual light.

Generally, images taken in blue light are appreciably larger than those taken in visual light, and attempts have been made to determine the thickness of the Martian atmosphere by measuring this difference in size. The visual images presumably show the solid surface of the planet, while the blue images include the outer atmospheric shell. Theoretically the method sounds plausible, but errors introduced by contrast effects and spreading of the image seem so serious as to render the method of doubtful value. For example, on blue and violet images the polar cap appears as a bright protuberance projecting considerably beyond the rest of the disk.

1. Clouds.—Mars shows two principal types of clouds: those that appear as conspicuous markings on the blue and violet images; and yellowish clouds that may be detected visually and that show on photographs taken in visual light. Occasionally there is a cloud that is visible in both blue and yellow light. Such a cloud was photographed at the edge of the planet from Mount Wilson observatory in 1954. The height of clouds may be measured, albeit roughly, when they project beyond the line between daylight and darkness (the terminator), or when they appear as protuberances at the edge of the disk. The blue clouds seem to be at a higher level than the yellow clouds, but reliable values for their relative heights are lacking.

A remarkable cloud showed on the blue images taken in 1954 and 1958, which, when viewed with the south pole uppermost, resembled the letter W. The marking was on the equator centred at about longitude 110°. There was a distinct knob at the western end of the W, and at the three intersections of the lines forming the strokes of the letter. The diameter of the knobs was about 280 mi. and the strokes between them 1,000 mi. in length. The knobs fell near the positions of "oases" and two of the stripes coincided roughly with the "canals," named Ulysses and Fortunae (see Canals below). Photographs of the W taken by E. C. Slipher in South Africa showed that it had an intermittent existence, forming in the afternoon and disappearing at night. Similar markings had been noted over this region at previous oppositions, *e.g.*, in 1926 by Wright and F. E. Ross. They also observed a cloud that formed about Martian noon and which became more intense as it was carried by rotation toward the evening terminator. Wright suggested that the cloud was a convective phenomenon of the Martian afternoons, recurrent over several days.

2. Blue Mist.—As already stated the atmosphere of Mars is transparent to yellow light but remarkably opaque to blue, violet and ultraviolet light. This opacity may be described as a blue mist. Photographs of the spectrum of Mars shows that the opacity to blue light begins at a wave length of about λ4,400.

On rare occasions, however, the blue mist clears to such an extent that the surface markings show almost as distinctly in blue light as in yellow. Notable instances of the blue clearing occurred in 1937, 1939 and 1941; in each case within a few days of opposition. At other oppositions, however, no blue clearing was observed. In 1954 the atmosphere of Mars was unusually transparent to blue light from May until July 2 (opposition date, June 25), when the atmosphere suddenly became opaque to blue light again.

At the opposition of 1956 extensive blue clearing was recorded by Gerard de Vaucouleurs in Australia, between Aug. 28 and Sept. 3, during which period the surface markings of the Syrtis Major and Mare Cimmerium were distinctly visible at wave lengths of λ4,400 and λ4,800. The end of the period was well defined, for the markings which were clearly recorded on plates taken Sept. 3 at 14:00–14:30 UT (universal time), were almost invisible on those taken Sept. 4 at 14:20–15:00 UT. No observations were taken near opposition on Sept. 10, but the violet layer was completely opaque and nearly uniform by Sept. 15.

Scarcely a trace of the blue clearing was observed in other parts of the world in 1956, possibly because of a dust storm which developed suddenly on Aug. 30 over the Mare Sirenum area, and which eventually obscured a major section of the southern hemisphere of the planet by late August and early September. By Sept. 5 the atmospheric dust had covered the entire planet except the south polar region. The blue clearing was detected from Australia because the face of the planet that was visible there was practically free of obscuration during the critical period.

There is no generally accepted explanation for the clearing of the blue mist. The fact that it has occasionally been observed to occur near opposition is of doubtful significance. This may be purely an observational effect since the planet is under intensive scrutiny at that time.

3. Composition of Martian Atmosphere.—The only substance positively identified in the Martian atmosphere is carbon dioxide (CO_2). The amount of carbon dioxide in the Martian atmosphere is estimated at about eight times (per unit of volume) more than that in Earth's atmosphere.

Attempts have been made to detect oxygen and water vapour in the atmosphere of Mars by spectroscopic analysis ever since the pioneer work of Jules Janssen and Sir William Huggins about 1867. The chief obstacle to detection is Earth's atmosphere. The problem is how to distinguish absorption due to oxygen and water vapour in the spectrum of Mars from the very strong absorption produced by these molecules in Earth's atmosphere. Two methods have been tried.

The older method (by which carbon dioxide was discovered by Kuiper in the atmosphere of Mars) consists in comparing the spectrum of Mars with the spectrum of another body, the moon, which is identical with Mars in every respect except that it has no atmosphere. Consider the history of a beam of light reaching Earth from Mars. Starting from the sun, it first passes through the Martian atmosphere down to that planet's surface. From the surface it is reflected through the atmosphere again into outer space. Light reflected toward Earth passes through the astronomer's telescope and onto a photographic plate or other recording device. The beam that reaches Earth therefore has passed twice through the atmosphere of Mars and once through Earth's atmosphere. Now consider a beam of light reflected from the surface of the moon. The moon has no atmosphere. Thus the spectrum of moonlight is nothing but reflected sunlight that has passed once through Earth's atmosphere. The absorption lines of oxygen (O_2) and water vapour in the spectrum of Mars are compared with those of the moon under as nearly identical conditions as possible. If these lines are stronger in the spectrum of Mars, it must be a result of the additional absorption produced by oxygen and water vapour in that planet's atmosphere. The method is sound in principle but difficult to carry out in practice. The moon and Mars must be observed at the same altitude in the sky, and the humidity at the point of observation must be the same at the time of both measurements—conditions that are seldom realized. Moreover, it is difficult to get photographs of two different objects that match so closely that detailed comparisons of them can be made. For this reason the method of lunar comparison has fallen into disuse.

About 1902, Percival Lowell devised another method which seemed more promising. As Mars and Earth revolve around the sun the distance between them is continually changing. At times the two planets are nearly stationary relative to each other as when they are nearest and farthest apart. At other times their velocity directly toward or away from each other may reach 12 mi. per second. This velocity should be sufficient to produce a Doppler effect (see LIGHT) which shifts a line in the spectrum of Mars slightly away from the position of the same line in the spectrum of Earth's atmosphere. This method consists of comparing the relative positions of spectrum lines on the same plate, a comparison much easier to make than one of the intensities of spectrum lines on differentplates.

Such tests for oxygen and water vapour in the spectrum of Mars were made in 1934, 1937 and 1941 by W. S. Adams and Theodore Dunham, Jr., with the 100-in. telescope at the Mount Wilson observatory when the planet had reached nearly its maximum velocity toward and later away from Earth. Study of the contours of the oxygen lines failed to reveal any asymmetry sufficient to indicate that oxygen was present in the Martian atmosphere to the extent of 1% of the quantity in Earth's atmosphere. A similar conclusion was reached regarding the presence of water vapour in the atmosphere of Mars.

High-dispersion spectra of Mars were taken by C. C. Kiess, C. H. Corliss, H. K. Kiess and E. L. R. Kiess in July 1956 (on Mauna Loa, Hawaii) at an altitude of 11,000 ft. Several photographs of the spectra of the moon and Mars were taken in juxtaposition for the purpose of detecting any unknown lines in the spectrum of Mars. The Doppler effect due to the motion of Mars toward Earth should have shifted lines in the spectrum of Mars by 0.200A to the violet of lines of terrestrial origin if water vapour were present.

These observations confirmed the earlier results of Adams and Dunham with respect to the small amount of oxygen and water vapour in the Martian atmosphere. In the case of water vapour it was possible to set an upper limit to the amount of moisture present. If the water vapour in the Martian atmosphere were entirely condensed over the surface of the planet it would form a film of liquid less than 0.0032 in. thick.

Of what then does the Martian atmosphere consist? The best guess is that it has the same composition as that of the atmosphere of Earth but with far less oxygen. This means that it consists chiefly of the inert gas nitrogen. Argon also may be present as the product of the decay of the radioactive isotope of potassium (K^{40}). Since neither nitrogen nor argon produces observable spectrum lines, their presence cannot be positively identified in the Martian atmosphere. An estimate of the probable composition of the Martian atmosphere is given in Table I.

Attempts made by various methods (none of them very reliable) to determine the atmospheric pressure at the surface of Mars have yielded surprisingly similar answers. By far the best determination is that by A. Dollfus (1957), which depends upon polarization measures over the disk of the planet and polarization measures in light of different colours. According to Dollfus, an aneroid barometer on the surface of Mars would indicate a pressure of 90 millibars. Since the force of gravity on Mars is 0.37g (g = surface gravity of Earth). a mercury ,barometer would register 90/0.37 or about 243 millibars, corresponding to a column of mercury of height 182 mm.. as compared with about 760 mm. on the surface of Earth. Since the surface gravity is about one-third as strong as that of Earth, a man who weighed 150 lb. on Earth would weigh about 57 lb. on Mars.

IV. SURFACE FEATURES

When viewed through a telescope of moderate power under favourable (good seeing) conditions. Mars presents the appearance of a bright-reddish or tawny-coloured disk girdled by darker markings in the southern hemisphere which may be at different times, blue-green. gray-green or light grayish-blue. The true colour of these dark markings is difficult to determine since it is strongly influenced by contrast with the bright-reddish colour of the neighbouring regions. At one of the poles there is usually a white cap ahich may appear as the most conspicuous marking on the disk, depending upon the Martian season and the orientation of the planet relative to Earth. During moments of exceptionally good seeing the observer also catches glimpses of detailed markings—small spots and specks and lines—which come and go so rapidly that it is impossible to set them down accurately in a sketch

The bright-reddish areas which cover about three-quarters of the planet and nhich give Mars its characteristic fiery red colour are apparently uniform expanses of barren desert. The dark areas which are situated mostly in the southern hemisphere are called maria (seas), since they were once supposed to be actual bodies of water. The absence of bright reflected sunlight from the maria, as well as the detail occasionally visible in them, indicate that they consist of dry land similar to deserts.

1. Polar Caps.—It was suggested by the British physicist George Johnstone Stoney, in 1898, that the polar caps consist of frozen carbon dioxide gas (dry ice) rather than snow and frost. Radiometric measures, as noted above. indicate a temperature of −70° C. at the polar caps, but carbon dioxide under the atmospheric pressure on Mars would not solidify unless the temperature were about −144° C. Measures by Kuiper in the infrared spectrum show that the polar caps reflect light like terrestrial snow. Snow becomes almost "black" beyond nave length 1 5μ, and almost completely black beyond 2.0μ, but dry ice remains "white" out to 2.jp. From his tests Kuiper concluded that the Martian polar caps are not composed of frozen carbon dioxide but are almost certainly composed of water (H_2O) frost at a temperature much below 0° C. Although the polar caps constitute direct observational evidence of the presence of water on Mars, the total amount for the entire planet is too slight to detect spectroscopically.

The melting polar cap in spring is surrounded by a dark band that remains in contact with the shrinking cap. This band was once regarded as marshy ground formed from the water of the melting polar snows, but it is extremely doubtful that there is enough water to form such a region. When viewed under the best conditions the band is seen to be discontinuous, broken up into individual spots. It appears to be part of the general wave of darkening in the Martian spring that spreads from the polar cap, over the maria. down to and beyond the equator.

2. Deserts.—Kuiper compared the reflectivity of the red Martian deserts nith that of red soil and red rock collected in Oklahoma. Texas and Arizona He found the reflectivity of these specimens to be quite different from that of the red regions of Mars. However, the reflectivity of a bronnish, fine-grained felsite closely matched that of the Martian deserts. He concluded, therefore, that the deserts of Mars consist of igneous rock similar to felsitic rhvolite

Dollfus advanced a more convincing theory. based on polarimetric and photometric studies of the red regions. He found that limonite properly pulverized reproduces the polarization and brightness curves of the deserts surprisingly well. The evidence from the polarization measures is particularly strong. since very few substances have a polarization curve resembling that of the Martian bright areas.

3. Maria.—As the polar caps in the southern hemisphere shrink in the Martian spring, the maria begin to darken and become more conspicuous, first near the pole, then gradually spreading toward the equator and even over into the opposite hemisphere. In the autumn some of the maria turn brown, brownish purple and carmine, while others are but little affected. There can be little doubt that seasonal changes occur in the maria, but they are more complex than was generally believed. These seasonal changes suggest the growth and decay of vegetation, and the idea that water vapour, not in the form of clouds but as an invisible gas, spreads from the pole toward the equator causing plant life to spring up in its make.

If the maria consist of vegetation, it must be of a type entirely different from that on Earth, and exceedingly hardy to withstand the freezing Martian nights. Plants of the type known on earth need oxygen for respiration, but there is no free oxygen present in the Martian atmosphere.

Evidence that the maria consist of some kind of organic substance was obtained by Sinton at the opposition of 19j6 and 1958. All organic molecules possess strong absorption bands near 3.4μ, the wave length of the carbon-hydrogen bond resonance. Measures on the spectra of Mars in this region indicate the probable presence of this band. This evidence, taken together with the observation of seasonal changes of the maria make it extremely probable that vegetation in some form is present on Mars. (See ***Life*** on *Mars?* below.)

In polarimetric and photometric studies of the maria made after 1947, Dollfus found that the maria have a powdery surface structure similar to that of the bright desert regions but more absorbent. He was able to simulate the variations in brightness of the maria in the laboratory by mixing pulverized limonite ($HFeO_2$) with a powder of very absorbing grains. Similar effects were obtained by partially covering the limonite with these grains and vice versa, by partially covering these grains with limonite.

The polarization of light from the dark regions of Mars is not unlike that from the bright deserts, but it varies with the change of seasons. This variation suggests a seasonal change in the nature of the surface, though on a microscopic scale. Physical or chemical changes in minerals are not alone sufficient to explain such changes. Dollfus found that certain algae, small lichens or minute mushrooms, when sprinkled on pulverized limonite: showed a polarization curve similar to that of the Martian dark spots. On Earth such microscopic organisms are generally creatures with a great power of adaptation. Their absorbent character suggests a superficial coloured pigment that offers protection against cold or excessive radiation by selective absorption of light.

Crustose lichens are among the hardiest plants on Earth, and exhibit the same general colours and reflection spectra as the maria; their size is consistent with the postulated size of the Martian organisms (calculated from the total amount of water on the planet). Moreover, lichens are known to tolerate extreme climatic conditions.

On the otlier hand. Frank Salisbury has presented several objections to the theory that the Martian maria are composed of lichen-like organisms. First, it is unlikely that lichens could subsist in an atmosphere of low oxygen content like that of Mars. Lichens do not change colour with the seasons as do the maria. Also, crustose lichens are extremely slow growing and are sparsely distributed. Yet it was observed in 1954 that, within a span of less than two years, a new dark region approximately the size of Texas had appeared on Mars.

An inorganic explanation of the maria may be considered along with the lichen hypothesis. Kuiper made observations of Mars in 1954 and 1956 with the 82-in. reflecting telescope of the McDonald observatory, paying special attention to the colours of the bright and dark areas. The colours which were expected to be green in the Martian spring were, instead, a neutral gray. The lack of vivid colouration suggested the possibility that the maria might be lava fields similar to the broad dark expanses on the moon. As a working hypothesis Kuiper suggested that the maria were lava fields partially covered by some very hardy vegetation.

In 1954 the astronomer Dean B. McLaughlin had already advanced an inorganic theory of the composition of the maria. He suggested that they were deposits of volcanic ash that had been weathered to a soil in which epidote and chlorite abounded, thereby accounting for the green colour. The seasonal darkening of the maria would result from the moistening of the surface minerals rather than from a chemical change. From observations that the maria terminated in funnel-shaped markings pointing north into the deserts, McLaughlin concluded that the tips of the funnels might be the sites of volcanoes whose ash had been carried by the winds and deposited in the patterns that form the maria. Since the winds bloning to the southern hemisphere are much stronger than those blowing to the northern hemisphere, the maria would thus be expected to form primarily south of the Martian equator. In fact, most of the maria are south of the equator.

Most astronomers, however. favour a vegetative hypothesis despite the difficulties it encounters. E. J. Öpik presented a crucial argument for this theory: the maria must have regenerative powers, or they would have been obliterated ages ago by the dust of the deserts.

4. Canals. — Discovery of the Martian markings designated as canals was made by the Italian observer G. V. Schiaparelli (*q.v.*) at the exceptionally close opposition of 1877. Schiaparelli described these markings as *canali* (channels or canals). Translated into English as canals, the word erroneously suggested that these channels were artificial waterways constructed by intelligent beings. In 1892, W. H. Pickering discovered a new feature of the canals which he called an oasis, a small round spot at the junction of several canals.

All observers agree that Mars shows a vast amount of fine detailed markings so complex as to be impossible to represent properly in a drawing. The markings come and go so rapidly with fluctuations in the seeing that even the best photographs fail to show the fine details that can be glimpsed by the eye.

Most astronomers have never been able to see canals on Mars and hence are naturally skeptical of their existence, a fact which is quite understandable when it is realized that most astronomers seldom give Mars more than a casual glance.

Judging from the maps which Schiaparelli made at the six oppositions from 1877 to 1888. the canals must have appeared to him as narrow dark lines extending across the deserts. Lowell in 1894 described them as a "network of fine straight, dark lines . . . either absolutely straight from one end to the other, or curved in an equally uniform manner."

E. M. Antoniadi stated that in good seeing the canals appeared to him as continuous lines, but in moments of the very finest seeing they broke up into a discontinuous series of lines and dots.

R. J. Trumpler's remarks about the canals (on the basis of observations made in 1924 and 1926 with the 36-in. refractor at Lick observatory) are of value, as representing the views of a careful and conservative observer:

> The network lines, the so-called canals, are not a well-defined class of similar objects, but vary greatly in visibility, width, and definition. Some of them like *Nectar, Cerberus, Thoth, Nepenthes,* are temporarily so wide as to resemble the dark areas. Practically every step of transition between these broad bands and the finest most difficult canals is represented.
>
> The canals as a rule, even the fainter ones, do not appear quite sharp but rather as diffuse hazy shadings. Sometimes they change in intensity along their course, and occasionally they even break off abruptly without reaching an endpoint. . . . In the dark areas the network is also present, but here the lines mostly become broad dark bands while the spots appear as diffuse condensations of shading. There are many reasons indicating that the iramework structure of the dark areas is of the same topographical character as the network (canal) svstem of the normal surface. . . . The network exhibits a great deal of irregularity and does not make the impression of artificiality. Although a certain tendency to straightness or directness oi line in the canals cannot be denied, it seems nevertheless possible to interpret the network by natural geological features of the crust of the planet. (R. J. Trumpler, "Visual and Photographic Observations of Mars Made at the Opposition of 1926," *Publications of the Astronomical Society of the Pacific,* vol. 39, p 103, 1927.)

In 1939, Edison Pettit began a series of drawings of Mars using a 6-in. Clark refractor. He undertook the work as a matter of self-education. with the intention of studying the seasonal changes. He had never been able to see the canals, and had concluded that they were visible only to a special type of eye. and that his eyes were of the great majority that could not see them.

Early one morning, while sketching the planet, a canal suddenly appeared and within a few seconds another. Within two hours he was able to see two more. sometimes all four being visible at once. On succeeding nights he was able to see the four canals again and some additional ones. In the following two months he made drawings of 40 canals, each identified three times before being put on a final drawing. On the best nights there were moments of "superseeing" when the whole canal pattern would flash out for a second or two. Very rarely was this interval as long as four or five seconds. The colour of the canals was an olive green, the same tint as the maria at that time.

On June 3, 1956, when Mars was at a distance of 75,000,000 mi., Robert S. Richardson observed Mars under very favourable seeing conditions with the 60-in. reflecting telescope on Mount Wilson. The canals appeared to be simply narrow extensions of the maria into the deserts, and were of the same colour as the maria. The markings did not have an artificial appearance, but gave the impression of being some natural surface feature.

On the other hand. Kuiper maintained. "I have never seen a long, narrow canal nor a network of 'fuzzy canals.' I am personally convinced that the objective evidence nhich has led to this concept has been misinterpreted and erroneously represented on drawings." (Gerard P. Kuiper. "On the Martian Surface Features," *Publications of the Astronomical Society of the Pacific,* vol. 67. no. 398, Oct. 1955.) Kuiper found that there was no evidence anywhere on the planet of a distinctly geometrical pattern; nor of a systematic streakiness in relation to the planetary coordinates (though in a given mare some streakiness may be observed). To him the dimensions of the patches appeared quite random and natural—and the representation of the many oases of roughly uniform size he considered definitely wrong.

An observation of Mars made by G. E. Hale and his associates at the 60-in. telescope on Mount Wilson on Nov. 3, 1909, has been quoted so often. and has come to be of such critical importance in the history of the canals. that it deserves comment. Mars was observed that night under excellent seeing conditions with a magnification of 800. Hale in a letter says: "So far as any of us could make out, there is not a trace of geometrical structure on the planet, nor any narrow straight canals."

All experienced observers of Mars are agreed that the visibility of the canals depends upon the Martian season. They first appear clearly in the southern hemisphere about early spring corresponding to April 1 (northern style season), and by the middle of June little is left of them.

Very few canals are visible in the southern hemisphere from late summer through winter. Hale's observation was made in Martian midsummer corresponding to terrestrial date July 23. It is therefore not surprising that he and his colleagues failed to see any canals that night.

V. LIFE ON MARS?

1. Plant Life.—Despite the daily extremes in Martian temperature, the absence of oxygen from the atmosphere and the low humidity, observational evidence from several different sources indicates the presence of life in the maria. Some interesting work on this subject of astrobotany was carried out by G. A. Tikhoff of the Academy of Science of the U.S.S.R. and his co-workers near the Arctic circle in the eastern Soviet Union, where conditions except for oxygen are scarcely less rigorous than those on Mars. The purpose of the project was to study plants growing under conditions resembling as nearly as possible those on Mars. The investigation proceeded from three basic assumptions: that the laws of life in the universe are identical in essence but differ in their manifestations; that the living organism is exceedingly adaptable to external conditions; and that plants possess optical adaptations to external conditions.

One of the objections to the presence of green plants on Mars is that the maria do not reflect light as chlorophyll does. Chlorophyll, the green colouring matter in plants, shows an absorption band at about $\lambda 6{,}700$, and reflects light strongly in the infrared beginning at about $\lambda 7{,}000$. But the maria reflect red and infrared equally well.

Tikhoff's group found that. as a general rule, plants growing under conditions of extreme cold do not reflect as much light as those growing in milder climates. Evergreens, for example, were found to reflect about half as much of the red rays in winter as in summer. About half the radiant energy from the sun is contained in the infrared region of the spectrum Ordinarily green plants reflect these rays strongly. But in an extremely cold climate the plants protect themselves from the cold by absorbing as much as possible of the radiant energy from the sun. They not only absorb much of the infrared radiation of the sun but a considerable portion of the red. orange and yellow light as well. Therefore, plants growing in excessively cold climates do not show the characteristic absorption band of chlorophyll in the red simply because the radiation throughout this whole region is absorbed. Plants growing in the arctic usually appear darker or "bluer" than plants growing in a warmer climate because they reflect principally violet. blue and green light; whereas plants growing in warmer climates reflect yellow and some orange light. From their observations on the Pamir plateau in the arctic, the climate of which is hardly less severe than that of Mars, Tikhoff and his colleagues concluded that the low Martian temperatures would not necessarily be fatal to plant life.

During the year the range in temperature of the surface soil, which supports such plants as blue wormwood, blue oxytrope and certain violets, is 102° C., and daily fluctuations amount to 60° C. The low temperatures experienced at night apparently harden a plant and make it more cold resistant. The ability of plants to withstand low temperatures is remarkable. For example, the flower buds of the scurvy grass on the Siberian shores of the Arctic ocean stand frosts of −46° C., sometimes even without a covering of snow, and still open and blossom in the summer. Furthermore, the atmosphere of Mars cannot be much drier than that of the Pamirs. which contains only an insignificant amount of moisture (at midday the relative humidity is practically zero).

There still remained the difficulty regarding oxygen. Although Tikhoff's research was carried out at a high altitude where the air is very thin, oxygen mas still abundant compared with the most that can be assumed to be present on Mars. The astrobotanists did not attempt to give a definite ansaer to this question, but pointed out that plants may conserve oxygen, both in their parts above ground and in their roots. Thus most bog and aquatic plants have become adapted to their environment by storing considerable stocks of oxygen in their bodies in wide intercellular spaces, and by developing respiratory root systems. This is only one way by which plants are known to adapt themselves to environments all but lacking in oxygen—Martian plants would conceivably have acquired quite different methods.

From considerations of the maria Salisbury concluded that life as it is known on Earth could not survive the rigours of the Martian climate. But he offered two biological possibilities: that life forms, essentially similar to those known on Earth, have become adapted to the rigours of the Martian climate; or that some other form of life, a parabiology, accounts for the markings on Mars.

2. Animal Life.—Existence of animal life on Mars is much less likely than plant life. It is unlikely that higher forms of animal life could exist in such a cold, arid and oxygenless world. Only the lowest types of animals, with little need of oxygen or water, would be able to survive. Experiments in this connection were made at the U.S. air force's School of Aviation Medicine (Randolph Air Force Base, Texas) by J. A. Kooistra, Jr., R. B. Mitchell and Hubertus Strughold. Four types of soil obtained from different geographic areas, with their inherent microflora, were exposed to environmental conditions simulating those on Mars.

Each soil type was pulverized and then mixed until homogeneous. A portion of the soil type was then sterilized and dried to constant weight to serve as a medium, while unsterilized portions of the soil served as inoculum. The soil media were mixed with the soil inoculum plus water to obtain the desired moisture level of 1%. This mixture was added to a Brewer anaerobic (oxygenless) jar which served as the simulator chamber. After base-line counts were made, the soil types were subjected to the combination of Martian environmental conditions.

Results obtained over a period of three months indicated that the micropopulation of the soil samples changed to accommodate organisms capable of surviving and multiplying under the simulated Martian conditions. The majority of the organisms that survived were facultative anaerobes of a gram-negative character. The experiments shoned that these low organisms at least could grow and multiply under conditions practically identical with those on Mars.

For information about these organisms *see* BACTERIOLOGY: *Conditions Affecting the Growth of Bacteria: Relation to Oxygen.*

3. Human Habitability of Mars.—With careful preparation a man could undoubtedly survive on Mars. The atmospheric pressure is probably sufficient so that only a simplified pressure suit with oxygen equipment and a helmet to preserve adequate pressure for breathing would be necessary. But, he could do nothing in the open that required free oxygen; he could not. for example, light a fire or smoke a pipe. Electrically generated heat would soon set a pot of water boiling but the pressure is so low it would be only lukewarm. A source of water supply could be established around the poles. Evaporation would be held down by the low temperature, but increased by the low pressure. A supply of oxygen might be obtained from water by electrolysis.

A visitor to Mars would probably find a cold, inert world monotonously uniform in aspect—a flat expanse of dry brownish soil as far as the eye could see and a gray-blue sky above. No mountain ranges or canyons would break a monotony of surface outline, similar to that of certain desert regions of the American southwest.

(R. S. RN.)

VI. SATELLITES

At the opposition of Mars which occurred in Aug. 1877, the planet was unusually near the Earth. Asaph Hall, then in charge of the 26-in. telescope at the Naval observatory in Washington, D.C., took advantage of this favourable circumstance to make a careful search for a visible satellite of the planet. On the night of Aug. 11. he found a faint object near the planet. Cloudy weather intervened, and the object was not again seen until the 16th. when it was found to be moving with the planet, leaving no doubt as to its being a satellite. On the following night an inner satellite much nearer the planet was observed. This discovery,

TABLE 11.—Data on Satellites of Mars

	Phobus	Deimos
Discoverer and date	A. a——, 1877	Hall, 1877
Mean distance from planet	5,825 mi.	14,580 mi.
Sidereal period	7 hr. 39 min.	1 da. 6 hr. 18 min.
Visual magnitude at opposition	+12	+13
Eccentricity	0.0170	0.0031
Diameter	10 mi.	10 mi.
Direction of revolution	direct	A. direct

apart from its intrinsic interest, is also noteworthy as the first of a series of discoveries of satellites of the outer planets. Hall named the outer satellite Deimos (Terror) and the inner Phobos (Fear), from the horses that drew the chariot of the god Mars. A remarkable feature of the orbit of Phobos is that it is so near the planet as to perform a revolution in less than one-third that of the diurnal rotation of Mars. *(See* Table II.) The result is that to an inhabitant of Mars this satellite would rise in the west and set in the east, making two apparent diurnal revolutions every day. The period of Deimos is only six hours greater than that of a Martian day; consequently its apparent motion around the planet would be so slow that more than two days elapse between rising and setting, and again between setting and rising. Lowell estimated the diameter of Deimos to be about 10 mi. and that of Phobos slightly more.

Long and careful series of observations have been made upon these bodies by other observers. At the very favourable oppositions of 1892 and 1894, observations were made at Pulkovo by Hermann Struve, who later subjected all the data up to 1909 to a very careful discussion. He showed that the inclination of the planes of the orbits to the equator of the planet is quite small, thus making it certain that these two planes can never wander far from each other. The relations of the several planes can be best conceived by considering the points at which lines perpendicular to them, or their poles, meet the celestial sphere. By theory, the pole of the orbital plane of each satellite revolves around the pole of a certain fixed plane, differing less from the plane of the equator of Mars the nearer the satellite is to Mars. *See* also Index references under "Mars" in vol. 24.

Pacific. Schiaparelli's memoirs are collected in *Le Opere* di *G. V. Schiaparelli* (1929–30). *See* also E. M. Antoniadi, *La Planète Mars* (1930); and F. L. Whipple, *Earth, Moon and Planets* (1941). (W. H. WR.; R. S. RN.)

MARSALA, seaport, Sicily, province of Trapani, 19 mi, by rail S. of Trapani. Pop. (1951) 30,743. It is situated on the low westernmost point of the island. The cathedral, dedicated to St. Thomas of Canterbury, contains 16 grey marble columns. The town trades in Marsala wine.

Marsala occupies the site of Lilybaeum, the principal Carthaginian stronghold in Sicily, founded by Himilco after the abandonment of Motya. Neither Pyrrhus nor the Romans were able to reduce it by siege, but it was surrendered to the latter in 241 B.C. In the later wars it was a starting point for the Roman expeditions against Carthage. The Saracens named it *Marsa Ali,* port of Ali. The harbour on the northeast was destroyed by Charles V to prevent its occupation by pirates. The modern harbour lies to the southeast. In 1860 Garibaldi landed at Marsala with 1,000 men and began his campaign in Sicily. Scanty remains of the ancient Lilybaeum, including fragments of the city walls, are visible. During World War II Marsala was heavily bombed by the Allies.

MARSCHALL VON BIEBERSTEIN, BARON ADOLF VON (1842–1912), German diplomatist, was born at Neuershausen, Baden, on Oct. 12, 1842. His grandfather, Karl Wilhelm, Baron Marschall von Bieberstein, ambassador of Baden in Stuttgart, represented Baden at the Congress of Vienna in 1815. Adolf was educated at Frankfort-on-Main, and at the universities of Heidelberg and Berlin. He held various administrative offices in the grand duchy of Baden, sitting from 1875–83 in the upper chamber of the Baden diet. In 1883 he was sent to Berlin as minister for Baden in the Federal council, and from 1884–90 he represented the council in the imperial insurance office. In 1890 he entered the imperial service, and succeeded Count Herbert Bismarck as state secretary for foreign affairs under Caprivi, continuing in that office under Prince von Hohenlohe; but he had incurred the enmity of Prince Bismarck by refusing his advice and the result was a fierce press campaign against him which finally obliged him to speak out when he appeared as witness at the trial of certain journalists in 1896 for *lèse-majesté.* He was opposed by the Agrarians for advocating the reduction of corn duties, and in 1897 resigned office, being appointed German ambassador in Constantinople, where he remained for nearly 15 years. He created a commanding position for himself and a growing ascendancy in Turkish affairs for his government. To him was largely due the promotion of the Baghdad railway. During his foreign secretaryship he took a strongly imperialist attitude. After the Krüger telegram, in the drafting of which Baron Marschall bore a leading part, it was he who declared in the reichstag that the maintenance of the independence of the Boer republics was a "German interest." He was an advocate of a strong naval policy for Germany. In 1907 he was principal German delegate in The Hague conference, and was the exponent of Germany's resolute and successful opposition to any practical discussion of the question of restriction of armaments. In May 1912 he succeeded Count Wolff-Metternich as ambassador to Great Britain, but his health broke down after a short time, and he died at Badenweiler on Sept. 24, 1912.

MARSCHNER, HEINRICH AUGUST (1795–1861), German composer and director, was born at Zittau, Saxony on Aug. 16, 1795. He studied music under Schicht at Leipzig, and in 1816 travelled to Pressburg and Vienna where he became acquainted with Košeluh and Beethoven. Weber produced his *Heinrich IV und Aubignk* at Dresden in 1820 and in 1824 Marschner was made musikdirector of the opera in that city. In 1827 he was appointed kapellmeister of the theatre in Leipzig, where he produced his highly successful romantic opera *Der Vampyr* in 1828, and in the following year his *Der Templer und die Judin.* In 1831 he became kapellmeister of the court at Hanover, and in May 1833, produced at Berlin his best and most successful opera, *Hans Heiling.* As a result of the performance of this work under his direction at Copenhagen in 1836, he was offered the position of musikdirector in Denmark. Marschner, however, returned to Hanover where, in 1859, he was given a pension and, after his death on Dec. 14, 1861, a monument was dedicated to his memory.

MARSDEN, WILLIAM (1754–1836), English orientalist, the son of a Dublin merchant, was born at Verval, Co. Wicklow, on Nov. 16, 1754. He was educated in Dublin, and having obtained an appointment in the civil service of the East India company went to Renkulen, Sumatra, in 1771. There he soon rose to the office of principal secretary to the government, and acquired a knowledge of the Malay language and country. Returning to England in 1779 with a pension, he wrote his Htstory of *Sumatra,* published in 1783. In 1795 Marsden was appointed second secretary and afterwards first secretary to the admiralty. In 1807 he retired and published. in 1812, his *Grammar* and *Dictionary* of the Malay *Language,* followed in 1818 by his translation of the Travels of *Marco* Polo. He died on Oct 6, 1836.

MARSEILLAISE, LA, the French national anthem, of a curiously fortuitous origin. It was composed—almost, it might be said, improvised — as to both words and music, in one night (April 24, 1792) by Claude Joseph Rouget de Lisle, a French captain of engineers who happened also to be a musical amateur. The need of a marching song for the French had been expressed by the mayor of Strasbourg, where de Lisle was then quartered, and the world-famous hymn was his patriotic response. It derived its name subsequently from the fact of its having been sung with indescribable enthusiasm by the troops on setting out from hfarseille for Paris. Rouget de Lisle's actual authorship of the music was long disputed but may now be taken as established beyond dispute although his work undoubtedly underwent certain improvements at the hands of various composers (including Grétry and Gossec) before it reached its existing form

MARSEILLES (Fr. **MARSEILLE),** a city of southern France, the chief seaport of France and of the Mediterranean and the capital of the department of Bouches-du-Rhône, lies 219 mi. S. by E. of Lyons and 534 mi. S.S.E. of Paris by the P.L.M. railway. Pop. (1954) 605,577.

History. — The Greek colony of Massilia (Massalia) was founded by the mariners of Phocaea in Asia Minor, about 600 B C.; probably Phoenicians settled at Marseilles before the Greek period. In 542 B C the fall of the Phocaean cities before the Persians probably sent new settlers to the Ligurian coast and cut off Massilia from close connection with the mother country. Isolated amid alien populations, the Massiliots made their way by prudence and by vigilant administration of their oligarchical government. Their colonies spread east and west along the coast from Monaco to Cape St. Martin in Spain, carrying with them the worship of Artemis. The inland trade, in which wine was an important element, can be traced by finds of Massilian coins across Gaul and through the Alps as far as Tirol. In the 4th century B.C. the Massiliot Pytheas visited the coasts of Gaul. Britain and Germany; and Euthymenes is said to have sailed donn the west coast of Africa as far as Senegal. The great rival of Massilian trade was Carthage, and in the Punic Wars the city took the side of Rome, and was rewarded by Roman assistance in the subjugation of the native tribes of Liguria In the war between Caesar and Pompey, Massilia took Pompey's side and in 49 B C. offereda vain resistance to Caesar's lieutenant Trebonius. In memory of its ancient services the city was left as a *civitas libera,* ("free city") but its power was broken and most of its dependencies taken from it. Thereafter Massilia has little place in Roman history; it became for a time an important school of letters and medicine, but its commercial and intellectual significance declined. The town appears to have been Christianized before the end of the 3rd century. Its reputation partly revived through the names of Gennadius and Cassianus (q v). which give it prominence in the history of semi-Pelagianism and the foundation of western monarchism.

After the ravages of successive invaders, Marseilles was repeopled in the 10th century under the protection of its viscounts. The town gradually bought up their rights, and at the beginning of the 13th century was formed into a republic, governed by a podestat, appointed for a term of one year, and renewable, who exercised his office in conjunction with 3 notables and a municipal council, composed of 80 citizens, 3 clerics and 6 principal tradesmen. The higher town was governed by the bishop, and had its harbour at the creek of La Joliette which at that period ran inland to the north of the old to n. The southern suburb was governed by the abbot of St Victor, and owned the Port des Catalans Situated between the two, the lower town, the republic, retained the Vieux-Port (old harbour), and was the most powerful of the three divisions. In 1245 and 1256 Charles of Anjou, count of Provence, whose predecessors had left the citizens a large measure of independence. established his authority above that of the republic. In 1423 Alphonso V of Aragon sacked the town. King René, who had made it his minter residence. however, caused trade, arts and manufactures to flourish again. On the incorporation of Provence in the kingdom of France in 1481, hfarseilles preserved a separate administration directed by royal officials. Under Francis I. Charles de Bourbon vainly besieged the town with the imperial forces in 1524 and 1536. During the wars of religion, Marseilles took part against the Protestants. and long refused to acknowledge Henry IV. The loss of the ancient liberties of the town brought new disturbances under the Fronde, which Louis XIV came in person to suppress He entered the town by a breach in the walls and afterward had Fort St. Nicolas constructed. Marseilles repeatedly suffered from the plague, notably in 1720–21.

During the Revolution the people rose against the ruling aristocracy. In the Terror they rebelled against the Convention but were promptly subdued. The wars of the empire, by dealing a blow to their maritime commerce. excited the hatred of the inhabitants against Napoleon, and they hailed the return of the Bourbons and the defeat of Waterloo. The prosperity of the city received a considerable impulse from the conquest of Algeria and from the opening of the Suez canal. During World War I part of the harbour became a British base, and many Indian, Australian and African troops passed through, and, after the armistice, an American embarkation camp was established. In World War II Marseilles was occupied by the Germans from Nov. 1942 until it was liberated in Aug. 1944 by the French 3rd infantry division under Gen. Goislard de Montsabert. To spare the population, he besieged the city without bombing it. When U S. soldiers returned home, in 1946, more than 1,000,000 embarked from Marseilles

The Town. — Marseilles is situated on the Gulf of Lyons on the eastern shore of a bay protected to the south by Cape Croisette but open toward the west. The city is built on undulating ground and the southnestern and most aristocratic quarter covers the slopes of the ridge crowned by a fort and the church of Notre-Dame-de-la-Garde and projecting westward into the bay to form a protection for the harbour. The newest portion lies on the southeastern slope of the ridge, which is better protected than most of the other quarters from the mistral and where in summer the temperature is always a little lower than in the centre of the town. From the old harbour, nhich opens on the west to the Gulf of Lyons, the famous La Canebière, the artery of the city's life, leads east-northeast.

The old town of Marseilles is bounded on the west by the Joliette basin and the sea, east by the Cours Belsunce, south by the northern quay of the old port, and north by the Boulevard des Dames. It consisted of a labyrinth of steep, dark and narrow streets inhabited by a seafaring population. On Jan. 24. 1943, the Germans evacuated the entire district on the edge of the port and destroyed it with explosives. Subsequently a new residential district was built there.

The entrance to the old harbour is defended by Fort St. Jean on the north and Fort St. Nicolas on the south. Behind the latter is the Anse (bay) de la Réserve. Beyond this again, situated in succession along the shore, come the Château du Pharo, which was given by the empress Eugénie to the town, the Anse du Pharo and the Anse des Catalans. In the roads to the southwest of the port lie the islands of Ratonneau and Pomegue. united by a jetty formerly forming a quarantine port but today abandoned Between them and the mainland is the islet of Château d'If, in which the scene of part of Dumas' Le Comte de *Monte-Cristo* is laid.

Marseilles possesses few remains of either the Greek or the Roman periods of occupation and is poor in medieval buildings. In the Place de la Major. the old cathedral of La Major (Sainte-Marie-Majeure), dating chiefly from the 12th century and built on the ruins of a temple of Diana, is poorly preserved; the chapel of St. Lazare in the left aisle is early Renaissance Beside this church and alongside the Joliette basin is the church begun in 1852, which has taken the place of the old cathedral.

On the south side of the old harbour near the Fort St. Nicolas stands the church of St. Victor, built in the 13th century and once attached to an abbey founded about 413. With its lofty crenelated walls and square towers built of large blocks of uncemented stone, it resembles a fortress. St. Victor is built above crypts dating mainly from the 11th century but also embodying architecture of the Carolingian period and of the early centuries of the Christian era. The spire of the ancient church of Accoules, and its only relic, marks the centre of Old Marseilles. Notre-Dame du Mont Carmel, also in the old town, occupies the place of what was the citadel of the Massiliots when they were besieged by Julius Caesar. The celebrated Notre-Dame-de-la-Garde, the steeple of which is surmounted by a gilded statue of the Virgin, 30 ft. in height, rises 150 ft. above the summit of the hill on which it stands.

Of the civil buildings of the city, the prefecture, one of the finest in France, the Palais de Justice and the Exchange all date from the latter half of the 19th century. The Hôtel de Ville (1673) stands on the northern quay of the old harbour. The Palais Longchamp (1862–69) is a museum and art gallery. The museum of antiquities, established in the Château Borély (1766–78) includes a Phoenician collection (containing the remains that support the hypothesis of the Phoenician origin of Marseilles). The city also has a colonial museum and a laboratory of marine zoology. The triumphal arch of Aix, originally dedicated to the victors of the Trocadéro, was in 1830 appropriated to the conquests of the empire.

The *canal de Marseille,* built between 1837 and 1848, which has transformed the town and its arid surroundings by bringing to them the waters of the Durance. leaves the river opposite Pertuis. It has a length of 97 mi. (including its four main branches) of which 13 mi. are underground. and irrigates some 7,500 ac. After crossing the valley of the Arc, between Aix and Rognac. by the magnificent aqueduct of Roquefavour, its waters are purified in the reservoirs of Realtort. It draws about 2,200 gal. of water per second from the Durance, supplies 2,450 h.p. to works in the vicinity of Marseilles. and insures a good water supply and efficient sanitation to the city.

hfarseilles is the seat of an archbishop and a prefect. It has tribunals of first instance and of commerce, a chamber of commerce and a board of trade arbitration. The educational institutions include a school of navigation and faculties of science, medicine and pharmacy; these two faculties form part of the university of Aix-Marseilles.

The Port, Trade and Industry.—The surface area of the Vieux-Port was doubled toward the north in 1846 by the creation of the new port of La Joliette; it was afterward extended farther north by eight wet docks. The port facilities, which were destroyed by the Germans in 1944, have been rebuilt and perfected. The new port is connected by the Rove tunnel to the Étang de Berre, which opens to the sea, and by the canal which is destined to go from Marseilles to the Rhône; the portion from Étang de Berre to the river was not completed by the late-1950s. There is an old canal from Port-de-Bouc at the mouth of the estuary to Arles, on the Rhône, but it is not deep enough to permit the passage of modern ships. A new port, Lavéra, has been built in the inner harbour of Port-de-Bouc which can receive nine tankers at once without the entry being blocked. Together with the refineries which line the banks of the Btang de Berre, Lavéra is a port annex of great importance to Marseilles. The airport of Marignane is on the south bank, $17\frac{1}{2}$ mi. from the centre of the city.

When they left in 1944, the Germans destroyed the fleet. By the late 1950s it had been rebuilt to a capacity of 915,000 tons distributed between passenger and cargo ships. Many lines are based here which send ships to the eastern Mediterranean, the east coast of Africa, Australia, India, Indochina, Algeria, Tunisia, Malta, Morocco and the Antilles, as well as Great Britain and the ports on the west coast of France. In addition, many of the big foreign lines call at the port, which is mainly a transhipment and industrial port instead of, as formerly, an entrepôt.

Marseilles is the western emporium for trade with the Levant and it is the French gate of the far east. It suffers from competition with Genoa for trade with Switzerland and from lack of communication with the inland waterways of France. It was hoped in the late 1950s that improved navigation on the Rhône and the construction of one new canal from Bouc to Arles, or to Saint-Louis, would make the city of Marseilles the national outlet from the rich basin in which it lies.

In order of importance, the imports are crude petroleum, grains, out of season fruits and vegetables, carbon, sugar. peanuts. chrome, phosphates, vegetable oils and greases, cotton, rubber, wine, copra, sulfur, coffee, Indian corn, skins and leathers. bananas, dates and dried fruits, manganese and nonferrous metals. Less important are meats, dried vegetables, cocoa, leaf tobacco, exotic woods, cork, paper and cardboard, wool, iron and steel.

The major export is petroleum. After that, successively, come construction materials, machines, chemical products, sugar, carbon, metalwork, farina, automobiles, lumber, fresh vegetables, cloth, beer, tobacco, wine. soap and vegetable oils.

The industry of Marseilles is closely connected with its imports, from which are taken most of the raw materials processed there. At mid-20th century, the most important industry was based on the pact of San Remo (1920) which gave France one-fourth of Iraq's production of petroleum of which a large part is refined at Berre.

The oldest and best known industry, founded in the 15th century, is that of soap. It retains its importance despite a decrease of 35% since 1935. The production of sugar has decreased similarly since 1920. Even though the oil refineries represent half the production of France, drastically reduced in the late 1950s, their production is 50% of what it was formerly. Marseilles is the largest producer of semolina in France; and is the fourth largest producer of *pasta* which is made from semolina. The building materials made—quicklime, cement, plaster. bricks and tiles—are a significant part of France's total. The manufacture of glass is still a major industry. Metallurgy and smelting have grown in importance since World War II and Marseilles has developed a very large chemical industry (sulfuric acid, superphosphates, hydrochloric acid, refined sulfur and copper sulfate), partly owing to the needs of the vine-growing region around the city. (J. BD.)

MARSH, ADAM (ADAM DE MARISCO) (d. *c.* 1258), English Franciscan, scholar and theologian, was born about 1200 in the diocese of Bath. and educated at Oxford under Grosseteste. Before 1226 Adam received the benefice of Wearmouth from his uncle, Richard Marsh, bishop of Durham; but between that year and 1230 he entered the Franciscan order. About 1238 he became the lecturer of the Franciscan house at Oxford. Roger Bacon, his pupil, speaks highly of his attainments in theology and mathematics. Consulted as a friend by Grosseteste, as a spiritual director by Simon de Montfort. the countess of Leicester and the queen, as an expert lawyer and theologian by the primate, Boniface of Savoy, he did much to guide the policy both of the opposition and of the court party in all matters affecting the interests of the Church. He shrank from office, and never became provincial minister of the English Franciscans, though constantly charged with responsible commissions. Henry III and Archbishop Boniface unsuccessfully endeavoured to secure for him the see of Ely in 12 j6. In 1257 Adam's health was failing, and he appears to have died in the following year. He sympathized with Montfort as with a friend of the Church and an unjustly treated man; but on the eve of the baronial revolution he was on friendly terms with the king. He rebuked both parties in the state for their shortcomings, but he did not break with either.

MARSH, GEORGE PERKINS (1801–1882), American diplomatist and philologist, was born at Woodstock, Vt., on March 15, 1801. He graduated at Dartmouth college in 1820, was admitted to the bar in 1825, and practised law at Burlington, Vt., devoting himself also to philological studies. From 1843 to 1849 he was a Whig representative in Congress. In 1849 he was made United States minister resident in Turkey, returning to Vermont

in 1854. In 1861 he became the first United States minister to the kingdom of Italy, and died in that office at Vallombrosa on July 23, 1882. Marsh was an able linguist, a scholar of great breadth, and a remarkable philologist for his day. His chief published works are: *A Compendious Grammar of the Old Northern or Icelandic Language* (1838); *The Camel, his Organization, Habits, and Uses, with Reference to his Introduction into the United States* (1856); *Lectures on the English Language* (1860); *The Origin and History of the English Language* (1862; revised ed., 1885); *Man and Nature* (1864); *The Earth as Modified by Human Action* (1874, 1885); and *Mediaeval and Modern Saints and Miracles* (1876).

MARSH, OTHNIEL CHARLES (1831–1899), U.S. paleontologist whose discoveries and scholarly descriptions of numerous fossils won him his scientific reputation. was born in Lockport, N.Y., on Oct 29, 1831. He graduated at Tale college in 1860, and studied geology and mineralogy in the Sheffield Scientific school there. Becoming interested in vertebrate paleontology, he studied abroad and on his return to Yale in 1866 was appointed professor of vertebrate paleontology. He was aided by a private fortune from his uncle, George Peabody, whom he induced to establish the Peabody Museum of Natural History in the college. With this backing, he sent out numerous exploring parties to Wyoming and other western states almost annually for the next three decades. In his publications on fossil finds he utilized the studies of such scientists as Samuel Wendell Williston, Oscar Harger, Max Schlosser and George Baur; these men were not generally permitted to publish themselves on vertebrate paleontology while in Marsh's employ. A host of short papers by Marsh appeared in the *American Journal of Science;* his major published works, however, were quarto volumes on toothed birds, the Dinocerata (archaic horned mammals). and North American dinosaurs. Marsh was prominent in national scientific affairs. and was president of the National Academy of Sciences for 12 years. His rival in the exploration of the western fossil beds nas Edward Drinker Cope (*q.v*) of Philadelphia; their rivalry developed into a bitter feud which somewhat clouded the reputations of both. Early government geological exploration of the west had been made by several independent surveys; they were combined in 1881 to form the United States Geological survey. Marsh was put in charge of its work in vertebrate paleontology and given liberal support.

Marsh's last years were saddened by financial reverses, loss of government support, and demand that fossils collected under government auspices be sent to the National museum. He died in New Haven on March 18, 1899.

See Charles Schuchert and Clara Mae LeVene, *O. C. Marsh: Pioneer in Paleontology* (1940). (A. S. Rr.)

MARSH, an area of low, flat-lying, wet ground subject to daily, seasonal or perennial flooding. In popular usage the term is applied interchangeably with swamp (*q.v.*). Technically marshes have many physical features common to swamps; they differchiefly in having vegetation composed dominantly of grasses and such grasslike plants as sedges and rushes. Characteristic marsh plants include cord and salt reed grass in salt water, saw grass and reeds in brackish to fresh water, and Indian rice and giant cane in fresh water.

Salt- and brackish-water marshes are common along low seacoasts, inside barrier bars and beaches, in estuaries and on deltas, and are often extensive in deserts. Maritime marshes often extend many miles inland and are variably subjected to tidal action. Fresh-water marshes are found frequently on mineral substrates of alluvial and lacustrine origin and are both numerous and extensive on upland areas with impeded drainage, particularly those, such as the most recently glaciated areas of North America. with underdeveloped drainage. Marshes were ubiquitous in the prairie of the midwestern United States, but their value as agricultural scils resulted in early drainage and cultivation. As wildlife refuges they provide a valuable economic and recreational resource.

Notable marshes in the United States are the Everglades of Florida, the tule marshes of the Sacramento and San Joaquin valleys of California and the Humboldt Salt marsh of Nevada. The vast Pinsk marshes of the Pripet river drainage in the Soviet Union and the Pontine marshes of Rome are of particular historical interest. (M. E. B.)

MARSHAL, a title given in various countries to certain military and civil officers, usually of high rank. The origin and development of the meaning of the designation is closely analogous with that of constable (*q.v.*). Just as the title of constable is traceable to the style and functions of the Byzantine count of the stable, so that of marshal was evolved from the title of the *marescalci,* or masters of the horse, of the early Frankish kings. In this original sense the word survived down to the close of the Holy Roman empire in the titular office of *Erz-Marschalk* (arch-marshal), borne by the electors of Saxony. Elsewhere the meaning of office and title was modified. The importance of cavalry in mediaeval warfare led to the marshalship being associated with military command; this again led to the duty of keeping order in court and camp, of deciding questions of chivalry, and to the assumption of judicial and executive functions. The marshal, as a military leader, was originally a subordinate officer, the chief command under the king being held by the constable; but in the 12th century, though still nominally second to the constable, the marshal has come to the forefront as commander of the royal forces and a great officer of State. In England after the Conquest the marshalship was hereditary in the family which derived its surname from the office, and the hereditary title of earl-marshal originated in the marriage of William Marshal with the heiress of the earldom of Pembroke (*see* EARL MARSHAL). Similarly, in Scotland, the office of marischal (from the French *mare'chal),* probably introduced under David I., became in the 14th century hereditary in the house of Keith. In 1485 the Scottish marischal became an earl under the designation of earl-marischal, the dignity coming to an end by the attainder of George, 10th earl-marischal, in 1716. In France, on the other hand, though under Philip Augustus the marshal of France *(marescalcus Franciae)* appears as commander-in-chief of the forces, care was taken not to allow the office to become descendible; under Francis I. the number of marshals of France was raised to two, under Henry III. to four, and under Louis XIV. to 20. Revived by Napoleon, the title fell into abeyance with the downfall of the Second empire.

In England the use of the word marshal in the sense of commander of an army appears very early; so Matthew Paris records that in 1214 King John constituted William, earl of Salisbury, *marescalcus* of his forces. The modem military title of field marshal, imported from Germany by King George II. in 1736, is derived from the high dignity of the *marescalcus* in a roundabout way. The *marescalcus campi,* or *mare'ckal des champs,* was originally one of a number of officials to whom the name, with certain of the functions, of the marshal was given. The marshal, being responsible for order in court and camp, had to employ subordinates, who developed into officials often but nominally dependent upon him. On military expeditions it was usual for two such marshals to precede the army, select the site of the camp and assign to the lords and knights their places in it. In time of peace they preceded the king on a journey and arranged for his lodging and maintenance. In France *mare'chal des logis* is the title of superior non-commissioned officers in the cavalry.

Similarly at the king's court the *marescalcus aulae* or *intrinsecus* was responsible for order, the admission or exclusion of those seeking access, ceremonial arrangements, etc. Such "marshals" were maintained, not only by the king, but by great lords and ecclesiastics. The more dignified of their functions, together with the title, survive in the various German courts, where the court marshal (*Hofmarschall*) is equivalent to the English lord chamberlain. Just as the *marescalcus intrinsecus* acted as the vicar of the marshal for duties "within" the court, so the *marescalcus forinsecus* was deputed to perform those acts of serjeanty due from the marshal to the Crown "without." Similarly there appears in the statute 5 Edw. III. cap. 8, a *marescalcus banci regii,* or marshal of the king's bench, who presided over the Marshalsea court, and was responsible for the safe custody of prisoners bestowed in the Marshalsea prison. The office of marshal of the queen's bench survived till 1849 (see LORD STEWARD; and MARSHALSEA). The official known as a judge's marshal, nhose office is of considerable antiquity. and whose duties consisted of making abstracts of indictments and pleadings for the use of the judge, still survives, but no longer exercises the above functions. He accompanies a judge of assize on circuit and is appointed by him at the beginning of each circuit. His travelling and other expenses are paid by the judge, and he receives an allowance of two guineas a day, which is paid through the Treasury. He introduces the high sheriff of the county to the judge of assize on his arrival. and swears in the grand jury. For the French *maréchaussée* see FRENCH LAW AND INSTITUTIONS.

In the sense of executive legal officer the title marshal survives in the United States of America in two senses. The United States marshal is the executive officer of the Federal courts. one being appointed for each district, or exceptionally, one for two districts. His duties are to open and close the sessions of the district and circuit courts, serve narrants and execute throughout the district the orders of the court. There are United States marshals also in Alaska, Hawaii and Puerto Rico They are appointed by the president of the U.S., nith the advice and consent of the Senate, for a term of four years. and, besides their duties in connection with the courts. are employed in the service of the internal revenue, public lands, post office, etc. The temporary police sworn in to maintain order in times of disturbance. known in England as special constables, are also termed marshals in the United States. In some of the southern and aestern States of the Union the title marshal has sunk to that of the village policeman, as distinct from the county officers known as sheriffs and those of the justices' courts called constables.

In England the title of marshal, as applied to an executive officer, survives only in the army. where the provost marshal is chief of the military police in large garrisons and in field forces. Office and title were borrowed from the French *prévôt des maréchaux*, the modern equivalent of the mediaeval *praepositus marescalcorum* or *guerrarum*.

MARSHALL, ALFRED (1842–1924), British economist who, through the influence of his work, was one of the chief founders of the school of neoclassical economists, was born in London on July 26, 1842. Educated at Merchant Taylors' school and at St. John's college, Cambridge, in 1877 he became the first principal of University college, Bristol, but resigned in 1881 because of ill health. He was a fellow and lecturer in political economy at Balliol college, Oxford, from 1883 to 1885, when he returned to Cambridge as professor of political economy in succession to Henry Fawcett. He was a member of the royal commission on labour from 1891 to 1894 and subsequently served in several government inquiries. In 1903, after years of struggle, he succeeded in establishing an economics tripos at Cambridge, separate frorn the moral sciences tripos. He retired from the chair of political economy in 1908 and thenceforward devoted himself to his writings until his death at Cambridge on July 13, 1924.

Marshall's first big work, *Principles of Economics* (1890), was in many ways his most important contribution to economic literature. His next volume: *Industry and Trade*, a realistic study of industrial organization, did not appear until 1919, but in the meanwhile he had devoted much time and energy to bringing out successive editions of his *Principles*. In 1923 he published his last volume, *Money, Credit and Commerce*. Marshall may be said to have been in the lineal descent of the great English economists—Adam Smith, Ricardo and J. S. Mill. His *Principles of Economics* was distinguished by its profound and systematic methods of analysis and by the introduction of a number of new concepts, such as elasticity of demand, consumer's surplus, quasi rent! the representative firm, etc., which played a great role in the subsequent development of economics. Writing at a time when the economic world was deeply divided on the theory of value, he succeeded, largely by introducing the element of time as a factor in analysis, in reconciling the classical cost of production principle with the marginal utility principle formulated by William Jevons (*q.v.*) and the Austrian school. He did much to rescue economics from rigid dogmatism by insisting that economic reasoning and laws were not themselves a body of concrete truth but an engine for the discovery of concrete truth. (C. W. G.; X.)

MARSHALL, GEORGE CATLETT (1880–1959), U S. army officer aho directed the organization and training of U.S. land and air forces during World War II, served as secretary of state and of defense. was author of the Marshall plan for European recovery and was winner of the Nobel peace prize (1953). He was born at Uniontown, Pa., on Dec. 31, 1880, and graduated from the Virginia Military institute, Lexington in 1901. Commissioned as a second lieutenant in February 1902, with date of rank from February 1901, his first service mas in the Philippines (1902–03). He was advanced through the grades to general of the army in Dec. 1944. As a five-star general he mas still on active duty and the highest ranking officer of the army at the time of his death.

In World War I he served as chief of operations of the 1st army and chief of staff of the 8th army corps. He drafted plans for the St Mihiel operation and later nas assigned the problem of transferring more than 500,000 men and 2.700 guns to the Argonne front for the Meuse-Argonne battle.

After World War I. he was an aide to Gen John J. Pershing from 1919 to 1924 and served with the 15th infantry regiment in Tientsin, China (1924–27). As assistant commandant in charge of instruction (1927–32) at the infantry school. Ft Benning he strongly influenced army doctrine and such later wartime leaders as Bradley. Collins, Ridgway, Stilwell, Bedell Smith. Hodges and Bolté. He was saorn in as chief of staff of the army on Sept 1, 1939 the day World War II began with the invasion of Poland by German troops For the next six years. Marshall directed the raising of new divisions, training of troops. development of new weapons and equipment, and selection of top commanders. He was chief of staff of the army at the time of Pearl Harbor. As an adviser to Pres. Franklin D. Roosevelt on strategy, he attended the conferences at Casablanca. Quebec, Tehran. Yalta and Potsdam.

Marshall resigned as chief of staff Nov 21, 1945. A few days later he was appointed special representative of Pres. Harry S. Truman to China with rank of ambassador. He was unsuccessful in his efforts to mediate the Chinese civil war.

Appointed secretary of state by President Truman on Jan. 21, 1947, he headed—during the next two years—U S. delegations to international conferences at Moscow, Rio de Janeiro, Bogotá, Paris, London and New York. On June 5, 1947, at Harvard university he proposed a European Recovery program nhich, knonn as the Marshall plan (*q.v.*), was enacted into law in April 1948 The Greek and Turkish aid programs, recognition of Israel and the initial discussions of the North Atlantic Treaty organization (NATO) agreements came during his secretaryship. He resigned on Jan 21, 1949 In the course of the year he was named chairman of the American Battle Monuments commission and president of the American Red Cross.

Marshall nas secretary of defense under Truman from Sept 21, 1950. to Sept. 12, 1951. In this post he helped implement the NATO agreements. He pressed vigorously for increases in man power and production of matériel to strengthen U S. forces in Korea, and urged the establishment of a universal military training program.

He represented Pres. Dwight D. Eisenhouer at the coronation of Elizabeth II in 1953. Later in the same year he was awarded the Nobel peace prize in recognition of his contributions to the economic rehabilitation of Europe after World War II and his efforts to promote international peace and understanding. He died in Washington, Oct. 16, 1959, and was buried in Arlington National cemetery (F.C. PE.)

MARSHALL, JOHN (1755–1835), fourth chief justice of the United States nhose constitutional decisions gave shape and definition to the structure of the federal government, was born on Sept 24. 1755, near a settlement then called Germantown (now Midland), Va. the eldest of 15 children of Thomas Marshall (1730–1802) and Mary Keith Marshall. His childhood and youth were spent in the near-frontier region nhich in 1759 became Fauquier county. first in the forested area of southern Fauquier in which he had been born. later on in the more extensive properties his father acquired in the Blue Ridge mountain area north and west of Warrenton. His education appears to have been largely the product of his parents' efforts, supplemented only by the instruction afforded by a visiting clergyman who lived with the family for about a year, and by a few months of slightly more formal training at an academy in Westmoreland county. Thomas and Mary Marshall, however, had more learning and wider experience to transmit to their children than was common among the farmers and hunters of the back country of northern Virginia. Mary Keith Marshall was the daughter of a college-trained Scottish clergyman who had migrated to Virginia. Thomas Marshall brought to the family circle a continually broadening experience. A friend of George Washington, he had been his assistant in surveying the extensive estates of Lord Fairfax. Soon after Fauquier county was established he was elected its representative in Virginia's house of burgesses. His career of officeholding next included service as sheriff of Fauquier county, a return to the house of burgesses, appointment as clerk of Dunmore county, followed once again by service in the house of burgesses. This was the period when the differences between the upland counties and the tidewater aristocracy grew sharp and were paralleled by an increasing sentiment for colonial autonomy and finally for independence among the back-country residents whom Thomas Marshall represented.

When political debate with England was followed by armed clashes in 1775. John Marshall. as lieutenant. joined his father in a Virginia regiment of minutemen and participated in the first fighting in that colony. Joining the Continental army in 1776. he served under Washington for three years in New Jersey, New York and Pennsylvania, including in this service the harsh winter of 1777–78 at Valley Forge. When the term of service of his Virginia troops expired in 1779, Marshall returned to Virginia and thereafter saw little active service prior to his discharge in 1781.

Marshall's career in law dates from 1780. His only formal training was a brief course of lectures given by George Wythe which he attended at William and Mary college early in that year. Licensed to practise in Aug. 1780, he returned to Fauquier county and was elected to the Virginia house of delegates in 1782 and 1784. Attending the sessions of the legislature in the capitol at Richmond. he established there both a lam practice and a home after marriage to Miss Mary Ambler in Jan. 1783.

For the next 15 years Marshall's career was marked by increasing stature at the brilliant bar of Virginia. He had not, in 1787, achieved a public position which would have sent him as a delegate to the Constitutional Convention in Philadelphia, but he was an active, if junior, proponent of the constitution in the closely contested fight for ratification. Virginia was then the largest and most populous of the states. Its ratification was not only essential to the success of the proposed constitution but was also among the most doubtful. Marshall was elected to the legislature which took the first step toward ratification by issuing a call for a convention to consider ratifying; he was also elected a delegate to the convention. On the floor of that convention the contest on behalf of the constitution was led by men senior to Marshall—James Madison. Edmund Randolph, Edmund Pendleton and Wilson Cary Nicholas; Patrick Henry and George Mason led the opposition. Jlarshall made one address in reply to a general attack by Henry. His principal effort on the floor was, perhaps prophetically, a defense of the judiciary article. It can only be assumed that his acknowledged popularity was employed with at least equal effectiveness off the floor to gain or hold the narrow margin by which Virginia's ratification was won.

With the new government under the constitution installed, President Washington offered Marshall appointment as United States attorney for Virginia. Marshall declined. In 1789. however, he sought and obtained a further term in Virginia's house of delegates as a supporter of the national government. As party lines emerged and became defined in the 1790s, Marshall became recognized as one of the leaders of the Federalist party (*q.v.*) in Virginia. In 1795, Washington tendered him an appointment as attorney general. This, too. was declined. but Marshall returned to the state legislature as a Federalist leader. His first federal service came when Pres. John Adams appointed him member of a commission, with Elbridge Gerry and Charles C. Pinckney, to seek improved relations with the government of the French republic. The mission was unsuccessful. But when its reports were published disclosing the approach of intermediaries, the shadowy figures of "X, Y and Z," who informed the commissioners that they would not be received by the French government unless they first paid large bribes, and the rebuff of these advances in a memorial which Marshall had prepared, Marshall became a popular figure and the conduct of his mission was applauded by one of the earliest American patriotic slogans, "Millions for defense, but not one cent for tribute" (*see* XYZ CORRESPONDENCE).

Returned from France. Marshall declined appointment to the supreme court to succeed Justice James Wilson but was persuaded by Washington to run for congress. He was elected in 1799 as a Federalist from the Richmond district, though not until he had expressed opposition to the unpopular alien and sedition laws which the Adams administration had sponsored (*see* UNITED STATES: *History: Struggle for National Government, 1783–1865*). His service in the house of representatives was brief. His chief accomplishment there appears to have been the effective defense of the president against a Republican attack for having honoured a British request under the extradition treaty for the surrender of a seaman charged with murder on a British warship on the high seas. In May 1800, President Adams requested the resignation of his secretary of war and offered the post to Marshall. Marshall declined. The president next dismissed his secretary of state and tendered the vacant place in his cabinet to Marshall. In an administration harassed by dissension and with uncertain prospects in the forthcoming election, the appeal of the invitation must have been addressed principally to Marshall's loyalty. After some hesitation he accepted and almost immediately became the effective head of government when the president retired to his home in Massachusetts for a stay of a few months. In the autumn of 1800, Chief Justice Oliver Ellsworth resigned owing to ill health. Adams, defeated in the election of November, tendered reappointment to John Jay, the first chief justice. Jay declined. The president then turned to his secretary of state and in Jan. 1801, sent to the senate the nomination of John Marshall to be chief justice of the United States. The last Federalist senate confirmed the nomination on Jan. 27, 1801. On Feb. 4, Marshall accepted the appointment but, at the president's request, continued to act as secretary of state for the last month of the Adams administration.

It fell to Marshall, and to the supreme court under and beginning with Marshall, to set forth with authority the main structural lines of the government of the United States. Whether the constitution had created a federation or a nation was not a matter on which universal agreement could have been won at the beginning of the 19th century. Though judicial decisions could not alone dispel differences of opinion. they could create a body of coherent, authoritative and disinterested doctrine around which opinion could mass and become effective. To the task of creating such a core of agreement bfarshall brought qualities which were admirably adapted for its accomplishment. His own mind had apparently a clear and well organized concept of the effective government which he believed mas needed and was provided by the constitution He wrote with a lucidity, a persuasiveness and a vigour which gave to his judicial opinions a quality of reasoned inevitability which more than offset nhat they sometimes lacked in precision of analysis. The 35 years of his magistracy gave opportunity for the development of a unified body of constitutional doctrine. It was the first aspect of Marshall's accomplishment that he and the court which he headed did not permit this opportunity to pass unrecognized.

Prior to Marshall's appointment, it had been the custom of the supreme court, as it was in England, that each justice deliver an opinion in each significant case. This method may be effective where a court is dealing nith an organized and existing body of law. With a new court and a largely unexplored body of law. it created an impression of tentativeness. if not of contradiction, nhich lent authority neither to the court nor to the law it expounded. With Marshall's appointment, and presumably at Marshall's instance, this practice changed. Thereafter, for some years, it became the general rule that there was only a single opinion from the supreme court, and that delivered by the chief justice. This change of practice alone would have contributed to making the court a more effective institution. And when the opinions were cast in the mold of Marshall's clear and compelling statement. growth of the court's authority came as a result which might have been, and presumably mas, anticipated.

Marbury v. *Madison* (1803) mas the first of hlarshall's great cases and the case which established for the court its power to state and expound constitutional law in disregarding federal statutes which it found in conflict with the constitution. President Adams had appointed a number of justices of the peace for the District of Columbia shortly before his term expired. Their commissions had been signed and the seal of the United States affixed in the office of the secretary of state, but some of them, including that of William Marbury, remained undelivered. President Jefferson is believed to have ordered that some of them not be delivered. After unsuccessful application at the department of state, Marbury instituted suit in the supreme court against James Madison. the new secretary. Though the matter was not beyond question, the court found that congress had by statute authorized that such suits be started in the supreme court rather than in a lower court. But the supreme court, speaking through Marshall, held that art. iii of the constitution did not permit this, and that the court could not follow a statute which was in conflict with the constitution. It thereby confirmed for itself its most controversial power, the function of judicial review, of finding and expounding the law of the constitution.

Marshall's emphasis was put on the assertion that if the constitution was to be a lasting and controlling document, judges who were sworn to uphold it could not follow a law which conflicted with it. As Chief Justice John Bannister Gibson of the supreme court of Pennsylvania later pointed out, the problem was not so much whether the court should follow laws which conflicted with the constitution as it was who—court or congress—should determine whether the conflict existed, a matter often as uncertain as it was in Marbury's case. This great power of determining whether there was conflict between a law and the constitution was not explicitly given to the court. 4s early as 1796 it had held ineffective a state law which it found in conflict with federal law, and in the same year had considered a constitutional challenge to a federal tax, but had left without specific decision its power to disregard a federal statute. Marshall's was the first decision which asserted and acted upon this authority. Though the court's action has been questioned, and even termed usurpation, history lends strong support to Marshall's action. British judges had passed upon the question whether the acts of colonial legislature were consistent with their charters, so the function was not an unfamiliar one. There mas some history of state courts having done the same with respect to state laws and state constitutions. Most of the leaders of the Constitutional Convention and many of those in state ratifying conventions appear to have contemplated judicial review and to have assumed that it would be exercised. And the terms of the Judiciary act passed by the first congress in 1789 appear equally clearly to have contemplated that this function would be carried out by judges subject to ultimate review by the supreme court.

Once the power of judicial review had been established, Marshall and the court followed with decisions which assured that it would be exercised, and the whole body of federal law determined, in a unified judicial system with the supreme court at its head. In *Martin* v. *Hunter's Lessee* (1816) the court overruled the court of appeals of Virginia, which had held that the state courts were not subject to review by the supreme court, even in cases where federal questions were involved. Marshall did not participate in this case because the specific point at issue was ownership of the Fairfax estate in which he had a large interest. But in *Cohens* v. *Virginia* (1821), Marshall followed the same reasoning and went a step further in holding that even criminal cases in the state courts, in which a state itself was a party. were subject to review by the supreme court if a question under federal law arose in the case. This decision provoked vigorous opposition by Judge Spencer Roane of Virginia, but it is clear that a unified federal system could hardly have been maintained had Marshall's decision been otherwise, And in *United States* v. *Peters* (1809), Marshall closed another possible gap in federal authority by holding that once the federal courts had acted, not even a state legislature could interpose effective authority to nullify or set aside its order or judgment

After asserting the authority of federal judges to interpret and apply the constitution, Marshall's most important decision in the exercise of this function was in *McCulloch* v. *Maryland* (1819) in nhich he upheld the authority of congress to create the Bank of the United States. Once again he was dealing uith a power not explicitly given. for the constitution did not in so many words emponer congress to create a corporation or establish a bank. But Marshall found that if congress determined that a corporation exercising banking poners would be a useful and appropriate means of accomplishing its purpose within the granted powers of regulating commerce, borrowing money, collecting taxes, paying and supporting troops, and the like, its action was authorized by the constitution. In nriting "[W]e must never forget that it is a *constitution* we are expounding . . . Let the end be legitimate, let it be within the scope of the constitution, and all means which are appropriate. which are plainly adapted to that end. which are not prohibited, but consist with the letter and spirit of the constitution, are constitutional," Marshall set a standard of judgment of congressional action which would validate the expanding federal legislation of later years. *McCulloch* v. *Maryland* uell illustrates that judicial revien may have an affirmative aspect as well as a negative. It may accord an authoritative legitimacy to contested government action no less significant than its restraint of prohibited or unauthorized action.

The constitution had been called into being as much by the need for restricting state legislation hostile to the commerce of other states as by any other single factor. It granted to congress the poner to "regulate commerce . . . among the several states." It left open the question nhether, or to what extent, state regulatory laws could be applied to interstate commerce. In order to encourage the development of the steamboat, New Tork had granted to Fulton and Livingston, and their licencees, a long-term monopoly of steam navigation on the waters of the state. In *Gibbons* v. *Ogden* (1824), the question was whether this New Tork statute could operate to exclude vessels propelled by steam and coming from another state. In dealing with the problem, Marshall first set forth the great scope of the power granted to congress by the commerce clause. There remained the dilemma whether this excluded state action in the field when congress had not acted. Marshall san that many state laws primarily of local concern would. be ineffective if they could not be applied to persons and goods from other states. At the same time many others could operate to evoke hostility and reprisals from other states. as indeed New York's steamboat monopoly was doing. In *Gibbons* v. *Ogden*, after an extensive survey of the problem nhich left it unanruered, Marshall resolved that particular case by invoking federal authority in the form of a federal coasting licence possessed by the New Jersey vessel to override New York's statutory monopoly. Yet in *Willson* v. *Black Bird Creek Marsh company* (1829), Marshall held in a brief and inexplicit opinion that a similar coasting licence could not justify destruction of a dam across a navigable stream which Delaware had authorized in order to drain a marsh. These apparently conflicting decisions showed not contradiction or indecision but rather a recognition that the problem was a complex one incapable of solution by any simple rule or formula. It remained for Marshall's successors to recognize explicitly what hlarshall's decisions had foreshadowed, that such problems could be dealt with only on the particularized basis of appraising the competing interests of the state and of a nationally open market in the circumstances of each case. When Maryland, however. imposed a special tax upon importers. thereby creating a hostile discrimination against foreign goods in the local market, Marshall had little difficulty in deciding, in *Brown* v. *Maryland* (1827), that this taxing statute was unconstitutional. Though the result of that decision was not questioned thereafter, hlarshall's opinion in *Brown* v. *Maryland* was not among his happiest. Instead of basing the decision upon the fact that the tax was discriminatory, Marshall held instead that for a time imports must be completely tax exempt. He suggested that this exemption existed during the time they remained in the original package and before the first sale. The opinion, rather than the result of the decision. posed for successor judges many difficult problems in enforcing general non-discriminatory state taxes insofar as they relate to imported goods.

Marshall's decisions dealing with the authority and organization of the federal government and with federal-state relationships created an organized structure upon which his successors have for the most part built and elaborated. His decisions dealing with the specific restraints upon government, chiefly involving the provision of art. i of the constitution that "No State shall . . . pass any . . . Law impairing the Obligation of Contracts" proved less enduring in establishing the uorking limits within which state governments must operate. Though *Fletcher* v. *Peck* (1810)—holding that a state could not legislatively revoke an executed sale of land uhich had subsequently been acquired by innocent purchasers—presumably remains effective (either by virtue of the 14th amendment or the contract clause), other decisions by Marshall under the contract clause have been modified. In *New Jersey* v. *Wilson* (1812), Marshall held that a legislative grant of tax exemption to land occupied by Indians remained effective and could not be denied by the state even after the land had been purchased by others. The construction which interpreted the grant in such sweeping terms was presumably qualified by Marshall himself in *Providence Bank* v. *Billings* (1830). The decision in *Trustees of Dartmouth College* v. *Woodward* (1819), that a grant of a corporate charter constituted a contract which was inviolate against subsequent amendment, was effectively lessened in scope both by more restrictive construction of such charters and by the subsequently developing practice of state legislatures in specifically reserving the power to amend. The decisions in *Sturges* v. *Crowninshield* (1819) and in *McMillan* v. *McNeill* (1819), holding that state laws could not grant a discharge to insolvent debtors. were modified by *Ogden* v. *Saunders* (1827) with respect to debts incurred after the passage of the state law. This decision was one of the few cases decided while Marshall was on the supreme court in nhich the majority did not agree with him, and in which he dissented. If it was true that Marshall's decisions attempting to mark out the scope of the constitution's specific prohibitions on government have been among his less enduring ones, the same has been no less true of his successors. It is in this area that judicial review has evoked its most vigorous critics.

For the first 30 years of his service as chief justice, Marshall's life was singularly happy. In the autumn of 1831, at the age of 76, he underwent the rigours of surgery for the removal of kidney stones and appeared to make a rapid and complete recovery But the death of his aife on Christmas of that year was a blow from nhich his spirits did not so readily recover. In 1835 his health declined rapidly and on July 6 of that year he died in Philadelphia. He lies buried in Richmond, where he had maintained a home for many years. It was said of him by Justice Holmes. "When we celebrate Marshall we celebrate at the same time and indivisibly the inevitable fact that the oneness of the nation and the supremacy of the national Constitution were declared to govern the dealings of man nith man by the judgments and decrees of the most august of courts." It is his lasting memorial that when the phrase "the great chief justice" is used, the reference is unmistakably to John Marshall.

Beveridge, *Life of John Marshall* (1919); James Bradley Thayer, *John Marshall* (1901); Charles Warren. *The Supreme Court in United States History* (1928); Kenneth B Umbreit, *Our Eleven Chief Justices* (1938) For a collection of Marshall's constitutional opinions, see *Constztutzonal Decisions of John Marshall,* ed. by Joseph P Cotton, Jr. (1905) (ET J B.)

MARSHALL, LOUIS (1856–1929), U.S. lawyer and Jewish community leader best known for his efforts to extend religious, cultural and political freedom to all racial, religious and linguistic minorities. was born in Syracuse, N.Y., on Dec. 14. 1856 He achieved eminence as an appellate lanyer, and made many important contributions to legal and constitutional reforms. At the Paris peace conference of 1919 he successfully advocated treaties signed by a number of eastern European countries intended to protect minority rights (*see* MINORITIES). His opposition to Henry Ford's *Dearborn Independent,* and particularly to its circulation of the forged "Protocols of the Elders of Zion," helped bring about the discontinuance of this publication. He helped develop many religious and philanthropic Jewish organizations of national and international scope. He died at Zurich, Switz., on Sept. 11, 1929. His writings are collected in *Louis Marshall: Champion of Liberty,* edited by Charles Reznikoff (1957). (A. EN.)

MARSHALL, STEPHEN (*c.* 1594–1655), English Presbyterian clergyman, was born at Godmanchester in Huntingdonshire, and was educated at Emmanuel college, Cambridge (M.A. 1622, B.D. 1629). After holding the living of Wethersfield in Essex he became vicar of Finchingfield in the same county, and in 1636 was reported for "want of conformity." He was a preacher of great power, and influenced the elections for the Short parliament of 1640. Clarendon esteemed his influence on the parliamentary side greater than that of Laud on the royalist. In 1642 he was appointed lecturer at St. Margaret's, Westminster, and delivered a series of addresses to the Commons in which he advocated episcopal and liturgical reform. He had a share in writing *Smectymnuus,* was appointed chaplain to the earl of Essex's regiment in 1642, and a member of the Westminster assembly in 1643. He represented the English parliament in Scotland in 1643, and attended the parliamentary commissions at the Uxbridge conference in 1645. He waited on Archbishop Laud before his execution, and was chaplain to Charles I at Holmby house and at Carisbrooke. A moderate and judicious Presbyterian, he prepared with others the "Shorter Catechism" in 1647, and was one of the "Triers" 1654. He died in November 16jj and was buried in Westminster abbey, but his body was exhumed at the Restoration.

MARSHALL, THOMAS RILEY (1854–1925), 28th vice-president of the United States, was born in North hlanchester, Ind.. on March 14, 1854. He attended the public schools of that community and graduated from Wabash college, Crawfordsville, Ind. He studied law in the office of Judge Walter Olds, in Fort Wayne, and was admitted to the bar on his 21st birthday. Betneen 1875 and 1909 he practised law in Columbia City, Ind. Marshall gained a state-wide reputation as a forceful and entertaining speaker and was elected governor in 1908. He was nominated for vice-president on the Democratic ticket at Baltimore in 1912, following the stormy proceedings in which Woodrow Wilson was finally nominated for president. hlarshall nas elected that year and re-elected in 1916, the first vice-president to succeed himself in almost a century.

Marshall presided over the senate with fairness, tact and poise. His personal influence on legislation was a ponerful aid to the administration. For almost two years folloning the outbreak of World War I he advocated strict neutrality. a stand he later regretted. Folloning the war. he proved a strong advocate of the League of Nations, and opposed women's suffrage. He won friends nith his kindliness, tolerance and nhimsical humour. During a tedious debate in the senate on the needs of the country he was heard to comment: "What this country needs is a really good five-cent cigar." His homespun philosophy and love of fun are preserved in his book *Recollections of Thomas R. Marshall: a Hoosier Salad* (1925). He served on the U.S. Coal commission in 1922 and died in Washington, D.C , on June 1. 1925.

See C. M. Thomas, *Thomas Riley Marshall, a Hoosier Statesman* (1939). (H. F. TT)

MARSHALL, a city of eastern Texas, U.S., seat of Harrison county, is 38 mi. W. of Shreveport. It is a historic community, settled in 1839. named for U.S. Chief Justice John Marshall, incorporated in 1843 and chartered in 1848. It adopted the council-manager form of municipal government in 1909. Situated on the Texas and Pacific railway, Marshall is the centre of a farming area (cotton, sweet potatoes. peas, cattle) with considerable oil production. It has large railroad repair shops, and manufactures include steel products, bricks and foundry items.

Marshall is the seat of the East Texas Baptist college (chartered 1917) and two colleges for Negroes, Bishop college (1881) and Wiley college (1873). The city served for a time as secession capital of Missouri during the American Civil War. Considerable tourist trade is derived from nearby Caddo lake, a popular vacation spot. For comparative population figures see table in TEXAS: *Population.* (N. McG.)

MARSHALL ISLANDS are the easternmost group of islands in Micronesia (*q.v.*) and the eastern district of the United States Trust Territory of the Pacific Islands. Two of the atolls. Kwajalein and Eniwetok, were the scenes of heavy fighting during World War II. Later Bikini and Eniwetok became centres for atomic bomb experiments. outside the jurisdiction of the Trust administration. (The islanders were transferred to other atolls by the U.S. navy, and in 1957 were paid $500,000 in reparations.) The administrative centre of the Marshall Islands district is located on Majuro. The islands extend roughly from latitude 3° to 15° N. and from longitude 161° to 172° E. Their land area is 61 sq.mi., and the lagoon area is about 4,500 sq.mi. A reef-enclosed lagoon 70 mi. long with an area of 840 sq.mi. makes Kwajalein the largest atoll in the world. The population increase (from 10.553 in 1948 to 14,163 in 1958) in the face of limited natural resources threatened the economy after mid-century.

The Marshall Islands are arranged in two parallel rows: the Ratak chain to the east and the Ralik chain to the west. These islands are coral caps on great dome volcanoes which rise 18,000 ft, from the floor of the ocean. Cores have been drilled on Eniwetok to depths of 4,222 and 4,610 ft. through coral limestone before reaching the volcanic stone base of olivine basalt. The fossil evidence so obtained indicates that the islands have been sinking slowly since Eocene times. Drills and soundings made on other islands indicate a similar origin. The dome volcanoes have formed in two rows which correspond to lines of weakness in the ocean floor. Most of the Marshall Islands are true atolls with central lagoons enclosed by coral reefs on which storms have piled small islets. Since these islets seldom rise more than 20 ft. above high tide they are easily flooded during storms, typhoons and tidal waves. A few of the islands have undergone recent uplift which has left shallow lagoons or none at all.

Although various Spanish expeditions of the 16th century passed through the Marshall Islands, the lack of wealth discouraged further exploration and mapping. Captain Marshall partially explored them in 1788 but much of the mapping was done by Russian expeditions under Adam Ivan Krusenstern in 1803 and Otto von Kotzebue in 1815 and 1823. Spain's claims to the islands were recognized in 1886. After the Spanish-American War, Spain sold the Marshalls to Germany. Japan seized the islands in 1914 and later administrated them as a mandate from the League of Nations. The United States administration was made a formal United Nations trusteeship. July 18, 1947. See also PACIFIC ISLANDS. (C. A. MR.)

MARSHALL PLAN, also known as the European Recovery program (ERP), a program of U.S. economic aid to Europe in the post-World War II period. On June 5, 1947, in an address at Harvard university, George C. blarshall, the C.S. secretary of state, advanced the idea of a program of European economic self-help supported by U.S. assistance. On the basis of a unified plan for western European economic reconstruction presented by a committee representing various European powers, the U.S. congress in Dec. 1947 authorized establishment of ERP. It was administered by the U.S. Economic Cooperation administration (ECA) and the Organization for European Economic Cooperation (O.E.E.C.), the European co-ordinating body. See FOREIGN AID PROGRAMS.

MARSHALLTOWN, a city located near the geographical centre of Iowa, U.S., the seat of Marshall county. is on the Iowa river about 50 mi. N.E. of Des Moines. Large wholesale businesses and diversified industries have been developed, including the manufacture of furnaces, pressure valves, governors, die castings and canned goods. It was named for Marshall, Mich., in 1851 by the first settler, Henry Xnson. Marshalltown became the county seat in 1859 and was incorporated as a city in 1863. When hospitalization of Civil War veterans became a matter of state concern, the town donated 128 ac. which became the site of the Iowa Soldiers' home, now a state residence for disabled and aging Iowa veterans of all wars. Its community school district supports a junior college (1927). For comparative population figures see table in IOWA: Population. (J. F. WA.)

MARSHALSEA, a prison formerly existing in Southwark and attached to the court of that name held by the steward and marshal of the king's house (see LORD STEWARD AND MARSHAL). It existed as early as the reign of Edward III. It was consolidated in 1842 with the queen's bench and the Fleet, and was then described as "a prison for debtors and for persons charged with contempt of Her Majesty's courts of the Marshalsea, the court of the queen's palace of Westminster, and the high court of admiralty, and also for admiralty prisoners under sentence of courts martial."

The Marshalsea prison was abolished in 1849. It is described in Charles Dickens' Little Dorrit.

MARSH MALLOW (Althaea *officinalis*), a European plant allied to the hollyhock (*q.v.*), found in Great Britain and sparingly naturalized in the eastern U.S. It grows in marshes, especially near the sea. Sweetmeats were formerly made irom the root, and both roots and leaves are used in medicine as demulcents.

In the United States a marshmallow is a confection of sugar, sirup, starch and gelatin.

MARSHMAN, JOSHUA (1768–1837). English Baptist missionary and orientalist, was born on April 20, 1768. at Westbury Leigh, in Wiltshire. In 1799 he was sent by the Baptist Missionary society to join its mission at Serampore. There he translated the Bible into various dialects and, aided by his son, established newspapers and founded Serampore college. He received the degree of D.D. from Brown university, Providence, R.I., in 1810. He died at Serampore on Dec. 5, 1837. Marshman translated into Chinese the book of Genesis, the Gospels. Romans and Corinthians; in 1809 he published The Works of Confucius and in 1814 his *Clavis Sinica*.

See J. C. Marshman, Life and Times of Carey, Marshman, and Ward, Embracing the History of the Serampore Mission, 2 vol. (1859).

MARSH MARIGOLD (Caltha *palustris*), a plant of the buttercup family (Ranunculaceae), the "winking Mary-buds" of Shakespeare (Cymbeline, act ii, scene 3), common in wet places on both sides of the Atlantic. In the U.S. it is usually called cowslip, and is often known as kingcup in Great Britain. The stem is thick and hollow; the leaves are shining and kidney-shaped; and the flowers, which bloom in March or April, have five yellow sepals. The early shoots and leaves are used like spinach and the flower buds preserved in salted vinegar form a substitute for capers. A double-flowered variety is often cultivated and is occasionally found wild. C. natus, a large species nith white or pink flowers, occurs in ponds from Minnesota north. *C. leptosepala,* with white or bluish. usually solitary flowers, native to the Rocky Mountain region from Alaska to New Mexico, is an excellent potherb. The genus contains 20 species, confined to temperate climates.

See RANUNCULACEAE.

MARSI, an ancient people of Italy, whose chief centre was Marruvium, on the eastern shore of Lake Fucinus. They are first mentioned as members of a confederacy with the Vestini, Paeligni and Marrucini (Liv., viii, 29, cf. viii, 6, and Polyb., ii, 24, 12). They joined the Samnites in 308 B.C. (Liv., ix, 41), and became allies of Rome in 304 B.C. (Liv., ix, 45).

After a short-lived revolt two years later, for which they were punished by loss of territory (Liv., x, 3), they were readmitted to the Roman alliance and remained faithful down to the social war, their contingent (*e.g.,* Liv., xliv, 46) being always regarded as the flower of the Italian forces (*e.g.,* Hor., Od., ii, 20, 18). In this war, which, because of the prominence of the Marsian rebels became known as the Marsic War, they fought bravely against odds under their leader, Q. Pompaedius Silo, and, though they were frequently defeated, the result of the war was the enfranchisement of the allies. The Marsi were also renowned for their magicians, nho had strange remedies for various diseases.

The Latin colony of Alba Fucens near the northwest corner of the lake was founded in the adjoining Aequian territory in 303 B.C., so that from the beginning of the 3rd century the Marsians were in touch with a Latin-speaking community, to say nothing of the Latin colony of Carsioli (298 B.C.) farther west. The earliest pure Latin inscriptions of the district seem to be *C.I.L.*, ix, 3827 and 3848, from the neighbourhood of Supinum; their character generally is of the Gracchan period, though it might be somewhat earlier.

Mommsen *(Unteritalische Dialekten,* p. 345) pointed out that in the social war all the coins of Pompaedius Silo have the Latin legend "Italia," while the other leaders in all but one case used Oscan.

The chief record of the dialect or patois is owed to the goddess Angitia, whose chief temple and grove stood at the southwest corner of Lake Fucinus, near the modern village of Luco. She (or they, for the name is in the plural in the Latin inscription next cited) was widely worshiped in the central highlands (Sulmo, *C.I.L.*, ix, 3074, Furfo Vestinorum, *ibid.*, 3515) as a goddess of healing, especially skilled to cure serpent bites by charms and the herbs of the Marsian woods. Her worshipers naturally practised the same arts—as their descendants do *(see* A. de Nino's collection of *Usi e costumi abruzzesi*), their country being in Rome counted the home of witchcraft; *see* Hor., *Sat.*, 1, 9, 29, *Epod.*, 17, 28, etc.

The earliest local inscriptions date from about 300 to 150 B.C. and include the bronze of Lake Fucinus, which seems to record a votive offering to Angitia. The language of these inscriptions differs very slightly from Roman Latin of that date. The older form of the name of the tribe (dat. plur. *Martses* = Lat. *Martiis*) shows its derivation and exhibits the assibilation of *-tio-* into *-tso-* proper to many Oscan dialects (*see* OSCAN), but strange to classical Latin.

See R. S. Conway, *The Italic Dialects* (1897).

MARSIGLI (MARSILIUS), **LUIGI FERDINANDO,** COUNT (1658–1730), Italian soldier and scientific writer, was born at Bologna on July 10, 1658. After a course of scientific studies in his native city he traveled through Turkey collecting data on the military organization and natural history. On his return he entered the service of the emperor Leopold (1682) and fought with distinction against the Turks, by whom he was wounded and captured in an action on the river Raab, and sold to a pasha whom he accompanied to the siege of Vienna. His release was purchased in 1684 and he afterward took part in the War of the Spanish Succession. In 1703 he was appointed second in command under Count Arco in the defense of Alt-Breisach. The fortress surrendered to the duke of Burgundy, and both Arco and Marsigli were court-martialed; the former was condemned to death and the latter cashiered, although acquitted of blame by public opinion. Marsigli devoted the rest of his life to scientific investigations, in the pursuit of which he made many journeys through Europe, spending a considerable time at Marseilles, France, to study the nature of the sea. In 1712 he presented his collections to his native city, where they formed the nucleus of the Bologna Institute of Science and Art.

He died at Bologna on Nov. 1, 1730.

BIBLIOGRAPHY.—A list of his works, more than 20 in number, is given in J.-P. Niceron's *Mémoires pour servir à l'histoire des hommes illustres de la republique des lettres,* 43 vol. (1727–45); his *Breve ristretto del saggio fisico intorno alla storia del mare* was published in 1711, and again (in French) in 1725; the *Stato militare dell' impero ottomano* was published in Italian and French (1732); the *Osservanioni intorno al Bosforo Tracio* (1681); and the *Danubius pannonico-mysicus,* a large work in six volumes containing much valuable historic and scientific information on the Danubian countries (1725). *See* Fontenelle, "Éloge" in the *Mémoires de l'académie des sciences* (1730). Quincy, *Mémoires sur la vie de M. le comte Marsigli* (1741); and Fantuzzi's biography of Marsigli (1770).

MARSILEACEAE, the water clover family, a group of aquatic or marsh ferns having four-parted cloverlike leaves in the major genus. This family along with the salvinia family (Salviniaceae) comprises the fern order Hydropteridales. The Marsileaceae contains three genera and about 72 species. *Marsilea,* commonly known as water clover or pepperwort, has about 65 species of wide distribution in tropical and temperate regions; the plants are submersed or emersed aquatics with leaf blades often floating on the water's surface. *Pilularia,* which occurs from Australia and New Zealand to Chile, North America and Europe, has grasslike leaves; and *Regnellidium,* known only from southern Brazil, has leaves with two opposite leaflets terminating the leaf stalk. *Marsilea* is grown in greenhouses; M. *quadrifolia* is grown in pools and aquariums. (J. M. BL.; X.)

MARSILIUS OF PADCA (*c.* 127j–C. 1342), Italian political philosopher, was the author of the *Defensor pacis,* one of the most original treatises on political theory produced during the middle ages. Born at Padua. he was educated at the university there and at first studied medicine. He is known to have been rector of the University of Paris on March 12, 1313. While at Paris he met John of Jandun, who assisted him in writing the *Defensor pacis.* This treatise, which was completed on June 24, 1324, had a direct bearing on the controversy between Pope John XXII and Louis of Bavaria (*see* LOUIS IV, Holy Roman emperor), to whose court Marsilius went in 1326. In the following year, when he was condemned as a heretic, Marsilius accompanied Louis on his Italian expedition, which gave practical expression to many of the ideas advanced in the *Defensor pacis.* When Louis entered Rome in Jan. 1328, Marsilius was rewarded by being appointed imperial vicar of the city. After the withdrawal of the imperial forces from Italy, Marsilius spent the remainder of his life in Bavaria, where he died, probably in 1342 and certainly before April 10, 1343. In 1342 Marsilius produced the *Defensor minor,* a brief summary of his earlier work.

Defensor Pacis.—The part played by John of Jandun in the writing of the *Defensor pacis* is a matter in dispute, but most modern scholars hold that Marsilius was almost solely responsible for writing the work.

Marsilius believed that the constant wars which devastated northern Italy were the direct result of the papal policy in furthering its temporal claims. Hence the treatise commences in line with the *De Monarchia* of Dante by affirming that the object of government is the maintenance of peace, but Marsilius went much further than Dante in his Erastian doctrine. He quotes Aristotle to the effect that the state exists for the sake of the good life, but departing from the harmony of church and state which St. Thomas Aquinas had emphasized, Marsilius claims that the church is really part of the state. Although Marsilius did not completely reject the Thomist conception of natural law, he made very little use of it. The law about which he was concerned was the positive law of the state which he averred to be supreme. Implicit in his thought was the distinction between what is legally and what is morally right. Positive law implies a legislator, and Marsilius makes it clear that this is the whole citizen body or the more weighty part of it. He realized, however, that it would be difficult in practice for the whole body of the citizens to legislate and that a more effective method would be to hand over the task of framing laws to a committee who would submit their work to them.

Marsilius thought it essential that the ruler be chosen by the citizens and that the armed forces placed at his disposal be sufficient for maintaining order but not so large that he could make himself a tyrant. The ruler was to be responsible to his subjects and if he betrayed his trust he could be deposed or punished. The state could carry out its proper function only in an atmosphere of peace and tranquility, but the church by interfering with the rights of the emperor had been an aggressor and a disturber of the peace. Marsilius argued that since Christ taught submission to the civil power, the temporal claims of the papacy were completely invalid. He denied, not only to the pope but to all bishops, the right of excommunication and the imposition of an interdict on their own authority. Heretics might be punished, but the right to inflict the penalty mas the prerogative of the civil power. All ecclesiastical appointments ought to be made by the state. The power of the clergy should be restricted to spiritual matters and the supreme power in the church should rest in a general council summoned hy the ruler in which both clergy and laity should be represented. The council. because it would speak with the will of the whole community. spiritual and temporal, should have power to depose or punish the pope. He believed that the church should return to the holy poverty of the apostolic age. Tithes should be abolished and the state should take over a considerable part of the property held by ecclesiastics.

Condemned by the church in 1327 and in 1378, the treatise was known to Wycliffe and Luther and had some influence at the time of the Reformation. The first printed edition (1517) was studied by both Thomas Cranmer and Richard Hooker (*qq.v.*).

There are editions of the *Defensor pacis* by C. W. Previté-Orton (1928) and by R. Scholz, 2 vol. (1932–33). For an English translation *see* A. Gewirth, *Marsilius of Padua: the Defender of Peace,* vol. ii (1955).

MARSIVAN or MERZIFON (anc. Phazemon?), a town in the Amasya *il* (province) of Turkey, situated at the foot of the Tavshan Dagh. Pop. (1960) 22,173. Before World War I, it was best known as a centre of American missionary and educational enterprise, and the seat of Anatolia college, a theological seminary. and schools.

MARSMAN, HENDRIK (1899–1940), one of the most outstanding Dutch poets and critics between the wars, was born at Zeist near Utrecht, Neth., Sept. 30, 1899. He studied law and practised in Utrecht, but after 1933 was entirely occupied with literature and journalism. After traveling in southern Europe, he settled in France. On June 21, 1940, he was drowned when the ship on which he was trying to reach England was torpedoed in the English channel.

Under the influence of the German expressionists, Marsman made his literary debut in about 1920 with rhythmic free verse which attracted notice for its almost aggressive independence. The collection *Verzen* (1923) expresses a paganism which the poet later described as representing the "vitalist" period of his career. As editor of the periodical *De Vrije Bladen,* he became in 1925 the foremost critic of the younger generation. His next collection of verse appeared in 1927 with the English title *Paradise Regained* and was greeted as a major artistic achievement. Another cycle. *Porta Nigra,* dominated by the idea of death, appeared in 1934. His last book of verse *Tempel en Kruis* (1940) opposes to prevalent pessimism and sense of disintegration the humanistic ideal of the creative spirit, symbolized by the Greek temple. Marsman wrote also several modernistic tales and a short novel, *De dood van Angèle Degroux* (1934), the action of which takes place in the artistic milieu of Paris and serves as a background to discussions on the attitude to life of the individual striving for independence. His *Verzameld Werk* appeared in 1947.

MARSTON, JOHN (c. 1575–1634), English dramatist and satirist, eldest son of John Marston of Coventry, at one time lecturer of the Middle Temple, was born in 1575 or early in 1576. His mother was the daughter of an Italian physician, Andrew Guarsi. He entered Brasenose College, Oxford, in 1592, taking his B A. degree in 1594. He married Mary Wilkes, daughter of one of the royal chaplains, and Ben Jonson said that "Marston wrote his father-in-law's preachings, and his father-in-law his sermons." His first work was *The Metamorphosis of Pigmalions Image, and certnine Satyres* (1598). "Pigmalion" is an erotic poem in the metre of *Venus and Adonis,* and Joseph Hall attached a rather clumsy epigram to every copy that was exposed for sale in Cambridge. In the same year Marston published, under the pseudonym of W. Kinsayder, already employed in the earlier volume, his *Scourge of Villanie,* eleven satires, in the sixth of which he asserted that Pigmalion was intended to parody the amorous poetry of the time. Both this volume and its predecessor ,were burnt by order of the archbishop of Canterbury.

The satires, in which Marston avowedly took Persius as his model, are coarse and vigorous. In addition to a general attack on the vices of his age he avenges himself on Joseph Hall who had assailed him in *Virgidemiae.* He had a great reputation among his contemporaries. John Weever couples his name with Ben Jonson's in an epigram; Francis Meres in *Palladis Tamia* (1598) mentions him among the satirists; a long passage is devoted to "Monsieur Kinsayder" in the *Return from Parnassus* (1606), and Dr. Brinsley Nicholson has suggested that *Furor poeticus* in that piece may be a satirical portrait of him.

On Sept. 28, 1599, Henslowe notices in his diary that he lent "unto Mr. Maxton, the new poete, the sum of forty shillings," as an advance on a play which is not named. Another hand has amended "Maxton" to "Mastone." The earliest plays to which Marston's name is attached are *The History of Antonio and Mellida. The First Part;* and *Antonio's Revenge. The Second Part* (both entered at Stationers' Hall in 1601 and printed 1602). These were written for the Paul's Boys, for whom he also probably revised the anonymous *Histriomastix,* and finally wrote *What you Will* (which was certainly written before 1607), while he was doubtless part author of *Jacke Drums Entertainment* (1600).

The melodrama and the exaggerated expression of these two plays offered an opportunity to Ben Jonson, who had already twice ridiculed Marston, and now pilloried him as Crispinus in *The Poetaster* (1601). The quarrel was patched up, for Marston dedicated his *Malcontent* (1604) to Jonson, and in the next year he prefixed commendatory verses to *Sejanus.* Far greater restraint is shown in *The Malcontent* than in the earlier plays. It was printed twice in 1604, the second time with additions by John Webster. *The Dutch Courtezan* (1605) and *Parasitaster, or the Fawne* (1606) followed. In 1605 *Eastward Hoe,* a gay comedy of London life, which gave offence to the king's Scottish friends, caused persons concerned in its production—Marston with others—to be imprisoned. *(See* JONSON, BEN.) In the preface to *The Wonder of Women, or the Tragedie of Sophonisba* (1606), Marston mocks at those authors who make a parade of their authorities and their learning. and the next play, *What you It'ill* (printed 1607; but probably written much earlier), contains a further attack on Jonson. Marston's undoubted dramatic work was completed in 1607. It is uncertain at what time he exchanged professions, but in 1616 he was presented to the living of Christchurch, Hampshire. He formally resigned his charge in 1631, and when his works were collected in 1633 the publisher, William Sheares, stated that the author "in his autumn and declining age" was living "far distant from this place." Nevertheless he died in London, in the parish of Aldermanbury, on June 25, 1634. He was buried in the Temple Church.

Marston's works were first published in 1633. once anonymously as *Tragedies and Comedies,* and then in the same year as *Workes of Mr. John Marston. The Works of John Marston* (3 vol.) were reprinted by J. O. Halliwell (Phillipps) (1856) and by A. Bullen, 3 vol. (1887). His *Poems* (2 vol.) were edited by A. Grosart in 1879.

For an account of the quarrel of Dekker and Marston with Ben Jonson *see* R. A. Small, *The Stage Quarrel Between Bert Jonson and the So-called Poetasters. See* also M. S. Allen, *The Satire of John Marston* (1920).

MARSTON MOOR, BATTLE OF, was fought on July 2, 1644, on a moor (now enclosed) 7 mi. W. of York, between the Royalist army under Prince Rupert and the Parliamentary and Scottish armies under the earl of Manchester. Lord Fairfax and Lord Leven. For the operations that preceded the battle *see* CIVIL WAR, ENGLISH. Rupert had relieved York and had joined forces with the marquess of Newcastle's army that had defended that city, and the Parliamentarians and Scots who had besieged it had drawn off south-westward followed by the Royalists. On the morning of July 2, however, Rupert's attack on their rearguard forced them to halt and deploy on rising ground on the south edge of the moor, their position being defined on the right and left by Long Marston and Tockwith and divided from the Royalist army on the moor by a lane connecting these two villages. The respective forces were—Royalists about 18,000, Parliamentarians and Scots about 27,000. The armies stood front to front. On the Royalist right was half the cavalry under Rupert; the infantry was in the centre in two lines and the left wing of cavalry was under General (Lord) Goring. The lane along the front was held by skirmishers. On the other side the cavalry of the Eastern Association under Lieut.-General Cromwell and that of the Scots under Major-General Leslie formed the left; the infantry of the Eastern Association under Major-General Crawford, of the Scots under Lord Leven, and of the Yorkshire Parliamentarians under Lord Fairfax was in the centre; and the Yorkshire cavalry under Sir Thomas Fairfax was on the right wing.

During the afternoon there was a desultory cannonade, but neither side advanced. At last, concluding from movements in the enemy's lines that there would be no fighting that day, Rupert and Newcastle strolled away to their coaches and their soldiers dismounted and lay down to rest. But seeing this Cromwell instantly advanced his wing to the attack (5 P.M.). His dragoons drove aaay the skirmishers along the lane, and the line cavalry crossed into the moor. The general forward movement spread along the Parliamentary line from left to right, the Eastern Association infantry being the first to cross the road. In Rupert's momentary absence, the surprised Royalist cavalry could make no head against Cromwell's charge, although the latter was only made piecemeal as each unit crossed the lane and formed to the front. Rupert soon galloped up with his fresh second line and drove back Cromwell's men, Cromwell himself being wounded, but Leslie and the Scots Cavalry, taking ground to their left, swung in upon Rupert's flank, and after a hard struggle the hitherto unconquered cavalry of the prince was broken and routed. Then, being unlike other cavalry of the time, a thoroughly disciplined force, the Eastern Association cavalry rallied, leaving the pursuit to the Scots light horse. On the Parliamentary right, Goring had swept away the Yorkshire horse, and although most of his troopers had followed in disorderly pursuit, Sir Charles Lucas with some squadrons was attacking the exposed right of Leven's infantry. At the same time the Parliamentary infantry had mostly crossed the lane and was fighting at close quarters and suffering severely, Newcastle's north-country "White-Coat" brigade driving back and finally penetrating their centre. Lord Leven gave up the battle as lost and rode away to Tadcaster. But the Scots on the right of the foot held firm against Lucas's attacks, and Cromwell and Leslie with their cavalry passed along the rear of the Royal army, guided by Sir Thomas Fairfax (who though wounded in the rout of his Yorkshire horse had made his way to the other flank). Then, on the ground where Goring had routed Fairfax, Cromwell and Leslie won an easy victory over Goring's scattered and disordered horsemen. The Eastern Association infantry had followed the horse and was now in rear of the Royalists. The original Parliamentary centre of foot, a remnant, but one containing only the bravest and steadiest men, held fast, and soon the Royalist infantry was broken up into isolated regiments and surrounded by the victorious horse and foot of the enemy. The White-Coats retreated into an enclosure and there defended themselves to the last man. The rest were cut down on the field or scattered in the pursuit and at nightfall the Royalist army had ceased to exist. Some of Rupert's foot regiments made their way to York, but the dispirited garrison only held out for a fortnight. Rupert rallied some six thousand of the men and escaped over the hills into Lancashire, thence rejoining King Charles in the south. But the Northern army, the main hope of the Royalist cause, was destroyed.

MARSUPIALIA, a subclass of Mammalia (*q.v.*) in which (with some exceptions) the young for some time after birth are kept in a pouch (marsupium) or bag of skin on the under side of the body of the female. Outstanding examples of the group are the kangaroos of Australia and the opossums of America, The marsupials are exceptionally important and interesting to the student of evolution for reasons which will appear later.

Discovery.—The South American opossums were seen and described by the first explorers of the New World, the Pinzons having taken a live one in Brazil in 1500, which was exhibited in Granada and described in a work by Trivigiano published in 1504. As to the North American opossums, Captain John Smith in his Description of *Virginia* (1612) states that: "An opossum hath a head like a Swine, and a taile like a Rat, and is of the bignesse of a Cat." Apart from the description by a Dutch voyager Pelsart (1629) of wallabies seen on islands off western Australia, the Australian marsupials remained practically unknown until Captain J. Cook's voyage. In 1770 Captain Cook saw kangaroos in the region now known as North Queensland. The kangaroo was at first regarded as a gigantic leaping rodent. The discovery of other Australian marsupials such as the marmot-like wombat, the rabbit-like bandicoot. the wolf-like thylacine, at first brought confusion into the gradual process of classifying the mammals of the world. Even Baron Cuvier did not at first realize that the marsupials formed an independent series. having only a general and superficial resemblance to the carnivorous, insectivorous and gnawing animals of the northern world. and separated from them by profound differences in the mode of reproduction. It remained for Henri M. D. De Blainville in 1816 and 1834 to take the steps of putting the marsupials by themselves in a subclass of mammals which he named Didelphia, co-ordinate in rank with the Ornithodelphia (the egg-laying mammals or monotremes) and with the Monodelphia, which are the placentals or ordinary mammals of the northern world.

Reproduction. — The most famous character of typical marsupials is the pouch in which the females carry their young. In its extreme form, as in the kangaroo, the pouch consists of a capacious elastic bag, lined with fur. The fold which grows up to form the pouch may be compared to a gigantic teat surrounding the entire mammary field. In some Australian dasyures the pouch-fold arises only around the front end of the mammary field; the presence of a scrotal pouch in the male thylacine shows how easily the abdominal wall sinks in. In its complete form the pouch has a circular aperture opening downward. As the number of nipples increases the mammary field becomes an elongate oval and the pouch gives place to low longitudinal ridges and finally disappears. It has been suggested that the lack of a pouch is really a primitive character and that we can trace many stages in the evolution of the pouch among living members of the group. Since the pouch is reduced or wanting in members of different families of marsupials, the foregoing hypothesis must assume also that when it is present the pouch has arisen independently in different families. However, before such an hypothesis can be seriously considered it would be necessary to disprove the older view that marsupials, like all other mammals. are subject to the occasional degeneration or loss of even highly evolved structures, that the pouch is normally an important part of the marsupial mode of caring for the young but that in special circumstances, such as a marked increase either in the number of young at a birth or in their size, the pouch becomes unnecessary and is reduced or eliminated. The nen-er view seems to rest in part also on the erroneous assumption that the banded anteater (*Myrmecobius*) is a little modified survivor of the Mesozoic mammals. In the marsupials of the polyprotodont division (see below) the pouch frequently opens downward or backward but in the kangaroos and phalangers, which rest in a sitting position, the pouch opens forward or upward.

Hardly less striking in appearance than the pouch are the pair of flat rod-like bones called the epipubic or marsupial bones, which lie in the deepest part of the muscular abdominal wall and are attached to the front or pubic border of the pelvis. These marsupial bones are present in both sexes and therefore are not exclusively related to the support of the female's pouch but seem rather to be remnants of the skeletal floor of the abdomen, which in primitive reptiles extends from the pubis to the sternum. Similar epipubic bones are found in the monotremes or egg-laying mammals. In some marsupials (including the thylacine or marsupial wolf) the epipubic bones are reduced to vestiges or completely lost.

At least in the larger marsupials the new-born animals are very small and in general poorly developed but it is remarkable that at this stage their fore-limbs are very large and tipped with strong claws, while the hind legs are hardly more than embryonic buds. In the case of the Virginia opossum, immediately after birth the young animal uses these large fore-limbs and claws in climbing along the under-side of the mother's body from the cloaca to the mammary field, where it attaches itself to one of the teats. The teat then swells and becomes fastened firmly in the mouth of the young; the windpipe of the young becomes prolonged upward and forward to fit into the back part of the nasal tunnel; thus the milk is prevented from getting into the windpipe and the air is delivered directly to the lungs. The teats vary in number from two in certain diprotodonts to 27 in *Monodelphis*.

The large size of the maternal teat and the prolonged attachment of the young to it may have crowded the tooth-forming part of the jaws to such an extent that the milk teeth are delayed in formation, only the hinder upper and lower premolars, at the back of the jaw, having room to develop in most marsupials, while even these milk teeth become reduced in size in the marsupial wolf (*Thylacinus*) and completely eliminated in the dasyures, wombats, koalas and marsupial anteaters. In this connection it is interesting to note that tiny vestiges of deciduous incisors and premolars, which never break through the gum, have been found in some marsupials.

At birth the young of the large forms are about an inch in length, entirely naked, blind, the ears hardly visible, the hind limbs small and the fore limbs more robust and with well-developed claws. The period of gestation in large kangaroos is about three weeks. At parturition the female sits with her tail brought forward between her legs and spends some of her time scratching at her pouch with the fore-paws and licking it. When the young animal emerges from the cloaca of the female it climbs by its clawed fore-limbs into the pouch, reaching the teats, one of which it eventually seizes with its mouth, the more easily as the teats at this time are pointed and rather turgid.

Shortly after the teat is received in the mouth of the young animal, lactation begins and the teat becomes somewhat flaccid. The body of the little kangaroo increases in size but the mouth that holds the teat does not at this time enlarge. The tip of the teat expands within the mouth so that the young cannot be released without rupturing the sides of its mouth. Numerous striated muscle fibres pass between the lobes of the mammary gland, indicating that the milk is forcibly expressed from it.

By the end of the Australian winter, September or October, the young kangaroo has grown considerably and is ready to leave the pouch. For some time before finally leaving the pouch it has been free from the teat and has eaten vegetation that it reached by leaning from the pouch while its mother was feeding.

The female reproductive organs of marsupials differ markedly from those of higher or placental mammals in the following respects: the vaginal tubes of the right and left sides always have at least a kink or sharp bend, one on each side, just above the place where the ureters pass downward to open into the bladder. These kinks usually join in the mid-line and from the point of junction is developed a cul-de-sac of varying lengths, leading backward toward the cloaca or short passage to the exterior. In females that have never produced young the median cul-de-sac ends blindly at the lower end. After the egg has passed down from the ovary into the oviduct it is fertilized by some of the sperm which has been kept in the vaginal caecum or kink above described. During parturition (in members of several families) the embryo passes down into the median cul-de-sac, which becomes prolonged backward, forming a median canal. A hole is formed in the median canal and the young escapes into the cloaca without going through the lateral canals. Thus the typical marsupials have a contorted vaginal canal with one median and two lateral passages, the median one being formed from the coalescence of part of the two laterals. In placental mammals, on the other hand, no traces of the three-way vaginal canal or of the kinks in the vaginal canals are ever formed but the lower part of the right and left oviducts tend to unite in a single median uterus. It is therefore inferred that the marsupial arrangement is a peculiar specialization not developed in the common ancestors of marsupials and placentals.

Another remarkable feature of the reproductive system of marsupials is the peculiar relstion of the two sacks or outgrowths from the ventral wall of the embryo, either one of which forms the functional placenta or organ of contact of the embryo with the uterus. In certain marsupials a double contact with the uterine wall is formed both by the true or allantoic placenta and by the omphalopleure or yolk-sack wall. In the bandicoots the true or allantoic placenta forms an intimate relationship with the uterine wall, essentially like that in the true placental mammals. On the other hand, in *Dasyurus* the allantois is degenerate and the yolk-sack alone makes contact with the uterine wall. Essentially similar conditions are found in the American opossum (*Didelphis*). In the higher placental mammals, on the other hand, only the true placenta is of functional importance in supplying the growing embryo with maternal nutriment. Thus the marsupials specialized in the early and brief internal development of the embryo, which depends for food chiefly upon its own yolk-sack and which completes its development after birth while attached to the teat. The higher or placental mammals gave the young a longer and better uterine development and a more flexible system of nursing, with greater maternal responsibility.

EVOLUTION AND CLASSIFICATION

As the existing monotremes in many respects represent a specialized side-group of the earliest mammals, the marsupials, on the whole, are the most central group of the mammalian class; consequently the problem of the origin of the marsupials largely resolves itself into the problem of the origin of the mammals, which is treated more fully under MAMMALIA. Nevertheless we present here a short review of the palaeontologic data bearing on the possible relationships of the marsupials to the several Mesozoic orders with which they have been thought to be connected.

Origin of **the** Marsupials.—The cynodont reptiles, whose fossil skeletons have been found in the Permian formations of Russia and the Triassic of South Africa, may not have been in the direct line of mammalian ascent but hey were certainly progressing in that direction and some of them, such as the smaller cynodonts of the family Galesauridae were approaching the carnivorous marsupials in the general appearance of the skull and jaws. The two minute fossil jaws from the Upper Triassic of Carolina named *Dromotherium* and *Microconodon*, which were regarded as basic Mammalia by H. F. Osborn are referred by G. G. Simpson, after careful study of the originals, to the group of cynodont reptiles.

The multituberculate or allotherian mammals (*see* MULTITUBERCULATA), which range in time from the Upper Triassic to the Lower Eocene, appear to have been a side branch of the primitive mammalian stock, paralleling the monotremes on the one hand and the diprotodont marsupials on the other but not closely related to either.

The fossil mammals called triconodonts from the Jurassic of England and Wyoming have usually been referred to the marsupials, but according to the recent studies by Simpson the triconodonts formed a special group of their own, with no valid claims to relationship with the marsupials. These were small predatory mammals, the largest about the size of a cat, with jagged cheek teeth, each molar crown comprising three cusps arranged in a longitudinal line. A braincase of *Triconodon* reveals an extremely primitive stage with large olfactory lobes and unexpanded forebrain. On the whole, the triconodonts stand on a lower level of evolution than any true marsupials.

Another Jurassic group, the Trituberculata, includes various small lower jaws, of which the most widely known has received the name *Amphitherium prevostii*. One of these jaws from Oxford was examined by Cuvier, who noted its resemblance to the jaw of the opossums but also noted that it had ten teeth on each side behind the canine, a greater number than that of any carnivorous marsupial. In 1888 H. F. Osborn pointed out that the lower molar teeth of *Amphitherium* consisted of two moieties: in front an elevated triangle of sharp cusps and behind a low heel or talonid; here clearly was a distinct prophecy of the famous "tuberculo-sectorial" lower molars of Eocene mammals. Whatever its precise relationships, the lower jaw of *Amphitherium* could be changed into that of a primitive marsupial by the inturning of the angular process, by the reduction in the number of the cheek teeth from ten to seven; and by the further development of the heel of the lower molars. Even less change would be required to transform it into the jaw of a generalized placental mammal, in which the angular process is not inflected.

The American Opossums.—The oldest known fossil which may be referred nithout any doubt to the group of marsupials is a fragmentary skull and lower jaw from the Upper Cretaceous of Montana, described by W. D. Matthew in 1916 as *Eodelphis browni;* this was discovered by Barnum Brown in association with the skull of a Cretaceous dinosaur. As Matthew pointed out, the pieces of the skull and the lower jaw match closely the corresponding parts of existing opossums, which thus take their place among the most primitive known mammals. Matthew has also traced the fossil history of the opossum family through several Eocene formations of Wyoming into the genus *Peratherium,* which is found in the Oligocene formations of western North America and France. In South America fossil opossums of the genera *Microbiotherium* and *Proteodidelphys,* date from the Lower Miocene and earlier formations. From these and similar facts Matthew has pointed out that the family of the opossums, like that of many other families of mammals, appears to have originated in North America and then to have spread on the one hand into Europe and on the other into South America. Possibly the common Virginia opossum, together with related genera in Mexico and Central America, may represent a reflux wave of immigrants coming from South America in Pliocene times.

T. H. Huxley, Dollo and R. A. Bensley have adduced much evidence tending to show that the common opossum (*Didelphis virginiana*) embodies nearly all the characters one might reasonably expect to find in the remote common ancestors of all the higher marsupials, since it retains all their primitive characters but has assumed few specializations of its own. This is not equivalent to saying, however, that American opossums are ancestral to the Australian marsupials. It probably means only that the American opossums are the survivors of an ancient and diversified group, which in some earlier geological epoch was spread perhaps as far east as Asia and which gave rise on the one hand to the American marsupials and on the other to the Australian carnivorous marsupials and later groups.

The tree-climbing habits of the opossum are expressed in its muscular prehensile tail and especially in the grasping power of its hands and feet, each with five fully developed toes; the "friction pads" on the sole of the foot also are well developed. The forearm can be freely twisted on the upper arm and the collarbones (clavicles) are well developed, as in most climbing mammals. In the hind-limbs the great toe is set off widely from the others, the feet are plantigrade and capable of being freely turned inward.

The braincase of a large opossum is relatively small and unexpanded in keeping with its low type of brain. The muzzle is large and in its interior the delicate bones that support the membranes of the sense of smell are well-developed; the bony orbits or sockets for the eyes are rather small, as are the eyes themselves; the inner ear-bones are relatively small and the same is true of the resonating chamber of the middle ear. All these and many similar facts suggest that the opossum is not an intelligent animal, that it pursues its prey chiefly by the sense of smell, and depends for safety upon hiding in the daytime and prowling about at night.

In conformity with its carnivorous-omnivorous habits, the skull of a large opossum recalls those of other carnivorous mammals in its stout cheek arches and in its high median and occipital crest, all for the support of the stout jaw muscles. The dentition also tells plainly that the opossum is primarily a flesh-eating animal, which however has not acquired highly specialized shearing teeth like those of a cat but has retained certain primitive features. The general outline of an upper molar cronn of an opossum is that of a scalene triangle with the apex on the inner side, the shorter leg being in front, the longer one behind. From the general surface of this triangle two small, V-shaped cusps project: a very small one in front (the paracone) and a much larger one behind (the metacone). Between any two adjacent upper molars are empty embrasures or openings, each like an inverted V with the tip pointing outward. Into these embrasures fit the elevated V-shaped forepart of the lower molars, surmounted by three blade-like cusps, the apex of this V pointing outward. The inverted V of a lower molar shears past the large V of an upper molar; while the inwardly projecting apex of an upper molar fits into a concave projection constituting the rear half of a lower molar. Thus the upper and lover molars of the opossum present fundamentally the same combination of shearing V's and piercing projections and sockets which is to be found in the most primitive mammals of the Cretaceous and Eocene ages.

In the opossum, as in all primitive marsupials, there are on each side four upper molars and four lower, also three upper premolars and three lower premolars. The upper premolar crowns hale a single high tip, equivalent to the highest cusp on the crown of the molars. Thus there are in all seven teeth on each side, above and below, behind the canines The same number of postcanine teeth is to be found in primitive placental mammals, but in the latter there are four premolars and three molars. The canine teeth, both upper and lower, of the opossum have long-curved, sharp-tipped crowns, well fitted for fighting and killing The incisor teeth are small and numerous with simple crowns, five on each side in the upper jaw and four in the lower jaw: of these the first upper incisors are somewhat larger and have downwardly directed points, while the first lower incisors are somemhat inclined forward. Here then is the first hint of the nipping or prehensile development of the incisors which becomes pronounced in the diprotodont group of marsupials. Accordingly the dental formula, shoning the number of different kinds of teeth in the upper and lower jaws of the common opossum may be written as follows: (incisors $\frac{5}{4}$ canines $\frac{1}{1}$ premolars $\frac{3}{3}$ molars $\frac{4}{4}$) X a = 50. From this as a starting-point the dental formulae of all other marsupials appear to have been derived either by reduction and loss of teeth or, in the case of *Myrmecobius,* by the secondary increase in number of the molar teeth. As in all typical marsupials, only the hinder or third premolars of the adult dentition are preceded by deciduous teeth.

The precise arrangement of the lateral and median vaginal canals varies widely in diiferent individuals and species of the opossum family. In some, the lateral canals are completely separate and there is hardly a beginning of the median cul-de-sac; in other species, however, it is very well developed and in still others transitional conditions are found. The attachment of the embryo to the wall of the uterus is by the yolk-sack, there being no true placenta.

Some of the smaller species of opossums have a large number of young at a birth, together with a large number of teats (rarely, as many as 27) and a reduction or loss of the pouch It is very doubtful, however, whether these are primitive characters; they seem more like retrogressive specializations nithin the family.

The common opossum (*Didelphis virginiana*) may reach a total length of 37 inches, the head and body being 22 inches long, while at the other extreme in the shrew-opossum of Brazil (*Monodelphis*) the length of the head and body is less than 3 inches. The murine opossum (*Marmosa*) of Central America and Brazil includes mouse-like insectivorous forms in which the pouch is absent. The water opossum or yapok (*Chironectes*) of Panama and Guiana is the only knonn marsupial adapted to a partly aquatic life. The toes of the hind feet are webbed and it resembles an otter in habits. The pouch is present.

The Australian Dasyuroids.—Under the name dasyuroicls we may include a series of Australian forms ranging from the tiny "pouched mice" to the wolf-like *Thylacinus.* They are frequently referred to collectively as "carnivorous marsupials." The ordinary "pouched mice" of the genus *Phascogale* are extremely active little animals with the blood-thirsty habits of shrews. They live mostly in the bush or forest. They differ profoundly from true mice not only in their internal anatomy but especially in their dentition, which is of the carnivorous-insectivorous type. In his excellent work *The Mammals of South Australia* F. Wood Jones writes: "The Yellow-footed Pouched Mouse is an animal of great interest from a zoological point of view, since in the whole of its anatomy it shows itself to be a remarkably generalized animal. It represents a marsupial base form, its general anatomy being but little modified from a basal mammalian plan, and it stereotypes the simple creature that could be considered ancestral to most of the marsupial radiations." Although too specialized in certain details. such as the reduction of the first toe of the hind foot and the loss of the caecum of the intestine: to be the direct ancestors of the diprotodont or herbivorous marsupials, the pouched mice of the genus *Phascogale* are at least structurally near to the diverging lines leading to the jumping pouched mice, to the dasyures, to the Tasmanian devil and other peculiar forms.

In the fat-tailed pouched mouse (*Sminthopsis crassicaudata*) the hind foot is much elongated and this feature is carried to an extreme in the jerboa pouched mouse (*Antechinomys*), which shows a maximum adaptation to the jumping habit, including a complete loss of the first digit of the hind foot. As in many other desert-living animals, the ears are very large and the bony shells covering the chambers of the middle ears are greatly enlarged. The animal is insectivorous and probably leaps after insects.

One of the most remarkable members of the pouched-mouse group is the mulgara, or crest-tailed pouched mouse (*Dasycercus cristicauda*), of South Australia. This sturdily built, short-limbed little animal is a typical desert form, which has multiplied in an astonishing manner during the passage of a mouse plague across cultivated districts, and is a fearless predatory animal.

The carnivorous adaptations of the mulgara are carried further in the so-called native cats. or dasyures, which are about as large as true cats but have pointed muzzles. The blades on the upper molars are relatively longer and more obliquely directed than in the mulgara and the third upper premolar is now completely eliminated. The skull bears heavy crests and well-developed cheek arches for the support of the powerful muscles. The general form of body is like that of a marten. In the spotted-tailed native cat (*Dasyurus maculatus*) the first digit of the hind foot is retained and the foot pads are striated in conformity with its tree-climbing habits; but in the common native cat (*Dasyurus viverrinus*) the first digit of the hind foot is lost and the foot pads are granular. It formerly inhabited treeless rocky country as well as cultivated districts and was a fearless predatory animal.

The Tasmanian devil (*Sarcophilus ursinus*) is a short-bodied, burly dasyurid with a broad muzzle: an enormous, broad and massive skull and most powerful jaws. There are strongly developed blades on the upper and lower molar teeth, which resemble those of such extinct placental carnivores as *Oxyaena*. The inner projections of the upper molar crowns are reduced and the planes of the inner surfaces of these blades now point more obliquely backward than those in the more primitive pouched mice.

In the, marsupial wolf or tiger (*Thylacinus*) the general habitus is somewhat wolflike, except that the feet are shorter and the hinder part of the body gradually tapers into the tail. Broad, transverse, black stripes over the back and tail give the animal its common name of "tiger." The thylacine (*q.v.*) is a wolflike derivative of the dasyuroid stock specialized for long-distance running. Its skull is elongate. in contrast with the very broad short skull of *Sarcophilus*. The molar teeth, although adapted for shearing flesh, differ markedly from those of the dasyures and *Sarcophilus*. The upper molars have lost the accessory cusps on the outer side of the crown, the internal spurs of the upper molars are subcircular, the two main external cusps are more or less approximated. In the lower molars the hinder spur or talonid is reduced, while the front part consists of two large bladelike cusps, the metaconid or hinder inner cusp being totally wanting. The nearest resemblances in dentition and skull are found not in any other Australian forms but among the extinct borhyaenids of the Patagonian Miocene. On the other hand, *Thylacinus* agrees closely with the Australian dasyuroids in many important details, so that there seems little doubt of its derivation from an Australian dasyuroid stock. The further significacce of these facts will be discussed below. The thylacine formerly inhabited the mainland of Australia, its fossil remains having been found in caves; but during historic times it has lived only in Tasmania. Since it was destructive to sheep it has been almost exterminated and survives only in the mountains.

Under the Australian dasyuroid series we include the banded anteater (*Myrmecobius*), or wombat, of South and Western Australia. This rare animal is now almost extinct. In general appearance it strongly recalls other small dasyuroids, having a long pointed muzzle and long ears, somewhat like *Antechinomys*, a transversely striped back. recalling *Thylacinus* and certain bandicoots, a bushy tail. like that of the brush-tailed pouched mouse. Moreover it is pouchless and the large foetuses are carried on the nipples, exposed as in *Dasycercus*. The high number of molars (sometimes rising to five in the upper and six in the lower jaws) may be regarded as a secondary increase in number correlated with reduction in size and spreading out of the teeth, in connection with an elongate, cylindrical, extensible tongue, and a backwardly prolonged palate. A comparative study of the entire skeleton of *Myrmecobius* leads to the conclusion that it is thoroughly dasyuroid in type. A fossil lower jaw from the basal Eocene of Montana, named *Myrmecoboides montanensis*, helps us to visualize the process by which more normal insectivorous lower molars could readily be modified into the *Myrmecobius* type by suppression of the main outer cusps on the lower molars and of the inner cusps of the upper molars! this producing what I. W. Gidley has well named a "pseudotriconodont" type. The fossil jam itself, however, is probably not at all related to *Myrmecobius*, since it agrees with the extinct placental insectivores of the family Lepticitidæ in its dental formula and in the family characters of the teeth.

A most highly aberrant dasyuroid is the pouched mole (*Notoryctes*) of South and Western Australia. The general appearance is like that of the African golden mole (*Chrysochloris*) In adaptation to its digging habits the conical head ends in front in a horny shield over the nose and evidently the head must be pushed into the soil. The neck vertebrae are fused to give it a firm support. The hands are provided with two enormous claws on the third and fourth fingers; the first and second fingers bearing much smaller claws which are opposable to the inner surfaces of the large outer claws. The fifth finger is very short and capped with a horny boss. The body is thick and cylindrical and the tail very short and covered with horny rings. The hind feet are short and spreading, with long digging claws. The eyes are degenerate, almost vestigial, and there are no external ears. The upper molar crowns, like those of the Cape golden mole, consist of very narrow V's, probably derived by degeneration from a more normal, less compressed type; in the lower molars the talonids or hinder spurs are lost. A pouch is present and opens backward. A comparative study of the skeleton has shown that the marsupial mole resembles the Cape golden moles, which are true placental mammals, only in its "habitus," while its "heritage" is unmistakably that of other marsupials.

The Australian Bandicoots. — The largest of these animals somewhat resemble rabbits both in appearance and habits, since they hare large ears and dig holes in the ground. They are therefore often called "native rabbits." But they are none the less true marsupials.

The hind feet are remarkably like those of kangaroos and have what was originally the fourth toe much elongated; the first toe, if present, is small; all the remaining toes have large pointed claws for scratching and digging. The hind foot also resembles those of kangaroos and other herbivorous marsupials in that the toes corresponding to the second and third of the normal mammalian foot are very slender, much smaller than the fourth toe, and so closely appressed to each other that they appear to be united at their bases. Each, however, is a complete digit with its own claw and separate muscles. These two digits serve as a comb by which the animal removes from its fur biting lice or other unwelcome objects.

This peculiar syndactylous specialization of the hind feet is found also throughout the series of diprotodont or herbivorous marsupials of Australia but not in any of the polyprotodont families (American opossums, Australian dasyuroids, etc.).

The bandicoots have front teeth of the carnivorous-insectivorous or polyprotodont type, essentially like those of the American opossums and the dasyuroids. while their molar teeth, although peculiar, show traces of derivation from some form in which the accessory cusps on the outer sides of the molar were strongly developed. The bandicoots, while chiefly insectivorous, frequently have the molar teeth much ground down by wear, which may indicate that their food gets mixed with a certain amount of grit Apparently in adaptation to this condition, the molar teeth tend to acquire high crowns, like those of many rodents. Bandicoots are pugnacious little animals which leap up in the air and strike each other with their long-clawed hind-feet. In the forms with very long hind-feet this extraordinary leaping ability is probably useful not only in escaping enemies but in capturing insects. All the species are now rapidly becoming rare. The family (Peramelidae) ranges from New Guinea and adjacent islands on the north to Tasmania on the south.

The Australian **Diprotodonts.**—Under the term Diprotodontia are generally included all the primarily herbivorous marsupials of Australia, in which the median pair of lower incisor teeth are more or less enlarged and inclined forward, so as to oppose one or more pairs of upper incisors, thereby functioning either as nippers or cutters. All known diprotodonts have the syndactylous relations of the second and third toes described above in the bandicoots. The diprotodont division includes a large number of species of highly diversified size and form, from the tiny dormouse phalanger to the almost elephantine extinct *Diprotodon,* and from the most agile pygmy "flying-squirrel" to the powerful and clumsy wombat,

Australians usually call the phalangers "opossums," but they are not closely related to the American animals. This mistake arises from the facts that both animals are pouched mammals, both live in trees, both have pointed muzzles and strongly grasping hands and feet and prehensile tails. But in many other important characters the American opossum and the Australian "opossum" differ widely. The former belongs to the polyprotodont division, having the incisors and canines disposed as in other carnivorous mammals, the latter have diprotodont front teeth, adapted for cutting vegetable fibre, and crested molar teeth adapted for grinding. Very striking is the contrast in the dental formulae of the two animals:

American opossum (*Didelphis*): $(\text{i.}\frac{5}{4}\ \text{c.}\frac{1}{1}\ \text{p.}\frac{3}{3}\ \text{m.}\frac{4}{4}) \times 2 = 50$

Australian "opossum" (*Trichosurus*): $(\text{i.}\frac{3}{2}\ c.\frac{1}{0}\ \text{p.}\frac{2}{2}\text{m.}\ \frac{4}{4}) \times 2 = 36$ (or less)

The polyprotodont American opossums have no trace of the syndactylous specialization of the hind feet which, as described above, is so characteristic of the Australian "opossum" and there are many striking differences in the skulls and other parts of the anatomy. The Australian phalangers as a group live in close ecologic relations with the eucalyptus trees that dominate the landscape in all but the dryest regions of the interior. Many eat eucalyptus leaves and the "native bear" (*Phascolarctos*) normally lives on nothing else. To overcome the aromatic essence of these leaves and extract nutriment from this highly indigestible material the phalangers have a long intestine and a greatly enlarged caecum. In locomotor habits the phalangers range from the sloth-like native bear, which clings tenaciously to the branches with its large hands and feet, to the highly active flying phalangers, including several quite difierent genera, which have a skimming membrane on the sides of the body and between the limbs. In one division of the family, including *Pseudochirus* and *Phascolarctos,* the upper molar teeth each bear two sharp V's or crescents. In another subfamily, which includes the Australian "opossum" (*Trichosurus*), the two V's of the upper molars are modified into cross-crests. The last lower premolar of the typical phalangers has a compressed cutting crown, with more or fewer vertical grooves and ridges In the phalangers, however, these cutting premolars are not as elongate as they are in the smaller kangaroos. These cutting premolars, both in the upper and lower jaws, became greatly enlarged in the extinct "marsupial lion" (*Thylacoleo*), in which the molars were reduced and the front teeth became enlarged and piercing. Sir Richard Owen was of the opinion that *Thylacoleo* was a fierce carnivorous creature but others have demurred from this opinion on various grounds and think the animal sheared some unknown kind of fruit. In widest contrast to the shearing-toothed *Thylacoleo* is the tiny long-snouted phalanger *(Tarsipes)* of West Australia, which is said to live on the honey and insects found in long-tubed flowers, into which it sticks its long muzzle and extensile tongue.

The kangaroos doubtless represent a ground-living group descended from arboreal ancestors; in the most primitive living type, the musk-kangaroo (*Hypsiprymnus*), the hind-foot still bears the stamp of the foot of the tree-living phalanger, in which the fourth digit is much enlarged, the second and third digits are reduced and syndactylous, the first digit is still present, and separate friction pads are retained under the digits. In the more advanced kangaroos the first digit is lost and so are the friction pads. For further evolution of this family *see* KANGAROO

The wombats *(Vomhatus)* are sometimes called "native badgers" on account of their robustness and burrowing habits, but they far excel the true or placental badgers in strength and in ability to dig deep tunnels with great rapidity. Their skulls are rodent-like in so far as they have only a single pair of long curved incisors in the upper jaw as well as in the lower; their molar teeth also have long-curved crowns and widely open roots. Each upper molar crown consists essentially of a pair of V's in tandem and this arrangement appears to be derivable from the double-V molars of the Koala (*Phascolarctos*) with which the wombats are in many ways rather closely related.

Fossil Marsupials of Australia. — During the Pleistocene or glacial epoch when northern Europe and northern North America were repeatedly covered by continental glaciers, Australia remained free of glaciers except in the vicinity of its highest mountains. While the mastodon, the mammoth, the cave-bear and other animals dominated Europe, Australia had her own peculiar mammalian fauna which has left its bones in cave deposits of eastern Australia and in ancient lake basins of the interior In the cave fauna are the scattered bones of giant kangaroos of many extinct species, of the lion-like *Thylacoleo,* of the marsupial wolf and many others. Around the margins of the lakes, however, lived still stranger beasts, the clumsy diprotodonts and notothcres. In general body form these resembled huge rodents; the name "marsupial rhinoceros" applied to one notothere seems highly inappropriate even if the animal did have a hump on its nasal bones In general the molar teeth of the diprotodonts each bear two sharp cross-crests, not unlike those of the extinct proboscidean *Dinotherium.* They appear to be an offshoot of the phalanger stock, distantly related to the kangaroos, wombats and native bears. The fossil diprotodont *Wynyardia,* described by Sir Baldwin Spencer from the Tertiary beds of Table Cape, Tasmania, was formerly regarded as of Oligocene age but is now known to be much younger (Pliocene). The skull is thoroughly phalangerid in type.

Fossil Marsupials of South **America.**—We have already noted that the family of American opossums, appearing late in the Cretaceous in North America, and continuing there well into Oligocene, somehow found its way into South America at least by Lower Miocene and possibly earlier. But along with these purely American fossils there have been found in the Santa Cruz (Lower Miocene) formation of Patagonia the fossil representatives of two families that have a strangely Australian appearance.

The first are unquestionably carnivorous marsupials, the several genera ranging from the size of a large opossum to that of a hyaena. Of these the largest and most famous form, called *Borhyaena,* figured in scientific literature as a kind of link between the extinct creodonts of the Eocene epoch of North America and the existing marsupial wolf of Australia But in every fundamental feature they are true carnivorous marsupials W. D. Matthew even holds that the special resemblances between the Patagonian borhyaenids and the Australian carnivorous marsupials are likewise due in part to parallel evolution, the borhyaenids being predatory derivatives of the American opossum stock, the Australian thylacines of the related Australian dasyurid stock, both derived ultimately from Cretaceous opossums of the northern hemisphere. But H. E. Wood has shown that, apart from the rather close resemblances in the borhyaenid dentitiop to that of the Australian thylacines, there are several curious resemblances in the backbone, pelvis and limbs, which tend to link borhyaenids with thylacines and contrast them both with opossums, so that to attribute this all to parallelism, plus descent from a common didelphid ancestor, seems to be essentially a *petitio principii*, especially as the now rather numerous known opossums from Cretaceous to Recent times show not the slightest tendency to vary in the borhyaenid-thylacine direction.

The second family of South American marsupials which seem to have a distinctly Australian appearance are the caenolestids. These little animals were long known from a few fragmentary fossils (*Epanorthus*, *Abderites*, etc). In 1895 Oldfield Thomas announced that this supposedly extinct family was actually represented in the living mammalian fauna of Ecuador and Bolivia by a small shrew-like animal, which he called *Caenolestes* and pointed out that it resembled certain of the extinct Patagonian epanorthids in its dentition, also that it resembled in other respects certain of the Australian phalangers, with the important exception that its hind feet were devoid of the syndactyl specialization of the second and third toes. Since that time a number of species of *Caenolestes* have been found in the mountains of the Andean parts of South America and the anatomy of the animal has been thoroughly studied, especially in the recent monograph by W. H. Osgood. From all this it appears that *Caenolestes* exhibits a highly confusing mixture of resemblances with the Austraiian bandicoots and diprotodonts, but that it contrasts widely with the opossums except in a few details, such as the construction of Jacobson's organ in the interior of the nose; in this it shows strong resemblances both to the opossums and the bandicoots. The general impression left by a careful consideration of the evidence is that, in spite of the somewhat phalanger-like features of its dentition, *Caenolestes* is not a true diprotodant but merely a phalanger-iike offshoot of a primitive marsupial stock that was perhaps more nearly allied with the bandicoots than with the American opossums.

How then did the extinct borhyaenids and the extinct and recent caenolestids, both apparently more nearly related to Australian stocks than to the American opossums, ever get into South America? Are they derived from two as yet undiscovered northern ancestral stocks which also gave rise respectively to the Australian dasyuroids and to the Austrnlian bandicoots and diprotodonts, or did they come into Patagonia from the south, after crossing some long-sunken archipelago connecting Patagonia with the once flourishing continent of Antarctica? Matthew has shown that in a great many other cases relict forms of the southern land masses have been derived from northern ancestors and this may eventually prove true in the case of the borhyaenids and caenolestids. Nevertheless, the more direct evidence so far brought forward by recent authors leaves the impression that the American opossums are not closely related either to the borhyaenids or to the caenolestids and that the latter two are more nearly related respectively with the dasyuroid and perameloid stocks of Australia in spite of their wide geographic separation.

Classification of Families. — The famous classification of the marsupials into two suborders, Polyprotodontia and Diprotodontia, based upon the numher and arrangement of the front teeth, seems at the present time to be a rather misleading simplification of a complex situation. The "polyprotodont" bandicoots, for example, appear to be more nearly related to the Australian true diprotodonts than to the American polyprotodont opossums, while the functionally "diprotodont" caenolestids appear to be more nearly related to the polyprotodont bantlicoots than to the true diprotodonts. No less objectionable is the old grouping into Diadactyla and Syndactyla recently revived by Wood Jones, which is based solely upon the presence or absence of the syndactylous specialization of the second and third toes of the hind foot. However, the bandicoots, which resemble the kangaroos in posscssing the syndactylous type of foot, differ profoundly from them in many other respects. From a comparative study of the dentition we may even affirm with B. A. Bensley that both bandicoots and kangaroos, along with all other Australian families, must be derived from primitive Australian polyprotodonts much resembling the pouched mice *(Phascogale)*. In short, in the present state of knowledge it seems advisable to abandon the old larger groups and to group the families into the following series of superfamilies:

1. Superfamily Didelphoidea. North America, Cretaceous to Recent; Europe, Oligocene; South America, Oligocene to Recent. Primarily arboreal with strongly grasping hind feet, the great toe (hallux) large and divergent. Second and third digits not syndactylous. Snout pointed. Insectivorous-carnivorous, with unreduced dentition; polyprotodont. Dental formula typically $i.\frac{5}{4}\ c.\frac{1}{1}\ p.\frac{3}{3}\ m.\frac{3}{3}$, seldbm reduced. Upper molars triangular, with strongly developed metacones (main posteroexternal cusps) and various developed accessory marginal cusps; internal cusps large. Lower molars primitive, tuberculo-sectorial. Auditory process of alisphenoid small or moderate, not covering tympanic cavity below. Jacobson's organ well developed. Nipples numerous (5–27). Pouch variable, if present opening forward or downward. Paired vaginal canals separate or partly united in a variable median cul-de-sac. Allantoic sack abortive, not forming a placenta.

Family Didelphiidae. North America, Cretaceous to Oligocene, Recent; South America, Oligocene (?), Lower Miocene, Recent.

2. Superfamily Dasyuroidea. Australian Region,-Pliocene to Recent; One family in South America,-Miocene. Terrestrial or slightly arboreal, with narrow or variously elongated hind feet, the hallux more or less reduced. Snout pointed to blunt. Insectivorous to extremely carnivorous dentition, polyprotodont, often with reduced premolars. Upper molars triangular to shearing. Internal cusps often small. Lower molars tuberculo-sectorial to shearing. Auditory process of alisphenoid much inflated. Nipples usually numerous (4–10). Pouch variable, often reduced or absent; if present, marsupial bones sometimes absent; typically opening backward. Median vaginal canal temporarily pierced at parturition. Allantoic sack abortive.

Family Dasyuridae. Australia, Pleistocene and Recent. Pouched mice, native cats, Tasmanian devil, Tasmanian wolf.

Family Borhyaenidae. Patagonia, South America, Lower Miocene.

Family Myrmecobiidae. Australia, Recent. Banded anteater.

Family Notoryctidae. Australia, Recent. Marsupial mole.

3. Superfamily Perameloidea. Australian Region. Terrestrial, with kangaroo-like hind limbs, longer than fore limbs, adapted for scratching, digging and leaping. Hallux reduced, fourth digit much enlarged, second and third syndactylous. Snout very long, projecting, pointed. Dentition insectivorous-omnivorous, polyprotodont. Dental formula: $(i.\frac{5\ \text{or}\ 4}{3}\ c.\frac{1}{1}\ p.\#\ m.\frac{4}{4})\times 2=48$ or 46. Incisor teeth with flattened, not pointed, crowns. Upper molars more or less quadrangular, long-crowned, main outer cusps probably representing much enlarged marginal cusps of primitive dasyuroids. Auditory process of alisphenoid inflated. Jacobson's organ well developed. Nipples six to eight. Pouch present, opening downward and somewhat backward. Median vaginal cul-de-sac moderately developed, young at least occasionally delivered *via* lateral vaginal canals. Allantoic placenta well developed.

Family Peramelidae. Australia and New Guinea, Pleistocene, Recent. Bandicoots.

4. Superfamily Caenolestoidea. Andean South America, Miocene to Recent. Terrestrial shrew-like forms with narrow non-syndactylous hind feet with slender hallux. Snout elongate. Insectivorous, functionally more or less diprotodont but with polyprotodont. Dental formula: $(i.\frac{4}{3\ \text{or}\ 4}\ c.\frac{1}{1}\ p.\$\ m.\frac{4}{4})\times 2=46$ or 48. First and second upper molars more or less quadrangular, short crowned; lower molars modified tuberculo-sectorial with large talonids. Last lower premolars sometimes compressed, grooved *(Abderites)*. Auditory process of alisphenoid moderate. Jacobson's organ very well developed, essentially as in polyprotodonts. Teats four. Pouch absent in adults. Marsupial bones well developed. Median vaginal canal essentially as in Didelphiidae.

Family Caenolestidae. Patagonia, Miocene to Recent.

5. Superfamily Phalangeroidea. Australian region, Pliocene to Recent. Primarily arboreal, secondarily terrestrial and derived

forms; the primitive arboreal type with strongly grasping hind feet, the hallux large and divergent, second and third digits markedly syndactylous. Snout typically rather short and thick. Dentition primarily herbivorous, diprotodont; dental formula reduced, typically (i. $\frac{3}{2}$ c. $\frac{1}{0}$ p. $\frac{2}{2}$ m. $\frac{4}{4}$) $\times 2 = 36$. Upper and lower molars typically bicrescentic or bilophodont. Last premolars compressed. in primitive forms grooved. Auditory process of alisphenoid usually well inflated, typically bridging petrous bone below and joining paroccipital process. Nipples usually four, rarely two. Pouch well developed, opening forward. Marsupial bones well developed. Median vaginal canal well developed, the young delivered through a temporary pseudovaginal opening. Allantois not forming a placenta.

Family Phalangeridae. Australian region, Pliocene to Recent. Phalangers, native bears.

Family Thylacoleontidae. Australia, Pleistocene.

Family Macropodidae. Australia, Pliocene to Pleistocene. Kangaroos.

Family Diprotodontidae. Australia, Pliocene to Recent.

Family Vombatidae. Australia, Pliocene to Recent. Wombats,

Troughton, *Furred Animals of Australia* (1941); G. H. H. Tate, *Amer. Mus. Novit.,* no. 1283, 1287 (1945); H. C. Raven and W. K. Gregory, *Amer. Mus. Novit.,* no. 1309 (1946). (W. K. G.; X.)

MARSUPIAL MOLE (*Notoryctes typhlops*), a small burrowing animal from central South Australia, constituting a family, Notoryctidae, of the pouched mammals or marsupials (see MARSUPIALIA). It resembles the true mole, family Talpidae, in size and appearance but is not a relative (see MOLE). Seither ear conches nor eyes are visible externally. Except for the horny skin on the nose and on the stumpy leathery tail, the body is covered with long, silky, golden-yellotv hair. When awake, the marsupial mole, as all moles. is extremely active, searching almost continuously for worms, insects! etc. It feverishly devours its food and abruptly falls asleep, only to awaken shortly and resume its frenetic search. The forefeet are wonderfully adapted to burrowing, the third and fourth toes being armed with enormous claws.

MARSUPIAL MOUSE, a small member of the family Dasyuridae (see MARSUPIALIA); most belong to the genus Phascogale. There are more than 12 species, none larger than a rat. Females of several species have pouches, but there are folds of skin only around the mammae in other forms. Marsupial mice are found throughout Australia, Tasmania, New Guinea and Aru Islands.

MARSUPIAL WOLF (Thylacinus cynocephalus), the largest carnivorous marsupial, resembling a wolf but smaller. Now confined to Tasmania, fossils show it was on the Australian mainland in the Pleistocene. Its face is sharp and foxlike. Grayish bronn, its entire back is marked with transverse, blackish-bronn bars. The pouch opens backuards; it bears two to four young. carrying them for about three months. It feeds on wallabies. small mammals and birds. When sheep were introduced, it preyed on them and was nearly exterminated. See also MARSUPIALIA (J. E HL; X.)

MARSYAS, a legendary Greek figure of Anatolian origin. According to the Greek legend Athena had invented the oboe and threw it anay in disgust because it distorted the features. Marsyas found it and, having acquired great skill in playing the instrument. challenged Apollo to a contest with his lyre. Midas, king of Phrygia who had been appointed judge, declared in favour of Marsyas, and Apollo punished Midas by changing his ears into ass's ears. In another version, the Muses were the judges, and they awarded the victory to Apollo, who tied Marsyas to a tree and flayed him alive. In Rome a statue of Marsyas, a favourite art subject, stood in the Forum, and this was imitated by Roman colonies and came to be considered a symbol of autonomy.

MARSYAS, FROM A COPY OF MYRON'S GROUP. ABOUT 450 B C. IN THE LATERAN MUSEUM. ROME

MARTELLO TOWER, a defensive work whose name is a corruption of that of Cape Mortella in Corsica, where a circular toner of this kind was captured only with great difficulty in 1794 by British forces supporting Corsican insurgents against the French. With the threat to England of invasion by Napoleon Bonaparte in 1803, the duke of York, as commander in chief, recommended this type of tower for coast defense, and 74 Martello towers were therefore erected on the most vulnerable stretch of the English channel coast. They were from 30 to 40 ft. high, with walls 9 ft. thick on the seaward side. and surrounded by a deep ditch. Entry was effected by a small; rear door at the head of a 20-ft. ladder. A platform held two howitzers and a swivel gun; a powder magazine and living quarters were below. The French built a few *tours modèles* of similar design, and others were built in the United States and Canada. Martello towers lost most of their value with the advent of powerful naval guns. (R. C. H.)

MARTEN, several species of the weasellike genus *Martes* of the mammalian carnivore family Mustelidae (see CARNIVORA). The American marten (*M.* americana) is similar to the pine marten (*M. martes*) of north and central Europe and the British Isles. The marten is a cat-sized animal with a long, somewhat bushy tail, and a lithe and slender body. The legs are short, the neck long and flexible and the ears short and rounded. The rich, dense and lustrous fur with stiff and shiny guard hairs, is highly valued. Martens are bloodthirsty and rapacious, feeding on small mammals, birds and occasionally bird eggs. They live in forests, especially in rocky areas: and climb trees as easily as a squirrel. Sexual maturity is reached at two years. Most species mate in late summer, one to five young being produced the following spring. In northern species the gestation period is prolonged (from 220 to 358 days according to species and locality). The gestation period may be markedly shortened by increasing the hours of light per day.

The pine marten is dark brown with a tawny throat. The dark sable (*M. zibellina*), which inhabits Siberia, has the most valuable fur. The beech or stone marten (M. foina), occurring from central and southern Europe to China, is a paler species. *M. melampus* is found in Japan. The large fisher or pekan (*M. pennanti*) occurs in North America. The large yellow-throated marten (*C. flavigula*), occurring from India and China to Java, belongs to the closely related genus *Charronia*. (K. R. KN.)

MARTENS, FËDOR FËDOROVICH (FRÉDÉRIC FROMMHOLD DE MARTENS; FRIEDRICH VON MARTENS) (1845–1909j, Russian jurist and author of works on the European penetration of Asia and Africa, was born at Parnu, in Livonia, Estonia, on Aug. 27, 184j. In 1868 he entered the Russian ministry of foreign affairs and in 1872 was made professor of public law in the Imperial School of Law and the Imperial Alexander lyceum, a post he held until 1905. In 1874 he started special juristic work for the Russian government. His work on the right of private property in war appeared in 1869. and that on the office of consul and consular jurisdiction in the east in 1873 (German trans., 1874). These were the first of a series of studies which won Martens a worldwide reputation and enhanced that of the Russian school of international jurisprudence.

Recueil des *traités* et *conventions conclus* par la *Russie avec* les *puissances étrangères* (15 vol., 1874–1909), edited by him, is the greatest of the series; published in Russian and French in parallel columns. it contains not only the texts of the treaties between Russia and other countries but also histories of the diplomatic conditions of which the treaties were the outcome, these being based upon unpublished Russian documents.

Martens' original work includes books on Russia and England in central Asia (1879). on Russia's conflict with China (1881), on the international law of civilized nations (1882), on the Egyptian question (1882) and on the African conference of Berlin and the colonial policy of modern states *(1887)*.

Repeatedly chosen to participate in international arbitrations: Martens acted in the disputes between Mexico and the United States — the first case to be determined by the permanent tribunal at The Hague — and that between Great Britain and France over Newfoundland in 1891. He played an important part in the negotiations between his own country and Japan which led to the peace of Portsmouth (Aug. 1905) and prepared the way for the Russo-Japanese convention. He was employed in laying the foundations for The Hague conferences and was one of the Russian plenipotentiaries at the first conference and president of the fourth committee — that on maritime law — at the second conference. He was judge of the Russian supreme prize court established to determine cases arising during the Russo-Japanese War of 1904–05. He died at Valga, in Livonia, on June 19, 1909.

See T. E. Holland in *Journal of the Society of Comparative Legislation* (Oct. 1909), where a list of writings of Martens appears. (E. H. Ld.; X.)

MARTENS, GEORG FRIEDRICH VON (1756–1821), German jurist and diplomat, the original editor of the principal printed collection of treaties of the world, was born at Hamburg on Feb. 22, 1756. He was educated at the universities of Gottingen. Regensburg and Vienna and became professor of jurisprudence at Gottingen in 1783 and was ennobled in 1789. In 1814 he was appointed privy cabinet councilor *(geheimer Kabinettsrat)* by the king of Hanover and in 1816 went as a representative of the king to the diet of the new German confederation at Frankfurt, where he died on Feb. 21, 1821.

Martens' major work. *Recueil des traités* from 1761, had been preceded by *Histoire diplomatique des traités,* covering the period from the end of the 16th century to the peace of Amiens (1577–1802). The first seven volumes of *Recueil des traités* were published 1791–1801 and were followed by four supplementary volumes partly edited by his nephew Karl von Martens. These were followed by *Nouveau recueil général des traités,* of treaties subsequent to 1808, in 16 vol. (1817–42) edited by G. F. von Martens, K. von Martens, F. Saalfeld and F. Murrhard; this last work was subsequently continued under other editors (2nd series, 20 vol., 1843–75; 3rd series, 35 vol., 1876–1908; 4th series, 41 vol., 1908–44).

Of Martens' other works the *Droit des gens,* first published in 1788, is probably the most famous. (E. H. Ld.)

MARTHA'S VINEYARD, an island off the southeastern coast of Massachusetts, about four miles across Vineyard sound from the mainland of Cape Cod. Long a leading fishing and whaling area, the island is nou almost entirely devoted to the summer tourist and recreation industries.

The island is nearly 20 mi, long, ranges from 2 to 10 mi. in width and represents largely the terminal moraine of a continental ice sheet. There is rolling to hilly country along the northeastern side, stretching out to nearly level plains in the south and east The highest point is only 311 ft. above sea level. The ocean has been very active in shaping the coast line, sealing off the many inlets along the south shore and building up long beaches and spits. The many-coloured clay bluffs at Gay Head are among the island's spectacular sights.

Martha's Vineyard probably was sighted by many early explorers, but the first known record was by Bartholomew Gosnold in 1602. Granted to Thomas Mayhew of Massachusetts, the island uas first occupied in 1642; it was under the jurisdiction of New York until 1692. There were early attempts at agriculture, salt evaporating, brickmaking and the smoking of fish. Fishing, which became an important source of revenue, led to the development of whaling and foreign trade, the two activities that eventually dominated the 18th and part of the 19th centuries. At one time the island boasted the world's largest sperm oil candle factory.

Advances in technology and a disadvantageous location terminated both of those trades, but the island's quaint old villages, Colonial architecture, scenic beauty and sandy beaches, as well as its protective coves for yachts and sailboats made Martha's Vineyard nearly ideal for summer vacationers and visitors.

The island itself contains six small towns: Tisbury, Oak Bluffs, Edgartown, West Tisbury, Chilmark and Gay Head, the latter occupied almost entirely by Indians. Together with the adjacent Elizabeth Islands and No Rlans Land, the island forms Dukes county, Mass. (G. K. L.)

MARTIAL (MARCUS VALERIUS MARTIALIS) (*c.* A.D. 40–*c.* A.D. 104), Roman epigrammatist. brought the Latin epigram to perfection and provided in his poems a picture of Roman society under the early empire which is remarkable both for its completeness and for its accurate portrayal of human foibles. His birthplace was Bilbilis. in Hispania Tarraconensis. of which he writes (in i, 61. 11–12): *te, Liciniane, gloriabitur nostra/nec me tncebit Bilbilis* ("of thee. Licinianus. our Bilbilis shall boast. nor will she keep silent about me"). His birthday was March 1. *Martem mearum principem Kalendarum* (x, 92, 10). Martial made much use of the mordant epigram bearing a sting in its tail. Frequently this sting consists merely of a single unexpected word. Poems of this kind exercised a great influence on the history of the genre in the literature of England. France. Spain and Italy. Though some of the poems are devoted to scenic descriptions. most are about people — emperors. public officials. writers. philosophers. lawyers, teachers. doctors. fops. gladiators. slaves, undertakers, gourmets, spongers, senile lovers and revolting debauchees.

Life at Rome. — In A.D. 64 he came to Rome, where. apart from a brief visit to Cisalpine Gaul in 88. he made his home for 34 years. There he sought the protection of his fellow Spaniards. the Senecas and Lucan. but. as they were involved in the Pisonian plot of 6j. this attachment was of short duration. Virtually nothing is known of his career during the next 1j years. In 80 was published the *Liber Spectaculorum,* containing 33 epigrams celebrating the shows held in the Colosseum, an amphitheatre in the middle of the city begun by Vespasian and completed by Titus in 79. Living at first in rather humble circumstances (i, 117, 7: *scalis habito tribus sed altis,* "I live up three staircases. and high ones too"), he gradually made headway and was able to have. in addition to his town house on the Quirinal (x, 58, 10: *vicinosque tibi, sancte Quirine, lares,* "And my house near to you, sacred Quirinus"), a small country place at Nomentum, in the Sabine territory (vi, 43, 3–4: *me Nomentani confirmant otia ruris/et casa iugeribus non onerosa suis,* "leisure in the Nomentan countryside restores me and a cottage not too big for its acres"). He won the ear of the court and received from Titus and Domitian. though he was not a father, the *ius trium liberorum* (the rights of a father of three children), a privilege which allowed a person to hold a public office before his 25th year and to be exempted from public burdens. *Rumpitur invidia tribuit quod Caesar uterque/ius mihi natorum* ("he is consumed with envy because both Caesars have granted me a father's rights"), he wrote in ix, 97, 5–6. He also, probably without having served in the army, obtained a military tribuneship and, despite his lack of means. the dignities of an *eques Romanus* ("Roman knight"). In 84 or 85 appeared two books of epigrams (in modern editions, books xiii and xiv) entitled *Xenia* and *Apophoreta,* two-line mottoes for presents distributed at the festival of the Saturnalia, in December. In 86 were issued books i and ii of the *Epigrams.* Between 86 and 98. when Martial returned to Spain. new books of the *Epigrams* were brought out more or less at yearly intervals. When the poet left Rome for his birthplace (xii, 18. 7–9: *multos repetita post Decembres . . . Bilbilis,* "Bilbilis sought again after many Decembers") he lived on an estate presented to him by his friend Marcella, a Spanish lady of whom he writes warmly in xii, 21 and 31. There he wrote and published the 12th and last book of his *Epigrams* and soon after died. Pliny the Younger. in a letter of 104, describes his feelings on hearing of the poet's death: "I hear that Valerius Martialis has died and I am grieved. He was a man of ability, sagacity and ardour. whose writing displayed wit, acrimony and no less good-nature. When he was leaving Rome I presented him with a parting gift, a tribute both to his friendship and to the lines he wrote about me." The poem referred to is x, 19, and Pliny quotes the last ten lines (12–21).

Literary Friendships. — At Rome, Martial seems to have enjoyed the friendship of the leading literary men of his time. Pliny, Lucan and the Senecas have already been mentioned.

Lucan is eulogized in vii, 22; vii. 21 and 23 are addressed to Polla Argentaria. Lucan's widow. The loyalty of Maximus Caesonius to the exiled Seneca is recorded in vii. 44 and 45. Quintilian is addressed in ii, 90, a poem which seems to express the poet's attitude to life:

Quintilian, distinguished trainer of our wayward youth, Quintilian, glory of the Roman gown, pardon me if I, though still poor, yet not made useless by the years, am quick to enjoy life. No man is quick enough really to enjoy life. If a man is eager to surpass his father's income, if he wants to crowd his halls with iamily busts, let him put off the job of living. My delight comes from the hearth and the roof-tree that does not object to sooty smoke, from a living spring and an untrained grass-plot. Give me a well-ied home-born servant, a wife who is no bluestocking, nights blessed with sleep and days innocent of litigation.

Silius Italicus, addressed in iv, 14. 1 as "pride of the Muses' sisterhood." is mentioned also in vi, 64. 10; vii. 63, 1–2; ix, 86. 1–2; and xi, 48 and 49. To Valerius Flaccus. another epic poet, there are references in i, 61. 4; i, 76; and iv. 42 and 49. For his relations with his true friend Juvenal see vii. 24 and 91; xii, 18. Martial never speaks of Statius, nor Statius of Martial. J. Wight Duff has suggested that "incompatibility of temperament" may explain this strange silence.

Form of the Epigram. — Martial wrote 1.561 epigrams in all. Of these 1,235 are in elegiacs. 238 in hendecasyllables and 77 in scazons or "limping iambics.!' The remainder includes pure hexameters (*e.g.*, i, 53), pure iambic trimeters (*e.g.*, vi, 12), iambic trimeter alternating with iambic dimeter (*e.g.*, i. 49) and scazons alternating with iambic dimeters (*e.g.*, i. 61). Occasionally Martial's epigrams are much longer than those of the Greek anthology (see ANTHOLOGY): 51 scazons make up iii. j8. while vi, 64 consists of 32 hexameters.

The elegiacs owe much to Ovid, though Catullian influence is probably to be discerned in the polysyllabic endings of pentameters. On Catullus also are based the hendecasyllables and scazons; but Martial's scazons begin more rigidly with a spondee. "Echoing verses" and involved patterns of various kinds are not uncommon (*cf.*, i, 32, 67. 77, 79; ii, 6, 33, 41, etc.). Puns. parodies, Greek quotations and ingenious ambiguities enliven Martial's pages. A type of epigram familiar to all is illustrated by i, 28. where the apparent contradiction of an insult masks an 'insult far more subtle: "If you think Acerra reeks of yesterday's wine. you are mistaken. He invariably drinks till morning."

Servility and Adulation. — Many readers of Martial are repelled by his flattery of any. especially the rich and powerful! who could fill his stomach or his purse. His frequent pleas for more and better presents from patrons and above all his use of the official title "Lord and God" toward Domitian cause a disgust not entirely warranted by the facts of history. For Martial. a poet known to the imperial court, to refuse extravagant homage might well have been suicidal. As for his begging verses. objectionable though they are. they must have paid dividends or the practice would have been abandoned. The poems on Domitian, disfigured by grotesque mythological conceits, are utterly foreign to Martial's usual direct style and are among his worst efforts.

Obscenity. — Byron asked, "What proper person can be partial1 To all those nauseous epigrams of Martial?" The Delphin editor abstracted the foulest verses and lumped them together at the end of the book. Opinions are bound to vary on the proportion of the indescribably salacious to the tolerably wholesome: it is certainly more than a tenth and considerably less than a quarter. Martial repeatedly warns his readers that his poems are not for the squeamish. He protests that though his page is licentious, his life is decent: lasciva est *nobis pagina*, vita *proba*, "though wanton my page, my life is good" (i. 4, 8). Catullus and Ovid had made similar distinctions before him: Apuleius and Ausonius were to do so in later generations. Martial hints more than once that he is far from being the worst of offenders.

Sentiment in **Martial.**—A genuine love of natural scenic beauty is seen in iv. 44 (lament for the devastation caused by the eruption of Vesuvius, A.D. 79); iv, 64 (view of Rome from a friend's estate); and x, 30 (seashore at Formiae). Tenderness toward slaves. inherited perhaps from the precept and practice of Seneca and Pliny. marks i. 88 and 101, both of which are funeral epigrams. Other sepulchral poems include v. 34 (on Erotion, a girl not yet six); vi, 85 (on Camonius Rufus. a lad of 20); and xi. 13 (on Paris. a celebrated actor, put to death by Domitian). The warmth of his friendship is to be seen in three famous epigrams, all addressed to Julius Martialis (i, 15; v, 20; and x, 47). The first ends with the advice — sera *nimis vita* est crastina: vive *hodie*, "live for to-day: tomorrow is too late." The second contains the sundial motto about the fleeting hours—*pereunt* et *imputantur*, "they perish and are scored against us." The third, which has been translated by a dozen English poets, consists of a comfortable recipe for happiness. Another, iv, 13, is a charming little epithalamium, while x, 23 is a serene picture of the peaceful old age of one who, by reliving his well-spent days, doubles his life's span.

MARTIAL LAW. This term is one of rather doubtful significance in the English legal system. but is fairly well defined in the United States. It can be argued plausibly, but scarcely with conviction, that the English legal system does not know of, and makes no provision for, martial law, and that it is merely a term relating the common law right to resist force by force to a state of war, whether civil or external. This view seems to be implicit in a dictum of Chief Justice Thomas Molony in R. v. *Strickland* (1921 2 Irish Reports 334) that "the term 'execution of Martial Law' is now nothing more than a convenient label for the state of affairs which exists when the military take exceptional measures to suppress an insurrection." In the words of Sir Frederick Pollock, "So-called 'martial law,' as distinct from military law, Is an unlucky name for the justification by the common law of acts done by necessity for the defence of the Commonwealth when there is war within the realm.!'

On the other hand, the learned editors of D. L. Keir and F. H. Lawson's Cases in Constitutional Law express the view that the military authorities "have the right not to be interfered with *durante bello*, and this right belongs, it is to be conceived, exclusively to the regularly constituted military forces." If this argument be correct. and this right does indeed belong exclusively to the lawfully constituted military authorities, then martial law is something more than a "convenient label." Indeed, Chief Justice Molony himself, in the case referred to above, gives the most forcible answer to his own definition, for he stated elsewhere in his judgment that "We hold that when a state of things does exist which justifies the 'execution of martial law,' and is proved to our satisfaction, our hands are tied . . . the courts have recognized frankly that when a state of war exists — and they have not relinquished the right of adjudicating on that point — they must 'accept the consequences.'" It may be that martial law can be defined as a stage intermediate between law and anarchy, in which, the normal administration of the law having broken down, the authority appointed in accordance with law maintains order by summary methods.

In any event, martial lam must be sharply distinguished from military law, which is the law governing the armed forces whether in war or peace; confusion has been caused by the fact that some of the older writers, for instance, Sir Matthew Hale in his History *of* the *Common* Law, used the term "martial law" in relation to what is now called "military law."

Martial law, in the modern sense, seems to have three different aspects in the relationship of the military authorities to (1) subjects and nonenemy aliens, (2) enemy aliens at home and (3) enemy aliens abroad. No very serious problems are presented by (2) and (3). As for (2), it is difficult, as Sir W. Holdsmorth has observed, to see by what authority these could be tried by English courts! though in practice: and on the authorities, it would appear that. once the ordinary courts were satisfied that a state of war existed at the relevant time: they would not inquire into any acts done by the military authority, at any rate unless it could be established that they were done in ill faith. As for (3), the crown has an "absolutely free hand," though in the light of the Nürnberg trial and the trials of lesser war criminals, the duke of Wellington's remark that martial law merely means "the will of the general who commands the army" requires some qualification: that n-ill must he exercised in accordance with international law and the conventions of civilized warfare—however these may be' interpreted from time to time.

Constitutionally and historically, the first aspect, namely the relationship of the military authorities in whom the execution of martial law is vested. toward the subjects and nonenemy aliens who are entitled to the protection of the crown. is the most important. It gives rise to three main questions: (1) What are the circumstances. if any. that lawfully give rise to the suspension of normal civil rights? (2) In what circumstances, if any, will the normal courts review the decisions of tribunals set up by the military authorities to help them in the exercise of their powers? (3) \\'hat remedies, if any, has the subject against abuse or excess of their powers on the part of the military authorities?

Circumstances Giving Rise to Martial **Law.**—As Chief Justice Molony pointed out in the Irish judgment referred to above, the courts have not relinquished the right of adjudicating on the question whether a state of war exists. In older authorities. the test that was applied seems to have been the simple one of whether the ordinary courts were sitting or not; if they were, for this purpose a state of peace was deemed to exist, and there was therefore no room for the declaration or execution of martial law. This rule, if it can be so termed, appears definitely to have been abrogated by the decisions of the judicial committee of the privy council in *Elphinstone* v. *Bedreechund* (1 Knapp. P.C. 316) and D. F. *Marais* v. *The General Officer Commanding the Lines of Communication of the Colony* (*i.e.*, the Cape of Good Hope) (1902 Appeal Cases 109). In the latter case martial law had been proclaimed both in the district in which the petitioner, Marais. had been arrested. and in that to which he had been moved. In giving the judgment of the judicial committee, Lord Halsbury, the lord chancellor, said that they were "of opinion that where war is raging acts done by the military authorities are not justiciable by the ordinary tribunals) and that war in this case was actually raging... is sufficiently evidenced by the facts disclosed by the petitioner's own petition and affidavit . . . The fact that for some purposes some tribunals had been permitted to pursue their ordinary course is not conclusive that war was not raging." The conclusion Lord Halsbury drew was that: "The truth is that no doubt has ever existed that where war actually prevails the ordinary courts have no jurisdiction over the action of the rnilitary authorities," but that "doubtless cases of difficulty arise when the fact of a state of rebellion or insurrection is not clearly established."

These statements in Marais's case probably represent the high-water mark of the doctrine of the immunity of the military authorities from control by the civil power. But it may be remarked that even here. where the simple test of whether or not the ordinary courts are sitting was discarded probably once and for all, the right of the judiciary to consider whether, as a matter of fact. war was actually raging was vindicated by Lord Halsbury as it has been by other judges both before and since. On what criteria the courts would come to a decision today there does not seem to be much positive guidance. The test of an immediate local emergency seems to have been discarded. On the other hand, the decision of the house of lords in *Johnstone* v. *Pedlar* (1921 2 Appeal Cases 262) that it was "not a good defence to an action of tort brought by a friendly alien resident in the United Kingdom against an officer of the Crown in respect of the wrongful seizure and detention of the alien's property that the seizure and detention have been adopted and ratified by the Crown as an act of State" would seem, in spite of the rather special character of the facts, to warrant the conclusion that a mere state of general war, not involving a suspension of the normal machinery for the maintenance of order and the execution of justice. does not suffice to justify an arbitrary act done under colour of emergency.

Jurisdiction of the Courts Over Tribunals.— It seems to be well established that the normal courts will not review the decisions of tribunals set up by the military authorities to help them in the exercise of their powers because they do not recognize these tribunals as courts of law. Historically, the reason seems to be that acts done in pursuance of martial law were, in the words of Keir and Lawson, "withdrawn from the cognizance of the common law:" and in consequence, although the crown's "executive acts escaped the interference of the judges, its power to do them did not in all cases receive judicial acknowledgment. It would accordingly be difficult at the present date to find authority for the view that such acts can legally be done under the Royal Prerogative." The leading authority in this field is the decision of the house of lords in *In re Clifford and O'Sullivan* (1921 2 Appeal Cases 570). In Dec. 1920 the commander in chief in Ireland declared the unauthorized carrying of arms to be punishable by death, and he authorized the general officer commanding in Cork to issue orders for the holding of military courts as might be necessary. In May 1921 Clifford and O'Sullivan, who were civilians. were tried by a military court on a charge of improperly carrying arms, and were convicted and sentenced to death, subject to confirmation; they applied in the chancery division in Ireland for a writ of prohibition against the military court. the commander in chief and the general commanding in Cork on the ground that the court was illegal and had no jurisdiction to deal with the matter. On appeal to the house of lords the application was dismissed, on the ground, among others, that prohibition did not lie. because the officers constituting the court did not claim to act as a judicial tribunal in any legal sense.

Remedies of the Subject.— The question of remedies against the abuse or excess of their powers on the part of the military authorities is one on which there is very little authority. Granted that. as the 16th-century judges declared, "in time of war a man may justify making fortifications on another's lands without licence" (1 Dyer 36 b), what is the position if he does so not for the purposes of defense but to gratify a private spite against the landowner? Keir and Lawson have no doubt but that "evidently the Commander-in-Chief would be liable for acts done *mala fide* and not solely with a view to suppressing insurrection." This view is eminently sensible and accords with the common-law doctrine of using the minimum degree of force that is necessary to repel force. Then there is the question of the character of the necessity. Of this Keir and Lawson say that "Dicey's doctrine, that he [*i.e.*, the military commander] must prove an immediate necessity for every act, is obviously too hard . . . ." This view is not only sensible but accords with the decision in Marais' case that the emergency need not be for these purposes an immediate or local one.

The modern practice of taking emergency powers by statute makes the likelihood of these questions assuming importance in the future somewhat doubtful. But in the past they certainly had considerable importance.

United States.— In the United States, martial law is the temporary rule by military authority of a designated domestic area in time of an emergency when the civil authorities are unable to function or their attempt to continue functioning for the time being might endanger the state. It may be declared by a proclamation of the president or the governor of a state, but such a proclamation is not necessary. Martial law becomes effective when military authorities supplant the civil authorities. Although neither mentioned in the constitution nor defined by statute. martial law long has been recognized in the United States. Civil courts many times have been called upon to pass upon the validity of acts taken in pursuance of martial law, but they have not precisely defined its limitations.

Martial law, as noted above, is to be distinguished from *militavy law*, which is the law governing those in the military service; from *military government*, which is the military rule of conquered territories; and from situations in which military forces are called upon to assist the civil authorities in maintaining public order without the existence of martial law. Where the military forces are called upon only to assist, the civil courts continue to function. and members of the civilian population may be punished only for violations of the civil law, not for violations of military orders other than those in implementation of civil law. *See* also MILITARY *GOVERNMENT*.

The use of federal or state military forces to quell a domestic disturbance or to assist in the maintenance of order during a disaster, such as a flood or a tornado, does not of itself bring about a state of martial law. In sending federal troops into Pennsylvania in 1794 to put down the Whiskey Rebellion. Pres. Washington specifically admonished the commander of the troops to enforce the law and deliver the insurgents to the regular courts for trial. During the labor trouble in the Coeur-d'Alene area of Idaho in 1899, the president sent federal troops to assist in the maintenance of order but directed that they support the civil authorities in the preservation of peace. Within a few hours after the initial shocks of the San Francisco earthquake of 1906, federal troops from a local garrison were assisting the civil authorities in maintaining order.

There have been cases in which governors of states hare improperly declared martial law in order to accomplish political purposes. Such was the case in Texas in 1931 when the governor declared martial law to permit enforcement of a limitation upon the production of oil; his act was declared invalid by the United States supreme court in the case of *Sterling* v. *Constantin.* Two other examples occurred in the 1930s. In South Carolina the governor declared a state of "rebellion, insurrection, resistance and insurgency" in an attempt to depose state highway commissioners; in Oklahoma the governor sought to prevent further constructiori of a dam until demands of the state highway commission for reimbursement for the closing of roads were met. In both cases, the courts declared the acts of the governors invalid.

The justification for martial law is that civil authorities are unable to function, or that because of impending grave danger, it would be unsafe for them to function. The question as to the continued functioning of the civil courts is particularly important. In' an area of active military hostilities. it is a practical impossibility for the civil courts to function. Where it is felt that their functioning should be suspended because of impending danger, a doubt may exist as to the necessity of the suspension. Immediately following the bombing of Pearl Harbor in 1941, for example, martial law was declared in Hawaii, the civil courts were closed and trials were by military courts. Although civil courts later were permitted to operate to a limited extent, martial law was not finally removed until late in 1944. In the case of *Duncan* v. *Kahanamoku,* which involved civilians tried by military courts in Hawaii, the U.S. supreme court found that there was no justification for suspension of the civil court functions at the time the accused civilians were convicted, but did not state the limit of martial law which the court would have found proper.

The U.S. constitution specifically recognizes that the privilege of the writ of habeas corpus may be suspended when in cases of rebellion or invasion the public safety may require it. This privilege requires that a person who is in confinement must be, upon his demand, brought before a court to determine the legality of his confinement. The privilege is suspended as an incident to martial law. During the period of martial law, the military commander rather than a civil court determines the propriety of the confinement. Thus a person believed dangerous to the state may be confined upon mere suspicion. without trial until the termination of martial law. During the Civil War, Pres. Lincoln suspended the privilege in various localities, particularly in the vicinity of the nation's capital.

While martial law is in effect! persons charged with violations of either civil law or military orders may be tried by military courts commonly known as provost courts. The sentences adjudged by such courts are no longer effective after the termination of martial law.

The authority of the military commander, during a period of martial law, is virtually unlimited, but the commander later may be called upon to justify his actions. He may be personally liable to pay damages for acts which do not appear to have been reasonably believed necessary at the time the acts were undertaken. However, the commander is judged according to the facts as they appeared at the time rather than according to the way they appeared in the light of later developments.

MARTIGNAC, JEAN BAPTISTE SYLVÈRE GAY, VICOMTE DE (1778–1832), French statesman, was born at Bordeaux on June 20, 1778. In 1798 he acted as secretary to Sieyès; then. after serving for a while in the army, he turned to literature, producing several light plays. Under the empire he practised with success as an advocate at Bordeaux, where in 1818 he became advocate general of the *cour royale.* In 1819 he was appointed *procureur général* at Limoges and in 1821 was returned for Marmande to the chamber of deputies. where he supported the policy of Villèle. In 1822 he was appointed councilor of state; in 1823 he accompanied the duc d'Angoulême to Spain as civil commissary; in 1824 he was created a viscount and appointed director general of registration. In contact with practical politics his ultraroyalist views were gradually modified in the direction of the Doctrinaires, and on the fall of Villèle he was selected by Charles X to carry out the new policy of compromise. On Jan. 4, 1828, he was appointed minister of the interior and, though not bearing the title of president. became the virtual head of the cabinet,. He succeeded in passing the act abolishing the press censorship and in persuading the king to sign the ordinances of June 16. 1828, on the Jesuits and the little seminaries. He was exposed to attack from both the extreme left and the extreme right, and, when in April 1829 a coalition of these groups defeated him in the chamber, Charles X, who had never believed in the policy he represented, replaced him by the prince de Polignac. His last public appearance was in defense of Polignac in the chamber of peers in Dec. 1830. He died April 3, 1832.

MARTEN, SAINT (*c.* 330–397), bishop of Tours, missionary and father of monasticism in Gaul, and one of the most revered saints of western Europe, was born at Sabaria in Pannonia (now Szombathely, Hung.), of pagan parents. but became a catechumen at an early age. As a youth he had to serve in the Roman army. His disciple arid biographer, Sulpicius Severus, tells the famous story. often depicted in art. of how Martin divided his military cloak with a naked beggar at Amiens. In a dream that night he saw Christ wearing the half cloak, and shortly afterward he received baptism. Later. he asked to be released from the army because "I am Christ's soldier: I am not allowed to fight." When taxed with cowardice he offered to stand in front of the battle line armed only with the sign of the cross. but the immediate surrender of the enemy made this superfluous.

On leaving the army Martin settled at Poitiers, where he was made an exorcist by the bishop St. Hilary. Later he lived in retirement, first at Milan, then on the island of Gallinaria, off Albenga. On Hilary's return from exile in 360 Martin also returned and founded a community of hermits at Ligugé, south of Poitiers, the first monastery in Gaul. Later he founded another, Marmoutier, outside Tours: to which he withdrew whenever possible after becoming bishop of 'Tours in 372, an office which he accepted unwillingly.

As bishop, Martin was an active missionary in Touraine and beyond. Christianity had scarcely penetrated yet into the country districts, where Martin went round preaching, visiting each of his outlying settlements every year and encouraging monasticism. His fame brought him into contact with the imperial court at Trier, where he took part in a conflict between church and state. He protested to the emperor Maximus, who was being induced to condemn the Spanish heretic Priscillian to death, against the killing of heretics and against civil interference in ecclesiastical matters. Priscillian was nevertheless executed, and Martin's continued protests together with his intercession for Priscillian's followers involved him in difficulties with the Spanish bishops.

Martin died at Candes on Nov. 8, 397. He had acquired a great reputation of working miracles, and was one of the first persons not a martyr to be publicly venerated as a saint. His feast day is Nov. 11, and his popularity in medieval England is attested by calendars and church dedications. See SEVERUS, SCLPICIUS.

See I. Costanza, *La leggenda di San Martino nel medioevo* (1921). (D. AR.)

MARTIN (MARTINUS), the name of three popes, Martin I, Martin IV and Martin V. In the 13th century the papal chancery misread the names of the two popes Marinus (*q.v.*) as Martin, and as a result of this error Simon of Brion in 1281 assumed the name of Martin IV instead of Martin II.

ST. MARTIN I (d. 655), pope from 649 to 655, succeeded Theodore I in June or July 649. He presided over the Lateran synod which condemned the Monothelite heresy. Thereupon by order of the emperor Constans II Martin was arrested, taken to Constantinople (Sept. 17. 654), publicly humiliated and banished to Cherson in May 6j5. He died there the following September. He is honoured as a martyr by the church both in the east (feast day Sept. 16 or the middle of April) and in the west (Nov. 12). (C. P. L.)

MARTIN IV (Simon of Brie, or Brion) (1210/20–1285), pope from 1281 to 1285, was born between 1210 and 1220 as the scion of a French noble family of Brie. St. Louis IX of France made him a member of his council and, in 1260, chancellor and keeper of the great seal. About a year later the French pope Urban IV elevated Simon to the dignity of cardinal priest of St. Cecilia. He was elected pope on Feb. 22, 1281.

Soon after his coronation at Orvieto on March 23, 1281, Martin IV began to reverse the policy of his great predecessor Nicholas III by restoring Charles of Anjou, king of Sicily, as Roman senator and by favouring his interests in every possible way, even at the expense of the union with the Greeks. Charles apparently convinced the pope that the only guarantee of a permanent union was the conquest of the Byzantine empire by himself, and Martin excommunicated the emperor Michael VIII for lack of sincerity in the cause of the union shortly before the latter's death on Dec. 12, 1282; this led to a new formal break between the churches of Constantinople and Rome under the emperor Andronicus II (1283). After the Sicilian Vespers (*q.v.*) of March 1282 had deprived Charles of Anjou of the island of Sicily, and the Sicilians had chosen Peter III of Aragon as their new ruler: Martin spent the remainder of his pontificate in vain attempts to dislodge him and to reinstate Charles. He excommunicated Peter III, called for a Sicilian "crusade," and declared that Peter had forfeited the kingdom of Aragon, which was a fief of the Holy See since the eleventh century; Philip III of France, Charles of Xnjou's nephew, was invited by the pope to take over Aragon for his youngest son Charles of Valois. However, a Roman uprising against Charles of Anjou cost him his senatorial dignity; a great sea battle between the Aragonese and Angevin fleets resulted in utter defeat of the latter and in the capture of Charles of Anjou's son, the future king Charles II of Naples; while Philip III's campaign in Aragon was likewise to end in disaster in the very year in which the pope died (March 28, 1285) at Perugia. His francophile policy had foreshadowed the Avignonese period of the papacy. Martin IV's successor was the Roman Honorius IV.

MARTIN V (Oddone Colonna) (1368–1431), pope from 1417 to 1431, was born at Genazzano. He was unanimously elected pope on Nov. 11, 1417, in a conclave held during the Council of Constance. which had been called to end the Great Schism (1378–1417j. Martin, a mild and gentle man, was at the time a cardinal-subdeacon who had helped organize the Council of Pisa.

As pope he faced enormous difficulties. As soon as the council was over he condemned the widely held conciliar theory which would make the pope subject to a council and forbade any appeal from papal judgment on matters of faith. Then he returned to Rome, which he found in ruins. He restored some of its churches and fortifications and tried to recover control of the Papal States. He norked hard to mediate the Hundred Years' War between France and England and to organize crusades against the Hussites in Bohemia.

Although he always had a dread of councils lest they try to revive the conciliar theory. Martin called the Council of Pisa in 1423 as prescribed by the Council of Constance. When a plague struck Pavia he moved the council to Siena. Martin's legates dissolved it when it dragged on in futile discussion of the conciliar theory. Martin neglected the great opportunity offered by church councils to reform the church; his efforts to meet the crying need for reform nere halfhearted and proved ineffective. He died on Feb. 20, 1431, shortly after calling the Council of Basel.

MARTIN, ARCHER JOHN PORTER (1910–), British biochemist, was awarded the Nobel prize in chemistry jointly with R. L. M. Synge in 1952 for the invention of partition chromatography. This effected the partition of a substance between two liquids by very simple means instead of by a series of intricate chemical operations and was subsequently so widely applied in chemical, biological and medical research as to constitute almost a new scientific tool. Martin was born in London on March 1, 1910, and was educated at Bedford school and Cambridge university, where he graduated in 1932. He worked in the Dunn Nutritional laboratory on problems relating to vitamin E from 1933 until 1938 when he was engaged with the Wool Industries Research association at Leeds in a study of the felting of wool. In 1946 he became head of the biochemistry division in the research department of Boots Pure Drug Co., Nottingham, and held the post until 1948 when he was appointed to the staff of the Medical Research council, working first at the Lister Institute of Preventive Medicine and then at the National Institute for Medical Research, where he later became head of the division of physical chemistry. He was elected a fellow of the Royal society in 1950, and he received the Berzelius gold medal in 1951. (D. McK.)

MARTIN, GLENN LUTHER (1886–1955), U.S. aircraft designer, held the unique distinction of being the only pioneering airplane inventor and pilot to have remained at the head of his own manufacturing organization during his entire business career. Born Jan. 17, 1886, at Macksburg, Ia., Martin later m s taken by his family to Liberal, Kan., where his "aircraft" business started when Glenn, aged 8, built kites in his mother's kitchen and sold them to his contemporaries. Later, in Santa Ana, Calif., Martin designed his first powered airplane and leased an abandoned church as his first factory. He became one of the outstanding "barnstormers" in the 1910–14 period, and from that experience developed several successful types of military aircraft. The first Martin bomber appeared in 1918–19, too late for active use in World War I, but its success established Martin as one of the leading military airplane manufacturers of the United States. He built a factory in Cleveland, O., and in 1929 moved his manufacturing facilities to Middle River, Md., near Baltimore. Martin bombers and flying boats played important roles all over the world in World War II. At peak, Martin's Baltimore plant employed over 50,000 people. Toward the end of his life Martin took great interest in civic affairs, education and wildlife conservation. He gave large sums to support the engineering schools in the University of Maryland. Martin died at Baltimore, Md., Dec. 4, 1955. (S. P. J.)

MARTIN, (BON LOUIS) HENRI (1810–1883), French historian. author of a famous history of France. was born on Feb. 20. 1810. at St. Quentin. With Paul Lacroix ("le Bibliophile Jacob") he planned a history of France, to consist of excerpts from the chief chroniclers and historians, with original matter filling up gaps in the continuity. His *Histoire de Fmnce,* 15 vol. (1833–36). was the result. This magnum opus, rewritten and further elaborated (4th ed., 16 vol. and index, 1861–65), gained for the author in 1856 the first prize of the Académie Française and in 1869 the grand biennial prize of 20,000 fr. A popular abridgment in seven volumes was published in 1867 (Eng. trans.; 1877–82). This, together with the continuation, *Histoire de France depuis 1789 jusqu'à nos jours* (6 vol., 1878–83), gave a complete history of France and superseded J. C. L. de Sismondi's *Histoire des Français.* A staunch republican, Martin sat in the *assemblée nationale* as deputy for Aisne in 1871 and was elected life senator in 1876, but he left no mark as a politician. He died in Paris on Dec. 14, 1883.

MARTIN, HOMER DODGE (1836–1897), U.S. painter, whose works have given him a place at the culmination of American landscape before Impressionism. was born in Albany, N.Y., Oct. 28. 1536. Martin studied briefly with James Hart, and his early work follows the tradition of the Hudson River school. He became a member of the National Academy of Design in 1874 and in 1877 was one of the founders of the Society of American Artists. The sombreness of his pictures prevented them from being sold, and so Martin's wife turned to journalism for support. Sent to England to make magazine illustrations; he later (1882–86) matured his style in France under Barbizon influence. His best works, such as "The Harp of the Winds:" "Ontario Sand Dunes" and "Westchester Hills," were done after his return to the United States; their spacious design and rich colour put them on a level with those of Alexander H. Wyant and George Inness. The artist's sight failed a few years before his death at St. Paul. Minn., Feb. 2. 1897. (Vl. B.)

MARTIN, LUTHER (*c.* 1748–1826), U.S. lawyer, a dissenting member of the Constitutional Convention of 1787 who thereafter became an ardent Federalist opposed to the philosophy of Thomas Jefferson. He was born near New Brunswick, N.J., probably in 1748. After graduating from the College of New Jersey (now Princeton university) in 1766, he taught school for a time and in 1771 was admitted to the Virginia bar. Shortly thereafter he settled in Maryland. He served as attorney general of Maryland from 1778 to 1805 and from 1813 to 1822 and during that entire period had an extensive and lucrative practice. private as well as public. He was leading counsel for the defense in two famous state trials of the Jeffersonian era, the impeachment of Justice Samuel Chase (*q.v.*) and the treason trial of Aaron Burr (*q.v.*), and was of counsel in many of the great constitutional cases of the formative years of tiie United States. His last and most famous was *McCulloch* v. *Maryland* (1819), involving the right of a state to tax an instrumentality of the federal government (the national bank). Martin, representing the state. abandoned federalism and reverted to his theory of the power of the states for which he had unsuccessfully contended in the Constitutional Convention. He was again unsuccessful.

After his paralysis in 1822 the Maryland legislature passed a unique act requiring each lawyer in the state to pay an annual licence fee to be used by trustees for the financial support of Martin, but he died in poverty on July 10, 1826, at the New York horne of his friend Aaron Burr. (A. Dm.)

MARTIN, PIERRE ÉMILE (1824–1915), French engineer noted as the inventor of the Siemens-Martin or open-hearth steel process (*q.v.*) for the manufacture of steel, was born at Bourges, Cher.. on Aug. 18, 1824, the son of Émile Martin, owner of the Sireuil ironworks in the Charente. While the chemistry of the steel-making process was aiready familiar. no means were available for artaining the high temperature required for its operation. On hearing of Sir William Siemens' development of the regenerative furnace about 1863, Martin obtained a licence to build such furnaces, starting with an experimental furnace of one-ton capacity. His steel products exhibited at the Paris exhibition of 1867 gained the exhibition's gold medal award. Nevertheless, his patents were challenged on the ground that he had merely made use of appliances and processes which were already known. and the development of his invention was delayed by proionged and costly litigation and by the rapid success of the Bessemer process. Martin was reduced to straitened circumstances but, in 1907, the Comité des Forges de France instituted a fund for his benefit and contributions were received from all the principal steel-making countries. In 1915 he was awarded the Ressemer gold medal of the Iron and Steel institute. but was unable to attend for the presentation in London. Martin died at Fourchambault, near Nevers, on May 23. 1915. (C.W. D.)

MARTIN, VIOLET FLORENCE (Martin Ross) (1862–1915), Irish writer, was born at Ross house, County Galway, from which she took her pen name, on June 11, 1862, of an old Irish family. From the time of her father's death in 1872 she spent her childhood in Dublin. and was educated privately and at Alexandra college. Dublin. The greater part of her life was spent in Ireland, but she often traveled abroad with her cousin Edith Oenone Somervilie. with whom she collaborated. Their books give vivid and sympathetic pictures of Irish life, and their love of hunting (Miss Somerville was for 12 years master of the West Carbery foxhounds) gave rise to the series of books of which *Some Experiences of an Irish R.M.* is perhaps the best known. Their novels include *The Real Charlotte* (1894), their first serious work; *Mount Music* (1919); and *The Enthusiast* (1921). The latter two were published under joint authorship. although after Miss Martin's death. since they were largely her work. Her qualities can best be seen in two volumes of essays, autobiographical in character, *Some Irish Yesterdays* (1906) and *Stray-Aways* (1920). She died at Cork on Dec. 21, 1915.

MARTIN, a name appiied to the well-known European and American birds. the house martin (*Delichon urbica*), sand martin (*Riparia riparia*) and purple martin (*Progne subis*). Others occur all over the world, except in New Zealand.

The house martin, like its ally, the swallow (*q.v.*), is a migrant, arriving in Europe and western Asia in spring from its winter quarters in South Africa and India. It is a smaller bird than the swallow, lacking the latter's forked tail; the plumage is black above and white beneath. The nest, a half hemisphere of mud and straw. lined with feathers, is built under the eaves of houses; occasionally nests are found on cliffs, which must have been the original site. Two broods are usual.

The sand niartin is smaller than the last and has a brownish tinge to the upper parts. It is the earliest of the British Hirundinidae to arrive. The nest is placed at the end of a horizontal burrow in a sandy bank or the face of a quarry. It ranges from Ireland to the Sea of Okhotsk and across North America, where it is called the bank swallow. In winter. it reaches the Transvaal. India and Caiçara in Brazil. The larger purple martin of Canada and the United States normally builds in hollow trees. It readily adapts itself to nesting boxes but leaves when house sparrows are abundant. It ranges from southern Mexico to within the Arctic circle. The rock martin (*Riparia rupestris*) of Europe builds a bottle-shaped nest of mud. All the martins feed on insects, which they capture as they fly. The eggs are usually white, The kingbird (*q.v.*) is known as bee martin.

MARTIN DU GARD, ROGER (1881–1958), French writer. won the Nobel prize for literature in 1937. He was born at Neuilly-sur-Seine on March 23, 1881, and educated to be an archivist and paleographer at the École des Chartes, Paris. His first book was an archaeological study, *L'Abbaye de Jumièges* (1909). His literary vocation was confirmed when he published *Jean Barois* (1913), a novel in dialogue demonstrating the effect of the Dreyfus case on the character and outlook of the younger generation in France and at the same time outlining some of the intellectual problenis of the period (*see* Dreyfus, Alfred). His masterpiece, however. is the story of two families, the Fontanins and the Thibaults, respectively Protestant and Catholic, told in the 11-volume series of eight novels collectively entitled *Les Thibault* (1922–40), of which the component parts are *Le Cahier gris* (1922); *Le Pénitencier* (1922); *La Belle saison,* 2 vol. (1923); *La Consultation* (1928); *La Sorelina* (1928); *La Mort du père* (1929); *L'Été 1914,* 3 vol. (1936); and *Épilogue* (1940). In these books he surveys French society before and during World War I by presenting the lives of the two families against the historical background and under the social and intellectual influences of the times.

Besides two other novels (*Confidence africaine*, 1931; *Vieille France*, 1933), his work includes three plays: *Le Testament du père Leleu* (1920), *La Gonfle* (1928) and *Un taciturne* (1931). He died at Bellême, Normandy, Aug. 23, 1958. (A. PE.)

MARTINEAU, HARRIET (1802–1876), English social and historical writer; a prominent public figure of her day, was born on June 12, 1802, in Norwich. Deaf from an early age, and later a victim of heart disease and other illnesses, she was nevertheless undeterred from an active career in which she mingled with the foremost intellectuals of the time. During a serious illness that she underwent from 1839–44, her friends raised an annuity enabling her to buy a small farm, "the Knoll," at Ambleside, which she cultivated until her death there on June 27, 1876.

A popularizer of economics and a propagandist for religious liberalism and for the abolition of slavery, Miss Martineau first gained a large reading public with an extensive series of stories and dialogues illustrating classical economics, chiefly the ideas of Malthus and Ricardo. After a visit to the United States (1834–36) she espoused the then unpopular abolitionist movement and abandoned her belief in a *laissez faire* economy for a more utopian system. A trip to the near east in 1846 led to a study of the evolution of religious beliefs and an increasing skepticism. Her chief historical work, *The History of the Thirty Years' Peace, 1816–1846* (1849), was a widely read popular volume. Her unorthodox views gained her a reputation for radicalism that alienated some of her friends but failed to impede her pursuit of ideas. She became an adherent of the positivist philosophy of Comte, whose *Positive Philosophy* she condensed and freely translated with the approval of the author. Probably this was Martineau's most scholarly work, but she is equally remembered for her candid autobiography, published posthumously in 1877.

In addition to the autobiography, Martineau's major works include *Illustrations of Political Economy*, 25 vol. (1832–34); *Poor Laws and Paupers Illustrated*, 10 vol. (1833–34); *Illustrations of Taxation*, 5 vol. (1834); *Society in America* (1837); *Retrospect of Western Travel* (1838); *Eastern Life, Past and Present* (1848); *Letters on the Laws of Man's Nature and Development* (1851); *The Positive Philosophy of Auguste Comte, Freely Translated and Condensed* (1853).

See also F. F. Miller, *Harriet Martineau* (1884); T. Bosanquet, *Harriet Martineau* (1927); F. S. Marvin, "Harriet Martineau: Triumph and Tragedy," in *Hibbert Journal*, vol. xxv (1928). (H. E. BAR.)

MARTINEAU, JAMES (1805–1900), English philosopher and divine, was born at Norwich, of Huguenot ancestry, on April 21, 1805, the seventh child of Thomas Martineau and Elizabeth Rankin, the sixth, h i senior by almost three yenrs, being his sister Harriet (*see* MARTINEAU, HARRIET). James was educated at Norwich Grammar school and at the private academy of Lant Carpenter at Bristol. On leaving, he was apprenticed to a civil engineer at Derby, but in 1822 entered Manchester college, then lodged at York n-ith a view to entering the Unitarian ministry.

On leaving the college in 1827 Martineau taught for a time in his old school at Bristol. From 1828 to 1832 he mas junior minister of a Presbyterian church in Dublin, but resigned on a matter of conscience. He was called to Liverpool, and there for a quarter of a century exercised extraordinary influence as a preacher. In 1840 he was appointed professor of mental and moral philosophy and political economy in Manchester New college, which had been moved to Manchester. This position he held for 4j years (until 188j). In 1853 the college moved to London, and four years later Martineau followed. In 1858 he became minister of Little Portland Street chapel in London. Martineau received many academic honours. He died in London on Jan. 11, 1900.

Martineau's most characteristic and stimulating works are his sermons, published as *Endeavours after a Christian Life* (1st series, 1843; 2nd series, 1847); *Hours of Thought on Sacred Things* (1st series, 1876; and series, 1879); the various hymnbooks he issued at Dublin in 1831, at Liverpool in 1840, in London in 1873; and the *Home Prayers* in 1891. Martineau just escaped the active period of the old Unitarian controversy. But its presence is felt in his *The Rationale of Religious Inquiry* (1836), and later in his *Types of Ethical Theory* (1885) and *A Study of Religion* (1888) and, in some measure, in *The Seat of Authority in Religion* (1890). Martineau's theory of the religious society or church was that of an idealist rather than of a statesman or practical politician. He stood equally remote from the old voluntary principle, that "the State had nothing to do with religion," and from the sacerdotal position that the clergy stood in an apostolic succession, and either constituted the church or were the persons into whose hands its guidance had been committed. He hated two things intensely, a sacrosanct priesthood and an enforced uniformity. He may be said to have believed in the sanity and sanctity of the state rather than of the church. Statesmen he could trust as he would not trust ecclesiastics. And so he even propounded a scheme, which fell stillborn, that would have repealed uniformity, taken the church out of the hands of a clerical order and allowed the co-ordination of sects or churches under the state. Not that he would have allowed the state to touch doctrine, to determine polity or discipline; but he would have had it to recognize historical achievement, religious character and capacity: and endow out of its ample resources those societies which had vindicated their right to be regarded as making for religion. His ideal may have been academic, but it was the dream of a mind that thought nobly both of religion and of the state.

Jackson, *James Martineau, a Biography and a Study* (1900); H. Sidgwick, *Lectures on the Ethics of Green, Spencer and Martineau* (1902); J. Hunt, *Religious Thought in England in the 19th Century*.

MARTINET, a military term (generally used in a disparaging sense) implying a strict disciplinarian or drillmaster. The term originated in the French army about the middle of Louis XIV's reign, and was derived from Jean Martinet, who as lieutenant colonel of the king's regiment of foot and inspector general of infantry, drilled and trained that arm in the model regular army created by Louis and the marquis de Louvois between 1660 and 1670. Martinet seems also to have introduced the copper pontoons with which Louis bridged the Rhine in 1672. He was killed; as a *maréchal de camp*, at the siege of Duisburg in the same year, being accidentally shot by his own artillery while leading the infantry assault. His death, and that of the Swiss captain Soury by the same discharge, gave rise to a bon mot, typical of the polite ingratitude of the age, that Duisburg had cost the king only a martin and a mouse.

The "martin" as a matter of fact shares with the marquis de Vauban and other professional soldiers of Louis XIV the glory of having made the French army the first and best regular army in Europe. Great nobles, such as the vicomte de Turenne, Prince de Condé and the duke of Luxembourg; led this army and inspired it, but their fame has obscured that of the men who made it manageable and efficient.

It was about this time that the soldier of fortune, who joined a regiment with his own arms and equipment and who had learned his trade by varied experience, began to give place to the suldier regularly enlisted as a recruit in permanent regiments and trained by his own officers. The consequence of this happening was the introduction of a uniform, or nearly uniform, system of drill and training.

Thus, Martinet was the forerunner of Leopold of Dessau and Frederick William, just as Jean Jacques de Fourilles, the organizer of the cavalry, who was forced into an untimely charge at Seneffe (1674) by a brutal taunt of Condé, and there met his death, was the forerunner of Hans von Zieten and Friedrich von Seydlitz. These men, while differing from the creators of the Prussian army in that they contributed nothing to the tactics of their arms, at least made tactics possible by the thorough drilling and organization they imparted to an army.

MARTÍNEZ DE LA ROSA, FRANCISCO DE PAULA (1787–1862), Spanish statesman and man of letters, whose distinguished career in politics and literature rings strangely hollow in a revolutionary epoch, was born in Granada, March 10, 1787. He was a member of the *Cortes* de Cádiz (1812) and his first prose comedy, *Lo que puede un empleo*, was played there. He was called from exile to be minister in the interregnum (1820–23) and again after further exile in France to be prime minister and creator of a constitution. the Estatuto Real (1834), which pleased nobody: but was happier in later years as ambassador (Paris. 1843. 1846 and Rome, 1847) and president of the Xteneo and academy. In literature: similarly, he progressed elegantly but without intimate conflict from Moratinian comedy. Xlfierian tragedy and an unexceptional *Arte poética* to the presentation of the first violently romantic drama. *La conjuración de Venecia* (April 23, 1834), a startling amalgam in prose of conflicts, passions. vengeance and cemeteries. His abundant neoclassical poetry reveals a lifelong interest in national history. He died at Madrid, Feb. 7, 1862.

See J. Sarrailh, *Un homme d'état espagnol* (19.30). (R. F. B.)

MARTÍNEZ RUIZ, JOSÉ: *see* Azorín.

MARTINEZ SIERRA, GREGORIO (1881–1948), one of the outstanding Spanish dramatists and producers of the 20th century, was born at Madrid on May 6, 1881. He published his first work, El *Poema del Trabajo,* at the age of 17, and although his true vocation was the theatre, he first won recognition as a poet and critic with *La Tristeza del Quijote* (1905) and *Tu eres la Paz* (1906). His best plays were *Cancidn de Cuna* (1911; *Cradle Song), Primavera en otoño* (1911; *The Romantic Young Lady). El Reino de Dios* (1916; *The Kingdom of God)* and *Los Pastores* (1913; *The Two Shepherds).* These owed much of their success in London and New York to the translations by Harley Granville-Barker. His *Un Teatro de arte en España* (1926) describes his work at the Teatro Eslava. Madrid, of which he was director from 1917 to 1928. He died at Madrid on Oct. 1, 1948. (W. F. Se.)

MARTÍNEZ ZUVIRÍA, GUSTAVO: *see* Wast, Hugo.

MARTINI, GIOVANNI BATTISTA (1706–1784), Italian musician. was born at Bologna on April 24, 1706. He was received as a Minorite on Sept. 11, 1722. In 1725 he became chapelmaster in the Franciscan church at Bologna, where he opened a school of composition at which several celebrated musicians were trained. He consistently declared his preference for the traditions of the old Roman school of composition. Padre Martini was a zealous collector of musical literature and possessed an extensive musical library which passed at his death to the Imperial library at Vienna and the city of Bologna; Burney estimated the collection at 17,000 volumes. He died at Bologna on Aug. 4, 1784 His *Elogio* was published by Pietro della Valle at Bologna in the same year.

Martini's father, Antonio Mario Martini, a violinist. had taught him the elements of music, and he had later learned singing and harpsichord playing from Padre Pradieri and counterpoint from Antonio Riccieri. His education in classics he received from the fathers of the oratory of San Filippo Neri. His canons were published about 1800. edited by Pio Cianchettini.

MARTINI, JOHANN PAUL AEGIDIUS (1741-1816) German musician, sometimes also known as Martini Il Tedesco, was born in Freistadt on Sept. 1. 1741. When he was only 10 he became organist at the Jesuit seminary at Neustadt and at 17 held the same position at the Franciscan convent at Freiburg. He soon determined to move to France, however, and first settled at Nancy. There he changed his family name, Schwartzendorf, to Martini, by which he was known thereafter. and entered the service of King Stanislaus I of Poland, then living in France. After the king's death, Martini went to Paris. where he remained for the rest of his life. He published his highly popular opera *L'Amoureux de quinze ans* in 1771. For a time, he served as conductor of the Théâtre Feydeau, and later became inspector of the Paris conservatory, following nhich he was made professor of composition there He was forced to retire in 1802 but when Louis XVIII came to power in 1814 he made Martini superintendent of court music Martini died in Paris. Feb. 10, 1816. Besides his considerable output of music both secular and religious, he wrote *Mélopée moderne,* a study of vocal music.

MARTINI (di Martino), **SIMONE** (*c* 1284–1344) Italian painter, incorrectly called Simone Memmi by Giorgio Vasari, was an early and important exponent of Gothic painting who did more than any other artist to spread the influence of Sienese painting He was very possibly a pupil of Duccio di Buoninsegna (*q.v*). from whom he inherited his love of harmonious, pure colours and most of his early figure types. To these he added a gracefulness of line and delicacy of interpretation which were inspired by French Gothic works, which the young artist studied in Italy. He carried to perfection the decorative line of the Gothic style. and he subordinated volume to the persuasive rhythm of this line, giving his figures a transcendental beauty and grace.

ALINARI

SAINT CLARA AND SAINT ELIZABETH BY SIMONE MARTINI. IN THE CHURCH OF S. FRANCESCO. ASSISI

Simone's earliest documented work is the large fresco in the Sala del Mappamondo of the Palazzo Pubblico, Siena. representing the "Madonna Enthroned with the Child. Angels. and Saints." This painting, signed and dated 1315, but retouched by Simone himself in 1321, is a free version of the main representation in Duccio's "Maestà" of 1308–11. However, the abstract character and lack of setting of the earlier work has given way to concrete concepts: Simone's Virgin, crowned and splendidly attired, is a Gothic queen who holds court under a Gothic canopy. About 1317 the artist painted in Naples the highly spiritual altarpiece "St. Louis of Toulouse Crowning His Brother, King Robert of Anjou," now in the Museo di Capodimonte in that city. Two or three years later he composed for Sta. Caterina. Pisa, a colouristically magnificent Madonna polyptych, which is now in the Museo Nazionale. Pisa. Perhaps in the middle of the 1320's he began the ten scenes, full of chivalrous ideals, from the life of St. Martin of Tours in this saint's chapel in the lower church of S. Francesco, Assisi. More down to earth is the equestrian portrait of 1328 in the Palazzo Pubblico. Siena, representing Guidoriccio da Foligno, general of the Sienese Republic. On the other hand, deliberately unreal is the "Annunciation" triptych, painted for the Cathedral of Siena. but now in the Uffizi gallery, Florence. Simone signed this work in 1333 with his brother-in-law, the Sienese painter Lippo Memmi, an associate for many years. The exquisite rhythm of the lines and dematerialized forms of Gabriel and Mary in the central part of the "Annunciation" led many artists to imitation, but none of them achieved as vibrant contours and as spirited forms as did Simone in this great masterpiece. In 1339 the painter settled at the papal court in Avignon, where he remained until his death in 1344, and where he made the acquaintance of Petrarch. He executed for the poet a portrait of his beloved Laura! as is known from two of Petrarch's sonnets, in which Simone is eulogized.

Simone was the most important Sienese painter after Duccio. His influence in Siena was great in the 14th century and considerable in the 15th. His art was imitated by local painters in Naples, Pisa. Orvieto, Assisi, and Avignon.

Bibliography.—Giovanni Paccagnini, *Simone Martini* (1955) with a comprehensive bibliography. Useful discussions of Simone's life and art in English are to be found in Raimond van Marle, *The Development of the Italian Schools of Painting,* vol. 2 (1924); and in Curt H. Weigelt, *Sienese Painting of the Treceiato* (1930). For Petrarch's references to Simone's portrait of Laura consult Francesco Petrarca, Le *Rime* (1929), sonnets LVIII and LIX, no. LXXVII and LXXVIII.

(G. M. Cr.)

MARTINIQUE, an island in the Lesser Antilles (West Indies) and a French overseas *département,* located 25 mi. S. of Dominica and 20 mi. N. of St. Lucia, about 14° 40' N. lat. and 61° W. long. Its area is 431 sq.mi. The island is 43.5 mi. long. with its greatest width 19 mi. A cluster of volcanic mountains in the north, a similar group in the south and a line of lower heights in between form the backbone of the island. Its deep ravines and precipitous escarpments are clothed in forest. Mt. Pelée in the north is the culminating point (4.554 ft.); that of Carbet reaches 3,911 ft.; the mountains in the south are much lower.

On the northwest and north the coast is elevated; on the south a lateral range, branching from the backbone of the island, forms a blunt peninsula hounding the low-shored bay of Fort-de-France. Another peninsula, Caravelle, projects from the middle part of the east coast, and south of this the coast is low and fretted, with many islets, cays and coral reefs. Plains, most numerous and extensive in the south, make up about one third of the total area.

History.—Martinique (Madinina), occupied originally by the Arawakan Indians, then conquered by the Cariban Indians, was probably discovered by Christopher Columbus on June 15, 1502. On June 25, 1635 possession was taken of the island in the name of the French Compagnie des fles d'Amérique. Actual settlement was carried out by Pierre Belain, sieur d'Esnambuc, captain general of the island of St. Christopher. In 1637 his nephew Dyel Duparquet became captain general of the colony, now numbering 700 men, and subsequently obtained the seigneury of the island by purchase from the company under the authority of the king of France.

In 1654 welcome was given to 300 Jews expelled from Brazil, and by 1658 there were at least 5,000 persons exclusive of the Caribs. The latter, pushed into the east; disappeared after many wars or were assimilated. Purchased by the French government from Duparquet's children for 120,000 livres, Martinique was assigned to the West India company, but in 1674 it became part of the royal domain.

The *habitants* (French landholders) at first cultivated cotton and tobacco, but in 1650 sugar planting began and in 1723 the coffee plant was introduced. Slave labour was an early feature (there were 60,000 Negroes in the island by 1736). In 1666 and 1667 the island was attacked by the British, but hostilities were terminated by the treaty of Bred?. The Dutch made similar attempts in 1674 and the British again in 1693 Life in Martinique during the 17th century is well described in the works of R. P. du Tertre and R. P. Labat. Captured by Adm. George Rodney in 1762, Martinique was restored to the French in 1763 but after the conquest by Sir John Jervis and Sir Charles Grey in 1793 it was retained by the British for eight years. Seized again in 1809, it was not surrendered till 1814. The island was the birthplace of the empress Josephine.

Slavery was abolished in 1848 through the initiative of the French reformer Victor Schoelcher and all the inhabitants became French citizens.

Martinique suffered from occasional hurricanes causing much damage to the sugar crops, as in 1767 when 1,600 persons perished, 1839, 1891, 1903 and 1928. But the most terrible natural disaster was the eruption of Mount Pelée in 1902, when St.-Pierre, formerly the chief commercial centre and the largest city of the island, was destroyed. Early in the year various manifestations of volcanic activity occurred; on April 25 there was a heavy fall of ashes and on May 2 and 3 a big eruption destroyed extensive sugar plantations north of St.-Pierre and caused a loss of some 150 lives, but on May 8 the final calamity came without warning when a mass of fire swept over St.-Pierre, destroying all but a single ship in the harbour. The total loss of life was estimated at 40,000. Besides St.-Pierre, one tenth of the island was devastated. Another series of eruptions took place in 1929.

From 1940 to 1945 Martinique was under the Vichy regime of France. It became a *département* in 1946.

Social and Economic Conditions.—The population (1954 census) was 239,130. The bulk of the population is Negro, ranging from the sacatras, who retain little trace of European blood, to the *sangmêlé*, with only a touch of Negro commixture.

The capital is Fort-de-France, on the bay of the same name, with a population in 1954 of 40,380. Other principal centres of population are Le Lamentin on the bay of Fort-de-France, and Le François and Robert on the east coast.

The dominant crop is sugar. Bananas are produced, also pineapples, cacao and coffee. Rum; sugar and bananas make up most of the exports. Imports embrace rice, flour and other foodstuffs, petroleum products and textiles. *See* also Index references under "Martinique" in the Index volume. (L. W. BE.; HU. DE.)

MARTINUZZI, GYÖRGY (properly JURAJ UTJEŠENOVIĆ) (1482–1551), Hungarian statesman, known in Hungarian history as FRATER GYÖRGY or simply THE FRATER, was born at Kamičic, Croatia. From 8 to 20 years of age he was attached to the court of John Corvinus: subsequently he saw something of warfare under John Zapolya but, tiring of a military life, he entered the Paulician Order when he was 28. His historical career began when his old patron Zapolya (who had become king of Hungary) forced to fly before his successful rival Ferdinand, afterward the emperor Ferdinand I, sent him on a diplomatic mission to Hungary. It was through his tact and ability that John recovered Buda (1529), and henceforth Frater Gyorgy became his treasurer and chief counselor.

In 1534 Martinuzzi became bishop of Nagyvarád (Grosswardein); in 1538 he concluded with Austria the peace of Grosswardein, which left Zapolya with the royal title and most of Hungary. On Zapolya's death (1540) Martinuzzi acted as guardian and regent for his infant son John Sigismund, for whom on Dec. 29, 1541, he concluded the treaty of Gyula with the sultan, which left an enlarged Transylvania as an independent principality under Turkish suzerainty. For a time Martinuzzi kept Transylvania neutral and on friendly terms with both Austria and the Porte. In 1550, however, the queen-mother Isabella, who hated him, contrived against him with the hospodars of Moldavia and Walachia and the Turks. Martinuzzi defeated all his enemies and concluded a composition confirmed by the diet of Kolozsvár (1551) whereby Isabella renounced her rights over Transylvania, in her son's name, to Ferdinand of Austria.

The Frater retained the governorship of Transylvania, and was subsequently consecrated cardinal and archbishop of Esztergom. Thus Hungary was once more reunited, but the inability of Ferdinand to defend it against the Turks, as promised: forced the Frater to resume payment of tribute to the Porte in Dec. 1551. Ferdinand, however, suspecting the cardinal's loyalty, had him assassinated at Alvinczy (Dec. 17, 1551). Ferdinand took the responsibility of the murder on himself. He sent to Julius III an accusation of treason against the Frater in 87 articles and the pope exonerated Ferdinand of blame.

MARTIUS, KARL FRIEDRICH PHILIPP VON (1794–1868), German botanist and traveler who studied the flora of Brazil, was born on April 17, 1794, at Erlangen, where he graduated M.D. in 1814. He afterward devoted himself to botanical study, and in 1817 was sent to Brazil by the king of Bavaria. In 1820 he was appointed conservator of the botanic garden at Munich, and in 1826 professor of botany in the university; he held both offices until 1864. His chief publications include: *Nova Genera et Species Plantarum Brasiliensium* (3 vol., 1823–32); *Icones selectae plantarum cryptogamicarum brasiliensium* (1827); *Historia palmarum* (3 vol., 1823–50); and an account of his travels in Brazil (3 vol., 1823–31). In 1840 he began the *Flora Brasiliensis*, with the assistance of other botanists.

Martius died at Munich on Dec. 13, 1868. The *Flora Brasiliensis* was not completed until 1906. It was edited after Martius' death, first by A. W. Eichler and then by I. Urban.

MARTYN, HENRY (1781–1812), English missionary to India, was born on Feb. 18, 1781, at Truro, Cornwall. He was educated at Truro grammar school and St. John's college, Cambridge, and was senior wrangler and first Smith's prizeman in 1801. In 1802 he became a fellow of his college. He obtained a chaplaincy under the East India company and left for India on July 5, 1805. He translated the whole of the New Testament into Hindi, and into Persian twice, and the Psalms into Persian, the Gospels into Judaeo-Persian, and the Prayer Book into Hindustani. Ordered by the doctors to take a sea voyage, he went to Persia to correct his Persian New Testament, whence he wished to go to Arabia and there compose an Arabic version. He set out from Bombay in Jan. 1811 for Bushire. After an exhausting journey from the coast he reached Shiraz and was soon plunged into discussion with the disputants of all classes. Having made an unsuccessful journey to Tabriz to present the shah with his translation of the New Testament, he fell ill with fever and had to seek a change of climate. On Sept. 12, 1812, he started with two Armenian servants. Although the plague was raging at Tokat (near Eski-Shehr in Asia Minor), he was compelled by prostration to stop there. On Oct. 6, he died.

MARTYN, JOHN (1699–1768), English botanist, author and translator of Virgil *(see* below), was born in London on Sept. 12, 1699. From 1733 to 1761 he was professor of botany at Cambridge and from 1730 to 1752 a physician at Chelsea; where he died on Jan. 29, 1768.

His reputation rests chiefly upon his translations, with critical notes. of the Georgics (1741) and Bucolics (1749) of Virgil and his *Historia plantarum rariorum* (1728–1737), describing and illustrating in colour noteworthy plants. The work was discontinued after five parts were published.

See G. C. Gorham, *Memoirs of John Martyn and Thomas Martyn* (1830). (J. W. Tr.)

MARTYROLOGY, a catalogue or list of martyrs or, more exactly, of saints, arranged in the order of their anniversaries. This is the accepted meaning in the Latin Church. In the Eastern Church the nearest equivalent to the martyrology is the Greek Synaxarium. As regards form, we should distinguish between simple martyrologies, which consist merely of an enumeration of names, and historical martyrologies, which also include stories or biographical details. As regards documents, the most important distinction is between local and general martyrologies. The former give a list of the festivals of some particular church; the latter are the result of a combination of several local martyrologies. The most important ancient martyrology that has been preserved is in the form (mainly) of an enumeration of names and was falsely attributed to St. Jerome. The preserved form goes back to the end of the 6th century. It is the result of the combination of a general martyrology of the Eastern Churches; a local martyrology of the Church of Rome, some general martyrologies of Italy and Africa and a series of local martyrologies of Gaul. The task of critics is to distinguish between its various constituent elements. Unfortunately, this document is in a lamentable condition. Of the best known historical martyrologies the most famous is that of Usuard (*c.* 875), on which the Roman martyrology was based. The first edition of the Roman martyrology appeared at Rome in 1583. The third edition, which appeared in 1584, was approved by Gregory XIII, who imposed this martyrology upon the whole church.

BIBLIOGRAPHY.—"Hieronymian Martyrology," ed. by H. Quentin, with notes by H. Delehaye, in *Acta Sanctorum,* Nov. II, i (1931); H. Delehaye in *Catholic Encyclopedia,* vol. ix, pp. 741 ff. (1910); H. Achelis, *Die Martyrologien: Ihre Geschichte und ihr Wert* (1910).

MARTYRS, EARLY CHRISTIAN. The original meaning of the Greek word martys was "witness"; in this sense it is often used in the New Testament. Since the most striking witness which Christians could bear to their faith was to die rather than deny it, the word soon began to be used in reference to one who was not only a witness but specifically a martyr. This usage is present, at least implicitly, in Acts xxii, 20 and Rev. ii, 13. The first Christian martyrs were St. Stephen (Acts vi, 8–vii, 60) and St. James (Acts xii, 2). Of the Apostles the most important martyrs were SS. Peter and Paul, both put to death at Rome (I Clement v). Clement of Rome describes them as God's athletes, contending for the heavenly prize, and mentions a "great multitude" executed at the same time (probably under Nero; *cf.* Tacitus, *Ann.,* xv, 44). Early in the 2nd century Ignatius of Antioch described his own prospective martyrdom as a way of "attaining to God" and urged the Roman Christians not to make any effort to have him spared.' In the sporadic persecutions of the first two centuries martyrdoms were not especially frequent, but the martyrs mere highly regarded by Christians (the emperor Marcus Xurelius viewed their constancy as theatrical). The earliest authentic "Acts of Martyrs" surviving are those of Justin at Rome *c.* 165, of Polycarp at Smyrna c. 167, of about 50 Christians at Lyons and Vienne (Gaul) in 177 and of a few at Scillium in Africa in 180. In addition, from the Roman side there are letters exchanged by Pliny the Younger, legate in Bithynia-Pontus, and the emperor Trajan in the year 112 (Pliny, *Ep.,* x, 96–97). From all these accounts something of the procedure involved can be made out. The government's position was not entirely clear. Were Christians to be condemned as Christians because of specific criminal charges or because of crimes inherent in the profession of Christianity? In any event, they were ordered to prove their abandonment of Christianity by offering sacrifices to the Roman gods; when they refused to do so, they were executed. Veneration of a martyr's relics is first attested in the *Martyrdom of Polycarp.*

With the passage of time and with a fresh emphasis on martyrdom (often regarded as a substitute for baptism) in the persecutions under Decius (A.D. 250) and Diocletian (A.D. 303–311), the authentic acts of the early martyrs were often replaced by legendary accounts (for instance, none of the versions of the death of Ignatius is genuine). Though doubts about these new narratives had arisen earlier, it was not until the late 19th century that the study of martyr acts was placed on a secure foundation, above all by the writings of the Bollandist Hippolyte Delehaye, who applied literary and historical criticism to these acts with significant success. After his time the study was advanced by the work of Herbert Musurillo, who carefully examined the papyrus fragments that record the difficulties of Alexandrian "martyrs" before various Roman emperors. These accounts do not provide prototypes of the martyr acts (closer parallels are found in such Hellenistic Jewish writings as IV Maccabees), but they reflect the kind of situation out of which martyr acts arose.

(R. McQ. G.)

MARUTS, the storm-gods of Hindu mythology, prominent in the Rig-Veda which makes them sons of Rudra but associates them with Indra, the goddesses Indrani and Saraswati and more closely with Rodasi, their beauteous bride. Yet they are sometimes hostile to Indra and rend Vritra, the "drought," in pieces. In the epic era they appear to be the Maruta, the winds, sons of the benevolent earth-goddess, Aditi.

MARVEL, IK: *see* MITCHELL, DONALD GRANT.

MARVELL, ANDREW (1621–1678), English poet, whose political reputation overshadowed appreciation of his unique gifts as a poet until the 20th century, was born on March 31, 1621, at Winestead, Yorkshire, where his father was rector. The latter moved in 1624 to become master of the Charterhouse, an almshouse (with a garden) just outside the city wall of Hull, and preacher (not incumbent) at the parish church. The boy attended Hull grammar school, and in his 13th year (like other boys from schools which did not carry education very far) proceeded to the university. He was a sizar at Trinity college, Cambridge: from 1633 to 1638, when he became a scholar, and took his B.A. in 1639. In Jan. 1641 his father was drowned when crossing the Humber, which may account for Marvell's departure from the university. Otherwise he would have proceeded M.A. and, being a first-rate scholar without great worldly ambition, would probably have enjoyed a distinguished academic career. One Greek and one Latin poem survive from his university days and also a well-authenticated story that he was temporarily led away by the Jesuits.

He had his living to earn. His brother-in-law Edmund Popple, a Hull merchant, probably took him into his office, but for four years, almost certainly 1642–46, he traveled on the continent, to Holland, France, Italy and Spain, thus missing the Civil War. He can only have done this as a tutor, almost certainly to one of the Skinner family of which Milton's friend Cyriack is the best known. At Rome he met Richard Flecknoe (*q.v.*), whom he satirized in a style reminiscent of both Horace and Donne. Back in England he may have contemplated a literary career in royalist circles, as the poems on Richard Lovelace. Lord Hastings and Lord Francis Villiers, younger brother of the 2nd duke of Buckingham, suggest; but Uorkshire drew him, and about 1651–52 he was tutor at Nun Appleton to Lord Fairfax's daughter Mary. Perhaps his political views were changing, but in neither religion nor politics was he ever a bigoted partisan. A moderate man, he was more influenced by persons than principles. His one firm persuasion was English patriotism. Now, though he admired Charles I's demeanour on the scaffold and though in 1651 he wrote scathingly about the Puritan historian Tom May, Oliver Cromwell's strength of character won him over ("An Horatian Ode upon Cromwell's

Return From Ireland" 1650). In 1653 Milton made an abortive attempt to get him appointed his assistant in the Latin secretaryship. Instead he became tutor to Cromwell's ward William Dutton from 1653 to 1657, at first at Windsor in the house of John Oxenbridge who had been to Bermuda (*cf.* "Bermudas"), later at Saumur, France, where there was a noted Protestant academy. In 1657 Marvell was himself appointed Latin secretary (*i.e.,* foreign secretary) under John Thurloe, the secretary of state, an office he held till the Restoration. Though poems on "The First Anniversary" (1655) and "On the Death of O.C." show his continued and growing admiration of Cromwell, his role was that of the civil servant, not the politician. His political career began with his election as M.P. for Hull in Richard Cromwell's parliament (1659). He was re-elected in 1660 and 1661 and was a house of commons man for the rest of his life. Dissatisfaction with Clarendon's government, especially the disastrous conduct of the Dutch War of 1664–67, appears in the long, witty and still most readable "Last Instructions to a Painter," written in 1667 but, like all but one of his political satires, not published till after the Revolution. In the next decade alarm about the king's intentions produced the anonymous *An Account of the Growth of Popery and Arbitrary Government in England* (1677), purporting to have been printed at Amsterdam. Traces survive of his close touch with the leaders of the Country party, but the long series of newsletters to the Hull corporation is concerned mostly with bare facts. The corporation paid him 6s. 8*d.* for each day's parliamentary attendance and also sent presents in kind. The only long break in attendance was in 1663–65 when he went as secretary on an embassy to Russia.

In 1678 Marvell, who seems to have been unmarried, had an attack of fever at his London lodgings and died on Aug. 18 through medical incompetence. He had in his charge 5500 belonging to two Hull friends who hoped thereby to save something from their bankruptcy. They arranged with his housekeeper-servant, Mary Palmer, to claim that she was his widow and entitled to his property. Marvell's Hull relations took out letters of administration for his property there, but Mary Palmer, finding his manuscript poems, had them published as "of my late dear Husband" (*Miscellaneous Poems by Andrew Marvell, Esq.,* 1681) : the object was probably not to make money by poems quite out of fashion but to bolster up the claim to widowhood. Otherwise most of the poems might have been lost for ever, or, like Thomas Traherne's, accidentally discovered two centuries later.

The 1681 volume was accurately described as miscellaneous. Its 58 items even include a letter and four prose epitaphs. Whatever poems, early or late, have not survived, the variety of Mary Palmer's haul suggests that it included what Marvell thought his best. There are, for example, a few dialogues, moral, pastoral or pastoral-moral; a few poems full of "metaphysical" conceits ("The Definition of Love" is as intellectual as anything of Donne's, and "To His Coy Mistress" sets playfulness against a sternly sublime background) ; two characteristically 17th-century "weeper" poems ("Eyes and Tears," "Mourning") ; one narrative ("The Nymph Complaining for the Death of Her Faun") in a unique way reminiscent of the Civil War; one meditative description of a portrait ("The Picture of little T.C.") ; two personal satires ("Flecknoe" and "Tom May's Death"), one without and one with venom. The group of Mower poems probably belongs to the Nun Appleton period, as the two local poems ("Upon the Hill and Grove at Bill-borow" and "Upon Appleton House") and "To Doctor Witty" certainly do. The moment of deepest experience in "Upon Appleton House" is similar to that in "The Garden" ("My Soul into the boughs does glide"), which on the evidence of its last stanza can also be ascribed to the two years of bliss with Fairfax: but a poet's maturest expression is based on repeated experiences, and it is not fanciful to trace to the Charterhouse garden the beginning of Marvell as the garden-loving poet.

Other poems of the 1650s can be dated by their subject-matter. "An Horatian Ode" (Horatian, *i e.,* not Pindaric), the two other Cromwell poems and "Bermudas" have been mentioned above. *The Character of Holland,* a satire of more than Hudibrastic wit, was occasioned by the Dutch War of 1652–54; "On a Victory Obtained by Blake" (1657) by the Spanish War; "Two Songs" by the marriage of Cromwell's daughter Mary (1657). Latin poems for diplomatic occasions indicate the aspirant to scholarly government service. Much later (1674) is the poem prefixed to the second edition of Milton's *Paradise Lost.* It occurs, oddly, near the middle of the volume. The arrangement of the contents cannot have been Marvell's but. with exceptions, it is intelligent and systematic, and is presumably the publisher's. He misplaced "Bermudas" through ignorance. and the pastoral "Dialogue Between Thyrsis and Dorinda" perhaps because it was a late find while the book was in the press. Though not a great poem, it is interesting: first, because in part at least it is known to have been in existence in 1643; secondly, because it was published (without the author's name) as words to music in 1659. At the last moment the publisher of the folio took fright about the three English Cromwell poems ("An Horatian Ode," "The First Anniversary," "Upon the Death of O.C.") and cut them out.

Though it cannot be proved that none of the *Miscellaneous Poems* (except that to Milton and Latin suggestions for an inscription on the Louvre) were written after the Restoration. it is improbable both for stylistic reasons and because it is known that Marvell became more and more absorbed by politics. He did from 1667 onward write anonymous verse satires, but, with exceptions, it is not easy to be sure which of those popularly (or conveniently) ascribed to him after his death in 1678 were really his. They circulated in manuscript and were printed after the Revolution in *Poems on Affairs of State* (1689–1716). His acknowledged success was in prose, *The Rehearsal Transpros'd* (1672–73). This was a witty best-seller and laughter-causer of the day, an attack on an ecclesiastico-political adversary, Samuel Parker, subsequently James II's bishop of Oxford and president of Magdalen college.

In the same vein as *The Rehearsal Transpros'd* was *Mr. Smirke: or the Divine in Mode* (1676; again a title taken from a current play). Marvell at this time developed an interest in the origins of the early church which produced *A Short Historical Essay Touching General Councils, Creeds, and Impositions in Matters of Religion* (1680), a pamphlet cutting the ground from the usual Protestant view of the first four centuries and well on the way to the deism of his nephew William Popple, author of *A Rational Catechism* (1687).

Achievement and Reputation.—While Marvell's controversial prose is now interesting only to specialists, and while his verse satire is far inferior to Dryden's and no better than that of dozens of his contemporaries, his small but exceptionally varied collection of miscellaneous poetry has continued to rise steadily in the estimation of general readers ever since Charles Lamb may be said to have discovered it. After Donne, perhaps even together with Donne. he is the finest of those many fine amateur poets of the earlier 17th century who wrote, not for publication, but for their own pleasure and that of their friends, and whose poetry reflects so much of what is most attractive in the culture and society in and out of which it was written. While no poetry could well be more original, could more unmistakeably reveal the hand of its author, than Marvell's, it is at the same time continuously dependent on the example and stimulation of predecessors and contemporaries. This is one of the great differences between Marvell and Donne; for, while Donne seems to have resolved to write in a manner in which no English poet had ever written before. Marvell, it might almost be said, was willing to accept, to exploit and to re-combine anything that had ever made poetry enjoyable. He is the only great metaphysical poet who did not break with the Elizabethan past, and who combines something of Donne's dialectic and ingenuity with a pastoral, pictorial and descriptive content which may be regarded as a development both of Elizabethan pastoralism and of those "catalogues of delights" (they seem to begin with Theocritus' description, imitated by Ovid, of Polyphemus' wooing of Galataea) of which Marlowe's *Passionate Shepherd* inspired so many imitations and of which even Milton's *L'Allegro* and *Il Penseroso* may be regarded as examples. Marvell, in fact, is the most eclectic of all 17th-century poets, and his originality consists very largely in the beauty and piquancy of his various combinations of old and new.

In spite of two 18th-century editions no one before Charles Lamb took any real interest in Marvell's poetry. He was revered as an incorruptible Whig, a republican of complete integrity. Wordsworth linked him with Algernon Sidney and James Harrington. In the 19th century he was republished and anthologized. but not till the 20th was he fully recognized as nature-mystic. meditative patriot, wit of great depth and superb master of the octosyllabic couplet. (H. M. MA.; J. B. LN.)

BIBLIOGRAPHY.—*The Works of Andrew Marvell* were ed. by T. Cooke, 2 vol. (1726) and E. Thompson, 3 vol. (1776). Their rediscovery in the late 19th century was marked by A. B. Grosart's *The Complete Works in Prose and Verse of Andrew Marvell*, 4 vol. (1872–75). *Poems and Letters* were ed. by H. M. Margoliouth, 2 vol. (1927; 2nd ed., 1953); *Poems: Printed from the Unique Copy in the British Museum, With Some Other Poems,* were ed. by H. Macdonald (1952); and *Selected Poetry and Prose* was ed. by D. Davison (1952). *See* also P. Legouis, *André Marvell, Poète, Puritain, Patriote* (1928); M. C. Bradbrook and M. G. Lloyd Thomas, *Andrew Marvell* (1940), with a summary of the evidence about Mary Palmer. (H. M. MA.)

MARX, JOSEPH (1882–), Austrian composer and critic known for his songs. Born at Graz, May 11, 1882, he was a pupil there of E. W. Degner. He became professor at the musical academy in Vienna in 1914, and was appointed director in 1922. In 1924 he helped to found the Vienna *Hochschule* for music. In 1931 he became music critic of the *Neues Wiener Journal* and in 1946 of the *Wiener Zeitung*. He wrote over 100 songs. the earliest of which date from about 1900. In them the style of Brahms and Hugo Wolf is blended with that of French and Kussian songs. "Tuch der Tranen" and "Kolumbine" show the influence of Debussy, and the realistic "Windräder" has an affinity with Moussorgsky. Marx's texts include poems by Joseph von Eichendorfi. Goethe, Ruiner Maria Rilke and Stefan Zweig, and he also set German translations of poems by Verlaine, Pierre Louys and André Giraud. In the *Italienisches Liederbuch* (1907–12) on poems by Paul Heyse, Marx developed further the style of Wolf. Many of his songs, such as "Und gestern hat er mir Rosen gebracht" and "Valse de Chopin," are remarkable for their accompaniments and sense of musical imagery. He also wrote *Castelli Romani* for piano and orchestra. chamber works and symphonic poems. His criticisms were published under the title *Betrachtungen einer romantischen Realisten* (1947).

See A. Liess, *Joseph Marx: Leben und Werk* (1943).

MARX, KARL HEINRICH (1818–1883), German philosopher of history and the most important figure in the history of socialist thinking. was born. May 5, 1818, of Jewish parents in the town of Trèves (Trier) in Rhenish Prussia. In 1824 his father. a lawyer with a keen interest in philosophy. embraced Christianity and all members of the family were baptized as Protestants. During his student days at the universities of Bonn and Berlin. Marx studied history and philosophy and was strongly influenced by the works of Georg Wilhelm Friedrich Hegel (*q.v.*), an influence that always remained one of the most important elements in his thinking. In 1841 he received a doctor's degree from the University of Jena. His liberal political views led him to consider journalism as a career and in 1842 he became an editor of the *Rheinische Zeitung* in Cologne. The following year he married Jenny von Westphalen, close friend of his boyhood and daughter of a high government official. It was a marriage of deep love that withstood the vicissitudes of all the subsequent years. Shortly after his marriage. Marx's newspaper was suppressed and he emigrated to Paris with his wife. There he became acquainted with French socialist writers and established his lifelong friendship with Friedrich Engels. Both these influences led Marx to become a socialist.

In 1847, at a new place of exile in Brussels, Marx wrote a reply to P. J. I'roudhon's book *Philosophie de la misère* ("Philosophy of Poverty") and entitled it *Misère de la philosophic* (Eng. trans., *Poverty of Philosophy*, 1935). In it he developed the fundamental propositions of his economic interpretation of history. Against I'roudhon's (and the utopian socialists') quest for the morally moat desirable social order he put his own search for the inevitable; *i.e.*, the system that would by necessity result from the operation of historical forces. Another even more important document originated from Marx's (and Engels') pen during the stay in Brussels—Dns *Kommunistische Manifest* (1848, many reprints; Eng. trans. by Samuel Moore, 1888), which contains a summary of his whole social philosophy. It was written to serve as the platform of the Communist league. *The Communist Manifesto* appeared at a moment most favourable to its effectiveness: on the eve of the February (1848) revolution in France during which socialism showed its power.

The revolutionary atmosphere in Germany in 1848 made it possible for Marx to return to Cologne and revive his newspaper, now under the title of *Neue Rheinische Zeitung*, but in 1849 he was expelled. This time he settled in London, where he spent the rest of his life—most of it in dire poverty. Journalistic activity for the *New York Tribune*, whose managing editor was Charles A. Dana. a Fourierist, at times alleviated the distress. but only the generosity of Engels. who worked in the Manchester affiliate of his father's textile firm. protected the Marx family from starvation. Several of Marx's children died. among them his only son. Edgar. Of his three daughters who reached adult life, two married French socialists (Paul Lafargue and Charles Longuet); the third, after Marx's death, established an unhappy association with the British Marxist Edn·ard Aveling and ended by suicide. Marx died on Mar. 14, 1883, fifteen months after the death of his wife. He was buried at Highgate cemetery.

In spite of poverty and persistent illness. Marx proved himself a prolific writer. Anxious to apply his philosophy of history to the events in France. where civil war had broken out between the workers and the middle class in the summer of 1848, Marx wrote his booklet Die *Klassenkämpfe in Frankreich 1848 bis 1850* (1850/1859; Eng. trans. 1942) and followed it up with *Drr Achtzehnte Brumaire tics Louis Napoleon Bonaparte* (1852–1885; Eng. trans. by Eden and Cedar Paul. 1940)—both of them masterpieces of historiography. He gave a critical history of econoinic literature in his hook *Zur Kritik der politischen Ökonomie* (1859, Eng. trans. by N. I. Stone. 1904). His most famous work was Das *Kapital.* (The first volume appeared in 1867; second and third volumes were published posthumously in 1885 and 1894 edited by Engels. An English translation of the first volume by Samuel Moore and Edward Aveling appeared in 1886; a translation of the second and third volumes by Ernest Cntermann. 1907 and 1909.) In this hook Marx developed a theory of the capitalist system and its dynamism. nith emphasis on its self-destructive tendencies.

The only important organizational activity Marx ever undertook was his leadership of the International Workingmen's association, (the First International) beginning in 1864. Most of the time his own followers were only a minority among the members, but he balanced the various factions against each other with great skill and infinite patience and held out to them their common goals, until the conflict with the anarchists put an end to the International. With the British labour movement Marx had little contact. although in the International some British trade-unionists were for a time among his strongest supporters. In France, his influence during his lifetime was overshadowed by that of Proudhon (*q.v.*) and in Germany—at least up to the late 1870s—by that of Ferdinand Lassalle (*q.v.*) but Lassalle and his successor, J. B. von Schweitzer. were interpreters rather than opponents of many of Marx's ideas. (See MARXISM.)

Marx regarded tsarism as the greatest enemy of freedom in all of Europe. and he wished for a strengthening of British imperial power as a counterweight to Russia. He also had a great hatred of Napoleon III. He was opposed to Prussian hegemony over Germany as established by Bismarck hut asserted the right of the German people to unity: some utterances to the contrary not withstanding. Marx respected and even shared national feelings. Marx took a passionate interest in the American Civil War as a partisan of the North. In spite of his merciless criticism of bourgeois liheralism. Marx treasured the liberal-humanitarian tradition from which the socialist movement had sprung. and in all probability would have abhorred the antihumanitarian practices of present-day Communism. Rlarx did not live long enough to co-ordinate the strands in his great fund of ideas, and the anreconciled contradictions became a source of dissension among his intellectual heirs.

With the exception of Engels. Marx had no close, lifelong friend. To many of his contemporaries, he appeared coldly arrogant. conceited and full of hate. Whether these traits were part of his nature or merely a response to his many frustrations, is a question which none of his many biographers has convincingly answered. *See* references under "Marx. Karl Heinrich" in the Index volume.

BIBLIOGRAPHY.—Franz Mehring, *Karl Marx* (1918; Eng. trans. by Edward Fitzgerald. 1935); Otto Rühle. *Karl Marx, His Life and Work* (1928; Eng. trans. by Eden and Cedar Paul, 1929); Gustav Mayer, *Friedrich Engels* (1934; Eng. trans. by G. and H. Highet, 1936); Moscow Institut Marxisma-Leninisma. *Karl Marx, Chronik seines Lebens* (1934); Dona Torr (trans. and ed.), *Correspondence, 1846–1895* (1934).

Writings.—An exhaustive bibliography of those of Marx's writings which have been translated into English is given in the second volume of Donald D. Egbert and Stow Persons (eds.), *Socialism and American Life* (1952). In an appendix to his biography. Mehring gives a fairly complete list of the originals. The collected edition of Marx's and Engels' writings planned by the Institut Marxisma-Leninisma has remained incomplete; the collection contains (in original German) the earliest works, the complete correspondence between Marx and Engels in four volumes (1929–31) and an annotated edition of the *Anti-Dühring* (1935), including all preparatory notes that could be iound, and also Marx's comments on the draft. (C. L.)

MARX, WILHELM (1863–1946), German politician, was born at Cologne Jan. 15, 1863. He entered the political branch of the civil service and became a judge. In 1899 he nas elected to the Prussian diet and in 1910 entered the German reichstag, where he soon became prominent among the leaders of the Centre. He was elected president of the Centre party in 1921. and on Sov. 30. 1923, succeeded Gustav Stresemann as chancellor of the reich. In Xug. 1924 he took part in the Conference of London which determined the acceptance of the Dawes plan. (*See* GERMANY.) In the autumn of 1924 Marx dissolved the reichstag in the hope of getting a government majority, and after the elections retired from the post of chancellor. In Feb. 1925 he became Prussian minister-president for a short period. After the death of Friedrich Ebert he stood as candidate for the post of president of the reich. but was defeated by Paul von Hindenburg. In Jan. 1926 he became minister for justice and occupied territories in the second Luther cabinet and later in the same year succeeded Hans Luther as chancellor. He remained chancellor through the reshuffle on the entry of the German National party representatives into the cabinet, but resigned on June 13, 1928, partly owing to ill health. He lived in retirement until he died at Bonn, on Aug. 5, 1946.

MARXISM, a body of social doctrine worked out by Karl Marx in cooperation with his friend Friedrich Engels and systematized later by some of Marx's followers. especially Karl Kautsky. Marxism is a philosophy of history, implemented by an elaborate economic theory. This philosophy purports to demonstrate the inevitability of socialism (*q.v.*) and eventually of full communism (*q.v.*), the latter to be understood as a classless, collectivist order in which the social product is distributed according to needs and in which the state, law, money and the concept of economic value have lost their functions and therefore have "withered an-ay." The following are the most important elements of Marxist doctrine:

Determinism.— Fundamentally. Marxists believe that history is governed by laws which the human mind can recognize and which offer man a possibility to foresee the future of society in its most important characteristics. Marxist determinism has been expressed with particular vigour by Rosa Luxemburg. one of the most original minds among the Marxists, n-ho spoke of the "granite foundation of objective historical necessity," on which Marxism has huilt the socialist creed. in contrast to the "fog of pre-Marxian systems and schools of thought which wanted to derive socialism merely from the injustice and wickedness of the present world and relied merely on the revolutionary determination of the workers" (from an appendix to the second German edition of her book *Die Akkumulation des Kapitals,* p. 37).

Marxist determinism promises victory to the working class and thus is apt to strengthen the latter's self-conhdence in the class struggle. .but at the same time the question arises as to why workers should make sacrifices in order to bring about developments which are inevitable in any event. This problem is related to, though not identical with, the issue of free will versus causal necessity as known to general philosophy. For Marxists, this fundamentally insoluble dilemma is particularly important because they regard themselves not only as scholars but also as active promoters of social change,

Economic Interpretation of History.——What are the laws that govern history and can be made the basis of social prognosis? The first of these laws is supposed to determine the direction of the historical process. In its general form. the law says that economic developments are basic to social evolution in other areas. Ideas and institutions. law and politics. even religious concepts and artistic expression are parts of the social "superstructure." inevitably changing with the gradual transformation of the economic foundation. Since technological development leads to production units of ever increasing size. bringing together ever greater masses of workers in one enterprise and requiring ever larger amounts of capital per unit of labor, only the community at large will finally be able to provide the organizational frame work of production. This conclusion is supported by the theorem that the rate of profit will inevitably decline (*see* below).

Marxism does not contend that ideas exercise no influence on history, but merely that they are not independent agents; as intermediary links between economic developments and outward event-, ideas may he very important from a Marxist point of view. Nor do Marxist believe that man is exclusively motivated by selfish or "material" interests; they do maintain that altruism, religious devotion. patriotism or other "idealistic" feelings are themselves the products of economic conditions and of their direct and indirect effects on the human mind.

The most problematic point in the economic interpretation of history is the ambiguity of the concept of *economic* change. If all the developments in the field of production. distribution and consumption were included. it would seem true enough that in this wide field some causes of practically all ideological and institutional developments can be found, but also that many economic facts in this broad sense are just as much effects as they are causes oi changes in the "superstructure"; for instance, changes in artistic tastes, in political institutions, in social traditions and even in religious doctrines influence consumption of commodities and thereby become determinants of production. and law is as much a determinant as it is a product of economic life. Thus a maze of mutual causal relationships results and, with cause and effect undistinguishable in many instances. no social prognosis could be built on this foundation. Marx himself nowhere gave an explicit and comprehensive presentation of his economic interpretation of history. although fragmentary expositions and allusions are dispersed over all his writings. Engels, with Marx's endorsement, supplied more extensive explanations. especially in his polemical book *Herr Eugen Dühring's Revolution in Science*, but even he did not quite clear up the meaning of the term "economic" as used in this context.

To read as much consistency as possible into the Marxist system, it must be assumed that those changes which are regarded as basic to all others are physical and for the most important part. technological. Technological progress. although its speed is influenced by political. legal and other developments in the "superstructure." is very nearly irreversible. Under all sorts of institutional arrangements and irrespective of prevailing religious creeds and philosophies. man has improved his control over nature. although with varying degrees of effectiveness. This gradual perfection of technology depends on physical experiment and its mathematico-philosophical interpretation. Since the results can be recortied— either in memory and tradition or in books and laboratory files—the stock of knowledge about nature is certain to grow. anti thus technology moves along a one-way road: toward greater human command over nature. To the extent that the social consequences of this movement can be foreseen. the Marxist claim to forecasts of social evolution has indeed a firm foundation.

The assumption that Marx meant physical change when he designated economic change as basic to all social evolution is supported by a number of examples through which Marx and Engels tried to elucidate their basic proposition. This version of the economic interpretation of history is accepted by some Marxist writers, especially George Plekhanov and Nicolai Rukharin, but rejected by others. for instance by Sidney Hook.

Whatever version is accepted, one weakness' remains in the economic interpretation of history. True as it is that we think in a particular may because we happen to live in an age with a particular state of technology, we also think as we do because the dominant ideas of the present age were preceded by other ideas which had exhausted their fruitfulness or were discovered to be nithout an adequate basis in facts. The Renaissance folloned the middle ages not merely because improved shipping and perfection of all sorts of tools had increased trade, improved the crafts, opened new sea lanes and led to new discoveries. and thereby created a new type of man, but also because men by mere intellectual and spiritual effort had found the limitations of medieval thinking and feeling. The economic interpretation of history overstates its case by denying that man's intellectual and spiritual development possesses any autonomy; but this part of Marxism has greatly enriched all social sciences by drnning attention to technological progress as a cause of some very important aspects of cultural and institutional development.

The economic interpretation of history, although called "historical materialism" by Marx himself and many Marxists, has no essential relationship to philosophical materialism, and only a vague analogy exists between the two concepts.

Dialectics.—Marx tended to believe that all important historical progress is achieved through an all-out conflict between an old and a new principle of social organization, and that consequently progress would be impeded if the tension between these two principles were "prematurely" reduced by limited reforms of the old system. This belief is based on dialectic philosophy, which Marx took over directly from the German philosopher Hegel and indirectly from ancient Greek philosophers. For the consistent Marxist dialectician. straight-line, gradual progress can never lead to worthwhile results; for him. reforms represent progress only if they operate as a foreign body within the existing system and thus accelerate its death, for instance, when taxation of profits within a capitalist system is raised so high as to destroy entrepreneurs' incentive. Since true reform, which does not destroy the present system but gradually transforms it, is ruled out, revolution becomes necessary. and to a consistent believer in dialectics the suffering and sacrifices of violent change constitute the price that mankind has to pay to have any essential progress at all.

This was the philosophy that Marx professed. but he failed to show complete consistency in dealing with its implications. Apparently he was not prepared to rule out peaceful progress unconditionally. and he may also have found it difficult to reconcile dialectic philosophy with the economic interpretation of history. since technological progress is the very model of "straight-line" gradual evolution.

Class **Struggle.**—Marx stressed the obvious truth that social groups have conflicts of interest that are often reflected in antagonistic political creeds. He tends to go beyond this truism by implying that the classes have no common interests at all, and that their struggle, in which he sees the great motive power of history. is essentially illimitable.

The basis of this more far-reaching belief is the connection Marxism established between the class struggle concept and dialectic philosophy. In the course of history, Marx saw each principle of social organization represented by a social class: feudalism by the nobility, capitalism by the entrepreneurs, socialism by the norkers. The struggle of the classes is identical with the dialectic conflict of organizational principles. Consequently, the class struggle is governed by the law of dialectics; it is necessarily an all-out conflict—it cannot be limited by the rules of democracy, which substitute "ballots for bullets" and require respect for the inalienable rights of the opponent. The victory of the new class must be followed by repression of the former ruling class until the last vestiges of the old order are extinguished. In the struggle of the workers against the capitalists, this repression will result in the "dictatorship of the proletariat," as the political form of society in the period of transition from capitalism to full communism.

As Marx was not a consistent dialectician, he wrote many passages that are incompatible with the belief in the illimitable class struggle. There exists, therefore. a cleavage in the Marxist system betneen the belief in democratic evolution and the contrary belief in the inevitability of revolution ending in dictatorship. This cleavage has transmitted itself to Marx's disciples and is reflected by the conflict betneen the supporters of democratic socialism. many of whom still treasure the Marxist tradition, and those of modern Communism. Intermediate positions between these two extremes were once held by writers like Kautsky, but this old Marxist "Centre" has in the main joined the democratic camp Some developments within the Communist camp. especially but not exclusively in Poland and Yugoslavia, indicate a possibility that a new Marxist centre may arise.

Labour Value **Theory.**—Marx accepted the explanation of value as given by the classical economists of his day, especially David Ricardo (q *v.*). According to the classical doctrine, the value of a commodity depends on the amount of labour time necessary for its production. Marx applied this theory with some refinements to human labour power. According to him a worker's labour power is sold like any other commodity, at a price determined by the labour time necessary to produce it (the time necessary to produce the means of subsistence and education). Labour power, however, is the only commodity that can produce a value greater than its own, because a worker can work more hours than are necessary to keep him alive and in a position to reproduce his kind The product of this "surplus labour" is called "surplus value" and is appropriated by the employer who has acquired the legal right to the full use of labour power by paying the worker the labour-time value of that power. This surplus value is the source of all nonwage income: profit, rent and interest. The purchase of labour power at a price corresponding to its labour-time value and therefore inevitably smaller than the labour-time value of the products is called "exploitation of labour" by Marx—a term which, according to hlarx's own allegation. was not intended as an ethical condemnation but which he nevertheless often used in a sense implying a moral judgment.

In elaborating the theory that "exploitation of labour" is the only source of profit, (in the third volume of Das *Kapital*), Marx ran into difficulties that caused him to deviate from the logical consequences of the labour value theory on which he had based his initial propositions. This widely discussed self-contradiction, however, merely adds one more argument to the body of proofs by which modern theory has refuted the explanation of value from labour time. Yet the labour theory of value. and its derivative, the surplus value theory, cannot be eliminated from the Marxist system as some recent Marxists and semi-Marxists have suggested, for these theories are indispensable for the support of the proposition that capitalism is doomed by objective economic necessity —a proposition that belongs to the very essence of Marxism.

Since all profit results from "exploitation of labour," the rate of profit—the amount per unit of total capital outlay—depends largely on the number of workers employed Machines cannot be "exploited": they can therefore not contribute to total profits, although they help labour produce more useful things. Only payroll capital—"variable capital"—is productive of surplus value and consequently of profit. The introduction of machines is profitable for the individual entrepreneur. to whom they give an advantage over his competitors, but as outlay for machinery grows in relation to outlay for wages, profit declines in relation to total capital outlay. The capitalist will receive less and less per hundred dollars of capital and can only try to postpone his bankruptcy by pressure upon the norkers; finally, the "capitalist class becomes unfit to rule, because it is incompetent to assure an existence to its slave nithin his slavery." Consequently the system collapses and the working class inherits the power.

Theory of Alienation.—One of the many subsidiary doctrines contained in Marx's writings has recently attracted much interest: the contention that, for the worker under industrial capitalism, work is merely a means to protect himself from starvation, whereas for the medieval craftsman, or even the peasant, work was also means of self-expression. To the extent that this "alienation" of man from his work really exists, it is obviously a result of the fragmentation of the work process through division of labour. Marx does not wish to return to medieval methods of production, but he believes that modern technology when freed from the fetters of capitalist profit calculation will liberate modern man from the tie to one particular occupation, will permit him to change his activities frequently enough to make him visualize every phase of his work as part of the social process of production and thus find new satisfaction. There is nothing in technological development, however, or in collectivist experience since Marx's days to support these particular expectations; on the other hand. the replacement of manual labour by machines in some of the most tedious jobs and the shortening of the working day have certainly alleviated the alienation problem.

Appraisal of Marxism. — In spite of its weaknesses, Marxism has played a role greater than any other recent system of social philosophy; its effects cannot be summarized by a simple formula. Marxism has strengthened the workers' movement which has been the greatest single force operating for social justice; it has reconciled the workers to modern technology, imbued them with a great respect for intellectual accomplishment and strengthened their desire for education; more effectively than any other school, it has called attention to the role of economic and especially of technological factors in history. On the other hand, it has supplied totalitarian enemies of freedom with important intellectual weapons. Marxism is the only admissible social doctrine in the Soviet Union and the "People's Democracies," although more recently the inadequacies of the labour value theory as a basis for rational planning have caused important, if tacit. modifications of Marxism.

Austro-Marxism.—In its orthodox form, Marxism denies the existence of any "super-class ethics": all moral rules are considered reflections of the social position of either the dominant class or of the oppressed class. In opposition to this view, an effort was made, mainly by Austrian socialists, to return to the pre-Marxian idea that the socialist postulates should be based on an ethical code binding on all humanity while most other elements of Marxist thought were retained. This open acknowledgment of the ethical basis of socialism was incompatible with the more extreme versions of the class struggle concept, since ethical rules which determine the ultimate ends of a movement also have a bearing on the legitimacy of means. Austro-Marxism might therefore have supplied the right-wing of the socialist movement with a badly needed theoretical basis, but most of the Austro-Marxists, as, for instance, their most prominent leader, Otto Bauer, kept politically close to the Marxist centre group.

Neo-Marxism. — In his analysis of capitalism, Marx had been concerned almost exclusively with a highly competitive kind of capitalist system in which the entrepreneurs were in the main opposed to state intervention. The decades after Marx's death produced a kind of capitalism that was permeated with monopoly and in which the majority of businessmen desired state intervention for the protection of monopolies, for protective tariffs and for the opening of foreign markets and promotion of foreign investments. A number of Marxists writers tried to modify Marxist theory in order to account for these new facts and to exploit them for the strengthening of Marxist policy arguments.

The first of these Neo-Marxists was Rudolf Hilferding (*q.v.*) who in his book *Das Finanzkapital* (1910) maintained that the increasing influence of the banks over industry was mainly responsible for cartelization — because the banks wanted to prevent their industrial customers from ruining each other through competition — and also for the search for foreign capital outlets. For the latter phenomenon, Rosa Luxemburg (*q.v.*) offered a new explanation in her book *Die Akkumulation des Kapitals* (1913). From Marx's discussion of the interdependence of consumer and producer goods industries she drew the conclusion that capitalism was threatened with a glut of consumer goods and maintained that this threat was the motive power behind the imperialist ventures of capitalist states—ventures which she regarded as temporarily successful but necessarily futile in the end. Fritz Sternberg, in his book *Der Imperialismus* (1926), tried to clear up the many obscurities in Luxemburg's reasoning and supplemented it with an argument which, from a Marxist point of view, seemed more convincing: since the colonial areas use more manual labour and less machinery. the decline of the rate of profit has not advanced as far there as in the old industrial countries; therefore. investment in colonies and semicolonies offers the western capitalists a temporarily higher profit rate. This latter argument was further expounded by the Polish writer Henryk Grossmann in his book *Das Akkumulations-und Zusammenbruchsgesetz des kapitalischen Systems* (1929). Finally, Evelyn John St. Loe Strachey gave a comprehensive presentation of the Neo-Marxist theory of imperialism and capitalist doom in his book The *Nature of Capitalist Crisis* (1935), using mainly the argument of the higher profit rate in the noncapitalistic areas.

The historic significance of Neo-Marxism rests upon its utilization by Lenin in his book *Imperialism, the Highest State of Capitalism* (1916). Lenin did not commit himself to the details of Rosa Luxemburg's analysis but took from it the general idea that western capitalism had prolonged its life by expanding into colonial areas; he drew the conclusion that capitalism would perish if deprived of its colonial domains. Under the spell of this thought, Bolshevism staged its anti-imperialist campaign in which it achieved major successes but also encountered conflicts with the rising nationalism of the ex-colonials — conflicts which seem to increase as "capitalist" imperialism becomes a thing of the past.

MARY, the mother of Jesus. Out of the sparse details of her life as portrayed in the Gospels, Christian piety and theology have constructed a picture that fulfills the prediction ascribed to her in the Magnificat (Luke i, 48): "Henceforth all generations will call me blessed."

It would be impossible to write a biography of Mary based upon biblical accounts., in spite of the fact that the span of time covered by those accounts is longer than the life of Jesus. The first mention of her is the story of the annunciation, which reports that she was living in Nazareth (Luke i, 26 ff.); the last mention of her (Acts i, 14) includes her in the company of those who devoted themselves to prayer after the ascension. Between these two references are several scenes of a rather occasional character. the visit with Elizabeth. her cousin and the mother of John the Baptist (Luke i, 39 ff.); the birth of Jesus and the presentation (Luke ii, 1 ff.); the coming of the Magi and the flight to Egypt (Matt. ii, 1 ff.); the Passover visit to Jerusalem (Luke ii, 41 ff.); the marriage at Cana in Galilee (John ii, 1 ff.); the attempt to see Jesus while he was teaching (Mark iii, 31 ff.); the station at the cross, where. apparently widowed, she mas entrusted to John (John xix, 26 ff.). Even those interpreters for whom these scenes have represented a series of literal historical accounts have found it difficult to draw a portrait of Mary on the basis of them.

But since the early days of Christianity. the themes which these scenes symbolize have been the basis for thought and contemplation about Mary, developing and expanding through the centuries. Christian communions and theologians differ from one another in their interpretation of Mary principally on the basis of where they set the terminal point for such development and expansion. To a considerable degree, therefore. a historical survey of that development is also an introduction to the state of contemporary Christian thought about Mary.

Guarantee of the Incarnation.— Probably the earliest allusion to Mary in Christian literature is the phrase "born of a woman" in Gal. iv, 4. As parallels like Job xiv, 1 and Matt. xi, 11 suggest. the phrase is a Hebraic way of speaking about the essential humanity of a person. When applied to Jesus. therefore. it was intended to assert that he was truly a man, in opposition to the attempt, later seen in the Docetae (*q.v.*), to deny that he had a completely human life. It seems unwarranted to read anything further into the phrase, as though "born of a woman" necessarily implied "but not of a man and a woman." Thus the phrase made of Mary the guarantee of the reality of the incarnation. For the ancient world, one human parent was necessary to assure that a person was genuinely human, and one of the roles assigned to Mary from the beginning has been that of providing this assurance. Some historians have even maintained that the primary connotation of the phrase "born of the Virgin Mary" in the Apostles' Creed was this same insistence by the church upon the reality of the incarnation. That insistence has been the irreducible minimum in all the theories about Mary that have appeared in Christian history. Those who deny the virgin birth usually claim to do so in the name of this insistence upon true humanity. Those who defend the virgin birth usually maintain that the true humanity was made possible when the Virgin accepted her role as the guarantee of the incarnation (Luke i, 38): "Let it be done to me according to thy word." This is the original source of the title "coredemptress" assigned to Mary in Roman Catholic theology, though the term has come to connote a more active participation by the Virgin in the redemption of mankind; the precise nature of this participation is still a matter of controversy among Catholic theologians.

Virgin Mother.— By far the most voluminous narratives about Mary in the New Testament are the infancy stories in Matthew and Luke. In their present form, both accounts make a point of asserting that Jesus was conceived in the womb of Mary without any human father (Matt. i. 18 ff.; Luke i, 34 ff.); the many textual variants in Matt. i, 16, some of them with the words "Joseph begat Jesus," have caused some scholars to question whether such an assertion was part of Matthew's original account. The most voluminous discussions of Mary in postbiblical Christian literature have also been those dealing with her virginity. The narratives in Matthew and Luke seem to be the only references to the matter in the New Testament, unless John i. 13 is taken to read ". . . who was born" rather than ". . . who were born." On the basis of these narratives, it was the unanimous teaching of all the orthodox fathers oi the church that Mary conceived her Son with her virginity unimpaired, a teaching enshrined in the Apostles' Creed and concurred in by the classical Reformers as well as by most Protestant believers since the Reiormation. Only with the rise of Protestant theological liberalism did this teaching begin to lose the universal support it had enjoyed. One of the major points in the attack by iundamentalism (*q.v.*) upon this liberalism was its insistence upon the literal accuracy of all the miracle stories in the Bible, including and especially those dealing with the miraculous conception of Jesus.

Mother of God.—The first major theological controversy over Mary had to do with the propriety of applying to her the title of *Theotokos*, ',God-bearer" or "mother of God." The title itself was a logical deduction from the dogma of the full deity of Christ as this was established during the 4th century, and those who defended that dogma were also the ones to draw the deduction. By the end of the 4th century, therefore, it had successfully established itself in various sections of the church. Because it seemed to him that the supporters of the title were confounding the divine and the human in Christ, Nestorius objected to its use. preferring the less explicit title *Christotokos*. Along with other aspects of his teaching. Nestorius' objections were condemned at Ephesus in 431, and *Theotokos* was unconditionally approved. In the devotion of Eastern Christendom the *Theotokos* (Russian *Bogoroditsa*) has played a major role, also becoming one of the favourite subjects for icon painters. Through its incorporation in the Ave Maria, the title "mother of God" has been circulated throughout western Catholicism. By the approval it received in both Lutheran and Reformed confessions during the period of the Reiormation. the title assured itself a place in the theology. if not in the piety. of orthodox Protestantism. It is as mother of God that the Virgin is also termed mediatress. The official teaching of the Roman communion has sought to make clear that this latter term is not intended to detract from the glory of Christ as sole Mediator, but that Mary mediates between Christ and mankind as she did at Cana in Galilee (John ii. 3).

Ever Virgin.— One corollary that could be deduced from the New Testament assertion of Mary's virginity in the conception of Jesus was the doctrine of her perpetual virginity. not only "before birth" but "in birth and after birth." to use the usual phrases. The Apostles' Creed appears to teach at least her virginity "in birth" when it says "born of the Virgin Mary." Although the earliest mention of the doctrine occurs in the apocryphal Protevangelium Jacobi. its origins and extent are not easy to trace, Roman Catholic historians and Protestant historians coming to contradictory conclusions. The doctrine had no explicit warrant in the Sew Testament. and Old Testament passages such as Ezek. xliv. 2 and Song of Sol. iv, 12 were probably convincing only to those who already believed the doctrine. In addition, the doctrine posed two problems of biblical interpretation. both of which were discussed in detail by defenders of the doctrine from Jerome to Luther. To the argument from words such as "until" (Matt. i. 25), "before" (Matt. i. 18) and "first-born" (Luke ii, 7) that Mary must have borne further children, the defenders of the perpetual virginity have replied that none of these words speaks at all about what followed: an only child is a first-born child, and a man who "died before repenting of his sins" did not necessarily repent thereafter. The other biblical problem was that oi the "brothers" of Jesus referred to in I Cor. ix, 5, Gal. i, 19, and several times in the Gospels and in Acts. Defenders of the perpetual virginity have explained these either as "kinsmen" or as children of Joseph by a previous marriage or as children of another Mary and of Cleophas. Partly because of these problems, the doctrine of the perpetual virginity of Mary has not been supported as unanimously as has the doctrine of the virginal conception or the title "mother of God." It achieved dogmatic status at the Council of Chalcedon in 451, and is therefore binding upon Eastern Orthodox and Roman Catholic believers; in addition, it is maintained by many Anglican, some Lutheran and a few Protestant theologians.

Immaculate.—As the doctrine of her perpetual virginity implied an integral purity of body and soul, so, in the opinion of many early theologians, she was also free of other sins. In a discussion aimed at proving the universality of sin, Augustine spoke for the western church when he wrote: "We must except the holy Virgin Mary. Out of respect for the Lord, I do not intend to raise a single question on the subject of sin. After all, how do we know what abundance of grace was granted to her who had the merit to conceive and bring forth Him who was unquestionably without sin?" (*Nature and Grace*, ch. 36). But it was the distinction between original sin and actual sin, firmly established in western theology by the same Augustine, that eventually compelled a further clarification of what the sinlessness of Mary meant. Certain eastern theologians in the 4th and 5th centuries were willing to attribute actual sins to her, but most theologians in both east and west came to accept the view that she never did anything sinful, a view that found expression even among the Reformers. But was she free from original sin as well? And if so, how? Thomas Aquinas took a representative position when he taught that her conception was tarnished, as was that of all men, but that God suppressed and ultimately extinguished original sin in her, apparently before she was born. But this position was opposed by the doctrine of the immaculate conception (*q.v.*), systematized by Duns Scotus and finally defined as Roman Catholic dogma in 1854. According to this dogma, Mary was not only pure in her life and in her birth, but "at the first instant of her conception was preserved immaculate from all stain of original sin, by the singular grace and privilege granted her by Almighty God, through the merits oi Christ Jesus, Savior of mankind."

Assumed Into Heaven.--When the immaculate conception was promulgated, petitions began coming to the Vatican for a definition regarding the assumption oi the Virgin into heaven, as this was believed by most Roman Catholics and celebrated in the feast of the assumption (*q.v.*). During the century that folloned, more than 8,000,000 persons signed such petitions; yet Rome hesitated, the doctrine being difficult to define on the basis of Scripture and early witnesses to Christian faith. No account of the place and circumstances of Mary's death was generally accepted in the early church, no burial place acknowledged, and no miracles credited to relics of her body. But such arguments from silence did not suffice to establish a dogma, and on the positive side even the earliest doctrinal and liturgical tradition appeared relatively late in history. Pope Pius XII made the dogma official in 1950, declaring "that the immaculate mother of God, the ever Virgin Mary, when the course of her earthly life was run! was assumed in body and in soul to heavenly glory." As it was formulated, the dogma left open to speculation the question of Mary's death.

In addition to these official titles and roles assigned to her by Catholic Christianity, the Virgin has served to symbolize the redemption of the life of nature and to provide a bridge between Christianity and those religions of nature that have spoken of this redemption. In the secular life and literature of the west since the day of the *Minnesänger,* she has symbolized the nobility of woman. Even those non-Roman churches which have most vigorously criticized the "Mariolatry" they claimed to find in the dogmas of the immaculate conception and the assumption have frequently addressed praises to her in their hymnody that they would have hesitated to express in the prose of their dogmatic theology. Thus, in ways she could never have anticipated, all generations have called her blessed.

(J. J. Px.)

MARY I (*1 j16–I*j58), queen of England. unpleasantly remembered as "Bloody Mary" because of the religious persecutions which occurred during her reign. was the daughter of Henry VIII and Catherine of Aragon. . Mary was born at Greenwich, on Monday, Feb. 18, 1516. and she was baptized on the following Wednesday, Thomas Cardinal Wolsey standing as her godfather. She seems to have been a precocious child and is reported in July 1520, when scarcely 4½ years old, as entertaining some visitors by a performance on the virginals. When she was little over nine, she was addressed in a complimentary Latin oration by commissioners sent over from Flanders on commercial matters and replied to them in the same language "with as much assurance and facility as if she had been twelve years old." Her father was proud of her achievements. About the same time that she replied to the commissioners in Latin. he was arranging that she should learn Spanish. Italian and French. A great part, however, of the credit of her early education was undoubtedly due to her mother, who not only consulted the Spanish scholar Juan Luis Vives upon the subject but was herself Mary's first teacher in Latin.

When Mary was two years old. she was proposed in marriage to the dauphin, son of Francis I. Three years later the French alliance was broken off and in 1522 she was affianced to her cousin, the young emperor Charles V, by the treaty of Windsor. In 1525, however. after his great victory over Francis at Pavia, Charles released himself from this engagement and made a more convenient match.

Later in the same year Mary was given an establishment of her own and was sent to Ludlow with a council which was designed to secure the better government of the Marches of Wales. For several years she accordingly kept her court at Ludlow, while new arrangements were made for the disposal of her hand. She was now proposed as a wife. not for the dauphin as before, but for his father Francis I, who had just been redeemed from captivity at Madrid, and who was only too glad of an alliance with England to mitigate the severe conditions imposed on him by the emperor.

When the Anglo-French alliance was finally concluded, however, by a treaty dated Westminster. April *30,* 1527, it was provided that Princess Mary should be married either to Francis himself or to his second son Henry, duke of Orléans.

It was immediately after this treaty that Henry VIII began the proceedings for his "divorce" from Catherine that were to make the next nine years perhaps the most miserable period of Mary's life. From the end of *1 j31* mother and daughter were kept apart. Possibly Queen Catherine had the harder trial; but Mary's was scarcely less severe. On the birth of Anne Boleyn's daughter Elizabeth (Sept. *1533).* Mary was required to give up the dignity of princess and acknowledge the illegitimacy of her own birth. On her refusal her household was broken up, and she was sent to Hatfield to act as lady-in-waiting to her own infant half-sister. Nor was even this the worst of her trials; she feared that her very life was in danger from the hatred of Anne Boleyn.

Mary's health, moreover, was indifferent, and even when she was seriously ill. although Henry sent his own physician. Dr. Buttes. to attend her, he declined to let her mother visit her. At her mother's death, in Jan. *1*536, she was forbidden to take a last farewell of her.

But in May following another change occurred. Anne Boleyn, her bitterest enemy, fell under the king's displeasure and was put to death. Mary was then urged to make a humble submission to her father as the means of recovering his favour and after a good deal of correspondence with the king's secretary. Thomas Cromwell. she eventually did so. The terms exacted of her were bitter in the extreme. but Mary, alone and at the mercy of her imperious father, at length subscribed an act of submission, acknowledging the king as "Supreme Head of the Church of England under Christ." repudiating the pope's authority, and confessing that the marriage between her father and mother "was by God's law and man's law incestuous and unlawful."

Henry was now reconciled to her and gave her a household in some degree suitable to her rank. During the rest of the reign her position was less difficult. She appeared at the court and a number of new marriage projects for her were made; though all of them came to nothing. Her privy purse expenses for nearly the whole of this period have been published and show that Hatfield, Beaulieu or Newhall in Essex. Richmond and Hunsdon were among her principal places of residence. Although she was still treated as of illegitimate birth. in 1j44 she was restored by statute to a position in the succession next after Edward and any other legitimate children who might be born to the king, but under conditions to be regulated by Henry's will.

During the reign of her brother. Edward VI, Mary was again subjected to severe trials. which at one time made her seriously meditate escaping abroad. Edward himself indeed seems to have been personally kind to her, but the religious innovations of his reign soon brought her into conflict with the government. She had done sufficient violence to her own convictions in submitting to a despotic father and was not disposed to yield an equally tame obedience to authority exercised by a factious council in the name of a younger brother not yet come to years of discretion. Besides, the cause of the pope was naturally her own. In spite of the declaration formerly wrung from herself. most people did not regard her as a bastard although the full recognition of her rights implied the recognition of the pope as head of the church. Hence, when in 1549 Edward's parliament passed an Act of Uniformity enjoining services in English and communion in both kinds, she insisted on having mass in her own private chapel under the old form. When ordered to desist, she appealed for protection to her cousin, the emperor Charles V, who intervened for some time not ineffectually. threatening war with England if her religious liberty was interfered with.

But Edward's court was composed of factions of which the most violent eventually carried the day. Lord Seymour, the admiral, was attainted of treason and beheaded in 1549. His brother. the protector Somerset, met with the same fate in 1552. John Dudley, duke of Northumberland, then became paramount in the privy council and easily obtained the sanction of the young king to those schemes for altering the succession which led immediately after Edward's death (July 6. 1jj3) to the usurpation of Lady Jane Grey. Dudley had, in fact, overawed the rest of the privy council, and when Edward died, he took such energetic measures to give effect to his scheme that Lady Jane was actually recognized as queen for some days, and Mary had to flee from Hunsdon into Norfolk. But the country was devoted to her cause, as indeed her right in law was unquestionable, and before many days she was royally received in London and took up her abode within the Tower.

Her first acts as queen displayed a character very different from that which she still holds in popular estimation. Her clemency toward those who had taken up arms against her was remarkable. She released from prison Lady Jane's father, the duke of Suffolk. and had difficulty even in signing the warrant for the execution of Northumberland. Lady Jane herself she fully meant to spare. and did spare till after Sir 'Thomas Wyatt's formidable insurrection in 1554. Her conduct. indeed, was in most respects conciliatory and pacific, and so far as they depended on her personal character the prospects of the new reign might have appeared altogether favourable.

But her position was one of peculiar difficulty, and the policy on which she determined was far from judicious. Inexperienced in the art of governing. she had no trusty councillor but Stephen Gardiner, bishop of Winchester; and she was naturally led to rely even more on the advice of her cousin, the emperor, who had been her mother's friend in adversity and had done such material service to herself in the preceding reign. Following the emperor's guidance she determined almost from the first to make his son Philip her husband. though she was 11 years his senior. She was also strongly desirous of restoring the old religion and wiping out the stigma of illegitimacy upon her birth.

Of all these objects her marriage mas the most unpopular. Restoration of the old religion might deprive the new owners of abbey lands of their comfortable acquisitions; and it was only with an express reservation of their interests that the thing was actually accomplished. A declaration of her own legitimacy necessarily cast a slur on that of her sister Elizabeth and cut her off from the succession. But the marriage promised to throw England into the arms of Spain and place the resources of the kingdom at the command of the emperor's son.

The commons sent her a deputation to entreat that she would marry an Englishman, and when her resolution became known early in 1554, insurrections broke out in different parts of the country. Suffolk, whose first rebellion had been pardoned. proclaimed Lady Jane Grey again in Leicestershire, while Wyatt raised the county of Kent and, though denied access by London bridge, led his men around by Kingston to the very gates of London before he was repulsed. In the midst of the danger Mary showed great intrepidity, and the rebellion was presently quelled. Thereupon she married Philip (July 25, 1554), restored the old religion and admitted Cardinal Pole to absolve the kingdom from its past disobedience to the Holy See (Nov. 30, 1j54).

It was a more than questionable policy thus to ally England with Spain—a power then actually at war with France. By the treaty, indeed, England was to remain neutral; but in the end it was drawn into the quarrel. Meanwhile the country was full of faction, and seditious pamphlets of Protestant origin inflamed the people with hatred against the Spaniards. Philip's Spanish followers met with ill-usage everywhere, and violent outbreaks occurred. A year after his marriage Philip went over to Brussels to receive from his father the government of the Low Countries and afterward the kingdom of Spain. To Mary's distress, his absence was prolonged for a year and a half, and when he returned in March 1jj7 it was for the purpose of getting England to declare war on France. As soon as this purpose was achieved he went back to Brussels (in July) to return no more to England.

In spite of the encouragement that France had given to disaffection among Mary's subjects, there had been strong opposition to Philip's demands among Mary's advisers. But an attempt by Thomas Stafford and other English refugees in France to seize Scarborough played into her hands, and she was able to declare war against the French on June 7, 1j57. In this war Mary found herself opposed by the pope, who took part with France against Spain; Scotland. too, soon declared war upon her: and on Jan. 5, 1558, she suffered the final calamity of the loss of Calais.

The persecution of the Protestants, which has cast so much infamy upon her reign. did not begin until Mary had been more than a year and a half on the throne. When the kingdom was reconciled to Rome and absolved by Cardinal Pole. it n-as natural and logical that the old heresy laws should be revived. as they were then by act of parliament. But Mary must bear the final responsibility for the severity of their enforcement, which was unprecedented in England.

Merciful and kindly by nature, she yet seems to have felt that the Protestants' stern fanaticism and ill-will to the old religion made them dangerous, even to the public peace; and that the persecution was necessary if the old faith were to be preserved in England. John Rogers, the first of the martyrs. was burned on Feb. 4, 1555. John Hooper, bishop of Gloucester, had been condemned six days before and suffered the same fate upon the 9th. From this time the persecution went on uninterrupted for three years and three-quarters. numbering among its victims Nicholas Ridley, Hugh Latimer and Thomas Cranmer. It came to an end at last on the death of Mary. Nearly 300 victims are known to have perished at the stake; and their fate created a revulsion against Rome that nothing else was likely to have effected.

Mary was of weak constitution and subject to frequent illnesses, both before and after her accession. One special infirmity caused her to believe a few months after her marriage that she was with child, and thanksgiving services were ordered throughout the diocese of London in Nov. 1554. The same delusion recurred in April 1558, when though she did not make her expectation public, she drew up a will in anticipation of the dangers of childbirth. constituting her husband regent during the minority of her prospective heir. To this she added a codicil on Oct. 28 following, when the illness th t was to be her last had set in. showing that she had ceased to have much expectation of maternity. and earnestly entreating her "next heir and successor by the laws" (whom she did not name) to allow execution of the instrument. She died on Nov. 17. 1j58.

Her name perhaps deserved better treatment than it has generally met with; for she was not by nature cruel. Her kindness to the poor is undoubted. and the severe execution of her laws seemed to her a necessity. Moreover. she was alive to the injustice with which the law was usually strained in behalf of the prerogative; and in appointing Sir Richard Morgan chief justice of the common pleas she charged him "not to sit in judgment otherwise for her highness than for her subjects." and to avoid the old error of refusing to admit witnesses against the crown.

Mary's conduct as queen was governed by the best possible intentions; and it is evident that her religious zeal caused most of the trouble she brought upon herself. Her subjects were entirely released, even by papal authority. from any obligation to restore the confiscated lands of the church. But she herself made it an object, at her own expense, to restore several of the monasteries; and courtiers who did not like to follow her example encouraged the fanatics to spread an alarm that it would even yet be made compulsory. So the worldly minded joined hands with godly heretics in stirring up enmity against her. Her unpopular foreign marriage and the national humiliations which followed upon it made their task all too easy.

See Sir Frederic Madden, Introduction to *The Privy Purse Expenses of the Princess Mary* (London, *1831*); J. M. Stone, *History of Mary I, Queen of England* (London, 1901); H F. M Prescott, *Mary Tudor* (rev. ed. of *Spanish Tudor*) (London, 1952). (J. GAI.; R. B WM.)

MARY II (1662–1694), queen of England. wife of king William III, elder daughter of James, duke of York, afterward King James II, by his first wife, Anne, daughter of Ednard Hyde, 1st earl of Clarendon. was born in London on April 30, 1662. She was educated as a Protestant, and as it was probable that she would succeed to the English throne after the deaths of her uncle, Charles II. and her father, the choice of a husband for her was an important political event. About 1672 the name of William, prince of Orange. was mentioned in this connection; and after some hesitation on both sides caused by the condition of European politics. the betrothal of William and Mary took place in Oct. 1677 and was quickly followed by their marriage in London on Kov. 4.

Mary's married life in the Netherlands does not appear to have been a happy one. She soon became very popular among the Dutch, but she remained childless. Her troubles were not diminished after her father became king of England in 1685. James had treated his daughter very shabbily in money matters; and it was increasingly difficult for her to remain loyal to both father and husband when they were so divergent in character and policy. Mary shared heartily in the events which immediately preceded William's expedition to England in 1688.

After the success of the undertaking she arrived in London in Feh. 1689; and by her faithful adherence to her promise that William should always bear rule made a satisfactory settlement of the English crown possible.

William and Mary were together proclaimed king and queen of England, and afterward of Scotland. and were crowned on April 11, 1689. During the king's absence from England the queen. assisted by a committee of the privy council, was entrusted with the duties of government. duties which she performed faithfully: but which she gladly laid down on William's return. In these times of danger, however, she acted when necessary with courage and promptitude, as when in 1690 she directed the arrest of her uncle Henry Hyde. 2nd earl of Clarendon; but she was constantly anxious for William's safety, and unable to trust many of her advisers.

Mary was distressed by a quarrel with her sister Anne that in 1692 resulted in the dismissal of Marlborough. This somewhat diminished her popularity, which had hitherto been one of the mainstays of the throne.

Weak in body and troubled in mind, the queen died at Kensington palace from smallpox on Dec. 28, 1694, and was buried in Westminster abbey.

Mary was a woman of a remarkably modest and retiring disposition, whose outstanding virtue was perhaps her unswerving loyalty to William. Burnet has passed a remarkable panegyric upon her character. She was extremely pious and charitable; her blameless private life was in marked contrast with her surroundings, both in England and the Ketherlands; without bigotry she was greatly attached to the Protestant faith and to the Church of England. Greenwich Hospital for Seamen was founded in her honour.

For the political events of Mary's life *see* WILLIAM III. For her private life *see* N. M. Waterson, *Mary II, Queen of England* (Durham, N.C., and Cambridge, 1928) ; G. M. V. Campbell Long (M. Bowen, pseudonym). *The Third Mary Stuart* (London. 1929) ; Hester Chapman, *Mary II, Queen of England* (London. Toronto, 1953).

MARY (VICTORIA MARY AUGUSTA LOUISA OLGA PAULINE CLAUDINE AGNES) (1867–1953), consort of George V (*q.v.*), was born on May 26. 186;. at London. She was the eldest child of Francis, prince (later duke) of Teck. of the royal house of Württemberg, and of Princess Mary of Great Britain, a granddaughter of George III. Born in Kensington palace, she spent her childhood and girlhood in London.

From the age of 16 to 18 she lived in Florence and there acquired that taste for the arts which was to distinguish her throughout life. In 1891 she became engaged to the elder son of the prince of Wales, the duke of Clarence. who died a few weeks before the marriage was to have taken place. A year later her engagement was announced to the duke's younger brother, afterward George V. They were married on July 6, 1893. As duchess of York (during Queen Victoria's reign) and princess of Wales (during Edward VII's reign) she was active with her husband in a variety of public duties, including a journey to Australia in 1901, for the opening of the federal parliament, and a long tour in India during 1905.

With the accession of King George in 1910 she became queen, and brought to her high position gifts of taste and intellect which quickly made their mark on court life. Her bearing showed how accurate Queen Victoria had been when she wrote that May (the name by which Queen Mary was known in the family circle) was so sensible and distinguée. Her good taste showed itself in the mastery of the royal collections and her anxiety that they should be displayed to the best advantage. In the 1920s she encouraged the publication of an account of the inside of Buckingham palace.

During World War I the queen was especially concerned with the welfare of servicemen and with nursing and after the war appeared increasingly in public, particularly after the decline of the king's health in 1928. His gratitude to her was expressed in his speech in Westminster during his silver jubilee in 1935, and the king asked that that passage be placed last in the speech because he was afraid that he might be overcome "when I think of all that I owe her."

In widowhood the queen moved to Marlborough house. To her eldest son. King Edward VIII, she mas singularly devoted, and his abdication was a severe test of her courage. During World War II she retired to Badminton, the home of her niece. the duchess of Beaufort. She became a familiar figure in the nest country, visiting bombed towns and service centres and delighting in giving lifts to soldiers and airmen in her car. In 1945 she resumed her life in London. Her health began to fail after the shock of the death of King George VI in 1952 and although she attended his lying in state in Westminster hall she was thereafter seldom seen in public.

She died at Marlborough house on March 24, 1953.

Although Queen Mary in her dress and manner retained something of the habit of the Victorians—she never made a speech in public and never spoke on the telephone—her spirit moved with the times, and this helps to explain her popularity with all classes.

Queen Mary had five sons—King George VI. the duke of Kent and Prince John; who predeceased her, and the dukes of Windsor and Gloucester, who survived her—and one daughter, the princess royal. (R. T. B. F.)

MARY (1496–1533), queen of France, daughter of Henry VII of England and Elizabeth of York. The treaty of Calais (Dec. 21, 1507) arranged for her marriage with Charles of Austria (Charles V) when the prince reached the age of 14, and the wedding was celebrated by proxy in 1508. The contract was renewed (1513) by Henry VIII, but the emperor Maximilian I was now in treaty for a marriage with Renee of France for his son, and evinced an intention to withdraw from the contract. He was forestalled by Cardinal A'olsey. who arranged, by the peace of 1514, the marriage of Mary with Louis XII of France.

The marriage was celebrated at Xbbeville on Oct. 9. The bridegroom was a broken man of 52; the bride a beautiful. well-educated and charming girl of 18, whose heart was already engaged to Charles Brandon, duke of Suffolk, her future husband. The political marriage was, however. no long one.

Mary was crowned queen of France on Nov. 5, 1514; on Jan. 1, 1515, King Louis died. Mary had only been induced to consent to the marriage with Louis by the promise that, on his death, she should be allowed to marry the man of her choice. But the dukes of Lorraine and Savoy were mentioned as possible suitors. and meanwhile the new king, Francis I, was making advances to her.

Suffolk himself was at the head of the embassy which came from England to congratulate the new king, and he used the opportunity to win the hand of the queen. Mary feared opposition, and, in spite of Suffolk's promise to the king to delay any action until after his return, she persuaded him to marry her secretly before he left Paris. Suffolk was ultimately pardoned through Wolsey's intercession, on payment of a heavy fine and the surrender of all the queen's jewels and plate. The marriage was openly solemnized at Greenwich on May 13, 1515. Mary died on June 24, 1533.

By the duke of Suffolk she had three children: Henry, born on March 11, 1516, created earl of Lincoln (1525), who died young; Frances, born on July 16, 1517, the wife of Henry Grey, marquess of Northampton, and mother of Lady Jane Grey (*q.v.*); and Eleanor.

MARY (QUEEN OF SCOTS)[1] (1542–1587), daughter of King James V. and his wife Mary of Lorraine, was born at Linlithgow in Dec. 1542, a few days before the death of her father. In July 1543 a treaty for the betrothal of the infant to Edward, heir of Henry VIII. of England, was made by the regent Arran, but Henry's obvious ambition to annex the crown of Scotland at once to that of England aroused instantly the general suspicion and indignation of Scottish patriotism. The marriage treaty was denounced by the Scots at the end of the same year, Henry retaliated by invasions of Scotland, and the Scots renewed their ancient alliance with France. In 1548 the queen of five years old was betrothed to the dauphin Francis, and set sail for France, where she arrived on Aug. 15. For the next ten years, the child was under the care of her mother's relatives, the Guises. In April 1558 she was married to the dauphin, and in November of the same year Elizabeth became queen of England. In the eyes of Roman Catholic Europe, Elizabeth's birth mas illegitimate, and Mary was de *jure* queen of England. Henry II. of France ordered his son and daughter-in-law to challenge Elizabeth's claim by assuming the royal arms of England. Civil strife broke out in Scotland between John Knox and the queen-dowager—between the self-styled "congregation of the Lord" and the adherents of the regent—and Elizabeth retaliated by helping the insurgent Protestants against the queen-dowager and her French troops. The war ended with the death of Mary of Lorraine in June 1560. Francis and Mary, who had become king and queen of France, had no efficient representative in Scotland. and the Protestant leaders were in control of the situation. On Aug. 25 Protestantism was proclaimed and Catholicism suppressed in Scotland by a parliament which mas assembled without the assent of the absent queen.

On Dec. 5 Francis II. died; in Aug. 1561 his widow left France for Scotland. The queen arrived in safety at Leith. On Aug. 21 she first met the only man able to withstand her; and their first passage of arms left, as he has recorded, upon the mind of John Knox an ineffaceable impression of her "proud mind, crafty wit and indurate heart against God and His truth." And yet her acts of concession and conciliation were such as no fanatic on the opposite side could have approved. She assented, not only to the undisturbed maintenance of the new creed, but even to a scheme for the endowment of the Protestant ministry out of the confiscated lands of the Church. Her half-brother, Lord James Stuart, shared the duties of her chief counsellor with William Maitland of Lethington, the keenest and most liberal thinker in the country. By the influence of Lord James, in spite of the earnest opposition of Knox, permission was obtained for her to hear mass celebrated in her private chapel—a licence to which, said the reformer, he would have preferred the invasion of ten thousand Frenchmen. Through all the first troubles of her reign the young queen steered her skilful and dauntless way with the tact of a woman and the courage of a man. An insurrection in the north, headed by the earl of Huntly, gave Lord James, whom she created earl of Murray, the opportunity of destroying the influence of the most powerful Catholic nobleman in Scotland (1562).

The question of the queen's second marriage was, meanwhile, occupying the attention of both English and Scottish statesmen. The chief aim of the diplomacy of Mary and Maitland of Lethington was a recognition by Elizabeth of the Scottish queen's claim to succeed her, in default of heirs of Elizabeth's own body. A marriage between Mary and a Habsburg prince was rendered impossible by Elizabeth's threat that, if Mary married a foreign prince, she would be debarred from the English succession. Elizabeth proposed as a suitor to the queen of Scots her own favourite Lord Robert Dudley, the widower if not the murderer of Amy Robsart; but she permitted Mary's cousin, Henry, Lord Darnley, to make a visit to Scotland Darnley's mother, the countess of Lennox, was the daughter of Margaret Tudor, widow of James IV, by her second husband, the earl of Angus, and therefore the next heir to the English throne after Mary herself. She had been born and brought up in England, and had married the earl of Lennox, an exiled Scottish traitor of Mary's minority. Elizabeth knew that a marriage which would unite the two claims to the succession was a probable result of Darnley's visit, but she protested against the marriage. Mary, who had already married her kinsman, in secret, at Stirling Castle, with Catholic rites celebrated in the apartment of David Rizzio, her secretary for correspondence with France, assured the English ambassador, in reply to the protest of his mistress, that the marriage would not take place for three months, when a dispensation from the pope would allow the cousins to be publicly united without offence to the Church On July 29, 1565, they were accordingly remarried at Holyrood. Protestant feeling was aroused, and Murray raised a rebellion. He entered Edinburgh with his forces, but failed to hold the town against the guns of the castle, and fell back upon Dumfries before the advance of the royal army, which was joined by James Hepburn, earl of Bothwell, on his return from a three years' outlawed exile in France. Another new adherent was the son of the late earl of Huntly, to whom the forfeited honours of his house were restored a few months before the marriage of his sister to Bothwell. In Oct. 1565 the queen marched an army of 18 000 men against the malcontents; their forces dispersed in face of superior numbers, and Murray, on seeking shelter in England, was received with contumely by Elizabeth, whose half-hearted help had failed to support his enterprise, and whose intercession for his return found at first no favour with the queen of Scots But the conduct of the besotted boy on whom, at their marriage, she had bestowed the title of king, began at once to justify the enterprise and to play into the hands of all his enemies alike. His father set him on to demand the crown matrimonial, which would at least have assured to him the rank and station of independent royalty for life Rizzio, hitherto his friend and advocate, induced the queen to reply by a reasonable refusal to this hazardous and audacious request. Darnley who professed to be jealous of Rizzio's intimacy with his wife, at once threw himself into the arms of the party opposed to the policy of the queen and her secretary, and the destruction of Rizzio was planned

On March 9 the palace of Holyrood was invested by a troop under the command of Morton, while Rizzio was dragged by force out of the queen's presence and slain without trial in the heat of the moment. A parliament which had been summoned for the attainder of Murray and his fellow-conspirators was discharged by proclamation issued in the name of Darnley as king; and in the evening of the next day the banished lords returned to Edinburgh On the day following they were graciously received by the queen, who undertook to sign a bond for their security, but delayed the subscription till next morning under plea of sickness During the night she escaped with Darnley, whom she had already seduced from the party of his accomplices, and arrived at Dunbar on the third morning after the slaughter of her favourite. From thence they returned to Edinburgh on March 28 guarded by 2,000 horsemen under the command of Bothwell, who had escaped from Holyrood on the night of the murder, to raise a force on the queen's behalf with his usual soldierly promptitude. The slayers of Rizzio fled to England, and were outlawed; Darnley was permitted to protest his innocence and denounce his accomplices.

A reconciliation between husband and wife followed the birth of their son, James, on June 19, 1566, but it was only temporary. Darnley refused to be present at the baptism of the prince in October, and soon afterwards, while suffering from a serious ill-

[1] In a letter dated April 4, 1882, referring to the publication of his drama *Mary Stuart*, Swinburne wrote to Edmund Clarence Stedman: "*Mary Stuart* has procured me two satisfactions which I prefer infinitely to six columns of adulation in The *Times* and any profit thence resulting. (1) A letter irom Sir Henry Taylor . . . (2) An application from the editor of the *Encyclopædia Britannica*—who might, *I* suppose, as in Macaulay's time, almost command the services of the most eminent scholars and historians of the country—to me, a mere poet, proposing that I should contribute to that great repository of erudition the biography of Mary Queen of Scots. I doubt if the like compliment was ever paid before to one of our 'idle trade.' " The present article is based on the biography consequently written by the poet ior the 9th edition, after revision by Prof. R. S. Rait.

ness, he went to stay with his father in Glasgow. He had earned his doom at all hands alike. and if his wife and Bothwell were by this time plotting against him, his death was not to be the result of a mere domestic conspiracy, for Bothwell had other accomplices than the queen On Jan. 22, 1567, Mary visited her husband at Glasgow and proposed to remove him to Craigmillar Castle, where he would have the benefit of medicinal baths; but instead of this resort he was conveyed, on the last day of the month, to the lonely and squalid shelter of the residence known as Kirk-of-Field. On the evening of Sunday, Feb. 9, Mary took her last leave of the miserable boy who had so often and so mortally outraged her as consort and as queen. That night the whole city was shaken out of sleep by an explosion of gunpowder which shattered to fragments the building in which he should have slept and perished; and the next morning the bodies of Darnley and a page were found strangled in a garden adjoining it, whither they had apparently escaped over a wall, to be despatched by the hands of Bothwell's confederates.

Three months and six days after the murder of her husband Mary became the wife of her husband's murderer. On Feh. 11 she had written to the bishop of Glasgow, her ambassador in France. announcing her providential escape from a design upon her own as well as her hushand's life. A reward of £2.000 was offered by proclamation for discovery of the murderer. Bothwell and others, his satellites or the queen's. were instantly placarded by name as the criminals. Gracefully and respectfully, with statesmanlike, yet feminine dexterity, the demands of Darnley's father for justice on the murderers of his son were accepted and eluded by his daughter-in-law. On March 28 the Privy Council. in which Bothwell himself sat, appointed April 12 as the day of his trial. Bothwell was acquitted in default of witnesses against him, and his wealth and power were enlarged by gift of the parliament which met on the 14th and rose on April 19—a date made notable by the subsequent supper at Ainslie's tavern. where Bothwell obtained the signatures of its leading members to a document affirming his innocence, and pledging the subscribers to promote the marriage by which they recommended the queen to reward his services and benefit the country. On the second day following Mary went to visit her child at Stirling, where his guardian, the earl of Mar, refused to admit more than two women in her train. It was well known in Edinburgh that Bothwell had a body of men ready to intercept her on the way bark, and carry her to Dunbar—not, as was naturally inferred. without good assurance of her consent. On April 24, as she approached Edinburgh. Bothwell accordingly met her at the head of 800 spearmen. assured her (as she afterwards averred) that she was in the utmost peril, and escorted her, together with Huntly, Lethington and Melville. who were then in attendance, to Dunbar Castle. On May 3 Lady Jane Gordon, who had become countess of Bothwell on Feb 22 of the year preceding, obtained a separation on the ground of her husband's infidelities. Mary and Bothwell returned to Edinburgh with every prepared appearance of a peaceful triumph. Lest her captivity should have been held to invalidate the late legal proceedings in her name, proclamation was made of forgiveness accorded by the queen to her captor in consideration of his past and future services. Bothwell. as a conscientious Protestant, reiused to marry his mistress according to the rites of her Church. and she, the chosen champion of its cause, agreed to be married to him by a Protestant,

On May 12 Bothwell was created duke of Orkney and Shetland and the marriage was solemnized three days later. The confederate lords almost immediately took up arms and seized the town and the castle of Edinburgh. Proclamations were issued in which the crime of Bothwell was denounced, and the disgrace of the country, the thraldom of the queen and the mortal peril of her infant son: were set forth as reasons for summoning all the lieges of the chief cities of Scotland to rise in arms on three hours' notice and join the forces assembled against the one common enemy. On June 1j, one month from their marriage day. the queen and Bothwell, at the head of a force of fairly equal numbers. but visibly inferior discipline, met the army of the confederates at Carberry hill, some 6m. from Edinburgh. Du Croc, the French ambassador, obtained permission, through the influence of Maitland, to convey to the queen the terms proposed by their leaders—that she and Bothwell should part, or that he should meet in single combat a champion chosen from among them. At last it was agreed that the queen should yield herself prisoner, and Bothwell be allowed to retire in safety to Dunbar, with the few followers who remained to him.

In the evening she was taken to Holyrood, and thence to the port of Leith, where she embarked under guard, with her attendants, for the island castle of Lochleven. On the 20th a silver casket containing letters and French aerses, miscalled sonnets, in the handuriting of the queen, was taken from the person of a servant who had been sent by Bothwell to bring it from Edinburgh to Dunbar. (See CASKET LETTERS) Three days after this discovery Lord Lindsay, Lord Ruthven and Sir Robert Melville were despatched to Lochleven, there to obtain the queen's signature to an act of abdication in favour of her son, and another appointing Murray regent during his minority. She submitted, and a commission of regency was established After an imprisonment of 11 months, in the course of which Elizabeth intervened on her behalf, and sent Mary a letrer and a ring in token of her protection, a young member of the household at Lochleven, Willie Douglas, aged 18, succeeded on May 2 in assisting her to escape by a postern gate to the lake-side, and thence in a boat to the msinland, where George Douglas, Lord Seton and others were awaiting her Thence they rode to Seton's castle of Niddry, and next day to Hamilton Palace, round nhich an army of 6,000 men was soon assembled The queen's forces made for the castle of Dumbarton, marching 2m. south of Glasgow, by the village of Langside. Here hlurray, with 4,500 men, met and defeated his sister's army on May 13. Mary fled 60m. from rhe field of her last battle before she halted at Sanquhar, and for three days of flight, according to her own account, had to sleep on the hard ground, live on oatmeal and sour milk, and fare at night like the owls, in hunger, cold and fear On the third day from the rout of Langside she crossed the Solway and landed at Workington in Cumberland, May 16. 1j68. On the 20th Lord Scrope and Sir Francis Knollys uere sent from court to carry messages and letters of comfort from Elizabeth to Mary at Carlisle. Her fateful choice of England instead of France was determined by her thirst for victory. She believed that Elizabeth's horror of rebellion would lead the English queen to assist her to regain her crown, and she knew no such help could be expected from France, embroiled in the wars of religion. On July 1j, after various delays interposed by her reluctance to leave the neighbourhood of the border, where on her arrival she had received the welcome and the homage of the leading Catholic houses of Northumberland and Cumberland, she was removed to Bolton Castle in north Yorkshire. During her residence here a conference was held at York between her onn and Elizabeth's commissioners and those appointed to represent her son as a king of Scots. These latter, of whom Murray himself was the chief, privately laid before the English commissioners the contents of the famous casket. On Oct. 24 the place of the conference was shifted from York to London. where the enquiry was to be held before Queen Elizabeth in council. Mary was already aware that the chief of the English commissioners, the duke of Norfolk, was secretly an aspirant to the peril of her hand: and on Oct 21 she gave the first sign of assent to the suggestion of a divorce from Bothwell On Oct. 26 the charge of complicity in the murder of Darnley was distinctly brought forward against her, in spite of Norfolk's reluctance and Murray's previous hesitation. On Jan. 10, 1569, the judgment given at the conference acquitted Murray and his adherents of rebellion, while affirming that nothing had been proved against Mary—a verdict accepted by Murray as equivalent to a practical recognition of his office as regent for the infant king. This position he was not long to hold; and the fierce exultation of Mary at the news of his murder gave reason to fear, if her liberty of correspondence and intrigue were not restrained, the likelihood of a similar fate for Elizabeth. On Jan. 26, 1569 she had been removed from Bolton Castle to Tutbury in Staffordshire, where proposals were conveyed to her, at the instigation of Leicester, for a marriage with the duke of Norfolk, to which she gave a graciously conditional assent; but the discovery of these proposals consigned Norfolk to the Tower, and on the outbreak of an insurrection in the north Mary, by Lord Hunsdon's advice, was again removed to Coventry, when a body of her intending deliverers was within a day's ride of Tutbury. In October Cecil had an interview with Mary at Chatsworth, when the conditions of her possible restoration to the throne in compliance with French demands were debated at length. The queen of Scots, with dauntless dignity, refused to yield the castles of Edinburgh and Dumbarton into English keeping, or to deliver up her fugitive English partisans then in Scotland; upon other points they came to terms, and the articles were signed Oct. 16. On the same day Mary wrote to Elizabeth. requesting the favour of an interview which might reassure her against the suggestion that this treaty was a mere pretence. On Nov 28 she was removed to Sheffield Castle, where she remained for the next 14 years in charge of the earl of Shrewsbury. The detection of a plot, in which Norfolk was implicated, for the invasion of England by Spain on behalf of Mary, who was then to take him as the fourth and most contemptible of her husbands, made necessary the reduction of her household and the stricter confinement of her person On May 28, 1j72, a demand from both houses of parliament for her execution as well as Norfolk's was rejected by Elizabeth, who, however, entered into negotiations with successive Scottish regents for Mary's delivery into their hands and her immediate execution.

In 1581 Mary accepted the advice of Catherine de' Medici and Henry III that she should allow her son's title to reign as king of Scotland conjointly with herself when released and restored to a share of the throne. This plan was but part of a scheme including the invasion of England by her kinsman, the duke of Guise, who was to land in the north and raise a Scottish army to place the released prisoner of Sheffield beside her son on the throne of Elizabeth After the overthrow of the Scottish accomplices in this notable project, Mary poured forth upon Elizabeth a torrent of pathetic and eloquent reproach for the many wrongs she had suffered at the hands of her hostess, and pledged her honour to the assurance that she now aspired to no kingdom but that of heaven. In the spring of 1583 she retained enough of this saintly resignation to ask for nothing but liberty. without a share in the government of Scotland; but Lord Burghley not unreasonably preferred, if feasible, to reconcile the alliance of her son with the detention of his mother. In the autumn of 1584 she was removed to Wingfield Manor under charge of Sir Ralph Sadler and John Somers, who accompanied her also on her next removal to Tutbury in Jan. 1585. On Christmas Eve, 1585, she was removed from the hateful shelter of Tutbury to the castle of Chartley in the same county. Her correspondence in cipher from thence with her English agents abroad, intercepted by Walsingham and deciphered by his secretary, gave eager encouragement to the design for a Spanish invasion of England under the prince of Parma. In 1j3j Anthony Babington was induced to undertake the deliverance of the queen of Scots by the murder of the queen oi England. In the conduct and detection of her correspondence with Babington, traitor was played off against traitor, and spies were utilized against assassins, with as little scruple as could be required or expected in the diplomacy of the time. In August the conspirators were netted, and Mary was arrested at the gate of Tixall park. At Tixall Mary was detained till her papers at Chartley had undergone thorough research. Her secretaries were examined in London, and one of them gave evidence that she had first heard of the conspiracy by letter from Babington, of whose design against the life of Elizabeth she thought it best to take no notice in her reply, though she did not hold herself bound to reveal it. On Sept. 2j she was removed to the castle of Fotheringhay in Northamptonshire. On Oct. 6 she was desired to answer the charges brought against her before certain of the chief English nobles.

On Oct. 14 and 1j, 1586. the trial was held in the hall of Fotheringhay castle. Mary conducted the whole of her own defense with courage incomparable and unsurpassable ability, insisting on the production of proof in her own handwriting as to her complicity with the project of the assassins. who had expiated their crime on the 20th and 21st of the month preceding. Elizabeth determined to adjourn the judgment and transfer the place of it to the star-chamber. Here, on Oct. 2j. the commissioners again met: and one of them alone. Lord Zouch, dissented from the verdict by which Mary was found guilty of having, since June 1 preceding, compassed and imagined divers matters tending to the destruction of Elizabeth. This verdict was conveyed to her, about three weeks later, by Lord Buckhurst and Robert Beale. She wrote to Elizabeth and the duke of Guise two letters of almost matchless eloquence and pathos. admirable especially for their loyal and grateful remembrance of all her faithful servants.

Elizabeth was uncertain how James VI., then 20 years of age, might take the execution of his mother. When Elizabeth discovered that James was much more interested in the succession to the English throne than in his mother's life. and that. if he was assured that her trial and condemnation would not prejudice his claim to the succession. he would (in his own words) "digest" his resentment. she rejected the intercessions made by France and Scotland, and on Feb. 1. 1587, she signed the death-warrant. On Feb. 7 the earls of Shrewsbury and Kent arrived at Fotheringhay with the commission of the council for execution of the sentence. Mary received the announcement with majestic tranquillity, expressing in dignified terms her readiness to die, her consciousness that she was a martyr for her religion, and her total ignorance of any conspiracy against the life of Elizabeth At eight next morning she entered the hall of execution, having taken leave of the weeping envoy from Scotland, to whom she gave a brief message for her son; took her seat on the scaffold, listened with an air of even cheerful unconcern to the reading of her sentence, solemnly declared her innocence of the charge conveyed in it and her consolation in the prospect of ultimate justice. rejected the professional services of Richard Fletcher, dean of Peterborough, lifted up her voice in Latin against his in English prayer, and when he and his fellom-worshippers had fallen duly silent prayed aloud for the prosperity of her own Church, for Elizabeth, for her son, and for all her enemies; then, with no less courage than had marked every hour and every action of her life, received the stroke of death from the wavering hand of the headsman.

Five months after Mary's death her body was buried at Peterborough, whence in 1612 it was removed to King Henry VII.'s chapel in Westminster Abbey. It still lies there in a sumptuous tomb erected by her son, James VI.

Mary Stuart was in many respects the creature of her age, of her creed, and of her station; but the noblest and most noteworthy qualities of her nature were independent of rank. opinion or time. Even the detractors who defend her conduct on the plea that she was a dastard and a dupe are compelled in the same breath to retract this implied reproach, and to admit. with illogical acclamation and incongruous applause. that the world never saw more splendid courage at the service of more brilliant intelligence, that a braver if not "a rarer spirit never did steer humanity." A kinder or more faithful friend, a deadlier or more dangerous enemy, it would be impossible to dread or to desire. Passion alone could shake the double fortress of her impregnable heart and ever-active brain. The passion of love. after very sufficient experience, she apparently and naturally outlived; the passion of hatred and revenge was as inextinguishable in her inmost nature as the emotion of loyalty and gratitude. Of repentance it would seem that she knew as little as of fear.

Adept as she was in the most exquisite delicacy of dissimulation, the most salient note of her original disposition mas daring rather than subtlety. Beside or behind the voluptuous or intellectual attractions of beauty and culture. she had about her the fresher charm of a fearless and frank simplicity. a genuine and enduring pleasure in small and harmless things no less than in such as were neither.

In 1562 she amused herself for some days by living "with her little troop" in the house of a burgess of St. Andrews "like a burgess's wife," assuring the English ambassador that he should not find the queen there.—"nor I know not myself where she is become." From Sheffield lodge. 12 years later, she applied to the archbishop of Glasgow and the cardinal of Guise for some pretty little dogs, to be sent her in baskets very warmly packed,—"for besides reading and working, I take pleasure only in all the little animals that I can get." For her own freedom of will and of way, she cared much; for her creed she cared something; for her country she cared nothing. (A. C. S.; R. S. R.)

BIBLIOGRAPHY.—The biography of Mary Stuart being virtually the history of Scotland during the period covered by her life, with which the history of England at the same period is also largely concerned, the chief events in which she figured are related in all the general *Histories* of both countries. The most important original authorities are the voluminous *State Papers* of the period, with other manuscript documents preserved at the British Museum, the Cambridge University Library, Hatfield and elsewhere. *See* especially the *Reports* of the Historical Manuscripts Commission; *Calendar of State Papers Relating to Scotland and Mary Queen of Scots* (Scottish Record Publ., 1898); *Calendar of Letters and State Papers Relating to English Affairs, Principally in the Archives at Simancas,* vol. i–iv (1892–99); and the *Calendars of State Papers: Domestic Series, Edw. VI.–James I.; Foreign Series, Elizabeth; Venice Series.* Important unofficial works: *Histories* of John Knox, Bishop John Lesley, George Buchanan and Robert Lindsay of Pitscottie; the *Diurnal of Remarkable Occurrents from the Death of James IV. till 1575* (Bannatyne club, 1833); Robert Birrell's "Diary," in Sir. J. G. Dalzell's *Fragments of Scottish History* (Edinburgh, 1798); etc. Much of Mary's own correspondence will be found in Prince A. Labanoff's *Lettres inédites, 1558–87* (1839), and *Lettres, instructions, et mémoires de Marie Stuart,* 7 vol. (London, 1844), selections from which have been translated into English by W. Turnbull in *Letters of Mary Queen of Scots* (1845), and by Agnes Strickland in *Letters of Mary Queen of Scots and Documents Connected with Her Personal History,* 3 vol. (1842). Recently the following three publications have added to our knowledge of original sources: Conycrs Read, *Bardon Papers;* J. Pollen, *The Babington Conspiracy;* and M. Wood, *Balcarres Papers.*

MARY OF LORRAINE (1515–1560)! generally known as MARY OF GUISE, queen of James V and afterward regent of Scotland, was born at Bar-le-Duc, France, on Nov. 22, 1515. She was the eldest child of Claude of Guise and Antoinette de Bourbon, and married in 1534 Louis II of Orleans, duke of Longueville, to whom in 1535 she bore a son. Francis (d. 1551). The duke died in 1537, and Mary was sought in marriage by James V, and by Henry VIII (after the death of Jane Seymour). James's suit was successful, and he married Mary at Paris, by proxy, early in 1538, and, in a second ceremony at St. Andrews, in June of that year. Her two sons. James (b. May 1540) and Robert or Arthur (b. April 1541), died within a few days of one another in April 1541, and her husband died in Dec. 1542, within a week of the birth of his heiress, Mary Queen of Scots. The regency fell to the heir presumptive, James. earl of Arran, who favoured England and the Protestant party, and who hoped to secure the infant princess for his son, Mary of Lorraine was approached by the English commissioner, Sir Ralph Sadler. to induce her to further her daughter's marriage contract with Henry's son, Edward. The marriage treaty between Mary, not then one year old, and Edward was signed in July at Greenwich, and guaranteed that Mary should be placed in Henry's keeping when she was ten. (See MARY QUEEN OF SCOTS.)

In 1550 Mary of Lorraine visited France and obtained from Henry II the confirmation of the dukedom of Châtelherault, already granted to the earl of Arran, in the hope of inducing him to resign the regency. Arran refused to comply until April 1554, when Mary of Lorraine took his place as regent for the absent queen. She had now to deal with an empty exchequer and with a strong opposition to her daughter's marriage with the dauphin Francis. The first revolt against her authority arose from an attempt to establish a standing army. When she provoked a war with England in 1557, the nobles refused to cross the border. In matters of religion she tried to hold the balance between the Catholics and Protestants and allowed the reformers the practice of their religion as long as they refrained from public preachings in Edinburgh and Leith, but the marriage of Francis and her daughter, Mary, in 1558 strengthened her position, and in 1559 she adopted the religious policy of her relatives, the Guises. She was reconciled with Archbishop John Hamilton, and took up arms against the Protestants of Perth, who, incited by John Knox, had destroyed the Charterhouse with the royal tombs. They submitted on condition that no foreign garrison be imposed on Perth and that the religious settlement be referred to the Scottish parliament. Mary of Lorraine broke the spirit of this agreement by garrisoning Perth with Scottish troops in the pay of France. The Lords of the Congregation soon assembled in considerable force on Cupar muir. Mary retreated to Edinburgh and thence to Dunbar, while Edinburgh opened its gates to the reformers, who issued a proclamation (Oct. 21, 1559) claiming that the regent was deposed. The lords sought help from Elizabeth I, while the regent had recourse to France. The strength of her opponents was increased by the defection of Châtelherault and his son Arran, and by the betrayal of her plans by her secretary, William Maitland, to the Lords of the Congregation. In Oct. 1559 they made an unsuccessful attack on Leith. Mary entered Edinburgh and conducted a campaign in Fife.

When an English army under Lord Grey entered Scotland in March 1560, the ailing regent received an asylum in Edinburgh castle, which was held strictly neutral by Lord Erskine (later earl of Mar). Before her death (June 11, 1560) Mary sent for the Lords of the Congregation, with whom she pleaded for the maintenance of the French alliance. (G. S. P.; S.)

MARY OF MODENA (MARIA BEATRICE ANNE MARGARET ISABEL D'ESTE) (1658–1718), queen of the English king James II, and daughter of Alphonso IV, duke of Modena, and the duchess Laura, of the Roman family Martinozzi, was born at Modena, Italy, on Oct. 5, 1658. She was married by proxy to James, then duke of York, on Sept. 30, 1673, and in November reached England, where she was regarded as an agent of the pope. During the "popish" plot. she went abroad with her husband. Between 1675 and 1682 she bore five children, of whom only one daughter survived infancy. When her second son, James Francis Edward, was born on June 10 (old style), 1688, it was said that the child was not really hers, and that a fraud had been perpetrated to secure a Roman Catholic heir. At the outbreak of the revolution she made the disastrous mistake of consenting to escape to France (Dec. 10, 1685) with her son. She urged James to follow when it was his manifest interest to stay in England. and when he went to Ireland, she pressed for his return. Another daughter, Louisa Maria, was born at St. Germain, France, on June 28. 1692. When her husband died on Sept. 6, 1701, she induced Louis XIV to recognize her son as king of England, an act which precipitated the War of the Spanish Succession (*q.v.*). Surviving James by 17 years. Mary lived at St. Germain and at Chaillot, in a house of the Visitation, where she died on May 7, 1718.

MARY (1457–1482), duchess of Burgundy, only child of Charles the Bold, duke of Burgundy, and his wife Isabella of Bourbon, was born on Feb. 13, 1457. As heiress of the rich Burgundian domains her hand was eagerly sought by a number of princes. When her father fell upon the field of Nancy, on Jan. 5, 1477, Louis XI of France took possession of the duchy of Burgundy, as a fief lapsed to the French crown, and also of Franche-Comté, Picardy and Artois (to which France was to renounce her claims in 1493). He was anxious that Mary should marry the dauphin Charles and thus confer the inheritance of the Netherlands on his descendants. Mary declined the French alliance and married the archduke Maximilian of Austria, afterward the emperor Maximilian I, at Ghent on Aug. 18, 1477. She died on March 27, 1482. Her son, Philip, married Joan the Mad of Castile and Aragon and was the father of Charles V; her daughter: Margaret of Austria, proved a great governess of the Netherlands and the Franche-Comté (*q.v.*).
